IBM Tivoli OMEGAMON XE for DB2 Performance Expert on z/OS
IBM Tivoli OMEGAMON XE for DB2 Performance Monitor on z/OS
Version 5.4.0

Report Reference

IBM
IBM Tivoli OMEGAMON XE for DB2 Performance Expert on z/OS
IBM Tivoli OMEGAMON XE for DB2 Performance Monitor on z/OS
Version 5.4.0

Report Reference

IBM
First edition, December 2016

This edition applies to the following releases and to all subsequent releases and modifications until otherwise indicated in new editions:

- IBM Tivoli OMEGAMON XE for DB2 Performance Expert on z/OS, version 5, release 4, modification 0 (5655-W37)
- IBM Tivoli OMEGAMON XE for DB2 Performance Monitor on z/OS, version 5, release 4, modification 0 (5655-W38)

This edition replaces SH12-7047-01.

What's new .............................................. xxxiii

Part 1. OMEGAMON XE for DB2 PE Logs

Chapter 1. DPMLOG Execution Log ........................ 1-1
  The DPMLOG Execution Log Header ......................... 1-2
  Field Descriptions ................................ 1-3

Chapter 2. Exception Log ................................ 2-1
  How to generate an Exception Log ......................... 2-2
  Example of the Exception Log ............................. 2-3
    The Exception Log Header ............................. 2-4
    Field Descriptions ................................ 2-5

Chapter 3. Job Summary Log .............................. 3-1
  How to Generate the Job Summary Log ..................... 3-2
  Example of the Job Summary log .......................... 3-3
    The Job Summary Log Header .......................... 3-4
    Field Descriptions ................................ 3-5
  Job Summary VSAM Data Set .............................. 3-6

Chapter 4. IFCID Frequency Distribution Log .............. 4-1
  How to Generate an IFCID Frequency Distribution Log .... 4-2
  Example of the IFCID Frequency Distribution Log ........ 4-3
    The IFCID Frequency Distribution Log Header .......... 4-4
    Field Descriptions ................................ 4-5

Part 2. Accounting Report Set

Chapter 5. Accounting Default Layouts .................. 5-1
  Headers Used in Accounting ............................. 5-2
  How Averages Are Calculated ............................ 5-4
  Accounting Report - Short ............................. 5-5
    General (Short Report) .............................. 5-12
    Package General (Short Report) ...................... 5-17
    Distributed Activity Server (Short Report) ........ 5-20
    Distributed Activity Requester (Short Report) .... 5-24
  Accounting Trace - Short ............................. 5-27
    General (Short Trace) .............................. 5-42
    Package General (Short Trace) ...................... 5-49
    Distributed Activity Server (Short Trace) .......... 5-51
    Distributed Activity Requester (Short Trace) .... 5-54
### Chapter 34. Locking Trace

<table>
<thead>
<tr>
<th>Section</th>
<th>Page</th>
</tr>
</thead>
<tbody>
<tr>
<td>Deadlock Trace</td>
<td>34-1</td>
</tr>
<tr>
<td>Trace Data Specific to Deadlock Event</td>
<td>34-3</td>
</tr>
<tr>
<td>Deadlock Trace Example</td>
<td>34-4</td>
</tr>
<tr>
<td>Timeout Trace</td>
<td>34-5</td>
</tr>
<tr>
<td>Trace Data Specific to Timeout Event</td>
<td>34-7</td>
</tr>
<tr>
<td>Timeout Trace Example</td>
<td>34-9</td>
</tr>
<tr>
<td>Lockout Trace</td>
<td>34-11</td>
</tr>
<tr>
<td>Lock Suspension Trace</td>
<td>34-13</td>

</tr>
<tr>
<td>IFCID 001 - CPU Time Data</td>
<td>40-3</td>
</tr>
<tr>
<td>IFCID 001 - DB2 Command Data</td>
<td>40-4</td>
</tr>
<tr>
<td>IFCID 001 - DDF Data by Location</td>
<td>40-5</td>
</tr>
</tbody>
</table>

Contents vii
IFCID 001 - Destination Related Data ................................. 40-36
IFCID 001 - Global DDF Data ........................................... 40-38
IFCID 001 - IFCID Data ................................................ 40-42
IFCID 001 - Log Manager Data ........................................ 40-43
IFCID 001 - Subsystem Services Data ............................ 40-48
IFCID 001 - QSST Data ................................................ 40-53
IFCID 001 - QVAS Data ................................................. 40-54
IFCID 001 - QVLS Data ................................................ 40-55
IFCID 001 - z/OS Metrics ............................................. 40-59
IFCID 002 - DB2 Statistics ............................................. 40-62
IFCID 002 - Accelerator Data - Prior to V4 .................... 40-64
IFCID 002 - Accelerator Data - Subsystem/Group Perspective V4 or later ........................................... 40-69
IFCID 002 - Accelerator Data - Accelerator Perspective V4 or later ........................................... 40-74
IFCID 002 - Accelerator SQL Call Data V4 or later ........ 40-78
IFCID 002 - Buffer Pool Activity .................................... 40-79
IFCID 002 - Data Manager Data ...................................... 40-96
IFCID 002 - Data Sharing Locking Data ......................... 40-102
IFCID 002 - Dynamic SQL Statement ......................... 40-105
IFCID 002 - EDM Pool Data ........................................ 40-107
IFCID 002 - Group Buffer Pools Activity Data ................ 40-113
IFCID 002 - Locking Data ............................................. 40-123
IFCID 002 - Miscellaneous ......................................... 40-127
IFCID 002 - Nested SQL Activity .................................... 40-129
IFCID 002 - Query Parallelism ...................................... 40-131
IFCID 002 - RID List Processing ................................... 40-135
IFCID 002 - ROWID .................................................. 40-137
IFCID 002 - Service Controller Data ............................. 40-138
IFCID 002 - Simulated Buffer Pool Activity ................. 40-146
IFCID 002 - SQL Call Data ......................................... 40-148
IFCID 003 - Accounting ................................................ 40-157
IFCID 003 - Accelerator Data ....................................... 40-159
IFCID 003 - Accelerator SQL Call Data V4 or later ......... 40-162
IFCID 003 - Buffer Manager Accounting Data ................. 40-164
IFCID 003 - Data Sharing Accounting Data ................. 40-168
IFCID 003 - Data Sharing Locking Data ....................... 40-169
IFCID 003 - DDF Data by Location .............................. 40-171
IFCID 003 - Dynamic SQL Statement ......................... 40-177
IFCID 003 - Group Buffer Pools Activity Data .......... 40-179
IFCID 003 - IFI Class 5 Times and Data Capture ........ 40-182
IFCID 003 - Initial Client/Server Correlation Data .......... 40-184
IFCID 003 - Initial DB2 Requester and MVS Correlation Data ................................. 40-187
IFCID 003 - Instrumentation Accounting Data .......... 40-190
IFCID 003 - Instrumentation Accounting Data Overflow .... 40-206
IFCID 003 - Locking Data .............................................. 40-210
IFCID 003 - Logging .................................................... 40-214
IFCID 003 - Miscellaneous ......................................... 40-215
IFCID 003 - Nested SQL Activity .................................... 40-216
IFCID 003 - Query Parallelism ...................................... 40-218
IFCID 003 - Resource Limit Facility ............................. 40-219
IFCID 003 - RID List Processing ................................... 40-221
IFCID 003 - Rollup Accounting Correlation Block ......... 40-222
IFCID 003 - ROWID .................................................. 40-223
IFCID 003 - SQL Call Data ....................................... 40-224
IFCID 004 - Trace Start .............................................. 40-225
IFCID 005 - Trace Stop ............................................... 40-226
IFCID 006 - Read I/O Start ...................................... 40-227
IFCID 007 - Read I/O Stop ....................................... 40-229
IFCID 008 - Write I/O Synch ...................................... 40-231
IFCID 009 - Write I/O ................................................ 40-233
IFCID 010 - Write I/O Async ..................................... 40-234
IFCID 011 - Validate Exit ........................................... 40-236

viii  OMEGAMON XE for DB2 PE & PM: Report Reference
IFCID 012 - Edit Exit to Encode .................................................. 40-237
IFCID 013 - Hash Scan Input Start ........................................... 40-238
IFCID 014 - Hash Scan End ...................................................... 40-240
IFCID 015 - Index Scan Begin .................................................. 40-241
IFCID 016 - Insert Scan Begin .................................................. 40-243
IFCID 017 - Sequential Scan Begin ........................................... 40-245

About this information

This information provides a detailed description of each report.

This information shows the reports produced by the following products:
• IBM® Tivoli® OMEGAMON® XE for DB2® Performance Expert on z/OS®
• IBM Tivoli OMEGAMON XE for DB2 Performance Monitor on z/OS

It gives examples of each report and describes the fields shown.

Note: In descriptions that apply to both, IBM Tivoli OMEGAMON XE for DB2 Performance Monitor on z/OS and IBM Tivoli OMEGAMON XE for DB2 Performance Expert on z/OS, the term OMEGAMON XE for DB2 PE is used for both.

Use this information to interpret OMEGAMON XE for DB2 PE reports. This information also supplies background and tuning information, where appropriate. If you need more conceptual information about OMEGAMON XE for DB2 PE reports and how reports are produced, refer to Reporting User’s Guide. For information about OMEGAMON XE for DB2 PE commands and command syntax, refer to Report Command Reference.

Always check the IBM DB2 and IMS™ Tools Library web page and the Tivoli library page for the most current version of this information:
• Tivoli OMEGAMON XE for DB2 Performance Expert on z/OS (PDFs and Techdocs on DB2 Tools Product Page)
• Tivoli OMEGAMON XE for DB2 Performance Monitor on z/OS (PDFs and Techdocs on DB2 Tools Product Page)

The technical changes for this edition are summarized under “What’s new” on page xxxiii. Specific changes since the previous edition of this information are indicated by a vertical bar (|) to the left of a change. Editorial changes that have no technical significance are not noted.

“Who should read this information” on page xx
This information is for anyone who uses OMEGAMON XE for DB2 PE reports and traces to monitor DB2.

“Terminology used in this information” on page xxi
This topic introduces the terminology used in this information.

“Conventions used in the OMEGAMON documentation” on page xxii
This information uses several conventions for special terms and actions, and operating system-dependent commands and paths.
Who should read this information

This information is for anyone who uses OMEGAMON XE for DB2 PE reports and traces to monitor DB2.

You can monitor activities for:
- Determining DB2 system performance and efficiency
- Tuning DB2
- Identifying bottlenecks
- Measuring an application's performance and resource cost
- Evaluating the effects of application on other applications and the system
### Terminology used in this information

This topic introduces the terminology used in this information. Table 1 shows the terminology used in this information.

**Table 1. Terminology used in this information**

<table>
<thead>
<tr>
<th>Terms used in this information ...</th>
<th>... are abbreviated to or hereafter referred to as ...</th>
</tr>
</thead>
<tbody>
<tr>
<td>IBM Tivoli OMEGAMON XE for DB2 Performance Expert on z/OS</td>
<td>OMEGAMON XE for DB2 PE</td>
</tr>
<tr>
<td>IBM Tivoli OMEGAMON XE for DB2 Performance Monitor on z/OS</td>
<td>OMEGAMON XE for DB2 PM</td>

</tbody>
</table>
Conventions used in the OMEGAMON documentation

This information uses several conventions for special terms and actions, and operating system-dependent commands and paths.

Panels and figures

The panels and figures in this document are representations. Actual product panels might differ.

Symbols

The following symbols might appear in command syntax:

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The or symbol is used to denote a choice. You can use the argument on the left or the argument on the right. For example: YES</td>
</tr>
<tr>
<td>In this example, you can specify YES or NO.</td>
<td></td>
</tr>
<tr>
<td>( )</td>
<td>Denotes optional arguments. Arguments that are not enclosed in square brackets are required. For example: APPDEST DEST (ALTDEST)</td>
</tr>
<tr>
<td>In this example, DEST is a required argument and ALTDEST is optional.</td>
<td></td>
</tr>
<tr>
<td>{ }</td>
<td>Some documents use braces to denote mandatory arguments, or to group arguments for clarity. For example: COMPARE {workload} - REPORT={SUMMARY</td>
</tr>
<tr>
<td>In this example, the workload variable is mandatory. The REPORT keyword must be specified with a value of SUMMARY or HISTOGRAM.</td>
<td></td>
</tr>
<tr>
<td>_</td>
<td>Default values are underscored. For example: COPY infile outfile - [COMPRESS={YES</td>
</tr>
<tr>
<td>In this example, the COMPRESS keyword is optional. If specified, the only valid values are YES or NO. If omitted, the default is YES.</td>
<td></td>
</tr>
</tbody>
</table>

Notation conventions

The following conventions are used when referring to high-level qualifiers:

hilev A high-level qualifier. The high-level qualifier is the first prefix or set of prefixes in the data set name. Site-specific high-level qualifiers are shown in italics.

For example:
- thilev refers to the high-level qualifier for your target data set.
- rilev refers to the high-level qualifier for your runtime data set.
- For members in target libraries, the high-level qualifier is thilev rather than rilev.
- silev refers to the SMP/E library high-level qualifier.
**Typeface conventions**

This information uses the following typeface conventions:

**Bold**
- Interface controls (check boxes, push buttons, radio buttons, spin buttons, fields, folders, icons, list boxes, items inside list boxes, multicolumn lists, containers, menu choices, menu names, tabs, property sheets), labels (such as **Note**):
- Keywords and parameters in text

**Italic**
- Words defined in text
- Emphasis of words (for example: Use the word *that* to introduce a restrictive clause.)
- New terms in text (except in a definition list)

**Monospaced**
- Examples and code examples
- File names, programming keywords, and other elements that are difficult to distinguish from surrounding text
- Message text and prompts addressed to the user
- Text that the user must type
- Values for arguments or command options

**Significant elements**

**Recommendation**
Provides guidance when more than one option is available.

**Related reading**
Refers you to other publications that contain relevant information.

**Requirement**
Identifies a condition that must be met to ensure that the product is functional.

**Restriction**
Identifies a restriction or limitation with this product or an associated procedure.

"Terminology used" on page xxv
IBM Tivoli OMEGAMON XE for DB2 Performance Monitor on z/OS can be considered as a functional subset of IBM Tivoli OMEGAMON XE for DB2 Performance Expert on z/OS. Therefore the abbreviation OMEGAMON XE for DB2 PE or DB2 PE is used for both products. If a distinction is required, OMEGAMON XE for DB2 PM or DB2 PM is used explicitly.

"How to read syntax diagrams" on page xxvi
The rules in this section apply to the syntax diagrams that are used in this publication.

"Where to find information" on page xxviii
You can access the documentation in several ways.

"Service updates and support information" on page xxix
You can access support information for IBM Tivoli OMEGAMON XE for DB2 Performance Expert on z/OS and IBM Tivoli OMEGAMON XE for DB2 Performance Monitor on z/OS on the Support home website, or you can use the IBM Support Assistant.
Accessibility features help people with a physical disability, such as restricted mobility or limited vision, or with other special needs, to use software products successfully. This Knowledge Center is developed to comply with the accessibility requirements of software products according to Section 508 of the Rehabilitation Act of the United States.

Your feedback is important in helping to provide the most accurate and high-quality information.
Terminology used

IBM Tivoli OMEGAMON XE for DB2 Performance Monitor on z/OS can be considered as a functional subset of IBM Tivoli OMEGAMON XE for DB2 Performance Expert on z/OS. Therefore the abbreviation OMEGAMON XE for DB2 PE or DB2 PE is used for both products. If a distinction is required, OMEGAMON XE for DB2 PM or DB2 PM is used explicitly.

The following table shows the products that are described in this publication and the short names with which they are referred to throughout this publication:

Table 2. Product names and their short names

<table>
<thead>
<tr>
<th>Product name</th>

<tr>
<td>IBM DB2 database for z/OS</td>
<td>DB2</td>
</tr>
</tbody>
</table>

- Performance Expert Client and Workstation Online Monitor designate the client component of DB2 PE.
  Prior to Version 5.4.0 the client component of DB2 PE also designated the end-user interface of Performance Expert for Multiplatforms, Performance Expert for Workgroups, and DB2 PE.
- OMEGAMON Collector designates the server component of DB2 PE.
How to read syntax diagrams

The rules in this section apply to the syntax diagrams that are used in this publication.

Arrow symbols

Read the syntax diagrams from left to right, from top to bottom, following the path of the line.

►► Two right arrows followed by a line indicate the beginning of a statement.

►► One right arrow at the end of a line indicates that the statement syntax is continued on the next line.

►► One right arrow followed by a line indicates that a statement is continued from the previous line.

►► A line followed by a right arrow and a left error indicates the end of a statement.

Conventions

- SQL commands appear in uppercase.
- Variables appear in italics (for example, column-name). They represent user-defined parameters or suboptions.
- When entering commands, separate parameters and keywords by at least one blank if there is no intervening punctuation.
- Enter punctuation marks (slashes, commas, periods, parentheses, quotation marks, equal signs) and numbers exactly as given.
- Footnotes are shown by a number in parentheses, for example, (1).

Required items

Required items appear on the horizontal line (the main path).

►►REQUIRED-ITEM

Optional items

Optional items appear below the main path.

►►REQUIRED-ITEM

If an optional item appears above the main path, that item has no effect on the execution of the statement and is used only for readability.

►►REQUIRED-ITEM

Multiple required or optional items

If you can choose from two or more items, they appear vertically in a stack. If you must choose one of the items, one item of the stack appears on the stack main path.

►►REQUIRED-ITEM
If choosing one of the items is optional, the entire stack appears below the main path.

```
►►
required-choice1
required-choice2
►◄
```

**Repeatable items**

An arrow returning to the left above the main line indicates that an item can be repeated.

```
►►REQUIRED-ITEM
repeatable-item
►◄
```

If the repeat arrow contains a comma, you must separate repeated items with a comma.

```
►►REQUIRED-ITEM
repeatable-item
►◄
```

If the repeat arrow contains a number in parenthesis, the number represents the maximum number of times that the item can be repeated.

```
►►REQUIRED-ITEM
(5)
repeatable-item
►◄
```

A repeat arrow above a stack indicates that you can specify more than one of the choices in the stack.

**Default keywords**

IBM-supplied default keywords appear above the main path, and the remaining choices are shown below the main path. In the parameter list following the syntax diagram, the default choices are underlined.

```
►►
default-choice

Where to find information

You can access the documentation in several ways.

The documentation for this product is provided in PDF and in HTML format at the following websites:

- Tivoli OMEGAMON XE for DB2 Performance Expert on z/OS
- Tivoli OMEGAMON XE for DB2 Performance Monitor on z/OS

Ordering publications

You can order many IBM publications such as product manuals or IBM Redbooks® online at the IBM Publications Center website.

You can also order by telephone by calling one of the following numbers:

- In the United States: 800-879-2755
- In Canada: 800-426-4968

In other countries, contact your software account representative to order Tivoli publications.

Accessing terminology online

The IBM Terminology website consolidates the terminology from IBM product libraries in one convenient location.
Service updates and support information

You can access support information for IBM Tivoli OMEGAMON XE for DB2 Performance Expert on z/OS and IBM Tivoli OMEGAMON XE for DB2 Performance Monitor on z/OS on the Support home website, or you can use the IBM Support Assistant.

Support home

On the Support home website, you can find service updates and support information including software fix packs, PTFs, Frequently Asked Questions (FAQs), technical notes, troubleshooting information, and downloads.
Accessibility features

Accessibility features help people with a physical disability, such as restricted mobility or limited vision, or with other special needs, to use software products successfully. This Knowledge Center is developed to comply with the accessibility requirements of software products according to Section 508 of the Rehabilitation Act of the United States.

The accessibility features in this Knowledge Center enable users to do the following tasks:

- Use assistive technologies, such as screen-reader software and digital speech synthesizer, to hear what is displayed on the screen. In this Knowledge Center, all information is provided in HTML format. Consult the product documentation of the assistive technology for details on using assistive technologies with HTML-based information.
- Operate specific or equivalent features using only the keyboard.
- Magnify what is displayed on the screen.

In addition, all images are provided with alternative text so that users with vision impairments can understand the contents of the images.

Navigating the interface by using the keyboard

Standard shortcut and accelerator keys are used by the product and are documented by the operating system. Refer to the documentation provided by your operating system for more information.

Magnifying what is displayed on the screen

You can enlarge information in the product windows using facilities provided by the operating systems on which the product is run. For example, in a Microsoft Windows environment, you can lower the resolution of the screen to enlarge the font sizes of the text on the screen. Refer to the documentation provided by your operating system for more information.
How to send your comments

Your feedback is important in helping to provide the most accurate and high-quality information.

If you have any comments about this information or any other documentation, you can complete and submit the Reader Comment Form.
What's new

This topic summarizes the significant improvements or enhancements for the product and refers you to the relevant topics for more information.

SH12-7065-00 — December 2016

This edition replaces IBM Tivoli OMEGAMON XE for DB2 Performance Expert on z/OS; IBM Tivoli OMEGAMON XE for DB2 Performance Monitor on z/OS: Report Reference, SH12-7047-01.

- Clarifications and corrections have been applied to the information where required.
- Existing block samples and descriptions have been refreshed.
- OMEGAMON XE for DB2 PE version 5.4 supports DB2 10 or later. References to DB2 9 have been removed.

- The following sections of the SQL Activity Report and Trace Blocks have been updated:
  - “Report and Trace Details” on page 46-3
  - “Field Descriptions of SQL Activity Detail Report and Trace Details” on page 46-5
  - “Scan Activity” on page 46-35
  - “Example of a Member-Scope Audit Detail Report and Trace (Type AUTHCNTL)” on page 9-3
  - “SQL Activity Trace Summarized by Occurrence, sorted by ELAPSED_TIME” on page 45-6

- The following IFCID descriptions have been updated:
  - “IFCID 001 - DB2 Command Data” on page 40-25
  - “IFCID 001 - DDF Data by Location” on page 40-32
  - “IFCID 001 - QVLS Data” on page 40-55
  - “IFCID 002 - Accelerator Data - Accelerator Perspective V4 or later” on page 40-74
  - “IFCID 002 - Accelerator Data - Prior to V4” on page 40-64
  - “IFCID 002 - Buffer Pool Activity” on page 40-79
  - “IFCID 002 - Data Manager Data” on page 40-96
  - “IFCID 002 - Data Sharing Locking Data” on page 40-102
  - “IFCID 002 - Dynamic SQL Statement” on page 40-105
  - “IFCID 002 - EDM Pool Data” on page 40-107
  - “IFCID 002 - Locking Data” on page 40-123
  - “IFCID 002 - Group Buffer Pools Activity Data” on page 40-113
  - “IFCID 002 - Miscellaneous” on page 40-127
  - “IFCID 002 - Query Parallelism” on page 40-131
  - “IFCID 002 - RID List Processing” on page 40-135
  - “IFCID 002 - Service Controller Data” on page 40-138
  - “IFCID 003 - Buffer Manager Accounting Data” on page 40-164
  - “IFCID 003 - DDF Data by Location” on page 40-171
  - “IFCID 003 - Dynamic SQL Statement” on page 40-177
  - “IFCID 003 - Initial Client/Server Correlation Data” on page 40-184
- “IFCID 239 - Package/DBRM Accounting Data” on page 40-750
- “IFCID 305 - Table Check Constraint” on page 40-813
- “IFCID 316 - SQL Statement Statistics” on page 40-821
- “IFCID 346 - Package/DBRM Detail” on page 40-854
- “IFCID 369 - Aggregated Accounting Statistics” on page 40-892
- “IFCID 376 - Incompatible Functions Executed” on page 40-889
- “IFCID 390 - IBM Service Record” on page 40-912 (new)
- “IFCID 391 - IBM Service Record” on page 40-913 (new)
- “IFCID 401 - Static Statements in EDM Pool” on page 40-917
- “IFCID 404 - IBM Service Record” on page 40-927 (new)
- “IFCID 413 - Beginning of Wait for Pipe Suspend” on page 40-928 (new)
- “IFCID 414 - End of Wait for Pipe Suspend” on page 40-929 (new)

The following descriptions of System Parameters reports have been updated:
- “Application Programming Defaults Panel 1 (DSNTIPF)” on page 54-4
- “Application Programming Defaults Panel 2 (DSNTIP4, DSNTIP41)” on page 54-10
- Chapter 55, “Alter Buffer Pool Command Issued,” on page 55-1
- Chapter 57, “Buffer Pool Parameters,” on page 57-1
- “Buffer Pool Parameters (DSNTIP1)” on page 54-18
- “DB2 Catalog and Directory Panel (DSNTIPA2)” on page 54-34
- “DB2 Utilities Parameters (DSNTIP6, DSNTIP61, DSNTIP62)” on page 54-36
- “DB2 Version Install (DSNTIPA1)” on page 54-43
- “Define Group or Member (DSNTIPK)” on page 54-23
- “Distributed Data Facility Panel 1 (DSNTIPR)” on page 54-27
- Chapter 53, “Example of the System Parameters Report,” on page 53-1
- “Install DB2 - Resource Limit Facility (DSNTIPO4) (DB2 12)” on page 54-44 (new for DB2 12)
- “IRLM Installation Parameters (DSNTIP1)” on page 54-47
- “Lock Escalation Parameters (DSNTIPJ)” on page 54-53
- “Operator Functions Installation Parameters (DSNTIPO)” on page 54-61
- “Other System Parameters” on page 54-65
- “Performance and Optimization (DSNTIP8, DSNTIP81)” on page 54-77
- “Query Accelerator Preferences (DSNTIP82)” on page 54-90
- “Routine Parameters (DSNTIPX)” on page 54-93
- “Sizes Panel 1 (DSNTIPD)” on page 54-95
- “SQL Object Defaults Panel (DSNTIP7, DSNTIP71, DSNTIP72)” on page 54-97
- “SQL Object Defaults Panel (DSNTIP7, DSNTIP71, DSNTIP72)” on page 54-97
- “Storage Sizes InstallationParms (DSNTIPC, DSNTIPE, DSNTIPE1)” on page 54-102
The following descriptions of Accounting report and trace blocks have been updated:

- “Accounting Trace - Long” on page 5-163
- “Accounting Trace - Short” on page 5-27
- “Accounting Report - Long” on page 5-57
- “Accounting Report - Short” on page 5-5
- “Buffer Pool Activity” on page 5-216
- “Distributed Activity - Requester” on page 5-225
- “Distributed Activity Requester (Short Report)” on page 5-24
- “Distributed Activity Requester (Short Trace)” on page 5-54
- “Distributed Activity - Server” on page 5-233
- “Distributed Activity Server (Short Report)” on page 5-20
- “Distributed Activity Server (Short Trace)” on page 5-51
- “Dynamic SQL Statement” on page 5-243 (new)
- “General (Short Report)” on page 5-12
- “General (Short Trace)” on page 5-42
- “Highlights - Report” on page 5-255
- “Highlights - Trace” on page 5-261
- “Initial DB2 Common Server or Universal JDBC Driver Correlation” on page 5-275
- “Initial DB2 Common Server Correlation” on page 5-273
- “Locking” on page 5-282
- “Times - Class 2 - DB2 Time” on page 5-367
- “Times - Class 3 - Suspensions” on page 5-375
- “Package Buffer Pool Activity - Class 10” on page 5-292
- “Package Locking Activity - Class 10” on page 5-311
- “Package Times - Class 8 - Suspensions” on page 5-317
- “Query Parallelism” on page 5-328
- “RID List” on page 5-334

The following descriptions of Statistics report and trace blocks have been updated:

- “Accelerator Data - Prior to Version 4” on page 49-6
- “Accelerator Data - Version 4 or later” on page 49-11
- “Aggregated Accounting Statistics” on page 49-20
- “Buffer Pool General” on page 49-25
- “Buffer Pool Read” on page 49-30
- “Buffer Pool Write” on page 49-42
- “DB2 Commands” on page 49-81
- “DBM1 and MVS Storage Below 2 GB” on page 49-65
- “DIST and MVS Storage Below 2 GB” on page 49-89
- “DRDA Remote Locations” on page 49-92
- “Dynamic SQL Statement” on page 49-76
- “EDM Pool Activity” on page 49-95
• The following sections have been updated:
  • Chapter 30, “Group-Scope Traces and Reports,” on page 30-1
  • “Locking Detail Report” on page 33-15
  • Chapter 6, “The Accounting Save-File Utility,” on page 6-1
  • Chapter 50, “The Statistics Save-File Utility,” on page 50-1
  • Chapter 64, “OMEGAMON XE for DB2 PE VSAM Data Sets,” on page 64-1
Part 1. OMEGAMON XE for DB2 PE Logs

This topic provides information about the OMEGAMON XE for DB2 PE logs.

The OMEGAMON XE for DB2 PE logs provide summarized information about various events during OMEGAMON XE for DB2 PE execution. You can save some of this summarized information for use in later processing. The following events are reported:

- Records in exception status
- DB2 START/STOP TRACE commands
- Reduction interval completion by report set
- SAVE subcommand completion by report set
- RESTORE subcommand completion by report set
- Errors and messages
- IFCID record distribution

How to generate logs or how to prevent log generation

The OMEGAMON XE for DB2 PE logs are generated automatically for each OMEGAMON XE for DB2 PE execution, provided there are valid DD statements in your JCL. To prevent generation of these logs, omit the ddname from your JCL (the preferred method), or specify DUMMY in the definition.

Different log types

The following OMEGAMON XE for DB2 PE logs are available:

- The *DPMLOG execution log* provides a listing of messages issued during command stream validation and OMEGAMON XE for DB2 PE initialization. It also reports any errors during the execution of OMEGAMON XE for DB2 PE.

- The *exception log* provides a listing identifying accounting and statistics records with at least one field containing a value outside user-specified limits.

- The *job summary log* includes the following occurrences in OMEGAMON XE for DB2 PE processing:
  - Detection of a DB2 START TRACE or DB2 STOP TRACE command
  - Reduction interval completion by report set
  - SAVE subcommand completion by report set
  - RESTORE subcommand completion by report set
  - Key error and warning messages

- The *IFCID frequency distribution log* provides the count of the input and processed trace records accumulated by IFCID. For each IFCID, a percentage of the total number of input and processed records is calculated.

[Chapter 1, “DPMLOG Execution Log,” on page 1-1]
This topic provides details about the DPMLOG Execution log.

[Chapter 2, “Exception Log,” on page 2-1]
This topic provides details about the Exception log.

[Chapter 3, “Job Summary Log,” on page 3-1]
This topic provides details about the Job Summary Log.

© Copyright IBM Corp. 1985, 2016
The IFCID Frequency Distribution log provides counts of the trace records by IFCID. There are counts for the number of valid records provided as input to OMEGAMON XE for DB2 PE as well as for the number of records that are processed after GLOBAL filtering and after duplicate records are dropped.
Chapter 1. DPMLOG Execution Log

This topic provides details about the DPMLOG Execution log.

The DPMLOG Execution log shows:
- Messages issued during OMEGAMON XE for DB2 PE initialization
- Command stream syntax errors
- Information, warning, and error messages issued during processing

Note: It is recommended that you check the DPMLOG messages after each batch execution, even if the job returned "0" as completion code.

How to generate a DPMLOG Execution log

If the DPMLOG DD statement is omitted, such a statement is dynamically allocated and the output is directed to the default SYSOUT class specified for the job.

Example of a DPMLOG Execution log - SYSPRINT message log

The field labels shown in the following sample of a SYSPRINT message log are described in the following section.

The following sections describe the header and the fields in the DPMLOG Execution log.

"The DPMLOG Execution Log Header" on page 1-2
This topic describes the header of the DPMLOG Execution log.

"Field Descriptions" on page 1-3
This topic describes the fields shown in the DPMLOG Execution log.
The DPMLOG Execution Log Header

This topic describes the header of the DPMLOG Execution log.

The header of the DPMLOG Execution log contains the following information:

OMEGAMON XE FOR DB2 PERFORMANCE EXPERT (VnRnMn)
The product name and the version, release, and modification level.

PAGE The page number in the format lll-nnnnnn, where lll denotes the location number within the report and nnnnnn the page number within the location.

EXECUTION LOG The name of the log report.

RUN DATE The date and time of the OMEGAMON XE for DB2 PE job generating the log. The default format is mm/dd/yy hh:mm:ss.th, which can be changed with the DATEFORMAT parameter.
Field Descriptions

This topic describes the fields shown in the DPMLOG Execution log.

**MSG.ID.**
The message identification in the format `FPEcnnmi`, where:
- `FPE` is the product code for OMEGAMON XE for DB2 PE
- `c` is the OMEGAMON XE for DB2 PE module component code
- `nnnn` is the error message number
- `i` is an action code. It can have the following values:
  - I (informational)
  - W (warning)
  - E (error)
  - S (severe error)
  - U (unrecoverable error)

**DESCRIPTION**
The complete text of the error message.
Chapter 2. Exception Log

This topic provides details about the Exception log.

The exception log identifies and lists Accounting and Statistics records with at least one field outside user-specified limits. You can use it to identify DB2 threads and Statistics intervals that contain fields with exceptional values. This helps you recognize performance problems in the DB2 subsystem and in threads.

Exception processing is accomplished by setting values in the exception threshold data set. You can define exception thresholds for specific Accounting and Statistics fields. When exception processing is requested, the instrumentation data is checked against these values. Only records with at least one field containing a value outside the user-specified limits are reported.

The exception log file data set is a sequential data set suitable for use by the DB2 load utility. It contains a listing of Accounting and Statistics exception records identical to the listing in the exception log.

Exception traces are available in the Accounting and Statistics report sets. Each of these relates separately to accounting or statistics data. The exception log reports Accounting and Statistics trace exceptions in the same report, in timestamp order. This helps you identify:

- Applications that might be causing exceptional conditions in the DB2 subsystem
- Exceptional DB2 subsystem conditions that might be causing thread performance problems

Although Accounting and Statistics exception reports are available in addition to traces, report entries are neither listed in the exception log nor stored in the exception log file data set.

Input to Exception Logs

DB2 Statistics and Accounting trace records with IFCID 001 and 002 (statistics) and IFCID 003 and 239 (accounting) are used as input to the exception log.
How to generate an Exception Log

This topic describes how to generate an Exception Log.

There is no OMEGAMON XE for DB2 PE command to generate the exception log. The exception log is generated automatically for an OMEGAMON XE for DB2 PE execution when the following DD statements are defined in your JCL:

**EXCPTDD**
Exception threshold data set

**EXTRCDD1**
Exception log

To prevent generation of the exception log, omit the EXTRCDD1 statement from your JCL (the preferred method), or specify DUMMY in the definition.

The amount of data reported in the exception log can be controlled by the GLOBAL INCLUDE or GLOBAL EXCLUDE and FROM and TO specifications.
Example of the Exception Log

This topic provides an example of an Exception Log.

Exception Log - example

The header and fields shown in the example of the Exception Log are described in the following sections.

The following sections describe the header and the fields in the Exception Log.

"The Exception Log Header" on page 2-4

This topic describes the header of the Exception log.

"Field Descriptions" on page 2-5

This topic describes the fields of an Exception Log.
The Exception Log Header

This topic describes the header of the Exception log.

The header of the Exception log contains the following information:

LOCATION
The DB2 reporting location. If the location name is not available, the DB2 data sharing group name is printed in this field. If the DB2 data sharing group name does not exist, the DB2 subsystem ID is printed.

GROUP
The name of the DB2 data sharing group. This field shows N/A if there is no group name.

MEMBER
The name of the DB2 data sharing member or the member name of the DB2 subsystem. This field shows N/A if there is no member name.

This field is not printed on the report page showing the GROUP BUFFERPOOLS PARAMETERS.

SUBSYSTEM
The ID of the DB2 subsystem that generated the data. This field is not printed on the report page showing the GROUP BUFFERPOOLS PARAMETERS.

DB2 VERSION
The DB2 version number of the subsystem that generated the data.

OMEGAMON XE FOR DB2 PERFORMANCE EXPERT (VnRnMn)
The product name and the version, release, and modification level.

EXECUTION LOG
The name of the log report.

PAGE
The page number in the format lll-nnnnnn, where lll denotes the location number within the report and nnnnnn the page number within the location.

ACTUAL FROM/TO
The date and time of the first and last record included in the log for a location, group, subsystem, or member.

PAGE DATE
The date of the timestamps printed on this page. A page break occurs at the change of the date. This is useful if a trace page contains more than one entry and the date is not shown for each entry.
Field Descriptions

This topic describes the fields of an Exception Log.

The following fields are shown including OMEGAMON XE for DB2 PE:

**PRIMAUTH**
  The primary authorization ID of the thread.

**ORIGAUTH**
  The original authorization ID of the thread.

**PLANNAME**
  The DB2 application plan name of the thread.

**CONNECT**
  The DB2 connection ID of the thread.

**CORRNAME**
  The correlation name of the thread.

**CORRNMBR**
  The correlation number of the thread.

**EXCEPTION TIME**
  For accounting records, this is the accounting timestamp. For statistics records, this is the END TIME of the statistics interval in which the exception occurred.

**INSTANCE**
  The LUW instance number.

**CONNTYPE**
  The type of connection for the associated thread. Values are:

  - **CICS**  CICS® Attach
  - **DB2 PRIV**  DB2 private protocol
  - **DB2CALL**  DB2 CALL Attach
  - **DLI-BTCH**  DL/I Batch
  - **DRDA**  DRDA® protocol
  - **IMS-CNTL**  IMS Control Region
  - **IMS-BMP**  IMS nontransaction-oriented BMP
  - **IMS-MPP**  IMS Attach MPP
  - **IMS-TBMP**  IMS transaction-oriented BMP
  - **RRS**  RRS attach
  - **TSO**  TSO foreground and background
  - **UTILITY**  Utility attach
If connection type is not present, ‘BLANK’ is printed.

**MAINPACK**
This identifier is used to distinguish plans according to the packages they contain.

**PER**
This identifies the log entry as an exception per system, per plan, or per program.

**FIELD ID**
The field ID of the accounting or statistics field in exception status.

**FIELD DESCRIPTION**
A description of the field in exception status. This description matches, as closely as possible, the terminology used in the Accounting and Statistics reports. If the field in exception status is a buffer pool field, the buffer pool ID is printed in front of the field description on the same line. Values are:
- BP0 — BP49
- BP32K — BP32K9

All nondistributed fields for an accounting thread or statistics interval are listed first. Any distributed fields in exception status follow the nondistributed fields and are grouped by remote location. Packages follow after DDF and are grouped by package name.

**BY**
The basis used for comparing values in the records to values in the exception threshold data set. Values are:
- TOTAL — an absolute value (the default)
- MINUTE — by minute
- SECOND — by second
- COMMIT — by commit
- THREAD — by thread

**CALCULATED OR FIELD VALUE**
The value from the field in exception status — either an absolute value or a value calculated according to the comparison basis.

Time values are reported in the format $ssssss.thtt$, where $ssssss$ is time in seconds and $thtt$ is in tenths, hundredths, thousandths, and ten-thousandths of seconds. Integer values such as aborts and selects are reported in the format $nnnnnnnnnn$. Other values are reported in the format $nnnnnnnn.nn$.

**OP**
The greater than (>) or less than (<) operator.

**THRESHOLD VALUE**
The value defined in the exception threshold data set, above or below which the actual value must fall to be considered in exception status.

**THRESHOLD TYPE**
Describes whether the THRESHOLD VALUE is defined in the exception threshold data set as a WARNING or a PROBLEM.

**Note:** PRIMAUTH, ORIGAUTH, PLANNNAME, CONNECT, CORRNAME, CORRMNBR, INSTANCE, CONNTYPE, and MAINPACK do not apply to statistics records. Except for MAINPACK, N/A is printed for these fields. For MAINPACK, nothing is printed.
Chapter 3. Job Summary Log

This topic provides details about the Job Summary Log.

The OMEGAMON XE for DB2 PE job summary log provides a summary of events during OMEGAMON XE for DB2 PE execution, and other information about DB2 that helps you interpret OMEGAMON XE for DB2 PE reports. The job summary log includes the following events:

- Detection of a DB2 START TRACE or DB2 STOP TRACE command.
- Reduction interval completion by report set. There is a summary of all intervals for each report set at the end of the reduction phase.
- RESTORE subcommand completion by report set. This includes the completion code, DB2 subsystem ID, timestamp information on any restored data, and the ddname of the RESTORE file.
- SAVE subcommand completion by report set. This includes the completion code, DB2 subsystem ID, timestamp information on any restored data, and the ddname of the SAVE file.
- Warning and Error Messages that identify corrupted performance trace input records.

Note: It is recommended that you check the DPMLOG messages after each batch execution, even if the job returned "0" as completion code.

"How to Generate the Job Summary Log" on page 3-2
This topic shows how to generate a Job Summary log.

"Example of the Job Summary log” on page 3-3
This topic provides an example of the Job Summary log.

"Job Summary VSAM Data Set” on page 3-6
The job summary VSAM data set (JSSRSDD) is used for saving and restoring data-related Job Summary information.
How to Generate the Job Summary Log

This topic shows how to generate a Job Summary log.

There is no OMEGAMON XE for DB2 PE command to generate the job summary log. The log is generated automatically for each OMEGAMON XE for DB2 PE execution, provided that the appropriate ddname is defined in your JCL.

The ddname for the job summary log is JOBSUMDD.

To prevent generation of the job summary log, omit the ddname from your JCL (the preferred method), or specify DUMMY in the definition.

Note: Omitting the ddname for the job summary log also prevents the generation of the IFCID frequency distribution log because both reports are written to JOBSUMDD.
Example of the Job Summary log

This topic provides an example of the Job Summary log.

Job Summary log - example

The fields shown in the example of the Job Summary log are described in the following sections.

The following sections describe the header and the fields in the Job Summary log.

"The Job Summary Log Header" on page 3-4

This topic describes the header of the Job Summary log.

"Field Descriptions" on page 3-5

This topic describes the fields of the Job Summary log.
The Job Summary Log Header

This topic describes the header of the Job Summary log.

The header of the Job Summary log contains the following information:

**OMEGAMON XE FOR DB2 PERFORMANCE EXPERT (VnRnMn)**

The product name and the version, release, and modification level.

**PAGE**

The page number in the format **lll-nnnnnn**, where **lll** denotes the location number within the report and **nnnnnn** the page number within the location.

**JOB SUMMARY LOG**

The name of the log report.

**RUN DATE**

The date and time of the OMEGAMON XE for DB2 PE job generating the log. The default format is **mm/dd/yy hh:mm:ss.th**, which can be changed with the DATEFORMAT parameter.
Field Descriptions

This topic describes the fields of the Job Summary log.

The following fields are shown:

**MSG.ID.**
The message identification in the format $FPEcnnni$, where:
- $FPE$ is the product code for OMEGAMON XE for DB2 PE
- $c$ is the OMEGAMON XE for DB2 PE module component code
- $nnn$ is the message number
- $i$ is an action code with possible values of:
  - I (informational)
  - W (warning)
  - E (error)
  - S (severe error)
  - U (unrecoverable error)

**LOCATION**
The DB2 location to which the message applies. If there is no location data, the subsystem ID (DB2ID) is printed.

**DESCRIPTION**
The complete text of the message.

**GROUP**
The name of the data sharing group.

**SSID**
The ID of the data sharing subsystem.

**MEMBER**
The name of the data sharing member.

**TIME_STAMP**
The date and time of the current input trace record, in the format $mm/dd/yy hh:mm:ss.th$. 
Job Summary VSAM Data Set

The job summary VSAM data set (JSSRSDD) is used for saving and restoring data-related Job Summary information.

When accounting or statistics data is saved and JSSRSDD has been included in the job stream, related Job Summary information is written to JSSRSDD. If JSSRSDD has been included in the job stream and data is restored, Job Summary information is restored to the job summary log.

If you are restoring data, the data set defined by JSSRSDD and the data set defined by the restore data set must match, that is, be produced by the same save operation.

JSSRSDD is optional. If you omit JSSRSDD, information about the previous processing of saved data is not restored or information about current processing is not saved.

The VSAM data set defined by JSSRSDD must already exist when you run OMEGAMON XE for DB2 PE. Either specify an existing data set from a previous OMEGAMON XE for DB2 PE run (when restoring data), or specify a new data set allocated using the IDCAMS DEFINE CLUSTER function. If an existing data set is used and the SAVE subcommand is specified, the new Job Summary data is added to the previous content.

See the Reporting User's Guide for the attributes of OMEGAMON XE for DB2 PE VSAM data sets.

**Note:** Do not specify DUMMY for JSSRSDD.
Chapter 4. IFCID Frequency Distribution Log

The IFCID Frequency Distribution log provides counts of the trace records by IFCID. There are counts for the number of valid records provided as input to OMEGAMON XE for DB2 PE as well as for the number of records that are processed after GLOBAL filtering and after duplicate records are dropped.

An IFCID count is listed, and a percentage of the total number of records is calculated.

One copy of the IFCID Frequency Distribution log is produced for each location.

Input to the IFCID Frequency Distribution logs

All records supplied as input to OMEGAMON XE for DB2 PE are used automatically as input to the IFCID Frequency Distribution Log.

“How to Generate an IFCID Frequency Distribution Log” on page 4-2

This topic shows how to generate an IFCID Frequency Distribution log.

“Example of the IFCID Frequency Distribution Log” on page 4-3

This topic provides an example of an IFCID Frequency Distribution Log.
How to Generate an IFCID Frequency Distribution Log

This topic shows how to generate an IFCID Frequency Distribution log.

There is no OMEGAMON XE for DB2 PE command to generate the IFCID Frequency Distribution log. The log is generated automatically for each OMEGAMON XE for DB2 PE execution, provided that the appropriate ddname is defined in your JCL.

The ddname for the IFCID Frequency Distribution log is JOBSUMDD.

To prevent the generation of the IFCID Frequency Distribution log, omit the ddname from your JCL (the preferred method), or specify DUMMY in the definition.

Note: Omitting the ddname for the IFCID Frequency Distribution log also prevents the generation of the Job Summary log because both logs are written to JOBSUMDD.
Example of the IFCID Frequency Distribution Log

This topic provides an example of an IFCID Frequency Distribution Log.

IFCID Frequency Distribution Log - example

The header and fields shown in the example of the IFCID Frequency Distribution Log are described in the following sections.

<table>
<thead>

TOTAL INPUT TRACE RECORDS = 218,714
TOTAL PROCESSED TRACE RECORDS = 210

The following sections describe the header and the fields in the IFCID Frequency Distribution log.

“The IFCID Frequency Distribution Log Header” on page 4-4
This topic describes the header of the IFCID Frequency Distribution log.

“Field Descriptions” on page 4-5
This topic describes the fields of the IFCID Frequency Distribution log.
The IFCID Frequency Distribution Log Header

This topic describes the header of the IFCID Frequency Distribution log.

The header of the IFCID Frequency Distribution log contains the following information:

**LOCATION**
The DB2 reporting location. If the location name is not available, the DB2 data sharing group name is printed in this field. If the DB2 data sharing group name does not exist, the DB2 subsystem ID is printed.

**GROUP**
The name of the DB2 data sharing group. This field shows N/A if there is no group name.

**MEMBER**
The name of the DB2 data sharing member or the member name of the DB2 subsystem. This field shows N/A if there is no member name.

This field is not printed on the report page showing the GROUP BUFFERPOOLS PARAMETERS.

**SUBSYSTEM**
The ID of the DB2 subsystem that generated the data. This field is not printed on the report page showing the GROUP BUFFERPOOLS PARAMETERS.

**DB2 VERSION**
The DB2 version number of the subsystem that generated the data.

**OMEGAMON XE FOR DB2 PERFORMANCE EXPERT (VnRnMn)**
The product name and the version, release, and modification level.

**IFCID FREQUENCY DISTRIBUTION LOG**
The title of the log report.

**PAGE**
The page number in the format lll-nnnnnn, where lll denotes the location number within the report and nnnnnn the page number within the location.

**RUN DATE**
The date and time of the OMEGAMON XE for DB2 PE job generating the log. The default format is mm/dd/yy hh:mm:ss.th, which can be changed with the DATEFORMAT parameter.

**ACTUAL FROM/TO**
The date and time of the first and last record included in the log for a location, group, subsystem, or member.
Field Descriptions

This topic describes the fields of the IFCID Frequency Distribution log.

The following fields are shown:

IFCID  The IFCID number of the record. The identifier is listed in decimal.

INPUT COUNT  The total number of occurrences of each IFCID in the raw data, after invalid records are rejected and partial GTF records are combined.

INPUT PCT OF TOTAL  The percentage of the total number of input records that the number in INPUT COUNT represents.

PROCESSED COUNT  The total number of occurrences of each IFCID in the processed data after GLOBAL filtering and after duplicate records are dropped. When DPMOUTDD is specified in the JCL, the value in this field is a reflection of the contents of the DPMOUT data set.

PROCESSED PCT OF TOTAL  The percentage of the total number of records in the processed data that the number in PROCESSED COUNT represents.

TOTAL INPUT TRACE RECORDS  The total of the INPUT COUNT column.

TOTAL PROCESSED TRACE RECORDS  The total of the PROCESSED COUNT column.
Part 2. Accounting Report Set

These topics provide information about the Accounting reports.

**Note:** For an introduction to the Accounting report set and general accounting information refer to the [Reporting User's Guide](#). It also provides information on input to Accounting reports and traces.

**Chapter 5, “Accounting Default Layouts,” on page 5-1**
This topic provides examples of the Accounting default layout for SHORT and LONG.

**Chapter 6, “The Accounting Save-File Utility,” on page 6-1**
Use the Save-File utility to migrate and convert Accounting Save data sets into a format suitable for OMEGAMON XE for DB2 PE V5.4.0.

**Chapter 7, “The Accounting File Data Set and Output Record,” on page 7-1**
The FILE subcommand formats DB2 Accounting records and writes them to sequential data sets suitable for use by the DB2 load utility. You can store unreduced Accounting data into the OMEGAMON XE for DB2 PE performance database. The performance database produces tailored reports using a reporting facility such as Query Management Facility (QMF).
Chapter 5. Accounting Default Layouts

This topic provides examples of the Accounting default layout for SHORT and LONG.

When data from a particular DB2 version is processed, N/A is printed for all fields in the report that are not applicable to that version.

For Accounting, the LAYOUT subcommand option ACCEL provides detailed thread-related Accelerator activity data.

You can use the user-tailored reporting (UTR) facility to modify the layouts and store the changes. If you do this, store your layouts under a different name to avoid confusion and keep the layouts relevant to this documentation.

“Headers Used in Accounting” on page 5-2
This topic describes the header of the Accounting report layout.

“How Averages Are Calculated” on page 5-4
Accounting reports show times and events averaged over the number of threads whilst Accounting traces show times and events as totals for each thread.

“Accounting Report - Short” on page 5-5
The short Accounting report shows some of the most significant fields averaged over the number of threads.

“Accounting Trace - Short” on page 5-27
The short Accounting trace shows some of the most significant fields summarized by thread.

“Accounting Report - Long” on page 5-57
This topic shows an example of a long version of the Accounting report.

“Accounting Trace - Long” on page 5-162
This topic shows an example of a long version of the Accounting trace.

“Accounting Report and Trace Blocks” on page 5-206
Accounting reports and traces are arranged in blocks. Each block contains accounting information about a particular activity. The layout of each block is presented followed by the field descriptions.
Headers Used in Accounting

This topic describes the header of the Accounting report layout.

OMEGAMON XE for DB2 PE header information is printed at the top of each page of an Accounting report or trace. For a report, the header differs depending on whether it is a member-scope or group-scope report.

Accounting Report Header Member-Scope

Here is a sample header for an Accounting report generated with member-scope.

LOCATION: PMODBN1
GROUP: DBN1
MEMBER: SN11
SUBSYSTEM: SN11
DB2 VERSION: V10

ACCOUNTING REPORT - SHORT
ORDER: PRIMAUTH-PLANNAME
SCOPE: MEMBER
REQUESTED FROM: NOT SPECIFIED
TO: NOT SPECIFIED
INTERVAL FROM: 01/30/15 22:53:32.60
TO: 01/30/15 22:50:05.07

Accounting Report Header-Group-Scope

Here is a sample header for an Accounting report generated with group-scope.

LOCATION: DSNCAT
GROUP: DSNCAT
DB2 VERSION: V10

ACCOUNTING REPORT - SHORT
ORDER: PRIMAUTH-PLANNAME
SCOPE: GROUP
REQUESTED FROM: NOT SPECIFIED
TO: NOT SPECIFIED
INTERVAL FROM: 01/30/15 18:47:13.28
TO: 01/30/15 19:55:28.69

Accounting Trace Header

Here is a sample header for an Accounting trace.

LOCATION: PMODBN1
GROUP: DBN1
MEMBER: SN11
SUBSYSTEM: SN11
DB2 VERSION: V10

ACCOUNTING TRACE - SHORT
ORDER: PRIMAUTH-PLANNAME
REQUESTED FROM: NOT SPECIFIED
TO: NOT SPECIFIED
INTERVAL FROM: 01/30/15 22:53:32.60
TO: 01/30/15
PAGE DATE: 01/30/15

Description of the Accounting header fields

The Accounting headers, shown in "Accounting Report Header Member-Scope," "Accounting Report Header-Group-Scope," and "Accounting Trace Header" contain the following information:

LOCATION
The DB2 reporting location. If the location name is not available, the DB2 data sharing group name is printed in this field. If the DB2 data sharing group name does not exist, the DB2 subsystem ID is printed.

GROUP
The name of the DB2 data sharing group. This field shows N/A if there is no group name.

MEMBER
The name of the DB2 data sharing member or the member name of the DB2 subsystem. This field shows N/A if there is no member name.

This field is not printed on the report page showing the GROUP BUFFERPOOLS PARAMETERS.

SUBSYSTEM
The ID of the DB2 subsystem that generated the data. This field is not printed on the report page showing the GROUP BUFFERPOOLS PARAMETERS.
DB2 VERSION
The DB2 version number of the subsystem that generated the data.

OMEGAMON XE FOR DB2 PERFORMANCE EXPERT (VnRnMn)
The product name and the version, release, and modification level.

Title - layout
The title of the report and the layout. The layout can be a default layout provided with OMEGAMON XE for DB2 PE or a layout you have tailored yourself.

ORDER
If the ORDER option of the REPORT or TRACE subcommand was used to arrange the report entries, the selected keywords are shown in this field. Depending on the context, the OMEGAMON XE for DB2 PE identifiers by which lock events are grouped are shown here.

SCOPE
Scope of the report or trace, this can be MEMBER or GROUP. A member-scope report or trace shows data from a group for each individual member. In a group-scope report or trace, the data from individual members is consolidated and presented for the entire group.

PAGE
The page number in the format \textit{lll-nnnnnn}, where \textit{lll} denotes the location number within the report and \textit{nnnnnn} the page number within the location.

REQUESTED FROM and TO
The FROM and TO dates and times specified in the REPORT or TRACE subcommand.

If both FROM and TO dates and times are omitted from the REPORT subcommand, the FROM and TO dates and times specified in GLOBAL are printed. If only the FROM date and time or only the TO date and time has been specified, NOT SPECIFIED is printed for the unspecified value.

If FROM and TO are not specified in REPORT or GLOBAL, NOT SPECIFIED appears for both the FROM and TO values.

If you have specified FROM and TO times without dates in REPORT or GLOBAL, ALL DATES is printed along with the specified times.

INTERVAL FROM
The start date and time of the first reduction interval covered by the report. If REDUCE is not specified, the INTERVAL defaults to 0 and the timestamps of the first and last events are printed.

INTERVAL TO
The end date and time of the last reduction interval covered by the report. If REDUCE is not specified, the INTERVAL defaults to 0 and the timestamps of the first and last events are printed.

PAGE DATE
The date of the timestamps printed on this page. A page break occurs at the change of the date. This is useful if a trace page contains more than one entry and the date is not shown for each entry.
How Averages Are Calculated

Accounting reports show times and events averaged over the number of threads whilst Accounting traces show times and events as totals for each thread.

Fields in an Accounting report can show:

- **Averages** presented with two decimal places behind the point.
- **Totals** presented as whole numbers. If it is not possible to distinguish the type of data, totals are indicated with a hash (#) as the first character in the label.
- **Times** presented with six decimal places behind the point.

Averages are calculated by dividing totals by QPACRLNU, which is the number of threads to roll data into this QPAC data section.

\[
\text{Average} = \frac{\text{Total of package counter or time (QPACxxxx)}}{\text{Number of threads that roll data into this QPAC data section (QPACRLNU)}}
\]

This applies to package class 7, 8, or 10 times and events:

- "Package Buffer Pool Activity - Class 10" on page 5-292
- "Package Locking Activity - Class 10" on page 5-311
- "Package SQL Activity - Class 10" on page 5-315
- "Package Times - Class 7" on page 5-325
- "Package Global Contention P-Locks - Class 8" on page 5-298
- "Package Global Contention L-Locks - Class 8" on page 5-296
- "Package Times - Class 8 - Suspensions" on page 5-317
- "Package Identification - Report" on page 5-301
- "Package Identification - Trace" on page 5-306
- "Package General (Short Report)" on page 5-17
- "Package General (Short Trace)" on page 5-49

For more information refer to the Accounting trace sections for a package.

Averages of plan level counters in repeating data sections are calculated by dividing totals by the number of data sections which are aggregated to produce the report entry (this includes the DDF and RLF count).

Averages of buffer pool counters are calculated on a per-record basis.
**Accounting Report - Short**

The short Accounting report shows some of the most significant fields averaged over the number of threads.

Short Accounting reports are arranged in blocks. Each block contains Accounting information about a particular activity. The layout of each block is presented followed by the field descriptions.

You can generate a short version of the Accounting report using the following command:

```
... ACCOUNTING REPORT LAYOUT (SHORT) ORDER (PRIMAUTH-PLANNAME) SCOPE (MEMBER) ...
```

**Accounting Report - Short**

This is an example of a short Accounting report.

This topic shows detailed information about “Accounting - Distributed Activity Requester (Short Report)”

Chapter 5. Accounting Default Layouts 5-11
General (Short Report)

This topic shows detailed information about “Accounting - General (Short Report)”.

This block is part of the Accounting Short Report.

Accounting - General (Short Report)

The field labels shown in the following sample layout of “Accounting - General (Short Report)” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>#OCCURS</td>
<td>The number of logical accounting records. A logical accounting record can contain more than one physical record.</td>
</tr>
<tr>
<td>#DISTRS</td>
<td>The number of accounting records with distributed activity. That is, the number of accounting records related to allied-distributed, DBAT, or DBAT-distributed threads.</td>
</tr>
<tr>
<td>#ROLLBK</td>
<td>The number of rollback requests. This is the number of units that were backed out, including rollbacks from attaches.</td>
</tr>
</tbody>
</table>

Special Considerations: This field contains the number of:
- Application program abends
- Application rollback requests
- Application deadlocks on database records
- Applications canceled by operator
- Thread abends due to resource shortage

Field Name: QWACABRT

This is an exception field.

#COMMIT
The number of successful two-phase (units of recovery) or single-phase (syncs) commit requests. It indicates the number of units of recovery that are completed successfully, and for which the associated commit duration locks were released. It represents the total number of commit requests processed by the DB2 subsystem, whether the request was an explicit or implicit external request from an IMS or a CICS connection, or an implicit internal request within DB2 when DB2 was the commit coordinator or conducted read-only commit processing as a commit participant on phase-1 calls from an IMS or CICS connection.

For parallel queries, only the commits from the initiating (parent) thread are recorded by this counter.

Field Name: QWACCOMM

This is an exception field.

SELECTS

The number of SQL SELECT statements executed.

Field Name: QXSELECT

This is an exception field.

FETCHES

The number of FETCH statements executed. This number at the server location might not match the number at the user application because of the internal processing of the Distributed Data Facility (DDF).

Field Name: QXFETCH

INSERTS

The number of INSERT statements executed.

Field Name: QXINSRT

UPDATES

The number of UPDATE statements executed.

Field Name: QXUPDTE

MERGES

The number of times a MERGE statement was executed.

Field Name: QXMERGE

OPENS

The number of OPEN statements executed.

Field Name: QXOPEN

CLOSES

The number of CLOSE statements executed. This number at the server location might not match the number at the user application because of the internal processing of the Distributed Data Facility (DDF).

Field Name: QXCLOSE

DELETES

The number of DELETE statements executed.

Field Name: QXDELET
PREPARE

The number of SQL PREPARE statements executed. This number at the server location might not match the number at the user application because of the internal processing of the Distributed Data Facility (DDF).

Field Name: QXPREP

CLASS1 EL.TIME

The class 1 elapsed time of the allied agent.

Special Considerations:
• If the begin time equals zero, or if the end time minus begin time equals zero or is negative, N/C is shown.
• Threads that can be reused, such as CICS protected threads or IMS/VS wait-for-input message regions, can include time during which the thread was inactive and waiting for work.
• Elapsed time to process distributed requests is included for allied-distributed threads.
• This time includes the time for processing SQL statements issued by stored procedures, user-defined functions, or triggers.
• In query CP, sysplex query, or utility parallelism, this is the time shown in the originating record, which overlaps the elapsed times shown in the parallel records.

Field Name: ADRECETT

This is an exception field.

CLASS1 CPUTIME

The class 1 CPU time in an application. It indicates:
• The class 1 CPU time of the allied agent, which may include the accumulated class 1 TCB time for processing stored procedures, user-defined functions, and triggers.
• The accumulated CPU time for processing parallel tasks. This is valid for query CP parallelism, sysplex query parallelism, and parallel tasks generated by utilities.
• In sysplex query parallelism, the individual CPU times are normalized by the conversion factor of the parallel tasks that is related to the originating task.

In sysplex query parallelism, only CPU times of parallel tasks, running on the same member of the SYSPLEX group as the originating task, are included.

This CPU time does not include time that is consumed on an IBM specialty engine.

Field Name: ADCPUT

This is an exception field.

CLASS2 EL.TIME

The class 2 elapsed time of the allied agent accumulated in DB2.

Field Name: ADDB2ETT

This is an exception field.

CLASS2 CPUTIME
The class 2 CPU time (in DB2). It indicates:

- The class 2 CPU time for the allied agent. This includes the accumulated class 2 TCB time for processing any stored procedures, user-defined functions, and triggers.
- The accumulated CPU time for processing parallel tasks. This is valid for query CP parallelism, sysplex query parallelism, and parallel tasks generated by utilities.
- For batch reporting, in sysplex query parallelism, the individual CPU times are normalized by the conversion factor of the parallel tasks, related to the originating task.
  For online monitoring, in sysplex query parallelism, only CPU times of parallel tasks, running on the same member of the sysplex group as the originating task, are included.

This CPU time does not include time that is consumed on an IBM specialty engine.

**Field Name:** ADDBCPUT

This is an *exception* field.

**GETPAGES**

The number of Getpage requests. This counter is incremented by successful Getpage requests for queries processed in parallel for each thread and for all successful and unsuccessful Getpage requests for queries that are not processed in parallel.

**Background and Tuning Information**

Reducing the number of Getpages can improve DB2 performance by reducing the number of synchronous page reads. With fewer Getpages, the requested page is more likely to be returned from the buffer pool. CPU usage is also reduced.

Check the ratio of Getpages to SQL DML statements, as a rule of thumb, try and keep this ratio below six for a typical online transaction SQL.

You might need to modify the database and query design, for example:

- Add indexes to tables to reduce the number of pages scanned.
- Reassess the number of tables used and denormalize them, if necessary. As an example, a large table with many columns can result in several pages being fetched to satisfy a simple query requesting just a few columns. Splitting such a table into several tables with fewer columns, tailored to queries, will result in fewer pages returned for each query.
- Use correlated rather than non-correlated queries to force the use of an index.

**Field Name:** QBACGET

This is an *exception* field.

**BUF.UPDT**

The number of times a buffer update occurs. This is incremented every time a page is updated and is ready to be written to DASD. If the same page is updated twice, for example, the number is incremented by 2.

This number is kept for all types of pages including data pages and work-file pages.
Background and Tuning Information

A nonzero value indicates any of the following activities:

- SQL INSERT, UPDATE, or DELETE
- Merge scan join
- Internal sort activity on the work files

Check the access path to determine whether sort activity can be minimized or avoided.

Field Name: QBACSWS
This is an exception field.

SYN.READ
The number of synchronous read I/O operations. DB2 increments this counter for each media manager synchronous physical read. Asynchronous I/O requests are not counted.

Field Name: QBACRIO
This is an exception field.

TOT.PREF
The number of sequential, dynamic, and list prefetch requests.

Field Name: ABCLSPR
This is an exception field.

LOCK SUS
The total number of all lock suspensions. This includes local and global lock suspensions.

Field Name: ALTSUSP
This is an exception field.

#LOCKOUT
The number of deadlocks and timeouts.

Field Name: ADTIMDLK
This is an exception field.
Package General (Short Report)

This topic shows detailed information about “Accounting - Package General (Short Report)”.

This block is part of the Accounting Short Report.

Accounting - Package General (Short Report)

The field labels shown in the following sample layout of “Accounting - Package General (Short Report)” are described in the following section.

<table>
<thead>
<tr>
<th>PROGRAM_NAME</th>
<th>TYPE</th>
<th>#OCCURS</th>
<th>#ALLOC</th>
<th>SQLSTMT</th>
<th>ELAP.TIME</th>
<th>CPU</th>
<th>SUSP.TIME</th>
<th>SUSP</th>
<th>CL7</th>
<th>CL8</th>
</tr>
</thead>
<tbody>
<tr>
<td>PKGNAME</td>
<td>PACKAGE</td>
<td>1164</td>
<td>1164</td>
<td>4.15</td>
<td>0.047610</td>
<td>0.009510</td>
<td>0.023908</td>
<td>4.47</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**PROGRAM NAME**

The program name (package ID or DBRM name).

In the case of rollup data (Accounting data of DDF/RRSAF threads and parallel tasks accumulated by DB2), the following value is shown "ROLSUM".

**Field Name:** QPACPKID

This is an exception field.

**TYPE**

An indicator of whether the block describes a package or a DBRM. Possible values are PACKAGE, DBRM, and BOTH. BOTH can be shown in reports if there are packages and DBRMs with the same program name.

**Field Name:** ADPCKTYP

**#OCCURS**

This value can be one of the following:

- In general, the total number of accounting trace sections for a package or DBRM regardless of enabled or disabled DB2 trace classes 7 and 8 at the time of writing the trace record. In case of Distributed Data Facility (DDF) or Recoverable Resource Manager Services Attach Facility (RRSAF) threads, it is the number of accounting intervals rolled up in a record.

- If REPORT ORDER (ACTNAME) is specified, the total number of package sections of a special activity type depends on the following:
  - If IFCID 233 or 380 is available, stored procedures (SP) are counted based on the available IFCID. If both IFCIDs are available, IFCID 380 is the preferred one for SP reporting. Subprograms called by these SPs are not taken into account.
  - If IFCID 233 or 381 is available, user-defined functions (UDF) are counted based on the available IFCID. If both IFCIDs are available, IFCID 381 is the preferred one for UDF reporting. Subprograms called by these UDFs are not taken into account.
  - If neither IFCID 233, 380, nor 381 is collected, all packages of an activity type are counted. The sum also includes the number of subprograms.

**Field Name:** ADTOTPOC
# ALLOCS

This value can be one of the following:

- In general, the number of times a package was invoked by a different package. For the first package run by an application, the initial call counts as a package switch. If this package called a nested package (such as a trigger, UDF, or stored procedure), a switch will not be counted upon return from such a package.

- If REPORT ORDER (ACTNAME) is specified, the number of times a package of a special activity type is invoked from a different package depends on the following:
  - If IFCID 233 or 380 is available, the invocations of stored procedures (SP) are counted based on the available IFCID. If both IFCIDs are available, IFCID 380 is the preferred one for SP reporting. Subprograms called by these SPs are not taken into account.
  - If IFCID 233 or 381 is available, the invocation of user-defined functions (UDF) are counted based on the available IFCID. If both IFCIDs are available, IFCID 381 is the preferred one for UDF reporting. Subprograms called by these UDFs are not taken into account.
  - If neither IFCID 233, 380, nor 381 is collected, all invocations of an activity type are counted. The sum also includes the number of subprograms.

Field Name: APACSWIT

**SQLSTMT**

The number of SQL statements issued in this package or DBRM.

This number may not be equal to the total number of SQL statements in the QXST data section because QXST does not count all SQL statements. For example, it does not count commit or rollback statements.

Note: This field is shown for the following field labels in Accounting trace:
- SQL STMT - TOTAL
- SQL STMT - AVERAGE:

Field Name: QPACSQLC

This is an exception field.

**CL7 ELAP.TIME**

The total elapsed time for executing the package or DBRM.

Field Name: QPACSCT

This is an exception field.

**CL7 CPU TIME**

The class 7 CPU time spent by the package or DBRM. It indicates:
- The TCB time
- The accumulated CPU time for processing parallel tasks. This is valid for query CP parallelism, sysplex query parallelism, and parallel tasks generated by utilities.

In sysplex query parallelism, only CPU times of parallel tasks, running on the same member of the sysplex group as the originating task, are included.
This time does not include the CPU time consumed on an IBM specialty engine.

**Field Name:** ADCPUTP

This is an *exception* field.

**CL8 SUSP:TIME**

The waiting time for the package or DBRM due to class 8 suspensions.

**Field Name:** ADTSUSTP

This is an *exception* field.

**CL8 SUSP**

The number of all types of class 8 suspensions.

**Field Name:** ADTSUSCP

This is an *exception* field.
Distributed Activity Server (Short Report)

This topic shows detailed information about “Accounting - Distributed Activity Server (Short Report)”.

This block is part of the Accounting Short Report.

**Note:** For information on how to calculate total values for multiple lines refer to “Distributed Activity Requester (Short Report)” on page 5-24.

**Accounting - Distributed Activity Server (Short Report)**

The field labels shown in the following sample layout of “Accounting - Distributed Activity Server (Short Report)” are described in the following section.

<table>
<thead>
<tr>
<th>SERVER</th>
<th>PRODUCT ID</th>
<th>PROD VERSION</th>
<th>METH</th>
<th>#DDFS</th>
<th>#ROLLBK</th>
<th>#COMMIT</th>
<th>SQLSENT</th>
<th>ROWRECV</th>
<th>CONVI</th>
<th>ELAPSED</th>
<th>REQ</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMODA11</td>
<td>DB2</td>
<td>V10R1</td>
<td>M5</td>
<td>N/P</td>
<td>1</td>
<td>0</td>
<td>1</td>
<td>2.00</td>
<td>1095.00</td>
<td>1.00</td>
<td>0.154750</td>
</tr>
</tbody>
</table>

**SERVER**

The name of the remote location with which this information is associated. If the local location is the requester, this field is a server location. If the local location is a server location, this field is the requester location. An allied thread is created at a DB2 requester, and a database access thread is created at a DB2 server. An accounting record is for either a requester or a server, but not for both.

This field is invalid if summary rollup data is present. In Accounting this field is set to *ROLSUM*.

**Field Name:** QLACLOCN

This is an *exception* field.

**PRODUCT ID**

The original DB2 field specifies the information in the following field names of the remote requester or server location:

**PRODUCT ID**

It consists of 3 characters and can have the following values:

<table>
<thead>
<tr>
<th>Original ID from DB2</th>
<th>Shown as</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSN</td>
<td>DB2</td>
</tr>
<tr>
<td>ARI</td>
<td>SQL/DS</td>
</tr>
<tr>
<td>QSQ</td>
<td>DB2/400</td>
</tr>
<tr>
<td>SQL</td>
<td>COMMON SERV</td>
</tr>
<tr>
<td>JCC</td>
<td>JDBC DRIVER</td>
</tr>
<tr>
<td>'000000'X, '404040'X</td>
<td>N/P</td>
</tr>
<tr>
<td>Other</td>
<td>Original ID from DB2</td>
</tr>
</tbody>
</table>

**Note:**

- If the record is written at the application requester location, or if summary rollup data is available, N/P is shown in Accounting TRACE and REPORT.
- In Accounting FILE and SAVE DDF tables, BLANK is shown.
PRODUCT VERSION (PROD VERSION)

It consists of 5 digits and is shown as \( VvRrMm \), where:

- \( V \) Version level
- \( R \) Release level
- \( M \) Modification level

Note: For DDF/RRSAF rollup records, the product ID and product version contain a value derived from the last thread to rollup. For query parallelism rollup threads, the value is derived from the parent record.

Field Name: QLACPRID

PRODUCT VERSION

The original DB2 field specifies the information in the following field names of the remote requester or server location:

PRODUCT ID

It consists of 3 characters and can have the following values:

<table>
<thead>
<tr>
<th>Original ID from DB2</th>
<th>Shown as</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSN</td>
<td>DB2</td>
</tr>
<tr>
<td>ARI</td>
<td>SQL/DS</td>
</tr>
<tr>
<td>QSQ</td>
<td>DB2/400</td>
</tr>
<tr>
<td>SQL</td>
<td>COMMON SERV</td>
</tr>
<tr>
<td>JCC</td>
<td>JDBC DRIVER</td>
</tr>
<tr>
<td>'000000'X, '404040'X</td>
<td>N/P</td>
</tr>
<tr>
<td>Other</td>
<td>Original ID from DB2</td>
</tr>
</tbody>
</table>

Note:
- If the record is written at the application requester location, or if summary rollup data is available, N/P is shown in Accounting TRACE and REPORT.
- In Accounting FILE and SAVE DDF tables, BLANK is shown.

PRODUCT VERSION (PROD VERSION)

It consists of 5 digits and is shown as \( VvRrMm \), where:

- \( V \) Version level
- \( R \) Release level
- \( M \) Modification level

Note: For DDF/RRSAF rollup records, the product ID and product version contain a value derived from the last thread to rollup. For query parallelism rollup threads, the value is derived from the parent record.

Field Name: QLACPRID

METH

The method of access: DB2 private protocol, DRDA protocol, or both.

This field is invalid if unique or summary rollup data is present. It can have the following value in:
- Accounting Trace and Report: N/P
- The Accounting FILE and SAVE PROGRAM table: blank

**Field Name:** ADPROT

**#DDFS**

The number of occurrences of the remote location and method pair.

**Field Name:** ASDDF

**#ROLLBK**

The total number of rollbacks (single phase and two-phase) sent.

**Field Name:** ADROL12S

**#COMMIT**

The total number of single-phase and two-phase commit requests sent.

**Field Name:** ADCOM12S

**SQLSENT**

The number of SQL statements sent to the server location. This value is maintained at the requesting location.

**Field Name:** QLACSQLS

**ROWRECV**

The number of rows of data retrieved from the server location. This value is maintained at the requester location.

*Special Considerations:*

1. The number of rows received from the server location does not include either the SQLDA or SQLCA.

2. Block fetch can significantly affect the number of rows sent across the network. When used with non-UPDATE cursors, block fetch puts as many rows as possible into the message buffer, and transmits the buffer across the network without requiring a VTAM® message. Consequently, more rows of data might be sent from the server location than are received by the reporting (requester) location. This is especially true when DB2 private protocol is used because multiple blocks can be transmitted from the server with no intervening messages sent by the requester.

**Field Name:** QLACROWR

This is an *exception* field.

**CONVI**

The number of conversations (both successful and unsuccessful) initiated by the requester location to be executed at the server location. This number is maintained at the requester.

**Field Name:** QLACCNV

This is an *exception* field.

**ELAPSED REQ**

The elapsed time at the requester. It includes the total of DB2 and network time.

**Field Name:** ADDSELRQ
This is an *exception* field.
Distributed Activity Requester (Short Report)

This topic shows detailed information about “Accounting - Distributed Activity Requester (Short Report)”.

This block is part of the Accounting Short Report.

**Note:** The total values for each requester (or server) are not calculated if there are multiple lines that result from different product IDs and product versions. However, you can calculate these totals as follows:

1. Field labels that start with a #-sign are totals. The sums of these fields are the values for each requester (or server).
2. The remaining numerical fields are averages for each #DDFS. Multiply the shown average values by the #DDFS value to calculate the absolute value for each requester (or server) and line.
3. Then summarize all absolute values for each requester (or server) and line, and divide the sum by the sum of all #DDFS values for each requester (or server).

You can customize the report layout using the user-tailored reporting (UTR) facility as described in the Reporting [Reporting User’s Guide](#) section about “Tailoring report layouts”.

**Accounting - Distributed Activity Requester (Short Report)**

The field labels shown in the following sample layout of “Accounting - Distributed Activity Requester (Short Report)” are described in the following section.

<table>
<thead>
<tr>
<th>REQUESTER</th>
<th>PRODUCT ID</th>
<th>PROD VERSION</th>
<th>METH</th>
<th>#DDFS</th>
<th>#ROLLBK</th>
<th>#COMMIT</th>
<th>SQLRECV</th>
<th>ROWSENT</th>
<th>CONVI</th>
</tr>
</thead>
<tbody>
<tr>
<td>::FFFF#1</td>
<td>JDBC DRIVER</td>
<td>V3 R65M0</td>
<td>DRDA</td>
<td>2</td>
<td>0</td>
<td>2</td>
<td>5.50</td>
<td>0.00</td>
<td>1.00</td>
</tr>
</tbody>
</table>

---

**REQUESTER**

The name of the remote location with which this information is associated. If the local location is the requester, this field is a server location. If the local location is a server location, this field is the requester location. An allied thread is created at a DB2 requester, and a database access thread is created at a DB2 server. An accounting record is for either a requester or a server, but not for both.

This field is invalid if summary rollup data is present. In Accounting this field is set to *ROLSUM*.

**Field Name:** QLACLOCN

This is an *exception* field.

**PRODUCT ID**

The original DB2 field specifies the information in the following field names of the remote requester or server location:

**PRODUCT ID**

It consists of 3 characters and can have the following values:

<table>
<thead>
<tr>
<th>Original ID from DB2</th>
<th>Shown as</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSN</td>
<td>DB2</td>
</tr>
<tr>
<td>ARI</td>
<td>SQL/DS</td>
</tr>
<tr>
<td>Original ID from DB2</td>
<td>Shown as</td>
</tr>
<tr>
<td>-------------------------</td>
<td>--------------------</td>
</tr>
<tr>
<td>QSQ</td>
<td>DB2/400</td>
</tr>
<tr>
<td>SQL</td>
<td>COMMON SERV</td>
</tr>
<tr>
<td>JCC</td>
<td>JDBC DRIVER</td>
</tr>
<tr>
<td>'000000', '404040'X</td>
<td>N/P</td>
</tr>
<tr>
<td>Other</td>
<td>Original ID from DB2</td>
</tr>
</tbody>
</table>

**Note:**
- If the record is written at the application requester location, or if summary rollup data is available, N/P is shown in Accounting TRACE and REPORT.
- In Accounting FILE and SAVE DDF tables, BLANK is shown.

**PRODUCT VERSION (PROD VERSION)**

It consists of 5 digits and is shown as $vvrrm$, where:

- $vv$ Version level
- $rr$ Release level
- $m$ Modification level

**Note:** For DDF/RRSAF rollup records, the product ID and product version contain a value derived from the last thread to rollup. For query parallelism rollup threads, the value is derived from the parent record.

**Field Name:** QLACPRID

**PRODUCT VERSION**

The original DB2 field specifies the information in the following field names of the remote requester or server location:

**PRODUCT ID**

It consists of 3 characters and can have the following values:

<table>
<thead>
<tr>
<th>Original ID from DB2</th>
<th>Shown as</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSN</td>
<td>DB2</td>
</tr>
<tr>
<td>ARI</td>
<td>SQL/DS</td>
</tr>
<tr>
<td>QSQ</td>
<td>DB2/400</td>
</tr>
<tr>
<td>SQL</td>
<td>COMMON SERV</td>
</tr>
<tr>
<td>JCC</td>
<td>JDBC DRIVER</td>
</tr>
<tr>
<td>'000000', '404040'X</td>
<td>N/P</td>
</tr>
<tr>
<td>Other</td>
<td>Original ID from DB2</td>
</tr>
</tbody>
</table>

**Note:**
- If the record is written at the application requester location, or if summary rollup data is available, N/P is shown in Accounting TRACE and REPORT.
- In Accounting FILE and SAVE DDF tables, BLANK is shown.

**PRODUCT VERSION (PROD VERSION)**

It consists of 5 digits and is shown as $vvrrm$, where:
Note: For DDF/RRSAF rollup records, the product ID and product version contain a value derived from the last thread to rollup. For query parallelism rollup threads, the value is derived from the parent record.

**Field Name:** QLACPRID

**METH**
The method of access: DB2 private protocol, DRDA protocol, or both.

This field is invalid if unique or summary rollup data is present. It can have the following value in:
- Accounting Trace and Report: N/P
- The Accounting FILE and SAVE PROGRAM table: blank

**Field Name:** ADPROT

**#DDFS**
The number of occurrences of the remote location and method pair.

**Field Name:** ASDDF

**#ROLLBK**
The total number of rollbacks (single phase and two-phase) received.

**Field Name:** ADROL12R

**#COMMIT**
The total number of commits (single phase and two-phase) received.

**Field Name:** ADCOM12R

**SQLRECV**
The number of SQL statements received from the requester location.

**Field Name:** QLACSQLR

**ROWSENT**
The number of rows sent from the server location to the requester location.
The value includes SQLDA and is maintained at the server location.

**Field Name:** QLACROWS

**CONVI**
A count of conversations initiated by the requester.
This number is updated at the server location.

**Field Name:** QLACCNVR
Accounting Trace - Short

The short Accounting trace shows some of the most significant fields summarized by thread.

Short Accounting traces are arranged in blocks. Each block contains Accounting information about a particular activity. The layout of each block is presented followed by the field descriptions.

The following example shows a short version of the Accounting trace produced by the following command:

... ACCOUNTING TRACE LAYOUT (SHORT) ...

Accounting Trace - Short

The following example shows a short version of the Accounting trace.

ACCOUNTING TRACE COMPLETE
General (Short Trace)

This topic shows detailed information about “Accounting - General (Short Trace)”.

This block is part of the Accounting Short Trace.

Accounting - General (Short Trace)

The field labels shown in the following sample layout of “Accounting - General (Short Trace)” are described in the following section.

---

**PRIMAUTH**

The primary authorization ID from a connection or signon. The connection authorization exit and the signon authorization exit can change the primary authorization ID so that it differs from the original primary authorization ID (ORIGAUTH). Distributed authorization ID translation can also change the primary authorization ID.

Field Name: QWHCAID

**PLANNAME**

The plan name. It is blank for a DB2 command thread; otherwise:

**DSNESPRR**
For SPUFI with repeatable read.

**DSNESPSC**
For SPUFI with cursor stability.

**DSNUTIL**
For utilities.

**DSNTEP2**
For DSNTEP2.

**DSNBIND**
For binding.

The application plan name
For IMS.

The application plan name
For CICS.

A blank plan name
For IMS and CICS commands.

**DSQPLAN**
For QMF™.

The first 8 bytes of the application name
For DRDA connections to the common servers.

Field Name: QWHCPLAN

This is an exception field.
**CORRNAME**

This field shows the correlation name. It is obtained by translating the correlation ID into correlation name and number. The default translation depends on the connection type of the thread:

- **Batch**  Job name
- **TSO or CAF**  Original authorization ID
- **CICS**  Transaction ID
- **IMS**  Application PST
- **RRSAF**
  - Characters 1 to 8 of the parameter correlation ID specified for SIGNON.

You can define your own correlation ID translation, which overrides the default translation.

**Field Name:** ADCORNME

**CORRNMBR**

This field shows the correlation number. It is obtained by translating the correlation ID into correlation name and number. The default translation depends on the connection type of the thread:

- **Batch**  Blank
- **TSO or CAF**  Blank
- **CICS**  Pool thread
- **IMS**  Application PSBNAME
- **RRSAF**
  - Characters 9 - 12 of the parameter correlation ID specified for SIGNON.

You can define your own correlation ID translation which overrides the default translation.

**Field Name:** ADCORNMB

**CONNECT**

The connection name. Possible values are:

- For batch: BATCH
- For TSO: TSO
- For QMF: DB2CALL
- For utilities: UTILITY
- For DB2 private protocol this is the DB2 subsystem ID
- For IMS: the IMS ID
- For CICS, this is the CICS ID
- For DRDA connections from non-DB2 requesters: SERVER

**Field Name:** QWHCCN

This is an *exception* field.

**THR.TYPE**
The type of thread. This field can contain one of the following values:

**ALLIED**
The thread is not involved in any distributed activity.

**ALLDDIST**
The thread is initiated by a DB2 attach and requests data from one or more server locations.

**DBAT**
The thread is initiated, created, and performing work on behalf of a remote (requester) location. The value DBAT also includes DBAT DISTRIBUTED threads that are initiated by a requester location and executed by the server location that in turn requests data from another server location.

**Background and Tuning Information**

If the thread is involved in distributed activity, some monitored values can produce different results. For example, the class 1 elapsed time for a distributed thread is higher because the network time is also included.

**Field Name:** ADTHRTYP

**ACCT TIMESTAMP**
The store clock value of the time when the accounting record was generated.

**Field Name:** QWHSSSTCK

**TERM. CONDITION**
The reason for termination, that is, for generating a DB2 accounting record.

**Field Name:** ADCNDRSN

**COMMITS**
The number of successful two-phase (units of recovery) or single-phase (syncs) commit requests. It indicates the number of units of recovery that are completed successfully, and for which the associated commit duration locks were released. It represents the total number of commit requests processed by the DB2 subsystem, whether the request was an explicit or implicit external request from an IMS or a CICS connection, or an implicit internal request within DB2 when DB2 was the commit coordinator or conducted read-only commit processing as a commit participant on phase-1 calls from an IMS or CICS connection.

For parallel queries, only the commits from the initiating (parent) thread are recorded by this counter.

**Field Name:** QWACCOMM

This is an *exception* field.

**SELECTS**
The number of SQL SELECT statements executed.

**Field Name:** QXSELECT

This is an *exception* field.

**OPENS**
The number of OPEN statements executed.

**Field Name:** QXOPEN
This is an exception field.

FETCHES

The number of FETCH statements executed. This number at the server location might not match the number at the user application because of the internal processing of the Distributed Data Facility (DDF).

Field Name: QXFETCH

DELETES

The number of DELETE statements executed.

Field Name: QXDELETE

INSERTS

The number of INSERT statements executed.

Field Name: QXINSRT

UPDATES

The number of UPDATE statements executed.

Field Name: QXUPDTE

MERGES

The number of times a MERGE statement was executed.

Field Name: QXMERGE

PREPARE

The number of SQL PREPARE statements executed. This number at the server location might not match the number at the user application because of the internal processing of the Distributed Data Facility (DDF).

Field Name: QXPREP

EL. TIME(CL1)

The class 1 elapsed time of the allied agent.

Special Considerations:

- If the begin time equals zero, or if the end time minus begin time equals zero or is negative, N/C is shown.
- Threads that can be reused, such as CICS protected threads or IMS/VS wait-for-input message regions, can include time during which the thread was inactive and waiting for work.
- Elapsed time to process distributed requests is included for allied-distributed threads.
- This time includes the time for processing SQL statements issued by stored procedures, user-defined functions, or triggers.
- In query CP, sysplex query, or utility parallelism, this is the time shown in the originating record, which overlaps the elapsed times shown in the parallel records.

Field Name: ADRECETT

This is an exception field.

CPU TIME(CL1)

The class 1 CPU time in an application. It indicates:
The class 1 CPU time of the allied agent, which may include the accumulated class 1 TCB time for processing stored procedures, user-defined functions, and triggers.

The accumulated CPU time for processing parallel tasks. This is valid for query CP parallelism, sysplex query parallelism, and parallel tasks generated by utilities.

In sysplex query parallelism, the individual CPU times are normalized by the conversion factor of the parallel tasks that is related to the originating task.

In sysplex query parallelism, only CPU times of parallel tasks, running on the same member of the SYSPLEX group as the originating task, are included.

This CPU time does not include time that is consumed on an IBM specialty engine.

**Field Name:** ADCPUT

This is an *exception* field.

**EL. TIME(CL2)**

The class 2 elapsed time of the allied agent accumulated in DB2.

**Field Name:** ADDB2ETT

This is an *exception* field.

**CPU TIME(CL2)**

The class 2 CPU time (in DB2). It indicates:

- The class 2 CPU time for the allied agent. This includes the accumulated class 2 TCB time for processing any stored procedures, user-defined functions, and triggers.
- The accumulated CPU time for processing parallel tasks. This is valid for query CP parallelism, sysplex query parallelism, and parallel tasks generated by utilities.
- For batch reporting, in sysplex query parallelism, the individual CPU times are normalized by the conversion factor of the parallel tasks, related to the originating task.

For online monitoring, in sysplex query parallelism, only CPU times of parallel tasks, running on the same member of the sysplex group as the originating task, are included.

This CPU time does not include time that is consumed on an IBM specialty engine.

**Field Name:** ADDBCPUT

This is an *exception* field.

**GETPAGES**

The number of Getpage requests. This counter is incremented by successful Getpage requests for queries processed in parallel for each thread and for all successful and unsuccessful Getpage requests for queries that are not processed in parallel.

**Background and Tuning Information**
Reducing the number of Getpages can improve DB2 performance by reducing the number of synchronous page reads. With fewer Getpages, the requested page is more likely to be returned from the buffer pool. CPU usage is also reduced.

Check the ratio of Getpages to SQL DML statements, as a rule of thumb, try and keep this ratio below six for a typical online transaction SQL.

You might need to modify the database and query design, for example:

- Add indexes to tables to reduce the number of pages scanned.
- Reassess the number of tables used and denormalize them, if necessary.

As an example, a large table with many columns can result in several pages being fetched to satisfy a simple query requesting just a few columns. Splitting such a table into several tables with fewer columns, tailored to queries, will result in fewer pages returned for each query.

- Use correlated rather than non-correlated queries to force the use of an index.

Field Name: QBACGET
This is an exception field.

**BUF.UPDT**

The number of times a buffer update occurs. This is incremented every time a page is updated and ready to be written to DASD. If the same page is updated twice, for example, the number is incremented by 2.

This number is kept for all types of pages including data pages and work-file pages.

**Background and Tuning Information**

A nonzero value indicates any of the following activities:

- SQL INSERT, UPDATE, or DELETE
- Merge scan join
- Internal sort activity on the work files

Check the access path to determine whether sort activity can be minimized or avoided.

Field Name: QBACSWS
This is an exception field.

**SYN.READ**

The number of synchronous read I/O operations. DB2 increments this counter for each media manager synchronous physical read. Asynchronous I/O requests are not counted.

Field Name: QBACRIO
This is an exception field.

**TOT.PREF**

The number of sequential, dynamic, and list prefetch requests.

Field Name: ABCLSPR
This is an exception field.

**LOCK SUS**
The total number of all lock suspensions. This includes local and global lock suspensions.

Field Name: ALTSUSP
This is an exception field.

LOCKOUTS
The number of deadlocks and timeouts.

Field Name: ADTIMDLK
This is an exception field.
Package General (Short Trace)

This topic shows detailed information about “Accounting - Package General (Short Trace)”.

This block is part of the Accounting Short Trace.

Accounting - Package General (Short Trace)

The field labels shown in the following sample layout of “Accounting - Package General (Short Trace)” are described in the following section.

<table>
<thead>
<tr>
<th>PROGRAM NAME</th>
<th>TYPE</th>
<th>SQLSTMT</th>
<th>CL7 ELAP TIME</th>
<th>CL7 CPU TIME</th>
<th>CL8 SUSP TIME</th>
<th>CL8 SUSP</th>
</tr>
</thead>
<tbody>
<tr>
<td>PKGNAME</td>
<td>PACKAGE</td>
<td>4</td>
<td>0.184705</td>
<td>0.003055</td>
<td>0.041534</td>
<td>4</td>
</tr>
</tbody>
</table>

...  

PROGRAM NAME

The program name (package ID or DBRM name).

In the case of rollup data (Accounting data of DDF/RRSAF threads and parallel tasks accumulated by DB2), the following value is shown "ROLSUM".

Field Name: QPACPKID

This is an exception field.

TYPE

An indicator of whether the block describes a package or a DBRM. Possible values are PACKAGE, DBRM, and BOTH. BOTH can be shown in reports if there are packages and DBRMs with the same program name.

Field Name: ADPCKTYP

SQLSTMT

The number of SQL statements issued in this package or DBRM.

This number may not be equal to the total number of SQL statements in the QXST data section because QXST does not count all SQL statements. For example, it does not count commit or rollback statements.

Note: This field is shown for the following field labels in Accounting trace:

- SQL STMT - TOTAL
- SQL STMT - AVERAGE:

Field Name: QPACSQLC

This is an exception field.

CL7 ELAP TIME

The total elapsed time for executing the package or DBRM.

Field Name: QPACSCT

This is an exception field.

CL7 CPU TIME

The class 7 CPU time spent by the package or DBRM. It indicates:

- The TCB time
• The accumulated CPU time for processing parallel tasks. This is valid for query CP parallelism, sysplex query parallelism, and parallel tasks generated by utilities.

In sysplex query parallelism, only CPU times of parallel tasks, running on the same member of the sysplex group as the originating task, are included.

This time does not include the CPU time consumed on an IBM specialty engine.

Field Name: ADCPUTP
This is an exception field.

CL8 SUSP:TIME
The waiting time for the package or DBRM due to class 8 suspensions.

Field Name: ADTSUSTP
This is an exception field.

CL8 SUSP
The number of all types of class 8 suspensions.

Field Name: ADTSUSCP
This is an exception field.
Distributed Activity Server (Short Trace)

This topic shows detailed information about “Accounting - Distributed Activity Server (Short Trace)”.

This block is part of the Accounting Short Trace.

Accounting - Distributed Activity Server (Short Trace)

The field labels shown in the following sample layout of “Accounting - Distributed Activity Server (Short Trace)” are described in the following section.

```
<table>
<thead>
<tr>
<th>SERVER</th>
<th>PRODUCT ID</th>
<th>PROD VERSION</th>
<th>METH</th>
<th>ROLLBACK</th>
<th>COMMITS</th>
<th>SQLSENT</th>
<th>ROWRECV</th>
<th>CONVI</th>
<th>ELAPSED REQ</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMODA1</td>
<td>DB2</td>
<td>V10R1</td>
<td>N/P</td>
<td>0</td>
<td>1</td>
<td>2</td>
<td>1095</td>
<td>1</td>
<td>0.154750</td>
</tr>
</tbody>
</table>
```

SERVER

The name of the remote location with which this information is associated. If the local location is the requester, this field is a server location. If the local location is a server location, this field is the requester location. An allied thread is created at a DB2 requester, and a database access thread is created at a DB2 server. An accounting record is for either a requester or a server, but not for both.

This field is invalid if summary rollup data is present. In Accounting this field is set to *ROLSUM*.

Field Name: QLACLCN

This is an exception field.

PRODUCT ID

The original DB2 field specifies the information in the following field names of the remote requester or server location:

PRODUCT ID

It consists of 3 characters and can have the following values:

<table>
<thead>
<tr>
<th>Original ID from DB2</th>
<th>Shown as</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSN</td>
<td>DB2</td>
</tr>
<tr>
<td>ARI</td>
<td>SQL/DS</td>
</tr>
<tr>
<td>SQL</td>
<td>DB2/400</td>
</tr>
<tr>
<td>SQL</td>
<td>COMMON SERV</td>
</tr>
<tr>
<td>JCC</td>
<td>JDBC DRIVER</td>
</tr>
<tr>
<td>'000000'X, '404040'X</td>
<td>N/P</td>
</tr>
<tr>
<td>Other</td>
<td>Original ID from DB2</td>
</tr>
</tbody>
</table>

Note:

- If the record is written at the application requester location, or if summary rollup data is available, N/P is shown in Accounting TRACE and REPORT.
- In Accounting FILE and SAVE DDF tables, BLANK is shown.

PRODUCT VERSION (PROD VERSION)

It consists of 5 digits and is shown as VvvRrrMm , where:
**Version level**

**Release level**

**Modification level**

**Note:** For DDF/RRSAF rollup records, the product ID and product version contain a value derived from the last thread to rollup. For query parallelism rollup threads, the value is derived from the parent record.

**Field Name:** QLACPRID

### PROD VERSION

The original DB2 field specifies the information in the following field names of the remote requester or server location:

**PRODUCT ID**

It consists of 3 characters and can have the following values:

<table>
<thead>
<tr>
<th>Original ID from DB2</th>
<th>Shown as</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSN</td>
<td>DB2</td>
</tr>
<tr>
<td>ARI</td>
<td>SQL/DS</td>
</tr>
<tr>
<td>QSQ</td>
<td>DB2/400</td>
</tr>
<tr>
<td>SQL</td>
<td>COMMON SERV</td>
</tr>
<tr>
<td>JCC</td>
<td>JDBC DRIVER</td>
</tr>
<tr>
<td>'000000'X, '404040'X</td>
<td>N/P</td>
</tr>
<tr>
<td>Other</td>
<td>Original ID from DB2</td>
</tr>
</tbody>
</table>

**Note:**

- If the record is written at the application requester location, or if summary rollup data is available, N/P is shown in Accounting TRACE and REPORT.
- In Accounting FILE and SAVE DDF tables, BLANK is shown.

### PRODUCT VERSION (PROD VERSION)

It consists of 5 digits and is shown as $vvvrmm$, where:

- $vv$: Version level
- $rr$: Release level
- $m$: Modification level

**Note:** For DDF/RRSAF rollup records, the product ID and product version contain a value derived from the last thread to rollup. For query parallelism rollup threads, the value is derived from the parent record.

**Field Name:** QLACPRID

### METH

The method of access: DB2 private protocol, DRDA protocol, or both.

This field is invalid if unique or summary rollup data is present. It can have the following value in:

- Accounting Trace and Report: N/P
- The Accounting FILE and SAVE PROGRAM table: blank
Field Name: ADPROT

ROLLBCK
The total number of rollbacks (single phase and two-phase) sent.

Field Name: ADROL12S

COMMTS
The total number of single-phase and two-phase commit requests sent.

Field Name: ADCOM12S

SQLSENT
The number of SQL statements sent to the server location. This value is maintained at the requesting location.

Field Name: QLACSQLS

ROWRECV
The number of rows of data retrieved from the server location. This value is maintained at the requester location.

Special Considerations:
1. The number of rows received from the server location does not include either the SQLDA or SQLCA.
2. Block fetch can significantly affect the number of rows sent across the network. When used with non-UPDATE cursors, block fetch puts as many rows as possible into the message buffer, and transmits the buffer across the network without requiring a VTAM message. Consequently, more rows of data might be sent from the server location than are received by the reporting (requester) location. This is especially true when DB2 private protocol is used because multiple blocks can be transmitted from the server with no intervening messages sent by the requester.

Field Name: QLACROWR
This is an exception field.

CONVI
The number of conversations (both successful and unsuccessful) initiated by the requester location to be executed at the server location. This number is maintained at the requester.

Field Name: QLACCNV5
This is an exception field.

ELAPSED REQ
The elapsed time at the requester. It includes the total of DB2 and network time.

Field Name: ADDSELRQ
This is an exception field.
Distributed Activity Requester (Short Trace)

This topic shows detailed information about “Accounting - Distributed Activity Requester (Short Trace)”.

This block is part of the Accounting Short Trace.

**Accounting - Distributed Activity Requester (Short Trace)**

The field labels shown in the following sample layout of “Accounting - Distributed Activity Requester (Short Trace)” are described in the following section.

