IBM IMS Database Utility Solution for z/OS
Version 1 Release 1

IMS High Availability Large Database
Toolkit User's Guide

IBM
Third Edition (December 2019)

This edition applies to Version 1 Release 1 of IBM IMS Database Utility Solution for z/OS® IMS High Availability Large Database Toolkit (program number 5655-DBU) and to all subsequent releases and modifications until otherwise indicated in new editions.

This edition replaces SC27-9007-01.

Index......................................................................................................................................................353
IBM® IMS Database Utility Solution for z/OS IMS High Availability Large Database Toolkit (formerly IBM IMS High Availability Large Database Conversion and Maintenance Aid for z/OS, and hereafter referred to as IMS HALDB Toolkit) provides application enabling features and system utilities for the improved management and operation of the IMS HALDB environment.

These topics provide instructions for using IMS HALDB Toolkit.

To use the procedures in this information, you must first install IMS HALDB Toolkit as described in the Program Directory for IMS Database Utility Solution for z/OS, GI13-4327, and then perform the postinstallation steps as described in the IMS Database Utility Solution: Overview and Customization, SC27-9006.

These topics are designed to help database administrators, system programmers, application programmers, and system operators perform the following tasks:

• Use IMS HALDB Toolkit to set up environments
• Define and process a conversion project
• Maintain IMS HALDB Toolkit
• Use the DBRC function for HALDBs
• Interpret reports issued by IMS HALDB Toolkit
• Troubleshoot IMS HALDB Toolkit problems

To use these topics, you should have a working knowledge of:

• The z/OS operating system
• ISPF

Always refer to the IMS Tools Product Documentation web page for complete product documentation resources:

The IMS Tools Product Documentation web page includes:

• Links to IBM Knowledge Center for the user guides ("HTML")
• PDF versions of the user guides ("PDF")
• Program Directories for IMS Tools products
• Recent updates to the user guides, referred to as "Tech docs" ("See updates to this information!")
• Technical notes from IBM Software Support, referred to as "Tech notes"
• White papers that describe product business scenarios and solutions
Part 1. Introduction to IMS HALDB Toolkit

IBM IMS Database Utility Solution for z/OS IMS High Availability Large Database (HALDB) Toolkit (also referred to as IMS HALDB Toolkit) provides application enabling features and system utilities for the improved management and operation of the IMS HALDB environment.

**Topic:**
- Chapter 1, "IMS HALDB Toolkit overview,” on page 3
Chapter 1. IMS HALDB Toolkit overview

IMS HALDB Toolkit provides HALDB functions that can be used for HALDB maintenance and operation tasks. Product features include application enabling features and system utilities for the improved management and operation of the IMS HALDB environment.

A High Availability Large Database (HALDB) is a partitioned full-function DL/I database. The supported database organizations are PHDAM, PHIDAM, and PSINDEX.

IMS databases are escalating in size because of regulatory compliance requirements and because businesses are serving more customers and using more suppliers. IMS HALDB Toolkit can help reduce the time and minimize the skills that are required to perform application support tasks and provide IMS HALDB maintenance, modeling, and analysis.

IMS HALDB Toolkit helps you to maintain 24x7 data availability. The tool’s application functions enable applications to make better use of the HALDB environment. The tool’s system utilities provide capabilities that can help improve HALDB serviceability.

Topics:
- “What’s new in IMS HALDB Toolkit” on page 3
- “IMS HALDB Toolkit features and benefits” on page 4
- “Usage and restrictions” on page 7
- “Considerations for the IMS management of ACBs” on page 8
- “Service updates and support information” on page 8
- “Product documentation and updates” on page 9
- “Accessibility features” on page 10

What's new in IMS HALDB Toolkit

This topic summarizes the technical changes for this edition.

New and changed information is indicated by a vertical bar (|) to the left of a change. Editorial changes that have no technical significance are not noted.

SC27-9007-02 (December 2019)

- The ANALYZEPART function has been enhanced to use unloaded data sets of a full-function database to simulate conversion from a full-function database to a HALDB, or unloaded data sets of a HALDB to simulate repartitioning of a HALDB (APAR PI92219).
  This APAR also provides a new option of ICTRLR parameter for MAINTAIN and CONVERT function to support yyddd format.
  In addition, this APAR enables IMS HALDB Toolkit batch and ISPF MAINTAIN to use DFSURGL0 for loading PSINDEX when using combined load library in STEPLIB with IMS High Performance Load modules.
  For more information, see the following topics:
    - “Simulating conversion or repartitioning using unloaded data sets as input” on page 16
    - “ANALYZEPART example: Using unloaded data sets as input” on page 36
- A new parameter, GDGLIMIT, has been added to CONVERT and MAINTAIN functions (APAR PI99707).
  For more information, see the following topics:
    - “CONVERT command parameters” on page 48
    - “MAINTAIN command parameters” on page 79
• New parameters, UNLSPAC and UNLUNIT, have been added to CONVERT and MAINTAIN functions (PH00721). For more information, see the following topics:
  – “CONVERT command parameters” on page 48
  – “MAINTAIN command parameters” on page 79

• A post conversion step to remove dynamic allocation members has been added (APAR PH01710). For more information, see the following topics:
  – “Converting databases offline” on page 44
  – “Converting to HALDB using the ISPF user interface” on page 259

• The ANALYZEPART function has been enhanced to simulate HALDB conversion and report the structure of the converted DBD by printing DBD source (DBDGEN utility control statements). DBD source helps you understand the structure of the converted DBD and prevent unexpected conversion failure that may occur during HALDB conversion (APAR PH04245). For more information, see “ANALYZEPART example: Generating DBD source” on page 38.

• IMS HALDB Toolkit has been enhanced to support the IMS management of ACBs for batch functions (APAR PH10937). For more information, see “Considerations for the IMS management of ACBs” on page 8.

• IMS HALDB Toolkit has been enhanced to support encrypted VSAM database data sets and encrypted image copy data sets (APAR PH11848). For more information, see the following topics:
  – “CONVERT command parameters” on page 48
  – “MAINTAIN command parameters” on page 79
  – “COPYDBRC command parameters” on page 118

• Information to learn the techniques for improving the performance of ANALYZEPART, CONVERT, and MAINTAIN function jobs have been added. For more information, see Chapter 29, “Performance tips and considerations,” on page 293.

**SC27-9007-01 (January 2017)**

• Descriptions for DD statements and command parameters in multiple topics have been added.

• New topics have been added to explain how the MAINTAIN function processes partitions. For more information, see “How the MAINTAIN function works when adding, deleting, and naming partitions” on page 98.

**IMS HALDB Toolkit features and benefits**

IMS HALDB Toolkit helps to administer databases through a HALDB conversion with ease and efficiency. IMS HALDB Toolkit helps reduce administrative costs by easing the conversion from full-function to HALDB and assisting in transporting HALDBs to IMS test systems.

In addition, IMS HALDB Toolkit provides the following features and functions:

• Batch conversion and maintenance offline
  The database to be converted must have IMS dynamic allocation member (MDA) descriptions.

• Simulation of new partition settings and simulation of conversion from full-function database to HALDB

• JCL, created by DBDLIB conversion, to convert entire DBD libraries
  DBDLIB conversion uses batch conversion to create JCL for each primary database.

• Offline reorganization of PSINDEX databases, including index pointer healing and reclaiming of VSAM space

• PSINDEX records of deleted partitions removed (DELETE PARTITION)
  It is not necessary to rebuild the PSINDEX by scanning all partitions.
• Performance improvement because PSINDEX records are sorted and inserted sequentially (ADD PARTITION, using LOAD processing)
• Merge identical HALDBs and combine user-partitioned databases into one multi-partitioned HALDB (MERGE HALDB)

IMS HALDB Toolkit dynamically detects the existence of the following tools and uses the tools as needed:
• IMS High Performance Image Copy for z/OS
• IMS High Performance Load for z/OS
• IMS High Performance Pointer Checker for z/OS
• IMS High Performance Unload for z/OS
• IMS Library Integrity Utilities for z/OS

If any of these tools are unavailable on the system, IMS HALDB Toolkit replaces them with an appropriate IMS utility (if they are available).

Application support

IMS HALDB Toolkit provides the following support for applications:

Dynamic DFSHALDB statement build
Dynamic management of the DFSHALDB statement is allowed by providing a key for the starting partition and a key for the ending partition.

When you specify a key range, the utility transforms the key range into a starting and ending partition. Therefore, the application does not require a change when partitions are split or consolidated.

Partition Selection API
A callable interface is provided to assign a key to a partition.

This API allows applications to split their input on a partition boundary for parallel processing.

The API returns the partition name and the partition number. The API does not require a DL/I environment.

Converting to HALDB

IMS HALDB Toolkit supports the following functions to help you convert full-function databases to HALDBs:

Simulate conversion to a HALDB
Before you convert the full-function database, simulate the HALDB partition settings to determine the most effective partition settings.

Conversion to a HALDB
You can convert to HALDB using a single step batch process.

You can alternatively convert to HALDB using the ISPF user interface to generate all required steps. Help panels are available for IMS HALDB Toolkit functions while you are in an ISPF session.

Maintaining HALDBs

IMS HALDB Toolkit supports the following functions to help you maintain HALDBs:

Simulate repartitioning of a HALDB
Before you consolidate or split partitions, simulate the new partitions to determine the most effective partition settings. This utility simulates the effect of the new partition settings with ease.

Consolidate or split partitions
As the data grows or shifts, partitions grow or shrink. This utility allows you to consolidate or split partitions with ease.
Index Pointer Healer

After reorganizing the primary database, all secondary index pointers require healing (the new self healing with HALDB). However, this task might demand extra resources that could impact performance during peak time.

This utility heals the pointer offline and at a less expensive time.

Load a single partition

Databases with secondary indexes must insert the secondary indexes in random sequence when loading. This utility delays the index insert to the end of the load process, then loads the indexes in sequence.

This method improves the elapsed time.

Delete a single partition

When a single partition is deleted, the secondary indexes must be rebuilt. This utility deletes all records from the secondary indexes that reference the deleted partition.

The entire process is recoverable and fast.

Merge HALDBs

When user partitioning (multiple identical databases on different key ranges) has been used, the conversion will first transform the databases to HALDB, and then merge them together using this process.

This task is necessary when you require secondary indexing and was not possible when using multiple databases.

Add an empty partition to the end of a database

This function is appropriate for growth that occurs mainly at the end of an existing database.

DBRC handling

IMS HALDB Toolkit supports the following functions for DBRC handling:

Cloning DBRC definitions

The clone function replicates HALDB DBRC definitions to other RECONs and allows you to exchange the high-level data set name qualifier.

Copy a HALDB to a different IMS system

The copy function transfers a production HALDB to a different IMS and allocates the target data set in that system, if the data set is not already available.

Backup DBRC definitions

The backup function saves database-related DBRC definitions. The definitions can be used as input for the batch DBRC utility (DSPURX00).

For more information, see Chapter 12, “HALDB without DBRC,” on page 177.

HALDB Analyzer

IMS HALDB Toolkit supports the HALDB Analyzer utility to help you analyze HALDBs:

Analyze HALDB constructs

This function analyzes the HALDB structure and verifies that all root keys are in the correct partition, that all ILKs are valid, and that all EPS pointers can find the correct ILE. Additionally, performance-related data is collected.

This utility can be used to check the health of a HALDB.

You can provide thresholds that trigger the utility to inform you when a maintenance function is required.

Extract root keys

This utility allows the extracting of all root keys to a sequential file. A record layout is provided.
**System utilities**

IMS HALDB Toolkit provides the following utilities to help you with database handling tasks:

**Split unload file**

This utility allows you to split an unload file into single partition unload files. The reloads then can run in parallel.

The single partition unload files are standard Hierarchical Direct (HD) unload files with header and trailer statistics.

Each file contains only records for the selected partition.

**Indirect list key (ILK) rebuild**

This utility enables you to rebuild all ILKs and their references, and allows you to resolve conflicting ILKs.

The databases must be offline for this activity.

**ACBLIB reference**

This utility provides a list of all PSBs that reference a given database, and assists in online changes by identifying which PSBs require change.

**Create DBD source**

This utility re-creates the DBD source statements from the DBDLIB.

---

**Usage and restrictions**

There are important usage and restrictions for the IMS HALDB Toolkit product.

**Logical relationships and secondary indexes**

IMS HALDB Toolkit converts databases and secondary indexes with the following logical relationships:

- Unidirectional logical relationships remain as unidirectional.
- Bidirectional logical relationships with physical pairing remain as bidirectional with physical pairing.
- Bidirectional logical relationships with virtual pairing are converted to bidirectional relationships with physical pairing.
- Shared secondary indexes are converted to single secondary indexes.
- Non-unique secondary indexes are converted to unique secondary indexes by adding the /SX field to the SUBSEQ parameters of the XDFLD.

A few installations have defined bidirectional logical relationships without any pairing even though this capability is not documented in the IMS product. IMS HALDB Toolkit does not support a conversion of these relationships to HALDB.

When running the CONVERT function as a batch job, DBDs with logical relationships (except for indexes) are not allowed. To convert DBDs with logical relationships, the ISPF interface must be used because the database and all logically related databases must be unloaded before the conversion can be done. Batch CONVERT does only one unload followed by one convert at a time. The ISPF interface can be used to construct the JCL such that all unloads are to be done before the conversion.

The CONVERT function does work for DBDs with logically related secondary indexes. The CONVERT function always converts the related non-HALDB Secondary Index to a HALDB Secondary Index (PSINDEX for example). This conversion from non-HALDB Secondary Index to a HALDB Secondary Index is so that the secondary index remains usable. If the secondary index is no longer required, one must remove it from the DBD and run DBDGEN again before running the CONVERT function.

**Database limitations**

The following limitations apply to IMS HALDB Toolkit database conversions:
Considerations for the IMS management of ACBs

When the IMS management of ACBs is enabled, IMS HALDB Toolkit can refer to database definitions in the IMS catalog directory instead of the DBD library.

IMS catalog definition is retrieved from either:
• The IMS Catalog Definition exit routine (DFS3CDX0) in the STEPLIB concatenation.
• The DFSDFxxx PROCLIB member specified by the DFSDF(\xxx) parameter in IHCSYSIN and the PROCLIB DD statement.

The following conditions must be satisfied to use IMS managed ACBs:
• IBM IMS Tools Base for z/OS, Version 1 Release 6 or later must be installed.
• The IMS catalog database must be registered to the RECON data sets.
• The name of the IMS catalog database must be defined in the RECON record with the following DBRC command: CHANGE RECON CATALOG(name).
• If the DFSMDA member with the TYPE=CATDSHLQ statement is used to specify the high-level qualifier of the IMS catalog system data sets, the library that contains the DFSMDA member must be in the STEPLIB concatenation of the IMS HALDB Toolkit job.

The following functions do not support the IMS management of ACBs:
• Batch functions: CONVERT, IHCUBDBD, IHCWPSBL, HALDBLOAD and a function to load logical children
• HALDB without DBRC
• All ISPF functions

The following restrictions apply when the IMS catalog database is specified on the DBD parameter:
• The IMS catalog is supported only by the ANALYZEPART function and the MAINTAIN function. No other function supports the IMS catalog.
• IMS DD must be specified.

For more information, see “MAINTAIN example: Maintaining a database when the IMS management of ACBs is enabled” on page 106.

Service updates and support information

Service updates and support information for this product, including software fix packs, PTFs, frequently asked questions (FAQs), technical notes, troubleshooting information, and downloads, are available from the web.

To find service updates and support information, see the following website:

IBM Support: IMS Database Utility Solution for z/OS
Product documentation and updates

IMS Tools information is available at multiple places on the web. You can receive updates to IMS Tools information automatically by registering with the IBM My Notifications service.

Information on the web

Always refer to the IMS Tools Product Documentation web page for complete product documentation resources:

The IMS Tools Product Documentation web page includes:

• Links to IBM Knowledge Center for the user guides (“HTML”)
• PDF versions of the user guides (“PDF”)
• Program Directories for IMS Tools products
• Recent updates to the user guides, referred to as "Tech docs" (“See updates to this information!”)
• Technical notes from IBM Software Support, referred to as "Tech notes"
• White papers that describe product business scenarios and solutions

IBM Redbooks® publications that cover IMS Tools are available from the following web page:

http://www.redbooks.ibm.com

The IBM Information Management System website shows how IT organizations can maximize their investment in IMS databases while staying ahead of today’s top data management challenges:

https://www.ibm.com/software/data/ims/

Receiving documentation updates automatically

To automatically receive automated emails that notify you when new technote documents are released, when existing product documentation is updated, and when new product documentation is available, you can register with the IBM My Notifications service. You can customize the service so that you receive information about only those IBM products that you specify.

To register with the My Notifications service:

1. Go to http://www.ibm.com/support/mysupport
2. Enter your IBM ID and password, or create one by clicking register now.
3. When the My Notifications page is displayed, click Subscribe to select those products that you want to receive information updates about. The IMS Tools option is located under Software > Information Management.
4. Click Continue to specify the types of updates that you want to receive.
5. Click Submit to save your profile.

How to send your comments

Your feedback helps IBM to provide quality information. Send any comments that you have about this book or other IMS Tools documentation to comments@us.ibm.com. Include the name and version number of the product and the title and number of the book. If you are commenting on specific text, list the location of the text (for example, a chapter, topic, or section title).
Accessibility features

Accessibility features help a user who has a physical disability, such as restricted mobility or limited vision, to use a software product successfully.

The major accessibility features in IMS HALDB Toolkit enable users to perform the following activities:

- Use assistive technologies such as screen readers and screen magnifier software. Consult the assistive technology documentation for specific information when using it to access z/OS interfaces.
- Customize display attributes such as color, contrast, and font size.
- Operate specific or equivalent features by using only the keyboard. See the following publications for information about accessing ISPF interfaces:
  - z/OS ISPF User's Guide, Volume 1
  - z/OS TSO/E Primer
  - z/OS TSO/E User's Guide

These guides describe how to use ISPF, including the use of keyboard shortcuts or function keys (PF keys), include the default settings for the PF keys, and explain how to modify their functions.
Part 2. Simulating HALDBs

By using the ANALYZEPART function, you can simulate HALDB partition settings to determine the effective partition settings.

The ANALYZEPART function is supported in batch mode and it can be used for offline databases.

With the ANALYZEPART function, you can:

- Simulate the HALDB partition settings before you convert a full-function database to a HALDB with the CONVERT function
- Simulate the new partition settings before you perform maintenance on HALDB partitions with the MAINTAIN function

**Topic:**

- Chapter 2, “Simulating HALDB using ANALYZEPART,” on page 13
Chapter 2. Simulating HALDB using ANALYZEPART

Use the ANALYZEPART command to simulate the effect of new partition settings or conversion from a full-function database to a HALDB in batch mode.

Topics:
- “ANALYZEPART data flow” on page 13
- “Simulating conversion to a HALDB” on page 14
- “Simulating repartitioning of a HALDB” on page 15
- “Simulating conversion or repartitioning using unloaded data sets as input” on page 16
- “ANALYZEPART DD statements” on page 17
- “ANALYZEPART command parameters” on page 20
- “ANALYZEPART examples” on page 31

ANALYZEPART data flow

The following figure shows the data flow for the ANALYZEPART function.

![ANALYZEPART data flow diagram]

Figure 1. ANALYZEPART data flow
The simulation result is written to the Collect DBDs report in the IHCLIST data set.

- If you request to generate DBRC commands, the DBRC commands are written to the data set pointed to from the `dbrcout` DD statement.
- If you request to generate DBD source, DBDGEN utility control statements are written to the data set pointed to from the `dbdsourse` DD statement.

### Simulating conversion to a HALDB

You can simulate conversion from a full-function database to a HALDB offline by using the `ANALYZEPART` command.

**About this task**

By simulating the effect of the HALDB partition settings, you can determine the most effective partition settings before you convert a full-function database to a HALDB by using the `CONVERT` command.

For a database with logical relationships, only the database that is specified on the DBD parameter is simulated. All the logically related databases are not simulated.

**Procedure**

1. Locate the sample JCL members in the SIHCSAMP file, members IHCEMAIx.
2. Specify the JCL DD statements.
   - For a list of DD statements, see “ANALYZEPART DD statements” on page 17.
3. Specify the ANALYZEPART command parameters.
   - For a list of ANALYZEPART command parameters, see “ANALYZEPART command parameters” on page 20.

The following table lists some of the common scenarios and ANALYZEPART parameters for simulating HALDB partition settings:

<table>
<thead>
<tr>
<th>Scenario</th>
<th>ANALYZEPART parameters</th>
<th>KEYSIN input</th>
</tr>
</thead>
<tbody>
<tr>
<td>Simulate conversion to a HALDB that has four partitions</td>
<td><code>ANALYZEPART DBD(xxxx) - PARTNUM(4)</code></td>
<td>Not applicable</td>
</tr>
<tr>
<td>Simulate conversion to a HALDB that has 512 MB size partitions</td>
<td><code>ANALYZEPART DBD(xxxx) - PARTSIZE(512)</code></td>
<td>Not applicable</td>
</tr>
<tr>
<td>Simulate conversion to a HALDB using your own key boundaries</td>
<td><code>ANALYZEPART DBD(xxxx) - KEYS(KEYSIN)</code></td>
<td><code>//KEYSIN DD * smaller-high-key middle-high-key last-high-key</code></td>
</tr>
</tbody>
</table>

You can also refer to the following examples to code ANALYZEPART JCL statements and command parameters:

- “ANALYZEPART example: Specifying the number of partitions ” on page 32
- “ANALYZEPART example: Specifying the partition size” on page 32
- “ANALYZEPART example: Specifying the key ranges for partitions” on page 33
- “ANALYZEPART example: Generating DBRC commands” on page 34
- “ANALYZEPART example: Using unloaded data sets as input” on page 36
Simulating repartitioning of a HALDB

You can simulate repartitioning of a HALDB offline by using the `ANALYZEPART` command.

**About this task**

By simulating the effect of the new partition settings, you can determine the most effective partition settings before you consolidate or split partitions by using the `MAINTAIN` command.

For a database with logical relationships, only the database that is specified on the DBD parameter is simulated. All the logically related databases are not simulated.

**Procedure**

1. Locate the sample JCL members in the SIHCSAMP file, members IHCEMAIx.
2. Specify the JCL DD statements.
   - For a list of DD statements, see “`ANALYZEPART` DD statements” on page 17.
3. Specify the `ANALYZEPART` command parameters.
   - For a list of `ANALYZEPART` command parameters, see “`ANALYZEPART` command parameters” on page 20.

The following table lists some of the most common functions and `ANALYZEPART` parameters:

<table>
<thead>
<tr>
<th>Scenario</th>
<th><code>ANALYZEPART</code> parameters</th>
<th>KEYSIN input</th>
</tr>
</thead>
<tbody>
<tr>
<td>Simulate consolidation of two partitions into one using PARTNUM</td>
<td><code>ANALYZEPART DBD(xxxx) - PARTLIST(part1,part2) - PARTNUM(1)</code></td>
<td>Not applicable</td>
</tr>
<tr>
<td>Simulate splitting of one partition into two using PARTNUM</td>
<td><code>ANALYZEPART DBD(xxxx) - PARTITION(part1) - PARTNUM(2)</code></td>
<td>Not applicable</td>
</tr>
<tr>
<td>Simulate splitting of one large partition into 2048 MB size partitions using PARTSIZE</td>
<td><code>ANALYZEPART DBD(xxxx) - PARTITION(bigpart1) - PARTSIZE(2048)</code></td>
<td>Not applicable</td>
</tr>
</tbody>
</table>
| Simulate splitting of one partition into three using your own key boundaries | `ANALYZEPART DBD(xxxx) - PARTITION(part1) - KEYS(KEYSIN)` | `//KEYSIN DD *` 
  `smaller-high-key` 
  `middle-high-key` 
  `last-high-key` |
| Simulate repartitioning with 2048 MB size partitions for all the partitions using PARTSIZE | `ANALYZEPART DBD(xxxx) - PARTITION(*) - PARTSIZE(2048)` | Not applicable |
You can also refer to the following examples to code ANALYZEPART JCL statements and command parameters:

- “ANALYZEPART example: Specifying the number of partitions” on page 32

Simulating conversion or repartitioning using unloaded data sets as input

You can use unloaded data sets of a full-function database to simulate conversion from a full-function database to a HALDB, or unloaded data sets of a HALDB to simulate repartitioning of a HALDB.

About this task

Instead of supplying a full-function database or a HALDB as input for the ANALYZEPART function, you can supply unloaded data sets of a full-function database or of a HALDB and simulate the effect of database conversion or repartitioning.

Restriction: When you simulate conversion from a full-function database to a HALDB by supplying unloaded data sets as input, the ANALYZEPART function processes only the primary DBD that is specified on the DBD parameter. It does not process any secondary index databases. If DBD source generation is requested, IMS HALDB Toolkit generates DBD source for secondary index databases as well as for the primary DBD.

Procedure

1. Prepare the unloaded data sets. If you already have unloaded data sets, make sure your unloaded data sets satisfy the following requirements:

   a. The ANALYZEPART function reads all data in the unloaded data sets that you specify on the DFSUINPT DD statement. If your unloaded data sets contain all the data of a HALDB and you want the ANALYZEPART function to process only some partitions, you must split the unloaded data sets so that the unloaded data sets that you specify on the DFSUINPT DD statement contain only the data of partitions that you want to process. You can do so by using the split unload file utility. For more information, see “Example 4: Split unloaded data sets and simulate repartitioning of a HALDB” on page 37.

   b. If the data in the unloaded data sets is masked and the original database uses unique keys, you must mask the unloaded data sets by using different unique values. The ANALYZEPART function does not check for duplicate keys. If duplicate keys exist in the unloaded data sets, the result of simulation might not be as expected.

   c. If the database contains compressed segments (in other words, if the SEGMENT statements of the DBDGEN utility has a COMPRTN keyword), use the FABHURG1 utility of IBM IMS High Performance Unload for z/OS to create the unloaded data sets. You must specify the DECN control statement for the FABHURG1 utility to create unloaded data sets that the ANALYZEPART function can read. For more information, see the topic “FABHURG1 unload utility” in the IMS High Performance Unload User’s Guide.

2. Locate the sample JCL members in the SIHCSAMP file, members IHCEMAIx.

3. Specify the JCL DD statements.
For a list of DD statements, see “ANALYZEPART DD statements” on page 17.

a) Specify a DFSUINPT DD statement and code the names of all the unloaded data sets on the statement.
b) Specify other JCL DD statements.

4. Specify the ANALYZEPART command parameters.

For a list of ANALYZEPART command parameters, see “ANALYZEPART command parameters” on page 20. For examples, see “ANALYZEPART example: Using unloaded data sets as input” on page 36 and “ANALYZEPART example: Generating DBD source” on page 38.

a) Specify the INPUT(UNLOAD) parameter. This parameter requests the ANALYZEPART function to read data from unloaded data sets.
b) If the unloaded data sets contain data from a HALDB, specify the partitions to simulate with the PARTLIST parameter or the PARTITION parameter. The ANALYZEPART function does not check the consistency of partitions against the unloaded data sets specified on the DFSUINPT DD statement. If there is inconsistency between the partitions and data in the unloaded data sets, the result of simulation might not be as expected.
c) Specify other ANALYZEPART command parameters.

Restriction: When unloaded data sets are provided as input, the ANALYZEPART function ignores the following parameters:

- Parameters related to secondary index databases (INDPART, INDPRIM, INDSIZE)
- READINT parameter

<td>SYSUDUMP</td>
<td>Output</td>
<td>LRECL=133</td>
<td>Optional</td>
</tr>
</tbody>
</table>

**STEPLIB**
This statement is required. The library data sets pointed to from the STEPLIB DD statement must always be APF-authorized, even if a DFSRESLB DD statement is provided. Authorized library data sets include:

- IMS HALDB Toolkit load library
- IMS utilities that are available for IMS HALDB Toolkit
- IMS RESLIB library
- Any other libraries

The libraries can appear in any order.

```
//STEPLIB DD DISP=SHR,DSN=ihcload
//        DD DISP=SHR,DSN=imstools
//        DD DISP=SHR,DSN=reslib
```

where:

- **ihcload** is the name of the library that contains the IMS HALDB Toolkit load modules.
- **imstools** is the optional name of the library that contains the IMS reorganization utilities load modules.
- **reslib** is the name of the library that contains the IMS load modules.

If you do not specify an IMSDALIB DD statement in the JCL, you must specify the MDALIB in the STEPLIB for dynamic allocation purposes.

**DFSRESLB**
This statement is optional. The statement points to an authorized library that contains IMS SVC modules.

IMS HALDB Toolkit dynamically allocates this DD if you do not provide it.

**IMS**
This statement is required only if the IMS management of ACBs is not enabled. The statement describes the library that contains the DBDs of the database that you are processing.

This data set must reside on DASD.

When the IMS management of ACBs is enabled, IMS HALDB Toolkit ignores the IMS DD statement.

**IMSDALIB**
This statement is optional. The statement specifies a partitioned data set or data sets that contain the dynamic allocation members for the database data sets of non-HALDB and the RECON data sets.

If DBRC is active and the IMSDALIB DD statement is coded, IMSDALIB is always referred to by DBRC, and DBRC determines the data sets to be allocated for each RECON DD.

For the database data sets of non-HALDB, IMSDALIB is referred to only when the dynamic allocation for the original data sets is requested. Dynamic allocation of the database data sets is attempted in the following order:

1. Dynamic allocation members in the IMSDALIB concatenation
2. Dynamic allocation members in JOBLIB or STEPLIB concatenation
This statement is optional. The statement points to the IMS.PROCLIB data set. If DFSDF(ddd) is specified in the IHCSYSIN data set, you must specify this DD statement and ensure that the DFSDFddd member exists in the IMS.PROCLIB data set.

These statements are optional. The statements define the database recovery control (DBRC) RECON data sets. RECON data sets dictate which databases and IMS online systems to use during the processing.

**Attention:** If you specify IMSDALIB DD dynamic allocation, do not use these RECON DD statements. If you used JCL to allocate RECON1 as a spare data set, you must restart the database.

This statement is optional if the database to be processed is not a HALDB. This statement defines the database data set. One statement of this type must be present for each data set in the DBD that describes this database. The DD name must match the DD name in the DBD.

For a HIDAM database, DD statements must also exist for the data sets that represent the index. The DD statements that relate to the index must contain DD names specified in the DBD for the index database.

The data sets, if specified, must reside on DASD. If you use dynamic allocation, do not code the DD statement for the database data sets.

**Attention:**
- You must not specify the DD statements for HALDB data sets because HALDB data sets are registered in RECON and are always allocated dynamically.
- If the DD statement is coded, do not code DCB=BUFNO=n or AMP='BUFND=n' to request access method buffers for database data sets because HSSR Engine of IMS HP Unload allocates its own buffer pools.

This statement is required when you supply unloaded data sets as input. The statement specifies one or more data sets that contain unloaded data of a full-function database or of a HALDB.

The supported format of the unloaded data sets is HD unload format. The ANALYZEPART function processes all the data sets that are specified on this DD statement and all the data inside the data sets.

For more information about supplying unloaded data sets as input, see the following topics:
- “Simulating conversion or repartitioning using unloaded data sets as input” on page 16
- “ANALYZEPART example: Using unloaded data sets as input” on page 36

This statement is required. The statement defines a control statement or data set that contains control statements that specify the functions of IMS HALDB Toolkit.

For more information about the format of IHCSYSIN DD statements, see “ANALYZEPART command parameters” on page 20.

This statement is optional. The statement defines the statistics output data set and output from other utilities that are executed under the control of IMS HALDB Toolkit.

The data set can reside on DASD, or it can be routed through the output job. IMS HALDB Toolkit dynamically allocates this data set if you do not provide it.

This statement is optional. The statement defines the IMS HALDB Toolkit output data set for progress messages issued during the job. For more information, see “MSGPRINT data set” on page 279.
The data set can reside on DASD, or it can be routed through the output job. IMS HALDB Toolkit dynamically allocates this data set if you do not provide this DD statement.

IHCLIST
This statement is optional. The statement defines the IMS HALDB Toolkit output data set for reports. For more information about the reports generated in this data set, see “IHCLIST data set” on page 280.

The data set can reside on DASD, or it can be routed through the output job. IMS HALDB Toolkit dynamically allocates this data set if you do not provide this DD statement.

TRACE
This statement is optional. The statement defines the output data set that IMS HALDB Toolkit uses to write diagnostic trace records. This data set might be required for problem diagnosis.

This data set can reside on DASD, or it can be routed through the output job. If you do not provide this DD statement, it is dynamically allocated to SYSOUT by IMS HALDB Toolkit.

SYSUDUMP
This statement is required only if a dump is requested by IBM Software Support. The statement defines a dump data set. If the IMS HALDB Toolkit detects an error and ends with a U0999 abend, this dump is not necessary. However, if any other system or user abend occurs, this data set might be required for problem diagnosis.

This data set can reside on DASD, or it can be routed through the output job.

**ANALYZEPART command parameters**

The following parameters are available to use with **ANALYZEPART** command simulation tasks. IMS HALDB Toolkit ignores any parameters that are unavailable for the requested process.

Subsections:
- “ANALYZEPART command parameters” on page 20
- “ANALYZEPART command parameters for generating DBRC commands” on page 25
- “ANALYZEPART command parameters for generating DBD source” on page 31

**ANALYZEPART command parameters**

Use the following parameters to define the conditions for simulating the database.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBD</td>
<td>Required</td>
<td>Specifies which DBD is to be simulated. If you specify a HALDB DBD, the value must be a HALDB master name and it cannot be a partition name.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Format</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td><em>(dbdname)</em></td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Default value</strong> <em>None.</em></td>
</tr>
<tr>
<td>Parameter</td>
<td>Requirement</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>-------------</td>
</tr>
<tr>
<td>DFSDF</td>
<td>Optional</td>
<td>Specifies the 3-character suffix of the DFSDFxxx member of the IMS PROCLIB data set that contains the settings and attributes of the IMS catalog. The specified member is used when the following two conditions are met: • IMS manages the ACBs (ACBMGMT=CATALOG). • The IMS Catalog Definition exit routine (DFS3CDX0) is not used. Ensure that the CATALOG section of the DFSDFxxx member specifies CATALOG=Y, ACBMGMT=CATALOG, and the alias name for the IMS catalog. <strong>Format</strong> <em>(ddd)</em> <strong>Default value</strong> None.</td>
</tr>
<tr>
<td>IMSID</td>
<td>Optional</td>
<td>IMSID must be specified when the IMS catalog is enabled by the IMS Catalog Definition exit routine and IMSID is referred to in the exit routine. <strong>Format</strong> <em>(nnnn)</em> <strong>Default value</strong> If omitted, the value is obtained from the current SDFSRESL(DFSVC000).</td>
</tr>
<tr>
<td>INDPART</td>
<td>Optional</td>
<td>Specifies the number of index partitions. This parameter is effective only when you simulate conversion from a full-function database to a HALDB. Cannot be used with INDSIZE. <strong>Format</strong> <em>(1-999)</em> <strong>Default value</strong> None.</td>
</tr>
<tr>
<td>INDPRIM</td>
<td>Optional</td>
<td>Specifies whether a secondary index is partitioned the same as the primary database. This parameter is effective only when you simulate conversion from a full-function database to a HALDB. The following restrictions apply: • The index key must be the root segment key. • The primary database must be partitioned using the KEYS parameter. <strong>Format</strong> *(Y</td>
</tr>
</tbody>
</table>
Table 4. ANALYZEPART command parameters (continued)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INDSIZE</td>
<td>Optional</td>
<td>Specifies the size of each index partition. This parameter is effective only when you simulate conversion from a full-function database to a HALDB. INDSIZE cannot be used with INDPART. <strong>Format</strong> <em>(1 - 4095)</em> <strong>Default value</strong> 1024</td>
</tr>
<tr>
<td>INPUT</td>
<td>Optional</td>
<td>Specifies that the input is unloaded data sets. Code the DFSUINPT DD to specify the unloaded data sets. <strong>Format</strong> <em>(UNLOAD)</em> <strong>Default value</strong> None.</td>
</tr>
<tr>
<td>KEYLEN</td>
<td>Optional</td>
<td>Specifies the length of the subkey when IHCPSEL0 is used. For example, to partition by country, using a country code that is 3 characters in position 7-9 of your key, specify the following parameters and values: <strong>KEYLEN(3) KEYOFF(6)</strong> <strong>Format</strong> <em>(nnn)</em> where <strong>nnn</strong> is 1 to root keylen - 1 <strong>Default value</strong> None.</td>
</tr>
<tr>
<td>KEYOFF</td>
<td>Optional</td>
<td>Specifies the offset within the root segment key to use when IHCPSEL0 is specified as PARTSEL. The offset must be at least 1. Offset 0 does not need a partition selection exit. For example, to partition by country, using a country code that is 3 characters in position 7-9 of your key, specify the following parameters and values: <strong>KEYLEN(3) KEYOFF(6)</strong> <strong>Format</strong> <em>(nnn)</em> where <strong>nnn</strong> is 1 to root keylen - 1 <strong>Default value</strong> None.</td>
</tr>
</tbody>
</table>
### Table 4. ANALYZEPART command parameters (continued)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>KEYS</td>
<td>Optional</td>
<td>Specifies a DD statement that contains records for the high keys. KEYS cannot be used with PARTNUM or PARTSIZE. The KEYS parameter can be specified as a character or hexadecimal. Specifying KEYS results in as many partitions as there are keys specified in the file. The specifications are analyzed to determine whether the requested partitioning is feasible. If the number of partitions has been specified, IMS HALDB Toolkit verifies that no partition is larger than 4 GB. If the high keys are created during analysis, there must be at least as many database records as there are requested partitions.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Format</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td><code>ddname</code></td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Default value</strong></td>

<td></td>
<td>None.</td>
</tr>
</tbody>
</table>
Table 4. ANALYZEPART command parameters (continued)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PARTNUM</td>
<td>Optional</td>
<td>Specifies the number of partitions to create. PARTNUM cannot be used with PARTSIZE or KEYS. Specifying the PARTNUM parameter causes IMS HALDB Toolkit to find the high keys. The specifications are analyzed to determine whether the requested partitioning is feasible. PARTNUM might not result in the exact number of partitions specified because a root segment and all of its dependent segments must be written to the same partition. Therefore, fewer than PARTNUM partitions might be created so that hierarchical integrity is preserved. If the number of partitions has been specified, IMS HALDB Toolkit verifies that no partition is larger than 8 GB. If the high keys are created during analysis, there must be at least as many database records as there are requested partitions. <strong>Format</strong> (1 - 999)  <strong>Default value</strong> None.</td>
</tr>
<tr>
<td>PARTSEL</td>
<td>Optional</td>
<td>Specifies a partition selection routine to use. The PARTSEL parameter must be specified with the KEYS parameter. IMS HALDB Toolkit provides an exit routine for partition selection (IHCPSEL0). When you use the IHCPSEL0 exit routine, the database is partitioned using a subset of the key. If you use the IHCPSEL0 exit routine, you must also select the KEYOFF and KEYLEN parameters. <strong>Format</strong> (partition_selection_routine)  <strong>Default value</strong> None.</td>
</tr>
<tr>
<td>PARTSIZE</td>
<td>Optional</td>
<td>Specifies the size of partitions to create. PARTSIZE cannot be used with PARTNUM or KEYS. Specifying this parameter causes IMS HALDB Toolkit to find the high keys. The specifications are analyzed to determine whether the requested partitioning is feasible. <strong>Format</strong> (1 - 8191)  <strong>Default value</strong> None.</td>
</tr>
</tbody>
</table>
Table 4. ANALYZEPART command parameters (continued)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
</table>
| READINT   | Optional    | Specifies that the ANALYZEPART function reads the database with read integrity (PROCOPT=G). This parameter is effective only when IMS HALDB Toolkit dynamically detects the existence of IMS High Performance Unload for z/OS. Specify READINT(N) to simulate HALDB partitions of a database that is used by an online IMS system and that allows update access (ACCESS=UP). When READINT(N) is used, the ANALYZEPART function reads the database without read integrity (PROCOPT=GO). **Attention:**  
  - When you specify READINT(N), IMS does not check the ownership of the segments returned. Therefore, the ANALYZEPART function might get a segment that had been updated by another program. Such a segment might cause data integrity problems, resulting in an IMS user abend, system loop, or system abend. To learn more about read without integrity, see the topic "Read without integrity" in *IMS Application Programming*.  
  - If the database is a PSINDEX that is used by an online IMS system with ACCESS=UP, READINT(N) cannot be used because the ANALYZEPART function reads the PSINDEX with read integrity (PROCOPT=G) even if you specify READINT(N). In this case, the job terminates with a database authorization failure. |
|           |             | **Format**  |
|           |             | (Y | N)         |
|           |             | **Default value** |
|           |             | Y            |

**ANALYZEPART command parameters for generating DBRC commands**

Use the following additional parameters to control the Database Recovery Control (DBRC) commands that IMS HALDB Toolkit generates. If you do not need to generate DBRC commands, do not use these parameters. These parameters are effective only when the DBRCOUT parameter, which specifies to generate DBRC commands, is specified.

Table 5. ANALYZEPART command parameters for generating DBRC commands

### Table 5. ANALYZEPART command parameters for generating DBRC commands (continued)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
</table>
| **DBDPATT** | Optional    | Creates a partition name from the DBD.  
  **Format**  
  \((cccccccc)\) where \(c\) is an asterisk (*) or a period (.)  
  You can use a maximum of 6 asterisks (*) to identify the position in the DBD name. The default is 6 asterisks.  
  When 6 positions are specified, only 1 character is used for the partition name, creating a limit of 36 partitions.  
  If fewer than 6 positions are specified, 1 - 3 characters are used for the partition name depending on the FIRSTPART parameter.  
  You can also use periods (.) to specify that certain characters of the DBD name are ignored.  
  **Default value**  
  \((******..)\) |
| **DBRCOUT** | Required    | Specifies the name of the DD to which IMS HALDB Toolkit prints DBRC commands.  
  Specify this parameter to generate DBRC commands. You must also specify the `dbrcout` DD statement in the JCL.  
  **Format**  
  \((ddname)\)  
  **Default value**  
  None. |
| **DSNDBD**  | Optional    | Specifies the suffix portion of the new data set name that you are using.  
  A total of 37 characters are allowed for the entire data set name, which includes the characters used for the DSNPREF prefix and the characters used for the DSNDBD suffix.  
  **Format**  
  \((DBD | PART | DBDPART)\)  
  **DBD**  
  Add the DBD name to DSNPREF.  
  **PART**  
  Add the partition name to DSNPREF.  
  **DBDPART**  
  Add the DBD name and the partition name to DSNPREF.  
  **Default value**  
  DBD |
<table>
<thead>

</table>
| IND$PAT$T | Optional    | Creates a partition name "stub" from the DBD name of a secondary index. This parameter is effective only when you simulate conversion from a full-function database to a HALDB.  

**Format**  
(cccccccc) where c is an asterisk (*) or a period (.)  
This parameter is similar to DBDPAT$T$. The "**" positions of the DBD name are kept to create the "name stub."  
You can use a maximum of 6 asterisks (*) to identify the position. The default is 6 asterisks.  
**Default value**  
DBDPAT$T$ is used. If neither DBDPAT$T$ nor IND$PAT$T$ is specified, the default is (******..). |
| INIT$PAT$T | Optional    | DDNAME in JCL that allows parameters that are not currently specified by the product to be added to the DBRC INIT.PART command.  
IMS HALDB Toolkit uses the defaults for GENMAX, DFL$T$JCL, ICJCL, OICJCL, RECOVJCL, RECOVPD, RECVJCL, and NOREUSE.  
Any DBRC statements that you specify on the initpart_dd DD statement are included in the statements that are generated by the product. DBRC statements coded on the initpart_dd DD statement must conform to the syntax of the INIT.PART command. For the syntax rules, see the topic "INIT.PART command" in *IMS Commands*.  
**Format**  
(initpart_dd)  
**Default value**  
None. |
<table>
<thead>
<tr>
<th><strong>Parameter</strong></th>
<th><strong>Requirement</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
</table>
| KEYSORDR      | Optional        | This parameter is effective only for HALDBs. IMS HALDB Toolkit ignores this parameter if this parameter is specified for a non-HALDB.

When KEYS(ddname) is specified, IMS HALDB Toolkit reads the high-key values from the KEYS(ddname) and then assigns them to partitions in ascending partition number order by issuing CHANGE.PART commands to DBRC. When KEYSORDR is also specified, IMS HALDB Toolkit subsequently reassigns the high-keys to the partitions, in both their individual ascending EBCDIC order, by issuing CHANGE.PART commands again.

The CHANGE.PART commands that are issued when reassigning the high-keys are in ascending EBCDIC order of partition name, which is the same order as is presented by a DBRC LIST.DB command. KEYSORDR processing is done whether adding or deleting partitions, or changing partitions’ attributes.

This option can also be used for the single purpose of reorganizing partitions’ high-keys, which is accomplished by placing unchanged high-keys in the KEYS(ddname).

When the KEYSORDR option is specified, PARTITION(*) is also required.

**Format**

(Y | N)

**Default value**

N

| OSAM          | Optional        | This parameter is effective only for non-HALDBs. IMS HALDB Toolkit ignores this parameter if this parameter is specified for a HALDB.

Converts VSAM to OSAM.

**Format**

(Y | N)

**Default value**

N

| RAAINCR       | Optional        | Increases HDAM root addressable area (RAA) by a specified number of blocks.

**Format**

(0 - 26777215)

**Default value**

None.

| RAPS          | Optional        | Specifies new PHDAM root anchor points (RAPs).

**Format**

(1 - 255)

**Default value**

If omitted, the default is to copy from the existing RAPs.
ANALYZEPART command parameters for generating DBD source

Use the following additional parameters to generate DBD source. DBD source, which are a series of DBDGEN utility statements, help you understand the structure of the converted database and prevent unexpected failures that may occur during HALDB conversion. If you do not need to generate DBD source, do not use these parameters. These parameters are effective only when the DBDSOURCE parameter, which specifies to generate DBD source, is specified.

The parameters in the following table are effective only for non-HALDBs. If any of these parameters are specified for a HALDB, IMS HALDB Toolkit ignores these parameters.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBDSOURCE</td>
<td>Required</td>
<td>Generates the DBD source for the converted HALDB and places it in the specified library. You must also specify the <code>dbdsourc</code> DD statement in the JCL. The data set that you specify for <code>dbdsourc</code> DD must be a partitioned data set (PDS) or a partitioned data set extended (PDSE) with LRECL=80 and RECFM=F. SYSOUT=* cannot be specified for this data set.</td>
</tr>

ANALYZEPART examples

Use the following examples to learn what you can do with the ANALYZEPART function.

- “ANALYZEPART example: Specifying the number of partitions ” on page 32
- “ANALYZEPART example: Specifying the partition size” on page 32
ANALYZEPART example: Specifying the number of partitions

If you know how many partitions you want to split the database into, you can use the PARTNUM parameter to specify this number.

To specify the number of partitions, use the sample member IHCEMAI1. The following example simulates splitting a database into two partitions:

```
//ANAPART   JOB CLASS=A,MSGCLASS=X
//**          Create partition boundary report
//**          read database and report on 2 partitions
//**-------------------------------------------------------------
//S2     EXEC PGM=IHCHALDB,DYNAMNBR=999, REGION=80M
//STEPLIB  DD DISP=SHR,DSN=your.SIHCLOAD
//         DD DISP=SHR,DSN=your.SDFSRESL
//         DD DISP=SHR,DSN=your.SHPSLMD0
//DFSRESLB DD DISP=SHR,DSN=your.SDFSRESL
//IMS      DD DISP=SHR,DSN=your.DBDLIB
//IMSDALIB DD DISP=SHR,DSN=your.MDALIB
//TRACE    DD DUMMY
//MSGPRINT DD SYSOUT=* 
//IHCLIST  DD SYSOUT=* 
//IHCSYSIN DD *
ANALYZEPART DBD(www) - 
         PARTNUM(2)
```

Figure 2. Sample JCL (IHCEMAI1) for batch using PARTNUM

If the database that you specify for the DBD parameter is a HALDB database, you must specify the PARTITION or the PARTLIST parameter. If the DBD parameter specifies a non-HALDB database, do not specify the PARTITION or the PARTLIST parameter.

For example, if you want to split a HALDB database into four partitions, change the PARTNUM value to 4 and specify the PARTITION parameter.

```
//IHCSYSIN DD *
ANALYZEPART DBD(www) - 
PARTNUM(4) - 
PARTITION(*)
```

ANALYZEPART example: Specifying the partition size

If you know how large you want each partition to be, you can use the PARTSIZE parameter to specify this number.

To specify the size of partitions, use the member IHCEMAI2. The following example simulates splitting a database into partitions each with a size of 1500 MB.
/*-------------------------------------------------------------------
* Create partition boundary report
* read database and report on partition size
*-------------------------------------------------------------------

//ANAPART JOB CLASS=A,MSGCLASS=X

EXEC PGM=IHCHALDB,DYNAMNBR=999,
REGION=80M

STEPLIB DD DISP=SHR,DSN=your SIHCLOAD
STEPLIB DD DISP=SHR,DSN=your SDFSRESL
STEPLIB DD DISP=SHR,DSN=your SHPSLMD0

DFSRESLB DD DISP=SHR,DSN=your SDFSRESL

IMS DD DISP=SHR,DSN=your DBDLIB

IMSDALIB DD DISP=SHR,DSN=your MDALIB

TRACE DD DUMMY

MSGPRINT DD SYSOUT=* 

IHCLIST DD SYSOUT=* 

IHCSYSIN DD *

ANALYZEPART DBD(xxx) - PARTSIZE(1500)

Figure 3. Sample JCL (IHCEMAI2) for batch using PARTSIZE

If the database that you specify for the DBD parameter is a HALDB database, you must specify the PARTICION or the PARTLIST parameter. If the DBD parameter specifies a non-HALDB database, do not specify the PARTICION or the PARTLIST parameter.

For example, if you want to repartition two partitions of a HALDB database into partitions each with a size of 2000 MB, change the PARTSIZE value to 2000 and specify the PARTLIST parameter.

ANALYZEPART example: Specifying the key ranges for partitions

If you want to assign specific key ranges to partitions, you can use the KEYS parameter to specify an input data set containing the keys. The KEYS parameter specifies the high key boundaries for each partition.

To specify the ranges for partitions, use the member IHCEMAI3. The following example simulates splitting a database into 13 partitions with each partition containing the keys up to the specified high key boundary.
ANALYZEPART example: Generating DBRC commands

When you simulate repartitioning of a HALDB or conversion to a HALDB by using the ANALYZEPART command, you can optionally specify the DBRCOUT parameter to generate a set of DBRC commands for the Database Recovery Control (DBRC) utility (DSPURX00).

If you use the CONVERT or the MAINTAIN command to make changes to a database, IMS HALDB Toolkit automatically updates information in RECON data sets so that the changes made to the database are reflected in the RECON data sets. However, if you plan to do this without using these commands, manual tasks typically involve unloading data from the database, updating the information in RECON data sets, and reloading data back to the database. If you use the ANALYZEPART command, IMS HALDB Toolkit will generate a set of DBRC commands that you can use to update the information in RECON data sets.