```
<table>
<thead>
<tr>
<th>REQUESTER</th>
<th>PRODUCT ID</th>
<th>PROD VERSION</th>
<th>METH</th>
<th>ROLLBACK</th>
<th>COMMITS</th>
<th>SQLRECV</th>
<th>ROWSENT</th>
<th>CONVI</th>
</tr>
</thead>
<tbody>
<tr>
<td>::FFFF#1</td>
<td>JDBC DRIVER V3</td>
<td>RESMD</td>
<td>DRDA</td>
<td>0</td>
<td>1</td>
<td>4</td>
<td>0</td>
<td>1</td>
</tr>
</tbody>
</table>
```

**REQUESTER**

The name of the remote location with which this information is associated. If the local location is the requester, this field is a server location. If the local location is a server location, this field is the requester location. An allied thread is created at a DB2 requester, and a database access thread is created at a DB2 server. An accounting record is for either a requester or a server, but not for both.

This field is invalid if summary rollup data is present. In Accounting this field is set to *ROLSUM*.

Field Name: QLACLOCN

This is an exception field.

**PRODUCT ID**

The original DB2 field specifies the information in the following field names of the remote requester or server location:

**PRODUCT ID**

It consists of 3 characters and can have the following values:

<table>
<thead>
<tr>
<th>Original ID from DB2</th>
<th>Shown as</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSN</td>
<td>DB2</td>
</tr>
<tr>
<td>ARI</td>
<td>SQL/DS</td>
</tr>
<tr>
<td>QSQ</td>
<td>DB2/400</td>
</tr>
<tr>
<td>SQL</td>
<td>COMMON SERV</td>
</tr>
<tr>
<td>JCC</td>
<td>JDBC DRIVER</td>
</tr>
<tr>
<td>'000000'X, '404040'X</td>
<td>N/P</td>
</tr>
<tr>
<td>Other</td>
<td>Original ID from DB2</td>
</tr>
</tbody>
</table>

**Note:**

- If the record is written at the application requester location, or if summary rollup data is available, N/P is shown in Accounting TRACE and REPORT.
- In Accounting FILE and SAVE DDF tables, BLANK is shown.

**PRODUCT VERSION (PROD VERSION)**

It consists of 5 digits and is shown as VvvRrrMm , where:
**Note:** For DDF/RRSAF rollup records, the product ID and product version contain a value derived from the last thread to rollup. For query parallelism rollup threads, the value is derived from the parent record.

**Field Name:** QLACPRID

**PROD VERSION**

The original DB2 field specifies the information in the following field names of the remote requester or server location:

**PRODUCT ID**

It consists of 3 characters and can have the following values:

<table>
<thead>
<tr>
<th>Original ID from DB2</th>
<th>Shown as</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSN</td>
<td>DB2</td>
</tr>
<tr>
<td>ARI</td>
<td>SQL/DS</td>
</tr>
<tr>
<td>QSQ</td>
<td>DB2/400</td>
</tr>
<tr>
<td>SQL</td>
<td>COMMON SERV</td>
</tr>
<tr>
<td>ICC</td>
<td>JDBC DRIVER</td>
</tr>
<tr>
<td>'000000'X, '404040'X</td>
<td>N/P</td>
</tr>
<tr>
<td>Other</td>
<td>Original ID from DB2</td>
</tr>
</tbody>
</table>

**Note:**

- If the record is written at the application requester location, or if summary rollup data is available, N/P is shown in Accounting TRACE and REPORT.
- In Accounting FILE and SAVE DDF tables, BLANK is shown.

**PRODUCT VERSION (PROD VERSION)**

It consists of 5 digits and is shown as VvvRrrMm, where:

<table>
<thead>
<tr>
<th>v</th>
<th>Version level</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>Release level</td>
</tr>
<tr>
<td>m</td>
<td>Modification level</td>
</tr>
</tbody>
</table>

**Note:** For DDF/RRSAF rollup records, the product ID and product version contain a value derived from the last thread to rollup. For query parallelism rollup threads, the value is derived from the parent record.

**Field Name:** QLACPRID

**METH**

The method of access: DB2 private protocol, DRDA protocol, or both.

This field is invalid if unique or summary rollup data is present. It can have the following value in:

- Accounting Trace and Report: N/P
- The Accounting FILE and SAVE PROGRAM table: blank
Field Name: ADPROTOC

ROLLBCK

The total number of rollbacks (single phase and two-phase) received.

Field Name: ADROL12R

COMMENTS

The total number of commits (single phase and two-phase) received.

Field Name: ADCOM12R

SQLRECV

The number of SQL statements received from the requester location.

Field Name: QLACSQLR

ROWSENT

The number of rows sent from the server location to the requester location. The value includes SQLDA and is maintained at the server location.

Field Name: QLACROWS

CONVI

A count of conversations initiated by the requester. This number is updated at the server location.

Field Name: QLACCNVR
### Accounting Report - Long

This topic shows an example of a long version of the Accounting report.

Use the following command to produce a long version of the Accounting report:

```
... ACCOUNTING REPORT
LAYOUT (LONG)
ORDER (PRIMAUTH-PLANNAME)
SCOPE (MEMBER)
...
```

### OMEGAMON XE for DB2 Performance Expert (V5R4M0)

This report provides performance statistics for DB2 Version V10. It includes details on page reads, buffer pool usage, program statistics, and more.

#### Page Reads
- **BPOOL Hit Ratio (%)**: 99.95%
- **GETPAGES**: 33183
- **Buffer Updates**: 12
- **Synchronous Writes**: 0
- **Synchronous Reads**: 6
- **SEQ. Prefetch Req's**: 0
- **List Prefetch Req's**: 0.30
- **Dyn. Prefetch Req's**: 168.10
- **Pages Read Asyncrh.**: 1.00

#### Program Name: OMPDA5
- **Type**: Agent
- **Collection ID**: DB2PM
- **Package**: ELAP-CPL TIME-AVG
- **CPU Time**: 0.039262
- **Average Lock/Latch**: 0.000000
- **Average Synchronous 1/0**: 0.000000
- **Average Other Read I/O**: 0.000000
- **Average Other Write I/O**: 0.000000
- **Average Serv.Task Switch**: 0.000000
- **Release**: 0.000000
- **I/O Time**: 8162.00
- **I/O Requests**: 7%
- **Suspension**: 0%
- **Entry/Exit**: 0.000000
- **Tie Time**: 0.000000
- **Total Clb Suspens.**: 0.000000

#### Pg Latch
- **Package**: ELAP-CPL TIME-AVG
- **CPU Time**: 0.035705
- **Average Lock/Latch**: 0.000000
- **Average Synchronous 1/0**: 0.000000
- **Average Other Read I/O**: 0.000000
- **Average Other Write I/O**: 0.000000
- **Average Serv.Task Switch**: 0.000000
- **Release**: 0.000000
- **I/O Time**: 8162.00
- **I/O Requests**: 7%
- **Suspension**: 0%
- **Entry/Exit**: 0.000000
- **Tie Time**: 0.000000
- **Total Clb Suspens.**: 0.000000

#### Conclusion
This report provides a comprehensive overview of DB2 performance, highlighting areas of optimization and potential bottlenecks. Regular monitoring and analysis of such reports are crucial for maintaining optimal database performance.

### Example Table Usage

**Table Example:**

<table>
<thead>
<tr>
<th>Location</th>
<th>Action</th>
<th>Time</th>
<th>Average</th>
</tr>
</thead>
<tbody>
<tr>
<td>OMPDBEE</td>
<td>SELECT</td>
<td>60.00</td>
<td>60.00</td>
</tr>
<tr>
<td></td>
<td>INSERT</td>
<td>0.00</td>
<td>0.00</td>
</tr>
<tr>
<td></td>
<td>DELETE</td>
<td>0.00</td>
<td>0.00</td>
</tr>
</tbody>
</table>

**Summary:**

- SELECT: 60.00 average time across different locations.
- INSERT: 0.00 average time.
- DELETE: 0.00 average time.

**Times/Events:**

- **Application (CL.1)**: Various database operations and statistics.
- **DB2 (CL.2)**: Detailed DB2 operations and performance metrics.

### TIME/EVENT

- **Elapsed Time**: Various durations for different operations.
- **Events**: Multiple entries indicating different events.

### HIGHLIGHTS

- **Normal Execution**: Normal conditions for most operations.
- **Abnormal Conditions**: Some operations are marked as abnormal.

Chapter 5. Accounting Default Layouts  5-205
Accounting Report and Trace Blocks

Accounting reports and traces are arranged in blocks. Each block contains accounting information about a particular activity. The layout of each block is presented followed by the field descriptions.

The layout of the Accounting report blocks and the corresponding trace blocks is similar, the main difference is that Accounting reports show times and events averaged over the number of threads, and accounting traces show times and events as totals for each thread.

Fields in an Accounting report can show average values, totals or times. Normally the columns within the blocks of a report are labeled to indicate the type of data shown, and are shown as follows:

**Averages**
- Have two decimal places behind the point

**Totals**
- Are whole numbers

**Times**
- Have six decimal places behind the point

Where it is not possible to distinguish the type of data, totals are indicated with a hash (#) as the first character in the label.

This topic shows each block in alphabetical order. Each field in the block is listed in the order that it appears, showing the field name (as shown in the long report and trace) followed by a description.

Each block is presented in the default layout. Some blocks can have columns, rows or fields that are not included in the default layout. For example, the SQL DCL, SQL DML, RID List, buffer pool and group buffer pool activity blocks have a /COMMIT column that is not shown in the default layout. You can include columns, rows, and fields not shown in the default layouts with user-tailored reporting (UTR).

Field names used in short reports and traces can vary slightly from those used in the long versions. This is to allow the layout of the printed report or trace to align properly.

If a counter value or specific information in reports, in windows, or on panels is not shown, the following notation is used to indicate the reason:

**N/A**
- Not applicable is shown if DB2 never produces a counter value in a specific context. Examples are:
  - A counter is not available in one DB2 version.
  - Counters are mutually exclusive.

**N/C**
- Not calculated is shown for a derived field where the value cannot be calculated or is useless. Examples are:
  - A divide by zero (percentages, ratios).
  - Suppression of negative elapsed time values.
  - Required counter values for calculation marked as N/A or N/P.
  - Insufficient data or small counter values to allow significant statements (meaningless or misleading averages).
N/P Not present is shown for a field where DB2 can present values, but does not in this instance. Examples are:

- When counter values are not generated because of operational conditions (a trace class is not active).
- An application does not provide a value because it is optional.

**Short, Unique, or Long Names or Strings**

The following types of names or strings are used in this information:

**Short name or string**

A short name or short string is either the value of an original DB2 field if it less than or equal to the defined length of the field, or it is the abbreviation of a longer value which is populated in a field of varying length.

**Unique name or string**

A unique name or unique string is a generated string based on the short string and its length, with a right-adjusted #-sign and a sequence number. This sequence number depends on the amount of long fields found during processing, which have the same string prefix and length as the short string. For example:

WSNAME: 1S-255-012345678#1

**Long name or string**

A long name or long string is the complete string populated in a field of varying length. This depends on the context where it is used.

**Accelerator**

This topic shows detailed information about “Accounting - Accelerator”.

The Accounting Accelerator report block is shown for each accelerator that provided services to a DB2 thread. The block consists of three adjacent columns which contain the accelerator identification, the activity-related counters, and the corresponding times.

**Note:**
- For product identifiers of IBM DB2 Analytics Accelerator for z/OS prior to AQT04015 the values of the following fields are N/A: SQL DML, SQL DDL, ROWS RETURN, COMMIT, and ROLLBACK.
- The Accounting trace shows values and times for each Q8AC section. The Accounting report does not only show accumulated values and times, but also average values and times calculated for one occurrence. It shows the sum of a counter or time of all Q8AC sections processed, divided by the number of processed Q8AC sections.

For more information on the Accounting fields referred to in the field descriptions below, see:
- “Times - Class 1 - Application Time” on page 5-360
- “Times - Class 2 - DB2 Time” on page 5-367

In the following example both layouts are shown, the report layout is followed by the trace layout.

**Accounting - Accelerator**

The field labels shown in the following sample layout of “Accounting - Accelerator” are described in the following section.

**Note:** The values represent metrics such as number of requests, bytes sent, and CPU times for various operations like inserts, updates, and deletes.
The number of messages sent.
Field Name: Q8ACMSGS

SENT - BLOCKS
The number of blocks sent.
Field Name: Q8ACBLKS

SENT - ROWS
The number of rows sent.
Field Name: Q8ACROWS

RECEIVED - BYTES
The number of bytes returned.
Field Name: Q8ACBYTR

RECEIVED - MESSAGES
The number of messages returned.
Field Name: Q8ACMSGR

RECEIVED - BLOCKS
The number of blocks returned.
Field Name: Q8ACBLKR

RECEIVED - ROWS
The number of rows returned.
Field Name: Q8ACROWR

SQL DML - INSERT
The accumulated number of INSERT statements sent to the accelerator from DB2.
Field Name: Q8ACINSC

SQL DML - INSERT ROWS
The accumulated number of rows inserted to the accelerator by DB2.
Field Name: Q8ACROWI

SQL DML - UPDATE
The accumulated number of UPDATE statements sent to the accelerator from DB2.
Field Name: Q8ACUPDC

SQL DML - UPDATE ROWS
The accumulated number of rows updated on the accelerator by DB2.
Field Name: Q8ACROWU

SQL DML - DELETE
The accumulated number of DELETE statements sent to the accelerator from DB2.
Field Name: Q8ACDELC
Accelerator

SQL DML - DELETE ROWS

The accumulated number of rows deleted on the accelerator by DB2.

Field Name: Q8ACROWD

SQL DML - OPEN

The accumulated number of OPEN statements sent to the accelerator from DB2.

Field Name: Q8ACOPNC

SQL DDL - CREATE

The accumulated number of CREATE statements sent to the accelerator from DB2.

Field Name: Q8ACCRTC

SQL DDL - DROP

The accumulated number of DROP statements sent to the accelerator from DB2.

Field Name: Q8ACDRPC

ROWS RETURN

The accumulated number of rows returned by the accelerator to DB2.

Note: For completed queries, this is the total number of rows returned to DB2. For in-process queries, this is the number of rows that have been sent so far (and more rows may still be coming).

Field Name: Q8ACROWC

COMMIT

The accumulated number of COMMIT statements sent to the accelerator from DB2.

Field Name: Q8ACCMTC

ROLLBACK

The accumulated number of ROLLBACK statements sent to the accelerator from DB2.

Field Name: Q8ACRBKC

ELAPSED TIME - SVCS TCP/IP

The accelerator services TCP/IP elapsed time measured in DB2. It starts when sending the requests to the accelerator and ends when receiving the results from the accelerator.

Field Name: Q8ACTELA

ELAPSED TIME - ACCUM ACCEL

The elapsed time spent in the accelerator when executing requests from the DB2 subsystem.

Field Name: Q8ACAELA

CPU TIME - SVCS TCP/IP

The accelerator services TCP/IP CPU time measured in DB2 for the amount of CPU consumed by the DDF service task to perform the SEND
and RECEIVE to an accelerator service. It does not account for the TCP/IP address CPU to route the message on to the network and receive the reply into the DDF task.

**Field Name:** Q8ACTCPU

**CPU TIME - ACCUM ACCEL**

The CPU time spent in the accelerator when executing requests from the DB2 subsystem.

**Field Name:** Q8ACACPU

**WAIT TIME - ACCUM ACCEL**

The wait time spent in the accelerator when executing requests from the DB2 subsystem.

**Field Name:** Q8ACAWAT

**DB2 THREAD - CLASS 1 - ELAPSED**

Class 1 elapsed time of the thread. See ADRECETT.

**Field Name:** ADACCET1

**DB2 THREAD - CLASS 1 - CP CPU**

Class 1 CP CPU time of the thread. See ADCPUT.

**Field Name:** ADACCCP1

**DB2 THREAD - CLASS 1 - SE CPU**

Class 1 SE CPU time of the thread. See AWACC1Z.

**Field Name:** ADACCSE1

**DB2 THREAD - CLASS 2 - ELAPSED**

Class 2 elapsed time of the thread. See ADDB2ETT.

**Field Name:** ADACCET2

**DB2 THREAD - CLASS 2 - CP CPU**

Class 2 CP CPU time of the thread. See ADDBCPUT.

**Field Name:** ADACCCP2

**DB2 THREAD - CLASS 2 - SE CPU**

Class 2 SE CPU time of the thread. See AWACC2Z.

**Field Name:** ADACCSE2
**Buffer Pool Activity**

This topic shows detailed information about “Accounting - Buffer Pool Activity”.

This block is printed for each active buffer pool. When there is more than one active buffer pool, a block is printed for each aggregation showing total buffer pool activity (all buffer pools, all 4 KB buffer pools, all 32 KB buffer pools).

The following example applies to both, the report layout and the trace layout.

**Accounting - Buffer Pool Activity**

The field labels shown in the following sample layout of “Accounting - Buffer Pool Activity” are described in the following section.

<table>
<thead>
<tr>
<th>Report</th>
<th>Trace</th>
</tr>
</thead>
<tbody>
<tr>
<td>BP1 BPOOL ACTIVITY</td>
<td>BPOOL HIT RATIO (%)</td>
</tr>
<tr>
<td>AVERAGE</td>
<td>TOTAL</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------</td>
</tr>
<tr>
<td>BPOOL HIT RATIO (%)</td>
<td>9.14</td>
</tr>
<tr>
<td>GETPAGES</td>
<td>7.57</td>
</tr>
<tr>
<td>BUFFER UPDATES</td>
<td>0.00</td>
</tr>
<tr>
<td>SYNCHRONOUS WRITE</td>
<td>0.00</td>
</tr>
<tr>
<td>SYNCHRONOUS READ</td>
<td>2.71</td>
</tr>
<tr>
<td>SEQ. PREFETCH REQS</td>
<td>0.00</td>
</tr>
<tr>
<td>LIST PREFETCH REQS</td>
<td>0.00</td>
</tr>
<tr>
<td>DYN. PREFETCH REQS</td>
<td>0.00</td>
</tr>
<tr>
<td>PAGES READ ASYNCHR.</td>
<td>0.00</td>
</tr>
</tbody>
</table>

**BPOOL HIT RATIO (%)**

The percentage of Getpage operations that were satisfied by a page already in the buffer pool.

The value is calculated as the ratio of number of successful Getpage operations minus the number of pages read from DASD (both synchronously and using prefetch), to the number of successful Getpage operations, expressed as a percentage.

**Background and Tuning Information**

The highest possible hit ratio is 100%, that is, when every page requested is always in the buffer pool. If the requested page is not in the buffer pool, the hit ratio is 0% or less. If the hit ratio is negative, this means that prefetch brought pages into the buffer pool that are not subsequently referenced, either because the query stops before it reaches the end of the table space, or because the prefetched pages are stolen by DB2 for reuse before the query can access them. A low buffer pool hit ratio is not necessarily bad. The hit ratio is a relative value, based on the type of application. For example, an application that browses large data might have a buffer pool hit ratio of 0. Watch for those cases where the hit ratio drops significantly for the same application. Here are some suggestions to increase the buffer hit ratio:

- Run the REORG utility for indexes or table spaces associated with the virtual buffer pool.
- Reserve more pages for random I/O by setting the SEQUENTIAL STEAL THRESHOLD (VPSEQT) to a lower value.
- Increase the buffer pool as long as the cost of paging does not outweigh the benefit of I/O avoidance.
- Establish more separate buffer pools, perhaps to isolate different applications.
• Place the objects that are only accessed sequentially in a separate buffer pool.

The hit ratio measurement becomes less meaningful if the buffer pool is used by additional processes, such as utilities or work files.

**Field Name:** ABUFFRAT

**GETPAGES**

The number of Getpage requests. This counter is incremented by successful Getpage requests for queries processed in parallel for each thread and for all successful and unsuccessful Getpage requests for queries that are not processed in parallel.

**Background and Tuning Information**

Reducing the number of Getpages can improve DB2 performance by reducing the number of synchronous page reads. With fewer Getpages, the requested page is more likely to be returned from the buffer pool. CPU usage is also reduced.

Check the ratio of Getpages to SQL DML statements, as a rule of thumb, try and keep this ratio below six for a typical online transaction SQL.

You might need to modify the database and query design, for example:

• Add indexes to tables to reduce the number of pages scanned.

• Reassess the number of tables used and denormalize them, if necessary.

As an example, a large table with many columns can result in several pages being fetched to satisfy a simple query requesting just a few columns. Splitting such a table into several tables with fewer columns, tailored to queries, will result in fewer pages returned for each query.

• Use correlated rather than non-correlated queries to force the use of an index.

**Field Name:** QBACGET

This is an exception field.

**BUFFER UPDATES**

The number of times a buffer update occurs. This is incremented every time a page is updated and is ready to be written to DASD. If the same page is updated twice, for example, the number is incremented by 2.

This number is kept for all types of pages including data pages and work-file pages.

**Background and Tuning Information**

A nonzero value indicates any of the following activities:

• SQL INSERT, UPDATE, or DELETE

• Merge scan join

• Internal sort activity on the work files

Check the access path to determine whether sort activity can be minimized or avoided.

**Field Name:** QBACSWS

This is an exception field.

**SYNCHRONOUS WRITE**
Buffer Pool Activity

The number of immediate (synchronous) write I/O operations.

Background and Tuning Information

Although an immediate write is rare, a small nonzero value is acceptable. A large value indicates that the system needs tuning.

Field Name: QBACIMW

This is an exception field.

Synchronous Read

The number of synchronous read I/O operations. DB2 increments this counter for each media manager synchronous physical read. Asynchronous I/O requests are not counted.

Field Name: QBACRIO

This is an exception field.

Seq. Prefetch Reqs

The number of SEQUENTIAL PREFETCH requests. This is incremented for each PREFETCH request. Each request can result in an I/O read. If it does, up to 64 pages can be read for SQL and up to 128 pages for utilities. For SQL, depending on the buffer pool size, a request does not result in an I/O if all the requested pages are already in the buffer pool.

DB2 can use sequential prefetch if the data is accessed in sequential order even though sequential prefetch was not requested at bind time. This is known as sequential detection and is not included in the sequential prefetch count. Sequential detection is included in dynamic prefetch requests field.

Background and Tuning Information

Table space scans and nonmatching index scans generally use sequential prefetch.

Field Name: QBACSEQ

This is an exception field.

List Prefetch Reqs

The number of LIST PREFETCH requests.

Special Considerations:

1. List prefetch allows DB2 to access data pages efficiently even if the needed data pages are not contiguous. It can be used with single index access and is always used with multiple index access.

2. List prefetch is always used to access data from the inner table during a hybrid join.

3. Data pages are read in quantities equal to the sequential prefetch quantity, which depends on the buffer pool size and is usually 64 pages.

4. During bind time DB2 does not use list prefetch if the estimated number of RIDs to be processed would take more than 50% of the RID pool. During execution time, list prefetch processing terminates if DB2 detects that more than 25% of the rows in the table need to be accessed. If list prefetch is terminated, it is indicated in IFCID 125.

Field Name: QBACLPF
This is an exception field.

**DYN. PREFETCH REQS**

The number of (dynamic) PREFETCH requests. This is triggered by sequential detection. This includes prefetches for segmented table spaces.

**Background and Tuning Information**

Dynamic prefetch is typically used for a SELECT or UPDATE that is run repeatedly, accessing the index for each access.

If sequential prefetch, list prefetch, and dynamic prefetch reads have large values, check whether the access path can be improved.

**Field Name:** QBACDPF

This is an exception field.

**PAGES READ ASYNCHR.**

The number of asynchronous pages read by prefetch that the agent triggered.

**Background and Tuning Information**

This is used to determine the buffer pool hit ratio: (Getpage requests - Synchronous reads - Asynchronous pages read) / Getpage requests.

**Field Name:** QBACSIO

This is an exception field.
Data Capture

This topic shows detailed information about “Accounting - Data Capture”.

This block shows data for Data Capture activities.

For formatting reasons, OMEGAMON XE for DB2 PE shows different labels for report and trace. In the following example both layouts are shown, the report on the left, and the trace layout on the right.

**Accounting - Data Capture**

The field labels shown in the following sample layout of “Accounting - Data Capture” are described in the following section.

<table>
<thead>
<tr>
<th>Report:</th>
<th>Trace:</th>
</tr>
</thead>
<tbody>
<tr>
<td>DATA CAPTURE</td>
<td>AVERAGE</td>
</tr>
<tr>
<td>IFI CALLS MADE</td>
<td>N/P</td>
</tr>
<tr>
<td>RECORDS CAPTURED</td>
<td>N/P</td>
</tr>
<tr>
<td>LOG RECORDS READ</td>
<td>N/P</td>
</tr>
<tr>
<td>ROWS RETURNED</td>
<td>N/P</td>
</tr>
<tr>
<td>RECORDS RETURNED</td>
<td>N/P</td>
</tr>
<tr>
<td>DATA DESC. RETURN</td>
<td>N/P</td>
</tr>
<tr>
<td>TABLES RETURNED</td>
<td>N/P</td>
</tr>
<tr>
<td>DESCRIBES</td>
<td>N/P</td>
</tr>
</tbody>
</table>

**IFI CALLS MADE (IFI CALLS)**

The total number of IFI calls. This field is only calculated if accounting class 5 is active.

Field Name: ADIFICAL

**RECORDS CAPTURED (REC.CAPTURED)**

The number of retrievable log records that were written for tables defined with DATA CAPTURE CHANGES. This number includes only those log records that can be retrieved by an IFI READS call for IFCID 185. Some records can be written but not retrieved, for example if monitor trace class 6 is not active.

Field Name: QIFAANRC

**LOG RECORDS READ (LOG REC.READ)**

The number of log reads performed for processing IFI READS requests for IFCID 185.

Field Name: QIFAANLR

**ROWS RETURNED (ROWS RETURN)**

The number of data rows returned in IFCID 185. Two rows are returned for each row altered by an SQL UPDATE statement.

Field Name: QIFAANDR

**RECORDS RETURNED (RECORDS RET.)**

The number of log records returned to the caller of the IFI READS call for IFCID 185.

Field Name: QIFAANRR

**DATA DESC. RETURN (DATA DES.RET)**
The number of data descriptions returned in IFCID 185. The data descriptions are mapped in IFCID 185.

**Field Name:** QIFAANDD

**TABLES RETURNED (TABLES RET.)**

The total number of tables returned to the caller of IFI READS call for IFCID 185.

**Field Name:** QIFAANTB

**DESCRIBES**

The number of data capture describes for processing READS requests for IFCID 185 data.

**Field Name:** QIFAANMB
Data Sharing Locking

This topic shows detailed information about “Accounting - Data Sharing Locking”.

This block shows the locking activity within a data sharing group.

For formatting reasons, OMEGAMON XE for DB2 PE shows different labels for report and trace. In the following example both layouts are shown, the report on the left, and the trace layout on the right.

Accounting - Data Sharing Locking

The field labels shown in the following sample layout of “Accounting - Data Sharing Locking” are described in the following section.

<table>
<thead>
<tr>
<th>Report:</th>

</tbody>
</table>

GLOBAL CONT RATE(%) (GLOB CONT(%) )

The total number of suspends because of contention divided by the total number of synchronous requests that went to XES, and the lock requests that were converted from synchronous to asynchronous locks, and the locks because of child lock propagation.

Field Name: AGLOBRAT

FALSE CONT RATE(%) (FALS CONT(%) )

The total number of suspends because of false contention divided by the total number of synchronous requests that went to XES and the lock requests that were converted from synchronous to asynchronous locks.

A false contention is where two different locks on different resources hash to the same lock entry.

Field Name: AFLSERAT

P/L-LOCKS XES(%) (P/L-LOCKS (%) )

Shows the percentage of P/L-lock requests that were propagated to XES synchronously.

Background and Tuning Information

This number reflects the effects of explicit hierarchical locking and other locking optimizations. In an environment where all the workload is data sharing, a value of 94% means that 6% of all transaction locks were not propagated to XES due to Data-Sharing locking optimizations.
DB2 has optimizations to reduce the need to go beyond the local IRLM whenever possible:

- Explicit hierarchical locking allows IRLM to grant child locks locally when there is no inter-DB2 R/W interest on the parent.
- If there is a single DB2 with update interest, and multiple DB2s with read-only interest, DB2 propagates fewer locks than when all DB2s have update interest in the page set.
- All locks that go beyond the local IRLM are owned by the subsystem, not the individual work unit. This allows for further optimization. Only the most restrictive lock mode for an object on a given subsystem must be propagated to XES and the coupling facility. A new lock that is equally, or less, restrictive than the currently held lock is not propagated.

Field Name: ALLOCRA

LOCK REQ - PLOCKS (P-LOCK REQ)

The number of lock requests for P-locks.

Field Name: QTGALPLK

UNLOCK REQ - PLOCKS (P-UNLOCK REQ)

The number of unlock requests for P-locks.

Field Name: QTGAUPLK

CHANGE REQ - PLOCKS (P-CHANGE REQ)

The number of change requests for P-locks.

Field Name: QTGACPLK

LOCK REQ - XES (LOCK - XES)

The number of P/L-lock requests propagated to z/OS XES synchronously. This number is not incremented if the request is suspended before going to XES.

Field Name: QTGALSLM

UNLOCK REQ - XES (UNLOCK-XES)

The number of unlock requests propagated to z/OS XES.

Field Name: QTGAUSLM

CHANGE REQ - XES (CHANGE-XES)

The number of change requests propagated to z/OS XES.

Field Name: QTGACSLM

SUSPENDS - IRLM (SUSP - IRLM)

The number of suspensions due to IRLM global resource contention (IRLM lock states were in conflict).

Field Name: QTGAIGLO

SUSPENDS - XES (SUSP - XES)

The number of suspensions due to z/OS XES global resource contention (z/OS XES lock states were in conflict whereas IRLM lock states were not).

Field Name: QTGASGLO

SUSPENDS - CONV (SUSP - CONV)
Data Sharing Locking

The total number of sync-to-async heuristic conversions for LOCK requests in XES. This conversion is done when XES determines that it is more efficient to drive the request asynchronously to the coupling facility (CF).

Field Name: QTGAFLSE

FALSE CONTENTIONS

The total number of false contentions for LOCK and UNLOCK requests. A false contention occurs when different resource names hash to the same entry in the coupling facility (CF) lock table. The CF detects contention within the hash entry, and XES uses intersystem messaging to determine that no actual resource contention exists.

Field Name: QTGAFCNT

INCOMPATIBLE LOCKS (INCOMP.LOCK)

The number of global lock or change requests denied or suspended due to an incompatible retained lock.

Field Name: QTGADRTA

NOTIFY MSGS SENT (NOTIFY SENT)

The number of notify messages sent.

Field Name: QTGANTFY
This topic shows detailed information about “Accounting - Distributed Activity - Requester”.

This block shows the information provided for the requester of the distributed activity.

In the following example both layouts are shown, the report layout followed by the trace layout.

**Accounting - Distributed Activity - Requester**

The field labels shown in the following sample layout of “Accounting - Distributed Activity - Requester” are described in the following section.

**Report:**

```plaintext
---- DISTRIBUTED ACTIVITY
RESPONDENT ::FFFF#1
PRODUCT ID : JDBC DRIVER #ROLLBC(1) RECEIVED: 0 MESSAGES RECEIVED: 10.50 BLOCKS SENT: 0.00

PRODUCT VERSION: V3 R65M0 MESSAGES SENT: 9 BLOCKS SENT: 0
METHOD: DQDA PROTOCOL MESSAGES RECEIVED: 9 CONVERSAT. INITIATED: 1
COMMTS(1) RECEIVED: 1 BYTES SENT: 516 NBR RLUP THREADS: 1
```

**Report - REQUESTER**

The name of the remote location with which this information is associated. If the local location is the requester, this field is a server location. If the local location is a server location, this field is the requester location. An allied thread is created at a DB2 requester, and a database access thread is created at a DB2 server. An accounting record is for either a requester or a server, but not for both.

This field is invalid if summary rollup data is present. In Accounting this field is set to "ROLSUM".

**Field Name:** QLACLOCN

This is an exception field.

**Report - PRODUCT ID**

The original DB2 field specifies the information in the following field names of the remote requester or server location:

**PRODUCT ID**

It consists of 3 characters and can have the following values:

<table>
<thead>
<tr>
<th>Original ID from DB2</th>
<th>Shown as</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSN</td>
<td>DB2</td>
</tr>
<tr>
<td>ARI</td>
<td>SQL/DS</td>
</tr>
<tr>
<td>QSQ</td>
<td>DB2/400</td>
</tr>
<tr>
<td>SQL</td>
<td>COMMON SERV</td>
</tr>
<tr>
<td>JCC</td>
<td>JDBC DRIVER</td>
</tr>
<tr>
<td>'000000'X, '404040'X</td>
<td>N/P</td>
</tr>
</tbody>
</table>
Distributed Activity - Requester

<table>
<thead>
<tr>
<th>Original ID from DB2</th>
<th>Shown as</th>
</tr>
</thead>
<tbody>
<tr>
<td>Other</td>
<td>Original ID from DB2</td>
</tr>
</tbody>
</table>

Note:
- If the record is written at the application requester location, or if summary rollup data is available, N/P is shown in Accounting TRACE and REPORT.
- In Accounting FILE and SAVE DDF tables, BLANK is shown.

**PRODUCT VERSION (PROD VERSION)**

It consists of 5 digits and is shown as $VvvRrrMm$, where:
- $vv$ = Version level
- $rr$ = Release level
- $m$ = Modification level

Note: For DDF/RRSAF rollup records, the product ID and product version contain a value derived from the last thread to rollup. For query parallelism rollup threads, the value is derived from the parent record.

Field Name: QLACPRID

Report - PRODUCT VERSION

The original DB2 field specifies the information in the following field names of the remote requester or server location:

**PRODUCT ID**

It consists of 3 characters and can have the following values:

<table>
<thead>
<tr>
<th>Original ID from DB2</th>
<th>Shown as</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSN</td>
<td>DB2</td>
</tr>
<tr>
<td>ARI</td>
<td>SQL/DS</td>
</tr>
<tr>
<td>QSQ</td>
<td>DB2/400</td>
</tr>
<tr>
<td>SQL</td>
<td>COMMON SERV</td>
</tr>
<tr>
<td>JCC</td>
<td>JDBC DRIVER</td>
</tr>
<tr>
<td>'000000'X, '404040'X</td>
<td>N/P</td>
</tr>
<tr>
<td>Other</td>
<td>Original ID from DB2</td>
</tr>
</tbody>
</table>

Note:
- If the record is written at the application requester location, or if summary rollup data is available, N/P is shown in Accounting TRACE and REPORT.
- In Accounting FILE and SAVE DDF tables, BLANK is shown.

**PRODUCT VERSION (PROD VERSION)**

It consists of 5 digits and is shown as $VvvRrrMm$, where:
- $vv$ = Version level
- $rr$ = Release level
- $m$ = Modification level
Note: For DDF/RRSAF rollup records, the product ID and product version contain a value derived from the last thread to rollup. For query parallelism rollup threads, the value is derived from the parent record.

Field Name: QLACPRID

Report - METHOD

The method of access: DB2 private protocol, DRDA protocol, or both.
This field is invalid if unique or summary rollup data is present. It can have the following value in:
• Accounting Trace and Report: N/P
• The Accounting FILE and SAVE PROGRAM table: blank

Field Name: ADPROT

Report - CONV.INITIATED

A count of conversations initiated by the requester.
This number is updated at the server location.

Field Name: QLACCNV

Report - #COMMIT(1) RECEIVED

The number of commit requests received from the requester (single-phase commit protocol) and committed requests received from the coordinator (two-phase commit protocol).

Field Name: QLACCOM

This is an exception field.

Report - #ROLLBK(1) RECEIVED

The number of abort requests received from the requester (single-phase commit protocol) and backout requests received from the coordinator (two-phase commit protocol).

Field Name: QLACABR

This is an exception field.

Report - SQL RECEIVED

The number of SQL statements received from the requester location.

Field Name: QLACSQL

This is an exception field.

Report - MESSAGES SENT

The number of messages sent to the location. It is maintained at the location where the messages originated.

Field Name: QLACMS

This is an exception field.

Report - MESSAGES RECEIVED

The number of messages received from the location. This value is maintained at the location where the messages were received.
Distributed Activity - Requester

More messages might be sent from the server location than are received by the requester because of the way in which distributed SQL statements are processed internally.

Field Name: QLACMSGR
This is an exception field.

Report - BYTES SENT
The number of bytes the server location sent to the requester location. This value is maintained at the server location.

More bytes of data might be sent from the server location than are received by the requester, due to the way in which distributed SQL statements are processed internally.

Field Name: QLACBYTS
This is an exception field.

Report - BYTES RECEIVED
The number of bytes the server location received from the requester location.

More bytes of data might be sent from the server location than are received by the requester, because of the way in which distributed SQL statements are processed internally.

Field Name: QLACBYTR
This is an exception field.

Report - #THREADS INDOUBT
The number of threads that went indoubt with the remote location as coordinator (two-phase commit operations only). It is maintained at the participant and indicates that the communication with the coordinator was lost.

Field Name: QLACINDT
This is an exception field.

Report - ROWS SENT
The number of rows sent from the server location to the requester location. The value includes SQLDA and is maintained at the server location.

Field Name: QLACROWS
This is an exception field.

Report - BLOCKS SENT
The number of blocks transmitted using block fetch. This value is maintained at the server location.

Field Name: QLACBTBF
This is an exception field.

Report - #DDF ACCESSES
The number of occurrences of the remote location and method pair.

Field Name: ASDDF
This is an exception field.
Report - #RLUP THREADS

The number of threads to roll data into this QLAC data section. Non-rollup QLACs have a value of 1 and rollup QLACs have a value of 1 or more.

Field Name: QLACRLNU

Trace - REQUESTER

The name of the remote location with which this information is associated. If the local location is the requester, this field is a server location. If the local location is a server location, this field is the requester location. An allied thread is created at a DB2 requester, and a database access thread is created at a DB2 server. An accounting record is for either a requester or a server, but not for both.

This field is invalid if summary rollup data is present. In Accounting this field is set to "ROLSUM".

Field Name: QLACLOCN

This is an exception field.

Trace - PRODUCT ID

The original DB2 field specifies the information in the following field names of the remote requester or server location:

PRODUCT ID

It consists of 3 characters and can have the following values:

<table>
<thead>
<tr>
<th>Original ID from DB2</th>
<th>Shown as</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSN</td>
<td>DB2</td>
</tr>
<tr>
<td>ARI</td>
<td>SQL/DS</td>
</tr>
<tr>
<td>QSQ</td>
<td>DB2/400</td>
</tr>
<tr>
<td>SQL</td>
<td>COMMON SERV</td>
</tr>
<tr>
<td>JCC</td>
<td>JDBC DRIVER</td>
</tr>
<tr>
<td>'000000'X, '404040'X</td>
<td>N/P</td>
</tr>
<tr>
<td>Other</td>
<td>Original ID from DB2</td>
</tr>
</tbody>
</table>

Note:
- If the record is written at the application requester location, or if summary rollup data is available, N/P is shown in Accounting TRACE and REPORT.
- In Accounting FILE and SAVE DDF tables, BLANK is shown.

PRODUCT VERSION (PROD VERSION)

It consists of 5 digits and is shown as VvvRrrMm, where:

\[v\]Version level
\[r\]Release level
\[m\]Modification level

Note: For DDF/RRSAF rollup records, the product ID and product version contain a value derived from the last thread to rollup. For query parallelism rollup threads, the value is derived from the parent record.

Field Name: QLACPRID
Distributed Activity - Requester

Trace - PRODUCT VERSION

The original DB2 field specifies the information in the following field names of the remote requester or server location:

**PRODUCT ID**

It consists of 3 characters and can have the following values:

<table>
<thead>
<tr>
<th>Original ID from DB2</th>
<th>Shown as</th>

<td>N/P</td>
</tr>
<tr>
<td>Other</td>
<td>Original ID from DB2</td>
</tr>
</tbody>
</table>

**Note:**
- If the record is written at the application requester location, or if summary rollup data is available, N/P is shown in Accounting TRACE and REPORT.
- In Accounting FILE and SAVE DDF tables, BLANK is shown.

**PRODUCT VERSION (PROD VERSION)**

It consists of 5 digits and is shown as VvvRrrMm, where:

- Vv V version level
- Rr R release level
- M M modification level

**Note:** For DDF/RRSAF rollup records, the product ID and product version contain a value derived from the last thread to rollup. For query parallelism rollup threads, the value is derived from the parent record.

**Field Name:** QLACPRID

Trace - METHOD

The method of access: DB2 private protocol, DRDA protocol, or both.

This field is invalid if unique or summary rollup data is present. It can have the following value in:
- Accounting Trace and Report: N/P
- The Accounting FILE and SAVE PROGRAM table: blank

**Field Name:** ADPROT

Trace - COMMITS(1) RECEIVED

The number of commit requests received from the requester (single-phase commit protocol) and committed requests received from the coordinator (two-phase commit protocol).

**Field Name:** QLACCOMR

This is an exception field.

Trace - ROLLBCK(1) RECEIVED
The number of abort requests received from the requester (single-phase commit protocol) and backout requests received from the coordinator (two-phase commit protocol).

**Field Name:** QLACABRR
This is an *exception* field.

**Trace - SQL RECEIVED**
The number of SQL statements received from the requester location.

**Field Name:** QLACSQLR
This is an *exception* field.

**Trace - MESSAGES SENT**
The number of messages sent to the location. It is maintained at the location where the messages originated.

**Field Name:** QLACMSGS
This is an *exception* field.

**Trace - MESSAGES RECEIVED**
The number of messages received from the location. This value is maintained at the location where the messages were received.

More messages might be sent from the server location than are received by the requester because of the way in which distributed SQL statements are processed internally.

**Field Name:** QLACMSGR
This is an *exception* field.

**Trace - BYTES SENT**
The number of bytes the server location sent to the requester location. This value is maintained at the server location.

More bytes of data might be sent from the server location than are received by the requester due to the way in which distributed SQL statements are processed internally.

**Field Name:** QLACBYTS
This is an *exception* field.

**Trace - BYTES RECEIVED**
The number of bytes the server location received from the requester location.

**Field Name:** QLACBYTR
This is an *exception* field.

**Trace - THREADS INDOUBT**
Distributed Activity - Requester

The number of threads that went indoubt with the remote location as coordinator (two-phase commit operations only). It is maintained at the participant and indicates that the communication with the coordinator was lost.

**Field Name:** QLACINDT

This is an exception field.

**Trace - ROWS SENT**

The number of rows sent from the server location to the requester location. The value includes SQLDA and is maintained at the server location.

**Field Name:** QLACROWS

This is an exception field.

**Trace - BLOCKS SENT**

The number of blocks transmitted using block fetch. This value is maintained at the server location.

**Field Name:** QLACBTBF

This is an exception field.

**Trace - CONVERSAT.INITIATED**

A count of conversations initiated by the requester. This number is updated at the server location.

**Field Name:** QLACCNVR

This is an exception field.

**Trace - NBR RLUP THREADS**

The number of threads to roll data into this QLAC data section. Non-rollup QLACs have a value of 1 and rollup QLACs have a value of 1 or more.

**Field Name:** QLACRLNU
Distributed Activity - Server

This topic shows detailed information about “Accounting - Distributed Activity - Server”.

This block shows the information provided for the server of the distributed activity.

In the following example both layouts are shown, the report layout followed by the trace layout.

 Accounting - Distributed Activity - Server

The field labels shown in the following sample layout of “Accounting - Distributed Activity - Server” are described in the following section.

Report:

---- DISTRIBUTED ACTIVITY ----
SERVER : PMODA11
PRODUCT ID : DB2

<tr>
<td>JCC</td>
<td>JDBC DRIVER</td>
</tr>
<tr>
<td>'000000'X, '404040'X</td>
<td>N/P</td>
</tr>
<tr>
<td>Other</td>
<td>Original ID from DB2</td>
</tr>
</tbody>
</table>

Note:

- If the record is written at the application requester location, or if summary rollup data is available, N/P is shown in Accounting TRACE and REPORT.
- In Accounting FILE and SAVE DDF tables, BLANK is shown.

PRODUCT VERSION (PROD VERSION)

It consists of 5 digits and is shown as VvvRrrMm, where:

- vvv Version level
Note: For DDF/RRSAF rollup records, the product ID and product version contain a value derived from the last thread to rollup. For query parallelism rollup threads, the value is derived from the parent record.

Field Name: QLACPRID

Report - METHOD

The method of access: DB2 private protocol, DRDA protocol, or both.

This field is invalid if unique or summary rollup data is present. It can have the following value in:

- Accounting Trace and Report: N/P
- The Accounting FILE and SAVE PROGRAM table: blank

Field Name: ADPROT

Report - REQUESTER ELAP. TIME

The elapsed time at the requester. It includes the total of DB2 and network time.

Field Name: ADDSELRQ

Report - DBAT WAITING TIME

Total elapsed time spent waiting for an available database access agent slot.

Field Name: QLACMDWT

Report - #DDF ACCESSES

The number of occurrences of the remote location and method pair.

Field Name: ASDDF

Report - CONVERSATIONS INITIATED

The number of conversations (both successful and unsuccessful) initiated by the requester location to be executed at the server location. This number is maintained at the requester.

Field Name: QLACCNVVS

Report - #CONVERSATIONS QUEUED

A number of conversation requests queued by DDF that are waiting for allocation. This value is maintained at the requester location.

If the value is a large number, you might want to increase the limit for the number of conversations.

Field Name: QLACCNVQ

This is an exception field.

Report - CONVERSATION TERMINATED

The number of terminated conversations in the server block (DB2 private protocol only). It is maintained at the requester location.
Distributed Activity - Server

This number can be different from the number of successful conversation allocations, because some conversations might not have been terminated when the accounting record was written.

Field Name: QLACCNVVT
This is an exception field.

Report - #RLUP THREADS
The number of threads to roll data into this QLAC data section. Non-rollup QLACs have a value of 1 and rollup QLACs have a value of 1 or more.

Field Name: QLACRLNU

Report - #COMMT(1)SENT
The number of commit requests sent to the server (single-phase commit protocol) and committed requests sent to the participant (two-phase commit protocol).

Field Name: QLACCOMS
This is an exception field.

Report - #ROLLB(1)SENT
The number of abort requests sent to the server (single-phase commit protocol) and backout requests sent to the participant (two-phase commit protocol).

Field Name: QLACABRS
This is an exception field.

Report - SQL SENT
The number of SQL statements sent to the server location. This value is maintained at the requesting location.

Field Name: QLACSQLS
This is an exception field.

Report - ROWS RECEIVED
The number of rows of data retrieved from the server location. This value is maintained at the requester location.

Special Considerations:
1. The number of rows received from the server location does not include either the SQLDA or SQLCA.
2. Block fetch can significantly affect the number of rows sent across the network. When used with non-UPDATE cursors, block fetch puts as many rows as possible into the message buffer, and transmits the buffer across the network without requiring a VTAM message. Consequently, more rows of data might be sent from the server location than are received by the reporting (requester) location. This is especially true when DB2 private protocol is used because multiple blocks can be transmitted from the server with no intervening messages sent by the requester.

Field Name: QLACROWR
This is an exception field.

Report - MESSAGES SENT
The number of messages sent to the location. It is maintained at the location where the messages originated.

**Field Name:** QLACMSGS

This is an exception field.

**Report - MESSAGES RECEIVED**

The number of messages received from the location. This value is maintained at the location where the messages were received.

More messages might be sent from the server location than are received by the requester because of the way in which distributed SQL statements are processed internally.

**Field Name:** QLACMSGR

This is an exception field.

**Report - BYTES SENT**

The number of bytes the server location sent to the requester location. This value is maintained at the server location.

More bytes of data might be sent from the server location than are received by the requester due to the way in which distributed SQL statements are processed internally.

**Field Name:** QLACBYTS

This is an exception field.

**Report - BYTES RECEIVED**

The number of bytes the server location received from the requester location.

More bytes of data might be sent from the server location than are received by the requester, because of the way in which distributed SQL statements are processed internally.

**Field Name:** QLACBYTR

This is an exception field.

**Report - BLOCKS RECEIVED**

The number of blocks received using block fetch. This value is maintained at the requester location.

**Field Name:** QLACBRBF

This is an exception field.

**Trace - SERVER**

The name of the remote location with which this information is associated. If the local location is the requester, this field is a server location. If the local location is a server location, this field is the requester location. An allied thread is created at a DB2 requester, and a database access thread is created at a DB2 server. An accounting record is for either a requester or a server, but not for both.

This field is invalid if summary rollup data is present. In Accounting this field is set to *ROLSUM*.

**Field Name:** QLACLOCN
This is an exception field.

**Trace - PRODUCT ID**

The original DB2 field specifies the information in the following field names of the remote requester or server location:

### PRODUCT ID

It consists of 3 characters and can have the following values:

<table>
<thead>
<tr>
<th>Original ID from DB2</th>
<th>Shown as</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSN</td>
<td>DB2</td>
</tr>
<tr>
<td>ARI</td>
<td>SQL/DS</td>
</tr>
<tr>
<td>QSQ</td>
<td>DB2/400</td>
</tr>
<tr>
<td>SQL</td>
<td>COMMON SERV</td>
</tr>
<tr>
<td>JCC</td>
<td>JDBC DRIVER</td>
</tr>
<tr>
<td>'000000'X, '404040'X</td>
<td>N/P</td>
</tr>
<tr>
<td>Other</td>
<td>Original ID from DB2</td>
</tr>
</tbody>
</table>

**Note:**
- If the record is written at the application requester location, or if summary rollup data is available, N/P is shown in Accounting TRACE and REPORT.
- In Accounting FILE and SAVE DDF tables, BLANK is shown.

### PRODUCT VERSION (PROD VERSION)

It consists of 5 digits and is shown as \text{VvvRrrMm} , where:

- \text{vv} Version level
- \text{rr} Release level
- \text{m} Modification level

**Note:** For DDF/RRSAF rollup records, the product ID and product version contain a value derived from the last thread to rollup. For query parallelism rollup threads, the value is derived from the parent record.

**Field Name:** QLACPRID

**Trace - PRODUCT VERSION**

The original DB2 field specifies the information in the following field names of the remote requester or server location:

### PRODUCT ID

It consists of 3 characters and can have the following values:

<table>
<thead>
<tr>
<th>Original ID from DB2</th>
<th>Shown as</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSN</td>
<td>DB2</td>
</tr>
<tr>
<td>ARI</td>
<td>SQL/DS</td>
</tr>
<tr>
<td>QSQ</td>
<td>DB2/400</td>
</tr>
<tr>
<td>SQL</td>
<td>COMMON SERV</td>
</tr>
<tr>
<td>JCC</td>
<td>JDBC DRIVER</td>
</tr>
<tr>
<td>'000000'X, '404040'X</td>
<td>N/P</td>
</tr>
</tbody>
</table>
Note:  
- If the record is written at the application requester location, or if summary rollup data is available, N/P is shown in Accounting TRACE and REPORT.
- In Accounting FILE and SAVE DDF tables, BLANK is shown.

PRODUCT VERSION (PROD VERSION)  
It consists of 5 digits and is shown as VvvRrrMm, where:

\[
\begin{align*}
vv & \quad \text{Version level} \\
rr & \quad \text{Release level} \\
m & \quad \text{Modification level}
\end{align*}
\]

Note: For DDF/RRSAF rollup records, the product ID and product version contain a value derived from the last thread to rollup. For query parallelism rollup threads, the value is derived from the parent record.

Field Name: QLACPRID

Trace - METHOD  
The method of access: DB2 private protocol, DRDA protocol, or both.  
This field is invalid if unique or summary rollup data is present. It can have the following value in:

- Accounting Trace and Report: N/P
- The Accounting FILE and SAVE PROGRAM table: blank

Field Name: ADPROT

Trace - REQUESTER ELAP TIME  
The elapsed time at the requester. It includes the total of DB2 and network time.

Field Name: ADDSELRQ

Trace - DBAT WAITING TIME  
Total elapsed time spent waiting for an available database access agent slot.

Field Name: QLACMDWT

Trace - CONVERSATIONS INITIATED  
The number of conversations (both successful and unsuccessful) initiated by the requester location to be executed at the server location. This number is maintained at the requester.

Field Name: QLACCNVS

Trace - CONVERSATIONS QUEUED  
A number of conversation requests queued by DDF that are waiting for allocation. This value is maintained at the requester location.

If the value is a large number, you might want to increase the limit for the number of conversations.
Distributed Activity - Server

Field Name: QLACCNVQ
This is an exception field.

Trace - CONVERSATION TERMINATED
The number of terminated conversations in the server block (DB2 private protocol only). It is maintained at the requester location.

This number can be different from the number of successful conversation allocations, because some conversations might not have been terminated when the accounting record was written.

Field Name: QLACCNVT
This is an exception field.

Trace - COMMT(1)SENT
The number of commit requests sent to the server (single-phase commit protocol) and committed requests sent to the participant (two-phase commit protocol).

Field Name: QLACCOMS
This is an exception field.

Trace - ROLLB(1)SENT
The number of abort requests sent to the server (single-phase commit protocol) and backout requests sent to the participant (two-phase commit protocol).

Field Name: QLACABRS
This is an exception field.

Trace - SQL SENT
The number of SQL statements sent to the server location. This value is maintained at the requesting location.

Field Name: QLACSQLS
This is an exception field.

Trace - ROWS RECEIVED
The number of rows of data retrieved from the server location. This value is maintained at the requester location.

Special Considerations:
1. The number of rows received from the server location does not include either the SQLDA or SQLCA.
2. Block fetch can significantly affect the number of rows sent across the network. When used with non-UPDATE cursors, block fetch puts as many rows as possible into the message buffer, and transmits the buffer across the network without requiring a VTAM message. Consequently, more rows of data might be sent from the server location than are received by the reporting (requester) location. This is especially true when DB2 private protocol is used because multiple blocks can be transmitted from the server with no intervening messages sent by the requester.

Field Name: QLACROWR
This is an exception field.
Trace - NBR RLUP THREADS

The number of threads to roll data into this QLAC data section. Non-rollup QLACs have a value of 1 and rollup QLACs have a value of 1 or more.

Field Name: QLACRLNU

Trace - MESSAGES SENT

The number of messages sent to the location. It is maintained at the location where the messages originated.

Field Name: QLACMSGS

Trace - MESSAGES RECEIVED

The number of messages received from the location. This value is maintained at the location where the messages were received.

More messages might be sent from the server location than are received by the requester because of the way in which distributed SQL statements are processed internally.

Field Name: QLACMSGR

Trace - BYTES SENT

The number of bytes the server location sent to the requester location. This value is maintained at the server location.

More bytes of data might be sent from the server location than are received by the requester due to the way in which distributed SQL statements are processed internally.

Field Name: QLACBYTS

Trace - BYTES RECEIVED

The number of bytes the server location received from the requester location.

More bytes of data might be sent from the server location than are received by the requester, because of the way in which distributed SQL statements are processed internally.

Field Name: QLACBYTR

Trace - BLOCKS RECEIVED

The number of blocks received using block fetch. This value is maintained at the requester location.

Field Name: QLACBRBF
Drain and Claim

Drain and Claim
This topic shows detailed information about “Accounting - Drain and Claim”.

This block contains information about requesting a drain or a claim.

For formatting reasons, OMEGAMON XE for DB2 PE shows different labels for report and trace. The following example shows both layouts, the report on the left, and the trace layout on the right.

Accounting - Drain and Claim

The field labels shown in the following sample layout of “Accounting - Drain and Claim” are described in the following section.

<table>
<thead>
<tr>
<th>REPORT</th>
<th>TRACE</th>
</tr>
</thead>
<tbody>
<tr>
<td>DRAIN/CLAIM</td>
<td>DRAIN/CLAIM</td>
</tr>
<tr>
<td>AVERAGE</td>
<td>TOTAL</td>
</tr>
<tr>
<td>DRAIN REQUESTS</td>
<td>0.00</td>
</tr>
<tr>
<td>DRAIN FAILED</td>
<td>0.00</td>
</tr>
<tr>
<td>CLAIM REQUESTS</td>
<td>15.00</td>
</tr>
<tr>
<td>CLAIM FAILED</td>
<td>0.00</td>
</tr>
</tbody>
</table>

**DRAIN REQUESTS (DRAIN REQST)**

The number of drain requests.

**Field Name:** QTXADRNO

**DRAIN FAILED**

The number of unsuccessful drain requests.

**Field Name:** QTXADRUN

**CLAIM REQUESTS (CLAIM REQST)**

The number of claim requests.

**Field Name:** QTXACLNO

**CLAIM FAILED**

The number of unsuccessful claim requests.

**Field Name:** QTXACLUN
Dynamic SQL Statement

This topic shows detailed information about “Accounting - Dynamic SQL Statement”.

This block provides information about the dynamic SQL statement.

The following example shows both layouts, the report on the left, and the trace layout on the right.

**Accounting - Dynamic SQL Statement**

The field labels shown in the following sample layout of “Accounting - Dynamic SQL Statement” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Report</th>
<th>Trace</th>
</tr>
</thead>
<tbody>
<tr>
<td>DYNAMIC SQL STMT</td>
<td></td>
<td></td>
</tr>
<tr>
<td>AVERAGE</td>
<td>0.00</td>
<td>0</td>
</tr>
<tr>
<td>TOTAL</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

**REOPTIMIZATION**

The total number of times reoptimization occurs because the value of the host variable or parameter marker changes.

Field Name: QXSTREOP

**NOT FOUND IN CACHE**

The number of times that DB2 searched the prepared statement cache but could not find a suitable prepared statement.

Field Name: QXSTNFND

**FOUND IN CACHE**

The number of times a PREPARE command was satisfied by copying a statement from the prepared statement cache.

Field Name: QXSTFND

**IMPLICIT PREPARES**

An implicit prepare occurs when the user copy of the prepared SQL statement no longer exists in the local dynamic SQL cache and the application plan or package is bound with KEEPDYNAMIC YES.

If the skeleton copy of the prepared SQL statement exists in the global dynamic SQL cache in the EDM pool, a short prepare is executed, otherwise a full prepare is executed.

Field Name: QXSTIPRP

**PREPARES AVOIDED**
Dynamic SQL Statement

This field indicates the number of times where no SQL PREPARE or EXECUTE IMMEDIATE was issued by the application and a copy of a prepared SQL statement was found in local dynamic SQL cache.

When an application plan or package is bound with KEEP_DYNAMIC YES, a copy of each prepared SQL statement for the application thread is held in the local dynamic SQL cache and kept across a commit boundary.

An application thread can save the total cost of a prepare by using a copy of the prepared statement in the local dynamic SQL cache from an earlier prepare by the same thread. To do this, the application must be modified to avoid issuing repetitive SQL PREPAREs for the same SQL statement.

Field Name: QXSTNPRP

CACHE_LIMIT_EXCEED

The number of times statements are invalidated in the local dynamic SQL cache because the MAXKEEPD limit has been reached and prepared SQL statements in the local dynamic SQL cache have to be reclaimed.

Field Name: QXSTDEXP

PREP_STMT_PURGED

The number of times statements are invalidated in the local dynamic SQL cache because of SQL DDL or updated RUNSTATS information and prepared SQL statements in the local dynamic SQL cache have to be reclaimed.

Field Name: QXSTDINV

STABILIZED PREPARE

The number of loads from the catalog.

It shows the number of times a PREPARE request was satisfied by making a copy from the stabilized statement in the SYSIBM.SYSDYNQRY catalog table. The stabilized statement search is done only when no matching statement was found in the prepared statement cache. This field should be identical to QISEDPSL, but it is reported from the QXST section (SQL Statement Execution).

Field Name: QXSTSFnD

CSWL - STMTS PARED

The number of times DB2 parsed dynamic statements because CONCENTRATE STATEMENTS WITH LITERALS behavior was used for the prepare of the statement for the dynamic statement cache.

Field Name: QXSTCWLP

CSWL - LITS REPLACED

The number of times DB2 replaced at least one literal in a dynamic statement because CONCENTRATE STATEMENTS WITH LITERALS was used for the prepare of the statement for dynamic statement cache.

Field Name: QXSTCWLr

CSWL - MATCHES FOUND

The number of times DB2 found a matching reusable copy of a dynamic statement in cache during prepare of a statement that had literals replaced because of CONCENTRATE STATEMENTS WITH LITERALS.
CSWL - DUPLS CREATED

The number of times DB2 created a duplicate STMT instance in the statement cache for a dynamic statement that had literals replaced by CONCENTRATE STATEMENTS WITH LITERALS behavior. The duplicate STMT instance was needed because a cache match failed because the literal reusability criteria was not met.

Field Name: QXSTCWLD
Global Contention L-Locks

This topic shows detailed information about “Accounting - Global Contention L-Locks”.

This block provides global contention information for a logical lock (L-lock) at plan level. It shows conflicts on locking requests between different DB2 members of a data sharing group when those members are trying to serialize shared resources.

For formatting reasons, OMEGAMON XE for DB2 PE shows different labels for report and trace. The following example shows both layouts, the report on the left, and the trace layout on the right.

**Accounting - Global Contention L-Locks**

The field labels shown in the following sample layout of “Accounting - Global Contention L-Locks” are described in the following section.

**L-LOCKS - AVERAGE TIME/ELAPSED TIME**

The accumulated global contention wait time for all L-locks.

**Field Name:** ADLKSUST

**L-LOCKS - AV.EVENT/EVENTS**

The number of global contention waits for all L-locks.

**Field Name:** ADLKSUSC

**PARENT (DB,TS,TAB,PART) - AVERAGE TIME/ELAPSED TIME**

The accumulated global contention wait time for parent L-locks.

A parent L-lock can be one of the following types:

- Database
- Tablespace
- Table
- Partition

**Background and Tuning Information**

Performance Expert might adjust this value if the thread was suspended when performance data was gathered.

**Field Name:** QWACAWTJ

**PARENT (DB,TS,TAB,PART) - AV.EVENT/EVENTS**

The number of global contention wait events for parent L-locks.

**Field Name:** ADLPSUSC

**CHILD (PAGE,ROW) - AVERAGE TIME/ELAPSED TIME**

The accumulated global contention wait time for child L-locks.

A child L-lock type can be:

- Page
• Row

Field Name: QWACAWTK

CHILD (PAGE,ROW) - AV.EVENT/EVENTS
The number of global contention wait events for child L-locks.
Field Name: ADLCSUSC

OTHER - AVERAGE TIME/ELAPSED TIME
The accumulated global contention wait time for other L-locks. Global extend lock is acquired in exclusive mode by Inserters before an extend service task switch.
Field Name: QWACAWTM

OTHER - AV.EVENT/EVENTS
The number of global contention wait events for other L-locks.
Field Name: ADLOSUSC
Global Contention P-Locks

This topic shows detailed information about “Accounting - Global Contention P-Locks”.

This block provides global contention information for a physical lock (P-lock) at plan level. It shows conflicts on locking requests between different DB2 members of a data sharing group when those members are trying to serialize shared resources.

For formatting reasons, OMEGAMON XE for DB2 PE shows different labels for report and trace. The following example shows both layouts, the report on the left, and the trace layout on the right.

Accounting - Global Contention P-Locks

The field labels shown in the following sample layout of “Accounting - Global Contention P-Locks” are described in the following section.

<table>
<thead>
<tr>
<th>Report:</th>
<th>Trace:</th>
</tr>
</thead>
<tbody>
<tr>

<td>OTHER - AVERAGE TIME/ELAPSED TIME</td>
<td></td>
</tr>
</tbody>
</table>
| The accumulated global contention wait time for other P-locks. Includes suspension for Castout P-Locks and DBET locks. It could be because of Index Split processing which can be minimized if the Index key size is not...
large. If you can minimize the number of Index Keys in the Index, it will help to reduce the number of Index splits.

Field Name: QWACAWTQ

OTHER - AV.EVENT/EVENTS

The number of global contention waits for other P-locks.

Field Name: ADPOSUSC
Group Buffer Pool Activity

This topic shows detailed information about “Accounting - Group Buffer Pool Activity”.

This block is printed for each active group buffer pool. When there is more than one active group buffer pool, a totals block is printed for each aggregation.

The following example shows both layouts, the report on the left, and the trace layout on the right.

Accounting - Group Buffer Pool Activity

The field labels shown in the following sample layout of “Accounting - Group Buffer Pool Activity” are described in the following section.

<table>
<thead>
<tr>

</table>

GBP-DEPEND GETPAGES

The number of coupling facility READ requests required because the buffer was marked invalid. Data is returned from the group buffer pool.

Field Name: QBGAGG

READ(XI)-DATA RETUR

The number of coupling facility read requests required because the buffer was marked invalid. Data is returned from the group buffer pool.

Field Name: QBGAXD

READ(XI)-NO DATA RT

The number of synchronous coupling facility read requests necessary because the buffer was marked invalid. Data is not returned from the group buffer pool.

Field Name: ABGAXR
This is an exception field.

**READ(NF)-DATA RETUR**

The number of coupling facility read requests necessary because the requested page was not found in the buffer pool. Data is returned from the coupling facility.

**Field Name:** QBGAMD

This is an exception field.

**READ(NF)-NO DATA RT**

The number of synchronous coupling facility read requests necessary because the requested page was not found in the buffer pool. Data is not returned from the coupling facility.

**Field Name:** ABGAMR

This is an exception field.

**PREFETCH PAGES READ**

The number of pages read from the group buffer pool due to prefetch under the control of the agent.

**Field Name:** QBGAMN

This is an exception field.

**CLEAN PAGES WRITTEN**

The number of clean pages written to the group buffer pool.

**Field Name:** QBGAWC

This is an exception field.

**UNREGISTER PAGE**

The number of coupling facility requests to unregister a page.

**Field Name:** QBGADG

This is an exception field.

**ASYNCH GBP REQUESTS**

The number of asynchronous IXLCACHE invocations for the primary group buffer pool.

**Field Name:** QBGAHS

**EXPLICIT X-INVALID**

The number of times an explicit coupling facility cross-invalidation request was issued.

**Field Name:** QBGAEX

**ASYNCH SEC-GBP REQ**

The number of IXLCACHE invocations for the secondary group buffer pool.

**Field Name:** QBGA2H

**PG P-LOCK LOCK REQ**

The number of all page P-lock lock requests.
Group Buffer Pool Activity

Field Name: ABGAPLR

SPACE MAP PAGES
The number of page P-lock lock requests for space map pages.
Field Name: QBGAP1

DATA PAGES
The number of page P-lock lock requests for data pages.
Field Name: QBGAP2

INDEX LEAF PAGES
The number of page P-lock lock requests for index-leaf pages.
Field Name: QBGAP3

PG P-LOCK UNLOCK REQ
The number of page P-lock unlock requests.
Field Name: QBGAU1

INDEX LEAF PAGES
The sum of all page P-lock lock suspensions.
Field Name: ABGAPLS

DATA PAGES
The number of page P-lock suspensions for space-map pages.
Field Name: QBGAS1

INDEX LEAF PAGES
The number of page P-lock suspensions for data pages.
Field Name: QBGAS2
This is an exception field.

WRITE AND REGISTER
The number of Write and Register (WAR) requests.
Field Name: QBGAWS

WRITE & REGISTER MULT
The number of write and register multiple (warm) requests.
Field Name: QBGAWM

CHANGED PAGES WRITTEN
The number of changed pages written to the group buffer pool as a result of write and register (WAR), or write and register multiple (WARM) requests.
Field Name: QBGASW
This is an exception field.
WRITE TO SEC-GBP

The number of requests to write changed pages to the secondary GBP for duplexing.

Field Name: QBGA2W

COMPL CHECKS SUSPEND

The number of completion checks for writes to the secondary GBP that were suspended because the write had not yet been completed.

Field Name: QBGA2S
Highlights

This topic shows the report and trace blocks for highlights. They present values such as the total number of threads and commitments for the entire group.

“Highlights - Report” on page 5-255
This topic shows detailed information about “Accounting - Highlights - Report”.

“Highlights - Trace” on page 5-261
This topic shows detailed information about “Accounting - Highlights - Trace”.

</table>

### #OCCURRENCES

The number of logical accounting records. A logical accounting record can contain more than one physical record.

This is the case, for example, in query CP and sysplex query parallelism, where several accounting records (IFCID 003 and, optionally, 239) are generated, namely one for the entire thread and one for each parallel task within the thread.

In case of Distributed Data Facility (DDF) or Recoverable Resource Manager Services Attach Facility (RRSAF) threads, it is the number of accounting intervals rolled up in a record.

This number is used for calculating averages (as a divisor) for class 1, 2, 3, and 5 times and events.

**Field Name:** ASOCCURS

### #ALLIEDS

The number of allied threads. In case of Distributed Data Facility (DDF) or Recoverable Resource Manager Services Attach Facility (RRSAF) threads, it is the number of accounting intervals rolled up in this record for the corresponding end user.

**Field Name:** ASALLIED

### #ALLIEDS DISTRIB
The number of allied-distributed threads. In case of Distributed Data Facility (DDF) or Recoverable Resource Manager Services Attach Facility (RRSAF) threads, it is the number of accounting intervals rolled up in this record for the corresponding end user.

Field Name: ASALLDST

#DBATS

The number of database access threads. In case of Distributed Data Facility (DDF) or Recoverable Resource Manager Services Attach Facility (RRSAF) threads, it is the number of accounting intervals rolled up in this record for the corresponding end user.

Field Name: ASDBATS

#DBATS DISTRIB.

The number of DBAT-distributed threads. In case of Distributed Data Facility (DDF) or Recoverable Resource Manager Services Attach Facility (RRSAF) threads, it is the number of accounting intervals rolled up in this record for the corresponding end user.

Field Name: ASDBATD

#NO PROGRAM DATA

The number of Accounting records without package data. In case of Distributed Data Facility (DDF) or Recoverable Resource Manager Services Attach Facility (RRSAF) threads, it cannot be determined. In this case it is 0.

Field Name: ADNOPACK

#NORMAL TERMINAT

The number of normal terminations. Here is a list of reasons for termination and the corresponding field names:

<table>
<thead>
<tr>
<th>Reason</th>
<th>Field Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>New user</td>
<td>ASNTNEWU</td>
</tr>
<tr>
<td>Deallocation</td>
<td>ASNTDEAL</td>
</tr>
<tr>
<td>Application program end</td>
<td>ASNTAPEN</td>
</tr>
<tr>
<td>Resignon</td>
<td>ASNTRESI</td>
</tr>
<tr>
<td>DBAT inactive</td>
<td>ASNTDBAT</td>
</tr>
<tr>
<td>RRS commit</td>
<td>ASRRSCOM</td>
</tr>
</tbody>
</table>

Note: Termination reasons in case of Distributed Data Facility (DDF) or Recoverable Resource Manager Services Attach Facility (RRSAF) threads are not counted when the accounting record is a roll-up accounting record.

Field Name: ASNORMTM
This is an exception field.

**#DDFRRSAF ROLLUP**

The number of DDF/RRSAF rollup records with accumulated counter data for an end user.

A rollup record is written when the number of occurrences of the end user on the thread reaches the ZPARM value for ACCUMACC and due to one of the following reasons:

- The number of times the threshold was reached for the number of end-user occurrences when data was accumulated by end user for DDF or RRSAF.
- The number of times the DB2 storage threshold for Accounting blocks was reached for data accumulated by end user for DDF or RRSAF.
- The number of times the threshold for the staleness was exceeded when data was accumulated by end user for DDF or RRSAF.

**Note:** End user is defined as the concatenation of the following values:

- End-user user ID (QWHEUID, 16 bytes)
- End-user transaction name (QWHCEUTX, 32 bytes)
- End-user workstation name (QWHCEUWN, 18 bytes)

Field Name: ASCUTS

**#ABNORMAL TERMIN**

The number of abnormal terminations. Here is a list of reasons for termination and the corresponding field names:

<table>
<thead>
<tr>
<th>Reason</th>
<th>Field Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application program abend</td>
<td>ASATAPAB</td>
</tr>
<tr>
<td>End of memory</td>
<td>ASATENDM</td>
</tr>
<tr>
<td>Resolve indoubt</td>
<td>ASATRIND</td>
</tr>
<tr>
<td>Cancel force</td>
<td>ASATCANF</td>
</tr>
</tbody>
</table>

Field Name: ASABNOTM

This is an exception field.

**#CP/X PARALLEL.**

The number of originating accounting records where query CP and sysplex query parallelism was used for at least one SQL statement. I/O parallelism might have been used by other SQL statements.

Field Name: ASPARCPU

**#UTIL PARALLEL.**

The number of Accounting records that indicated that UTILITY parallelism was used by at least one SQL statement and query CP and sysplex query parallelism was not used by any SQL statement.

Field Name: ASPARUT
#IO PARALLELISM

The number of accounting records that indicated that I/O parallelism was used by at least one SQL statement and query CP and sysplex query parallelism was not used by any SQL statement.

Field Name: ASPARIO

#PCA RUP COUNT

The number of parallel child agents rolled into this record. The value depends on the record type:

1. For all non-rollup records, this value is 0.
2. For a parallel query rollup record, this value is the number of parallel child agents rolled into this record.
3. For a DDF/RRSAF rollup record, this value is the number of parallel query child agents rolled into this record. These agents are NOT counted in QWACPCNT.
4. For an autonomous procedure rollup record, this value is 0.

Field Name: APTCOUNT

#RUP AUTONOM. PR

The number of accounting records that indicated a roll-up autonomous thread.

Field Name: ADRUPATX

#AUTONOMOUS PR

The number of autonomous procedures that were executed:

1. For non-rollup records, this value is the number of autonomous procedures that were executed.
2. For a parallel query rollup record, this value is 0.
3. For a DDF or RRSAF rollup record, this value is the number of autonomous procedures that were executed. These procedures are NOT counted in QWACPCNT.
4. For autonomous procedures rollup records, this value is 0.

Field Name: AATCOUNT

#INCREMENT. BIND

The number of incremental binds (excluding prepare). It is incremented by:

- SQL statements with BIND VALIDATE(RUN) that fail at bind time and are bound again at execution time
- Static DDL statements (such as CREATE TABLE, DROP TABLE, LOCK TABLE) that use DB2 private protocol

Background and Tuning Information

If a plan is bound with VALIDATE(RUN), DB2 performs validity checks at bind time and rechecks any failures at run time. This can result in catalog contention and degraded application performance, depending on the number of statements flagged and how many times they are executed. Avoid VALIDATE(RUN) if possible. Ensure that all objects are created and all privileges are granted before bind, and select the VALIDATE(BIND) option.

Field Name: QXINCRB
This is an exception field.

#COMMENTS
The number of successful two-phase (units of recovery) or single-phase (syncs) commit requests. It indicates the number of units of recovery that are completed successfully, and for which the associated commit duration locks were released. It represents the total number of commit requests processed by the DB2 subsystem, whether the request was an explicit or implicit external request from an IMS or a CICS connection, or an implicit internal request within DB2 when DB2 was the commit coordinator or conducted read-only commit processing as a commit participant on phase-1 calls from an IMS or CICS connection.

For parallel queries, only the commits from the initiating (parent) thread are recorded by this counter.

Field Name: QWACCOMM
This is an exception field.

#ROLLBACKS
The number of rollback requests. This is the number of units that were backed out, including rollbacks from attaches.

Special Considerations: This field contains the number of:
- Application program abends
- Application rollback requests
- Application deadlocks on database records
- Applications canceled by operator
- Thread abends due to resource shortage

Field Name: QWACABRT
This is an exception field.

#SVPT REQUESTS
The number of named SAVEPOINTs set within a transaction.

Field Name: QWACSVPT

#SVPT RELEASE
The number of RELEASE SAVEPOINT statements executed.

Background and Tuning Information
Release savepoints as soon as possible. Outstanding savepoints block SQL operations that resolve remote locations. DB2 always releases outstanding savepoints when a transaction ends.

Field Name: QWACRLSV
This is an exception field.

#SVPT ROLLBACK
The number of ROLLBACK TO SAVEPOINT statements executed.

Field Name: QWACRBSV

MAX SQL CASC LVL
The maximum level of indirect SQL cascading. This includes cascading because of triggers, UDFs, or stored procedures.
### Field Name: QXCASCDP
This is an *exception* field.

**UPDATE/COMMIT**
The sum of SQL INSERT, SQL UPDATE, and SQL DELETE statements executed.

**Field Name: ASIUD**
This is an *exception* field.

### SYNCH I/O AVG.
The synchronous I/O suspension time per event.

**Field Name: AAIOTMCN**
This is an *exception* field.

### MAX WFILE BLKS
The maximum number of work-file blocks that are used by this agent at any given point in time (traditional work-file blocks, declared global temporary tables (DGTT) and DGTT indexes) (DB2 field QWAC_WORKFILE_MAX).

**Field Name: AWWFMAX**
Highlights - Trace

This topic shows detailed information about “Accounting - Highlights - Trace”.

Accounting - Highlights - Trace

The field labels shown in the following sample layout of “Accounting - Highlights - Trace” are described in the following section.

HIGHLIGHTS

--------------------------

THREAD TYPE: ALLIED
TERM.CONDITION: NORMAL
INVOKE REASON: DEALLOC
PARALLELISM: N/P
PCA RUP COUNT: 0
RUP AUTONOMOUS PR: 0
AUTONOMOUS PR: 0
QUANTITY: 0

UPDATE/COMMIT: N/P
SYNCH I/O AVG.: 0.000996
PROGRAMS: 0
MAX CASCADE: N/P
MAX WFILE BLKS: 0

THREAD TYPE

The type of thread. This field can contain one of the following values:

ALLIED
The thread is not involved in any distributed activity.

ALLDDIST
The thread is initiated by a DB2 attach and requests data from one or more server locations.

DBAT
The thread is initiated, created, and performing work on behalf of a remote (requester) location. The value DBAT also includes DBAT DISTRIBUTED threads that are initiated by a requester location and executed by the server location that in turn requests data from another server location.

Background and Tuning Information

If the thread is involved in distributed activity, some monitored values can produce different results. For example, the class 1 elapsed time for a distributed thread is higher because the network time is also included.

Field Name: ADTHRTYP

TERM.CONDITION

Termination condition. Signon in a CICS environment is controlled by an additional RCT option, TXIDSO. If YES, resignon occurs if the only identifier changed is the transaction ID. If NO, resignon does not occur.

Field Name: ADTERMCO

INVOKE REASON

The status of the thread. The values are:
### Highlights - Trace

</table>

**Field Name:** ADINVRSN

**PARALLELISM**

An indicator to show which type of parallel processing is used when SQL statements are executed:

**SQL statement**

Parallel processing
I/O  For threads exploiting query I/O parallelism but no query CP or sysplex query parallelism
CP  For threads exploiting query CP parallelism
SYSPLEX  For threads exploiting sysplex query parallelism
UTILITY  For utility threads with subtasks
NO  For threads without subtasks

Field Name: ADPARLEV

PCA RUP COUNT
The number of parallel child agents rolled into this record. The value depends on the record type:
1. For all non-rollup records, this value is 0.
2. For a parallel query rollup record, this value is the number of parallel child agents rolled into this record.
3. For a DDF/RRSAF rollup record, this value is the number of parallel query child agents rolled into this record. These agents are NOT counted in QWACPCNT.
4. For an autonomous procedure rollup record, this value is 0.

Field Name: APTCOUNT

RUP AUTONOM.PR
The number of accounting records that indicated a roll-up autonomous thread.

Field Name: ADRUPATX

AUTONOMOUS PR
The number of autonomous procedures that were executed:
1. For non-rollup records, this value is the number of autonomous procedures that were executed.
2. For a parallel query rollup record, this value is 0.
3. For a DDF or RRSAF rollup record, this value is the number of autonomous procedures that were executed. These procedures are NOT counted in QWACPCNT.
4. For autonomous procedures rollup records, this value is 0.

Field Name: AATCOUNT

QUANTITY
The number of parallel child agents, or Accounting intervals rolled up, or autonomous procedures rolled up. The value depends on the record type:
• For a non-rollup parent record, this value is the number of parallel child agents that were created.
• For a non-rollup child agent record, this value is 0.
• For a parallel query rollup record, this value is the number of parallel child agents rolled into the record.
• For a DDF/RRSAF rollup record, this value is the number of Accounting intervals that were rolled into the record for the corresponding end user.
• For an autonomous procedure rollup record, this value is the number of autonomous procedures rolled into the record.

**Field Name:** QWACPCNT

**COMMENTS**

The number of successful two-phase (units of recovery) or single-phase (syncs) commit requests. It indicates the number of units of recovery that are completed successfully, and for which the associated commit duration locks were released. It represents the total number of commit requests processed by the DB2 subsystem, whether the request was an explicit or implicit external request from an IMS or a CICS connection, or an implicit internal request within DB2 when DB2 was the commit coordinator or conducted read-only commit processing as a commit participant on phase-1 calls from an IMS or CICS connection.

For parallel queries, only the commits from the initiating (parent) thread are recorded by this counter.

**Field Name:** QWACCOMM

This is an *exception* field.

**ROLLBACK**

The number of rollback requests. This is the number of units that were backed out, including rollbacks from attaches.

*Special Considerations:* This field contains the number of:

• Application program abends  
• Application rollback requests  
• Application deadlocks on database records  
• Applications canceled by operator  
• Thread abends due to resource shortage

**Field Name:** QWACABRT

This is an *exception* field.

**SVPT REQUESTS**

The number of named SAVEPOINTs set within a transaction.

**Field Name:** QWACSVPT

**SVPT RELEASE**

The number of RELEASE SAVEPOINT statements executed.

**Background and Tuning Information**

Release savepoints as soon as possible. Outstanding savepoints block SQL operations that resolve remote locations. DB2 always releases outstanding savepoints when a transaction ends.

**Field Name:** QWACRLSV

This is an *exception* field.

**SVPT ROLLBACK**

The number of ROLLBACK TO SAVEPOINT statements executed.

**Field Name:** QWACRBSV

**INCREM.BINDS**
The number of incremental binds (excluding prepare). It is incremented by:

- SQL statements with BIND VALIDATE(RUN) that fail at bind time and are bound again at execution time
- Static DDL statements (such as CREATE TABLE, DROP TABLE, LOCK TABLE) that use DB2 private protocol

**Background and Tuning Information**

If a plan is bound with VALIDATE(RUN), DB2 performs validity checks at bind time and rechecks any failures at run time. This can result in catalog contention and degraded application performance, depending on the number of statements flagged and how many times they are executed. Avoid VALIDATE(RUN) if possible. Ensure that all objects are created and all privileges are granted before bind, and select the VALIDATE(BIND) option.

**Field Name:** QXINCRB

This is an exception field.

**UPDATE/COMMIT**

The sum of SQL INSERT, SQL UPDATE, and SQL DELETE statements executed.

**Field Name:** ASIUD

This is an exception field.

**SYNCH I/O AVG.**

The synchronous I/O suspension time per event.

**Field Name:** AAIOTMCN

This is an exception field.

**PROGRAMS**

The number of packages or DBRMs for which accounting data was collected.

**Field Name:** QWACPKGN

This is an exception field.

**MAX CASCADE**

The maximum level of indirect SQL cascading. This includes cascading because of triggers, UDFs, or stored procedures.

**Field Name:** QXCASCDP

This is an exception field.

**MAX WFILE BLKS**

The maximum number of work-file blocks that are used by this agent at any given point in time (traditional work-file blocks, declared global temporary tables (DGTT) and DGTT indexes) (DB2 field QWAC_WORKFILE_MAX).

**Field Name:** AWWFMAX
Identification

This topic shows detailed information about “Accounting - Identification”.

This block is shown for the accounting trace. It displays OMEGAMON XE for DB2 PE identifiers present in an accounting trace. These identifiers can be used on the ORDER option for an accounting report.

**Accounting - Identification**

The field labels shown in the following sample layout of “Accounting - Identification” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACCT TSTAMP</td>
<td>The store clock value of the time when the accounting record was generated.</td>
</tr>
<tr>
<td>PLANNAME</td>
<td>The plan name. It is blank for a DB2 command thread; otherwise:</td>
</tr>
<tr>
<td></td>
<td>DSNESPRR For SPUFI with repeatable read.</td>
</tr>
<tr>
<td></td>
<td>DSNESPICS For SPUFI with cursor stability.</td>
</tr>
<tr>
<td></td>
<td>DSNUTIL For utilities.</td>
</tr>
<tr>
<td></td>
<td>DSNTEP2 For DSNTEP2.</td>
</tr>
<tr>
<td></td>
<td>DSNBIND For binding.</td>
</tr>
<tr>
<td></td>
<td>The application plan name For IMS.</td>
</tr>
<tr>
<td></td>
<td>The application plan name For CICS.</td>
</tr>
<tr>
<td></td>
<td>A blank plan name For IMS and CICS commands.</td>
</tr>
<tr>
<td></td>
<td>DSQPLAN For QMF.</td>
</tr>
<tr>
<td></td>
<td>The first 8 bytes of the application name For DRDA connections to the common servers.</td>
</tr>
</tbody>
</table>

Field Name: QWHCPLAN

This is an exception field.

WLM SCL
The MVS™ workload manager service class name. This field is used for database access threads on MVS 5.2 or later.

**Field Name:** QWACWLME

**CICS NET**

The network ID of the accounting correlation token used to correlate DB2 IFC records to CICS records for the CICS transaction.

**Field Name:** ADCICSLU

**BEGIN TIME**

The beginning store clock value for the period covered by the accounting record. You can determine the elapsed time of the application by subtracting this field from the ending store clock value (QWACESC). Threads that do not terminate (such as CICS primed threads and IMS wait-for-input message regions) can have an ending clock value that includes the time during which the thread was inactive and waiting for work.

If a roll-up trace record is written with accumulated counter data, QWACBSC represents the earliest begin store clock value for a thread that has rolled data into the record. In this case, QWACESC shows the accumulated elapsed time.

**Field Name:** QWACBSC

**PROD TYP**

Shows the product identifier (ID) of the requester. It can have the following values:

- **DB2** For DB2 UDB for z/OS
- **SQL/DS** For DB2 UDB for VSE and VM
- **JDBC DRIVER** For Universal JDBC driver
- **COMMON SERV** For DB2 UDB for Linux, UNIX, Windows
- **DB2/400** For DB2 UDB for iSeries

Otherwise, it shows the first 3 characters of the product ID, or N/P if the record was written at the application requester location.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup. For parallel query rollup records, the value will be derived from the parent record.

**Field Name:** QWHDPRID

**CICS LUN**

The LU name of the accounting correlation token used to correlate DB2 IFC records to CICS records for the CICS transaction.

**Field Name:** ADCICSLU

**END TIME**
Identification

The ending store clock value. You can use this field with the beginning store clock value (QWACBSC) to determine the elapsed time of an application.

If a roll-up record is written with accumulated accounting data, QWACESC contains the accumulated elapsed time. In Accounting Trace reports, the elapsed time is shown under CLASS 1: NONNESTED ELAPSED TIME and the END TIME is reported as N/P, because QWACESC does not contain a timestamp. In the Accounting FILE GENERAL table, the accumulated elapsed time QWACESC is stored in column CLASS1_ELAPSED and column CLASS1_TIME_END contains a timestamp 1900-01-01-00.00.00.000000.

Field Name: QWACESC

PROD VER

The version, release, and modification level of the product, which generated the accounting information. It has the following format:

\[ Vv \] Version level  
\[ Rr \] Release level  
\[ Mm \] Modification level

N/P is shown if the Product Type is not present or the record was written at the application requester location.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup. For parallel query rollup records, the value will be derived from the parent record.

Field Name: QWHDPRIDV

LUW NET

The network ID.

Field Name: QWHSNID

CICS INS

The instance number of the accounting correlation token.

Background and Tuning Information

The accounting correlation token is made up from the CICS Token Network ID, Token LU name, and instance number.

CICS generates an LU 6.2 unit of work ID for every CICS task, whether terminal or non-terminal driven.

If TOKENE=YES in the RCT entry, then the CICS logical unit of work ID (LUWID) less the commit count (2 bytes) is passed into this field. The first eight bytes are the network name. For CICS, this is a variable-length field, so the first eight bytes are right padded with blanks. The second eight bytes give the LU name. This is also a variable-length field in CICS and is, therefore, also right padded with blanks, as necessary. The final six bytes are the uniqueness value.

Field Name: ADCICSIN

REQUESTER

The location name of the requester. If the thread is an allied thread (no distributed requests) or the thread is an allied-distributed thread (this
Identification

location is the requester), OMEGAMON XE for DB2 PE sets this field equal to the local location. If the thread is a database access thread (this location is a server).

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup. For parallel query rollup records, the value will be derived from the parent record.

Field Name: QWHDRQNM

CORRNAME

This field shows the correlation name. It is obtained by translating the correlation ID into correlation name and number. The default translation depends on the connection type of the thread:

Batch  Job name
TSO or CAF  Original authorization ID
CICS  Transaction ID
IMS  Application PST
RRSAF  Characters 1 to 8 of the parameter correlation ID specified for SIGNON.

You can define your own correlation ID translation, which overrides the default translation.

Field Name: ADCORNME

LUW LUN

The name of the logical unit.

Field Name: QWHSLUNM

MAINPACK

The MAINPACK value, which is derived from a package name. If this is not possible (for example, if there are no QPAC sections), the MAINPACK value is initialized to the plan name.

Field Name: ADMAINPK

This is an exception field.

CORRNMBR

This field shows the correlation number. It is obtained by translating the correlation ID into correlation name and number. The default translation depends on the connection type of the thread:

Batch  Blank
TSO or CAF  Blank
CICS  Pool thread
IMS  Application PSBNAME
RRSAF  Characters 9 - 12 of the parameter correlation ID specified for SIGNON.
You can define your own correlation ID translation which overrides the default translation.

Field Name: ADCORNMB

LUW INS

The instance number. When concatenated with the fully qualified network name, it uniquely identifies a distributed thread.

Field Name: QWHSLUUV

ENDUSER

The user ID of the workstation end user. This user ID can be different from the authorization ID used to connect to DB2. This field contains blanks if the client does not supply this information.

Field Name: QWHCEUID

PRIMAUTH

The primary authorization ID from a connection or signon. The connection authorization exit and the signon authorization exit can change the primary authorization ID so that it differs from the original primary authorization ID (ORIGAUTH). Distributed authorization ID translation can also change the primary authorization ID.

Field Name: QWHCAID

CONNTYPE

The connecting system type code (in hexadecimal). This field can have a null value. Utilities, for example, do not have a connecting system type.

Field Name: QWHCATYP

LUW SEQ

The LUW sequence number, which identifies the last commit scope that the logical unit participated in. This number is incremented whenever a thread is committed or rolled back.

Field Name: QWHSLUCC

TRANSACT

The transaction or application name that is run.

Field Name: QWHCEUTX

ORIGAUTH

The original authorization ID. Possible values are:

- For TSO: the logon ID
- For batch: the user ID on the job statement
- For IMS (message-driven regions): the signon ID, LTERM, ASXBUSR, or PSB name
- For IMS (control regions): the user ID on the job statement, or the RACF® started procedure entry if RACF is used
- For CICS: the user ID, TERM ID, TRAN ID, or as specified in the resource control table
- For MVS operator commands and DB2 system internal agents: SYSOPR
- For a distributed application server (AS):
If the application requester (AR) is a DB2 system, then this is the same value that was assigned at the AR.

If the application requester is not a DB2 system, then this is the user ID used to make the initial connection with the application server.

**Field Name:** QWHCOPID

**CONNECT**

The connection name. Possible values are:

- For batch: BATCH
- For TSO: TSO
- For QMF: DB2CALL
- For utilities: UTILITY
- For DB2 private protocol this is the DB2 subsystem ID
- For IMS: the IMS ID
- For CICS, this is the CICS ID
- For DRDA connections from non-DB2 requesters: SERVER

**Field Name:** QWHCCN

This is an *exception* field.

**WSNAME**

The end user's workstation name.

**Field Name:** QWHCEUWN
Initial DB2 Common Server Traces

This topic shows the trace blocks for the initial DB2 common server.

“Initial DB2 Common Server Correlation” on page 5-273

This topic shows detailed information about “Accounting - Initial DB2 Common Server Correlation”.

“Initial DB2 Common Server or Universal JDBC Driver Correlation” on page 5-275

This topic shows detailed information about “Accounting - Initial DB2 Common Server or Universal JDBC Driver Correlation”.

Initial DB2 Common Server Traces
Initial DB2 Common Server Correlation

This topic shows detailed information about “Accounting - Initial DB2 Common Server Correlation”.

This block shows the Accounting trace for the initial DB2 common server correlation.

Accounting - Initial DB2 Common Server Correlation

The field labels shown in the following sample layout of “Accounting - Initial DB2 Common Server Correlation” are described in the following section.

--- INITIAL DB2 COMMON SERVER CORRELATION -----------------------------------------------
PRODUCT ID: COMMON SERV
PRODUCT VERSION: V9 R1 M1
CLIENT PLATFORM: AIX 64BIT
CLIENT APPLNAME: PRCCHNG
CLIENT AUTHID: USRT001
DDCS ACC.SUFFIX: "BLANK"

PRODUCT ID
The product identifier of the requester:

DB2       DB2 UDB for z/OS
SQL/DS     DB2 UDB for VSE and VM
COMMON SERV  DB2 UDB for Linux, UNIX, and Windows
DB2/400    DB2 UDB for iSeries
N/P        If the record was written at the application requester location

Otherwise, it shows the first 3 characters of the product ID.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDAPRIDP

PRODUCT VERSION
The version, release, and modification level of the product, which generated the accounting information. It has the following format: vv rr m,
where:

vv    Version level
rr    Release level
m     Modification level

N/P is shown if the record was written at the application requester location.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDAPRIDV

CLIENT PLATFORM
The client platform, such as AIX®. This is a 1 to 18 character field padded with blanks.
For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

**Field Name:** QMDAPLAT

**CLIENT APPLNAME**

The name of the client application. This is a 1 to 20 character field padded with blanks. An example is "PAYROLL".

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

**Field Name:** QMDAAPPL

**CLIENT AUTHID**

The client authorization ID of an application process. This is a 1 to 8 character field padded with blanks. An example is "SMITH".

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

**Field Name:** QMDAATID

**DDCS ACC.SUFFIX**

The account suffix. The maximum length of this field is 200 bytes. This field is the user-supplied portion (suffix) of the accounting string. An example is "DEFAULT_DRDA". A value of zero in QMDASFLN Indicates there is no account suffix.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

**Field Name:** QMDASUFX
Initial DB2 Common Server or Universal JDBC Driver Correlation

This topic shows detailed information about “Accounting - Initial DB2 Common Server or Universal JDBC Driver Correlation”.

This block shows the accounting trace for the initial DB2 common server or universal JDBC driver correlation.

Accounting - Initial DB2 Common Server or Universal JDBC Driver Correlation

The field labels shown in the following sample layout of “Accounting - Initial DB2 Common Server or Universal JDBC Driver Correlation” are described in the following section.

--- INITIAL DB2 COMMON SERVER OR UNIVERSAL JDBC DRIVER CORRELATION

PRODUCT ID : JDBC DRIVER
PRODUCT VERSION: V3 R66M0
CLIENT PLATFORM: IS-255-01234567890
CLIENT APPLNAME: IS-255-0123456789012
CLIENT AUTHID : IS-128--
DDCS ACC.SUFFIX: IS-255-01234567890123456789012#1

PRODUCT TYP

Shows the product identifier (ID) of the requestor. It can have the following values:

- **DB2**  For DB2 UDB for z/OS
- **SQL/DS**  For DB2 UDB for VSE and VM
- **JDBC DRIVER**  For Universal JDBC driver
- **COMMON SERV**  For DB2 UDB for Linux, UNIX, Windows
- **DB2/400**  For DB2 UDB for iSeries

Otherwise, it shows the first 3 characters of the product ID, or N/P if the record was written at the application requester location.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDAPRID

PRODUCT VERSION

The version, release, and modification level of the product, which generated the accounting information. It has the following format: \( vv \, rr \, m \), where:

- \( vv \)  Version level
- \( rr \)  Release level
- \( m \)  Modification level

N/P is shown if the record was written at the application requester location.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDAPRIVD
CLIENT PLATFORM

The client platform, such as AIX. This is a 1 to 18 character field padded with blanks.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDAPLAT

CLIENT APPLNAME

The name of the client application. This is a 1 to 20 character field padded with blanks. An example is "PAYROLL".

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDAAPPL

CLIENT AUTHID

The client authorization ID of an application process. This is a 1 to 8 character field padded with blanks. An example is "SMITH".

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDAATID

DDCS ACC.SUFFIX

The account suffix. The maximum length of this field is 200 bytes. This field is the user-supplied portion (suffix) of the accounting string. An example is "DEFAULT_DRDA". A value of zero in QMDASFLN Indicates there is no account suffix.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDASUFX
Initial DB2 Requester Correlation

This topic shows detailed information about “Accounting - Initial DB2 Requester Correlation”.

This block shows the accounting trace for the initial DB2 requester correlation.

Accounting - Initial DB2 Requester Correlation

The field labels shown in the following sample layout of “Accounting - Initial DB2 Requester Correlation” are described in the following section.

```
---- INITIAL DB2 REQUESTER CORRELATION ---------------------------------------------
PRODUCT ID : DB2
PRODUCT VERSION: CCCCCCCC
LOCATION NAME : CCCCCCCCCCCCCCC
NET ID : CCCCCCCC
LU NAME : CCCCCCCC
AUTHID : CCCCCCCC
CONNTYPE : CCCCCCCC
CORRNMBR : CCCCCCCC
```

**PRODUCT ID**

Shows the product identifier (ID) of the requestor. It can have the following values:

- **DB2** For DB2 UDB for z/OS
- **SQL/DS** For DB2 UDB for VSE and VM
- **JDBC DRIVER** For Universal JDBC driver
- **COMMON SERV** For DB2 UDB for Linux, UNIX, Windows
- **DB2/400** For DB2 UDB for iSeries

Otherwise, it shows the first 3 characters of the product ID, or N/P if the record was written at the application requester location.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDAPRID

**PRODUCT VERSION**

The version, release, and modification level of the product, which generated the accounting information. It has the following format: vv rr m, where:

- **vv** Version level
- **rr** Release level
- **m** Modification level

N/P is shown if the record was written at the application requester location.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDB2PRDV
LOCATION NAME

The location name for the DB2 subsystem that created the QMDAINFO values.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

This identifier can be a long string. If there is insufficient space to show the complete string, the string is truncated in the report block. The complete string is shown in a separate list of long names at the end of the report.

Field Name: QMDALOCN

NET ID

The NETID of the DB2 subsystem that created the QMDAINFO values.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDANETN

LU NAME

The SNA LU name of the DB2 subsystem that created the QMDAINFO values.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDALUNM

AUTHID

The DB2 authorization ID that the SQL application used before name translation and before driving the connection exit at the DB2 site where the SQL application is running.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDAAUTH

CONNTYPE

The type of subsystem connection at the DB2 system where the SQL application is running. Possible values and their descriptions are:

BATCH
- TSO or call attach

SASS
- CICS

MASS
- IMS

DIST
- Distributed

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDACTYP

CORRNAME

The translated correlation name derived from the correlation ID. The translation depends on the connection ID.

Field Name: ADRQCRNM
CORRNMBR

The translated correlation number derived from the correlation ID. The translation depends on the connection ID.

Field Name: ADRQCRNB
Initial Other Requester Correlation

Initial Other Requester Correlation

This topic shows detailed information about “Accounting - Initial Other Requester Correlation”.

This block shows the accounting trace for the initial other requester correlation.

Accounting - Initial Other Requester Correlation

The field labels shown in the following sample layout of “Accounting - Initial Other Requester Correlation” are described in the following section.

--- INITIAL OTHER REQUESTER CORRELATION ---------------------------------------------------------------
PRODUCT ID   | SQL/DS
PRODUCT VERSION | CCCCCCCC
STRING       | CCCCCCCC

PRODUCT ID

The product identifier of the requester:

DB2       DB2 UDB for z/OS
SQL/DS    DB2 UDB for VSE and VM
COMMON SERV DB2 UDB for Linux, UNIX, and Windows
DB2/400   DB2 UDB for iSeries
N/P       If the record was written at the application requester location

Otherwise, it shows the first 3 characters of the product ID.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDAPRIDP

PRODUCT VERSION

The version, release, and modification level of the product, which generated the accounting information. It has the following format: vv rr m,

where:

vv     Version level
rr     Release level
m      Modification level

N/P is shown if the record was written at the application requester location.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDAPRIDV

STRING

The accounting string:

- For local DB2 threads, the format of the accounting string is shown in QMDAINFO.
- For database access threads, the accounting string contains the accounting string sent by the requester.
The QMDAPRID value identifies which product generated the accounting string.
- If the requester is DB2, the accounting string is defined in QMDAINFO.
- If QMDAPTY is DSN, QMDAINFO defines the format.
- If QMDAPTY is SQL or JCC, QMDASQLI defines the format.
- Otherwise, the format is undefined.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDAASTR
This topic shows detailed information about “Accounting - Locking”.

This block provides locking information. Locking ensures the integrity of data.

For formatting reasons, OMEGAMON XE for DB2 PE shows different labels for report and trace. The following example shows both layouts, the report on the left, and the trace layout on the right.

**Accounting - Locking**

The field labels shown in the following sample layout of “Accounting - Locking” are described in the following section.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

**TIMEOUTS**

The number of times a unit of work was suspended for a time exceeding the timeout value. This number should be low, ideally 0.

Field Name: QTXATIM

**DEADLOCKS**

The number of times deadlocks were detected. This number should be low, ideally 0.

**Background and Tuning Information**

Deadlocks occur when two or more application processes each hold locks on resources that the others need, without which they cannot proceed. Ensure that all applications accessing the same tables access them in the same order.

To improve concurrency:

- Use row level locking instead of page level locking to minimize deadlocks.
- For small tables use page level locking with MAXROWS 1.

To minimize deadlocks:

- Delay updates to just before commit.
- Use SELECT with the FOR UPDATE clause to use U lock.
- Adjust the deadlock detection cycle parameter DEADLOK in the IRLM procedure.
This field is incremented once for each deadlock encountered. There is no correlation between this field and the deadlock events reported in the Locking report set or the number of IFCID 172 records written. This field reports all deadlocks, regardless of how they were resolved. The locking report and record trace IFCID 172 show only those deadlocks that were resolved by DB2.

**Field Name:** QTXADEA

This is an *exception* field.

**ESCAL.(SHARED)/ESCAL.(SHAR)**

The number of times the maximum page locks per table space are exceeded, and the table space lock escalates from a page lock (IS) to a table space lock (S) for this thread. You can specify the number of locks allowed per table space with the LOCKS PER TABLE(SPACE) parameter on the DB2 install panel DSNTIPJ.

**Background and Tuning Information**

Escalations can cause unpredictable response times. Lock escalations should only happen when an application process updates or references (if repeatable read is used) more pages than normal.

**Field Name:** QTXALES

This is an *exception* field.

**ESCAL.(EXCLUS)/ESCAL.(EXCL)**

The number of times the maximum page locks per table space are exceeded and the table space lock escalates from a page lock (IX) to a table space lock (X).

**Background and Tuning Information**

Escalations can cause unpredictable response times. Lock escalations should only happen when an application process updates or references (if repeatable read is used) more pages than it normally does.

A useful rule of thumb is to compare the number of escalations (shared and exclusive) to the successful escalations (those that did not cause deadlocks and timeouts). If this value, or the number Lock escalations - shared and if the number of timeouts or deadlocks is also not 0, the timeout or deadlock is probably caused by the escalation.

If many escalations cause deadlocks and timeouts, the recommendation is to change the escalation threshold value. Use of ANY is extremely useful to prevent unnecessary and expensive page locks, for example locking all pages in a tablespace.

Lock escalations, shared or exclusive, should not be expected in a transaction environment.

**Field Name:** QTXALEX

This is an *exception* field.

**MAX PG/ROW LOCKS HELD/MAX PG/ROW LCK HELD**

The maximum number of page or row locks concurrently held against all table spaces by a single application during its execution. This count is a high-water mark. It cannot exceed the LOCKS PER USER parameter on panel DSNTIPJ.
Locking

Field Name: QTXANPL
This is an *exception* field.

LOCK REQUEST
The number of requests to lock a resource.

Field Name: QTXALOCK
This is an *exception* field.

UNLOCK REQUEST
The number of requests to unlock a resource.
This value can be less than the number of lock requests because DB2 can release several locks with a single unlock request.

Field Name: QTXAUNLK

QUERY REQUEST
The number of query requests.

Field Name: QTXAQR

CHANGE REQUEST
The number of change requests.

Field Name: QTXACHG

OTHER REQUEST
The number of requests to IRLM to perform a function other than LOCK, UNLOCK, QUERY, or CHANGE.

Field Name: QTXAIRLM

TOTAL SUSPENSIONS
The number of all types of lock suspensions.

Field Name: ALRSUSP

LOCK SUSPENSIONS/LOCK SUSPENS
The number of times a lock could not be obtained and the unit of work was suspended.

Background and Tuning Information
This number should be low, ideally 0.
The number of lock suspensions is a function of the lock requests. Lock suspensions (or conflicts) can happen on either LOCK REQUEST or CHANGE REQUEST.
Suspensions are highly dependent on the application and table space locking protocols.

Field Name: QTXASLOC
This is an *exception* field.

IRLM LATCH SUSPENS.
The number of latch suspensions.

Field Name: QTXASLAT
This is an exception field.

OTHER SUSPENS.
The number of suspensions caused by something other than lock or latch.
Field Name: QTXASOTH
This is an exception field.
Logging Activity

This topic shows detailed information about “Accounting - Logging Activity”.

This block provides information about the logging activity.

The following example shows both layouts, the report on the left, and the trace layout on the right.

**Accounting - Logging Activity**

The field labels shown in the following sample layout of “Accounting - Logging Activity” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOG RECORDS WRITTEN</td>
<td>The number of log records written.</td>
</tr>
<tr>
<td>TOT BYTES WRITTEN</td>
<td>The total number of log record bytes written.</td>
</tr>
<tr>
<td>LOG RECORD SIZE</td>
<td>The average number of bytes written per log record.</td>
</tr>
</tbody>
</table>

**LOG RECORDS WRITTEN (LOG RECS WRITTEN)**

The number of log records written.

**Field Name:** QWACLRRN

**TOT BYTES WRITTEN (TOT BYTES WRITTEN)**

The total number of log record bytes written.

**Field Name:** QWACLRRAB

**LOG RECORD SIZE**

The average number of bytes written per log record.

**Field Name:** ALRAVGB
Measured/Elig Times

This topic shows detailed information about “Accounting - Measured/Elig Times”.

Accounting - Measured/Elig Times

The field labels shown in the following sample layout of “Accounting - Measured/Elig Times” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>APPL (CL1)</th>
<th>DB2 (CL2)</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>

APPL (CL1) - ELAPSED TIME

The class 1 elapsed time of the allied agent.

Special Considerations:

- If the begin time equals zero, or if the end time minus begin time equals zero or is negative, N/C is shown.
- Threads that can be reused, such as CICS protected threads or IMS/VSe wait-for-input message regions, can include time during which the thread was inactive and waiting for work.
- Elapsed time to process distributed requests is included for allied-distributed threads.
- This time includes the time for processing SQL statements issued by stored procedures, user-defined functions, or triggers.
- In query CP, sysplex query, or utility parallelism, this is the time shown in the originating record, which overlaps the elapsed times shown in the parallel records.

Field Name: ADRECETT

This is an exception field.

APPL (CL1) - CP CPU TIME

The class 1 CPU time in an application. It indicates:

- The class 1 CPU time of the allied agent, which may include the accumulated class 1 TCB time for processing stored procedures, user-defined functions, and triggers.
- The accumulated CPU time for processing parallel tasks. This is valid for query CP parallelism, sysplex query parallelism, and parallel tasks generated by utilities.
- In sysplex query parallelism, the individual CPU times are normalized by the conversion factor of the parallel tasks that is related to the originating task.

In sysplex query parallelism, only CPU times of parallel tasks, running on the same member of the SYSPLEX group as the originating task, are included.

This CPU time does not include time that is consumed on an IBM specialty engine.
Measured/Elig Times

Field Name: ADCPUT
This is an exception field.

**APPL (CL1) - CP CPU TIME - ELIGIBLE FOR SECP**
The accumulated CPU time that is consumed on a standard CP for work eligible on an IBM specialty engine.

For records for the parent tasks in parallel queries, this value reflects zIIP-eligible time for the parent and the child tasks. Child task records have a value of 0.

Field Name: AWACZEL

**APPL (CL1) - SE CPU TIME**
The sum of several accumulated CPU times consumed while running on an IBM specialty engine in all environments. These times are consumed when:
- Running stored procedure requests and triggers on the main application execution unit.
- Satisfying stored procedure requests processed in a DB2 stored procedure or WLM address space. SQL procedure times are included in this time if the SQL procedure was called on a nested task and was not invoked by the main application execution unit.
- Satisfying UDF requests processed in a DB2 stored procedure or WLM address space.
- Running triggers on a nested task.
- Running parallel tasks in an application which contains the accumulated CPU time used to satisfy UDF requests.

**Note:** All CPU times of an IBM specialty engine (SE) that are reported in DB2 trace records are already normalized by DB2 to the speed of the general purpose processor.

Field Name: AWACC1Z

**DB2 (CL2) - ELAPSED TIME**
The class 2 elapsed time of the allied agent accumulated in DB2.

Field Name: ADDB2ETT
This is an exception field.

**DB2 (CL2) - ELAPSED TIME - ELIGIBLE FOR ACCEL**
The accumulated elapsed time spent processing SQL in DB2 that may be eligible for execution on an accelerator.

Field Name: AWACEEL2

**DB2 (CL2) - CP CPU TIME**
The class 2 CPU time (in DB2). It indicates:
- The class 2 CPU time for the allied agent. This includes the accumulated class 2 TCB time for processing any stored procedures, user-defined functions, and triggers.
- The accumulated CPU time for processing parallel tasks. This is valid for query CP parallelism, sysplex query parallelism, and parallel tasks generated by utilities.
For batch reporting, in sysplex query parallelism, the individual CPU times are normalized by the conversion factor of the parallel tasks related to the originating task.

For online monitoring, in sysplex query parallelism, only CPU times of parallel tasks, running on the same member of the sysplex group as the originating task, are included.

This CPU time does not include time that is consumed on an IBM specialty engine.

**Field Name:** ADDBCPUT

This is an *exception* field.

**DB2 (CL2) - CP CPU TIME - ELIGIBLE FOR ACCEL**

The accumulated CPU time spent processing SQL in DB2 that may be eligible for execution on an accelerator.

**Field Name:** AWACECP2

**DB2 (CL2) - SE CPU TIME**

The accumulated and consumed class 2 time on an IBM specialty engine (SE) that consists of times for non-nested, stored procedures, user-defined functions, triggers, and parallel tasks.

**Note:** All CPU times of an IBM specialty engine that are reported in DB2 trace records are already normalized by DB2 to the speed of the general purpose processor.

**Field Name:** AWACC2Z

**DB2 (CL2) - SE CPU TIME - ELIGIBLE FOR ACCEL**

The accumulated CPU time consumed on an IBM specialty engine while processing SQL in DB2 that may be eligible for execution on an accelerator.

**Field Name:** AWACESE2
This topic shows detailed information about “Accounting - Miscellaneous”.

This block provides miscellaneous data for large objects (LOBs).

For formatting reasons, OMEGAMON XE for DB2 PE shows different labels for report and trace. The following example shows both layouts, the report on the left, and the trace layout on the right.

**Accounting - Miscellaneous**

The field labels shown in the following sample layout of “Accounting - Miscellaneous” are described in the following section.

<table>
<thead>
<tr>
<th>Report:</th>
<th>Trace:</th>
</tr>
</thead>
<tbody>
<tr>
<td>MISCELLANEOUS</td>
<td>MISCELLANEOUS</td>
</tr>
<tr>
<td>AVERAGE</td>
<td>TOTAL</td>
</tr>
<tr>
<td>TOTAL</td>
<td>TOTAL</td>
</tr>
</tbody>
</table>

| MAX STO LOB VAL (KB) | 0.00 | 0 | MAX STO LOB VAL (KB) | 0 |
| MAX STO XML VAL (KB) | 0.00 | 0 | MAX STO XML VAL (KB) | 0 |
| ARRAY EXPANSIONS | 0.00 | 0 | ARRAY EXPANSIONS | 0 |
| SPARSE IX DISABLED | 0.00 | 0 | SPARSE IX DISABLED | 0 |
| SPARSE IX BUILT WF | 0.00 | 0 | SPARSE IX BUILT WF | 0 |

**MAX STO LOB VAL (KB)**

Maximum storage used for LOB values.

Field Name: QXSTLOBV

**MAX STO XML VAL (KB)**

Maximum storage used for XML values.

Field Name: QXSTXMLV

**ARRAY EXPANSIONS**

The number of times a variable array has been expanded beyond 32 KB (DB2 field: QXSTARRAY_EXPANSIONS).

Field Name: AXSTAEEXP

**SPARSE IX DISABLED**

The number of times that sparse index was disabled because of insufficient storage.

Field Name: QXSIWF

**SPARSE IX BUILT WF**

The number of times that sparse-index built a physical work file for probing.

Field Name: QXSIWF
MVS Accounting

This topic shows detailed information about “Accounting - MVS Accounting”.

This block provides information about an MVS accounting trace.

**Accounting - MVS Accounting**

The field labels shown in the following sample layout of “Accounting - MVS Accounting” are described in the following section.

MVS ACCOUNTING DATA : IS-255-01234567890123456789012#2
ACCOUNTING TOKEN(CHAR) : N/A
ACCOUNTING TOKEN(HEX) : N/A

**MVS ACCOUNTING DATA**

The MVS accounting string associated with the MVS address space of the SQL application. It is filled if PROD_TYP=D; otherwise X’00’ is used.

This information comes from the ACCT= parameter on the job statement. If the ACCT= parameter is blank, the information on the EXEC statement is used. TSO logon Accounting information is used only if there is a value in the account field on the TSO Logon panel. Do not confuse this field with the Accounting correlation token.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

**Field Name:** QMDAACCT

**ACCOUNTING TOKEN(CHAR)**

The accounting token. For RRSAF, this is the RRSAF accounting token defined during signon. For DDF, this is the DDF correlation token.

This value is displayed in character format.

**Field Name:** AWHCTOKC

**ACCOUNTING TOKEN(HEX)**

The accounting token. For RRSAF, this is the RRSAF accounting token defined during signon. For DDF, this is the DDF correlation token.

This value is displayed in hexadecimal format.

**Field Name:** AWHCTOKH
Package Buffer Pool Activity - Class 10

This topic shows detailed information about “Accounting - Package Buffer Pool Activity - Class 10”.

This block shows buffer pool information at package level. It is repeated for each package present in the requested report. The block is headed by the package name.

The following example shows both layouts, the report on the left, and the trace layout on the right.

Accounting - Package Buffer Pool Activity - Class 10

The field labels shown in the following sample layout of “Accounting - Package Buffer Pool Activity - Class 10” are described in the following section.

<table>

</tbody>
</table>

**BPOOL HIT RATIO (%)**

The percentage of Getpage operations that were satisfied by a page already in the buffer pool.

The value is calculated as the ratio of number of successful Getpage operations minus the number of pages read from DASD (both synchronously and using prefetch), to the number of successful Getpage operations, expressed as a percentage.

**Background and Tuning Information**

The highest possible hit ratio is 100%, that is, when every page requested is always in the buffer pool. If the requested page is not in the buffer pool, the hit ratio is 0% or less. If the hit ratio is negative, this means that prefetch brought pages into the buffer pool that are not subsequently referenced, either because the query stops before it reaches the end of the table space, or because the prefetched pages are stolen by DB2 for reuse before the query can access them. A low buffer pool hit ratio is not necessarily bad. The hit ratio is a relative value, based on the type of application. For example, an application that browses large data might have a buffer pool hit ratio of 0. Watch for those cases where the hit ratio drops significantly for the same application. Here are some suggestions to increase the buffer hit ratio:

- Run the REORG utility for indexes or table spaces associated with the virtual buffer pool.
- Reserve more pages for random I/O by setting the SEQUENTIAL STEAL THRESHOLD (VPSEQT) to a lower value.
- Increase the buffer pool as long as the cost of paging does not outweigh the benefit of I/O avoidance.
• Establish more separate buffer pools, perhaps to isolate different applications.
• Place the objects that are only accessed sequentially in a separate buffer pool.

The hit ratio measurement becomes less meaningful if the buffer pool is used by additional processes, such as utilities or work files.

Field Name: ABUFFRAP

GETPAGES

The number of Getpage requests. This counter is incremented by successful Getpage requests for queries processed in parallel for each thread and for all successful and unsuccessful Getpage requests for queries that are not processed in parallel.

Background and Tuning Information

Reducing the number of Getpages can improve DB2 performance by reducing the number of synchronous page reads. With fewer Getpages, the requested page is more likely to be returned from the buffer pool. CPU usage is also reduced.

Check the ratio of Getpages to SQL DML statements, as a rule of thumb, try and keep this ratio below six for a typical online transaction SQL.

You might need to modify the database and query design, for example:
• Add indexes to tables to reduce the number of pages scanned.
• Reassess the number of tables used and denormalize them, if necessary. As an example, a large table with many columns can result in several pages being fetched to satisfy a simple query requesting just a few columns. Splitting such a table into several tables with fewer columns, tailored to queries, will result in fewer pages returned for each query.
• Use correlated rather than non-correlated queries to force the use of an index.

Field Name: QBACGETP

BUFFER UPDATES

The number of times a buffer update occurs. This is incremented every time a page is updated and is ready to be written to DASD. If the same page is updated twice, for example, the number is incremented by 2.

This number is kept for all types of pages including data pages and work-file pages.

Background and Tuning Information

A nonzero value indicates any of the following activities:
• SQL INSERT, UPDATE, or DELETE
• Merge scan join
• Internal sort activity on the work files

Check the access path to determine whether sort activity can be minimized or avoided.

Field Name: QBACSWSP

SYNCHRONOUS WRITE

The number of immediate (synchronous) write I/O operations.
Background and Tuning Information

Although an immediate write is rare, a small nonzero value is acceptable. A large value indicates that the system needs tuning.

Field Name: QBACIMWP

SYNCHRONOUS READ

The number of synchronous read I/O operations. DB2 increments this counter for each media manager synchronous physical read. Asynchronous I/O requests are not counted.

Field Name: QBACRIOP

SEQ. PREFETCH REQS

The number of SEQUENTIAL PREFETCH requests. This is incremented for each PREFETCH request. Each request can result in an I/O read. If it does, up to 64 pages can be read for SQL and up to 128 pages for utilities. For SQL, depending on the buffer pool size, a request does not result in an I/O if all the requested pages are already in the buffer pool.

DB2 can use sequential prefetch if the data is accessed in sequential order even though sequential prefetch was not requested at bind time. This is known as sequential detection and is not included in the sequential prefetch count. Sequential detection is included in dynamic prefetch requests field.

Background and Tuning Information

Table space scans and nonmatching index scans generally use sequential prefetch.

Field Name: QBACSEQP

LIST PREFETCH REQS

The number of LIST PREFETCH requests.

Special Considerations:
1. List prefetch allows DB2 to access data pages efficiently even if the needed data pages are not contiguous. It can be used with single index access and is always used with multiple index access.
2. List prefetch is always used to access data from the inner table during a hybrid join.
3. Data pages are read in quantities equal to the sequential prefetch quantity, which depends on the buffer pool size and is usually 64 pages.
4. During bind time DB2 does not use list prefetch if the estimated number of RIDs to be processed would take more than 50% of the RID pool. During execution time, list prefetch processing terminates if DB2 detects that more than 25% of the rows in the table need to be accessed.

If list prefetch is terminated, it is indicated in IFCID 125.

Field Name: QBACLFPFP

DYN. PREFETCH REQS

The number of (dynamic) PREFETCH requests. This is triggered by sequential detection. This includes prefetches for segmented table spaces.

Background and Tuning Information
Dynamic prefetch is typically used for a SELECT or UPDATE that is run repeatedly, accessing the index for each access.

If sequential prefetch, list prefetch, and dynamic prefetch reads have large values, check whether the access path can be improved.

Field Name: QBACDPFP

PAGES READ ASYNCHR.

The number of asynchronous pages read by prefetch that the agent triggered.

Background and Tuning Information

This is used to determine the buffer pool hit ratio: (Getpage requests - Synchronous reads - Asynchronous pages read) / Getpage requests.

Field Name: QBACSIOP
Package Global Contention L-Locks - Class 8

This topic shows detailed information about “Accounting - Package Global Contention L-Locks - Class 8”.

This block provides global contention information for a logical lock (L-lock) at package level. It shows conflicts on locking requests between different DB2 members of a data sharing group when those members are trying to serialize shared resources.

**Note:** The current package name is shown in the header line of the block instead of this block title.

### Accounting - Package Global Contention L-Locks - Class 8

The field labels shown in the following sample layout of “Accounting - Package Global Contention L-Locks - Class 8” are described in the following section.

<table>
<thead>
<tr>
<th>Report:</th>
<th>Trace:</th>
</tr>
</thead>
<tbody>
<tr>
<td>AYRSD020</td>
<td>AVERAGE TIME</td>
</tr>
<tr>
<td>GLOBAL CONTENTION L-LOCKS</td>
<td>0.000000</td>
</tr>
<tr>
<td>PARENT (DB,TS,TAB,PART)</td>
<td>0.000000</td>
</tr>
<tr>
<td>CHILD (PAGE,ROW)</td>
<td>0.000000</td>
</tr>
<tr>
<td>OTHER</td>
<td>0.000000</td>
</tr>
</tbody>
</table>

**GLOBAL CONTENTION L-LOCKS - AVERAGE TIME/ELAPSED TIME**

The accumulated wait times due to global contention for all L-Locks.

**Field Name:** APLKSUST

**GLOBAL CONTENTION L-LOCKS - AV.EVENT/EVENTS**

The accumulated wait trace events processed for waits for global contention of all L-Locks.

**Field Name:** APLKSUSC

**PARENT (DB,TS,TAB,PART) - AVERAGE TIME/ELAPSED TIME**

The accumulated wait time due to global contention for parent L-Locks. Parent L-Locks are any of the following L-Lock types: database, tablespace, table, or partition.

**Field Name:** QPACAWTJ

**PARENT (DB,TS,TAB,PART) - AV.EVENT/EVENTS**

The number of wait trace events processed for waits for global contention for parent L-Locks.

**Field Name:** APLPSUSC

**CHILD (PAGE,ROW) - AVERAGE TIME/ELAPSED TIME**

The accumulated wait time due to global contention for child L-Locks. Child L-Locks are any of the following L-Lock types: page or row.

**Field Name:** QPACAWTK

**CHILD (PAGE,ROW) - AV.EVENT/EVENTS**

The number of wait trace events processed for waits for global contention for child L-Locks.

**Field Name:** APLCSUSC

**OTHER - AVERAGE TIME/ELAPSED TIME**
The accumulated wait time due to global contention for other L-Locks.

*Field Name:* QPACAWTM

**OTHER - AV.EVENT/EVENTS**

The number of wait trace events processed for waits for global contention for other L-Locks.

*Field Name:* APLOSUSC
This topic shows detailed information about “Accounting - Package Global Contention P-Locks - Class 8”.

This block provides global contention information for a physical lock (P-lock) at package level. It shows conflicts on locking requests between different DB2 members of a data sharing group when those members are trying to serialize shared resources.

The following example shows both layouts, the report on the left, and the trace layout on the right.

**Note:** The current package name is shown in the header line of the block instead of this block title.

**Accounting - Package Global Contention P-Locks - Class 8**

The field labels shown in the following sample layout of “Accounting - Package Global Contention P-Locks - Class 8” are described in the following section.

### GLOBAL CONTENTION P-LOCKS - AVERAGE TIME/ELAPSED TIME

The accumulated wait times due to global contention for all P-Locks.

**Field Name:** APPLSUST

### GLOBAL CONTENTION P-LOCKS - AV.EVENT/EVENTS

The accumulated wait trace events processed for waits for global contention of all P-Locks.

**Field Name:** APPLSUSC

### PAGESET/PARTITION - AVERAGE TIME/ELAPSED TIME

The accumulated wait time due to global contention for pageset/partition P-Locks.

**Field Name:** QPACAWTN

### PAGESET/PARTITION - AV.EVENT/EVENTS

The number of wait trace events processed for waits for global contention for pageset/partition P-Locks.

**Field Name:** APPSSUSC

### PAGE - AVERAGE TIME/ELAPSED TIME

The accumulated wait time due to global contention for page P-Locks.

**Field Name:** QPACAWTO

### PAGE - AV.EVENT/EVENTS

The number of wait trace events processed for waits for global contention for page P-Locks.

**Field Name:** APPPSUSC
OTHER - AVERAGE TIME/ELAPSED TIME

The accumulated wait time due to global contention for other P-Locks.

Field Name: QPACAWTQ

OTHER - AV.EVENT/EVENTS

The number of wait trace events processed for waits for global contention for other P-Locks.

Field Name: APPOSUSC
Package Identification

This topic shows the report and trace blocks for package identification. They present information for the identification of packages. A package is an object containing a set of SQL statements that have been statically bound and that is available for processing.

For more information on calculating package average data refer to “How Averages Are Calculated” on page 5-4.

“Package Identification - Report” on page 5-301
This topic shows detailed information about “Accounting - Package Identification - Report”.

“Package Identification - Trace” on page 5-306
This topic shows detailed information about “Accounting - Package Identification - Trace”.

5-300  OMEGAMON XE for DB2 PE & PM: Report Reference
Package Identification - Report

This topic shows detailed information about “Accounting - Package Identification - Report”.

Accounting - Package Identification - Report

The field labels shown in the following sample layout of “Accounting - Package Identification - Report” are described in the following section.

</tbody>
</table>

PCKNAME

This label is replaced by the package name, or, if ORDER (ACTNAME) was in effect, the package activity name. An activity name is truncated if it is longer than 8 characters.

Field Name: PCKNAME

TYPE

An indicator of whether the block describes a package or a DBRM. Possible values are PACKAGE, DBRM, and BOTH. BOTH can be shown in reports if there are packages and DBRMs with the same program name.

Field Name: ADPCKTYP

LOCATION

The location name.

If this field is blank in trace or report, the package or DBRM was executed locally. If it is not blank, all times represent the time spent locally to execute the remote package for this APPL_DIR requester.

This field is invalid (N/P) if summary rollup data is present.

Field Name: QPACLOCN

This is an exception field.

COLLECTION ID

The package collection ID. This field does not apply to DBRMs. If the program name cannot be identified, this field is not present in report or trace.

This field is invalid if summary rollup data is present. It can have the following value in:
Package Identification - Report

- Accounting trace and report: N/P
- The Accounting FILE and SAVE PROGRAM table: blank

**Field Name: QPACCOLN**
This is an *exception* field.

**PROGRAM NAME**
The program name (package ID or DBRM name).
In the case of rollup data (Accounting data of DDF/RRSAF threads and parallel tasks accumulated by DB2), the following value is shown "ROLSUM".

**Field Name: QPACPKID**
This is an *exception* field.

**PROGRAM NAME**
This field is identical to QPACPKID except of when ORDER (ACTNAME) was in effect. can belong to the same activity name. In a data block that reports totals it is set to ALL PROG.

**Field Name: APACPKID**

**ACTIVITY TYPE**
The type of activity. The following values indicate how the package was loaded:

**ALL TYPES**
In a data block that reports totals it is set to ALL TYPES.

**STORED PROC**
When running an external procedure

**TRIGGER**
When running a trigger

**UDF**
When running a user-defined function

**NATIVE SQL PROC**
When running a native SQL procedure

**NATIVE UDF**
When running a native UDF procedure (a non-inline user-defined function)

**NONNESTED**
Indicates that none of the above values is true

**MULTIPLE**
Indicates that packages with the same key but with different activity types were running

**N/P**
Invalidated in case of rollup summary

The nested activity values that are shown in column NEST_ACTIVITY_TYPE of the table DB2PMFACCT_PROGRAM are:

**S**
For Stored Procedure

**T**
For Trigger

**U**
For UDF
Q  For native SQL procedure  
D  For Native UDF  
N  For nonnested (other)  
blank  For invalidated in case of rollup summary  

This field is invalid if unique or summary rollup data is present.  

Field Name: ADPATYP  

ACTIVITY NAME  
The name of the nested activity.  
This field contains the name of the nested activity if the package is defined for a:  
  • Trigger  
  • Stored procedure  
  • User-defined function (UDF)  
  • Native SQL procedure  
  • Non-inline UDF  

In a data block that reports totals it is set to ALL NAMES.  
This field is invalid if summary rollup data is present.  
It can have the following value in:  
  • Accounting Trace and Report: N/P  
  • The Accounting FILE and SAVE PROGRAM tables: blank  

Field Name: ADPAANM  

SCHEMA NAME  
Schema name of the nested activity.  
If the package is defined for a trigger, stored procedure, or user-defined function, then this field contains the name of the schema to which the nested activity belongs. It can have the following value in:  
  • Accounting Trace and Report: N/P  
  • The Accounting FILE and SAVE PROGRAM tables: blank  

This field is invalid if summary rollup data is present.  

Field Name: ADPASCH  

SUCC AUTH CHECK  
For Accounting reports, this field shows a value of 0. This field is valid for non-rollup data.  

Field Name: ADPCKANR  

OCCURRENCES  
This value can be one of the following:  
  • In general, the total number of accounting trace sections for a package or DBRM regardless of enabled or disabled DB2 trace classes 7 and 8 at the time of writing the trace record. In case of Distributed Data Facility (DDF) or Recoverable Resource Manager Services Attach Facility (RRSAF) threads, it is the number of accounting intervals rolled up in a record.
• If REPORT ORDER (ACTNAME) is specified, the total number of package sections of a special activity type depends on the following:
  – If IFCID 233 or 380 is available, stored procedures (SP) are counted based on the available IFCID. If both IFCIDs are available, IFCID 380 is the preferred one for SP reporting. Subprograms called by these SPs are not taken into account.
  – If IFCID 233 or 381 is available, user-defined functions (UDF) are counted based on the available IFCID. If both IFCIDs are available, IFCID 381 is the preferred one for UDF reporting. Subprograms called by these UDFs are not taken into account.
  – If neither IFCID 233, 380, nor 381 is collected, all packages of an activity type are counted. The sum also includes the number of subprograms.

Field Name: ADTOTPOC

NBR OF ALLOCATIONS

This value can be one of the following:

• In general, the number of times a package was invoked by a different package. For the first package run by an application, the initial call counts as a package switch. If this package called a nested package (such as a trigger, UDF, or stored procedure), a switch will not be counted upon return from such a package.

• If REPORT ORDER (ACTNAME) is specified, the number of times a package of a special activity type is invoked from a different package depends on the following:
  – If IFCID 233 or 380 is available, the invocations of stored procedures (SP) are counted based on the available IFCID. If both IFCIDs are available, IFCID 380 is the preferred one for SP reporting. Subprograms called by these SPs are not taken into account.
  – If IFCID 233 or 381 is available, the invocation of user-defined functions (UDF) are counted based on the available IFCID. If both IFCIDs are available, IFCID 381 is the preferred one for UDF reporting. Subprograms called by these UDFs are not taken into account.
  – If neither IFCID 233, 380, nor 381 is collected, all invocations of an activity type are counted. The sum also includes the number of subprograms.

Field Name: APACSWIT

SQL STMT - AVERAGE

The number of SQL statements issued in this package or DBRM.

This number may not be equal to the total number of SQL statements in the QXST data section because QXST does not count all SQL statements. For example, it does not count commit or rollback statements.

Note: This field is shown for the following field labels in Accounting trace:

• SQL STMT - TOTAL
• SQL STMT - AVERAGE:

Field Name: QPACSQLC

This is an exception field.
SQL STMT - TOTAL

The number of SQL statements issued in this package or DBRM.

This number may not be equal to the total number of SQL statements in the QXST data section because QXST does not count all SQL statements. For example, it does not count commit or rollback statements.

Note: This field is shown for the following field labels in Accounting trace:

- SQL STMT - TOTAL
- SQL STMT - AVERAGE:

Field Name: QPACSQLC

This is an exception field.

NBR RLUP THREADS

This value can be one of the following:

- In general, the number of threads to roll data into this QPAC data section. Non-rollup QPACs have a value of 1 and rollup QPACs have a value of 1 or more. This number is used as a divisor for calculating averages for package class 7, 8, or 10 times and events.

- If REPORT ORDER (ACTNAME) is specified, the number of threads to roll data into this QPAC data section of a special activity type depends on the following:
  - If IFCID 233 or 380 is available, the number of threads to roll data into this QPAC data section for stored procedures (SP) is counted based on the available IFCID. If both IFCIDs are available, IFCID 380 is the preferred one for SP reporting. Subprograms called by these SPs are not taken into account.
  - If IFCID 233 or 381 is available, the number of threads to roll data into this QPAC data section for user-defined functions (UDF) is counted based on the available IFCID. If both IFCIDs are available, IFCID 381 is the preferred one for UDF reporting. Subprograms called by these UDFs are not taken into account.
  - If neither IFCID 233, 380, nor 381, is collected, the total number of threads to roll data into this QPAC data section is counted. The sum also includes the number of subprograms.

Field Name: QPACRLNU
Package Identification - Trace

Accounting - Package Identification - Trace

This topic shows detailed information about “Accounting - Package Identification - Trace”.

The field labels shown in the following sample layout of “Accounting - Package Identification - Trace” are described in the following section.

</table>

PCKNAME

This label is replaced by the package name, or, if ORDER (ACTNAME) was in effect, the package activity name. An activity name is truncated if it is longer than 8 characters.

Field Name: PCKNAME

TYPE

An indicator of whether the block describes a package or a DBRM. Possible values are PACKAGE, DBRM, and BOTH. BOTH can be shown in reports if there are packages and DBRMs with the same program name.

Field Name: ADPCKTYP

LOCATION

The location name.

If this field is blank in trace or report, the package or DBRM was executed locally. If it is not blank, all times represent the time spent locally to execute the remote package for this APPL_DIR requester.

This field is invalid (N/P) if summary rollup data is present.

Field Name: QPACLOCN

This is an exception field.

COLLECTION ID

The package collection ID. This field does not apply to DBRMs. If the program name cannot be identified, this field is not present in report or trace.

This field is invalid if summary rollup data is present. It can have the following value in:

- Accounting trace and report: N/P
- The Accounting FILE and SAVE PROGRAM table: blank
Field Name: QPACCOLN
This is an exception field.

PROGRAM NAME
The program name (package ID or DBRM name).
In the case of rollup data (Accounting data of DDF/RRSAF threads and parallel tasks accumulated by DB2), the following value is shown *ROLSUM*.

Field Name: QPACPKID
This is an exception field.

CONSISTENCY TOKEN
The program (package or DBRM) consistency token.
This field is invalid (0) if summary rollup data is present.

Field Name: QPACCONT

ACTIVITY TYPE
The type of activity. The following values indicate how the package was loaded:

ALL TYPES
In a data block that reports totals it is set to ALL TYPES.

STORED PROC
When running an external procedure

TRIGGER
When running a trigger

UDF
When running a user-defined function

NATIVE SQL PROC
When running a native SQL procedure

NATIVE UDF
When running a native UDF procedure (a non-inline user-defined function)

NONNESTED
Indicates that none of the above values is true

MULTIPLE
Indicates that packages with the same key but with different activity types were running

N/P
Invalidated in case of rollup summary

The nested activity values that are shown in column NEST_ACTIVITY_TYPE of the table DB2PMFACCT_PROGRAM are:

S For Stored Procedure
T For Trigger
U For UDF
Q For native SQL procedure
D For Native UDF
Package Identification - Trace

N  For nonnested (other)
blank  For invalidated in case of rollup summary

This field is invalid if unique or summary rollup data is present.

Field Name: ADPATYP

ACTIVITY NAME

The name of the nested activity.

This field contains the name of the nested activity if the package is defined for a:
• Trigger
• Stored procedure
• User-defined function (UDF)
• Native SQL procedure
• Non-inline UDF

In a data block that reports totals it is set to ALL NAMES.

This field is invalid if summary rollup data is present.

It can have the following value in:
• Accounting Trace and Report: N/P
• The Accounting FILE and SAVE PROGRAM tables: blank

Field Name: ADPAANM

SCHEMA NAME

Schema name of the nested activity.

If the package is defined for a trigger, stored procedure, or user-defined function, then this field contains the name of the schema to which the nested activity belongs. It can have the following value in:
• Accounting Trace and Report: N/P
• The Accounting FILE and SAVE PROGRAM tables: blank

This field is invalid if summary rollup data is present.

Field Name: ADPASCH

SUCC AUTH CHECK

For Accounting traces, this field indicates whether authorization information was found for this package without accessing the DB2 catalog.

This field is valid for non-rollup data. Possible values are:
• YES
• NO
• N/A if DB2 or later is used
• N/P, this field is invalid for Accounting trace
• blank, this field is invalid in the Accounting FILE PROGRAM table

Note: This field is invalid if unique or summary rollup data is present.

Field Name: ADPCKAUT

NBR OF ALLOCATIONS

This value can be one of the following:
In general, the number of times a package was invoked by a different package. For the first package run by an application, the initial call counts as a package switch. If this package called a nested package (such as a trigger, UDF, or stored procedure), a switch will not be counted upon return from such a package.

If REPORT ORDER (ACTNAME) is specified, the number of times a package of a special activity type is invoked from a different package depends on the following:

- If IFCID 233 or 380 is available, the invocations of stored procedures (SP) are counted based on the available IFCID. If both IFCIDs are available, IFCID 380 is the preferred one for SP reporting. Subprograms called by these SPs are not taken into account.
- If IFCID 233 or 381 is available, the invocation of user-defined functions (UDF) are counted based on the available IFCID. If both IFCIDs are available, IFCID 381 is the preferred one for UDF reporting. Subprograms called by these UDFs are not taken into account.
- If neither IFCID 233, 380, nor 381 is collected, all invocations of an activity type are counted. The sum also includes the number of subprograms.

Field Name: APACSWIT

SQL STMT - AVG

The number of SQL statements issued in this package or DBRM.

This number may not be equal to the total number of SQL statements in the QXST data section because QXST does not count all SQL statements. For example, it does not count commit or rollback statements.

Note: This field is shown for the following field labels in Accounting trace:

- SQL STMT - TOTAL
- SQL STMT - AVERAGE:

Field Name: QPACSQLC

This is an exception field.

SQL STMT - TOTAL

The number of SQL statements issued in this package or DBRM.

This number may not be equal to the total number of SQL statements in the QXST data section because QXST does not count all SQL statements. For example, it does not count commit or rollback statements.

Note: This field is shown for the following field labels in Accounting trace:

- SQL STMT - TOTAL
- SQL STMT - AVERAGE:

Field Name: QPACSQLC

This is an exception field.

NBR RLUP THREADS

This value can be one of the following:

- In general, the number of threads to roll data into this QPAC data section. Non-rollup QPACs have a value of 1 and rollup QPACs have a
value of 1 or more. This number is used as a divisor for calculating averages for package class 7, 8, or 10 times and events.

- If REPORT ORDER (ACTNAME) is specified, the number of threads to roll data into this QPAC data section of a special activity type depends on the following:
  - If IFCID 233 or 380 is available, the number of threads to roll data into this QPAC data section for stored procedures (SP) is counted based on the available IFCID. If both IFCIDs are available, IFCID 380 is the preferred one for SP reporting. Subprograms called by these SPs are not taken into account.
  - If IFCID 233 or 381 is available, the number of threads to roll data into this QPAC data section for user-defined functions (UDF) is counted based on the available IFCID. If both IFCIDs are available, IFCID 381 is the preferred one for UDF reporting. Subprograms called by these UDFs are not taken into account.
  - If neither IFCID 233, 380, nor 381, is collected, the total number of threads to roll data into this QPAC data section is counted. The sum also includes the number of subprograms.

Field Name: QPACRNU
Package Locking Activity - Class 10

This topic shows detailed information about “Accounting - Package Locking Activity - Class 10”.

This block shows locking information at package level. It is repeated for each package present in the requested report. The block is headed by the package name.

The following example shows both layouts, the report on the left, and the trace layout on the right.

Accounting - Package Locking Activity - Class 10

The field labels shown in the following sample layout of “Accounting - Package Locking Activity - Class 10” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TIMEOUTS</td>
<td>The number of times a unit of work was suspended for a time exceeding</td>
</tr>
<tr>
<td></td>
<td>the timeout value. This number should be low, ideally 0.</td>
</tr>
<tr>
<td>DEADLOCKS</td>
<td>The number of times deadlocks were detected. This number should be low, ideally 0.</td>
</tr>
</tbody>
</table>

**Background and Tuning Information**

Deadlocks occur when two or more application processes each hold locks on resources that the others need, without which they cannot proceed. Ensure that all applications accessing the same tables access them in the same order.

To improve concurrency:
- Use row level locking instead of page level locking to minimize deadlocks.
- For small tables use page level locking with MAXROWS 1.

To minimize deadlocks:
- Delay updates to just before commit.
- Use SELECT with the FOR UPDATE clause to use U lock.
Adjust the deadlock detection cycle parameter DEADLOK in the IRLM procedure.

This field is incremented once for each deadlock encountered. There is no correlation between this field and the deadlock events reported in the Locking report set or the number of IFCID 172 records written. This field reports all deadlocks, regardless of how they were resolved. The locking report and record trace IFCID 172 show only those deadlocks that were resolved by DB2.

**Field Name:** QTXADEA

This is an *exception* field.

**ESCAL.(SHARED)**

The number of times the maximum page locks per table space are exceeded, and the table space lock escalates from a page lock (IS) to a table space lock (S) for this thread. You can specify the number of locks allowed per table space with the LOCKS PER TABLE(SPACE) parameter on the DB2 install panel DSNTIPJ.

**Background and Tuning Information**

Escalations can cause unpredictable response times. Lock escalations should only happen when an application process updates or references (if repeatable read is used) more pages than normal.

**Field Name:** QTXALES

This is an *exception* field.

**ESCAL.(EXCLUS)**

The number of times the maximum page locks per table space are exceeded and the table space lock escalates from a page lock (IX) to a table space lock (X).

**Background and Tuning Information**

Escalations can cause unpredictable response times. Lock escalations should only happen when an application process updates or references (if repeatable read is used) more pages than it normally does.

A useful rule of thumb is to compare the number of escalations (shared and exclusive) to the successful escalations (those that did not cause deadlocks and timeouts). If this value, or the number Lock escalations - shared and if the number of timeouts or deadlocks is also not 0, the timeout or deadlock is probably caused by the escalation.

If many escalations cause deadlocks and timeouts, the recommendation is to change the escalation threshold value. Use of ANY is extremely useful to prevent unnecessary and expensive page locks, for example locking all pages in a table space.

Lock escalations, shared or exclusive, should not be expected in a transaction environment.

**Field Name:** QTXALEX

This is an *exception* field.

**MAX PG/ROW LOCKS HELD**
The maximum number of page or row locks concurrently held against all table spaces by a single application during its execution. This count is a high-water mark. It cannot exceed the LOCKS PER USER parameter on panel DSNTIPJ.

Field Name: QTXANPL
This is an exception field.

LOCK REQUEST
The number of requests to lock a resource.
Field Name: QTXALOCK
This is an exception field.

UNLOCK REQUEST
The number of requests to unlock a resource.
This value can be less than the number of lock requests because DB2 can release several locks with a single unlock request.
Field Name: QTXAUNLK

QUERY REQUEST
The number of query requests.
Field Name: QTXAQR

CHANGE REQUEST
The number of change requests.
Field Name: QTXACHG

OTHER REQUEST
The number of requests to IRLM to perform a function other than LOCK, UNLOCK, QUERY, or CHANGE.
Field Name: QTXAIRLM

LOCK SUSPENSIONS
The number of times a lock could not be obtained and the unit of work was suspended.

Background and Tuning Information
This number should be low, ideally 0.
The number of lock suspensions is a function of the lock requests. Lock suspensions (or conflicts) can happen on either LOCK REQUEST or CHANGE REQUEST.
Suspensions are highly dependent on the application and table space locking protocols.
Field Name: QTXASLOC
This is an exception field.

IRLM LOCK SUSPENS.
The number of latch suspensions.
Field Name: QTXASLAT
Package Locking Activity - Class 10

This is an exception field.

OTHER SUSPENS.
The number of suspensions caused by something other than lock or latch.

Field Name: QTXASOTH
This is an exception field.
Package SQL Activity - Class 10

This topic shows detailed information about “Accounting - Package SQL Activity - Class 10”.

This block shows SQL information at package level. It is repeated for each package present in the requested report. The block is headed by the package name.

The following example shows both layouts, the report on the left, and the trace layout on the right.

**Accounting - Package SQL Activity - Class 10**

The field labels shown in the following sample layout of “Accounting - Package SQL Activity - Class 10” are described in the following section.

<table>
<thead>
<tr>
<th>Report:</th>
<th>Trace:</th>
</tr>
</thead>
<tbody>
<tr>
<td>package</td>

</tbody>
</table>

**SELECT**

The number of SQL SELECT statements executed.

**Field Name:** QPSELECT

This is an exception field.

**INSERT**

The number of INSERT statements executed.

**Field Name:** QPINSRT

This is an exception field.

**UPDATE**

The number of UPDATE statements executed.

**Field Name:** QPUPDTE

This is an exception field.

**DELETE**

The number of DELETE statements executed.

**Field Name:** QPDELETE

This is an exception field.

**DESCRIBE**

The number of data capture describes.
Package SQL Activity - Class 10

Field Name: QPDESC
PREPARE
The number of full prepare requests.
Field Name: QPPREP
OPEN
The number of full open requests.
Field Name: QPOOPEN
FETCH
The number of fetch requests.
Field Name: QPFETCH
CLOSE
The number of close requests.
Field Name: QPCLOSE
LOCK TABLE
The number of lock tables.
Field Name: QPLOCK
CALL
The number of SQL calls.
Field Name: QPCALL
Package Times - Class 8 - Suspensions

This topic shows detailed information about “Accounting - Package Times - Class 8 - Suspensions”.

This block provides suspension information for class 8.

The following example shows both layouts, the report on the left, and the trace layout on the right.

### Accounting - Package Times - Class 8 - Suspensions

The field labels shown in the following sample layout of “Accounting - Package Times - Class 8 - Suspensions” are described in the following section.

<table>

</tbody>
</table>

**PACKAGE**

This label is replaced by the package name, or, if ORDER (ACTNAME) was in effect, the package activity name. An activity name is truncated if it is longer than 8 characters.

**Field Name:** PACKAGE

**AVERAGE TIME - LOCK/LATCH**

The sum of the number of wait trace events processed for waits for lock and the number of wait trace events processed for page latch contention while executing this package.

**Note:** The internally defined field adjusts the original DB2 value. DB2 counts each event twice, one for the entry and one for the exit.

**Field Name:** AWTPLOLA

**AVERAGE TIME - IRLM LOCK+LATCH**

The accumulated lock elapsed wait time that occurred while executing this package.

**Background and Tuning Information**

OMEGAMON XE for DB2 PE might adjust this value if the thread was suspended when performance data was gathered.

If the suspension time is high, investigate locking activity.

**Field Name:** QPACAWTL
Package Times - Class 8 - Suspensions

This is an exception field.

**AVERAGE TIME - DB2 LATCH**

The accumulated latch elapsed wait time for latch suspensions that occurred while executing this package.

*Field Name:* QPACAWLH

**AVERAGE TIME - SYNCHRONOUS I/O**

The accumulated elapsed wait time for I/O suspensions under this thread during the execution of the package or DBRM.

*Background and Tuning Information*

OMEGAMON XE for DB2 PE might adjust this value if the thread was suspended when its performance data was gathered.

*Field Name:* QPACAWTI

This is an exception field.

**AVERAGE TIME - OTHER READ I/O**

The accumulated waiting time for a read I/O performed under a thread other than this one during the execution of the package or DBRM.

*Background and Tuning Information*

OMEGAMON XE for DB2 PE might adjust this value if the thread was suspended when performance data was gathered.

This field includes waits caused by sequential prefetch, list prefetch, dynamic prefetch, and synchronous read I/O performed by other threads.

If the value in this field is high, the problem could be an I/O bound query using prefetch or an I/O contention. The application is accessing data from a busy data set, volume, or control unit and is continually being suspended. Consult the DBA and MVS systems programmer.

*Field Name:* QPACAWTR

This is an exception field.

**AVERAGE TIME - OTHER WRITE I/O**

The accumulated waiting time due to a write I/O performed for another thread during the execution of a package or DBRM.

*Background and Tuning Information*

If the value in this field is high, the problem could be I/O contention. The application is accessing data from a busy data set, volume, or control unit and is continually being suspended. Consult the DBA and MVS systems programmer to resolve possible data set placement problems.

*Field Name:* QPACAWTW

This is an exception field.

**AVERAGE TIME - SER. TASK SWITCH**

The accumulated waiting time due to a synchronous execution unit switch to DB2 services from this thread during the execution of the package or DBRM.

*Background and Tuning Information*
OMEGAMON XE for DB2 PE might adjust this value if the thread was suspended when its performance data was gathered.

This value includes the waits because of an OPEN/CLOSE data set, SYSLGRNG update, DATASPACE MANAGER services, DEFINE, EXTEND, and DELETE data set, AUTONOMOUS PROCEDURE, and DDF Requester waiting for Server reply and VSAM Catalog update.

**Field Name:** QPACAWTE

This is an **exception** field.

**AVERAGE TIME - ARCH.LOG(QUIESCE)**

The accumulated waiting time caused by processing ARCHIVE LOG(QUIESCE) commands during the execution of the package or DBRM. This number represents the amount of time that an individual thread was suspended because of the command, not the time it took for the entire command to complete.

**Background and Tuning Information**

OMEGAMON XE for DB2 PE might adjust this value if the thread was suspended when its performance data was gathered.

Avoid issuing the -ARCHIVE LOG QUIESCE command during peak periods.

**Field Name:** QPACALOG

**AVERAGE TIME - DRAIN LOCK**

The accumulated waiting time due to a drain lock.

**Field Name:** QPACAWDR

**AVERAGE TIME - CLAIM RELEASE**

The accumulated waiting time for a drain waiting for claims to be released during the execution of the package or DBRM.

**Background and Tuning Information**

OMEGAMON XE for DB2 PE might adjust this value if the thread was suspended when its performance data was gathered.

**Field Name:** QPACAWCL

**AVERAGE TIME - PAGE LATCH**

The accumulated waiting time caused by a page latch contention.

**Field Name:** QPACAWTP

**AVERAGE TIME - NOTIFY MESSAGES**

The accumulated elapsed waiting time due to suspensions caused by sending notify messages to other members in the data sharing group. Messages are sent, for example, when database descriptors are changed due to DDL.

This value is only calculated if accounting class 8 is active and DB2 is a member of a DB2 data sharing group.

**Field Name:** QPACAWTG

**AVERAGE TIME - GLOBAL CONTENTION**
The accumulated waiting time caused by the suspension of IRLM lock requests due to global lock contentions in a data sharing environment that require intersystem communication to resolve.

Field Name: APGCSUST

**AVERAGE TIME - TCP/IP LOB XML**

The accumulated wait time for TCP/IP LOB and XML materialization while running this package or DBRM.

Field Name: QPACALBW

**AVERAGE TIME - ACCELERATOR**

The accumulated wait time for requests to an accelerator while executing this package.

Field Name: QPACAACW

**AVERAGE TIME - PQ SYNCHRONIZATION**

The accumulated time waiting for parallel query processing to synchronize between parent and child tasks.

Field Name: APPQSST

**AVERAGE TIME - FAST INSERT PIPE**

The accumulated wait time for a pipe while this package was executed (DB2 field QPAC_PIPE_WAIT).

Field Name: APPISUST

**AVERAGE TIME - TOTAL CL8 SUSPENS.**

The waiting time for the package or DBRM due to class 8 suspensions.

Field Name: ADTSUSTP

This is an *exception* field.

**AVG.EV - LOCK/LATCH**

The sum of the number of wait trace events processed for waits for local contention for locks and the number of wait trace events processed for waits for latch contention while executing this package.

Note: The internally defined field adjusts the original DB2 value. DB2 counts each event twice, one for the entry and one for the exit.

Field Name: ADLLPSSC

This is an *exception* field.

**AVG.EV - IRLM LOCK+LATCH**

The number of wait trace events processed for waits for lock while executing this package.

Note: The internally defined field adjusts the original DB2 value. DB2 counts each event twice, one for the entry and one for the exit.

Field Name: ADLBPSSC

**AVG.EV - DB2 LATCH**

The number of wait trace events processed for page latch contention while executing this package.
Note: The internally defined field adjusts the original DB2 value. DB2 counts each event twice, one for the entry and one for the exit.

Field Name: ADLAPSSC

**AVG.EV - SYNCHRONOUS I/O**

The total number of synchronous I/O suspensions under this thread during the execution of the package or DBRM.

Field Name: ADIOPSSC

**AVG.EV - OTHER READ I/O**

The total number of suspensions due to a read I/O performed under a thread other than the one being reported.

Field Name: ADARPSSC

**AVG.EV - OTHER WRITE I/O**

The total number of suspensions due to a write I/O performed under a thread other than this one during the execution of a package or DBRM.

Field Name: ADAWPSSC

**AVG.EV - SERV.TASK SWITCH**

The total number of suspensions due to a synchronous execution unit switch to DB2 services during the execution of the package or DBRM.

Field Name: ADSTPSSC

**AVG.EV - ARCH.LOG(QUIESCE)**

The total number of suspensions caused by processing ARCHIVE LOG(QUIESCE) commands during the execution of the package or DBRM.

Field Name: ADALPSSC

**AVG.EV - ARCHIVE LOG READ**

The number of wait trace events processed for archive reads, active reads, and active log prefetch reads while running this package or DBRM.

Field Name: ADLRPSSC

**AVG.EV - DRAIN LOCK**

The total number of suspensions due to drain lock processing during the execution of the package or DBRM.

Field Name: ADDRPSSC

**AVG.EV - CLAIM RELEASE**

The total number of suspensions until the claims are released during the execution of the package or DBRM.

Field Name: ADCMPSSC

**AVG.EV - PAGE LATCH**

The total number of suspensions due to page latch contentions during the execution of the package or DBRM.

Field Name: ADPGPSSC

**AVG.EV - NOTIFY MESSAGES**
Package Times - Class 8 - Suspensions

The number of suspensions due to messages being sent to other members in the data sharing group. This value is calculated only if accounting class 8 is active and DB2 is a member of a data sharing group.

Field Name: ADNOPSSC

AVG.EV - GLOBAL CONTENTION

The total number of suspensions during global lock contention. This value is calculated only if accounting class 8 is active and DB2 is a member of a data sharing group.

Field Name: ADGCPSSC

AVG.EV - TCP/IP LOB XML

The number of wait trace events processed for waits for TCP/IP LOB and XML materialization while running this package or DBRM.

Field Name: ADLMPSSC

AVG.EV - ACCELERATOR

The total number of suspensions due to a request to an accelerator during the execution of the package.

Field Name: ADAAPSSC

AVG.EV - PQ SYNCHRONIZATION

The number of times the parallel query processing suspended because it was waiting for the synchronization of the parent/child.

Field Name: APPQSSC

AVG.EV - FAST INSERT PIPE

The number of wait trace events that were processed for waits for a pipe while this package was executed (DB2 field QPAC_PIPEWAIT_COUNT / 2).

Field Name: APPISUSC

AVG.EV - TOTAL CL8 SUSPENS.

The number of all types of class 8 suspensions.

Field Name: ADTSUSCP

This is an exception field.

TIME/EVENT - LOCK/LATCH

The sum of the number of wait trace events processed for waits for local contention for locks and the number of wait trace events processed for waits for latch contention while executing this package.

Note: The internally defined field adjusts the original DB2 value. DB2 counts each event twice, one for the entry and one for the exit.

Field Name: AALLPTMC

TIME/EVENT - IRLM LOCK+LATCH

The number of wait trace events processed for waits for lock while executing this package.
Note: The internally defined field adjusts the original DB2 value. DB2 counts each event twice, one for the entry and one for the exit.

Field Name: AALOPTMC

TIME/EVENT - DB2 LATCH

The number of wait trace events processed for page latch contention while executing this package.

Note: The internally defined field adjusts the original DB2 value. DB2 counts each event twice, one for the entry and one for the exit.

Field Name: AALAPTMC

TIME/EVENT - SYNCHRONOUS I/O

The synchronous I/O suspension time per event.

Field Name: AAIIOPTMC

TIME/EVENT - OTHER READ I/O

Any other read time per event.

Field Name: AAARPTMC

TIME/EVENT - OTHER WRITE I/O

Any other write time per event.

Field Name: AAWPTMC

TIME/EVENT - SERV.TASK SWITCH

The synchronous execution service time per event.

Field Name: AASTPTMC

TIME/EVENT - ARCH.LOG(QUIESCE)

The archive log time per event.

Field Name: AAALPTMC

TIME/EVENT - ARCHIVE LOG READ

The archive read suspension time per event.

Field Name: AALRPTMC

TIME/EVENT - DRAIN LOCK

The drain lock time per event.

Field Name: AADRPTMC

TIME/EVENT - CLAIM RELEASE

The claim release time per event.

Field Name: AACMPTMC

TIME/EVENT - PAGE LATCH

The page latch time per event.

Field Name: AAPGPTMC

TIME/EVENT - NOTIFY MESSAGES

The notify messages time per event.
Package Times - Class 8 - Suspensions

Field Name: AANOPTMC
TIME/EVENT - GLOBAL CONTENTION
The global contention time per event.
Field Name: AAGCPTMC
TIME/EVENT - TCP/IP LOB XML
The accumulated wait time for TCP/IP LOB and XML materialization while running this package or DBRM.
Field Name: QPACALBW
TIME/EVENT - ACCELERATOR
The accelerator waiting time per event during the execution of the package.
Field Name: AAAAPTMC
TIME/EVENT - PQ SYNCHRONIZATION
The average wait time for a package for parallel query processing to synchronize between parent and child tasks.
Field Name: APPQSTMC
TIME/EVENT - FAST INSERT PIPE
The average wait time for a pipe.
Field Name: APPITMCN
TIME/EVENT - TOTAL CL8 SUSPENDS.
The class 8 time per event.
Field Name: AATOTSTP
Package Times - Class 7

This topic shows detailed information about “Accounting - Package Times - Class 7”.

This block shows the class 7 application times at package level.

For formatting reasons, OMEGAMON XE for DB2 PE shows different labels for report and trace. The following example shows both layouts, the report on the left, and the trace layout on the right.

Accounting - Package Times - Class 7

The field labels shown in the following sample layout of “Accounting - Package Times - Class 7” are described in the following section.

</tbody>
</table>

ELAP-CL7 TIME-AVG

The total elapsed time for executing the package or DBRM.

Field Name: QPACSCT

CP CPU TIME

The class 7 CPU time spent by the package or DBRM. It indicates:
- The TCB time
- The accumulated CPU time for processing parallel tasks. This is valid for query CP parallelism, sysplex query parallelism, and parallel tasks generated by utilities.

In sysplex query parallelism, only CPU times of parallel tasks, running on the same member of the sysplex group as the originating task, are included.

This time does not include the CPU time consumed on an IBM specialty engine.

Field Name: ADCPUTP

This is an exception field.

AGENT
Package Times - Class 7

The class 7 CPU time for all executions of the package or DBRM. This time does not include the:

- Class 7 time for parallel tasks
- CPU time that is consumed on an IBM specialty engine

**Field Name:** QPACTJST

This is an *exception* field.

**AGENT - PAR.TASKS**

The accumulated time for the package or DBRM to process parallel tasks. These tasks can be query CP, sysplex query, utility parallel tasks, or rollup autonomous tasks.

In sysplex query parallelism, the accumulated time reflects only parallel tasks running on the same DB2 subsystem as the originating task.

In case of rolled-up data, it is the sum of all CPU times, of originating and parallel tasks.

This time does not include CPU time consumed on an IBM specialty engine.

**Field Name:** ADCPCL7T

**SE CPU TIME**

The total CPU time for all executions of this package or DBRM that was consumed on an IBM specialty engine (SE).

**Note:** All CPU times of an IBM specialty engine that are reported in DB2 trace records are already normalized by DB2 to the speed of the general purpose processor.

**Field Name:** APACC7Z

**SUSPENSION-CL8**

The waiting time for the package or DBRM due to class 8 suspensions.

**Field Name:** ADTSUSTP

This is an *exception* field.

**SUSPENSION-CL8 - AGENT**

The class 8 suspension time for executing the package or DBRM. In query or utility parallelism, this does not include the class 8 time for parallel tasks.

**Field Name:** ADTCBCL8

**SUSPENSION-CL8 - PAR.TASKS**

The sum of the suspension times of the parallel tasks for the package or DBRM. The tasks can be query CP or sysplex query parallel tasks, tasks generated by utilities, or roll-up autonomous tasks.

In case of rolled-up data, it is the sum of all suspension times, of originating and parallel tasks.

**Field Name:** ADCPCL8T

**NOT ACCOUNTED**
The total unaccounted time in DB2 due to the execution of the package or DBRM. In query CP and sysplex query parallelism, it is the unaccounted time of the originating task only.

In case of rolled-up data, it is the unaccounted time of all tasks, of originating and parallel tasks.

Field Name: `ADNACL7T`

This is an *exception* field.

**AVG.DB2 ENTRY/EXIT**

The number of DB2 entries or exits processed during the execution of the package or DBRM.

In Accounting reports this is shown twice; as a total and as an average.

Field Name: `QPACARNA`

**CP CPU SU**

The CPU service units for a package or DBRM. It indicates:

- The service units for the TCB time.
- The accumulated service units for processing parallel tasks if query CP or sysplex query parallelism is exploited.

These CPU service units do not include the service units that were consumed on an IBM specialty engine.

Field Name: `ADSUCPU7`

**CP CPU SU - AGENT**

The CPU service units for a package or DBRM. These CPU service units do not include the service units that were consumed on an IBM specialty engine.

Field Name: `ADSUTCB7`

**CP CPU SU - PAR.TASKS**

The CPU service units accumulated for a package or DBRM for processing parallel tasks. These tasks can be query CP or sysplex query parallelism tasks, or roll-up autonomous tasks.

These service units do not include service units consumed on an IBM specialty engine.

Field Name: `ADSUCPP7`

**SE CPU SU**

The total CPU service units for all executions of this package or DBRM that were consumed on an IBM specialty engine.

Field Name: `ADSUC7Z`
Query Parallelism

This topic shows detailed information about “Accounting - Query Parallelism”.

If a query exploits query CP (central processor) parallelism or sysplex query parallelism, several tasks (called parallel tasks) perform the work. For each of these tasks an accounting record is generated, which contains counters and timers pertinent to the work performed by the particular task. In addition, an accounting record is created that contains the details on nonparallel work within the thread as well as data related to parallel work.

For formatting reasons, OMEGAMON XE for DB2 PE shows different labels for report and trace. The following example shows both layouts, the report on the left, and the trace layout on the right.

**Accounting - Query Parallelism**

The field labels shown in the following sample layout of “Accounting - Query Parallelism” are described in the following section.

<table>

</tbody>
</table>

**MAXIMUM DEGREE-ESTIMATED**

The maximum parallel-group estimated degree (DB2 field: QXMAXESTIDG). It is the bind time estimated degree based on the cost formula. If the parallel group contains a host variable or parameter marker, bind time will estimate the parallel-group degree based on a valid assumption value.

Field Name: AXMESTDG

**MAXIMUM DEGREE-PLANNED**

The maximum parallel-group planned degree (DB2 field: QXMAXPLANIDG). It is the ideal parallel-group degree obtained at execution time after the host variable or parameter marker value is "plug-in" and before the buffer pool negotiation and the system negotiation are performed.

Field Name: AXMPLNDG

**MAXIMUM DEGREE-EXECUTED**

The maximum degree of parallelism executed among all parallel groups to indicate the extent to which queries were processed in parallel.

Field Name: QXMAXDEG
MAXIMUM MEMBERS USED

The maximum number of DB2 members that participated in the processing of a query.

Field Name: AMAXMEMB

PARALLEL GROUPS EXECUTED

The total number of parallel groups executed.

Field Name: QXTOTGRP

RAN AS PLANNED

The total number of parallel groups that executed in the planned parallel degree. This field is incremented by one for each parallel group that executed in the planned degree of parallelism (as determined by DB2).

Field Name: QXNORGRP

RAN REDUCED-_STORAGE

The total number of parallel groups that did not reach the planned parallel degree because of a lack of storage space or contention on the buffer pool. The exception field name is QXREDGRP.

Background and Tuning Information
If this field is not 0, increase the size of the current buffer pool using the ALTER BUFFERPOOL command or use the ALTER TABLESPACE command to assign table spaces accessed by this query to a different buffer pool.

Field Name: QXREDGRP

This is an exception field.

RAN REDUCED-NEGOTIATION

The number of parallel-group degrees that is reduced because of the system negotiation result of the system stress level (DB2 field: QXSTOREDGRP).

Field Name: AXREDPGD

SEQ-CURSOR

The total number of parallel groups that fell back to sequential mode due to a cursor that can be used by UPDATE or DELETE.

Field Name: QXDEGCUR

SEQ-NO ESA SORT

The total number of parallel groups that fell back to sequential mode due to a lack of ESA sort support.

Field Name: QXDEGESA

SEQ-NO BUFFER

The total number of parallel groups that fell back to sequential mode due to a storage shortage or contention on the buffer pool. The exception field name is QXDEGBUF.

Field Name: QXDEGBUF
Query Parallelism

SEQ-AUTONOMOUS PROC

The total number of parallel groups that fell back to sequential mode under an autonomous procedure.

Field Name: QXDEGAT

SEQ-NEGOTIATION

The number of parallel groups is degenerated to sequential because of the system negotiation result of system stress level (DB2 field: QXSTODNGGRP).

Field Name: AXDEGPGD

ONE DB2-COORDINATOR = NO

The total number of parallel groups executed on a single DB2 subsystem due to the COORDINATOR subsystem value being set to NO. When the statement was bound, the COORDINATOR subsystem value was set to YES. This situation can also occur when a package or plan is bound on a DB2 subsystem with COORDINATOR=YES, but is run on a DB2 subsystem with COORDINATOR=NO.

Field Name: QXCOORNO

ONE DB2-ISOLATION LEVEL

The total number of parallel groups executed on a single DB2 subsystem due to repeatable-read or read-stability isolation.

Field Name: QXISORR

ONE DB2-DCL TTABLE

The number of parallel groups in a query block that were downgraded to CPU parallelism because they referenced a UDF and a declared temporary table was detected at execution time.

DB2 enforces execution on a single DB2 (CPU parallelism), in this instance, because it cannot determine at incremental bind time for the statement whether the UDF will reference the declared temporary table. Other parallel groups in the same statement are not necessarily downgraded.

Field Name: QXDEGDTT

MEMBER SKIPPED (%)

The percentage of parallel groups that were not distributed over the data sharing group, as originally planned at bind time, because one or more DB2 members did not have enough buffer pool storage. This only applies to parallel groups that were intended to run in sysplex query parallelism.

This percentage is to indicate a lack of buffers at a member. It is only increased when the buffer pool is defined to allow for parallelism. For example, if VPXPISEQT=0 on an assistant, DB2 does not send parallel work there, and the percentage is not increased.

Field Name: AXXCRAT

DISABLED BY RLF (Report)

The number of threads where at least one dynamic SQL statement was disabled by the Resource Limit Facility (RLF).

Field Name: ADPARDNR
DISABLED BY RLF (Trace)

Indicates whether Query Parallelism is disabled by the Resource Limit Facility (RLF) for at least one dynamic SELECT statement in this thread.

Field Name: ADPARDIS

REFORM PARAL-CONFIG

The total number of parallel groups where DB2 reformulated the parallel portion of the access path because of a change in the number of active members, or because of a change of processor models on which they run, from bind time to run time. This counter is incremented only on the parallelism coordinator at run time.

Field Name: QXREPOP1

REFORM PARAL-NO BUF

The total number of parallel groups in which DB2 reformulated the parallel portion of the access path because there were insufficient buffer-pool resources. This counter is incremented only at the parallelism coordinator at run time.

Field Name: QXREPOP2
Resource Limit Facility

Resource Limit Facility

This topic shows detailed information about “Accounting - Resource Limit Facility”.

This block shows information about the Resource Limit Facility (RLF), which prevents dynamic manipulative SQL statements from exceeding specified time limits.

The following example shows both layouts, the report layout followed by the trace layout.

Accounting - Resource Limit Facility

The field labels shown in the following sample layout of “Accounting - Resource Limit Facility” are described in the following section.

Report:

<table>
<thead>
<tr>
<th>RESOURCE LIMIT TYPE</th>
<th>#OCCUR</th>
<th>AVERAGE CPU SECONDS</th>
<th>HIGHEST CPU SECONDS</th>
</tr>
</thead>
<tbody>
<tr>
<td>INFINITE LIMIT</td>
<td>1</td>
<td>5.000000</td>
<td>5.000000</td>
</tr>
</tbody>
</table>

Trace:

--- RESOURCE LIMIT FACILITY

<table>
<thead>
<tr>
<th>TYPE: N/P</th>
<th>TABLE ID: N/P</th>
<th>SERV.UNITS: N/P</th>
<th>CPU SECONDS: 0.000000</th>
<th>MAX CPU SEC: N/P</th>
</tr>
</thead>
</table>

RESOURCES LIMIT TYPE (TYPE)

The resource limit type. This is taken from QTXAPREC and can be:

- AUTHID/PLAN
- AUTHID ANY PLAN
- PLAN ANY AUTHID
- BLANK AUTHID & PLAN
- INSTALL NO ENTRY
- INSTALL I/O ERROR
- NO LIMIT - SYSADM/SYSOPR
- AUTHID/COLLECTION/PACKAGE
- AUTHID ANY PACKAGE
- AUTHID ANY COLLECTION
- AUTHID ANY PACKAGE/COLLECTION
- PACKAGE/COLLECTION ANY AUTHID
- ANY AUTHID/PACKAGE
- ANY AUTHID/COLLECTION
- ANY AUTHID/PACKAGE/COLLECTION

The following can be reported:

INFINITE LIMIT

Reported when QTXAPREC has any value except NO LIMIT - SYSADM/SYSOPR and QTXAILMT is on.

NO RUN OR ZERO LIMIT

Reported when QTXANRUN is on.

Field Name: ADRLFTYP

#OCCUR
The number of RLF occurrences.

Field Name: ASRLFOCC

AVERAGE CPU SECONDS

The number of CPU seconds used.

Field Name: ADRLFCPU

HIGHEST CPU SECONDS

The highest CPU seconds used in a successful DB2 internal call rather than in a single SQL call. Because there are usually many DB2 calls for each SQL call, this value could be quite small compared to the total CPU time used in the SQL call.

Only times for successful DB2 calls are used to determine the value of this field.

Field Name: ADRLFMAX

TABLE ID

The identifier of the resource limit specification table.

Field Name: QTXARLID

SERV.UNITS

The maximum number of CPU service units to be used. Normally, the value is not 0 if the RES LIMIT TYPE is LIMIT. A value of 0 indicates no limit.

Field Name: QTXASLMT
RID List

This topic shows detailed information about “Accounting - RID List”.

This block shows information about the Record identifier (RID) list.

The following example shows both layouts, the report on the left, and the trace layout on the right.

**Accounting - RID List**

The field labels shown in the following sample layout of “Accounting - RID List” are described in the following section.

<table>
<thead>
<tr>
<th>Report:</th>
<th>Trace:</th>
</tr>
</thead>
<tbody>
<tr>
<td>RID LIST</td>
<td>AVERAGE</td>
</tr>
<tr>
<td>------------------------</td>
<td>--------</td>
</tr>
<tr>
<td>USED</td>
<td>0.00</td>

<tr>
<td>FAIL-NO STORAGE</td>
<td>0.00</td>
</tr>
<tr>
<td>FAIL-LIMIT EXCEEDED</td>
<td>0.00</td>
</tr>
<tr>
<td>INTERRUPTED-NO STORAGE</td>
<td>0.00</td>
</tr>
<tr>
<td>INTERRUPTED-LIMIT EXC.</td>
<td>0.00</td>
</tr>
<tr>
<td>OVERFLOWED-NO STORAGE</td>
<td>0.00</td>
</tr>
<tr>
<td>OVERFLOWED-LIMIT EXC.</td>
<td>0.00</td>
</tr>
<tr>
<td>SKIPPED-INDEX KNOWN</td>
<td>0.00</td>
</tr>
</tbody>
</table>

**USED**

The number of times RID list (also called RID pool) processing is used.

During RID (RECORD ID) list processing, DB2 uses an index to produce a list of candidate RIDs, which is called a RID list. The RID list can be sorted and intersected (ANDed) or unioned (ORed) with other RID lists before actually accessing the data pages. RID list processing is used for a single index (index access with list prefetch) or for multiple indexes (multiple index access), which is when the RID lists are ANDed and ORed.

This field is incremented once for a given table access when RID list processing is used for index access with list prefetch, for multiple index access, or for both. For multiple index access, if a final RID list is obtained through ANDing and ORing of RID lists, the counter is incremented once, even if not all indexes were used by the RIDs in the multiple index access.

**Background and Tuning Information**

A nonzero value in this field indicates that DB2 has used list prefetch. If this is the case, check the access path selection.

**Field Name:** QXMIAP

This is an exception field.

**FAIL-NO STORAGE**

The number of times DB2 detected that no storage was available to hold a list of RIDs during a given RID list process involving one index (single index access with list prefetch) or multiple indexes (multiple index access).

This field can be incremented during retrieval, sorting, ANDing, and ORing of RID lists for index access with list prefetch (single index). For
single index access, this field can only be incremented once per access. For multiple index access, it can be incremented for every index involved in the ANDing and ORing of RID lists.

**Field Name:** QXNSMIAP

This is an exception field.

**FAIL-LIMIT EXCEEDED (FAIL-LIMIT EXC.)**

The number of times DB2 detected that a RID list exceeded one or more internal limits during a given RID list (or RID pool) process involving one index (single index access with list prefetch) or multiple indexes (multiple index access). The internal limits include the physical limitation of the number of RIDs a RID list can hold and threshold values for the retrieval, ORing, and ANDing of RIDs.

For index access with list prefetch (single index), this field can only be incremented during RID list retrieval. For multiple index access, this field can be incremented during RID list retrieval, ANDing, and ORing. This counter reflects the number of times internal limits or threshold values were exceeded for the RID lists obtained directly from an index as well as for RID lists derived during the ANDing and ORing process.

**Background and Tuning Information**

Before you increase the RID list storage size, investigate the cause of the failure using the statistics record or the performance trace. You can specify the desired size for the RID list on the DB2 installation panel DSNTIPC.

**Field Name:** QXMRIAP

This is an exception field.

**INTERRUPTED-NO STORAGE**

The number of times a RID list append for a hybrid join was interrupted because no RID pool storage was available to hold the list of RIDs.

**Field Name:** QXHJINCS

**INTERRUPTED-LIMIT EXC.**

The number of times a RID list append for a hybrid join was interrupted because the number of RIDs exceeded one or more internal limits.

**Field Name:** QXHJINCT

**OVERFLOWED-NO STORAGE**

The number of times a RID list was overflowed to a work file because no RID pool storage was available to hold the list of RIDs.

**Field Name:** QXWFRIDS

**OVERFLOWED-LIMIT EXC.**

The number of times a RID list was overflowed to a work file because the number of RIDs exceeded one or more internal limits.

**Field Name:** QXWFRIDT

**SKIPPED-INDEX KNOWN**

The number of times a RID list retrieval for multiple index access was skipped because it was not necessary due to DB2 being able to predetermine the outcome of index ANDing or ORing.
RID List

Field Name: QXR5MIAP
This topic shows detailed information about “Accounting - ROWID”.

This block shows information about the row identifier (ROWID).

The following example shows both layouts, the report on the left, and the trace layout on the right.

**Accounting - ROWID**

The field labels shown in the following sample layout of “Accounting - ROWID” are described in the following section.

<table>
<thead>
<tr>
<th>Report:</th>
<th>Trace:</th>
</tr>
</thead>
<tbody>
<tr>
<td>ROWID</td>
<td>ROWID</td>
</tr>
<tr>
<td>AVERAGE</td>
<td>TOTAL</td>
</tr>
<tr>
<td>---------</td>
<td>--------</td>
</tr>
<tr>
<td>DIRECT ACCESS</td>
<td>0.00</td>
</tr>
<tr>
<td>INDEX USED</td>
<td>0.00</td>
</tr>
<tr>
<td>TS SCAN USED</td>
<td>0.00</td>
</tr>
</tbody>
</table>

**DIRECT ACCESS (DIR ACCESS)**

The number of times that direct row access was successful.

**Field Name:** QXROIMAT

**INDEX USED**

The number of times that direct row access failed and an index was used to find a record.

**Background and Tuning Information**

This can happen, for example, when a REORG is performed between the read of the ROWID column and the use of the host variable in the WHERE clause of the SQL statement. This causes the RID value in the host variable to be incorrect.

**Field Name:** QXROIIDX

**TS SCAN USED (TS SCAN)**

The number of times that an attempt to use direct row access reverted to using a table-space scan because DB2 was unable to use a matching index scan.

**Background and Tuning Information**

Ideally, this value should be 0.

Table-space scans can happen, for example, when a REORG is performed between the read of the ROWID column and the use of the host variable in the WHERE clause of the SQL statement. This causes the RID value in the host variable to be incorrect. DB2 first tries a matching-index scan before using a table-space scan.

To avoid table space scans, you can force the access path of an unsuccessful direct row access to use a matching index scan on the primary-index key by adding PKCOL to the WHERE clause in the SQL statement. .... WHERE ROWIDCOL=:HVROWID AND PKCOL=:HVPK

....

**Field Name:** QXROITS
Service Units

This topic shows detailed information about “Accounting - Service Units”.

This block shows class 1 and class 2 CPU times as service units.

The following example shows both layouts, the report on the left, and the trace layout on the right.

Accounting - Service Units

The field labels shown in the following sample layout of “Accounting - Service Units” are described in the following section.

CLASS 1: CP CPU

The class 1 CPU service units (in an application). It indicates:

- The TCB service units.
- The accumulated TCB service units for processing stored procedures if stored procedures are present.
- The accumulated CPU service units for processing parallel tasks. This is valid for query CP parallelism, sysplex query parallelism, and parallel tasks generated by utilities.

These CPU service units do not include the service units that were consumed on an IBM specialty engine.

Field Name: ADSUCPU1

CLASS 1: CP CPU - AGENT

The class 1 TCB service units (in an application). This field is derived from the TCB time and the conversion factor of the originating task.

Field Name: ADSUAGT1

CLASS 1: CP CPU - AGENT - NONNESTED

The TCB service units accumulated in nonnested activity.

Field Name: ADSUNN1

CLASS 1: CP CPU - AGENT - STORED PRC

The TCB service units accumulated in an application for stored procedures. This field is derived from the TCB time and the conversion factor of the originating task.
Field Name: ADSUTCS1

**CLASS 1: CP CPU - AGENT - UDF**

The TCB service units accumulated in an application for UDF.

Field Name: ADSUTCU1

**CLASS 1: CP CPU - AGENT - TRIGGER**

The number of TCB service units accumulated in DB2 used while executing under control of a trigger.

Field Name: ADSUTCT2

**CLASS 1: CP CPU - PAR.TASKS**

The sum of the CPU service units of the parallel tasks running in an application. These tasks can be query CP or sysplex query parallel tasks, parallel tasks produced by utilities, or roll-up autonomous tasks.

Field Name: ADSUCPP1

**CLASS 1: CP CPU - ELIG SECP**

The accumulated CPU service units that ran on a standard CP for work eligible on an IBM specialty engine.

Field Name: ADSUZEL

**CLASS 1: SE CPU**

The sum of several accumulated CPU service units consumed while running on an IBM specialty engine in all environments. This field is derived from the TCB time and the conversion factor of the originating task. These service units are consumed when:

- Running stored procedure requests and triggers on the main application execution unit.
- Satisfying stored procedure requests processed in a DB2 stored procedure or WLM address space. SQL procedure times are included in this time if the SQL procedure was called on a nested task and was not invoked by the main application execution unit.
- Satisfying UDF requests processed in a DB2 stored procedure or WLM address space.
- Running triggers on a nested task.
- Running parallel tasks in an application which contains the accumulated CPU time used to satisfy UDF requests.

**Note:** All CPU service units of an IBM specialty engine (SE) that are reported in DB2 trace records are already normalized by DB2 to the speed of the general purpose processor.

Field Name: ADSUC1Z

**CLASS 1: SE CPU - NONNESTED**

The class 1 CPU service units for nonnested activity on the main application task consumed while running on an IBM specialty engine. These service units ignore the CPU time consumed when running stored procedure requests, or triggers on the main application execution unit on an IBM specialty engine.

Field Name: ADSUSEN1
CLASS 1: SE CPU - STORED PROC

The accumulated and consumed service units for stored procedures on an IBM specialty engine that consist of following parts:

- Service units processed in a DB2 stored procedure or WLM address space. SQL procedure service units are included if the SQL procedure was called on a nested task and was not invoked by the main application execution unit.
- Service units when running on the main application execution unit. As these stored procedures run entirely within DB2, this part of the service units counts for class 1 and class 2 time.

Field Name: ADSUSES1

CLASS 1: SE CPU - UDF

The accumulated CPU service units used to satisfy UDF requests processed in a DB2 stored procedure or WLM address space while running on an IBM specialty engine.

Field Name: ADSUSEU1

CLASS 1: SE CPU - TRIGGER

The accumulated CPU service units consumed on an IBM specialty engine while running triggers on a nested task or on the main application execution unit.

Field Name: ADSUSETR

CLASS 1: SE CPU - PAR.TASKS

The sum of the CPU service units of the parallel tasks running in an application on an IBM specialty engine. These service units contain the nonnested and consumed service units for stored procedures, UDFs, and triggers.

Field Name: ADSUSEP1

CLASS 2: CP CPU

The class 2 service units (in DB2). It indicates:

- The TCB service units.
- The accumulated TCB service units for processing stored procedures if stored procedures are present.
- The accumulated CPU service units for processing parallel tasks. This is valid for query CP parallelism, sysplex query parallelism, and parallel tasks produced by utilities.

These CPU service units do not include the service units that were consumed on an IBM specialty engine.

Field Name: ADSUCPU2

CLASS 2: CP CPU - AGENT

The class 2 TCB service units (in DB2). This field is derived from the TCB time and the conversion factor of the originating task.

Field Name: ADSUAGT2

CLASS 2: CP CPU - AGENT - NONNESTED

The number of class 2 service units accumulated in nonnested activity.
Field Name: ADSUNN2

CLASS 2: CP CPU - AGENT - STORED PRC

The TCB service units accumulated in DB2 for stored procedures. This field is derived from the TCB time and the conversion factor of the originating task.

Field Name: ADSUTCS2

CLASS 2: CP CPU - AGENT - UDF

The TCB service units accumulated in DB2 for UDF.

Field Name: ADSUTCU2

CLASS 2: CP CPU - AGENT - TRIGGER

The number of TCB service units accumulated in DB2 used while executing under control of a trigger.

Field Name: ADSUTCT2

CLASS 2: CP CPU - PAR.TASKS

The sum of the CPU service units of the parallel tasks running in DB2. These tasks can be query CP or sysplex query parallel tasks, parallel tasks produced by utilities, or roll-up autonomous tasks.

These service units do not include service units consumed on an IBM specialty engine.

Field Name: ADSUCPP2

CLASS 2: CP CPU - ELIG ACCEL

The accumulated service units spent processing SQL in DB2 that may be eligible for execution on an accelerator.

Field Name: ADSUAEC2

CLASS 2: SE CPU

The sum of the accumulated CPU service units consumed while running in DB2 on an IBM specialty engine due to CPU time spent:

- Nonnested on main application execution unit.
- On triggers on main application execution unit and nested tasks.
- Processing SQL statements issued by UDFs processed in a DB2 stored procedure or WLM address space.
- On stored procedures on main application execution unit and nested tasks processed in a DB2 stored procedure or WLM address space. SQL procedure times are included if the SQL procedure was called on a nested task and was not invoked by the main application execution unit.

Field Name: ADSUCZ2

CLASS 2: SE CPU - NONNESTED

The class 2 CPU service units for nonnested activity on the main application task consumed while running on an IBM specialty engine.

Field Name: ADSUSEN2

CLASS 2: SE CPU - STORED PROC

The accumulated and consumed service units for stored procedures on an IBM specialty engine that consist of following parts:
**Service Units**

- Service units consumed in DB2, in a DB2 stored procedure, or WLM address space. SQL procedure service units are included if the SQL procedure was called on a nested task and was not invoked by the main application execution unit.
- Service units when running on the main application execution unit. As these stored procedures run entirely within DB2, this part of service units counts for class 1 and class 2 time.

**Field Name:** ADSUSES2

**CLASS 2: SE CPU - UDF**

The accumulated and consumed service units for stored procedures on an IBM specialty engine that consist of following parts:

- Service units consumed in DB2, in a DB2 stored procedure, or WLM address space. SQL procedure service units are included if the SQL procedure was called on a nested task and was not invoked by the main application execution unit.
- Service units when running on the main application execution unit. As these stored procedures run entirely within DB2, this part of service units counts for class 1 and class 2 time.

This time is a subset of QWACSP_CLS1SE.

**Field Name:** ADSUSEU2

**CLASS 2: SE CPU - TRIGGER**

The accumulated CPU service units consumed on an IBM specialty engine while running triggers on a nested task or on the main application execution unit.

**Field Name:** ADSUSETR

**CLASS 2: SE CPU - PAR.TASKS**

The sum of the CPU service units of the parallel tasks running in DB2. These service units contain the nonnested and consumed service units for stored procedures, UDFs, and triggers.

**Field Name:** ADSUSEP2

**CLASS 2: SE CPU - ELIG ACCEL**

The accumulated service units consumed on an IBM specialty engine while processing SQL in DB2 that may be eligible for execution on an accelerator.

**Field Name:** ADSUAES2
Stored Procedures

This topic shows detailed information about “Accounting - Stored Procedures”.

This block shows information about stored procedure.

For formatting reasons, OMEGAMON XE for DB2 PE shows different labels for report and trace. The following example shows both layouts, the report on the left, and the trace layout on the right.

Accounting - Stored Procedures

The field labels shown in the following sample layout of “Accounting - Stored Procedures” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CALL STATEMENTS</td>
<td>The number of SQL CALL statements executed. Field Name: QXCALL</td>

SQL DCL

This topic shows detailed information about “Accounting - SQL DCL”.

This block shows information about SQL DCL (Data Control Language) declarations.

The following example applies to both, the report layout and the trace layout.

**Accounting - SQL DCL**

The field labels shown in the following sample layout of “Accounting - SQL DCL” are described in the following section.