To generate DBRC commands, add the DBRCOUT parameter to the ANALYZEPART command and the dbrcout DD statement, as shown in the following example:

```plaintext
//ANAPART JOB CLASS=A,MSGCLASS=X
//* Create partition boundary report for HALDB
//* read database and report on specific key boundaries
//S2 EXEC PGM=IHCHALDB,DYNAMNBR=999,
// REGION=80M
//STPLIB DD DISP=SHR,DSN=
// your.SIHCLOAD
// STEPLIB DD DISP=SHR,DSN=
// your.SDFSRESL
// STEPLIB DD DISP=SHR,DSN=
// your.SHPSLMD0
// DFSRESLB DD DISP=SHR,DSN=
// your.SDFSRESL
// IMS DD DISP=SHR,DSN=
// your.DDBLIB
// IMSDALIB DD DISP=SHR,DSN=
// your.MDALIB
// TRACE DD DUMMY
// MSGPRINT DD SYSOUT=* 
// IHCLIST DD SYSOUT=* 
// ****************************************
//KEYSIN DD * (documentation only)
// your first high-order key for partition1
// your second high-order key for partition2 and so on...
// your highest key for last partition
// ****************************************
//KEYSIN DD *
//A999999999
//B999999999
//C999999999
//D999999999
//E999999999
//F999999999
//G999999999
//H999999999
//I999999999
//J999999999
//K999999999
//L999999999
//M999999999
//IHCSYSIN DD *
//ANALYZEPART DBD(xxx) PARTITION(*) - KEYS(KEYSIN)

Figure 4. Sample JCL (IHCEMAI3) for batch using KEYS

If the database that you specify for the DBD parameter is a HALDB database, you must specify the PARTITION or the PARTLIST parameter. If the DBD parameter specifies a non-HALDB database, do not specify the PARTITION or the PARTLIST parameter.

If you use the ANALYZEPART command, IMS HALDB Toolkit will generate a set of DBRC commands that you can use to update the information in RECON data sets. To generate DBRC commands, add the DBRCOUT parameter to the ANALYZEPART command and the dbrcout DD statement, as shown in the following example:

```plaintext
//ANALYZEPART DBD(xxx) PARTITION(*) - KEYS(KEYSIN)
```
The DBRCOUT parameter value (\textit{dbrcout}) specifies the name of the DD to which IMS HALDB Toolkit writes the DBRC commands.

**Example 1**

If you want the DBRC commands printed in EBCDIC order based on the high-keys specified in the KEYSIN DD, specify the KEYSORDR(Y) parameter, the PARTITION(*) parameter, and the KEYSIN DD statement, as shown in the following example:

```plaintext
//DBRCOUT DD  SYSOUT=*  
//KEYSIN DD  *  
A999999999  
B999999999  
C999999999  
D999999999  
//IHCSYSIN DD  *  
ANALYZEPART DBD(	extit{xxxx}) -  
PARTITION(*) -  
KEYS(KEYSIN) -  
KEYSORDR(Y) -  
DBRCOUT(DBRCOUT)
```

**Example 2**

If you want the DBRC commands include specific DBRC keyword values, specify the parameter values. The following parameters are supported: CONST, DBDPATT, DSNDBD, DSNPREF, FBFF, FIRSTPART, FSPF, INITPART, RAAINCR, RAPS. For more information about these parameters, see “ANALYZEPART command parameters for generating DBRC commands” on page 25.

The following example specifies specific DBRC keyword values for FBFF, FSPF, and RAPS keywords.

```plaintext
//DBRCOUT DD  SYSOUT=*  
//IHCSYSIN DD  *  
ANALYZEPART DBD(	extit{xxxx}) -  
PARTITION(*) -  
PARTNUM(3) -  
FBFF(10) -  
FSPF(20) -  
RAPS(5) -  
DBRCOUT(DBRCOUT)
```

**Example 3**

In the following example:

- //DBRCOUT DD SYSOUT=* specifies to print the DBRC commands to the SYSOUT stream.
- The KEYSIN DD statement and the KEYSORDR(Y) parameter specify to print the DBRC commands in EBCDIC order of the keys.
- The DBDPATT, FIRSTPART, DSNPREF, and DSNDBD parameters specify the DBRC command keyword values to be used in the DBRC commands.

```plaintext
//DBRCOUT DD  SYSOUT=*  
//KEYSIN DD  *  
A999999999  
B999999999  
C999999999  
D999999999  
//IHCSYSIN DD  *  
ANALYZEPART DBD(\textit{TESTDB01}) -  
PARTITION(*) -  
KEYS(KEYSIN) -  
KEYSORDR(Y) -  
DBDPATT(****....) -  
FIRSTPART(001) -  
DSNPREF(DBSMS.DB) -  
DSNDBD(PART) -  
DBRCOUT(DBRCOUT)
```
The resulting DBRC commands will look like the following example.

```plaintext
CHANGE.PART DBD(TESTDB01) PART(TEST001)                              - 
  KEYSTRNG(A999999999) - 
  BLOCKSZ(8192) - 
  FBFF(10) - 
  FSPF(20) - 
  DSNPREFIX(DBSMS.DB.TEST001)

CHANGE.PART DBD(TESTDB01) PART(TEST002)                              - 
  BLOCKSZ(8192) - 
  FBFF(10) - 
  FSPF(20) - 
  DSNPREFIX(DBSMS.DB.TEST002)

INIT.PART DBD(TESTDB01) PART(TEST003)                                - 
  KEYSTRNG(B999999999) - 
  BLOCKSZ(8192) - 
  FBFF(10) - 
  FSPF(20) - 
  DSNPREFIX(DBSMS.DB.TEST003)
```

**ANALYZEPART example: Using unloaded data sets as input**

If you want to use unloaded data sets as input for the ANALYZEPART function, specify the unloaded data sets on the DFSUINPT DD statement and specify the INPUT(UNLOAD) parameter.

Subsections:
- “Example 1: Simulate conversion to a HALDB” on page 36
- “Example 2: Simulate repartitioning of a HALDB (all partitions)” on page 36
- “Example 3: Simulate repartitioning of a HALDB (one partition)” on page 37
- “Example 4: Split unloaded data sets and simulate repartitioning of a HALDB” on page 37

**Example 1: Simulate conversion to a HALDB**

To simulate conversion of a full-function database to a HALDB, add the DFSUINPT DD statement and the INPUT(UNLOAD) parameter.

In this example:
- DFSUINPT DD statement specifies the unloaded data set.
- INPUT(UNLOAD) parameter specifies to read input data from the unloaded data set.
- PARTNUM(3) parameter specifies to convert the database into a HALDB with three partitions.

```plaintext
//DFSUINPT DD DISP=SHR, DSN=your.hd.unload.dataset
//IHCSYSIN DD *
ANALYZEPART DBD(****) - 
  INPUT(UNLOAD) - 
  PARTNUM(3)
```

**Example 2: Simulate repartitioning of a HALDB (all partitions)**

To simulate repartitioning of all the partitions in a HALDB, use the following example.

In this example:
- DFSUINPT DD statement specifies the unloaded data set. The unloaded data set contains all the data from all the partitions.
- INPUT(UNLOAD) parameter specifies to read input data from the unloaded data set.
- PARTITION(*) specifies to process all the partitions in the HALDB.
- PARTSIZE(2048) specifies to create partitions each with a size of 2048 MB.
- DBRCOUT parameter and dbrcout DD specify to generate DBRC commands for repartitioning.

```plaintext
//DFSUINPT DD DISP=SHR, DSN=your.hd.allpart.unload.dataset
//dbrcout DD SYSOUT=* 
//IHCSYSIN DD *
```
Example 3: Simulate repartitioning of a HALDB (one partition)

To simulate repartitioning of one partition into two partitions, use the following example.

In this example:
- DFSUINPT DD statement specifies the unloaded data set. The unloaded data set contains all the data of the partition.
- INPUT(UNLOAD) parameter specifies to read input data from the unloaded data set.
- PARTLIST(part1) specifies to process only one partition.
- PARTNUM(2) specifies to simulate repartitioning into two partitions.

Example 4: Split unloaded data sets and simulate repartitioning of a HALDB

If you have an unloaded data set that contains data of all partitions and you want to simulate only some partitions, split the unloaded data set by using the split unload file utility before you simulate repartitioning with the ANALYZEPART function.

In this example, you have an unloaded data set that contains all the data from a HALDB that has three partitions (part1, part2, and part3). You want to simulate repartitioning of two partitions (part1 and part2).

Step 1: Splitting unloaded data set

Use the split unload file utility to split the unloaded data set into multiple unloaded data sets. This utility splits unloaded data sets into single partition unloaded data sets. For more information about the split unload file utility, see Chapter 8, “Splitting an unload file into single partition files,” on page 151.

The following JCL example is for the split unload file utility. In this example:
- DFSUINPT DD statement specifies the unloaded data set that contains all the data of a HALDB that has three partitions.
- part1Z, part2Z, and part3Z DD statements specify the output data sets, which are single partition unloaded data set for each partition.
Step 2: Simulate repartitioning of two partitions

Specify the unloaded data sets for part1 and part2 generated by the split unload file utility and run the ANALYZEPART function.

In this example:

- your.hd.part1.unload.dataset on the DFSUINPT DD contains unloaded data of partition part1.
- your.hd.part2.unload.dataset on the DFSUINPT DD contains unloaded data of partition part2.
- INPUT(UNLOAD) parameter specifies to read input data from the unloaded data sets.
- PARTLIST(part1,part2) specifies to process two partitions.
- PARTNUM(3) specifies to simulate repartitioning into three partitions.

```
RUN PGM(IHCUSPLT) -DBD(yyyyy) /* === DBD name
//DFSUINPT DD DISP=SHR,DSN=your.hd_allpart.unload.dataset
//part1  DD DISP=(*,CATLG),UNIT=SYSDA,SPACE=(CYL,(50,20)),
//      DSN=your.hd_part1.unload.dataset
//part2  DD DISP=(*,CATLG),UNIT=SYSDA,SPACE=(CYL,(50,20)),
//      DSN=your.hd_part2.unload.dataset
//part3  DD DISP=(*,CATLG),UNIT=SYSDA,SPACE=(CYL,(50,20)),
//      DSN=your.hd_part3.unload.dataset
//*
```

ANALYZEPART example: Generating DBD source

When you simulate conversion to a HALDB by using the ANALYZEPART command, you can optionally specify the DBDSOURCE parameter to generate a set of DBD sources for the Database Description (DBD) Generation (DBDGEN) utility.

If you also specify the DBDSRCONLY(Y) parameter, you can generate a set of DBD sources without simulating HALDB conversion. When DBDSRCONLY(Y) is specified, IMS HALDB Toolkit ignores all the parameters that are not used for generating the DBD source and creates no reports in the IHCLIST data set.

To generate DBD source, add the DBDSOURCE parameter to the ANALYZEPART command and the dbdsource DD statement, as shown in the following example:

```
//DFSUINPT DD DISP=SHR,DSN=your.hd_allpart.unload.dataset
//     DD DISP=SHR,DSN=your.hd_part2.unload.dataset
//IHCSYSIN DD *
//ANALYZEPART DBD(yyyyy) -
//     INPUT(UNLOAD) -
//     PARTLIST(part1,part2) -
//     PARTNUM(3)
```

The DBDSOURCE parameter value (dbdsource) specifies the name of the DD to which IMS HALDB Toolkit writes the DBD sources.

Example 1

If you want to generate DBD source without simulating HALDB conversion, specify the DBDSRCONLY(Y) parameter, as shown in the following example:

```
//DBDSRC DD DISP=(,CATLG),DSN=your.DBDSRC,
//     UNIT=SYSDA,SPACE=(TRK,(3,1,5)),DCB=(RECFM=FB,LRECL=80,BLKSIZE=8000)
//IHCSYSIN DD *
//ANALYZEPART DBD(yyyyy) -
//     PARTNUM(3) -
//     DBDSOURCE(dbdsource)
```
**Example 2**

If you want to change a database with multiple data set groups into a database with a single data set group and convert VSAM to OSAM, specify DSG1(Y) and OSAM(Y).

For more information about these parameters, see “ANALYZEPART command parameters for generating DBD source” on page 31.

```
//DBDSRC DD DISP=(,CATLG), DSN=your.DBDSRC,
  UNIT=SYSDA, SPACE=(TRK,(3,1,5)), DCB=(RECFM=FB,LRECL=80,BLKSIZE=8000)
//IHCSYSIN DD *
ANALYZEPART DBD(xxxx) -
  PARTNUM(3) -
  DSG1(Y) -
  OSAM(Y) -
  DBDSOURCE(DBDSRC)
```

**Example 3**

If you want to use an unload data set as input and generate DBD source, specify the INPUT(UNLOAD) and the DBDSOURCE parameters, as shown in the following example:

```
//DFSUINPT DD DISP=SHR, DSN=your.hd.unload.dataset
//DBDSRC DD DISP=(,CATLG), DSN=your.DBDSRC,
  UNIT=SYSDA, SPACE=(TRK,(3,1,5)), DCB=(RECFM=FB,LRECL=80,BLKSIZE=8000)
//IHCSYSIN DD *
ANALYZEPART DBD(xxxx) -
  INPUT(UNLOAD) -
  PARTNUM(3) -
  DBDSOURCE(DBDSRC)
```
Part 3. Converting to a HALDB

In batch mode, you can convert to HALDB in a single step by using the **CONVERT** command. Alternatively, you can use the ISPF user interface to perform the same task.

**Topic:**
- Chapter 3, “Converting to HALDB using CONVERT,” on page 43
Chapter 3. Converting to HALDB using CONVERT

Use the **CONVERT** command to convert a database in batch mode. New data set allocations use the same System Managed Storage (SMS) constructs or the same volume serial when running outside of SMS.

**Topics:**
- “CONVERT data flow” on page 43
- “Converting databases offline” on page 44
- “CONVERT DD statements” on page 45
- “CONVERT command parameters” on page 48
- “CONVERT examples” on page 68

### CONVERT data flow

The following figure shows the data flow for the CONVERT function.

![CONVERT data flow diagram](image)

**Figure 5. CONVERT data flow**

The CONVERT function performs all of the following processes in a single job step:
- Unload
- Change DBD
- Define HALDB
- Allocate HALDB
- Initialize HALDB
- Reload
- Backup
Converting databases offline

You can convert full-function databases offline by using the CONVERT command.

About this task

Databases must be offline to use this method. You must manually /DBR your databases before running the conversion job.

Restriction: Databases with logical relationships (except for indexes) are not supported.

Procedure

1. Locate the sample JCL for this task in the SIHCSAMP file, member IHCECVTN.
2. Specify the JCL DD statements.
   For a list of DD statements, see “CONVERT DD statements” on page 45.
3. Specify the CONVERT command parameters.
   For a list of CONVERT command parameters, see “CONVERT command parameters” on page 48.
   Specify the ONLINE parameter as ONLINE(N). ONLINE(N) is the default if you do not specify this parameter. The following parameters are required to perform offline conversion:

   ```
   //IHCSYSIN DD *
   CONVERT DBD(xxx) ONLINE(N) ...
   ```

   You can also refer to the following examples to code CONVERT JCL statements and command parameters:
   - “CONVERT example: Specifying the number of partitions ” on page 68
   - “CONVERT example: Specifying the partition size” on page 69
   - “CONVERT example: Specifying the key ranges for partitions” on page 70
4. Manually /DBR your databases before running the conversion job.
5. After the conversion process is complete and you are certain that you will not need to revert the database to its non-HALDB state:
   - You can delete any DFSMDA members for the old database.
   - If the Integrity Checker utility of IMS Library Integrity Utilities is active in your environment, you can delete the RDE for the old database by using the LICON utility.

Example

The following example shows the sample JCL for batch offline conversion:
### CONVERT DD statements

DD statements are used to identify the source of input and the placement of output information.

The following table shows DD statements and record format for the **CONVERT** command.

<table>
<thead>
<tr>
<th>DD name</th>
<th>Use</th>
<th>Format</th>
<th>Need</th>
</tr>
</thead>
<tbody>
<tr>
<td>STEPLIB</td>
<td>Input</td>
<td>Same as IMS</td>
<td>Required</td>
</tr>
<tr>
<td>DFSRESLB</td>
<td>Input</td>
<td>Same as IMS</td>
<td>Optional</td>
</tr>
<tr>
<td>MACLIB</td>
<td>Input</td>
<td>Same as IMS</td>
<td>Required</td>
</tr>
<tr>
<td>IMS</td>
<td>Input</td>
<td>Same as IMS</td>
<td>Required</td>
</tr>
<tr>
<td>IMSDALIB</td>
<td>Input</td>
<td>Same as IMS</td>
<td>Optional</td>
</tr>
<tr>
<td>RECONx</td>
<td>Input/Output</td>
<td>Same as IMS</td>
<td>Required when ACBGEN(Y)</td>
</tr>
<tr>
<td>PSBLIB</td>
<td>Input</td>
<td>Same as IMS</td>

</table>

**STEPLIB**

This statement is required. The library data sets pointed to from the STEPLIB DD statement must always be APF-authorized, even if a DFSRESLB DD statement is provided. Authorized library data sets include:

- IMS HALDB Toolkit load library
- IMS utilities that are available for IMS HALDB Toolkit
- IMS RESLIB library
- Any other libraries

The libraries can appear in any order.

```
//STEPLIB DD DISP=SHR,DSN=ihcload
//      DD DISP=SHR,DSN=imstools
//      DD DISP=SHR,DSN=reslib
```

where:

- `ihcload` is the name of the library that contains the IMS HALDB Toolkit load modules.
- `imstools` is the optional name of the library that contains the IMS reorganization utilities load modules.
- `reslib` is the name of the library that contains the IMS load modules.

If you do not specify an IMSDALIB DD statement in the JCL, you must specify the MDALIB in the STEPLIB for dynamic allocation purposes.

**DFSRESLB**

This statement is optional. The statement points to an authorized library that contains IMS SVC modules.

IMS HALDB Toolkit dynamically allocates this DD if you do not provide it.

**MACLIB**

This statement is required. The statement specifies the MACLIB data set for DBDGEN.

**IMS**

This statement is required. The statement describes the library that contains the DBDs of the database that you are processing.
This data set must reside on DASD.

**IMSDALIB**
This statement is optional. The statement specifies a partitioned data set or data sets that contain the dynamic allocation members for the database data sets of non-HALDB and the RECON data sets.

If DBRC is active and the IMSDALIB DD statement is coded, IMSDALIB is always referred to by DBRC, and DBRC determines the data sets to be allocated for each RECON DD.

For the database data sets of non-HALDB, IMSDALIB is referred to only when the dynamic allocation for the original data sets is requested. Dynamic allocation of the database data sets is attempted in the following order:

1. Dynamic allocation members in the IMSDALIB concatenation
2. Dynamic allocation members in JOBIB or STEPLIB concatenation

**RECONx**
These statements are optional. The statements define the database recovery control (DBRC) RECON data sets. RECON data sets dictate which databases and IMS online systems to use during the processing.

⚠️ **Attention:** If you specify IMSDALIB DD dynamic allocation, do not use these RECON DD statements. If you used JCL to allocate RECON1 as a spare data set, you must restart the database.

**original_dbds**
This statement is optional. This statement defines the database data set. One statement of this type must be present for each data set in the DBD that describes this database. The DD name must match the DD name in the DBD.

For a HIDAM database, DD statements must also exist for the data sets that represent the index. The DD statements that relate to the index must contain DD names specified in the DBD for the index database.

The data sets, if specified, must reside on DASD. If you use dynamic allocation, do not code the DD statement for the database data sets.

⚠️ **Attention:** If this DD statement is coded, do not code DCB=BUFNO= or AMP='BUFND=' to request access method buffers for database data sets because HSSR Engine of IMS HP Unload allocates its own buffer pools.

**IHCSYSIN**
This statement is required. The statement defines a control statement or data set that contains control statements that specify the functions of IMS HALDB Toolkit.

For more information about the format of IHCSYSIN DD statements, see “CONVERT command parameters” on page 48.

**SYSPRINT**
This statement is optional. The statement defines the statistics output data set and output from other utilities that are executed under the control of IMS HALDB Toolkit.

The data set can reside on DASD, or it can be routed through the output job. IMS HALDB Toolkit dynamically allocates this data set if you do not provide it.

**MSGPRINT**
This statement is optional. The statement defines the IMS HALDB Toolkit output data set for progress messages issued during the job. For more information, see “MSGPRINT data set” on page 279.

The data set can reside on DASD, or it can be routed through the output job. IMS HALDB Toolkit dynamically allocates this data set if you do not provide this DD statement.

**IHCLIST**
This statement is optional. The statement defines the IMS HALDB Toolkit output data set for reports. For more information about the reports generated in this data set, see “IHCLIST data set” on page 280.
The data set can reside on DASD, or it can be routed through the output job. IMS HALDB Toolkit dynamically allocates this data set if you do not provide this DD statement.

**DBDPRINT**
This statement is required. The statement defines the output data set for the assemble step of DBDGEN.
The data set can reside on DASD, or it can be routed through the output job.

**LNKPRINT**
This statement is required. The statement defines the output data set for the link step of DBDGEN.
The data set can reside on DASD, or it can be routed through the output job.

**AMSPRINT**
This statement is required. The statement defines the output data set for the IDCAMS utility.
The data set can reside on DASD, or it can be routed through the output job.

**TRACE**
This statement is optional. The statement defines the output data set that IMS HALDB Toolkit uses to write diagnostic trace records. This data set might be required for problem diagnosis.

This data set can reside on DASD, or it can be routed through the output job. If you do not provide this DD statement, it is dynamically allocated to SYSOUT by IMS HALDB Toolkit.

**SYSUDUMP**
This statement is required only if a dump is requested by IBM Software Support. The statement defines a dump data set. If the IMS HALDB Toolkit detects an error and ends with a U0999 abend, this dump is not necessary. However, if any other system or user abend occurs, this data set might be required for problem diagnosis.

This data set can reside on DASD, or it can be routed through the output job.

**IMSACB**
This statement is required when ACBGEN(Y). The statement describes the staging ACBLIB where IMS HALDB Toolkit generates the new ACBs for the converted DBDs.
This data set must reside on DASD.

**PSBLIB**
This statement is required when ACBGEN(Y). The statement describes the PSB library to rebuild all PSBs in the ACB library that reference the DBD to be converted.

### CONVERT command parameters

The following parameters are available to use with **CONVERT** command conversions.

IMS HALDB Toolkit ignores any parameters that are unavailable for the requested process.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACBGEN</td>
<td>Optional</td>
<td>Specifies to run the ACBGEN process during the takeover phase.</td>
</tr>
<tr>
<td>Format</td>
<td></td>
<td>(Y</td>
</tr>
<tr>
<td>Default value</td>
<td></td>
<td>N</td>
</tr>
<tr>
<td>Parameter</td>
<td>Requirement</td>
<td>Description</td>

</tbody>
</table>
| GDGLIMIT  | Optional    | Specifies the maximum number of GDG (generation data group) data sets that can be associated with the GDG. This value is used only when the GDG base does not exist and a GDG is created during the job.  
IMS HALDB Toolkit uses the value specified for this parameter when a GDG is requested for image copy data sets.  
If you specify one of the following parameters, the existence of a GDG base is verified before the image copy data set is allocated:  
• ICTRLR(1) to request that image copy data sets are GDGs  
• &GDG is specified on the IC1DSN or IC2DSN parameter to request that image copy data sets are GDGs  
If a GDG base does not exist, IMS HALDB Toolkit automatically defines one using the GDGLIMIT parameter value to control the number of generations to keep.  
**Format**  
(1 - 255)  
**Default value**  
20 |
| IC.COMP   | Optional    | Used for IMS High Performance Image Copy processing. This parameter specifies whether compression is used.  
If the copy is a standard image copy, this parameter is ignored.  
**Format**  
(Y | N)  
**Default value**  
N |
| IC.COMPRTN| Optional    | Used for IMS High Performance Image Copy processing. If IC.COMP(Y) is used, this parameter specifies the name of a compression routine.  
If the copy is a standard image copy, this parameter is ignored.  
**Format**  
(comprtn)  
**Default value**  
FABJCMP1 |
| IC.VIC    | Optional    | Specifies whether a virtual image copy is taken.  
Specify Y to activate IC.VIC and suppress the creation of image copies for all PSINDEXes. A NOTIFY.UIC is used instead.  
**Format**  
(Y | N)  
**Default value**  
N |
### Table 8. CONVERT command parameters (continued)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IC.VICDSN</td>
<td>Optional</td>
<td>Activated only when IC.VIC(Y) is also specified. Specify a string of up to 44 characters that are used as UDATA for the NOTIFY.UIC. The string must conform to z/OS and IMS data set name rules.</td>
</tr>
</tbody>
</table>

**Format**

(dsname)

**Default value**

None.
Table 8. CONVERT command parameters (continued)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IC1DSN</td>
<td>Optional</td>
<td>This parameter provides an alternative to using the ICHLQ, ICID, ICMID, and ICTRLR parameters to specify the data set name for an image copy.</td>
</tr>
</tbody>
</table>

**Format**

\[(dsname)\]

The data set name can contain variables. To specify a variable, use an ampersand (&). The following variables are supported:

- **&JOBNAME**
  - Name of this job.

- **&DBD**
  - The DBD name. This value changes to the first partition name when not all partitions are processed.

- **&DDNAME**
  - The DD name of the database data set.

- **&DATE1**
  - This variable is substituted as Dyyyyddd.

- **&DATE2**
  - This variable is substituted as Dddyyyy.

- **&DATE3**
  - This variable is substituted as Dddmmyy.

- **&DATE4**
  - This variable is substituted as Dmmddyy.

- **&DATE5**
  - This variable is substituted as Dyymmd.

- **&TIME1**
  - This variable is substituted as Thhmmss.

- **&TIME2**
  - This variable is substituted as Thhmm.

- **&GDG**
  - The identifier for the GDG data set.
  - If specified, &GDG must be the last value on the IC1DSN parameter.

where:

- **yyyy** is the 4-digit year
- **yy** is the last 2 digits of the year
- **mm** is the month
- **ddd** is the day of the year
- **dd** is the day of the month
- **hh** is the hour (24-hour clock) local time
- **mm** is the minute
- **ss** is the second

**Default value**

None.

</table>
| INDPATT   | Optional    | Creates a partition name "stub" from the DBD name of a secondary index.  
  **Format**  
  (cccccccc) where c is an asterisk (*) or a period (.)  
  This parameter is similar to DBDPATT. The "**" positions of the DBD name are kept to create the "name stub."  
  You can use a maximum of 6 asterisks (*) to identify the position. The default is 6 asterisks.  
  **Default value**  
  DBDPATT is used. If neither DBDPATT nor INDPATT is specified, the default is (******..). |
| INDPRIM   | Optional    | Specifies whether a secondary index is partitioned the same as the primary database.  
  The following restrictions apply:  
  • The index key must be the root segment key.  
  • The primary database must be partitioned using the KEYS parameter.  
  **Format**  
  (Y | N)  
  **Default value**  
  N |
| INDSIZE   | Optional    | Specifies the size of each index partition.  
  Cannot be used with INDPART.  
  **Format**  
  (1 - 4095)  
  **Default value**  
  1024 |

### Table 8. CONVERT command parameters (continued)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
</table>
| PARTNUM   | Optional    | Specifies the number of partitions to be created. PARTNUM cannot be used with PARTSIZE or KEYS. Specifying this parameter causes IMS HALDB Toolkit to find the high keys. The specifications are analyzed to determine whether the requested partitioning is feasible. PARTNUM might not result in the exact number of partitions specified because a root segment and all of its dependent segments must be written to the same partition. Therefore, fewer than PARTNUM partitions might be created so that hierarchical integrity is preserved. If the number of partitions has been specified, IMS HALDB Toolkit verifies that no partition is larger than 4 GB. If the high keys are created during analysis, there must be at least as many database records as there are requested partitions.  
**Format**  
(1 - 999)  
**Default value**  
If none of the parameters PARTNUM, PARTSIZE, or KEYS are specified, the default setting PARTSIZE(2048) is used. |
| PARTSEL   | Optional    | Specifies a partition selection routine to be used. This parameter must be used with the KEYS parameter. IMS HALDB Toolkit provides an exit for partition selection (IHCPSEL0). When you use this exit, the database is partitioned using a subset of the key. If you use IHCPSEL0, you must also select the KEYOFF and KEYLEN parameters.  
**Format**  
(partition_selection_routine)  
**Default value**  
None. |
| PARTSIZE  | Optional    | Specifies the size of partitions that are created. PARTSIZE cannot be specified with PARTNUM or KEYS. Specifying the PARTSIZE parameter causes IMS HALDB Toolkit to find the high keys. The specifications are analyzed to determine whether the requested partitioning is feasible.  
**Format**  
(1 - 8191)  
- For a VSAM, 1 - 4095.  
- For a VSAM with the OSAM(Y) parameter, 1 - 8191.  
- For an OSAM, 1 - 8191.  
**Default value**  
If none of the parameters PARTNUM, PARTSIZE, or KEYS are specified, the default setting PARTSIZE(2048) is used. |

</table>

**Format**

\((nn,pppp,ssss)\)

- **nn**: The number of volumes to be used. This parameter is for SMS controlled allocations.
  - If \(nn\) is greater than 1, candidate volumes are defined. If \(nn\) is zero, VOLALLOX is ignored.
- **pppp**: The number of cylinders for the primary allocation.
- **ssss**: The number of cylinders for the secondary allocation.

**Default value**

- \(nn\): 0
- \(pppp\): None.
- \(ssss\): None.

---

**CONVERT examples**

Use the following examples to learn what you can do with the CONVERT function.

- “CONVERT example: Specifying the number of partitions” on page 68
- “CONVERT example: Specifying the partition size” on page 69
- “CONVERT example: Specifying the key ranges for partitions” on page 70

**CONVERT example: Specifying the number of partitions**

If you know how many partitions you intend to convert to, you can use the PARTNUM parameter to specify this number.

To specify the number of partitions, use the sample member IHCECVT1. The following example converts a database into two partitions:
CONVERT example: Specifying the partition size

If you know how large you want each partition to be, you can use the PARTSIZE parameter to specify this number.

To specify the size of partitions, use the member IHCECVT2. The following example converts a database into partitions each with a size of 2048 MB.
**CONVERT example: Specifying the key ranges for partitions**

If you want to assign specific key ranges to partitions, you can use the KEYS parameter to specify an input data set containing the keys. The KEYS parameter specifies the high key boundaries for each partition.

To specify the ranges for partitions, use the member IHCECVT3. The following example converts a database into two partitions with each partition containing the keys up to the specified high key boundary.

Figure 9. Sample JCL (IHCECVT3) for batch using KEYS
Part 4. Maintaining HALDBs

In batch mode, you can perform maintenance on HALDB partitions by using the `MAINTAIN` command. Use the `MAINTAIN` command to consolidate, split, and reorganize partitions.

Instead of using the `MAINTAIN` command in batch mode, you can alternatively use the ISPF user interface to perform the same tasks.

By using batch mode, you can:

- Merge two HALDBs into one, which provides the capability to resolve user partitioning
- Provide a way to delete single partitions without rebuilding secondary indexes

**Topic:**

- Chapter 4, “Maintaining HALDB using MAINTAIN,” on page 75
Chapter 4. Maintaining HALDB using MAINTAIN

Use the **MAINTAIN** command to perform maintenance tasks on a database in batch mode.

**Topics:**
- “MAINTAIN data flow” on page 75
- “Maintaining databases offline” on page 76
- “MAINTAIN DD statements” on page 77
- “MAINTAIN command parameters” on page 79
- “How the MAINTAIN function works when adding, deleting, and naming partitions” on page 98
- “MAINTAIN examples” on page 102

**MAINTAIN data flow**

The following figure shows the data flow for the MAINTAIN function.

![Figure 10. MAINTAIN data flow](image)

The MAINTAIN function performs all of the following processes in a single job step:
- Unload
- Define new partition settings
- Allocate DBDS
- Initialize partitions
- Reload
- Backup
Maintaining databases offline

You can maintain HALDBs offline by using the **MAINTAIN** command and the batch process.

**About this task**

Alternatively, you can use the ISPF user interface to perform the same offline maintenance tasks.

**Restriction:** Databases with logical relationships (except for indexes) are not supported.

**Procedure**

1. Take the databases offline manually.
   - Databases must be offline before beginning any maintenance task.
2. Specify the JCL DD statements.
   - For a list of DD statements, see “MAINTAIN DD statements” on page 77.
3. Specify the MAINTAIN command parameters.
   - For a list of MAINTAIN command parameters, see “MAINTAIN command parameters” on page 79.

You can perform several functions by using the **MAINTAIN** command. The following table lists some of the most common functions:

<table>
<thead>
<tr>
<th>Scenario</th>
<th>MAINTAIN parameters</th>
<th>KEYSIN input</th>
</tr>
</thead>
<tbody>
<tr>
<td>Consolidate two partitions into one using PARTNUM</td>
<td>MAINTAIN DBD(xxxx) - PARTLIST(part1,part2) - PARTNUM(1)</td>
<td>Not applicable</td>
</tr>
<tr>
<td>Consolidate all partitions into one using one key (highest key)</td>
<td>MAINTAIN DBD(xxxx) - PARTITION(*) - KEYS(keys)</td>
<td>//KEYSIN DD * highest-key</td>
</tr>
<tr>
<td>Split one partition into two using PARTNUM</td>
<td>MAINTAIN DBD(xxxx) - PARTITION(part1) - PARTNUM(2)</td>
<td>Not applicable</td>
</tr>
<tr>
<td>Split one large partition into 2048 MB size partitions using PARTSIZE</td>
<td>MAINTAIN DBD(xxxx) - PARTITION(bigpart2) - PARTSIZE(2048)</td>
<td>Not applicable</td>
</tr>
<tr>
<td>Split one partition into three using your own key boundaries</td>
<td>MAINTAIN DBD(xxxx) - PARTITION(part1) - KEYS(KEYSIN)</td>
<td>//KEYSIN DD * smaller-high-key middle-high-key last-high-key-part</td>
</tr>
<tr>
<td>Add, change, or delete partitions such that four partitions result, and that their high-keys are assigned in EBCDIC order based on the high-keys found in KEYSIN</td>
<td>MAINTAIN DBD(xxxx) PARTITION(*) - KEYS(KEYSIN) KEYSORDR(Y)</td>
<td>//KEYSIN DD * A999 G999 M999 Z999</td>
</tr>
</tbody>
</table>
Table 9. Common MAINTAIN functions (continued)

<table>
<thead>
<tr>
<th>Scenario</th>
<th>MAINTAIN parameters</th>
<th>KEYSIN input</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reorganize one partition without any changes</td>
<td>MAINTAIN DBD(xxxx) - PARTITION(part3) - PARTNUM(1)</td>
<td>Not applicable</td>
</tr>
</tbody>
</table>

You can also refer to the following examples to code MAINTAIN JCL statements and command parameters:

- “MAINTAIN example: Specifying the number of partitions” on page 102
- “MAINTAIN example: Specifying the partition size” on page 103
- “MAINTAIN example: Specifying the key ranges for partitions” on page 104
- “MAINTAIN example: Maintaining a database when the IMS management of ACBs is enabled” on page 106

Performance tips and considerations
Use this information to learn the techniques for improving the performance of ANALYZEPART, CONVERT, and MAINTAIN function jobs.

**MAINTAIN DD statements**

DD statements are used to identify the source of input and the placement of output information.

The following table shows DD statements and record format for the MAINTAIN command.

<table>
<thead>
<tr>
<th>DD name</th>
<th>Use</th>
<th>Format</th>
<th>Need</th>
</tr>
</thead>
<tbody>
<tr>
<td>STEPLIB</td>
<td>Input</td>
<td>Same as IMS</td>
<td>Required</td>
</tr>
<tr>
<td>DFSRESLB</td>
<td>Input</td>
<td>Same as IMS</td>
<td>Optional</td>
</tr>
<tr>
<td>IMS</td>
<td>Input</td>
<td>Same as IMS</td>
<td>Optional</td>
</tr>
<tr>
<td>IMSDALIB</td>
<td>Input</td>
<td>Same as IMS</td>
<td>Optional</td>
</tr>
<tr>
<td>PROCLIB</td>
<td>Input</td>
<td>Same as IMS</td>
<td>Optional</td>
</tr>
<tr>
<td>RECONx</td>
<td>Input/Output</td>
<td>Same as IMS</td>
<td>Optional</td>
</tr>
<tr>
<td>IHCSYSIN</td>
<td>Input</td>
<td>LRECL=80</td>
<td>Required</td>
</tr>
<tr>
<td>SYSPRINT</td>
<td>Output</td>
<td>LRECL=133</td>
<td>Optional</td>
</tr>
<tr>
<td>MSGPRINT</td>
<td>Output</td>
<td>LRECL=133</td>
<td>Optional</td>
</tr>
<tr>
<td>IHCLIST</td>
<td>Output</td>
<td>LRECL=133</td>
<td>Optional</td>
</tr>
<tr>
<td>AMSPRINT</td>
<td>Output</td>
<td>LRECL=133</td>
<td>Required</td>
</tr>
<tr>
<td>TRACE</td>
<td>Output</td>
<td>LRECL=133</td>
<td>Optional</td>
</tr>
<tr>
<td>SYSUDUMP</td>
<td>Output</td>
<td>LRECL=133</td>
<td>Optional</td>
</tr>
</tbody>
</table>

**STEPLIB**

This statement is required. The library data sets pointed to from the STEPLIB DD statement must always be APF-authorized, even if a DFSRESLB DD statement is provided. Authorized library data sets include:
• IMS HALDB Toolkit load library
• IMS utilities that are available for IMS HALDB Toolkit
• IMS RESLIB library
• Any other libraries

The libraries can appear in any order.

```
//STEPLIB DD DISP=SHR,DSN=ihcload
//        DD DISP=SHR,DSN=imstools
//        DD DISP=SHR,DSN=reslib
```

where:

• `ihcload` is the name of the library that contains the IMS HALDB Toolkit load modules.
• `imstools` is the optional name of the library that contains the IMS reorganization utilities load modules.
• `reslib` is the name of the library that contains the IMS load modules.

If you do not specify an IMSDALIB DD statement in the JCL, you must specify the MDALIB in the STEPLIB for dynamic allocation purposes.

**DFSRESLBD**

This statement is optional. The statement points to an authorized library that contains IMS SVC modules.

IMS HALDB Toolkit dynamically allocates this DD if you do not provide it.

Even if IMS High Performance Load modules are found in the combined load library of IMS solution pack in the STEPLIB concatenation, when the MAINTAIN function processes PSINDEXes, the function uses DFSURGL0 (HD Reorganization Reload utility) in this library to reload PSINDEXes.

**IMS**

This statement is required only if the IMS management of ACBs is not enabled. The statement describes the library that contains the DBDs of the database that you are processing.

This data set must reside on DASD.

When the IMS management of ACBs is enabled, IMS HALDB Toolkit ignores the IMS DD statement.

**IMSDALIB**

This statement is optional. The statement specifies a partitioned data set or data sets that contain the dynamic allocation members for the database data sets of non-HALDB and the RECON data sets.

If DBRC is active and the IMSDALIB DD statement is coded, IMSDALIB is always referred to by DBRC, and DBRC determines the data sets to be allocated for each RECON DD.

For the database data sets of non-HALDB, IMSDALIB is referred to only when the dynamic allocation for the original data sets is requested. Dynamic allocation of the database data sets is attempted in the following order:

1. Dynamic allocation members in the IMSDALIB concatenation
2. Dynamic allocation members in JOBLIB or STEPLIB concatenation

**PROCLIB**

This statement is optional. The statement points to the IMS.PROCLIB data set. If DFSDF(*ddd*) is specified in the IHCSYSIN data set, you must specify this DD statement and ensure that the DFSDF*ddd* member exists in the IMS.PROCLIB data set.

**RECONx**

These statements are optional. The statements define the database recovery control (DBRC) RECON data sets. RECON data sets dictate which databases and IMS online systems to use during the processing.
Attention: If you specify IMSDALIB DD dynamic allocation, do not use these RECON DD statements. If you used JCL to allocate RECON1 as a spare data set, you must restart the database.

IHCSYSIN
This statement is required. The statement defines a control statement or data set that contains control statements that specify the functions of IMS HALDB Toolkit.

For more information about the format of IHCSYSIN DD statements, see “MAINTAIN command parameters” on page 79.

SYSPRINT
This statement is optional. The statement defines the statistics output data set and output from other utilities that are executed under the control of IMS HALDB Toolkit.

The data set can reside on DASD, or it can be routed through the output job. IMS HALDB Toolkit dynamically allocates this data set if you do not provide it.

MSGPRINT
This statement is optional. The statement defines the IMS HALDB Toolkit output data set for progress messages issued during the job. For more information, see “MSGPRINT data set” on page 279.

The data set can reside on DASD, or it can be routed through the output job. IMS HALDB Toolkit dynamically allocates this data set if you do not provide this DD statement.

IHCLIST
This statement is optional. The statement defines the IMS HALDB Toolkit output data set for reports. For more information about the reports generated in this data set, see “IHCLIST data set” on page 280.

The data set can reside on DASD, or it can be routed through the output job. IMS HALDB Toolkit dynamically allocates this data set if you do not provide this DD statement.

AMSPRINT
This statement is required. The statement defines the output data set for the IDCAMS utility.

The data set can reside on DASD, or it can be routed through the output job.

TRACE
This statement is optional. The statement defines the output data set that IMS HALDB Toolkit uses to write diagnostic trace records. This data set might be required for problem diagnosis.

This data set can reside on DASD, or it can be routed through the output job. If you do not provide this DD statement, it is dynamically allocated to SYSOUT by IMS HALDB Toolkit.

SYSUDUMP
This statement is required only if a dump is requested by IBM Software Support. The statement defines a dump data set. If the IMS HALDB Toolkit detects an error and ends with a U0999 abend, this dump is not necessary. However, if any other system or user abend occurs, this data set might be required for problem diagnosis.

This data set can reside on DASD, or it can be routed through the output job.

MAINTAIN command parameters
The following parameters are available to use with MAINTAIN command maintenance tasks.
IMS HALDB Toolkit ignores any parameters that are unavailable for the requested process.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BYTELIM</td>
<td>Optional</td>
<td>Specifies a new maximum-insert-byte for the DBD.</td>
</tr>
<tr>
<td></td>
<td></td>

<tr>
<td>Parameter</td>
<td>Requirement</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| DFSDF     | Optional    | Specifies the 3-character suffix of the DFSDFxxx member of the IMS PROCLIB data set that contains the settings and attributes of the IMS catalog. The specified member is used when the following two conditions are met:  
  • IMS manages the ACBs (ACBMGMT=CATALOG).  
  • The IMS Catalog Definition exit routine (DFS3CDX0) is not used. Ensure that the CATALOG section of the DFSDFxxx member specifies CATALOG=Y, ACBMGMT=CATALOG, and the alias name for the IMS catalog.  
  
  **Format**  
  (ddd)  
  
  **Default value**  
  None. |
| DSNDBD    | Optional    | Specifies the suffix portion of the new data set name that you are using. A total of 37 characters are allowed for the entire data set name, which includes the characters used for the DSNPREF prefix and the characters used for the DSNDBD suffix.  
  
  **Format**  
  (DBD | PART | DBDPART)  
  
  **DBD**  
  Add the DBD name to DSNPREF.  
  
  **PART**  
  Add the partition name to DSNPREF.  
  
  **DBDPART**  
  Add the DBD name and the partition name to DSNPREF.  
  
  **Default value**  
  DBD |
| DSNPREF   | Required    | Specifies a high-level data set name to use when building new partition data set names. The DBRC DSNPREFX parameter is created from this specification and is appended with the DBD name. The final data set name is then appended by DBRC with the DBD file letter and the partition name.  
  
  **Format**  
  (dsnprefix)  
  
  **Default value**  
  None. |
### Table 11. MAINTAIN command parameters (continued)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>FBFF</strong></td>
<td>Optional</td>
<td>Specifies a new free block frequency factor (FBFF) to use when defining a partition.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Format</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>(0 - 99)</td>
</tr>

<td>Activated only when IC.VIC(Y) is also specified. Specifies a string of up to 44 characters that is used as UDATA for the NOTIFY.UIC. The string must conform to z/OS and IMS data set name rules.</td>
</tr>
</tbody>
</table>

**Format**  
(dsname)  

**Default value**  
None.
Table 11. MAINTAIN command parameters (continued)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IC1DSN</td>
<td>Optional</td>
<td>This parameter provides an alternative to using the ICHLQ, ICID, ICMID, and ICTRLR parameters to specify the data set name for an image copy.</td>
</tr>
</tbody>
</table>

**Format**

(dsname)

The data set name can contain variables. To specify a variable, use an ampersand (&). The following variables are supported:

- **&JOBNAME**
  Name of this job.
- **&DBD**
  The DBD name. This value changes to the first partition name when not all partitions are processed.
- **&DDNAME**
  The DD name of the database data set.
- **&DATE1**
  This variable is substituted as $yyyyddd$.
- **&DATE2**
  This variable is substituted as $dddyyyy$.
- **&DATE3**
  This variable is substituted as $ddmmyy$.
- **&DATE4**
  This variable is substituted as $mmddyy$.
- **&DATE5**
  This variable is substituted as $yymmdd$.
- **&TIME1**
  This variable is substituted as $thhmmss$.
- **&TIME2**
  This variable is substituted as $thhmm$.
- **&GDG**
  The identifier for the GDG data set.
  If specified, &GDG must be the last value on the IC1DSN parameter.

where:

- $yyyy$ is the 4-digit year
- $yy$ is the last 2 digits of the year
- $mm$ is the month
- $dd$ is the day of the year
- $dd$ is the day of the month
- $hh$ is the hour (24-hour clock) local time
- $mm$ is the minute
- $ss$ is the second

**Default value**

None.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IC2DSN</td>
<td>Optional</td>
<td>Specifies the secondary image copy data set name. To create the data set name, use the same method that is described for the IC1DSN keyword. You must specify a unique data set name. <strong>Format</strong> <em>(dsname)</em> <strong>Default value</strong> None.</td>
</tr>
<tr>
<td>ICHLQ</td>
<td>Optional</td>
<td>Specifies the high-level qualifier (HLQ) for the image copy data sets. <strong>Format</strong> <em>(ichlq)</em> <strong>Default value</strong> If omitted, defaults to DSNPREF.</td>
</tr>
<tr>
<td>ICID</td>
<td>Optional</td>
<td>Used to override the default (IC1 or IC2) for the suffix qualifier for dual image copy data sets. <strong>Format</strong> *(1</td>
</tr>
<tr>
<td>ICMID</td>
<td>Optional</td>
<td>Specifies the mid-level data set qualifier for image copy data sets. <strong>Format</strong> <em>(1 - 4)</em> The ICMID parameter specifications render the following mid-level data set qualifiers: <em>ICMID(1)</em> <code>dbdname.ddname</code>. <em>ICMID(2)</em> <code>dbdname</code>. <em>ICMID(3)</em> <code>ddname</code>. <em>ICMID(4)</em> None. <strong>Default value</strong> 3</td>
</tr>
<tr>
<td>ICNUM</td>
<td>Optional</td>
<td>Specifies single or dual image copies. <strong>Format</strong> *(1</td>
</tr>

</table>
### Table 11. MAINTAIN command parameters (continued)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INITPART</td>
<td>Optional</td>
<td>DDNAME in JCL that allows parameters that are not currently specified by the product to be added to the DBRC INIT.PART command. IMS HALDB Toolkit uses the defaults for GENMAX, DFLTJCL, ICJCL, OICJCL, RECOVJCL, RECOVPD, RECVJCL, and NOREUSE. Any DBRC statements that you specify on the initpart_dd DD statement are included in the statements that are generated by the product. DBRC statements coded on the initpart_dd DD statement must conform to the syntax of the INIT.PART command. For the syntax rules, see the topic &quot;INIT.PART command&quot; in IMS Commands. Format (initpart_dd) Default value None.</td>
</tr>
<tr>
<td>KEYLABEL</td>
<td>Optional</td>
<td>Specifies the encryption key label for encrypting dynamically allocated database data sets and image copy data sets. The key label can be up to 64 bytes. Format (keylabel) Default value • For database data sets: If omitted, the default action is to copy from existing data sets. • For image copy data sets: None.</td>
</tr>
<tr>
<td>KEYLEN</td>
<td>Optional</td>
<td>Specifies the length of the subkey when IHCPSEL0 is used. For example, to partition by country, using a country code that is 3 characters in position 7-9 of your key, specify the following parameters and values: KEYLEN(3) KEYYOFF(6) Format (nnn) where nnn is 1 to root keylen -1 Default value None.</td>
</tr>
</tbody>
</table>
Table 11. MAINTAIN command parameters (continued)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
</table>
| KEYOFF    | Optional    | Specifies the offset within the root segment key to use when IHCSEL0 is specified as PARTSEL. The offset must be at least 1. Offset 0 does not need a partition selection exit. For example, to partition by country, using a country code that is 3 characters in position 7-9 of your key, specify the following parameters and values:  

| KEYLEN(3) | KEYOFF(6) |

**Format**  
(nn) where nn is 1 to root keylen -1

**Default value** None.

| KEYS      | Optional    | Specifies a DD statement that contains records for the high keys. KEYS cannot be used with PARTNUM or PARTSIZE. The KEYS parameter can be specified as a character or hexadecimal. Specifying KEYS results in as many partitions as there are keys specified in the file. The specifications are analyzed to determine whether the requested partitioning is feasible. If the number of partitions has been specified, IMS HALDB Toolkit verifies that no partition is larger than 4 GB. If the high keys are created during analysis, there must be at least as many database records as there are requested partitions. If KEYSORDR(Y) is specified with KEYS, then the keys are sorted in EBCDIC order, then assigned to the partitions in name order (also EBCDIC order).  

**Format**  
(ddname)

**Default value** If none of the parameters PARTNUM, PARTSIZE, or KEYS are specified, the default setting PARTSIZE(2048) is used.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>KEYSORDR</td>
<td>Optional</td>
<td>When KEYS(ddname) is specified, IMS HALDB Toolkit reads the high-key values from the KEYS(ddname) and then assigns them to partitions in ascending partition number order by issuing CHANGE.PART commands to DBRC. When KEYSORDR is also specified, IMS HALDB Toolkit subsequently reassigns the high-keys to the partitions, in both their individual ascending EBCDIC order, by issuing CHANGE.PART commands again. The CHANGE.PART commands that are issued when reassigning the high-keys are in ascending EBCDIC order of partition name, which is the same order as is presented by a DBRC LIST.DB command. KEYSORDR processing is done whether adding or deleting partitions, or changing partitions’ attributes. This option can also be used for the single purpose of reorganizing partitions’ high-keys, which is accomplished by placing unchanged high-keys in the KEYS(ddname). When the KEYSORDR option is specified, PARTITION(*) is also required.</td>

- **\(nn\)**: The number of volumes to be used. This parameter is for SMS controlled allocations.
  - If \(nn\) is greater than 1, candidate volumes are defined. If \(nn\) is zero, VOLALLOX is ignored.
- **\(pppp\)**: The number of cylinders for the primary allocation.
- **\(ssss\)**: The number of cylinders for the secondary allocation.

**Default value**

- \(nn\): 0
- \(pppp\): None.
- \(ssss\): None.

---

### How the MAINTAIN function works when adding, deleting, and naming partitions

Learn how the MAINTAIN function adds, deletes, and names partitions.

#### Adding or deleting partitions

When adding partitions (splitting partitions) or deleting partitions (merging partitions), the MAINTAIN function processes the partitions according to the following rules:

- If the high key of an existing partition matches one of the new high keys, IMS HALDB Toolkit keeps that existing partition unchanged.
- IMS HALDB Toolkit assigns new high keys to partitions in ascending order, firstly to the new partitions (if created) and then to the existing partitions that have no high keys assigned. When there are multiple existing partitions with no high keys assigned, IMS HALDB Toolkit assigns high keys to the partitions in ascending order of the original high keys.
- IMS HALDB Toolkit deletes unnecessary partitions in ascending order of the original high keys.

The following examples demonstrate specific cases to help you understand the changes that the MAINTAIN function makes to partitions.

#### Example 1: Splitting one partition

HALDB PHDOA has three partitions; Part_A (high key is 200), Part_B (high key is 400), and Part_C (high key is 600). You want to split partition Part_B into two partitions so you specify the MAINTAIN command as follows:

```
MAINTAIN DBD(PHDOA) PARTITION(Part_B) PARTNUM(2)
```

In this case, IMS HALDB Toolkit processes the partitions as follows:

1. Creates a new partition, Part_D.
2. Calculates the new high keys for splitting partition Part_B and resulted with high keys of 300 and 400.
3. Checks whether the existing partition (in this case Part_B) has one of the new high keys. IMS HALDB Toolkit detected that Part_B has the high key of 400 so it keeps Part_B unchanged.
4. Assigns the new high key of 300 to the new partition Part_D.

**Example 2: Splitting multiple partitions**

HALDB PHDOB has four partitions; Part_A (high key is 150), Part_B (high key is 300), Part_C (high key is 450), and Part_D (high key is 600). You want the HALDB PHDOB to have six partitions instead of four partitions so you specify the MAINTAIN command as follows:

```
MAINTAIN DBD(PHDOB) PARTITION(*) PARTNUM(6)
```

In this case, IMS HALDB Toolkit processes the partitions as follows:

1. Creates two new partitions, Part_E and Part_F.
2. Calculates the new high keys for repartitioning and resulted with high keys of 100, 200, 300, 400, 500, and 600.
3. Checks whether any of the existing partitions has one of the new high keys. It detected that Part_B has the high key of 300 and Part_D has the high key of 600 so it keeps these two partitions unchanged.
4. Assigns a high key to each of the remaining partitions in ascending order of the high keys, starting with the new partition; high key 100 to Part_E and high key 200 to Part_F. Then it assigns the remaining high keys to the existing partitions that have no high keys assigned; high key 400 to Part_A and high key 500 to Part_C.
Example 3: Merging multiple partitions into one partition

HALDB PHDOC has three partitions; Part_A (high key is 200), Part_B (high key is 400), and Part_C (high key is 600). You want the HALDB PHDOC to have only one partition instead of three partitions so you specify the MAINTAIN command as follows:

```
MAINTAIN DBD(PHDOC) PARTITION(*) PARTNUM(1)
```

In this case, IMS HALDB Toolkit processes the partitions as follows:

1. Checks whether any of the existing partitions has the new high key, which is 600. It detected that Part_C has the high key of 600 so it keeps Part_C unchanged.
2. Deletes the other two partitions.

Example 4: Merging multiple partitions into fewer partitions

HALDB PHDOD has six partitions; Part_A (high key is 100), Part_B (high key is 200), Part_C (high key is 300), Part_D (high key is 400), Part_E (high key is 500), and Part_F (high key is 600). You want the HALDB PHDOD to have four partitions instead of six partitions so you specify the MAINTAIN command as follows:

```
MAINTAIN DBD(PHDOD) PARTITION(*) PARTNUM(4)
```
In this case, IMS HALDB Toolkit processes the partitions as follows:
1. Calculates the new high keys for the partitions and resulted with high keys of 150, 300, 450, and 600.
2. Checks whether any of the existing partitions has one of the new high keys. It detected that Part_C has the high key of 300 and Part_F has the high key of 600 so it keeps these two partitions unchanged.
3. Deletes two partitions in ascending order of original high keys. In this case, Part_A, which had a high key of 100, and Part_B, which had a high key of 200.
4. Assigns the remaining high keys to each of the remaining partitions in ascending order of the high keys; high key 150 to Part_D and high key 450 to Part_E.

**Original partitions**

<table>
<thead>
<tr>
<th>Part</th>
<th>High key</th>
</tr>
</thead>
<tbody>
<tr>
<td>Part_A</td>
<td>100</td>
</tr>
<tr>
<td>Part_B</td>
<td>200</td>
</tr>
<tr>
<td>Part_C</td>
<td>300</td>
</tr>
<tr>
<td>Part_D</td>
<td>400</td>
</tr>
<tr>
<td>Part_E</td>
<td>500</td>
</tr>
<tr>
<td>Part_F</td>
<td>600</td>
</tr>
</tbody>
</table>

**New partitions**

<table>
<thead>
<tr>
<th>Part</th>
<th>High key</th>
</tr>
</thead>
<tbody>
<tr>
<td>Part_C</td>
<td>300 (No change)</td>
</tr>
<tr>
<td>Part_D</td>
<td>150 (New high key)</td>
</tr>
<tr>
<td>Part_E</td>
<td>450 (New high key)</td>
</tr>
<tr>
<td>Part_F</td>
<td>600 (No change)</td>
</tr>
</tbody>
</table>

**Assigning partition names**

The MAINTAIN function does not change the names of existing partitions. It only assigns names to new partitions.

New partition names are determined based on the CONST, DBDPATT, and FIRSTPART parameters and the current partition ID in the RECON data sets. For more information about these parameters, see “MAINTAIN command parameters” on page 79.

The following examples demonstrate how IMS HALDB Toolkit assigns partition names when the FIRSTPART parameter is specified.

**Example 1: Assigning partition names when FIRSTPART(01)**

HALDB PHDOE has five partitions; PHDOE01, PHDOE02, PHDOE03, PHDOE04, and PHDOE05. The value of CURRENT PARTITION ID in RECON is 5 (index=5). You want to split partition PHDOE01 into three partitions so you specify the MAINTAIN command as follows:

```
MAINTAIN DBD(PHDOE) DBDPATT(*****...) PARTITION(PHDOE01) PARTNUM(3) FIRSTPART(01)
```

In this case, IMS HALDB Toolkit processes the partitions as follows:
1. Creates two new partitions.
2. Reads the DBDPAT(******...) parameter and uses the first five letters (PHDOE) of the DBD name for the first five characters of the new partition names.
3. Reads the FIRSTPART(01) parameter and obtains the value of CURRENT PARTITION ID from RECON, which is 5. Adds two character numeric extension of 06 and 07 to the end of the new partition names.
4. The two new partitions have the names of PHDOE06 and PHDOE07 respectively.
Example 2: Assigning partition names when FIRSTPART(AA)

HALDB PHDOF has five partitions; PHDOFAA, PHDOFAB, PHDOFAC, PHDOFAD, and PHDOFAE. The value of CURRENT PARTITION ID in RECON is 5 (index=5). You want to split partition PHDOFAA into three partitions so you specify the MAINTAIN command as follows:

```
MAINTAIN DBD(PHDOF) DBDPATT(******...) PARTITION(PHDOFAA) PARTNUM(3) FIRSTPART(AA)
```

In this case, IMS HALDB Toolkit processes the partitions as follows:

1. Creates two new partitions.
2. Reads the DBDPAT(******...) parameter and uses the five letters (PHOF) of the DBD name for the first five characters of the new partition names.
3. Reads the FIRSTPART(AA) parameter and obtains the value of CURRENT PARTITION ID from RECON, which is 5. Adds two character extension of AF and AG to the end of the new partition names.
4. The two new partitions have the names of PHDOFAF and PHDOFAG respectively.

**MAINTAIN examples**

Use the following examples to learn what you can do with the MAINTAIN function.

- “MAINTAIN example: Specifying the number of partitions ” on page 102
- “MAINTAIN example: Specifying the partition size” on page 103
- “MAINTAIN example: Specifying the key ranges for partitions” on page 104
- “MAINTAIN example: Maintaining a database when the IMS management of ACBs is enabled” on page 106

**MAINTAIN example: Specifying the number of partitions**

If you know how many partitions you intend to maintain, you can use the PARTNUM parameter to specify this number.

To specify the number of partitions, use the sample member IHCEMTN1. The following example splits a database into four partitions:
//JOBNAME   JOB NAME,000,CLASS=A,MSGCLASS=X
//*******************************************************************************
//*  SAMPLE JCL FOR MAINTAIN - using PARTNUM method
//*  SPLITS PARTB AND PARTC INTO 4 PARTITIONS
//*  Your old HALDB databases/partitions must be registered to DBRC
//*  You must /dbr the affected partitions prior to executing this job
//*  unless you use ONLINE(Y) and have Online Reorg installed
//*******************************************************************************
//S2     EXEC PGM=IHCHALDB,DYNAMNBR=999,REGION=80M
//STEPLIB DD DISP=SHR,DSN=your.SIHCLOAD   <=== your hcma loadlib
//         DD DISP=SHR,DSN=your.SDFSRESL     <=== ims reslib
//DFSRESLB DD DISP=SHR,DSN=your.SDFSRESL     <=== ims reslib
//IMS     DD DISP=SHR,DSN=your.dbdlib     <=== ims dbdlib
//IMSDALIB DD DISP=SHR,DSN=your.mdalib     <=== ims mdalib
//SYSPRINT DD SYSOUT=*                    
//MSGPRINT DD SYSOUT=*                    
//AMSPRINT DD SYSOUT=*                    
//SYSUDUMP DD SYSOUT=*                    
//IHCLIST DD SYSOUT=*                     
//IHCSYSIN DD *                          
//MAINTAIN ONLINE(N) -                    
//      PARTNUM(4) - 
//      DBD(masterdbd) -                   
//      PARTLIST(partb,partc) -            
//      DBDPATT(*****...) DSNPREF(DBSMS.DB) - 
//      ICIMID(3) -                        
//      ICHLQ(DBSMS.DB.IC) -               
//      ICTRLR(2) -                        
//      IC.COMP(Y) -                       
//      IC.COMPRTN(FABJCM2P2) -             
//      PTRCHECK(Y)

Figure 11. Sample JCL (IHCEMTN1) for batch using PARTNUM

MAINTAIN example: Specifying the partition size
If you know how large you want each partition to be, you can use the PARTSIZE parameter to specify this number.

To specify the size of partitions, use the member IHCEMTN2. The following example splits a database into partitions each with a size of 2048 MB.
**MAINTAIN example: Specifying the key ranges for partitions**

If you want to assign specific key ranges to partitions, you can use the KEYS parameter to specify an input data set containing the keys. The KEYS parameter specifies the high key boundaries for each partition.

To specify the ranges for partitions, use the member IHCEMTN3. The following example splits the partition that is specified on the PARTITION parameter into 13 partitions with specific key ranges.
//JOBNAME JOB NAME,000,CLASS=A,MSGCLASS=X
//******************************************************************************
//  SAMPLE JCL FOR MAINTAIN - using KEYS method
//  * Splits the first partition into specific key-boundaries
//  * (note: the first partition had a high key of M999999999
//  * and has records for all key ranges)
//  * Your old HALDB databases/partitions must be registered to DBRC
//  * You must /dbr the affected partitions prior to executing this job
//  * unless you use ONLINE(Y) and have Online Reorg installed
//******************************************************************************
//S2 EXEC PGM=IHCHALDB,DYNAMNBR=999,REGION=80M
//STEPLIB DD DISP=SHR,DSN=your.SIHCLOAD  <=== your hcma loadlib
//      DD DISP=SHR,DSN=your.SDFSRESL     <=== ims reslib
//      DD DISP=SHR,DSN=your.SHPSLMD0     <=== ims tools loadlib
//DFSRESLB DD DISP=SHR,DSN=your.SDFSRESL <= ims reslib
//IMS    DD DISP=SHR,DSN=your.dbdlib     <= ims dbdlib
//IMSDALIB DD DISP=SHR,DSN=your.mdalib    <= ims mdalib
//SYSPRINT DD SYSOUT=*                  
//MSGPRINT DD SYSOUT=*                 
//AMSPRINT DD SYSOUT=*                 
//SYSUDUMP DD SYSOUT=*                 
//IHCLIST DD SYSOUT=*                  
//******************************************************************************

Maintain example: Maintaining a database when the IMS management of ACBs is enabled

This example shows JCL statements to maintain a database in an IMS managed ACBs environment.

```
//S2     EXEC PGM=IHCHALDB,DYNAMNBR=999,REGION=80M
//STEPLIB DD DISP=SHR,DSN=IMSTOOLS.SIHCLOAD <=== hcma loadlib
//       DD DISP=SHR,DSN=IMSTOOLS.SHPNLMD0 <=== ims tools loadlib
//       DD DISP=SHR,DSN=IMSTOOLS.SGLXLOAD <=== ims tools base loadlib
//       DD DISP=SHR,DSN=IMS.SDFSRESL <=== ims reslib
//       DD DISP=SHR,DSN=IMS.MDALIB <=== ims mdalib
//DFSRESLB DD DISP=SHR,DSN=IMS.SDFSRESL <=== ims reslib
//PROCLIB DD DISP=SHR,DSN=IMS.PROCLIB <=== ims proclib
//SYSPRINT DD SYSOUT=* 
//MSGPRINT DD SYSOUT=*
//AMSPRINT DD SYSOUT=*
//SYSUDUMP DD SYSOUT=*
//IHMCLST DD SYSOUT=*
//IHCYSIN DD * 
MAINTAIN ONLINE(N) -
   PARTNUM(4) -
   DBD(masterdbd) -
   DBDList(partb,partc) -
   DBDPATT(*****...) DSNPREF(DBSMS.DB) -
   ICMD(3) -
   ICICLQ(DBSMS.DB.IC) -
   ICTRLR(2) -
   ICF,COMP(Y) -
   ICF,COMPRTN(FABJICMP2) -
   PTRCHECK(Y) -
   DFSDF(CAT)
```

Figure 14. Sample JCL stream to maintain a database in an IMS managed ACBs environment

- The DFSDF(CAT) parameter in IHCSYSIN and the PROCLIB DD statement specify the DFSDFCAT PROCLIB member that contains the IMS catalog definition.
- If you include the IMS Catalog Definition exit routine (DFS3CDX0) in the STEPLIB concatenation, you do not need to specify the DFSDF parameter and the PROCLIB DD statement.
- The SGLXLOAD library of IMS Tools Base must be in the STEPLIB concatenation.
- The library containing the DFSMDA member with TYPE=CATDSHLQ statement must be in the STEPLIB concatenation if the DFSMDA member is used to specify the high-level qualifier of the IMS catalog system data sets.
- The IMS DD statement is not needed.
Part 5. HALDB utilities

JCL for HALDB utilities can be created from the examples in the sample library file, or through the ISPF user interface.

The topics in this section describe how to use the sample JCL provided in the SIHCSAMP file. The sample member is named for each specific utility.

A comment is made if an equivalent ISPF-generated JCL option is available for the utility. See the ISPF section of this reference for ISPF-related information.

Topics:

• Chapter 5, “Using DBRC enhancement utilities,” on page 109
• Chapter 6, “Using the HALDB Analyzer,” on page 127
• Chapter 7, “Reorganizing a PSINDEX,” on page 145
• Chapter 8, “Splitting an unload file into single partition files,” on page 151
• Chapter 9, “Recovering by using the ILK reset utility,” on page 157
• Chapter 10, “Healing index pointers,” on page 161
• Chapter 11, “System utilities,” on page 167
Chapter 5. Using DBRC enhancement utilities

DBRC maintains information that is required for database recoveries, generates recovery control (RECON) statements, verifies recovery input, maintains a separate change log for database data sets, and supports sharing of IMS databases and areas by multiple IMS subsystems.

IMS HALDB Toolkit provides several DBRC enhancement utilities to support HALDB movement between multiple RECONs.

Topics:
- “Backing up DBRC definitions for HALDB DBD” on page 109
- “Cloning DBRC definitions for test environments” on page 114
- “Copying HALDBs to a different IMS system” on page 122

Backing up DBRC definitions for HALDB DBD

The DBRC definitions backup utility allows you to save the current DBRC definition of a HALDB to a sequential file.

About this task

You would perform a backup each time before you make changes. In this case, you want to change the partition layout.

The utility creates DBRC statements that can be used as input for the batch DBRC utility (DSPURX00).

Procedure

1. Locate the sample JCL in the SIHCSAMP file, member IHCEDBBK.
2. Specify the JCL DD statements.
   For a list of DD statements, see “BACKUPDBRC DD statements” on page 110.
3. Specify the BACKUPDBRC command parameters.
   For the DBD parameter, you must specify the DBD for the HALDB (primary or index).
   For other parameters, see “BACKUPDBRC command parameters” on page 112.

Example

The following example shows the sample JCL for backing up DBRC definition for HALDB DBD:
Figure 15. JCL for backing up DBRC definition for HALDB DBD

### BACKUPDBRC DD statements

DD statements are used to identify the source of input and the placement of output information. The following table shows DD statements and record format for the `BACKUPDBRC` command.

<table>
<thead>
<tr>
<th>DD name</th>
<th>Use</th>
<th>Format</th>
<th>Need</th>
</tr>
</thead>
<tbody>
<tr>
<td>STEPLIB</td>
<td>Input</td>

<td>Optional</td>
</tr>
<tr>
<td>SYSUDUMP</td>
<td>Output</td>
<td>LRECL=133</td>
<td>Optional</td>
</tr>
</tbody>
</table>

**STEPLIB**

This statement is required. The library data sets pointed to from the STEPLIB DD statement must always be APF-authorized, even if a DFSRESLB DD statement is provided. Authorized library data sets include:

- IMS HALDB Toolkit load library
• IMS utilities that are available for IMS HALDB Toolkit
• IMS RESLIB library
• Any other libraries

The libraries can appear in any order.

```plaintext
// STEPLIB DD DISP=SHR, DSN=ihcload
//       DD DISP=SHR, DSN=imstools
//       DD DISP=SHR, DSN=reslib
```

where:

• `ihcload` is the name of the library that contains the IMS HALDB Toolkit load modules.
• `imstools` is the optional name of the library that contains the IMS reorganization utilities load modules.
• `reslib` is the name of the library that contains the IMS load modules.

If you do not specify an IMSDALIB DD statement in the JCL, you must specify the MDALIB in the STEPLIB for dynamic allocation purposes.

**DFSRESLB**
This statement is optional. The statement points to an authorized library that contains IMS SVC modules.

IMS HALDB Toolkit dynamically allocates this DD if you do not provide it.

**IMS**
This statement is required only if the IMS management of ACBs is not enabled. The statement describes the library that contains the DBDs of the database that you are processing.

This data set must reside on DASD.

When the IMS management of ACBs is enabled, IMS HALDB Toolkit ignores the IMS DD statement.

**IMSDALIB**
This statement is optional. The statement specifies a partitioned data set or data sets that contain the dynamic allocation members for the database data sets of non-HALDB and the RECON data sets.

If DBRC is active and the IMSDALIB DD statement is coded, IMSDALIB is always referred to by DBRC, and DBRC determines the data sets to be allocated for each RECON DD.

For the database data sets of non-HALDB, IMSDALIB is referred to only when the dynamic allocation for the original data sets is requested. Dynamic allocation of the database data sets is attempted in the following order:

1. Dynamic allocation members in the IMSDALIB concatenation
2. Dynamic allocation members in JOBLIB or STEPLIB concatenation

**PROCLIB**
This statement is optional. The statement points to the IMS.PROCLIB data set. If DFSDF(ddd) is specified in the IHCSYSIN data set, you must specify this DD statement and ensure that the DFSDFddd member exists in the IMS.PROCLIB data set.

**RECONx**
These statements are optional. The statements define the database recovery control (DBRC) RECON data sets. RECON data sets dictate which databases and IMS online systems to use during the processing.

**Attention:** If you specify IMSDALIB DD dynamic allocation, do not use these RECON DD statements. If you used JCL to allocate RECON1 as a spare data set, you must restart the database.

**IHCSYSIN**
This statement is required. The statement defines a control statement or data set that contains control statements that specify the functions of IMS HALDB Toolkit.
For more information about the format of IHCSYSIN DD statements, see “BACKUPDBRC command parameters” on page 112.

**SYSPRINT**
This statement is optional. The statement defines the statistics output data set and output from other utilities that are executed under the control of IMS HALDB Toolkit.

The data set can reside on DASD, or it can be routed through the output job. IMS HALDB Toolkit dynamically allocates this data set if you do not provide it.

**MSGPRINT**
This statement is optional. The statement defines the IMS HALDB Toolkit output data set for progress messages issued during the job. For more information, see “MSGPRINT data set” on page 279.

The data set can reside on DASD, or it can be routed through the output job. IMS HALDB Toolkit dynamically allocates this data set if you do not provide this DD statement.

**DBRCOUT**
This statement is required if TODD(ddname) parameter is not specified. The statement defines the output data set for generating DBRC statements.

**TRACE**
This statement is optional. The statement defines the output data set that IMS HALDB Toolkit uses to write diagnostic trace records. This data set might be required for problem diagnosis.

This data set can reside on DASD, or it can be routed through the output job. If you do not provide this DD statement, it is dynamically allocated to SYSOUT by IMS HALDB Toolkit.

**SYSUDUMP**
This statement is required only if a dump is requested by IBM Software Support. The statement defines a dump data set. If the IMS HALDB Toolkit detects an error and ends with a U0999 abend, this dump is not necessary. However, if any other system or user abend occurs, this data set might be required for problem diagnosis.

This data set can reside on DASD, or it can be routed through the output job.

**BACKUPDBRC command parameters**
The following table summarizes the BACKUPDBRC command parameters.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBD</td>
<td>Required</td>
<td>Specifies the name of the HALDB DBD.</td>
</tr>
<tr>
<td>Format</td>
<td></td>
<td>(dddbname)</td>
</tr>
<tr>
<td>Default</td>
<td></td>
<td>value</td>
</tr>
</tbody>
</table>

None.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DFSDF</td>
<td>Optional</td>
<td>Specifies the 3-character suffix of the DFSDFxxx member of the IMS PROCLIB data set that contains the settings and attributes of the IMS catalog. The specified member is used when the following two conditions are met: • IMS manages the ACBs (ACBMGMT=CATALOG). • The IMS Catalog Definition exit routine (DFS3CDX0) is not used. Ensure that the CATALOG section of the DFSDFxxx member specifies CATALOG=Y, ACBMGMT=CATALOG, and the alias name for the IMS catalog. <strong>Format</strong> <em>(ddd)</em> <strong>Default value</strong> None.</td>
</tr>
<tr>
<td>IMSID</td>
<td>Optional</td>
<td>IMSID must be specified when the IMS catalog is enabled by the IMS Catalog Definition exit routine and IMSID is referred to in the exit routine. <strong>Format</strong> <em>(nnnn)</em> <strong>Default value</strong> If omitted, the value is obtained from the current SDFSRESL(DFSVC000).</td>
</tr>
<tr>
<td>INCLIC</td>
<td>Optional</td>
<td>Specifies whether to include the non-fuzzy image copies. <strong>Format</strong> *(Y</td>
</tr>
<tr>
<td>INCLIND</td>
<td>Optional</td>
<td>Specifies whether to include the secondary index. <strong>Format</strong> *(Y</td>
</tr>
<tr>
<td>TODD</td>
<td>Optional</td>
<td>Specifies the output file where the DBRC statements are written. You must specify either the TODD(ddname) parameter in the IHCSYSIN DD statement or the DBRCOUT DD statement in the JCL. <strong>Format</strong> <em>(ddname)</em> <strong>Default value</strong> None.</td>
</tr>
</tbody>
</table>
Cloning DBRC definitions for test environments

In a test environment, the clone DBRC definitions utility allows you to ease DBRC problems by cloning DBRC definitions to an alternate RECON.

About this task

The utility replicates HALDB DBRC definitions to other RECONs and allows you to exchange the high-level data set name qualifier.

You must have your own data sets for testing the batch program, or testing online programs with IMS Batch Terminal Simulator. This requires you to have your own RECONs.

When batch jobs are run with DBRC active, you must accommodate recovery and authorization issues as well. For example, if an application program fails, the database is flagged by DBRC to indicate the need for some recovery action. This utility helps eliminate those problems.

To use this utility, include the sample JCL in your test JCL.

Alternatively, you can create the JCL by using the ISPF user interface.

Procedure

1. Locate the sample JCL for this utility in the SIHCSAMP file, member IHCECLON.
2. Specify the JCL DD statements.
   For a list of DD statements, see “COPYDBRC DD statements” on page 116.
3. Specify the COPYDBRC command parameters.
   For a list of COPYDBRC command parameters, see “COPYDBRC command parameters” on page 118.
4. Include the sample JCL in your test JCL.

Example

In the following sample JCL:

• the.other.RECON is the RECON for the programmer.
• your.RECON is the RECON to be copied from.
• your.DBDLIB is the DBD library for the DBD.
Clone DBRC definitions to alternate RECON

Allocate RECON datasets

</table>

**STEPLIB**

This statement is required. The library data sets pointed to from the STEPLIB DD statement must always be APF-authorized, even if a DFSRESLB DD statement is provided. Authorized library data sets include:

- IMS HALDB Toolkit load library
- IMS utilities that are available for IMS HALDB Toolkit
- IMS RESLIB library
- Any other libraries

The libraries can appear in any order.

```sql
//STEPLIB DD DISP=SHR, DSN=ihcload
   // DD DISP=SHR, DSN=imstools
   // DD DISP=SHR, DSN=reslib
```
where:

- `ihcload` is the name of the library that contains the IMS HALDB Toolkit load modules.
- `imstools` is the optional name of the library that contains the IMS reorganization utilities load modules.
- `reslib` is the name of the library that contains the IMS load modules.

If you do not specify an IMSDALIB DD statement in the JCL, you must specify the MDALIB in the STEPLIB for dynamic allocation purposes.

**DFSRESLB**
This statement is optional. The statement points to an authorized library that contains IMS SVC modules.

IMS HALDB Toolkit dynamically allocates this DD if you do not provide it.

**IMS**
This statement is required only if the IMS management of ACBs is not enabled. The statement describes the library that contains the DBDs of the database that you are processing.

This data set must reside on DASD.

When the IMS management of ACBs is enabled, IMS HALDB Toolkit ignores the IMS DD statement.

**IMSDLIB**
This statement is optional. The statement specifies a partitioned data set or data sets that contain the dynamic allocation members for the database data sets of non-HALDB and the RECON data sets.

If DBRC is active and the IMSDALIB DD statement is coded, IMSDALIB is always referred to by DBRC, and DBRC determines the data sets to be allocated for each RECON DD.

For the database data sets of non-HALDB, IMSDALIB is referred to only when the dynamic allocation for the original data sets is requested. Dynamic allocation of the database data sets is attempted in the following order:

1. Dynamic allocation members in the IMSDALIB concatenation
2. Dynamic allocation members in JOBLIB or STEPLIB concatenation

**PROCLIB**
This statement is optional. The statement points to the IMS.PROCLIB data set. If DFSDF(ddd) is specified in the IHCSYSIN data set, you must specify this DD statement and ensure that the DFSDF(ddd) member exists in the IMS.PROCLIB data set.

**RECONx**
These statements are optional. The statements define the database recovery control (DBRC) RECON data sets. RECON data sets dictate which databases and IMS online systems to use during the processing.

**Attention:** If you specify IMSDALIB DD dynamic allocation, do not use these RECON DD statements. If you used JCL to allocate RECON1 as a spare data set, you must restart the database.

**IHCSYSIN**
This statement is required. The statement defines a control statement or data set that contains control statements that specify the functions of IMS HALDB Toolkit.

For more information about the format of IHCSYSIN DD statements, see “COPYDBRC command parameters” on page 118.

**MSGPRINT**
This statement is optional. The statement defines the IMS HALDB Toolkit output data set for progress messages issued during the job. For more information, see “MSGPRINT data set” on page 279.

The data set can reside on DASD, or it can be routed through the output job. IMS HALDB Toolkit dynamically allocates this data set if you do not provide this DD statement.
TRACE
This statement is optional. The statement defines the output data set that IMS HALDB Toolkit uses to write diagnostic trace records. This data set might be required for problem diagnosis.

This data set can reside on DASD, or it can be routed through the output job. If you do not provide this DD statement, it is dynamically allocated to SYSOUT by IMS HALDB Toolkit.

SYSUDUMP
This statement is required only if a dump is requested by IBM Software Support. The statement defines a dump data set. If the IMS HALDB Toolkit detects an error and ends with a U0999 abend, this dump is not necessary. However, if any other system or user abend occurs, this data set might be required for problem diagnosis.

This data set can reside on DASD, or it can be routed through the output job.

COPYDBRC command parameters
The following table summarizes the COPYDBRC command parameters.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COPYIC</td>
<td>Optional</td>
<td>Specifies whether to create NOTIFY.IC statements. COPYIC and DFDSS parameters are mutually exclusive.</td>

</table>
| IMSID     | Optional    | IMSID must be specified when the IMS catalog is enabled by the IMS Catalog Definition exit routine and IMSID is referred to in the exit routine.  
**Format**  
\((nnnn)\)  
**Default value**  
If omitted, the value is obtained from the current SDFSRESL(DFSVC000). |
| INCLIND   | Optional    | Specifies whether to include the secondary index.  
**Format**  
\((Y | N)\)  
**Default value**  
Y |
| KEYLABEL  | Optional    | Specifies the encryption key label to be used in IDCAMS processing.  
The key label can be up to 64 bytes.  
**Format**  
\((keylabel)\)  
**Default value**  
If omitted, the default action is to copy from existing data sets. |
| STORCLAS  | Optional    | Represent the SMS constructs to be used for the IDCAMS statements.  
**Format**  
\((storclas)\)  
**Default value**  
If omitted, the default action is to copy from existing data sets. |
| TODD      | Required    | Specifies the output file where the DBRC statements are written.  
This file will be the input to the DBRC utility.  
**Format**  
\((ddname)\)  
**Default value**  
None. |
| VOLSER    | Conditionally required | Specifies the volume serial to be used for IDCAMS.  
This parameter is required for non-SMS allocation.  
**Format**  
\((volume)\)  
**Default value**  
None. |
**Copying HALDBs to a different IMS system**

You can copy HALDBs to different IMS systems by using either image copies or DFSMSdss.

In this topic:

- “Copying HALDBs by using an image copy” on page 122
- “Copying HALDBs by using DFSMSdss” on page 123

**Copying HALDBs by using an image copy**

The HALDB copy utility allows you to copy a HALDB, using the latest non-fuzzy image copy, to a different IMS.

**About this task**

The utility transfers a production HALDB to a different IMS and allocates the target data set in that system, if the data set is not already available.

This task is typically performed when a problem is discovered in the production database, where the database cannot be kept offline until the error in the application has been identified and resolved.

This utility performs the following operations:

- Copies the most recent HALDB definitions across to a different RECON by changing the hlq portion of the data set name.
- Creates the necessary allocation statements.
- Registers all non-fuzzy image copies to the new RECON.

After these operations have been performed, you can run a recovery using the new RECON. Alternatively, you can create the JCL by using the ISPF user interface.

**Procedure**

1. Locate the sample JCL for this utility in the SIHCSAMP file, member IHCECOPY.
2. Specify the JCL DD statements.
   For a list of DD statements, see “COPYDBRC DD statements” on page 116.
3. Specify the COPYDBRC command parameters.
   For a list of COPYDBRC command parameters, see “COPYDBRC command parameters” on page 118.
Copy a database to different RECON
Once this is complete, do GENJCL.RECOV for that RECON

Figure 18. Sample JCL from member IHCECOPY

Copying HALDBs by using DFSMSdss

You can use DFSMSdss to copy a HALDB to a different IMS.

About this task

Using DFSMSdss works like image copy recovery. The target RECON must reflect any deleted partitions and you must /DBR the database.

You can create the partition definition for the target RECON and create the DFSMSdss commands that are necessary to make the copy.
Procedure

1. Locate the sample JCL for this utility in the SIHCSAMP file, member IHCEDFDS.
2. Specify the JCL DD statements.
   For a list of DD statements, see “COPYDBRC DD statements” on page 116.
3. Specify the COPYDBRC command parameters.
   For a list of COPYDBRC command parameters, see “COPYDBRC command parameters” on page 118.
4. Make sure that the target RECON reflects any deleted partitions.
5. Run /DBR on the database.

Example

```c
/*------------------------------------------------------------------*/
/*           Copy a database to different RECON                    */
/*           The copy function is done via DFDSS                    */
/*------------------------------------------------------------------*/
//CRE    EXEC PGM=IHCWHALD,
//            REGION=60M
//STEPLIB  DD DISP=SHR,DSN=your.SIHCLOAD
//         DD DISP=SHR,DSN=your.SDFSRESL
//DFSRESLB DD DISP=SHR,DSN=your.SDFSRESL
//IMS      DD DISP=SHR,DSN=your.DBDLIB
//RECON1   DD DISP=SHR,DSN=your.RECON1
//RECON2   DD DISP=SHR,DSN=your.RECON2
//RECON3   DD DISP=SHR,DSN=your.RECON3
//MSGPRINT DD SYSOUT=*
//SYSUDUMP DD SYSOUT=*
//IHCSYSIN DD *

Figure 19. Sample JCL from member IHCEDFDS (Part 1 of 2)
Figure 20. Sample JCL from member IHCEDFDS (Part 2 of 2)
Chapter 6. Using the HALDB Analyzer

The HALDB Analyzer utility checks the health of a HALDB by verifying HALDB constructs within a database and its indexes.

About this task

The utility analyzes the HALDB structure and verifies that all root keys are in the correct partition, that all ILKs are valid, and that all EPS pointers will find the correct ILE. Additional performance-related data is also collected.

The HALDB Analyzer monitors specific HALDB components. You can provide thresholds that trigger the utility to issue critical warnings when these components are not performing properly. These components include:

**Partition selection**
A root segment in a partition is not found in the same partition when searched by partition selection.

**Randomizer error**
A call to the randomizer using an existing root segment does not return a zero return code. This warning is performed for the standard IMS randomizer (DFSHDCnn) only.

**ILKs in error**
The ILK of a segment is invalid.

**Duplicate ILKs**
There should not be any duplicate ILKs.

**Missing ILEs**
EPS pointer requires pointer healing, but there is no corresponding ILE.

A return code of 8 is set when any of these situations is detected.

Performance and administration parameters allow you to set threshold levels for the components being monitored by the HALDB Analyzer.

The threshold values for performance and administration parameters are set as percentage numbers from 0 to 100, unless otherwise stated.

The parameters produce two levels of warning operands:

**Normal warning level**
The warning level operand notifies you of a problem situation, but allows you some time to resolve the problem.

**Critical warning level**
The critical level operand informs you that an immediate action needs to be taken to correct the problem.

A value of 0 in any operand suppresses the notification. However, the report still shows the data. There are no default settings for the parameters. When the keyword is omitted, no threshold warning is issued.

Procedure

1. Locate the sample JCL for the HALDB Analyzer utility in the SIHCSAMP file, member IHCEANA.
2. Specify the JCL DD statements.
   For a list of DD statements, see “CHECK DD statements” on page 128.
3. Specify the CHECK command parameters.
   For a list of CHECK command parameters, see “CHECK command parameters” on page 131.
CHECK DD statements

DD statements are used to identify the source of input and the placement of output information.

The following table shows DD statements and record format for the CHECK command.

<table>
<thead>
<tr>
<th>DD name</th>
<th>Use</th>

</tbody>
</table>
STEPLIB
This statement is required. The library data sets pointed to from the STEPLIB DD statement must always be APF-authorized, even if a DFSRESLB DD statement is provided. Authorized library data sets include:

- IMS HALDB Toolkit load library
- IMS utilities that are available for IMS HALDB Toolkit
- IMS RESLIB library
- Any other libraries

The libraries can appear in any order.

```
//STEPLIB DD DISP=SHR,DSN=ihcload
//        DD DISP=SHR,DSN=imstools
//        DD DISP=SHR,DSN=reslib
```

where:

- `ihcload` is the name of the library that contains the IMS HALDB Toolkit load modules.
- `imstools` is the optional name of the library that contains the IMS reorganization utilities load modules.
- `reslib` is the name of the library that contains the IMS load modules.

If you do not specify an IMSDALIB DD statement in the JCL, you must specify the MDALIB in the STEPLIB for dynamic allocation purposes.

DFSRESLB
This statement is optional. The statement points to an authorized library that contains IMS SVC modules.

IMS HALDB Toolkit dynamically allocates this DD if you do not provide it.

IMS
This statement is required only if the IMS management of ACBs is not enabled. The statement describes the library that contains the DBDs of the database that you are processing.

This data set must reside on DASD.

When the IMS management of ACBs is enabled, IMS HALDB Toolkit ignores the IMS DD statement.

IMSDALIB
This statement is optional. The statement specifies a partitioned data set or data sets that contain the dynamic allocation members for the database data sets of non-HALDB and the RECON data sets.

If DBRC is active and the IMSDALIB DD statement is coded, IMSDALIB is always referred to by DBRC, and DBRC determines the data sets to be allocated for each RECON DD.

For the database data sets of non-HALDB, IMSDALIB is referred to only when the dynamic allocation for the original data sets is requested. Dynamic allocation of the database data sets is attempted in the following order:

1. Dynamic allocation members in the IMSDALIB concatenation
2. Dynamic allocation members in JOBLIB or STEPLIB concatenation

PROCLIB
This statement is optional. The statement points to the IMS.PROCLIB data set. If DFSDF(ddd) is specified in the IHCSYSIN data set, you must specify this DD statement and ensure that the DFSDFddd member exists in the IMS.PROCLIB data set.

RECONx
These statements are optional. The statements define the database recovery control (DBRC) RECON data sets. RECON data sets dictate which databases and IMS online systems to use during the processing.
Attention: If you specify IMSDALIB DD dynamic allocation, do not use these RECON DD statements. If you used JCL to allocate RECON1 as a spare data set, you must restart the database.

IHCSYSIN
This statement is required. The statement defines a control statement or data set that contains control statements that specify the functions of IMS HALDB Toolkit.

For more information about the format of IHCSYSIN DD statements, see “CHECK command parameters” on page 131.

MSGPRINT
This statement is optional. The statement defines the IMS HALDB Toolkit output data set for progress messages issued during the job. For more information, see “MSGPRINT data set” on page 279.

The data set can reside on DASD, or it can be routed through the output job. IMS HALDB Toolkit dynamically allocates this data set if you do not provide this DD statement.

IHCLIST
This statement is optional. The statement defines the IMS HALDB Toolkit output data set for reports. For more information about the reports generated in this data set, see “IHCLIST data set” on page 280.

The data set can reside on DASD, or it can be routed through the output job. IMS HALDB Toolkit dynamically allocates this data set if you do not provide this DD statement.

TRACE
This statement is optional. The statement defines the output data set that IMS HALDB Toolkit uses to write diagnostic trace records. This data set might be required for problem diagnosis.

This data set can reside on DASD, or it can be routed through the output job. If you do not provide this DD statement, it is dynamically allocated to SYSOUT by IMS HALDB Toolkit.

SYSUDUMP
This statement is required only if a dump is requested by IBM Software Support. The statement defines a dump data set. If the IMS HALDB Toolkit detects an error and ends with a U0999 abend, this dump is not necessary. However, if any other system or user abend occurs, this data set might be required for problem diagnosis.

This data set can reside on DASD, or it can be routed through the output job.
### CHECK command parameters

The following table summarizes the `CHECK` command parameters.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>4GBWARN</td>
<td>Optional</td>
<td>Sets the warning level for used space. None of the data sets can use more than 4 GB (gigabytes). When the data set tries to go beyond this limit, an abend 844 will occur. This is not the high allocation point, but rather the high use point. This point can be indicated by the threshold setting. 4GBWARN and 8GBWARN are mutually exclusive.</td>
</tr>
</tbody>
</table>

#### Format

```
( llll, hhhh )
```

- **llll**
  - Sets the low threshold. Specify a number (in MB) in the range of 0 - 4095. You will get a warning when this value is exceeded. If you specify a value of 0, this warning is suppressed.

- **hhhh**
  - Sets the high threshold. Specify a number (in MB) in the range of 0 - 4095. You will get a critical warning when this value is exceeded. If you specify a value of 0, this warning is suppressed.

#### Default value

None.

#### Usage

A recommended setting is: 4GBWARN (2500, 3500)

#### Resolution

When the partition grows too large, you should split it into two partitions.
### Table 17. CHECK command parameters (continued)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>8GBWARN</td>
<td>Optional</td>
<td>Sets the warning level for used space. None of the data sets can use more than 8 GB (gigabytes). When the data set tries to go beyond this limit, an abend 844 will occur. This is not the high allocation point, but rather the high use point. This point can be indicated by the threshold setting. 4GBWARN and 8GBWARN are mutually exclusive.</td>
</tr>
</tbody>
</table>

**Format**

\[(lilll, hhhh)\]

- **lilll**
  Sets the low threshold. Specify a number (in MB) in the range of 0 - 8191. You will get a warning when this value is exceeded. If you specify a value of 0, this warning is suppressed.

- **hhhh**
  Sets the high threshold. Specify a number (in MB) in the range of 0 - 8191. You will get a critical warning when this value is exceeded. If you specify a value of 0, this warning is suppressed.

**Default value**

None.

**Usage**

A recommended setting is: 8GBWARN \((6500, 7500)\)

**Resolution**

When the partition grows too large, you should split it into two partitions.

| DFSDF     | Optional    | Specifies the 3-character suffix of the DFSDFxxx member of the IMS PROCLIB data set that contains the settings and attributes of the IMS catalog.  
The specified member is used when the following two conditions are met:  
  • IMS manages the ACBs (ACBMGMT=CATALOG).  
  • The IMS Catalog Definition exit routine (DFS3CDX0) is not used.  
Ensure that the CATALOG section of the DFSDFxxx member specifies CATALOG=Y, ACBMGMT=CATALOG, and the alias name for the IMS catalog.  
**Format**  

(ddd)  
**Default value**  
None.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXTENT</td>
<td>Optional</td>
<td>Indicates the extent number that triggers a warning. The maximum number of extents allowed depends on the data management type. <strong>VSAM</strong> The maximum number of extents per data set is 251. The maximum number of extents per volume is 123. <strong>OSAM</strong> The maximum number of extents per data set depends on the version of IMS; approximately 120 for IMS V14 and later. The maximum number of extents per volume is 16. When no more extents are possible, an attempt to obtain a new one creates an out-of-space condition, which leads to an 844 IMS abend. The purpose of the EXTENT parameter settings is to prevent this occurrence. <strong>Format</strong> ((lll,hhh)) (lll) Sets the low threshold. Specify a number in the range of 0 - 251. You will get a warning when this value is exceeded. If you specify a value of 0, this warning is suppressed. (hhh) Sets the high threshold. Specify a number in the range of 0 - 251. You will get a critical warning when this value is exceeded. If you specify a value of 0, this warning is suppressed. <strong>Default value</strong> None. <strong>Usage</strong> A recommended setting is: EXTENT(25,35) <strong>Resolution</strong> Consider dividing this partition into two partitions using the functions provided with this utility. If the space usage is not very high, adjust the primary and the secondary space parameter to allow fewer extents. It is also possible that your SMS pool volumes are heavily split, so that each space request must be satisfied using multiple extents. In this situation, your volumes should be maintained.</td>
</tr>
<tr>
<td>IMSID</td>
<td>Optional</td>
<td>IMSID must be specified when the IMS catalog is enabled by the IMS Catalog Definition exit routine and IMSID is referred to in the exit routine. <strong>Format</strong> ((nnnn)) <strong>Default value</strong> If omitted, the value is obtained from the current SDFSRESL(DFSVC000).</td>
</tr>
<tr>

<td>-------------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| KEYS      | Optional    | The designated ddname will receive a file containing the root keys.  
**Format**  
(ddname)  
**Default value**  
None.  
**Usage**  
Use this parameter if you want to perform a root key analysis; otherwise, do not specify this parameter.  
The KEYS file is created upon request only. The file only exists when the KEYS parameter has been specified.  
The following example shows the layout of the file:  
| PID | DS     | XL2 | Current partition id |
| REORGNO | DS     | XL2 | Current reorg number |
| SEGRBA  | DS     | XL4 | Current RBA (data portion if split) |
| TARGPID | DS     | XL2 | Target partition id |
| RMRESULT | DS    | XL4 | Randomizer result |
| KEY     | DS     | 0C  | Start of root key |
| MINROOT  | Optional | Defines the minimum amount of root segments in the database for the segment-oriented thresholds. If there are less than the specified root segments, some warnings are suppressed. This is because the percentage values do not perform well with small databases. The thresholds are suppressed for ROOTHOME, ROOTOVFL, SPLIT, and PTRHEAL.  
**Format**  
(nn.nnnnn)  
**Default value**  
0 |
### Table 17. CHECK command parameters (continued)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PTRHEAL</td>
<td>Optional</td>
<td>Indicates the amount of EPS pointer (PSINDEX ONLY) that needs pointer healing. The secondary index EPS pointer is not maintained when reorganizing the primary database (or a partition). In this situation, pointer healing (updating the direct pointer from the index to its target) must be done when the pointer is used. The ILDS data set is used. This process creates many I/Os. Therefore, it is recommended that you have all pointers healed. This parameter can help you decide when to perform this task.</td>
</tr>
</tbody>
</table>

**Format**

\[(ll, hh)\]

- \(ll\) Sets the low threshold. Specify a percentage number in the range of 0 - 99. You will get a warning when this value is exceeded. If you specify a value of 0, this warning is suppressed.

- \(hh\) Sets the high threshold. Specify a percentage number in the range of 0 - 99. You will get a critical warning when this value is exceeded. If you specify a value of 0, this warning is suppressed.

**Default value**

None.

**Usage**

A recommended setting is: PTRHEAL(20, 60)

**Resolution**

You can use the pointer healer function provided by IMS HALDB Toolkit or rebuild the indexes using an index builder utility.
### Table 17. CHECK command parameters (continued)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAPUSE</td>
<td>Optional</td>
<td>Indicates the usage of root anchor points (RAPs) in a PHDAM database. This parameter is used only for PHDAM. RAP usage is very dependent on the randomizing module. This parameter is designed for DFSHDC40, but can be used for others as well. A performance criteria for DFSHDC40 is that it should have more RAPs than root segments. This condition leads to RAPs not being used. The RAPUSE parameter monitors this usage.</td>
</tr>
</tbody>
</table>

**Format**

\[(ll, hh)\]

- **ll**
  Sets the low threshold. Specify a percentage number in the range of 0 - 99. You will get a warning when this value is exceeded. If you specify a value of 0, this warning is suppressed.

- **hh**
  Sets the high threshold. Specify a percentage number in the range of 0 - 99. You will get a critical warning when this value is exceeded. If you specify a value of 0, this warning is suppressed.

**Default value**

None.

**Usage**

A recommended setting is: RAPUSE \(60, 80\)

**Resolution**

The randomizing parameter must be changed. See ROOTHOME for details.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ROOTHOME</td>
<td>Optional</td>
<td>Indicates the number of root segments that are not in home block. This parameter is effective for PHDAM only. It is ignored for PHIDAM.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>PHDAM has a randomizing module that addresses a root anchor point (RAP). The root segment is chained off. For performance reasons, the root segment should be residing in the same block. However, this is not always the case. This parameter allows you to set thresholds on how many root segments are not in that block.</td>

<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>ROOTOVFL</td>
<td>Optional</td>
<td>Indicates how many root segments are in overflow. This parameter applies to PHDAM only. It is like the ROOTHOME parameter. However, this situation occurs when many new root segments are inserted. All roots in the overflow area are also reflected by ROOTHOME, but these roots could be brought back by a simple reorganization.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>ll</strong> Sets the low threshold. Specify a percentage number in the range of 0 - 99. You will get a warning when this value is exceeded. If you specify a value of 0, this warning is suppressed.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>hh</strong> Sets the high threshold. Specify a percentage number in the range of 0 - 99. You will get a critical warning when this value is exceeded. If you specify a value of 0, this warning is suppressed.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Default value</strong> None.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Resolution</strong> The resolution is to change the randomizing parameter for the indicated partition.</td>
</tr>
<tr>
<td>SPACE</td>
<td>Optional</td>
<td>Sets thresholds for partition size. This parameter can be used to make decisions about partitions.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>llll</strong> Sets the lowest preferred partition size. Specify a number (in MB) in the range of 0 - 8191. You will get a warning when the partition size is smaller than this value. If you specify a value of 0, this warning is suppressed.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>hhhh</strong> Sets the high partition size. Specify a number (in MB) in the range of 0 - 8191. You will get a critical warning when this value is exceeded. If you specify a value of 0, this warning is suppressed.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Default value</strong> None.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Usage</strong> A recommended setting is: SPACE (512, 3500)</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Resolution</strong> When a partition is too small, you might want to combine it with the left or right (or both) neighboring partition. The IMS HALDB Toolkit provides the functionality to do this. When a partition becomes too large, it should be split into two partitions.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Requirement</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>-------------</td>
</tr>
<tr>
<td>SPLIT</td>
<td>Optional</td>
<td>Indicates how many of the split segments are split to a different block. A variable length segment could be split into the prefix and the data portion. This can happen during an update when the size of the data increases, but there is not enough room to update this in place. The prefix portion cannot be moved and needs to stay in place. The data portion is now stored at a different location and is pointed to by an additional pointer in the prefix. This becomes a problem when the different location is in a different block. That situation will cause an additional I/O when retrieving the segment. The parameter threshold settings address this specific situation. The parameter is active for each segment type that has variable length or is compressed.</td>
</tr>
</tbody>
</table>

**Format**

\[(ll,hh)\]

**ll**

Sets the low threshold for all segments of a segment type that is split to a different block. Specify a percentage number in the range of 0 - 99. You will get a warning when this value is exceeded. If you specify a value of 0, this warning is suppressed.

**hh**

Sets the high threshold. Specify a percentage number in the range of 0 - 99. You will get a critical warning when this value is exceeded. If you specify a value of 0, this warning is suppressed.

**Default value**

None.

**Usage**

A recommended setting is: SPLIT(5,20)

**Resolution**

A reorganization will resolve this problem.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SYNONYM</td>
<td>Optional</td>
<td>Indicates the number of root segment occurrences in the synonym chain. This parameter is effective for PHDAM only. It is ignored for PHIDAM.</td>
</tr>
</tbody>
</table>
|             |             | **Format**

<td>In HALDB, each segment has a unique indirect list key (ILK) that can never be the same for the same segment type in the entire database. The pointer healing process relies on this uniqueness. This condition should be treated like a pointer, so its verification is important. The function provided will check for duplicate and invalid ILK. Format (Y</td>
</tr>
</tbody>
</table>
Chapter 7. Reorganizing a PSINDEX

The reorganize PSINDEX utility helps you reorganize a partitioned secondary index (PSINDEX) to improve space management due to heavy update activity, where the number of CI splits and CA splits would be high.