```
SQL DCL          TOTAL
---------------   -------
LOCK TABLE       0
GRANT            0
REVOKE           0
SET CURR.SQLID   0
SET HOST VAR.    0
SET CUR.DEGREE   0
SET RULES        0
SET CURR.PATH    0
SET CURR.PREC    0
CONNECT TYPE 1   0
CONNECT TYPE 2   0
SET CONNECTION   0
RELEASE          0
CALL             0
ASSOC LOCATORS   0
ALLOC CURSOR     0
HOLD LOCATOR     0
FREE LOCATOR     0
DCL-ALL          0
```

**LOCK TABLE**

The number of LOCK TABLE statements executed.

*Field Name:* QXLOCK

**GRANT**

The number of GRANT statements executed.

*Field Name:* QXGRANT

**REVOKE**

The number of REVOKE statements executed.

*Field Name:* QXREVOK

**SET CURR.SQLID**

The number of SET CURRENT SQLID statements executed.

*Field Name:* QXSETSQL

**SET HOST VAR.**

The number of SET HOST VARIABLE statements executed. The special register that was retrieved is not tracked.

*Field Name:* QXSETHV

**SET CUR.DEGREE**
The number of SET CURRENT DEGREE statements executed.
Field Name: QXSETCDG

SET RULES
The number of SET CURRENT RULES statements executed.
Field Name: QXSETCRL

SET CURR.PATH
The number of SET CURRENT PATH statements executed.
Field Name: QXSETPTH

SET CURR.PREC
The number of SET CURRENT PRECISION statements executed.
Field Name: QXSETCPR

CONNECT TYPE 1
The number of CONNECT type 1 statements executed.
Field Name: QXCON1

CONNECT TYPE 2
The number of CONNECT type 2 statements executed.
Field Name: QXCON2

SET CONNECTION
The number of SET CONNECTION statements executed.
Field Name: QXSETCON

RELEASE
The number of RELEASE statements executed.
Field Name: QXREL

CALL
The number of SQL CALL statements executed.
Field Name: QXCALL

ASSOC LOCATORS
The number of SQL ASSOCIATE LOCATORS statements executed.
Field Name: QXALOCL

ALLOC CURSOR
The number of SQL ALLOCATE CURSOR statements executed.
Field Name: QXALOCC

HOLD LOCATOR
The number of HOLD LOCATOR statements executed.
Field Name: QXHLDLOC

FREE LOCATOR
The number of times a FREE LOCATOR statement was issued.
Field Name: QXFRELOC

DCL-ALL

The total number of DCL statements executed.

Field Name: ASCDCL
SQL DDL

This topic shows detailed information about “Accounting - SQL DDL”.

This block shows information about SQL DDL (Data Definition Language) statements.

The following example applies to both, the report layout and the trace layout.

**Accounting - SQL DDL**

CREATE VIEW
The number of CREATE VIEW statements executed.

Field Name: QXDEFVU

CREATE ALIAS
The number of CREATE ALIAS statements executed.

Field Name: QXCRALS

CREATE PROCEDURE
The number of CREATE PROCEDURE statements issued.

Field Name: QXCRPRO

CREATE FUNCTION
The number of CREATE FUNCTION statements executed.

Field Name: QXCRUDF

CREATE TRIGGER
The number of CREATE TRIGGER statements executed.

Field Name: QXCTRIG

CREATE DIST TYPE
The number of CREATE DISTINCT TYPE statements executed.

Field Name: QXCDIST

CREATE SEQUENCE
The number of CREATE SEQUENCE statements.
Field Name: QXCRESEQ

CREATE TRUST_CTX

The number of CREATE TRUSTED CONTEXT statements issued.

Field Name: QXCRCTX

CREATE ROLE

The number of CREATE ROLE statements executed.

Field Name: QXCRROL

CREATE MASK/PERM

The number of CREATE MASK and CREATE PERMISSION statements executed.

Field Name: QXCREMP

CREATE VARIABLE

The number of CREATE VARIABLE statements.

Field Name: QXCRTSV

TOTAL CREATE

The number of SQL CREATE statements executed.

Field Name: ASTOTCRTCRT

This is an exception field.

DROP TABLE

The number of DROP TABLE statements executed.

Field Name: QXDRPTA

This is an exception field.

DROP INDEX

The number of DROP INDEX statements executed.

Field Name: QXDRPI

This is an exception field.

DROP TABLESPACE

The number of DROP TABLESPACE statements executed.

Field Name: QXDRPTS

This is an exception field.

DROP DATABASE

The number of DROP DATABASE statements executed.

Field Name: QXDRPDB

This is an exception field.

DROP STOGROUP

The number of DROP STOGROUP statements executed.

Field Name: QXDRPST

This is an exception field.
SQL DDL

DROP SYNONYM
The number of DROP SYNONYM statements executed.
Field Name: QXDRPSY
This is an exception field.

DROP VIEW
The number of DROP VIEW statements executed.
Field Name: QXDRPVU
This is an exception field.

DROP ALIAS
The number of SQL DROP ALIAS statements executed.
Field Name: QXDRPAL
This is an exception field.

DROP PACKAGE
The number of SQL DROP PACKAGE statements executed.
Field Name: QXDRPPKG
This is an exception field.

DROP PROCEDURE
The number of DROP PROCEDURE statements executed.
Field Name: QXDRPPR

DROP FUNCTION
The number of DROP FUNCTION statements executed.
Field Name: QXDRPFN

DROP TRIGGER
The number of DROP TRIGGER statements executed.
Field Name: QXDRPTR

DROP DIST TYPE
The number of DROP DISTINCT TYPE statements executed.
Field Name: QXDDIST

DROP SEQUENCE
The number of DROP SEQUENCE statements.
Field Name: QXDROSEQ

DROP TRUST_CTX
The number of DROP TRUSTED CONTEXT statements issued.
Field Name: QXDRPCTX

DROP ROLE
The number of DROP ROLE statements issued.
Field Name: QXDRPROL
DROP MASK/PERM
The number of DROP MASK and DROP PERMISSION statements executed.
Field Name: QXDRPMP

DROP VARIABLE
The number of DROP VARIABLE statements.
Field Name: QXDRPSV

TOTAL DROP
The number of SQL DROP statements executed.
Field Name: ASTOTDRP
This is an exception field.

ALTER TABLE
The number of ALTER TABLE statements executed.
Field Name: QXALTTA
This is an exception field.

ALTER INDEX
The number of ALTER INDEX statements executed.
Field Name: QXALTIX
This is an exception field.

ALTER TABLESPACE
The number of ALTER TABLESPACE statements executed.
Field Name: QXALTTS
This is an exception field.

ALTER DATABASE
The number of ALTER DATABASE statements executed.
Field Name: QXALDAB
This is an exception field.

ALTER STOGROUP
The number of ALTER STOGROUP statements executed.
Field Name: QXALTST
This is an exception field.

ALTER VIEW
The number of ALTER VIEW statements issued.
Field Name: QXALTVW

ALTER PROCEDURE
The number of ALTER PROCEDURE statements executed.
Field Name: QXALPRO

ALTER FUNCTION
SQL DDL

The number of ALTER FUNCTION statements executed.
Field Name: QXALUDF

ALTER SEQUENCE
The number of ALTER SEQUENCE statements.
Field Name: QXALTSEQ

ALTER TRUST. CTX
The number of ALTER TRUSTED CONTEXT statements issued.
Field Name: QXALTCTX

ALTER ROLE
The number of ALTER JAR statements issued.
Field Name: QXALTJR

ALTER MASK/PERM
The number of ALTER MASK and ALTER PERMISSION statements executed.
Field Name: QXALTMP

TOTAL ALTER
The number of SQL ALTER statements executed.
Field Name: ASTOTALT
This is an exception field.

TRUNC TBL
The number of TRUNCATE TABLE statements issued.
Field Name: QXTRTBL

RENAME TBL
The number of RENAME TABLE statements executed.
Field Name: QXRNTAB

RENAME IX
The number of RENAME INDEX statements issued.
Field Name: QXRNIX

COMMENT ON
The number of COMMENT ON statements executed.
Field Name: QXCMTON

LABEL ON
The number of LABEL ON statements executed.
Field Name: QXLABON
SQL DML

This topic shows detailed information about “Accounting - SQL DML”.

This block shows information about SQL DML (Data Manipulation Language) statements.

The following example shows both layouts, the report on the left, and the trace layout on the right.

**Accounting - SQL DML**

The field labels shown in the following sample layout of “Accounting - SQL DML” are described in the following section.

<table>
<thead>
<tr>
<th>Report:</th>
<th>Trace:</th>

</tbody>
</table>

**SELECT**

The number of SQL SELECT statements executed.

**Field Name:** QXSELECT

**INSERT**

The number of INSERT statements executed.

**Field Name:** QXINSRT

**INSERT - ROWS**

The number of rows inserted (DB2 field: QXRWSINSRTD).

**Field Name:** ARWINSRT

**UPDATE**

The number of UPDATE statements executed.

**Field Name:** QXUPDTE

**UPDATE - ROWS**

The number of rows updated (DB2 field: QXRWSUPDTD).

**Field Name:** ARWUPDAT

**MERGE**
The number of times a MERGE statement was executed.

**Field Name:** QXMERGE

**DELETE**

The number of DELETE statements executed.

**Field Name:** QXDELETE

**DELETE - ROWS**

The number of rows deleted (DB2 field: QXAWSDELETD).

**Field Name:** ARWDELETE

**DESCRIBE**

The number of DESCRIBE, DESCRIBE CURSOR, DESCRIBE INPUT, and DESCRIBE PROCEDURE statements executed. This number at the server location might not match the number at the user application because of the internal processing of the Distributed Data Facility (DDF).

**Field Name:** QXDESC

**DESC.TBL**

The number of DESCRIBE TABLE statements executed.

**Field Name:** QXDSCRTB

**PREPARE**

The number of SQL PREPARE statements executed. This number at the server location might not match the number at the user application because of the internal processing of the Distributed Data Facility (DDF).

**Field Name:** QXPREP

**OPEN**

The number of OPEN statements executed.

**Field Name:** QXOPEN

**FETCH**

The number of FETCH statements executed. This number at the server location might not match the number at the user application because of the internal processing of the Distributed Data Facility (DDF).

**Field Name:** QXFETCH

**FETCH - ROWS**

The number of rows fetched (DB2 field: QXAWSFETCHD).

**Field Name:** ARWFETCH

**CLOSE**

The number of CLOSE statements executed. This number at the server location might not match the number at the user application because of the internal processing of the Distributed Data Facility (DDF).

**Field Name:** QXCLOSE

**DML-ALL**

The total number of SQL DML statements executed.
Field Name: ASCDML
Termination - Abnormal

This topic shows detailed information about “Accounting - Termination - Abnormal”.

This block shows a report for abnormal termination.

**Accounting - Termination - Abnormal**

The field labels shown in the following sample layout of “Accounting - Termination - Abnormal” are described in the following section.

<table>
<thead>
<tr>
<th>ABNORMAL TERM</th>
<th>TOTAL</th>
</tr>
</thead>
<tbody>
<tr>
<td>APPL.PROGR. ABEND</td>
<td>0</td>
</tr>
<tr>
<td>END OF MEMORY</td>
<td>0</td>
</tr>
<tr>
<td>RESOL.IN DOUBT</td>
<td>0</td>
</tr>
<tr>
<td>CANCEL FORCE</td>
<td>0</td>
</tr>
</tbody>
</table>

**APPL.PROGR. ABEND**

The number of abnormal terminations due to an application program abend.

*Field Name*: ASATAPAB

**END OF MEMORY**

The number of abnormal terminations due to an end of memory. For example, accounting was invoked for an agent that was executing in an address space that experienced an abnormal end of memory.

*Field Name*: ASATENDM

**RESOL.IN DOUBT**

The number of abnormal terminations due to a resolve indoubt. For example, the recovery manager issued recover indoubt for a dependent thread that had not yet gone through end-of-task processing.

*Field Name*: ASATRIND

**CANCEL FORCE**

The number of abnormal terminations due to a stop force. For example, accounting was invoked for an agent that was executing when a -STOP DB2 MODE(FORCE) command was issued.

*Field Name*: ASATCANF
Termination - In Doubt

This topic shows detailed information about “Accounting - Termination - In Doubt”.

This block shows a report for in-doubt termination.

Accounting - Termination - In Doubt

The field labels shown in the following sample layout of “Accounting - Termination - In Doubt” are described in the following section.

<table>
<thead>
<tr>
<th>IN DOUBT</th>
<th>TOTAL</th>
</tr>
</thead>
<tbody>
<tr>
<td>APPL.PGM ABEND</td>
<td>0</td>
</tr>
<tr>
<td>END OF MEMORY</td>
<td>0</td>
</tr>
<tr>
<td>END OF TASK</td>
<td>0</td>
</tr>
<tr>
<td>CANCEL FORCE</td>
<td>0</td>
</tr>
</tbody>
</table>

APPL.PGM ABEND

The number of work units indoubt due to an application program abend. The agent was indoubt when it abended.

Field Name: ASIDAPAB

END OF MEMORY

The number of work units indoubt due to an end of memory. For example, accounting was invoked for an agent that was indoubt when the address space in which it was executing experienced an abnormal end of memory.

Field Name: ASIDENDM

END OF TASK

The number of work units indoubt due to an end of task.

Field Name: ASIDENDT

CANCEL FORCE

The number of work units indoubt due to a stop force. For example, accounting was invoked for an agent that was indoubt when a -STOP DB2 MODE(FORCE) command was issued.

Field Name: ASIDCANF
Termination - Normal

Termination - Normal

This topic shows detailed information about “Accounting - Termination - Normal”.

This block shows a report for normal termination.

Accounting - Termination - Normal

The field labels shown in the following sample layout of “Accounting - Termination - Normal” are described in the following section.

<table>
<thead>
<tr>
<th>NORMAL TERM.</th>
<th>AVERAGE</th>
<th>TOTAL</th>
</tr>
</thead>
<tbody>
<tr>
<td>NEW USER</td>
<td>0.00</td>
<td>0</td>
</tr>
<tr>
<td>DEALLOCATION</td>
<td>1.00</td>
<td>1</td>
</tr>
<tr>
<td>APPL.PROGR. END</td>
<td>0.00</td>
<td>0</td>
</tr>
<tr>
<td>RESIGNON</td>
<td>0.00</td>
<td>0</td>
</tr>
<tr>
<td>DBAT INACTIVE</td>
<td>0.00</td>
<td>0</td>
</tr>
<tr>
<td>TYPE2 INACTIVE</td>
<td>0.00</td>
<td>0</td>
</tr>
<tr>
<td>RRS COMMIT</td>
<td>0.00</td>
<td>0</td>

<tr>
<td>END USER THRESH</td>
<td>0.00</td>
<td>0</td>
</tr>
<tr>
<td>BLOCK STOR THR</td>
<td>0.00</td>
<td>0</td>
</tr>
<tr>
<td>STALENESS THR</td>
<td>0.00</td>
<td>0</td>
</tr>
</tbody>
</table>

NEW USER

The number of normal terminations due to a new user: either the authorization ID changed or there was a signon with the same authorization ID (normal).

Field Name: ASNTNEWU

DEALLOCATION

The number of normal terminations due to deallocation, which is a normal program termination.

Field Name: ASNTDEAL

APPL.PROGR. END

The number of normal terminations due to an application program end: the application program terminated without using DB2 protocols to end its connection to DB2. The agent did not abend so it is considered a normal termination.

Field Name: ASNTAPEN

RESIGNON

The number of normal terminations due to a resignon.

Field Name: ASNTRRESI

DBAT INACTIVE

The number of normal terminations due to a DBAT becoming inactive.

Field Name: ASNTDBAT

TYPE2 INACTIVE

The number of times a DDF type 2 thread became inactive.

Field Name: ASNTDBA2

RRS COMMIT
Termination - Normal

The number of times a DB2 application using the RRS attach facility with accounting interval specified as COMMIT successfully committed a logical unit of work.

Field Name: ASRRSCOM

END USER THRESH

The number of times the threshold was reached for number of end user occurrences when data was accumulated by end user for DDF or RRSAF.

Field Name: ASNTTHEU

BLOCK STOR THR

The number of times the DB2 storage threshold for Accounting blocks was reached for data accumulated by end user for DDF or RRSAF.

Field Name: ASNTTHST

STALENESS THR

The number of times the threshold for the staleness was exceeded when data was accumulated by end user for DDF or RRSAF.

Field Name: ASNTTHSL
Times - Class 1 - Application Time

Times - Class 1 - Application Time

This topic shows detailed information about “Accounting - Times - Class 1 - Application Time”.

This block shows information for the Application Time class 1.

The following example shows both layouts, the report on the left, and the trace layout on the right.

Accounting - Times - Class 1 - Application Time

The field labels shown in the following sample layout of “Accounting - Times - Class 1 - Application Time” are described in the following section.

</tbody>
</table>

**ELAPSED TIME**

The class 1 elapsed time of the allied agent.

*Special Considerations:*

- If the begin time equals zero, or if the end time minus begin time equals zero or is negative, N/C is shown.
- Threads that can be reused, such as CICS protected threads or IMS/VS wait-for-input message regions, can include time during which the thread was inactive and waiting for work.
- Elapsed time to process distributed requests is included for allied-distributed threads.
- This time includes the time for processing SQL statements issued by stored procedures, user-defined functions, or triggers.
• In query CP, sysplex query, or utility parallelism, this is the time shown in the originating record, which overlaps the elapsed times shown in the parallel records.

Field Name: ADRECETT
This is an exception field.

ELAPSED TIME - NONNESTED
The class 1 elapsed time of the allied agent.

Special Considerations:
1. If the begin time equals zero, or if the end time minus begin time equals zero or is negative, N/C is shown.
2. Threads that can be reused, such as CICS protected threads or IMS/VS wait-for-input message regions, can include time during which the thread was inactive and waiting for work.
3. Elapsed time to process distributed requests is included for allied-distributed threads.
4. This time includes the time for processing SQL statements issued by stored procedures, user-defined functions, or triggers.
5. In query CP, sysplex query, or utility parallelism, this is the time shown in the originating record, which overlaps the elapsed times shown in the parallel records.

Field Name: ADELETTSP1

ELAPSED TIME - STORED PROC
An accumulated and consumed time for stored procedures. It consists of the following parts:
• The total elapsed time spent by the allied agent in stored procedures. A stored procedure may initiate a trigger or invoke a user-defined function. The time spent for initiation or invocation is not included in this counter.
• Accumulated elapsed time consumed when running stored procedure requests on the main application execution unit. As these stored procedures run entirely within DB2, this time represents class 1 and class 2 time.

Field Name: AAWAELUD1

ELAPSED TIME - TRIGGER
The total elapsed time spent by the allied agent in triggers.
A trigger may invoke a stored procedure or a user-defined function. The time spent there is not included in this counter.

For triggers there is no distinction between class 1 and class 2 CPU time: all processing controlled by a trigger is within DB2.

**Note:** This field is not normally shown in the short layouts but can be included with UTR.

**Field Name:** ADTRET

**CP CPU TIME**

The class 1 CPU time in an application. It indicates:

- The class 1 CPU time of the allied agent, which may include the accumulated class 1 TCB time for processing stored procedures, user-defined functions, and triggers.
- The accumulated CPU time for processing parallel tasks. This is valid for query CP parallelism, sysplex query parallelism, and parallel tasks generated by utilities.
- In sysplex query parallelism, the individual CPU times are normalized by the conversion factor of the parallel tasks that is related to the originating task.

In sysplex query parallelism, only CPU times of parallel tasks, running on the same member of the SYSPLEX group as the originating task, are included.

This CPU time does not include time that is consumed on an IBM specialty engine.

**Field Name:** ADCPUT

This is an *exception* field.

**CP CPU TIME - AGENT**

It comprises the class 1 CPU time of the allied agent, which may include the accumulated class 1 CPU time for processing stored procedures, user-defined functions, and triggers if present.

CPU time for processing parallel tasks is not charged to this counter.

This CPU time does not include the CPU time that is consumed on an IBM specialty engine.

**Field Name:** ADAGENT1

This is an *exception* field.

**CP CPU TIME - AGENT - NONNESTED**

The class 1 CPU time of the nonnested activity of the allied agent.

**Field Name:** ADNNEST1

**CP CPU TIME - AGENT - STORED PRC**

An accumulated and consumed time for stored procedures that consists of following parts:

- The CPU time accumulated in DB2 for processing SQL CALL statements in the stored procedures or WLM address space. This time is only calculated if accounting class 1 is active.
The accumulated CPU time consumed when running stored procedure requests on the main application execution unit. This time does not include CPU time consumed on an IBM specialty engine. As these stored procedures run entirely within DB2, this time represents class 1 and class 2 time.

Field Name: ADCPUSP1

**CP CPU TIME - AGENT - UDF**

The accumulated CPU time consumed executing user-defined functions. This time does not include CPU consumed on an IBM specialty engine. It consists of following parts:

- The accumulated CPU time used to satisfy UDF requests processed in a DB2 stored procedure or WLM address space. This time is only calculated if accounting class 1 is active.
- The accumulated CPU time consumed executing user-defined functions on the main application execution unit. This time represents class 1 and class 2 time, because these UDFs run entirely within DB2.

Field Name: AWACPUD1

**CP CPU TIME - AGENT - TRIGGER**

The accumulated CPU time consumed while executing under the control of triggers.

For triggers there is no distinction between class 1 and class 2 CPU time. All processing controlled by a trigger is within DB2.

Field Name: ADTRCP

**CP CPU TIME - PAR.TASKS**

The sum of the CPU times of the parallel tasks running in an application. It can also include the accumulated class 1 CPU time for processing stored procedures, user-defined functions, and triggers if present.

These parallel tasks can be query CP, sysplex query parallel tasks, or parallel tasks produced by utilities. In sysplex query parallelism, the accumulated time reflects only parallel tasks running on the same DB2 subsystem as the originating task.

This time does not include CPU time consumed on an IBM specialty engine.

CPU time for agent tasks is not charged to this counter.

Field Name: ADCPUPLL

**SE CPU TIME**

The sum of several accumulated CPU times consumed while running on an IBM specialty engine in all environments. These times are consumed when:

- Running stored procedure requests and triggers on the main application execution unit.
- Satisfying stored procedure requests processed in a DB2 stored procedure or WLM address space. SQL procedure times are included in this time if the SQL procedure was called on a nested task and was not invoked by the main application execution unit.
- Satisfying UDF requests processed in a DB2 stored procedure or WLM address space.
Times - Class 1 - Application Time

- Running triggers on a nested task.
- Running parallel tasks in an application which contains the accumulated CPU time used to satisfy UDF requests.

Note: All CPU times of an IBM specialty engine (SE) that are reported in DB2 trace records are already normalized by DB2 to the speed of the general purpose processor.

Field Name: AWACC1Z

SE CPU TIME - NONNESTED

The class 1 CPU time for nonnested activity on the main application task consumed while running on an IBM specialty engine. This time ignores the CPU time that is consumed when running stored procedure requests, UDF requests, or any triggers on the main application execution unit on an IBM specialty engine.

Field Name: ADSENNC1

SE CPU TIME - STORED PROC

An accumulated and consumed time for stored procedures on an IBM specialty engine that consists of following parts:

- The time processed in a DB2 stored procedure or WLM address space. SQL procedure times are included in this time if the SQL procedure was called on a nested task and was not invoked by the main application execution unit.
- The time when running on the main application execution unit. This part of time counts for class 1 and class 2 time, because these stored procedures run entirely within DB2.

Field Name: ADSESP1

SE CPU TIME - UDF

An accumulated and consumed time for user-defined functions on an IBM specialty engine that consists of following parts:

- The accumulated CPU time used to satisfy UDF requests processed in a DB2 stored procedure or WLM address space.
- The accumulated CPU time consumed when running user-defined functions on the main application execution unit. This time represents class 1 and class 2 time, because these UDFs run entirely within DB2.

Field Name: AWACSEU1

SE CPU TIME - TRIGGER

The accumulated CPU time consumed on an IBM specialty engine while running triggers on a nested task or on the main application execution unit.

Field Name: AWACTRZ

SE CPU TIME - PAR.TASKS

The sum of the CPU times of the parallel tasks, or roll-up autonomous tasks that are running in an application on an IBM specialty engine.

It contains the accumulated CPU time that is used to satisfy UDF requests, which are processed in a DB2 stored procedure or WLM address space while running on an IBM specialty engine.
Field Name: ADSEPLL1

SUSPEND TIME

The amount of application suspension time spent outside DB2.

Field Name: ASUSTCL1

SUSPEND TIME - STORED PROC

The total elapsed waiting time for an available TCB before the stored procedure could be scheduled.

Field Name: QWACCAST

SUSPEND TIME - UDF

The total elapsed time spent waiting for an available TCB before the user-defined function could be scheduled.

Field Name: QWACUDST
Times - Class 1 - Elapsed Time Distribution

This topic shows detailed information about “Accounting - Times - Class 1 - Elapsed Time Distribution”.

The elapsed time distribution block shows the distribution of the task. For threads exploiting parallelism, only the nonparallel part is taken into account.

The following example applies to both, the report layout and the trace layout.

Accounting - Times - Class 1 - Elapsed Time Distribution

The field labels shown in the following sample layout of “Accounting - Times - Class 1 - Elapsed Time Distribution” are described in the following section.

ELAPSED TIME DISTRIBUTION

</table>

## ELAPSED TIME

The class 2 elapsed time of the allied agent accumulated in DB2.

**Field Name:** ADDB2ETT

This is an exception field.

## ELAPSED TIME - NONNESTED

The class 2 elapsed time for nonnested activity accumulated in DB2 for the allied agent. This time does not include the time spent in DB2 processing SQL statements issued by stored procedures, user-defined functions, or triggers.

**Special Considerations**

- The time for most thread allocation and certain abend conditions is not reflected in this time.
- The elapsed time for distributed processing is included in the elapsed time of allied-distributed threads.

Chapter 5. Accounting Default Layouts 5-367
• In query CP, sysplex query, or utility parallelism, this is the time shown in the originating record, which overlaps the elapsed times shown in the parallel records.

Note: This field is not normally shown in the short layouts but can be included with UTR.

Field Name: QWACASC

ELAPSED TIME - STORED PROC
An accumulated and consumed time for stored procedures that consists of following parts:
• The total elapsed time that the allied agent spent when running SQL in the stored procedures or WLM address space. A stored procedure may initiate a trigger or invoke a user-defined function. This time is not included in this counter.
• Accumulated elapsed time consumed when running stored procedure requests on the main application execution unit. As these stored procedures run entirely within DB2, this time represents class 1 and class 2 time.

Field Name: ADELTSP2

ELAPSED TIME - UDF
The total elapsed time that is spent executing SQL using user-defined function (UDF) requests that are processed in a DB2 stored procedure or WLM address space. This time includes time required to connect and disconnect the UDF task. Non-inline UDF times are included in this time if the native UDF was called on a nested task and was not invoked by the main application execution unit.

This time includes the elapsed time that is consumed when executing user-defined functions on the main application execution unit.

A user-defined function may initiate a trigger or invoke a stored procedure. Any time spent there is not included in this counter.

Field Name: AWAELUD2

ELAPSED TIME - TRIGGER
The total elapsed time spent by the allied agent in triggers.

A trigger may invoke a stored procedure or a user-defined function. The time spent there is not included in this counter.

For triggers there is no distinction between class 1 and class 2 CPU time: all processing controlled by a trigger is within DB2.

Note: This field is not normally shown in the short layouts but can be included with UTR.

Field Name: ADTRET

CP CPU TIME
The class 2 CPU time (in DB2). It indicates:
• The class 2 CPU time for the allied agent. This includes the accumulated class 2 TCB time for processing any stored procedures, user-defined functions, and triggers.
• The accumulated CPU time for processing parallel tasks. This is valid for query CP parallelism, sysplex query parallelism, and parallel tasks generated by utilities.

• For batch reporting, in sysplex query parallelism, the individual CPU times are normalized by the conversion factor of the parallel tasks, related to the originating task.

For online monitoring, in sysplex query parallelism, only CPU times of parallel tasks, running on the same member of the sysplex group as the originating task, are included.

This CPU time does not include time that is consumed on an IBM specialty engine.

**Field Name:** ADDBCPUT

This is an *exception* field.

**CP CPU TIME - AGENT**

It comprises the class 2 CPU time of the allied agent. This time includes the accumulated class 2 CPU time for processing stored procedures, user-defined functions, and triggers, if present. CPU time for processing parallel tasks is not charged to this counter.

This CPU time does not include the CPU time that is consumed on an IBM specialty engine.

**Field Name:** ADAGENT2

**CP CPU TIME - AGENT - NONNESTED**

The class 2 CPU time of the nonnested activity of the allied agent.

This value indicates the CPU time the allied agent spent in DB2 for nonnested activity. This time does not include the time for processing SQL statements issued by stored procedures, user-defined functions, or triggers.

**Special Considerations:**

1. For allied-distributed threads, this does not include the time used to process distributed SQL. For DBAT-distributed threads, this includes only processing at this location.

2. Most thread allocation and certain abend conditions are not included.

3. This time does not include the time for processing parallel tasks generated by utilities or in query CP or sysplex query parallelism.

**Field Name:** ADNNEST2

**CP CPU TIME - AGENT - STORED PRC**

An accumulated and consumed time for stored procedures that consists of the following information:

• The CPU time accumulated in DB2 for processing SQL statements issued by stored procedures processed in a DB2 stored procedure or WLM address space. This time is only calculated if accounting class 2 is active.

• In DB2 time needed to connect and disconnect the SP task for non-SQL stored procedures.

• SQL procedure times are included in this time if the SQL procedure was called on a nested task and was not invoked by the main application execution unit.

• CPU time that is consumed when running stored procedure requests on the main application execution unit.
Times - Class 2 - DB2 Time

This time does not include the CPU time consumed on an IBM specialty engine.

Field Name: ADCPUSP2

CP CPU TIME - AGENT - UDF

The accumulated CPU time consumed executing user-defined functions. This time does not include CPU time consumed on an IBM specialty engine. It consists of following parts:

- The accumulated CPU time consumed in DB2 when processing SQL statements that were issued by UDFs in a DB2 stored procedure or WLM address space. This time also includes the DB2 time required to connect or disconnect the UDF task. It is only calculated if accounting class 2 is active.
- The accumulated CPU time consumed executing user-defined functions on the main application execution unit. This time represents class 1 and class 2 time, because these UDFs run entirely within DB2.

Field Name: AWACPUD2

CP CPU TIME - AGENT - TRIGGER

The accumulated CPU time consumed while executing under the control of triggers.

For triggers there is no distinction between class 1 and class 2 CPU time. All processing controlled by a trigger is within DB2.

Field Name: ADTRCP

CP CPU TIME - PAR.TASKS

The sum of the CPU times of the parallel tasks running in DB2. These tasks can be query CP, sysplex query parallel tasks, parallel tasks produced by utilities, or rollup autonomous tasks.

In sysplex query parallelism, the accumulated time reflects only parallel tasks running on the same DB2 subsystem as the originating task.

This time does not include the CPU time consumed on an IBM specialty engine.

Field Name: ADDBCPC2

SE CPU TIME

The accumulated and consumed class 2 time on an IBM specialty engine (SE) that consists of times for non-nested, stored procedures, user-defined functions, triggers, and parallel tasks.

Note: All CPU times of an IBM specialty engine that are reported in DB2 trace records are already normalized by DB2 to the speed of the general purpose processor.

Field Name: AWACC2Z

SE CPU TIME - NONNESTED

The class 2 CPU time for nonnested activity on the main application task consumed while running on an IBM specialty engine.

Field Name: ADSENNC2

SE CPU TIME - STORED PROC
Times - Class 2 - DB2 Time

An accumulated and consumed time for stored procedures on an IBM specialty engine that consists of following parts:

- The time consumed in DB2 in a DB2 stored procedure or WLM address space. SQL procedure times are included in this time if the SQL procedure was called on a nested task and was not invoked by the main application execution unit.
- The time when running on the main application execution unit. This part of time counts for class 1 and class 2 time, because these stored procedures run entirely within DB2.

This time is a subset of QWACSP_CLS1SE.

Field Name: ADSESP2

SE CPU TIME - UDF

The accumulated and consumed time for user-defined functions on an IBM specialty engine that consists of following parts:

- The accumulated CPU time consumed in DB2 processing SQL statements issued by UDFs processed in a DB2 stored procedure or WLM address space. This time is a subset of QWACUDF_CLS1SE.
- The accumulated CPU time that is consumed when running user-defined functions on the main application execution unit. This time represents class 1 and class 2 time, because these UDFs run entirely within DB2.

Field Name: AWACSEU2

SE CPU TIME - TRIGGER

The accumulated CPU time consumed on an IBM specialty engine while running triggers on a nested task or on the main application execution unit.

Field Name: AWACTRZ

SE CPU TIME - PAR.TASKS

The sum of the CPU times of the parallel tasks, or roll-up autonomous task that are running in DB2 on an IBM specialty engine.

It contains the accumulated CPU time that is consumed in DB2 when processing SQL statements that are issued by UDFs processed in a DB2 stored procedure or WLM address space while running on an IBM specialty engine.

Field Name: ADSEPLL2

SUSPEND TIME

The waiting time for all types of class 3 suspensions by the originating task and parallel tasks, if parallelism is employed.

Field Name: ADTSUST

This is an exception field.

SUSPEND TIME - AGENT

The waiting time of the allied agent for all types of class 3 suspension

This counts class 3 suspension time within nested activity.

Suspension time of parallel tasks in query or utility parallelism is not included.
Times - Class 2 - DB2 Time

Field Name: ADTCBCL3

This is an exception field.

SUSPEND TIME - PAR.TASKS

The sum of the suspension times spent for parallel tasks. These tasks can be query CP or sysplex query parallel tasks, parallel tasks produced by utilities, or roll-up autonomous tasks.

Field Name: ADCPCL3T

NOT ACCOUNT.

The time not accounted in DB2. This time determines whether there is a large percentage of time that has not been captured within the DB2 accounting record and whether system monitoring tools (such as RMF™) should be examined to determine the cause of a performance problem.

In query or utility parallelism, it is the unaccounted time of the originating task only.

Check the DB2 accounting class 2 elapsed time that is not recorded as class 2 CPU time or class 3 suspensions. The following list shows why DB2 Class 2 Not Accounted time can be significant:

- Too much detailed online tracing, or problems with vendor performance monitors. This situation is usually the primary cause of high not-accounted-for time on systems that are not CPU-constrained.
- Running in a very high CPU utilization environment and waiting for CPU cycles if DB2 work WLM service class goals are not set properly.
- Running in a high MVS paging environment and waiting for storage allocation.
- The IBM specialty engines are highly utilized and the SYS1.PARMLIB(IEAOPTxx) member has the following settings: IIPHONORPRIORITY=NO and IFAHONORPRIORITY=NO.
- Frequent gathering of data set statistics (SMF 46 Type 2 records) DD consolidation overhead (z/OS parm DDCONS=YES DETAIL).
- CF Lock Structure system managed DUPLEXing since DB2 is not informed about related suspensions waits.
- In very I/O intensive environments, the Media Manager might be running out of request blocks.
- Time spent waiting for parallel tasks to complete (when query parallelism is used for the query).
- HSM (Hierarchical Storage Management) data set recall is an asynchronous process.
- Waiting for requests to be returned from SNA DB2 Server.
- Data set open contention related to PCLOSET being too small.
- DB2 internal suspend and resume looping when several threads are waiting for the same resource.

Field Name: ADNOTACC

DB2 ENT/EXIT

The total number of DB2 entry and exit events processed by the allied address space to calculate the elapsed time in DB2 and the processor time.

This counter does not include the SQL entry and exit events processed by stored procedures.
Field Name: QWACARNA
This is an *exception* field.

**EN/EX-STPROC**
The number of SQL entry or exit events performed by stored procedures. This number is only calculated if accounting class 2 is active.

Field Name: QWACSPNE

**EN/EX-UDF**
The number of SQL entry/exit events performed by user-defined functions. This is only calculated if accounting class 2 is active.

Field Name: QWACUDNE
Times - Class 2 - Time Distribution

This topic shows detailed information about “Accounting - Times - Class 2 - Time Distribution”.

The class 2 time distribution block shows the distribution of the active-in-DB2 time, the not-accounted time, and the suspension time, of the originating task. For threads exploiting query parallelism, only the nonparallel part is taken into account.

The following example applies to both, the report layout and the trace layout.

Accounting - Times - Class 2 - Time Distribution

The field labels shown in the following sample layout of “Accounting - Times - Class 2 - Time Distribution” are described in the following section.

CLASS 2 TIME DISTRIBUTION

**LOCK/LATCH(DB2+IRLM) - AVERAGE TIME/ELAPSED TIME**

The sum of the accumulated wait time due to local contention for locks and the accumulated wait time due to latch contention.

Field Name: AWTLOLA

**LOCK/LATCH(DB2+IRLM) - AV.EVENT/EVENTS**

The sum of the number of wait trace events processed for waits for local contention for locks and the number of wait trace events processed for waits for latch contention.

Field Name: ADLLSUSC

This is an exception field.

**IRLM LOCK+LATCH - AVERAGE TIME/ELAPSED TIME**

The accumulated wait time because of local contention for locks. The term local contention is used to differentiate from global contention (which is reported in QWACAWTL). Local contention does not require intersystem communication. The contention is detected and resolved entirely within this subsystem.

Field Name: QWACAWTL

This is an exception field.

**IRLM LOCK+LATCH - AV.EVENT/EVENTS**

The number of wait trace events processed for waits for local contention for locks.

Field Name: ADLBSUSC

**DB2 LATCH - AVERAGE TIME/ELAPSED TIME**

The accumulated wait time because of latch contention.

Field Name: QWACAWLH
DB2 LATCH - AV.EVENT/EVENTS

The number of wait trace events processed for waits for latch contention.

**Note:** The internally defined field adjusts the original DB2 value. DB2 counts each event twice, one for the entry and one for the exit.

**Field Name:** ADLASUSC

SYNCHRON. I/O - AVERAGE TIME/ELAPSED TIME

The I/O elapsed time accumulated due to synchronous I/O suspensions. DB2 calculates this value by subtracting the store clock time when an agent begins waiting for a synchronous I/O from the time the agent is resumed.

**Field Name:** ADIOSUST

SYNCHRON. I/O - AV.EVENT/EVENTS

The total number of synchronous I/O suspensions.

**Field Name:** ADIOSUSC

DATABASE I/O - AVERAGE TIME/ELAPSED TIME

The accumulated I/O elapsed wait time for database I/O done under this thread. This field is for synchronous I/O only. It includes synchronous read and write I/O. This value is an average.

**Field Name:** QWACAWTI

DATABASE I/O - AV.EVENT/EVENTS

The number of wait trace events processed for waits for database I/O under this thread.

**Field Name:** ADIOARNE

LOG WRITE I/O - AVERAGE TIME/ELAPSED TIME

The accumulated wait time for log write I/O.

This value is an average.

**Field Name:** QWACAWLG

LOG WRITE I/O - AV.EVENT/EVENTS

The number of wait trace events processed for waits for log write I/O. This value is an average.

**Field Name:** ADLWSUSC

OTHER READ I/O - AVERAGE TIME/ELAPSED TIME

The accumulated waiting time due to a read I/O that performed under a thread other than the one being reported. The time does not represent the total duration of the subject read I/O. It includes:

- Sequential prefetch
- List prefetch
- Dynamic Prefetch
- Synchronous read I/O performed by a thread other than the one being reported

**Field Name:** QWACAWTR

This is an *exception* field.
OTHER READ I/O - AVERAGE TIME/ELAPSED TIME

The total number of suspensions due to a read I/O performed under a thread other than the one being reported.

Field Name: ADARSUSC

This is an exception field.

OTHER WRITE I/O - AVERAGE TIME/ELAPSED TIME

The accumulated waiting time due to a write I/O that performed under a thread other than the one being reported. This time does not represent the total duration of the subject write I/O. It includes:

- An asynchronous write I/O
- A synchronous write I/O performed by a thread other than the one being reported
- Frequent system checkpoints and low settings for deferred write thresholds
- When updating a page that is being written, the first thread wait is captured under Other Write I/O
- Other concurrent threads on the same DB2 subsystem will encounter Page latch suspension.

Field Name: QWACAWTW

This is an exception field.

OTHER WRITE I/O - AVERAGE TIME/ELAPSED TIME

The total number of suspensions due to a write I/O performed under a thread other than the one being reported. It includes:

- An asynchronous write I/O
- A synchronous write I/O performed by a thread other than the one being reported.

Field Name: ADAWSUSC

This is an exception field.

SER.TASK SWITCH - AVERAGE TIME/ELAPSED TIME

The accumulated waiting time due to a synchronous execution unit switching to DB2 services from the thread being reported. It includes:

- Open/close data set
- SYSLGRNG or SYSLGRNX update
- Commit phase 2
- Dataspace manager services
- Define data set
- Extend data set
- Delete data set
- Log I/Os for commit and abort processing

Special Considerations:

1. There are no service waits associated with commit phase 2 under read-only threads originating from CICS or IMS. There is a service wait for any thread doing commit phase 2 after an update.
2. There is no overlap between the elapsed time reported in this field and the other class 3 elapsed times.
Field Name: ADSTSUST
This is an exception field.

**SER.TASK SWTC - AV.EVENT/EVENTS**

The total number of suspensions due to a synchronous execution unit switching to DB2 services from the thread being reported.

Field Name: ADSTSUSC
This is an exception field.

**UPDATE COMMIT - AVERAGE TIME/ELAPSED TIME**

The accumulated wait time because of synchronous execution unit switch for DB2 Phase 2 commit, abort, or deallocation. This includes wait time for Phase 2 commit Log writes and database writes for LOB with LOG NO. For data sharing environment Page P-locks unlocks for updated pages and GBP writes.

Field Name: QWACAWTE

**UPDATE COMMIT - AV.EVENT/EVENTS**

The number of wait trace events processed for waits for synchronous execution unit switching for commit or abort.

This value is an average.

Field Name: ADSTARNNS

**OPEN/CLOSE - AVERAGE TIME/ELAPSED TIME**

Accumulated waiting time for a synchronous execution unit switch to the DB2 OPEN/CLOSE data set service for the HSM recall service.

This value is an average.

Field Name: QWAXOCSE

**OPEN/CLOSE - AV.EVENT/EVENTS**

The number of wait trace events processed for waits for synchronous execution unit switching to the open/close service.

This value is an average.

Field Name: ADOCUSUSC

**SYSLGRNG REC - AVERAGE TIME/ELAPSED TIME**

Accumulated wait time for a synchronous execution unit switch to the DB2 SYSLGRNG recording service. This service is sometimes used for Level ID checking for downlevel detection.

This value is an average.

Field Name: QWAXSLSE

**SYSLGRNG REC - AV.EVENT/EVENTS**

The number of wait trace events processed for waits for synchronous execution unit switching to the SYSLGRNG recording service.

This value is an average.

Field Name: ADSLSUSC

**EXT/DEL/DEF - AVERAGE TIME/ELAPSED TIME**
Accumulated wait time for a synchronous execution unit switch to the DB2 data space manager services. This includes DEFINE DATA SET, EXTEND DATA SET, DELETE DATA SET, RESET DATA SET, and VSAM CATALOG ACCESS.

This value is an average.

Field Name: QWAXDSSE

EXT/DEL/DEF - AV.EVENT/EVENTS

The number of wait trace events processed for waits for synchronous execution unit switching to the data space manager service tasks.

This value is an average.

Field Name: ADDSSUSC

OTHER SERVICE - AVERAGE TIME/ELAPSED TIME

Could be due to a VSAM catalog update. In the distributed environment, it includes the waiting time for the response from the server system.

Performance trace for IFCID 46 to 50, 170, and 171 provide more detailed information for analysis.

Field Name: QWAXOTSE

OTHER SERVICE - AV.EVENT/EVENTS

The number of wait trace events processed for waits for synchronous execution unit switching to other service tasks.

This value is an average.

Field Name: ADOTSUSC

ARC.LOG(QUIES) - AVERAGE TIME/ELAPSED TIME

The accumulated waiting time due to the processing of ARCHIVE LOG MODE(QUIESCE) commands.

This time does not represent the time required to perform the entire command.

Field Name: QWAXALOG

This is an exception field.

ARC.LOG(QUIES) - AV.EVENT/EVENTS

The total number of suspensions due to the processing of ARCHIVE LOG MODE(QUIESCE) commands.

This counter belongs to class 1 (not to class 3 like the rest of the fields in this section) but it is shown here to be adjacent to the archive log quiesce suspension time, which is in class 3.

Field Name: ADALSUSC

This is an exception field.

LOG READ - AVERAGE TIME/ELAPSED TIME

The accumulated wait time for:
- Archive Log reads
- Active Log reads
- Active Log prefetch reads
Fast Log apply log reads

Field Name: QWAXAWAR

LOG READ - AV.EVENT/EVENTS

The number of wait trace events processed for archive reads, active reads, and active log prefetch reads.

Field Name: ADLRSUSC

This is an exception field.

DRAIN LOCK - AVERAGE TIME/ELAPSED TIME

The accumulated waiting time for a drain lock. This is the time the requester is suspended while waiting to acquire the drain lock.

Field Name: QWAXAWDR

This is an exception field.

DRAIN LOCK - AV.EVENT/EVENTS

The total number of suspensions due to drain lock processing.

Field Name: ADDRUSSC

This is an exception field.

CLAIM RELEASE - AVERAGE TIME/ELAPSED TIME

The accumulated waiting time for a drain waiting for claims to be released. After the drain lock is acquired, the drainer must wait for claim holders to release the object.

Field Name: QWAXAWCL

This is an exception field.

CLAIM RELEASE - AV.EVENT/EVENTS

The total number of suspensions until the claims are released.

Field Name: ADCMSUSC

This is an exception field.

PAGE LATCH - AVERAGE TIME/ELAPSED TIME

Page latch suspension could be due to concurrent threads that try to update a hot page that is frequently written because of a low deferred write threshold.

In the data sharing environment, within the same member, the first thread gets a P-lock (such as: Index leaf page P-Lock or P-Lock for Space map page or data page P-lock for Row level locking) during high INSERT activity. Performance trace for IFCID 226 and 227 provide more information for detailed analysis.

With a high number of concurrent threads, for subsequent threads in the same member for the same resource, contention is reported as encountering a page latch contention. Randomizing the Index key helps minimizing page latch contentions for the Index leaf page.

If the page latch is for a space map page and an incremental image copy is not used, use the DDL TRACKMOD NO option to avoid frequent updates to the space map page. The Member Cluster option reduces page latch contention for a space map page.
Times - Class 3 - Suspensions

Field Name: QWACAWTP

PAGE LATCH - AV.EVENT/EVENTS

The total number of suspensions due to page latch contentions.

Field Name: ADPGSUSC

NOTIFY MSGS - AVERAGE TIME/ELAPSED TIME

The accumulated elapsed waiting time due to suspensions caused by sending notify messages to other members in the data sharing group. Messages are sent, for example, when the database descriptors are changed due to DDL.

Field Name: QWACAWTG

NOTIFY MSGS - AV.EVENT/EVENTS

The number of suspensions caused by sending messages to other members in the data sharing group. This value is only calculated if accounting class 3 is active and DB2 is a member of a data sharing group.

Field Name: ADNOSUSC

GLOBAL CONTENTION - AVERAGE TIME/ELAPSED TIME

The total accumulated waiting time caused by the suspension of IRLM lock requests due to global lock contention in a data sharing environment that requires intersystem communication to resolve.

Look at the Accounting section that shows Parent/Child/Other break down for the L-Lock and P-Lock Global contentions. Also look at the GBP Buffer Pool statistics Page P-Lock suspensions and negotiations category (Space map page / Data page / Index leaf page) in the Statistics report for the same time interval:

- If the majority of the negotiations are for the space map pages or data pages, the Member Cluster option can help.
- If the majority of the negotiations are for data pages, consider to change small tables with row level locking to page level locking with MAXROWS 1.
- If the majority of the negotiations are for Index leaf pages, consider adding more free space (PCTFREE / FREEPAGE) and/or minimizing the index key size for a unique or semi-unique multi-column index.
Field Name: ADFCSUSC

ASYNCH CF REQUESTS - AVERAGE TIME/ELAPSED TIME
The accumulated wait time for IXLCACHE and IXLFCOMP requests.

Field Name: QWAXIXLT

ASYNCH CF REQUESTS - A.EVENT/EVENTS
The number of IXLCACHE and IXLFCOMP asynchronous requests.

Field Name: ADIXSUSC

TCP/IP LOB XML - AVERAGE TIME/ELAPSED TIME
The accumulated wait time for TCP/IP LOB and XML (storing large object and XML) materialization.

Field Name: QWACALBW

TCP/IP LOB XML - A.EVENT/EVENTS
The number of wait trace events processed for waits for TCP/IP LOB and XML materialization.

Field Name: ADLMSUSC

ACCELERATOR - AVERAGE TIME/ELAPSED TIME
The accumulated wait time for requests to an accelerator.

Field Name: QWACAACW

ACCELERATOR - A.EVENT/EVENTS
The total number of suspensions due to a request to an accelerator.

Field Name: ADAASUSC

AUTONOMOUS PROCEDURE - AVERAGE TIME/ELAPSED TIME
The accumulated time waiting for autonomous procedures to complete.

Field Name: AATXSUST

AUTONOMOUS PROCEDURE - A.EVENT/EVENTS
The number of autonomous procedures that were executed:
1. For non-rollup records, this value is the number of autonomous procedures that were executed.
2. For a parallel query rollup record, this value is 0.
3. For a DDF or RRSAF rollup record, this value is the number of autonomous procedures that were executed. These procedures are NOT counted in QWACPCNT.
4. For autonomous procedures rollup records, this value is 0.

Field Name: AATCOUNT

PQ SYNCHRONIZATION - AVERAGE TIME/ELAPSED TIME
The accumulated time waiting for parallel queries to synchronize between parent and child tasks.

Field Name: AWPQSST

PQ SYNCHRONIZATION - A.EVENT/EVENTS
The number of times the parallel query processing had to suspend because it was waiting for the synchronization of parent or child.
Times - Class 3 - Suspensions

Field Name: AWPQSSC

LOB COMPRESSION - AVERAGE TIME/ELAPSED TIME
The accumulated time waiting for a compression of DB2 large objects (LOB) (DB2 field QWAX_LOBCOMP_WAIT).

Field Name: AWLCSUST

LOB COMPRESSION - AV.EVENT/EVENTS
The number of wait trace events processed for DB2 large object (LOB) compressions (DB2 field QWAX_LOBCOMP_COUNT).

Field Name: AWLCSUSC

FAST INSERT PIPE - AVERAGE TIME/ELAPSED TIME
The accumulated wait time for pipe wait (DB2 field QWAX_PIPE_WAIT).

Field Name: AWPIUSUST

FAST INSERT PIPE - AV.EVENT/EVENTS
The number of wait trace events that were processed for pipe wait (DB2 field QWAX_PIPEWAIT_COUNT / 2).

Field Name: AWPIUSUSC

TOTAL CLASS 3 - AVERAGE TIME/ELAPSED TIME
The waiting time for all types of class 3 suspensions by the originating task and parallel tasks, if parallelism is employed.

Field Name: ADTSUST
This is an exception field.

TOTAL CLASS 3 - AV.EVENT/EVENTS
The total number of class 3 suspensions.

Field Name: ADTSUSC
This is an exception field.
**Times - Class 5 - IFI Time**

This topic shows detailed information about “Accounting - Times - Class 5 - IFI Time”.

This block shows information for the Instrumentation Facility Interface (IFI) class 5.

The following example shows both layouts, the report on the left, and the trace layout on the right.

**Accounting - Times - Class 5 - IFI Time**

The field labels shown in the following sample layout of “Accounting - Times - Class 5 - IFI Time” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Report</th>
<th>Trace</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td>LOG EXTRACT</td>
<td>N/P</td>
<td>LOG EXTRACT</td>
</tr>
</tbody>
</table>

**ELAPSED TIME**

The accumulated elapsed time for processing IFI calls. This field is only calculated if accounting class 5 is active.

Field Name: QIFAAIET

**CP CPU TIME**

The accumulated CPU time spent processing IFI calls. This is the same as the TCB time (class 5).

This field is only calculated if accounting class 5 is active.

Field Name: QIFAAITT

This is an exception field.

**DCAPT.DESC**

The accumulated elapsed time for processing data capture describes. Data capture describes occur only during IFI read requests for IFCID 185. This time is a subset of the log extraction time.

Field Name: QIFAAAMBT

This is an exception field.

**LOG EXTRACT**

The accumulated elapsed time for extracting log records for tables defined with DATA CAPTURE CHANGES. This time is a subset of the class 5 elapsed time.

Field Name: QIFAAAMLT

This is an exception field.
Times - Class 7 - CP CPU Distribution

Times - Class 7 - CP CPU Distribution

This topic shows detailed information about “Accounting - Times - Class 7 - CP CPU Distribution”.

This block shows the distribution of the class 7 CP CPU time among all packages.

The following example shows both layouts, first the report layout, followed by the trace layout.

Accounting - Times - Class 7 - CP CPU Distribution

The field labels shown in the following sample layout of “Accounting - Times - Class 7 - CP CPU Distribution” are described in the following section.

PROGRAM NAME

The program name (package ID or DBRM name).

In the case of rollup data (Accounting data of DDF/RRSAF threads and parallel tasks accumulated by DB2), the following value is shown *ROLSUM*.

Field Name: QPACPKID

This is an exception field.

CLASS 7 ELAPSED TIME CONSUMERS

The ratio of the class 7 elapsed time, expressed as a percentage of the total class 7 elapsed time of all programs.

Field Name: ARATCL7
Triggers

This topic shows detailed information about “Accounting - Triggers”.

This block provides information about triggers.

For formatting reasons, OMEGAMON XE for DB2 PE shows different labels for report and trace. The following example shows both layouts, the report on the left, and the trace layout on the right.

Accounting - Triggers

The field labels shown in the following sample layout of “Accounting - Triggers” are described in the following section.

<table>
<thead>
<tr>
<th></th>
<th>Report:</th>
<th>Trace:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>TRIGGERS</td>
<td>TRIGGERS</td>

<td>0.00</td>
<td>SQL ERROR</td>
</tr>
<tr>
<td></td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

**STATEMENT TRIGGER (STMT TRIGGER)**

The number of times a statement trigger was activated.

*Field Name:* QXSTTRG

**ROW TRIGGER**

The number of times a row trigger was activated.

*Field Name:* QXROWTRG

**SQL ERROR OCCUR (SQL ERROR)**

The number of times an SQL error occurred during the execution of a triggered action. This includes errors that occur in user-defined functions or stored procedures that are called from triggers and that pass back a negative SQLCODE.

*Field Name:* QXTRGERR
# Truncated Values

This topic shows detailed information about “Accounting - Truncated Values”.

OMEGAMON XE for DB2 PE can report values that are too long to fit in the space available in the report layout. When this happens, the value reported in the block is truncated. Truncated values are then listed at the end of each logical report unit, together with the full values.

The list of Truncated Values shows pairs of a truncated values (unique name) and its original full value (long name). This list can show pairs caused by long names of client end-user transaction names and workstation names. It shows the complete long name on several lines if required. A truncated value can consist of up to 32 characters, which is the length of the short name of an end-user transaction name.

The mapping between truncated and full values remains the same for multiple reports from the same input data. This mapping for multiple reports from different input data cannot be guaranteed.

The following example applies to both, the report layout and the trace layout.

## Accounting - Truncated Values

The field labels shown in the following sample layout of “Accounting - Truncated Values” are described in the following section.

```plaintext
<table>
<thead>
<tr>
<th>TRUNCATED VALUE</th>
<th>FULL VALUE</th>
</tr>

Chapter 5. Accounting Default Layouts  5-389
User-Defined Functions

User-Defined Functions

This topic shows detailed information about “Accounting - User-Defined Functions”.

This block shows information about user-defined functions.

The following example shows both layouts, the report on the left, and the trace layout on the right.

Accounting - User-Defined Functions

The field labels shown in the following sample layout of “Accounting - User-Defined Functions” are described in the following section.

Report: | Trace:
--- | ---
UDF | UDF
AVERAGE | TOTAL
--- | ---
EXECUTED | EXECUTED
0.00 | 0
ABENDED | ABENDED
0.00 | 0
TIMED OUT | TIMED OUT
0.00 | 0
REJECTED | REJECTED
0.00 | 0

EXECUTED

The number of user-defined functions executed.

Field Name: QXCAUD

ABENDED

The number of times a user-defined function abended.

Field Name: QXCAUDAB

TIMED OUT

The number of times a user-defined function timed out while waiting to be scheduled.

Field Name: QXCAUDTO

REJECTED

The number of times a user-defined function was rejected.

Field Name: QXCAUDRJ
Chapter 6. The Accounting Save-File Utility

Use the Save-File utility to migrate and convert Accounting Save data sets into a format suitable for OMEGAMON XE for DB2 PE V5.4.0.

The function performed is specified in a parameter on the EXEC command.

"Migrating Data Sets" on page 6-2
This topic describes how to migrate Accounting Save data sets created by OMEGAMON XE for DB2 PE V5.2.0 or V5.3.0 into the record format of OMEGAMON XE for DB2 PE V5.4.0.

"Converting Data Sets" on page 6-3
To store performance data in Performance Database tables or spreadsheets, you must first convert Accounting Save data sets of OMEGAMON XE for DB2 PE V5.4.0 into sequential data sets that can be used by the DB2 load utility or the Spreadsheet Input-Data Generator of OMEGAMON XE for DB2 PE.

"Save-File Utility DD Statements" on page 6-4
This topic lists the DD statements needed for migration and conversion. All of the DD statements described here are required.
Migrating Data Sets

This topic describes how to migrate Accounting Save data sets created by OMEGAMON XE for DB2 PE V5.2.0 or V5.3.0 into the record format of OMEGAMON XE for DB2 PE V5.4.0.

To migrate Accounting Save data sets:

1. Create a VSAM data set for V520 or V530.
2. Define an OMEGAMON XE for DB2 PE V5.4.0 VSAM data set using IDCAMS as output.
3. Use the MIGRATE function of the Save-File utility to migrate the data sets of OMEGAMON XE for DB2 PE V5.2.0 or V5.3.0.
4. Restore the migrated VSAM data sets in V540 and compare the reports.

The RKO2SAMP library provides the sample job DGOPJAMI, which you can modify to suit your installation.

**Note:**

- You can only process VSAM data sets in the same version of OMEGAMON XE for DB2 PE as they have been created. For example, if you create a SAVE data set in version 530, it can only be RESTORED in version 530.
- To use a SAVE data set in a higher version, you must migrate the SAVE data set using a migration utility.
- Before you restore or convert SAVE data sets from V5.2.0 or V5.3.0, you must first migrate this data to OMEGAMON XE for DB2 PE V5.4.0 format.
- Restored reports only show fields that are supported by the current version of OMEGAMON XE for DB2 PE.
Converting Data Sets

To store performance data in Performance Database tables or spreadsheets, you must first convert Accounting Save data sets of OMEGAMON XE for DB2 PE V5.4.0 into sequential data sets that can be used by the DB2 load utility or the Spreadsheet Input-Data Generator of OMEGAMON XE for DB2 PE.

You can use the CONVERT function of the Accounting Save-File Utility to convert Accounting Save data sets of OMEGAMON XE for DB2 PE V5.4.0 into sequential data sets. The RKO2SAMP library provides the sample job DGOPJACO, which you can modify to suit your installation.

You can also use the ACCOUNTING SAVE subcommand with the CONVERT option to convert and save reduced data into a sequential data set. The output of this subcommand option is a sequential data set, that is specified and requested in SYSIN. The data set attributes are:

Organization
   PS

Record format
   VB

Record length
   9072

Block size
   9076

For more information about the ACCOUNTING SAVE subcommand refer to Command Reference.

The following list shows the types of records that are created by the CONVERT function (or CONVERT command option) and where to find their layout descriptions in the sample library RKO2SAMP:

- General data records (DGOADSGE)
- Buffer pool data records (DGOADSBU)
- Distributed Data Facility (DDF) data records (DGOADSDF)
- Group buffer pool records (DGOADSGP)
- Package records (DGOADSPK)
- Resource Limit Facility (RLF) records (DGOADSRF)
- Accelerator records (DGOADSX)

For more information about the Spreadsheet Input-Data Generator refer to Reporting User's Guide.
Save-File Utility DD Statements

This topic lists the DD statements needed for migration and conversion. All of the DD statements described here are required.

**Input**

The DDNAME of the input data set. This can be an OMEGAMON XE for DB2 PE V5.2.0 or V5.3.0 Accounting SAVE data set for the MIGRATE function, or an OMEGAMON XE for DB2 PE V5.4.0 Accounting VSAM Save data set for the CONVERT function.

**Output**

The DDNAME of the output data set.

For CONVERT, allocate the data set with the following characteristics:

- **RECFM**: VB
- **LRECL**: 9072
- **BLKSIZE**: 9076

Refer to Chapter 64, “OMEGAMON XE for DB2 PE VSAM Data Sets,” on page 64-1 for details on how to specify the allocated data sets to migrate to OMEGAMON XE for DB2 PE V5.4.0.

**DPMLOG**

OMEGAMON XE for DB2 PE command processor messages and messages indicating exceptional processing conditions are written to DPMLOG. If DPMLOG is not specified, it is dynamically allocated to the SYSOUT message class of the job.

Allocate the data set with the following attributes:

- **RECFM**: FBA
- **LRECL**: 133
- **BLKSIZE**: 6251
Chapter 7. The Accounting File Data Set and Output Record

The FILE subcommand formats DB2 Accounting records and writes them to sequential data sets suitable for use by the DB2 load utility. You can store unreduced Accounting data into the OMEGAMON XE for DB2 PE performance database. The performance database produces tailored reports using a reporting facility such as Query Management Facility (QMF).

You can also use the File data sets to generate CSV (comma-separated value) input-data. This CSV data can then be transferred to workstations and imported into spreadsheets to improve DB2 performance analysis using graphical representations or pivot tables. For more information refer to Reporting User’s Guide.

FILE can also be used to produce data sets containing only exception records. The following record format types are available. Descriptions of the Accounting File data sets and the fields contained can be found in the RKO2SAMP library under the following names:

- **DGOADFGE**
  General Accounting records

- **DGOADFBU**
  Buffer pool records

- **DGOADFDF**
  DDF records

- **DGOADFGP**
  Group buffer pool records

- **DGOADFPK**
  Package records

- **DGOADFXC**
  Accelerator records

The output is a sequential data set containing information from the DB2 IFCID 003 and IFCID 239 records. The parallel records are contained in the originating record. The number of records in the output are as follows:

- One record for General Accounting data
- Separate records for each buffer pool used
- Separate records for each remote location participating in the distributed activity
- Separate records for each group buffer pool used
- Separate records for each package and DBRM executed
- Separate records for each accelerator used
Part 3. Audit Report Set

These topics provide information about the Audit reports.

Note: A report can be ordered by identifiers in contrast to a trace. For an introduction to the Audit report set and general audit information refer to the Reporting User’s Guide.

Chapter 8, “The Audit Summary Reports,” on page 8-1
The Audit summary reports present aggregated DB2 data. Data is accumulated and grouped by the specified OMEGAMON XE for DB2 PE identifiers.

Chapter 9, “The Audit Detail Report and the Audit Trace,” on page 9-1
Both the audit detail report and the audit trace show a detailed listing of all occurrences of the different audit types. The layout of the Audit report and trace is similar. The audit trace is sorted by timestamp, the audit detail report is sorted first by identifier, then by timestamp. Any combination of event types can be specified.

Chapter 10, “The Audit File Data Set and Output Record,” on page 10-1
The FILE subcommand formats DB2 Audit records and writes them to sequential data sets that can be loaded into DB2 tables.
Chapter 8. The Audit Summary Reports

The Audit summary reports present aggregated DB2 data. Data is accumulated and grouped by the specified OMEGAMON XE for DB2 PE identifiers.

The LEVEL subcommand option creates a basic summary report, which shows totals for the different audit types. Use the LEVEL and TYPE options to produce summary reports for the audit report types.

“Summary Report - Basic and Field Descriptions” on page 8-2
To produce a basic summary report, use the AUDIT REPORT LEVEL(SUMMARY) command without any TYPE constraints.

“Authorization Change Summary Report and Fields (AUTHCHG)” on page 8-5
This report presents all authorization change events according to the combination of OMEGAMON XE for DB2 PE identifiers specified.

“Authorization Control Summary Report and Fields (AUTHCNTL)” on page 8-7
This report presents all authorization control events according to the combination of OMEGAMON XE for DB2 PE identifiers specified.

“Authorization Failure Summary Report and Fields (AUTHFAIL)” on page 8-9
This report presents all authorization failure events according to the combination of OMEGAMON XE for DB2 PE identifiers you specified.

“DML at Bind Access Summary Report and Fields (BIND)” on page 8-12
This report presents all DML at bind access events according to the combination of OMEGAMON XE for DB2 PE identifiers specified.

“DDL Access Summary Report and Fields (DDL)” on page 8-14
This report presents all DDL access events according to the combination of OMEGAMON XE for DB2 PE identifiers specified.

“DML Access Summary Report and Fields (DML)” on page 8-16
This report presents all DML access events according to the combination of OMEGAMON XE for DB2 PE identifiers specified.

“Utility Access Summary Report and Fields (UTILITY)” on page 8-18
This presents all utility access events according to the combination of OMEGAMON XE for DB2 PE identifiers specified.
Summary Report - Basic and Field Descriptions

To produce a basic summary report, use the AUDIT REPORT LEVEL(SUMMARY) command without any TYPE constraints.

You can generate a summary report as follows:

```
AUDIT REPORT LEVEL (SUMMARY)
```

Note: For bind events, specify the program name for PLANNNAME in ORDER, INCLUDE and EXCLUDE. For utility events, specify the utility name of the PLANNNAME in ORDER, INCLUDE, and EXCLUDE. The header of this summary report will, however, still show PLANNNAME.

In group-scope reports, MEMBER and SUBSYSTEM are not shown.

Levels of accumulation (Audit summary report)

The Audit summary report gives the following levels of accumulation:

**GROUP TOTAL**

The group total is printed on group-scope reports when the member value changes.

**SUBTOTAL**

If you request ordering by three identifiers, a subtotal block of two lines is printed on the change of the second-level identifier when there is more than one third-level identifier reported under it.

The first line shows the string "SUBTOTAL" in the first column.

The second line shows the name of the second identifier in the first column and the calculated data in all other columns.

**TOTAL**

If you request ordering by two or three identifiers, a total block of two lines with all applicable data is printed on the change of the first-level identifier when there is more than one second-level identifier reported under it.

The first line shows the string "TOTAL" in the first column.

The second line shows the name of the first identifier in the first column, and the calculated data in all other columns.

**GRAND TOTAL**

A grand total block of two lines with all applicable data is printed for a location when there is more than one first-level identifier reported.

The first line shows the string "GRAND TOTAL" in the first column.

The second line shows the name of the member (in a member-scope report) or the group (in a group-scope report) in the first column, and the calculated data in all other columns.
Layout of a Member-Scope Audit Summary Report

Here is a sample layout of a Member-Scope Audit Summary report.

<table>

</table>

Field description

The basic Audit summary report contains the following fields:

**OMEGAMON XE for DB2 PE identifiers**

The report can be sorted by up to five combinations of any three identifiers. These are printed in the first three columns from the left and indented in the sequence specified by ORDER.

The default is PRIMAUTH-PLANNAME.

For group-scope reports, MEMBER is automatically added as the last identifier.

The values printed in the following columns represent totals for each combination of the selected OMEGAMON XE for DB2 PE identifiers.

**TOTAL**

A total number of Audit events.

**AUTH FAILURE**

The total number of authorization failures (IFCID 140 records).

**GRANT/REVOKE**

The total number of authorization GRANTs or REVOKEs (IFCID 141).

**DDL ACCESS**

The total number of DDL operations against auditable DB2 tables (IFCID 142 records).

**DML READ ACCESS**

The total number of first READ attempts within a logical unit of work against auditable DB2 tables (IFCID 144 records).
DML WRITE ACCESS
The total number of first WRITE attempts against audited DB2 tables
(IFCID 143 records).

DML AT BIND
The total number of statements referenced during a static or dynamic bind
(IFCID 145) against auditable DB2 tables.

AUTHID CHANGE
The total number of initial AUTHID establishments, AUTHID changes, or
attempted AUTHID changes (IFCID 055, 083, 087, and 169 records).

UTILITY ACCESS
The total number of times a utility was used to access a DB2 object (IFCID
024 records).
Authorization Change Summary Report and Fields (AUTHCHG)

This report presents all authorization change events according to the combination of OMEGAMON XE for DB2 PE identifiers specified.

Use the following command to generate an authorization change summary report.

```
AUDIT REPORT
LEVEL (SUMMARY)
TYPE (AUTHCHG)
```

</tbody>
</table>
SET CURRENT SQLID
The authorization changes due to a SET CURRENT SQLID request. The total number of IFCID 055 records for this set of identifiers.

END OF IDENTIFY
The authorization changes due to an identify request. The total number of IFCID 083 records for this set of identifiers.

END OF SIGNON
The authorization changes due to a signon. The total number of IFCID 087 records for this set of identifiers.

DISTRIBUTED TRANSLATION
The authorization changes due to distributed translation. The total number of IFCID 169 records for this set of identifiers.

TOTAL
All authorization changes. The total number of IFCIDs 55, 83, 87, and 169 for this set of identifiers.
Authorization Control Summary Report and Fields (AUTHCNTL)

This report presents all authorization control events according to the combination of OMEGAMON XE for DB2 PE identifiers specified.

Use the following command to generate an authorization control summary report.

```
AUDIT REPORT
  LEVEL (SUMMARY)
  TYPE (AUTHCNTL)
```

Layout of a Member-Scope Audit Authorization Control Summary Report

The layout of this report varies slightly depending if it is a member or group-scope report.

For group-scope reports:
- MEMBER and SUBSYSTEM are not shown on the page header
- MEMBER is not added to the identifiers specified.
- A GROUP TOTAL is shown when a member value changes.

Layout of a Group-Scope Audit Authorization Control Summary Report

Here is a sample layout of a Group-Scope Audit Authorization Control Summary report.

Field description

The authorization control summary report contains the following fields:

OMEGAMON XE for DB2 PE Identifiers
The identifiers define the order of the Audit data reported. Up to three identifiers are printed.

The defaults are:
Audit Report - Authorization Control Summary (AUTHCNTL)

- For member-scope reports, PRIMAUTH-PLANNNAME-OBJECT
- For group-scope reports, OBJECT

For group-scope reports, MEMBER is automatically added as the last identifier.

**OBJECT TYPE**
The DB2 object type of the GRANT or REVOKE. Possible values are:
- TSPACE
- LOBTS
- TAB/VIEW

**GRANTS**
All grant operations.

**REVOKES**
All revoke operations.

**TOTAL**
All grant/revoke operations. The total number of IFCID 141 records for this set of identifiers.
Authorization Failure Summary Report and Fields (AUTHFAIL)

This report presents all authorization failure events according to the combination of OMEGAMON XE for DB2 PE identifiers you specified.

Use the following command to generate an authorization failure summary report.

```bash
AUDIT REPORT
LEVEL (SUMMARY)
  TYPE (AUTHFAIL)
```

Layout of a Member-Scope Audit Authorization Failure Summary Report

The layout of the default member-scope authorization failure summary report, ordered by object type, source object, source owner, target object, and target owner within plan name within primary authorization ID, is shown in the following example.

```
LOCATION: LOCATI_2
GROUP: GROUP_1
MEMBER: MEMBER_2
SUBSYSTEM: SYS2
DB2 VERSION: V10
```

```
PRIMAUTH PLANNAME PRIVILEGE OBJECT --------- SOURCE ----------- TARGET ----------- TOTAL
--- -------- -------- --------- ------------ ----------- ----------- -------
AUTH_20 PLAN_20 SELECT TABLE SYSEIM SYSDATABASE SYSEIM SYSDATABASE 2
PLAN_30  TOTAL*   2

AUTH_30 PLAN_20 INSERT TABLE SYSEIM SYSDATABASE SYSEIM SYSDATABASE 2
PLAN_30  TOTAL*   2

*GRAND TOTAL* 8
```

Layout of a Group-Scope Audit Authorization Failure Summary Report

Here is a sample layout of a Group-Scope Audit Authorization Failure Summary report.

```
LOCATION: LOCATI_2
GROUP: GROUP_1
DB2 VERSION: V10
```

```
PRIVILEGE OBJECT --------- SOURCE ----------- TARGET ----------- TOTAL
--- -------- --------- ----------- ----------- -------
SELECT TABLE SYSEIM SYSDATABASE SYSEIM SYSDATABASE MEMBER_2 8

*GRAND TOTAL* 16
```

Field description

The authorization failure summary report contains the following fields:

**OMEGAMON XE for DB2 PE identifiers**

The identifiers define the order of the Audit data reported. Up to three identifiers are printed.

The defaults are:

- For member-scope reports, PRIMAUTH-PLANNAME-OBJECT
- For group-scope reports, OBJECT
Audit Report - Authorization Failure Summary

For group-scope reports, MEMBER is automatically added as the last identifier.

**PRIVILEGE**

The privilege that was checked. Possible values are provided in the DB2 macro DSNHQW02.

**OBJECT TYPE**

The DB2 object type. Possible values are:

- **BUFFER**
  - Buffer Pool
- **COLLECT**
  - Collection
- **DATABASE**
  - Database
- **DISTTYPE**
  - Distinct Type
- **FUNCTION**
  - Function
- **PACKAGE**
  - Package
- **SCHEMA**
  - Schema
- **PROCEDUR**
  - Procedure
- **APPLPLAN**
  - Application Plan
- **LOBTS**
  - Large Object Table Space
- **STOGROUP**
  - Storage Group
- **TAB/VIEW**
  - Table or View
- **USERAUTH**
  - System privileges, such as SYSADM or SYSOPR
- **SEQUENCE**
  - Sequence

**SOURCE OBJECT OWNER**

If the object type is USERAUTH and the privilege is CREATE ALIAS, this is the qualifier of the alias being created. N/A is printed when the privilege is any other value.

If the object type is not USERAUTH, this is the qualifier of the object against which the authorization was checked.

**SOURCE OBJECT NAME**

If the object type is USERAUTH and the privilege is CREATEALIAS, CREATEDBA, CREATEDBC, or CREATESG this is the name of the alias, or object being created. N/A is printed when the privilege has any other value.
Audit Report - Authorization Failure Summary

If the object type is not USERAUTH, this is the name of the object against which the authorization was checked.

**TARGET OBJECT OWNER**
This is the qualifier of the object being created. It is valid when the Privilege is CREATE TABLE or CREATE INDEX. It is also valid for an authorization check against the following privileges:
- CREATE VIEW
- SELECT
- INSERT
- DELETE
- UPDATE

Otherwise N/A is printed.

**TARGET OBJECT NAME**
This is the qualifier of the object being created. It is valid when the Privilege is CREATE TABLE or CREATE INDEX. It is also valid for an authorization check against the following privileges:
- CREATE VIEW
- SELECT
- INSERT
- DELETE
- UPDATE

Otherwise N/A is printed.

**TOTAL**
All authorization failures. The total number of IFCID 140 records for this set of identifiers.
DML at Bind Access Summary Report and Fields (BIND)

This report presents all DML at bind access events according to the combination of OMEGAMON XE for DB2 PE identifiers specified.

Use the following command to generate a DML at bind access summary report.

```
AUDIT
REPORT
LEVEL (SUMMARY)
TYPE (BIND)
```

Layout of a Member-Scope Audit DML at Bind Access Summary Report

For ORDER, INCLUDE, and EXCLUDE, the program name is used for PLANNAME.

```
LOCATION: LOCATI_2
GROUP: GROUP_1
MEMBER: MEMBER_2
SUBSYSTEM: SYS2
DB2 VERSION: V10
PRIMAUTH PROGRAM DATABASE TABLEID TOTAL
-------- -------- -------- --------
AUTH_20 DSNESM68 DBASE1 7     1
AUTH_30 DSNESM68 DBASE1 7     1
*GRAND TOTAL*                  8
```

Layout of a Group-Scope Audit DML at Bind Access Summary Report

Here is a sample layout of a Group-Scope Audit DML at Bind Access Summary report.

```
LOCATION: LOCATI_2
GROUP: GROUP_1
DB2 VERSION: V10
DATABASE TABLEID MEMBER 1ST READ 1ST WRITE TOTAL
-------- -------- -------- -------- --------
DBASE1    7 MEMBER_2 8       8       16
7 MEMBER_3 8       8       16
*GRAND TOTAL* 16      16      32
```

Field description

The DML at bind access summary report contains the following fields:

**OMEGAMON XE for DB2 PE identifiers**

The identifiers define the order of the Audit data reported. Up to three identifiers are printed.

The defaults are:

- For member-scope reports, PRIMAUTH-PLANNAME-OBJECT
- For group-scope reports, OBJECT

For group-scope reports, MEMBER is considered the last ORDER identifier and is automatically added as the second, third, or fourth identifier.

**DATABASE**

Either the name of the database that contains the auditable DB2 table, or the internal DB2 identification (DBID) of the database that contains the auditable DB2 table.
**Note:** DATABASE is a repeating field and can have more than one entry on the report.

**TABLEID**
The object identifier (OBID) of the auditable DB2 table.

**Note:** TABLEID is a repeating field and can have more than one entry on the report.

**TOTAL**
All DML at bind events. The total number of IFCID 145 records for this set of identifiers.
DDL Access Summary Report and Fields (DDL)

This report presents all DDL access events according to the combination of OMEGAMON XE for DB2 PE identifiers specified.

Use the following command to generate a DDL access summary report.

```
AUDIT REPORT
LEVEL (SUMMARY)
TYPE (DDL)
```

8-14 OMEGAMON XE for DB2 PE & PM: Report Reference
Field description

The DDL access summary report contains the following fields:

**OMEGAMON XE for DB2 PE identifiers**

The identifiers define the order of the Audit data reported. Up to three identifiers are printed.

The defaults are:

- For member-scope reports, PRIMAUTH-PLANNAME-OBJECT
- For group-scope reports, OBJECT

For group-scope reports, MEMBER is considered the last ORDER identifier and is automatically added as the second, third, or fourth identifier.

**OBJECT OWNER**

The user identification of the owner of the audited object table accessed. It is blank for IFCID 271.

**OBJECT NAME**

The name of the accessed audited DB2 table, the ROW PERMISSION, or the COLUMN MASK objects that have been created, dropped, or altered.

**CREATE**

All create object operations.

**ALTER**

All create object operations.

**DROP**

All drop object operations.

**TOTAL**

All DDL access operations. The total number of IFCID 142 or IFCID 271 records for this set of identifiers.
DML Access Summary Report and Fields (DML)

This report presents all DML access events according to the combination of OMEGAMON XE for DB2 PE identifiers specified.

Use the following command to generate a DML access summary report.

```
AUDIT REPORT
LEVEL (SUMMARY)
TYPE (DML)
```

### Layout of a Member-Scope Audit DML Access Summary Report

```
LOCATION: LOCATI_2
GROUP: GROUP_1

DATABASE PAGESET TABLEID MEMBER 1ST READ 1ST WRITE TOTAL
-------- -------- -------- -------- -------- -------- --------
DBASE1 PSET1 7 MEMBER_2 8 8 16
7 MEMBER_3 8 8 16
*GRAND TOTAL*

16 16 32
```

### Field description

The DML access summary report contains the following fields:

**OMEGAMON XE for DB2 PE Identifiers**

The identifiers define the order of the Audit data reported. Up to three identifiers are printed.

The defaults are:

- For member-scope reports, PRIMAUTH-PLANNAME-OBJECT
- For group-scope reports, OBJECT

For group-scope reports, MEMBER is considered the last ORDER identifier and is automatically added as the second, third, or fourth identifier.

**DATABASE**

The name of the database that contains the auditable DB2 table. If the database name is unavailable, the decimal DBID is printed.
PAGESET
The name of the page set that contains the auditable DB2 table. If the page set name is unavailable, the decimal PSID is printed. If neither of these values is present, N/P is printed.

TABLEID
The object identifier (OBID) of the table, if applicable, associated with the access.

1ST READ
The total number of first read attempts within a logical unit of work against auditable DB2 tables.

1ST WRITE
The total number of first write attempts against audited DB2 tables.

TOTAL
All DML access operations. The total number of IFCID 143 and 144 records for this set of identifiers.
Utility Access Summary Report and Fields (UTILITY)

This presents all utility access events according to the combination of OMEGAMON XE for DB2 PE identifiers specified.

Use the following command to generate a utility access summary report.

```
AUDIT REPORT
  LEVEL (SUMMARY)
  TYPE (UTILITY)
```

**Note:** For ORDER, INCLUDE and EXCLUDE, the utility name is used for PLANNAME.

Layout of a Member-Scope Audit Utility Access Summary Report

Here is a sample layout of a Member-Scope Audit Utility Access Summary report.

```
LOCATION: LOCATI_2
GROUP: GROUP_1
MEMBER: MEMBER_2
SUBSYSTEM: SYSZ
DB2 VERSION: V10

PRIMAUTH UTILNAME DATABASE PAGESET TOTAL
-------- -------- -------- --------
AUTH_20 LOAD DBASE1 PSET1 4
AUTH_30 LOAD DBASE1 PSET1 4
*GRAND TOTAL* 8
```

Field description

The utility access summary report contains the following fields:

**OMEGAMON XE for DB2 PE Identifiers**

The identifiers define the order of the Audit data reported. Up to three identifiers are printed.

The defaults are:

- For member-scope reports, PRIMAUTH-PLANNAME-OBJECT
- For group-scope reports, OBJECT

For group-scope reports, MEMBER is considered the last ORDER identifier and is automatically added as the second, third, or fourth identifier.
Audit Report - Utility Access Summary (UTILITY)

DATABASE
The name of the database that contains the auditable DB2 object or the decimal DBID of that database.

PAGESET
The name or the decimal PSID of the page set that contains the DB2 object.

TOTAL
All utility access operations. Total number of IFCID 024 records for this set of identifiers.
Chapter 9. The Audit Detail Report and the Audit Trace

Both the audit detail report and the audit trace show a detailed listing of all occurrences of the different audit types. The layout of the Audit report and trace is similar. The audit trace is sorted by timestamp, the audit detail report is sorted first by identifier, then by timestamp. Any combination of event types can be specified.

Use the following command to generate an audit detail report.

```auditreport
AUDIT REPORT
  LEVEL (DETAIL)
```

Use the following command to generate an audit trace.

```
AUDIT TRACE
```

Short, Unique, or Long Names or Strings

The following types of names or strings are used in this information:

**Short name or string**
A short name or short string is either the value of an original DB2 field if it less than or equal to the defined length of the field, or it is the abbreviation of a longer value which is populated in a field of varying length.

**Unique name or string**
A unique name or unique string is a generated string based on the short string and its length, with a right-adjusted #-sign and a sequence number. This sequence number depends on the amount of long fields found during processing, which have the same string prefix and length as the short string. For example:

WSNAME: 1S-255-012345678#1

**Long name or string**
A long name or long string is the complete string populated in a field of varying length. This depends on the context where it is used.

This section shows examples of a Member-Scope Audit Detail report and trace (Type AUTHCNTL).

Field Descriptions (Audit Detail Report and Audit Trace)” on page 9-8

Authorization Change Detail (Type AUTHCHG)” on page 9-9

The following sections list the various types of authorization changes that can be printed. They describe the fields if you select AUTHCHG. The types are sorted by IFCID.

Authorization Control Detail (Type AUTHCNTL)” on page 9-19

This topic shows detailed information about “Authorization Control Detail (Type AUTHCNTL)”. 
“Authorization Failure Detail (Type AUTHFAIL)” on page 9-23
This topic shows detailed information about “Authorization Failure Detail (Type AUTHFAIL)”.

“DML at Bind Access Detail (Type BIND)” on page 9-25
This topic shows detailed information about “DML at Bind Access Detail (Type BIND)”.

“DDL Access Detail (Type DDL)” on page 9-27
This topic shows the various types of DDL Access detail that can be printed. It describes the corresponding fields if you select DDL. The types are sorted by IFCID.

“DML Access Detail (Type DML)” on page 9-31
This topic shows a sample and the field description of “DML Access Detail (Type DML)”.

“Utility Access Detail (Type UTILITY)” on page 9-32
This topic shows a sample and the field description of the “Utility Access Detail (Type UTILITY)”.
Example of a Member-Scope Audit Detail Report and Trace (Type AUTHCNTL)

This section shows examples of a Member-Scope Audit Detail report and trace (Type AUTHCNTL).

AUDIT TRACE COMPLETE

|

Chapter 9. The Audit Detail Report and the Audit Trace

9-7


Field Descriptions (Audit Detail Report and Audit Trace)

This topic contains the description of the columns of the audit detail report and audit trace.

**OMEGAMON XE for DB2 PE identifiers**

The identifiers define the order of the Audit data reported. If the requester location differs from the local location, the report or trace shows REQLOC together with the appropriate name under the first column of identifiers.

The member name (MEMBER) is printed if you requested a group-scope report or trace.

**TIMESTAMP**

The time of the event.

**TYPE**

The type of event being reported. You can control which of the events is reported using TYPE with INCLUDE or EXCLUDE. Possible values are:

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AUTHCHG</td>
<td>Authorization change.</td>
</tr>
<tr>
<td>AUTHCNTL</td>
<td>Authorization control.</td>
</tr>
<tr>
<td>AUTHFAIL</td>
<td>Authorization failure.</td>
</tr>
<tr>
<td>BIND</td>
<td>Audited DML at bind access.</td>
</tr>
<tr>
<td>DDL</td>
<td>Audited DDL access.</td>
</tr>
<tr>
<td>DML</td>
<td>Audited DML access.</td>
</tr>
<tr>
<td>UTILTY</td>
<td>Audited utility access.</td>
</tr>
</tbody>
</table>

**DETAIL**

Each event has its own specific detail.

Your selection for the TYPE option determines which of the fields described on the following pages is printed.
Authorization Change Detail (Type AUTHCHG)

The following sections list the various types of authorization changes that can be printed. They describe the fields if you select AUTHCHG. The types are sorted by IFCID.

- “Set Current SQLID (IFCID 055)” on page 9-10
  This topic provides a sample and the field description of the Authorization Change type of Set Current SQLID (IFCID 055).

- “End of Identify (IFCID 083)” on page 9-11
  This topic provides a sample and the field description of the Authorization Change type of End of Identify (IFCID 083).

- “End of Signon (IFCID 087)” on page 9-12
  This topic provides a sample and the field description of the Authorization Change type of End of Signon (IFCID 087).

- “Outbound DDF Translation (IFCID 169)” on page 9-13
  This topic provides a sample and the field description of the Authorization Change type of Outbound DDF Translation (IFCID 169).

- “Inbound DDF Translation (IFCID 169)” on page 9-14
  This topic provides a sample and the field description of the Authorization Change type of Inbound DDF Translation (IFCID 169).

- “Establish Trusted Context or Reuse Trusted Context (IFCID 269)” on page 9-15
  This topic provides a sample and the field description of the Authorization Change type of Establish Trusted Context or Reuse Trusted Context (IFCID 269).

- “KERBEROS or ENCRYPTED (IFCID 319)” on page 9-17
  This topic provides a sample and the field description of the Authorization Change type of KERBEROS or ENCRYPTED (IFCID 319).
Set Current SQLID (IFCID 055)

This topic provides a sample and the field description of the Authorization Change type of Set Current SQLID (IFCID 055).

Set Current SQLID (IFCID 055) - Authorization Change

This sample shows the layout for an authorization change type of Set Current SQLID (IFCID 055):

<table>
<thead>
<tr>
<th>TYPE</th>
<th>SET CURRENT SQLID</th>
</tr>
</thead>
<tbody>
<tr>
<td>STATUS</td>
<td>SUCCESS</td>
</tr>
<tr>
<td>PREVIOUS SQLID</td>
<td>THIS IS AN EXAMPLE OF A VERY LONG PREVIOUS SQLID THAT EXCEEDS THE LINE</td>
</tr>
<tr>
<td>NEW SQLID</td>
<td>THIS IS AN EXAMPLE OF A VERY LONG NEW SQLID THAT EXCEEDS THE LINE</td>
</tr>
</tbody>
</table>

Field description

The fields are described in the following:

**TYPE**   The kind of authorization change or establishment: SET CURRENT SQLID.

**STATUS** The success or failure of the attempted authorization change. Possible values are:

- SUCCESS for a successful authorization change
- FAILURE for a failed attempt

**Note:** The SQL statement is always successful if the user has SYSADM authority.

*Derivation*: DB2 field QW0055ST

**PREVIOUS SQLID** The initial value of the SQLID before execution of the request.

*Derivation*: DB2 field QW0055OI

**NEW SQLID** If the command completed successfully, the new value of the SQLID is shown. If the command did not complete successfully, the value of the attempted SQLID change is shown.

*Derivation*: DB2 field QW0055NI.
End of Identify (IFCID 083)

This topic provides a sample and the field description of the Authorization Change type of End of Identify (IFCID 083).

End of Identify (IFCID 083) - Authorization Change

This sample shows the layout for an authorization change type of End of Identify (IFCID 083):

<table>
<thead>
<tr>
<th>TYPE:</th>
<th>END OF IDENTIFY</th>
<th>STATUS:</th>
<th>SUCCESS</th>
</tr>
</thead>
<tbody>
<tr>
<td>PREVIOUS AUTHID:</td>
<td>KARN</td>
<td>CURRENT SQLID:</td>
<td>KARN</td>
</tr>
<tr>
<td>SECONDARY AUTHID:</td>
<td>DEV03704</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Field description

The fields are described in the following:

TYPE
The kind of authorization change or establishment: END OF IDENTIFY.

STATUS
The success or failure of the attempted authorization change. Possible values are:

SUCCESS
The access is permitted.

EXITFAIL
The access is denied by the authorization exit.

FAILURE
The access is denied by the security authorization facility or security system.

Derivation: DB2 field QW0083AD

PREVIOUS AUTHID
The original value of the authorization ID, as passed to the IDENTIFY or SIGNON authorization exit.

Derivation: DB2 field QW0083OP

CURRENT SQLID
The value of the authorization ID as set by the IDENTIFY or SIGNON authorization exit.

Derivation: DB2 field QW0083QD

SECONDARY AUTHID
Lists the secondary authorization IDs set by the IDENTIFY or SIGNON authorization exit. If no secondary authorization IDs exist, this line is not printed. Secondary authorization IDs are printed in rows of five, up to a maximum of 49 rows (245 AUTHIDs).

Derivation: DB2 field QW0083SA
End of Signon (IFCID 087)

This topic provides a sample and the field description of the Authorization Change type of End of Signon (IFCID 087).

End of Signon (IFCID 087) - Authorization Change

This sample shows the layout for an authorization change type of End of Signon (IFCID 087):

<table>
<thead>
<tr>
<th>TYPE:</th>
<th>END OF SIGNON</th>
</tr>
</thead>
<tbody>
<tr>
<td>STATUS:</td>
<td>SUCCESS</td>
</tr>
<tr>
<td>PREV AUTHID:</td>
<td>XXASP07</td>
</tr>
<tr>
<td>NEW AUTHID:</td>
<td>XXASP09</td>
</tr>
<tr>
<td>SECONDARY AUTHID:</td>
<td>XXXASP09 XXASP11 XXASP26</td>
</tr>
</tbody>
</table>

Field description

The fields are described in the following:

**TYPE**  The kind of authorization change or establishment: END OF SIGNON.

**STATUS**  The success or failure of the attempted access. Possible values are:

- **SUCCESS**  The access is permitted.
- **EXITFAIL**  The access was denied by the signon authorization exit.

  *Derivation:* DB2 field QW0087AD

**PREV AUTHID**  The original value of the authorization ID, as passed to the IDENTIFY or SIGNON authorization exit.

  *Derivation:* DB2 field QW0087OP

**NEW AUTHID**  The value of the authorization ID as set by the IDENTIFY or SIGNON authorization exit.

  *Derivation:* DB2 field QW0087QD

**SECONDARY AUTHID**  Lists the secondary authorization IDs set by the IDENTIFY or SIGNON authorization exits. If no secondary authorization IDs exist, this line is not printed. Secondary authorization IDs are printed in rows of five, up to a maximum of 49 rows (245 AUTHIDs).

  *Derivation:* DB2 field QW0087SA
Outbound DDF Translation (IFCID 169)

This topic provides a sample and the field description of the Authorization Change type of Outbound DDF Translation (IFCID 169).

Outbound DDF Translation (IFCID 169) - Authorization Change

This sample shows the layout for an authorization change type of Outbound DDF Translation (IFCID 169):

```
| TYPE                  | OUTBOUND DDF TRANSLATION |
|                       | REMOTE LU NAME: 'BLANK'  |
| PREVIOUS AUTHID       | PSYSAUTH                  |
| NEW AUTHID            | NSYSAUTH                  |
| RESPOND LOCATION      | RESPONDING LOCNM          |
| TYPE                  | OUTBOUND DDF TRANSLATION |
| RESPOND LOCATION      | RESPONDING LOCNM          |
| DATABASE ALIAS        | THIS IS AN EXAMPLE OF A VERY LONG ALIAS NAME THAT EXCEEDS THE OUTPUT LINE |
| TYPE                  | OUTBOUND DDF TRANSLATION |
| PREV. SYSAUTHID       | PSYSAUTH                  |
| NEW SYSAUTHID         | NSYSAUTH                  |
| RESPOND LOCATION      | RESPONDING LOCNM          |
| DATABASE ALIAS        | THIS IS AN EXAMPLE OF A VERY LONG ALIAS NAME THAT EXCEEDS THE OUTPUT LINE |
```

Field description

The fields are described in the following:

**TYPE**  
The kind of authorization change or establishment: OUTBOUND DDF TRANSLATION.

**REMOTE LU NAME**  
The logical unit name of the DB2 subsystem.

*Derivation:* DB2 field QW0169LU

**PREVIOUS AUTHID**  
The authorization ID before translation.

*Derivation:* DB2 field QW0169AU

**NEW AUTHID**  
The new value of the authorization ID.

*Derivation:* DB2 field QW0169NE

**RESPOND LOCATION**  
The location name of the serving DB2 subsystem. For outbound translation and for inbound translation with AUTHIDs this field shows the responding location name.

*Derivation:* DB2 field QW0169LO

**DATABASE ALIAS**  
The database alias name sent to the server.

*Derivation:* DB2 field QW0169AL

**PREV. SYSAUTHID**  
The system authorization ID before translation.

*Derivation:* DB2 field QW0169AU
Inbound DDF Translation (IFCID 169)

This topic provides a sample and the field description of the Authorization Change type of Inbound DDF Translation (IFCID 169).

Inbound DDF Translation (IFCID 169) - Authorization Change

This sample shows the layout for an authorization change type of Inbound DDF Translation (IFCID 169):

<table>
<thead>
<tr>
<th>TYPE:</th>
<th>INBOUND DDF TRANSLATION</th>
<th>REMOTE LU NAME:</th>
<th>‘BLANK’</th>
</tr>
</thead>
<tbody>
<tr>
<td>PREVIOUS AUTHID:</td>
<td>PSYSAUTH</td>
<td></td>
<td></td>
</tr>
<tr>
<td>NEW AUTHID:</td>
<td>NSYSAUTH</td>
<td></td>
<td></td>
</tr>
<tr>
<td>RESPOND LOCATION:</td>
<td>RESPONDING</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>TYPE:</th>
<th>INBOUND DDF TRANSLATION</th>
<th>REMOTE LU NAME:</th>
<th>‘BLANK’</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOCAL LOCATION:</td>
<td>RESPONDING LOCNM</td>
<td></td>
<td></td>
</tr>
<tr>
<td>LOCATION ALIAS:</td>
<td>THIS IS AN EXAMPLE OF A VERY LONG LOCATION ALIAS NAME THAT EXCEEDS THE OUTPUT LINE</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Field description

The fields are described in the following:

**TYPE**  The kind of authorization change or establishment: INBOUND DDF TRANSLATION.

**REMOTE LU NAME**  The logical unit name of the DB2 subsystem.

*Derivation:* DB2 field QW0169LU

**PREVIOUS AUTHID**  The authorization ID before translation.

*Derivation:* DB2 field QW0169AU

**NEW AUTHID**  The new value of the authorization ID.

*Derivation:* DB2 field QW0169NE

**RESPOND LOCATION**  The location name of the serving DB2 subsystem. For outbound translation and for inbound translation with AUTHIDs this field shows the responding location name.

*Derivation:* DB2 field QW0169LO

**LOCAL LOCATION**  The location name of the serving DB2 subsystem. For inbound translation with location alias name this field shows the local location name.

*Derivation:* DB2 field QW0169LO

**LOCATION ALIAS**  For translation type inbound this field shows the location alias name received from the requestor.

*Derivation:* DB2 field QW0169AL
Establish Trusted Context or Reuse Trusted Context (IFCID 269)

This topic provides a sample and the field description of the Authorization Change type of Establish Trusted Context or Reuse Trusted Context (IFCID 269).

Establish Trusted Context or Reuse Trusted Context (IFCID 269) - Authorization Change

This sample shows the layout for an authorization change type of Establish Trusted Context or Reuse Trusted Context (IFCID 269):

- **TYPE:** ESTABLISH TRUSTED CONTEXT
- **STATUS:** SUCCESS
- **OBJECT OWNER:** ROLE
- **SECURITY LABEL:** SECLABEL
- **CONTEXT NAME:** THIS IS AN EXAMPLE OF A VERY LONG XXXXXXXXXXXXXXX NAME THAT EXCEEDS THE OUTPUT LINE
- **CONTEXT ROLE:** THIS IS AN EXAMPLE OF A VERY LONG CONTEXT ROLE THAT EXCEEDS THE OUTPUT LINE
- **USER ROLE:** THIS IS AN EXAMPLE OF A VERY LONG USER ROLE THAT EXCEEDS THE OUTPUT LINE
- **PREV. SYSAUTHID:** THIS IS AN EXAMPLE OF A VERY LONG SYSTEM AUTHENTICATION ID THAT EXCEEDS THE OUTPUT LINE
- **REUSE AUTHID:** THIS IS AN EXAMPLE OF A VERY LONG REUSE AUTHENTICATION ID THAT EXCEEDS THE OUTPUT LINE
- **SERVAUTH NAME:** THIS IS AN EXAMPLE OF A VERY LONG SERVER AUTHENTICATION NAME THAT EXCEEDS THE OUTPUT LINE
- **JOB NAME:** THIS IS AN EXAMPLE OF A VERY LONG LOCAL JOB NAME THAT EXCEEDS THE OUTPUT LINE
- **ENCRYPTION:** THIS IS AN EXAMPLE OF A VERY LONG ENCRYPTION VALUE THAT EXCEEDS THE OUTPUT LINE
- **TCP/IP USED:** THIS IS AN EXAMPLE OF A VERY LONG USED TCP/IP ADDRESS THAT EXCEEDS THE OUTPUT LINE

Field description

The fields are described in the following:

**TYPE**  The kind of authorization change or establishment: ESTABLISH TRUSTED CONTEXT.

**STATUS**  The status of the trusted connection:

SUCCESS  If a trusted connection was established or reused successfully.

FAILED or FAILURE  If a trusted connection failed, when it was tried to be established or reused.

If the status is neither SUCCESS nor FAILURE, the value itself is shown.

*Derivation:* DB2 field QW0269ST

**OBJECT OWNER**  The owner of objects created in the trusted context.

**SQLCODE**  The SQLCODE returned after executing the SQL statement.

*Derivation:* DB2 field QW0269SQ

**SECURITY LABEL**  The security label.

*Derivation:* DB2 field QW0269SL

**CONTEXT NAME**  The trusted context name.

Chapter 9. The Audit Detail Report and the Audit Trace
Derivation: DB2 field QW0269TC

CONTEXT ROLE
The default role associated with the context.

Derivation: DB2 field QW0269RC

USER ROLE
The user role.

Derivation: DB2 field QW0269RU

PREV. SYSAUTHID
The system authorization ID that is used to establish the trusted connection.

Derivation: DB2 field QW0269SA

REUSE AUTHID
The authorization ID under which a trusted connection is reused.

Derivation: DB2 field QW0269RA

SERVAUTH NAME
The SERVAUTH name of the TCP/IP security zone.

Derivation: DB2 field QW0269SR

JOB NAME
The job name for a local application.

Derivation: DB2 field QW0269JN

ENCRYPTION
The encryption value.

Derivation: DB2 field QW0269EC

TCP/IP USED
The actual communication TCP/IP address used for connection.

Derivation: DB2 field QW0269AD
KERBEROS or ENCRYPTED (IFCID 319)

This topic provides a sample and the field description of the Authorization Change type of KERBEROS or ENCRYPTED (IFCID 319).

KERBEROS or ENCRYPTED (IFCID 319) - Authorization Change

This sample shows the layout for an authorization change type of KERBEROS or ENCRYPTED (IFCID 319):

```
TYPE: KERBEROS
COMMS ADDR TYPE: TCP/IP
IP ADDR: 000102030405060718191A1B1C1D1E1F
PORT: 1234
DERIVED LOCAL UID: DERLOCID
CLIENT PRODUCT ID: CLPROOID
PRINCIPAL NAME: THIS IS AN EXAMPLE OF A VERY LONG REQUESTING KERBEROS NAME THAT EXCEEDS THE OUTPUT LINE
```

```
TYPE: KERBEROS
COMMS ADDR TYPE: SNA
```

```
TYPE: ENCRYPTED
COMMS ADDR TYPE: TCP/IP
IP ADDR: 000102030405060718191A1B1C1D1E1F
PORT: 1234
DERIVED LOCAL UID: DERLOCID
SECURITY MECHANISM: UID Encrypt PW.
```

```
TYPE: ENCRYPTED
COMMS ADDR TYPE: SNA
```

Field description

The fields are described in the following:

**TYPE**  The type of security identity: KERBEROS or ENCRYPTED.

*Derivation:* DB2 field QW0319TY

**COMMS ADDR TYPE**  Type of communication address: SNA or TCP/IP.

*Derivation:* DB2 field QW0319CT

**IP ADDR**  If the type of the communication address is TCP/IP, it is the 16 byte hexadecimal (HLHLHLHLHLHLHLHLHLHLHLHLHLHLHLHL) IP address of the internal 128 bit format, where:

- H represents the high order half byte value
- L represents the low order half byte value

*Derivation:* DB2 field QW0319IPA

**PORT**  The internal port format in case of communication address type TCP/IP.

*Derivation:* DB2 field QW0319PRT

**DERIVED LOCAL UID**  Local user ID mapped by DB2.

*Derivation:* DB2 field QW0319US

**CLIENT PRODUCT ID**  The identification of the client product.

*Derivation:* DB2 field QW0319CP
PRINCIPAL NAME
The requesting principal name. This can be up to 256 characters and can contain lowercase characters.
*Derivation: DB2 field QW0319D1*

LU NAME
If the type of the communication address is SNA, it is the 8 byte logical unit name.
*Derivation: DB2 field QW0319LUN*

SECURITY MECHANISM
The security mechanism. Possible values are:
- UID Encrypt PW
- Encrypt UID PW
- Encrypt UID PW NewPW
- Encrypt UID Data
- Encrypt UID PW Data
- Encrypt UID PW NewPW
- Data Encrypt UID only
*Derivation: DB2 field QW0319SM*
Authorization Control Detail (Type AUTHCNTL)

This topic shows detailed information about “Authorization Control Detail (Type AUTHCNTL)”.

When you select AUTHCNTL, the data is retrieved from IFCID 141 or 361, and the following fields are printed:

For the GRANTOR (IFCID 141)

<table>
<thead>
<tr>
<th>GRANTOR: JUB</th>
<th>OWNER TYPE: ROLE</th>
<th>REASON: N/P</th>
<th>SQLCODE: 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>OBJECT TYPE: TAB/VIEW TEXT: GRANT INSERT ON TABLE JUB.AUDTB1 TO PUBLIC</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

GRANTOR or REVOKER
The authorization ID of the user who issued the GRANT or REVOKE.
This field is blank if the BY clause is used in a REVOKE statement.

OWNER TYPE
The authorization type of the owner. Possible values are:

- ROLE  A role is used.

PRIM/SECOND AUTHID
The user ID of the primary or the secondary authorization ID is used.

N/P  Not present. A blank is shown in the performance database.

REASON
The reason why access was granted.

In the Audit report set this field is only valid for GRANTS. It indicates the authorization level of the grantor. For REVOKEs and unsuccessful GRANTS, N/A is printed.

Possible values are:

- PACKADMA (abbreviation for PACKADM ON ALL COLLECTIONS)
- DBCTRL  
- DBADM  
- SECADM  
- ACCCTRL (abbreviation for ACCESSCTRL)
- SYSCTRL  
- DBMAINT  
- SYSOPR  
- PACKADMS (abbreviation for PACKADM ON A SPECIFIC COLLECTION-ID)
- SYSADM

SQLCODE
The SQL return code from the GRANT or REVOKE operation.

OBJECT TYPE
The DB2 object type. Possible values are:

BUFFER  
  Buffer Pool

COLLECT  
  Collection
Audit Report - Authorization Control Detail (Type AUTHCNTL)

DATABASE
   Database
DISTTYPE
   Distinct Type
FUNCTION
   Function
PACKAGE
   Package
SCHEMA
   Schema
PROCEDUR
   Procedure
APPLPLAN
   Application Plan
LOBTS
   Large objects table space
STOGROUP
   Storage Group
TAB/VIEWS
   Table or View
USERAUTH
   System privileges, such as SYSADM or SYSOPR
SEQUENCE
   Sequence
ACEE
   Access control environment element
ROW
   Row
TEXT
   The SQL statement text associated with the GRANT or REVOKE. Long SQL text can be truncated.

For the authorization ID (AUTHID) (IFCID 361)

AUTHCNTL AUTH TYPE: SYSADM
   PRIV CHECKED: EXECUTE
   AUTHID: SYSADM
   SOURCE OBJECT QUALIFIER: DSNTEP3
   NAME: DSNTEP3
   TARGET OBJECT QUALIFIER: N/P
   NAME: N/P
   OTHER OBJECT NAME: N/P
   TEXT: N/P

Or ROLE instead of AUTHID:

AUTH TYPE: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
   PRIV CHECKED: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
   ROLE: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
   SOURCE OBJECT QUALIFIER: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
   NAME: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
   TARGET OBJECT QUALIFIER: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
   NAME: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
   OTHER OBJECT
Audit Report - Authorization Control Detail (Type AUTHCNTL)

NAME:  xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

TEXT:  xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

AUTH TYPE

The authority type.
Possible values are:
• SYSDBADM (System DBADM)
• DBCTRL
• DBADM
• SECADM
• ACCSCTRL (ACCESSCTRL)
• SYSADMI (Installation SYSADM)
• SQLADM
• SYSCTRL
• DBMAINT
• SYSOPR
• PACKADM
• SYSOPRI (Installation SYSOPR)
• SYSADM
• DATAACC (DATAACCESS)
• USER

PRIV CHECKED

The privilege that was checked. Possible values are provided in the DB2 macro DSNDQW05.

OBJECT TYPE

The DB2 object type.
Possible values are:
• ACEE
• BUFFER (Bufferpool)
• COLLECT (Collection)
• DATABASE
• DISTTYPE (Distinct Type)
• FUNCTION
• SESSIONV (Session Variable)
• JAR
• PACKAGE
• ROLE
• SCHEMA
• TRUSTCTX (Trusted Context)
• PROCEDUR (Procedure)
• APPLPLAN (Application Plan)
• LOBTS (LOB Tablespace)
• STOGROUP (Storage Group)
• TAB/VIEW (Table or View)
Audit Report - Authorization Control Detail (Type AUTHCNTL)

- USERAUTH (User Auth)
- SEQUENCE
- ROW

AUTHID or ROLE
The authorization ID or the role that has the authority.

SOURCE OBJECT - QUALIFIER
The source object qualifier or owner.

SOURCE OBJECT - NAME
The source object name.

TARGET OBJECT - QUALIFIER
The target object qualifier or owner.

TARGET OBJECT - NAME
The target object name.

OTHER OBJECT - NAME
The other object name or subsystem parameter.

TEXT
The SQL statement (truncated at 4000 bytes).
Authorization Failure Detail (Type AUTHFAIL)

This topic shows detailed information about “Authorization Failure Detail (Type AUTHFAIL)”.

When you select AUTHFAIL, the data is retrieved from IFCID 140, and the following fields are printed:

- **AUTHID CHECKED**: DE#08541
- **PRIVILEGE**: VALID
- **SECLABEL**
- **OBJECT TYPE**: ACEE
- **REASON**: 0
- **SOURCE OBJECT**: AUDDB1
- **SOURCE OWNER**: DE#08541
- **TARGET OBJECT**: AUDTB4
- **TARGET OWNER**: DE#08541
- **MLS RID**: XXXXX
- **SECLABEL**: XXXXXXX
- **TEXT**: CREATE TABLE AUDTB4 (IDCOLUMN ROWID GENERATED ALWAYS NOT NULL, BELIEBIG CHAR(50)) IN AUDDB1.AUDTS1

**Field description**

Here is a description of the field labels shown in the previous example:

- **AUTHID CHECKED**
  The authorization ID causing the failure.

- **PRIVILEGE**
  The privilege that was checked. Possible values are provided in the DB2 macro DSNDQW02.

- **OBJECT TYPE**
  The DB2 object type. Possible values are:
  - **ACEE**: Access control environment element (ACEE)
  - **APPLPLAN**: Application Plan
  - **BUFFER**: Buffer Pool
  - **COLLECT**: Collection
  - **DATABASE**: Database
  - **DISTTYPE**: Distinct Type
  - **FUNCTION**: Function
  - **LOBTS**: Table Space
  - **PACKAGE**: Package
  - **PROCEDUR**: Procedure
  - **ROW**: Row
  - **SCHEMA**: Schema
  - **SEQUENCE**: Sequence
Audit Report - Authorization Failure Detail (Type AUTHFAIL)

STOGROUP
   Storage Group

TAB/VIEW
   Table or View

USERAUTH
   System privileges, such as SYSADM or SYSOPR

REASON
   The user-defined reason code from the access control authorization exit routine.

RC
   The return code from the access control authorization exit routine. A value of 0 means "not applicable".

SOURCE OBJECT
   If the OBJECT TYPE field is not blank, this field displays the name of the object against which the authorization was checked.

   If the object type is blank, then this field displays the name of the object being created. It is valid only when the privilege is CREATE ALIAS, CREATE DBA, CREATE DBC, or CREATE STOGROUP.

   Otherwise, N/A is printed.

SOURCE OWNER
   If the OBJECT TYPE field is not blank, this field displays the qualifier of the object against which the authorization was checked. It is valid only for qualifiable objects.

   If the object type is blank, this field displays the qualifier of the alias being created. It is valid only when the privilege is CREATE ALIAS.

   Otherwise, N/A is printed.

TARGET OBJECT
   The name of the object being defined. It is valid only when the target owner field is valid. Otherwise, N/A is printed.

TARGET OWNER
   The qualifier of the object being defined. It is valid when the privilege is CREATE INDEX or CREATE TABLE. It is also valid for a CREATE VIEW authorization check against the set of CREATE VIEW, SELECT, INSERT, DELETE, and UPDATE privileges. Otherwise, N/A is printed.

MLS RID
   The record identifier (RID) of the Multilevel Security (MLS) table that is updated or deleted.

SECLABEL
   The security label of a row in the Multilevel Security (MLS) table.

TEXT
   The SQL statement text associated with the failure. Long SQL statement text can be truncated, depending on the amount of space available.
## DML at Bind Access Detail (Type BIND)

This topic shows detailed information about “DML at Bind Access Detail (Type BIND)”.

When you select the BIND type, the data is retrieved from IFCID 145, and the following fields are printed:

<table>
<thead>
<tr>
<th>TYPE</th>
<th>DETAIL</th>
</tr>
</thead>
</table>
| BIND | PACKAGE: PM01DB11.DSNREXX.DSNREXX.X 'I74B9F33IC568TC2'  
 | STMT#: 0  
 | ISOLATION(CS): 'BLANK'  
 | KEEP UPD LOCKS: NO  
 | TEXT: INSERT INTO PRL.AUDTB1 OVERRIDING USER VALUE VALUES(NULL, 'HEIDI', 'AXEL', 1)  
 | DATABASE: 264  
 | ACCESS CTRL SCHEMA: N/P  
 | ACCESS CTRL OBJECT: N/P |

### Field description

**PACKAGE/DBRM NAME**

The name of the database request module (DBRM) or package containing the DML statement being bound.

A package name is made up of the following parts:

**Location**

The location name is applicable only to packages, otherwise 'BLANK' is printed.

**Collection ID**

The package collection ID is applicable only to packages, otherwise 'BLANK' is printed.

**Package ID**

The program name for DBRMs or the package ID for packages.

**Consistency token**

A hexadecimal dump of the DB2 timestamp of the program during precompilation. This field contains the value in the TIMESTAMP column of SYSIBM.SYSDBRM. The value represents the time of the precompilation in internal format, that is, modified store clock (STCK) format.

**TYPE**

The type of statement being bound.

**STMT#**

The statement number in the program or DBRM involved in the bind.

**ISOLATION**

The isolation of the bind. Possible values are:

- **CS**: Cursor stability
- **RR**: Repeatable read
- **RS**: Read stability
- **UR**: Uncommitted read

**KEEP UPD LOCKS**

Indicates if an update lock is kept. YES is only valid if the value in the TYPE field is SQL OPEN CURSOR and the value in the ISOLATION field is RR or RS.

**TEXT**

The SQL statement text associated with the BIND. If SQL text is not present, N/P is printed. Long SQL text can be truncated.
Audit Report - DML at Bind Access Detail (Type BIND)

DATABASE
Either the name or the decimal DBID of the database that contains the auditable DB2 table. The name is printed if known, otherwise OMEGAMON XE for DB2 PE reports a decimal DBID.

TABLE OBID
The object identifier (OBID) of the DB2 table.

Note: DATABASE and TABLE OBID are repeating fields and can have more than one entry in the report or trace. Two or more occurrences result from a DML statement that refers to two or more DB2 tables.

STMT ID
The SQL unique statement ID.

ACCESS CTRL SCHEMA
The name of the access control schema.

ACCESS CTRL OBJECT
The name of the access control object.
DDL Access Detail (Type DDL)

This topic shows the various types of DDL Access detail that can be printed. It describes the corresponding fields if you select DDL. The types are sorted by IFCID.

“Create Trusted Context or Alter Trusted Context (IFCID 270)” on page 9-28
This topic shows a sample and the field description of a DDL change type of Create Trusted Context or Alter Trusted Context (IFCID 270).

“DDL data retrieved from IFCID 142 or 271” on page 9-29
This topic shows a sample and the field description of DDL data retrieved from IFCID 142 or 271.
Create Trusted Context or Alter Trusted Context (IFCID 270)

This topic shows a sample and the field description of a DDL change type of Create Trusted Context or Alter Trusted Context (IFCID 270).

The following sample shows the layout for an DDL change type of Create Trusted Context or Alter Trusted Context (IFCID 270):

TYPE: CREATE TRUSTED CONTEXT
SQLCODE: 100
TEXT: THIS IS THE VARIABLE LENGTH SQL STATEMENT WHEN A TRUSTED CONTEXT IS CREATED OR ALTERED. MAXIMUM LENGTH IS 4000.

Field description

The fields are described in the following:

**TYPE**  The type of trusted context. Possible values are:

- CREATE TRUSTED CONTEXT or CREATE
  If a trusted context is created.
- ALTER TRUSTED CONTEXT or ALTER
  If a trusted context is altered.

  *Derivation: DB2 field QW0270TY*

**SQLCODE**  The SQL return code from the CREATE or ALTER TRUSTED CONTEXT statement.

  *Derivation: DB2 field QW0270SQ*

**TEXT**  The SQL statement (truncated at 4000 bytes).

  *Derivation: DB2 field QW0270SS*
DDL data retrieved from IFCID 142 or 271

This topic shows a sample and the field description of DDL data retrieved from IFCID 142 or 271.

If the data is retrieved from IFCID 142, ...

If you select DDL and the data is retrieved from IFCID 142 and the following fields are printed:

<table>
<thead>
<tr>
<th>TABLE NAME: AUDTB1</th>
<th>OWNER: JUB</th>
<th>CREATOR: JUB</th>
</tr>
</thead>
<tbody>
<tr>
<td>DATABASE: 274</td>
<td>TABLE OBID: 3</td>
<td>TYPE: CREATE</td>
</tr>
<tr>
<td>OWNER TYPE: PRIM/SECOND AUTHID</td>
<td>SECLABEL: XXXXXXXX</td>
<td>MLS: XXXX</td>
</tr>
<tr>
<td>R/C ACCESS CTRL: COLUMN</td>
<td></td>
<td></td>
</tr>
<tr>
<td>TEXT: CREATE TABLE JUB.AUDTB1 (IDCOLUMN INTEGER GENERATED ALWAYS AS IDENTITY, NNAME VARCHAR(50) NOT NULL, VNAME CHAR(10) NOT NULL, ANZAHL INTEGER NOT NULL) AUDIT ALL IN AUDDB1.AUDTS1</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**TABLE NAME**

The name of the audited DB2 table.

**OWNER**

The authorization ID of the owner of the audited DB2 table.