About this task

The following tasks can be performed by this utility:

• Reclaim space
• Reclaim split indexes
• Remove deleted index records

Although this reorganization task could be performed with IDCAMS REPRO, the task would not be registered with DBRC.

The following example shows another way to use the REORGIND command to reorganize a PSINDEX:

```
REORGIND DBD(dbdname) PARTITN(psindex_partition_name)
```

Procedure

1. Locate the sample JCL for this utility in the SIHCSAMP file, member IHCEREOI.
2. Specify the JCL DD statements.
   For a list of DD statements, see “REORGIND DD statements” on page 146.
3. Specify the REORGIND command parameters.
   For a list of REORGIND command parameters, see “REORGIND command parameters” on page 148.

Example

```
//JOBNAME JOB 00,000,CLASS=A,MSGCLASS=X
//*------------------------------------------------------------
//*           Reorg partition
//*------------------------------------------------------------
//REO EXEC PGM=IHCHALDB, REGION=60M
//STEPLIB DD DISP=SHR,DSN=your.SIHCLOAD
// DD DISP=SHR,DSN=your.SDFSRESL
//RECON1 DD DISP=SHR,DSN=your.RECON1
//RECON2 DD DISP=SHR,DSN=your.RECON2
//RECON3 DD DISP=SHR,DSN=your.RECON3
//DFSRESLB DD DISP=SHR,DSN=your.SDFSRESL
//IMS DD DISP=SHR,DSN=your.DBDLIB
//MSGPRINT DD SYSOUT=*
//SYSUDUMP DD SYSOUT=*
//IHCYSIN DD *
//REORGIND DBD(SH022)
/*
```

Figure 22. Sample JCL for reorganizing a PSINDEX
REORGIND DD statements

DD statements are used to identify the source of input and the placement of output information.

The following table shows DD statements and record format for the REORGIND command.

<table>

STEPLIB

This statement is required. The library data sets pointed to from the STEPLIB DD statement must always be APF-authorized, even if a DFSRESLB DD statement is provided. Authorized library data sets include:

- IMS HALDB Toolkit load library
- IMS utilities that are available for IMS HALDB Toolkit
- IMS RESLIB library
- Any other libraries

The libraries can appear in any order.

```
//STEPLIB DD DISP=SHR,DSN=ihcload
// DD DISP=SHR,DSN=imstools
// DD DISP=SHR,DSN=reslib
```

where:

- `ihcload` is the name of the library that contains the IMS HALDB Toolkit load modules.
- `imstools` is the optional name of the library that contains the IMS reorganization utilities load modules.
- `reslib` is the name of the library that contains the IMS load modules.

If you do not specify an IMSDALIB DD statement in the JCL, you must specify the MDALIB in the STEPLIB for dynamic allocation purposes.

DFSRESLB

This statement is optional. The statement points to an authorized library that contains IMS SVC modules.

IMS HALDB Toolkit dynamically allocates this DD if you do not provide it.
IMS

This statement is required only if the IMS management of ACBs is not enabled. The statement describes the library that contains the DBDs of the database that you are processing.

This data set must reside on DASD.

When the IMS management of ACBs is enabled, IMS HALDB Toolkit ignores the IMS DD statement.

IMSDALIB

This statement is optional. The statement specifies a partitioned data set or data sets that contain the dynamic allocation members for the database data sets of non-HALDB and the RECON data sets.

If DBRC is active and the IMSDALIB DD statement is coded, IMSDALIB is always referred to by DBRC, and DBRC determines the data sets to be allocated for each RECON DD.

For the database data sets of non-HALDB, IMSDALIB is referred to only when the dynamic allocation for the original data sets is requested. Dynamic allocation of the database data sets is attempted in the following order:

1. Dynamic allocation members in the IMSDALIB concatenation
2. Dynamic allocation members in JOBLIB or STEPLIB concatenation

PROCLIB

This statement is optional. The statement points to the IMS.PROCLIB data set. If DFSDF(ddd) is specified in the IHCSYSIN data set, you must specify this DD statement and ensure that the DFSDFddd member exists in the IMS.PROCLIB data set.

RECONx

These statements are optional. The statements define the database recovery control (DBRC) RECON data sets. RECON data sets dictate which databases and IMS online systems to use during the processing.

Attention: If you specify IMSDALIB DD dynamic allocation, do not use these RECON DD statements. If you used JCL to allocate RECON1 as a spare data set, you must restart the database.

IHCSYSIN

This statement is required. The statement defines a control statement or data set that contains control statements that specify the functions of IMS HALDB Toolkit.

For more information about the format of IHCSYSIN DD statements, see “REORGIND command parameters” on page 148.

SYSPRINT

This statement is optional. The statement defines the statistics output data set and output from other utilities that are executed under the control of IMS HALDB Toolkit.

The data set can reside on DASD, or it can be routed through the output job. IMS HALDB Toolkit dynamically allocates this data set if you do not provide it.

MSGPRINT

This statement is optional. The statement defines the IMS HALDB Toolkit output data set for progress messages issued during the job. For more information, see “MSGPRINT data set” on page 279.

The data set can reside on DASD, or it can be routed through the output job. IMS HALDB Toolkit dynamically allocates this data set if you do not provide this DD statement.

TRACE

This statement is optional. The statement defines the output data set that IMS HALDB Toolkit uses to write diagnostic trace records. This data set might be required for problem diagnosis.

This data set can reside on DASD, or it can be routed through the output job. If you do not provide this DD statement, it is dynamically allocated to SYSOUT by IMS HALDB Toolkit.
**SYSUDUMP**
This statement is required only if a dump is requested by IBM Software Support. The statement defines a dump data set. If the IMS HALDB Toolkit detects an error and ends with a U0999 abend, this dump is not necessary. However, if any other system or user abend occurs, this data set might be required for problem diagnosis.

This data set can reside on DASD, or it can be routed through the output job.

**REORGIND command parameters**

The following table summarizes the REORGIND command parameters.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBD</td>
<td>Required</td>
<td>Specifies the name of a primary DBD or a PSINDEX. If you specify a primary DBD, PARTITN must not be specified. All PSINDEX partitions for the specified primary DBD are reorganized. If you specify a PSINDEX DBD, you can specify a partition. If a partition is not specified or specified with an asterisk (*), then all partitions of that PSINDEX are reorganized.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Format</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>(dbdname)</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Default value</strong> None.</td>
</tr>
<tr>
<td>DFSDF</td>
<td>Optional</td>
<td>Specifies the 3-character suffix of the DFSDFxxx member of the IMS PROCLIB data set that contains the settings and attributes of the IMS catalog. The specified member is used when the following two conditions are met: • IMS manages the ACBs (ACBMGMT=CATALOG). • The IMS Catalog Definition exit routine (DFS3CDX0) is not used. Ensure that the CATALOG section of the DFSDFxxx member specifies CATALOG=Y, ACBMGMT=CATALOG, and the alias name for the IMS catalog.</td>
</tr>

| PARTITN   | Optional    | Specifies the name of the PSINDEX partition. If the DBD is PSINDEX, the default name value is an asterisk (*). This parameter is invalid when a primary DBD is specified. **Format** *(psindex_partition_name | *)  
|           |             | **Default value**  
|           |             | *               |
Chapter 8. Splitting an unload file into single partition files

The split unload file utility allows you to split or consolidate an unload file into single partition unload files. The reloads then can run in parallel.

About this task
A HALDB unload file can contain data from multiple partitions. As the data grows or shifts, partitions grow or shrink. When reloading partitions, it would be faster to reload each partition in parallel.

The single partition unload files are standard Hierarchical Direct (HD) unload files with header and trailer statistics. Each file contains only records for the selected partition.

This utility separates the HALDB unload file on the partition boundary and maintains the unload header and trailer records for each file.

The sample JCL for this utility is in the SIHCSAMP file, member IHCESPLT.

You must specify the DBD and the unload file you want to split.

The DD name for the single partition HD unload files are constructed using the partition name appended with a Z. These files are required.

Procedure
1. Locate the sample JCL for this utility in the SIHCSAMP file, member IHCESPLT.
2. Specify the JCL DD statements.
   For a list of DD statements, see “IHCUSPLT DD statements” on page 152.
3. Specify the IHCUSPLT command parameters.
   For a list of IHCUSPLT command parameters, see “IHCUSPLT command parameters” on page 154.

Example
In the following example, each partition unload file is named PARTxxZ.
IHCUSPLT DD statements

DD statements are used to identify the source of input and the placement of output information.

The following table shows DD statements and record format for the IHCUSPLT command.

<table>
<thead>
<tr>
<th>DD name</th>

</table>

STEPLIB
This statement is required. The library data sets pointed to from the STEPLIB DD statement must always be APF-authorized, even if a DFSRESLB DD statement is provided. Authorized library data sets include:
• IMS HALDB Toolkit load library
• IMS utilities that are available for IMS HALDB Toolkit
• IMS RESLIB library
• Any other libraries

The libraries can appear in any order.

```
//STEPLIB DD DISP=SHR,DSN=ihcload
//        DD DISP=SHR,DSN=imstools
//        DD DISP=SHR,DSN=reslib
```

where:
• `ihcload` is the name of the library that contains the IMS HALDB Toolkit load modules.
• `imstools` is the optional name of the library that contains the IMS reorganization utilities load modules.
• `reslib` is the name of the library that contains the IMS load modules.

If you do not specify an IMSDALIB DD statement in the JCL, you must specify the MDALIB in the STEPLIB for dynamic allocation purposes.

**DFSRESLB**
This statement is optional. The statement points to an authorized library that contains IMS SVC modules.

IMS HALDB Toolkit dynamically allocates this DD if you do not provide it.

**IMS**
This statement is required only if the IMS management of ACBs is not enabled. The statement describes the library that contains the DBDs of the database that you are processing.

This data set must reside on DASD.

When the IMS management of ACBs is enabled, IMS HALDB Toolkit ignores the IMS DD statement.

**IMSDALIB**
This statement is optional. The statement specifies a partitioned data set or data sets that contain the dynamic allocation members for the database data sets of non-HALDB and the RECON data sets.

If DBRC is active and the IMSDALIB DD statement is coded, IMSDALIB is always referred to by DBRC, and DBRC determines the data sets to be allocated for each RECON DD.

For the database data sets of non-HALDB, IMSDALIB is referred to only when the dynamic allocation for the original data sets is requested. Dynamic allocation of the database data sets is attempted in the following order:

1. Dynamic allocation members in the IMSDALIB concatenation
2. Dynamic allocation members in JOBLIB or STEPLIB concatenation

**PROCLIB**
This statement is optional. The statement points to the IMS.PROCLIB data set. If DFSDF(`ddd`) is specified in the IHCSYSIN data set, you must specify this DD statement and ensure that the DFSDF(`ddd`) member exists in the IMS.PROCLIB data set.

**RECONx**
These statements are optional. The statements define the database recovery control (DBRC) RECON data sets. RECON data sets dictate which databases and IMS online systems to use during the processing.

**Attention:** If you specify IMSDALIB DD dynamic allocation, do not use these RECON DD statements. If you used JCL to allocate RECON1 as a spare data set, you must restart the database.

**DFSUINPT**
This statement is required. The statement defines the unload file you want to split.
**IHCSYSIN**
This statement is required. The statement defines a control statement or data set that contains control statements that specify the functions of IMS HALDB Toolkit.

For more information about the format of IHCSYSIN DD statements, see “IHCUSPLT command parameters” on page 154.

**partition_nameZ**
These statements are required. Each of these statements defines the HD unload file for each partition. The DD names for the single partition HD unload files are constructed using the partition name appended with a Z.

**MSGPRINT**
This statement is optional. The statement defines the IMS HALDB Toolkit output data set for progress messages issued during the job. For more information, see “MSGPRINT data set” on page 279.

The data set can reside on DASD, or it can be routed through the output job. IMS HALDB Toolkit dynamically allocates this data set if you do not provide this DD statement.

**TRACE**
This statement is optional. The statement defines the output data set that IMS HALDB Toolkit uses to write diagnostic trace records. This data set might be required for problem diagnosis.

This data set can reside on DASD, or it can be routed through the output job. If you do not provide this DD statement, it is dynamically allocated to SYSOUT by IMS HALDB Toolkit.

**SYSUDUMP**
This statement is required only if a dump is requested by IBM Software Support. The statement defines a dump data set. If the IMS HALDB Toolkit detects an error and ends with a U0999 abend, this dump is not necessary. However, if any other system or user abend occurs, this data set might be required for problem diagnosis.

This data set can reside on DASD, or it can be routed through the output job.

---

**IHCUSPLT command parameters**

</tr>
</tbody>
</table>
| DFSDF     | Optional    | Specifies the 3-character suffix of the DFSDFxxx member of the IMS PROCLIB data set that contains the settings and attributes of the IMS catalog. The specified member is used when the following two conditions are met:  
- IMS manages the ACBs (ACBMGMT=CATALOG).  
- The IMS Catalog Definition exit routine (DFS3CDX0) is not used. Ensure that the CATALOG section of the DFSDFxxx member specifies CATALOG=Y, ACBMGMT=CATALOG, and the alias name for the IMS catalog.  
**Format**  
(ddd)  
**Default value**  
None. |
| IMSID     | Optional    | IMSID must be specified when the IMS catalog is enabled by the IMS Catalog Definition exit routine and IMSID is referred to in the exit routine.  
**Format**  
(nnnn)  
**Default value**  
If omitted, the value is obtained from the current  
SDFSRESL(DFSVC000). |
Chapter 9. Recovering by using the ILK reset utility

Recovery is the process of rebuilding databases after a system failure. IMS HALDB Toolkit provides the ILK utility to help you recover from the database rebuild process.

About this task

In a HALDB, an indirect list entry key (ILK) is a unique token that is assigned to a segment in PHDAM and PHIDAM databases when the segment is created. Eight bytes in length and stored in the prefix of the segment, the ILK uniquely identifies every segment in PHDAM and PHIDAM databases.

The ILK reset utility enables you to rebuild all ILKs and their references, and allows you to resolve conflicting ILKs.

The ILK reset utility resets the ILK of each segment. The utility offers a solution when duplicate or invalid ILKs are encountered. Run this utility when the HALDB Analyzer detects invalid ILKs.

This utility does not support logical relations. It creates an HD unload file, which contains the new ILKs. This file can be used as input to reload.

Procedure

1. Locate the sample JCL for this utility in the SIHCSAMP file, member IHCEILK.
2. Specify the JCL DD statements.
   For a list of DD statements, see “RESETILK DD statements” on page 158.
3. Specify the RESETILK command parameters.
   For a list of RESETILK command parameters, see “RESETILK command parameters” on page 160.
4. Make sure that an index builder utility is available because secondary indexes must be rebuilt.
5. Take the databases offline.

Example

```sql
//JOBNAME JOB 00,000,CLASS=A,MSGCLASS=X
//*------------------------------------------------------------
//* resetting ILK
//* a new HD unload file is created containing
//* new ILKs.  Reload database using this unload file.
//* secondary indexes must be rebuild
//*------------------------------------------------------------
//S2 EXEC PGM=IHCHALDB,
//    REGION=50M
//STEPLIB DD DISP=SHR,DSN=your.SIHCLIB,
//    Disp=SHR,DSN=your.SDFSRESL
//DFSRESLB DD DISP=SHR,DSN=your.SDFSRESL
//RECON1 DD DISP=SHR,DSN=your.RECON1
//RECON2 DD DISP=SHR,DSN=your.RECON2
//RECON3 DD DISP=SHR,DSN=your.RECON3
//IMS DD DISP=SHR,DSN=your.DBDLIB
//TRACE DD SYSOUT=* 
//MSGPRINT DD SYSOUT=* 
//SYSUDUMP DD SYSOUT=* 
//IHCSYSIN DD * 
//RESETILK DBD(ddd)
//DFSURG01 DD UNIT=SYSDA,Disp=(,PASS),
//    DSN=&UNL,SPACE=(CYL,(1,1))
```

</tbody>
</table>

**STEPLIB**

This statement is required. The library data sets pointed to from the STEPLIB DD statement must always be APF-authorized, even if a DFSRESLB DD statement is provided. Authorized library data sets include:

- IMS HALDB Toolkit load library
- IMS utilities that are available for IMS HALDB Toolkit
- IMS RESLIB library
- Any other libraries

The libraries can appear in any order.

```plaintext
//STEPLIB DD DISP=SHR,DSN=ihcload
// DD DISP=SHR,DSN=imstools
// DD DISP=SHR,DSN=reslib
```

where:

- `ihcload` is the name of the library that contains the IMS HALDB Toolkit load modules.
- `imstools` is the optional name of the library that contains the IMS reorganization utilities load modules.
- `reslib` is the name of the library that contains the IMS load modules.

If you do not specify an IMSDALIB DD statement in the JCL, you must specify the MDALIB in the STEPLIB for dynamic allocation purposes.

**DFSRESLB**

This statement is optional. The statement points to an authorized library that contains IMS SVC modules.

IMS HALDB Toolkit dynamically allocates this DD if you do not provide it.
IMS
This statement is required only if the IMS management of ACBs is not enabled. The statement describes the library that contains the DBDs of the database that you are processing. This data set must reside on DASD.

When the IMS management of ACBs is enabled, IMS HALDB Toolkit ignores the IMS DD statement.

IMSDLIB
This statement is optional. The statement specifies a partitioned data set or data sets that contain the dynamic allocation members for the database data sets of non-HALDB and the RECON data sets.

If DBRC is active and the IMSDLIB DD statement is coded, IMSDLIB is always referred to by DBRC, and DBRC determines the data sets to be allocated for each RECON DD.

For the database data sets of non-HALDB, IMSDLIB is referred to only when the dynamic allocation for the original data sets is requested. Dynamic allocation of the database data sets is attempted in the following order:

1. Dynamic allocation members in the IMSDLIB concatenation
2. Dynamic allocation members in JOBLIB or STEPLIB concatenation

PROCLIB
This statement is optional. The statement points to the IMS.PROCLIB data set. If DFSDF(ddd) is specified in the IHCSYSIN data set, you must specify this DD statement and ensure that the DFSDFddd member exists in the IMS.PROCLIB data set.

RECONx
These statements are optional. The statements define the database recovery control (DBRC) RECON data sets. RECON data sets dictate which databases and IMS online systems to use during the processing.

Attention: If you specify IMSDLIB DD dynamic allocation, do not use these RECON DD statements. If you used JCL to allocate RECON1 as a spare data set, you must restart the database.

IHCSYSIN
This statement is required. The statement defines a control statement or data set that contains control statements that specify the functions of IMS HALDB Toolkit.

For more information about the format of IHCSYSIN DD statements, see “RESETILK command parameters” on page 160.

DFSURGU1
This statement is required. The statement defines a new HD unload file for storing new ILKs.

MSGPRINT
This statement is optional. The statement defines the IMS HALDB Toolkit output data set for progress messages issued during the job. For more information, see “MSGPRINT data set” on page 279.

The data set can reside on DASD, or it can be routed through the output job. IMS HALDB Toolkit dynamically allocates this data set if you do not provide this DD statement.

TRACE
This statement is optional. The statement defines the output data set that IMS HALDB Toolkit uses to write diagnostic trace records. This data set might be required for problem diagnosis.

This data set can reside on DASD, or it can be routed through the output job. If you do not provide this DD statement, it is dynamically allocated to SYSOUT by IMS HALDB Toolkit.

SYSUDUMP
This statement is required only if a dump is requested by IBM Software Support. The statement defines a dump data set. If the IMS HALDB Toolkit detects an error and ends with a U0999 abend, this dump is not necessary. However, if any other system or user abend occurs, this data set might be required for problem diagnosis.

This data set can reside on DASD, or it can be routed through the output job.
## RESETILK command parameters

The following table summarizes the **RESETILK** command parameters.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
</table>
| DBD       | Required    | Specifies the name of a primary DBD.  
**Format**  
`(dbdname)`  
**Default value**  
None. |
| DFSDF     | Optional    | Specifies the 3-character suffix of the DFSDFxxx member of the IMS PROCLIB data set that contains the settings and attributes of the IMS catalog.  
The specified member is used when the following two conditions are met:  
• IMS manages the ACBs (ACBMGMT=CATALOG).  
• The IMS Catalog Definition exit routine (DFS3CDX0) is not used.  
Ensure that the CATALOG section of the DFSDFxxx member specifies CATALOG=Y, ACBMGMT=CATALOG, and the alias name for the IMS catalog.  
**Format**  
`(ddd)`  
**Default value**  
None. |
| IMSID     | Optional    | IMSID must be specified when the IMS catalog is enabled by the IMS Catalog Definition exit routine and IMSID is referred to in the exit routine.  
**Format**  
`(nnnn)`  
**Default value**  
If omitted, the value is obtained from the current SDFSRESL(DFSVC000). |
Chapter 10. Healing index pointers

After reorganizing the primary database, all secondary index pointers require healing. HALDB can handle this situation with its self-healing feature. Indexes can provide direct access to data, which otherwise can be found only by scanning the entire database.

About this task
HALDB identifies the new direct pointer by using the indirect list data set (ILDS) and replaces the invalid pointer with the current pointer. This process is called pointer healing.

However, this task might demand extra resources that can affect performance during peak time.

The index pointer healer utility allows you to heal index pointers offline and at a less expensive time. The utility allows you to replace, or heal, all index pointers that have become invalid after a database reorganization. The utility updates the index using the ILDS, which is an efficient process because it works sequentially.

When the primary database (or its partitions) is reorganized, the secondary indexes are not rebuilt. However, the target segment in the primary database has moved to a different place (the relative byte address or RBA). This condition makes the direct pointer in the index invalid.

Pointer healing takes place only when required (for example, when the secondary index is used to locate the target). This process requires many I/Os. It is recommended that you avoid pointer healing during peak transaction time.

The following conditions apply to using the index pointer healer utility:

- The primary database must not be open for update.
- The secondary indexes must be offline.

Alternatively, you can create the JCL by using the ISPF user interface.

Procedure
1. Locate the sample JCL for this utility in the SIHCSAMP file, member IHCEIXHL.
2. Specify the JCL DD statements.
   For a list of DD statements, see “PTRHEAL DD statements” on page 162.
3. Specify the PTRHEAL command parameters.
   For a list of PTRHEAL command parameters, see “PTRHEAL command parameters” on page 164.
4. Make sure that the primary database is closed for update.
5. Make sure that the secondary indexes are offline.
Example

```
//JOBNAME  JOB  00,000,CLASS=A,MSGCLASS=X
//**------------------------------------------------------------
//*          Pointer healing for secondary indexes
//*          for index DBD specified.
//**------------------------------------------------------------
//S2     EXEC PGM=IHCHALDB,
//       REGION=50M
//STEPLIB DD DISP=SHR,DSN=your.SIHCLOAD
//DFSRESLB DD DISP=SHR,DSN=your.SDFSRESL
//RECON1   DD DISP=SHR,DSN=your.RECON1
//RECON2   DD DISP=SHR,DSN=your.RECON2
//RECON3   DD DISP=SHR,DSN=your.RECON3
//IMS      DD DISP=SHR,DSN=your.DBDLIB
//TRACE    DD SYSOUT=*
//MSGPRINT DD SYSOUT=*
//SYSUDUMP DD SYSOUT=*
//IHCSYSIN DD *
PTRHEAL DBD( nnnnn )
```

Figure 25. Sample Index Pointer Healer JCL

**STEPLIB**

This statement is required. The library data sets pointed to from the STEPLIB DD statement must always be APF-authorized, even if a DFSRESLB DD statement is provided. Authorized library data sets include:

- IMS HALDB Toolkit load library
- IMS utilities that are available for IMS HALDB Toolkit
- IMS RESLIB library
- Any other libraries
The libraries can appear in any order.

```plaintext
//STEPLIB DD DISP=SHR,DSN=ihcload
//        DD DISP=SHR,DSN=imstools
//        DD DISP=SHR,DSN=reslib
```

where:

- **ihcload** is the name of the library that contains the IMS HALDB Toolkit load modules.
- **imstools** is the optional name of the library that contains the IMS reorganization utilities load modules.
- **reslib** is the name of the library that contains the IMS load modules.

If you do not specify an IMSDALIB DD statement in the JCL, you must specify the MDALIB in the STEPLIB for dynamic allocation purposes.

**DFSRESLB**

This statement is optional. The statement points to an authorized library that contains IMS SVC modules.

IMS HALDB Toolkit dynamically allocates this DD if you do not provide it.

**IMS**

This statement is required only if the IMS management of ACBs is not enabled. The statement describes the library that contains the DBDs of the database that you are processing.

This data set must reside on DASD.

When the IMS management of ACBs is enabled, IMS HALDB Toolkit ignores the IMS DD statement.

**IMSDALIB**

This statement is optional. The statement specifies a partitioned data set or data sets that contain the dynamic allocation members for the database data sets of non-HALDB and the RECON data sets.

If DBRC is active and the IMSDALIB DD statement is coded, IMSDALIB is always referred to by DBRC, and DBRC determines the data sets to be allocated for each RECON DD.

For the database data sets of non-HALDB, IMSDALIB is referred to only when the dynamic allocation for the original data sets is requested. Dynamic allocation of the database data sets is attempted in the following order:

1. Dynamic allocation members in the IMSDALIB concatenation
2. Dynamic allocation members in JOBLIB or STEPLIB concatenation

**PROCLIB**

This statement is optional. The statement points to the IMS.PROCLIB data set. If DFSDF(*ddd*) is specified in the IHCSYSIN data set, you must specify this DD statement and ensure that the DFSDF*ddd* member exists in the IMS.PROCLIB data set.

**RECONx**

These statements are optional. The statements define the database recovery control (DBRC) RECON data sets. RECON data sets dictate which databases and IMS online systems to use during the processing.

**Attention:** If you specify IMSDALIB DD dynamic allocation, do not use these RECON DD statements. If you used JCL to allocate RECON1 as a spare data set, you must restart the database.

**IHCSYSIN**

This statement is required. The statement defines a control statement or data set that contains control statements that specify the functions of IMS HALDB Toolkit.

For more information about the format of IHCSYSIN DD statements, see “PTRHEAL command parameters” on page 164.
**MSGPRINT**
This statement is optional. The statement defines the IMS HALDB Toolkit output data set for progress messages issued during the job. For more information, see “MSGPRINT data set” on page 279.

The data set can reside on DASD, or it can be routed through the output job. IMS HALDB Toolkit dynamically allocates this data set if you do not provide this DD statement.

**TRACE**
This statement is optional. The statement defines the output data set that IMS HALDB Toolkit uses to write diagnostic trace records. This data set might be required for problem diagnosis.

This data set can reside on DASD, or it can be routed through the output job. If you do not provide this DD statement, it is dynamically allocated to SYSOUT by IMS HALDB Toolkit.

**SYSUDUMP**
This statement is required only if a dump is requested by IBM Software Support. The statement defines a dump data set. If the IMS HALDB Toolkit detects an error and ends with a U0999 abend, this dump is not necessary. However, if any other system or user abend occurs, this data set might be required for problem diagnosis.

This data set can reside on DASD, or it can be routed through the output job.

Chapter 11. System utilities

IMS HALDB Toolkit provides several utilities to help you with database handling tasks.

Topics:
- “Rebuilding DBD source from DBDLIB” on page 167
- “Creating a PSB list for selected DBDs” on page 170
- “Creating OSAM multi-volume data sets” on page 172
- “Listing VIO and unit names” on page 173

Rebuilding DBD source from DBDLIB

The rebuild DBD source utility rebuilds DBD source statements from DBDLIB. If you are not sure that your DBD source reflects the DBDLIB, you can use this utility to rebuild the DBD source. The DBDLIB contains the most recent DBD description.

About this task

DBD source statements are compiled to create the DBD description in DBDLIB. The rebuild DBD source utility reverses that process.

A database description (DBD) is the collection of macro parameter statements that define the characteristics of a database, such as the database's organization and access method, the segments and fields in a database record, and the relationship between types of segments.

The output from this job is written to the OUTPUT file.

Procedure

1. Locate the sample JCL for this utility in the SIHCSAMP file, member IHCEDBD.
2. Specify the JCL DD statements.
   - For a list of DD statements, see “IHCUDBD DD statements” on page 168.
3. Specify the IHCUDBD command parameters.
   - For a list of IHCUDBD command parameters, see “IHCUDBD command parameters” on page 170.
Example

```
//JOBNAME JOB 00,000,CLASS=A,MSGCLASS=X
//**------------------------------------------------------------
//**     Rebuild DBD source
//**------------------------------------------------------------
//S2     EXEC PGM=IHCHALDB,
//       REGION=50M
//STEPLIB DD DISP=SHR,DSN=your.SIHCLOAD
//RECON1 DD DISP=SHR,DSN=your.SDFSRESL
//RECON2 DD DISP=SHR,DSN=your.RECON1
//RECON3 DD DISP=SHR,DSN=your.RECON2
//RECONx DD DISP=SHR,DSN=your.RECON3
//IMS DD DISP=SHR,DSN=your.DBDLIB
//TRACE DD DUMMY
//MSGPRINT DD SYSOUT=*
//OUTPUT DD SYSOUT=*
//IHCSYSIN DD *
Run PGM(IHCUDBD) -
      DBD(ddddd)            <=== specify DBD name
```

Figure 26. Sample JCL member IHCEDBD

**IHCUDBD DD statements**

DD statements are used to identify the source of input and the placement of output information.

The following table shows DD statements and record format for the **IHCUDBD** command.

<table>
<thead>
<tr>
<th>DD name</th>
<th>Use</th>

**STEPLIB**

This statement is required. The library data sets pointed to from the STEPLIB DD statement must always be APF-authorized, even if a DFSRESLB DD statement is provided. Authorized library data sets include:

- IMS HALDB Toolkit load library
- IMS utilities that are available for IMS HALDB Toolkit
- IMS RESLIB library
- Any other libraries
The libraries can appear in any order.

```plaintext
//STEPLIB DD DISP=SHR,DSN=ihcload
// DD DISP=SHR,DSN=imstools
// DD DISP=SHR,DSN=reslib
```

where:

- `ihcload` is the name of the library that contains the IMS HALDB Toolkit load modules.
- `imstools` is the optional name of the library that contains the IMS reorganization utilities load modules.
- `reslib` is the name of the library that contains the IMS load modules.

If you do not specify an IMSDALIB DD statement in the JCL, you must specify the MDALIB in the STEPLIB for dynamic allocation purposes.

**IMS**

This statement is required. The statement describes the library that contains the DBDs of the database that you are processing.

This data set must reside on DASD.

**IMSDALIB**

This statement is optional. The statement specifies a partitioned data set or data sets that contain the dynamic allocation members for the database data sets of non-HALDB and the RECON data sets.

If DBRC is active and the IMSDALIB DD statement is coded, IMSDALIB is always referred to by DBRC, and DBRC determines the data sets to be allocated for each RECON DD.

For the database data sets of non-HALDB, IMSDALIB is referred to only when the dynamic allocation for the original data sets is requested. Dynamic allocation of the database data sets is attempted in the following order:

1. Dynamic allocation members in the IMSDALIB concatenation
2. Dynamic allocation members in JOBLIB or STEPLIB concatenation

**RECONx**

These statements are optional. The statements define the database recovery control (DBRC) RECON data sets. RECON data sets dictate which databases and IMS online systems to use during the processing.

**Attention:** If you specify IMSDALIB DD dynamic allocation, do not use these RECON DD statements. If you used JCL to allocate RECON1 as a spare data set, you must restart the database.

**IHCSYSIN**

This statement is required. The statement defines a control statement or data set that contains control statements that specify the functions of IMS HALDB Toolkit.

For more information about the format of IHCSYSIN DD statements, see “IHCUDBD command parameters” on page 170.

**OUTPUT**

This statement is required. The statement defines the output data set for storing the rebuilt DBD source.

The output file can be allocated as SYSOUT=* or PDS.

**MSGPRINT**

This statement is optional. The statement defines the IMS HALDB Toolkit output data set for progress messages issued during the job. For more information, see “MSGPRINT data set” on page 279.

The data set can reside on DASD, or it can be routed through the output job. IMS HALDB Toolkit dynamically allocates this data set if you do not provide this DD statement.
TRACE
This statement is optional. The statement defines the output data set that IMS HALDB Toolkit uses to write diagnostic trace records. This data set might be required for problem diagnosis.

This data set can reside on DASD, or it can be routed through the output job. If you do not provide this DD statement, it is dynamically allocated to SYSOUT by IMS HALDB Toolkit.

SYSUDUMP
This statement is required only if a dump is requested by IBM Software Support. The statement defines a dump data set. If the IMS HALDB Toolkit detects an error and ends with a U0999 abend, this dump is not necessary. However, if any other system or user abend occurs, this data set might be required for problem diagnosis.

This data set can reside on DASD, or it can be routed through the output job.

IHCUDBD command parameters
The following table summarizes the IHCUDBD command parameters.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBD</td>
<td>Required</td>
<td>Specifies the DBD name.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Format</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>(dbdname)</td>
<td>None.</td>
</tr>
</tbody>
</table>

Creating a PSB list for selected DBDs
A program specification block (PSB) is a control block that describes databases and logical message destinations used by an application program. A PSB consists of one or more program communication blocks (PCB).

About this task
A program communication block (PCB) is an IMS control block that describes an application program’s interface to and view of an IMS database or, additionally for message processing and batch message processing programs, to the source and destinations of messages. PCBs are defined by the user during PSB generation.

The show PSB utility can be used to create a list of program specification blocks (PSB) that reference a given database, and assists in online changes by identifying which PSBs require change.

The references to both the DBDs and the PSBs reside in the application control block (ACB) library. The ACB library is used during online and database batch (DBB) region type execution of IMS.

Procedure
1. Locate the sample JCL for this utility in the SIHCSAMP file, member IHCEACBL.
2. Specify the JCL DD statements.
   For a list of DD statements, see “IHCWPSBL DD statements” on page 171.
3. Edit the list of the DBD names on the DBDLIST DD.

Results
The list of PSB names can be found in the MSGPRINT file.
**Example**

```bash
//JOBNAME JOB 0,000,CLASS=A,MSGCLASS=X
//*******************************************************
//*        SHOW PSBS FROM ACBLIB FOR SPECIFIED DBD(S)
//*******************************************************
//PSBS EXEC PGM=IHCYUTIL,
//          REGION=50M
//STEPLIB DD DISP=SHR,DSN=
//         DD DISP=SHR,DSN=
//IMS     DD DISP=SHR,DSN=
//IMSACB   DD DISP=SHR,DSN=
//TRACE    DD SYSOUT=*
//MSGPRINT DD SYSOUT=*
//SYSUDUMP DD SYSOUT=*
//IHCSYSIN DD *
RUN PGM(IHCWPSBL)
//DBDLIST  DD *
DBDNAME1 <=== specify DBD name
DBDNAME2
/*
```

**Figure 27. Sample JCL member IHCEACBL**

## IHCWPSBL DD statements

DD statements are used to identify the source of input and the placement of output information.

The following table shows DD statements and record format for the **IHCWPSBL** command.

<table>
<thead>
<tr>
<th>DD name</th>
<th>Use</th>
<th>Format</th>
<th>Need</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td>SYSUDUMP</td>
<td>Output</td>
<td>LRECL=133</td>
<td>Optional</td>
</tr>
</tbody>
</table>

**STEPLIB**

This statement is required. The library data sets pointed to from the STEPLIB DD statement must always be APF-authorized, even if a DFSRESLB DD statement is provided. Authorized library data sets include:

- IMS HALDB Toolkit load library
- IMS utilities that are available for IMS HALDB Toolkit
- IMS RESLIB library
- Any other libraries

The libraries can appear in any order.
where:

- `ihcload` is the name of the library that contains the IMS HALDB Toolkit load modules.
- `imstools` is the optional name of the library that contains the IMS reorganization utilities load modules.
- `reslib` is the name of the library that contains the IMS load modules.

If you do not specify an IMSDALIB DD statement in the JCL, you must specify the MDALIB in the STEPLIB for dynamic allocation purposes.

**IMS**

This statement is required. The statement describes the library that contains the DBDs of the database that you are processing.

This data set must reside on DASD.

**IMSAACB**

This statement is required. The statement defines the ACB library that contains the DBD that the DBDLIST DD statement specifies.

This data set must reside on DASD.

**IHCSSYSIN**

This statement is required. The statement defines a control statement or data set that contains control statements that specify the functions of IMS HALDB Toolkit.

**DBDLIST**

This statement is required. This statement defines the DBDs. To specify multiple DBDs, write one DBD name on each line.

**MSGPRINT**

This statement is optional. The statement defines the IMS HALDB Toolkit output data set for progress messages issued during the job. For more information, see “MSGPRINT data set” on page 279.

The data set can reside on DASD, or it can be routed through the output job. IMS HALDB Toolkit dynamically allocates this data set if you do not provide this DD statement.

**TRACE**

This statement is optional. The statement defines the output data set that IMS HALDB Toolkit uses to write diagnostic trace records. This data set might be required for problem diagnosis.

This data set can reside on DASD, or it can be routed through the output job. If you do not provide this DD statement, it is dynamically allocated to SYSOUT by IMS HALDB Toolkit.

**SYSUDUMP**

This statement is required only if a dump is requested by IBM Software Support. The statement defines a dump data set. If the IMS HALDB Toolkit detects an error and ends with a U0999 abend, this dump is not necessary. However, if any other system or user abend occurs, this data set might be required for problem diagnosis.

This data set can reside on DASD, or it can be routed through the output job.

---

**Creating OSAM multi-volume data sets**

This utility creates the additional VTOC records on the subsequent volumes using the secondary allocation. Overflow Sequential Access Method (OSAM) is an IMS data management access method that combines selected characteristics of BSAM and BDAM. OSAM is used by the following IMS database access methods: HIDAM and HDAM if VSAM is not used. OSAM is also used by some of the online pool management routines.
About this task

The OSAM multi-volume utility allows you to create OSAM multi-volume data sets using the ALLOCATE command in TSO/IDCAMS.

You do not need to create OSAM multi-volume data sets for z/OS Storage Management Subsystem (SMS) managed data sets. This utility is appropriate only for non-SMS data sets.

The ALLOCATE command creates the catalog entries for all specified volumes, but only builds a VTOC record on the first volume. IMS OSAM does not allow this and will abend.

Procedure

1. Locate the sample JCL for this utility in the SIHCSAMP file, member IHCEOSAM.
2. Edit the JCL as necessary.

Example

```plaintext
//JOBNAME   JOB 00,000,CLASS=A,MSGCLASS=X
//*-----------------------------------------------------------
//*           OSAM MULTI VOLUME UTILITY
//*           MAKE SURE THAT ALL VOLUMES HAVE A VTOC
//*           NOT REQUIRED WHEN SMS
//*-----------------------------------------------------------
//MVOL      EXEC PGM=IHCYOSAM
//STEPLIB    DD DISP=SHR,DSN=your.SIHCLOAD
//MSGPRINT   DD SYSOUT=*  
//SYSIN      DD *
dsn1

dsn2
```

Figure 28. Sample JCL member IHCEOSAM

Listing VIO and unit names

It is possible for an installation parameter to ask you for non-VIO (virtual I/O) unit names. This list DASD unit names utility shows all unit names that do not reflect device types (such as 3390) and marks those that are defined as VIO.

Procedure

1. Locate the sample JCL for this utility in the SIHCSAMP file, member IHCEUNIT.
2. Edit the JCL as necessary.

Results

The list of unit names can be found in the MSGPRINT file.
Example

```plaintext
//JOBNAME   JOB 0,000,CLASS=A,MSGCLASS=X
//*****************************************************
//*         LIST  DASD UNIT NAMES
//*****************************************************
//UNIT   EXEC PGM=IHCYUTIL,
//        REGION=50M
//STEPLIB   DD DISP=SHR,DSN=your.SIHCLoad
//        DD DISP=SHR,DSN=your.SDFSRESL
//TRACE   DD SYSOUT=* 
//MSGPRINT DD SYSOUT=* 
//SYSUDUMP DD SYSOUT=* 
//IHCSYSIN DD *
RUN   PGM(IHCEUNIT)
```
Part 6. HALDB without DBRC

The HALDB without DBRC feature provides the ability to perform data set name substitutions outside of DBRC. This feature is intended for use in test installations.

You can also convert non-HALDB DBDs and data sets to HALDB DBDs and data sets.

**Topic:**

- Chapter 12, “HALDB without DBRC,” on page 177
Chapter 12. HALDB without DBRC

You can use this feature to perform HALDB data set name substitutions outside of DBRC. It is intended for use in test installations. The feature can process multiple database data sets with one definition.

You can substitute HALDB data set names by using either of the following methods:

• Substituting data set names by specifying the DD statements in the JCL.
• Modifying the global table definitions by using the ISPF user interface or batch definitions.

You can also convert non-HALDB DBDs and data sets to HALDB DBDs and data sets by using the ISPF user interface.

When you use the HALDB without DBRC utility, the database is treated as if it is not registered to DBRC.

The underlying HALDB structure comes from the RECON. This RECON could be the same RECON that is used in the associated online system or the RECON for that online system in a test environment. The RECON holds the HALDB definitions, such as partition names and numbers, key ranges, and file attributes. The HALDB without DBRC utility does not update the RECON, it only refers to it to obtain the HALDB definitions.

All the functions of IMS HALDB Toolkit, except for the HALDB without DBRC function, use DBRC (DBRC=Y). In a HALDB environment without DBRC, all IMS utilities that rely on the RECON content are not usable. However, the backup and recovery utilities continue to work.

Topics:

• “Configuring HALDB for use without DBRC” on page 177
• “Substituting data set names by using JCL” on page 178
• “Substituting data set names by using ISPF or batch definitions” on page 179
• “Converting non-HALDB DBDs to HALDB DBDs” on page 193

Configuring HALDB for use without DBRC

You can configure HALDB without DBRC to perform data set name substitutions by modeling them after the DD statements that are provided in the JCL or by using the ISPF interface or batch definitions.

Before you begin

In the IMS batch JCL, the DBRC parameter in the parameter string must be set to Y to obtain the partition information from the RECON.

CAUTION:

• DSPCTR0, DFSISV10, and IHCUTIDD, which are customized modules of IMS HALDB Toolkit, must reside on a different library from the library where other IMS Tools product modules reside.
• You must not concatenate the library that contains DSPCTR0, DFSISV10, and IHCUTIDD modules to the STEPLIB statement of IMS online (DBRC region) JCL.
• Remember to back up the database as necessary. The HALDB without DBRC utility processes the database as if it is not registered to RECON and therefore no recovery point is created.

About this task

During the configuration, set the JCLALLO parameter in the IHCEDBRI member to indicate whether you want to substitute data set names by modeling them after the DD statements in the JCL or by using the ISPF user interface or batch definitions to modify the global tables.
Procedure

To substitute data set names by using the ISPF user interface or batch definitions, complete the following steps:

1. Add the DBRCNODD=YES | NO parameter to the IHCEDBRI member by choosing one of the following options:
   - To deactivate DBRC for this particular run only, add DBRCNODD=YES and specify the following DD statement: //$$DBRCNO DD DUMMY.
   - To deactivate DBRC entirely, add DBRCNODD=NO. If necessary, you can temporarily disable this bypass by specifying the following statement: //$$DBRCYY DD DUMMY.

2. Add the JCLALLO=YES | NO parameter to the IHCEDBRI member by choosing one of the following options:
   - To create rules for substituting HALDB data set names by using the ISPF or batch definitions, add JCLALLO=NO.
   - To substitute data set names by specifying JCL, add JCLALLO=YES.

3. Run SIHCSAMP member IHCEDBRI.
   The information KSDS is created, and its data set name is saved in a program.

   **CAUTION:** Make sure you create the IHCUTIDD module in a library that is different from where other IMS Tools product libraries exist.

4. Run SIHCSAMP member IHCEDBRC. IHCEDBRC generates modules DSPCRTR0 and DFSISVI0.

   **CAUTION:** Make sure you create DSPCRTR0 and DFSISVI0 modules in a library that is different from where other IMS Tools product libraries exist.

   This step re-links the DBRC module DSPCRTR0 to add the intercept module. The module can reside in the IMS RESLIB, but for testing purposes, add it to the output data set (your_output_dataset in IHCEDBRC) and not to the IMS HALDB Toolkit library.

5. Concatenate the output data sets generated by IHCEDBRI and IHCEDBRC to the STEPLIB DD. These data sets must be concatenated before IMS RESLIB.

6. For ISPF users: Copy the CLIST IHCCNOTY into your CLIST library.
   The CLIST contains the ISPF invocation. You must adjust the data set names to your names. You can change the CLIST name after you copy it into your CLIST library.

Substituting data set names by using JCL

You can substitute data set names by adding DD statements to the JCL.

**Procedure**

To substitute data set names by using JCL:

Add a DD statement for each HALDB that is used.

The following example shows the valid form for the DD statements that you add.

```
//haldbdn DD DISP=SHR, DSN=your.first.partition.A00001
```

All other partition data sets must use the same dsname prefix, `your.first.partition`. The HALDB master DBD name must be `haldbdn`. If you have a PSINDEX, each index must be specified.

**Results**

Data set names are modeled after the DD statements that you specified in the JCL.
Substituting data set names by using ISPF or batch definitions

You can create data set naming rules by using the ISPF user interface or batch update.

If you are unfamiliar with JCL or batch scripts, you can use the ISPF interface to gain an understanding of the types of rules you can create.

In this topic:

• “Substituting data set names by using the ISPF user interface” on page 180
• “Substituting data set names by using batch functions” on page 188

Global tables

The HALDB without DBRC feature includes three preinstalled global tables. You can use the ISPF interface or batch update to modify these tables to create rules for substituting HALDB data set names.

These global tables are used when special tables do not exist. Each global table has one row defined by the key "**Global." These rows cannot be deleted because they function as a fallback for row selection errors. However, these rows might be the only rows you need, and they can be modified.

The following global tables are preinstalled:

**SYSTEM table**
Each row in the SYSTEM table defines a certain system. If you need different user definitions per system, the SYSTEM table can have a user table assigned. If the global DBD table cannot be used for certain DBDs, it can have a DBD table assigned to it.

**USER table**
Each row in the USER table defines a certain user. Use it only if the global user row is not sufficient. If special definitions for that user and that DBD are required, the user row can have a DBD table attached to it.

**DBD table**
Each row in the DBD table defines a certain DBD. This row is required only if the data set name creation rule is kept at the DBD level. A DBD table can be assigned to a user, a system, or a system and a user.

Data set names

Data set names are created by modeling them after DD statements in the JCL or by using the ISPF user interface or batch update to modify table definitions that are identified by the IMS system (IMSID), the user (USERID), and the DBD.

Data set names in HALDB are specified by using the DSNPREFIX parameter in DBRC, which is limited to 37 characters.

You can use any combination of the following five elements to create the DSNPREFIX parameter:

**HLQ**
The high-level qualifier. It can contain up to 37 characters.

**SYS**
The name of the system. It can contain up to eight characters.

**USR**
The name of the user. It can contain up to eight characters. You can specify whether to use the content of the USR field, the TSO user ID, or a TSO user ID that is created by using a pattern.

**DBD**
The name of the DBD. It can contain up to eight characters.

**PART**
The name of the partition. It can contain up to seven characters.

Here is an example of the DSNPREFIX parameter:
You conduct data set substitution at the DBD level. The rule for creating data set names is the same for all partitions of the same DBD.

### Substituting data set names by using the ISPF user interface

You can use the ISPF user interface to create rules for substituting HALDB data set names.

To use the ISPF user interface, begin by opening the **IMS HALDB Toolkit** panel, as shown in the following figure.

---

**Figure 30. IMS HALDB Toolkit panel**

You can use the ISPF user interface to do the following tasks:

- “Modifying the system definition” on page 180
- “Modifying the system selection method” on page 182
- “Maintaining the RECON table” on page 183
- “Maintaining the IMSID table” on page 184
- “Specifying the level where rules are active” on page 184
- “Maintaining SYSTEMs” on page 186
- “Specifying the USER for creating data set names” on page 186
- “Maintaining USERS” on page 187

**Modifying the system definition**

You can modify the system definition to change the IMS libraries and DBD libraries.

**Procedure**

To modify the system definition, complete the following steps:

1. On the **IMS HALDB Toolkit** panel, specify option 1, System Setup.
   
   The **System Setup** panel is displayed, as shown in the following figure.
2. Specify option 1, System definition.

   The System definition panel is displayed, as shown in the following figure.

   Figure 31. System Setup panel

3. Specify 1, Specify IMS libraries.

   The Update IMS Libraries panel is displayed, as shown in the following figure. The specified IMS libraries are used as default settings and are required for specific functions.

   Figure 32. System definition panel

4. Verify or update the IMS libraries and press Enter.

   You can specify the following DD names:

   **MACLIB**
   
   Specifies the MACLIB data set. Use MACLIB2 to specify an additional macro library.

   **RESLIB**
   
   Specifies the RESLIB data set. Use RESLIB2 and RESLIB3 if you need a concatenation to the RESLIB.

   **MDALIB**
   
   Specifies the MDALIB data set. Use MDALIB2 if you have more than one MDALIB. MDALIB might hold the RECON data set that contains the HALDB layout that you will use

   The System definition panel is displayed again.

5. On the System definition panel, specify option 2, Specify DBD libraries.

   The Update DBD libraries panel is displayed, as shown in the following figure.
6. Verify or update the DBD libraries and press Enter.

   The DBD libraries contain the non-HALDB and the HALDB DBDs. To convert multiple data sets, both libraries must be available.

Results
The system definition is updated with the IMS libraries and DBD libraries that you specified.

Modifying the system selection method
You can use a system selection method other than the default setting by modifying the system selection method.

About this task
The default setting for the system selection method is IMSID. In this setting, an IMSID selects the system row. Selecting a system row assigns a key for the system table. If the system table does not have a key, the default setting is the global key. After the system row has been selected, all other table selections are made based on that table.

To use a system selection method other than IMSID, complete the following steps:

Procedure
1. On the IMS HALDB Toolkit panel, specify option 1, System Setup.
   The System Setup panel is displayed, as shown in the following figure.

   Figure 35. System Setup panel

2. Specify option 2, System selection method.
   The System Selection Method panel is displayed, as shown in the following figure.
Figure 36. **System Selection Method** panel

3. Specify one of the four following options to locate the system row in the system table.

   These options are used to define the rules for naming data sets.

   **RECON**
   
   If you select RECON, you must create a table that assigns RECON data set names to a system row by its name.

   **IMSID**
   
   If you select IMSID, you must create a matching table that assigns an IMSID to the name of a system row. If the table does not contain an assignment for the specified IMSID, the IMSID is used to locate the system row.

   **FILE**
   
   If you select FILE, you must provide a DD statement that has a record that contains the name of the system table row.

   **User exit**
   
   If you cannot use one of the other three methods, select User exit. The user exit provides the system name.

**Results**

The system selection method is updated so that the method that you selected will locate the system row and assign a key for the system table.

**What to do next**

You can maintain the RECON table and the IMSID table or specify the level where the rules are active.

**Maintaining the RECON table**

You can display, add, update, or delete a RECON.

**Procedure**

To display, add, update, or delete a RECON, complete the following steps:

1. On the **IMS HALDB Toolkit** panel, specify option 1, System Setup.

   The **System Setup** panel is displayed, as shown in the following figure.

2. Specify option 3, Maintain RECON table.

   The **System Selection by RECON data set name** panel is displayed, as shown in the following figure.
### Maintaining the IMSID table

You can display, add, update, or delete an IMSID.

**Procedure**

To display, add, update, or delete an IMSID, complete the following steps:

1. On the **IMS HALDB Toolkit** panel, specify option 1, System Setup.

   The **System Setup** panel is displayed, as shown in the following figure.

```
+----------------------------------------------+----------------------------------------------+
| Command ===>                                 | Command ===>                                 |
| System HALDB Toolkit                         | System HALDB Toolkit                         |
| Select function                              | Select function                              |
| System Setup                                 | System Setup                                 |
| 1 System definition                          | 1 System definition                          |
| 2 System selection method, current is IMSID  | 2 System selection method, current is IMSID  |
| 3 Maintain RECON table                       | 3 Maintain RECON table                       |
| 4 Maintain IMSID table                       | 4 Maintain IMSID table                       |
|                                             |                                             |
```

**Figure 39. System Setup panel**

2. Specify option 4, Maintain IMSID table.

   The **System Selection by IMSID** panel is displayed, as shown in the following figure.

```
+----------------------------------------------+----------------------------------------------+
| Command ===>                                 | Command ===>                                 |

| Select Function                              | Select Function                              |
| System Selection by IMSID                    | System Selection by IMSID                    |
| 1 Display IMSID                              | 1 Display IMSID                              |
| 2 Add new IMSID                              | 2 Add new IMSID                              |
| 3 Update IMSID                               | 3 Update IMSID                               |
| 4 Delete IMSID                               | 4 Delete IMSID                               |
|                                             |                                             |
```

**Figure 40. System Selection by IMSID panel**

3. Specify whether you want to display, add, update, or delete an IMSID.

### Specifying the level where rules are active

You can specify whether the rules for creating the DSNPREFIX parameter are active on the SYSTEM level, the USER level, or the DBD level.

**Procedure**

1. On the **IMS HALDB Toolkit** panel, select option 2, Maintain SYSTEMs.
The **SYSTEM Definition** panel is displayed, as shown in the following figure.

<table>
<thead>
<tr>
<th>Command ===&gt;</th>
<th>SYSTEM Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Select Function</strong></td>
<td>Current SYSTEM: IVP1</td>
</tr>
<tr>
<td>1  Select SYSTEM</td>
<td></td>

</tr>
</tbody>
</table>

---

**Figure 42. SYSTEM Definition of the selected SYSTEM panel**

On this panel, the SYSTEM status indicates whether the SYSTEM you selected and the dsname substitution are active.

3. Specify a Y next to the level where you want the rules for creating a data set name to be active.

You can specify the SYSTEM level, the USER level, or the DBD level. In the previous figure, the rules are active on the SYSTEM level.

In the previous figure, the rules use the HLQ and the name of the DBD to create the DSNPREFX parameter.

**Results**

The DSNPREFX parameter is created based on the rules that are specified and the level where those rules are active.
Maintaining SYSTEMs
You can select, add, update, and delete SYSTEMs.

About this task
The systems are kept in the SYSTEM table. Each row in the table represents a system. Systems are selected by searching the SYSTEM table for the name of the system. If the name of the system is not found, the global system row, which is represented by "**Global,**" is selected. All other table selections are based on the selected system.

Procedure
1. On the IMS HALDB Toolkit panel, select option 2, Maintain SYSTEMs.
   The SYSTEM Definition panel is displayed, as shown in the following figure. You are automatically connected to the SYSTEM that you previously selected.

   ![SYSTEM Definition panel](image)

   Figure 43. SYSTEM Definition panel

2. Specify the appropriate option to select, add, update, or delete a SYSTEM.

Specifying the USER for creating data set names
You can specify whether you want to use the content of the USR field, a TSO user ID, or a TSO user ID that is generated by a pattern as the USER.

Procedure
1. On the IMS HALDB Toolkit panel, select option 3, Maintain USERs.
   The USER Definition panel is displayed, as shown in the following figure.

   ![USER Definition panel](image)

   Figure 44. USER Definition panel

2. Select option 2, Display USER.
   The panel for the USER Definition of the USER that you selected is displayed, as shown in the following figure.
3. Specify a Y next to the method that you want to use to create the USER field when you build the data set name.

You can create the USER field by choosing one of the following methods:

- **Use USR field**
  The definition of the USR field.

- **Use TSO User ID**
  The current USER.

- **Create from TSO User ID using pattern**
  A user ID that is generated by a pattern.

In the previous figure, the USER field is created by using a TSO user ID that is generated by a pattern.

In the previous figure, the rule uses all five elements to create the DSNPREFX parameter.

**Maintaining USERS**
You can select, add, update, and delete USERS.

**Procedure**
To select, add, update, and delete USERS, complete the following steps:

1. On the **IMS HALDB Toolkit** panel, select option 3, Maintain USERS.

   The **USER Definition** panel is displayed, as shown in the following figure. You are automatically connected to the current user.

2. Specify the appropriate option to select, add, update, or delete a USER.
**Substituting data set names by using batch functions**

You can use batch update to create rules for substituting HALDB data set names.

In batch update, each table is identified by the NAME parameter, and the data comes from an input file that is specified by the FILE parameter. You can do the following tasks, which use the same input file:

- ADD
- DELETE
- UPDATE

The SYSTEM parameter and the USER parameter specify the association of the table rows. An asterisk in parentheses (*) defines a row as global.

The samples contain comment rows to help you align parameters. These rows begin with an asterisk and are followed by a field name. You enter data directly underneath these rows, starting at the asterisk.

The rule for constructing data set names is defined as 12345, where:

1. Identifies the high-level qualifier (HLQ).
2. Identifies the name of the system.
3. Identifies the name of the user.
4. Identifies the name of the DBD.
5. Identifies the name of the partition.

The SIHCSAMP file provides members IHCESAM1 to IHCESAM6. These sample members provide example JCL for specifying rules for creating the DSNPREFIX parameter and adding a row to each table.

<table>
<thead>
<tr>
<th>SIHCSAMP member</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IHCESAM1</td>
<td>Adds a system to the SYSTEM table. For more information, see “Adding a system to the SYSTEM table” on page 188.</td>
</tr>
<tr>
<td>IHCESAM2</td>
<td>Adds a user to the USER table of SYSTEM IVP1. For more information, see “Adding an IMS ID to the IMSID table of SYSTEM IVP1” on page 190.</td>
</tr>
<tr>
<td>IHCESAM3</td>
<td>Adds an IMS ID to the IMSID table of SYSTEM IVP1. For more information, see “Adding a row to the DBD table” on page 191.</td>
</tr>
<tr>
<td>IHCESAM4</td>
<td>Adds a row to the DBD table. For more information, see “Adding a user to the USER table of SYSTEM IVP1” on page 189.</td>
</tr>
<tr>
<td>IHCESAM5</td>
<td>Adds DD names to the DBDLIB table of SYSTEM IVP1. For more information, see “Adding DD names to the DBDLIB table of SYSTEM IVP1” on page 192.</td>
</tr>
<tr>
<td>IHCESAM6</td>
<td>Adds DD names to the IMSLIB table of SYSTEM IVP1. For more information, see “Adding DD names to the IMSLIB table of SYSTEM IVP1” on page 192.</td>
</tr>
</tbody>
</table>

**Adding a system to the SYSTEM table**

You can add a system to the SYSTEM table by modifying the member IHCESAM1 in the SIHCSAMP file.

**Procedure**

1. Locate the sample JCL in the SIHCSAMP file, member IHCESAM1.
2. Modify the following parameters:
SYSID
The ID of the system. In the example, IVP1 is the specified SYSID.

SYSNAM
The name of the system, which is used to create the data set name. In the example, IMSP is the specified SYSNAM. You can also specify IVP1.

RULE
The rules that are used to create the DSNPREFIX parameter. In the example, 14 is specified. According to these rules, the DSNPREFIX parameter is created from the HLQ and the name of the DBD.

A
Indicates whether the system is activated. In the example, Y is specified, indicating that the SYSTEM is activated. You can specify Y or N.

HLQ
The high-level qualifier that is used to create the DSNPREFIX parameter. In the example, DBSMS.CKIHC is specified as the HLQ.

DESCR
The description of the system. In the example, test is specified as the DESCR.

Example

```
SYSID  SYSNAM  RULE   A  HLQ                       DESCR
IVP1   IMSP    14      Y  DBSMS.CKIHC               test
```

Figure 47. Sample JCL for the SYSTEM table

Adding a user to the USER table of SYSTEM IVP1
You can add a user to the USER table of SYSTEM IVP1 by modifying the member IHCESAM2 in the SIHCSAMP file.

About this task
The rule for creating the user name is also used for creating the data set name, even when the data set name creation level is not on the USER level.

Procedure
1. Locate the sample JCL in the SIHCSAMP file, member IHCESAM2.
2. Modify the following parameters:

UID
The name of the user ID. TEST1 is specified as the UID.

RULE
The rules that are used to create the DSNPREFIX parameter. According to these rules, the DSNPREFIX parameter is created from the HLQ, the system, the user, the DBD, and the partition name.
The indicator that determines the content of the USER field when the data set name is created.
You can specify one of the following values:

- **R**
  Uses the USR field.

- **D**
  Uses the UID field.

- **P**
  Uses a pattern to create the portion of the user ID. P is specified as the content of the USER field.

**HLQ**
The high-level qualifier that is used to create the DSNPREFIX parameter. DBSMS.CKIHC is specified as the HLQ.

**Important:** Do not change this field if it is used at this level for creating the data set name.

**USR**
The definition of the user TEST is specified as the USR.

**Important:** Do not change this field if it is used at this level for creating the data set name.

**USER NAME**
The name of the user. TEST User is specified as the USER NAME.

**Example**

```
//S2     EXEC PGM=IHCHALDB,
//            REGION=80M,DYNAMNBR=99
//STEPLIB  DD DISP=SHR,DSN=your.SIHCLOAD
//DFSRESLB DD DISP=SHR,DSN=your.SDFSRESL
//IMSDALIB DD DISP=SHR,DSN=your.MDALIB
//IMS     DD DISP=SHR,DSN=your.DBDLIB
//TRACE   DD SYSPUT=*+
//SYSPRINT DD SYSPUT=*+
//SYSDUMP  DD SYSPUT=*+
//IHCSYSIN DD *+
//TABLE    NAME(USER) FILE(DD2) FUNCTION(ADD)  SYSTEM(IVP1)
//DD2     DD *
* *UID   *PATTERN*RULE  * *HLQ     * *USR   *USER NAME
TEST1   **** 12345   P   DBSMS.CKIHC   TEST   Test User
```

*Figure 48. Sample JCL for the USER table*

**Adding an IMS ID to the IMSID table of SYSTEM IVP1**
You can add an IMS ID to the IMSID table of SYSTEM IVP1 by modifying the member IHCESAM3 in the SIHCSAMP file.

**Procedure**
1. Locate the sample JCL in the SIHCSAMP file, member IHCESAM3.
2. Modify the following parameters:

   **IMSID**
   The name of the IMS ID. In the example, CKCK is specified as the IMSID.

   **SYSID**
   The name of the system ID. In the example, IVP1 is specified as the SYSID.
**DESCR**

The description of the IMS ID. In the example, Same IMS data sets as IVP1 is specified as the DESCR.

**Example**

```plaintext
//S2 EXEC PGM=IHCHALDB,
// REGION=80M,DYNAMNBR=99
//STEPLIB DD DISP=SHR,DSN=your.SIHCLOAD
// DFSRESLB DD DISP=SHR,DSN=your.SDFSRESL
// IMSdalib DD DISP=SHR,DSN=your.MDALIB
// IMS DD DISP=SHR,DSN=your.DBDLIB
//TRACE DD SYSOUT=*
//SYSPRINT DD SYSOUT=*
//SYSUDUMP DD SYSOUT=*
//IHCSSYSIN DD *
//TABLE NAME(IMSID) FILE(DD3) FUNCTION(ADD)
//DD3 DD *

*IMSID  *SYSID  *DESCR
CKCK  IVP1  Same IMS datasets as IVP1
```

Figure 49. Sample JCL for the IMSID table

---

**Adding a row to the DBD table**

You can add a row to the DBD table by modifying the member IHCESAM4 in the SIHCSAMP file.

**Procedure**

1. Locate the sample JCL in the SIHCSAMP file, member IHCESAM4.
2. Modify the following parameters:

   **DBD**
   
   The name of the DBD. In the example, PHD02 is specified as the DBD.

   **RULE**
   
   The rules for creating the data set name. In the example, 1234 is specified as the RULE. According to the rule for constructing data set names, the DSNPREFX parameter is created from the HLQ, the system, the user, and the name of the DBD.

   **HLQ**
   
   The name of the high-level qualifier. In the example, DBSMS.CKIHC is specified as the HLQ.

**Example**

```plaintext
//S2 EXEC PGM=IHCHALDB,
// REGION=80M,DYNAMNBR=99
//STEPLIB DD DISP=SHR,DSN=your.SIHCLOAD
// DFSRESLB DD DISP=SHR,DSN=your.SDFSRESL
// IMSdalib DD DISP=SHR,DSN=your.MDALIB
// IMS DD DISP=SHR,DSN=your.DBDLIB
//TRACE DD SYSOUT=*
//SYSPRINT DD SYSOUT=*
//SYSUDUMP DD SYSOUT=*
//IHCSSYSIN DD *
//TABLE NAME(DBD) FILE(DD3) FUNCTION(ADD) SYSTEM(*) USER(*)
//DD3 DD *

*DBD  *RULE  *HLQ
PHD02  1234  DBSMS.CKIHC
```

Figure 50. Sample JCL for the DBD table
Adding DD names to the DBDLIB table of SYSTEM IVP1
You can add DD names to the DBDLIB table of SYSTEM IVP1 by modifying the member IHCESAM5 in the SIHCSAMP file.

About this task
If you want to assign the DBDs to more than one system, repeat the TABLE command with the name of a different system. If all systems have the same DBDLIBs, assign the different SYSTEM name to the global table.

Procedure
1. Locate the sample JCL in the SIHCSAMP file, member IHCESAM5.
2. Modify the following parameter:

   **DDNAME**
   This name is fixed. You can specify DDs of the non-HALDB as DBDLIB1 to DBDLIB5. However, you must specify the DD of the HALDB DBDLIB as DBDLIBH. In the example, DBDLIB1 is specified as the DD of the non-HALDB DBDLIB, and DBDLIBH is specified as the DD of the HALDB DBDLIB.

Example

```
//S2 EXEC PGM=IHCHALDB,
   REGION=80M,DYNAMNBR=99
//STEPLIB DD DISP=SHR,DSN=your.SIHCLOAD
   DD DISP=SHR,DSN=your.SDFSRESL
//DFSRESLB DD DISP=SHR,DSN=your.SDFSRESL
//IMSDALIB DD DISP=SHR,DSN=your.MDALIB
//IMS DD DISP=SHR,DSN=your.DBDLIB
//TRACE DD SYSOUT=*
//SYSPRINT DD SYSOUT=*
//SYSUDUMP DD SYSOUT=*
//IHCSYSIN DD *
TABLE NAME(DBDLIB) FILE(DDDD) FUNCTION(ADD) SYSTEM(IVP1)
   DD *
   DDDDD 
   *DDNAME *DSN
   DBDLIB1 your.DBDLIB
   DBDLIBH your.haldb.DBDLIB
```

Figure 51. Sample JCL for the DBDLIB table

Adding DD names to the IMSLIB table of SYSTEM IVP1
You can add DD names to the IMSLIB table of SYSTEM IVP1 by modifying the member IHCESAM6 in the SIHCSAMP file.

Procedure
1. Locate the sample JCL in the SIHCSAMP file, member IHCESAM6.
2. Modify the following parameters:

   **DDNAME**
   Only the following DD names are allowed:

   **MACLIB**
   Specifies the MACLIB data set. Use MACLIB2 to specify an additional macro library for DBDGEN.

   **RESLIB**
   Specifies the RESLIB data set. Use RESLIB2 and RESLIB3 if you need a concatenation to the RESLIB.

   **MDALIB**
   Specifies the MDALIB data set. Use MDALIB2 to specify more than one MDALIB.
Example

```bash
//S2     EXEC PGM=IHCHALDB,
//          REGION=80M,DYNAMNBR=99
//STEPLIB DD DISP=SHR,DSN=your.SIHCLOAD
//         DD DISP=SHR,DSN=your.SDFSRESL
//DFSRESLB DD DISP=SHR,DSN=your.SDFSRESL
//IMSDLIB DD DISP=SHR,DSN=your.MDALIB
//IMS     DD DISP=SHR,DSN=your.DBDLIB
//TRACE   DD SYSOUT=*  
//SYSPRINT DD SYSOUT=*  
//SYSUDUMP DD SYSOUT=*  
//IHCSYSIN DD *
TABLE    NAME(IMSLIB)  FILE(DDIM) FUNCTION(ADD) SYSTEM(IVP1)
//DDIM    DD *
*DDNAME  *DSN
MACLIB    your.SDFSMAC
RESLIB    your.SDFSRESL
MDALIB    your.MDALIB
```

Figure 52. Sample JCL for the IMSLIB table

---

**Converting non-HALDB DBDs to HALDB DBDs**

You can use the ISPF user interface to convert non-HALDB DBDs to HALDB DBDs, and later convert non-HALDB data sets to HALDB data sets.

**Step 1. Converting non-HALDB DBDs to HALDB DBDs**

You must convert non-HALDB DBDs to HALDB DBDs before you can convert non-HALDB data sets to HALDB data sets.

**About this task**

To convert non-HALDB DBDs to HALDB DBDs, complete the following steps:

**Procedure**

1. On the **IMS HALDB Toolkit** panel, select option 4, Convert DBD.

   The **Update DBD libraries** panel is displayed, as shown in the following figure.

   ![Figure 53. Update DBD libraries panel](image)

2. Verify the DBD libraries or modify them, and press Enter.

   The **Update IMS libraries** panel is displayed, as shown in the following figure.
3. Verify the IMS libraries or modify them, and press Enter.

The **DBD Conversion** panel is displayed, as shown in the following figure.

4. Specify the name of the HALDB DBD that you want to convert.
5. Specify whether you want to convert from VSAM to OSAM or to a single data set.
   You can select both types of conversions, neither type of conversion, or just one type of conversion.
6. Press Enter to begin the conversion.

**Results**
The source of the specified DBD in the non-HALDB library is rebuilt in HALDB format. Then, the source is recompiled and the HALDB DBD is saved in the specified HALDB DBD library.

**What to do next**
Keep the non-HALDB DBDs and the HALDB DBDs because you will need them to convert non-HALDB data sets to HALDB data sets.

**Step 2. Converting non-HALDB data sets to HALDB data sets**
To convert non-HALDB data sets to HALDB data sets, you need data set names for the non-HALDB.

**Before you begin**
Before you convert non-HALDB data sets to HALDB data sets, you must convert non-HALDB DBDs to HALDB DBDs. Also, you must register the definitions of the converted HALDB DBDs to the RECON data sets.

**About this task**
You can load the database with an application program. However, you also must create the HALDB data sets.

**Attention:** After you convert non-HALDB data sets to HALDB data sets, do not delete the non-HALDB DBD because you might want to convert the data sets from other users later. However, conduct new testing with the new HALDB DBDLIB.

You do not need JCL for the new data sets because they are dynamically allocated.
Procedure

To convert non-HALDB data sets to HALDB data sets:

1. On the IMS HALDB Toolkit panel, select option 5 and press Enter.
   The Update IMS libraries panel is displayed, as shown in the following figure.

```
Command ==> IMS HALDB Toolkit
          Update IMS libraries
MACLIB  your.SDFSMAC
RESLIB  your.SDFSRESL
MDALIB  your.MDALIB
```

*Figure 56. Update IMS libraries panel*

2. Verify the IMS libraries or modify them, and press Enter.
   The Update DBD libraries panel is displayed, as shown in the following figure.

```
Command ==> IMS HALDB Toolkit
          Update DBD libraries
Non HALDB DBD libraries
    your.DBDLIB
HALDB DBD library
    your.haldb.DBDLIB
```

*Figure 57. Update DBD libraries panel*

3. Verify the DBD libraries or modify them, and press Enter.
   The Dataset Conversion panel is displayed, as shown in the following figure.

```
Command ==> IMS HALDB Toolkit
          Dataset Conversion
Specify DBD.......: HDO9
Non HALDB DBDLIB....: your.DBDLIB
    ...
HALDB DBDLIB.......: your.haldb.DBDLIB
```

*Figure 58. Dataset Conversion panel*

4. Specify the name of the HALDB DBD.
   The JCL that is required to transform the non-HALDB data sets to HALDB data sets is generated.

   **Important:** For the non-HALDB data sets, you must include the DD statements, including those DD statements for secondary indexes. If data sets are missing, you are prompted to specify the DD statements.
Part 7. Application support

IMS HALDB Toolkit provides functions that enable IMS batch applications to make better use of the HALDB environment.

**Topics:**
- Chapter 13, “Partition selection API,” on page 199
- Chapter 14, “Testing partition selection exits,” on page 201
- Chapter 15, “Loading logical children (PROCOPT=L),” on page 207
- Chapter 16, “Creating a DFSHALDB statement,” on page 209
- Chapter 17, “Loading a single partition,” on page 213
- Chapter 18, “Deleting a single partition,” on page 217
- Chapter 19, “Merging two databases into one HALDB,” on page 221
Chapter 13. Partition selection API

The partition selection API provides a callable interface to assign a key to a partition. This API allows applications to split their input on a partition boundary for parallel processing. The API returns the partition name and the partition number. The API does not need to run in a DL/I environment.

You can use the partition selection API with an application that processes partitions in parallel. When an application wants to process partitions in parallel, there might be a need to split the application's input on partition boundaries. However, the application does not know those boundaries, especially when those boundaries can be changed. The partition selection API resolves this problem by receiving the database root segment key and returning the partition name and number.

**Invoking the partition selection API**

The following definition specifications are required to invoke the partition selection API:

- Define HANDLE as a 4-byte binary field
- Define PARTNAME as an 8-byte character field
- Define PARTNUM as a 2-byte binary field
- Define RETCODE as a 4-byte binary field
- Define RSNCODE as a 4-byte binary field

The application must be linked as AMODE 31.

**API calls**

The following calls are appropriate for the partition selection API:

**Initial (one time) call**

CALL IHCUAPI using ("INIT",HANDLE,RETCODE,RSNCODE,dbname)

The API sets HANDLE to be used in subsequent calls.

**Selection call**

CALL IHCUAPI using ("SEL",HANDLE,RETCODE,RSNCODE,yourkey,PARTNAME,PARTNUM)

The caller provides yourkey.

The API returns PARTNAME and PARTNUM.

**Termination (last) call**

CALL IHCUAPI using ("TERM",HANDLE,RETCODE,RSNCODE)

RETCODE and RSNCODE are returned for each call.

**Return and reason codes**

Table 29. Return and reason codes

<table>
<thead>
<tr>
<th>Return code</th>

| 261         |             | Invalid TCB  
TERM call has a different TCB than INIT |
| 512-599     |             | Internal error  
Contact IBM Software Support |
The test partition selection exit utility allows testing of partition selection exits without requiring the DBD to be previously converted to HALDB.

**About this task**

Additionally, the distribution results of a partition selection exit can be tested. The DBD can currently be HALDB.

The input for this utility is an HD unload file. This file must have DFSURGU1 as the ddname.

The output of this utility is a distribution list.

**Procedure**

1. Locate the sample JCL for this utility in the SIHCSAMP file, member IHCEPSEL.
2. Specify the JCL DD statements.
   - For a list of DD statements, see “PSEXIT DD statements” on page 201.
3. Specify the PSEXIT command parameters.
   - For a list of PSEXIT command parameters, see “PSEXIT command parameters” on page 204.

**Example**

```jcl
// *------------------------------------------------------------
// *            Test partition selection exit
// *------------------------------------------------------------
/PSEXIT EXEC PGM=IHCHALDB,
  REGION=50M
//STEPLIB DD DISP=SHR,DSN=your.SIHCLOAD
// DD DISP=SHR,DSN=your.SDFSRESL
//DFSRESLB DD DISP=SHR,DSN=your.SDFSRESL
//IMS DD DISP=SHR,DSN=your.BDLIB
//RECON1 DD DISP=SHR,DSN=your.RECON1
//RECON2 DD DISP=SHR,DSN=your.RECON2
//RECON3 DD DISP=SHR,DSN=your.RECON3
//DFSURGU1 DD DISP=SHR,DSN=your.unload.file
//MSGPRINT DD SYSOUT=*                      /*     <=== partition high keys
//SYSUDUMP DD SYSOUT=*                      /*     <=== partition select
//IHCYSYSIN DD *
//PSEXIT DD(mnnn) -                         /*     <=== specify DBD
  PARTNUM(n) -                             /*     <=== no. of partitions
  KEYLEN(xx) -                             /*     <=== for IHCPSEL0
  KEYOFF(xx) -                             /*     <=== for IHCPSEL0
  PSNAME(IHCPSEL0) -                      /*     <=== partition select

**STEPLIB**
This statement is required. The library data sets pointed to from the STEPLIB DD statement must always be APF-authorized, even if a DFSRESLB DD statement is provided. Authorized library data sets include:

- IMS HALDB Toolkit load library
- IMS utilities that are available for IMS HALDB Toolkit
- IMS RESLIB library
- Any other libraries

The libraries can appear in any order.

```
//STEPLIB DD DISP=SHR,DSN=ihcload
//      DD DISP=SHR,DSN=imstools
//      DD DISP=SHR,DSN=reslib
```

where:

- **ihcload** is the name of the library that contains the IMS HALDB Toolkit load modules.
- **imstools** is the optional name of the library that contains the IMS reorganization utilities load modules.
- **reslib** is the name of the library that contains the IMS load modules.

If you do not specify an IMSDALIB DD statement in the JCL, you must specify the MDALIB in the STEPLIB for dynamic allocation purposes.

**DFSRESLB**
This statement is optional. The statement points to an authorized library that contains IMS SVC modules.

IMS HALDB Toolkit dynamically allocates this DD if you do not provide it.

**IMS**
This statement is required only if the IMS management of ACBs is not enabled. The statement describes the library that contains the DBDs of the database that you are processing.
This data set must reside on DASD.

When the IMS management of ACBs is enabled, IMS HALDB Toolkit ignores the IMS DD statement.

**IMSDALIB**
This statement is optional. The statement specifies a partitioned data set or data sets that contain the dynamic allocation members for the database data sets of non-HALDB and the RECON data sets.

If DBRC is active and the IMSDALIB DD statement is coded, IMSDALIB is always referred to by DBRC, and DBRC determines the data sets to be allocated for each RECON DD.

For the database data sets of non-HALDB, IMSDALIB is referred to only when the dynamic allocation for the original data sets is requested. Dynamic allocation of the database data sets is attempted in the following order:

1. Dynamic allocation members in the IMSDALIB concatenation
2. Dynamic allocation members in JOBLIB or STEPLIB concatenation

**PROCLIB**
This statement is optional. The statement points to the IMS.PROCLIB data set. If DFSDF(ddd) is specified in the IHCSYSIN data set, you must specify this DD statement and ensure that the DFSDFddd member exists in the IMS.PROCLIB data set.

**RECON**
These statements are optional. The statements define the database recovery control (DBRC) RECON data sets. RECON data sets dictate which databases and IMS online systems to use during the processing.

**Attention:** If you specify IMSDALIB DD dynamic allocation, do not use these RECON DD statements. If you used JCL to allocate RECON1 as a spare data set, you must restart the database.

**DFSURGU1**
This statement is required. The statement defines the DBD unload file that the DBD parameter specifies.

**IHCSYSIN**
This statement is required. The statement defines a control statement or data set that contains control statements that specify the functions of IMS HALDB Toolkit.

For more information about the format of IHCSYSIN DD statements, see “PSEXIT command parameters” on page 204.

**KEYS**
This statement is required for selection exits that require a string for partition selection. If the selection routine does not need keys or strings, use the PARTNUM parameter instead.

The statement defines the KEYS file that contains a list of keys. Use this statement with the KEYLEN and the KEYOFF parameters.

**MSGPRINT**
This statement is optional. The statement defines the IMS HALDB Toolkit output data set for progress messages issued during the job. For more information, see “MSGPRINT data set” on page 279.

The data set can reside on DASD, or it can be routed through the output job. IMS HALDB Toolkit dynamically allocates this data set if you do not provide this DD statement.

**IHCLIST**
This statement is optional. The statement defines the IMS HALDB Toolkit output data set for reports. For more information about the reports generated in this data set, see “IHCLIST data set” on page 280.

The data set can reside on DASD, or it can be routed through the output job. IMS HALDB Toolkit dynamically allocates this data set if you do not provide this DD statement.
**TRACE**
This statement is optional. The statement defines the output data set that IMS HALDB Toolkit uses to write diagnostic trace records. This data set might be required for problem diagnosis.

This data set can reside on DASD, or it can be routed through the output job. If you do not provide this DD statement, it is dynamically allocated to SYSOUT by IMS HALDB Toolkit.

**SYSUDUMP**
This statement is required only if a dump is requested by IBM Software Support. The statement defines a dump data set. If the IMS HALDB Toolkit detects an error and ends with a U0999 abend, this dump is not necessary. However, if any other system or user abend occurs, this data set might be required for problem diagnosis.

This data set can reside on DASD, or it can be routed through the output job.

---

### PSEXIT command parameters

The following table summarizes the PSEXIT command parameters.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
</table>
| DBD       | Required    | Specifies the name of the DBD to be tested. The unload file (DFSURGU1) must be for the specified DBD.  

   **Format**

   *(dbdname)*  

   **Default value**

   None. |
| DFSDF     | Optional    | Specifies the 3-character suffix of the DFSDFxxx member of the IMS PROCLIB data set that contains the settings and attributes of the IMS catalog.  

   The specified member is used when the following two conditions are met:  

   • IMS manages the ACBs (ACBMGMT=CATALOG).  

   • The IMS Catalog Definition exit routine (DFS3CDX0) is not used.  

   Ensure that the CATALOG section of the DFSDFxxx member specifies CATALOG=Y, ACBMGMT=CATALOG, and the alias name for the IMS catalog.  

   **Format**

   *(ddd)*  

   **Default value**

   None. |
| IMSID     | Optional    | IMSID must be specified when the IMS catalog is enabled by the IMS Catalog Definition exit routine and IMSID is referred to in the exit routine.  

   **Format**

   *(nnnn)*  

   **Default value**

   If omitted, the value is obtained from the current SDFSRESL(DFSVC000). |

<tbody>
<tr>
<td>PSNAME</td>
<td>Required</td>
<td>Specifies the name of the partition selection exit you have written.</td>
</tr>
</tbody>
</table>

**Format**

(exit_name)

**Default value**

None.
A logical child is a segment that has a physical parent and a logical parent.

A logical relationship allows for a different view of segments in a database by providing a new set of pointers (LP,LT,LCH). HALDB only uses the LP equivalent as an EPS pointer. The LP-EPS pointer requires the ILK of the logical parent, which is not known at that time.

HALDB does not allow loading of logical child segments because there is no WF1 work file, and the extended pointer set (EPS) of the logical parent and the paired segment are unavailable at load time.

WF1 is the work file created during reorganization reload or by a database load application.

In addition, load segments in the hierarchy below the logical child segment (variable intersection data) are not allowed.

IMS HALDB Toolkit improves this situation by allowing these load segments with the following restrictions:

- The logical child segment must contain the LPCK in the IO area.
- The application will receive a BB status code.
  The segments (1 child and dependents) are inserted later.
- JCL is structured as follows:
  - Step 1 is the load program. File DFSURWF1 is used to store the delayed segments.
  - Step 2 is prefix update. This step inserts all delayed segments. All WF1 data sets created by step 1 must be included in the DFSURWF3 file.
- You must change your JCL as follows:
  - Use IHCWRC00 instead of DFSRRC00 to accommodate steps 1 and 2
  - Include the SIHCLOAD target load library in the STEPLIB

At the end of the load (prefix update), all databases are labeled IC needed unless they are defined as NONRECOV.
Chapter 16. Creating a DFSHALDB statement

The DFSHALDB create utility provides dynamic management of the DFSHALDB statement by providing a key for the starting partition and a key for the ending partition.

About this task

Batch applications can process a subset of a HALDB. To accomplish this task, the applications must specify a DFSHALDB DD statement and a parameter statement that specifies the program communication block (PCB), the starting partition, and the number of consecutive partitions.

When the partition structure changes, this statement must be modified. The DFSHALDB create utility makes this change obsolete.

When you specify a key range, the utility transforms the key range into a starting and ending partition. Therefore the application does not require a change when partitions are split or consolidated.

This utility runs as an additional step in front of the specified application.

Procedure

1. Locate the sample JCL for this utility in the SIHCSAMP file, member IHCEDFSH.
2. Specify the JCL DD statements.
   For a list of DD statements, see “IHCUDFSH DD statements” on page 210.
3. Specify the IHCUDFSH command parameters.
   For a list of IHCUDFSH command parameters, see “IHCUDFSH command parameters” on page 212.
   You must specify the DBD and the PCB to be used in the RUN command.

Example

```hll
//----------------------------------------------------------
//*            Create a DFSHALDB statement from keys.       *
//*            The file (DFSHALDB) must be used in          *
//*            the subsequent IMS step.                     *
//*----------------------------------------------------------
//S2     EXEC PGM=IHCHALDB,                                  /*
//            REGION=80M                                   /*
//STEPLIB DD DISP=SHR, DSN=your.SIHCLOAD                   /*
//            DD DISP=SHR, DSN=your.SDFSRESL               /*
//RECON1 DD DISP=SHR, DSN=your.RECON1                      /*
//RECON2 DD DISP=SHR, DSN=your.RECON2                      /*
//RECON3 DD DISP=SHR, DSN=your.RECON3                      /*
//IMS DD DISP=SHR, DSN=your.DBDLIB                         /*
//TRACE DD SYSOUT=*                                       /*
//SYSABEND DD SYSOUT=*                                     /*
//MSGPRINT DD SYSOUT=*                                     /*
//IHCSYSIN DD *                                            /*
//RUN       PGM(IHCUDFSH) -                                  /*
//            DDB(nnnnn) -                                 /*
//            PCB(2)                                       /*
//            DDB *                                       /*
//KEYS 08001800                                           /*
//            DD *                                       /*
//DFSHALDB DD DISP=(,PASS),UNIT=SYSDA,SPACE=(TRK,1),      /*
//            DSN=&&DFSHAL                                 /*
```

</tbody>
</table>

**STEPLIB**
This statement is required. The library data sets pointed to from the STEPLIB DD statement must always be APF-authorized, even if a DFSRESLIB DD statement is provided. Authorized library data sets include:
- IMS HALDB Toolkit load library
- IMS utilities that are available for IMS HALDB Toolkit
- IMS RESLIB library
- Any other libraries
The libraries can appear in any order.

```
//STEPLIB DD DISP=SHR,DSN=ihcload
// DD DISP=SHR,DSN=imstools
// DD DISP=SHR,DSN=reslib
```

where:
- *ihcload* is the name of the library that contains the IMS HALDB Toolkit load modules.
- *imstools* is the optional name of the library that contains the IMS reorganization utilities load modules.
- *reslib* is the name of the library that contains the IMS load modules.
If you do not specify an IMSDALIB DD statement in the JCL, you must specify the MDALIB in the STEPLIB for dynamic allocation purposes.

**IMS**
This statement is required only if the IMS management of ACBs is not enabled. The statement describes the library that contains the DBDs of the database that you are processing.
This data set must reside on DASD.
When the IMS management of ACBs is enabled, IMS HALDB Toolkit ignores the IMS DD statement.
IMSDALIB
This statement is optional. The statement specifies a partitioned data set or data sets that contain the dynamic allocation members for the database data sets of non-HALDB and the RECON data sets.

If DBRC is active and the IMSDALIB DD statement is coded, IMSDALIB is always referred to by DBRC, and DBRC determines the data sets to be allocated for each RECON DD.

For the database data sets of non-HALDB, IMSDALIB is referred to only when the dynamic allocation for the original data sets is requested. Dynamic allocation of the database data sets is attempted in the following order:

1. Dynamic allocation members in the IMSDALIB concatenation
2. Dynamic allocation members in JOBLIB or STEPLIB concatenation

PROCLIB
This statement is optional. The statement points to the IMS.PROCLIB data set. If DFSDF(ddd) is specified in the IHCSYSIN data set, you must specify this DD statement and ensure that the DFSDFddd member exists in the IMS.PROCLIB data set.

RECON
These statements are optional. The statements define the database recovery control (DBRC) RECON data sets. RECON data sets dictate which databases and IMS online systems to use during the processing.

Attention: If you specify IMSDALIB DD dynamic allocation, do not use these RECON DD statements. If you used JCL to allocate RECON1 as a spare data set, you must restart the database.

IHCSYSIN
This statement is required. The statement defines a control statement or data set that contains control statements that specify the functions of IMS HALDB Toolkit.

For more information about the format of IHCSYSIN DD statements, see “IHCUDFSH command parameters” on page 212.

KEYS
This statement is required. The statement specifies the low and the high key. The utility refers to the key range and transforms the key range into a starting and ending partition.

DFSHALDB
This statement is required. The statement defines a file to be used in a subsequent step.

Specify the following line:

```
//DFSHALDB DD DSN=&&HAL,DISP=(OLD,DELETE)
```

MSGPRINT
This statement is optional. The statement defines the IMS HALDB Toolkit output data set for progress messages issued during the job. For more information, see “MSGPRINT data set” on page 279.

The data set can reside on DASD, or it can be routed through the output job. IMS HALDB Toolkit dynamically allocates this data set if you do not provide this DD statement.

TRACE
This statement is optional. The statement defines the output data set that IMS HALDB Toolkit uses to write diagnostic trace records. This data set might be required for problem diagnosis.

This data set can reside on DASD, or it can be routed through the output job. If you do not provide this DD statement, it is dynamically allocated to SYSOUT by IMS HALDB Toolkit.

SYSUDUMP
This statement is required only if a dump is requested by IBM Software Support. The statement defines a dump data set. If the IMS HALDB Toolkit detects an error and ends with a U0999 abend, this dump is not necessary. However, if any other system or user abend occurs, this data set might be required for problem diagnosis.
This data set can reside on DASD, or it can be routed through the output job.

### IHCUDFSH command parameters

The following table summarizes the IHCUDFSH command parameters.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
</table>
| DBD       | Required    | Defines the DBD.  
Format (dbdname)  
Default value None. |
| DFSDF     | Optional    | Specifies the 3-character suffix of the DFSDFxxx member of the IMS PROCLIB data set that contains the settings and attributes of the IMS catalog.  
The specified member is used when the following two conditions are met:  
• IMS manages the ACBs (ACBMGMT=CATALOG).  
• The IMS Catalog Definition exit routine (DFS3CDX0) is not used.  
Ensure that the CATALOG section of the DFSDFxxx member specifies CATALOG=Y, ACBMGMT=CATALOG, and the alias name for the IMS catalog.  
Format (ddd)  
Default value None. |
| IMSID     | Optional    | IMSID must be specified when the IMS catalog is enabled by the IMS Catalog Definition exit routine and IMSID is referred to in the exit routine.  
Format (nnnn)  
Default value  
If omitted, the value is obtained from the current SDFSRESL(DFSVC000). |
| PCB       | Required    | Defines the PCB number.  
Format (pcb_number)  
Default value None. |
Chapter 17. Loading a single partition

Databases with secondary indexes must insert the secondary indexes in random sequence when loading.

About this task
You can improve performance (elapsed time) when loading partitions that contain secondary indexes by using the load a single partition utility. The utility delays the insertion of secondary indexes until the end of the load process, at which point it sorts the indexes and loads the indexes sequentially.

Procedure
1. Locate the sample JCL for this utility in the SIHCSAMP file, member IHCELOAD.
2. Specify the JCL DD statements.
   For a list of DD statements, see “HALDBLOAD DD statements” on page 213.
3. Specify the HALDBLOAD command parameters.
   For a list of HALDBLOAD command parameters, see “HALDBLOAD command parameters” on page 215.

Example

```
//JOBNAME JOB 00,000,CLASS=A,MSGCLASS=X
//------------------------------------------------------------
//*                                     LOAD a single partition
//*------------------------------------------------------------
//DROP EXEC PGM=IHCHALDB,
//      REGION=60M
//STEPLIB DD DISP=SHR,DSN=your.SIHCLOAD
//         DD DISP=SHR,DSN=your.SDFSRESL
//RECON1 DD DISP=SHR,DSN=your.RECON1
//RECON2 DD DISP=SHR,DSN=your.RECON2
//RECON3 DD DISP=SHR,DSN=your.RECON3
//DFSRESLB DD DISP=SHR,DSN=your.SDFSRESL
//IMS DD DISP=SHR,DSN=your.DBDLIB
//MSGPRINT DD SYSOUT=*                  
//SYSUDUMP DD SYSOUT=*                
//IHCSYSIN DD *          
//HALDBLOAD DBD(dbdname) PARTITION(partname) -
//    PSB(psbname) -
//    PCB(1) -
//    PGM(pgmname)
/*
```

**STEPLIB**

This statement is required. The library data sets pointed to from the STEPLIB DD statement must always be APF-authorized, even if a DFSRESLB DD statement is provided. Authorized library data sets include:

- IMS HALDB Toolkit load library
- IMS utilities that are available for IMS HALDB Toolkit
- IMS RESLIB library
- Any other libraries

The libraries can appear in any order.

```
//STEPLIB DD DISP=SHR,DSN=ihcload
//        DD DISP=SHR,DSN=imstools
//        DD DISP=SHR,DSN=reslib
```

where:

- `ihcload` is the name of the library that contains the IMS HALDB Toolkit load modules.
- `imstools` is the optional name of the library that contains the IMS reorganization utilities load modules.
- `reslib` is the name of the library that contains the IMS load modules.

If you do not specify an IMSDALIB DD statement in the JCL, you must specify the MDALIB in the STEPLIB for dynamic allocation purposes.

**DFSRESLB**

This statement is optional. The statement points to an authorized library that contains IMS SVC modules.

IMS HALDB Toolkit dynamically allocates this DD if you do not provide it.

**IMS**

This statement is required. The statement describes the library that contains the DBDs of the database that you are processing.

This data set must reside on DASD.

**IMSDALIB**

This statement is optional. The statement specifies a partitioned data set or data sets that contain the dynamic allocation members for the database data sets of non-HALDB and the RECON data sets.

If DBRC is active and the IMSDALIB DD statement is coded, IMSDALIB is always referred to by DBRC, and DBRC determines the data sets to be allocated for each RECON DD.
For the database data sets of non-HALDB, IMSDALIB is referred to only when the dynamic allocation for the original data sets is requested. Dynamic allocation of the database data sets is attempted in the following order:

1. Dynamic allocation members in the IMSDALIB concatenation
2. Dynamic allocation members in JOBLIB or STEPLIB concatenation

**RECON**
These statements are optional. The statements define the database recovery control (DBRC) RECON data sets. RECON data sets dictate which databases and IMS online systems to use during the processing.

**Attention:** If you specify IMSDALIB DD dynamic allocation, do not use these RECON DD statements. If you used JCL to allocate RECON1 as a spare data set, you must restart the database.

**PGMLIB**
This statement is optional. The statement defines the APF-authorized application program. You can use either STEPLIB or PGMLIB to specify the application program.

**IHCSYSIN**
This statement is required. The statement defines a control statement or data set that contains control statements that specify the functions of IMS HALDB Toolkit.

For more information about the format of IHCSYSIN DD statements, see “HALDBLOAD command parameters” on page 215.

**MSGPRINT**
This statement is optional. The statement defines the IMS HALDB Toolkit output data set for progress messages issued during the job. For more information, see “MSGPRINT data set” on page 279.

The data set can reside on DASD, or it can be routed through the output job. IMS HALDB Toolkit dynamically allocates this data set if you do not provide this DD statement.

**TRACE**
This statement is optional. The statement defines the output data set that IMS HALDB Toolkit uses to write diagnostic trace records. This data set might be required for problem diagnosis.

This data set can reside on DASD, or it can be routed through the output job. If you do not provide this DD statement, it is dynamically allocated to SYSOUT by IMS HALDB Toolkit.

**SYSUDUMP**
This statement is required only if a dump is requested by IBM Software Support. The statement defines a dump data set. If the IMS HALDB Toolkit detects an error and ends with a U0999 abend, this dump is not necessary. However, if any other system or user abend occurs, this data set might be required for problem diagnosis.

This data set can reside on DASD, or it can be routed through the output job.

### Table 35. HALDBLOAD command parameters (continued)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
</table>
| PARTITION | Required | Specifies the partition name to be loaded.  
*Format*  
(partname)  
*Default value*  
None. |
| PCB | Optional | Specifies the PCB. You can specify a PCB name, or a PCB number as specified in the PSB.  
*Format*  
(pcbname | nnn)  
*Default value*  
If omitted, the default is to use the first PCB for the DBD with PROCOPT=L |
| PGM | Required | Specifies the program name to load the partition.  
*Format*  
(pgmname)  
*Default value*  
None. |
| PSB | Required | Specifies the name of the PSB to be used to load the partition.  
*Format*  
(psbname)  
*Default value*  
None. |
Chapter 18. Deleting a single partition

The drop partition utility provides an alternative approach for correcting a pointer error after a single database partition is deleted.

About this task
When a single partition is deleted, all secondary indexes for the primary database are invalid. The indexes now contain records for non-existent segments. This condition is known as a pointer error. The secondary indexes must be corrected. You can correct the indexes by rebuilding the indexes using an index builder tool (such as IMS Index Builder).

You could alternatively remove those index records that point to the deleted partition. The drop partition utility provides this solution. This process is recoverable and fast and might be more efficient than rebuilding the indexes.

Alternatively, you can create the JCL by using the ISPF user interface.

Procedure
1. Locate the sample JCL for this utility in the SIHCSAMP file, member IHCEDROP.
2. Specify the JCL DD statements.
   For a list of DD statements, see “REORGIND DD statements” on page 217.
3. Specify the REORGIND command parameters.
   For a list of REORGIND command parameters, see “REORGIND command parameters” on page 220.

Example

```
//JOBNAME JOB 00,000,CLASS=A,MSGCLASS=X
//**************************************************************
//        Drop partition                                     
//**************************************************************
//DROP EXEC PGM=IHCHALDB,                                          
//    REGION=60M                                                  
//STEPLIB DD DISP=SHR,DSN=your.SIHCLOAD                        
//RECON1 DD DISP=SHR,DSN=your.RECON1                            
//RECON2 DD DISP=SHR,DSN=your.RECON2                            
//RECON3 DD DISP=SHR,DSN=your.RECON3                            
//DFSRESLB DD DISP=SHR,DSN=your.DDFSRESL                        
//IMS DD DISP=SHR,DSN=your.DBDLIB                               
//MSGPRINT DD SYSOUT=*                                          
//SYSDUMP DD SYSOUT=*                                           
//IHCSYSIN DD *                                                 
//REORGIND DBD(PHDO2) DROP(PHDO22) *                           
/*
```

**STEPLIB**

This statement is required. The library data sets pointed to from the STEPLIB DD statement must always be APF-authorized, even if a DFSRESLB DD statement is provided. Authorized library data sets include:

- IMS HALDB Toolkit load library
- IMS utilities that are available for IMS HALDB Toolkit
- IMS RESLIB library
- Any other libraries

The libraries can appear in any order.