**CREATOR**

The authorization ID of the creator of the DB2 table.

**DATABASE**

Either the name or the decimal DBID of the database that contains the auditable DB2 table. The name is printed if known, otherwise OMEGAMON XE for DB2 PE reports a decimal DBID.

**TABLE OBID**

The object identifier (OBID) of the auditable table associated with the access.

**TYPE**

The statement type. Possible values are:
- CREATE
- DROP
- ALTER

**OWNER TYPE**

The type of the table owner. Possible values are:
- ROLE A role is used.
- PRIM/SECOND AUTHID

The user ID of the primary or the secondary authorization ID is used.

- N/P A blank is shown in the performance database.
- N/A A blank is shown in the performance database.

**SECLABEL**

The security label of the user.

**MLS**

The Multilevel Security (MLS) table can contain the following values:
- Y For a Create or Drop operation of a table that has multilevel security, or for an Alter operation of a table to add a security label column.
- N For an Alter operation of a table that has multilevel security.
- NONE The table does not have multilevel security.
Audit Report - DDL Access Detail (Type DDL)

N/P  Not present. A blank is shown in the performance database.
N/A  A blank is shown in the performance database.

R/C ACCESS CTRL
The access control field contains data about ROW-LEVEL and COLUMN-LEVEL (R/C) ACCESS CONTROL in DDL. It can have the following values:
'R' (ROW)
   Activates row-level access control.
'C' (COLUMN)
   Activates column-level access control.
'B' (BOTH)
   Activates row-level and column-level access control.
' ' (NO)
   Activates no access control.

TEXT  The SQL statement text associated with the table access. Long SQL text can be truncated.

If the data is retrieved from IFCID 271, ...

If you select DDL and the data is retrieved from IFCID 271, the following fields are printed:

<table>
<thead>
<tr>
<th>TYPE</th>
<th>DETAIL</th>
</tr>
</thead>
</table>
| DDL  | CHANGE TYPE: CREATE OBJECT: ROW PERMISSION SQLCODE: XXXX TEXT: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
DML Access Detail (Type DML)

This topic shows a sample and the field description of “DML Access Detail (Type DML)”.

When you select DML, the data is retrieved from IFCID 143 and 144, and the following fields are printed:

<table>
<thead>
<tr>
<th>TYPE</th>
<th>DETAIL</th>
</tr>
</thead>
<tbody>
<tr>
<td>DML</td>
<td>TYPE : 1ST WRITE</td>
</tr>
<tr>
<td></td>
<td>STMT ID : 0</td>
</tr>
<tr>
<td>DATABASE: 318</td>
<td>TABLE OBID: 42</td>
</tr>
<tr>
<td>PAGESET : 41</td>
<td>LOG RBA : X'0042ECF1B144'</td>
</tr>
</tbody>
</table>

Field description

TYPE  The type of access. It is determined by the IFCID (143 is a WRITE and 144 is a READ).

STMT ID  The statement ID.

DATABASE  Either the name or the decimal DBID of the database that contains the auditable DB2 table. The name is printed if known, otherwise OMEGAMON XE for DB2 PE reports a decimal DBID.

TABLE OBID  The object identifier (OBID) of the auditable DB2 table associated with the access.

PAGESET  Either the name or the decimal PSID of the page set that contains the auditable DB2 table. The name is printed if known, otherwise OMEGAMON XE for DB2 PE reports a decimal PSID. If neither field is available, N/A is printed in this field.

LOG RBA  The log relative byte address of the current unit of recovery. It is printed in hexadecimal, when present.
Audit Report - Utility Access Detail (Type UTILITY)

Utility Access Detail (Type UTILITY)

This topic shows a sample and the field description of the “Utility Access Detail (Type UTILITY)”.

When you select UTILITY, the data is retrieved from IFCID 024, and the following fields are printed:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>NAME</td>
<td>LOAD</td>
</tr>
<tr>
<td>DATABASE</td>
<td>DBASE1</td>
</tr>
<tr>
<td>PAGESET</td>
<td>PSET1</td>
</tr>
<tr>
<td>ID</td>
<td>DSNTEX</td>
</tr>
<tr>
<td>PHASE</td>
<td>RELOAD</td>
</tr>
<tr>
<td>TYPE</td>
<td>RECORD</td>
</tr>
</tbody>
</table>

Field description

Here is a description of the field labels shown in the previous example:

NAME
The name of the utility.

ID
The DB2 user’s identification of the utility.

DATABASE
Either the name or the decimal DBID of the database that contains the auditable DB2 object.

For the report entry describing the start of a utility (IFCID 023), N/P is printed. To determine the real value, find the corresponding entry describing the utility object or phase change (IFCID 024), or the entry describing the utility end information.

PHASE
The utility phase identification.

PAGESET
Either the name or the decimal PSID of the page set that contains the auditable DB2 object. If neither field is present, N/A is printed.

TYPE
The type of utility access. For the utility phase UTILINIT and UTILTERM, N/A is printed.
Chapter 10. The Audit File Data Set and Output Record

The FILE subcommand formats DB2 Audit records and writes them to sequential data sets that can be loaded into DB2 tables.

The audit FILE subcommand produces up to seven sequential variable-blocked data sets. You can use FILE to separate the various audit types by specifying one audit type per FILE subcommand.

The content of the output data set is determined by the options you specify for the FILE subcommand and by the input DB2 audit trace data processed.

Each output record is divided into several parts:

- The **Standard Header** section contains header data common to all records. This section is at the beginning of each record. It contains DB2 identifier information known as the correlation header. It also contains the DB2 distributed network header information associated with the record.
- The **Data** section lists data unique to the audit category of the record. Each audit type maps the areas of the record differently. Records which share the same header information have a repeating subtype.

File data is written to a File data set. The following types of records are created:

- Bind
- Auth Change
- Auth Control
- DDL
- Auth Failure
- SQL
- Utility

Descriptions of the layouts of these records can be found in the RKO2SAMP library under the following names:

- **DGOXDBND**
  - Bind
- **DGOXDCHG**
  - Auth Change
- **DGOXDCNT**
  - Auth Control
- **DGOXDDDL**
  - DDL
- **DGOXDDML**
  - DML
- **DGOXDFAI**
  - Auth Failure
- **DGOXDSQL**
  - SQL
Audit Report - File Data Set

Utility
Part 4. Explain Report

These topics provide information about the Explain report.

The Explain report of OMEGAMON XE for DB2 PE is divided into sections. The sections that are shown in the Explain report depend on:

- Which object is to be explained.
  Most sections are applicable to all explain functions, but there are a few which are applicable to selected functions only.
- The requested level of detail.

At normal completion of Explain, the last pages of the output show a summary of the OMEGAMON XE for DB2 PE explain execution. This is called the Summary Report.

Note: For an introduction to the Explain report set and general explain information refer to the [Reporting User’s Guide](#). For details on how to specify EXPLAIN commands refer to the [Report Command Reference](#).

Chapter 11, “The Page Header,” on page 11-1
The explain page header is printed on every page of the Explain report.

Chapter 12, “Object Identification,” on page 12-1
Use the page header to quickly identify the object that is explained. A complete identification is contained in the object identification section of the report.

Chapter 13, “Table PLAN_TABLE Data,” on page 13-1
This section of the Explain report lists the raw EXPLAIN data as found in the DB2 table PLAN_TABLE.

Chapter 14, “Access Path Data,” on page 14-1
This section of the Explain report introduces the access path chosen by DB2.

Chapter 15, “Index Data,” on page 15-1
If an index is used, that is, an access path other than TABLE SPACE SCAN, information about this index is shown. The data is derived from the SYSIBM.SYSINDEXES table.

Chapter 16, “Key Data,” on page 16-1
If an index is used and LEVEL(INDEXES) is not specified, information about the key columns is presented. The data is derived from the SYSIBM.SYSKEYS and SYSIBM.SYSCOLUMNS tables.

Chapter 17, “Key Distribution Data,” on page 17-1
This section introduces the Key Distribution Data.

Chapter 18, “Table and Table Space Data,” on page 18-1
This section of the Explain report shows information for the accessed table and its corresponding table space.

Chapter 19, “Host Variable Data,” on page 19-1
This section of the Explain report is produced if HOSTVAR(YES) is specified for the OMEGAMON XE for DB2 PE explain plan or package.

Chapter 20, “Bind Plan Data,” on page 20-1
This section of the Explain report is shown if the object being explained is a plan or query number for a mini plan created by the bind process. Information related to the binding of the plan, such as plan binder, bind time, or isolation level, is presented.
Chapter 21, “Bind Package Data,” on page 21-1
This section of the Explain report is shown if the object being explained is a package.

Chapter 22, “Summary Report,” on page 22-1
This section introduces the summary report.

Chapter 23, “EXPLAIN PLAN Command,” on page 23-1
This section introduces the EXPLAIN PLAN command.

Chapter 24, “EXPLAIN PACKAGE Command,” on page 24-1
This section introduces the EXPLAIN PACKAGE command.

Chapter 25, “EXPLAIN SQLSTMT Command,” on page 25-1
This section shows an example of an Explain report generated with the EXPLAIN SQLSTMT command.
Chapter 11. The Page Header

The explain page header is printed on every page of the Explain report.

For details on how to specify EXPLAIN PACKAGE commands refer to the Report Command Reference.

Explain - General Page Header

This sample shows the header of an Explain report, in its general form:

ACTUAL AT: 02/18/16 15:05:08 OMEGAMON XE DB2 PE (V5.4) PAGE: 1-1
EXPLAIN PACKAGE DB2 VERSION: V10
LOCATION: PMODA11 DGOFTPG3 USER AUTHID: XRR
SUBSYSTEM: DA11 DETAIL CURR.SQLID: XRR

Field description

The header contains the following information, described in the order left block, middle block, right block:

**ACTUAL AT**
The date and time at which the DB2 subsystem (specified in SUBSYSTEM) containing explain functions, is accessed to collect the requested data.

**LOCATION**
The location name of the DB2 subsystem specified in SUBSYSTEM.

**SUBSYSTEM**
The ID of the DB2 subsystem that generated the data.

**OMEGAMON XE for DB2 PE (Vn)**
The product name and version.

**EXPLAIN**
The object to be explained as specified in the EXPLAIN command (for example, QMFQUERY, PACKAGE, or PLAN).

**<object type>**
The name of the object to be explained as specified in the EXPLAIN command. It can have one of the following values:

**SQL STATEMENT**
None

**QUERYNO**
Query number

**PLAN**
Plan name, such as LARGEPLAN.

**PACKAGE**
Package ID

**QMFQUERY**
Unqualified QMF query name

**<level>**
The level of the report specified in the LEVEL subcommand option. Values are:

- SUMMARY
- SQL
- BASIC
- INDEX
- DETAIL
- NO RAW EXPLAIN DATA
- KEY DISTRIBUTION

**PAGE** The page number in the format *lll-nnnn*, where *lll* denotes the report number and *nnnn* the page number within the report.

**DB2 VERSION**
The version and release of the DB2 subsystem specified in SUBSYSTEM.

**USER AUTHID**
The user authorization ID.

**CURR.SQLID**
The current SQLID as specified in the SQLID option, or the default.
Chapter 12. Object Identification

Use the page header to quickly identify the object that is explained. A complete identification is contained in the object identification section of the report.

“Plan Identification” on page 12-2
This section shows examples of identification plan with DBRM$s and with packages.

“Package Identification” on page 12-3
This section shows examples of package identification.

“QMF Query Identification” on page 12-4
This section shows examples of QMF Query identification.

“SQL Text Identification” on page 12-5
If an SQL statement identified by its text is explained by the EXPLAIN SQLSTMT command, the object identification section shows the statement text.

“SQL Query Number Identification” on page 12-6
If an SQL statement identified by a query number is explained by the EXPLAIN QUERYNO command, there is no object identification section.
Plan Identification

This section shows examples of identification plan with DBRMs and with packages.

If a plan is explained by the EXPLAIN PLAN command, the object identification section of the report shows the following for each SQL statement:

- Plan name
- DBRM or package name
- Statement number
- Statement text
- Statement-related information

Examples are shown in “Explain Identification - Plan with DBRMs” and “Explain Identification - Plan with Packages.”

Explain Identification - Plan with DBRMs

Here is an example of an Identification - Plan with DBRMs.

```
PLAN LOCATION : DSNAPC1
PLAN NAME : FVTXPLAN
DBRM NAME : CHOLD
DBRM VERSION ID :
STATEMENT NUMBER : 182

SQL STATEMENT READ FROM SYSIBM.SYSSMT:

DECLARE C2 CURSOR FOR
SELECT NAME, BINDATE, BINDTIME, ISOLATION FROM SYSIBM.SYSPLAN
WHERE CREATOR = USER AND NAME IN ('EEE2', 'EEE3', 'EEE4')
ORDER BY NAME
STATUS : COMPILED-BOUND USING DEFAULTS FOR INPUT VARIABLES
ISOLATION: CURSOR STABILITY
```

Explain Identification - Plan with Packages

Here is an example of an Identification - Plan with packages.

```
PLAN LOCATION : DSNAPC1
PLAN NAME : FVTXPLAN
PACKAGE LOCATION : DSNAPC1
PACKAGE COLLECTION : MIXCOL
PACKAGE ID : MIX
PACKAGE VERSION ID : VER3
STATEMENT NUMBER : 87

SQL STATEMENT READ FROM SYSIBM.SYSPACKSTM:

DECLARE CURSOR_1 CURSOR FOR
SELECT EMPNO, LASTNAME, WORKDEPT, BIRTHDATE FROM DSNB610.EMP
WHERE (EMPNO BETWEEN '000170' AND '000240' AND WORKDEPT IN ('D01', 'E21', 'X23'))
OR (EMPNO = '000100' AND WORKDEPT = (SELECT MIN(DEPTNO)
FROM DSNB610.DEPT
WHERE MGRNO = '000050')
ORDER BY EMPNO
STATUS : COMPILED-BOUND USING DEFAULTS FOR INPUT VARIABLES
ISOLATION: CURSOR STABILITY
```
Package Identification

This section shows examples of package identification.

If a package is explained by the EXPLAIN PACKAGE command, the object identification section of the report shows the following for each SQL statement:

- Full package name
- Statement number
- Statement text
- Statement-related information

For details on how to specify EXPLAIN PACKAGE commands refer to the Report Command Reference.

Explain Identification - Package

Here is an example of a package identification.

```
PACKAGE LOCATION :PMODA11
PACKAGE COLLECTION:K02EX520
PACKAGE ID :DGOFTPG3
PACKAGE VERSION ID:OMPE_FINAL
STATEMENT NUMBER :1011071
SQL STATEMENT READ FROM SYSIBM.SYSPACKSTMT:

DECLARE C_DGOYTPG_71 CURSOR WITH HOLD FOR
SELECT LOCATION, COLLID, NAME, CONTOKEN, OWNER, CREATOR, TIMESTAMP, BINDTIME, QUALIFIER, PKSIZE, AVGSIZE, SYSENTRIES, VALID, OPERATIVE, VALIDATE, ISOLATION, RELEASE, EXPLAIN, QUOTE, COMMA, HOSTLANG, CHARSET, MIXED, DEC31, DEFERPREP, SQLERROR, VERSION, PDSNAME, DEGREE, GROUP_MEMBER, DYNAMICRULES, DEFERPREPARE, KEEPDYNAMIC, PATHSCHEMAS, TYPE, DBPROTOCOL, FUNCTIONTS, OPTHINT, ENCODING_CCSID, IMMEDWRITE, RELBOUND, CATENCODE, REMARKS
FROM DGO_SYSPACKAGE
WHERE LOCATION LIKE :HV_LOC71_LOCATION AND COLLID LIKE :HV_LOC71_COLLID AND NAME LIKE :HV_LOC71_NAME AND VERSION LIKE :HV_LOC71_VERSION
ORDER BY LOCATION, COLLID, NAME, PCTIMESTAMP DESC QUERYNO 001011071

STATUS : COMPILED-BOUND USING DEFAULTS FOR INPUT VARIABLES
ISOLATION: UNCOMMITTED READ / FROM SYSPACKAGE
```
QMF Query Identification

This section shows examples of QMF Query identification.

If a QMF query is explained by the EXPLAIN QMFQUERY command, the object identification section of the report shows the following for each SQL statement:

- Full QMF query name
- Statement text

For details on how to specify EXPLAIN QMFQUERY commands refer to the Report Command Reference.

Explain Identification - QMF Query

Here is an example of the QMF query identification.

QMFQUERY: USRL.MY_QUERY

```
```
```
```
```
```
```
SQL Text Identification

If an SQL statement identified by its text is explained by the EXPLAIN SQLSTMT command, the object identification section shows the statement text.

For details on how to specify EXPLAIN SQLSTMT commands refer to the Report Command Reference.

Explain Identification - SQL Text

Here is an example of the SQL Text Identification.

SQL STATEMENT TEXT :

```
SELECT * FROM SYSIBM.SYSPACKAGE
WHERE NAME = 'DGOFTP63'
AND COLLID = 'KO2EX520'
```
SQL Query Number Identification

If an SQL statement identified by a query number is explained by the EXPLAIN QUERYNO command, there is no object identification section.

For details on how to specify EXPLAIN QUERYNO commands refer to the [Report Command Reference](#).
Chapter 13. Table PLAN_TABLE Data

This section of the Explain report lists the raw EXPLAIN data as found in the DB2 table PLAN_TABLE.

For details on how to specify EXPLAIN commands refer to the Report Command Reference.

Explain Report - PLAN_TABLE Report Block

This is an example of the PLAN_TABLE report block.

The report field labels are the full PLAN_TABLE column names. For a detailed description of the PLAN_TABLE columns, refer to the DB2 SQL Reference. If the report field value is a long name or a long value, it is marked with an asterisk (*) at the end of the report field value, and it is reported at the end of the block in its full length.

The plan table is searched by using the bind time of the package. There might be multiple occurrences of the package with different bind times. For example, the DB2 system catalog might contain the latest package that is created by the DB2 command BIND or REBIND. It might also contain a former package version that is activated by the DB2 command REBIND SWITCH.
Chapter 14. Access Path Data

This section of the Explain report introduces the access path chosen by DB2.

For details on how to specify EXPLAIN commands refer to the Report Command Reference.

Explain Report - Access Path Data Block

The following example shows that the access path is contained in a frame.

```
+------------------------------------------------------------------+
| MATCHING INDEX SCAN WITH SCAN OF REFERENCED DATA PAGES           |
| NUMBER OF MATCHING COLUMNS: 1 - THE INDEX HAS 4 COLUMNS          |
| NON-CLUSTERED INDEX SCAN WILL BE USED                            |
| OPTIMIZER EXPECTS DYNAMIC PREFETCH                               |
| PAGE RANGE SCAN WILL NOT BE USED                                 |
+------------------------------------------------------------------+
```
Explain Report
Chapter 15. Index Data

If an index is used, that is, an access path other than TABLE SPACE SCAN, information about this index is shown. The data is derived from the SYSIBM.SYSINDEXES table.

For details on how to specify EXPLAIN commands refer to the Report Command Reference.

Explain Report - Index Data Block

Here is an example of the index data block section.

```
INDEX: SYSIBM.DSNKX01 -----------------------------------------------
STATTIME: 2016-02-16-14.45.54.186869
CREATED: 0001-01-01-00.00.00.000000 ALTERED: 2003-09-21-23.30.17.962937
FULL KEY CARD: 885, PAGES: 16, LEVELS: 2, CLUSTERING: Y
1ST KEY CARD: 1, SPACE: 245.760K, UNIQUE: YES, CLUSTERED: N
INDEX TYPE: 2, PGSIZE: 4096, BFPOOL: BP0, DB.NAME: DSNDB06
CLUSTERRATIO: 84.6328%, ERRULE: NO, CLRULE: NO, IXSPACE: DSNKX01
MAX.PIECESIZE: 0, COPY: NO, COPYLRSN: X'000000000000'
```
Explain Report
Chapter 16. Key Data

If an index is used and LEVEL(INDEXES) is not specified, information about the key columns is presented. The data is derived from the SYSIBM.SYSKEYS and SYSIBM.SYSCOLUMNS tables.

If a matching index scan is used in the access path, the report indicates the columns that are used in the index scan. This is indicated by an arrow (<===) in the column named KEY USED. The number of arrows corresponds to the contents of the matching columns field MATCHCOLS in the PLAN_TABLE report block.

For details on how to specify EXPLAIN commands refer to the Report Command Reference.

**Explain Report - Key Data Block**

Here is an example of the explain key data block section.

<table>
<thead>
<tr>
<th>KEY NO.</th>
<th>COLUMN NAME</th>
<th>COL.TYPE</th>
<th>LNG NULL</th>
<th>COL. STAT</th>
<th>LENGTH</th>
<th>NULL CARD.</th>
<th>ORDER</th>
<th>KEY.card.</th>

<td>X'56385231'</td>
<td></td>
<td>0</td>
<td>SYSIBM</td>
</tr>
</tbody>
</table>
Chapter 17. Key Distribution Data

This section introduces the Key Distribution Data.

If LEVEL(KEYDIST) has been specified and RUNSTATS has produced key distribution information for the first column of the index, a section in the report shows the distribution of up to ten most frequently used key values. The data is derived from the SYSIBM.SYSTABLES.CREATOR.

For details on how to specify EXPLAIN commands refer to the Report Command Reference.

**Explain Report - Key Distribution Data Block**

This example shows the key distribution data section.

```
KEY DISTRIBUTION FOR : SYSBM.SYSTABLES.CREATOR  -------------------------
SYSIBM (27%),DSNB230 (11%),U473298 ( 9%),Q ( 7%),XXASP09 ( 5%)
U01 ( 5%),USR2 ( 5%),XXASP32 ( 3%),XXASP16 ( 3%),USER001 ( 2%)
```
Chapter 18. Table and Table Space Data

This section of the Explain report shows information for the accessed table and its corresponding table space.

The data is derived from the SYSIBM.SYSTABLES and SYSIBM.SYSTABLESPACE tables.

For details on how to specify EXPLAIN commands refer to the Report Command Reference.

Explain Report - Table Data Block

This is an example of the Explain Table Data section.

```
TABLE: SYSTM.SYSPACKAGE
STATSTIME: 2016-02-16-14.45.54.186869, TB TYPE : TABLE
CREATED : 2013-04-01-00.00.00.000000, ALTERED : 2010-07-01-09.00.57.417442
ROWS : 885, COLUMNS : 60, ROWLENGTH: 3913, EDIT PROC.
% PAGES : 16, DBASE ID: 6, AUDITING : NONE, VALIDPROC.
ACT.PAGES: 62, TABLE ID: 128, STATUS : COMPX, TABCREATOR: SYSIBM
TAB.STAT.: , ENC.SCHEME: UNICODE
TABLESPACE: DSNDB06.SYSTSPKG
NAME : SYSTSPKG, DATABASE : DSNDB06
CREATOR : SYSIBM, CREATED BY: SYSIBM
STATSTIME : 2016-02-16-14.45.54.186869,
ACTIVE PGS: 372, DBASE ID : 6, TS STATUS : A, TS TYPE : G
PAGE SIZE : 4KB, OBJ ID : 2067, ERASERULE : NO, STORGROUP :
SPACE : 1.720M, PAGESET ID: 2068, CLOSERULE : NO, BUF_POOL : BP0

AVG ROWLEN: 201,
```

If table space scan has been selected as the access path method, and INDEX(NO) is not specified, a separate block is presented for each available index on the subject table along with information about key columns.

See Chapter 15, “Index Data,” on page 15-1 and Chapter 16, “Key Data,” on page 16-1 for the layout of these blocks.
Chapter 19. Host Variable Data

This section of the Explain report is produced if HOSTVAR(YES) is specified for the OMEGAMON XE for DB2 PE explain plan or package.

If you define host variables which are not consistent with the corresponding column definition, DB2 selects an inefficient access path.

In “Explain Report - Host Variables Data Block,” the access path selected is table space scan even though an index is defined on the only column referenced in the WHERE clause. As the example in “Explain Report - Host Variables Data Block” shows, DB2 has selected table space scan because the column definition is three characters, but the corresponding host variable is defined as four characters. By changing the host variable definition to three characters, a matching index scan is selected by DB2.

For details on how to specify EXPLAIN commands refer to the Report Command Reference.

Explain Report - Host Variables Data Block

Here is an example of an Explain Report for the Host Variables Data block

```sql
DECLARE C1 CURSOR FOR
SELECT DEPTNO, DEPTNAME, LOCATION
FROM DSNB610.DEPT
WHERE DEPTNO = :HOSTVAR_STRUCTURE.DEPARTMENT_NUMBER
ORDER BY DEPTNO
```

```
+------------------------------------------------------------------+
| TABLE SPACE SCAN - NO INDEX IS USED |                      |
| STANDARD SEQUENTIAL PREFETCH WILL BE PERFORMED |                |
+------------------------------------------------------------------+

```

```

Explain Report
Chapter 20. Bind Plan Data

This section of the Explain report is shown if the object being explained is a plan or query number for a mini plan created by the bind process. Information related to the binding of the plan, such as plan binder, bind time, or isolation level, is presented.

This part of the report is only produced in connection with the first SQL statement of the plan.

When a plan is explained using OMEGAMON XE for DB2 PE explain, the bind-related data is stored in a DB2 table which enables you to compare relevant information for up to three generations of the plan.

If, in a given row, there is a difference among the three columns, an arrow (<===) is shown in the rightmost column.

The bottom part of this section shows data for each DBRM and package in the most recent plan generation. The report states the precompilation date and time, programming language, number of SQL statements, single-byte or double-byte character set, use of comma, use of decimal(31), type of source, and the DB2 release when the module was precompiled.

For details on how to specify EXPLAIN commands refer to the "Report Command Reference".

Explain Report - Bind Plan Data
Chapter 21. Bind Package Data

This section of the Explain report is shown if the object being explained is a package.

The information related to the binding of the package, such as package owner, bind time or isolation level, is presented.

This part of the report is only produced in connection with the first SQL statement of the package.

For details on how to specify Explain commands refer to the Report Command Reference.

Explain Report - Package Data Block

Explain Report
Chapter 22. Summary Report

This section introduces the summary report.

At normal completion of OMEGAMON XE for DB2 PE explain, the last pages of the output are a summary of the OMEGAMON XE for DB2 PE explain execution. This is called the Summary Report. Each command is prefixed with the report number.

For each SQLSTMT, QUERYNO, and QMFQUERY request, the access path is listed adjacent to the input request. For each PLAN or PACKAGE statement, the access path is listed for every SQL statement in the plan or package.

To the right of the access path information, the report page number (rrr-nnnn) is shown, unless LEVEL(SUMMARY) was specified. In this way the summary report can be used as a table of contents.

For details on how to specify EXPLAIN SUMMARY commands refer to the Report Command Reference.

Explain Report - Summary Report Block

This is an example of a Summary report.

Column description

The TYP column can contain the following values:

- P: Package
- D: DBRM
- S: Standard sequential prefetch
- L: Prefetch through a page list Table space scan
- +: Nonmatching index scan
- A blank: No prefetch or others

The numbers in brackets following MATCHING INDEX SCAN, for example (2/3), show how many columns match, namely 2, and how many columns the index has, namely 3.
Explain Report
# Chapter 23. EXPLAIN PLAN Command

This section introduces the EXPLAIN PLAN command.

When you bind a plan, you might decide to include a package list that contains wildcard characters, for example COLLID3.* or even *.*. This could result in a plan pointing at thousands of packages with an even greater number of explainable SQL statements. To control the volume of output produced, the PACKLIMIT option is provided.

If a particular plan consists of more packages than specified in PACKLIMIT, a report with all the package names is produced, but no SQL statements in these packages are explained. This report shows the collection IDs, the creator and owner names, the version IDs, and the dates of precompilation. However, if any DBRMs belong to the plan, SQL statements in these DBRMs are explained.

For details on how to specify EXPLAIN PLAN commands refer to the [Report Command Reference](#).

## Explain PLAN Report - Package List Block

The following report example results of an EXPLAIN PLAN statement with PACKLIMIT(10) if a plan named LARGPLAN was bound with a package list of COLLECT.*, which includes 80 packages:

Explain Report
Chapter 24. EXPLAIN PACKAGE Command

This section introduces the EXPLAIN PACKAGE command.

When a package is explained, you can specify the collection ID, the package name, or both, as generic names using an asterisk (*) as a wildcard character. For example, you have the following options:

EXPLAIN PACKAGE (DSNAPC1.COLLECT.MYT*)
EXPLAIN PACKAGE (DSNAPC1.COLLECT.MYTEST)

If a wildcard character is used, OMEGAMON XE for DB2 PE explain counts the total number of SQL statements that belong to the packages (the total number of SQL statements also includes non-explainable statements).

If the number of packages is more than one, and the total number of SQL statements in these packages is larger than 300, OMEGAMON XE for DB2 PE explain does not explain any SQL statements unless the FORCE(YES) option is specified.

If the package specification does not contain any wildcard character, the total number of SQL statements is less than 300, or only one package conforms to the specification, the SQL statements are explained. However, if the package exists in more than one version, only the most recent version is explained. In this case a report showing all the versions for that package is produced.

For example, the following command was used to produce the report shown in “Explain Report - Package Version List Block”:

EXPLAIN PACKAGE (DSNAPC1.COLLECT.MYTEST.(7)) GEN(3)

For details on how to specify EXPLAIN commands refer to the Report Command Reference.

Explain Report - Package Version List Block

Here is an example of the Explain report for the Package Version List block:

© Copyright IBM Corp. 1985, 2016
This report shows that the package exists in 21 versions, where the version that corresponds to generation number -7 was selected for explanation. The report further shows that the user asked for the explanation of three generations (-7, -8, and -9). The first generation to be explained is marked with an asterisk (*). Instead of specifying a generation ID, the version ID could be specified. The version ID can be specified either in full or in combination with a wildcard character as in the following example:

```
EXPLAIN PACKAGE(DSNAPC1.COLLECT.MYTEST.(VERSION7*)) GEN(3)
```

A maximum of 100 generations are listed.
Chapter 25. EXPLAIN SQLSTMT Command

This section shows an example of an Explain report generated with the EXPLAIN SQLSTMT command.

For details on how to specify EXPLAIN commands refer to the Report Command Reference.

Explain Report - Example for SQL Text

Use the following EXPLAIN SQLSTMT command to generate the following example of an explain report.

GLOBAL PLANEX(KO2EXPL)

Part 5. I/O Activity Report Set

These topics provide information about the I/O activity reports.

Note: For an introduction to the I/O Activity report set and general I/O Activity information refer to the Reporting User’s Guide

Chapter 26, “Summary and Detail Report Header,” on page 26-1
OMEGAMON XE for DB2 PE header information is printed at the top of each page of the summary and detail report.

Chapter 27, “I/O Activity Summary Report and Field Descriptions,” on page 27-1
The I/O activity summary report provides an overview of system-wide I/O activity that is used to monitor trends and identify problem areas.

Chapter 28, “I/O Activity Detail Reports,” on page 28-1
A separate detail report is produced for each category of I/O activity.
I/O Activity Report
Chapter 26. Summary and Detail Report Header

OMEGAMON XE for DB2 PE header information is printed at the top of each page of the summary and detail report.

I/O Activity Report Header Example

Here is an example of an I/O Activity Report Header.

LOCATION: LOCATION1
GROUP: GROUP2
MEMBER: MEMBER4
SUBSYSTEM: DB2D
DB2 VERSION: V10

Field description

The report header contains the following information, described in the order left block, middle block, right block:

LOCATION
The DB2 reporting location. If the location name is not available, the DB2 data sharing group name is printed in this field. If the DB2 data sharing group name does not exist, the DB2 subsystem ID is printed.

GROUP
The name of the DB2 data sharing group. This field shows N/A if there is no group name.

MEMBER
The name of the DB2 data sharing member or the member name of the DB2 subsystem. This field shows N/A if there is no member name.

This field is not printed on the report page showing the GROUP BUFFERPOOLS PARAMETERS.

SUBSYSTEM
The ID of the DB2 subsystem that generated the data. This field is not printed on the report page showing the GROUP BUFFERPOOLS PARAMETERS.

DB2 VERSION
The DB2 version number of the subsystem that generated the data.

OMEGAMON XE FOR DB2 PERFORMANCE EXPERT (VnRnMn)
The product name and the version, release, and modification level.

Title - layout
The title of the report and the layout. The layout can be a default layout provided with OMEGAMON XE for DB2 PE or a layout you have tailored yourself.

ORDER
If the ORDER option of the REPORT or TRACE subcommand was used to arrange the report entries, the selected keywords are shown in this field. Depending on the context, the OMEGAMON XE for DB2 PE identifiers by which lock events are grouped are shown here.

PAGE
The page number in the format ill-nnnnnn, where ill denotes the location number within the report and nnnnnn the page number within the location.
REQUESTED FROM and TO
The FROM and TO dates and times specified in the REPORT or TRACE subcommand.

If both FROM and TO dates and times are omitted from the REPORT subcommand, the FROM and TO dates and times specified in GLOBAL are printed. If only the FROM date and time or only the TO date and time has been specified, NOT SPECIFIED is printed for the unspecified value.

If FROM and TO are not specified in REPORT or GLOBAL, NOT SPECIFIED appears for both the FROM and TO values.

If you have specified FROM and TO times without dates in REPORT or GLOBAL, ALL DATES is printed along with the specified times.

INTERVAL FROM
The start date and time of the first reduction interval covered by the report. If REDUCE is not specified, the INTERVAL defaults to 0 and the timestamps of the first and last events are printed.

INTERVAL TO
The end date and time of the last reduction interval covered by the report. If REDUCE is not specified, the INTERVAL defaults to 0 and the timestamps of the first and last events are printed.
Chapter 27. I/O Activity Summary Report and Field Descriptions

The I/O activity summary report provides an overview of system-wide I/O activity that is used to monitor trends and identify problem areas.

The I/O activity summary report:

- Summarizes the information contained in the I/O activity detail reports for a location (refer to Chapter 28, "I/O Activity Detail Reports," on page 28-1).
- Shows on a single page a block of entries for each of the I/O categories: buffer pool, EDM pool, active log, archive log/BSDS, and cross invalidation (XI).
- Is produced if you specify the IOACTIVITY(REPORT) command and there is at least one I/O activity IFCID begin/end pair in the input data set satisfying the FROM and TO, and INCLUDE or EXCLUDE criteria. You do not have to specify the SUMMARY level because this is the default.

The following command produces the I/O activity summary report shown in "Example I/O Activity Summary Report."

```
; IOACTIVITY REPORT
```

**I/O ACTIVITY REPORT COMPLETE**

**“BUFFER POOL” on page 27-3**
This section of the summary report contains selected fields from the Buffer Pool report.

**“EDM POOL” on page 27-5**
This section of the summary report contains selected fields from the EDM pool report.

**“ACTIVE LOG” on page 27-7**
This section of the summary report contains selected fields from the Active Log report.

**“ARCHIVE LOG” on page 27-8**
This section of the summary report contains selected fields from the Archive Log report.

**“BOOTSTRAP DATASET” on page 27-10**
This section of the summary report contains selected fields from the Bootstrap Dataset report.

**“CROSS-INVALIDATION ACTIVITY” on page 27-11**
This section of the summary report contains selected fields from the Cross-Invalidation report.
BUFFER POOL

This section of the summary report contains selected fields from the Buffer Pool report.

The following fields are printed in the report:

TOTAL I/O REQUESTS
The total number of I/O requests (TOTALS) and the average elapsed time per I/O request (AET).

TOTAL READ I/O REQUESTS
The total number of I/O read requests (TOTALS) and the average elapsed time per read request (AET).

NON-PREFETCH READS
The total number of non-prefetch reads.

PREFETCH READS
An aggregate of all types of prefetches:
- Sequential prefetches (determined at bind time)
- List prefetch
- Sequential prefetch triggered by the sequential detection logic

WITHOUT I/O
The number of unsuccessful prefetch reads. This can occur because all the pages requested by a prefetch read were already in the buffer pool.

WITH I/O
The number of successful prefetch reads.

PAGES READ
The number of pages read for all prefetch read requests.

PAGES READ / SUCC READ
The number of pages read per successful prefetch read request.

TOTAL WRITE REQUESTS
The total number of write I/O requests (TOTALS) and the average elapsed time per write request (AET).

The write requests are divided into two categories: synchronous writes and asynchronous writes.

SYNCHRONOUS WRITES
The number of synchronous writes (TOTALS) and the average elapsed time per synchronous write request (AET).

COUPLING FACILITY CASTOUTS
The number of synchronous writes due to coupling facility castouts.

PAGES WRITTEN PER WRITE
The average number of pages per synchronous write.

ASYNCHRONOUS WRITES
The number of asynchronous writes (TOTALS) and the average elapsed time per asynchronous write (AET).
COUPLING FACILITY CASTOUTS
   The number of asynchronous writes due to coupling facility castouts.

PAGES WRITTEN PER WRITE
   The average number of pages written per asynchronous write.
EDM POOL

This section of the summary report contains selected fields from the EDM pool report.

The following fields are printed in the report:

**CURSOR TABLE - HEADER**
The number of load requests for cursor table headers (CT/PT/DBD REFERENCES).
The number of cursor table header loads not in the EDM pool (NOT IN EDM POOL).
The average elapsed time of a cursor table header load (AET).
The average length of a loaded cursor table header in bytes (AVG LEN (BYTES)).

**CURSOR TABLE - DIRECTORY**
The number of load requests for cursor table directories (CT/PT/DBD REFERENCES).
The number of cursor table directory loads not in the EDM pool (NOT IN EDM POOL).
The average elapsed time of a cursor table directory load (AET).
The average length of a loaded cursor table directory in bytes (AVG LEN (BYTES)).

**CURSOR TABLE - RDS SECTION**
The number of load requests for cursor table RDS sections (CT/PT/DBD REFERENCES).
The number of cursor table RDS section loads not in the EDM pool (NOT IN EDM POOL).
The average elapsed time of a cursor table RDS section load (AET).
The average section length of a loaded cursor table RDS section in bytes (AVG LEN (BYTES)).

**TOTAL PLANS**
The number of load requests for plans; that is, the sum of CT/PT/DBD references for cursor table header, directory, and RDS section (CT/PT/DBD REFERENCES).
The number of plan loads not in the EDM pool (NOT IN EDM POOL).
The average elapsed time per plan load (AET).
The average section length of a loaded plan in bytes (AVG LEN (BYTES)).

**PACKAGE TABLE - HEADER**
The number of load requests for package table headers (CT/PT/DBD REFERENCES).
The number of package table header loads not in the EDM pool (NOT IN EDM POOL).
The average elapsed time of a package table header load (AET).
The average length of a loaded package table header in bytes (AVG LEN (BYTES)).
## I/O Activity - Summary Report

### PACKAGE TABLE - DIRECTORY
The number of load requests for package table directories (CT/PT/DBD REFERENCES).

The number of package table directory loads not in the EDM pool (NOT IN EDM POOL).

The average elapsed time of a package table directory load (AET).

The average length of a loaded package table directory in bytes (AVG LEN (BYTES)).

### PACKAGE TABLE - RDS SECTION
The number of load requests for package table RDS sections (CT/PT/DBD REFERENCES).

The number of package table RDS section loads not in the EDM pool (NOT IN EDM POOL).

The average elapsed time of a package table RDS section load (AET).

The average section length of a package table RDS section in bytes (AVG LEN (BYTES)).

### TOTAL PACKAGES
The number of load requests for package tables; that is, the sum of CT/PT/DBD references for the package table header, directory, and RDS section (CT/PT/DBD REFERENCES).

The number of package table loads not in the EDM pool (NOT IN EDM POOL).

The average elapsed time per package table load (AET).

The average section length of a loaded package table in bytes (AVG LEN (BYTES)).

### DATABASE DESCRIPTORS
The number of load requests for database descriptors (CT/PT/DBD REFERENCES).

The number of DBD loads not in the EDM pool (NOT IN EDM POOL).

The average elapsed time of a database descriptor load (AET).

The average length of a loaded database descriptor in bytes (AVG LEN (BYTES)).
ACTIVE LOG

This section of the summary report contains selected fields from the Active Log report.

The following fields are printed in the report:

TOTAL WAITS
The total number of waits for read and write requests and other waits (TOTALS) and the average elapsed time of an I/O wait of any type (AET).

READ REQUESTS
The number of read requests (TOTALS) and the average elapsed time of a read request (AET).

WRITE REQUESTS
The number of write requests (TOTALS) and the average elapsed time of a write request (AET).

CONT. CI / WRITE
The number of contiguous control intervals per write request.

OTHER WAITS
The total number of waits for resource allocation and deallocation, and the number of waits to open and close data sets (TOTALS).

The average elapsed time of all other waits (AET).

The next four rows relate to waits other than waits for read or write requests.

ALLOCATE
The number of waits for resource allocation (TOTALS) and the average elapsed time of a wait for resource allocation (AET).

DEALLOCATE
The number of waits for resource deallocation (TOTALS) and the average elapsed time of waits for resource deallocation (AET).

OPEN
The number of waits to open data sets (TOTALS) and the average elapsed time of waits to open data sets (AET).

CLOSE
The number of waits to close data sets (TOTALS) and the average elapsed time of waits to close data sets (AET).
ARCHIVE LOG

This section of the summary report contains selected fields from the Archive Log report.

The following fields are printed in the report:

**READ REQUESTS**
- The total number of archive read requests (TOTALS) and the average elapsed time of an archive read request (AET).
- Archive read requests are subdivided into the following categories:
  - **DASD READ**
    - The total number of reads from the DASD and (TOTALS) the average elapsed time of reads from the DASD (AET).
  - **TAPE READ**
    - The total number of reads from the tape (TOTALS) and the average elapsed time of reads from the tape (AET).

**OFFLOAD REQUESTS**
- The total number of archive offloads (TOTALS) and the average elapsed time per archive offload (AET).

**BLOCKS / OFFLOAD**
- The number of blocks of data written per offload.

**OTHER WAITS**
- Waits other than read or write requests. The total elapsed time (TOTALS) and the average elapsed time of all other waits (AET).

  - **ALLOCATE**
    - The total number of waits (TOTALS) and the average elapsed time of a wait for resource allocation (AET).
  - **DEALLOCATE**
    - The total number of waits (TOTALS) and the average elapsed time of a wait for resource deallocation (AET).
  - **OPEN**
    - The total number of waits (TOTALS) and the average elapsed time of a wait to open data sets (AET).
  - **CLOSE**
    - The total number of waits (TOTALS) and the average elapsed time of a wait to close data sets (AET).
  - **HSM RECALL**
    - The total number of waits (TOTALS) and the average elapsed time of a wait for HSM to recall data sets (AET).
  - **CATALOG LOCATE**
    - The total number of waits (TOTALS) and the average elapsed time per wait to locate data sets through the catalog (AET).
  - **MULTI-DATA SET TAPE**
    - The total number of waits (TOTALS) and the average elapsed time per wait for multi-data set tape volume (AET).
  - **TAPE VOL POSITIONING**
    - The total number of waits (TOTALS) and the average elapsed time per wait for tape volume positioning (AET).
WTOR ISSUED
The total number of waits (TOTALS) and the average elapsed time per wait due to write-to-operator messages being issued (AET).

DATA SET UNAVAILABLE
The total number of waits (TOTALS) and the average elapsed time of waits due to a data set being unavailable (AET).

PHYSICAL UNIT UNAV.
The total number of waits (TOTALS) and the average elapsed time of waits due to an unavailable physical unit (AET).

RDR SERV. UNAVAILABLE
The total number of waits (TOTALS) and the average elapsed time of a wait due to an unavailable reader service task (AET).
BOOTSTRAP DATASET

This section of the summary report contains selected fields from the Bootstrap Dataset report.

The following fields are printed in the report:

**TOTAL WAITS**
The total number of waits due to read and write requests for the bootstrap data set (TOTALS) and the average duration of bootstrap data set waits (AET).

**READ REQUESTS**
The total number of BSDS reads (TOTALS) and the average elapsed time per read from BSDS (AET).

**WRITE REQUESTS**
The total number of writes to the BSDS (TOTALS) and the average elapsed time per BSDS write (AET).
CROSS-INVALIDATION ACTIVITY

This section of the summary report contains selected fields from the Cross-Invalidation report.

The following fields are printed in the report:

SYNCHRONOUS READS
The number of cross-invalidated pages which are refreshed via synchronous read.

REFRESHED FROM GROUP BPOOL
The number of cross-invalidated pages which are refreshed from the group buffer pool via synchronous read.

REFRESHED FROM DASD
The number of cross-invalidated pages which are refreshed from the DASD via synchronous read.

SEQUENTIAL PREFETCH
The number of cross-invalidated pages which are refreshed via sequential prefetch.

REFRESHED FROM GROUP BPOOL
The number of cross-invalidated pages which are refreshed from the group buffer pool via sequential prefetch.

REFRESHED FROM DASD
The number of cross-invalidated pages which are refreshed from the DASD via sequential prefetch.
I/O Activity Report
Chapter 28. I/O Activity Detail Reports

A separate detail report is produced for each category of I/O activity.

Totals are accumulated for most columns in the report. The information in the Total column on each detail report for grand totals also appears in the I/O activity summary report.

The following sections show samples and field descriptions for each category of the I/O Activity Detail report.

“Buffer Pool Report” on page 28-2
“EDM Pool Report” on page 28-6

The EDM pool report provides information about the number of cursor table, package table, or database directory requests, loads from the DASD, their average elapsed times, and the average section lengths of the loaded data items.

“Active Log Report” on page 28-9

The active log report provides information about the writing and retrieving of log records. It presents the number of reads, writes, and non-I/O waits related to the active log and the average elapsed times spent waiting for these events.

“Archive Log/BSDS Report” on page 28-12

The archive log/BSDS report provides information about the writing of log records and the retrieval of log data. It also contains information about the bootstrap data set that controls the movement of full active log data sets to the archive log.

“Cross-Invalidation Report” on page 28-19

The cross-invalidation report presents buffer refresh events due to cross invalidation summarized by selected OMEGAMON XE for DB2 PE identifiers. If two DB2 systems compete for read/write interest on a page set or partition, a certain amount of buffer cross-invalidation activity occurs to maintain DB2 buffer pool coherency between the two systems.
Buffer Pool Report

The buffer pool report provides information about the movement of database pages between the DASD and the main storage buffers. It presents information about the number of read and write operations, the amount of read and write requests, and the average wait times.

The following command produces the buffer pool report shown in "I/O Activity Buffer Pool Report."

```
: I/OACTIVITY REPORT
   LEVEL(BUFFER)
:
```

I/O Activity Buffer Pool Report

The following example shows a buffer pool report.

AND GROUP = 'PRIMAUTH'
AND SUBSYSTEM = 'AUTH_10'
AND LOCATION = 'LOCATION1'
AND VERSION = 'V10'
```
Column description

The following is a description of each column printed in the buffer pool report:

**OMEGAMON XE for DB2 PE Identifiers**

The buffer pool report presents data summarized by OMEGAMON XE for DB2 PE identifiers. The report can be ordered by up to three OMEGAMON XE for DB2 PE identifiers. The identifiers used to sort the report are printed in the leftmost column. They are printed whenever they change. The second and third identifiers are indented to appear under the relevant column subheading.

**Note:** Blank or null OMEGAMON XE for DB2 PE identifiers are denoted by the word 'BLANK'.

**I/O REQUEST**

**TOTAL**

The total number of I/O requests.

**AET**

The average elapsed time per I/O request.

**READ REQUESTS**

**TOTAL**

The number of read I/O requests of a specific type.

**TYPE**

The type of read request. The field can contain one of the following values:

**SYNCH**

Synchronous read request

**SEQPF**

Sequential prefetch requests (determined at bind time)
I/O Activity - Detail Report

DYNPF
Dynamic prefetch request (triggered at run time by sequential detection logic)

LSTPF
List prefetch request
If there are no read requests, a dash (—) is printed.

WITH I/O AET
The average elapsed time for a read of a specific type.

WITH I/O %
The percentage of total read requests of a particular type that resulted in an I/O.

WITH I/O PAGES/READ
Pages read per successful read request of a particular type.

W/OUT I/O %
The percentage of total read requests of a particular type that did not result in an I/O. This can occur because all the pages requested by a prefetch read were already in the buffer pool.

WRITE REQUEST

TOTAL
The number of write I/O requests of a specific type. Up to two lines are generated, depending on the write type.
For synchronous writes: count of matching IFCID 008 and 009 record pairs
For asynchronous writes: count of matching IFCID 009 and 010 record pairs

TYPE
The type of write request. The field can contain one of the following values:
SYNCH
Synchronous write request
ASYNC
Asynchronous write request
If there are no write requests, a dash (—) is printed.

CASTOUT
The number of synchronous and asynchronous writes due to coupling facility castouts. This field contains one of the following values:
YES
The write operations were initiated due to a coupling facility castout.
NO
The write operations were initiated as a normal write I/O.

AET
The average elapsed time per write of a specific type.

PAGES/WRITE
The number of pages written per write of a specific type.

DB OPEN
The number of database open requests.
PAGE FAULTS
The number of anticipated page faults. Real storage frames are tested before issuing write.

ACTIVE BUFFERS
The number of active buffers in the pool.

UPDATED PAGES
The number of updated pages in the deferred write queue for the buffer pool that is identified in field QW0008BP or QW0010BP.

SUBTOTAL
When a report is ordered by three identifiers and there is more than one third-level identifier reported under it, a subtotal is printed each time the second-level identifier changes.

TOTAL
When a report is ordered by two or three identifiers and there is more than one second-level identifier reported under it, a total is printed each time the first-level identifier changes.

GRAND TOTAL
A grand total is printed at the end of each location if there is more than one first-level identifier reported.
The EDM pool report provides information about the number of cursor table, package table, or database directory requests, loads from the DASD, their average elapsed times, and the average section lengths of the loaded data items.

**Note:** The OMEGAMON XE for DB2 PE Statistics reports and traces include EDM pool statistics. Refer to [Part 9, “Statistics Report Set”](#) for more information.

The following command produces the EDM pool report shown in “I/O Activity EDM Pool Report.”

```plaintext
I/OACTIVITY
  REPORT
    LEVEL (EDM)
```

**I/O Activity EDM Pool Report**

This is an example of an EDM pool report.

### Column description

The following is a description of each column printed in the EDM pool report:

**OMEGAMON XE for DB2 PE Identifiers**

The EDM pool report presents data summarized by OMEGAMON XE for DB2 PE identifiers. The report can be ordered by up to three OMEGAMON XE for DB2 PE identifiers. The identifiers used to sort the report are printed in the leftmost column. They are printed whenever they change. The second and third identifiers are indented to appear under the relevant column subheading.

*Note:* Blank or null OMEGAMON XE for DB2 PE identifiers are denoted by the word 'BLANK'.

**PACKAGE / DBD / PLAN NAME**

The name of the cursor table, package table, or database directory. The package name is printed on four lines, and consists of the following fields:

- **LOCN** Location name
- **COLL** Collection identifier
- **PKID** Package identifier
- **CTKN** Consistency token

**TYPE** The type of data being accessed.

**CT/PT/DBD REFERENCE**

The number of cursor table, package table, or database directory requests performed by the data type specified in the TYPE column.

**NOT IN EDM POOL**

The number of times cursor table, package table, or database directory was not found in the EDM pool. If it is not found in the EDM pool, the request can be satisfied from the buffer pool or the DASD.

**ELAPSED TIME PER LOAD**

The average elapsed time of loads from the buffer pool or DASD.

**AVERAGE SECTION LENGTH (BYTES)**

The average section length of a loaded data item identified in the TYPE column.

**TYPE TOTAL**

When the data contains two or more EDM records with the same data type and the same OMEGAMON XE for DB2 PE identifiers, a type total line is printed with the following heading:

- DBD TOTAL for type DBD
I/O Activity - Detail Report

- PLANNAME TOTAL for type CT
- PACKAGE TOTAL for type PT

**SUBTOTAL**
When a report is ordered by three identifiers and there is more than one third-level identifier reported under it, a subtotal is printed each time the second-level identifier changes.

**TOTAL**
When a report is ordered by two or three identifiers and there is more than one second-level identifier reported under it, a total is printed each time the first-level identifier changes.

**GRAND TOTAL**
A grand total is printed at the end of each location if there is more than one first-level identifier reported.
Active Log Report

The active log report provides information about the writing and retrieving of log records. It presents the number of reads, writes, and non-I/O waits related to the active log and the average elapsed times spent waiting for these events.

The report is ordered by the data set identifier.

The following command produces the active log report shown in "I/O Activity Log Report."

```
IOACTIVITY
REPORT
LEVEL (ACTLOG)
```

I/O Activity Log Report

I/O Activity Report Complete
Column description

The following is a description of each column printed in the active log report:

OMEGAMON XE for DB2 PE Identifiers
The active log report presents data summarized by OMEGAMON XE for DB2 PE identifiers. The report can be ordered by up to three OMEGAMON XE for DB2 PE identifiers. The identifiers used to sort the report are printed in the leftmost column. They are printed whenever they change. The second and third identifiers are indented to appear under the relevant column subheading.

Note:
1. Blank or null OMEGAMON XE for DB2 PE identifiers are denoted by the word 'BLANK'.
2. DATASET is the most significant identifier. It is the 8-byte ID that identifies the active log data set where the reported activity occurs. It has the value ACTLGcxx, where c is the copy number and xx is the sequence number of the active log data set.

I/O REQ

TOTAL
The total number of I/O requests.

AET
The average elapsed time of all waits.

READ REQ

TOTAL
The total number of read requests.

AET
The average elapsed time of a read request.

WRITE REQUESTS

TOTAL
The total number of write requests.

AET
The average elapsed time of a write request.

CI/WRITE
The number of control intervals per write.

OTHER WAITS

ALLOC
The number of waits for resource allocation.

AET
The average elapsed time of a wait for resource allocation.

DEALLOC
The number of waits for resource deallocation.

AET
The average elapsed time of waits for resource deallocation.

OPEN
The number of waits to open data sets.

AET
The average elapsed time of a wait to open data sets.
CLOSE
   The number of waits to close data sets.

AET    The average elapsed time of a wait to close data sets.

SUBTOTAL
   When a report is ordered by three identifiers and there is more than one third-level identifier reported under it, a subtotal is printed each time the second-level identifier changes.

TOTAL
   When a report is ordered by two or three identifiers and there is more than one second-level identifier reported under it, a total is printed each time the first-level identifier changes.

GRAND TOTAL
   A grand total is printed at the end of each location if there is more than one first-level identifier reported.
Archive Log/BSDS Report

The archive log/BSDS report provides information about the writing of log records and the retrieval of log data. It also contains information about the bootstrap data set that controls the movement of full active log data sets to the archive log.

The report presents the following activity types:

- Archive waits
- Archive read requests
- Archive offload requests
- BSDS read requests
- BSDS write requests

"Archive Log Activity" on page 28-13
This section shows an example of how to produce the Archive Log/BSDS report and explains fields and columns shown in the report.

"Bootstrap Data Set Activity" on page 28-17
This section shows an example of how to produce the Bootstrap Data Set (BSDS) report and explains fields shown in the report.
I/O Activity - Detail Report

Archive Log Activity

This section shows an example of how to produce the Archive Log/BSDS report and explains fields and columns shown in the report.

The following command produces the Archive Log/BSDS report in "I/O Activity—Archive Log Activity Report."

```
I0ACTIVITY
REPORT
    LEVEL (ARCLOG)
```

I/O Activity—Archive Log Activity Report

This is an example of an archive log/BSDS report.

Column description

The following is a description of each column printed in the archive log activity section of the archive log/BSDS report.

OMEGAMON XE for DB2 PE Identifiers

The archive log activity report presents data summarized by OMEGAMON XE for DB2 PE identifiers. The report can be ordered by up to three OMEGAMON XE for DB2 PE identifiers. The identifiers used to sort the report are printed in the leftmost column. They are printed whenever they change. The second and third identifiers are indented to appear under the relevant column subheading.

Note:

1. Blank or null OMEGAMON XE for DB2 PE identifiers are denoted by the word 'BLANK'.
2. DATASET is the most significant identifier. It is the 8-byte ID that identifies the archive log data set where the reported activity occurs. It has the value cxxxxxxx, where c is the copy number and xxxxxxx is the sequence number. The sequence number is the same as the last seven characters of the data set name.

WAIT TYPE

READ FROM DASD
The total number of waits and the average elapsed time of a wait for archive log reads from the DASD.

READ FROM TAPE
The total number of waits and the average elapsed time of a wait of archive log reads from the tape.

OFFLOAD
The total number of waits for archive log write requests and the average elapsed time of waits per archive log write.

OTHER
The total number of non-I/O waits and the average elapsed time of non-I/O waits on the archive log data set.

OTHER WAITS
The following fields identify the other waits section.

ALLOCATE
The total number of waits and the average elapsed time of a wait for resource allocation.
DEALLOCATE
The total number of waits and the average elapsed time of a wait for resource deallocation.

OPEN
The total number of waits and the average elapsed time of a wait to open a data set.

CLOSE
The total number of waits and the average elapsed time of a wait to close a data set.

HSM RECALL
The total number of waits and the average elapsed time of a wait for HSM to recall data sets.

CATALOG LOCATE
The total number of waits and the average elapsed time of a wait to locate data sets through the catalog.

MULTI DATA SET TAPE VOLUME
The total number of waits and the average elapsed time per wait for multi-data set tape volume.

TAPE VOLUME POSITIONING
The total number of waits and the average elapsed time per wait for tape volume positioning.

WTOR ISSUED
The total number of waits and the average elapsed time of waits due to a write-to-operator message being issued.

DATA SET UNAVAILABLE
The total number of waits and the average elapsed time of a wait due to a data set being unavailable.

PHYSICAL UNIT UNAVAILABLE
The total number of waits and the average elapsed time of a wait due to an unavailable physical unit.

READER SERVICE UNAVAILABLE
The total number of waits and the average elapsed time per wait for an unavailable reader service task.

SUBTOTAL
When a report is ordered by three identifiers and there is more than one third-level identifier reported under it, a subtotal is printed each time the second-level identifier changes.

TOTAL
When a report is ordered by two or three identifiers and there is more than one second-level identifier reported under it, a total is printed each time the first-level identifier changes.

GRAND TOTAL
A grand total is printed at the end of each location if there is more than one first-level identifier reported.
Bootstrap Data Set Activity

This section shows an example of how to produce the Bootstrap Data Set (BSDS) report and explains fields shown in the report.

The following command produces the archive log/BDS report in "I/O Activity—Bootstrap Data Set Activity."

```plaintext
IOACTIVITY
REPORT
LEVEL (ARCLOG)
```

Field description

The following field descriptions are for the bootstrap data set activity section of the archive log/BDS report.

OMEGAMON XE for DB2 PE Identifiers

The bootstrap data set activity report presents data summarized by OMEGAMON XE for DB2 PE identifiers. The report can be ordered by up to three OMEGAMON XE for DB2 PE identifiers. The identifiers used to sort the report are printed in the leftmost column. They are printed
whenever they change. The second and third identifiers are indented to appear under the relevant column subheading.

Note:
1. Blank or null OMEGAMON XE for DB2 PE identifiers are denoted by the word ‘BLANK’.
2. DATASET is the most significant identifier. It is the 8-byte ID that identifies the BSDS data set where the reported activity occurs. It can have either of the following values:
   • BSDS0001
   • BSDS0002

WAIT TYPE

READ  The total number of BSDS reads and the average elapsed time per BSDS read.

WRITE  The total number of BSDS writes and the average elapsed time per BSDS write.

READ AND WRITE  The total number of BSDS reads and writes and the average elapsed time per BSDS read and write.

SUBTOTAL  When a report is ordered by three identifiers and there is more than one third-level identifier reported under it, a subtotal is printed each time the second-level identifier changes.

TOTAL  When a report is ordered by two or three identifiers and there is more than one second-level identifier reported under it, a total is printed each time the first-level identifier changes.

GRAND TOTAL  A grand total is printed at the end of each location if there is more than one first-level identifier reported.
Cross-Invalidation Report

The cross-invalidation report presents buffer refresh events due to cross invalidation summarized by selected OMEGAMON XE for DB2 PE identifiers. If two DB2 systems compete for read/write interest on a page set or partition, a certain amount of buffer cross-invalidation activity occurs to maintain DB2 buffer pool coherency between the two systems.

Cross-invalidation (XI) renders a higher percentage of the buffer pool data invalid. It has the effect of reducing the buffer pool size and thus the buffer pool hit ratio. Buffer pool pages must be continually refreshed when high cross-invalidation levels are reached. This can be a significant overhead in data sharing if workloads between DB2 systems are not properly balanced.

The following command produces the cross-invalidation report in "I/O Activity Cross-Invalidation Report."

I/O ACTIVITY REPORT COMPLETE

Column description

The following is a description of each column printed in the cross-invalidation report:
I/O Activity - Cross-Invalidation Report

OMEGAMON XE for DB2 PE Identifiers
The XI report presents data summarized by OMEGAMON XE for DB2 PE identifiers. The report can be ordered by up to three OMEGAMON XE for DB2 PE identifiers. The identifiers used to sort the report are printed in the leftmost column. They are printed whenever they change. The second and third identifiers are indented to appear under the relevant column subheading.

Note: Blank or null OMEGAMON XE for DB2 PE identifiers are denoted by the word 'BLANK'.

PAGE The name of the page involved in the cross invalidation. The name consists of the following parts:
DB Database name
OB Page set name
PIECE# Page set piece number
PAGE# Page number
BPID Buffer pool ID

If DATABASE or PAGESET are selected in the ORDER option, DB or OB are not shown as part of the page name.

SYNCHRONOUS READS The number of times the page was refreshed via a synchronous read for a particular combination of OMEGAMON XE for DB2 PE identifiers and cross-invalidated page:

GBPOOL From the group buffer pool.
DASD From the DASD.

SEQUENTIAL PREFETCHES The number of times the page was refreshed via a sequential prefetch for a particular combination of OMEGAMON XE for DB2 PE identifiers and cross-invalidated page:

GBPOOL From the group buffer pool.
DASD From DASD.

SUM OF The totals for all pages within a combination of OMEGAMON XE for DB2 PE identifiers if two or more entries are printed in the PAGE column.

SUBTOTAL When a report is ordered by three identifiers and there is more than one third-level identifier reported under it, a subtotal is printed each time the second-level identifier changes.

TOTAL When a report is ordered by two or three identifiers and there is more than one second-level identifier reported under it, a total is printed each time the first-level identifier changes.
GRAND TOTAL
A grand total is printed at the end of each location if there is more than one first-level identifier reported.
I/O Activity Report
Part 6. Locking Report Set

These topics provide information about the Locking reports.

For an introduction to the Locking report set and general locking information refer to the Reporting User’s Guide. It also provides information on input to locking reports.

Chapter 29, “Member-Scope Traces and Reports,” on page 29-1
Member-scope traces present events in chronological sequence within the DB2 subsystem (member) where the events occurred, whereas reports show these events aggregated by the OMEGAMON XE for DB2 PE identifiers you have specified.

Chapter 30, “Group-Scope Traces and Reports,” on page 30-1
In group-scope traces, events are reported in a chronological sequence within the DB2 data sharing group, regardless of which member of the group actually generated the events.

Chapter 31, “Identifiers Used in Locking,” on page 31-1

Chapter 32, “The Locking Header of Reports and Traces,” on page 32-1
This topic describes the headers and fields of Locking reports and traces. The report header and trace header are similar for all reports and traces. All other report or trace sections differ depending on the type of report and are described in the respective report or trace topics.

Chapter 33, “Locking Activity Report,” on page 33-1
Here you find a detailed description about Locking activity reports.

Chapter 34, “Locking Trace,” on page 34-1

Chapter 35, “The Locking File Data Set,” on page 35-1
The locking file data set creates a sequential data set of formatted DB2 locking detail records that can be loaded into the OMEGAMON XE for DB2 PE performance database using the DB2 load utility.
Chapter 29. Member-Scope Traces and Reports

Member-scope traces present events in chronological sequence within the DB2 subsystem (member) where the events occurred, whereas reports show these events aggregated by the OMEGAMON XE for DB2 PE identifiers you have specified.

OMEGAMON XE for DB2 PE can present data from several DB2 members within a data sharing group. The data in member-scope reports is presented by a combination of location, group, subsystem, and member. Whenever one of the values changes, a new page is started and the page number is initialized.

The information in this section is only applicable to DB2 data sharing environments.

Note: For an introduction to the Locking report set and general locking information refer to the Reporting User's Guide.

LOCKING TRACE COMPLETE
Chapter 30. Group-Scope Traces and Reports

In group-scope traces, events are reported in a chronological sequence within the DB2 data sharing group, regardless of which member of the group actually generated the events.

The member name is printed in the body of the trace for each reported event, so that it is easy to see the member where the event occurred. Similarly, group-scope reports show events that are aggregated by the OMEGAMON XE for DB2 PE identifiers you specified. Data in group-scope reports is presented by member.

The information in this section is only applicable to DB2 data sharing environments.

Note: For an introduction to the Locking report set and general locking information refer to the Reporting User’s Guide.

Group-Scope Locking Report

You can generate a Group-Scope Locking report as follows:

```
LOCKING
REPORT
SCOPE (GROUP)
LEVEL (SUSPENSION)
```

This is an example of a Group-Scope Locking report:

```
LOCATION: USIBMSYSTDB2

Chapter 31. Identifiers Used in Locking

Note: For an introduction to the Locking report set and general locking information refer to the Reporting User’s Guide.

In addition to the standard OMEGAMON XE for DB2 PE identifiers, Locking reports and traces use two other identifiers to show the type of resource and event type:

**RESOURCETYPE-Resource type**

The type of lock resource. You can specify one of the values shown in Table 33-1 on page 33-3.

**TYPE-Event type**

Specifies which event types are to be included in, or excluded from, the lock detail trace. The valid values for this field are shown in Table 31-1.

<table>
<thead>
<tr>
<th>Type</th>
<th>Events</th>
</tr>
</thead>
<tbody>
<tr>
<td>IRLMREQ</td>
<td>Lock, unlock, change, query, and notify requests</td>
</tr>
<tr>
<td>CLAIMREQ</td>
<td>Claim acquire, claim change, and claim release</td>
</tr>
<tr>
<td>DRAINREQ</td>
<td>Drain request and drain release</td>
</tr>
<tr>
<td>PLOCKREQ</td>
<td>Page set or partition as well as page P-Lock requests</td>
</tr>
<tr>
<td>IRLMSUSP</td>
<td>The beginning of lock, unlock, change, query, and notify suspensions</td>
</tr>
<tr>
<td>DRAINSUSP</td>
<td>The beginning of drain suspensions</td>
</tr>
<tr>
<td>LATCHSUSP</td>
<td>The beginning of page latch suspensions</td>
</tr>
<tr>
<td>IRLMRES</td>
<td>The end (resumption) of lock, unlock, change, query, and notify suspensions</td>
</tr>
<tr>
<td>DRAINRES</td>
<td>The end (resumption) of drain suspensions</td>
</tr>
<tr>
<td>LATCHRES</td>
<td>The end (resumption) of page latch suspensions</td>
</tr>
<tr>
<td>TIMEOUT</td>
<td>Timeouts</td>
</tr>
<tr>
<td>DEADLOCK</td>
<td>Deadlocks</td>
</tr>
<tr>
<td>LOCKSUMMARY</td>
<td>Lock summary events</td>
</tr>
<tr>
<td>LOCKAVOID</td>
<td>Successful lock avoidance events</td>
</tr>
</tbody>
</table>

The default is *all* event types.

Note: TYPE can also be used with the REDUCE and FILE subcommands of locking. These subcommands support a limited number of types, as follows:

- Valid types for REDUCE are: IRLMRES, DRAINRES, and LATCHRES.
- Valid types for FILE are: IRLMREQ, CLAIMREQ, DRAINREQ, and LOCKAVOID.

If a non-valid type for REDUCE or FILE is used with EXCLUDE, the event type is not filtered.
If no valid types for REDUCE or FILE are used with INCLUDE, an empty report or file is produced.
Chapter 32. The Locking Header of Reports and Traces

This topic describes the headers and fields of Locking reports and traces. The report header and trace header are similar for all reports and traces. All other report or trace sections differ depending on the type of report and are described in the respective report or trace topics.

Note: For an introduction to the Locking report set and general locking information refer to the Reporting User’s Guide.

Layout of a Locking Report Header

The following example shows the layout of a report header, where the letter x is a placeholder marking the maximum size of the data section of each field.

```
LOCATION: xxxxxxxxxxxxxxxxxxx
GROUP: xxxxxxxx
MEMBER: xxxxxxxx
SUBSYSTEM: xxxx
DB2 VERSION: Vn Rn
```

```
LOCATION: xxxxxxxxxxxxxxxxxxx OMEGamon XE for DB2 Performance Expert (v5r3m0)

```

Field descriptions of Locking headers

Headings are printed on all reports and traces at the start of each page. Locking reports and traces carry the following header information:

LOCATION

The DB2 reporting location. If the location name is not available, the DB2 data sharing group name is printed in this field. If the DB2 data sharing group name does not exist, the DB2 subsystem ID is printed.

GROUP

The name of the DB2 data sharing group. This field shows N/A if there is no group name.

MEMBER

The name of the DB2 data sharing member or the member name of the DB2 subsystem. This field shows N/A if there is no member name.

This field is not printed on the report page showing the GROUP BUFFERPOOLS PARAMETERS.

SUBSYSTEM

The ID of the DB2 subsystem that generated the data. This field is not printed on the report page showing the GROUP BUFFERPOOLS PARAMETERS.

DB2 VERSION

The DB2 version number of the subsystem that generated the data.
OMEGAMON XE FOR DB2 PERFORMANCE EXPERT (VnRnMn)

The product name and the version, release, and modification level.

REPORT or TRACE type
For report, this can be:
- SUSPENSION
- LOCKOUT
- DETAIL

For trace, this can be:
- DEADLOCK
- TIMEOUT
- SUSPENSION
- LOCKOUT
- DETAIL

ORDER
If the ORDER option of the REPORT or TRACE subcommand was used to arrange the report entries, the selected keywords are shown in this field. Depending on the context, the OMEGAMON XE for DB2 PE identifiers by which lock events are grouped are shown here.

SCOPE
Scope of the report or trace, this can be MEMBER or GROUP. A member-scope report or trace shows data from a group for each individual member. In a group-scope report or trace, the data from individual members is consolidated and presented for the entire group.

PAGE
The page number in the format lll-nnnnnn, where lll denotes the location number within the report and nnnnnn the page number within the location.

REQUESTED FROM and TO
The FROM and TO dates and times specified in the REPORT or TRACE subcommand.

If both FROM and TO dates and times are omitted from the REPORT subcommand, the FROM and TO dates and times specified in GLOBAL are printed. If only the FROM date and time or only the TO date and time has been specified, NOT SPECIFIED is printed for the unspecified value.

If FROM and TO are not specified in REPORT or GLOBAL, NOT SPECIFIED appears for both the FROM and TO values.

If you have specified FROM and TO times without dates in REPORT or GLOBAL, ALL DATES is printed along with the specified times.

INTERVAL FROM
The start date and time of the first reduction interval covered by the report. If REDUCE is not specified, the INTERVAL defaults to 0 and the timestamps of the first and last events are printed.

INTERVAL TO
The end date and time of the last reduction interval covered by the report. If REDUCE is not specified, the INTERVAL defaults to 0 and the timestamps of the first and last events are printed.

ACTUAL FROM/TO
The date and time of the first and last record included in the log for a location, group, subsystem, or member.
**PAGE DATE**

The date of the timestamps printed on this page. A page break occurs at the change of the date. This is useful if a trace page contains more than one entry and the date is not shown for each entry.
Chapter 33. Locking Activity Report

Here you find a detailed description about Locking activity reports.

**Note:** For an introduction to the Locking Activity report set and general locking information refer to the [Reporting User’s Guide](#).

“Lock Suspension Report” on page 33-2
The Lock Suspension report summarizes all Lock Suspension activities across a specified time period.

“Using Lock Suspension Data with Spreadsheets” on page 33-9
This section provides the necessary information to enable you to use lock suspension report data that is created with the LOCKING REPORT SPREADSHEETDD command in a spreadsheet program.

“Lockout Report” on page 33-12
The lockout report summarizes timeouts and deadlocks occurring within a specified period of time.

“Locking Detail Report” on page 33-15
The Locking Detail (also referred to as Lock Detail) report is based on IFCID 21, which records the detail lock requests.
The Lock Suspension report summarizes all Lock Suspension activities across a specified time period.

The suspensions are reported by any combination of up to three OMEGAMON XE for DB2 PE identifiers. The report summarizes the Lock Suspension activities of:

- An IRLM request (except when the resource type is a drain lock).
- An IRLM request where the resource type is a drain lock.
- A drain request where the claim count is not zero.
  
  This suspension occurs when the agent making the drain request has to wait for the claim count on the particular resource to become zero.

- A suspension of a page latch request.
  
  This suspension occurs when the agent making the page latch request has to wait for a page which is currently being held by another agent.

The Lock Suspension report is produced if level SUSPENSION is specified in the REPORT subcommand. The ORDER subcommand specifies by which OMEGAMON XE for DB2 PE identifiers the report is to be sorted.

Optionally, the SPREADSHEETDD subcommand option can be used to create a data set with Lock Suspension data that can be imported in spreadsheet programs for individual analyses. Refer to “Using Lock Suspension Data with Spreadsheets” on page 33-9 for more details.

Every suspension results in a normal resume or a lockout (deadlock or timeout), or is canceled (in the case of page latch suspensions). In any case, and if the suspension delay is unacceptable, review the plans and associated tables and indexes.

"Layout of a Suspension Report" shows the layout of a suspension report. The letter x is a placeholder marking the maximum size of a field. See “Lock Suspension Report” on page 33-8 for an example of a suspension report.

The report presents data summarized by OMEGAMON XE for DB2 PE identifiers. The report can be sorted by up to three identifiers. For group-scope reports, the member name is added implicitly as an additional identifier and sort criterion.

Layout of a Suspension Report

This is the layout of a suspension report.
Field description

The header information to this report is described in Chapter 32, “The Locking Header of Reports and Traces,” on page 32-1.

IDENT1XX, IDENT2XX, IDENT3XX

These mark the positions where the order criteria are listed and reported.

In group-scope reports, MEMBER is automatically added as the second, third, or fourth identifier.

If you specify DATABASE, PAGESET, or both, in the ORDER option, the database name, page set name, or both names, are removed from the resource name. In this case, ‘BLANK’ is printed.

MEMBER

Group member name of the DB2 subsystem. This is only printed for member-scope reports.

LOCK RESOURCE TYPE

The type of resource on which the suspended request is made. Valid values are shown in Table 33-1

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>

Table 33-1. Lock Resource Type (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SKPT</td>
<td>Skeleton package table</td>
</tr>
</tbody>
</table>

Note, if the lock resource type has a value of SKPT the Lock Detail report shows compressed parts of the SKPT resource name as hexadecimal strings in reports and traces. It consists of the following parts:
- Collection ID, which is compressed (18 bytes)
- Program name, which is compressed (8 bytes)
- Consistency token (8 bytes)

With the hexadecimal value you can compare values of different locks. See "Layout of a Locking Detail report for the lock resource type SKPT" on page 33-16 for an example of a Locking Detail report for the lock resource type SKPT.

SKPT resource names are shown for the Locking Activity report at the following LEVEL:
- LOCKOUT
- SUSPENSION

SKPT resource names are shown for the Locking Activity trace at the following LEVEL:
- LOCKOUT
- TIMEOUT
- SUSPENSION
- DETAIL

<td>Subpage</td>
</tr>
<tr>
<td>UID</td>
<td>Utility ID</td>
</tr>
<tr>
<td>VER#</td>
<td>Version number of LOB</td>
</tr>
</tbody>
</table>

Note:
1. The database names and object names are translations obtained from the IFCID 105 and 107 records. If these records are not available, the decimal representation of the database and object names are printed.

2. If you specify DATABASE, PAGESET, or both, in the ORDER option, the database name, page set name, or both names, are removed from the resource name and printed in the OMEGAMON XE for DB2 PE identifier column. If the name only consists of the database and page set, N/P is printed in the resource name column. If the resource name does not contain the database and page set, 'BLANK' is printed in the OMEGAMON XE for DB2 PE identifier column and all resource name parts are printed in the lock resource block.

**TOTAL SUSPENDS**
The number of suspensions for the particular combination of OMEGAMON XE for DB2 PE identifiers.

**SUSPEND REASONS**
The reason why a particular request was suspended. The requests composing the particular combination of OMEGAMON XE for DB2 PE identifiers and lock resource can be suspended for several reasons. The SUSPEND REASONS column shows all reasons identified by the IRLM resume records. Therefore, the sum of the counts in this column can differ from the TOTAL SUSPENDS count.

The categorized reasons for suspension are:

**LOCAL**
Local resource contention. This occurs when you request access to a local resource that is locked.

**LATCH**
IRLM latch contention. This occurs when the IRLM needs to serialize a resource. For example, the IRLM serializes the adding
and removing of locks to the lock table. The lock table is latched for a short period of time, and the resulting suspensions, if any, are brief.

**GLOB.**
Global contention. This occurs when you request access to a global resource that is locked.

**IRLMQ**
IRLM queued request.

**S.NFY**
Intersystem message sending.

**OTHER**
Suspensions other than those listed here. Suspensions reported as OTHER are either serviceability values, drain suspensions, contentions with retained locks, or page latch suspensions.

**RESUME REASONS**
The reasons for resumption of the suspended tasks. The reason can be normal, timeout, deadlock, and canceled (canceled only applies to page latch suspensions).

**NORMAL NMBR**
The number of suspensions that ended when the task resumed normal processing after completion of the lock request. In page latch suspensions, this is the number of suspensions where the latch requester was not canceled.

**NORMAL AET**
The average elapsed time of a suspension that ended in the task resuming normally. In page latch suspensions, this is the average elapsed time of a suspension where the latch requester was not canceled.

The format for this field is `ssss.nnnnnn`.

**TIMEOUT NMBR**
The number of waits to access locked resources that resulted in exceeding a preset time interval.

**TIMEOUT AET**
The average elapsed time of a resumption due to a timeout.

The format for this field is `ssss.nnnnnn`.

**CANCEL NMBR**
The number of page latch suspensions that ended with the latch requester being canceled.

**CANCEL AET**
The average elapsed time of a page latch suspension that ended with the latch requester being canceled.

The format for this field is `ssss.nnnnnn`.

**DEADLOCK NMBR**
The number of deadlocks.

**DEADLOCK AET**
The average duration of a deadlock.

The format for this field is `ssss.nnnnnn`.
Locking Activity - Suspension Report

SUM OF
The sum printed for the lowest-level identifier when there is more than one combination of request type, resource type, and lock resource reported under it.

GROUP TOTAL
The sum of report entries that belong to a data sharing group if more than one member of the group is reported for a particular combination of OMEGAMON XE for DB2 PE identifiers. A GROUP TOTAL only appears in group-scope reports.

SUBTOTAL
When a report is ordered by three identifiers and there is more than one third-level identifier reported under it, a subtotal is printed each time the second-level identifier changes.

TOTAL
When a report is ordered by two or three identifiers and there is more than one second-level identifier reported under it, a total is printed each time the first-level identifier changes.

GRAND TOTAL
If there is more than one first-level identifier reported, a grand total is printed at the end of each group in a group-scope report or at the end of each member in a member-scope report.

Lock Suspension Report

The following sample suspension report is produced with this command:

: LOCKING REPORT :

This is a sample Lock Suspension report.

... LOCKING REPORT COMPLETE
Using Lock Suspension Data with Spreadsheets

This section provides the necessary information to enable you to use lock suspension report data that is created with the LOCKING REPORT SPREADSHEETDD command in a spreadsheet program.

It is assumed that you created a data set with lock suspension data on the host by using the SPREADSHEETDD option of the LOCKING REPORT command. Refer to the Report Command Reference for more information about the SPREADSHEETDD option. Further, it is assumed that you downloaded the data set to your client as a text file (choose ascii or text, not binary, as transfer type in your file transfer program). The data set should be available as a plain text file in ASCII format on your client.

It is assumed that you are familiar with the use of spreadsheet programs. Modern spreadsheets provide means to import data from plain text files, provided that data in these files is organized as records and individual fields of the records are separated by a known separator character. The file containing lock suspension data has its fields separated by colons (;). Therefore, you must specify the colon as the separator character (also called a delimiter) when you are importing the data into the spreadsheet program. See the help information of the spreadsheet of your choice for details on how to import data.

After the data is imported to your spreadsheet, the records from the plain text file are represented in spreadsheet rows and the fields are represented in spreadsheet columns.

The remainder of this section describes details about the data as it is initially represented in the spreadsheet. Further use, such as sorting, filtering, analysis, and interpretation is not described. For the latter, see “Lock Suspension Report” on page 33-2.

- The first row contains report header information, similar to OMEGAMON XE FOR DB2 PERFORMANCE EXPERT (V5R4M0) Locking Report Suspension.
  You might notice how the colon-separated format in the plain text file converts to subsequent cells in a spreadsheet row.

- The second row contains the column labels, as shown in Table 33-3. Approximately 35 columns are shown; the precise number depends on what was specified with the ORDER subcommand option when the data was generated.
- The third and all following rows contain the accumulated lock suspension data values.
  Empty cells represent missing data values, usually shown in reports as N/A, N/C, or N/P.

The lockout report summarizes timeouts and deadlocks occurring within a specified period of time.

The report shows the number of times an agent, identified by up to three OMEGAMON XE for DB2 PE identifiers, has been timed out or involved in a deadlock when requesting a particular resource. In addition, it shows the other contenders for the resource and the number of times they act as holders or waiters.

There is no correlation between the number of deadlock events reported by Locking reports and traces and the number of deadlocks reported in Accounting and Statistics reports. Whereas Accounting and Statistics reports count all deadlock occurrences, regardless of how they resolve, Locking reports only those deadlocks that were resolved by DB2. DB2 can resolve a deadlock either by making a process roll back, thereby releasing the locks it holds on resources, or by requesting a process to terminate.

The lockout report is produced if level LOCKOUT is specified in the REPORT subcommand and if there is at least one combination of a lockout agent's identifier satisfying the FROM and TO, and INCLUDE or EXCLUDE criteria.

The ORDER subcommand specifies by which OMEGAMON XE for DB2 PE identifiers the report is to be sorted. You can specify up to three identifiers.

Note: For an introduction to the Locking report set and general locking information refer to the Reporting User's Guide.

Layout of a Lockout Report

This is the layout of a lockout report. The letter x is a placeholder marking the maximum size of a field. See “Example of a Lockout Report” on page 33-14 for an example of a lockout report.
Field description

Here is a description of all fields except for the report header, which is described in Chapter 32, “The Locking Header of Reports and Traces,” on page 32-1.

LOCK RESOURCE TYPE
The type of resource involved in the lockout. Valid values are shown in Table 33-1 on page 33-3.

LOCK RESOURCE NAME
The name of the resource on which the timeout or deadlock occurred. Each part of the lock resource name is printed on a separate line. The abbreviations shown in the report are explained, in alphabetical order, in Table 33-2 on page 33-5.

TIMEOUTS
The number of times the resource was involved in a timeout.

DEADLOCKS
The number of times the resource was involved in a deadlock.

There is no correlation between the number of deadlocks reported by Locking reports and traces and the number of deadlocks reported in Accounting and Statistics reports. Whereas Accounting and Statistics reports count all deadlock occurrences, regardless of how they resolve, Locking reports only those deadlocks that were resolved by DB2. DB2 can resolve a deadlock either by making a process roll back, thereby releasing the locks on resources, or by requesting a process to terminate.

AGENTS
The agents in contention for the resource during the lockout. This block consists of the following columns:

MEMBER
The agent's member name. In a non-data-sharing environment, this field shows N/P.

PLANNAME
The agent's plan name or the word SYSTEM if there is contention with a retained lock.

CONNECT
The agent's connection name.

CORRID
The agent's correlation identifier.

BLOCKER/HOLDER
For timeouts, the number of times the agent held the resource during the lockout.

For deadlocks, the number of times the agent was the blocker, either as a holder or a waiter.

WAITER
The number of times the agent waited for the resource during the lockout.

LOCKOUTS FOR
The number of timeout and deadlock records aggregated for the currently reported set of OMEGAMON XE for DB2 PE identifiers.

For timeouts, this value is equivalent to the sum of the entries in the TIMEOUTS column.
A deadlock record involves several resources. Therefore, this value differs from the sum of the entries in the DEADLOCKS column.

**GROUP TOTAL**

The sum of report entries that belong to a data sharing group if more than one member of the group is reported for a particular combination of the DB2 identifiers. A GROUP TOTAL only appears in group-scope reports.

**SUBTOTAL**

When a report is ordered by three identifiers and there is more than one third-level identifier reported under it, a subtotal is printed each time the second-level identifier changes.

**TOTAL**

When a report is ordered by two or three identifiers and there is more than one second-level identifier reported under it, a total is printed each time the first-level identifier changes.

**GRAND TOTAL**

If there is more than one first-level identifier reported, a grand total is printed at the end of each group in a group-scope report or at the end of each member in a member-scope report.

### Example of a Lockout Report

The following command is used to produce the example of the Lockout report:

```plaintext
LOCKING REPORT
LEVEL (LOCKOUT)
```

Here is the example of the Lockout report:

```
LOCATION: STLEC1
GROUP: N/P
SUBSYSTEM: VA1A
DB2 VERSION: V10

PRIMAUTH  PLANNAME   TYPE  NAME   TIMEOUTS  DEADLOCKS  MEMBER  PLANNAME  CONNECT  CORRID  HOLDER  WAITER
---------  --------  -----  -----    --------    --------    ------   --------    ------    ------    -------  -------
SYSADM     DSNTEP3  SKPT    1       0         N/P      DSNTEP3  BATCH    L829UTT1  1       0

**LOCKOUTS FOR DSNTEP3**  **  **  **

LOCKING REPORT COMPLETE
```
Locking Detail Report

The Locking Detail (also referred to as Lock Detail) report is based on IFCID 21, which records the detail lock requests.

The Locking Detail report is produced if level DETAIL is specified in the REPORT subcommand.

The ORDER subcommand specifies by which OMEGAMON XE for DB2 PE identifiers the report is to be sorted. In this sample the data is accumulated and ordered by DATABASE-PAGESET.

“Layout of a Locking Detail Report” shows the layout of a Locking Detail report. The letter x is a placeholder marking the maximum size of a field. See “Locking Detail Report” on page 33-17 for an example of a Locking Detail report.

Note: For an introduction to the Locking report set and general locking information refer to the Reporting User’s Guide.

Layout of a Locking Detail Report

You can generate a Locking Detail report as follows:

```
LOCATION: xxxx
GROUP: xxxx
MEMBER: xxxx
SUBSYSTEM: xxxx
DB2 VERSION: Vx

LOCATION: xxxx
GROUP: xxxx
MEMBER: xxxx
SUBSYSTEM: xxxx
DB2 VERSION: Vx

LOCKING REPORT
SCOPE (MEMBER)
LEVEL (DETAIL)

LOCATION: xxxx
GROUP: xxxx
MEMBER: xxxx
SUBSYSTEM: xxxx
DB2 VERSION: Vx

LOCATION: xxxx
GROUP: xxxx
MEMBER: xxxx
SUBSYSTEM: xxxx
DB2 VERSION: Vx

LOCATION: xxxx
GROUP: xxxx
MEMBER: xxxx
SUBSYSTEM: xxxx
DB2 VERSION: Vx
```

Note: If the lock resource type has a value of SKPT (skeleton package table locking) the Lock Detail report shows compressed parts of the SKPT resource name as hexadecimal strings in reports and traces. It consists of the following parts:

- Collection ID, which is compressed.
- Program name, which is compressed.
- Consistency token

With the hexadecimal value you can compare values of different locks. See “Layout of a Locking Detail report for the lock resource type SKPT” on page 33-16 for an example of a Locking Detail report for the lock resource type SKPT.
Locking Activity - Lock Detail Report

Layout of a Locking Detail report for the lock resource type SKPT

Here is an example of the layout of a Locking Detail report for the lock resource type SKPT.

Field description

Here is a description of all fields except for the report header, which is described in Chapter 32, “The Locking Header of Reports and Traces,” on page 32-1.

LOCK RESOURCE TYPE
The type of resource on which the lock detail request is made. Valid values are shown in Table 33-1 on page 33-3.

LOCK RESOURCE NAME
The name on which the lock detail request is made. Each part of the lock resource name is printed on a separate line. The abbreviations shown in the report are explained, in alphabetical order, in Table 33-2 on page 33-5.

TOTAL REQ
The total number of lock requests. The sum is calculated by adding the number of request types like LOCK, UNLOCK, CHANGE, or OTHER request types.

LOCAL
The number of lock requests that were not sent to cross-system extended services (XES). The sum is calculated by adding the number of request types like LOCK, UNLOCK, CHANGE, or OTHER request types found in the IRLM FUNCTION CODE if data indicates that the request was not sent to z/OS XES.

XES
The number of lock requests that were sent to cross-system extended services (XES). The sum is calculated by adding the number of request types like LOCK, UNLOCK, CHANGE, or OTHER request types found in the IRLM FUNCTION CODE if data indicates that the request was sent to z/OS XES.

REQ TYPE
The lock request types:

LOCK  Lock function
UNLOCK
Unlock function

CHNGE
Change function

OTHER
Any other functions

LOCK STATE
The lock state can be:
IS    Intent share
IX    Intent exclusive
SIX   Share with intent exclusive
NSU   Non shared update
S     Share
X     Exclusive
U     Update

LOCK DURATION
The lock duration can be:
CMT   Commit
CMT+1 Commit + 1
ALLOC Allocation
MAN   Manual
MAN+1 Manual + 1
OTHER Other

COND
The number of lock requests with request type or mode CONDITIONAL.

AUTREL
The number of lock requests with request type or mode AUTOMATIC
RELEASE.

TOTAL
Total lines are printed regardless of the number of different IDs printed
before even if the report presents only a single ID.

Locking Detail Report

You can generate a Locking Detail report as follows:

LOCKING REPORT
SCOPE (MEMBER)
LEVEL (DETAIL)
### Locking Activity - Lock Detail Report

"Locking Detail Report" on page 33-17 shows a sample Locking Detail report, produced by the following command:

```

| LOCKING REPORT COMPLETE |
Chapter 34. Locking Trace

Note: For an introduction to the Locking report set and general locking information refer to the [Reporting User’s Guide](#). It also provides information on input to locking.

The layout for locking traces is the same for each trace apart from the event-specific data. “Layout of a Deadlock Trace” shows the general layout of the locking trace and describes the common fields.

### Layout of a Deadlock Trace

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOCATION</td>
<td>The location where the locking trace was generated.</td>
</tr>
<tr>
<td>GROUP</td>
<td>The group identifier on which the locking trace is based.</td>
</tr>
<tr>
<td>MEMBER</td>
<td>The member identifier on which the locking trace is based.</td>
</tr>
<tr>
<td>SUBSYSTEM</td>
<td>The subsystem identifier on which the locking trace is based.</td>
</tr>
<tr>
<td>DB2 VERSION</td>
<td>The version of DB2 on which the locking trace is based.</td>
</tr>
<tr>
<td>PRIMAUTH</td>
<td>The primary authorization identifier.</td>
</tr>
<tr>
<td>ORIGAUTH</td>
<td>The origination authorization identifier.</td>
</tr>
<tr>
<td>CORRNAME</td>
<td>The corrector name.</td>
</tr>
<tr>
<td>CONNTYPE</td>
<td>The connection type.</td>
</tr>
<tr>
<td>PLANNAME</td>
<td>The plan name.</td>
</tr>
<tr>
<td>CONNECT</td>
<td>The connection identifier.</td>
</tr>
<tr>
<td>EVENT</td>
<td>The locking event.</td>
</tr>
<tr>
<td>TIMESTAMP</td>
<td>The time at which the event occurred.</td>
</tr>
<tr>
<td>RELATED TIMESTAMP</td>
<td>The timestamp of the suspended request that was selected as the victim of this event.</td>
</tr>
<tr>
<td>EVENT SPECIFIC DATA</td>
<td>Event-specific data for the locking event.</td>
</tr>
</tbody>
</table>

### Field description

Here you find a description of all fields except for the trace header and the OMEGAMON XE for DB2 PE identifiers, for details of the trace header see Chapter 32, “The Locking Header of Reports and Traces,” on page 32-1. The descriptions start with the timestamp block and move to the right.

**reporttype**

This can be:
- DEADLOCK
- TIMEOUT
- LOCKOUT
- SUSPENSION
- DETAIL

**EVENT TIMESTAMP**

The time at which the event occurred. The trace is sorted and printed in the order of this timestamp. The format of this timestamp is `hh:mm:ss.nnnnnnn`. For other traces, this field always shows N/P because the related suspension event is not reported.

**RELATED TIMESTAMP**

The timestamp of the suspended request that was selected as the victim of this event. This field only shows a value for suspension and detail traces. For other traces, this field always shows N/P because the related suspension event is not reported.

**EVENT**

The Locking event. This varies according to the type of trace.
LOCK RESOURCE TYPE
The type of locked resource. The values for the locked resource types are shown in Table 33-1 on page 33-3.

LOCK RESOURCE NAME
The name of the resource. Each part of the lock resource name is printed on a separate line. The format of the name depends on the resource type as shown in Table 33-2 on page 33-5.

EVENT SPECIFIC DATA
The layout and content of the event specific data varies according to the reported event and is described in the sections following.

“Deadlock Trace” on page 34-3
The deadlock trace contains an entry for every occurrence of a deadlock during a specified time period.

“Timeout Trace” on page 34-1
The timeout trace shows when a timeout occurred and provides details of the resource involved in the timeout event and information about the threads that held the resource or waited to use the resource.

“Lockout Trace” on page 34-16
The lockout trace contains details of timeout and deadlock events.

“Lock Suspension Trace” on page 34-17
The lock suspension trace identifies applications that have been suspended after a lock was requested on a resource that is not available.

“Lock Detail Trace Data” on page 34-30
The lock detail trace describes all locking events in a DB2 system. It includes those that can be viewed in suspension, timeout, or deadlock traces. This trace gives you a global view of the entire locking activity in the system.
Deadlock Trace

The deadlock trace contains an entry for every occurrence of a deadlock during a specified time period.

The trace shows when the deadlock occurred and provides details on the resources involved in the deadlock and information about the threads that held the resource or waited to use the resource. If the resource was held by more than one agent and not all of them were actively involved in the deadlock, the holder data cannot be determined and is not printed.

The data specific to the deadlock. For each resource involved in a deadlock there is a block of waiter’s data and a block of blocker’s data.

A blocker is a thread that prevents the victim getting its lock. The blocker can be a holder of the lock or another waiter (one that came in before the victim) that is incompatible with the holder’s lock.

There is no correlation between the number of deadlock events reported by Locking reports and traces and the number of deadlocks reported in Accounting and Statistics reports. Whereas Accounting and Statistics reports count all deadlock occurrences, regardless of how they resolve, Locking reports only those deadlocks that were resolved by DB2. DB2 can resolve a deadlock either by making a process roll back, thereby releasing the locks it holds on resources, or by requesting a process to terminate.

The format of the deadlock-specific data is shown in “The Format of Deadlock-Specific Data” on page 34-4.

“Trace Data Specific to Deadlock Event” on page 34-4
“Deadlock Trace Example” on page 34-7
Trace Data Specific to Deadlock Event

This topic describes the trace data that is specific to the Deadlock Event.

The Format of Deadlock-Specific Data

The following example shows the layout of Deadlock-Specific data.

```
COUNTER =XXXXX  WAITERS =XXXXX
TSTAMP =MM/DD/YY HH:MM:SS.ss
HASH =X'HIIIIIIIIIII'
----------  BLOCKER is HOLDER  ----------
LUW=xxxxxxxxx,xxxxxxxx,xxxxxxxxxxxxx
MEMBER =xxxxxxxxx CONNECT =xxxxxxxxx
PLANNAME=xxxxxxxxx CORRID =xxxxxxxxxxxxx
DURATION=xxxxxxxx PRIMAUTH=xxxxxxxxx
STATE =xxxxx STMTINFO=xxxxxxxxx
ENDUSER =xxxxxxxxxxxxx
MEMBER =xxxxxxxxxxxxx
TRANSAC=xxxxxxxxxxxxxxxxxxxxxxxxxxxxx
PROGNAME=xxxxxxxxx
COLLID =xxxxxxxxxxxxxxxxx
LOCATION=xxxxxxxxxxxxxxxxx
CONTOKEN=X'xxxxxxxxxxxxxxxxxx'
STMTID =X'xxxxxxxxxxxxxxxxx'
----------  WAITER  ----------
LUW=xxxxxxxxx,xxxxxxxx,xxxxxxxxxxxxx
MEMBER =xxxxxxxxx CONNECT =xxxxxxxxx
PLANNAME=xxxxxxxxx CORRID =xxxxxxxxxxxxx
REQUEST =xxxxx WORTH =xxxxx
STATE =xxxxx STMTINFO=xxxxxxxxx
ENDUSER =xxxxxxxxxxxxx
MEMBER =xxxxxxxxxxxxx
TRANSAC=xxxxxxxxxxxxxxxxxxxxxxxxxxxxx
PROGNAME=xxxxxxxxx
COLLID =xxxxxxxxxxxxxxxxx
LOCATION=xxxxxxxxxxxxxxxxx
CONTOKEN=X'xxxxxxxxxxxxxxxxxx'
STMTID =X'xxxxxxxxxxxxxxxxx'
```

Field description

The individual fields have the following meaning:

**COUNTER**
- The deadlock interval counter.

**WAITERS**
- The number of waiters involved in the deadlock.

**TSTAMP**
- The time when the deadlock occurred.

**HASH**
- The lock resource hash value.

**LUW**
- The ID of the blocker's or waiter's logical unit of work.

**MEMBER**
- The blocker's or waiter's member name. In a non-data-sharing environment, this field contains N/P.

**CONNECT**
- The holder's or waiter's connection name.

**PLANNAME**
- The blocker's or waiter's plan name.

**CORRID**
- The blocker's or waiter's correlation name.
DURATION
The lock duration of the deadlock blocker or waiter. Valid values are shown in Table 34-1.

Table 34-1. Lock Duration

<table>
<thead>
<tr>
<th>Duration</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MANUAL</td>
<td>Varies depending on the ISOLATION parameter</td>
</tr>
<tr>
<td>MANUAL+1</td>
<td>Temporary change of consistency level from CS to RR during bind and DDL</td>
</tr>
<tr>
<td>COMMIT</td>
<td>Until commit</td>
</tr>
<tr>
<td>COMMIT+1</td>
<td>Past commit; applies to locks needed to maintain the position for a cursor opened WITH HOLD</td>
</tr>
<tr>
<td>ALLOCATN</td>
<td>Until deallocation</td>
</tr>
<tr>
<td>PLAN</td>
<td>For the duration of the plan</td>
</tr>
<tr>
<td>UTILITY</td>
<td>For the duration of the utility execution</td>
</tr>
<tr>
<td>INTEREST</td>
<td>For the duration of P-Locks</td>
</tr>
<tr>
<td>FREE ALL</td>
<td>Until all locks are freed</td>
</tr>
</tbody>
</table>

PRIMAUTH
The primary authorization ID of the thread.

REQUEST
The waiter's request, which can be one of the following:
- LOCK
- UNLOCK
- CHANGE

WORTH
The waiter's worth value assigned by DB2.

STATE
The holder's or waiter's state or mode of the lock applied to the resource. Valid values are shown in Table 34-2.

Table 34-2. Lock State

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UPS</td>
<td>Unprotected share</td>
</tr>
<tr>
<td>IS</td>
<td>Intent share</td>
</tr>
<tr>

<td>Share</td>
</tr>
<tr>
<td>U</td>
<td>Update</td>
</tr>
<tr>
<td>SIX</td>
<td>Share with intent exclusive</td>
</tr>
<tr>
<td>NSU</td>
<td>Nonshared update</td>
</tr>
<tr>
<td>X</td>
<td>Exclusive</td>
</tr>
</tbody>
</table>

STMTINFO
The statement information of the holder or waiter.

ENDUSER
End user's user ID. This field is not shown when this information is not present.
Locking Activity - Trace

**WSNAME**
End user’s workstation name. This field is not shown when this information is not present.

**TRANSAC**
The end user's transaction name. This field is not shown when this information is not present.

**PROGNAME**
The program name can be one of the following:
- The name of the blocker's program that is currently in control at the time of the deadlock and not necessarily the program that acquired the lock.
- The waiter’s program that is contending the resource.

**COLLID**
The collection identifier can be one of the following:
- The package collection ID of the blocker's program that is currently in control at the time of the deadlock and not necessarily the program that acquired the lock.
- The package collection ID of the waiter's program that is contending the resource.

**LOCATION**
The location can be one of the following:
- The location of the blocker's program that is currently in control at the time of the deadlock and not necessarily the program that acquired the lock.
- The location of the waiter's program that is contending the resource.

**CONTOKEN**
The consistency token can be one of the following:
- The consistency token of the blocker's program that is currently in control at the time of the deadlock and not necessarily the program that acquired the lock.
- The consistency token of the waiter's program that is contending the resource.

**STMTID**
The statement ID of the holder or waiter.
Deadlock Trace Example

"Deadlock trace example" shows a sample deadlock trace, produced by the following command:

```
LOCKING TRACE (DEADLOCK)
```

Deadlock trace example

This is a sample deadlock trace:

locking trace complete
Timeout Trace

The timeout trace shows when a timeout occurred and provides details of the resource involved in the timeout event and information about the threads that held the resource or waited to use the resource.

The following sections show the layout of event-specific information for a timeout trace and describe the fields reported. At the end of this topic you find an example of a timeout trace.

“Trace Data Specific to Timeout Event” on page 34-12
“Timeout Trace Example” on page 34-15
Trace Data Specific to Timeout Event

The details related to the timeout. The format of the timeout-specific data is shown in "Format of timeout-specific data."

Format of timeout-specific data

The following example shows details related to the timeout.