```plaintext
//STEPLIB DD DISP=SHR,DSN=ihcload
//        DD DISP=SHR,DSN=imstools
//        DD DISP=SHR,DSN=reslib
```

where:

- `ihcload` is the name of the library that contains the IMS HALDB Toolkit load modules.
- `imstools` is the optional name of the library that contains the IMS reorganization utilities load modules.
- `reslib` is the name of the library that contains the IMS load modules.

If you do not specify an IMSDALIB DD statement in the JCL, you must specify the MDALIB in the STEPLIB for dynamic allocation purposes.

**DFSRESLB**

This statement is optional. The statement points to an authorized library that contains IMS SVC modules.

IMS HALDB Toolkit dynamically allocates this DD if you do not provide it.

**IMS**

This statement is required only if the IMS management of ACBs is not enabled. The statement describes the library that contains the DBDs of the database that you are processing.

This data set must reside on DASD.

When the IMS management of ACBs is enabled, IMS HALDB Toolkit ignores the IMS DD statement.
IMSDLIB
This statement is optional. The statement specifies a partitioned data set or data sets that contain the dynamic allocation members for the database data sets of non-HALDB and the RECON data sets.

If DBRC is active and the IMSDALIB DD statement is coded, IMSDALIB is always referred to by DBRC, and DBRC determines the data sets to be allocated for each RECON DD.

For the database data sets of non-HALDB, IMSDALIB is referred to only when the dynamic allocation for the original data sets is requested. Dynamic allocation of the database data sets is attempted in the following order:

1. Dynamic allocation members in the IMSDALIB concatenation
2. Dynamic allocation members in JOBLIB or STEPLIB concatenation

PROCLIB
This statement is optional. The statement points to the IMS.PROCLIB data set. If DFSDF(ddd) is specified in the IHCSYSIN data set, you must specify this DD statement and ensure that the DFSDFsddd member exists in the IMS.PROCLIB data set.

RECON
These statements are optional. The statements define the database recovery control (DBRC) RECON data sets. RECON data sets dictate which databases and IMS online systems to use during the processing.

Attention: If you specify IMSDALIB DD dynamic allocation, do not use these RECON DD statements. If you used JCL to allocate RECON1 as a spare data set, you must restart the database.

IHCSYSIN
This statement is required. The statement defines a control statement or data set that contains control statements that specify the functions of IMS HALDB Toolkit.

For more information about the format of IHCSYSIN DD statements, see “REORGIND command parameters” on page 220.

SYSPRINT
This statement is optional. The statement defines the statistics output data set and output from other utilities that are executed under the control of IMS HALDB Toolkit.

The data set can reside on DASD, or it can be routed through the output job. IMS HALDB Toolkit dynamically allocates this data set if you do not provide it.

MSGPRINT
This statement is optional. The statement defines the IMS HALDB Toolkit output data set for progress messages issued during the job. For more information, see “MSGPRINT data set” on page 279.

The data set can reside on DASD, or it can be routed through the output job. IMS HALDB Toolkit dynamically allocates this data set if you do not provide this DD statement.

TRACE
This statement is optional. The statement defines the output data set that IMS HALDB Toolkit uses to write diagnostic trace records. This data set might be required for problem diagnosis.

This data set can reside on DASD, or it can be routed through the output job. If you do not provide this DD statement, it is dynamically allocated to SYSOUT by IMS HALDB Toolkit.

SYSUDUMP
This statement is required only if a dump is requested by IBM Software Support. The statement defines a dump data set. If the IMS HALDB Toolkit detects an error and ends with a U0999 abend, this dump is not necessary. However, if any other system or user abend occurs, this data set might be required for problem diagnosis.

This data set can reside on DASD, or it can be routed through the output job.
# REORGIND command parameters

The following table summarizes the REORGIND command parameters.

## Table 37. REORGIND command parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBD</td>
<td>Required</td>
<td>Specifies the master DBD name.</td>
</tr>
</tbody>
</table>
|           |             | Format:
|           |             | (dbdname) |
|           |             | Default value:
|           |             | None. |
| DFSDF     | Optional    | Specifies the 3-character suffix of the DFSDFxxx member of the IMS PROCLIB data set that contains the settings and attributes of the IMS catalog.  |
|           |             | The specified member is used when the following two conditions are met:  |
|           |             | • IMS manages the ACBs (ACBMGMT=CATALOG).  |
|           |             | • The IMS Catalog Definition exit routine (DFS3CDX0) is not used.  |
|           |             | Ensure that the CATALOG section of the DFSDFxxx member specifies CATALOG=Y, ACBMGMT=CATALOG, and the alias name for the IMS catalog.  |
|           |             | Format:
|           |             | (ddd) |
|           |             | Default value:
|           |             | None. |
| DROP      | Required    | Specifies the name of the partition to be removed.  |
|           |             | Format:
|           |             | (partname) |
|           |             | Default value:
|           |             | None. |
| IMSID     | Optional    | IMSID must be specified when the IMS catalog is enabled by the IMS Catalog Definition exit routine and IMSID is referred to in the exit routine.  |
|           |             | Format:
|           |             | (nnnn) |
|           |             | Default value:
|           |             | If omitted, the value is obtained from the current SDFSRESL(DFSVC000). |
Chapter 19. Merging two databases into one HALDB

The merge DBD utility allows you to merge identical HALDBs, or combine user-partitioned databases into one multi-partitioned HALDB.

About this task

The following requirements for this utility and task apply:

• Both DBDs must currently be HALDB
• No secondary index is allowed
• No logical relationships are allowed
• Both DBDs must be identical
  
If compression is used, the compression exit must support both DBDs.
• If you use your own partition selection exit, ensure that it is supported by IMS HALDB Toolkit, or use the supplied exit, IHCPSELO
  
The partition string is copied to the target ("to") DBD.
• DBDs must use high keys that reflect their data
  
IMS HALDB Toolkit must be able to merge the partition definition into one DBD without changing defined high keys.

IMS HALDB Toolkit verifies that key ranges do not conflict. If they conflict, the merge process stops. However, because the merge is performed using temporary RECONs, the database will not have been changed. During post-processing, the DBRC is updated. The source ("from") DBD is deleted, and its partitions become part of the target DBD.

You must perform an image copy of the new partitions while the source DBD is offline, unless the source partitions are to be added to the end of the target DBD. In that case, the source DBD might be kept online.

When user partitioning (multiple identical databases on different key ranges) has been used, the conversion first transforms the databases to HALDB, and then merges them together using this process.

This task is necessary when you require secondary indexing that was not possible when using multiple databases.

Procedure

1. Locate the sample JCL for this utility in the SIHCSAMP file, member IHCEMERG.
2. Specify the JCL DD statements.
   
   For a list of DD statements, see “HALDBCOPY DD statements” on page 222.
3. Specify the HALDBCOPY command parameters.
   
   For a list of HALDBCOPY command parameters, see “HALDBCOPY command parameters” on page 224.

Example

The following example shows the JCL for merging user-partitioned HALDBs into one HALDB.
HALDBCOPY DD statements

DD statements are used to identify the source of input and the placement of output information.

The following table shows DD statements and record format for the HALDBCOPY command.

**STEPLIB**

This statement is required. The library data sets pointed to from the STEPLIB DD statement must always be APF-authorized, even if a DFSRESLB DD statement is provided. Authorized library data sets include:

- IMS HALDB Toolkit load library
- IMS utilities that are available for IMS HALDB Toolkit
- IMS RESLIB library
- Any other libraries

The libraries can appear in any order.
where:

- `ihcload` is the name of the library that contains the IMS HALDB Toolkit load modules.
- `imstools` is the optional name of the library that contains the IMS reorganization utilities load modules.
- `reslib` is the name of the library that contains the IMS load modules.

If you do not specify an IMSDALIB DD statement in the JCL, you must specify the MDALIB in the STEPLIB for dynamic allocation purposes.

**DFSRESLB**
This statement is optional. The statement points to an authorized library that contains IMS SVC modules.

IMS HALDB Toolkit dynamically allocates this DD if you do not provide it.

**IMS**
This statement is required only if the IMS management of ACBs is not enabled. The statement describes the library that contains the DBDs of the database that you are processing.

This data set must reside on DASD.

When the IMS management of ACBs is enabled, IMS HALDB Toolkit ignores the IMS DD statement.

**IMSDALIB**
This statement is optional. The statement specifies a partitioned data set or data sets that contain the dynamic allocation members for the database data sets of non-HALDB and the RECON data sets.

If DBRC is active and the IMSDALIB DD statement is coded, IMSDALIB is always referred to by DBRC, and DBRC determines the data sets to be allocated for each RECON DD.

For the database data sets of non-HALDB, IMSDALIB is referred to only when the dynamic allocation for the original data sets is requested. Dynamic allocation of the database data sets is attempted in the following order:

1. Dynamic allocation members in the IMSDALIB concatenation
2. Dynamic allocation members in JOBLIB or STEPLIB concatenation

**PROCLIB**
This statement is optional. The statement points to the IMS.PROCLIB data set. If DFSDF(ddd) is specified in the IHCSYSIN data set, you must specify this DD statement and ensure that the DFSDF(ddd) member exists in the IMS.PROCLIB data set.

**RECONx**
These statements are optional. The statements define the database recovery control (DBRC) RECON data sets. RECON data sets dictate which databases and IMS online systems to use during the processing.

**Attention:** If you specify IMSDALIB DD dynamic allocation, do not use these RECON DD statements. If you used JCL to allocate RECON1 as a spare data set, you must restart the database.

**IHCSYSIN**
This statement is required. The statement defines a control statement or data set that contains control statements that specify the functions of IMS HALDB Toolkit.

For more information about the format of IHCSYSIN DD statements, see “HALDBCOPY command parameters” on page 224.

**SYSPRINT**
This statement is optional. The statement defines the statistics output data set and output from other utilities that are executed under the control of IMS HALDB Toolkit.
The data set can reside on DASD, or it can be routed through the output job. IMS HALDB Toolkit dynamically allocates this data set if you do not provide it.

**MSGPRINT**
This statement is optional. The statement defines the IMS HALDB Toolkit output data set for progress messages issued during the job. For more information, see “MSGPRINT data set” on page 279.

The data set can reside on DASD, or it can be routed through the output job. IMS HALDB Toolkit dynamically allocates this data set if you do not provide this DD statement.

**TRACE**
This statement is optional. The statement defines the output data set that IMS HALDB Toolkit uses to write diagnostic trace records. This data set might be required for problem diagnosis.

This data set can reside on DASD, or it can be routed through the output job. If you do not provide this DD statement, it is dynamically allocated to SYSOUT by IMS HALDB Toolkit.

**SYSUDUMP**
This statement is required only if a dump is requested by IBM Software Support. The statement defines a dump data set. If the IMS HALDB Toolkit detects an error and ends with a U0999 abend, this dump is not necessary. However, if any other system or user abend occurs, this data set might be required for problem diagnosis.

This data set can reside on DASD, or it can be routed through the output job.

### HALDBCOPY command parameters

• Chapter 26, “Using ISPF DBRC support functions,” on page 271
Chapter 20. Setting up the environment for the ISPF user interface

The JCL for many of the IMS HALDB Toolkit utilities can be created using the ISPF user interface.

Topics:
- “Starting the ISPF user interface” on page 229
- “Creating an IMS environment” on page 230
- “Creating projects” on page 238
- “Deleting an environment” on page 240

Starting the ISPF user interface

You can use the CLIST to start the ISPF user interface.

Before you begin

Before you run IMS HALDB Toolkit as an ISPF application, you must perform a one-time setup task. Ensure that the steps in the topic "Setting up the ISPF interface for IMS HALDB Toolkit" in the IMS Database Utility Solution: Overview and Customization have been completed.

Procedure

- Issue the following command to start the ISPF user interface:

  ```
  ex 'your.CLIST(IHCCHAL)'
  ```

The IMS HALDB Toolkit main menu panel is displayed:

```
------------------------------ IMS HALDB Toolkit -----------------------------
Command ===>
_  Select Function                    Current Settings
     Environment: Version: IMS 14 Tool 1100
 0  Setup Utilities
 1  Add-Delete-Change Environment
 2  Select an Environment
 3  Projects in Progress
 4  Convert from Full Function to HALDB
 5  Convert entire DBD library to HALDB
 6  Split or Consolidate HALDB Partitions
 7  Database Utilities
 8  Other Utilities
 9  DBRC for HALDB
```

*Figure 64. Main menu panel*
Creating an IMS environment

You create an IMS environment to keep conversion projects and definitions for different IMS systems in one place. Help is available for each panel.

About this task

An IMS environment consists of library definitions such as RESLIB, DBDLIB, MDALIB and, perhaps, RECON. Projects are connected to an environment.

Environments typically have names such as TEST or PROD. There is no limit to the number of environments you can create. An environment must be completely defined before it can be used by a project.

Databases can belong to multiple IMS systems. However, only one RECON should represent a database.

Parameters and data sets are uniquely defined for each IMS environment, and most parameters can have an ask-me-later setting. This setting allows you to delay a decision until it is needed and applicable.

Procedure

1. Start the ISPF user interface.

   The IMS HALDB Toolkit main menu is displayed.

   Figure 65. Main menu panel

2. Select option 1 from the Main Menu and press Enter.

   The Environment Maintenance panel is displayed.

   Figure 66. Environment Maintenance panel
3. To add a new environment, select option 2 from the Environment Maintenance panel and press Enter.

The Define a New Environment panel is displayed:

```
------------------------------------------- IMS HALDB Toolkit -------------------------------------------
Command ===> Define a new Environment
Environment Name: PROD
Description: Production IMS
```

*Figure 67. Define a New Environment panel*

4. Enter an environment name and a description that provides useful information. Press Enter.

The Project Definition Settings panel is displayed.

You can now define project-related definitions that are specific to the environment.

```
------------------------------------------- IMS HALDB Toolkit -------------------------------------------
Command ===> Project Definition Settings
Project Method: 2 1 Partitioning evaluation separate
                2 Partitioning evaluation during UNLOAD
JCL Generation: 1 1 Single JOBs for each phase
                2 One multi-step JOB (after evaluation)
Delete old Database: 1 1 No
                     2 Yes, before allocation of new
                     3 Yes, after reload
                     4 Yes, at the end of the project
```

*Figure 68. Project Definition Settings panel*

5. On this panel make the following specifications:

- Whether to perform partitioning evaluation separately or during the unload process
- How you would prefer JCL to be generated (as a single JOB for each phase or as one multi-step JOB)
- Whether you would like the data sets of the database that is being converted, to be deleted. If the data sets are to be deleted, specify at which stage the deletion occurs.

When you have finished specifying all of the panel information, press Enter.

The Data sets panel is displayed.
6. From the **Data Sets** panel, specify the data sets to use when generating the JCL.

If the RECONs are not located in either the RESLIB or MDALIB data sets, you can specify them explicitly with option 4. Otherwise, the **Specify RECON Data set names** panel is skipped.

7. If you selected option 4 to specify RECON data sets, the **Specify RECON Data Set Names** panel is displayed.

8. Specify the RECON data set names to use and press **Enter**.

The **DBD Libraries** panel is displayed.

9. Specify the DBD load libraries to use and press **Enter**.

The **DBD Conversion Rules** panel is displayed.
10. Specify the conversion rules to use, and press Enter.

The **Save Source Statements** panel is displayed.
Press the HELP key for explanation of items on the panel.

11. Specify where you would like to save the generated DBD source and the IDCAMS source statements, and press Enter.

The **Primary DBD Partitioning Rules** panel is displayed.
Figure 74. **Primary DBD Partitioning Rules** panel

12. Specify conversion rules for the primary DBD, and press **Enter**.

The **PSINDEX Definition Rules** panel is displayed.

---

**PSINDEX Definition Rules**

- **Partitions**: 2
  - 1 Fixed Number of Partitions
  - 2 Fixed Partition Size (MB)
  - 3 Ask during Conversion
  - 4 Specify High Keys

- **PDB Conversion**: 2
  - 1 Use existing Keys or Partitions
  - 2 Create new Partition boundaries
  - 3 Ask during Conversion

- **Additional Partitioning Layouts to be created?**
  - 1 Yes
  - 2 No, use the one created during Collect

- **Combine Database records**: 5000 (number of database records)

---

Figure 75. **PSINDEX Definition Rules** panel

13. Specify the conversion rules for secondary index DBDs, and press **Enter**.

The **Partition Naming Rules** panel is displayed.
Figure 76. **Partition Naming Rules panel**

14. Specify the naming rules for partition names and partition data set names, and press **Enter**.

The **Space Allocation Rules for PHDAM and PHIDAM** panel is displayed.

Figure 77. **Space Allocation Rules for PHDAM and PHIDAM panel**

15. Specify space allocation rules for both PHDAM and PHIDAM, and press **Enter**.

The **Space Allocation Rules for PSINDEX Data Sets** panel is displayed.
Specify space allocation rules for HALDB secondary indexes, and press Enter.

The **Space Allocation Rules for ILDS Data Sets** panel is displayed.

17. Specify space allocation rules for HALDB ILDS data sets, and press Enter.

The **JCL Defaults** panel is displayed.
18. Specify the JOBCARD JCL defaults and the allocations rules to use during the unload process and press Enter.

The Utility Setup for UNLOAD panel is displayed.

19. Specify the specific rules to use for the UNLOAD utility and press Enter.

The Utility Setup for RELOAD panel is displayed.

20. Specify the specific rules to use for the RELOAD utility and press Enter.
The **Utility Setup for BACKUP** panel is displayed.

---

**Utility Setup for BACKUP**

1. Select Backup type
   1. Standard IMS (DFSUDMP0)
   2. HP Image Copy (FABJMAIN)

2. Select No. of copies (1 or 2)

3. Select Data set Name Rule
   1. High Level Qualifier: `dbd.ddname.IC.timestamp`
   2. High Level Qualifier: `ddname.IC.timestamp`
   3. High Level Qualifier: `dbd.ddname.IC.GDG`
   4. High Level Qualifier: `ddname.IC.GDG`
   5. Use the one created by GENJCL.IC

Specify High Level qualifier: `your.hlq`

Specify Data set Name for Product Library: `your.SHPSLMDD`

---

**Figure 83. Utility Setup for BACKUP panel**

21. Specify the specific rules to use for the image copy utility and press **Enter**.

**Results**

After you have completed all panels, a dialog box displays indicating that the environment was successfully created.

If the environment was successfully created, press **Enter** and the first panel for creating a project will be displayed.

You can create the project now or later.

---

**Creating projects**

After defining an environment, you can create one or more conversion projects which are associated with that environment.

**About this task**

**Note:** If you have just added an environment, you should already be on the **Convert Full function to HALDB** panel.

**Procedure**

1. Select option 4 from the IMS HALDB Toolkit Main Menu, and press **Enter**.
   
   The **Convert from Full Function to HALDB** panel is displayed.
Figure 84. *Convert Full function to HALDB* panel

2. Select option 1 (Add-Delete-Change Project), and press **Enter**.

The **Project Maintenance for Environment** panel is displayed.

Figure 85. *Project Maintenance for Environment* panel

3. To add a new project, select option 2 and press **Enter**.

The **Define a New Conversion Project** panel is displayed.

Figure 86. *Define a New Conversion Project* panel

4. Specify a useful name and description for the project, and press **Enter**.

The **Project Tracking and Staging KSDS Allocation** panel is displayed.
5. Specify the KSDS allocation rules, and press Enter.

   An ISPF edit panel is displayed with generated JCL that you can submit to create the required KSDS data set. If necessary, edit the job, then submit it.

6. After the job runs successfully, press the END key (PF3).

   The next panel indicates that the environment definitions have been copied, and asks you if you want to change any options.

   ![Figure 88. Change options panel](image)

   If you are satisfied with the environment options for the environment connected to this project, press Enter.

   If you want to change any options, you can do so by specifying Y and pressing Enter. Panels from the environment definition are displayed again.

   After the options are changed, a panel is displayed indicating that the project was created and that the environment options have been updated.

### Deleting an environment

An IMS environment allows you to keep conversion projects and definitions for different IMS systems in one place. You can also delete existing environments that are no longer needed.

#### Procedure

1. Select option 1 (Add-Delete-Change Environment) from the IMS HALDB Toolkit Main Menu and press Enter.

   The Environment Maintenance panel is displayed.
Figure 89. Environment Maintenance panel

2. Select option 1 to see a list of all environments and press Enter.

The Environment List panel is displayed. The panel shows an example of a list of environments.

Figure 90. Environment List panel

3. You can select the one to delete by entering an s next to PROD environment. Press Enter.

The next panel that is displayed is a verification panel that confirms the deletion.

Figure 91. Verification panel for deleting environments

If Y is specified, a dialog box is displayed which indicates that the environment was deleted. Otherwise, you are returned to the list of environments and no environment is deleted.
Chapter 21. Processing a project

You can process a project to perform maintenance and conversion tasks.

Topics:
- “Selecting a project” on page 243
- “Processing a project using the Project Work panel” on page 246
- “Creating and submitting JCL” on page 248
- “Using SYNC points to halt or continue to the next phase of a project” on page 249
- “Processing a project using a partition selection exit” on page 250

Selecting a project

You can use the IMS HALDB Toolkit main menu to select conversion and maintenance options for projects.

You must select an environment before beginning a conversion so that IMS HALDB Toolkit knows which data sets and RECONs to use. If you do not currently have an environment or you want to switch to a different environment, select option 2 (Add-Delete-Change Environment) from the IMS HALDB Toolkit main menu.

To begin a conversion project from an existing environment, select option 4 (Convert from Full Function to HALDB) from the IMS HALDB Toolkit main menu.

To begin an entire DBD library conversion project from an existing environment, select option 5 (Convert entire DBD library to HALDB) from the IMS HALDB Toolkit main menu.

To begin a maintenance project from an existing environment, select option 6 (Split or Consolidate HALDB Partitions) from the IMS HALDB Toolkit main menu.

Alternatively, you can select option 3 (Projects in Progress) to obtain a list of all projects for this environment. From this list, you can select the appropriate project.

Choosing a new or "last active" conversion project

To begin a conversion project from an existing environment, select option 4 (Convert from Full Function to HALDB) from the IMS HALDB Toolkit main menu.

The Convert Full Function to HALDB panel is displayed.
Selecting option 4 on this panel automatically connects IMS HALDB Toolkit to the last active project.

**Note:** If no connection can be made, the message no project selected is displayed. In that case, select option 3 to select a project.

### Choosing a new or "last active" entire DBD library conversion project

To begin an entire DBD library conversion project from an existing environment, select option 5 (Convert entire DBD library to HALDB) from the IMS HALDB Toolkit main menu.

The **Convert DBD library to HALDB** panel is displayed.

Selecting option 4 or option 5 on this panel automatically connects IMS HALDB Toolkit to the last active project.

**Note:** If no connection can be made, the message no project selected is displayed. In that case, select option 3 to select a project.

### Choosing a new or "last active" maintenance project

To begin a maintenance project from an existing environment, select option 6 (Split or Consolidate HALDB Partitions) from the IMS HALDB Toolkit main menu.

The **Split or Consolidate HALDB Partitions** panel is displayed.
Selecting option 4 on this panel automatically connects IMS HALDB Toolkit to the last active project. **Note:** If no connection can be made, the message no project selected is displayed. In that case, select option 3 to select a project.

**Selecting a project from the environment**

After you choose a new or "last active" project, the Project List for Environment your environment panel is displayed, which shows all projects in the specified environment.

In the following example, two types of projects are shown: maintenance (M) and conversion (C).

![Project List for Environment](image)

You can now select a conversion or maintenance project.

If the conversion or maintenance project you select has already been selected by a different user ID, you cannot select it.

After you select a project, the **Project Work** panel is displayed.
Processing a project using the Project Work panel

After you select a project to convert, the Project Work panel is displayed.

About this task

You can select any of the following options in any order that is necessary to help you complete your work.

Procedure

- If you select option 0 (Setup Parameter) from the Project Work panel, the Select Function panel is displayed. Select the Setup Parameter to specify any setup changes. However, some changes can only be performed at the start of a project.

You can use the Select Function panel to change setup parameters that were made during project definition or to include parameters that might have been omitted. Depending on which step the conversion process is performing, some changes might have no effect.

You should ensure that you complete all changes before selecting DBDs to be converted.

- Select the Continue with Current Project to continue with a project that was interrupted. If the previous step was completed, conversion begins with the next step.

If this is the first time you are selecting option 1, IMS HALDB Toolkit proceeds to the DBD selection phase.
If you select option 2 (Show Status of Project) from the Project Work panel, the DBDs in Project HDO2 panel is displayed. Select Show Status of Project to view the step which is currently being processed. Use the Help key for explanations of fields on the panel.

This panel is informational, only, and lists all DBDs that have been specified for conversion.

In the example, suppose you selected HDO2 and HPV20. The secondary indexes (indicated by X) and the primary index (indicated by P) are added, automatically.

If the selected databases had logically related databases, they would also be added automatically, and the process would continue until all related databases were added.

If you had a complex relationship consisting of, for example, five primary DBDs and twenty secondary indexes, all would be included by selecting only one.

---

Command ===>

<table>
<thead>
<tr>
<th>S</th>
<th>DBD</th>
<th>Type</th>
<th>Prim DBD</th>
<th>Log. Current Level</th>
<th>Current Status</th>
</tr>
</thead>

</tbody>
</table>

Figure 98. DBDs in Project HDO2 panel

Select Recreate JCL of Current Phase to re-create JCL for all processes currently in SUBMITTED status. This might be necessary if, for example, a batch function did not complete and you are no longer in the panel to submit the JCL.

After re-creating the JCL, you might need to resubmit it.

• If you select option 4 (Restart at Current or Prior Level) from the Project Work panel, a list of project phases is displayed in chronological order. Select Restart at Current or Prior Level to restart a conversion project from the current or prior level. This would typically be necessary if the JOB did not complete, and the JCL is no longer available.

This panel shows all steps within a current conversion phase that are finished or in progress. You can go back to a previous step if the step has not completed. After you have started the "reload" phase, it might not be possible to go back. You cannot proceed to a future step. When you restart at a prior level, the project restarts at the beginning of that step.

In the following example, the last project syncpoint is displayed at the top of the panel; the current phase is displayed at the bottom.

---

Command ===>

<table>
<thead>
<tr>
<th>Sel</th>
<th>Project Phase</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Sync all Reloads</td>
</tr>
<tr>
<td></td>
<td>Post Processing</td>
</tr>
<tr>
<td></td>
<td>Remove Project</td>
</tr>
</tbody>
</table>

Figure 99. Project phases panel

If you select option 5 (Restart from Beginning) from the Project Work panel, a delete confirmation panel is displayed. Select Restart from Beginning to restart a conversion project from the beginning. All data currently held in the project file is deleted.
Any changes made during the process up to this point, are not backed out.

---

Command ===>

The project is restarted from the beginning. All work so far will be deleted. If this is what you want, specify "Y".

<table>
<thead>
<tr>
<th>N</th>
<th>Clear Project Dataset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Y</td>
<td>Yes</td>
</tr>
<tr>
<td>N</td>
<td>No</td>
</tr>
</tbody>
</table>

**Figure 100. Clear Project Dataset panel**

**Ask me later**

If, when setting up your parameters, you specified Ask me later, the panels that correspond begin to display.

**About this task**

At this stage of the conversion process, other special panels might also display.

---

**Creating and submitting JCL**

When all questions have been answered regarding how to process a conversion project, IMS HALDB Toolkit creates JCL and presents an ISPF panel for you to submit it.

**About this task**

---

**Figure 101. ISPF panel for submitting conversion JCL**

When the JCL processes successfully, an indicator displays to confirm that the batch job has completed.
A phase can have more than one batch job; all the jobs must be completed before the next phase begins.

## Using SYNc points to halt or continue to the next phase of a project

After certain phases complete, a sync point is reached. The sync point allows you to interrupt the project at a logical point.

### About this task

Sync points specify whether to continue to the next step.

A typical reason to halt a project is when batch processing has not completed and you will be unavailable for a period of time.

### Procedure

To halt or continue to the next phase from a project checkpoint:

1. At a project checkpoint, the **Project Checkpoint** panel displays and you can choose to start the next phase or halt the project.

   ![Figure 102. Project Checkpoint panel](image)

   - Specify Y to begin the next phase of the project.
   - Specify N to halt the project.

To halt or resume project conversion:

2. If you halt the project, a **Project Halted** panel is displayed.

   ![Figure 103. Project Halted panel](image)

   The status panel automatically causes the **Project Work** panel to display.

   - Optional: To quit the project and continue later, by pressing the End key.
   - Optional: To resume project conversion, select the appropriate option from the **Project Work** panel.
Figure 104. Project Work panel

- Optional: To resume project conversion, select the appropriate option from the Project Work panel.
- Optional: To resume project conversion, select option 1 from the Project Work panel. The project continues from where it stopped.

Processing a project using a partition selection exit

You must use a partition selection exit to process the project, if the database records (root segments) are to be distributed by methods other than the root segment key. If the database records are to be distributed by a portion of the root key, which is not the leftmost portion, you must use a selection exit.

Before you begin

For example, if the regional identifier is in a lower portion of the key, and the data should be separated by region identifier.

Restriction on partition selection exits:

- Caution should be used if you want to specify a partition selection exit for the secondary index.

  Using the exit can result in index keys that are no longer consecutive from one index partition to the next, thus impacting applications that use PCBs with PROCSEQ.

- IMS HALDB Toolkit does not support a selection exit on PSINDEX.

- If the data is to be distributed using the leftmost portions of the root segment high key, no selection exit is required, and none should be provided.

About this task

Selection exits are called for initialization and sequencing.

Exits provide the following functions:

- IMS knows the number of partitions and provides the partition number as input to the exit.
- The exit has additional parameters including the keystrng parameter from the partition definition. This parameter can be used to identify and sequence partitions.

Other methods are possible; however, they are prone to errors when the exit identifies a certain number of partitions, but does not receive that input from the DBRC definitions.

Procedure

1. Activate the partition selection exit for use.
2. Define partition boundaries.
3. Select or change the DBD.
4. Optional: Define other conversion options.

Results
If you use the IHPCSEL0 exit, you can activate the exit and define the partition boundaries as part of one task. If you supply your own partition selection exit, you must perform extra steps to make sure that your conversion process runs smoothly.

IHCPSEL0 exit
The IHCPSEL0 exit is provided with IMS HALDB Toolkit and works the same way as the high key works for partitioning without a selection exit.

IHCPSEL0 uses the DBRC keystrng parameter to identify the key portion and the high subkey for that partition. This enables flexibility for changing the partitioning method. The keystrng parameter is specified as ooo;lll;kkkkk where:

- **ooo**
  - Is the numeric specifying the offset from the start of the root key. The smallest offset is 001.

- **lll**
  - Is the numeric specifying the length of the subkey. lll+ooo must not be larger than the root segment key.

- **kkkkk**
  - Is the high-level qualifier key of the subkey for this partition.

IHCPSEL0 performs certain checks during initialization. It verifies that all ooo and lll are the same for each partition. Then, it checks for duplicate high keys.

Keys can be defined shorter than lll. In that case, they are padded with x"FF".

Using a partition selection exit for conversion
After you create a project and before you select a DBD, you can activate a partition selection exit. You can also use this procedure to define the partition boundaries.

About this task
On the next panel (Specify a Partition Selection Exit), you are asked to specify the partition selection exit.

Procedure
1. Select option 1 under "Selection Exit" on the DBD Conversion Rules panel.

You can also specify a partition selection exit for the secondary index; however, this might cause problems. The index keys will no longer be consecutive from one index partition to the next. This has an impact on applications that use PCBs with PROCSEQ. IMS HALDB Toolkit does not support a selection exit on PSINDEX.
2. On the next panel (Partition Selection Exit), specify the partition selection exit.

You can use either IHCPSEL0, which is supplied, or provide your own selection exit.

If you use your own exit, you must provide strings for the partition or define the number of partitions.

3. If you use IHCPSEL0, provide the subset high keys.

IMS HALDB Toolkit provides the Specify Partition Keystrings panel and the Partition Keystrings (character) panel for you to enter subset high key information.
Specify Partition Keystrings

1. Select
   1. Enter keystrings in character format
   2. Enter keystrings in hex format
   3. Provide dataset

   Member  (if dataset is partitioned)

Figure 107. **Specify Partition Keystrings** panel

Partition Keystrings for HIDV2
Character Keystrings only

Max key length: 4
No. of keys: 0

Specify Key: 499

Specify 'FF' for high value key

Figure 108. **Partition Keystrings (character)** panel

4. When you are finished entering keys, press the **End** key.

   The Keystings for xxxxxxx panel displays all of the keys that you entered.

5. Optional: Use the Keystings for xxxxxxx panel to change any of the information that you entered.

Figure 109. **Verifying partition keystrings**

IMS HALDB Toolkit performs a final check for the partition selection exit.

6. Optional: If you encounter the Partition Selection Exit xxxxxxxx is not currently in your RESLIB panel, copy the exit into your RESLIB. Partition boundary calculations are then performed.

Chapter 21. Processing a project 253
Changing the DBDs
After DBDs and partition boundaries are selected, you can begin conversion by unloading the primary DBDs.

About this task
New DBDs and partitions must be defined, and new data sets must be allocated. Then, reloads can be performed and conversion will be complete.

Because the DBDs have changed, an online change must be performed before making the new HALDBs available. The conversion process makes all changes except online changes, although it creates required JCL and control statements.

You submit the JCL as specified in your setup options or during project definition. You can change the options according to the needs of your project.

Creating partition boundaries
After DBDs are selected, you should locate effective partition boundaries. This section describes ways to create partition boundaries.

About this task
You can accomplish this by locating the high-level key of each partition that you want. You must select partition boundaries for all participating databases, including secondary indexes.

The index record size increases significantly because of the increase in the pointer size from 4 to 28 and the addition of the root segment key.

Procedure
• Use a partition selection exit.
• Specify the high key for a partition.
• Set partition boundaries automatically.
Defining the number of partitions by specifying high keys
After DBDs are selected, you can define the number of database partitions you want to have by specifying high keys for the partitions.

About this task
The number of partitions will be the number of high keys you specify. You must select partition boundaries for all participating databases, including secondary indexes. You need not specify the keys in sequence. The highest key defined is replaced as x’FF’.

The index record size increases significantly because of the increase in the pointer size from 4 to 28 and the addition of the root segment key.

Procedure
1. On the Primary DBD Partitioning Rules panel, select option 4 Specify High Keys.

```
----------------------------- IMS HALDB Toolkit -----------------------------
Command ==> Primary DBD Partitioning Rules

Partitions:  3  1  Fixed Number of Partitions  1
  2  Fixed Partition Size (MB)       2048
  3  Ask during Conversion
  4  Specify High Keys

PDB Conversion:  3  1  Use existing Keys or Partitions
  2  Create new Partition boundaries
  3  Ask during Conversion

Additional Partitioning Layouts to be created?
  2  1  Yes
  2  No, use the one created during Collect

Combine Database records:  5000 (number of database records)
```

*Figure 111. Primary DBD Partitioning Rules panel*

The Specify Partition Keystrings panel is displayed.

2. To specify keys, select option 1 or 2 depending on whether you want character or hex format.

```
----------------------------- IMS HALDB Toolkit -----------------------------
Command ==> Specify Partition Keystrings

Select
  1  Enter keystrings in character format
  2  Enter keystrings in hex format
  3  Provide dataset Member              (if dataset is partitioned)

```

*Figure 112. Specify Partition Keystrings panel*

3. Optional: Select option 1 and the Specify Partition Keystrings Character Keystrings only panel is displayed.

Enter one key at a time; or, if you have a file containing the keys, you can use it here.

The file must have as many records as the number of keys you want, the keys must be the first position of the record, and the file must have fixed record length.
4. When you have entered all keys, press the **End** key.
   The Keystings for xxxxx panel displays all keys that were entered.
5. To change this list, select option D, C, or I.
6. Press the **End** key to begin processing, when the list is final.
7. Verify partitioning results. You can view results using the output list from the data collector.

---

**Figure 114. Displaying high keys**

**Setting partition boundaries automatically**
There are two methods to set partition boundaries automatically: specifying the partition size (recommended) and specifying the number of partitions.

**Procedure**
1. To specify partition size, select option 2 in the "Partitions" section of the **Primary DBD Partitioning Rules** panel.
   This method ensures that no partition will be larger than the maximum size allowed.
2. Optional: To specify the number of partitions, select option 1 in the "Partition" section of the Primary DBD Partitioning Rules panel.

   If you use this method, a resulting partition might be larger than the 4 GB maximum. In that case, IMS HALDB Toolkit resets the size to 2 GB.

3. Optional: To specify partition boundaries for a secondary index, select option 1 or 2 in the PSINDEX Definition Rules panel.

4. You must consider VSAM freespace.

   Typically, option 2 (the default) with a maximum size of 1 GB is the best option.

Specifying additional conversion options

You can specify additional options during the conversion process.

About this task

For example:

- Change the DBD name.

  Changing the name impacts post-processing. You must define the new DBDs to your online system, change all PSBs, and ensure that the applications will be changed if they are aware of the DBD name.

- Convert from VSAM to OSAM.

---

**Figure 115. Primary DBD Partitioning Rules panel**

2. Optional: To specify the number of partitions, select option 1 in the "Partition" section of the Primary DBD Partitioning Rules panel.

   If you use this method, a resulting partition might be larger than the 4 GB maximum. In that case, IMS HALDB Toolkit resets the size to 2 GB.

3. Optional: To specify partition boundaries for a secondary index, select option 1 or 2 in the PSINDEX Definition Rules panel.

4. You must consider VSAM freespace.

   Typically, option 2 (the default) with a maximum size of 1 GB is the best option.

**Figure 116. PSINDEX Definition Rules panel**

---

**Specifying additional conversion options**

You can specify additional options during the conversion process.

**About this task**

For example:

- Change the DBD name.

  Changing the name impacts post-processing. You must define the new DBDs to your online system, change all PSBs, and ensure that the applications will be changed if they are aware of the DBD name.

- Convert from VSAM to OSAM.
OSAM has advantages not available in VSAM, especially when you use OSAM sequential buffering (OSB).

- Convert to a single data set group.
  Some databases contain multiple data set groups to minimize problems with database size.
  When you use IMS HALDB Toolkit, this adjustment is unnecessary. You need only one data set group.
Chapter 22. Converting to HALDB

If the database is offline, you can use the ISPF user interface to convert the database to a HALDB. The following sections explain how to accomplish this task.

Topics:
• “Considerations for converting to HALDB” on page 259
• “Converting to HALDB using the ISPF user interface” on page 259

Considerations for converting to HALDB

The following considerations apply when you convert to a HALDB by using the ISPF user interface.

When databases are offline, conversion options are available by using ISPF panels or by using the batch conversion method.

Converting full-function databases requires that IMS HALDB Toolkit evaluate partition sizes and boundaries. Partitioned databases which use the PDB/PDF product are considered full-function databases and can be converted as such.

The conversion process for PDBs/PDFs uses partition high keys (for HIDAM/HISAM to PHIDAM) or the number of partitions (HDAM to PHDAM).

You can also choose to select the partition boundaries again. In this case, the partition definition from the PDB is ignored and the database is treated in the same way as any full-function database.

Converting to HALDB using the ISPF user interface

You can use the ISPF user interface to convert your full-function databases to HALDB.

Procedure

1. To display the DBD Conversion Selection panel, select option 1 (Continue with Current Project) from the Project Work panel.
   If you did not select DBDs, or if you cleared the project data set, this step is necessary.
2. Select one of the provided DBD libraries, or enter a specific DBD library and press Enter to see a list of DBDs.
   All DBDs and related databases must be converted together. You must select, at minimum, the primary DBD.
   All related DBDs and indexes will be automatically included. In addition, you can add DBDs that are not related (from an IMS perspective), and they will be converted at the same time.
3. Select the primary DBD to be converted; related DBDs are automatically added to the list.

4. Press the **End** key to display the status panel showing all selected DBDs.

5. View your selections, and press the **End** key to display the following DBD Selection for Project xxxxx panel, which allows you to confirm that the DBD list is complete.

---

**Figure 117. DBD Conversion Selection panel**

**Figure 118. Selection panel for DBDs to be converted**
Command ===> 

DBD Selection for Project 0-HD02

Confirm the end of DBD Selection

Y "Y" If no more DBDs are to be added
"N" If more DBDs are to be added
"H" Hold project

Figure 119. Confirmation panel for DBD selections

6. Continue processing the project as described in Chapter 21, “Processing a project,” on page 243.

7. After the conversion process is complete and you are certain that you will not need to revert the database to its non-HALDB state, you can delete any DFSMDA members for the old database.
Chapter 23. Maintaining HALDB

The maintenance function from the ISPF user interface helps you maintain HALDBs after you convert them from full-function. The maintenance function is used to split or consolidate partitions.

You can use ISPF to perform maintenance tasks after databases are converted.

The databases must be offline before beginning any maintenance task. The databases must be taken offline manually.

To maintain a database online, you must use the batch process.

You can perform the following tasks using the ISPF user interface:

- Select DBDs for maintenance
- Select and maintain partitions
- Create and run JCL

The following sections explain how to accomplish these tasks.

Topics:

- “Splitting or consolidating HALDB partitions” on page 263
- “Selecting DBDs for maintenance” on page 264
- “Selecting and maintaining partitions” on page 265

Splitting or consolidating HALDB partitions

You access the maintenance panel by selecting option 6 from the IMS HALDB Toolkit main menu.

About this task

The Split or Consolidate HALDB Partitions panel is displayed.

The panel shows the current environment in which you are working and the IMS version for which it is defined. If you are connected to a project which is eligible for maintenance, the project name is also displayed.

---

Command ==>  

<table>
<thead>
<tr>
<th>Select Function</th>
<th>Current Settings</th>

</tr>
</tbody>
</table>

Figure 120. Split or Consolidate HALDB Partitions panel

The panel offers the following functions:

- Select option 1 to maintain projects that are defined within the specified environment.
- Select option 2 to display all projects that are defined within the environment.
- Select option 3 to select a project. If no project is preselected, you must select a project before proceeding.
A list of projects is displayed; however, only those defined as maintenance projects (Type: M) are eligible for selection.

After you select a project, the name is displayed on the project line.

- Select option 4 to connect to the project that is displayed under Current Settings and to display the Project Work panel.

In ISPF mode, Help is available for using the fields on this panel.

```
| Command ===>
|-------------
| Project Work Panel       Environment: New Envir
|                Project: PHIDV2

0 Select Function
0  Setup Parameter
1  Continue with Current Project

Project KSDS: your.project.consoli.phidv2
```

**Figure 121. Project Work panel**

### Selecting DBDs for maintenance

If you select option 1 on the Split or Consolidate HALDB Partitions panel, you are asked to select the DBD.

**About this task**

DBDs are extracted from the RECON.

The HALDB DBDs panel is displayed.

Select the DBD to be processed. Only one DBD can be selected at-a-time.

```
| Command ===>
|-------------
| HALDB DBDs

Sel  DBD      Organization
----------
  PHDV1  PHDAM,VSAM
  PHIDV2  PHIDAM,VSAM
  PPAIR2  PHDAM,OSAM
  PSHV21  PSINDEX
  PSHV22  PSINDEX
  QHV21   PSINDEX
  QHV22   PSINDEX
  QIDV2   PHIDAM,VSAM
  YHV21   PSINDEX
  YHV22   PSINDEX
  YIDV2   PHIDAM,VSAM
  ZEY120O PHDAM,OSAM

********* Bottom of data *********
```

**Figure 122. Selecting HALDB DBDs**

The panel is displayed for selecting the DBD library which contains the selected DBD, as shown in the following example.
Select the appropriate DBD library or type the data set name. The DBD library you choose will be associated with the project.

--- IMS HALDB Toolkit ---

Command ===>

- Select one of the provided DBD libraries
- or specify a DBD library
- for HALDB DBD PHDV1

```
your.DBDLIB
```

Specify a DBDLIB dataset name

--- IMS HALDB Toolkit ---

**Figure 123. Selecting HALDB DBD library**

The next step is to select a partition.

**Selecting and maintaining partitions**

You use the **Select Partitions for Maintenance** panel to select and maintain partitions. All partitions are displayed in key sequence.

**About this task**

The current size of the partition and the space used are displayed to assist you in deciding which partitions to select.

You can select multiple partitions. However, if you select more than one, they must be in key sequence and be selected or cleared one-at-a-time.

IMS HALDB Toolkit considers multiple partitions as one entity and creates new partitions based on the goals that you defined in the project setup.

--- IMS HALDB Toolkit ---

</table>

---

**Figure 124. Displaying all partitions in key sequence**

**Restriction on partition selection exits**

Only partition selection exit IHCPSEL0 (provided with this product) is supported.

DBDs with other partition selection exits are not supported.
Chapter 24. Creating JCL statements for database utilities

IMS HALDB Toolkit can create JCL for database utilities. You can then run reorganization or backup and recovery utilities for HALDBs or selected partitions.

Procedure

1. From the IMS HALDB Toolkit main menu, select option 7 (Database Utilities) and press Enter.

   The Database Utilities panel is displayed.

```
----------------------------- IMS HALDB Toolkit -----------------------------
Command ===> Database Utilities
Select Function                          Current Settings
Environment: ims14

1  Index Pointer Healer
2  Recover Partition
3  Backup Partition
4  Unload Partition
5  Reload Partition
6  Unload entire Database
7  Reload entire Database
8  Reorganize PSINDEX
9  Drop Partition
A  Load Partition
B  Merge HALDBs
```

Figure 125. Database utilities main menu

This panel allows you to select utility functions for performing actions on selected databases or partitions.

**Option 1**

This function reads the PSINDEX data sets and determines whether the EPS pointers are valid. If necessary, ILDS data sets from the primary database partitions are used to update the index pointer. This function requires the primary database to be offline.

**Options 2 - 7**

These functions create JCL to perform the action of the selected utility. Either IMS Tools products or standard utilities are used. On the main menu, you can select option 0 (Setup Utilities) to specify which utilities and associated parameters IMS HALDB Toolkit should use.

**Option 8**

If your CI and CA splits are a high number, this function reorganizes the PSINDEX. This function requires the PSINDEX database to be offline.

**Option 9**

This function is used to remove a partition. If the database has secondary indexes, the function also removes corresponding index records. This method is faster than rebuilding indexes for remaining partitions.

It is still possible to undo the drop at this time. Because a dropped partition has only been "disabled", it can be reactivated. However, secondary indexes must be rebuilt. If the database has been updated, you must unload and reload to reactivate the dropped partition.

**Option A**

This function allows you to load a single partition (PCB with PROCOPTL). Using this function can cause performance issues if secondary indexes are inserted. The insertion of secondary indexes is
delayed until the partition has been loaded. The index records are then inserted sequentially. The application does not see status codes related to insertion of the records. However, if index loading fails, the job ends.

**Option B**

This function enables user-partitioned databases to transform to a single HALDB. The following restrictions apply:

- DBDs must be identical.
- The key range of the partitions must not overlap.

This function imports selected partitions into the target master DBD. Data set names are changed according to the rules in the target database. This function checks the key consistency of neighboring partitions. The merge is performed only if all checks have been satisfied.

2. Select a function from the menu and press **Enter**.

   A panel displays that shows all HALDBs that are currently defined.

3. Select a DBD on which to perform a function and, if necessary, its partition. Press **Enter**.

   The JCL for that function is generated automatically.
Chapter 25. Other ISPF utilities

You can use Other Utilities functions provided by the ISPF user interface to perform other HALDB tasks. From the IMS HALDB Toolkit main menu, select option 8 (Other Utilities) and press Enter.

The Utilities panel is displayed.

```
----------------------------- IMS HALDB Toolkit -----------------------------
Command ===>

Utilities
Select Function Current Settings
1  Show DBD Source  Environment: ims14
2  Reassemble DBD
3  Partition Selection Exit Test Utility
4  OSAM Multi volume
```

Figure 126. Utilities panel

Option 1 allows you to rebuild the source of your DBD. You are asked to specify the DBDLIB and select a DBD. The DBD source will be displayed.

Option 2 is the same as option 1, but applies JCL to the DBD source to enable you to do a DBDGEN.

Option 3 generates the JCL for testing a partition selection exit.

Option 4 creates the JCL to handle a non-SMS OSAM Multi volume.
Chapter 26. Using ISPF DBRC support functions

You can use DBRC support functions provided by the ISPF user interface to show, clone, copy, and backup HALDB definitions and partitions.

About this task

To use DBRC utilities, select option 9 (DBRC for HALDB) from the IMS HALDB Toolkit main menu and press Enter.

The DBRC Support panel is displayed to allow you to select a function that is supported by DBRC.

---

Figure 127. DBRC Support panel

Topics:

• “Showing partition definitions” on page 271
• “Cloning DBRC definitions” on page 272
• “Copying DBRC partitions” on page 274
• “Backing up DBRC DBD definitions” on page 275

Showing partition definitions

You can use the DBRC Support panel to show partition definitions.

Procedure

1. From the IMS HALDB Toolkit main menu, select option 9 (DBRC for HALDB) and press Enter.
   The DBRC Support panel is displayed.
2. From the DBRC Support panel, select option 1 (Show Partition Definitions) and press Enter.
   The Partition Definition in DBRC panel is displayed. The panel shows a list of all HALDB master DBDs and their partition definitions.
Command ===>

Partition Definition in DBRC

Displayed as currently defined in RECON data sets

Select

1 Show all HALDB DBDs and Partitions
2 Show DBD
3 Show Partition

RECON1: your.RECON1
RECON2: your.RECON2
RECON3: your.RECON3

Figure 128. Partition Definition in DBRC panel

3. To see details about a DBD and its partitions, select a row and press Enter.

For following example shows the result for option 1 (Show all HALDB DBDs and Partitions):

Command ===>

HALDB DBDs and Partitions Row 1 of 7

Sel DBD Part Organization Sel.Exit

PHD02A PHD02A0 PHDAM,OSAM
PHD02A1
PHD02A2
PHD02A3
PHD02B0
PHD02B1

Figure 129. HALDB DBDs and Partitions panel

Cloning DBRC definitions

You can use the clone function from the DBRC Support panel to replicate HALDB DBRC definitions to other RECONs.

Procedure

1. From the IMS HALDB Toolkit main menu, select option 9 (DBRC for HALDB) and press Enter.

   The DBRC Support panel is displayed.

2. From the DBRC Support panel, select option 5 (Clone Partition Definition) and press Enter.

   The HALDB DBDs panel is displayed showing the list of HALDB DBDs.
## Selecting DBDs to be cloned or copied

3. Enter `s` to make a partition selection, along with any secondary indexes you want to include, and press `Enter`.

   The **Enter Target RECON Data Set Names** panel is displayed.

   ```
   Command ===>
   Enter target RECON Dataset names
   RECON1 your.other.recon1
   RECON2 your.other.recon2
   RECON3 your.other.recon3
   ```

## Selecting the target RECON data sets

4. Specify the RECON data sets to which you plan to clone the HALDB DBRC definitions and press `Enter`.

   The **Options for DBRC Cloning of DBD** panel is displayed:

   ```
   Command ===>
   Options for DBRC cloning of DBD  PHDO2
   Enter new dataset name prefix
   your.new.hlq
   Add DBD name to dataset name prefix
   Y  Y Yes
   N  No
   Include secondary indexes
   Y  Y Yes
   N  No
   ```

## Specifying cloning parameters

5. Specify the following parameters:

   - Specify a new data set name prefix.
   - If you include the secondary index databases, use the DBD name as an additional data set qualifier

IMS HALDB Toolkit creates the JCL to transport partition definitions of the selected DBD and any secondary indexes.

Submit the JCL to create the partition definition in your alternate RECONs.

**Note**: You should not use this function to transport image copies to partitions that have just been defined. Use the Copy function, instead. However, you can use any Load process to transport data to replicated partitions.
Copying DBRC partitions

You can use the copy function from the **DBRC Support** panel to replicate HALDB DBRC definitions to other RECONS.

**About this task**

Use this function to copy DBRC definitions and partition data sets to a different RECON.

The data transport process can unload or reload. However, this function is designed to allow transport with image copies.

**Procedure**

1. From the IMS HALDB Toolkit main menu, select option 9 (DBRC for HALDB) and press **Enter**.
   
   The **DBRC Support** panel is displayed.

2. From the **DBRC Support** panel, select option 6 (Copy Partitions to a Different RECON) and press **Enter**.
   
   The **Enter Target RECON Dataset Names** panel is displayed.

   ![Figure 133. Selecting the target RECON data sets](image)

   3. Specify the RECON data sets to which you plan to copy the HALDB DBRC definitions and press **Enter**.

   The **Copy Database to Different RECON** panel is displayed.

   ![Figure 134. Specifying copy parameters](image)

4. Specify the following parameters:
   
   - Specify a new data set name prefix.
   - If you include the secondary index databases, use the DBD name as an additional data set qualifier.

   IMS HALDB Toolkit can create the IDCAMS statements for the new files.

   IMS HALDB Toolkit creates the JCL.
The first step creates a file containing DBRC statements and (optionally) a file containing IDCAMS statements.

The DBRC statements create the HALDB DBD and its partitions. The partition number is maintained so that image copies can be used.

Additionally, all complete image copy entries are transported to the new RECONs.

VOLSER information is not copied.

You must have CATDS in your DBRC definition.

An optional third step uses the IDCAMS statements to allocate new files. File sizes are copied from the original files.

You can now load your database into the new files by using the Recovery function and accessing the new RECON.

**Backing up DBRC DBD definitions**

You can use the **DBRC Support** panel to back up DBRC DBD definitions.

**Procedure**

1. From the IMS HALDB Toolkit main menu, select option 9 (DBRC for HALDB) and press **Enter**.

   The **DBRC Support** panel is displayed.

2. Select option 7 from the DBRC Support menu.

   A list of HALDB master DBDs displays.

3. Select the DBD.

   A **View** panel displays the database and partition definition for the selected master DBD.

4. Select all rows.

5. Issue a **CREATE** command on the command line, and specify the file to which the definitions are to be backed up.
Part 9. Reference

The topics in this section provide you with technical references to help you interpret IMS HALDB Toolkit reports and understand the contents of the sample library file.

Topics:

- Chapter 27, “Sample reports,” on page 279
- Chapter 28, “Contents of the sample library file (SIHCSAMP),” on page 291
- Chapter 29, “Performance tips and considerations,” on page 293
Chapter 27. Sample reports

This topic contains samples of reports that you might encounter as you use IMS HALDB Toolkit.

This topic contains only those reports created by IMS HALDB Toolkit. The reports created by the IMS and IMS Tools products are described in the manuals for those utilities.

Topics:

• “MSGPRINT data set” on page 279
• “IHCLIST data set” on page 280

MSGPRINT data set

The MSGPRINT data contains progress messages issued during the IMS HALDB Toolkit job.

Runtime Messages report

The following figure shows an example of the Runtime Messages report.

```

The following descriptions apply to the fields in this report:
Part
Displays the partition number. The partition number is assigned based on the order of high keys. Partition numbers in this report do not indicate partition IDs.

Roots
Displays the number of root segments and its percentage of all root segments. This shows how many database records will be assigned to that partition.

All Segments
Displays the number of segments in each partition and its percentage of all segments.

Prefix Bytes
Displays the number of bytes (and its percentage of all bytes) that are required to store the prefix. This has particular significance for index databases. For example, the report in Figure 136 on page 281 shows that the GRX01 database has 153 MB for the prefix and 145 MB for data.

Data Bytes
Displays the number of bytes (and its percentage of all bytes) required to store the data portion. This is the actual amount of data that will be stored on disk.

Total Bytes
Displays the sum of prefix bytes and data bytes.

Total
Displays the total number of bytes and segments in the database.

Runtime Options In Effect report
The Runtime Options In Effect report summarizes the runtime options that were applied to the job.

Figure 138. Runtime Options In Effect report

The following descriptions apply to the fields in this report:

Primary DBD
The name of the primary DBD.

Source for Analyzer
The input provided to the Analyzer. This field shows either Database or Unload file.

Method of Operation
Whether an unload was performed. This field shows either Analyze only or Analyze and Unload.

Database Type
The type of the database. This field shows either HALDB or Not HALDB.

Partition
The name of the partition that was processed.

Partitioning for primary DBD
The method used for partitioning the primary DBD. This field shows one of the following methods:
Partitioning for secondary Indexes
The method used for partitioning the secondary indexes. This field shows one of the following methods:

- Partition Number
- Partition Size
- High Keys
- Along with primary DBD

Unload report
The Unload report shows the number of segments and the segment size. The segment size is the true size as it is stored in the database.

It can be useful to know the average database record length when tuning your database. In this case, it is helpful for specifying the byte limit parameter of your PHDAM database.

A sample report is shown in the following example:

Avg. database record length: 1,827.03

Figure 139. Unload for DBD GRE report

The following descriptions apply to the fields in this report:

Segment
Displays the segment name

Segment Count
Displays the number of segments of this type in the database

Segment Data
Displays the total amount of data bytes for this segment type in the database

Prefix and Data
Displays the total bytes of this segment type in the database

Total
Displays the sum of the segment types

Avg. database record length
Displays the result of dividing the total prefix and data bytes by the number of root segments
HALDB Analyzer report

This report shows analysis information gathered by the HALDB Analyzer utility.

*Figure 146. Partition selection test tool report*
Chapter 28. Contents of the sample library file (SIHCSAMP)

This reference topic provides descriptions for the contents of the IMS HALDB Toolkit sample library file (SIHCSAMP).

The following members are included in sample library SIHCSAMP:

**IHCCHAL**
This member provides the sample skeleton CLIST for ISPF invocation.

*Requirement:* The ISPF data set names must match the target library names.

**IHCCHAL1**
This member provides the skeleton CLIST for invocation from control suite.

**IHCCKSDS**
This member provides the sample JCL for ISPF installation.

**IHCCSET**
This member provides the sample JCL for installation setup parameters that are used on a routine basis.

**IHCEACBL**
This member provides the sample JCL to create a list of PSBs that contain a specified DBD.

**IHCEANA**
This member provides the sample JCL to run the HALDB analyzer.

**IHCECLON**
This member provides the sample JCL to clone DBRC for test environments.

**IHCECOPY**
This member provides the sample JCL to copy a database to a different IMS (and RECON).

**IHCECVTN**
This member provides the sample JCL to convert to HALDB offline.

**IHCECVTY**
This member provides the sample JCL to convert to HALDB online.

*Note:* This member is not supported by IMS Database Utility Solution.

**IHCECVT1**
This member provides the sample JCL to convert to HALDB by specifying the number of partitions.

**IHCECVT2**
This member provides the sample JCL to convert to HALDB by specifying the partition size.

**IHCECVT3**
This member provides the sample JCL to convert to HALDB by specifying the high keys of the partition.

**IHCEDBBK**
This member provides the sample JCL to back up DBRC definitions for a specified DBD.

**IHCEDBD**
This member provides the sample JCL to re-create DBD source from DBDLIB.

**IHCEDBRC**
This member provides the sample JCL to relink the DBRC module DSPCRTR0.

**IHCEDBRI**
This member provides the sample JCL to set up HALDB data set name substitution outside of DBRC.

**IHCEDFS**
This member provides the sample JCL to copy a database to a different IMS using DFSMSdss.
**IHCEDFSH**
This member provides the sample JCL to create DFSHALDB statement using keys.

**IHCEDROP**
This member provides the sample JCL to drop a single partition.

**IHCEILK**
This member provides the sample JCL to reset ILK.

**IHCEIXHL**
This member provides the sample JCL for the Index Pointer Healer.

**IHCELOAD**
This member provides the sample JCL to load a single partition.

**IHCEMAI1**
**IHCEMAI2**
**IHCEMAI3**
These members provide the sample JCL to run the analysis portion of the CONVERT and MAINTAIN commands.

**IHCEMERG**
This member provides the sample JCL to merge two HALDBs into one.

**IHCEMTNN**
This member provides the sample JCL to maintain HALDB partitions offline.

**IHCEMTNY**
This member provides the sample JCL to maintain HALDB partitions online.

**Note:** This member is not supported by IMS Database Utility Solution.

**IHCEMTN1**
This member provides the sample JCL to split two partitions into four partitions.

**IHCEMTN2**
This member provides the sample JCL to rearrange partitions using the partition size.

**IHCEMTN3**
This member provides the sample JCL to rearrange partitions using high keys.

**IHCEOSAM**
This member provides the sample JCL for OSAM multivolume allocation (non-SMS).

**IHCESPSEL**
This member provides the sample JCL for the partition selection test tool.

**IHCEREOI**
This member provides the sample JCL to reorganize a PSINDEX.

**IHCESAM1**
**IHCESAM2**
**IHCESAM3**
**IHCESAM4**
**IHCESAM5**
**IHCESAM6**
These members provide the sample JCL to create rules for substituting HALDB data set names outside of DBRC.

**IHCESPLT**
This member provides the sample JCL to split an unload file on a partition boundary.

**IHCEUNIT**
This member provides the sample JCL to show all DASD unit names and mark VIO.
Chapter 29. Performance tips and considerations

Use this information to learn the techniques for improving the performance of ANALYZEPART, CONVERT, and MAINTAIN function jobs.

Generally, the performance of an IMS HALDB Toolkit job is not affected by IHCSYSIN command parameters. However, you can improve the IMS HALDB Toolkit job performance by tuning the processes of other IMS Tools products that IMS HALDB Toolkit calls. Such IMS Tools products include IMS High Performance Unload, IMS High Performance Load, and IMS High Performance Image Copy.

The following table summarizes the IMS Tools products that IMS HALDB Toolkit functions call.

<table>
<thead>
<tr>
<th>IMS Tools product</th>
<th>ANALYZEPART</th>
<th>CONVERT</th>
<th>MAINTAIN</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMS HP Unload</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>IMS HP Load</td>
<td>-</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>IMS HP Image Copy</td>
<td>-</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

**Improving the performance of the unload process (IMS HP Unload)**

If IMS High Performance Unload is used for unloading data, you can tune and improve the performance of the unload process. To do so, create an IMS High Performance Unload default option table (FABHOPT) with HSSROPT control statements that improve the performance of the HSSR Engine and concatenate the FABHOPT to the STEPLIB DD of the IMS HALDB Toolkit JCL job.

For more information about creating an IMS High Performance Unload default option table, see the topic “Site default options” in the *IMS High Performance Unload User’s Guide*.

**Improving the performance of the load process (IMS HP Load)**

If IMS High Performance Load is used for loading data, you can tune and improve the performance of the load process. To do so, provide IMS High Performance Load control statements with the following methods:

- Specify RELOAD.xxxx parameters in the IHCSYSIN DD. RELOAD.xxxx parameters are applied to the load process as FRRIN control statement keywords to control the behavior of the load processing.
- Create an IMS High Performance Load default option table (HPSROPT) with FRRIN control statements that improve the performance of the load processing and concatenate the HPSROPT to the STEPLIB DD of the IMS HALDB Toolkit JCL job.

HPSROPT, if concatenated to the STEPLIB DD, is always referred to. All RELOAD.xxxx parameters in IHCSYSIN DD and applicable FRRIN control statement keywords in HPSROPT are applied to the load process. If the same parameter is present in both IHCSYSIN DD and HPSROPT, for example, RELOAD.HPIO(YES) in IHCSYSIN DD and HPIO=N in HPSROPT, the parameter in IHCSYSIN is applied.

For more information about creating an IMS High Performance Load default option table, see the topic “Setting installation default options” in the *IMS High Performance Load User’s Guide*.

**Improving the performance of the image copy process (IMS HP Image Copy)**

If IMS High Performance Image Copy is used for creating image copies, you can tune and improve the performance of the image copy process. To do so, provide IMS High Performance Image Copy control statements with the following methods:

- Specify IC.xxxx parameters in the IHCSYSIN DD. IC.xxxx parameters are applied to the image copy process as ICEIN control statement keywords to control the behavior of the image copy processing.
- Create an IMS High Performance Image Copy default option table (FABJGLI0) with ICEIN control statements that improve the performance of the image copy processing and concatenate the FABJGLI0 to the STEPLIB DD of the IMS HALDB Toolkit JCL job.
FABJGLI0, if concatenated to the STEPLIB DD, is always referred to. All IC.xxxx parameters in IHCSYSIN DD and applicable ICEIN control statement keywords in FABJGLI0 are applied to the load process. If the same parameter is present in both IHCSYSIN DD and FABJGLI0, for example, IC.VIC(Y) in IHCSYSIN DD and VIC=N in FABJGLI0, the parameter in IHCSYSIN is applied.

For more information about creating an IMS High Performance Image Copy default option table, see the topic "Setting default values for the FABJMAIN program" in the *IMS High Performance Image Copy User's Guide*. 
Part 10. Troubleshooting

The topics in this section provide you with technical references to help you troubleshoot and diagnose IMS HALDB Toolkit problems.

Topics:

• Chapter 30, “Messages and codes,” on page 297
• Chapter 31, “Gathering diagnostic information,” on page 347
Chapter 30. Messages and codes

This section provides detailed information about IMS HALDB Toolkit messages and codes.

Topics:

- “Return and abend codes” on page 297
- “Trace file or trace panel” on page 297
- “ISPF messages” on page 298
- “Batch messages” on page 298

Return and abend codes

This reference section provides detailed information about IMS HALDB Toolkit return and abend codes. You might encounter the following return or abend codes during processing. A return or abend code other than 0 is an unusual condition.

An abend code of U 999 is issued after a subtask abends. The subtask abend code is also shown in the messages.

Either of the following return codes is issued:

0
  Function completed successfully.

4
  One or more of the following is true:
  • Not all functions completed.
  • You may need to perform an IMS online change to complete the requested function.
  • TAKEOVER(DELAY) was specified.

Trace file or trace panel

In a normal situation, a trace file is automatically attached to batch processing.

In the event of an error situation, you should attach the trace file to your error documentation to assist IBM Software Support in resolving the problem.

A trace panel is a screen containing trace information which depicts an error situation. When you submit error documentation, print the screen and attach it to the documentation to assist IBM Software Support.

For more information about the diagnostic information that you should attach when contacting IBM Software Support, see Chapter 31, “Gathering diagnostic information,” on page 347.
ISPF messages

For explanations of ISPF messages, see the appropriate ISPF publication.

Batch messages

This reference section provides detailed information about IMS HALDB Toolkit batch messages.

Message format

IMS HALDB Toolkit messages adhere to the following format:

IHC0nnnnnx

Where:

<table>
<thead>
<tr>
<th>IHC0</th>
<th>Indicates that the message was issued by IMS HALDB Toolkit</th>
</tr>
</thead>
<tbody>
<tr>
<td>nnnn</td>
<td>Indicates the message identification number</td>
</tr>
<tr>
<td>x</td>
<td>Indicates the severity of the message:</td>
</tr>
<tr>
<td>A</td>
<td>Indicates that operator intervention is required before processing can continue.</td>
</tr>
<tr>
<td>E</td>
<td>Indicates that an error occurred, which might or might not require operator intervention.</td>
</tr>
<tr>
<td>I</td>
<td>Indicates that the message is informational only.</td>
</tr>
<tr>
<td>W</td>
<td>Indicates that the message is a warning to alert you to a possible error condition.</td>
</tr>
</tbody>
</table>

Each message also includes the following information:

Explanation:

The Explanation section explains what the message text means, why it occurred, and what its variables represent.

System action:

The System action section explains what the system will do in response to the event that triggered this message.

User response:

The User response section describes whether a response is necessary, what the appropriate response is, and how the response will affect the system or program.

<table>
<thead>
<tr>
<th>IHC01000E text</th>
<th>User response</th>
</tr>
</thead>
<tbody>
<tr>
<td>None.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>IHC01000I text</th>
<th>User response</th>
</tr>
</thead>
<tbody>
<tr>
<td>None.</td>
<td></td>
</tr>
</tbody>
</table>
User response
None. This message is informational.

**IHC01001I**  Control cards used in this run

**Explanation**
Displays the control statements that you supplied.

**System action**
None.

User response
None. This message is informational.

**IHC01002I**  Utility driver [started | ended | terminated] with error.

**Explanation**
This message indicates the start or termination of a batch run. Previous messages indicate a possible error reason.

**System action**
None.

User response
None. This message is informational.

**IHC01003I**  Highest return code is nnnn

**Explanation**
The highest return code of the utilities and functions is nnnn.

**System action**
None.

User response
None. This message is informational.

**IHC01004E**  Error return code is nnnn, reason code rrrr

**Explanation**
A utility function ended with an error. The return code is indicated by nnnn, and the reason code is indicated by rrrr.

**System action**
The utility has been terminated.

User response
Evaluate the preceding error messages to determine the cause of the problem and resolve the error condition.

**IHC01005E**  Expected continuation not received.

**Explanation**
The control statements are in error. A continuation was indicated, but no additional control statement was found.

**System action**
Processing terminates.

User response
Correct the control statement error and resubmit the job.

**IHC01006E**  No commands found.

**Explanation**
The IHCSYSIN file was specified, but no control statements were specified.

**System action**
Processing terminates.

User response
Provide the necessary control statements.

**IHC01007E**  Invalid command cmd found in line nnn.

**Explanation**
The command cmd is invalid. The control statement line is indicated by nnn.

**System action**
Processing terminates.

User response
Correct the control statement and resubmit the job.

**IHC01008E**  Invalid keyword key found in line nnn.

**Explanation**
The keyword key is not valid for the specified command.
System action
Processing terminates.

User response
Correct the control statement and resubmit the job.

IHC01009E Invalid syntax for keyword key in line nnn.

Explanation
The keyword requires syntax rules. Syntax rules are: numeric, ddname, dsname, or simply yes, or no. Message IHC01014I is issued to show the reason for the error.

System action
Processing terminates.

User response
Correct the control statement and resubmit the job.

IHC01010E Duplicate keyword key in line nnn.

Explanation
The keyword key is being used more than once in the same command.

System action
Processing terminates.

User response
Correct the control statement and resubmit the job.

IHC01011E No command found in line nnn.

Explanation
A command must start within the first 20 bytes of a control statement. No command was found.

System action
Processing terminates.

User response
Remove the duplicate keyword and resubmit the job.

IHC01012E Command cmd requires keyword key.

Explanation
The indicated keyword key is required for this command cmd.

System action
Processing terminates.

User response
Add the keyword and resubmit the job.

IHC01013E Keyword key and key are mutually exclusive.

Explanation
Mutually exclusive keywords have been specified.

System action
Processing terminates.

User response
Correct the control statement and resubmit the job.

IHC01014I Reason is rsn

Explanation
This message explains control statement errors. The variable rsn provides information about the control statement errors.

System action
None.

User response
None. This message is informational.

IHC01015E Keyword key requires keyword key

Explanation
Both of the specified keywords are required and must be specified.

System action
Processing terminates.

User response
Add the missing keyword and resubmit the job.

IHC01016I Command cccccc started/ended/terminated
**Explanation**
Command cccccc has either started or ended.

**System action**
None.

**User response**
None. This message is informational.

**IHC01017E**  Nothing to schedule

**Explanation**
After all control cards have been checked, there was no command to be processed.

**System action**
Processing stops.

**User response**
Keep the output listing and contact IBM Software Support.

**IHC01018E**  No control cards specified.

**Explanation**
The file IHCSYSIN is empty.

**System action**
Processing terminates.

**User response**
Provide control statements.

**IHC01019I**  IMS batch driver started/ended

**Explanation**
The IMS batch driver component is used to run IMS applications in a shell. This is done to support additional functionality.

**System action**
None.

**User response**
None. This message is informational.

**IHC01020E**  DBD nnnnn is in error, reason: rrr

**Explanation**
The DBD decoder found errors for DBD nnnnn. These errors are probably due to one of the following reasons rrr:

- DBD has logical relation.
- The DBD version is not supported.
- The DBD type is not supported.
- DBD nnnnn is not a valid DBD.
- The DBD name is different from the member name. The member name in the DBD library and the name inside the DBD are different. The name inside the DBD is the valid name.
- DOS does not support this DBD.
- The index DBD has no primary DBD.
- The index DBD has more than one target DBD. IMS HALDB Toolkit does not support multiple target DBDs.
- The target DBD is an IMS HALDB Toolkit DBD, but the index DBD is not.
- The index DBD is an IMS HALDB Toolkit DBD, but the target DBD is not.

**System action**
Processing stops.

**User response**
correct the invalid DBDs and restart the process.

**IHC01021E**  IMS or DBDLIB DD-statement missing

**Explanation**
The JCL is missing one or both of these statements.

**System action**
Processing stops.

**User response**
Add the IMS DD statement describing the appropriate DBDLIBs.

**IHC01022E**  RESLIB not in STEPLIB concatenation

**Explanation**
The IMS SDFSRESL is not available to this job step.

**System action**
Processing stops.

**User response**
Add the IMS SDFSRESL to the STEPLIB concatenation.
**User response**
Add the IMS SDFSRESL to the STEPLIB.

**IHC01023E**  
**Explanation**
IMS HALDB Toolkit is run under an unsupported version of IMS.

**System action**
Processing stops.

**User response**
Run IMS HALDB Toolkit with a supported version of IMS.

**IHC01024E**  
**Explanation**
A HALDB function was requested, but the selected DBD is not a PSINDEX DBD.

**System action**
The function (step) ends.

**User response**
Select a PSINDEX DBD. This is a secondary index DBD which has been converted to HALDB.

**IHC01025E**  
**Explanation**
DBD nnnnn was requested, but is not in the DBD library.

**System action**
The job step ends.

**User response**
Ensure that you are using the correct DBD library; the IMS DD statement is pointing to those files.

**IHC01026E**  
**Explanation**
The PSEXIT command is used to show the results of the partition selection exit IHCPSEL0.

**System action**
The job step ends.

**User response**
Create the KEYLEN, KEYOFF, or both specifications, and restart the process.

**IHC01027E**  
**Explanation**
The PSEXIT command is used with full function databases to test the functionality and distribution of a partition selection exit. The specified DBD is already HALDB.

**System action**
The job step ends.

**User response**
None.

**IHC01028E**  
**Explanation**
The partition selection exit, IHCPSEL0, requires that key strings be specified. No keys were found.

**System action**
The job step ends.

**User response**
Provide keys in the //KEYS DD statement.

**IHC01029E**  
**Explanation**
The partition selection exit, nnnnn, returned an error during its initialization phase.

**System action**
The job step ends.

**User response**
If the exit is IHCPSEL0, the reason is located in the messages job log. Otherwise, check with the author of the identified exit to determine the reason for the error.

**IHC01030E**  
**Explanation**
DBRC is not operational.
**Explanation**
DBRC was requested; however, DBRC initialization failed.

**System action**
Processing stops.

**User response**
Keep the output listing and contact IBM Software Support.

**IHC01031I**
DBRC subsystem nnnnnn signon/signoff successful/failed

**Explanation**
This message is displayed at the start or the end of the DBRC connection. nnnnnn indicates the specified subsystem name.

**System action**
None.

**User response**
If no request to DBRC is required, this message might be appropriate. However, if subsequent errors are displayed, the reason might be an error in DBRC connection.

**IHC01032E**
HALDB master DBD nnnnnn is not in the RECON

**Explanation**
The master DBD definition of a HALDB is kept in the RECON. A HALDB DBD named nnnnnn was requested. The RECON does not have a record for this DBD.

**System action**
Processing stops.

**User response**
Correct the DBD name if this is the error. Otherwise, you might be using the wrong RECON.

**IHC01033E**
DBD nnnnnn is not HALDB

**Explanation**
The DBD nnnnnn is expected to be a HALDB DBD. However, this is not the case.

**System action**
Processing stops.

**IHC01034E**
Partition nnnnnn is not in master DBD dddddd

**Explanation**
Partition nnnnnn was requested. However, nnnnnn is not defined within its master DBD dddddd.

**System action**
Processing stops.

**User response**
Either the partition name or the DBD name is wrong. You might also be using the wrong RECON.

**IHC01035I**
Partition pppp authorized nnnn

**Explanation**
Partition pppp has been authorized with DBRC. nnnn is the authorization scope. It may be read, read exclusive, update, or exclusive.

**System action**
The DBRC authorization for the indicated partition has been performed.

**User response**
None. This message is informational.

**IHC01036E**
Partition pppp not authorized, reason is nn

**Explanation**
Partition pppp could not be authorized with DBRC. The reason code nn can be found in message DFS047I.

**System action**
Processing stops.

**User response**
Make the database available by issuing the appropriate IMS commands.

**IHC01037I**
Partition pppp authorization released
Explanation
Partition pppp is no longer authorized for the current function.

System action
None.

User response
None. This message is informational.

IHC01038E   Error during START of ISPF, reason code is xx

Explanation
The ISPF application failed during startup. The code can be 20 to 24.

System action
The application terminated.

User response
Apply the appropriate action based on the reason code:
• Reason code 20: A previous error occurred.
  Save the trace screen and contact IBM Software Support.
• Reason code 21: A trace screen was displayed.
  Save the trace screen and contact IBM Software Support.
• Reason code 22 to 24: An internal error occurred.
  Contact IBM Software Support.

IHC01039E   orphaned split data is nnn

Explanation
When IMS Online Reorganization Facility scanned the primary database to build a shadow copy of the primary index, it detected that there were data portions of split root segments that did not have the corresponding segment portions.

System action
The IMS Online Reorganization Facility job continues.

User response
The number of orphaned split data segments should be small. If you receive this message and the number that is displayed as nnn is 10 or more, it indicates that the primary database might have a problem. Check the primary database.

IHC01040I   Data set dsname not found

Explanation
Dynamic allocation returned an error when allocating the data set named dsname. The data set was not found.

System action
If the data set is essential, the process terminates with error.

User response
The data set name comes from the MDALIB or from the RECON. Correct the data set name in those places and resubmit the job.

IHC01041I   Data set dsname in use

Explanation
Dynamic allocation returned an error when allocating the data set. The data set is allocated in an exclusive state by a different job.

System action
The process terminates.

User response
Wait until the other job releases the data set and resubmit your job.

IHC01042E   Subtask task id has terminated abnormally.

Explanation
The functions of IMS HALDB Toolkit run as subtasks. Some of them might be in parallel. The subtask did not complete normally.

System action
The process is terminated. The final abend code will be U999.

User response
Collect the job output, including the dump, and contact IBM Software Support.

IHC01043E   Abend code is code
Explanation
This message follows IHC01042E to display the abend code.

System action
The process terminates.

User response
Collect the job output, including the dump, and contact IBM Software Support.

IHC01044E Unexpected end of service task

Explanation
The service task task terminated unexpectedly.

System action
The process terminates.

User response
Collect the job output, including the dump, and contact IBM Software Support.

IHC01045I Return code is nnnn

Explanation
The command ended with return code nnnn.

System action
None.

User response
None. This message is informational.

IHC01046E Data set nnnnn is migrated

Explanation
The data set named nnnnn could not be accessed.

System action
Processing stops.

User response
Recall the prior data set and rerun it.

IHC01047E Partition selection module nnnnn not found

Explanation
The PSEXIT command could not find the specified partition selection exit.

System action
Processing stops.

User response
Provide the library containing the exit in the STEPLIB.

IHC01048I Partition selection size set to 2048MB

Explanation
Simulation, conversion, or maintenance of a HALDB was requested, specifying a fixed number of target partitions. However, one of the following conditions occurred:

- ANALYZEPART
  The size of the partitions would exceed 8 GB.
- CONVERT
  The size of the partitions would exceed 4 GB.
- MAINTAIN
  • For a VSAM or OSAM HALDB whose maximum data capacity is 4 GB, the size of the partitions would exceed 4 GB.
  • For an OSAM HALDB whose maximum data capacity is 8 GB, the size of the partitions would exceed 8 GB.

System action
The selection of a fixed number of partitions is ignored. Processing continues with partition size set to 2 GB. This increases the number of partitions beyond the requested number.

User response
None. The simulation, conversion, or maintenance is valid. It is not necessary to restart with a different parameter.

IHC01049E Pointer error detected. Index must be rebuilt.

Explanation
The index pointer healer detected that an index EPS pointer requires healing. The corresponding ILE (the record in the target partition ILDS) was not found.

System action
Index pointer healer stops.
User response
Rebuild the invalid index or ILDS. If the index is invalid, rebuild it using either recovery or a PSINDEX rebuild tool. If the ILDS is invalid, rebuild it using the ILDS tool.

IHC01050E  DD statement ddname not found in JCL

Explanation
The DD statement named ddname is required. It is not present in the JCL.

System action
Processing terminates.

User response
Provide the specified DD statement and resubmit the job.

IHC01051E  HD unload file is from HALDB database

Explanation
The PSEXIT command is using an unload file which is already from a HALDB.

System action
Processing stops.

User response
Provide an unload file from a full-function database.

IHC01052E  Error from Sort

Explanation
Standard sort is used. The sort returned with an error.

System action
Processing terminates.

User response
Collect the sort job output, including the dump, and contact IBM Software Support.

IHC01053E  VSAM func error DD=ddname, RC=rc, RPL feedback=fdbk.

Explanation
The indicated VSAM function experienced an error.

System action
Processing terminates.

User response
Collect the VSAM job output, including the dump, and contact IBM Software Support.

IHC01054E  Key table xxxxx not in project KSDS

Explanation
This is a should-not-occur situation.

System action
Processing stops.

User response
Keep the output listing and contact IBM Software Support.

IHC01055E  Errors in control cards.

Explanation
This message is preceded by other messages that identify errors in control statements.

System action
Processing terminates.

User response
Correct control statement errors and resubmit the job.

IHC01056E  Project KSDS is invalid

Explanation
The project KSDS has been provided through the IHCPROJ DD statement. This data set does not contain the required project information.

System action
Processing stops.

User response
Keep the output listing, and contact IBM Software Support. This JCL has been created by a conversion or maintenance project.

IHC01057E  Data set dsname ignored
Explanation
The IDCAMS rebuild process is attempting to retrieve the data set attributes from existing data sets. The specified data set name \textit{dsname} could not be found.

**System action**
No IDCAMS statements are created for the target file.

**User response**
You must manually allocate the file that is to be copied.

---

**IHC01058I**

\textbf{No pointer to heal in file \textit{ddname}}

Explanation
The pointer healer function was requested. The file indicated that its DD name did not have a pointer to heal.

**System action**
None.

**User response**
None. This message is informational.

---

**IHC01059I**

\textbf{File \textit{ddname} has nnn1 pointer. nnn2 needed healing.}

Explanation
The pointer healer function was requested. The index file \textit{ddname} has \textit{nnn1} pointer. However, only \textit{nnn2} pointer needed healing.

**System action**
None.

**User response**
None. This message is informational.

---

**IHC01060I**

\textbf{Total records in index \textit{xxxxx} are nnnn}

Explanation
The message displays the number of records in index \textit{xxxxx}.

**System action**
None.

---

**IHC01061I**

\textbf{Initial load for DBD \textit{dbd}}

Explanation
The specified DBD is loading the database using a PROCOPT=L PSB.

**System action**
None.

**User response**
None. This message is informational.

---

**IHC01062I**

\textbf{Loading index DBD \textit{dbd}}

Explanation
While the primary database is loaded (see 01061I), the secondary index \textit{dbd} is also loaded.

**System action**
None.

**User response**
None. This message is informational.

---

**IHC01063I**

\textbf{Loading index file \textit{ddname}}

Explanation
The PSINDEX file \textit{ddname} is loaded as part of loading the secondary index.

**System action**
None.

**User response**
None. This message is informational.

---

**IHC01064I**

\textbf{Number of records in file \textit{ddname} is nnn}

Explanation
The PSINDEX file \textit{ddname} has been loaded. The number of records in this file is \textit{nnn}.

**System action**
None.
User response
None. This message is informational.

IHC01065I Application program pgm started/ended

Explanation
The application program pgm is participating in the PROCOPT=L support function. The message shows the start and the end of the program.

System action
None.

User response
None. This message is informational.

IHC01066I PSB is psb

Explanation
The message shows the PSB used by this application.

System action
None.

User response
None. This message is informational.

IHC01067I Application program return code is nnnn

Explanation
The application ended with the specified return code.

System action
None.

User response
None. This message is informational.

IHC01068I IMS version is vers

Explanation
The message shows the IMS version that is currently being used.

System action
None.

User response
None. This message is informational.

IHC01069I DDname ddn is not part of the DBD dbd

Explanation
The DD name ddn was found in the MDA member, but does not belong to the given DBD.

System action
None required; however, you might want to check the DBD to ensure that all other members belong there.

User response
None. This message is informational.

IHC01070E DBD dbd is OSAM, but file allocated is VSAM

Explanation
During data set verification, a mismatch was found between the DBD type and the file type.

System action
Processing stops.

User response
Verify that both your MDA library and your DBD library are correct.

IHC01071E DBD dbd is VSAM, but file allocated as OSAM

Explanation
During data set verification, a mismatch was found between the DBD type and the file type.

System action
Processing stops.

User response
Verify that both your MDA library and your DBD library are correct.

IHC01072E File ddn is OSAM/KSDS/ESDS but should be OSAM/KSDS/ESDS

Explanation
The DD name ddn has an invalid file type.
**IHC01073I**  
**Explanation**  
This message is issued to indicate the start or the end of an IMS Batch region.

**System action**  
Processing stops.

**User response**  
Assign the correct data set to the file indicated by *ddn*.

---

**IHC01074I**  
**Explanation**  
This part of the initial load support function. The PSINDEX file *ddn* is now being sorted and created.

**System action**  
None.

**User response**  
None. This message is informational.

---

**IHC01075E**  
**Explanation**  
The current function unloads a DBD participating in a user-partitioning conversion, when multiple identical DBDs are converted to one HALDB. The high-level qualifier key of each DBD has been specified. The unload function of this DBD now detects that a key is not within its boundaries.

**System action**  
Processing stops.

**User response**  
Begin the boundary selection process again. The initial boundary selection might be incorrect.

**IHC01076I**  
**Explanation**  
This message is related to IHC01075E. It shows the key in process.

**System action**  
Processing stops.

**User response**  
Begin the boundary selection process again. The initial boundary selection might be incorrect.

**IHC01077I**  
**Explanation**  
This message is related to IHC01075E. It shows the lowest key that this DBD is allowed to accept.

**System action**  
Processing stops.

**User response**  
Begin the boundary selection process again. The initial boundary selection might be incorrect.

**IHC01078I**  
**Explanation**  
This message is related to IHC01075E. It shows the highest key that this DBD is allowed to accept.

**System action**  
Processing stops.

**User response**  
Begin the boundary selection process again. The initial boundary selection might be incorrect.

**IHC01079I**  
**Explanation**  
This message is issued during the unload phase. HSSR is used to assist the unload function.

**System action**  
None.

**User response**  
None. This message is informational.
IHC01080I  Start of ddname listing.

Explanation
The specified file is being listed. The possible DD names are DFSVSAMP and DFSHALDB.

System action
None.

User response
None. This message is informational.

IHC01081I  End of ddname listing

Explanation
This message indicates that the listing of the specified file has ended.

System action
None.

User response
None. This message is informational.

IHC01082I  Unloading DBD dbd

Explanation
The database dbd is currently being unloaded.

System action
None.

User response
None. This message is informational.

IHC01083I  Loading DBD dbd

Explanation
The database dbd is currently being loaded.

System action
None.

User response
None. This message is informational.

IHC01084I  nnnn database records read [FINAL]

Explanation
This is a progress message that is issued every 250,000 database records (root segments). The indication of FINAL shows the total amount of database records.

System action
None.

User response
None. This message is informational.

IHC01085E  Error in partition part part, data set ddn

Explanation
This message is accompanied by 01086E or 01087E.

System action
Processing stops.

User response
Keep the output listing, and contact IBM Software Support.

IHC01086E  Expected partition part part

Explanation
The partitioning scheme is out-of-order.

System action
Processing stops.

User response
Keep the output listing, and contact IBM Software Support.

IHC01087E  Status code cc received

Explanation
The status code cc was received as a response from an IMS call.

System action
Processing stops.

User response
The status code may indicate an unavailable database. If this is the case, make the database available and
rerun. In all other cases, keep the output listing and contact IBM Software Support.

**IHC01088E Utility terminates with error**

**Explanation**
An error condition has occurred. Previous messages have been issued to explain the error.

**System action**
Processing stops.

**User response**
Proceed as instructed in previous messages that were issued to explain the error.

**IHC01089I Analyzing DBD dbdname**

**Explanation**
The specified DBD is analyzed.

**System action**
None.

**User response**
None. This message is informational.

**IHC01090E Last partition is already empty**

**Explanation**
The last partition does not contain any data.

**System action**
The request to add an empty partition is discarded.

**User response**
None.

**IHC01091E MDA dbdname DDname ddname not found**

**Explanation**
The MDA member dbdname does not have the specified DD defined.

**System action**
The process terminates.

**User response**
Correct the specified MDA member and resubmit the job.

**IHC01092I DBDGEN complete for DBD dbdname**

**Explanation**
The specified DBD has been compiled and linked.

**System action**
None.

**User response**
None. This message is informational.

**IHC01093E DBD dbdname has external logical relationship.**

**Explanation**
The specified DBD has a logical relationship to a different DBD. This type of relationship is not supported by IMS Online Reorganization Facility therefore, the specified DBD cannot be reorganized with IMS Online Reorganization Facility.

**System action**
Processing terminates.

**User response**
None.

**IHC01094E DBD dbdname has HALDB OLR active.**

**Explanation**
IMS OLR is currently reorganizing this partition. IMS Online Reorganization Facility cannot run with OLR active. This situation can also occur when OLR is
paused. The indication is that both the A-J and M-V data sets are active.

**System action**  
Processing terminates.

**User response**  
Reorganize a different partition or wait until OLR completes to resubmit your job.

**IHC01096E**  
DBD dbdname is HALDB with logical relationship

**Explanation**  
The specified DBD is a HALDB and also has a logical relationship. IMS Online Reorganization Facility can process a HALDB with a logical relationship only if all partitions are processed in the IMS Online Reorganization Facility job.

**System action**  
Processing terminates.

**User response**  
To process all partitions in one IMS Online Reorganization Facility job, specify the PARTITION(*) keyword and resubmit the job.

**IHC01097E**  
DBD dbdname is not registered.

**Explanation**  
The specified DBD is not in DBRC. IMS Online Reorganization Facility requires that the DBDs must be registered. This requirement also applies to the index DBDs.

**System action**  
Processing terminates.

**User response**  
Register this DBD and all its index DBDs and resubmit the job.

**IHC01098E**  
DBD dbdname has conflicting DBRC definitions.

**Explanation**  
The specified DBD does not match its DBRC definition.

**System action**  
Processing terminates.

**User response**  
Compare your DBD to a LIST.RECON of that DBD. Correct the errors and resubmit the job.

**IHC01099E**  
DBD dbdname has dbrc status.

**Explanation**  
The specified DBD has a DBRC status that does not allow the processing of this DBD.

**System action**  
Processing terminates.

**User response**  
Correct the DBRC exception and resubmit the job.

**IHC01100I**  
process started in sub address space

**Explanation**  
The specified process started in a dependent address space.

**System action**  
None.

**User response**  
None. This message is informational.

**IHC01101I**  
process ended in sub address space, return code code

**Explanation**  
The specified process ended in a dependent address space.

**System action**  
None.

**User response**  
None. This message is informational.

**IHC01102E**  
Sub address space terminated abnormally

**Explanation**  
The dependent address space did not end normally.
**System action**
The primary address space terminates. The messages will be displayed in the message file.

**User response**
This message is accompanied by another message that indicates the cause of the error. If you cannot resolve the problem, contact IBM Software Support.

**IHC01103E**  
*DBD dbdname does not have DBDS ddname in DBRC*

**Explanation**
The specified DBD does not have the DBDS record defined in DBRC. The DBD definition in DBRC is incomplete.

**System action**
The process terminates.

**User response**
Add the specified DBDS to the RECON. Use the INIT.DBDS function of the DBRC utility.

**IHC01104E**  
*Dynamic allocation failed, DSN dsname*

**Explanation**
The data set that is indicated by dsname is probably a database data set. The data set name was obtained from the RECON. Additional messages explain the reason for the allocation failure.

**System action**
Processing terminates.

**User response**
Correct the reason for the allocation failure and resubmit the job.

**IHC01105E**  
*DSN dsname is too long.*

**Explanation**
The length of the specified database data set name exceeds the maximum allowable length. Database data set names are appended with ".S", which means that database data set names can be a maximum of 42 characters.

**System action**
Processing terminates.
System action
The process continues.

User response
None. This message is informational.

IHC01110E  HIDAM root segment has compressed key.

Explanation
The root segment of a HIDAM or PHIDAM database is compressed. The compression is not only DATA, but also KEY. IMS Online Reorganization Facility does not allow compressed root keys for HIDAM databases.

System action
Processing terminates.

User response
The database must not have key compression. Remove the key compression by using the offline utilities and perform a DBD change between unload and reload.

IHC01111E  Software for product not available.

Explanation
The named product is required for IMS Online Reorganization Facility to do the reorganization.

System action
Processing terminates.

User response
Add the program library for the specified product to the STEPLIB. Make sure that the library is APF authorized.

IHC01112I  Reloading DD ddname DSN dsname

Explanation
The target data sets that are identified in this message will be used to load the database.

System action
None.

User response
None. This message is informational.

IHC01113E  OPEN failed for DDname ddname.

Explanation
The OPEN operation failed for the DD name indicated by ddname.

System action
Processing terminates.

User response
Collect the output and contact IBM Software Support.

IHC01114I  Secondary index build started or ended.

Explanation
This message indicates that a secondary index build process has either started or has ended.

System action
None.

User response
None. This message is informational.

IHC01115I  DDname ddname found in JCL. It is deallocated.

Explanation
The specified DD statement is allocated internally.

System action
None.

User response
Remove the DD statement from the JCL and resubmit the job.

IHC01116I  Shared index written with index DBD dbdname.

Explanation
The shared secondary index will be assigned to the first DBD.

System action
None.

User response
None. This message is informational.
IHC01117I Pre Reorganization Utility started or ended

Explanation
This message indicates that the prereorganization utility has either started or has ended.

System action
None.

User response
None. This message is informational.

IHC01118I Prefix Resolution started or ended.

Explanation
This message indicates that the prefix resolution has either started or has ended.

System action
None.

User response
None. This message is informational.

IHC01119I Prefix Update started or ended.

Explanation
This message indicates that the prefix update has either started or has ended.

System action
None.

User response
None. This message is informational.

IHC01120E Primary DBD dbdname is NONRECOV.

Explanation
The primary DBD is defined as NONRECOV in DBRC. This is not permitted.

System action
Processing terminates.

User response
Change the DBD to RECOV in DBRC and resubmit the job.

IHC01121E DBD dbdname is not supported for this function.

Explanation
The specified DBD has an unsupported DBD type. HSAM, DEDB, or Index DBDs are not supported.

System action
Processing terminates.

User response
The specified DBD cannot be reorganized with this tool.

IHC01122I IC ddname specified but ignored. DBD is NONRECOV.

Explanation
The specified database DDNAME was specified to be image copied. However, the DBD is defined as NONRECOV. Therefore, an image copy is unnecessary.

System action
None.

User response
If you need an image copy, run the offline utility.

IHC01123E IC ddname is not a valid DDname.

Explanation
The ICDDN keyword specifies a database DD statement. Neither the Primary DBD nor its index DBDs contain this DD.

System action
Processing terminates.

User response
Correct the ICDDN keyword and resubmit the job.

IHC01124E IC ddname DDname icddn specified, but not in JCL.

Explanation
The ICDDN keyword specifies an image copy DD icddn for the database DD ddname. The icddn was not found in the JCL.
**System action**
Processing terminates.

**User response**
Provide a DD statement for the image copy and resubmit the job.

**IHC01125E**  Duplicate DDname *ddname* in ICDDN keyword.

**Explanation**
The ICDDN keyword is used to describe the image copies. The specified DDNAME is used more than once.

**System action**
Processing terminates.

**User response**
Provide a unique DD statement for each image copy and resubmit the job.

**IHC01126E**  Inconsistent shared index *dbdname* DBD. Reason *rsn*.

**Explanation**
Shared secondary indexes are being used. They must point to the same primary DBD to be supported by IMS Online Reorganization Facility. Additionally, all shared secondary indexes must have the same DBDS in DBRC.

**System action**
Processing terminates.

**User response**
Provide a unique file for the image copy and resubmit the job.

**IHC01127E**  No IC1 found for *ddname*.

**Explanation**
The ICDDN keyword for the database DD *ddname* does not have a primary image copy specified.

**System action**
Processing terminates.

**User response**
You cannot specify a secondary IC without a primary IC. Change the ICDDN keyword and resubmit the job.

**IHC01128E**  IC *ddname* DSN for *icddn* too long.

**Explanation**
Dynamic allocation for image copy data sets is being used. The generated *ddname* is too long.

**System action**
Processing terminates.

**User response**
Create a shorter IC data set name and resubmit the job.

**IHC01129E**  IC DDName *ddname* is for database.

**Explanation**
The ICDDN keyword specified a database as target for image copy.

**System action**
Processing terminates.

**User response**
Provide a unique data set name for each image copy and resubmit the job.

**IHC01130E**  DSname for *ddname* is the same as for *ddname*.

**Explanation**
The image copy data sets that are identified by the ICDDN keyword have different DD statements, but have the same data set name.

**System action**
Processing terminates.

**User response**
Provide different data sets for the image copies and resubmit the job.

**IHC01131E**  dsname for *icddn* is the same as for database *ddname*.

**Explanation**
The data set name that was used for an image copy is a database data set name.
**System action**
Processing terminates.

**User response**
Provide a different data set name for the image copy and resubmit the job.

**IHC01132E** GDG *gdgbase* not defined.

**Explanation**
GDG was specified as a data set name for image copy. However, the GDG base does not exist.

**System action**
Processing terminates.

**User response**
Provide a different data set name for the image copy and resubmit the job.

**IHC01133E** Index DBD *dbdname* for primary DBD *dbdname* in error.

**Explanation**
The index DBD that is indicated by *dbdname* for the primary DBD that is indicated by *dbdname* is in error.

**System action**
Processing terminates.

**User response**
Create the GDG base and resubmit the job.

**IHC01134E** NEWDBD DD not in JCL.

**Explanation**
The NEWDBD keyword was specified in the control statement. The specified DD statement has not been provided.

**System action**
Processing terminates.

**User response**
Collect the output, the specified DBD source, and contact IBM Software Support.

**IHC01135E** No DBD specified.

**Explanation**
No DBD keyword was specified in the control statements.

**System action**
Processing terminates.

**User response**
Provide a different data set name for the image copy and resubmit the job.

**IHC01136E** Multiple REORG commands specified

**Explanation**
More than one REORG command was found in IHCSYSIN.

**System action**
Processing terminates.

**User response**
Run each REORG as separate job step.

**IHC01137E** DBD *dbdname* compare error. Reason is: *rsn*

**Explanation**
The NEWDBD keyword was specified in the control statement. The old and new DBD are compared. The new DBD contains changes that are not supported. The reason text provides an explanation.

**System action**
Processing terminates.

**User response**
The changes that can be made to the DBD are restricted when IMS Online Reorganization Facility is used. Use offline utilities for this reorganization.

**IHC01138E** Primary DBD *dbdname* is not in NEWDBD.

**Explanation**
The NEWDBD keyword was specified in the control statements. However, the library does not have the primary DBD in it.

**System action**
Processing terminates.
User response
If you intended to make a DBD change, move your changed DBD to the file that is identified by the NEWDBD keyword.

Explanation
Post reorganization processing failed in phase:

System action
The process terminates.

User response
This error typically occurs during a RESTART process. Because a database data set has been deleted, the database must be recovered.

Explanation
A secondary index has been changed, but the new DBD has not been provided.

System action
The process terminates.

User response
Correct the changed DBD and resubmit the job.

Explanation
The NEWDBD keyword has been specified. The new DBD added external logical relationships which are not supported.

System action
Processing terminates.

User response
Use offline utilities for this process.

Explanation
This message is issued after unload has completed.

System action
None.

User response
None. This message is informational.
**IHC01146I**  Prior job *jobname* at time for DBD *dbdname* in phase *phase*

**Explanation**
This message indicates a pending restart. A previous job ran at the specified time for the specified DBD and stopped at the specified phase.

**System action**
None.

**User response**
None. This message is informational.

---

**IHC01147I**  *(param)* specified for this execution.

**Explanation**
The RESTART function is used.

**System action**
None.

**User response**
None. This message is informational.

---

**IHC01148I**  DBD *dbdname* has non-unique segments

**Explanation**
The DBD has segment types that do not have a sequence field or that have a non-unique sequence field.

**System action**
None.

**User response**
None. This message is informational.

---

**IHC01149E**  IMSACB DD required with **NEWDBD** and **ONLINECHANGE(Y)**.

**Explanation**
The new DBD will be propagated to the online system, which requires the staging library ACBLIB.

**System action**
Processing terminates.

**User response**
Use an offline utility and reorganize all partitions.

---

**IHC01150E**  Invalid **attrib** for ddname DD

**Explanation**
The attributes for a KSDS are invalid.

**System action**
The process terminates.

**User response**
Correct the attributes for the shadow data sets and resubmit the job.

---

**IHC01151I**  Temporary RECON created or deleted.

**Explanation**
A HALDB partition was specified. A temporary RECON was created to define the partitions and the shadow data set names. This RECON is used for the reorganization process.

**System action**
None.

**User response**
None. This message is informational.

---

**IHC01152E**  NEWDBD specified with HALDB database.

**Explanation**
IMS Online Reorganization Facility does not support DBD changes for HALDB databases.

**System action**
Processing terminates.

**User response**
Use an offline utility and reorganize all partitions.

---

**IHC01153E**  ddname DD cannot be a temporary data set.

**Explanation**
A temporary data set was specified for the indicated DD.
**System action**
Processing terminates.

**User response**
Specify a permanent data set and resubmit the job.

**IHC01154E** Unable to load module `modname`.

**Explanation**
The specified module `modname` was not found.

**System action**
Processing terminates.

**User response**
Make the user exit available in the JCL and resubmit the job.

**IHC01155I** Rebuilding primary index.

**Explanation**
A HIDAM or PHIDAM database is being used. The primary index is created in the shadow data set.

**System action**
None.

**User response**
None. This message is informational.

**IHC01156E** Error creating interim LOG

**Explanation**
IMS Online Reorganization Facility was unable to allocate a data set for use as a batch log during the apply process. The allocation parameters of this interim data set are based on the IEFRDER DD statement in the JCL.

**System action**
The IMS Online Reorganization Facility job terminates.

**User response**
Review the preceding messages to determine why the allocation failed. Resolve the allocation problems and resubmit job.

**IHC01157E** Shadow data set for `ddname` too small

**Explanation**
The space allocation for the specified predefined shadow data set was insufficient.

**System action**
The process terminates.

**User response**
Increase the size of the specified data set and resubmit the job.

**IHC01158E** Partition keyword required for HALDB

**Explanation**
A HALDB was specified; however, no partition was specified. You must specify the partition that you want reorganized.

**System action**
The process terminates.

**User response**
Specify a partition with the PARTITION IHCSYSIN DD statement keyword and resubmit the job.

**IHC01159E** Invalid component DSN `dsname`

**Explanation**
The specified dsname is a component name of a VSAM cluster. The dsname is too long to use to create shadow data sets.

**System action**
The process terminates.

**User response**
Shorten the data set name and resubmit the job.

**IHC01160E** Primary DSN `dsname` and shadow have different attributes

**Explanation**
Preallocated shadow data sets were used. The data set attributes of the shadow data sets must match the original data sets. The specified data set attributes and the attributes of the shadow data sets do not match.

**System action**
The process terminates.
User response
Provide the correct attributes. If this data set is an index data set, you probably specified the wrong keylen, key offset, or record length and resubmit the job.

**IHC01161E**  
**HALDB partition name is on M-V data sets**

**Explanation**
The partition that is identified by name is currently on the M-V data sets. IMS Online Reorganization Facility was unable to create a copy of the data sets on the shadow file.

**System action**
IMS Online Reorganization Facility processing terminates.

**User response**
Use an offline reorganization or another IMS Online Reorganization to switch the active data sets, to make them the A-J data sets, and resubmit the job.

**IHC01162E**  
**Invalid subparameter for PTRCHECK keyword**

**Explanation**
The PTRCHECK keyword has a Y or N in the first position and up to four additional parameters. The specified parameters are invalid.

**System action**
The process terminates.

**User response**
Provide valid parameters for the PTRCHECK keyword and resubmit the job.

**IHC01163E**  
**Pointer error detected**

**Explanation**
IMS High Performance Pointer Checker detected a pointer error during the image copy process of the newly reorganized shadow database data sets.

**System action**
Processing terminates.

**User response**
Collect the job output, including the IMS High Performance Pointer Checker output, and contact IBM Software Support.

**IHC01164E**  
**Dynamic allocation failed, DD ddname**

**Explanation**
IMS Online Reorganization Facility was unable to dynamically allocate a required DD. Messages that are issued prior to this one explain the reason for the allocation failure.

**System action**
Processing terminates.

**User response**
Correct the reason for the allocation failure and resubmit the IMS Online Reorganization Facility job.

**IHC01165E**  
**Invalid PARTITION specified**

**Explanation**
A name was entered in the PARTITION keyword, but the partition name is not part of the master DBD.

**System action**
Processing terminates.

**User response**
Correct the partition name and resubmit the IMS Online Reorganization Facility job.

**IHC01166I**  
**DBD dbdname has internal logical relationship**

**Explanation**
This is an informational message that informs you that the dbdname that you specified contains at least one internal logical relationship.