```
REQUEST =LOCK UNCONDITIONAL
STATE =IS ZPARM INTERVAL= 30
DURATION=COMMIT INTERVAL=COUNTER= 1
HASH =X'00015F0F'
STMTINFO=DYNAMIC
STMTID =X'000000000000A341'
----------- Holder/Waiters -----------
HOLDER
LUW=DEIBMIPS.IPUAXZ32.C6215376BB44
MEMBER =SZ32 CONNECT =BATCH
PLANNAME=DSNTIA10 CORRID =YULT3978
DURATION=COMMIT PRIMAUTH=SKA
STATE =X STMTINFO=DYNAMIC
STMTID =X'000000000000A312'
```

Field description

The individual fields have the following meaning:

REQUEST
The timeout request, consists of one of the following:
- LOCK
- CHANGE

Followed by the timeout attribute CONDITIONAL or UNCONDITIONAL.

STATE
The state or mode of the lock applied to the resource. Valid values are shown in Table 34-2 on page 34-5

ZPARM INTERVAL
The timeout interval (ZPARM value), which is the timeout value specified on the installation panel DSNTIPX or in the ZPARM name STOR TIME in DSN6SYSP.

DURATION
The length of time for which the lock was held. Valid values are shown in Table 34-3

Table 34-3. Lock Duration

<table>
<thead>
<tr>
<th>Duration</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MANUAL</td>
<td>Varies depending on the ISOLATION parameter</td>
</tr>
<tr>
<td>MANUAL+1</td>
<td>Temporary change of consistency level from CS to RR during bind and DDL</td>
</tr>
<tr>
<td>COMMIT</td>
<td>Until commit</td>
</tr>
<tr>
<td>COMMIT+1</td>
<td>Past commit; applies to locks needed to maintain the position for a cursor opened WITH HOLD</td>
</tr>
<tr>
<td>ALLOCATN</td>
<td>Until deallocation</td>
</tr>
<tr>
<td>PLAN</td>
<td>Lock held for the duration of the plan</td>
</tr>
<tr>
<td>UTILITY</td>
<td>For the duration of the utility execution</td>
</tr>
<tr>
<td>FREE ALL</td>
<td>Until all locks are freed</td>
</tr>
<tr>
<td>X'00'</td>
<td>The suspension reason is a retained lock</td>
</tr>
</tbody>
</table>
The DURATION attribute controls when locks are released. As a general rule, a lock is only released when an agent makes an unlock request with a duration longer than, or equal to, the longest lock duration specified for the resource by that agent.

You increase lock durations using either a lock request or a change request. Lock durations are decreased using a change request.

**INTERV.COUNTER**

The number of timeout intervals that can occur before the agent is timed out.

**HASH**

The lock resource hash value.

**STMTINFO**

The waiter's statement information. Possible values are:

- **STATIC**
  The statement is of type static.

- **DYNAMIC**
  The statement is of type dynamic.

**STMTID**

The cached statement ID for the statement waiting for the resource. A value of zero indicates that the client did not supply this information.

**Fields that are printed for each holder/waiter**

The following fields are printed for each **holder/waiter** of the reported lock resource:

- **LUW**
  The ID of the holder’s or waiter's logical unit of work. If the reason for the suspension is a retained lock, this field contains the word SYSTEM.

- **MEMBER**
  The holder’s or waiter’s DB2 member name. In a non-data-sharing environment, N/P is printed.

- **CONNECT**
  The holder’s or waiter’s connection name. If the reason for the suspension is a retained lock, this field contains the word SYSTEM.

- **PLANNAME**
  The holder’s or waiter’s plan name. If the reason for the suspension is a retained lock, this field contains the word SYSTEM.

- **CORRID**
  The holder’s or waiter’s correlation identifier. If the reason for the suspension is a retained lock, this field contains the word SYSTEM.

- **DURATION**
  The lock duration of the timeout holder or waiter. Valid values are shown in Table 34-3 on page 34-12.

- **PRIMAUTH**
  The primary authorization ID.

- **STATE**
  The holder’s or waiter’s state or mode of the lock applied to the resource. Valid values are shown in Table 34-2 on page 34-5.
Locking Activity - Trace

**STMTINFO**
The holder’s statement information. Possible values are:

**STATIC**
The statement is of type static.

**DYNAMIC**
The statement is of type dynamic.

**STMTID**
The cached statement ID for the statement holding the resource. A value of zero indicates that the client did not supply this information.
### Timeout Trace Example

**LOCKING TRACE COMPLETE**
The lockout trace contains details of timeout and deadlock events.

You generate it by using the following command:

```plaintext
LOCKING TRACE LEVEL (LOCKOUT)
```

For information on the layout of a lockout trace, refer to “Deadlock Trace” on page 34-3 and “Timeout Trace” on page 34-11.

Here is an example of a lockout trace.

LOCKING TRACE COMPLETE
Lock Suspension Trace

The lock suspension trace identifies applications that have been suspended after a lock was requested on a resource that is not available.

The trace shows an entry for the suspension of each of the following:
- An IRLM request (except when the resource type is a drain lock).
- An IRLM request where the resource type is a drain lock.
- A drain request where the claim count is not zero.
  This suspension occurs when the agent making the drain request has to wait for the claim count on the particular resource to become zero.
- A page latch request.
  This suspension occurs when the agent making the page latch request has to wait for a page that is currently being held by another agent.

The lock suspension trace is produced if level SUSPENSION is specified in the TRACE subcommand and if there is at least one pair of IFCIDs 44/45, 213/214, 215/216, or 226/227 in the input data set satisfying the FROM and TO, and INCLUDE or EXCLUDE criteria.

The following sections show the layout of a lock suspension trace and describe the various fields of the trace. At the end of this topic you find an example of a lock suspension trace.

“Lock Suspension Trace Example” on page 34-18
This topic shows an example of a Lock Suspension trace.

“Lock Suspension Events - Lock, Unlock, Change, and Notify Suspend” on page 34-19
This topic shows the format of data specific to Lock, Unlock, Change, and Notify Suspend for Lock Suspension events. It also describes the fields provided for this event.

“Lock Suspension Events - Lock, Unlock, Change, and Notify Resume” on page 34-21
The format of the data for these events depends on whether these events occurred in a data sharing or non-data-sharing environment.

“Lock Suspension Events - Query Suspend” on page 34-24
This topic shows the format of data specific to Query Suspend for Lock Suspension events. It also describes the fields provided for this event.

“Lock Suspension Events - Query Resume” on page 34-25
This topic shows the format of data specific to Query Resume for Lock Suspension events. It also describes the fields provided for this event.

“Lock Suspension Events - Drain Suspend” on page 34-26
This topic shows the format of data specific to Drain Suspend for Lock Suspension events. It also describes the fields provided for this event.

“Lock Suspension Events - Drain Resume” on page 34-27
This topic shows the format of data specific to Drain Resume for Lock Suspension events. It also describes the fields provided for this event.

“Lock Suspension Events - Latch Suspend” on page 34-28
This topic shows the format of data specific to Latch Suspend for Lock Suspension events. It also describes the fields provided for this event.

“Lock Suspension Events - Latch Resume” on page 34-29
This topic shows the format of data specific to Latch Resume for Lock Suspension events. It also describes the fields provided for this event.
Lock Suspension Trace Example

This topic shows an example of a Lock Suspension trace.

Enter the following command to produce a Lock Suspension trace:

```
:LOCKING
  TRACE
  LEVEL (SUSPENSION)
```

Lock Suspension trace example

</tr>
</tbody>
</table>

**PARENT**
The parent token for explicit hierarchical locking.

**HASH**
The lock hash value.
The following fields are printed if both of the following conditions are satisfied:
- The OMEGAMON XE for DB2 PE subsystem is a member of a data sharing group.
- It is an IRLM suspension.

Stands for the lock attributes, which can be one or more of the following:
- MODIFY or NMODIFY
- GLOBAL or LOCAL
- P-LOCK or L-LOCK

**XES PROP**
An indicator whether or not IRLM propagated the request to XES. Possible values are Y(es) or N(o).

**XES FORC**
An indicator whether or not the lock was requested to be forced to XES. Possible values are Y(es) or N(o).

**XES ASYN**
An indicator whether or not IRLM sent the request asynchronously to XES. Possible values are Y(es) or N(o).

This field is only printed if XES PROP=Y.
Lock Suspension Events - Lock, Unlock, Change, and Notify Resume

The format of the data for these events depends on whether these events occurred in a data sharing or non-data-sharing environment.

"Format of data specific to Lock, Unlock, Change, and Notify Resume (Data Sharing)" shows the format in a data sharing environment; "Format of data specific to Lock, Unlock, Change, and Notify Resume (Non-Data Sharing)" in a non-data-sharing environment.

Format of data specific to Lock, Unlock, Change, and Notify Resume (Data Sharing)

This is the sample format for data specific to Lock, Unlock, Change, and Notify Resume in a data sharing environment.

Description of individual fields

The individual fields have the following meaning:

SUSP.TIME
The duration of the suspension.

DURATION
The length of time the lock is held. For a list of possible values, refer to Table 34-4 on page 34-19.

STATE
The state or mode of the lock applied to the resource. For a list of possible values, refer to Table 34-2 on page 34-5.

RESUME RSN
The reason for resumption. Valid values are shown in Table 34-6.

<table>
<thead>
<tr>
<th>Reason</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NORMAL</td>
<td>The suspended task resumed normally when the resource became available.</td>
</tr>
<tr>
<td>DEADLOCK</td>
<td>The suspended task resumed after a deadlock.</td>
</tr>
<tr>
<td>TIMEOUT</td>
<td>The suspended task resumed when a preset time interval expired.</td>
</tr>
<tr>
<td>IDENTIFY</td>
<td>The suspended task is resumed after an identify call to IRLM.</td>
</tr>
</tbody>
</table>

Table 34-6. Reason for Resume - IRLM Requests
Locking Activity - Trace

XES PROP
An indicator whether or not IRLM propagated the request to XES. Possible values are Y(es) or N(o).

XES FORC
An indicator whether or not the lock was requested to be forced to XES. Possible values are Y(es) or N(o).

XES ASYN
An indicator whether or not IRLM sent the request asynchronously to XES. Possible values are Y(es) or N(o).

This field is only printed if XES PROP=Y.

Stands for the lock attributes. It can be one or more of the following:
• MODIFY or NMODIFY
• GLOBAL or LOCAL
• P-LOCK or L-LOCK

For example:

MODIFY   GLOBAL L-LOCK

PARENT
The parent token for explicit hierarchical locking.

HASH
The lock hash value.

Description of suspension fields

A request can be suspended for several reasons. For example, the original reason may have been an IRLM latch contention, then the request may first have hit local contention and, after it was resolved, global level contention. The fields in the right block show whether or not a particular reason for suspension was encountered, which is indicated by Y(es) or N(o). The original reason is marked with an asterisk (*).

LOCAL CONTENTION
The local resource contention.

LATCH CONTENTION
The IRLM latch contention.

IRLM QUEUED REQ
The IRLM queued request. This request is only valid for IRLM suspensions.

GLOBAL CONT.
The global contention. Intersystem communication is required to resolve the lock request. This reason applies to data sharing environments only.

NOTIFY MSG SENT
Intersystem message sending. This reason only applies to data sharing environments and IFCID 44 suspensions.

Only applies if it is an IRLM suspension and the global contention is hit (GLOBAL CONT=Y). If these conditions are satisfied, it can be one of the following values:
IRLM GLOBAL CONT
The request hit IRLM global resource contention.

XES GLOBAL CONT
The request hit XES global resource contention.

FALSE/SYNC-ASYNC
This can be one of the following:

FALSE CONT
The request is a false contention (shown if QW0045W8 is ON)

SYNC-TO-ASYNC CONV
The request is a sync-to-async conversion (shown if QW0045W8 is OFF)

RETAINED LOCK
Indicates whether there was contention with a retained lock.
Lock Suspension Events - Query Suspend

This topic shows the format of data specific to Query Suspend for Lock Suspension events. It also describes the fields provided for this event.

**Format of data specific to Query Suspend**

This is an example of the format of the data for this event.

```
ORIG.RSN=xxxxx xxxxxxxxxx
```

**Field description**

This field shows the original reason for suspension. For a list of possible values, refer to Table 34-5 on page 34-19.
Lock Suspension Events - Query Resume

This topic shows the format of data specific to Query Resume for Lock Suspension events. It also describes the fields provided for this event.

Format of data specific to Query Resume

The data specific to this event is derived from the IFCIDs 44/45 and 213/214. This is the format of the data for this event:

```
SUSP.TIME =s.nnnnnn
LOCAL CONTENTION=Y
RESUME RSN=xxxxxxxx
LATCH CONTENTION=Y*
IRLM QUEUED REQ =N
```

Field description

This field shows the original reason for suspension. For a list of possible values, refer to “Format of data specific to Lock, Unlock, Change, and Notify Resume (Data Sharing)” on page 34-21.
Lock Suspension Events - Drain Suspend

This topic shows the format of data specific to Drain Suspend for Lock Suspension events. It also describes the fields provided for this event.

Format of data specific to Drain Suspend

This is the format of the data for this event:

```
CLAIM NO=nnnnn  CLASS=xxxxx
```

Field description

The individual fields have the following meaning:

**CLAIM NO**

The number of claims held on this resource.

**CLASS**

The claim class. Valid values are shown in Table 34-7.

Table 34-7. Claim Classes - DRAIN SUSPEND

<table>
<thead>
<tr>
<th>Class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CS</td>
<td>Cursor stability read</td>
</tr>
<tr>
<td>RR</td>
<td>Repeatable read</td>
</tr>
<tr>
<td>WRITE</td>
<td>Write</td>
</tr>
</tbody>
</table>
Lock Suspension Events - Drain Resume

This topic shows the format of data specific to Drain Resume for Lock Suspension events. It also describes the fields provided for this event.

The data specific to this event is derived from the IFCIDs 215 and 216. The format of the data for this event is shown in “Format of data specific to Drain Resume”

Format of data specific to Drain Resume

This is the format of the data for this event:

SUS.TIME=s.nnnnnn
CLASS =xxxxx
RESM.RSN=xxxxxxxx
CLAIM NO=nnnnn

Field description

The individual fields have the following meaning:

SUS.TIME
The duration of the suspension.

CLASS
The claim class. Valid values are shown in Table 34-7 on page 34-26.

RESM.RSN
The reason for resumption. Valid values are shown in the following table.

<table>
<thead>
<tr>
<th>Reason</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NORMAL</td>
<td>The suspended task resumed normally when the resource became available.</td>
</tr>
<tr>
<td>TIMEOUT</td>
<td>The suspended task resumed when a preset time interval expired.</td>
</tr>
</tbody>
</table>

CLAIM NO
The number of claims held on this resource.
Lock Suspension Events - Latch Suspend

This topic shows the format of data specific to Latch Suspend for Lock Suspension events. It also describes the fields provided for this event.

Format of data specific to Latch Suspend

This is the format of the data for this event:

```
TYPE=xxxxxxxxx
```

Field description

The field shown represents the type of the latch. It can have one of the following values:

Table 34-9. Latch Types - LATCH SUSPEND

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SHARED</td>
<td>S latch</td>
</tr>
<tr>
<td>EXCLUSIVE</td>
<td>X latch</td>

</tbody>
</table>
Lock Suspension Events - Latch Resume

This topic shows the format of data specific to Latch Resume for Lock Suspension events. It also describes the fields provided for this event.

Format of data specific to Latch Resume

This is the format of the data for this event:

```
SUS.TIME=s.nnnnnn  TYPE=xxxxxxxxx
STATUS  =xxxxxxxxx
```

Field description

The individual fields have the following meaning:

**SUS.TIME**

The duration of the suspension.

**TYPE**

The type of latch. Valid values are shown in Table 34-9 on page 34-28.

**STATUS**

The latch status. It can have one of the following values:

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NORMAL</td>
<td>Normal completion of a page latch wait.</td>
</tr>
<tr>
<td>CANCELLED</td>
<td>The page latch wait was canceled before the latch was obtained. For example, the agent representing the latch was abnormally terminated during a page latch wait.</td>
</tr>
</tbody>
</table>
Lock Detail Trace Data

The lock detail trace describes all locking events in a DB2 system. It includes those that can be viewed in suspension, timeout, or deadlock traces. This trace gives you a global view of the entire locking activity in the system.

You determine which locking events you want to see in a lock detail trace. You do this in the TRACE command by specifying the TYPE identifier in the INCLUDE and EXCLUDE options.

The lock detail trace is produced if level DETAIL is specified on the TRACE command and if there is at least one IFCID in the input data set that satisfies the FROM and TO, and INCLUDE or EXCLUDE criteria.

The following sections show the sample layout of a Lock Detail trace and describe the various fields of the trace.

- “Example of a Lock Detail Trace” on page 34-31: This topic shows an example of a Lock Detail trace.
- “Lock Detail Trace - Lock Summary” on page 34-32: This section shows the event specific data for Lock Summary.
- “Lock Detail Trace - Lock, Unlock, and Change Requests” on page 34-34: This section shows the event specific data for Lock, Unlock, and Change Requests.
- “Lock Detail - Query Requests” on page 34-37: This section shows the event specific data for Query Requests.
- “Lock Detail - Claim Acquire, Change, and Release” on page 34-38: This section shows the event specific data for Claim Acquire, Change, and Release.
- “Lock Detail - Drain Request, Pseudo, and Release” on page 34-40: This section shows the event specific data for Drain Request, Pseudo, and Release.
- “Lock Detail - Lock Avoidance” on page 34-42: This section shows the event specific data for Lock Avoidance.
- “Lock Detail - P-Lock Requests” on page 34-43: This section shows the event specific data for P-Lock requests.
- “Lock Detail - Notify Request” on page 34-46: This section shows the event specific data for Notify request.
- “Lock Detail - Lock Escalatn” on page 34-47: This section shows the event specific data for Lock Escalatn.
Example of a Lock Detail Trace

This topic shows an example of a Lock Detail trace.

"Lock Detail trace example" shows a sample Lock Detail trace, produced by the following command:

```
LOCKING TRACE LEVEL (DETAIL)
```

Chapter 34. Locking Trace 34-31
Lock Detail Trace - Lock Summary

This section shows the event specific data for Lock Summary.

The format of Lock Summary data

The following sample shows the format of the data for this event.

```
MAX PAGE & ROW LOCKS= 11   LOCKAV=YES
SHARED.ESCAL= 0   EXCLUS.ESCAL= 0
MAX PAGE & ROW LOCKS= 1   LOCKAV=NO
TABLESPACE TYPE=UNSEGMENTED SIZE=PAGE
TABLES WITH ESCALATIONS=XXXXXX
MAX STATE=XXXXX   PRE-ESCAL.STATE=XXXXX
```

Field description

The individual fields have the following meaning:

**MAX PAGE & ROW LOCKS**

The maximum number of page or row locks across all table spaces held concurrently for the thread.

If IFCID 020 is not present, N/A is printed in this field.

**LOCKAV**

Indicates if lock avoidance techniques are used within this unit of work across all table spaces. Possible values are Y(es) or N(o).

If IFCID 218 is not present, N/A is printed in this field.

**SHARED ESCAL**

The number of escalations to shared mode for the thread:

- For segmented table spaces, the number of tables that have escalated
- For partitioned table spaces using selective partition locking (SPL), the number of partitions that have escalated
- For simple and partitioned table spaces, the number of table spaces that have escalated

If IFCID 020 is not present, N/A is printed in this field.

**EXCLUS.ESCAL**

The number of escalations to exclusive mode for the thread:

- For segmented table spaces, the number of tables that have escalated
- For partitioned table spaces using selective partition locking (SPL), the number of partitions that have escalated
- For simple and partitioned table spaces, the number of table spaces that have escalated

If IFCID 020 is not present, N/A is printed in this field.

Fields that are printed once for each table space

The following fields are printed once for each table space:

**MAX PAGE & ROW LOCKS**

The maximum number of page or row locks per table space held concurrently by the thread.

If IFCID 020 is not present, N/A is printed in this field.
LOCKAV
Indicates if lock avoidance techniques are used for this table space.
Possible values are Y(es) or N(o).
If IFCID 218 is not present, N/A is printed in this field.

TABLE SPACE TYPE
The table space type:

SIMPLE
Simple table spaces

SEGMENTED
Segmented table spaces

PARTITIONED
Partitioned table spaces

PARTIT.-SPL
Partitioned table spaces using selective partition locking (SPL)
If IFCID 020 is not present, the table space type is not printed.

SIZE
The lock size used, which can be one of the following:
- PAGE
- ROW
- TABLE

TABLES WITH ESCALATIONS
The number of tables within the table space for which escalations occurred.
This field is only printed for segmented table spaces or partitioned table spaces using SPL.
If IFCID 020 is not present, N/A is printed in this field.

MAX STATE
The highest lock state for the table space. This field is only printed for simple table spaces or partitioned table spaces not using SPL.
If IFCID 020 is not present, N/A is printed in this field.
Possible values are shown in Table 34-11.

<table>
<thead>
<tr>
<th>Table 34-11. Lock State</th>
</tr>
</thead>
<tbody>
<tr>
<td>State</td>
</tr>
<tr>
<td>IS</td>
</tr>
<tr>
<td>IX</td>
</tr>
<tr>
<td>S</td>
</tr>
<tr>
<td>U</td>
</tr>
<tr>
<td>SIX</td>
</tr>
</tbody>
</table>

PRE-ESCAL. STATE
The lock state before escalations. A list of values is shown in Table 34-11. If no escalation occurred, NO ESCALATIONS is printed.
This field is only printed for simple table spaces or partitioned table spaces not using SPL.
If IFCID 020 is not present, N/P is printed.
Lock Detail Trace - Lock, Unlock, and Change Requests

This section shows the event specific data for Lock, Unlock, and Change Requests.

Format of Lock, Unlock, and Change Requests

The following sample shows the format of the data for these events.

DURATION=xxxxxxxx
STATE=xxxxx
XES
PROP=x
RSN
CODE=xxxxxxxx
RTNCD=xx
XES
FORC=x
XES
CACHE=xxx
XES
OWNER=xxxxxxxx
HASH='x'.

Field description

The individual fields have the following meaning:

DURATION

The length of time the lock is held. Valid values are shown in Table 34-12.

Table 34-12. Lock Duration-IRLM Requests

<table>
<thead>
<tr>
<th>Duration</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INTEREST</td>
<td>Duration used for P-Locks</td>
</tr>
<tr>
<td>MANUAL</td>
<td>Varies depending on the ISOLATION parameter</td>
</tr>
<tr>
<td>MANUAL+1</td>
<td>Temporary change of consistency level from CS to RR during bind and DDL</td>
</tr>
<tr>
<td>COMMIT</td>
<td>Until commit</td>
</tr>
<tr>
<td>COMMIT+1</td>
<td>Past commit; applies to locks needed to maintain the position for a cursor opened WITH HOLD</td>
</tr>
<tr>
<td>ALLOCATN</td>
<td>Until deallocation</td>
</tr>
<tr>
<td>PLAN</td>
<td>For the duration of the plan</td>
</tr>
<tr>
<td>UTILITY</td>
<td>For the duration of the utility execution</td>
</tr>
<tr>
<td>FREE ALL</td>
<td>Until all locks are freed</td>
</tr>
<tr>
<td>N/A</td>
<td>Not applicable for NOTIFY SUSPEND</td>
</tr>
</tbody>
</table>

The duration controls when locks are released. A lock is usually only released when an agent makes an unlock request with a duration longer, or equal to, the longest lock duration the agent specified for the resource.

You can increase lock durations using either a lock request or a change request.

STATE

The state or mode of the lock applied to the resource. Valid values are shown in Table 34-13.

Table 34-13. Lock State-IRLM Requests

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IS</td>
<td>Intent share</td>
</tr>
<tr>
<td>IX</td>

</tbody>
</table>
Table 34-13. Lock State-IRLM Requests (continued)

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>X</td>
<td>Exclusive</td>
</tr>
<tr>
<td>N/A</td>
<td>Not applicable for NOTIFY SUSPEND</td>
</tr>
</tbody>
</table>

**RTNCD**

The return code issued in response to the request. The possible return codes are shown in Table 34-14.

Table 34-14. Return Codes-IRLM Requests

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Successful completion</td>
</tr>
<tr>
<td>4</td>
<td>Successful completion, lock state unchanged</td>
</tr>
<tr>
<td>8</td>
<td>Unsuccessful completion, system error</td>
</tr>
<tr>
<td>12</td>
<td>Unsuccessful completion, logic error in request</td>
</tr>
<tr>
<td>16</td>
<td>Unsuccessful completion, request specification not valid</td>
</tr>
</tbody>
</table>

**RSN CODE**

The reason code issued in response to the request. The reason code is not applicable for lock avoidance.

**Fields that are only printed if the DB2 subsystem is a member of a data sharing group**

The remaining fields are only printed if the DB2 subsystem is a member of a data sharing group.

aaaaa

Stands for the lock attributes, which can be:

- MODIFY or NMODIFY
- GLOBAL or LOCAL
- P-LOCK or L-LOCK

**PARENT**

The parent lock token if one was specified for explicit hierarchical locking. The field is only printed for LOCK REQUESTs.

If this field is not 0, the request applies to a child of a parent that has already been locked.

**CACHE**

The cached state of a P-Lock. For the state values, refer to Table 34-13 on page 34-34.

This field is only applicable and printed for page set and partition P-Locks.

**OWNER**

The member name of the owner of a retained lock that caused this request to be denied and the owner of the lock that caused this request to time out. If neither of these conditions exist, this field is not printed.

**HASH**

The lock hash value.
**Locking Activity - Trace**

**XES PROP**
An indicator whether or not IRLM propagated the request to XES. Possible values are Y(es) or N(o).

**XES FORC**
An indicator whether or not the lock was requested to be forced to XES. Possible values are Y(es) or N(o).

**XES ASYN**
An indicator whether or not IRLM sent the request asynchronously to XES. Possible values are Y(es) or N(o).

This field is only printed if XES PROP=Y.
Lock Detail - Query Requests

This section shows the event specific data for Query Requests.

Format of Query Requests

This is an example of the format of the data for this event.

RSN CODE=xxxxxxxx RTNCD=xx

For an explanation of the individual fields refer to Table 34-14 on page 34-35.
Locking Activity - Trace

**Lock Detail - Claim Acquire, Change, and Release**

This section shows the event specific data for Claim Acquire, Change, and Release.

**Format of Claim Acquire, Change, and Release**

This is an example of the format of the data for this event.

DURATION=xxxxxxxxx  CLASS=xxxxxxx
RSN CODE=xxxxxxxxx  RTNCD=x

**Field description**

The individual fields have the following meaning:

**DURATION**

The duration of the claim. The values for this field are shown in Table 34-15.

<table>
<thead>
<tr>
<th>Duration</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMMIT</td>
<td>Until commit</td>
</tr>
<tr>
<td>COMMIT+1</td>
<td>Past commit; applies to locks needed to maintain the position for a cursor opened WITH HOLD</td>
</tr>
<tr>
<td>ALLOCATN</td>
<td>Until deallocation</td>
</tr>
</tbody>
</table>

**CLASS**

The claim class of the claim request. The values for this field are shown in Table 34-16.

<table>
<thead>
<tr>
<th>Class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CS</td>
<td>Cursor stability read</td>
</tr>
<tr>
<td>RR</td>
<td>Repeatable read</td>
</tr>
<tr>
<td>WRITE</td>
<td>Write</td>
</tr>
</tbody>
</table>

**RSN CODE**

The reason code issued in response to the request. The values for this field are shown in Table 34-17.

<table>
<thead>
<tr>

Chapter 34. Locking Trace
Locking Activity - Trace

Lock Detail - Lock Avoidance

This section shows the event specific data for Lock Avoidance.

This event does not have event-specific data.
Lock Detail - P-Lock Requests

This section shows the event specific data for P-Lock requests.

P-Lock requests include the following events:

- **Page set or partition P-Lock request or page set or partition P-Lock negotiation request**
  
  These P-Locks track inter-DB2 interest on a linear page set (table space or index) or a partition of a partitioned page set.

  The cached state of the page set or partition P-Lock tells DB2 which data sharing protocols must be used to maintain inter-DB2 buffer coherency for the page set or partition. For example, a cached state of IS tells DB2 that whenever a page belonging to that page set or partition is read into the buffer pool, the page must be registered to the coupling facility for cross-invalidation purposes. If the cached state were SIX, the coupling facility page registration would not be necessary.

  Normally the P-Lock is held by DB2 in the cached state. The P-Lock state determines whether or not the page set or partition is GBP-dependent:

  - If the page set or partition P-Lock is held in S or X, then the page set or partition is not GBP-dependent.
  - Otherwise, the page set or partition is GBP-dependent.

- **Page P-Lock request or page P-Lock negotiation request**
  
  These P-Locks preserve the inter-DB2 cached page (buffer) coherency when row level locking is used and the page set or partition is actively R/W shared between two or more DB2 systems. The most common cases of subpage concurrency are row-level locking.

  **Note:** Page P-Locking can add a significant overhead to data sharing if inter-DB2 workloads are not properly balanced. Class 21 is added to monitor these events without having to use the costly Class 7. However, page P-Lock events are recorded in Class 7 as well. Therefore, if Class 7 and 21 are both active, two records are reported for the same event.

  The format of the data for these events is shown in "Format of Page Set or Partition P-Lock Requests" and "Format of Page P-Lock Requests."

**Format of Page Set or Partition P-Lock Requests**

The following example shows the format of the data for this event.

\[
\text{REQUEST}=xxxxxx \quad \text{OBJECT}=xxxxxxxxxxx \\
\text{MEMBER}=xxxxxxxx \quad \text{REQUESTED STATE}=xxxxx \\
\text{OLD STATE}=xxxxx \quad \text{OLD CACHED STATE}=xxxxx \\
\text{NEW STATE}=xxxxx \quad \text{NEW CACHED STATE}=xxxxx \\
\text{aaaaaaaaaaaaaaaaaaaaaaaa}
\]

**Format of Page P-Lock Requests**

The following example shows the format of the data for this event.

\[
\text{REQUEST}=xxxxxx \quad \text{OBJECT}=xxxxxxxxxxx \\
\text{MEMBER}=xxxxxxxx \quad \text{REQUESTED STATE}=xxxxx \\
\text{OLD STATE}=xxxxx \quad \text{NEW STATE}=xxxxx \\
\text{aaaaaaaaaaaaaaaaaaaaaaaa}
\]

**Field description**

Here is a description of the field labels shown in the previous examples:
REQUEST
The IRLM request type, which can be one of the following:
- LOCK
- UNLOCK
- CHANGE
- EXIT

OBJECT
The DB2 object type, which can be one of the following:
- TABLESPACE
- INDEXSPACE
- DATA PAGE
- HEADER PAGE
- INDEX PAGE
- SPACE MAP PAGE

MEMBER
A DB2 member name that depends on the request type:
- For exit requests, the name of the DB2 member in conflict with this member's currently held P-Lock state.
- For lock, unlock, and change requests, for which P-Lock is rejected, the name of the DB2 member in conflict with this request.

REQUESTED STATE
The requested lock state. It only applies to lock, change, and exit requests.
For exit requests, this is the P-Lock state requested by the member causing the P-Lock exit of this member. If the request from the other member was not in conflict with the state of this member, this field shows NH.

The values for this field are shown in Table 34-23

Table 34-23. Lock State

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NH</td>
<td>Not held</td>
</tr>
<tr>
<td>IS</td>
<td>This DB2 has R/O interest on the page set or partition and one or more other DB2s in the group have R/W interest</td>
</tr>
<tr>
<td>IX</td>
<td>This DB2 has R/W interest on the page set or partition, one or more other DB2s in the group have R/O interest, and one or more can also have R/O interest</td>
</tr>
<tr>
<td>S</td>
<td>This DB2 has R/O interest on the page set or partition and no other DB2 in the group has R/W interest but one or more can have R/O interest</td>
</tr>
<tr>

<td>This DB2 has R/W interest on the page set or partition and no other DB2 in the group has R/W interest but one or more can have R/O interest</td>
</tr>
<tr>
<td>NSU</td>
<td>Nonshared update</td>
</tr>
<tr>
<td>X</td>
<td>This DB2 has R/W interest on the page set or partition and no other DB2 in the group has any interest</td>
</tr>
<tr>
<td>RD</td>
<td>Request denied</td>
</tr>
</tbody>
</table>

OLD STATE
The previously held P-Lock state.
The values for this field are shown in Table 34-23
NEW STATE
The newly held P-Lock state.
The values for this field are shown in Table 34-23 on page 34-44.

OLD CACHED STATE
The previous P-Lock cached state.
The values for this field are shown in Table 34-23 on page 34-44.

NEW CACHED STATE
The new P-Lock cached state.
The values for this field are shown in Table 34-23 on page 34-44.

Stands for the P-Lock attributes, which can be one or more of the following:
• UNCONDITIONAL or CONDITIONAL.
• RESTART or NONRESTART. Such a request instructs IRLM to convert a retained lock held by the DB2 system into an active lock. If the requested lock is not retained, IRLM grants the request as normal.
• MODIFY or NONMODIFY.
Locking Activity - Trace

Lock Detail - Notify Request

This section shows the event specific data for Notify request.

In some cases, DB2 data sharing uses the IRLM notify request to maintain non-buffer pool cache coherency between DB2 systems in the group. Examples of a notify request usage are DBD coherency and High Used RBA (HURBA) for a data set.

Format of Data Specific to NOTIFY REQUEST

This is an example of the format of the data for this event.

```
TYPE=xxxxxxxx
STATE =xxxxx
WAIT=xxx
HOLDERS=xxxxx
```

Field description

Here is a description of the field labels shown in the previous example:

**TYPE**  The type of notify operation. Possible values are SEND or RECEIVE.

**STATE**  The lock state. For a list of possible values, refer to Table 34-13 on page 34-34.

If this field contains one of the listed values, only those lock holders owning the lock in the specified state are notified.

N/A in this field means that the notify message is sent to all DB2 systems holder of the lock, regardless of the state they hold it in.

This field is not applicable or printed if TYPE=RECEIVE.

**WAIT**  Indicates if the request is synchronous, that is, suspended until all responses are received, in which case WAIT=YES is printed, or asynchronous, that is, WAIT=NO.

**HOLDERS**  The number of holders notified.

This field is not applicable or printed if TYPE=RECEIVE.
Lock Detail - Lock Escalation

This section shows the event specific data for Lock Escalation.

This trace shows details of a lock escalation. It is shown when data from IFCID 337 is present in the input data.

Format of the Lock Escalation

This sample shows the format of the data specific to Lock Escalation.

```
STATE = IS
NUMLOCKS = 815
STMTNO = 4711
STMTINFO = XXXXXXXXXXXXXXXXXXXXX
STMTID = 'XXXXXXXXXXXXXXXXX'
COLLID = COLLECTIONXXXXXXXXX2XXXXXXXXX3
XXXXXXXXX4XXXXXXXXX5XXXXXXXXX6
XXXXXXXXX7XXXXXXXXX8XXXXXXXXX9
XXXXXXXXX0XXXXXXXXX1XXXXXXXXX2

<tr>
<td>U</td>
<td>Update</td>
</tr>
<tr>
<td>SIX</td>
<td>Shared intent exclusive</td>
</tr>
<tr>
<td>X</td>
<td>Exclusive</td>
</tr>
</tbody>
</table>

**NUMLOCKS**

Number of held lower level locks that were released by escalation.

**STMTNO**

Statement number.

**STMTINFO**

The waiter statement information. Possible values are:

- **STATIC**
  The statement is of type static

- **DYNAMIC**
  The statement is of type dynamic.

- **NONE**
  No statement ID, no type.

**STMTID**

The waiter statement ID.
Locking Activity - Trace

COLLID
Collection ID.

PACKAGE
Package name.
Chapter 35. The Locking File Data Set

The locking file data set creates a sequential data set of formatted DB2 locking detail records that can be loaded into the OMEGAMON XE for DB2 PE performance database using the DB2 load utility.

Use the performance database to produce tailored reports using a reporting facility such as Query Management Facility (QMF).

The locking file data set contains a record for each occurrence of the following events:

- A LOCK, UNLOCK, CHANGE, or QUERY request processed by DB2
- A request to acquire a claim, change a claim duration, or release a claim
- A request to release a drain on a claim class
- Whenever lock avoidance is successful

The output of the FILE command is a sequential variable blocked data set.

The content of the output data set is determined by the FILE command options you specify, and by the input SMF/GTF records processed.

Descriptions of the layouts of these records can be found in the RKO2SAMP library. The member name is DGOLDFIL.

**Note:** For an introduction to the Locking report set and general locking information refer to the Reporting User’s Guide.
Part 7. Record Trace Report Set

These topics provide information about the record trace reports.

Note: For an introduction to the Record Trace report set and general Record Trace information refer to the Reporting User’s Guide. It also provides information on input to Record Trace reports.

Chapter 36, “Record Headers,” on page 36-1
Records written in a record trace report are prefixed by a header. The header is rewritten if any of the header information changes.

Chapter 37, “The Summary Record Trace,” on page 37-1
The summary record trace lists all records in the same sequence as an input data set.

Chapter 38, “The Short and Long Record Traces,” on page 38-1
The short and long record traces are similar. The short record trace reports non-serviceability data from records which are used by other subcomponents of the batch component. Serviceability records and fields are not printed on the short record trace. Only the occurrence of large records such as statistics, accounting, and system parameters is shown.

Chapter 39, “Dump Record Trace,” on page 39-1
The dump record trace lists all data from selected records of an input data set in hexadecimal format.

Chapter 40, “IFCID Record Blocks,” on page 40-1
This topic describes the Instrumentation Facility Component Identifier (IFCID) record trace blocks. The description within each block is presented in alphabetical order.

Chapter 41, “The Record Trace File Data Set and Output Records,” on page 41-1
The record trace file data set is a sequential data set of formatted records suitable for loading into the performance database using the DB2 load utility and from which reports can be produced using a reporting facility such as Query Management Facility (QMF).
Record Trace Report
Chapter 36. Record Headers

Records written in a record trace report are prefixed by a header. The header is rewritten if any of the header information changes.

<table>
<thead>
<tr>

<td>1</td>
<td>3 ACCOUNTING</td>
<td>NETWORKID: Y61Y</td>
<td>LUNAME: STMY61Y</td>
<td>LUMSEQ: 1</td>
</tr>
</tbody>
</table>

Field description

The following information is reported in the trace header:

**PRIMAUTH**
The authorization ID under which the transaction is running. Derived from the DB2 field QWHCAID.

**ORIGAUTH**
The original authorization ID under which the transaction started. Derived from the DB2 field QWHCOPID.

**PLANNNAME**
The DB2 plan name. Derived from the DB2 field QWHCPLAN.

**CONNECT**
The connection ID. Derived from the DB2 field QWHCCN.

**CORRNAME**
The correlation name. Derived from the DB2 field QWHCCV.

**CORRNMBR**
The correlation number. Derived from the DB2 field QWHCCV.

**INSTANCE**
The unique number assigned to a thread. Derived from the DB2 field QWHSLUUV.

**CONNTYPE**
The type of connection being used to interface with DB2. Derived from the DB2 field QWHATYP.

**END_USER**
User ID of the workstation end user. Derived from the DB2 field QWHCEUID.

**RECORD TIME**
The timestamp contained in the trace record. The format is hours, minutes, seconds, and hundred-millionths of a second. Derived from the DB2 field QWH SSTCK.

**TCB CPU TIME**
The CPU time stored in the trace record. The format is minutes, seconds, and hundred-millionths of a second. Derived from the DB2 field QWHHCPU.

**WS_NAME**
Name of the workstation. Derived from the DB2 field QWHCEUWN.
**DEST SEQ NO**
The destination sequence number. Derived from the DB2 field QWHSWSEQ.

**ACE**
The relative number of the agent control element address in the ACE cross-reference table. This table is printed at the end of each location for every trace specified. Derived from the DB2 field QWHSACE.

**IFCID**
The instrumentation facility component identification (DB2 trace record type). Derived from the DB2 field QWHSIID.

**DESCRIPTION**
A brief description of the IFCID record. The description indicates whether the record contains accounting, statistics, or performance data. For performance data, the description also indicates the event.

**TRANSACT**
Name of the workstation transaction. Derived from the DB2 field QWHCEUTX.

**DATA**
The data is printed in the standard hexadecimal dump format. The character format is on the right.
Chapter 37. The Summary Record Trace

The summary record trace lists all records in the same sequence as an input data set.

You can use this listing to check which records are in the DB2 instrumentation trace data. The short trace and long traces are normally too bulky for this purpose.

The summary record trace can be used with all the selection options such as INCLUDE and EXCLUDE.

The following command produces the summary record trace shown in "Example of the Summary Record Trace."

```
RETRACE
  TRACE
  FROM (17:38:00)
  TO (17:40:00)
  LEVEL (SUMMARY)
```

Example of the Summary Record Trace

Here is an example of a Summary record trace.

<table>
<thead>
<tr>
<th>LOCATION: STLCLI</th>

<tr>
<td>PLANNAME</td>
<td>RECORD</td>
<td>DEST</td>
</tr>
</tbody>
</table>
For every trace specified, an ACE cross-reference table is printed for each location.

This topic describes the general format of the IFCID records presented in the summary record trace.
ACE Cross-Reference Table

For every trace specified, an ACE cross-reference table is printed for each location.

The columns of the ACE cross-reference table are:

ACE NUMBER
The cross-reference number for the hexadecimal address of the agent control element. The lowest valid cross-reference number is 1. 0 indicates that the ACE address is not available.

ACE ADDRESS
The hexadecimal address of the agent control element. Derived from the DB2 field QWHSACE.
Data Fields

This topic describes the general format of the IFCID records presented in the summary record trace.

The records are presented in the requested sequence. There is one entry on the report for each record selected from the input data set, so the report can show more than one record of the same IFCID record type. Use the RECORD TIME field on the report to distinguish between records with the same IFCID record type.

Note:
1. An arrow (→) pointing to the right on the trace indicates the beginning of an event.
2. An arrow (←) pointing to the left on the trace indicates the end of an event.

Logical Unit of Work Identifiers on page 37-5
The logical unit of work identifiers are shown in the DATA column in front of the formatted data.

DDF Data on page 37-6
DDF data is only printed if there is a DDF header.

Accounting Token on page 37-7
All record trace reports show the value (in hexadecimal) of the accounting token in the DATA column when it contains a value other than blanks or binary zeros.
Logical Unit of Work Identifiers

The logical unit of work identifiers are shown in the DATA column in front of the formatted data.

NETWORKID: APCNET  LUNAME: SYDAPC4  LUWSEQ: 1

Field description

NETWORKID
The network ID.

LUNAME
The name of the logical unit.

LUWSEQ
The sequence number of the logical unit of work.
Record Trace - Summary

**DDF Data**

DDF data is only printed if there is a DDF header.

The following is printed in the DATA column after the formatted record:

- **REQUESTING LOCATION**: USIBMSYSTDB2
- **REQUESTING TIMESTAMP**: 01/30/14 18:54:53.90530718
- **AR NAME**: USIBMSYSTDB2
- **PRDID**: DB2 11 M0

**Field description**

Here is a description of the field labels shown in the previous example:

- **REQUESTING LOCATION**
  The location requesting the work.

- **REQUESTING TIMESTAMP**
  The timestamp of the requester location.

- **AR NAME**
  The name of the application requester.

- **PRDID**
  The name, version, release, and modification level of the product making the request.
Accounting Token

All record trace reports show the value (in hexadecimal) of the accounting token in the DATA column when it contains a value other than blanks or binary zeros.

The Accounting token is used to correlate CICS records with DB2 records for the same task. If TOKENI=YES for TYPE=INIT, TOKENE=YES for TYPE=ENTRY, or both applies, in the resource control table, then the CICS logical unit of work ID (LUWID) minus the commit count (2 bytes) is passed to this field.

The first 8 bytes contain the network name, and the following 8 bytes contain the LU name. The final 6 bytes are the unique value.

ACCTKN X '00000000000000000000000000000000000000000000'
Record Trace Report
Chapter 38. The Short and Long Record Traces

The short and long record traces are similar. The short record trace reports non-serviceability data from records which are used by other subcomponents of the batch component. Serviceability records and fields are not printed on the short record trace. Only the occurrence of large records such as statistics, accounting, and system parameters is shown.

The long record trace reports all instrumentation facility records including Statistics, Accounting, and Performance records. The DB2 field names of serviceability fields are printed, as well as the occurrence of the serviceability records.

Depending on the record layout, the records are presented in either the DATA column or the full width of the report page.

If there is no data present for an IFCID, NO DATA is printed. If any unexpected data is found, it is printed in dump format. The dump format is also used for IFCID 0.

"The Short Record Trace" on page 38-2
The short record trace lists selected records from an input data set. It selects and formats nonserviceability data from the user-selected records that appear on other OMEGAMON XE for DB2 PE reports.

"The Long Record Trace" on page 38-3
The long record trace lists selected records from an input data set. It lists and formats all data from user-selected records.
The Short Record Trace

The short record trace lists selected records from an input data set. It selects and formats nonserviceability data from the user-selected records that appear on other OMEGAMON XE for DB2 PE reports.

Use the short record trace to access the DB2 nonserviceability data used by OMEGAMON XE for DB2 PE, and to access data not presented in other reports.

Some long records (for example, system statistics) are ignored by the short record trace and some records are shown in abbreviated form.

The short record trace can be used with all the selection options such as INCLUDE and EXCLUDE.

The following command produces the short record trace example shown in "Example of the Short Record Trace."

```
RECTRACE TRACE FROM (,21:54:00) TO (,21:56:00)
```

**Example of the Short Record Trace**

This is an example of a short record trace produced by the previous command:

```

```

... RECORD TRACE COMPLETE
```
The Long Record Trace

The long record trace lists selected records from an input data set. It lists and formats all data from user-selected records.

Use the long record trace to produce a formatted report of all data in the selected trace records.

The long record trace can be used with all the selection options such as INCLUDE and EXCLUDE.

Note: A long record trace can show a great amount of data. Consider limiting the size of the report with the INCLUDE, EXCLUDE, FROM, and TO options of the TRACE subcommand.

The following command produces the long record trace example in "Example of a Long Record Trace."

```
... RECTRACE TRACE FROM (,21:54:00) TO (,21:56:00) LEVEL(LONG) ...
```

Example of a Long Record Trace

This is an example of a long record trace produced by the previous command:

RECORD TRACE COMPLETE
```
Chapter 39. Dump Record Trace

The dump record trace lists all data from selected records of an input data set in hexadecimal format.

The following command produces the dump record trace example shown in "Dump Record Trace Example."

```
RECTRACE
TRACE LEVEL (DUMP)
```

### Dump Record Trace Example

Here is an example of a dump record trace for IFCID 225. The left-hand side of the trace shows a full hexadecimal dump of the record and the section on the right shows the same data in character format.

```

Note: This type of record trace is used for diagnostic purposes only. It is not explained in detail.

"Column Descriptions of the Dump Record Trace" on page 39-3
The column description of the Dump record trace.

"ACE Cross-Reference Table" on page 39-4
For every trace specified, an ACE cross-reference table is printed at the end of each location.
Column Descriptions of the Dump Record Trace

The column description of the Dump record trace.

The following columns are shown on the dump record trace:

**PRIMAUTH**
The authorization ID under which the transaction is running. Derived from the DB2 field QWHCAID.

**ORIGAUTH**
The original authorization ID under which the transaction started. Derived from the DB2 field QWHCOPID.

**PLANNAME**
The DB2 plan name. Derived from the DB2 field QWHCPLAN.

**CONNECT**
The connection ID. Derived from the DB2 field QWHCCN.

**CORRNAME**
The correlation name. Derived from the DB2 field QWHCCV.

**CORRNMBR**
The correlation number. Derived from the DB2 field QWHCCV.

**CONNTYPE**
The type of connection being used to interface with DB2. Derived from the DB2 field QWHCCST.

**INSTANCE**
The unique number assigned to a thread. Derived from the DB2 field QWHSUNIQ.

**RECORD TIME**
The timestamp contained in the trace record. The format is hours, minutes, seconds, and hundred-millionths of a second. Derived from the DB2 field QWHSSTCK.

**TCB CPU TIME**
The CPU time stored in the trace record. The format is minutes, seconds, and hundred-millionths of a second. Derived from the DB2 field QWHUCPU.

**DEST SEQ NO**
The destination sequence number. Derived from the DB2 field QWHSWSEQ.

**ACE**
The relative number of the agent control element address in the ACE cross-reference table. This table is printed at the end of each location for every trace specified. Derived from the DB2 field QWHSACE.

**IFCID**
The instrumentation facility component identification (DB2 trace record type). Derived from the DB2 field QWHSIID.

**DESCRIPTION**
A brief description of the IFCID record. The description indicates whether the record contains accounting, statistics, or performance data. For performance data, the description also indicates the event.

**DATA**
The data is printed in the standard hexadecimal dump format. The character format is on the right.
For every trace specified, an ACE cross-reference table is printed at the end of each location.

The columns of the ACE cross-reference table are:

**ACE NUMBER**
The cross-reference number for the hexadecimal address of the agent control element. The lowest valid cross-reference number is 1. 0 indicates that the ACE address is not available.

**ACE ADDRESS**
The hexadecimal address of the agent control element. Derived from the DB2 field QWHSACE.
Chapter 40. IFCID Record Blocks

This topic describes the Instrumentation Facility Component Identifier (IFCID) record trace blocks. The description within each block is presented in alphabetical order.

“IFCID 001 - System Statistics” on page 40-19
System service statistics are written at regular intervals specified by the install parameter STATISTICS TIME on panel DSNTIPN.

“IFCID 002 - DB2 Statistics” on page 40-62
“IFCID 003 - Accounting” on page 40-157

“IFCID 004 - Trace Start” on page 40-225
This topic shows detailed information about “Record Trace - IFCID 004 - Trace Start”.

“IFCID 005 - Trace Stop” on page 40-226
This topic shows detailed information about “Record Trace - IFCID 005 - Trace Stop”.

“IFCID 006 - Read I/O Start” on page 40-227
This topic shows detailed information about “Record Trace - IFCID 006 - Read I/O Start”.

“IFCID 007 - Read I/O Stop” on page 40-229

This topic shows detailed information about “Record Trace - IFCID 110 - Bind Free Start”.

“IFCID 111 - Bind Free End” on page 40-484
This topic shows detailed information about “Record Trace - IFCID 111 - Bind Free End”.

“IFCID 112 - Thread Allocate” on page 40-485
This topic shows detailed information about “Record Trace - IFCID 112 - Thread Allocate”.

“IFCID 113 - Agent Allocate” on page 40-488
This topic shows detailed information about “Record Trace - IFCID 113 - Agent Allocate”.

“IFCID 114 - Archive Wait Start” on page 40-491
This topic shows detailed information about “Record Trace - IFCID 114 - Archive Wait Start”.

“IFCID 115 - Archive Wait End DASD” on page 40-492
This topic shows detailed information about “Record Trace - IFCID 115 - Archive Wait End DASD”.

“IFCID 116 - Archive Wait End Tape” on page 40-493
This topic shows detailed information about “Record Trace - IFCID 116 - Archive Wait End Tape”.

“IFCID 117 - Archive Read Start” on page 40-494
This topic shows detailed information about “Record Trace - IFCID 117 - Archive Read Start”.

“IFCID 118 - Archive Read End” on page 40-495
This topic shows detailed information about “Record Trace - IFCID 118 - Archive Read End”.

“IFCID 119 - BSDS Write Start” on page 40-496
This topic shows detailed information about “Record Trace - IFCID 119 - BSDS Write Start”.

“IFCID 120 - BSDS Write End” on page 40-497
This topic shows detailed information about “Record Trace - IFCID 120 - BSDS Write End”.

Chapter 40. IFCID Record Blocks  40-7
IFCID Record Blocks

“IFCID 121 - IBM Service Record” on page 40-498
This topic shows detailed information about “Record Trace - IFCID 121 - IBM Service Record”.

“IFCID 122 - IBM Service Record” on page 40-499
This topic shows detailed information about “Record Trace - IFCID 122 - IBM Service Record”.

“IFCID 123 - SRV Record” on page 40-500
This topic shows detailed information about “Record Trace - IFCID 123 - SRV Record”.

“IFCID 124 - SQL Statement Record” on page 40-501
This topic shows detailed information about “Record Trace - IFCID 124 - SQL Statement Record”.

“IFCID 125 - RID Pool Processing” on page 40-504
This topic shows detailed information about “Record Trace - IFCID 125 - RID Pool Processing”.

“IFCID 126 - Log Buffer Write” on page 40-506
This topic shows detailed information about “Record Trace - IFCID 126 - Log Buffer Write”.

“IFCID 127 - Page Wait I/O In Prog (Start)” on page 40-507
This topic shows detailed information about “Record Trace - IFCID 127 - Page Wait I/O In Prog (Start)”.

“IFCID 128 - Page Wait I/O In Prog (End)” on page 40-509
This topic shows detailed information about “Record Trace - IFCID 128 - Page Wait I/O In Prog (End)”.

“IFCID 129 - CI-S Obtained via IFI Reads” on page 40-511
This topic shows detailed information about “Record Trace - IFCID 129 - CI-S Obtained via IFI Reads”.

“IFCID 140 - Audit Auth Failures” on page 40-512
This topic shows detailed information about “Record Trace - IFCID 140 - Audit Auth Failures”.

“IFCID 141 - Audit DDL Grant/Revoke” on page 40-517
This topic shows detailed information about “Record Trace - IFCID 141 - Audit DDL Grant/Revoke”.

“IFCID 142 - Audit DDL Create/Alter/Drop” on page 40-521
This topic shows detailed information about “Record Trace - IFCID 142 - Audit DDL Create/Alter/Drop”.

“IFCID 143 - Audit First Write” on page 40-525
This topic shows detailed information about “Record Trace - IFCID 143 - Audit First Write”.

“IFCID 144 - Audit First Read” on page 40-526
This topic shows detailed information about “Record Trace - IFCID 144 - Audit First Read”.

“IFCID 145 - Audit DML Statement” on page 40-527
This topic shows detailed information about “Record Trace - IFCID 145 - Audit DML Statement”.

“IFCID 146 - User Record” on page 40-532
This topic shows detailed information about “Record Trace - IFCID 146 - User Record”.

“IFCID 147 - Thread Summary” on page 40-533
“IFCID 149 - Resource Locking” on page 40-553
“IFCID 150 - Thread Locking” on page 40-554
“IFCID 151 - User Record” on page 40-564
This topic shows detailed information about “Record Trace - IFCID 151 - User Record”.

“IFCID 152 - User Record” on page 40-565
This topic shows detailed information about “Record Trace - IFCID 152 - User Record”.

“IFCID 153 - User Record” on page 40-566
This topic shows detailed information about “Record Trace - IFCID 153 - User Record”.

“IFCID 154 - User Record” on page 40-567
This topic shows detailed information about “Record Trace - IFCID 154 - User Record”.

“IFCID 155 - User Record” on page 40-568
This topic shows detailed information about “Record Trace - IFCID 155 - User Record”.

“IFCID 156 - User Record” on page 40-569
This topic shows detailed information about “Record Trace - IFCID 156 - User Record”.

“IFCID 157 - DRDS RDS Interface” on page 40-570
This topic shows detailed information about “Record Trace - IFCID 157 - DRDS RDS Interface”.

“IFCID 158 - DRDS CNV Interface” on page 40-571
This topic shows detailed information about “Record Trace - IFCID 158 - DRDS CNV Interface”.

“IFCID 159 - DRDS Req Site Data” on page 40-572
This topic shows detailed information about “Record Trace - IFCID 159 - DRDS Req Site Data”.

“IFCID 160 - DC Requester” on page 40-573
This topic shows detailed information about “Record Trace - IFCID 160 - DC Requester”.

“IFCID 161 - DC Server” on page 40-574
This topic shows detailed information about “Record Trace - IFCID 161 - DC Server”.

“IFCID 162 - DTM Request” on page 40-575
This topic shows detailed information about “Record Trace - IFCID 162 - DTM Request”.

“IFCID 163 - DTM Respond” on page 40-576
This topic shows detailed information about “Record Trace - IFCID 163 - DTM Respond”.

“IFCID 164 - IBM Service Record” on page 40-577
This topic shows detailed information about “Record Trace - IFCID 164 - IBM Service Record”.

“IFCID 165 - IBM Service Record” on page 40-578
This topic shows detailed information about “Record Trace - IFCID 165 - IBM Service Record”.

“IFCID 166 - IBM Service Record” on page 40-579
This topic shows detailed information about “Record Trace - IFCID 166 - IBM Service Record”.

“IFCID 167 - Conv Alloc Req Queued” on page 40-580
This topic shows detailed information about “Record Trace - IFCID 167 - Conv Alloc Req Queued”.
IFCID Record Blocks

"IFCID 168 - IBM Service Record” on page 40-581
This topic shows detailed information about “Record Trace - IFCID 168 - IBM Service Record”.

"IFCID 169 - DIST Authid Translation” on page 40-582
This topic shows detailed information about “Record Trace - IFCID 169 - DIST Authid Translation”.

"IFCID 170 - Suspend of Agent” on page 40-584
This topic shows detailed information about “Record Trace - IFCID 170 - Suspend of Agent”.

"IFCID 171 - IBM Service Record” on page 40-585
This topic shows detailed information about “Record Trace - IFCID 171 - IBM Service Record”.

"IFCID 172 - Deadlock Data” on page 40-586
"IFCID 173 - Class 2 Time” on page 40-597
This topic shows detailed information about “Record Trace - IFCID 173 - Class 2 Time”.

"IFCID 174 - Arch Log CMD Sus Start” on page 40-598
This topic shows detailed information about “Record Trace - IFCID 174 - Arch Log CMD Sus Start”.

"IFCID 175 - Arch Log CMD Sus End” on page 40-599
This topic shows detailed information about “Record Trace - IFCID 175 - Arch Log CMD Sus End”.

"IFCID 177 - Package Allocation” on page 40-600
This topic shows detailed information about “Record Trace - IFCID 177 - Package Allocation”.

"IFCID 178 - IBM Service Record” on page 40-603
This topic shows detailed information about “Record Trace - IFCID 178 - IBM Service Record”.

"IFCID 179 - IBM Service Record” on page 40-604
This topic shows detailed information about “Record Trace - IFCID 179 - IBM Service Record”.

"IFCID 180 - DC Communication Buffers” on page 40-605
This topic shows detailed information about “Record Trace - IFCID 180 - DC Communication Buffers”.

"IFCID 181 - IBM Service Record” on page 40-607
This topic shows detailed information about “Record Trace - IFCID 181 - IBM Service Record”.

"IFCID 182 - IBM Service Record” on page 40-608
This topic shows detailed information about “Record Trace - IFCID 182 - IBM Service Record”.

"IFCID 183 - DRDS RDS/SCC Interface” on page 40-609
This topic shows detailed information about “Record Trace - IFCID 183 - DRDS RDS/SCC Interface”.

"IFCID 184 - DC Communication Buffers” on page 40-612
This topic shows detailed information about “Record Trace - IFCID 184 - DC Communication Buffers”.

"IFCID 185 - READs Data Capture Start” on page 40-613
This topic shows detailed information about “Record Trace - IFCID 185 - READs Data Capture Start”.

"IFCID 186 - IBM Service Record” on page 40-614
This topic shows detailed information about “Record Trace - IFCID 186 - IBM Service Record”.

40-10 OMEGAMON XE for DB2 PE & PM: Report Reference
“IFCID 188 - READs Data Capture End” on page 40-615
This topic shows detailed information about “Record Trace - IFCID 188 - READs Data Capture End”.

“IFCID 190 - IBM Service Record” on page 40-617
This topic shows detailed information about “Record Trace - IFCID 190 - IBM Service Record”.

“IFCID 191 - DDM Level 6B Objects” on page 40-618
“IFCID 191 - 6B DSS Section” on page 40-625
This topic shows detailed information about “Record Trace - IFCID 191 - 6B DSS Section”.

“IFCID 192 - DDM Level 6A Header Errors” on page 40-626
“IFCID 193 - UOW/SQLCODE Mismatch” on page 40-630
This topic shows detailed information about “Record Trace - IFCID 193 - UOW/SQLCODE Mismatch”.

“IFCID 194 - Invalid SNA FMH-5 Received” on page 40-631
This topic shows detailed information about “Record Trace - IFCID 194 - Invalid SNA FMH-5 Received”.

“IFCID 195 - SQLDA Discrepancy” on page 40-632
This topic shows detailed information about “Record Trace - IFCID 195 - SQLDA Discrepancy”.

“IFCID 196 - Timeout Data” on page 40-634
“IFCID 197 - DB2 Messages” on page 40-641
This topic shows detailed information about “Record Trace - IFCID 197 - DB2 Messages”.

“IFCID 198 - Buffer Manager Page Access” on page 40-642
This topic shows detailed information about “Record Trace - IFCID 198 - Buffer Manager Page Access”.

“IFCID 199 - Buffer Pool Statistics at Data Set Level” on page 40-644
This topic shows detailed information about “Record Trace - IFCID 199 - Buffer Pool Statistics at Data Set Level”.

“IFCID 201 - Alter Buffer Pool” on page 40-647
This topic shows detailed information about “Record Trace - IFCID 201 - Alter Buffer Pool”.

“IFCID 202 - Buffer Pool Attributes” on page 40-651
This topic shows detailed information about “Record Trace - IFCID 202 - Buffer Pool Attributes”.

“IFCID 203 - DDF Heuristic COMMIT/ROLLBK” on page 40-655
This topic shows detailed information about “Record Trace - IFCID 203 - DDF Heuristic COMMIT/ROLLBK”.

“IFCID 204 - DDF Partner Cold Start” on page 40-657
This topic shows detailed information about “Record Trace - IFCID 204 - DDF Partner Cold Start”.

“IFCID 205 - DDF Warm Start Log Name Error Information” on page 40-659
“IFCID 206 - DDF Protocol Error” on page 40-663
This topic shows detailed information about “Record Trace - IFCID 206 - DDF Protocol Error”.

“IFCID 207 - DDF Heuristic Damage” on page 40-665
This topic shows detailed information about “Record Trace - IFCID 207 - DDF Heuristic Damage”. 
IFCID Record Blocks

“IFCID 208 - DDF Syncpoint Protocol Error” on page 40-667
This topic shows detailed information about “Record Trace - IFCID 208 - DDF Syncpoint Protocol Error”.

“IFCID 209 - DDF Syncpoint Comm Failure” on page 40-669
This topic shows detailed information about “Record Trace - IFCID 209 - DDF Syncpoint Comm Failure”.

“IFCID 210 - Warm Start Log Name Change” on page 40-671
This topic shows detailed information about “Record Trace - IFCID 210 - Warm Start Log Name Change”.

“IFCID 211 - Claim Data” on page 40-672
This topic shows detailed information about “Record Trace - IFCID 211 - Claim Data”.

“IFCID 212 - Drain Data” on page 40-673
This topic shows detailed information about “Record Trace - IFCID 212 - Drain Data”.

“IFCID 213 - Drain Lock Wait Start” on page 40-675
This topic shows detailed information about “Record Trace - IFCID 213 - Drain Lock Wait Start”.

“IFCID 214 - Drain Lock Wait End” on page 40-677
This topic shows detailed information about “Record Trace - IFCID 214 - Drain Lock Wait End”.

“IFCID 215 - Claim Count 0 Wait Start” on page 40-679
This topic shows detailed information about “Record Trace - IFCID 215 - Claim Count 0 Wait Start”.

“IFCID 216 - Claim Count 0 Wait End” on page 40-680
This topic shows detailed information about “Record Trace - IFCID 216 - Claim Count 0 Wait End”.

“IFCID 217 - Storage Pools” on page 40-681

“IFCID 218 - Lock Avoidance Summary” on page 40-688
This topic shows detailed information about “Record Trace - IFCID 218 - Lock Avoidance Summary”.

“IFCID 219 - Utility LISTDEF List Information” on page 40-689
This topic shows detailed information about “Record Trace - IFCID 219 - Utility LISTDEF List Information”.

“IFCID 220 - Utility Data Set Information” on page 40-690
This topic shows detailed information about “Record Trace - IFCID 220 - Utility Data Set Information”.

“IFCID 221 - Parallel Group Execution” on page 40-692

“IFCID 222 - Parallel Group Elapsed Time” on page 40-699
This topic shows detailed information about “Record Trace - IFCID 222 - Parallel Group Elapsed Time”.

“IFCID 223 - Lock Avoidance Detail” on page 40-701
This topic shows detailed information about “Record Trace - IFCID 223 - Lock Avoidance Detail”.

“IFCID 224 - Select Procedure Bypassed” on page 40-703
This topic shows detailed information about “Record Trace - IFCID 224 - Select Procedure Bypassed”.

“IFCID 225 - Storage MGR Pool Summary” on page 40-704

“IFCID 226 - Page Latch Contention Start” on page 40-723
This topic shows detailed information about “Record Trace - IFCID 226 - Page Latch Contention Start”.

40-12 OMEGAMON XE for DB2 PE & PM: Report Reference
“IFCID 227 - Page Latch Contention End” on page 40-725
This topic shows detailed information about “Record Trace - IFCID 227 - Page Latch Contention End”.

“IFCID 228 - Archive Deallocation Start” on page 40-727
This topic shows detailed information about “Record Trace - IFCID 228 - Archive Deallocation Start”.

“IFCID 229 - Archive Deallocation End” on page 40-728
This topic shows detailed information about “Record Trace - IFCID 229 - Archive Deallocation End”.

“IFCID 230 - Group Buffer Pool Attributes” on page 40-729
This topic shows detailed information about “Record Trace - IFCID 230 - Group Buffer Pool Attributes”.

“IFCID 231 - Parallel Group Task Time” on page 40-732
This topic shows detailed information about “Record Trace - IFCID 231 - Parallel Group Task Time”.

“IFCID 233 - Call User Routine” on page 40-734
This topic shows detailed information about “Record Trace - IFCID 233 - Call User Routine”.

“IFCID 234 - Calling Agent Auth IDs” on page 40-736
This topic shows detailed information about “Record Trace - IFCID 234 - Calling Agent Auth IDs”.

“IFCID 236 - DDF SNA XLN Protocol Error” on page 40-737
This topic shows detailed information about “Record Trace - IFCID 236 - DDF SNA XLN Protocol Error”.

“IFCID 237 - Set Current Degree” on page 40-738
This topic shows detailed information about “Record Trace - IFCID 237 - Set Current Degree”.

“IFCID 238 - IBM Service Record” on page 40-739
This topic shows detailed information about “Record Trace - IFCID 238 - IBM Service Record”.

“IFCID 239 - Overflow Package/DBRM” on page 40-740

“IFCID 247 - SQLDA Data and Input Host Variable Data” on page 40-764
This topic shows detailed information about “Record Trace - IFCID 247 - SQLDA Data and Input Host Variable Data”.

“IFCID 248 - IBM Service Record” on page 40-767
This topic shows detailed information about “Record Trace - IFCID 248 - IBM Service Record”.

“IFCID 249 - EDM Pool Invalidate DBD” on page 40-768
This topic shows detailed information about “Record Trace - IFCID 249 - EDM Pool Invalidate DBD”.

“IFCID 250 - Connect/Rebuild Connect/Disconnect Group Bpool” on page 40-769
This topic shows detailed information about “Record Trace - IFCID 250 - Connect/Rebuild Connect/Disconnect Group Bpool”.

“IFCID 251 - Buffer Manager PSET/Part P-Lock Request” on page 40-772
This topic shows detailed information about “Record Trace - IFCID 251 - Buffer Manager PSET/Part P-Lock Request”.

“IFCID 252 - IBM Service Record” on page 40-774
This topic shows detailed information about “Record Trace - IFCID 252 - IBM Service Record”.

Chapter 40. IFCID Record Blocks 40-13
IFCID Record Blocks

"IFCID 254 - Coupling Facility Cache Structure Statistics" on page 40-775
This topic shows detailed information about “Record Trace - IFCID 254 -
Coupling Facility Cache Structure Statistics”.

"IFCID 255 - Buffer Refresh Due to XI” on page 40-778
This topic shows detailed information about “Record Trace - IFCID 255 - Buffer
Refresh Due to XI”.

"IFCID 256 - Alter Group Buffer Pool” on page 40-780
This topic shows detailed information about “Record Trace - IFCID 256 - Alter
Group Buffer Pool”.

"IFCID 257 - IRLM Notify Req Detail” on page 40-782
This topic shows detailed information about “Record Trace - IFCID 257 - IRLM
Notify Req Detail”.

"IFCID 258 - Data Set Extend Activity” on page 40-785
This topic shows detailed information about “Record Trace - IFCID 258 - Data
Set Extend Activity”.

"IFCID 259 - Buffer Manager Pg P-Lock Req” on page 40-787
This topic shows detailed information about “Record Trace - IFCID 259 - Buffer
Manager Pg P-Lock Req”.

"IFCID 260 - IBM Service Record” on page 40-789
This topic shows detailed information about “Record Trace - IFCID 260 - IBM
Service Record”.

"IFCID 261 - Group Buffer Pool Checkpoint” on page 40-790
This topic shows detailed information about “Record Trace - IFCID 261 - Group
Buffer Pool Checkpoint”.

"IFCID 262 - GBPOOLT Castout Threshold Processing” on page 40-792
This topic shows detailed information about “Record Trace - IFCID 262 -
GBPOOLT Castout Threshold Processing”.

"IFCID 263 - Page Set and Partition Castout Detail” on page 40-794
This topic shows detailed information about “Record Trace - IFCID 263 - Page
Set and Partition Castout Detail”.

"IFCID 265 - IBM Service Record” on page 40-797
This topic shows detailed information about “Record Trace - IFCID 265 - IBM
Service Record”.

"IFCID 266 - IBM Service Record” on page 40-798
This topic shows detailed information about “Record Trace - IFCID 266 - IBM
Service Record”.

"IFCID 267 - CF Rebuild/Alter/Start” on page 40-799
This topic shows detailed information about “Record Trace - IFCID 267 - CF
Rebuild/Alter/Start”.

"IFCID 268 - CF Rebuild/Alter End” on page 40-800
This topic shows detailed information about “Record Trace - IFCID 268 - CF
Rebuild/Alter End”.

"IFCID 269 - Trusted/Context Trace” on page 40-803
This topic shows detailed information about “Record Trace - IFCID 269 -
Trusted/Context Trace”.

“IFCID 270 - Trusted/Context Trace” on page 40-806
This topic shows detailed information about “Record Trace - IFCID 270 -
Trusted/Context Trace”.

“IFCID 271 - Row Level and Column Level Access Control” on page 40-807
This topic shows detailed information about “Record Trace - IFCID 271 - Row
Level and Column Level Access Control”.
IFCID Record Blocks

- “IFCID 333 - IBM Service Record” on page 40-846
  This topic shows detailed information about “Record Trace - IFCID 333 - IBM Service Record”.

- “IFCID 335 - System Event Stalled” on page 40-847
  This topic shows detailed information about “Record Trace - IFCID 335 - System Event Stalled”.

- “IFCID 337 - Lock Escalation Occurrences” on page 40-848
  This topic shows detailed information about “Record Trace - IFCID 337 - Lock Escalation Occurrences”.

- “IFCID 342 - WF/TEMP DB Usage” on page 40-850
  This topic shows detailed information about “Record Trace - IFCID 342 - WF/TEMP DB Usage”.

- “IFCID 343 - MAXTEMPS Limit/Exceeded” on page 40-852
  This topic shows detailed information about “Record Trace - IFCID 343 - MAXTEMPS Limit/Exceeded”.

- “IFCID 345 - Trace Data / SP/UDF” on page 40-853
  This topic shows detailed information about “Record Trace - IFCID 345 - Trace Data / SP/UDF”.

- “IFCID 346 - Package/DBRM Detail” on page 40-854
  This topic shows detailed information about “Record Trace - IFCID 346 - Package/DBRM Detail”.

- “IFCID 350 - SQL Statement” on page 40-864
  This topic shows detailed information about “Record Trace - IFCID 350 - SQL Statement”.

- “IFCID 351 - Wait TCPIP LOB” on page 40-866
  This topic shows detailed information about “Record Trace - IFCID 351 - Wait TCPIP LOB”.

- “IFCID 353 - IBM Service Record” on page 40-867
  This topic shows detailed information about “Record Trace - IFCID 353 - IBM Service Record”.

- “IFCID 354 - IBM Service Record” on page 40-868
  This topic shows detailed information about “Record Trace - IFCID 354 - IBM Service Record”.

- “IFCID 357 - Beginning of an Index I/O Parallel INSERT” on page 40-869
  This topic shows detailed information about “Record Trace - IFCID 357 - Beginning of an Index I/O Parallel INSERT”.

- “IFCID 358 - End of an Index I/O Parallel INSERT” on page 40-870
  This topic shows detailed information about “Record Trace - IFCID 358 - End of an Index I/O Parallel INSERT”.

- “IFCID 359 - Index Page Split” on page 40-871
  This topic shows detailed information about “Record Trace - IFCID 359 - Index Page Split”.

- “IFCID 360 - Incrementally Rebound Queries” on page 40-872
  This topic shows detailed information about “Record Trace - IFCID 360 - Incrementally Rebound Queries”.

- “IFCID 361 - Audit Admin Authorities” on page 40-873
  This topic shows detailed information about “Record Trace - IFCID 361 - Audit Admin Authorities”.

- “IFCID 362 - Start Trace and Stop Trace with Audit Policy” on page 40-876
  This topic shows detailed information about “Record Trace - IFCID 362 - Start Trace and Stop Trace with Audit Policy”.

- “IFCID 363 - Parallel Straw Model Performance Trace” on page 40-878
“IFCID 365 - Remote Location Statistics” on page 40-883
This topic shows detailed information about “Record Trace - IFCID 365 - Remote Location Statistics”.

“IFCID 366 - Incompatible Functions Executed” on page 40-886
This topic shows detailed information about “Record Trace - IFCID 366 - Incompatible Functions Executed”.

“IFCID 376 - Incompatible Functions Executed” on page 40-889
This topic shows detailed information about “Record Trace - IFCID 376 - Incompatible Functions Executed”.

“IFCID 369 - Aggregated Accounting Statistics” on page 40-892
This topic shows detailed information about “Record Trace - IFCID 369 - Aggregated Accounting Statistics”.

“IFCID 370 - Database Open Information” on page 40-895
This topic shows detailed information about “Record Trace - IFCID 370 - Database Open Information”.

“IFCID 371 - Database Close Information” on page 40-897
This topic shows detailed information about “Record Trace - IFCID 371 - Database Close Information”.

“IFCID 377 - Pseudo Delete Daemon Cleanup” on page 40-899
This topic shows detailed information about “Record Trace - IFCID 377 - Pseudo Delete Daemon Cleanup”.

“IFCID 378 - Accel. Call Event Begin” on page 40-900
This topic shows detailed information about “Record Trace - IFCID 378 - Accel. Call Event Begin”.

“IFCID 379 - Accel. Call Event End” on page 40-901
This topic shows detailed information about “Record Trace - IFCID 379 - Accel. Call Event End”.

“IFCID 380 - Stored Procedure Detail Record” on page 40-902
This topic shows detailed information about “Record Trace - IFCID 380 - Stored Procedure Detail Record”.

“IFCID 381 - UDF Detail Record” on page 40-905
This topic shows detailed information about “Record Trace - IFCID 381 - UDF Detail Record”.

“IFCID 384 - IBM Service Record” on page 40-908
This topic shows detailed information about “Record Trace - IFCID 384 - IBM Service Record”.

“IFCID 385 - IBM Service Record” on page 40-909
This topic shows detailed information about “Record Trace - IFCID 385 - IBM Service Record”.

“IFCID 386 - IBM Service Record” on page 40-910
This topic shows detailed information about “Record Trace - IFCID 386 - IBM Service Record”.

“IFCID 389 - FTB Indexes” on page 40-911
This topic shows detailed information about “Record Trace - IFCID 389 - FTB Indexes”.

“IFCID 390 - IBM Service Record” on page 40-912
This topic shows detailed information about “Record Trace - IFCID 390 - IBM Service Record”.

“IFCID 391 - IBM Service Record” on page 40-913
This topic shows detailed information about “Record Trace - IFCID 391 - IBM Service Record”.

40-18 OMEGAMON XE for DB2 PE & PM: Report Reference
IFCID 001 - System Statistics

System service statistics are written at regular intervals specified by the install parameter STATISTICS TIME on panel DSNTIPN.

Most counters in this record are accumulated since DB2 was last started. Some counters can include values recorded prior to the report period covered. Values are reset to zero when DB2 is started.

Chapter 40. IFCID Record Blocks
IFCID 001 - Checkpoint and IFI Data

This topic shows detailed information about “Record Trace - IFCID 001 - Checkpoint and IFI Data”.

Record trace - IFCID 001 - Checkpoint and IFI Data

The field labels shown in the following sample layout of “Record Trace - IFCID 001 - Checkpoint and IFI Data” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name: QWSDCKPT</th>
<th>This is an exception field.</th>
</tr>
</thead>
</table>

REASON STATISTICS INVOKED

The reason why statistics records were written.

Field Name: QWSDRINV

HIGH USED RBA

The high-used RBA address of the log (DB2 field prior to DB2 11: QWSDLR).

Field Name: QWSDLRG

IFI ABENDS

CHECKPOINT COUNT

The number of checkpoints DB2 has taken.

A checkpoint is a point at which DB2 records internal status information to the DB2 log. This information is used in the recovery process if DB2 abends.

Background and Tuning Information

For Statistics reports only: A checkpoint is taken when the specified number of log records have been written. A checkpoint is also taken each time DB2 switches to a new active log data set. If the Statistics reporting period is 30 minutes and the value of this field is 15, then DB2 is taking checkpoints every 2 minutes.

If the data sets are too small or the value for LOGLOAD is too low, checkpoints occur too frequently. As a result, database writes do not perform efficiently. The frequency of DB2 checkpoints can be decreased by increasing the value of the DSNZPARM LOGLOAD (CHECKPOINT FREQ on the Tracing install panel).

Rule of thumb: In a production environment, DB2 should take checkpoints every 10 minutes or so.

The default value for LOGLOAD is 50000. The actual value that you choose is dependent on the volume and nature of the work performed by your DB2 subsystem. It is a trade-off between the performance efficiency of larger numbers and the longer time to restart DB2 when there is an abnormal termination.

Field Name: QWSDCKPT

This is an exception field.

REASON STATISTICS INVOKED

The reason why statistics records were written.

Field Name: QWSDRINV

HIGH USED RBA

The high-used RBA address of the log (DB2 field prior to DB2 11: QWSDLR).

Field Name: QWSDLRG

IFI ABENDS
The number of instrumentation facility interface (IFI) abends.

**Field Name:** QWSDSCA

**IFI READA**

The number of calls made to IFI using the READA (read asynchronous data) function.

**Field Name:** QWSDSCRA

**DCAP.LOG REC.RETRIEVED**

The number of log records retrieved for which data capture processing was invoked.

**Field Name:** QWSDCDLC

**DCAP.DATA ROWS RETURNED**

The total number of data capture data rows returned.

**Field Name:** QWSDCDDR

**IFI UNRECOG.**

The number of calls made to IFI using a function that is not recognized by the interface.

**Field Name:** QWSDSCU

**IFI READS**

The number of calls made to IFI using the READS (read synchronous data) function.

**Field Name:** QWSDSCRS

**DCAP.LOG READS**

The total number of data capture log reads for processing IFI reads requests for IFCID 185.

**Field Name:** QWSDCDLR

**DCAP.DATA DESC.RETURNED**

The total number of data capture describes performed.

A data capture describe is the process of getting descriptive information about a DB2 table from the catalog.

**Field Name:** QWSDCDDD

**IFI COMMANDS**

The number of calls made to IFI using the COMMAND function.

**Field Name:** QWSDSCCO

**IFI WRITE**

The number of calls made to IFI using the WRITE function.

**Field Name:** QWSDSCWR

**DCAP.LOG REC.RETURNED**

The total number of data capture log records returned.

**Field Name:** QWSDCDRR
DCAP:DESCRIBES

The total number of data capture describes performed.

A data capture describe is the process of getting descriptive information about a DB2 table from the catalog.

Field Name: QWSDCDMB

DCAP:TABLES RETURNED

The total number of data capture tables returned to the caller of the IFI reads call for IFCID 185.

Field Name: QWSDCDTB

NO ROLLUP ACC RECS-ROLLUP THRESHOLD EXCEEDED

The number of roll-up accounting records written due to roll-up threshold exceeded.

Field Name: QWSDARTH

NO ROLLUP ACC RECS-ROLLUP STORAGE THRESHOLD EXC

The number of roll-up accounting records written due to roll-up accounting storage threshold exceeded.

Field Name: QWSDARSG

NO ROLLUP ACC RECS-STALENESS THRESHOLD EXCEEDED

The number of roll-up accounting records written due to staleness threshold exceeded.

Field Name: QWSDARST

NO RECS NOT QUALIFIED FOR ACC ROLLUP

The number of records that failed to qualify for accounting roll-up because all roll-up key fields are equal to NULL or because of NULL values that are not permitted.

Field Name: QWSDARIR
IFCID 001 - CPU Time Data

This topic shows detailed information about “Record Trace - IFCID 001 - CPU Time Data”.

This section shows CPU timer values for each resource manager and control address space.

Record trace - IFCID 001 - CPU Time Data

The field labels shown in the following sample layout of “Record Trace - IFCID 001 - CPU Time Data” are described in the following section.

CPU TIME DATA

<table>

</tbody>
</table>

PROCEDURE NAME

The last 4 characters of the procedure used to start the address space, or a constant identifier.

Field Name: QWSAPROC

ADDR SPACE ASID

The ASID of the address space.

Field Name: QWSAASID

ASCB

The ASCB token.

Field Name: QWSAASCB

SRB TIME

The accumulated SRB time for the address space. This value includes both, the preemptable and nonpreemptable SRB time. It does not include CPU time that is consumed on an IBM zIIP.

Field Name: QWSASRBT

PREEMP SRB TIME

The preemptible SRB timer value for the address space. This value does not include the CPU time that is consumed on an IBM zIIP.

Field Name: QWSAPSRB

PREEMP SRB ZIIP

The preemptable SRB timer value that is consumed on an IBM zIIP for address space.

Field Name: QWSAPSZIIP

TCB TIME

The accumulated job step time (TCB) for the address space.

Field Name: QWSAEJST

QWSAMCPUS (S)
IFCID 001 - CPU Time Data

This field is for IBM service use.

Field Name: QWSAMCPU
IFCID 001 - DB2 Command Data

This topic shows detailed information about “Record Trace - IFCID 001 - DB2 Command Data”.

Record trace - IFCID 001 - DB2 Command Data

The field labels shown in the following sample layout of “Record Trace - IFCID 001 - DB2 Command Data” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISPLAY DB</td>
<td>The number of DB2 DISPLAY DATABASE commands issued to view objects within one or more DB2 databases. This includes normal and abnormal completion of the command.</td>

<td>The number of DB2 START DATABASE commands issued to make a database available for use. This includes normal and abnormal completion of the command.</td>
</tr>
</tbody>
</table>

### DISPLAY DB

The number of DB2 DISPLAY DATABASE commands issued to view objects within one or more DB2 databases. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR0

### DISPLAY THRD

The number of DB2 DISPLAY THREAD commands issued to view threads active within the DB2 subsystem. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR1

### DISP UTIL

The number of DB2 DISPLAY UTILITY commands issued to view the status of one or more DB2 utilities. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR2

### DISP TRACE

The number of DB2 DISPLAY TRACE commands issued to determine the currently active DB2 traces. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR3

### DISPL RLIMIT

The number of DB2 DISPLAY RLIMIT commands issued to view the current status of the DB2 resource limit facility. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR4

### START DB

The number of DB2 START DATABASE commands issued to make a database available for use. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR5
START TRACE

The number of DB2 START TRACE commands issued to initiate a DB2 trace. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR6

START DB2

The number of DB2 START DB2 commands issued to bring up a DB2 subsystem. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR7

START RLIM

The number of DB2 START RLIMIT commands issued to enable the DB2 resource limit facility. This includes normal and abnormal completion of the command.

Field Name: Q9STCTRE

STOP DB

The number of DB2 STOP DATABASE commands issued to prevent access to a DB2 database. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR8

STOP TRACE

The number of DB2 STOP TRACE commands issued to terminate one or more active DB2 traces. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR9

STOP DB2

The number of STOP DB2 commands. This includes both normal and abnormal completions.

Field Name: Q9STSCRA

STOP RLIM

The number of DB2 STOP RLIMIT commands issued to disable the DB2 resource limit facility. This includes normal and abnormal completion of the command.

Field Name: Q9STCTRF

RECOV BSDS

The number of DB2 RECOVER BSDS commands issued to reestablish dual bootstrap data sets after one has been disabled by a data set error. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR3

RECOV INDOUBT

The number of DB2 RECOVER INDOUBT commands issued to recover threads left indoubt because DB2 or a transaction manager could not automatically recover them. This includes normal and abnormal completion of the command.
Field Name: Q9STCTR4

MODIFY TRACE

The number of DB2 MODIFY TRACE commands issued to alter trace events (IFCID) for an active trace. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR4

TERM UTILITY

The number of DB2 TERM UTILITY commands issued to stop execution of a DB2 utility. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR4

START DDF

The number of DB2 START DDF commands issued to enable the DB2 distributed data facility. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR4

STOP DDF

The number of DB2 STOP DDF commands issued to disable the DB2 distributed data facility. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR4

CANCEL THREAD

The number of DB2 CANCEL THREAD commands issued to cancel a thread. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR4

DISPL LOCATN

The number of DB2 DISPLAY LOCATION commands issued to display statistics about threads with a distributed relationship. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR4

UNREC CMDS

The number of commands not recognized by DB2. The number is incremented if the command verb or primary keyword cannot be determined. For example:

- "-DISPLOX DATABASE(*)" is an unknown verb.
- "-DISPLAY FATAFASE(*)" is an unknown primary keyword.

Field Name: Q9STCTR4

ARCH LOG

The number of DB2 ARCHIVE LOG commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR4

SET ARCH
The number of DB2 SET ARCHIVE commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTRLP

DISPL ARCH
The number of DB2 DISPLAY ARCHIVE commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTRQ

RESET INDOUBT
The number of DB2 RESET INDOUBT commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTRR

ALTER BUFFER
The number of DB2 ALTER BUFFERPOOL commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR

DISP BUF
The number of DB2 DISPLAY BUFFERPOOL commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR

DISP PROCEDURE
The number of DB2 DISPLAY PROCEDURE commands executed. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR

RESET GENERIC
The number of DB2 RESET GENERICLU commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR

ALTER GBPOOL
The number of DB2 ALTER GROUPBUFFERPOOL commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTRS

DISP GBPOOL
The number of DB2 DISPLAY GROUPBUFFERPOOL commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR

START PROC
The number of DB2 START PROCEDURE commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR

STOP PROCEDURE
The number of DB2 STOP PROCEDURE commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR

DISPLAY GROUP
The number of DB2 DISPLAY GROUP commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTRX

ALTER UTILITY
The number of DB2 ALTER UTILITY commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTRY

DISP FUNC
The number of DB2 DISPLAY FUNCTION commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTRZ

START FUNC
The number of DB2 START FUNCTION commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTX0

STOP FUNCTION
The number of DB2 STOP FUNCTION commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTX1

SET LOG
The number of DB2 SET LOG commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTX2

DISPLAY LOG
The number of DB2 DISPLAY LOG commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTX3

SET SYSPARM
The number of DB2 SET SYSPARM commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTX4

DISPLAY DDF
IFCID 001 - DB2 Command Data

- The number of DB2 DISPLAY DDF commands issued. This includes normal and abnormal completion of the command.
  Field Name: Q9STCTX5

ACCESS DB
- The number of DB2 ACCESS DATABASE commands issued. This includes normal and abnormal completion of the command.
  Field Name: Q9STCTAD

START PROFILE
- The number of DB2 START PROFILE commands issued. This includes normal and abnormal completion of the command.
  Field Name: Q9STCTSS

STOP PROFILE
- The number of DB2 STOP PROFILE commands issued. This includes normal and abnormal completion of the command.
  Field Name: Q9STCTST

DISPLAY PROF
- The number of DB2 DISPLAY PROFILE commands issued. This includes normal and abnormal completion of the command.
  Field Name: Q9STCTSD

DISP PROFILE
- The number of DB2 DISPLAY PROFILE commands issued. This includes normal and abnormal completion of the command.
  Field Name: Q9STCTSD

DISP ACCEL
- The number of DB2 DISPLAY ACCEL commands issued. This includes normal and abnormal completion of the command.
  Field Name: Q9STCTDA

START ACCEL
- The number of DB2 START ACCEL commands issued. This includes normal and abnormal completion of the command.
  Field Name: Q9STCTSA

STOP ACCEL
- The number of DB2 STOP ACCEL commands issued. This includes normal and abnormal completion of the command.
  Field Name: Q9STCTXA

MODIFY DDF
- The number of DB2 MODIFY DDF commands issued. This includes normal and abnormal completion of the command.
  Field Name: Q9STCTMD

START DYNQRY
- The number of START DYNQUERYCAPTURE DB2 commands.
Field Name: Q9STCTSQ
STOP DYNQRY
The number of STOP DYNQUERYCAPTURE DB2 commands.
Field Name: Q9STCTXQ
DISP DYNQRY
The number of DISPLAY DYNQUERYCAPTURE DB2 commands.
Field Name: Q9STCTDQ
IFCID 001 - DDF Data by Location

IFCID 001 - DDF Data by Location

This topic shows detailed information about “Record Trace - IFCID 001 - DDF Data by Location”.

Record trace - IFCID 001 - DDF Data by Location

The field labels shown in the following sample layout of “Record Trace - IFCID 001 - DDF Data by Location” are described in the following section.

<table>
<thead>
<tr>

<td>0</td>
</tr>
</tbody>
</table>

LOCATION NAME (SHORT)

The name of the remote location.

Field Name: QLSTLOCN

LOCATION NAME (LONG)

The name of the remote location.

Field Name: QLSTLOCN

INITIATED CONVERSATIONS

The number of conversations that were initiated from the requester location. This value is maintained at the requester location.

A conversation is a specific instance of using TCP/IP or SNA LU 6.2 to transfer information between a requester and a server. A conversation is a logical connection between a requester and a server.

Field Name: QLSTCNVS

INITIATED FROM REMOTE SITE

The number of conversations that were initiated from the requester to the server location. This value is updated at the server location.

Field Name: QLSTCNVR

MESSAGES SENT TO REMOTE

The number of messages sent to the remote location. A message is a group of characters and control bit sequences transferred on a single TCP/IP or SNA API call. This value is maintained at the location where the messages originated.

Field Name: QLSTMSGS

SQL STMTS SENT TO REMOTE

The number of SQL statements sent to the remote server. This value is updated at the requester location.

Field Name: QLSTSQLS

BYTES SENT TO REMOTE

40-32 OMEGAMON XE for DB2 PE & PM: Report Reference
The number of bytes of data sent to the requester location. This value is maintained at the server location.

**Field Name:** QLSTBYTS

**ROWS SENT TO REMOTE**

The number of data rows sent to the requester location (includes SQLDA). This value is updated at the server location.

**Field Name:** QLSTROWS

**BLOCKS TRANSMITTED**

The number of blocks transmitted using block fetch. This value is maintained at the server location.

**Field Name:** QLSTBTBF

**COMMITS REQUESTS SENT**

The number of commit requests sent to the server (single-phase commit protocol) and the committed requests sent to the participant (two-phase commit protocol).

**Field Name:** QLSTCOMS

**INDOUBT THREADS**

The number of threads that became indoubt with the remote location as the coordinator (two-phase commit operations only). A large value might indicate network problems.

**Field Name:** QLSTINDT

**PRDID REMOTE LOCATION**

The product ID and version of the remote location.

**Field Name:** QLSTPRID

**DEALLOCATED CONVERSATIONS**

The number of conversations that were deallocated from this site to the remote site.

**Field Name:** QLSTCNVT

**MESSAGES RECV FR REMOTE**

The number of messages received by VTAM from the remote location. This value is maintained at the location where the messages were received.

More messages might be sent from the server location than are received by the requester due to the manner in which distributed SQL statements are processed internally.

**Field Name:** QLSTMSGR

**SQL STMTS RECV FR REMOTE**

The number of SQL statements received from the requester location. This value is updated at the server location.

**Field Name:** QLSTSQLR

**BYTES RECV FR REMOTE**

The number of bytes of data received from the server location. This value is maintained at the requester location.
More bytes of data might be sent from the server location than are received by the requester due to the manner in which distributed SQL statements are processed internally.

Field Name: QLSTBYTR

ROWS RETRIEVED FR REMOTE

The number of data rows received from the server location. This value is maintained at the requester location.

Note:
- This value does not include any SQLDA or SQLCA transmitted.
- Block fetch can significantly affect the number of rows sent across the network. When used with nonupdate cursors, block fetch groups as many rows as possible into the message buffer, and transmits the buffer over the network without requiring a VTAM message. Consequently, more rows of data might be sent from the server location than are received by the requester location.
  This is especially true when DB2 private protocol is used because multiple blocks can be transmitted from the server with no intervening messages from the requester.

Field Name: QLSTROWR

BLOCKS RECEIVED

The number of blocks received from the remote location using block fetch. This value is maintained at the requester location.

Field Name: QLSTBRBF

COMMIT REQUESTS RECEIVED

The number of commit requests received from the requester (single-phase commit protocol) and committed requests received from the coordinator (two-phase commit protocol).

Field Name: QLSTCOMR

ABORT REQUESTS SENT

The number of abort requests sent to the server (single-phase commit protocol) and backout requests sent to the participant (two-phase commit protocol).

Field Name: QLSTABRS

ABORT REQUESTS RECEIVED

The number of abort requests received from the requester (single-phase commit protocol) and backout requests received from the coordinator (two-phase commit protocol).

Field Name: QLSTABRR

CONV REQUESTS QUEUED

The number of conversation requests queued by the distributed data facility and waiting for allocation. This value is maintained at the requester location.

Background and Tuning Information

When this value is high, increase the limit for the number of conversations.
Field Name: QLSTCNVQ
This is an exception field.
IFCID 001 - Destination Related Data

This topic shows detailed information about “Record Trace - IFCID 001 - Destination Related Data”.

This record contains one data section for each destination.

DEST NAME

The name of the external destination:

GTF  Generalized trace facility
SMF  System management facilities
RES  Resident trace table (not accumulated)
OPN  Special destination for IFI READA buffered records

All other values are shown in hexadecimal.

Field Name: QWSBNM

SEQNO

The unique destination sequence of the last record written to the destination.

Field Name: QWSBSEQ

RECS WRITTEN

The number of records written to the destination.

Field Name: QWSBSRW

RECS NOT WRITTEN

The number of records not written to the destination.

Field Name: QWSBSRNW

BUFFER ERRORS

The number of SMF buffer-overrun errors.

Field Name: QWSBSBUF

NOT ACTIVE ERRORS

The number of times SMF was not active.

Field Name: QWSBSACT

RECS NOT ACCEPTED

The number of records not accepted by the destination writer.

Field Name: QWSBSRNA

WRITER FAILURES
The number of write failures to the destination.

Field Name: QWSBSWF
IFCID 001 - Global DDF Data

This topic shows detailed information about “Record Trace - IFCID 001 - Global DDF Data”.

Record trace - IFCID 001 - Global DDF Data

The field labels shown in the following sample layout of “Record Trace - IFCID 001 - Global DDF Data” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBAT/CONN QUEUED-MAX ACTIVE</td>
<td>The number of times a DBAT or connection was queued because it reached the ZPARM maximum for active remote threads (MAXDBAT).</td>
</tr>
<tr>
<td>Conn Rejected-MAX Connected</td>
<td>This is an exception field.</td>

<tr>
<td>Cold Start Connections</td>
<td>The number of queued client connections whose TCP/IP socket were closed due to system parameter MAXCONQW being exceeded.</td>
</tr>
</tbody>
</table>

DBAT/CONN QUEUED-MAX ACTIVE

The number of times a DBAT or connection was queued because it reached the ZPARM maximum for active remote threads (MAXDBAT).

Field Name: QDSTQDBT

This is an exception field.

CONN REJECTED-MAX CONNECTED

The number of connections that were rejected because the ZPARM limit for maximum remote connections (CONDBAT) was reached.

Field Name: QDSTQCR

CONN CLOSED - MAX QUEUED

The number of queued client connections whose TCP/IP sockets were closed because the system parameter MAXCONQWN was exceeded.

The socket close only occurs when the DB2 subsystem is a member of a data sharing group and DB2 was started with DDF THREADS set to INACTIVE.

Field Name: QDSTNCQC

QUEUEED CLIENT CONNECTIONS

The number of queued client connections whose TCP/IP socket were closed due to system parameter MAXCONQW being exceeded.

The socket close only occurs when the DB2 subsystem is a member of a data sharing group and DB2 was started with DDF THREADS set to INACTIVE.

Field Name: QDSTNCW

COLD START CONNECTIONS
The number of cold start connections with all remote locations (two-phase commit operations only).

**Field Name:** QDSTCSTR

This is an *exception* field.

**WARM START CONNECTIONS**

The number of warm start connections with all remote locations (two-phase commit operations only).

**Field Name:** QDSTWSTR

This is an *exception* field.

**RESYNCHRONIZATION ATTEMPTED**

The number of resynchronization connections attempted with all remote locations (two-phase commit operations only).

**Background and Tuning Information**

A large value can indicate network or system problems.

**Field Name:** QDSTRSAT

This is an *exception* field.

**RESYNCHRONIZATION SUCCEEDED**

The number of resynchronization connections that succeeded with all remote locations (two-phase commit operations only).

**Background and Tuning Information**

If the value of this field is much less than the number of resynchronizations attempted, network problems might exist.

**Field Name:** QDSTRSSU

This is an *exception* field.

**CUR TYPE 1 INACTIVE DBATS**

The current number of inactive DBATs type 1 (snapshot).

**Field Name:** QDSTQCIT

**HWM TYPE 1 INACTIVE DBATS**

The maximum number of inactive type 1 DBATs.

This value is a high-water mark.

**Field Name:** QDSTQMIT

This is an *exception* field.

**TYPE 1 CONNECTIONS TERMINAT**

The number of threads or connections that were terminated instead of being made type 1 inactive because the maximum number of type 1 inactive threads was reached (MAXTYPE1).

**Field Name:** QDSTNITC

**CUR INACTIVE CONNS (TYPE 2)**

The current number of type 2 inactive connections.

**Field Name:** QDSTCIN2
HWM INACTIVE CONNS (TYPE 2)

The maximum number of concurrent type 2 inactive connections that existed.
This value is a high-water mark for QDSTCIN2.
Field Name: QDSTMIN2

ACC QU INACT CONNS (TYPE 2)

The number of RECEIVE requests on type 2 inactive or new connections that are queued to be serviced by a disconnected (pooled) DBAT.
Field Name: QDSTQIN2

CUR QU INACT CONNS (TYPE 2)

The current number of type 2 inactive or new connections that are queued waiting for a database access thread (DBAT).
Field Name: QDSTNQR2

MIN QUEUE TIME

The minimum queue time of a type 2 inactive or new connection that was queued waiting for a database access thread (DBAT) in the last statistical period.
Field Name: QDSTNQMN

MAX QUEUE TIME

The maximum queue time of a type 2 inactive or new connection that was queued waiting for a database access thread (DBAT) in the last statistical period.
Field Name: QDSTNQMX

AVG QUEUE TIME

The average queue time of a type 2 inactive or new connection that was queued waiting for a database access thread (DBAT) in the last statistical period.
Field Name: QDSTNQAV

HWM QU INACT CONNS (TYPE 2)

The maximum number of type 2 inactive or new connections that are queued waiting for a database access thread.
This value is a high-water mark for QDSTNQR2.
Field Name: QDSTMQR2

CUR ACTIVE AND DISCON DBATS

The current number of active and disconnected (pooled) DBATs.
Field Name: QDSTCNAT

HWM ACTIVE AND DISCON DBATS

The maximum number of active and disconnected (pooled) DBATs that existed.
This value is a high-water mark for QDSTCNAT.
Field Name: QDSTHWAT
This is an exception field.

**HWM TOTL REMOTE CONNECTIONS**

The maximum number of active and remote connections. This value is a high-water mark.

**Field Name:** QDSTHWDT

This is an exception field.

**CUR DISCON DBATS NOT IN USE**

The current number of disconnected (pooled) DBATs that are available to process type 2 inactive or new connections.

**Field Name:** QDSTNADS

**HWM DISCON DBATS NOT IN USE**

The maximum number of disconnected (pooled) DBATs that are available to process type 2 inactive or new connections.

This value is a high-water mark for QDSTNADS.

**Field Name:** QDSTMADS

**DBATS CREATED**

The number of requests that required a database access thread (DBAT) to be created to process the request.

**Note:** This does not include database access threads created to replace disconnected (pooled) DBATs that terminated because they reached their reuse limit.

**Field Name:** QDSTNDBA

**DISCON (POOL) DBATS REUSED**

The number of requests that were satisfied by assigning a disconnected (pooled) DBAT to process the request.

**Field Name:** QDSTPOOL

**CUR ACTIVE DBATS-BND DEALLC**

The current number of DBATs that are active because the associated packages were bound with RELEASE(DEALLOCATE).

**Field Name:** QDSTNARD

**HWM ACTIVE DBATS-BND DEALLC**

The maximum number of DBATs that are active because the associated packages were bound with RELEASE(DEALLOCATE).

**Field Name:** QDSTMARD
This topic shows detailed information about “Record Trace - IFCID 001 - IFCID Data”.

This record contains one data section for each active IFCID.

**Record trace - IFCID 001 - IFCID Data**

The field labels shown in the following sample layout of “Record Trace - IFCID 001 - IFCID Data” are described in the following section.

<table>

**IFCID**

The IFCID for the following statistics.

**Field Name:** QWSCIID

**IFCID SEQNO**

The last sequence number used for this IFCID.

**Field Name:** QWSCISEQ

**RECS WRITTEN**

The number of records successfully written for this IFCID.

**Field Name:** QWSCSRSW

**RECS NOT WRITTEN**

The number of records not written to this IFCID.

**Field Name:** QWSCSRNW

**RECS NOT DESIRED**

The number of records not desired.

**Field Name:** QWSCSRND

**BUFFER NOT AVAILABLE**

The number of errors due to the buffer not being available.

**Field Name:** QWSCSBNA

**COLLECT FAILURES**

The number of collection failures.

**Field Name:** QWSCSCF
IFCID 001 - Log Manager Data

This topic shows detailed information about “Record Trace - IFCID 001 - Log Manager Data”.

Record trace - IFCID 001 - Log Manager Data

The field labels shown in the following sample layout of “Record Trace - IFCID 001 - Log Manager Data” are described in the following section.

<table>
<thead>
<tr>
<th>WRITE REQUEST-WAIT</th>

</tr>
</tbody>
</table>

WRITE REQUEST-WAIT

The number of wait log write requests. Wait indicates that the log record is first written to the log buffer and then to the log data set.

Field Name: QJSTWRW

READ FROM OUTPUT BUFFER

The number of log reads satisfied from the output buffer.

Background and Tuning Information

This field, together with the reads satisfied from active log and reads satisfied from archive log (QJSTRACT and QJSTRARH) fields indicate how efficiently DB2 retrieves log records. Use these numbers to adjust the number of output buffers and the total active log capacity to maximize DB2 performance.

Field Name: QJSTRBUF

This is an exception field.

WRITE REQUEST-NO WAIT

The number of log write requests.

The log record is written asynchronously to the log buffer. The application does not wait for the record to be written to the log data set and regains control immediately.

Buffered log records are written to DASD when the buffer threshold is exceeded.

Field Name: QJSTWRNW

This is an exception field.

READ FROM ACTIVE LOG

The number of log reads satisfied from the active log data set.

Background and Tuning Information

This field, together with the reads satisfied from archive log and reads satisfied from output buffer fields, indicate how efficiently DB2 retrieves
log records. Use these numbers to adjust the number of output buffers and the total active log capacity to maximize DB2 performance. Ideally, this value should be 0 or very small.

Field Name: QJSTRACT
This is an exception field.

WRITE REQUEST-FORCE
The number of force log write requests. Force indicates that the log record is written to the log buffer, forcing the buffer to be written to the log data set on DASD.

Field Name: QJSTWRF

READ FROM ARCHIVE LOG
The number of log reads satisfied from archive log data sets.

Field Name: QJSTRARY

WRITE LOG BUFFER
The number of calls to the log write routine. This does not represent the number of physical log I/Os.

Field Name: QJSTBFWR

READ DELAY-TAPE VOLUME CONTENTION
The number of read accesses that were delayed because of a tape volume contention when only one reader per tape is possible.

Background and Tuning Information
This field shows the number of agents forced to wait because a tape volume was already in use by another. If this number is not 0, increase the read tape units on the archive log data set parameters panel DSNTIPA.

Field Name: QJSTTVC
This is an exception field.

WRITE I/O REQUESTS
The total number of log-write I/O requests (such as media manager calls). This is the sum of the IFCID 038/039 pairs and includes both copy1 and copy2 active log data set writes.

Background and Tuning Information
This value should correspond to the active log write I/O activity in an RMF report.

Field Name: QJSTLOGW

READ DELAY-UNAVAILABLE RESOURCE
The number of read accesses delayed due to unavailable resources.

Background and Tuning Information
Generally, this can be due to insufficient tape units allocated. If this is so, reissue the SET ARCHIVE command and use a higher value for the count parameter. Another (although unlikely) cause is insufficient archive log read service task availability.

Field Name: QJSTWUR
This is an exception field.

**WRITE BUFFER SCHEDULED-THRESHOLD**

The number asynchronous log write requests made because the log write threshold was reached.

**Background and Tuning Information**

This counter is provided primarily for an internal check. It is recommended to use the default write threshold of 20 buffers.

**Field Name:** QJSTTHRW

**CI CREATED-ACTIVE LOG**

The number of active log output control intervals created.

**Background and Tuning Information**

Log records are placed sequentially in output log buffers, which are formatted as VSAM control intervals. The control intervals are written to a set of predefined DASD active log data sets, which are used sequentially and recycled.

The ratio of this field to write output log buffers should be low.

**Rules of thumb:**

The lower the value, the better. A high value indicates that too many I/Os are required for the number of log buffers created.

It is possible that WRTTHRS is set too low. It is also possible that transactions could be arriving so infrequently that at commit time force requests are not queued and each force request is individually triggering an I/O of its log buffers.

**Field Name:** QJSTBFFL

**WRITE BUFFER PAGED IN**

The number of times an output log buffer had to be paged in before it could be initialized. The log-write latch is held at this point.

**Background and Tuning Information**

A nonzero value could indicate that the output log buffer size is too large, or there is insufficient real storage to back up the output log buffer size.

**Field Name:** QJSTBPAG

**CI OFFLOADED**

The number of control intervals (CIs) offloaded from the active log to the archive log.

**Field Name:** QJSTCIOF

**WAIT FOR UNAVAILABLE LOG BUFFER**

The number of waits caused by an unavailable output log buffer.

When DB2 wants to write a log record and the log buffer is not available, DB2 and the application must wait for an available log buffer.

**Background and Tuning Information**

Another possible cause is that the size of the write threshold might be too close to the size of the output buffer.
IFCID 001 - Log Manager Data

If this field is not 0, increase the number in the output buffer field on installation panel DSNTIPL to increase the number of output buffers or increase the size of the buffer.

Field Name: QJSTWTB
This is an exception field.

CI WRITTEN
The total number of log control intervals (CIs) written. This includes CI rewrites and both COPY1 and COPY2 active log data set writes. If a given CI is rewritten 5 times, this counter is incremented by 5.

Field Name: QJSTCIWR

TOTAL BSDS ACCESS REQUESTS
The number of BSDS access requests.

Field Name: QJSTBSDS

CI SERIAL WRITE
The number of serial log write I/O requests. A serial log write I/O request occurs when DB2 rewrites a log CI that was previously written as a partial CI, in a dual logging environment. This value includes COPY1 and COPY2 active log data set writes. The difference between WRITE I/O REQ and CI SERIAL WRITE gives the number of parallel log write I/O requests. Typically, the first CI in a list of one start I/O is written serially, and the remaining to both COPY1 and COPY2 active log data sets. This value is meaningful only when DB2 runs in dual active log mode.

Field Name: QJSTSERW

ARCHIVE READ ALLOCATIONS
The number of archive log read allocations.
It indicates the frequency of archive log open and close activity.

Background and Tuning Information
A high number indicates a need for more or larger active log data sets. This value should be small, ideally 0.

Field Name: QJSTALR

LOOK-AHEAD TAPE VOL MOUNTS ATTEMPTED
The number of look ahead (tape volume) mounts attempted.

Background and Tuning Information
This field and field QJSTLAMS (label LOOK-AHEAD MOUNT SUCCESSFUL) show the efficiency of look ahead for tape mounts.

Field Name: QJSTLAMA

ARCHIVE WRITE ALLOCATIONS
The number of archive log write allocations.
It indicates the frequency of archive log open and close activity.

Background and Tuning Information
A high number indicates a need for more or larger active log data sets. This value should be small, ideally 0.
Field Name: QJSTALW

LOOK-AHEAD TAPE VOL MOUNTS SUCCEEDED

The number of successful look-ahead (tape volume) mounts. It indicates the look-ahead mounting performance gains.

Background and Tuning Information

For maximum performance, this field and field QJSTLAMA (label LOOK-AHEAD MOUNT ATTEMPTED) should be equal. To find the number of failed attempts, subtract the value in this field from LOOK-AHEAD MOUNT ATTEMPTED. Too many failed attempts negate potential performance gains. This can be caused by not having enough tape units available. Issue the DISPLAY ARCHIVE command and note the current count value. Then issue the SET ARCHIVE command using a higher value for the count parameter.

Field Name: QJSTLAMS

QJSTLSUS

This field is for IBM service use.

Field Name: QJSTLSUS

QJSTSPNN

This field is for IBM service.

</tr>
</tbody>
</table>

**IDENTIFY**

The number of successful connections to DB2 from an allied address space (TSO, BATCH, CICS, IMS, CAF, or UTILITY).

**Field Name:** Q3STIDEN

**CREATE THREAD**

The number of successful create thread requests. It does not include DBATs.

A thread is required before an application can use SQL. When established, a thread can have one or more secondary authorization IDs.

A thread is needed to perform any DB2 activity. For example, a thread is needed to run a DB2 utility to perform an IFI request such as READS, or to process a DB2 command such as -DISPLAY THREAD. However, a thread is not created if the command failed because of a syntax error.

**Background and Tuning Information**

Thread reuse can help improve performance.

The term *thread reuse* only applies to IMS and CICS attachments. In the case of the TSO attachment facility and the call attachment facility (CAF), threads cannot be reused, because the threads are allocated to the user address space.

Thread reuse should be considered in the following cases:

- If transaction volume is high:
  High volume transactions should achieve a high percentage of thread reuse. If threads are reused on low volume transactions, the number of threads needed increases because these threads are not automatically terminated by IMS when not being used. This may result in too many idle threads for the level of the DB2 workload. Under CICS, protected threads are terminated after about 45 seconds if no transaction eligible to reuse the thread has been received.

- If thread creation cost is significant:
  As a rule of thumb, more than 5% of the total CPU cost of transaction processing is considered significant.

The ACQUIRE and RELEASE parameters of BIND should be specified to minimize the thread creation cost, while providing the needed concurrency:
• If most of the application plan’s SQL statements are executed, then ACQUIRE(ALLOCATE) is cheaper than ACQUIRE(USE).

• If only a small number of the SQL statements are executed, ACQUIRE(USE) becomes cheaper and improves concurrency, because the required resources are only acquired (locked) when the plan actually references (uses) them. An example would be a generalized plan used by many different transactions. It would contain multiple logic paths referencing different tables.

Note that, when packages are involved, ACQUIRE(USE) is always implicitly used.

• Concurrency in thread reuse is based on page locking provided by the IS and IX intent locks, whose duration is governed by ACQUIRE and RELEASE of BIND.

RELEASE(DEALLOCATE) is strongly recommended for thread-reuse transactions to reduce transaction CPU time.

When thread reuse is implemented, monitor the EDM pool. It should be sufficient in size to accommodate expanding plans where the next transaction requires additional plan sections over those that are already part of the plan.

Field Name: Q3STCTHD

This is an exception field.

UR INDOUBT

The number of indoubt units of recovery.

A unit of recovery is indoubt when a failure occurs after a successful prepare but before a successful commit. The failure can occur in the address space of the application, the transaction manager, DB2, or all of these. IMS and CICS applications use the prepare and commit sequence to commit work. Ideally, this value should be 0.

Field Name: Q3STINDT

This is an exception field.

COMMIT PH 2

The number of successful commit phase 2 in a two-phase environment such as CICS or IMS. It includes successfully committed agents associated with threads that use the Recoverable Resource Manager Services Attach Facility (RRSAF). It does not include successful single-phase commits or distributed two-phase commits.

Background and Tuning Information

IMS and CICS applications use the PREPARE and COMMIT sequence to commit work. A nonzero value for this field indicates that updates have occurred.

Field Name: Q3STCOMM

ROLLBACK

The number of times a unit of recovery was successfully rolled back. Some reasons for a rollback include:

• Application program abend
• Application rollback request
• Application deadlock on database records
IFCID 001 - Subsystem Services Data

- Application canceled by operator
- Thread abend due to resource shortage

This number also includes successfully aborted agents associated with threads that use the Recoverable Resource Manager Services Attach Facility (RRSAF).

**Field Name:** Q3STABRT

This is an *exception* field.

**SIGNON**

The number of signons that identified a new user of an existing thread for IMS and CICS.

This field is valid only for CICS and IMS (not valid for TSO, CAF, or UTILITY).

The initial signon does not perform an authorization check because the thread does not exist yet, but a resignon can.

**Background and Tuning Information**

If the number of signons is greater than the number of create thread occurrences, some threads have been reused. In the case of the TSO attachment facility and the call attachment facility (CAF), there is no sign-on, because the user is identified when the TSO address space is connected.

**Field Name:** Q3STSIGN

This is an *exception* field.

**UR INDOUBT RESOLV**

The number of indoubt units of recovery successfully resolved, either automatically or manually. It includes successful indoubt resolutions for agents associated with threads that use the Recoverable Resource Manager Services Attach Facility (RRSAF).

A unit of recovery is indoubt when a failure occurs after a successful prepare but before a successful commit. This number should equal the number of units of recovery gone indoubt. If it is less, then some indoubt units of recovery might still exist.

**Field Name:** Q3STRIUR

**COMMIT PH 1**

The number of successful requests for commit phase 1 in a two-phase commit environment such as CICS or IMS. It includes successfully prepared agents associated with threads that use the Recoverable Resource Manager Services Attach Facility (RRSAF). It does not include successful single-phase commits or distributed two-phase commits.

**Background and Tuning Information**

IMS and CICS applications use the PREPARE and COMMIT sequence to commit work.

**Field Name:** Q3STPREP

**SSAM EOM**

The number of times MVS deleted non-DB2 address space while connected to DB2.
Field Name: Q3STMEOM

**TERMIN.THREAD**

The number of time threads that terminated successfully.

This number does not agree with the create thread count because each level of a thread's access (IDENTIFY, SIGNON, and CREATE THREAD) must be terminated.

**Background and Tuning Information**

The value of this field is usually greater than the number of create thread occurrences, because it also includes the termination of connections to DB2 (IDENTIFY) and other internal counts.

Field Name: Q3STTERM

**EXITS**

The number of successful DSN3EXIT requests.

Field Name: Q3STEXIT

**SYNCHS**

The total number of commits in a single-phase commit environment such as TSO, CAF, or UTILITY. IMS applications use the prepare-and-commit sequence; CICS applications use both the synchronized commit request and the prepare-and-commit sequence to commit work.

Note that DBATs executed on this location are not included. For DBAT statistics, see SINGLE PHASE COMMITS received on the DDF activity block.

Field Name: Q3STSSYNC

**SSAM EOT**

The number of times non-DB2 tasks abended while connected to DB2.

Field Name: Q3STMEOT

**CRT.THRD QUED**

The number of create thread requests queued (not including DBATs).

The total number of threads accessing data that can be allocated concurrently is the MAX USERS value on the installation panel DSNTIPE. Requests are queued when the MAX USERS value is exceeded. If no threads are queued during peak hours, the maximum number of threads might be set too high.

**Background and Tuning Information**

As a rule of thumb about 1% thread queuing is acceptable. When this is appreciably higher, increase the value of MAX USERS on the DB2 install panel DSNTIPE.

The combined maximum allowed for MAX USERS and MAX REMOTE ACTIVE cannot exceed 2000.

Field Name: Q3STCTHW

This is an exception field.

**SUBS.INT.CALLS**

The number of subsystem interface calls processed.
Field Name: Q3TSSSI

**READ ONLY COMMIT**

The number of read-only commits.

There are occasions when CICS or IMS invokes DB2 when no DB2 resource was altered since the completion of the last commit process. When this occurs, DB2 performs both phases of the two-phase commit during the first commit phase and records that the user or job is read-only in relation to its DB2 processing.

Field Name: Q3STRDON

**IDBACK**

The maximum number of connections to a single instance from batch or TSO background tasks.

This is a high-water mark.

Field Name: Q3STHWIB

**IDFORE**

The maximum number of connections to a single instance from TSO foreground tasks.

This is a high water-mark.

Field Name: Q3STHWIF

**CTHREAD**

The highest number of batch CICS, IMS, and TSO tasks (CTHREAD) to a single instance.

This is a high-water mark.

Field Name: Q3STHWCT
**IFCID 001 - QSST Data**

This topic shows detailed information about “Record Trace - IFCID 001 - QSST Data”.

This block contains DB2 serviceability fields. Most of these fields are for IBM service use.

**Record trace - IFCID 001 - QSST Data**

** QSSTGPLF**

This field is for IBM service use.

*Field Name:* QSSTGPLF

** QSSTCONT**

The number of full system contractions.

*Field Name:* QSSTCONT

** QSSTCRIT**

The number of critical storage shortages after contraction.

*Field Name:* QSSTCRIT

** QSSTABND**

The number of abends due to local storage shortage.

*Field Name:* QSSTABND
**ICFID 001 - QVAS Data**

This topic shows detailed information about “Record Trace - IFCID 001 - QVAS Data”.

This block contains DB2 serviceability fields. These fields are for IBM service use.

**Record trace - IFCID 001 - QVAS Data**

The field labels shown in the following sample layout of “Record Trace - IFCID 001 - QVAS Data” are described in the following section.

IFCID 001 - QVLS Data

This topic shows detailed information about “Record Trace - IFCID 001 - QVLS Data”.

The QVLS latch counters represent the number of suspends that were performed by agents that attempted to obtain a latch.

The DB2 latch contentions can be traced by running a performance trace for IFCID 51, 52, 56, and 57. The latch class counters may represent more than one contention because they are reported as modulo 32. For example, LC12 could be either due to latch class X’0C’ or latch class X’4C’. The following paragraph shows the predominant latch contention for each latch class. The latch class contentions per second are reported in the Statistics report and trace.

If the latch class contentions per second are:

- Less than 1000, you can ignore them.
- Between 1000 and 10000, you need to start monitoring the issue.
- Greater than 10000 and if this has an impact on your performance, gather the performance trace for the IFCIDs 51, 52, 56, and 57. Then contact IBM support for assistance.

There is not a one-to-one relationship between the QVLS counters and IFCID 56 or 57, because an agent might suspend multiple times or not at all, while trying to obtain a latch. That is why the QVLS counters are not directly related to Accounting Class 3.

Record trace - IFCID 001 - QVLS Data

The field labels shown in the following sample layout of “Record Trace - IFCID 001 - QVLS Data” are described in the following section.

### QVLSLC01

This field is infrequently used.

**Field Name:** QVLSLC01

### QVLSLC02

The predominant latch usage is: Global authorization cache.

**Field Name:** QVLSLC02

### QVLSLC03

The predominant latch usage is: DDF disconnect.

**Field Name:** QVLSLC03

### QVLSLC04

The predominant latch usage is: SYSSTRING cache.

**Field Name:** QVLSLC04

### QVLSLC05
The predominant latch usage is: IRLM data sharing exits or RLF.

**Field Name:** QVLSLC05

QVLSLC06

The predominant latch usage is: Data sharing index split.

**Field Name:** QVLSLC06

QVLSLC07

The predominant latch usage is: Index lotch and OBD allocation.

**Field Name:** QVLSLC07

QVLSLC08

The predominant latch usage is: Query parallelism.

**Field Name:** QVLSLC08

QVLSLC09

The predominant latch usage is: Utilities or stored procedure URIDs.

**Field Name:** QVLSLC09

QVLSLC10

The predominant latch usage is for Sequence objects (stand-alone and table-based Identity Column). DB2 12 latch contention can be significantly reduced for the Identity Column in a data-sharing environment because of the reduction in log force write.

**Field Name:** QVLSLC10

QVLSLC11

The predominant latch usage is for Sequence objects (stand-alone and table-based Identity Column) for concurrent transactions. DB2 12 latch contention can be significantly reduced for the Identity Column in a data-sharing environment because of the reduction in log force write.

**Field Name:** QVLSLC11

QVLSLC12

The predominant latch usage is database allocation control latch (latch class X'0C') or WebSphere® global transaction ID latch (latch class X'4C').

**Field Name:** QVLSLC12

QVLSLC13

The predominant latch usage is: Pageset operations.

**Field Name:** QVLSLC13

QVLSLC14

The predominant latch usage is represented by various buffer pool related activities, including buffer pool control block and pool serialization.

**Field Name:** QVLSLC14

QVLSLC15

The predominant latch usage is: ARCHIVE LOG MODE(QUIESCE).

**Field Name:** QVLSLC15
QVLSLC16

The predominant latch usage is: UR synonym chain.

Field Name: QVLSLC16

QVLSLC17

The predominant latch usage is: RURE chain.

Field Name: QVLSLC17

QVLSLC18

The predominant latch usage is: DDF resynch list.

Field Name: QVLSLC18

QVLSLC19

The predominant latch usage is logical log write (in contrast to physical log write).

Field Name: QVLSLC19

QVLSLC20

The predominant latch usage is: System checkpoint.

Field Name: QVLSLC20

QVLSLC21

The predominant latch usage is: Accounting rollup.

Field Name: QVLSLC21

QVLSLC22

The predominant latch usage is: Internal checkpoint.

Field Name: QVLSLC22

QVLSLC23

The predominant latch usage is Buffer Manager latch for page latch contention timer queue or deferred write latch. Both types of latches have latch class X'17'.

Field Name: QVLSLC23

QVLSLC24

The predominant latch usage is EDM LRU latch or Buffer Manager prefetch scheduling latch. EDM LRU latch can be identified by latch class X'18' while Buffer Manager prefetch scheduling latch can be identified by latch class X'38' in a latch contention trace.

Field Name: QVLSLC24

QVLSLC25

The predominant latch usage is: EDM hash latch.

Field Name: QVLSLC25

QVLSLC26

The predominant latch usage is: Dynamic statement cache.

Field Name: QVLSLC26
IFCID 001 - QVLS Data

QVLSLC27
The predominant latch usage is: stored procedure queue latch and UDF.
Field Name: QVLSLC27

QVLSLC28
The predominant latch usage is: Stored procedures or authorization cache.
Field Name: QVLSLC28

QVLSLC29
The predominant latch usage is: Field procs and DDF transaction manager.
Field Name: QVLSLC29

QVLSLC30
The predominant latch usage is: Agent services.
Field Name: QVLSLC30

QVLSLC31
The predominant latch usage is: Storage manager.
Field Name: QVLSLC31

QVLSLC32
The predominant latch usage is shared storage pool latch.
Field Name: QVLSLC32

QVLSLC254
The predominant latch usage is: Index latch.
Field Name: QVLSLC254
IFCID 001 - z/OS Metrics

This topic shows detailed information about “Record Trace - IFCID 001 - z/OS Metrics”.

Record trace - IFCID 001 - z/OS Metrics

QWOSFLG : 0 QWOSRCDE: 0 QWOSRSH: 0

LPAR CPS

The number of standard central processors (CPs) on the logical partition (LPAR) at the end of the defined Monitor III gatherer time interval (called MINTIME). This value does not include ZIIPs. This value is from Resource Measurement Facility (RMF) field CPUG3_PRCON.

Field Name: QWOSLNCP

LPAR CPU UTILIZATION

The percentage of the MINTIME time interval during which RMF reported that the entire LPAR was in use, averaged for a single processor. This value is calculated using Resource Measurement Facility (RMF) field CPUG3_LOGITI.

Field Name: QWOSLPRU

DB2 SUBSYS CPU UTILIZATION

The percentage of the MINTIME time interval during which RMF reported that all DB2 address spaces were in use, calculated for a single processor.

Field Name: QWOSDB2U

LPAR PAGE-IN RATE

The PAGE-IN rate (%) for the LPAR. This value is always set to 0.

Field Name: QWOSLPIR

DB2 SUBSYS PAGE-IN RATE

The PAGE-IN rate (%) for the DB2 subsystem. This value is set to 0.

Field Name: QWOSDPIR

LPAR REAL STOR (MB)

The total real storage in the LPAR, in MB. This value is derived from RMF field GEIRPOOL_VE, which is the number of online real storage frames.

Field Name: QWOSLRST

DB2 SUBSYS USED REAL STOR (MB)
The real storage used by DB2 subsystems, in MB. This value is the sum of the following values for all DB2 address spaces in the LPAR, converted to MB:

- The number of frames for swapped-in users. This value is derived from RMF field ASIFMCT_VE.
- The number of frames for idle users. This value is derived from RMF field ASIFMCTI_VE.

Field Name: QWOSDRSU

LPAR VIRT STOR (MB)

The total virtual storage in the LPAR, in MB. This value is the sum of the following values for all address spaces in the LPAR:

- The number of frames for swapped-in users. This value is derived from RMF field ASIFMCT_VE.
- The number of frames for idle users. This value is derived from RMF field ASIFMCTI_VE.
- The number of auxiliary slots. This value is derived from RMF field ASIAUXSC_VE.

Field Name: QWOSLVST

DB2 SUBSYS USED VIRT STOR (MB)

The virtual storage used by DB2 subsystems, in MB. This value is the sum of the following values for all DB2 address spaces in the LPAR, converted to MB:

- The number of frames for swapped-in users. This value is derived from RMF field ASIFMCT_VE.
- The number of frames for idle users. This value is derived from RMF field ASIFMCTI_VE.

Field Name: QWOSDVSU

LPAR FREE REAL STOR (MB)

The free real storage in the LPAR, in MB. This value is derived from RMF field GEIRAFC, which is the number of available real storage frames.

Field Name: QWOSLRSF

DB2 MSTR CPU UTILIZATION

The percentage of the MINTIME time interval during which RMF reported that the DB2 MSTR address space was in use, calculated for a single processor.

Field Name: QWOSMSTU

LPAR FREE VIRT STOR (MB)

The free virtual storage in the LPAR, in MB. This value is the sum of the following values, converted to MB:

- The total real storage in the LPAR (QWOSLRST)
- The number of currently available slots (RMF field GEISLTA)

Field Name: QWOSLVSF

DB2 DBM1 CPU UTILIZATION
The percentage of the MINTIME time interval during which RMF reported that the DB2 DBM1 address space was in use, calculated for a single processor.

Field Name: QWOSDBMU

UNREFERENCED INTERVALS

The Unreferenced Interval Count (UIC). This value is RMF field GEIAHUIC_VE.

Field Name: QWOSLUIC

QWOSFLG

This field is for IBM service use.

Field Name: QWOSFLG

QWOSRCDE

This field is for IBM service use.

Field Name: QWOSRCDE

QWOSRSNC

This field is for IBM service use.

Field Name: QWOSRSNC
IFCID 002 - DB2 Statistics

Database 2 Statistics shows the data from IFCID 002.

Chapter 40. IFCID Record Blocks 40-63
This topic shows detailed information about “Record Trace - IFCID 002 - Accelerator Data - Prior to V4”. This topic only refers to IBM DB2 Analytics Accelerator for z/OS prior to version 4.

Note: The field descriptions of the fields QUERIES SUCCESSFULLY EXECUTED, QUERIES FAILED TO EXECUTE, CURRENTLY EXECUTING QUERIES, and MAXIMUM EXECUTING QUERIES refer to SQL statements passed to the accelerator. For product identifiers of IBM DB2 Analytics Accelerator for z/OS prior to AQT04015, the SQL statements are SELECT queries passed to the accelerator.

Record trace - IFCID 002 - Accelerator Data - Prior to V4

The field labels shown in the following sample layout of “Record Trace - IFCID 002 - Accelerator Data - Prior to V4” are described in the following section.

### PRODUCT ID

The accelerator product identifier.

**Field Name:** Q8STPRID

### SERVER ID

The accelerator server identifier.

**Field Name:** Q8STNAME

### STATE

Shows the current accelerator state. The state depends on the version of IBM DB2 Analytics Accelerator for z/OS:

- Version 4:
  - 0 = INITIALIZING
  - 1 = ONLINE
  - 3 = OFFLINE
  - 5 = MAINTENANCE

---

6 = DOWN
7 = UNKNOWN

Field Name: Q8STTATE

QUERIES SUCCESSFULLY EXECUTED
The number of SQL statements (sent by this DB2 system since accelerator start) that were successfully executed in the accelerator.

Field Name: Q8STSREQ

QUERIES FAILED TO EXECUTE
The number of SQL statements (sent by this DB2 system since accelerator start) that failed to be successfully executed for any reason.

Field Name: Q8STFREQ

QUERIES FAILED TO EXECUTE - ACCELERATOR IN INVALID STATE
The number of queries (sent by this DB2 system since accelerator start) that failed to be successfully executed, for example, because the accelerator was in an invalid state.

Field Name: Q8STFINV

CURRENTLY EXECUTING QUERIES
The number of currently (actively) executing SQL statements in the accelerator on behalf of all DB2 systems (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STACTV_64).

Field Name: Q8STACTV

MAXIMUM EXECUTING QUERIES
The maximum number of SQL statements actively executing in the accelerator concurrently at any time since accelerator start on behalf of all DB2 systems (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STMAXA_64).

Field Name: Q8STMAXA

CONNECTS TO ACCELERATOR
The number of connects to the accelerator from this DB2 system.

Field Name: Q8STCONN

REQUESTS SENT TO ACCELERATOR
The number of Distributed Relational Database Architecture™ (DRDA) requests sent by this DB2 system to the accelerator.
Field Name: Q8STREQ

REQUESTS SENT TO ACCELERATOR - TIMED OUT
The number of connections that were timed out when this DB2 system sent requests to the accelerator.

Field Name: Q8STTOUT

REQUESTS SENT TO ACCELERATOR - FAILED
The number of connections that failed when this DB2 system sent requests to the accelerator.

Field Name: Q8STFAIL

BYTES SENT TO ACCELERATOR
The total number of bytes sent to the accelerator.

Field Name: Q8STBYTS

BYTES RECEIVED FROM ACCELERATOR
The total number of bytes received from the accelerator.

Field Name: Q8STBYTR

MESSAGES SENT TO ACCELERATOR
The total number of messages sent to the accelerator.

Field Name: Q8STMSGS

MESSAGES RECEIVED FROM ACCELERATOR
The total number of messages received from the accelerator.

Field Name: Q8STMSGR

BLOCKS SENT TO ACCELERATOR
The total number of blocks sent to the accelerator.

Field Name: Q8STBLKS

BLOCKS RECEIVED FROM ACCELERATOR
The total number of blocks received from the accelerator.

Field Name: Q8STBLKR

ROWS SENT TO ACCELERATOR
The total number of rows sent to the accelerator.

Field Name: Q8STROWS

ROWS RECEIVED FROM ACCELERATOR
The total number of rows received from the accelerator.

Field Name: Q8STROWR

TCP/IP SERVICES ELAPSED TIME
The accumulated accelerator services TCP/IP elapsed time measured in DB2. It starts when sending the requests to the accelerator and ends when receiving the results from the accelerator.

Field Name: Q8STTELA

WAIT TIME IN ACCELERATOR
The wait time spent in the accelerator when executing requests from the DB2 subsystem.

Field Name: Q8STAWAT

AVG. QUEUE LENGTH (LAST 3 HOURS)

The average queue length during the last 3 hours at the accelerator.

Field Name: Q8STAVGQ03

AVG. QUEUE LENGTH (LAST 24 HOURS)

The average queue length during the last 24 hours at the accelerator.

Field Name: Q8STAVGQ24

MAXIMUM QUEUE LENGTH

The high watermark of the queue length at the accelerator (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STMAXQ_64).

Field Name: Q8STMAXQ

AVG QUEUE WAIT ELAPSED TIME

The average wait time at the accelerator queue.

Field Name: Q8STQUEW

MAX QUEUE WAIT ELAPSED TIME

The maximum wait time at the accelerator queue.

Field Name: Q8STQUEM

WORKER NODES

The number of active worker nodes (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STWNOD_64).

Field Name: Q8STWNOD

WORKER NODES AVG CPU UTILIZATION (%)

The current CPU utilization on the accelerator worker nodes. This is a snapshot, which is the average CPU utilization across all worker nodes (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STWCPU_64).

Field Name: Q8STWCPU

COORDINATOR AVG CPU UTILIZATION (%)

The current CPU utilization on the accelerator coordinator node (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STCCPU_64).

Field Name: Q8STCCPU

DISK STORAGE AVAILABLE (MB)

The disk storage (MB) available at the accelerator.

Field Name: Q8STDSSA

DISK STORAGE AVAILABLE - IN USE (%)

The current disk utilization of the accelerator worker nodes, expressed as percentage of the used I/O channels/resources.

Field Name: Q8STDSSKU
DISK STORAGE AVAILABLE - IN USE FOR DATABASE (MB)

The disk storage in-use for accelerator databases for this DB2 system.

Field Name: Q8STDSKB

DATA SLICES

The number of data slices at the accelerator. This equals the degree of parallel I/O channels.

Field Name: Q8STNMDS

DATA SKEW

When table data is loaded into the accelerator, it may be unevenly distributed across the different data slices on the disks. This disparity is called data skew. The counter represents the accumulated skew over all tables that belong to the DB2 subsystem. The skew of a table is the ratio that shows how uneven the data slices are, as calculated by ((maximum data slice size - minimum data slice size) / median data slice size).

A high value indicates, that data reorganization can improve disk utilization and query performance.

Field Name: Q8STSKEW

PROCESSORS

The number of CPU cores available on all worker nodes.

Field Name: Q8STCORS

ELAPSED TIME IN ACCELERATOR

The accumulated elapsed time spent in the accelerator when executing requests from the DB2 subsystem.

Field Name: Q8STAELA

CPU TIME SPENT IN ACCELERATOR

The CPU time spent in the accelerator when executing requests from the DB2 subsystem.

Field Name: Q8STACPU
This topic shows detailed information about “Record Trace - IFCID 002 - Accelerator Data - Subsystem/Group Perspective V4 or later”.

Note: This topic only refers to IBM DB2 Analytics Accelerator for z/OS version 4 or later.

A value of -1 in the following fields indicates that the status of the acceleration or replication server is unknown:
- CPU TIME EXECUTING QUERIES
- CPU TIME LOAD/ARCHIVE/RESTORE
- WAIT TIME IN ACCELERATOR
- CPU TIME FOR REPLICATION
- REPLIATION LATENCY

Note: The descriptions of the fields labelled with SQL STMTS refer to SQL statements passed to the accelerator. For product identifiers of IBM DB2 Analytics Accelerator for z/OS prior to AQT04015, the SQL statements are SELECT queries passed to the accelerator and the fields INSERT STMTS to ROLLBACK STMTS are N/A.

Record trace - IFCID 002 - Accelerator Data - Subsystem/Group Perspective V4 or later

The field labels shown in the following sample layout of “Record Trace - IFCID 002 - Accelerator Data - Subsystem/Group Perspective V4 or later” are described in the following section.

PRODUCT ID

The accelerator product identifier.

Field Name: Q8STPRID

SERVER ID

The accelerator server identifier.
Field Name: Q8STNAME

STATE
Shows the current accelerator state. The state depends on the version of IBM DB2 Analytics Accelerator for z/OS:

- Version 4:
  0 = INITIALIZING
  1 = ONLINE
  3 = OFFLINE
  5 = MAINTENANCE
  255 = UNKNOWN

- Prior to Version 4:
  0 = INITIALIZED
  1 = ONLINE
  2 = PAUSED
  3 = OFFLINE
  4 = STOPPED
  5 = MAINTENANCE
  6 = DOWN
  7 = UNKNOWN

Field Name: Q8STSTATE

SQL STMTS SUCCESSFULLY EXECUTED
The number of SQL statements (sent by this DB2 system since accelerator start) that were successfully executed in the accelerator.

Field Name: Q8STREQ

CURRENTLY EXECUTING SQL STMTS
The number of currently executing SQL statements in the accelerator on behalf of this DB2 system.

Field Name: Q8STNQCS

MAXIMUM EXECUTING SQL STMTS
Shows the maximum number of SQL statements executing in the accelerator at any time since accelerator start on behalf of this DB2 system.

Field Name: Q8STMNQS

CONNECTS TO ACCELERATOR
The number of connects to the accelerator from this DB2 system.

Field Name: Q8STCONN

REQUESTS SENT TO ACCELERATOR
The number of Distributed Relational Database Architecture (DRDA) requests sent by this DB2 system to the accelerator.

Field Name: Q8STREQ
REQUESTS TIMED OUT
The number of connections that were timed out when this DB2 system sent requests to the accelerator.
Field Name: Q8STTOUT

REQUESTS FAILED
The number of connections that failed when this DB2 system sent requests to the accelerator.
Field Name: Q8STFAIL

BLOCKS SENT TO ACCELERATOR
The total number of blocks sent to the accelerator.
Field Name: Q8STBLKS

BLOCKS RECEIVED FROM ACCELERATOR
The total number of blocks received from the accelerator.
Field Name: Q8STBLKR

ELAPSED TIME IN TCP/IP SERVICES
The accumulated accelerator services TCP/IP elapsed time measured in DB2. It starts when sending the requests to the accelerator and ends when receiving the results from the accelerator.
Field Name: Q8STTELA

CPU TIME IN TCP/IP SERVICES
The accelerator services TCP/IP CPU time measured in DB2. It starts when sending the requests to the accelerator and ends when receiving the results from the accelerator.
Field Name: Q8STTCPU

ELAPSED TIME IN ACCELERATOR SERVICES
The accelerator services elapsed time.
Field Name: Q8STSELA

CPU TIME IN ACCELERATOR SERVICES
The CPU time of the accelerator services.
Field Name: Q8STSCPU

LOG RECORDS READ
The number of log records read by the replication capture agent for this DB2 system.
Field Name: Q8STNLRS

LOG RECORDS FOR ACCELERATOR TABLES
The number of log records (read by the replication capture agent for this DB2 system) that are applicable to tables in this accelerator.
Field Name: Q8STNLTS

LOG RECORD BYTES PROCESSED
The number of log record bytes processed by the replication capture agent for this DB2 system.

Field Name: Q8STNBS

CPU TIME FOR REPLICATION

The total CPU cost associated with the replication apply process for this DB2 system.

Field Name: Q8STTCCS

REPLICATION STATUS

The current replication state of the accelerator for this DB2 system:

0  Started
1  Stopped
2  Error
3  Starting
4  Stopping

Field Name: Q8STCSS

REPLICATION STATUS CHANGE

The timestamp when the last change of the accelerator replication state occurred for this DB2 system.

Field Name: Q8STTLSC

SQL STMTS FAILED TO EXECUTE

The number of SQL statements (sent by this DB2 system since accelerator start) that failed to be successfully executed for any reason.

Field Name: Q8STFREQ

CPU TIME EXECUTING SQL STMTS

The total CPU cost associated with executing SQL statements in the accelerator on behalf of this DB2 system.

Field Name: Q8STTCQS

CPU TIME LOAD/ARCHIVE/RESTORE

The total CPU cost spent in the accelerator for data maintenance operations from this DB2 system. Replication-related operations are not included.

Field Name: Q8STTCMS

BYTES SENT TO ACCELERATOR

The total number of bytes sent to the accelerator.

Field Name: Q8STBYTS

BYTES RECEIVED FROM ACCELERATOR

The total number of bytes received from the accelerator.

Field Name: Q8STBYTR

MESSAGES SENT TO ACCELERATOR

The total number of messages sent to the accelerator.
Field Name: Q8STMSGS
MESSAGES RECEIVED FROM ACCELERATOR
The total number of messages received from the accelerator.
Field Name: Q8STMSGR
ROWS SENT TO ACCELERATOR
The total number of rows sent to the accelerator.
Field Name: Q8STROWS
ROWS RECEIVED FROM ACCELERATOR
The total number of rows received from the accelerator.
Field Name: Q8STROWR
ELAPSED TIME IN ACCELERATOR
The accumulated elapsed time spent in the accelerator when executing requests from the DB2 subsystem.
Field Name: Q8STAELA
CPU TIME IN ACCELERATOR
The CPU time spent in the accelerator when executing requests from the DB2 subsystem.
Field Name: Q8STACPU
WAIT TIME IN ACCELERATOR
The wait time spent in the accelerator when executing requests from the DB2 subsystem.
Field Name: Q8STAWAT
INSERT ROWS FOR ACCELERATOR TABLES
The number of INSERT rows applicable to accelerator tables that were processed by the replication capture agent for this DB2 system.
Field Name: Q8STNIS
UPDATE ROWS FOR ACCELERATOR TABLES
The number of UPDATE rows applicable to accelerator tables that were processed by the replication capture agent for this DB2 system.
Field Name: Q8STNUS
DELETE ROWS FOR ACCELERATOR TABLES
The number of DELETE rows applicable to accelerator tables that were processed by the replication capture agent for this DB2 system.
Field Name: Q8STNDS
REPLICATION LATENCY
The current replication latency for this DB2 system. Latency is defined as the time difference between the timestamp, when the last log record was applied to the target, compared to the current time.
Field Name: Q8STCRL
IFCID 002 - Accelerator Data - Accelerator Perspective V4 or later

This topic shows detailed information about “Record Trace - IFCID 002 - Accelerator Data - Accelerator Perspective V4 or later”.

Note: This topic only refers to IBM DB2 Analytics Accelerator for z/OS version 4 or later.

A value of -1 in the following fields indicates that the status of the acceleration or replication server is unknown:

- CPU TIME EXECUTING QUERIES
- CPU TIME LOAD/ARCHIVE/RESTORE
- AVG QUEUE WAIT ELAPSED TIME
- MAX QUEUE WAIT ELAPSED TIME
- WORKER NODES DISK UTILIZATION (%)
- WORKER NODES AVG CPU UTILIZATION (%)
- COORDINATOR CPU UTILIZATION (%)
- CPU TIME FOR REPLICATION

Note: The descriptions of the fields labelled with SQL STMTS refer to SQL statements passed to the accelerator. For product identifiers of IBM DB2 Analytics Accelerator for z/OS prior to AQT04015, the SQL statements are SELECT queries passed to the accelerator and the fields INSERT STMTS to ROLLBACK STMTS are N/A.

Record trace - IFCID 002 - Accelerator Data - Accelerator Perspective V4 or later

The field labels shown in the following sample layout of “Record Trace - IFCID 002 - Accelerator Data - Accelerator Perspective V4 or later” are described in the following section.

SQL STMTS SUCCESSFULLY EXECUTED

The number of SQL statements (sent by all DB2 systems since accelerator start) that successfully executed in the accelerator.

Field Name: Q8STNQSA

CURRENTLY EXECUTING SQL STMTS
The number of currently (actively) executing SQL statements in the accelerator on behalf of all DB2 systems (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STACTV_64).

Field Name: Q8STACTV

MAXIMUM EXECUTING SQL STMTS

The maximum number of SQL statements actively executing in the accelerator concurrently at any time since accelerator start on behalf of all DB2 systems (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STMAXA_64).

Field Name: Q8STMAXA

ACCELERATOR SERVER START

The timestamp when the accelerator server process started last time.

Field Name: Q8STTSTART

ACCELERATOR STATUS CHANGE

The timestamp when the last change of the accelerator occurred.

Field Name: Q8STTATC

CURRENT QUEUE LENGTH

| The current queue length at the accelerator.
| Field Name: Q8STCQL

MAXIMUM QUEUE LENGTH

| The high watermark of the queue length at the accelerator (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STMAXQ_64).
| Field Name: Q8STMAXQ

AVG QUEUE WAIT ELAPSED TIME

| The average wait time at the accelerator queue.
| Field Name: Q8STQUEW

MAX QUEUE WAIT ELAPSED TIME

| The maximum wait time at the accelerator queue.
| Field Name: Q8STQUEM

WORKER NODES DISK UTILIZATION (%)

| The current disk utilization of the accelerator worker nodes, expressed as percentage of the used I/O channels/resources.
| Field Name: Q8STDSKU

WORKER NODES AVG CPU UTILIZATION (%)

| The current CPU utilization on the accelerator worker nodes. This is a snapshot, which is the average CPU utilization across all worker nodes (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STWCPU_64).
| Field Name: Q8STWCPU

COORDINATOR CPU UTILIZATION (%)
The current CPU utilization on the accelerator coordinator node (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STCCPU_64).

Field Name: Q8STCCPU

LOG RECORDS READ
The number of log records read by the replication capture agents for all DB2 systems.

Field Name: Q8STNLRA

LOG RECORDS FOR ACCELERATOR TABLES
The number of log records read by the replication capture agents for all DB2 systems that are applicable to tables in this accelerator.

Field Name: Q8STNLTA

LOG RECORD BYTES PROCESSED
The number of log record bytes processed by the replication capture agents for all DB2 systems.

Field Name: Q8STNBA

CPU TIME FOR REPLICA
The total CPU cost associated with the replication apply process for all DB2 systems.

Field Name: Q8STTCCA

SQL STMTS FAILED TO EXECUTE
Shows the number of SQL statements (sent by all DB2 systems since accelerator start) that were not successfully executed for any reason.

Field Name: Q8STNQFA

CPU TIME EXECUTING SQL STMTS
The total CPU cost associated with executing SQL statements in the accelerator on behalf of all DB2 systems.

Field Name: Q8STTCQA

CPU TIME LOAD/ARCHIVE/RESTORE
The total CPU cost spent in the accelerator for data maintenance operations from all DB2 systems. Replication-related operations are not included.

Field Name: Q8STTCMA

DISK STORAGE AVAILABLE (MB)
The disk storage (MB) available at the accelerator.

Field Name: Q8STDSKA

DISK STOR IN USE - THIS DB2 SYS (MB)
The disk storage in-use for accelerator databases for this DB2 system.

Field Name: Q8STDSKB

DISK STOR IN USE - ALL DB2 SYS (MB)
The disk storage (MB) in-use for accelerator databases for all DB2 systems.

Field Name: Q8STDSA
WORKER NODES
The number of active worker nodes (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STWNOD_64).
Field Name: Q8STWNOD

AVAILABLE CPU CORES
The number of CPU cores available on all worker nodes.
Field Name: Q8STCORS

DATA SLICES
The number of data slices at the accelerator. This equals the degree of parallel I/O channels.
Field Name: Q8STNMDS

INSERT ROWS FOR ACCELERATOR TABLES
The number of INSERT rows applicable to accelerator tables that were processed by the replication capture agents for all DB2 systems.
Field Name: Q8STNIA

UPDATE ROWS FOR ACCELERATOR TABLES
The number of UPDATE rows applicable to accelerator tables that were processed by the replication capture agents for all DB2 systems.
Field Name: Q8STNUA

DELETE ROWS FOR ACCELERATOR TABLES
The number of DELETE rows applicable to accelerator tables that were processed by the replication capture agents for all DB2 systems.
Field Name: Q8STNDA
IFCID 002 - Accelerator SQL Call Data V4 or later

This topic shows detailed information about “Record Trace - IFCID 002 - Accelerator SQL Call Data V4 or later”.

Record trace - IFCID 002 - Accelerator SQL Call Data V4 or later

The field labels shown in the following sample layout of “Record Trace - IFCID 002 - Accelerator SQL Call Data V4 or later” are described in the following section.

<table>
<thead>
<tr>
<th>ACCELERATOR SQL CALL DATA</th>

</table>

**INSERT STMTS SENT TO ACCELERATOR**

The number of INSERT statements sent by the DB2 system to the accelerator.

Field Name: Q8STINSC

**DELETE STMTS SENT TO ACCELERATOR**

The number of DELETE statements sent by the DB2 system to the accelerator.

Field Name: Q8STDELC

**CREATE STMTS SENT TO ACCELERATOR**

The number of CREATE statements sent by the DB2 system to the accelerator.

Field Name: Q8STCR

**ROLLBACK STMTS SENT TO ACCELERATOR**

The number of ROLLBACK statements sent by the DB2 system to the accelerator.

Field Name: Q8STRBKC

**UPDATE STMTS SENT TO ACCELERATOR**

The number of UPDATE statements sent by the DB2 system to the accelerator.

Field Name: Q8STUPDC

**DROP STMTS SENT TO ACCELERATOR**

The number of DROP statements sent by the DB2 system to the accelerator.

Field Name: Q8STDRPC

**COMMIT STMTS SENT TO ACCELERATOR**

The number of COMMIT statements sent by the DB2 system to the accelerator.

Field Name: Q8STCMTC

**OPEN STMTS SENT TO ACCELERATOR**

The number of OPEN statements sent by the DB2 system to the accelerator.

Field Name: Q8STOPNC
IFCID 002 - Buffer Pool Activity

This topic shows detailed information about “Record Trace - IFCID 002 - Buffer Pool Activity”.

This block shows buffer pool activity at thread level.

For details on buffer pool activities, refer to the documentation of Performance Expert Buffer Pool Analyzer.

This report has the same layout as "IFCID 002 - Miscellaneous” on page 40-127.

**BUFFER POOL ID**

The buffer pool ID.

**Field Name:** QBSTPID

**FLAGS**

The flag byte shows if more QBST data is following or if this is the last of the QBST repeating groups.

**Field Name:** QBSTFLG

**CURRENT ACTIVE BUFFERS**

The total number of currently active (nonstealable) buffers. This field is an instantaneous sample of the number of buffers in the buffer pool that were updated or in use at the time this monitor data was requested. Because this field gives a snapshot value at statistics collection time, it only shows a problem if it happens at this time.

**Background and Tuning Information**

The buffer pool might be too small if the percentage of active pages in the buffer pool is beyond the deferred write threshold (DWQT).
Field Name: QBSTCBA

GETPAGE REQUESTS

The number of Getpage requests including conditional and unconditional requests.

Field Name: QBSTGET

BUFFER UPDATES

The number of times buffer updates were requested against pages in the buffer pool.

Background and Tuning Information

The ratio of Buffer Updates to Pages Written (QBSTPWS) suggests a high level of efficiency as it increases, because more updates are being externalized per physical write.

Buffer updates per pages written depends strongly on the type of application. For example, a batch program that processes a table in skip sequential mode with a high row update frequency in a dedicated environment can achieve very good update efficiency. In contrast, update efficiency tends to be lower for transaction processing applications, because transaction processing tends to be random.

The following can influence the number of updates per page:

Number of rows per page
A small PCTFREE value gathers more rows on the same page. However, at the same time this can impact concurrency.

Buffer pool size and deferred write thresholds
Increase DWQT and VDWQT or the size of the buffer pool. This causes DB2 to let page updates accumulate in the buffer pool. Therefore, the probability that more updates per page get captured increases. This effect is less significant if the buffer pool is concurrently used by several transactions, it also depends on the type of transaction.

Field Name: QBSTSWS

This is an exception field.

UNAVAILABLE BUFFER-VPOOL FULL

The number of times a usable buffer could not be located in the virtual buffer pool because the virtual buffer pool was full.

Background and Tuning Information

Ideally, this value should be 0. Any other value indicates that the buffer pool is underallocated. In this case, use the ALTER BUFFERPOOL command to increase the virtual buffer pool size until this value remains at 0.

Field Name: QBSTXFL

This is an exception field.

GETPAGE REQUESTS-SEQUENTIAL

The number of Getpage requests issued by sequential access requesters.

Field Name: QBSTSGT
PAGES WRITTEN

The number of pages in the buffer pool written to DASD.

Background and Tuning Information

Consider the ratio of Pages Written per write I/O. The number of write I/O operations includes Asynchronous Writes (QBSTWIO) and Synchronous Writes (QBSTIMW).

The ratio of pages per write I/O suggests a high level of efficiency as the ratio increases, because more pages are being externalized per physical write.

The following factors impact the ratio of pages written per write I/O:

Checkpoint frequency
At checkpoint time, I/Os are scheduled to write all updated pages on the deferred write queue to DASD. If this occurs too frequently, the deferred write queue does not grow large enough to achieve a high ratio of pages written per write I/O.

The checkpoint frequency depends on the number of logs written between two consecutive checkpoints. This number is set at installation time; see the field CHECKPOINT FREQ of installation panel DSNTIPN.

Frequency of active log switch
DB2 takes a system checkpoint each time the active log is switched. High frequency of active log switches causes the problem described under checkpoint frequency.

Buffer pool size and deferred write thresholds
The deferred write thresholds (VDWQT and DWQT) are a function of buffer pool size. If the buffer pool size is decreased, these thresholds are reached more frequently, causing I/Os to be scheduled more often to write some of the pages on the deferred write queue to DASD. This prevents the deferred write queue from growing large enough to achieve a high ratio of pages written per write I/O.

Number of data sets, and the spread of updated pages across them
The efficiency of write I/O also depends on the number of data sets associated with the buffer pool and spread of updated pages across them. Because of the nature of batch processing, the ratio of pages written to write I/Os can be expected to be higher than that expected for transaction type workloads.

To determine update efficiency, use also the value in the Buffer Updates field (QBSTWS) to check the number of buffer updates per page written.

Field Name: QBSTPWS
This is an exception field.

NUMBER OF DATA SET OPENS

The number of data sets physically opened successfully. This value is cumulative from the start of the DB2 statistics interval.

Field Name: QBSTDSO
This is an exception field.
SYNCHRONOUS READS

The number of synchronous read I/O operations performed by DB2 for applications and utilities.

Background and Tuning Information

This number includes both Synchronous Reads Sequential Access Only (QBSTSIO) and synchronous read operations for non-sequential access.

You can use this value and the value of Synchronous Reads Sequential Access Only to calculate the number of Non-Sequential Synchronous Reads.

Check the buffer pool hit ratio if the number of non-sequential synchronous reads is larger than expected.

Field Name: QBSTRIO

This is an exception field.

SYNCHRONOUS WRITES

The total number of immediate writes.

Immediate writes occur when:

- An immediate write threshold (IWTH) is reached
- No deferred write engines are available
- More than two checkpoints pass without a page being written.

Sometimes DB2 uses synchronous writes even when the IWTH is not exceeded. As an example, when more than two checkpoints pass without a page being written. This type of situation does not indicate a buffer shortage.

Background and Tuning Information

A small number of immediate writes can be expected. Synchronous writes occur if there are too many checkpoints and/or the buffer pool is too small.

If a large number of synchronous writes occur, monitor the DM Critical Threshold Reached (QBSTDTCM) field. Reaching Immediate Write Threshold (IWTH-97.5%) implies that the Data Management Threshold (DMTH-95%) has been crossed. You can ignore the value in the immediate write field when DM Critical Threshold Reached is zero. Otherwise consider increasing the size of the buffer pool. You can use the ALTER BUFFERPOOL command.

Check also the System Event Checkpoint field (QWSDECKPT) in the Subsystem Services block to see whether the frequency of DB2 checkpoints should be reduced. To do this, increase the value of ZPARAM LOGLOAD.

Field Name: QBSTIMW

This is an exception field.

BUFFERS ALLOCATED-VPOOL

The number of buffers allocated for a virtual buffer pool.

Note: In DB2 10, the buffer pool size can increase continuously by up to 25% for each DB2 restart. In DB2 11, the AUTOSIZE option of the ALTER BUFFERPOOL command can limit the range within VPSIZEMIN and VPSIZEMAX.
You should monitor the buffer pool hit ratio field to find the optimum size of the buffer pool. Usually the buffer pool hit ratio is improved by increasing the size of the buffer pool. However, paging the buffer pool storage impacts DB2 performance if the virtual buffer pool is too large.

Page-ins Required for Read I/O (QBSTRPI) and Page-ins Required for Write I/O (QBSTWPI) are useful when determining whether paging affects the performance of a certain buffer pool. The Resource Measurement Facility (RMF) also provides reports on MVS paging activity:

**Storage Paging**

When the virtual buffer pool is extended into expanded storage, MVS storage paging activity occurs. If a large buffer pool size results in excessive storage paging, consider allocating more real storage to the LPAR.

**Paging to Auxiliary Storage**

If the virtual buffer pool size requirements exceed the central storage and expanded storage available, the oldest buffer pool pages migrate to auxiliary paging storage. When these pages are accessed subsequently, I/O must bring them back into real storage. This should be avoided. You could have a smaller buffer pool and let DB2 do the I/O rather than use MVS paging with its I/O CPU overhead. This is a situation that you (as the system programmer) should monitor.

You can use the ALTER BUFFERPOOL command to alter the size of the virtual buffer pool.

Changing the size of the virtual buffer pool implicitly changes the buffer pool thresholds. See the Deferred Write Threshold Reached field (QBSTDWT).

**Field Name:** QBSTVPL

**SYNCHRONOUS READS-SEQUENTIAL**

The number of synchronous read I/O requests issued by sequential access requesters.

**Background and Tuning Information**

Sequential synchronous read I/Os can occur because:

- Prefetch is disabled (QBSTSPD).
- Prefetch pages could have been stolen from the buffer pool before the Getpage request is issued for those pages. Subsequently the pages are reread synchronously. A negative buffer pool hit ratio can indicate the same problem.
- The pages requested are not consecutive: DB2 estimated the selected range of pages to be so small that prefetch would make no sense. See also Sequential Prefetch Requested (QBSTSEQ).

It is normal to have a small value for SYNC READ I/O (SEQUENTIAL) because before the sequential prefetch is scheduled, the first page of a prefetch is read by SYNC READ I/O. However, if this number is large, consider increasing the size of the buffer pool or reviewing the sequential steal thresholds (VPSEQT and HPSEQT).

**Field Name:** QBSTSIO
This is an exception field.

**ASYNCHRONOUS WRITES**

The number of asynchronous write I/O operations performed by media manager to a direct access storage device.

*Field Name:* QBSTWIO

This is an exception field.

**DFHSM MIGRATED DATA SETS**

The number of times migrated data sets were encountered.

*Field Name:* QBSTMIG

This is an exception field.

**SEQUENTIAL PREFETCH REQUESTS**

The number of sequential prefetch requests. This counter is incremented for each PREFETCH request (which can result in an I/O read). If the prefetch results in an I/O read, up to 64 pages may be read for SQL, and up to 128 pages for utilities. A request does not result in an I/O read if all pages to be prefetched are already in the buffer pool.

This counter does not include sequential detection, which is recorded in the Dynamic Prefetch - Requested field.

*Background and Tuning Information*

Sequential prefetch reads a sequential set of pages. It allows CP and I/O operations to be overlapped. DB2 determines at BIND time whether sequential prefetch is used or not.

Sequential prefetch is generally used for a table space scan.

The number of prefetch requests by itself is not a good indicator for efficiency of prefetching:

- At run time not every prefetch request results in read I/O: the Sequential Prefetch Reads field (QBSTPIO) shows the number of read I/O operations caused by sequential prefetch. The Prefetch Disabled No Buffer (QBSTSPD) and Prefetch Disabled No Read Engine fields (QBSTREE) show the number of times prefetch was disabled because buffers and read engines had not been available.
- Check the value in the buffer pool hit ratio. A negative value indicates that prefetched pages are stolen from the buffer pool before they are read. The pages are subsequently reread synchronously. There will be also a large value in the Synchronous Reads Total (QBSTRIO) field.
- Decreasing the size of the buffer pool can reduce the prefetch quantity, leading to a larger number of prefetch requests. See also the Sequential Prefetch Pages Read field (QBSTSPP).

*Field Name:* QBSTSEQ

This is an exception field.

**HORIZONTAL DEFERRED WRITE THRESHOLD**

The number of times the deferred write threshold (DWTH) was reached.

This threshold is a percentage of the virtual buffer pool that might be occupied by unavailable pages, including both updated pages and pages in use. DB2 checks this threshold when an update to a page is completed. If
the percentage of unavailable pages in the virtual buffer pool exceeds the threshold, write operations are scheduled for enough data sets (up to 128 pages per data set) to reduce the number of unavailable buffers to 10% below the threshold.

**Background and Tuning Information**

The default value for this threshold is 30%. You can change that to any value from 0% to 90% by using the DWQT option on the ALTER BUFFERPOOL command.

The deferred write thresholds, DWQT and VDWQT, are specified as a percentage, their absolute value depends on the size of the virtual buffer pool.

Consider the following aspects when changing the deferred write thresholds:

**Optimize the ratio of pages written per write I/O**

The ratio can be monitored using the Pages Written (QBSTPWS) field.

When the buffer pool is relatively small, the default thresholds could prevent the deferred write queue from growing large enough to achieve a high ratio of pages written per write I/O. Raising these thresholds will, in this instance, reduce the I/O write frequency, increasing the number of pages written per I/O.

**Distribute I/O evenly over time**

If a virtual buffer pool is very large, it is unlikely that the default values of either DWQT or VDWQT will ever be reached. In this case, write I/Os tend to occur in surges, triggered by DB2 checkpoints. Lowering the VDWQT and the DWQT could improve performance by distributing the write I/Os more evenly over time.

**Impact on other buffer pool thresholds**

Increasing DWQT and VDWQT allows updated pages to use a larger portion of the virtual buffer pool. Large DWQT and VDWQT can have a significant effect on the other thresholds. For example, in work load where pages are frequently updated, and the updated pages exceed the size of the virtual buffer pool, setting both DWQT and VDWQT to 90% would probably cause frequent threshold-reached events for sequential prefetch (and possibly the data management and immediate write).

**Field Name:** QBSTDWT

This is an exception field.

**DFHSM RECALL TIMEOUTS**

The number of recall timeouts.

**Field Name:** QBSTRTO

**SEQUENTIAL PREFETCH READS**

The number of asynchronous read I/O operations due to normal sequential prefetch (applications and utilities).

**Background and Tuning Information**

Prefetch Read I/O is not activated if one of the following conditions applies:
ICF02 - Buffer Pool Activity

- All pages in the prefetch range are already in the buffer pool.
- Prefetch is disabled (QBSTSPD).

This means that the value in this field is usually smaller than the number of sequential prefetch requests (QBSTSEQ).

Field Name: QBSTPIO
This is an exception field.

VERTICAL DEFERRED WRITE THRESHOLD
The number of times the vertical deferred write threshold (VDWQT) was reached. This threshold is similar to the deferred write threshold but it applies to the number of updated pages for one single page set in the buffer pool. If the percentage or number of updated pages for the data set exceeds the threshold, writes up to 128 pages are scheduled for that data set.

Field Name: QBSTDWV
This is an exception field.

VPOOL EXPANSION OR CONTRACT
The number of successful virtual buffer pool expansions or contractions due to the ALTER BUFFERPOOL command. An increase in this counter indicates that buffer-pool-related system parameters have been changed.

Field Name: QBSTVPA
This is an exception field.

PAGES READ VIA SEQUENTIAL PREFETCH
The total number of pages read due to a normal sequential prefetch. A sequential prefetch request does not result in a read I/O if all the desired pages are found in the buffer pool.

Background and Tuning Information
For requests issued by application programs, the number of pages per READ I/O primarily depends on the page size and the size of the buffer pool. Normally sixty-four 4 KB pages (or eight 32 KB pages) is the maximum prefetch quantity for table space scans, whether data or index. Utilities use a prefetch quantity of up to 64 pages.

The number of pages per READ I/O can be lower because:
- Pages within the prefetch range may already be in the buffer pool.
- Not enough pages are available because of a buffer shortage.
- A prefetch quantity of 8 pages or less is used for work files.

A small value for this ratio can indicate:
- A good performing buffer pool being so large that most of the pages, which had otherwise to be prefetched, are cached in the buffer pool. In this case, the buffer pool hit ratio should be high.
- A buffer shortage condition, reducing the efficiency of sequential prefetch. This could mean, for example, work-file prefetch quantity reduction from 8 to 4 to 2, as the number of available buffers shrinks. In this case, you should consider tuning the buffer pool.

Field Name: QBSTSPP
This is an exception field.
DATA MANAGER BUF CRITICAL THRESHOLD

The number of times the data manager critical threshold (DMTH-95%) was reached.

This field shows how many times a page was immediately released because the data management threshold was reached.

The threshold is checked before a page is read or updated. If the threshold has not been exceeded, DB2 accesses the page in the virtual buffer pool once for each page, no matter how many rows are retrieved or updated in that page. If the threshold has been exceeded, Getpage requests and RELEASEs apply to rows instead of pages. That is, if more than one row is retrieved or updated in a page, more than one Getpage request and RELEASE is performed on that page.

Background and Tuning Information

Avoid reaching this threshold wherever possible because it significantly affects CPU usage. Set virtual buffer pool sizes large enough or reduce the workload on the buffer pool.

Field Name: QBSTDTC

This is an exception field.

VPOOL EXPANSION FAILURE

The total number of virtual buffer pool expansion failures due to the lack of virtual storage space.

Background and Tuning Information

Ideally, this value should be 0. If it is not, check the virtual storage allocation of the DB2 database address space for areas that can be reduced. For example, you can reduce the size of other buffer pools.

Field Name: QBSTXFV

This is an exception field.

LIST PREFETCH REQUESTS

The number of list prefetch requests.

List prefetch allows DB2 to access data pages efficiently even when the required data pages are not contiguous. It allows CP and I/O operations to be overlapped.

Background and Tuning Information

DB2 determines at BIND time whether sequential prefetch is used. List prefetch is chosen as follows:

- Usually with a single index that has a cluster ratio lower than 80%.
- Sometimes on a single index with a high cluster ratio, if the estimated amount of data to be accessed is too small to make sequential prefetch efficient.
- Always to access data by multiple index access.
- Always to access data from the inner table during a hybrid join.

DB2 never chooses list prefetch if the estimated number of RIDs to be processed takes more than 50% of the RID pool. During execution time, list prefetch processing terminates if more than 25% of the rows (with a minimum of 4075) in the table must be accessed.
Data pages are read in quantities equal to the sequential prefetch quantity (QBSTSEQ), which depends on buffer pool size and is usually 64 pages.

Field Name: QBSTLPF
This is an exception field.

CONCURRENT PREFETCH I/O STREAMS-HWM
The highest number of concurrent prefetch I/O streams allocated to support a parallel I/O or CP query in this buffer pool. It reflects prefetch activities for non-workfile page sets.
This number only applies to query I/O and CP parallelism.
Field Name: QBSTXIS
This is an exception field.

LIST PREFETCH READS
The number of asynchronous read I/O operations caused by the list prefetch.
The number of pages read is shown by the List Prefetch Pages Read (QBSTLPP) field.

Background and Tuning Information
Prefetch Read I/O is not activated if one of the following conditions apply:
• All pages in the prefetch range are already in the buffer pool.
• Prefetch is disabled (Prefetch Disabled No Read Engine - QBSTREE).
This means that the value in this field is usually less than the number of list prefetch requests (QBSTLPF).
Field Name: QBSTLIO
This is an exception field.

PAGE-INS REQUIRED FOR WRITE
The number of page-ins required for a write I/O.
Field Name: QBSTWPI

PREFETCH I/O STREAMS REDUCTION
The total number of requested prefetch I/O streams that were denied because of a lack of buffer pool storage space.
It only applies to query I/O and CP parallelism.
For example, if 100 prefetch I/O streams are requested and only 80 are granted, then 20 is added to the number in this field.

Background and Tuning Information
Consider increasing the size of the buffer pool if this value is not 0.
The ratio of this field and the Reduced parallel query requests field gives the average degree of parallel query processing that was reduced because of insufficient buffer pool space. The Prefetch I/O streams - Concurrent streams - high-water mark field gives the highest degree of parallel query processing that was reduced for one or more queries processed in parallel.
The number in this field reflects the prefetch activities for non-workfile page sets.
Field Name: QBSTJIS

This is an exception field.

**PAGES READ VIA LIST PREFETCH**

The number of pages read via list prefetch.

Field Name: QBSTLPP

**MAX WORKFILES CONCURRENTLY USED**

The maximum number of work files concurrently used during merge processing within this statistics period.

Ideally, each work file needs 16 buffers to allow DB2 to perform a sequential prefetch for work files.

Field Name: QBSTWFM

This is an exception field.

**PARALLEL QUERY REQUESTS**

The total number of requests made for parallel query support in this buffer pool. This field only applies to non-workfile page sets in query I/O and CP parallelism.

Field Name: QBSTPQO

**DYNAMIC PREFETCH REQUESTS**

The number of dynamic prefetch requests. Dynamic prefetch is the process that is triggered because of sequential detection. If the prefetch request results in an I/O read, up to 32 advancing pages can be read at a time.

**Background and Tuning Information**

Dynamic prefetch reads a sequential set of pages. It allows CP and I/O operations to be overlapped. If DB2 does not choose prefetch at bind time it can sometimes use it at execution time. The method is called sequential detection.

The number of prefetch requests by itself is not a good indicator for efficiency of prefetching because:

- At run time not every prefetch request results in read I/O: the Dynamic Prefetch Reads field shows the number of read I/O operations caused by dynamic prefetch. The Prefetch Disabled No Buffer (QBSTSPD) and Prefetch Disabled No Read Engine (QBSTREE) fields show the number of times prefetch was disabled because buffers and read engines had not been available.

- Prefetch pages can be stolen from the buffer pool before they are read. This is indicated by a negative buffer pool hit ratio. The pages are subsequently reread synchronously. This will also cause an unexpectedly large value for total synchronous reads (QBSTRIO).

Decreasing the size of the buffer pool can reduce the prefetch quantity (QBSTDPP), leading to a larger number of prefetch requests.

Field Name: QBSTDPF

This is an exception field.

**MERGE PASSES REQUESTED**
The total number of merge passes for DB2 sort activities. This value reflects how many merge passes were requested for DB2 to determine the number of work files permitted to support each merge pass.

Field Name: QBSTWFR

**DYNAMIC PREFETCH READS**

The number of asynchronous read I/Os because of dynamic prefetch. The number of pages read is recorded in the Dynamic Prefetch Pages Read field.

**Background and Tuning Information**

A prefetch request does not result in an I/O if one of the following conditions apply:
- All pages to be prefetched are already in the buffer pool.
- The prefetch is canceled.

This means that the value in this field is usually smaller than the number of dynamic prefetch requests.

Field Name: QBSTDIO

This is an *exception* field.

**MERGE PASS DEGRADED-LOW BUFFER**

The number of times that a merge pass was not efficiently performed due to a shortage of space in the buffer pool. The number in this field is incremented for each merge pass where the maximum number of work files allowed is less than the number of work-files requested.

**Background and Tuning Information**

The maximum number of work files allowed is calculated as follows:
- Buffers consumed = 2 * (work files already allocated)
- Buffers available = (sequential steal threshold * buffer pool size - buffers consumed)
- Maximum work files allowed = buffers available / (2 * 8)

The default for the sequential steal threshold is 0.8.

Ideally, the number in this field should be 0. Otherwise, it indicates a shortage of buffer pool space or that there are too many concurrent work files. For example, there could be a number of concurrently open cursors that require sorting. Consider increasing the buffer pool size using the ALTER BUFFERPOOL command.

Field Name: QBSTWFF

This is an *exception* field.

**PAGES READ VIA DYNAMIC PREFETCH**

The number of pages read because of dynamic prefetch. Dynamic prefetch is the process that is triggered by sequential detection.

**Background and Tuning Information**

The ratio of Dynamic Prefetch Pages Read to Dynamic Prefetch Reads is between 0 and 32.

DB2 can fetch up to 32 pages per prefetch.

The number of pages per READ I/O can be lower because:
• Pages within the prefetch range are already in the buffer pool.
• Not as many pages are available due to a buffer shortage.

A small value for this ratio can indicate:
• A good performing buffer pool being large enough to contain pages that would otherwise be prefetched. This is indicated by a high buffer pool hit ratio.
• A buffer shortage condition, which reduces the efficiency of dynamic prefetch. In this instance the buffer pool hit ratio will be low. Consider tuning the buffer pool.

Field Name: QBSTDPP

This is an exception field.

WORKFILE REQUEST REJECTED-LOW BUFFER

The total number of work files that were rejected during all merge passes because of insufficient buffer resources.

Background and Tuning Information

This field and the degraded low buffers field determine the average number of work files that cannot be honored at each merge pass because of insufficient buffer pool space.

Ideally, the number in this field should be 0. Otherwise, it indicates a shortage of buffer pool space or that there are too many concurrent work files. For example, there could be a number of concurrently open cursors that require sorting. Consider increasing the size of the buffer pool using the ALTER BUFFERPOOL command.

Note that, when there are many concurrent sorts or large sorts, it is a good idea to dedicate a separate buffer pool for sort work files. This will greatly facilitate work-file performance tuning.

Field Name: QBSTWFD

This is an exception field.

WORKFILE REQUESTED-ALL MERGE PASS

The total number of work files requested for all merge passes.

This field and the Merge Passes Requested field determine the average number of work files requested in a single merge pass.

For DB2 to perform an efficient prefetch for work files, each workfile should have at least 16 dedicated buffers. Work files used during sort phase processing or other non-sort-related processing are not included in this number.

Field Name: QBSTWFT

WORKFILE NOT CREATED-NO BUFFER

This field is only applicable if DB2 is running under MVS/XA.

The number of times a work file could not be created due to insufficient buffer resources. It indicates that a sort is in progress and limited in regard to the number of work files it can use.

Background and Tuning Information
Ideally, this should be 0. Otherwise, it indicates a shortage of buffer pool space or that there are many concurrent work files. For example, there could be a number of open cursors that require sorting.

Generally, sorts are performed more efficiently with additional work files, but there are internal DB2 limits on the number of work files a transaction can have. It is possible that at run time a transaction cannot use as many work files as it had planned. You can control this by increasing the buffer pool size (ALTER BUFFERPOOL), or changing the transaction so it requires fewer concurrent work files.

**Field Name:** QBSTMAX

This is an *exception* field.

**PREFETCH QUANTITY REDUCED TO HALF**

The total number of times prefetch quantity is reduced from normal to 50% of normal. The normal size depends on the page size of the buffer pool.

This field only applies to query I/O and CP parallelism.

**Background and Tuning Information**

The number in this field indicates when DB2 had to reduce the sequential prefetch quantity to continue executing concurrently with parallel queries in the system. If the number is small, it may be tolerable.

**Field Name:** QBSTPL1

This is an *exception* field.

**PREFETCH DISABLED-NO BUFFER**

The total number of times sequential prefetch was disabled because buffers were not available.

**Field Name:** QBSTSPD

This is an *exception* field.

**WORKFILE PREFETCH NOT SCHEDULED**

The number of times a sequential prefetch was not scheduled for a work file because the dynamic prefetch quantity is zero.