**System action**
Processing continues. IMS Online Reorganization Facility performs any prefix resolution and update processing that is required for the process that is being performed.

**User response**
None. This message is informational.

**IHC01169E**  
**More than 255 RAPS**
Explanation
More than 255 RAPS have been specified for a partition, which exceeds the limit in IMS.

System action
The process terminates.

User response
Specify a smaller amount of RAPS.

IHC01170E Byte limit too large

Explanation
The byte limit exceeded the maximum size, which is 16 MB.

System action
The process terminates.

User response
Specify a smaller byte limit.

IHC01171E DBD dbdname has logical relationship

Explanation
The purpose of the current function is to convert an entire DBDLIB. However, this function does not allow for logically related DBDs.

System action
The DBD is excluded from this process.

User response
Specify a primary DBD.

IHC01172I DBD dbdname was excluded, reason is: reason

Explanation
The current function is to convert an entire DBDLIB. The specified DBD will be excluded from this function due to one or more of the following reasons:
• DBD construct error
• DBD is not supported
• DBD is HALDB
• DBD has logical relation
• Primary index is missing
• Secondary index is missing

System action
Processing terminates.

User response
When this message is issued, it likely indicates that there is a pointer error in the original database data set. Run IMS High Performance Pointer Checker or an equivalent tool against the original database to determine the pointer errors. Resolve the pointer errors and resubmit the IMS Online Reorganization Facility job.

IHC01173I DBD dbdname is an index

Explanation
The specified DBD is a PSINDEX or a secondary index. The selected function does not allow for an index DBD.

System action
The process terminates.

User response
Specify a primary DBD.

IHC01174E Orphaned split segment found

Explanation
When scanning the primary database to build a shadow copy of the primary index, IMS Online Reorganization Facility detected that there was a root that had been split, and the pointer to the data portion was invalid.

System action

User response
When this message is issued, it likely indicates that there is a pointer error in the original database data set. Run IMS High Performance Pointer Checker or an equivalent tool against the original database to determine the pointer errors. Resolve the pointer errors and resubmit the IMS Online Reorganization Facility job.

IHC01175E All partitions required for NONRECOV DBD
Explanation
A nonrecoverable HALDB was specified in the DBD keyword. The command that was specified requires that IMS Online Reorganization Facility change the database to be recoverable during the IMS Online Reorganization Facility processing. IMS Online Reorganization Facility can be run only at the master DBD level for a HALDB, so all partitions must be included in the IMS Online Reorganization Facility processing.

System action
Processing terminates.

User response
Either remove the PARTITION keyword from the command so that all partitions are processed, or manually change the DBD to recoverable and resubmit the IMS Online Reorganization Facility job.

IHC01176E Data set found empty

Explanation
This message is preceded by IHC01085, which identifies the primary database DDname and DSname. One record containing the partition ID and the reorg number should be found.

System action
The process terminates.

User response
Either remove the PARTITION keyword from the command so that all partitions are processed, or manually change the DBD to recoverable and resubmit the IMS Online Reorganization Facility job.

IHC01177E Shadow data set dsname defined as NOREUSE but data set is not empty

Explanation
The specified data set must be empty.

System action
The process terminates.

User response
Either specify the data set as REUSE or DELETE/DEFINE it prior to this process.

IHC01178E Dynamic allocation limit reached. Specify larger DYNAMNBR.

Explanation
The maximum dynamic allocation limit has been reached.

System action
The process terminates.

User response
Specify the DYNAMNBR parameter on your EXEC statement. A value of DYNAMNBR=999 typically resolves this problem.

IHC01179E VIO has been allocated to ddname

Explanation
The current process does not support VIO data sets.

System action
The process terminates.

User response
Specify a unit name that is not VIO. Use the IHCEUNIT member in SIHCSAMP file to locate other unit names that are non-VIO.

IHC01180E Sort work ddname has not enough disk space

Explanation
ddname cannot allocate enough sort work space. The system might be low on work space.

System action
The job fails.

User response
Override the DD with sufficient disk space so that the system can allocate enough sort work space for the DD.

IHC01181W ORF must take IC for ONLINE(Y) work. ICOFF(N) set.

Explanation
ICOFF(N) must be set to process an online database. IMS HALDB Toolkit changed the ICOFF keyword to ICOFF(N).

System action
ICOFF(N) is set and processing continues.
IHC01183E  All partitions required for NOOSAM8G(Y)

**Explanation**
IMS HALDB Toolkit found the NOOSAM8G(Y) parameter on the MAINTAIN command but no PARTITION(*) parameter. You must specify PARTITION(*) when you specify the NOOSAM8G(Y) parameter.

**System action**
The process terminates.

**User response**
Either remove the NOOSAM8G(Y) parameter from the command or specify PARTITION(*).

IHC01184E  NOOSAM8G(Y) cannot be specified for a database registered as NOOSAM8G in RECON

**Explanation**
The NOOSAM8G(Y) parameter cannot be specified for a database that is registered as NOOSAM8G in the RECON data sets.

**System action**
The process terminates.

**User response**
Remove the NOOSAM8G(Y) parameter from the command.

IHC01185E  PARTSIZE must be less than 4096 for a database registered as NOOSAM8G in RECON

**Explanation**
The PARTSIZE value must be less than 4096 when you specify NOOSAM8G(Y).

**System action**
The process terminates.

**User response**
Either remove the NOOSAM8G(Y) parameter or specify a value that is less than 4096 for PARTSIZE.

IHC01186E  PARTSIZE must be less than 4096 when you specify NOOSAM8G(Y)

**Explanation**
The PARTSIZE value must be less than 4096 when you specify NOOSAM8G(Y).

**System action**
The process terminates.

**User response**
Either remove the NOOSAM8G(Y) parameter or specify a value that is less than 4096 for PARTSIZE.

IHC01188E  DBRCOUT for a non-HALDB requires DSNPREF

**Explanation**
The database that is identified from the DBD parameter is a non-HALDB. When a non-HALDB is provided as the input for ANALYZEPART and the DBRCOUT parameter is specified, the DSNPREF parameter must also be specified.

**System action**
The process terminates.

**User response**
Specify the DSNPREF parameter and resubmit the job.

IHC01189E  ddname is not APF authorized

**Explanation**
One or more libraries in the ddname concatenation are not APF authorized.

**System action**
The process terminates.

**User response**
APF authorize all the libraries that are concatenated to the ddname and rerun the job.

IHC01200E  FROMDBD ddname1 TODBD dbdname2 compare failed: reason

**Explanation**
The merge process detected one or more errors. Potential reasons include:
- DBD names are identical
• Segment structure is different
• Segment definition is different
• DBD type is different
• DBD has secondary index
• DBD has logical relation
• DBD has different partition selection exits
• IHCPSEL0 is defined different

**System action**
The process terminates.

**User response**
None. Merging these two HALDBs is not possible.

**IHC01201E**  
**DBD ddname is PSINDEX**

**Explanation**
The specified DBD is an index DBD.

**System action**
The process terminates.

**User response**
A PSINDEX DBD cannot be specified for merging.

**IHC01202E**  
**PGM name not found**

**Explanation**
The specified program was not found.

**System action**
The process terminates.

**User response**
Correct the program name and resubmit the job.

**IHC01203E**  
**PSB name not found**

**Explanation**
The specified PSB was not found.

**System action**
The process terminates.

**User response**
Correct the PSB name and resubmit the job.

**IHC01204E**  
**PSB not found or valid**

**Explanation**
The specified PCB is not in the PSB or does not have PROCOPT=L.

**System action**
The process terminates.

**User response**
Correct the PSB/PCB parameter and resubmit the job.

**IHC01205E**  
**DFSRESLB DD is required to MAINTAIN PSINDEX.**

**Explanation**
When the MAINTAIN function processes PSINDEXes, the function uses DFSURGL0 (HD Reorganization Reload utility) in the DFSRESLB DD to reload databases. Because the DFSRESLB DD statement is not coded in the JCL, IMS HALDB Toolkit attempted to dynamically allocate the DFSRESLB DD statement using the IMS RESLIB library. However, the IMS RESLIB library containing IMS SVC modules was not found in the STEPLIB concatenation so IMS HALDB Toolkit did not allocate the DFSRESLB DD statement.

**System action**
Processing terminates.

**User response**
Specify the IMS RESLIB library containing IMS SVC modules to the STEPLIB DD statement or the DFSRESLB DD statement and rerun the job.

**IHC01206I**  
**A GDG base entry is being created. NAME: GDG_base, LIMIT: nnn**

**Explanation**
The IDCAMS utility is creating a GDG base entry. GDG_base shows the name of the GDG base entry data set, and nnn shows the maximum number of data sets that can be associated with the GDG.

**System action**
None.

**User response**
None. This message is informational.

**IHC01207I**  
**DBD is a HALDB. DBDSRCONLY(Y) is ignored.**
**Explanation**
DBDSRCONLY(Y) is specified. However, IMS HALDB Toolkit ignored this parameter because the DBD is for a HALDB.

**System action**
None.

**User response**
None. This message is informational.

---

**IHC01208I**  
**Explanation**
DBDSRCONLY(Y) is specified. Because the DBD is for a non-HALDB, the parameter is effective and IMS HALDB Toolkit generates DBD source without simulating HALDB conversion.

**System action**
None.

**User response**
None. This message is informational.

---

**IHC01209I**  
**Explanation**
Parameters not related to DBD source generation are ignored.

**System action**
None.

**User response**
None. This message is informational.

---

**IHC01210E**  
**Explanation**
DBDSRCONLY(Y) parameter is specified without the DBDSOURCE parameter. DBDSRCONLY parameter must be used with the DBDSOURCE parameter.

**System action**
Processing stops.

**User response**
Specify the DBDSOURCE parameter and rerun the job.

---

**IHC01211I**  
**Explanation**
DBD is a HALDB. DBDSOURCE is ignored.

**System action**
None.

**User response**
None. This message is informational.

---

**IHC01212I**  
**Explanation**
Any DFSMDA members can be deleted for the old database

**System action**
None.

**User response**
None. This message is informational.

---

**IHC01301W**  
**Explanation**
Dynamic allocation failed, SVC 99 reason code 'xxxx'

**System action**
If the data set is a required data set, then processing terminates. Otherwise, processing continues.
User response
Correct the reason for the allocation failure and resubmit the IMS Online Reorganization Facility job.

**IHC01500W**  
Online Reorg Facility [initialization for imsid | logger exit initialization] failed, RC=xxxx

Explanation
During IMS control region startup, IMS Online Reorganization Facility was not initialized in the IMS subsystem, imsid.

System action
IMS startup continues but IMS Online Reorganization Facility will be active for the IMS subsystem, imsid, only when it is restarted.

User response
Review the previous error messages and try to correct the problem. If you are unable to correct the problem, contact IBM Software Support.

The following table lists the IHC01500W return codes and their meanings.

<table>
<thead>
<tr>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>Unable to locate SCD. Contact IBM Software Support.</td>
</tr>
<tr>
<td>3</td>
<td>Unable to locate IMS Online Reorganization Facility anchor. Logger exit initialization failed.</td>
</tr>
<tr>
<td>4</td>
<td>IEANTRT call failed. The error was returned from IEANTRT.</td>
</tr>
<tr>
<td>5</td>
<td>BDL failed for the required module. Unable to load IMS Online Reorganization Facility module into ECSA. Verify that the complete IMS Online Reorganization Facility library is in the STEPLIB.</td>
</tr>
<tr>
<td>6</td>
<td>LOAD failed for required module. Verify that the complete IMS Online Reorganization Facility library is in the STEPLIB.</td>
</tr>
<tr>
<td>7</td>
<td>Unable to obtain ECSA.</td>
</tr>
<tr>
<td>8</td>
<td>Unsupported IMS release.</td>
</tr>
<tr>
<td>9</td>
<td>Logger exit initialization failed.</td>
</tr>
<tr>
<td>17</td>
<td>Unable to load the HRFYOFxx module or the HRFYOFxx module is not reentrant. Ensure that the IMS Online Reorganization Facility library is in the STEPLIB.</td>
</tr>
</tbody>
</table>

**IHC01501W**  
DEBUG setup failed: reason, RC=xxxx

Explanation
IMS Online Reorganization Facility was unable to start up additional debugging options. The reason specified explains why setup failed.

System action
Processing continues with DEBUG off.

User response
Report the reason and RC to IBM Software Support.

**IHC01502I**  
Online Reorg Facility DEBUG status

Explanation
This informational message indicates that the DEBUG services have been activated or stopped.

System action
None.

User response
None. This message is informational.

**IHC01503I**  
action XCF group groupname as member membername

Explanation
This informational message indicates that the job has either joined or left an XCF group.

System action
None.
User response
Verify that *groupname* is the same group name as other address spaces to be able to communicate with them.

**IHC01504E**  Target IMS system *imsid* is not active on this host

**Explanation**
An IMS Online Reorganization Facility maintenance utility was run on an MVS™ system and the target IMS subsystem, *imsid*, is not active on that MVS system.

**System action**
The IMS Online Reorganization Facility job terminates.

**User response**
Resubmit the job on the same MVS system where the target IMS subsystem is active.

**IHC01505E**  Online Reorg Facility is not active in target IMS system

**Explanation**
An IMS Online Reorganization Facility maintenance utility was run but IMS Online Reorganization Facility is not active in the target IMS subsystem.

**System action**
The IMS Online Reorganization Facility job terminates.

**User response**
Verify that the target IMS subsystem is correct. IMS Online Reorganization Facility must initially be activated in an IMS subsystem with a restart of the IMS control region. Verify that this was done and that the IHC01500I message was issued to indicate that the IMS Online Reorganization Facility was initialized successfully.

**IHC01506W**  DEBUG status for IMS *imsid* already state

**Explanation**
An IMS Online Reorganization Facility utility was run to set the DEBUG state. The DEBUG state for the IMS subsystem was already in the requested state.

**System action**
None. DEBUG status is left in previous state.

**User response**
Verify that the DEBUG status is in the appropriate state.

**IHC01507I**  DEBUG action request for IMS *imsid* completed

**Explanation**
An IMS Online Reorganization Facility utility was run and has successfully changed the DEBUG state for an IMS subsystem.

**System action**
The requested DEBUG state is now in effect for the target IMS subsystem.

**User response**
None. This message is informational.

**IHC01508W**  Unable to install new maintenance: *reason*

**Explanation**
The IMS Online Reorganization Facility maintenance utility was unable to install new maintenance into an IMS online subsystem.

**System action**
The previous maintenance level is still in effect for the IMS subsystem.

**User response**
Correct the *reason* that new maintenance was unable to be installed and resubmit the job.

**IHC01509W**  IMS using ORF library *datasetname*, new maintenance being loaded from *datasetname*

**Explanation**
IMS Online Reorganization Facility maintenance utility is being executed with a different library than the IMS control region was initially started with.

**System action**
New maintenance is installed into the IMS control region from the different library.

**User response**
The next time the IMS subsystem is restarted it will activate IMS Online Reorganization Facility from the library in the control region STEPLIB. If you want the
installation of the new maintenance level to be permanently installed into the IMS subsystem, the new maintenance level must either be copied into the STEPLIB data set for the IMS control region, or the library with the new maintenance level must be added to the STEPLIB of the IMS control region.

**IHC01510I**  
**Online Reorg Facility Vv.r maintenance successfully installed in imsid**

**Explanation**  
This informational message indicates that a new maintenance level has successfully been installed into the *imsid* online IMS subsystem.

**System action**  
The new maintenance level is now in effect in the target IMS subsystem.

**User response**  
None. This message is informational.

**IHC01511E**  
**Target member membername action reason**

**Explanation**  
An attempt to connect to the IMS Online Reorganization Facility or IMS Tools Online System Interface component in an IMS control region address space failed for the specified reason.

**System action**  
The IMS Online Reorganization Facility job terminates.

**User response**  
If the IMS subsystem is down, it must either be restarted or the SUBSYS record must be removed from DBRC. If the IMS subsystem is active, verify that either the IMS Online Reorganization Facility or IMS Tools Online System Interface component was successfully initialized in that subsystem and that the component joined the same XCF group.

**IHC01512I**  
**Connected with target member membername**

**Explanation**  
This informational message indicates that the job has successfully connected to the corresponding member.

**System action**  
Processing continues.

**IHC01513E**  
**ORF subtask failed RC=xxxx**

**Explanation**  
The IMS Online Reorganization Facility subtask in the IMS control region terminated unexpectedly.

**System action**  
IMS Online Reorganization Facility processing in the IMS control region is no longer available.

**User response**  
Contact IBM Software Support. The IMS subsystem must be restarted to reactivate IMS Online Reorganization Facility in that IMS subsystem.

**IHC01514I**  
**capturetype capture for DBD(dbdname) action**

**Explanation**  
This informational message indicates that capturing log or change records for the DBD has either been started or has just ended.

**System action**  
If capture has been activated, the captured records will begin being sent to the remote IMS Online Reorganization Facility utility. If capture has been stopped, no more change records for the DBD will be sent to the IMS Online Reorganization Facility utility.

**User response**  
None. This message is informational.

**IHC01515W**  
**message_type from member membername**

**Explanation**  
An unexpected XCF message was received from the corresponding member. *message_type* shows one of the following values:

- **NEWMBR**  
The member that newly joined the XCF group. This type of message is typically received when an IMS subsystem is started during the reorganization.

- **LOSTCONN**  
The connection to the member was lost. This type of message is typically received when an IMS subsystem terminates during the reorganization or the reorganization job abnormally terminates.
System action

If the IMS Online Reorganization Facility job receives the message, that job terminates. If the message is received in the IMS control region, capturing changes for the remote IMS Online Reorganization Facility utility ends.

User response

None.

IHC01516E XCF buffer limit exceeded

Explanation

The maximum amount of storage for incoming XCF messages has been exceeded; no further incoming XCF messages can be received.

System action

The IMS Online Reorganization Facility job terminates.

User response

The maximum amount of storage that is used for incoming XCF messages is controlled by the XCFMAX parameter in the HRFSETOP member.

This situation is usually the result of the IMS Online Reorganization Facility utility's inability to process the number of captured change records from the IMS control regions. It might be the result of an extreme amount of online activity and of the IMS Online Reorganization Facility utility running at a priority at which it cannot obtain any CPU cycles to receive pending XCF messages.

Resubmit the IMS Online Reorganization Facility job at a higher priority and at a less active time, or set the XCFMAX value slightly higher. This situation might also occur if the IMS Online Reorganization Facility utility does not receive the pending messages when it should. This situation would likely be an outstanding WTOR or CPU loop.

IHC01517E Error encountered during capturetype capture for DBD dbdname: FUNC=function RC=xxxx RSN=xxxx

Explanation

The IMS Online Reorganization Facility was unable to capture a change record for a DBD.

System action

Record capture is terminated for the DBD. The IMS Online Reorganization Facility job is notified of the records that were being captured. The IMS Online Reorganization Facility job abends.

User response

Contact IBM Software Support.

IHC01518E command call failed: RC=xxxx RSN=xxxx

Explanation

The IMS Online Reorganization Facility utility encountered an error when issuing the IMS command, command.

System action

The IMS Online Reorganization Facility utility abends.

User response

Review the return and reason codes that are described in IMS Application Programming EXEC DLI Commands for CICS® and IMS.

IHC01519I Number of records captured was xxxx

Explanation

Number of records captured was xxxx.

System action

None.

User response

None. This message is informational.

IHC01520E calltype call ended with "statuscode status code"

Explanation

When applying captured changes to the reorganized shadow data sets, the IMS Online Reorganization Facility utility encountered an unexpected status code.

System action

The IMS Online Reorganization Facility job abends.

User response

Contact IBM Software Support.
IHC01521W  Error from modulename:  
FUNC=function RC=xxxx RSN=xxxx

Explanation
An error was encountered while capturing records in the IMS control region.

System action
The IMS Online Reorganization Facility job abends.

User response
Contact IBM Software Support.

IHC01522E  DBRC request request for DBD ddname DDN ddname failed, RC=xxxx

Explanation
A DBRC request failed.

System action
The IMS Online Reorganization Facility job abends.

User response
Review the return and reason code listed in the IMS Messages and Codes, Volume 4: IMS Component Codes to see whether it can be corrected. The IMS Online Reorganization Facility job can be restarted and as part of that restart. The DBRC request is also reattempted. If the error cannot be corrected, contact IBM Software Support.

IHC01523E  DBRC request request for LOGDSN datasetname failed, RC=xxxx

Explanation
A DBRC request for a log data set failed.

System action
The IMS Online Reorganization Facility job abends.

User response
Review the return and reason code listed in the IMS Messages and Codes, Volume 4: IMS Component Codes to see whether it can be corrected. The IMS Online Reorganization Facility job can be restarted and the DBRC request will be retried. If the error cannot be corrected, contact IBM Software Support.

IHC01524I  The following jobs currently have DBD dbdname allocated:

Explanation
This message is issued with messages IHC01525I and IHC01526I.

System action
None.

User response
None. This message is informational.

IHC01525I  Jobname jobname IMSID imsid Reg# regionnumber

Explanation
This message is issued with messages IHC01524I and IHC01526I.

System action
None.

User response
None. This message is informational.

IHC01526I  The jobs must be stopped before jobname can continue

Explanation
This message is issued in conjunction with messages IHC01524I and IHC01525I when an IMS Online Reorganization Facility job needs to run the /STOP or /DBRECOVERY command on a DBD and it is unable to do so until the jobs that are listed relinquish control of the DBD. Message IHC01526A follows this message.

System action
None.

User response
None. This message is informational.

IHC01526A  (jobname): Waiting for BMPs (imsid): Reply 'RETRY' or 'CANCEL'

Explanation
This WTOR message is issued after messages IHC01524I, IHC01525I, and IHC01526I. This message indicates that IMS Online Reorganization Facility is trying to issue the /STOP or /DBRECOVERY command on a DBD but the attempt to do so is failing because active BMP jobs exist.
System action
The IMS Online Reorganization Facility job waits for the operator reply. During the wait, the IMS Online Reorganization Facility job makes retry attempts in the background and deletes the WTOR message after a successful retry attempt.

User response
Take one of the following actions:

• Type RETRY to make IMS Online Reorganization Facility immediately retry the attempt.
• Type CANCEL to cancel the reorganization job.
• Type nothing and wait for the listed BMP jobs to end or to be paused, or manually end the BMP jobs so that the control of the DBD is released.

IHC01527W  reply is an invalid reply

Explanation
An invalid response to the previous WTOR was entered.

System action
The previous WTOR is reissued.

User response
Enter a valid reply.

IHC01528I  The reply was reply

Explanation
This informational message indicates the operator response for the previous outstanding WTOR.

System action
Processing continues according to reply.

User response
None. This message is informational.

IHC01529W  Takeover processing delayed due to TAKEOVER(DELAY)

Explanation
TAKEOVER(DELAY) was specified in the control statements. The IMS Online Reorganization Facility job ends without doing takeover processing.

System action
Restart information is saved and the IMS Online Reorganization Facility job ends with RC=4. The original database is left in a DB recovery needed state with PROHIBIT AUTH status set in DBRC.

User response
Determine the reason for delaying the takeover processing. When takeover processing is required, resubmit the IMS Online Reorganization Facility job with TAKEOVER(YES) specified.

IHC01530I  datasetname allocated to DD ddname

Explanation
During restart, IMS Online Reorganization Facility allocates certain DD statements to the data sets that were in effect at the time the previous job terminated. If the ddname is in the JCL that is used to restart the job, it will be deallocated first.

System action
Processing continues.

User response
None. This message is informational.

IHC01531I  TOIrequest request for DBD dbdname action

Explanation
This informational message indicates that IMS Tools System Interface requests have been made and have completed to an IMS control region.

System action
Processing continues.

User response
None. This message is informational.

IHC01532I  Restart information save

Explanation
This informational message is issued before takeover processing to indicate that restart information has been successfully saved in the IMS Online Reorganization Facility restart data set.
System action
Takeover processing begins unless TAKEOVER(DELAY) was specified.

User response
None. This message is informational.

Explanation
An IMS Tools Online System Interface request to the target IMS subsystem failed.

System action
The IMS Online Reorganization Facility job abends.

User response
Review the IMS Tools Online System Interface return and reason codes. There might also be additional messages in the IMS control region that describe why the request failed. The most likely cause is the status of a DBD in the IMS control region. If the problem can be corrected, resubmit the IMS Online Reorganization Facility job. If you are unable to correct the problem, contact IBM Software Support.

Explanation
When applying captured change records to the shadow data sets, IMS Online Reorganization Facility encountered a change record that involved a segment that is not in the DBD for which the IMS Online Reorganization Facility job is running.

System action
The IMS Online Reorganization Facility job abends.

User response
Verify that the DMB used in the online IMS subsystems corresponds to the DBD for which the IMS Online Reorganization Facility job is running.

Explanation
A DBRC request failed.

System action
The IMS Online Reorganization Facility job abends.

User response
Review the return and reason code listed in the IMS Messages and Codes, Volume 4: IMS Component Codes to determine whether it can be corrected. You can restart the IMS Online Reorganization Facility job and the DBRC request will be reattempted. If the error cannot be corrected, contact IBM Software Support.

Explanation
An IMS Online Reorganization Facility job for a DBD was started and there is already an IMS Online Reorganization Facility job for the same DBD active in the IMS subsystem. Only one IMS Online Reorganization Facility job can be executing for a DBD or HALDB partition.

System action
The duplicate IMS Online Reorganization Facility job abends.

User response
Wait for the current IMS Online Reorganization Facility job for the DBD to end before resubmitting a subsequent IMS Online Reorganization Facility job if it is still needed.
Explanation
An IMS Online Reorganization Facility request that was issued to the IMS Tools Online System Interface failed.

System action
The IMS Online Reorganization Facility job terminates.

User response
Review the return codes for IMS Tools Online System Interface. If the return and reason codes indicate a problem that you can fix in the IMS subsystem, correct the problem and resubmit the job. If you cannot fix the problem, contact IBM Software Support.

IHC01539I  Caught up with applying changes, waiting for TAKEOVER Window

Explanation
IMS Online Reorganization Facility has reached the point in the job where it can begin the takeover process. A TAKEOVER window was specified and the begin takeover time has not been reached.

System action
IMS Online Reorganization Facility begins idling until the begin takeover time that was specified is reached. During this idling time, any changes being applied to the original database are still captured and applied to the shadow database.

User response
If no action is taken, IMS Online Reorganization Facility begins the takeover process at the specified time. If you want the takeover performed sooner, you can enter a TAKEOVER command with an MVS MODIFY command. This will cause the takeover process to begin.

IHC01540I  command command was entered

Explanation
An MVS MODIFY or STOP command was entered by an operator for the IMS Online Reorganization Facility job.

System action
If the command is valid, IMS Online Reorganization Facility processes the command.

User response
None. This message is informational.

IHC01541I  Current phase is: phase started at hh:mm:ss

Explanation
This message indicates the current status of the IMS Online Reorganization Facility job. The message is the result of the MONITOR keyword being specified or a MONITOR request on the MODIFY command by an operator.

System action
Processing continues.

User response
None. This message is informational.

IHC01542I  nnnnn type records captured, nnnnn type records applied – nnn %

Explanation
This message is the second part of monitor information. It indicates the number of log records or change records that were captured by the online systems, and how many and what percentage of those records have been applied to the shadow data sets being reorganized. The message is the result of the MONITOR keyword being specified or a MONITOR request on a MODIFY command by an operator.

System action
Processing continues.

User response
None. This message is informational.

IHC01543W  Takeover window has expired

Explanation
The end time that was specified by the TAKEOVER.WINDOW parameter has been reached and IMS Online Reorganization Facility is not yet ready to perform takeover processing for the job.

System action
IMS Online Reorganization Facility will take the action specified by the endaction operand of the TAKEOVER.WINDOW parameter.

User response
If WTOR was specified as the action to take when the takeover window expired, determine the action that
you want to take and reply to message IHC01544I accordingly.

**IHC01544I** Specify action to take: N - keep idling until next window, T - do TAKEOVER when ready, C - continue until TAKEOVER then ask again, A - abend job

**Explanation**
The specified TAKEOVER window has expired and WTOR was specified as the action to take.

**System action**
The IMS Online Reorganization Facility job continues processing and waits for an operator response.

**User response**
Determine the action that you want to take at this time and enter a response through the operator console. The options are:

**N** Indicates that the IMS Online Reorganization Facility job continues processing and tries to perform takeover during the same window on the following day.

**T** Indicates that you want to finish reorganizing the shadow data sets and perform takeover when the job reaches that point.

**C** Indicates that you want to finish reorganizing the shadow data sets and then ask the operator what to do when the takeover point is reached.

**A** Indicates that you want to abend the job.

**IHC01545I** Ready for Takeover

**Explanation**
The IMS Online Reorganization Facility job is ready for takeover.

**System action**
The IMS Online Reorganization Facility job issues IHC01544I and waits for an operator response.

**User response**
See message IHC01544I.

**IHC01546W** Unable to complete ONLINECHANGE – reason

**Explanation**
The Online Reorganization Facility job detected DBD changes. ONLINCHANGE(Y) was in effect, but IMS Online Reorganization Facility was unable to locate any IMSACBA or IMSACBB data sets to copy new ACBs into.

**System action**
The IMS Online Reorganization Facility job continues takeover processing but ends with RC=4. The databases are left in PROHIBIT AUTH state.

**User response**
The new ACBs have been generated into the IMSACB data set. You must manually copy these ACBs into the appropriate IMSACBA and IMSACBB data sets. After copying the ACBs, reset the PROHIBIT AUTH flag in DBRC. In future runs of IMS Online Reorganization Facility, if all online IMS subsystems are down, you can supply the appropriate IMSACBA and IMSACBB DD statements in the IMS Online Reorganization Facility job to identify the appropriate data sets.

**IHC01547E** Backout failed for DBD dbname on imsid – original database is in inconsistent state

**Explanation**
When IMS Online Reorganization Facility was replicating changes that were made to the original database in the online IMS subsystems to the shadow database, the online IMS subsystem encountered an error when it attempted to backout some of the changes that were made to the original database.

**System action**
IMS stops the original database and leaves it with some changes that have not been backed out. The IMS Online Reorganization Facility job cannot determine which changes should or should not be applied to the shadow database, so the job terminates.

**User response**
Correct the problem with the original database and resubmit the IMS Online Reorganization Facility job.

**IHC01548E** Change capture terminated with inflight changes

**Explanation**
IMS Online Reorganization Facility is terminating the apply phase; however, it cannot determine if some of
the captured changes should be committed or if they should be backed out.

**System action**
The IMS Online Reorganization Facility job terminates abnormally.

**User response**
This is likely a logic error in IMS Online Reorganization Facility. Contact IBM Software Support.

---

**IHC01549E** Unexpected return code (return code) from USEREXIT

**Explanation**
During the apply phase, IMS Online Reorganization Facility received the return code from the USEREXIT that was specified in the RELOAD.USEREXIT keyword. The return code is an invalid return code from the USEREXIT.

**System action**
The IMS Online Reorganization Facility job terminates abnormally.

**User response**
Correct the problem with the USEREXIT that caused it to return the invalid return code, and resubmit the IMS Online Reorganization Facility job.

---

**IHC01550E** USEREXIT requested source segment (segment name) in HALDB database be deleted

**Explanation**
During the apply phase, the USEREXIT returned a return code that requested a source segment to be deleted. For HALDBs, IMS Online Reorganization Facility does not support deletion of index source segments.

**System action**
The IMS Online Reorganization Facility job terminates abnormally.

**User response**
Either resubmit the job without the USEREXIT, or change the USEREXIT so that it does not delete any index source segments.

---

**IHC01551E** Another ORF job already running for DBD ddbname

**Explanation**
IMS Online Reorganization Facility is already running for this DBD.

**System action**
The process terminates.

**User response**
None.

---

**IHC01552E** Error saving information in restart data set

**Explanation**
The restart data could not be saved.

**System action**
The process terminates.

**User response**
Contact IBM Software Support.

---

**IHC01553E** nn status code from nnnn call to HSSR for segment segname

**Explanation**
An unexpected status code was received.

**System action**
The process terminates.

**User response**
Contact IBM Software Support.

---

**IHC01554E** dsname not found in catalog

**Explanation**
A database data set that should have been in the catalog was not found.

**System action**
The process terminates.

**User response**
Contact IBM Software Support.

---

**IHC01555E** Information in catalog for dsname is different

---
Explanation
This message is followed by messages IHC01556E and IHC01557E. The allocated and cataloged data sets have discrepancies.

System action
The process terminates.

User response
Contact IBM Software Support.

IHC01556E  type in catalog is/are: text

Explanation
See message IHC01555E.

System action
The process terminates.

User response
Contact IBM Software Support.

IHC01557E  type in this job is/are: text

Explanation
See message IHC01555E.

System action
The process terminates.

User response
Contact IBM Software Support.

IHC01558W  DBs are left in prohibit auth state

Explanation
The takeover process did not finish completely. The databases are left in a prohibit authorization (PROHIBIT AUTH = ON) state.

System action
The process ended.

User response
Complete one of the following tasks depending on the situation:
- If the takeover was delayed because you specified TAKEOVER(DELAY), specify the RESTART(AUTO) keyword and resubmit the job. The process restarts from the Takeover phase to finish the job.
- If the takeover is incomplete because you specified ONLINECHANGE(N), see the preceding IHC01578W message.
- If the takeover is incomplete because of an error, correct the error. Then specify the RESTART(AUTO) keyword and resubmit the job or manually complete the remaining tasks.

IHC01559E  DB dbdname is not in prohibit auth state

Explanation
The specified DBD should still be in prohibit authorization state. However, it is not in that state anymore. The previous IMS Online Reorganization Facility operation did not finish normally.

This problem is probably detected during an IMS Online Reorganization Facility restart operation during which the database was activated by an operator command. The database might have been updated in between two IMS Online Reorganization Facility runs. The current status of the database is not known.

System action
The process terminates.

User response
Collect all output, including output from the previous runs, and check the IMS messages from the CTL and DLISAS region for information that might be related to this database. A time stamp recovery also might be necessary. Contact IBM Software Support.

IHC01560E  SORT|IDCAMS failed, Return code is retcode

Explanation
The call to the specified utility failed. Additional error messages are issued.

System action
The process terminates.

User response
Refer to the additional messages for information about how to resolve this error.

IHC01561E  RESTART data set can only be single volume

Explanation
The file allocation of the restart data set is invalid.
System action
The process terminates.

User response
Resubmit the IMS Online Reorganization Facility restart data set definition.

IHC01562E Unable to locate RECON data sets
Explanation
The RECON data sets were not allocated.

System action
The process terminates.

User response
Provide RECON data sets by:
• Specifying RECON x DDs, or
• Specifying IMSDALIB that has the RECON MDAs

IHC01563E Captured change records out of sequence
Explanation
A sequence error was detected when the captured change records were applied.

System action
The process terminates.

User response
Provide RECON data sets by:
• Specifying RECON x DDs, or
• Specifying IMSDALIB that has the RECON MDAs

IHC01564E Not all DBDs defined to imsid
Explanation
The database definition in the online system is inconsistent. The primary DBD or some index DBDs might be missing.

System action
The process terminates.

User response
Correct the IMS GEN.

IHC01567E DBD dbdname has been allocated by unknown subsystem since IMS Online Reorganization facility stopped capturing changes
Explanation
The database has been allocated since the changes have been applied, but before the takeover process has been started.

System action
The function ends abnormally.

User response
The original database might have been updated. These updates will be lost if a takeover is performed; therefore, restart the process from the beginning.

IHC01568I DBDs not defined to imsid
Explanation
The requested DBDs are not defined in the specified IMS system.

System action
The XCF connection to this IMS system is terminated.

User response
Act on the WTOR.
IHC01569I  DLI batch job: jobname active

Explanation
IMS Online Reorganization Facility detected that the database to reorganize is being accessed by a DLI batch job. This message is followed by message IHC01569A or IHC01571E.

System action
None.

User response
See the subsequent message IHC01569A or IHC01571E.

IHC01569A  (jobname): Waiting for DLI batch jobs to finish. Reply 'C' to cancel

Explanation
This WTOR message is issued after message IHC01569I. This message indicates that the IMS Online Reorganization Facility job is waiting for the DLI batch jobs to stop.

System action
Processing waits for the DLI batch jobs to stop. During the wait, the IMS Online Reorganization Facility job makes retry attempts in the background and deletes the WTOR message after all the DLI batch jobs stop.

User response
Take one of the following actions:
• Type 'C' to cancel the reorganization job.
• Type nothing and wait for the listed DLI batch jobs to end, or manually end the DLI batch jobs so the reorganization job can proceed.

IHC01570E  Waiting for BMPs has expired

Explanation
The number of retry attempts to stop BMP jobs reached the maximum number set by the BMPRETRY parameter in the base configuration module.

System action
The process terminates.

User response
Wait for the BMP jobs that are shown in the WTOR message to end, and resubmit the job. You can increase the maximum number of retry attempts by specifying the BMPRETRY parameter in the base configuration module. If the database is used by long-running BMP jobs, consider enabling BMP job pause handling. For more information, see the topic "BMP pause feature" in the IMS Database Solution Pack IMS Online Reorganization Facility User's Guide.

IHC01571E  Waiting for DLI batch jobs has expired

Explanation
The number of retry attempts to wait for DLI batch jobs reached the maximum number set by the DLIRETRY parameter in the base configuration module.

System action
The process terminates.

User response
Wait for the DL/I batch jobs that are shown in the preceding message IHC01569I to end, and resubmit the IMS Online Reorganization Facility job. You can increase the maximum number of retry attempts by specifying the DLIRETRY parameter in the base configuration module.

IHC01572E  Waiting for database pause has expired

Explanation
An attempt to pause the database has timed out.

System action
The process terminates.

User response
Resubmit the job. If the error persists, contact IBM Software Support.

IHC01573E  Logical DBD dbdname is not specified by the LOGICALDBD keyword.

Explanation
The database was updated by using a PCB that references the indicated logical DBD, but the LOGICALDBD keyword does not specify the logical DBD. Any logical DBD that applications use for update...
during the reorganization must be specified with the LOGICALDBD keyword.

**System action**
Processing terminates.

**User response**
Use the LOGICALDBD keyword to specify the logical DBD.

**IHC01574E**
DBD `dbdname` has insert, delete, or replace rules that are not supported.

**Explanation**
Unsupported path type is specified in the insert, delete, or replace rules of the indicated DBD. For HALDB databases that have internal logical relationships, the following restrictions apply to the insert, delete, and replace rules. The rules are specified by using the RULES= keyword of a SEGM statement in the physical DBD.

- Insert rules L and V are not supported for logical parents. Only the P insert rule is supported.
- Delete rules L and V are not supported for logical parents. Only the P deletion rule is supported.
- Replace rule V is not supported for logical parents.

No restrictions apply to the insert, delete, and replace rules of full-function databases.

**System action**
Processing terminates.

**User response**
None. You cannot use IMS Online Reorganization Facility to process a HALDB DBD with these rules.

**IHC01575E**
Internal message buffer allocation failed.

**Explanation**
IMS Online Reorganization Facility cannot allocate the internal message buffers for receiving XCF messages.

**System action**
Processing terminates.

**User response**
Adjust the size of the internal message buffers by specifying the XCFMAX parameter in the base configuration module. For more information, see the topic “Base configuration parameters” in the IMS Database Solution Pack IMS Online Reorganization Facility User’s Guide.

**IHC01577E**
ONLINECHANGE(N) required because PSBs must be rebuilt.

**Explanation**
The specified DBD change involves changes to PSBs, which requires the ONLINECHANGE(N) keyword.

**System action**
Processing terminates.

**User response**
Specify ONLINECHANGE(N) and resubmit the job. After the job ends, perform any required post-processing tasks.

**IHC01578W**
IMS online change is required.

**Explanation**
IMS Online Reorganization Facility updated the staging ACB library with the new database definition, but the ACBs in online IMS subsystems are not updated.

**System action**
Processing continues.

**User response**
Use the Online Change Copy utility to copy the ACBs from the staging ACB library to the inactive ACB library. Then perform a standard IMS online change.
Unable to change DEBUG status:

Explanation
IMS Online Reorganization Facility could not change the DEBUG state for the target IMS subsystem.

System action
The previous DEBUG state is still in effect for the target IMS subsystem.

User response
Correct the condition reported in the message and resubmit the job.

Database database was not allocated on STA request

Explanation
Database was started on online IMS subsystems, but the database was not allocated due to a dynamic allocation failure. The database will be allocated when it is scheduled.

This message might be issued when a job step that follows the IMS Online Reorganization Facility job step attempts to statically allocate the database data sets. After the database data sets are reorganized, the job will have exclusive use of the database data sets until the job completes. Therefore, even if DISP=SHR is specified in the allocation job step, the online IMS subsystem fails to allocate the database data sets.

System action
Processing continues.

User response
If static allocation of database data set is requested in a subsequent job step, remove that job step and included it in another job.

Number of online IMS subsystems has changed

Explanation
The IMS Online Reorganization Facility job detected a change in the number of online IMS subsystems during reorganization. See the preceding IHC01515W message to determine whether IMS subsystem was started or terminated.

System action
Processing terminates.

User response
If you do not plan to start or shutdown any online IMS subsystems, resubmit the IMS Online Reorganization Facility job. If you received this message as a result of an error or a sudden termination of the IMS control region, correct the problem in the IMS control region and resubmit the IMS Online Reorganization Facility job.

One of dual image copy data sets was not created

Explanation
Dual image copy was requested but either the primary or the secondary image copy data set was not created due to an error in the image copy process.

System action
Processing continues.

User response
To create another copy, use the Create Image Copy (CRC) function of IMS High Performance Image Copy. For more information, see the IMS High Performance Image Copy User's Guide.

Unexpected return code from partition selection exit, FUNC=function, RC=rc

Explanation
The partition selection exit returned an unexpected return code. function is the function code, and rc is the return code from the exit.

System action
Processing stops.

User response
Correct the error in the partition selection exit, and resubmit the IMS Online Reorganization Facility job.

Unexpected return code from TOSI client, MOD=module, FUNC=function, RC=rc, RSN=rsn

Explanation
The IMS Tools Base IMS Tools Online System Interface (TOSI) client returned an unexpected return code. module is the module name, function is the function code, and rc is the return code.
System action
Processing terminates.

User response
Contact IBM Software Support.

IHC01585E  TOSI command security check failed for imsid, CLASS=class, COMMAND=command

Explanation
The IMS HALDB Toolkit job is not authorized to execute the indicated command on the IMS subsystem imsid. class is the security class that is used on the IMS subsystem.

System action
Processing terminates.

User response
Make sure that your user ID has the required authority to issue the command.

IHC01601I  Notification for dbname [partname] has been sent to AD server

Explanation
A system notification was sent to the Autonomics Director server.

System action
Processing continues.

User response
None. This message is informational.

IHC01602W  Notification failed, FUNC=function, RC=rc, RSN=rsn

Explanation
IMS Online Reorganization Facility failed to send the system notification to the Autonomics Director server.

System action
Processing continues.

User response
Ensure that the Autonomics Director server, which the ADXCFGGRP keyword specifies, is started correctly.

IHC01603W  Notification to AD was canceled: reason

Explanation
IMS Online Reorganization Facility did not send a system notification to the Autonomics Director server.

System action
Processing continues. But the system notification to the Autonomics Director server is not sent.

User response
Complete one of the following tasks depending on the reason indicated in the message:

IAVNTFYO LOAD FAILURE
Ensure that the SHKTLOAD library of IMS Tools Base is specified in the STEPLIB concatenations correctly.

INITIALIZATION FAILURE
Ensure that the XCF group name specified with the ADXCFGGRP keyword is correct and the specified Autonomics Director server is correctly configured.

UNSUPPORTED FUNCTION
Ensure that all the conditions for using the ADXCFGGRP keyword are met. For the conditions, see the topic "ADXCFGGRP keyword" in the IMS Database Solution Pack IMS Online Reorganization Facility User’s Guide.

INTERNAL ERROR
Contact IBM Software Support.

IHC01604I  Utility history data for dbname [partname] stored

Explanation
IMS Online Reorganization Facility stored the utility history data for the indicated resource in the IMS Tools KB Sensor Data repository. If the database is a full-function database, dbname is the name of the database. If the database is a HALDB, dbname is the master DBD name, and partname is the name of the HALDB partition.

System action
Processing continues.

User response
None. This message is informational.

IHC01605W  An error occurred in HKTEXST call, FUNC=function, RC=rc, RSN=rsn
Explanation
An error occurred during the IMS Tools KB job statistics API (HKTEXST) call. *function* is the function code, and *rc* and *rsn* are the return code and the reason code from the API.

System action
Processing continues, but the utility history data is not stored in the IMS Tools KB Sensor Data repository.

User response
Contact IBM Software Support.

IHC01606W Utility history data process was canceled. REASON: *reason*

Explanation
An error occurred and the utility history data process was canceled. *reason* is one of the following texts:

- INITIALIZATION FAILURE
- INTERNAL ERROR

System action
Processing continues, but the utility history data is not stored in the IMS Tools KB Sensor Data repository.

User response
Complete one of the following tasks depending on the reason:

INITIALIZATION FAILURE
Ensure that the SHKTLOAD library of IMS Tools Base is included in the STEPLIB concatenation and that the IMS Tools KB server is configured correctly.

INTERNAL ERROR
Contact IBM Software Support.

IHC01611I Reorganization starts for [database *dbname* | partition *partname*]

Explanation
The Conditional Reorganization Support Service (CRSS) determined that the database or the partition requires a reorganization. IMS Online Reorganization Facility is starting the reorganization process for the indicated database or partition.

System action
Processing continues.

User response
Complete the following steps:

1. Check the output from the job.

If the reorganization policy was customized to send exception notification messages by using the z/OS WTO service, the TSO/E SEND command, or through email or texting, check those messages that are issued by the job. Those messages include a job summary message (policy evaluation summary message) that summarizes the result of policy evaluation performed by Policy Services during the job.

For more information, see the topic “Checking the policy evaluation summary message” in the *IMS Database Reorganization Expert User’s Guide*. For information about finding the Diagnosis report that was created by this job and that is stored in the Output repository of IMS Tools Knowledge Base, see the topic “Finding Diagnosis reports by using report completion codes” in the *IMS Database Reorganization Expert User’s Guide*. 

Chapter 30. Messages and codes 343
2. Check the exceptions in the Diagnosis report and identify the cause of the database exceptions.

For more information, see the topic "Identifying the cause of database exceptions" in the IMS Database Reorganization Expert User's Guide.

**IHCO1614I** No exception is detected in [database dbname | partition partname]

**Explanation**
The Conditional Reorganization Support Service (CRSS) evaluated the indicated database or partition and detected no database exceptions.

**System action**
Processing continues.

**User response**
None. This message is informational.

**IHCO1615I** [Database dbname | Partition partname] is reorganized because REORGDIAG is specified

**Explanation**
The indicated database or partition is reorganized regardless of its status because the job runs in Reorganization Diagnosis mode.

**System action**
Processing continues.

**User response**
None. This message is informational.

**IHCO1616W** An error occurred in BBECRAPI call, FUNC=function, RC=rc, RSN=rsn

**Explanation**
An error occurred during the Conditional Reorganization Support Service (CRSS) API call. function is the function code, and rc and rsn are the return code and the reason code from the API.

**System action**
Processing continues.

**User response**
The detail of the error or the warning is recorded in the journal messages that are issued by the CRSS. Correct the error and rerun the job.

**IHCO1617W** Conditional Reorg service is deactivated. REASON: reason

**Explanation**
The Conditional Reorganization Support Service (CRSS) cannot continue the job because of the reason displayed.

**System action**
The processing continues without the CRSS. If the job runs in either Conditional Reorganization mode or Reorganization Diagnosis mode, IMS Online Reorganization Facility reorganizes the database regardless of database status, but the CRSS does not generate a Diagnosis report.

**User response**
Complete one of the following tasks depending on the reason:

- **BBECRI00 LOAD FAILURE**
  Ensure that the IMS Database Reorganization Expert load library is included in the STEPLIB concatenation.

- **INITIALIZATION FAILURE**
  Ensure that Policy Services is configured correctly.

- **ITKB INIT FAILURE**
  Ensure that the SHKTLOAD library of IMS Tools Base is included in the STEPLIB concatenation and that the Tools KB Server is configured correctly.

- **ITKBSERVER NOT SPECIFIED**
  Ensure that the ITKBSERVER keyword is specified in the HRFSYSIN DD statement.

- **UNSUPPORTED FUNCTION**
  Ensure that all of the following conditions for the CRSS are met:
  - The primary database to reorganize is a full-function database or a single partition of a HALDB.
  - The primary database to reorganize is not an index database.
  - TAKEOVER(N) is not specified in the REORG HRFSYSIN DD statement.
  - DBD change is not requested.

- **INTERNAL ERROR**
  Contact IBM Software Support.
IHC01701E  HPSCCATI API failed, RC=rc, RSN=rsn

Explanation
Received an error from the HPSCCATI API. rc and rsn are the return code and the reason code in decimals.

System action
Processing terminates.

User response
Contact IBM Software Support.

IHC01702I  IMS management of ACBs is enabled

Explanation
The IMS management of ACBs is enabled.

System action
Processing continues.

User response
None. This message is informational.

IHC01703E  GEX$CATQ API failed, RC=rc, RSN=rsn, DBD=dbd

Explanation
Received an error from the GEX$CATQ API. The return code from the macro call was rc and the reason code was rsn. For the reason of the error, see the preceding messages with the GEX prefix that were issued by GEX $CAQ API.

System action
Processing terminates.

User response
Locate preceding error messages and identify the cause of the error.

IHC01704E  The specified DBD is for an IMS catalog database. IMS DD statement is required.

Explanation
The database specified on the DBD parameter is the IMS catalog database, and the IMS management of ACBs is enabled.

System action
Processing terminates.

User response
If you want to process the IMS catalog database, disable the IMS management of ACBs, specify the IMS DD statement and rerun the job.

IHC01705E  Failed to process IMS-managed ACBs. REASON: reason

Explanation
IMS HALDB Toolkit failed to process IMS managed ACBs because of the reason displayed.

System action
Processing terminates.

User response
Perform the action that corresponds to the reason shown in the message and rerun the job.

CATALOG OPEN FAILURE
Ensure that the IMS Tools Generic Exits load library is included in the STEPLIB concatenation.

If the reason is not in this list, contact IBM Software Support.
Chapter 31. Gathering diagnostic information

Before you report a problem with IMS HALDB Toolkit to IBM Software Support, you need to gather the appropriate diagnostic information.

Procedure

Provide the following information for all IMS HALDB Toolkit problems:

- A clear description of the problem and the steps that are required to re-create the problem
- All messages that were issued as a result of the problem
- The trace file or trace panel. For more information, see “Trace file or trace panel” on page 297.
- Product release number and the number of the last program temporary fix (PTF) that was installed
- The version of IMS that you are using and the type and version of the operating system that you are using
This information was developed for products and services offered in the U.S.A.

This material may be available from IBM in other languages. However, you may be required to own a copy of the product or product version in that language in order to access it.

IBM may not offer the products, services, or features discussed in this document in other countries. Consult your local IBM representative for information on the products and services currently available in your area.