**Background and Tuning Information**

The work-file prefetch checks the dynamic prefetch quantity (normally 1 to 8 pages). When the quantity is zero, the value in this field is incremented. A high number in this field implies that the buffer pool is too small.

Ideally, the number in this field should be 0. Otherwise, it indicates a shortage of buffer pool space or that there are many concurrent work files. For example, there could be a number of concurrently open cursors that require sorting.

Consider increasing the size of the buffer pool or allocating a buffer pool specifically for DSNDDB07 usage. This can be especially effective with high-use query systems whose reports make extensive use of sort activity.

**Field Name:** QBSTWKPD

This is an *exception* field.

**PREFETCH QUANTITY REDUCED TO QUARTER**
The total number of times prefetch quantity is reduced from 50% to 25% of normal. The normal size depends on the page size of the buffer pool.

This field only applies to query I/O and CP parallelism.

**Background and Tuning Information**

The query response for parallel queries can be significantly degraded if the value in this field is not 0.

**Field Name:** QBSTPL2

This is an *exception* field.

**PREFETCH DISABLED-NO READ ENGINE**

The total number of times a prefetch is disabled because of an unavailable read engine.

**Background and Tuning Information**

Because there are 600 read engines, a maximum of 600 concurrent prefetch operations can be processed at a time. When this maximum is reached, prefetching is disabled and this count is incremented. The value in this field should be close to 0.

**Field Name:** QBSTREE

This is an *exception* field.

**WORKFILE PAGES TO DESTRUCT**

The number of pages for which destructive read was requested.

**Field Name:** QBSTWDRP

**FAILED COND SEQ&RDM GETPAGE REQUEST**

The number of sequential and random Getpage requests which failed because the page was not in the buffer pool. Failed conditional requests do not initiate I/O operations.

**Field Name:** QBSTNGT

**PAGE-INS REQUIRED FOR READ**

The number of page-ins required for a read I/O.

- **Note:** A non-zero value can be accepted if a buffer pool expansion via ALTER BPSIZE occurs. In other situations, a non-zero value indicates a shortage of real storage relative to the buffer pool size.

**Field Name:** QBSTRPI

This is an *exception* field.

**WORKFILE PAGES NOT WRITTEN**

The number of pages dequeued from VDWQ for destructive read requests.

**Field Name:** QBSTWBVQ

**FAILED COND SEQ GETPAGE REQUEST**

The number of conditional sequential Getpage requests which failed because the page was not in the buffer pool. Failed conditional requests do not initiate I/O operations.

**Field Name:** QBSTNSG
MINIMUM BUFFERS ON SLRU (LWM)

The minimum number of buffers on the sequential least-recently-used (SLRU) chain in the last statistical period. This is the low-water mark (LWM) within an interval.

Field Name: QBSTSMIN

PAGES ADDED TO LPL

The number of times that one or more pages were added to the logical page list (LPL).

Field Name: QBSTLPL

MAXIMUM BUFFERS ON SLRU (HWM)

The maximum number of buffers on the sequential least-recently-used (SLRU) chain in the last statistical period. This is the high-water mark (HWM) within an interval.

Field Name: QBSTSMAX

LENGTH OF SLRU = VPSEQT

The number of times when the length of the sequential least-recently-used (SLRU) chain equals the sequential steal threshold VPSEQT.

Field Name: QBSTHST

IN-MEM OVL RND REQUESTS

The number of non-sequential GETPAGE requests using overflowed buffers.

If this counter has a non-zero value, the buffer pool size should be increased.

Field Name: QBSTAGET

This is an exception field.

IN-MEM OVL SEQ REQUESTS

The number of sequential GETPAGE requests using overflowed buffers.

If this counter has a non-zero value, the buffer pool size should be increased.

Field Name: QBSTASGE

This is an exception field.

IN-MEM OVL RND SYNC READS

The number of synchronous read I/O operations for non-sequential GETPAGE requests using overflowed buffers.

If this counter has a non-zero value, the buffer pool size should be increased.

Field Name: QBSTASYN

This is an exception field.

IN-MEM OVL SEQ SYNC READS

The number of synchronous read I/O operations for sequential GETPAGE requests using overflowed buffers.
If this counter has a non-zero value, the buffer pool size should be increased.

**Field Name:** QBSTASSE

This is an *exception* field.

**RANDOM GETPAGE BUFFER HIT**

The number of times that the random Getpage request has a buffer hit and the buffer is on the least-recently-used (SLRU) chain.

**Field Name:** QBSTRHS
IFCID 002 - Data Manager Data

This topic shows detailed information about “Record Trace - IFCID 002 - Data Manager Data”.

Record trace - IFCID 002 - Data Manager Data

The field labels shown in the following sample layout of “Record Trace - IFCID 002 - Data Manager Data” are described in the following section.

**CUR RIDLIST BLOCKS**

The number of RID blocks currently in use (snapshot value).

**Field Name: QISTRRCUR**

**CUR RIDLIST BLOCKS OVERFLOWED**

This field is currently not set by DB2.

**Field Name: QISTWFRCUR**

**MAX RIDLIST BLOCKS**

The highest number of RID blocks in use at any time since DB2 startup. This is a high-water mark.

**Field Name: QISTRHIG**

This is an *exception* field.

**MAX RIDLIST BLOCKS OVERFLOWED**

This field is currently not set by DB2.

**Field Name: QISTWFRRHIG**

**RL PROCESSING-RDS LIMIT EXCEEDED**

The number of times when the number of RIDS that can fit into the guaranteed number of RID blocks was greater than the maximum limit (25% of table size).

**Background and Tuning Information**

Ideally, this value should be 0.

The matching index scan part of the RID list processing scanned more than 25% of the index. RID list processing is then terminated, the index scan is abandoned and normally replaced by a tablespace scan.
Reasons for this are:

- Inaccurate or incomplete RUNSTATS statistics. To avoid this, you should collect all statistics on a regular basis, especially simple and correlated column statistics. Using RUNSTATS with SHRLEVEL(CHANGE) does not prevent access to data.
- Optimizer error. In this instance, you could disable RID list processing by adding the clause OPTIMIZE FOR 1 ROW to the SQL statement, or force the access path to index only by adding the necessary columns to the index.

**Field Name:** QISTRLLM
This is an *exception* field.

**RL PROCESSING-DM LIMIT EXCEEDED**

The number of times when the number of RID entries was greater than the physical limit of approximately 26 million RIDs.

**Field Name:** QISTRPLM
This is an *exception* field.

**RL PROCESSING-NO STORAGE**

The number of times the DBM1 storage was exhausted during RID list processing.

**Background and Tuning Information**

This failure occurs when the DBM1 storage limit is reached.

**Field Name:** QISTRSTG
This is an *exception* field.

**RL PROCESSING-PROC.LIMIT EXCEEDED**

The number of times the maximum RID pool storage was exceeded.

The size is determined by the installation parameter RID POOL SIZE (DB2 install panel DSNTIPC). It can be 0, or between 128 KB and 10 GB. The general formula for calculating the RID pool size is:

(Number of concurrent RID processing activities) x (average number of RIDs) x 2 x (5 bytes per RID).

**Field Name:** QISTRMAX
This is an *exception* field.

**COLUMNS BYPASSED**

The total number of columns (rows x columns) for which an invalid select procedure was encountered.

DB2 bypasses invalid select procedures which can cause some degradation in performance.

**Field Name:** QISTCOLS
This is an *exception* field.

**CUR TOTAL STORAGE USED (KB)**

The total amount of storage (KB) currently used in the Workfile Database at system level.
Field Name: QISTWCTO

MAX AGENT STORAGE LIMIT (KB)

The maximum amount of storage (KB) in the Workfile Database that can be used by each agent (derived from ZPARM MAXTEMPS).

Field Name: QISTWMXA

MAX TOTAL STORAGE USED (KB)

The maximum total amount of storage (KB) ever used in the Workfile Database at system level since DB2 startup.

Field Name: QISTWMXU

MAX STORAGE USAGE LIMIT EXCEEDED

The number of times the maximum amount of storage that an agent can use in the Workfile database was exceeded.

Field Name: QISTWFNE

CUR 4K TABSPACE STORAGE USED (KB)

The total amount of storage (KB) currently used for 4 KB table spaces in the Workfile Database.

Field Name: QISTW4K

CUR 32K TABSPACE STORAGE USED (KB)

The total amount of storage (KB) currently used for 32 KB table spaces in the Workfile Database.

Field Name: QISTW32K

4K INSTEAD OF 32K TABSPACE USED

The number of times that space in a 4 KB page table space was used because space in a 32 KB page table space was preferred but not available in the Workfile Database.

Field Name: QISTWFIP

32K INSTEAD OF 4K TABSPACE USED

The number of times that space in a 32 KB page table space was used because space in a 4 KB page table space was preferred but not available in the Workfile Database.

Field Name: QISTWFIP1

CUR ACTIVE (DM) IN-MEMORY

The number of currently active in-memory work files created by the Data Manager.

Field Name: QISTIMAC

CUR STORAGE (DM) IN-MEMORY (KB)

The total space used for currently active in-memory work files created by the Data Manager.

Field Name: QISTIMSC

MAX ACTIVE (DM) IN-MEMORY
The maximum number of in-memory work files (created by the Data Manager) that were active at any point in time since DB2 startup. This is a high-water mark count.

**Field Name:** QISTIMAH

**MAX STORAGE (DM) IN-MEMORY (KB)**

The maximum space used for active in-memory work files created by the Data Manager at any point in time since DB2 startup. This is a high-water mark count.

**Field Name:** QISTIMSH

**CUR ACTIVE (SORT) IN-MEMORY**

The number of currently active in-memory work files created by the SORT component.

**Field Name:** QISTSIAC

**CUR STORAGE (SORT) IN-MEMORY (KB)**

The total space used for currently active in-memory work files created by the SORT component.

**Field Name:** QISTSISC

**MAX ACTIVE (SORT) IN-MEMORY**

The maximum number of in-memory work files created by the SORT component that were active at any point in time since DB2 start. This is a high-water mark count.

**Field Name:** QISTSIAH

**MAX STORAGE (SORT) IN-MEMORY (KB)**

The maximum space used for active in-memory work files created by the SORT component at any point in time since DB2 startup. This is a high-water mark count.

**Field Name:** QISTSISH

**CUR ACTIVE (NONSORT) IN-MEMORY**

The number of currently active non-SORT related in-memory work files created by the Data Manager.

**Field Name:** QISTI2AC

**CUR DGTT STORAGE USED (KB)**

The total amount of storage (KB) currently used for DGTTs in the Workfile Database by all agents on the system.

**Field Name:** QISTDGTTCTO

**MAX ACTIVE (NONSORT) IN-MEMORY**

The maximum number of non-SORT related in-memory work files created by the Data Manager that were active at any point in time since DB2 startup. This is a high-water mark count.

**Field Name:** QISTI2AH

**MAX DGTT STORAGE USED (KB)**
The maximum total amount of storage (KB) ever used for DGTTs in the Workfile Database by all agents on the system since DB2 startup.

Field Name: QISTDGTTMXU

IN-MEMORY (NONSORT) OVERFLOWED

The number of times non-SORT related in-memory work files overflowed into a physical table space.

Field Name: QISTI2OF

CUR WORKFILE STORAGE USED (KB)

The total amount of storage (KB) currently used for non-DGTT work files in the Workfile Database by all agents on the system.

Field Name: QISTWFCT

IN-MEMORY WORKFILE NOT CREATED

The number of times an in-memory work file was not created due to critical storage conditions.

Field Name: QISTIMNC

MAX WORKFILE STORAGE USED

The maximum total amount of storage (KB) ever used for non-DGTT work files in the Workfile Database by all agents on the system since DB2 startup.

Field Name: QISTWFMXU

TOTAL STORAGE CONFIG (KB)

The total storage (KB) configured for all table spaces in the Workfile Database.

Field Name: QISTWSTG

MAX AGENT STORAGE USED (KB)

The maximum amount of storage (KB) ever used in the Workfile Database by any thread since DB2 startup.

Field Name: QISTAMXU

TOTAL DGTT STORAGE CONFIG (KB)

The total preferred storage (KB) configured for DGTTs in the Workfile Database.

Field Name: QISTDGTTSTG

AGENT STORAGE THRESHOLD (%)

The alert threshold of high space-usage for DGTTs or non-DGTT work files in the Workfile Database by an agent (derived from ZPARM WFSTGUSE_AGENT_THRESHOLD).

Field Name: QISTASTH

TOTAL WORKFILE STORAGE CONFIG (KB)

The total preferred storage (KB) configured for non-DGTT work files in the Workfile Database.

Field Name: QISTWFSTG
TOTAL STORAGE THRESHOLD (%)

The alert threshold of high space-usage for DGTTs or non-DGTT work files in the Workfile Database (derived from zparm WFSTGUSE_SYSTEM_THRESHOLD).

Field Name: QISTSSTH

INSERT ROWS SKIPPED

The number of rows skipped by read transactions because of uncommitted INSERT operations (using currently committed semantic for FETCH).

Field Name: QISTRCCI

DELETE ROWS ACCESSED

The number of rows accessed by read transactions because of uncommitted DELETE operations (using currently committed semantic for FETCH).

Field Name: QISTRCCD

UPDATE ROWS ACCESSED

The number of rows accessed by read transactions because of uncommitted UPDATE operations (using currently committed semantic for FETCH).

Field Name: QISTRCCU

NUMBER OF FAST INSERT PIPES

The number of Data Manager (DM) fast insert pipes that were allocated since DB2 restart.

Field Name: QISTINPA

NUMBER OF FAST INSERT PIPES DISABLED

The number of DM fast insert pipes that have been disabled since DB2 restart.

Field Name: QISTINPD
IFCID 002 - Data Sharing Locking Data

IFCID 002 - Data Sharing Locking Data

This topic shows detailed information about “Record Trace - IFCID 002 - Data Sharing Locking Data”.

Record trace - IFCID 002 - Data Sharing Locking Data

The field labels shown in the following sample layout of “Record Trace - IFCID 002 - Data Sharing Locking Data” are described in the following section.

LOCK REQ (P-LOCKS)

The number of lock requests for P-locks.

Field Name: QTGSLPLK

SYNCH.XES - LOCK REQ

The number of P/L-lock requests propagated to z/OS XES synchronously.

This number is not incremented if the request is suspended before going to XES.

Field Name: QTGSLSLM

SUSPENDS - IRLM GLBL CONT

The number of suspensions due to IRLM global resource contention. All IRLM lock states were in conflict on the same resource.

Global contention requires intersystem communication to resolve the lock conflict whereas local contention does not.

Field Name: QTGSIGLO

UNLOCK REQ (P-LOCKS)

The number of unlock requests for P-locks.

Field Name: QTGSUPLK

SYNCH.XES - CHANGE REQ

The number of change requests propagated to z/OS XES synchronously, including logical and physical locks.

This number is not incremented if the request is suspended before going to XES.

Field Name: QTGSCSCLM

SUSPENDS - XES GLBL CONT

The number of suspensions due to z/OS XES global resource contention. The z/OS XES lock states were in conflict but the IRLM lock states were not.

IRLM has many lock states but XES is only aware of the exclusive and shared lock states.

Field Name: QTGSSGLO

CHANGE REQ (P-LOCKS)

The number of change requests for P-locks.

Field Name: QTGSCPLK

SYNCH.XES - UNLOCK REQ

The number of unlock requests propagated to z/OS XES synchronously, including logical and physical locks.

This number is not incremented if the request is suspended before going to XES.

Field Name: QTGSUSLM

NOTIFY MESSAGES SENT

The number of notify messages sent.

Field Name: QTGSNTFY

ASYNCH.XES - RESOURCES

The number of resources propagated by IRLM to z/OS XES asynchronously, including logical and physical locks.

This can happen when new inter-DB2 interest occurs on a parent resource or when a request completes after the requester's execution unit was suspended.

Field Name: QTGSKIDS

INCOMPAT RETAINED LOCK

The number of global lock or change requests denied or suspended due to an incompatible retained lock.

Field Name: QTGSDRTA

NOTIFY MESSAGES RECEIVED

The number of notify messages received.

Field Name: QTGSNTFR

P-LOCK/NOTIFY EXITS ENGINES

The maximum number of engines available for physical lock exit or notify exit requests.

Field Name: QTGSPEMX

P-LOCK/NFY EX.ENGINE N/A

The number of times an engine is not available for physical lock exit or notify exit requests.

Field Name: QTGSPEQW

PSET/PART P-LOCK NEGOTIAT.

The number of times this DB2 was driven to negotiate a partition or page set physical lock due to changing inter-DB2 interest levels on the partition or page set.

Field Name: QTGSPPPPE

PAGE P-LOCK NEGOTIAT.
IFCID 002 - Data Sharing Locking Data

The number of times this DB2 negotiated a page physical lock because of physical lock contention within DB2.

Field Name: QTGSPGPE

OTHER P-LOCK NEGOTIATION.

The number of times this DB2 was driven to negotiate a physical lock type other than page set, partition, or page.

Field Name: QTGSOTPE

P-LOCK CHANGE DURING NEG.

The number of times a physical lock change request was issued during physical lock negotiation.

Field Name: QTGSCHNP

FALSE CONTENTIONS

The total number of false contentions for LOCK and UNLOCK requests. A false contention occurs when different resource names hash to the same entry in the coupling facility (CF) lock table. The CF detects contention within the hash entry, and XES uses intersystem messaging to determine that no actual resource contention exists.

Note: The QTGSFCON flag indicates whether the false contention is reported at subsystem(=1) or LPAR level (=0).

Field Name: QTGSFLMG

SYNC-ASYNC XES CONV

The number of synchronous to asynchronous heuristic conversions for LOCK requests in XES. This conversion is done when XES determines that it is more efficient to drive the request asynchronously to the coupling facility (CF).

Field Name: QTGSFLSE

FLMG COUNTS PER

Flags describing QTGS counters:

ON QTGSFLMG counts per subsystem (SUBSYS)

OFF QTGSFLMG counts per LPAR

Field Name: QTGSFLGS

NO DELAY LOCK REQ REJECTS

The total number of failed DB2 lock requests to XES to process without delay. XES rejects the lock request because it could not process it synchronously.

Field Name: QTGSCREJ
**IFCID 002 - Dynamic SQL Statement**

This topic shows detailed information about “Record Trace - IFCID 002 - Dynamic SQL Statement”.

**Record trace - IFCID 002 - Dynamic SQL Statement**

The field labels shown in the following sample layout of “Record Trace - IFCID 002 - Dynamic SQL Statement” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>REOPTIMIZATION</td>
<td>The total number of times reoptimization occurs because the value of the host variable or parameter marker changes.</td>
</tr>
<tr>
<td>FOUND IN CACHE</td>
<td>The number of times a PREPARE command was satisfied by copying a statement from the prepared statement cache.</td>
</tr>
<tr>
<td>IMPLICIT PREPARES</td>
<td>An implicit prepare occurs when the user copy of the prepared SQL statement no longer exists in the local dynamic SQL cache and the application plan or package is bound with KEEPDYNAMIC YES.</td>
</tr>
<tr>
<td>NOT FOUND IN CACHE</td>
<td>The number of times that DB2 searched the prepared statement cache but could not find a suitable prepared statement.</td>
</tr>
<tr>
<td>PREPARES AVOIDED</td>
<td>This field indicates the number of times where no SQL PREPARE or EXECUTE IMMEDIATE was issued by the application and a copy of a prepared SQL statement was found in local dynamic SQL cache.</td>
</tr>
</tbody>
</table>

Field Name: QXSTREOP

Field Name: QXSTFND

Field Name: QXSTIPRP

Field Name: QXSTDEXP

Field Name: QXSTNFND

---

The number of times statements are invalidated in the local dynamic SQL cache because the MAXKEEPD limit has been reached and prepared SQL statements in the local dynamic SQL cache have to be reclaimed.

Field Name: QXSTNFND

The number of times that DB2 searched the prepared statement cache but could not find a suitable prepared statement.

Field Name: QXSTNFND

This field indicates the number of times where no SQL PREPARE or EXECUTE IMMEDIATE was issued by the application and a copy of a prepared SQL statement was found in local dynamic SQL cache.

When an application plan or package is bound with KEEPDYNAMIC YES, a copy of each prepared SQL statement for the application thread is held in the local dynamic SQL cache and kept across a commit boundary.
An application thread can save the total cost of a prepare by using a copy of the prepared statement in the local dynamic SQL cache from an earlier prepare by the same thread. To do this, the application must be modified to avoid issuing repetitive SQL PREPAREs for the same SQL statement.

**Field Name:** QXSTNPRP

**STMT INVALID (DDL)**

The number of times statements are invalidated in the local dynamic SQL cache because of SQL DDL or updated RUNSTATS information and prepared SQL statements in the local dynamic SQL cache have to be reclaimed.

**Field Name:** QXSTDINV

**CSWL STMTS PARSED**

The number of times DB2 parsed dynamic statements because CONCENTRATE STATEMENTS WITH LITERALS behavior was used for the prepare of the statement for the dynamic statement cache.

**Field Name:** QXSTCWLW

**CSWL LITS REPLACED**

The number of times DB2 replaced at least one literal in a dynamic statement because CONCENTRATE STATEMENTS WITH LITERALS was used for the prepare of the statement for dynamic statement cache.

**Field Name:** QXSTCWLR

**CSWL MATCHES FOUND**

The number of times DB2 found a matching reusable copy of a dynamic statement in cache during prepare of a statement that had literals replaced because of CONCENTRATE STATEMENTS WITH LITERALS.

**Field Name:** QXSTCWLM

**CSWL DUPLS CREATED**

The number of times DB2 created a duplicate STMT instance in the statement cache for a dynamic statement that had literals replaced by CONCENTRATE STATEMENTS WITH LITERALS behavior. The duplicate STMT instance was needed because a cache match failed because the literal reusability criteria was not met.

**Field Name:** QXSTCWLD

**LOAD FROM CATALOG**

The number of loads from the catalog.

It shows the number of times a PREPARE request was satisfied by making a copy from the stabilized statement in the SYSIBM.SYSDYNQRY catalog table. The stabilized statement search is done only when no matching statement was found in the prepared statement cache. This field should be identical to QISEDPSL, but it is reported from the QXST section (SQL Statement Execution).

**Field Name:** QXSTSFND
ICCID 002 - EDM Pool Data

This topic shows detailed information about “Record Trace - ICCID 002 - EDM Pool Data”.

PAGES IN POOL

This field shows the sum of the values for the following counters:

- HELD BY CT
- HELD BY PT
- FREE PAGES

Field Name: QISEPAGE

CT PAGES

The current number of pages used for the cursor tables (CTs). This is a snapshot value.

Field Name: QISECT

PT PAGES

The current number of pages used for package tables (PTs). This is a snapshot value.

Field Name: QISEKT

FREE PAGES

The number of pages currently not used by any object in the EDM pool, in the EDM pool (below), or in the RDS pool (below). This is a snapshot value.

Field Name: QISEFREE

CT REQUESTS

The number of requests for cursor table (CT) sections.
Field Name: QISECTG

PT REQUESTS
The number of requests for package table (PT) sections.

Field Name: QISEKTG

DBD REQUESTS
The number of requests for database descriptors (DBDs).

Field Name: QISEDBDG

EDM POOL FULL
The total number of failures because the EDM pool or EDM pool (below) was full.

Field Name: QISEFAIL
This is an exception field.

CT NOT IN POOL
The number of times a cursor table section was loaded from DASD.
To find the number of times the CT was found in the EDM pool, subtract this value from the value of the Requests for sections - CT field.

Field Name: QISECTL
This is an exception field.

PT NOT IN POOL
The number of times a package table section was loaded from DASD.
To find the number of times the PT was already in the EDM pool, subtract this value from the value of the Requests for sections - PT field.

Field Name: QISEKTL
This is an exception field.

DBD NOT IN POOL
The total number of times database descriptors were loaded from DASD.
To find the number of times the DBD was already in the EDM pool, subtract this value from the value of Requests for sections - DBD field.

Field Name: QISEDBDL
This is an exception field.

CACHE INSERTS
The number of full prepare requests.
A Full Prepare occurs for both Explicit Prepare and Implicit Prepare requests when the skeleton copy of the prepared SQL statement is not found in global dynamic SQL cache in the EDM pool.

Field Name: QISEDSI
This is an exception field.

CACHE REQUESTS
The number of requests for prepared statement cache sections.
Field Name: QISEDGS

LOAD FROM CATALOG

The number of times a dynamic SQL statement is found in a catalog.

Field Name: QISEDPSF

LOOK-UP IN CATALOG

The number of look-ups in a catalog to satisfy a dynamic SQL statement prepare request.

This field is updated when a statement is not found in the cache and the criteria is met to look for it in the catalog table. It is only incremented on the first look up and not if there are multiple rows that might be a match. This is a system level value so it will be the number of times it has been checked since DB2 was started. It is incremented even if no copies of the statement have been captured.

Field Name: QISEDPSL

POSSIBLE ROW FOUND

The number indicates duplicated statement hash (stmt hash) entries. It shows the number of times rows are read from the catalog before a match is found.

This field is incremented each time a row is read that might be a match. This is a serviceability field.

Field Name: QISEDPSM

MATCH THR TXT/BND OPT

The number of times a catalog match is found without checking the authentication ID (authid). This number indicates whether statements are monitored by multiple authids.

This field is incremented each time a row is read and everything is matched, but before the authids are checked. This is a serviceability field.

Field Name: QISEKFM

PKG SEARCH NOT FOUND

When a package is bound with a wild card (*) for package names, in the form of PKLIST(COL1.*,COL2.*.....), EDM generates a NOT-FOUND record to avoid future I/O if a collection ID/package name combination does not exist.

This field shows how often a cached record was located during package binding.

Field Name: QISEKFM

PKG SEARCH NOT FOUND INSERT

When a package is bound with a wild card (*) for package names, in the form of PKLIST(COL1.*,COL2.*.....), EDM generates a NOT-FOUND record to avoid future I/O if a collection ID/package name combination does not exist.

This field shows how often a record was added to the cache during package binding.
PKG SEARCH NOT FOUND DELETE

When a package is bound with a wild card (*) for package names, in the form of PKLIST(COL1.*,COL2.*....), EDM generates a NOT-FOUND record to avoid future I/O if a collection ID/package name combination does not exist.

This field shows how often a record was removed from the cache during package binding.

Field Name: QISEKNFR

STATEMENTS IN GLOBAL CACHE

Number of statements in the global cache.

Field Name: QISESTMT

PAGES IN STMT POOL (ABOVE)

The current number of pages in the EDM Statement pool above the 2 GB bar. This is a snapshot value. For DB2 12 this field shows N/A.

Field Name: QISECPGE

PAGES IN DBD POOL (ABOVE) (Prior to DB2 12)

This field shows the number of pages in the DBD pool above the 2 GB bar.

Field Name: QISEDPPGE

HELD BY STATEMENTS

The number of pages in the EDM Statement pool above the 2 GB bar that is used for cached dynamic SQL statements. This is a snapshot value.

Field Name: QISEDYNP

HELD BY DBD

The current number of pages used for database descriptors (DBDs). This is a snapshot value.

Field Name: QISEDBD

FREE PAGES (Prior to DB2 12)

This field shows the number of free pages in the DBD pool above the 2 GB bar.

Field Name: QISEDFFRE

This is an exception field.

STEALABLE PAGES

The current number of stealable pages used for skeleton cursor and package tables.

Field Name: QISEKLRU

FAILS DUE TO STMT POOL FULL

The total number of failures because the EDM Statement pool above the 2 GB bar was full. For DB2 12 this field shows N/A.

Field Name: QISECFAL

FREE PAGES
The number of pages currently not used by any object in the EDM Statement pool above the 2 GB bar. For DB2 12 this field shows N/A.

Field Name: QISECFRE

FAILS DUE TO DBD POOL FULL

This field shows the total number of failures because the DBD pool above the 2 GB bar was full.

Field Name: QISEDFAL

This is an exception field.

PAGES IN RDS POOL (ABOVE)

The number of pages in the RDS pool above the 2 GB bar.

Field Name: QISESPGE

PAGES IN SKEL POOL (ABOVE) (Prior to DB2 12)

The current number of pages in the EDM skeleton pool above the 2 GB bar.

Field Name: QISEKPGE

HELD BY CT

The number of pages in the RDS pool above the 2 GB bar used for the cursor tables (CTs). This is a snapshot value.

Field Name: QISECTA

HELD BY SKCT

The current number of pages used for skeleton cursor tables (SKCTs). This is a snapshot value.

Field Name: QISESKCT

HELD BY PT

The number of pages in the RDS pool above the 2 GB bar used for the package tables (PTs). This is a snapshot value.

Field Name: QISEKTA

HELD BY SKPT

The current number of pages used for skeleton package tables (SKPTs). This is a snapshot value.

Field Name: QISESKPT

FREE PAGES (Prior to DB2 12)

The number of pages currently not used by any object in the EDM skeleton pool above the 2 GB bar.

Field Name: QISEKFRE

STEALABLE PAGES

The current number of stealable pages used for database descriptors (DBDs).

Field Name: QISEDLRU

FAILS DUE TO RDS POOL FULL
The number of failures because the RDS pool above the 2 GB bar was full.
Field Name: QISESFAL

FREE PAGES
The number of free pages in the RDS pool above the 2 GB bar.
Field Name: QISESFRE

FAILS DUE TO SKEL POOL FULL
The total number of failures because the EDM skeleton pool above the 2 GB bar was full.
Field Name: QISEKFAL

SHAREABLE STATIC SQL STMT REQUESTS
The number of shareable static SQL statement requests. Prior to DB2 11, the field is used for the number of requests of executable code sequences (xPROC).
Field Name: QISEKSPG

XPROC ALLOC STOR
The total storage allocated to executable code sequences (xPROC).
Field Name: QISEKSPA

PLAN BTB STORAGE
The storage allocated to plans below the bar.
Field Name: QISESQCB

PKG BTB STORAGE
The storage allocated to packages below the bar.
Field Name: QISESQKB

PLAN ATB STORAGE
The storage allocated to plans above the bar
Field Name: QISESQCA

PKG ATB STORAGE
The storage allocated to packages above the bar.
Field Name: QISESQKA

REQ STOR FOR STATIC STMTS
The total storage requested for shareable static SQL statements.
Field Name: QISEKSPA8
ICFID 002 - Group Buffer Pools Activity Data

This topic shows detailed information about “Record Trace - IFCID 002 - Group Buffer Pools Activity Data”.

Record trace - IFCID 002 - Group Buffer Pools Activity Data

The field labels shown in the following sample layout of “Record Trace - IFCID 002 - Group Buffer Pools Activity Data” are described in the following section.

GROUP BUFFER POOL ID

The group buffer pool identifier.

Field Name: QBGLGN

FLAGS

The flag byte shows if more QBGL data is following or if this is the last of the QBGL repeating groups.

Field Name: QBGLFLG

SYN. READS(XI)-DATA RETURNED

The number of requests made to read a page from the group buffer pool because the page was invalidated in the member's buffer pool. The member found the required page in the group buffer pool.

Background and Tuning Information

When you increase the size of the group buffer pool (GBP), the number of pages returned from the GBP can increase. Conversely, decreasing the size of the GBP can cause DB2 to return fewer pages because the GBP cannot hold pages long enough to allow them to be retrieved again.

Field Name: QBGLXD

This is an exception field.

SYN. READS(NF)-DATA RETURNED

The number of requests made to read a page from the group buffer pool because the page was not in the buffer pool of the member. The member found the page in the group buffer pool.

Background and Tuning Information
The requesting member needs a page from a table space or index that is GBP-dependent or has GBPCACHE ALL defined. To get that page, the group buffer pool is checked before the page set on DASD.

If the group buffer pool is used to cache both clean and changed pages (GBPCACHE ALL is used for all data), you can try to get more pages returned from the group buffer pool by increasing the size of the group buffer pool. Do not tune the GBP based on this counter if it is used for caching changed pages only (GBPCACHE CHANGED).

**Field Name:** QBGLMD

This is an *exception* field.

**SYN.READS(XI)-NO DATA RET.**

The number of requests to read a page from the group buffer pool made because the page was invalidated in the member's buffer pool. The page was not found in the GBP and the page was recovered from DASD.

**Field Name:** QBGLGXR

**SYN.READS(NF)-NO DATA RET.**

The number of requests made to read a page from the group buffer pool because the page was not in the member's buffer pool. The member did not find the required data in the group buffer pool and had to retrieve the page from DASD.

**Background and Tuning Information**

The requesting member needs a page from a table space or index that is GBP-dependent or has GBPCACHE ALL defined. To get that page, the group buffer pool is checked before the page set on DASD.

You can compare the value in this counter with the number of pages that were returned from the group buffer pool, see Sync.Read (Not Found) - Data Returned. If the group buffer pool is used to cache both clean and changed pages (GBPCACHE ALL is used for all data), you can try to get more pages returned from the group buffer pool by increasing the size of the group buffer pool. Do not tune the GBP based on this counter if it is used for caching changed pages only (GBPCACHE CHANGED).

**Field Name:** QBGLMR

**READ FOR CASTOUT MULT**

The number of Read For Castout Multiple requests.

**Field Name:** QBGLCM

**WRITE AND REGISTER MULT**

The number of Write and Register Multiple requests.

**Field Name:** QBGLWM

**READ FOR CASTOUT**

The number of Read For Castout requests. One page read per request.

**Field Name:** QBGLCR

**WRITE AND REGISTER**

The number of Write and Register requests.

**Field Name:** QBGLWS
CLEAN PAGES WRITTEN

The number of clean pages that were synchronously written to the group buffer pool from the virtual pool.

Background and Tuning Information

Only GBPCACHE ALL causes clean (unchanged) pages to be written to the coupling facility. The pages are written to the coupling facility even if the page set is not GBP-dependent. If group buffer pool caching works effectively for prefetch, the value in this field should be much smaller than the value in Synchronous Read (Not Found) - Data Returned.

Field Name: QBGLWC

This is an exception field.

PAGES WRITE & REG MULT

The number of pages written using Write and Register Multiple (WARM) requests.

Field Name: QBGLWP

CHANGED PAGES SYNC.WRITTEN

The number of changed pages written synchronously to the group buffer pool.

Pages are written with Write and Register (WAR) requests or Write and Register Multiple (WARM) requests.

At commit time changed pages are forced from the virtual buffer pool of the member to the coupling facility.

Background and Tuning Information

In data sharing, changed pages must have been written to the group buffer pool by the time a transaction commits. The pages are written either synchronously (force at commit) or asynchronously, for example, when a local buffer pool threshold is reached or at a member's checkpoint. The number of pages that have to be forced out synchronously (in “burst mode”) at commit time can be reduced if asynchronous writes are triggered more frequently.

You can use the vertical deferred write threshold (VDWQT) to reduce the number of pages that have to be forced out synchronously and to increase the number of pages that are asynchronously written before the transaction commits. For GBP-dependent page sets, writes triggered by the vertical deferred write threshold go to the coupling facility. You can cause changed pages to be written out quicker and in smaller increments, by reducing the vertical deferred write threshold (VDWQT).

Field Name: QBGLSW

This is an exception field.

PAGES CASTOUT

The number of data pages that were cast out of the group buffer pool of the member.

Castout to a page set or partition is done by the castout owner of the page set or partition. This is normally the DB2 subsystem that had the first update intent on the page set or partition.
Background and Tuning Information

The number of pages written per I/O is normally close to the value of this field divided by the value in Unlock Castout.

For example, if an average of four pages is written per castout write I/O, the number of pages cast out should be four times the number in this field. Because DB2 usually includes more than one page in the request to write pages to DASD, the number in this field should always be significantly more than Unlock Castout. If it is not (for example, when "unlock castout" is more than half of "pages castout"), the castout write I/O is inefficient; probably because you have random update patterns on the DB2 data or a low castout threshold.

Field Name: QBGLRC

This is an exception field.

CHANGED PAGES ASYNC.WRITTEN

The number of changed pages written asynchronously to the group buffer pool.

Pages are written in response to Write and Register (WAR) and Write and Register Multiple (WARM) requests.

Changed pages can be written from the member’s virtual buffer pool to the group coupling facility before the application commits. This happens when, for example, a local buffer pool threshold is reached, or when P-lock negotiation forces the pages on the vertical deferred write queue to be written to the group buffer pool.

Background and Tuning Information

In data sharing, changed pages must have been written to the group buffer pool before a transaction commits. The pages are written either synchronously during commit processing or asynchronously before the transaction commits when, for example, a local buffer pool threshold is reached or at a member’s checkpoint. See Changed Pages - Written Synchronously for the number of changed pages synchronously written to the group buffer pool.

The vertical deferred write threshold (VDWQT) can be used to reduce the number of pages that have to be forced out synchronously and to increase the number of pages that are asynchronously written before the transaction commits. For GBP-dependent page sets, writes triggered by the vertical deferred write threshold go to the coupling facility. If you want changed pages to be written out quicker and in smaller increments, you can lower the vertical deferred write threshold (VDWQT).

Field Name: QBGLAW

This is an exception field.

CASTOUT CLASS THRESHOLD

The number of times group buffer pool castout was initiated because the group buffer pool class castout threshold was detected.

Background and Tuning Information
The class castout threshold is one of two group buffer pool thresholds. In most cases the default value for the class threshold (5 percent) is a good choice. Depending on your workload, altering this value can reduce DASD contention during castout.

Field Name: QBGLCT
This is an exception field.

WRITE FAILED-NO STORAGE
The number of coupling facility write requests that could not complete due to a lack of coupling facility storage resources.

Background and Tuning Information
A value greater than zero indicates that the data page resources of the coupling facility are being consumed faster than the DB2 castout processes can free them.

On write failure, the affected DB2 member initiates castout and retries several times, and finally, if it is a changed page, it will be added to the logical page list (LPL) requiring recovery.

If the problem is not simply due to a momentary surge in activity, you need either to decrease the group buffer pool castout thresholds, or to increase the number of data entries in the group buffer pool. To increase the number of data entries, you can do one of the following:

- Increase the total size of the group buffer pool.
- Adjust the ratio of directory entries to data entries in favor of data entries.

Field Name: QBGLWF
This is an exception field.

GROUP BP CASTOUT THRESHOLD
The number of times a group buffer pool castout was initiated because the group buffer pool castout threshold was detected.

Background and Tuning Information
The GBP castout threshold, GBP class castout threshold, and the length of the GBP checkpoint interval determine the castout characteristics of the group buffer pool.

You can consider this threshold a safety margin to protect the group buffer pool from being accidentally flooded by overactive applications.

In most situations, the default value for the group buffer pool castout threshold of 30 percent is a good choice. Use the ALTER GROUPBUFFERPOOL command to tune the group buffer pool thresholds.

Field Name: QBGLGT
This is an exception field.

REG.PAGE LIST (RPL) REQ.
The number of register page list (RPL) requests made by prefetch. The group buffer pool must be allocated in a group coupling facility with CFLEVEL=2 or higher.

Background and Tuning Information
Performance might be improved by enabling RPL.

Field Name: QBGLAX
This is an exception field.

DELETE NAME LIST SEC-GBP
The number of DELETE NAME LIST requests to delete pages from the secondary group buffer pool that have just been cast out from the primary.

Field Name: QBGL2D
This is an exception field.

GBP CHECKPOINTS TRIGGERED
The number of group buffer pool checkpoints triggered by this member.

Background and Tuning Information
The value of this counter depends on the length of the group buffer pool checkpoint interval.

Field Name: QBGLCK

DELETE PAGE FROM SEC-GBP
The number of group buffer pool requests to delete a page from the secondary group buffer pool. These requests are issued by the group buffer pool structure owner to delete orphaned data entries in the secondary GBP as part of the garbage collection logic.

Field Name: QBGL2N

PAGES RETRIEVED FROM GBP
The number of coupling facility reads performed by prefetch to retrieve a changed page from the group buffer pool.

Field Name: QBGLAY
This is an exception field.

READ CASTOUT STATS SEC-GBP
The number of coupling facility requests to read the castout statistics for the secondary group buffer pool. These requests are issued by the group buffer pool structure owner to check for orphaned data entries in the secondary group buffer pool.

Field Name: QBGL2R
This is an exception field.

READ STORAGE STATS
The number of times DB2 requested statistics information from the group buffer pool. It is issued by the group buffer pool structure owner at timed intervals to determine whether the group buffer pool castout threshold (GBPOOLT) has been reached.

Field Name: QBGLOS

UNLOCK CASTOUT
The number of times DB2 issued an unlock request to the coupling facility for completed castout I/Os.
When pages are cast out to DASD, they are locked for castout in the coupling facility. This castout lock is not an IRLM lock; it is to ensure that only one system can cast out a given page at a time.

**Background and Tuning Information**

The number of pages written per I/O is normally close to the value of pages castout divided by the value of this field.

For example, if an average of four pages is written per castout write I/O, the number of pages cast out should be four times the value in this field.

Because DB2 usually includes more than one page in a write request, the number in this field should always be significantly less than pages castout. If it is not (for example, when “unlock castout” is more than half of “pages castout”), the castout write I/O is inefficient; possibly because you have random update patterns on the DB2 data or a low castout threshold.

**Field Name:** QBGLUN

**DELETE NAME**

The number of requests made by DB2 to delete directory and data entries associated with a particular page set or partition from the group buffer pool.

DB2 issues this request when it changes a page set or partition from GBP-dependent to non GBP-dependent. DB2 also issues this request for objects that are defined with GBPCACHE ALL when those objects are first opened.

**Background and Tuning Information**

This counter is a measure of how often page sets or partitions change between being and not being dependent on the group buffer pool.

You can prevent DB2 going in and out of GBP dependency too often by tuning the following subsystem parameters that affect data sets when they are switched to a different state:

**PCLOSEN**

Pseudoclose frequency. The number of checkpoints required before a data set that was not updated can be a pseudoclose candidate.

If the PCLOSEN condition is met, the page set or partition is converted from read-write to read-only state. Depending on other concurrent users, this could raise the chance for the page set or partition to go out of GBP dependency.

**PCLOSESET**

Pseudoclose time. The amount of time (in minutes) that must elapse before a data set can be a pseudoclose candidate.

If the PCLOSEN or PCLOSESET condition is met, the page set or partition is converted from read-write to read-only state. Depending on other concurrent users, this could raise the chance for the page set or partition to go out of GBP dependency.

**LOGLOAD**

The number of log records that DB2 writes between successive checkpoints.

These parameters are specified in the CHECKPOINT FREQ field in panel DSNTIPN.
Field Name: QBGLDN

READ CASTOUT CLASS

The number of requests made to the group buffer pool to determine which pages, from a particular page set or partition, must be cast out because they are cached as changed pages.

This request is issued either by the page set or partition castout owner, or, when the group buffer pool castout threshold is reached, by the group buffer pool structure owner.

Field Name: QBGLCC

UNREGISTER PAGE

The number of times DB2 unregistered interest for a single page. This happens when DB2 steals pages from the member's buffer pool that belong to GBP-dependent page sets or partitions.

Background and Tuning Information

A large value here indicates that the local buffer pool contains a mixture of GBP-dependent data and non-GBP-dependent data.

The page stolen from the local buffer pool is replaced by a new one. This counter makes a distinction on whether the new page depends on the group buffer pool or not.

Usually a page of a GBP-dependent page set or partition is replaced by a page that is also GBP-dependent. In this instance, the unregister request for the page being stolen is combined with the read and register request for the new page. These combined requests do not contribute to this counter.

If, however, a page of a GBP-dependent page set or partition is replaced by a page that is not GBP-dependent, then only an unregister request is sent to the coupling facility. These separate requests are counted here.

Field Name: QBGLDG

NR.OF READ FOR CASTOUT REQ.

The number of requests issued by the group buffer pool structure owner to determine which castout classes have changed pages.

This request is made by the group buffer pool structure owner when the group buffer pool threshold is reached. Normally, you would expect only one or two requests each time the group buffer pool threshold is reached.

Field Name: QBGLCS

REGISTER PAGE

The number of times DB2 registered interest in a single page.

These are "register-only" requests, which means that DB2 is not requesting any data back from the request.

This request is made only to create a directory entry for the page to be used for cross-invalidation when the page set or partition P-lock is downgraded from S to IS mode, or from SIX to IX mode.

Field Name: QBGLRG

READ DIRECTORY INFO
The number of requests issued by the group buffer pool structure owner to read the directory entries of all changed pages in the group buffer pool.

This request is issued at group buffer pool checkpoints to record the oldest recovery log record sequence number (LRSN). It is used as a basis for recovery if the group buffer pool fails.

Such requests might have to be issued several times for each group buffer pool checkpoint to read the directory entries for all changed pages.

**Background and Tuning Information**

If the value of this counter appears to be abnormally high, consider upgrading the coupling facility to CFLEVEL=2 or higher to raise the number of directory entries that can be read with one request. You can also increase the group buffer pool checkpoint interval, but this can lengthen the recovery for the group buffer pool.

**Field Name:** QBGLRD

**EXPLICIT X-INVALID**

The number of times an explicit coupling facility cross-invalidation request was issued.

**Field Name:** QBGLEX

**GBP-DEPENDENT GETPAGES**

The number of Getpages made for GBP-dependent objects.

**Field Name:** QBGLGG

**PG P-LOCK UNLOCK REQ**

The number of page P-lock unlock requests.

**Field Name:** QBGLU1

**ASYNCH GBP REQUESTS**

The number of asynchronous IXLCACHE invocations for the primary group buffer pool.

**Field Name:** QBGAHS

**PG P-LOCK LOCK REQ SP MAP PG**

The number of page P-lock lock requests for space map pages.

**Field Name:** QBGLP1

**ASYNCH SEC-GBP REQUESTS**

The number of IXLCACHE invocations for the secondary group buffer pool.

**Field Name:** QBGA2H

**PG P-LOCK LOCK SUSP SP MAP PG**

The number of page P-lock suspensions for space map pages.

**Field Name:** QBGLS1

**WRITE SEC-GBP FAILED**

The number of coupling facility requests to write changed pages to the secondary group buffer pool for duplexing that failed because of a lack of storage in the coupling facility.
Field Name: QBGL2F
This is an exception field.

PG P-LOCK LOCK NEG SP MAP PG
The number of page P-lock negotiations for space map pages.
Field Name: QBGLN1

PG P-LOCK LOCK REQ DATA PG
The number of page P-lock requests for data pages.
Field Name: QBGLP2

PG P-LOCK LOCK REQ IX LEAF PG
The number of page P-lock requests for index leaf pages.
Field Name: QBGLP3

PG P-LOCK LOCK SUSP DATA PG
The number of page P-lock suspensions for data pages.
Field Name: QBGLS2

PG P-LOCK LOCK SUSP IX LEAF PG
The number of page P-lock suspensions for index leaf pages.
Field Name: QBGLS3

PG P-LOCK LOCK NEG DATA PG
The number of page P-lock negotiations for data pages.
Field Name: QBGLN2

PG P-LOCK LOCK NEG IX LEAF PG
The number of page P-lock negotiations for index leaf pages.
Field Name: QBGLN3

PAGES IN WRITE AROUND
The number of changed pages that were written to disk through group buffer pool write-around due to condition write failures to the group buffer pool.
Field Name: QBGLWA
IFCID 002 - Locking Data

This topic shows detailed information about “Record Trace - IFCID 002 - Locking Data”.

Record trace - IFCID 002 - Locking Data

The field labels shown in the following sample layout of “Record Trace - IFCID 002 - Locking Data” are described in the following section.

### DEADLOCKS

The number of times deadlocks were detected. This number should be low, ideally 0.

#### Background and Tuning Information

Deadlocks occur when two or more application processes each hold locks on resources that the others need, without which they cannot proceed. Ensure that all applications accessing the same tables access them in the same order.

To improve concurrency:

- Use row level locking instead of page level locking to minimize deadlocks.
- For small tables use page level locking with MAXROWS 1.

To minimize deadlocks:

- Delay updates to just before commit.
- Use SELECT with the FOR UPDATE clause to use U lock.
- Adjust the deadlock detection cycle parameter DEADLOK in the IRLM procedure.

This field is incremented once for each deadlock encountered. There is no correlation between this field and the deadlock events reported in the Locking report set or the number of IFCID 172 records written. This field reports all deadlocks, regardless of how they were resolved. The locking report and record trace IFCID 172 show only those deadlocks that were resolved by DB2.

Field Name: QTXADEA

This is an exception field.

#### LOCK REQUEST

The number of requests to lock a resource.

Field Name: QTXALOCK

This is an exception field.

#### LOCK SUSPENSIONS

The number of times a lock could not be obtained and the unit of work was suspended.

#### Background and Tuning Information

This number should be low, ideally 0.
The number of lock suspensions is a function of the lock requests. Lock suspensions (or conflicts) can happen on either LOCK REQUEST or CHANGE REQUEST.

Suspensions are highly dependent on the application and table space locking protocols.

**Field Name:** QTXASLOC

This is an *exception* field.

**CLAIM REQUESTS**

The number of claim requests.

**Field Name:** QTXACLNO

This is an *exception* field.

**TIMEOUTS**

The number of times a unit of work was suspended for a time exceeding the timeout value. This number should be low, ideally 0.

**Field Name:** QTXATIM

This is an *exception* field.

**UNLOCK REQUEST**

The number of requests to unlock a resource.

This value can be less than the number of lock requests because DB2 can release several locks with a single unlock request.

**Field Name:** QTXAUNLK

**IRLM LATCH SUSPENS.**

The number of latch suspensions.

**Field Name:** QTXASLAT

**CLAIM REQ. FAILED**

The number of unsuccessful claim requests.

**Field Name:** QTXACLUN

**ESCALATIONS(SHR)**

The number of times the maximum page locks per table space are exceeded, and the table space lock escalates from a page lock (IS) to a table space lock (S) for this thread. You can specify the number of locks allowed per table space with the LOCKS PER TABLE(SPACE) parameter on the DB2 install panel DSNTIPJ.

**Background and Tuning Information**

Escalations can cause unpredictable response times. Lock escalations should only happen when an application process updates or references (if repeatable read is used) more pages than normal.

**Field Name:** QTXALES

This is an *exception* field.

**QUERY REQUEST**

The number of query requests.
Field Name: QTXAQR
This is an exception field.

OTHER SUSPENSIONS
The number of suspensions caused by something other than lock or latch.
Field Name: QTXASOTH
This is an exception field.

DRAIN REQUESTS
The number of drain requests.
Field Name: QTXADRNO
This is an exception field.

ESCALATIONS(EXC)
The number of times the maximum page locks per table space are exceeded and the table space lock escalates from a page lock (IX) to a table space lock (X).

Background and Tuning Information
Escalations can cause unpredictable response times. Lock escalations should only happen when an application process updates or references (if repeatable read is used) more pages than it normally does.

A useful rule of thumb is to compare the number of escalations (shared and exclusive) to the successful escalations (those that did not cause deadlocks and timeouts). If this value, or the number Lock escalations - shared and if the number of timeouts or deadlocks is also not 0, the timeout or deadlock is probably caused by the escalation.

If many escalations cause deadlocks and timeouts, the recommendation is to change the escalation threshold value. Use of ANY is extremely useful to prevent unnecessary and expensive page locks, for example locking all pages in a tablespace.

Lock escalations, shared or exclusive, should not be expected in a transaction environment.
Field Name: QTXALEX
This is an exception field.

CHANGE REQUEST
The number of change requests.
Field Name: QTXACHG
This is an exception field.

DRAIN REQ. FAILED
The number of unsuccessful drain requests.
Field Name: QTXADRUN
This is an exception field.

MAXIMUM PAGE/ROW LOCKS HELD
IFCID 002 - Locking Data

The maximum number of page or row locks concurrently held against all table spaces by a single application during its execution. This count is a high-water mark. It cannot exceed the LOCKS PER USER parameter on panel DSNTIPJ.

Field Name: QTXANPL
This is an exception field.

OTHER REQUEST
The number of requests to IRLM to perform a function other than LOCK, UNLOCK, QUERY, or CHANGE.

Field Name: QTXAIRLM
This is an exception field.
**IFCID 002 - Miscellaneous**

This topic shows detailed information about “Record Trace - IFCID 002 - Miscellaneous”.

**Record trace - IFCID 002 - Miscellaneous**

The field labels shown in the following sample layout of “Record Trace - IFCID 002 - Miscellaneous” are described in the following section.

<table>

</tbody>
</table>

MAX CASCAD LVL

The maximum level of indirect SQL cascading. This includes cascading because of triggers, UDFs, or stored procedures.

Field Name: QXCASCDDP

This is an exception field.

CALL STATEMENTS

The number of SQL CALL statements executed.

Field Name: QXCALL

This is an exception field.

PROCEDURE ABENDS

The number of times a stored procedure terminated abnormally.

Field Name: QXCALLAB

This is an exception field.

CALL TIMEOUTS

The number of times an SQL call timed out waiting to be scheduled.

Field Name: QXCALLTO

This is an exception field.

CALL REJECTS

The number of times an SQL CALL statement was rejected due to the procedure being in the STOP ACTION(REJECT) state.

Field Name: QXCALLRJ

This is an exception field.

UDF EXECUTED

The number of user-defined functions executed.

Field Name: QXCAUD

This is an exception field.

UDF ABENDS

The number of times a user-defined function abended.

Field Name: QXCAUDAB

This is an exception field.
IFCID 002 - Nested SQL Activity

UDF TIMEOUTS
The number of times a user-defined function timed out while waiting to be scheduled.
Field Name: QXCAUDTO
This is an exception field.

UDF REJECTS
The number of times a user-defined function was rejected.
Field Name: QXCAUDRJ
This is an exception field.

STMT TRIGGER
The number of times a statement trigger was activated.
Field Name: QXSTTRG
This is an exception field.

ROW TRIGGER
The number of times a row trigger was activated.
Field Name: QXROWTRG
This is an exception field.

SQL ERROR TRIGGER
The number of times an SQL error occurred during the execution of a triggered action. This includes errors that occur in user-defined functions or stored procedures that are called from triggers and that pass back a negative SQLCODE.
Field Name: QXTRGERR
This is an exception field.
IFCID 002 - Query Parallelism

This topic shows detailed information about “Record Trace - IFCID 002 - Query Parallelism”.

Record trace - IFCID 002 - Query Parallelism

The field labels shown in the following sample layout of “Record Trace - IFCID 002 - Query Parallelism” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QXMAXESTIDG</td>
<td>MAX DEG ESTIMATED</td>
</tr>
<tr>
<td>QXXCSKIP</td>
<td>MEMBERS SKIPPED</td>
</tr>
<tr>
<td>QXRLFDP</td>
<td>PARALL. DISABLED</td>
</tr>
<tr>
<td>QXMAXPLANDG</td>
<td>MAX DEG PLANNED</td>
</tr>
<tr>
<td>QXMAXDEG</td>
<td>MAX DEG EXECUTED</td>
</tr>
</tbody>
</table>

**MAX DEG ESTIMATED**

The maximum degree of parallelism estimated for a parallel group at bind time based on the cost formula. If the parallel group contains a host variable or parameter marker, then bind time will estimate the parallel group degree based on a valid assumption value.

Field Name: QXMAXESTIDG

**MEMBERS SKIPPED**

The number of times the parallelism coordinator had to bypass a DB2 when distributing tasks because one or more DB2 members did not have enough buffer pool storage. The number in this field is only incremented at the parallelism coordinator once per parallel group, even though more than one DB2 might have lacked buffer pool storage for that parallel group. It is also only incremented when the buffer pool is defined to allow for parallelism. For example, if VPXSEQT=0 on an assistant, DB2 does not send parallel work there and the number in this field is not incremented.

Field Name: QXXCSKIP

**PARALL. DISABLED**

Indicates whether query parallelism is disabled by the Resource Limit Facility for at least one dynamic select statement in this thread. A non-zero value means that query parallelism is disabled.

Field Name: QXRLFDP

**MAX DEG PLANNED**

The maximum degree of parallelism planned for a parallel group. It is the ideal parallel group degree obtained at execution time after the host variable or parameter marker value is "plug-in" and before buffer pool negotiation and system negotiation are performed.

Field Name: QXMAXPLANDG

**MAX DEG EXECUTED**

The maximum degree of parallelism executed among all parallel groups to indicate the extent to which queries were processed in parallel.

Field Name: QXMAXDEG
FALL TO SEQ-CURSOR

The total number of parallel groups that fell back to sequential mode due to a cursor that can be used by UPDATE or DELETE.

Field Name: QXDEGCUR

GROUPS EXECUTED

The total number of parallel groups executed.

Field Name: QXTOTGRP

ONE DB2-COORD=NO

The total number of parallel groups executed on a single DB2 subsystem due to the COORDINATOR subsystem value being set to NO. When the statement was bound, the COORDINATOR subsystem value was set to YES. This situation can also occur when a package or plan is bound on a DB2 subsystem with COORDINATOR=YES, but is run on a DB2 subsystem with COORDINATOR=NO.

Field Name: QXCOORNO

FALL TO SEQ-NOESA

The total number of parallel groups that fell back to sequential mode due to a lack of ESA sort support.

Field Name: QXDEGESOA

PARALL.GROUPS

The total number of parallel groups that DB2 intended to run across the data sharing group. This number is only incremented at the parallelism coordinator at run time.

Field Name: QXXCBPNX

ONE DB2-ISO LVL

The total number of parallel groups executed on a single DB2 subsystem due to repeatable-read or read-stability isolation.

Field Name: QXISORR

FALL TO SEQ-STOR

The total number of parallel groups that fell back to sequential mode due to a storage shortage or contention on the buffer pool.

The exception field name is QXDEGBUF.

Field Name: QXDEGBUF

RAN REDUCED-STOR

The total number of parallel groups that did not reach the planned parallel degree because of a lack of storage space or contention on the buffer pool.

The exception field name is QXREDGRP.

Background and Tuning Information

If this field is not 0, increase the size of the current buffer pool using the ALTER BUFFERPOOL command or use the ALTER TABLESPACE command to assign table spaces accessed by this query to a different buffer pool.
Field Name: QXREDGRP

This is an exception field.

ONE DB2-DCL TTAB

The number of parallel groups in a query block that were downgraded to CPU parallelism because they referenced a UDF and a declared temporary table was detected at execution time.

DB2 enforces execution on a single DB2 (CPU parallelism), in this instance, because it cannot determine at incremental bind time for the statement whether the UDF will reference the declared temporary table. Other parallel groups in the same statement are not necessarily downgraded.

Field Name: QXDEGDTT

FALL TO SEQ-NEGOTN

The total number of parallel groups that fell back to sequential mode due to system negotiation result of system stress level.

Field Name: QXSTODGNGRP

RAN REDUCED-NEGOTN

The total number of parallel groups that did not reach the planned parallel degree due to system negotiation result of system stress level.

Field Name: QXSTOREDGRP

REFORM PARAL-CFG

The total number of parallel groups where DB2 reformulated the parallel portion of the access path because of a change in the number of active members, or because of a change of processor models on which they run, from bind time to run time. This counter is incremented only on the parallelism coordinator at run time.

Field Name: QXREPOP1

FALL TO SEQ-A.PROC

The total number of parallel groups that fell back to sequential mode under an autonomous procedure.

Field Name: QXDEGAT

RAN AS PLANNED

The total number of parallel groups that executed in the planned parallel degree. This field is incremented by one for each parallel group that executed in the planned degree of parallelism (as determined by DB2).

Field Name: QXNORGRP

REFORM PARAL-BUF

The total number of parallel groups in which DB2 reformulated the parallel portion of the access path because there were insufficient buffer-pool resources. This counter is incremented only at the parallelism coordinator at run time.

Field Name: QXREPOP2

QXPAROPT

This field is for IBM service.
IFCID 002 - RID List Processing

This topic shows detailed information about “Record Trace - IFCID 002 - RID List Processing”.

Record trace - IFCID 002 - RID List Processing

The field labels shown in the following sample layout of “Record Trace - IFCID 002 - RID List Processing” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RL PROCESSING USED</td>
<td>The number of times RID list (also called RID pool) processing is used.</td>
</tr>
<tr>
<td>RL PROCESSING NOT USED-LIMIT EXCEEDED</td>
<td>The number of times DB2 detected that a RID list exceeded one or more internal limits during a given RID list (or RID pool) process involving one index (single index access with list prefetch) or multiple indexes (multiple index access). This field can be incremented during retrieval, sorting, ANDing, and ORing of RID lists for index access with list prefetch (single index). For single index access, this field can only be incremented once per access. For multiple index access, it can be incremented for every index involved in the ANDing and ORing of RID lists.</td>
</tr>
<tr>
<td>RL PROCESSING NOT USED-NO STORAGE</td>
<td>The number of times DB2 detected that no storage was available to hold a list of RIDs during a given RID list process involving one index (single index access with list prefetch) or multiple indexes (multiple index access). This field can be incremented during retrieval, sorting, ANDing, and ORing of RID lists for index access with list prefetch (single index). For single index access, this field can only be incremented once per access. For multiple index access, it can be incremented for every index involved in the ANDing and ORing of RID lists.</td>
</tr>
</tbody>
</table>

Background and Tuning Information

A nonzero value in this field indicates that DB2 has used list prefetch. If this is the case, check the access path selection.

Field Name: QXMIAP

This is an exception field.

Field Name: QXNSMIAP

This is an exception field.
For index access with list prefetch (single index), this field can only be incremented during RID list retrieval. For multiple index access, this field can be incremented during RID list retrieval, ANDing, and ORing. This counter reflects the number of times internal limits or threshold values were exceeded for the RID lists obtained directly from an index as well as for RID lists derived during the ANDing and ORing process.

**Background and Tuning Information**

Before you increase the RID list storage size, investigate the cause of the failure using the statistics record or the performance trace. You can specify the desired size for the RID list on the DB2 installation panel DSNTIPC.

**Field Name:** QXMRRMIAP

This is an *exception* field.

**RL SKIPPED-INDEX KNOWN**

The number of times a RID list retrieval for multiple index access was skipped because it was not necessary due to DB2 being able to predetermine the outcome of index ANDing or ORing.

**Field Name:** QXRSMIAP

**RL OVERFLOWED-NO STORAGE**

The number of times a RID list was overflowed to a work file because no RID pool storage was available to hold the list of RIDs.

**Field Name:** QXWFRIDS

**RL INTERRUPTED (HJ)-NO STORAGE**

The number of times a RID list append for a hybrid join was interrupted because no RID pool storage was available to hold the list of RIDs.

**Field Name:** QXHJINCS

**RL OVERFLOWED-MAX LIMIT**

The number of times a RID list was overflowed to a work file because the number of RIDs exceeded one or more internal limits.

**Field Name:** QXWFRIDT

**RL INTERRUPTED (HJ)-MAX LIMIT**

The number of times a RID list append for a hybrid join was interrupted because the number of RIDs exceeded one or more internal limits.

**Field Name:** QXHJINCT
IFCID 002 - ROWID

This topic shows detailed information about “Record Trace - IFCID 002 - ROWID”.

Record trace - IFCID 002 - ROWID

The field labels shown in the following sample layout of “Record Trace - IFCID 002 - ROWID” are described in the following section.

<table>
<thead>
<tr>
<th>ROWID</th>
<th>DIRECT ACCESS</th>
<th>INDEX USED</th>
<th>TABLE SPACE SCAN USED</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

DIRECT ACCESS

The number of times that direct row access was successful.

Field Name: QXROIMAT

INDEX USED

The number of times an index was used to find a record.

Field Name: QXROIINX

TABLE SPACE SCAN USED

The number of times that an attempt to use direct row access reverted to using a table-space scan because DB2 was unable to use a matching index scan.

Background and Tuning Information

Ideally, this value should be 0.

Table-space scans can happen, for example, when a REORG is performed between the read of the ROWID column and the use of the host variable in the WHERE clause of the SQL statement. This causes the RID value in the host variable to be incorrect. DB2 first tries a matching-index scan before using a table-space scan.

To avoid table space scans, you can force the access path of an unsuccessful direct row access to use a matching index scan on the primary-index key by adding PKCOL to the WHERE clause in the SQL statement.

Field Name: QXROITS

.... WHERE ROWIDCOL=:HVROWID AND PKCOL=:HVPK
......

</table>

**PLAN ALLOC.ATMP**

The number of times a request was made to allocate a bound plan for an agent.

It represents the number of times DB2 was requested to create a thread by the attachment facility for the user. This does not include allocations for DB2 system agents.

Field Name: QTALLOCA

**PACK.ALLOC.ATMP**

The number of attempts to allocate a package.

Field Name: QTPKALLA

**OPEN DATASETS - HWM**

The maximum number of data sets concurrently open since the last time DB2 was started. This is a high-water mark (HWM).

**Background and Tuning Information**

Monitor this field to see whether you are reaching the maximum number of open data sets permissible.

**Note:** The maximum number of open data sets is 200,000. The default is 20,000.

Field Name: QTMAXDS

This is an exception field.

**AUTHORIZ.ATTEMPTS**

The number of authorization checks performed for plans, packages, and stored procedures since DB2 was started. This includes successful and failed checks.

Field Name: QTAUCHK

This is an exception field.
The number of successful plan allocation attempts.
The cause of plan allocation failure could be plan unavailability or attempting to allocate a nonexistent plan.

Field Name: QTALLOC

PACK_ALLOC_SUCC.
The number of successful package allocation attempts.

Background and Tuning Information
Package allocation failure can occur when a package is unavailable or does not exist.

A high count of the number of packages unsuccessfully allocated (QTPKALLA - QTPKALL) typically occurs when a package list with multiple collections is used and frequently-used packages are found in the back end rather than in the front end of a package list. For example, when a package is found in the tenth collection, QTPKALLA is incremented by 10, one for each collection searched, but QTPKALL is incremented by 1.

A high number of packages unsuccessfully allocated can be accompanied by a high count of the number of unsuccessful checks for package execute authority made using the package authorization check because an application entry was not found in the cache (QTPACNOT). In this case, placing frequently used packages in the front end of a package list would reduce the number of Buffer Manager Getpages to the catalog/directory tables.

Field Name: QTPKALL

OPEN DATASETS - CURR.
The number of data sets concurrently open (snapshot).

Field Name: QtDspn

AUTHORIZ.SUCCESS.
The number of successful authorization checks performed on plans, packages, and stored procedures, since DB2 was started.

Field Name: QTASUSC
This is an exception field.

PLANS BOUND
The number of plans successfully bound and kept for future agent allocations.

This field represents the sum of successful BIND ADD (QTBINDA) and successful BIND REPLACE (QTBINDR) commands. This counter is not incremented for BIND subcommands with no plan ID specified, as identified by QTTESTB. Note that QTBINDA + QTBINDR is not necessarily equal to this field. It is equal only if all BIND ADD and BIND REPLACE subcommands issued are successful.

Field Name: QTPLNBD
This is an exception field.

PACKAGES BOUND
The number of packages bound and kept for future package allocations.
IFCID 002 - Service Controller Data

It is the sum of successful BIND ADD PACKAGE and BIND REPLACE PACKAGE subcommands, but only if all these commands are really issued successfully.

Field Name: QTPKGBD

DS NOUSE,NOCLOSE-HWM

The maximum number of data sets on the deferred close queue. It is a high-water mark representing the maximum number of data sets that are not in use but have not been physically closed yet.

Field Name: QTMXPB

This is an exception field.

AUTH.SUCC-NO CAT.

The number of successful authorization checks that do not use the DB2 catalog (including plan cache checks and public checks).

Background and Tuning Information

For transaction level security, ENABLE and DISABLE on BIND PACKAGE should be used to ensure adequate security. Granting execute authority on the plan to public should be adequate.

Field Name: QTAUCCH

BIND PLAN (ADD)

The number of successful and unsuccessful BIND ADD subcommands issued.

The sum of QTBINDA, QTBINDR, and QTTESTB equals the total number of BIND subcommands.

Field Name: QTBINDA

BIND PACK (ADD)

The number of successful and unsuccessful BIND ADD PACKAGE subcommands issued.

Field Name: QTBINDPA

DS NOUSE,NOCLOSE-CURR.

The number of data sets that are not currently used, but are not closed due to a deferred close (snapshot).

Field Name: QTSLWDD

This is an exception field.

AUTH.SUCC-PUBLIC

The number of successful authorization checks based on EXECUTE authority granted to PUBLIC.

Field Name: QTAUPUB

This is an exception field.

BIND PLAN (REPL)

The number of successful and unsuccessful BIND REPLACE subcommands issued.

Field Name: QTBINDR
This is an exception field.

**BIND PACK (REPL)**

The number of successful and unsuccessful BIND REPLACE PACKAGE subcommands issued.

**Field Name:** QTBINDPR

This is an exception field.

**DS CLOSED-THRESH.REACH**

The number of data sets that were closed because the total number of open data sets reached the deferred close threshold value. The deferred close value is based on the value of DSMAX or the MVS DD limit (whichever is smaller).

**Field Name:** QTDSDRN

This is an exception field.

**PKG-AUTH.SUCC**

The number of successful package EXECUTE authorization checks without accessing the DB2 catalog.

**Field Name:** QTPACAUT

**AUTOB.PLAN ATTMP**

The number of attempts to autobind a plan. This occurs when the plan was invalidated by modifications to the declarations of the data referenced by the programs bound as part of the plan. For example, dropping an index when it is used in the plan results in automatic bind.

**Field Name:** QTABINDA

**AUTOB.PACK ATTMP**

The number of attempts to autobind a package.

**Background and Tuning Information**

If YES was specified, or defaulted, for autobind on DB2 install panel DSNTIPB, an autobind occurs when a plan or package:

- Is invalid because declarations of the data referenced by the program or package were modified. For example, when an index used in a package is dropped, an automatic bind occurs when the package is run for the first time after the index was dropped.
- Was bound in a later release and is used in a previous release for the first time.
- Was used in a previous release but is later remigrated and used in a later release for the first time.

**Field Name:** QTAUTOBA

This is an exception field.

**R/W TO R/O CONVERSIONS**

The number of infrequently updated data sets that are converted from R/W to R/O state. An updated data set is considered infrequently updated when it has not been updated for either 5 consecutive DB2 checkpoints or 60 minutes. For tablespace data sets, the switching from R/W to R/O state means the SYSLGRNG entry is closed.
**IFCID 002 - Service Controller Data**

Field Name: QTPCCT

This is an *exception* field.

PKG-AUTH.SUCC-PUB

The number of successful package EXECUTE authorization checks without accessing the DB2 catalog. Package EXECUTE authority was granted to PUBLIC in the package authorization cache.

Field Name: QTPACPUB

**AUTOB.PLAN SUCC.**

The number of plans successfully autobound.

Field Name: QTABIND

**AUTOB.PACK SUCC.**

The number of packages successfully autobound.

Field Name: QTPKABND

PKG-AUTH.UNSUCC

The number of unsuccessful package EXECUTE authorization checks in the package authorization cache. No applicable entry was found in the cache and DB2 catalog access was used.

Field Name: QTPACNOT

REBIND PLAN COMM

The number of REBIND subcommands issued. More than one plan can be rebound with a single REBIND subcommand. If the value in this field is 1, the number of plans you are attempting to rebind is shown in the Rebind - plan attempts field.

Field Name: QTREBIND

**REBIND PACK COMM**

The number of REBIND PACKAGE subcommands issued. More than one package can be rebound with a single subcommand. If the value in this field is 1, Rebind - package attempts shows the number of packages you are attempting to rebind.

Field Name: QTRBINDP

PKG-AUTHID OWRTN

The number of times an authorization ID was overwritten to add another one to the package authorization cache.

Field Name: QTPACOW1

**REBIND PLAN ATTM**

The number of attempts to rebind a plan. This number can be larger than the value shown in the Rebind - plan subcommands field because you can specify more than one plan in a single REBIND subcommand.

Field Name: QTRBINDA

**REBIND PACK ATTM**
The number of attempts to rebind a package. This can be larger than the value shown in Rebind package subcommands because you can rebind more than one package with a single command.

Field Name: QTRBNDPA

PKG-ENTRY OWRTN

The number of times an entry for a collection-ID or package-ID was overwritten to add another one to the package authorization cache.

Field Name: QTPACOW2

PLANS REBOUND

The number of rebind attempts that completed successfully. This field is equal to the Rebind - Plan attempts field if all specified plans rebound successfully.

Field Name: QTPLNRBD

PACKAGES REBOUND

The number of packages successfully rebound. If all specified packages were rebound successfully, this field is equal to Rebind package attempts.

Field Name: QTPKGRBD

RTN-AUTH.SUCC

The number of times the routine authorization cache was checked successfully of EXECUTE authority on a stored procedure or user-defined function. The DB2 catalog was not accessed. This counter includes the number of PUBLIC authorization checks.

Field Name: QTRACAUT

FREE PLAN COMMD

The number of FREE subcommands issued.

More than one plan can be freed with a single FREE subcommand. If this field is 1, then the number of plans you are trying to free is shown in ATTEMPTS TO FREE A PLAN.

Field Name: QTFREE

FREE PACKAGE COM

The number of FREE PACKAGE subcommands issued.

More than one package can be freed with a single FREE subcommand. If the value in this field is 1, then the number of packages you are attempting to free is shown in ATTEMPTS TO FREE A PACKAGE.

Field Name: QTFREEP

RTN-AUTH.SUCC-PUB

Number of successful authorization checks for user-defined function or stored procedure execution authority when that authority is held by PUBLIC. The DB2 catalog was not checked.

Field Name: QTRACPUB

FREE PLAN ATTMPT

The number of attempts to free a plan.
This value can be larger than FREE PLAN SUBCOMMANDS because multiple plan IDs can be specified in a single FREE subcommand.

Field Name: QTFREEA

FREE PACK ATTEMPT
The number of attempts to free a package. This number can be larger than FREE PACKAGE SUBCOMMANDS because you can free several packages with a single command.

Field Name: QTFREEAP

RTN-AUTH.UNSUCC
Number of unsuccessful authorization checks for user-defined function or stored procedure EXECUTE authority because no applicable entry was found in the routine authorization cache.

Field Name: QTRACNOT

PLANS FREED
The number of times a plan was successfully freed.
Freeing a plan can fail if someone else is using the plan and holds a lock on it.

Field Name: QTPLNFRD

PACKAGES FREED
The number of times a package was successfully freed. If all the specified packages were freed successfully, the value of this field is equal to ATTEMPTS TO FREE A PACKAGE.

Field Name: QTPKGFRD

RTN-AUTHID OWRTN
Number of times an individual authorization ID was overwritten in an entry of the routine authorization cache.

Field Name: QTACOW1

TEST BINDS
The number of BIND subcommands issued without a plan ID.

Field Name: QTTESTB

AUTOB.INV.RES.ID
The number of requests to allocate a nonexistent plan or package. This is the number of all plan and package allocation attempts that failed because the resource was unavailable or the object did not exist.

Field Name: QTINVRID

RTN-ENTRY OWRTN
Number of times that DB2 overwrote a routine entry in the routine authorization cache.
An entry in the routine authorization cache can refer to a function or procedure or to all functions or procedures within a specific schema.

Field Name: QTRACOW2

RTN-CACHE NO ADD
Number of times that DB2 could not add an entry to the routine authorization cache.

An entry in the routine authorization cache can refer to a function or procedure or to all functions or procedures within a specific schema.

Field Name: QTRACNAC
**IFCID 002 - Simulated Buffer Pool Activity**

This topic shows detailed information about “Record Trace - IFCID 002 - Simulated Buffer Pool Activity”.

This block is provided for each simulated buffer pool.

**Record trace - IFCID 002 - Simulated Buffer Pool Activity**

The field labels shown in the following sample layout of “Record Trace - IFCID 002 - Simulated Buffer Pool Activity” are described in the following section.

<table>
<thead>
<tr>
<th>SIMULATED BUFFER POOL ACTIVITY</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>BUFFER POOL ID</td>
<td>8</td>
<td>X '80'</td>
</tr>
<tr>

<td>2:37:06.172028</td>
<td></td>
</tr>
</tbody>
</table>

**BUFFER POOL ID**

The buffer pool ID.

*Field Name: QBSPBPID*

**CURRENT PAGES IN USE**

The number of simulated buffers currently in use in the simulated buffer pool.

*Field Name: QBSPIUS*

**MAX PAGES IN USE**

The highest number of simulated buffers that were in use in the simulated buffer pool.

*Field Name: QBSPHUS*

**CURRENT SEQ PAGES IN USE**

The number of simulated buffers currently in use for sequential pages in the simulated buffer pool.

*Field Name: QBSPSUS*

**MAX SEQ PAGES IN USE**

The highest number of simulated buffers that were in use for sequential pages in the simulated buffer pool.

*Field Name: QBSPHSU*

**PAGES MOVED INTO SIMULATED BP**

The number of pages logically moved into the simulated buffer pool from the virtual buffer pool.

*Field Name: QBSPMVI*

**TOTAL AVOIDABLE SYNC I/O DELAY**

The total time waiting for synchronous read I/O from disk for pages found in the simulated buffer pool.

*Field Name: QBSPDTM*
The flag byte shows if more QBSP data is following or if this is the last of the QBSP repeating groups.

**Field Name:** QBSPFLG

**AVOIDABLE READ I/O - SYNC READ I/O (R)**

The number of pages found in the simulated buffer pool for a random request that could have avoided a synchronous read I/O from disk.

**Field Name:** QBSPDRR

**AVOIDABLE READ I/O - SYNC READ I/O (S)**

The number of pages found in the simulated buffer pool for a sequential request that could have avoided a synchronous read I/O from disk.

**Field Name:** QBSPDRS

**AVOIDABLE READ I/O - ASYNC READ I/O**

The number of pages found in the simulated buffer pool for a prefetch request that could have avoided an asynchronous read I/O from disk.

**Field Name:** QBSPDRA

**AVOIDABLE READ I/O - SYNC GBP READS (R)**

The number of pages found in the simulated buffer pool for a random request that could have avoided a synchronous read from GBP.

**Field Name:** QBSPGRR

**AVOIDABLE READ I/O - SYNC GBP READS (S)**

The number of pages found in the simulated buffer pool for a sequential request that could have avoided a synchronous read from GBP.

**Field Name:** QBSPGRS

**AVOIDABLE READ I/O - ASYNC GBP READS**

The number of pages found in the simulated buffer pool for a prefetch request that could have avoided an asynchronous read from GBP.

**Field Name:** QBSPGRA

</tbody>
</table>

**Field Name:** QXSELECT

The number of SQL SELECT statements executed.

**Field Name:** QXINSERT

The number of INSERT statements executed.

**Field Name:** QXUPDATE

The number of UPDATE statements executed.

**Field Name:** QXDELETE

The number of DELETE statements executed.

**Field Name:** QXDESCRIBE

The number of DESCRIBE, DESCRIBE CURSOR, DESCRIBE INPUT, and DESCRIBE PROCEDURE statements executed. This number at the server.
location might not match the number at the user application because of the internal processing of the Distributed Data Facility (DDF).

Field Name: QXDESC

PREPARE

The number of SQL PREPARE statements executed. This number at the server location might not match the number at the user application because of the internal processing of the Distributed Data Facility (DDF).

Field Name: QXPREP

OPEN

The number of OPEN statements executed.

Field Name: QXOPEN

CLOSE

The number of CLOSE statements executed. This number at the server location might not match the number at the user application because of the internal processing of the Distributed Data Facility (DDF).

Field Name: QXCLOSE

FETCH

The number of FETCH statements executed. This number at the server location might not match the number at the user application because of the internal processing of the Distributed Data Facility (DDF).

Field Name: QXFETCH

COMMENT ON

The number of COMMENT ON statements executed.

Field Name: QXCMT

LOCK TABLE

The number of LOCK TABLE statements executed.

Field Name: QXLOCK

GRANT

The number of GRANT statements executed.

Field Name: QXGRANT

REVOKE

The number of REVOKE statements executed.

Field Name: QXREVOK

INCREMENTAL BINDS

The number of incremental binds (excluding prepare). It is incremented by:

• SQL statements with BIND VALIDATE(RUN) that fail at bind time and are bound again at execution time
• Static DDL statements (such as CREATE TABLE, DROP TABLE, LOCK TABLE) that use DB2 private protocol

Background and Tuning Information
If a plan is bound with VALIDATE(RUN), DB2 performs validity checks at bind time and rechecks any failures at run time. This can result in catalog contention and degraded application performance, depending on the number of statements flagged and how many times they are executed. Avoid VALIDATE(RUN) if possible. Ensure that all objects are created and all privileges are granted before bind, and select the VALIDATE(BIND) option.

Field Name: QXINCRB
This is an exception field.

LABEL ON
The number of LABEL ON statements executed.
Field Name: QXLABON
This is an exception field.

DESCRIBE TABLE
The number of DESCRIBE TABLE statements executed.
Field Name: QXDSCRTB
This is an exception field.

CONNECT TYPE 1
The number of CONNECT type 1 statements executed.
Field Name: QXCON1
This is an exception field.

CONNECT TYPE 2
The number of CONNECT type 2 statements executed.
Field Name: QXCON2
This is an exception field.

RELEASE
The number of RELEASE statements executed.
Field Name: QXREL
This is an exception field.

ASSOCIATE LOCATOR
The number of SQL ASSOCIATE LOCATORS statements executed.
Field Name: QXALOCL
This is an exception field.

ALLOCATE CURSOR
The number of SQL ALLOCATE CURSOR statements executed.
Field Name: QXALOCC
This is an exception field.

RENAME TABLE
The number of RENAME TABLE statements executed.
Field Name: QXRNTAB
This is an exception field.

HOLD LOCATOR
The number of SQL HOLD LOCATOR statements executed.
Field Name: QXHOLDL

FREE LOCATOR
The number of SQL FREE LOCATOR statements executed.
Field Name: QXFREEL

MERGE
The number of times a MERGE statement was executed.
Field Name: QXMERGE

TRUNCATE TABLE
The number of TRUNCATE TABLE statements issued.
Field Name: QXTRTBL

RENAME INDEX
The number of RENAME INDEX statements issued.
Field Name: QXRNIX

CREATE DATABASE
The number of CREATE DATABASE statements executed.
Field Name: QXCRDAB

DROP DATABASE
The number of DROP DATABASE statements executed.
Field Name: QXDRPDB

ALTER DATABASE
The number of ALTER DATABASE statements executed.
Field Name: QXALDAB

CREATE STOGROUP
The number of CREATE STOGROUP statements executed.
Field Name: QXCRSTG

DROP STOGROUP
The number of DROP STOGROUP statements executed.
Field Name: QXDRPST

ALTER STOGROUP
The number of ALTER STOGROUP statements executed.
Field Name: QXALTST

CREATE TABSPACE
The number of CREATE TABLESPACE statements executed.
Field Name: QXCTABS

DROP TABSPACE
The number of DROP TABLESPACE statements executed.

Field Name: QXDRPTS

ALTER TABSPACE
The number of ALTER TABLESPACE statements executed.

Field Name: QXALTTS

CREATE TABLE
The number of CREATE TABLE statements executed.

Field Name: QXCRTAB

DROP TABLE
The number of DROP TABLE statements executed.

Field Name: QXDRPTA

ALTER TABLE
The number of ALTER TABLE statements executed.

Field Name: QXALTTA

CREATE AUX TABLE
The number of CREATE AUXILIARY TABLE statements executed.

Field Name: QXCRATB

CREATE TMP TABLE
The number of CREATE GLOBAL TEMPORARY TABLE statements executed.

Field Name: QXCRGTT

DECLARE TMP TABLE
The number of DECLARE GLOBAL TEMPORARY TABLE statements executed.

Field Name: QXDCLGTT

CREATE INDEX
The number of CREATE INDEX statements executed.

Field Name: QXCRINX

DROP INDEX
The number of DROP INDEX statements executed.

Field Name: QXDRPIX

ALTER INDEX
The number of ALTER INDEX statements executed.

Field Name: QXALTIX

CREATE VIEW
The number of CREATE VIEW statements executed.
Field Name: QXDEFWU

DROP VIEW
The number of DROP VIEW statements executed.
Field Name: QXDRPVU

ALTER VIEW
The number of ALTER VIEW statements issued.
Field Name: QXALTVW

CREATE SYNONYM
The number of CREATE SYNONYM statements executed.
Field Name: QXCRSYN

DROP SYNONYM
The number of DROP SYNONYM statements executed.
Field Name: QXDRPSY

CREATE ALIAS
The number of CREATE ALIAS statements executed.
Field Name: QXCRALS

DROP ALIAS
The number of SQL DROP ALIAS statements executed.
Field Name: QXDRPAL

CREATE SEQUENCE
The number of CREATE SEQUENCE statements.
Field Name: QXCRESEQ

DROP SEQUENCE
The number of ALTER SEQUENCE statements.
Field Name: QXALTSEQ

ALTER SEQUENCE
The number of DROP SEQUENCE statements.
Field Name: QXDROSEQ

CREATE TRIGGER
The number of SQL CREATE TRIGGER statements.
Field Name: QXCRTRIG

DROP TRIGGER
The number of DROP TRIGGER statements executed.
Field Name: QXDRPTR

CREATE DIST TYPE
The number of CREATE DISTINCT TYPE statements executed.
Field Name: QXCDIST
DROP DIST TYPE
The number of DROP DISTINCT TYPE statements executed.
Field Name: QXDDIST

CREATE FUNCTION
The number of CREATE FUNCTION statements executed.
Field Name: QXCRUDF

DROP FUNCTION
The number of DROP FUNCTION statements executed.
Field Name: QXDRPFN

ALTER FUNCTION
The number of DROP DISTINCT TYPE statements executed.
Field Name: QXDDIST

CREATE PROCEDURE
The number of CREATE PROCEDURE statements issued.
Field Name: QXCRPRO

DROP PROCEDURE
The number of DROP PROCEDURE statements executed.
Field Name: QXDRPPR

ALTER PROCEDURE
The number of ALTER PROCEDURE statements executed.
Field Name: QXALPRO

CREATE ROLE
The number of CREATE ROLE statements executed.
Field Name: QXCRROL

DROP ROLE
The number of DROP ROLE statements issued.
Field Name: QXDRPROL

CREATE TRUST CONT
The number of CREATE TRUSTED CONTEXT statements issued.
Field Name: QXCRCTX

DROP TRUST CONT
The number of DROP TRUSTED CONTEXT statements issued.
Field Name: QXDRPCTX

ALTER TRUST CONT
The number of ALTER TRUSTED CONTEXT statements issued.
Field Name: QXALTCTX

CREATE MASK/PERM
The number of CREATE MASK and CREATE PERMISSION statements executed.

Field Name: QXCREMP

DROP MASK/PERM
The number of DROP MASK and DROP PERMISSION statements executed.

Field Name: QXDRPMP

ALTER MASK/PERM
The number of ALTER MASK and ALTER PERMISSION statements executed.

Field Name: QXALTMP

CREATE VARIABLE
The number of CREATE VARIABLE statements.

Field Name: QXCRTSV

DROP VARIABLE
The number of DROP VARIABLE statements.

Field Name: QXDRPSV

DROP PACKAGE
The number of SQL DROP PACKAGE statements executed.

Field Name: QXDRPPKG

ALTER JAR
The number of ALTER JAR statements issued.

Field Name: QXALTJR

SET CUR SQL ID
The number of SET CURRENT SQLID statements executed.

Field Name: QXSETSQL

SET HOST VAR
The number of SET HOST VARIABLE statements executed. The special register that was retrieved is not tracked.

Field Name: QXSETHV

SET CONNECTION
The number of SET CONNECTION statements executed.

Field Name: QXSETCON

SET CUR DEGREE
The number of SET CURRENT DEGREE statements executed.

Field Name: QXSETCDG

SET CUR RULES
The number of SET CURRENT RULES statements executed.

Field Name: QXSETCRL
IFCID 002 - SQL Call Data

SET CUR PATH
The number of SET CURRENT PATH statements executed.
Field Name: QXSETPTH

SET CUR PRECISION
The number of SET CURRENT PRECISION statements executed.
Field Name: QXSETCPR

ROWS FETCHED
The number of rows fetched.
Field Name: QXRWSFETCHD

ROWS INSERTED
The number of rows inserted.
Field Name: QXRWSINSRTD

ROWS UPDATED
The number of rows updated.
Field Name: QXRWSUPDTD

ROWS DELETED
The number of rows deleted.
Field Name: QXRWSDELETD
IFCID 003 - Accounting

**Chapter 40. IFCID Record Blocks**  
**40-159**
The number of blocks sent.

Field Name: Q8ACBLKS

ROWS SENT TO ACCELERATOR

The number of rows sent.

Field Name: Q8ACROWS

BYTES RECEIVED FROM ACCELERATOR

The number of bytes returned.

Field Name: Q8ACBYTR

MESSAGES RECEIVED FROM ACCELERATOR

The number of messages returned.

Field Name: Q8ACMSGR

BLOCKS RECEIVED FROM ACCELERATOR

The number of blocks returned.

Field Name: Q8ACBLKR

ROWS RECEIVED FROM ACCELERATOR

The number of rows returned.

Field Name: Q8ACROWR

ACCELERATOR SVCS TCPIP CPU TIME

The accelerator services TCP/IP CPU time measured in DB2 for the amount of CPU consumed by the DDF service task to perform the SEND and RECEIVE to an accelerator service. It does not account for the TCP/IP address CPU to route the message on to the network and receive the reply into the DDF task.

Field Name: Q8ACTCPU

ACCUMULATED ACCELERATOR CPU TIME

The CPU time spent in the accelerator when executing requests from the DB2 subsystem.

Field Name: Q8ACACPU

ACCUMULATED ACCELERATOR WAIT TIME

The wait time spent in the accelerator when executing requests from the DB2 subsystem.

Field Name: Q8ACAWAIT

ACCELERATOR SVCS TCPIP ELAPSED TIME

The accelerator services TCP/IP elapsed time measured in DB2. It starts when sending the requests to the accelerator and ends when receiving the results from the accelerator.

Field Name: Q8ACTELA

ACCUMULATED ACCELERATOR ELAPSED TIME

The elapsed time spent in the accelerator when executing requests from the DB2 subsystem.
Field Name: Q8ACAELA
IFCID 003 - Accelerator SQL Call Data V4 or later

This topic shows detailed information about “Record Trace - IFCID 003 - Accelerator SQL Call Data V4 or later”.

Record trace - IFCID 003 - Accelerator SQL Call Data V4 or later

The field labels shown in the following sample layout of “Record Trace - IFCID 003 - Accelerator SQL Call Data V4 or later” are described in the following section.

<table>
<thead>
<tr>
<th>ACCELERATOR SQL CALL DATA</th>
</tr>
</thead>
<tbody>
<tr>
<td>INSERT STMTS SENT TO ACCELERATOR</td>
</tr>
<tr>
<td>DELETE STMTS SENT TO ACCELERATOR</td>
</tr>
<tr>
<td>UPDATE STMTS SENT TO ACCELERATOR</td>
</tr>
<tr>
<td>OPEN STMTS SENT TO ACCELERATOR</td>
</tr>
<tr>
<td>CREATE STMTS SENT TO ACCELERATOR</td>
</tr>
<tr>
<td>COMMIT STMTS SENT TO ACCELERATOR</td>
</tr>
</tbody>
</table>

**INSERT STMTS SENT TO ACCELERATOR**

The accumulated number of INSERT statements sent to the accelerator from DB2.

**Field Name:** Q8ACINSC

**DELETE STMTS SENT TO ACCELERATOR**

The accumulated number of DELETE statements sent to the accelerator from DB2.

**Field Name:** Q8ACDELC

**UPDATE STMTS SENT TO ACCELERATOR**

The accumulated number of UPDATE statements sent to the accelerator from DB2.

**Field Name:** Q8ACUPDC

**OPEN STMTS SENT TO ACCELERATOR**

The accumulated number of OPEN statements sent to the accelerator from DB2.

**Field Name:** Q8ACOPNC

**CREATE STMTS SENT TO ACCELERATOR**

The accumulated number of CREATE statements sent to the accelerator from DB2.

**Field Name:** Q8ACCRTC

**COMMIT STMTS SENT TO ACCELERATOR**

The accumulated number of COMMIT statements sent to the accelerator from DB2.

**Field Name:** Q8ACCMTC

**ROWS INSERTED**

The accumulated number of rows inserted to the accelerator by DB2.

**Field Name:** Q8ACROWI

**ROWS DELETED**

The accumulated number of rows deleted on the accelerator by DB2.

**Field Name:** Q8ACROWD
IFCID 003 - Accelerator SQL Call Data V4 or later

ROWS UPDATED
The accumulated number of rows updated on the accelerator by DB2.
Field Name: Q8ACROWU

ROWS FETCHED
The accumulated number of rows returned by the accelerator to DB2.

Note: For completed queries, this is the total number of rows returned to DB2. For in-process queries, this is the number of rows that have been sent so far (and more rows may still be coming).
Field Name: Q8ACROWC

DROP STMTS SENT TO ACCELERATOR
The accumulated number of DROP statements sent to the accelerator from DB2.
Field Name: Q8ACDRPC

ROLLBACK STMTS SENT TO ACCELERATOR
The accumulated number of ROLLBACK statements sent to the accelerator from DB2.
Field Name: Q8ACRBKC
IFCID 003 - Buffer Manager Accounting Data

This topic shows detailed information about “Record Trace - IFCID 003 - Buffer Manager Accounting Data”.

Record trace - IFCID 003 - Buffer Manager Accounting Data

The field labels shown in the following sample layout of “Record Trace - IFCID 003 - Buffer Manager Accounting Data” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BUFFER POOL ID</td>
<td>The buffer pool ID used by this thread.</td>
</tr>
<tr>
<td>GETPAGES</td>
<td>The number of Getpage requests. This counter is incremented by successful</td>

<tr>
<td></td>
<td>are not counted.</td>
</tr>
<tr>
<td>SEQ. PREFETCH</td>
<td>This is an exception field.</td>
</tr>
<tr>
<td>PAGES READ ASYN-PAR</td>
<td>This is an exception field.</td>
</tr>
</tbody>
</table>

Background and Tuning Information

Reducing the number of Getpages can improve DB2 performance by reducing the number of synchronous page reads. With fewer Getpages, the requested page is more likely to be returned from the buffer pool. CPU usage is also reduced.

Check the ratio of Getpages to SQL DML statements, as a rule of thumb, try and keep this ratio below six for a typical online transaction SQL.

You might need to modify the database and query design, for example:

- Add indexes to tables to reduce the number of pages scanned.
- Reassess the number of tables used and denormalize them, if necessary. As an example, a large table with many columns can result in several pages being fetched to satisfy a simple query requesting just a few columns. Splitting such a table into several tables with fewer columns, tailored to queries, will result in fewer pages returned for each query.
- Use correlated rather than non-correlated queries to force the use of an index.

SEQ. PREFETCH

This is an exception field.
The number of SEQUENTIAL PREFETCH requests. This is incremented for each PREFETCH request. Each request can result in an I/O read. If it does, up to 64 pages can be read for SQL and up to 128 pages for utilities. For SQL, depending on the buffer pool size, a request does not result in an I/O if all the requested pages are already in the buffer pool.

DB2 can use sequential prefetch if the data is accessed in sequential order even though sequential prefetch was not requested at bind time. This is known as sequential detection and is not included in the sequential prefetch count. Sequential detection is included in dynamic prefetch requests field.

**Background and Tuning Information**

Table space scans and nonmatching index scans generally use sequential prefetch.

**Field Name:** QBACSEQ

This is an *exception* field.

**GETPAGES FAILED**

The number of times that a page requested for a query processed in parallel was unavailable because an I/O was in progress or the page was not found in the buffer pool. The agent does not wait, but control returns to the agent.

This counter is used only when queries are processed in parallel.

**Background and Tuning Information**

If this value is close to zero, most pages are already in the buffer pool, and wait time for synchronous I/O is small.

This counter can be high when, for example, there is a cluster index scan and the data is not truly clustered by the index key. In this instance, data pages are not accessed in their true order and the cluster ratio is not valid. Use the Runstats utility to update it.

The value of this field is also used to determine how many sequential prefetches of one page were scheduled.

**Field Name:** QBACNGT

**LIST PREFETCH**

The number of LIST PREFETCH requests.

**Special Considerations:**

1. List prefetch allows DB2 to access data pages efficiently even if the needed data pages are not contiguous. It can be used with single index access and is always used with multiple index access.
2. List prefetch is always used to access data from the inner table during a hybrid join.
3. Data pages are read in quantities equal to the sequential prefetch quantity, which depends on the buffer pool size and is usually 64 pages.
4. During bind time DB2 does not use list prefetch if the estimated number of RIDs to be processed would take more than 50% of the RID pool. During execution time, list prefetch processing terminates if DB2 detects that more than 25% of the rows in the table need to be accessed. If list prefetch is terminated, it is indicated in IFCID 125.
Field Name: QBACLPF
This is an exception field.

BUFFER UPDATES
The number of times a buffer update occurs. This is incremented every
time a page is updated and is ready to be written to DASD. If the same
page is updated twice, for example, the number is incremented by 2.
This number is kept for all types of pages including data pages and
work-file pages.

Background and Tuning Information
A nonzero value indicates any of the following activities:
- SQL INSERT, UPDATE, or DELETE
- Merge scan join
- Internal sort activity on the work files
Check the access path to determine whether sort activity can be minimized
or avoided.

Field Name: QBACSWAS
This is an exception field.

DYNAMIC PREFETCH
The number of (dynamic) PREFETCH requests. This is triggered by
sequential detection. This includes prefetches for segmented table spaces.

Background and Tuning Information
Dynamic prefetch is typically used for a SELECT or UPDATE that is run
repeatedly, accessing the index for each access.
If sequential prefetch, list prefetch, and dynamic prefetch reads have large
values, check whether the access path can be improved.

Field Name: QBACDPF
This is an exception field.

SYNCHRON. WRITE
The number of immediate (synchronous) write I/O operations.

Background and Tuning Information
Although an immediate write is rare, a small nonzero value is acceptable.
A large value indicates that the system needs tuning.

Field Name: QBACIMW
This is an exception field.

PAGES READ ASYN-PAR
The number of asynchronous pages read by prefetch that the agent
triggered.

Background and Tuning Information
This is used to determine the buffer pool hit ratio: (Getpage requests -
Synchronous reads - Asynchronous pages read) / Getpage requests.

Field Name: QBACSI0
This is an exception field.
IFCID 003 - Data Sharing Accounting Data

This topic shows detailed information about “Record Trace - IFCID 003 - Data Sharing Accounting Data”.

Record trace - IFCID 003 - Data Sharing Accounting Data

The field labels shown in the following sample layout of “Record Trace - IFCID 003 - Data Sharing Accounting Data” are described in the following section.

DATA SHARING ACCOUNTING DATA

MEMBER NAMES: N/P

For an assisting task, the name of the parallelism coordinator. For a coordinating task, the name of each assisting member.

Field Name: QWDAXCQO
IFCID 003 - Data Sharing Locking Data

This topic shows detailed information about “Record Trace - IFCID 003 - Data Sharing Locking Data”.

Record trace - IFCID 003 - Data Sharing Locking Data

The field labels shown in the following sample layout of “Record Trace - IFCID 003 - Data Sharing Locking Data” are described in the following section.

<table>
<thead>
<tr>
<th>DATA SHARING LOCKING DATA</th>
<th>LOCK REQUESTS</th>
<th>UNLOCK REQUESTS</th>
<th>CHANGE REQUESTS</th>
<th>NOTIFY SENT</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>5</td>
<td>5</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td></td>

<td>SUSPENSIONS - XES</td>
<td>INCOMPATIBLE LOCKS</td>
<td>FALSE CONTENTIONS</td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

**LOCK REQUESTS**

The number of lock requests for P-locks.

Field Name: QTGALPLK

**LOCK - XES**

The number of P/L-lock requests propagated to z/OS XES synchronously.

This number is not incremented if the request is suspended before going to XES.

Field Name: QTGALSLM

**SUSPENSIONS - IRLM**

The number of suspensions due to IRLM global resource contention (IRLM lock states were in conflict).

Field Name: QTGAIGLO

**UNLOCK REQUESTS**

The number of unlock requests for P-locks.

Field Name: QTGAUPLK

**UNLOCK - XES**

The number of unlock requests propagated to z/OS XES.

Field Name: QTGAUSLM

**SUSPENSIONS - XES**

The number of suspensions due to z/OS XES global resource contention (z/OS XES lock states were in conflict whereas IRLM lock states were not).

Field Name: QTGASGLO

**CHANGE REQUESTS**

The number of change requests for P-locks.

Field Name: QTGACPLK

**CHANGE - XES**

The number of change requests propagated to z/OS XES.

Field Name: QTGACSLM

**INCOMPATIBLE LOCKS**
The number of global lock or change requests denied or suspended due to an incompatible retained lock.

**Field Name:** QTGADRTA

**NOTIFY SENT**

The number of notify messages sent.

**Field Name:** QTGANTFY

**SYNC-ASYNC XES CONV**

The total number of sync-to-async heuristic conversions for LOCK requests in XES. This conversion is done when XES determines that it is more efficient to drive the request asynchronously to the coupling facility (CF).

**Field Name:** QTGAFLSE

**FALSE CONTENTIONS**

The total number of false contentions for LOCK and UNLOCK requests. A false contention occurs when different resource names hash to the same entry in the coupling facility (CF) lock table. The CF detects contention within the hash entry, and XES uses intersystem messaging to determine that no actual resource contention exists.

**Field Name:** QTGAFCNT
IFCID 003 - DDF Data by Location

This topic shows detailed information about “Record Trace - IFCID 003 - DDF Data by Location”.

Record trace - IFCID 003 - DDF Data by Location

The field labels shown in the following sample layout of “Record Trace - IFCID 003 - DDF Data by Location” are described in the following section.

<td>X'10'</td>
</tr>
</tbody>
</table>

**TYPE (Either ROLLUP, ROLSUM OR PACKAGE)**

The flag byte:

- **X'20'** This value is shown if DRDA is used to communicate with the server.
- **X'40'** This value is shown if DB2 private protocol is used to communicate with the server.
- All other values shown in this field are serviceability.

**Field Name:** QLACFLGS

**LOCATION NAME (LONG)**

The name of the remote location with which this information is associated. If the local location is the requester, this field is a server location. If the local location is a server location, this field is the requester location. An allied thread is created at a DB2 requester, and a database access thread is created at a DB2 server. An accounting record is for either a requester or a server, but not for both.

This field is invalid if summary rollup data is present. In Accounting this field is set to *ROLSUM*.

**Field Name:** QLACLOCN

This is an exception field.

**LOCATION NAME (SHORT)**

The name of the remote location with which this information is associated. If the local location is the requester, this field is a server location. If the local location is a server location, this field is the requester location. An allied thread is created at a DB2 requester, and a database access thread is created at a DB2 server. An accounting record is for either a requester or a server, but not for both.

This field is invalid if summary rollup data is present. In Accounting this field is set to *ROLSUM*.
IFCID 003 - DDF Data by Location

Field Name: QLACLOCN
This is an exception field.

ABORT REQUESTS RECEIVED
The number of abort requests received from the requester (single-phase commit protocol) and backout requests received from the coordinator (two-phase commit protocol).

Field Name: QLACABRR
This is an exception field.

BLKS RECV USING BLK FETCH
The number of blocks received using block fetch. This value is maintained at the requester location.

Field Name: QLACBRBF
This is an exception field.

BYTES RECV FROM REMOTE
The number of bytes the server location received from the requester location.

More bytes of data might be sent from the server location than are received by the requester, because of the way in which distributed SQL statements are processed internally.

Field Name: QLACBYTR
This is an exception field.

CONV REQS QUEUED BY DDF
A number of conversation requests queued by DDF that are waiting for allocation. This value is maintained at the requester location.

If the value is a large number, you might want to increase the limit for the number of conversations.

Field Name: QLACCNVQ
This is an exception field.

CONV INITIATED FR LOCAL
The number of conversations (both successful and unsuccessful) initiated by the requester location to be executed at the server location. This number is maintained at the requester.

Field Name: QLACCNVS
This is an exception field.

COMMIT REQS RECV FR REQ/COO
The number of commit requests received from the requester (single-phase commit protocol) and committed requests received from the coordinator (two-phase commit protocol).

Field Name: QLACCOMR
This is an exception field.

MESS RECV FR REMOTE
The number of messages received from the location. This value is maintained at the location where the messages were received.

More messages might be sent from the server location than are received by the requester because of the way in which distributed SQL statements are processed internally.

**Field Name:** QLACMSGR

This is an *exception* field.

**ROWS OF DATA RETR FR REMOTE**

The number of rows of data retrieved from the server location. This value is maintained at the requester location.

**Special Considerations:**

1. The number of rows received from the server location does not include either the SQLDA or SQLCA.
2. Block fetch can significantly affect the number of rows sent across the network. When used with non-UPDATE cursors, block fetch puts as many rows as possible into the message buffer, and transmits the buffer across the network without requiring a VTAM message. Consequently, more rows of data might be sent from the server location than are received by the reporting (requester) location. This is especially true when DB2 private protocol is used because multiple blocks can be transmitted from the server with no intervening messages sent by the requester.

**Field Name:** QLACROWR

This is an *exception* field.

**SQL STMT RECEIVED FR REMOTE**

The number of SQL statements received from the requester location.

**Field Name:** QLACSQLR

This is an *exception* field.

**LOCAL ELAPSED TIME**

The elapsed time at the requester location until the database access agent completed its work, including DB2 processing time and network time. This value is maintained at the requester location and is calculated by accumulating the difference between the store clock values obtained before and after each network request.

**Field Name:** QLACCPUL

**ROLLED NBR THREADS**

The number of threads to roll data into this QLAC data section. Non-rollup QLACs have a value of 1 and rollup QLACs have a value of 1 or more.

**Field Name:** QLACRLNU

**FLAGS**

The flag byte:

X'20' This value is shown if DRDA is used to communicate with the server.
This value is shown if DB2 private protocol is used to communicate with the server.

All other values shown in this field are serviceability.

Field Name: QLACFLGS

ABORT REQUESTS SENT

The number of abort requests sent to the server (single-phase commit protocol) and backout requests sent to the participant (two-phase commit protocol).

Field Name: QLACABRS

This is an exception field.

BLKS TRANS USING BLK FETCH

The number of blocks transmitted using block fetch. This value is maintained at the server location.

Field Name: QLACBTBF

This is an exception field.

BYTES SENT TO REMOTE

The number of bytes the server location sent to the requester location. This value is maintained at the server location.

More bytes of data might be sent from the server location than are received by the requester due to the way in which distributed SQL statements are processed internally.

Field Name: QLACBYTES

This is an exception field.

CONV INITIATED FR REMOTE

A count of conversations initiated by the requester.

This number is updated at the server location.

Field Name: QLACCNVR

This is an exception field.

CONV TERMINATED FR LOCAL

The number of terminated conversations in the server block (DB2 private protocol only). It is maintained at the requester location.

This number can be different from the number of successful conversation allocations, because some conversations might not have been terminated when the accounting record was written.

Field Name: QLACCNVT

This is an exception field.

COMMIT REQS SENT TO SRV/PAR

The number of commit requests sent to the server (single-phase commit protocol) and committed requests sent to the participant (two-phase commit protocol).

Field Name: QLACCOMS
This is an *exception* field.

**MSGS SENT TO REMOTE**

The number of messages sent to the location. It is maintained at the location where the messages originated.

**Field Name:** QLACMSGS

This is an *exception* field.

**ROWS OF DATA SENT TO REMOTE**

The number of rows sent from the server location to the requester location. The value includes SQLDA and is maintained at the server location.

**Field Name:** QLACROWS

This is an *exception* field.

**SQL STMT SENT TO REMOTE**

The number of SQL statements sent to the server location. This value is maintained at the requesting location.

**Field Name:** QLACSQLS

This is an *exception* field.

**INDOUBT THREADS**

The number of threads that went indoubt with the remote location as coordinator (two-phase commit operations only). It is maintained at the participant and indicates that the communication with the coordinator was lost.

**Field Name:** QLACINDT

This is an *exception* field.

**PRID REMOTE SITE**

The original DB2 field specifies the information in the following field names of the remote requester or server location:

**PRODUCT ID**

It consists of 3 characters and can have the following values:

<table>
<thead>
<tr>
<th>Original ID from DB2</th>
<th>Shown as</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSN</td>
<td>DB2</td>
</tr>

<td>JCC</td>
<td>JDBC DRIVER</td>
</tr>
<tr>
<td>'000000'X, '404040'X</td>
<td>N/P</td>
</tr>
<tr>
<td>Other</td>
<td>Original ID from DB2</td>
</tr>
</tbody>
</table>

**Note:**

- If the record is written at the application requester location, or if summary rollup data is available, N/P is shown in Accounting TRACE and REPORT.
- In Accounting FILE and SAVE DDF tables, BLANK is shown.
PRODUCT VERSION (PROD VERSION)

It consists of 5 digits and is shown as VvvRrrMm, where:

- \( V \): Version level
- \( R \): Release level
- \( M \): Modification level

**Note:** For DDF/RRSAF rollup records, the product ID and product version contain a value derived from the last thread to rollup. For query parallelism rollup threads, the value is derived from the parent record.

Field Name: QLACPRID
IFCID 003 - Dynamic SQL Statement

This topic shows detailed information about “Record Trace - IFCID 003 - Dynamic SQL Statement”.

Record trace - IFCID 003 - Dynamic SQL Statement

The field labels shown in the following sample layout of “Record Trace - IFCID 003 - Dynamic SQL Statement” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DYNAMIC SQL STMT</td>
<td>REOPTIMIZATION: 0 FOUND IN CACHE: 10 IMPLICIT PREPARES: 0</td>
</tr>
<tr>
<td></td>
<td>STMT INVALID (MAX): 0 NOT FOUND IN CACHE: 0 PREPARES AVOIDED: 0</td>
</tr>
<tr>
<td></td>
<td>STMT INVALID (DDL): 0 CSWL LITS REPLACED: 0 CSWL MATCHES FOUND: 0</td>
</tr>
<tr>
<td></td>
<td>CSWL DUPLS CREATED: 0 LOAD FROM CATALOG: 0</td>
</tr>
</tbody>
</table>

REOPTIMIZATION

The total number of times reoptimization occurs because the value of the host variable or parameter marker changes.

Field Name: QXSTREOP

FOUND IN CACHE

The number of times a PREPARE command was satisfied by copying a statement from the prepared statement cache.

Field Name: QXSTFND

IMPLICIT PREPARES

An implicit prepare occurs when the user copy of the prepared SQL statement no longer exists in the local dynamic SQL cache and the application plan or package is bound with KEEPDYNAMIC YES.

If the skeleton copy of the prepared SQL statement exists in the global dynamic SQL cache in the EDM pool, a short prepare is executed, otherwise a full prepare is executed.

Field Name: QXSTIPRP

STMT INVALID (MAX)

The number of times statements are invalidated in the local dynamic SQL cache because the MAXKEEPD limit has been reached and prepared SQL statements in the local dynamic SQL cache have to be reclaimed.

Field Name: QXSTDEXP

NOT FOUND IN CACHE

The number of times that DB2 searched the prepared statement cache but could not find a suitable prepared statement.

Field Name: QXSTNFND

PREPARES AVOIDED

This field indicates the number of times where no SQL PREPARE or EXECUTE IMMEDIATE was issued by the application and a copy of a prepared SQL statement was found in local dynamic SQL cache.

When an application plan or package is bound with KEEPDYNAMIC YES, a copy of each prepared SQL statement for the application thread is held in the local dynamic SQL cache and kept across a commit boundary.
An application thread can save the total cost of a prepare by using a copy of the prepared statement in the local dynamic SQL cache from an earlier prepare by the same thread. To do this, the application must be modified to avoid issuing repetitive SQL PREPAREs for the same SQL statement.

Field Name: QXSTNPRP

**STMT INVALID (DDL)**

The number of times statements are invalidated in the local dynamic SQL cache because of SQL DDL or updated RUNSTATS information and prepared SQL statements in the local dynamic SQL cache have to be reclaimed.

Field Name: QXSTDINV

**CSWL STMTS PARSED**

The number of times DB2 parsed dynamic statements because CONCENTRATE STATEMENTS WITH LITERALS behavior was used for the prepare of the statement for the dynamic statement cache.

Field Name: QXSTCWLP

**CSWL LITS REPLACED**

The number of times DB2 replaced at least one literal in a dynamic statement because CONCENTRATE STATEMENTS WITH LITERALS was used for the prepare of the statement for dynamic statement cache.

Field Name: QXSTCWLR

**CSWL MATCHES FOUND**

The number of times DB2 found a matching reusable copy of a dynamic statement in cache during prepare of a statement that had literals replaced because of CONCENTRATE STATEMENTS WITH LITERALS.

Field Name: QXSTCWLM

**CSWL DUPLS CREATED**

The number of times DB2 created a duplicate STMT instance in the statement cache for a dynamic statement that had literals replaced by CONCENTRATE STATEMENTS WITH LITERALS behavior. The duplicate STMT instance was needed because a cache match failed because the literal reusability criteria was not met.

Field Name: QXSTCWLD

**LOAD FROM CATALOG**

The number of loads from the catalog.

It shows the number of times a PREPARE request was satisfied by making a copy from the stabilized statement in the SYSIBM.SYSDYNQRY catalog table. The stabilized statement search is done only when no matching statement was found in the prepared statement cache. This field should be identical to QISEDPSL, but it is reported from the QXST section (SQL Statement Execution).

Field Name: QXSTSFND
IFCID 003 - Group Buffer Pools Activity Data

This topic shows detailed information about “Record Trace - IFCID 003 - Group Buffer Pools Activity Data”.

Record trace - IFCID 003 - Group Buffer Pools Activity Data

The field labels shown in the following sample layout of “Record Trace - IFCID 003 - Group Buffer Pools Activity Data” are described in the following section.

GROUP BUFFER POOL ID

The group buffer pool identifier.

Field Name: QBGAGN

READ(XI)-DATA RETURNED

The number of coupling facility read requests required because the buffer was marked invalid. Data is returned from the group buffer pool.

Field Name: QBGAXD

READ(XI)-NO DATA RET.

The number of group buffer pool read requests due to buffer XI where no data was returned.

Field Name: QBGAXR

EXPLICIT X-INVALID

The number of times an explicit coupling facility cross-invalidation request was issued.

Field Name: QBGAEX

GBP-DEPENDENT GETPAGES

The number of coupling facility READ requests required because the buffer was marked invalid. Data is returned from the group buffer pool.

Field Name: QBGAGG

PG P-LOCK LOCK REQ SP M

The number of page P-lock requests for space map pages.

Field Name: QBGAP1

PG P-LOCK LOCK SUSP SP

The number of page P-lock suspensions for space-map pages.

Field Name: QBGAS1

PG P-LOCK UNLOCK REQ

The number of page P-lock unlock requests.

Field Name: QBGAU1
WRITE & REGISTER MULT

The number of write and register multiple (warm) requests.

Field Name: QBGAWM

READ(NF)-DATA RETURNED

The number of coupling facility read requests necessary because the requested page was not found in the buffer pool. Data is returned from the coupling facility.

Field Name: QBGAMD

READ(NF)-NO DATA RET.

The number of group-buffer-pool reads due to local buffer-pool miss where no data was returned.

Field Name: QBGAMR

READ PREFETCH

The number of pages read from the group buffer pool due to prefetch under the control of the agent.

Field Name: QBGAMN

ASYNCH GBP REQUESTS

The number of asynchronous IXLCACHE invocations for the primary group buffer pool.

Field Name: QBGAHS

PG P-LOCK LOCK REQ DATA

The number of page P-lock lock requests for data pages.

Field Name: QBGAP2

PG P-LOCK LOCK SUSP DAT

The number of page P-lock lock suspensions for data pages.

Field Name: QBGAS2

This is an exception field.

WRITE AND REGISTER

The number of Write and Register (WAR) requests.

Field Name: QBGAWS

CLEAN PAGES WRITTEN

The number of clean pages written to the group buffer pool.

Field Name: QBGAWC

CHANGED PAGES WRITTEN

The number of changed pages written to the group buffer pool as a result of write and register (WAR), or write and register multiple (WARM) requests.

Field Name: QBGASW

This is an exception field.

UNREGISTER PAGE
The number of coupling facility requests to unregister a page.

**Field Name:** QBGADG

This is an *exception* field.

**ASYNCH SEC-GBP REQUESTS**

The number of IXLCACHE invocations for the secondary group buffer pool.

**Field Name:** QBGA2H

**PG P-LOCK LOCK REQ IX L**

The number of page P-lock lock requests for index-leaf pages.

**Field Name:** QBGAP3

**PG P-LOCK LOCK SUSP IX**

The number of page P-lock lock suspensions for index-leaf pages.

**Field Name:** QBGAS3
IFCID 003 - IFI Class 5 Times and Data Capture

This topic shows detailed information about “Record Trace - IFCID 003 - IFI Class 5 Times and Data Capture”.

Record trace - IFCID 003 - IFI Class 5 Times and Data Capture

The field labels shown in the following sample layout of “Record Trace - IFCID 003 - IFI Class 5 Times and Data Capture” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IFI CALL ELAPSED TIME</td>
<td>The accumulated elapsed time for processing IFI calls. This field is only calculated if accounting class 5 is active.</td>
</tr>
<tr>
<td>IFI CALL TCB CPU TIME</td>
<td>The accumulated CPU time spent processing IFI calls. This is the same as the TCB time (class 5). This field is only calculated if accounting class 5 is active.</td>
</tr>
<tr>
<td>DESCRIBES ELAPSED</td>
<td>The accumulated elapsed time for processing data capture describes. Data capture describes occur only during IFI read requests for IFCID 185. This time is a subset of the log extraction time. This is an exception field.</td>
</tr>
<tr>
<td>LOG EXTRACT ELAPSED</td>
<td>The accumulated elapsed time for extracting log records for tables defined with DATA CAPTURE CHANGES. This time is a subset of the class 5 elapsed time. This is an exception field.</td>
</tr>
<tr>
<td>IFI CALLS</td>
<td>The number of IFI calls. This is an exception field.</td>
</tr>
<tr>
<td>LOG READS PERFORMED</td>
<td>The number of log reads performed for processing IFI READS requests for IFCID 185.</td>
</tr>
</tbody>
</table>
| LOG RECS CAPTURED           | The number of retrievable log records that were written for tables defined with DATA CAPTURE CHANGES. This number includes only those log
records that can be retrieved by an IFI READS call for IFCID 185. Some records can be written but not retrieved, for example if monitor trace class 6 is not active.

**Field Name:** QIFAANRC

**DATA DESCR. RETURNED**

The number of data descriptions returned in IFCID 185. The data descriptions are mapped in IFCID 185.

**Field Name:** QIFAANDD

**DESCRIBES**

The number of data capture describes for processing READS requests for IFCID 185 data.

**Field Name:** QIFAANMB

**DATA ROWS RETURNED**

The number of data rows returned in IFCID 185. Two rows are returned for each row altered by an SQL UPDATE statement.

**Field Name:** QIFAANDR

**LOG RECS RETURNED**

The number of log records returned to the caller of the IFI READS call for IFCID 185.

**Field Name:** QIFAANRR

**TABLES RETURNED**

The total number of tables returned to the caller of IFI READS call for IFCID 185.

**Field Name:** QIFAANTB
IFCID 003 - Initial Client/Server Correlation Data

This topic shows detailed information about “Record Trace - IFCID 003 - Initial Client/Server Correlation Data”.

This topic also shows detailed information about “Initial Other Requester Correlation Data”.

Record trace - IFCID 003 - Initial Client/Server Correlation Data

The field labels shown in the following sample layout of “Record Trace - IFCID 003 - Initial Client/Server Correlation Data” are described in the following section.

<table>
<thead>
<tr>
<th>Bytes</th>
<th>The length of the product ID and accounting string.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.</td>
</tr>
<tr>
<td>Field Name</td>
<td>QMDAASLN</td>
</tr>
</tbody>
</table>

Product ID

Shows the product identifier (ID) of the requester. It can have the following values:

- **DB2** For DB2 UDB for z/OS
- **SQL/DS** For DB2 UDB for VSE and VM
- **JDBC DRIVER** For Universal JDBC driver
- **COMMON SERV** For DB2 UDB for Linux, UNIX, Windows
- **DB2/400** For DB2 UDB for iSeries

Otherwise, it shows the first 3 characters of the product ID, or N/P if the record was written at the application requester location.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDAPRID

Product Version

The version, release, and modification level of the product, which generated the accounting information. It has the following format: $vv$ $rr$ $m$,

where:

- **$vv$** Version level
- **$rr$** Release level
- **$m$** Modification level
N/P is shown if the record was written at the application requester location.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDAPMOD

CLIENT PLATFORM

The client platform, such as AIX. This is a 1 to 18 character field padded with blanks.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDAPLAT

CLIENT APPLICATION NAME

The name of the client application. This is a 1 to 20 character field padded with blanks. An example is "PAYROLL".

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDAAPPL

CLIENT AUTHID

The client authorization ID of an application process. This is a 1 to 8 character field padded with blanks. An example is "SMITH".

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDAAATID

DDCS ACCOUNT SUFFIX

The account suffix. The maximum length of this field is 200 bytes. This field is the user-supplied portion (suffix) of the accounting string. An example is "DEFAULT_DRDA". A value of zero in QMDASFLN Indicates there is no account suffix.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDASUFX

ACCOUNTING STRING

The accounting string:

• For local DB2 threads, the format of the accounting string is shown in QMDAINFO.

• For database access threads, the accounting string contains the accounting string sent by the requester.

• The QMDAPRID value identifies which product generated the accounting string.
  – If the requester is DB2, the accounting string is defined in QMDAINFO.
  – If QMDAPTYP is DSN, QMDAINFO defines the format.
  – If QMDAPTYP is SQL or JCC, QMDASQLI defines the format.
  – Otherwise, the format is undefined.
For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDAASTR
IFCID 003 - Initial DB2 Requester and MVS Correlation Data

This topic shows detailed information about “Record Trace - IFCID 003 - Initial DB2 Requester and MVS Correlation Data”.

Record trace - IFCID 003 - Initial DB2 Requester and MVS Correlation Data

The field labels shown in the following sample layout of “Record Trace - IFCID 003 - Initial DB2 Requester and MVS Correlation Data” are described in the following section.

BYTES: 226
PRODUCT ID: DB2
PRODUCT VERSION: V11R01M5
LOCATION: PMODB1H
NET ID: DEIBMIPS
LU NAME: IPSAQH1
CONNECT: DB2CALL
CONNTYPE: BATCH
PLANNAME: DBHHEX1
PLANNNAME: DBHHEX1
MVS ACCOUNTING DATA: ACCOUNTING-ASTR0-1234567890ABCDEDGHIJKLMNOPQRSTUVWXYZACCOUNTING-ASTR1-1234567890ABCDEDGHIJKLMNOPQRSTUVWXYZACCOUNTING-ASTR2-1234567890ABCDEDGHI
*** Long name section: LOCATION: PMODB1H
*** End of long names

BYTES

The length of the product ID and accounting string.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDAASLN

PRODUCT ID

Shows the product identifier (ID) of the requester. It can have the following values:

DB2 For DB2 UDB for z/OS

SQL/DS For DB2 UDB for VSE and VM

JDBC DRIVER For Universal JDBC driver

COMMON SERV For DB2 UDB for Linux, UNIX, Windows

DB2/400 For DB2 UDB for iSeries

Otherwise, it shows the first 3 characters of the product ID, or N/P if the record was written at the application requester location.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDAPRID

PRODUCT VERSION

The version, release, and modification level of the product, which generated the accounting information. It has the following format: \( vv \ rr \ m \), where:

\( vv \) Version level

\( rr \) Release level

\( m \) Modification level
ICFID 003 - Initial DB2 Requester and MVS Correlation Data

N/P is shown if the record was written at the application requester location.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDAPMOD

LOCATION

The location name for the DB2 subsystem that created the QMDAINFO values.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

This identifier can be a long string. If there is insufficient space to show the complete string, the string is truncated in the report block. The complete string is shown in a separate list of long names at the end of the report.

Field Name: QMDALOCN

NET ID

The NETID of the DB2 subsystem that created the QMDAINFO values.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDANETN

LU NAME

The SNA LU name of the DB2 subsystem that created the QMDAINFO values.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDALUNM

CONNECT

The connection name of the DB2 system that created the MVS and DDF accounting values.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDACNAM

CONNTYPE

The type of subsystem connection at the DB2 system where the SQL application is running. Possible values and their descriptions are:

BATCH  
    TSO or call attach

SASS   CICS

MASS  IMS

DIST  Distributed

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDACTYP
IFCID 003 - Initial DB2 Requester and MVS Correlation Data

CORRNAME

The first 8 bytes of the correlation ID at the DB2 system running the SQL.
The last 4 bytes of the correlation ID at the DB2 system running the SQL.
For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDACORR

AUTHID

The DB2 authorization ID that the SQL application used before name translation and before driving the connection exit at the DB2 site where the SQL application is running.
For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDAAUTH

PLANNAME

The DB2 plan used at the DB2 system running the SQL.
For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDAPLAN

MVS ACCOUNTING DATA

The MVS accounting string associated with the MVS address space of the SQL application. It is filled if PROD_TYP=0; otherwise X'00' is used.
This information comes from the ACCT= parameter on the job statement. If the ACCT= parameter is blank, the information on the EXEC statement is used. TSO logon Accounting information is used only if there is a value in the account field on the TSO Logon panel. Do not confuse this field with the Accounting correlation token.
For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDAACCT
IFCID 003 - Instrumentation Accounting Data

IFCID 003 - Instrumentation Accounting Data

This topic shows detailed information about “Record Trace - IFCID 003 - Instrumentation Accounting Data”.

Note: IFCID 003 and IFCID 147 have the same layout.

Record trace - IFCID 003 - Instrumentation Accounting Data

The field labels shown in the following sample layout of “Record Trace - IFCID 003 - Instrumentation Accounting Data” are described in the following section.

CLASS 1: BEGINNING STORE CLOCK TIME

The beginning store clock value for the period covered by the accounting record. You can determine the elapsed time of the application by subtracting this field from the ending store clock value (QWACESC). Threads that do not terminate (such as CICS primed threads and IMS wait-for-input message regions) can have an ending clock value that includes the time during which the thread was inactive and waiting for work.
If a roll-up trace record is written with accumulated counter data, QWACBSC represents the earliest begin store clock value for a thread that has rolled data into the record. In this case, QWACESC shows the accumulated elapsed time.

**Field Name:** QWACBSC

**CLASS 1: ENDING STORE CLOCK TIME**

The ending store clock value. You can use this field with the beginning store clock value (QWACBSC) to determine the elapsed time of an application.

If a roll-up record is written with accumulated accounting data, QWACESC contains the accumulated elapsed time. In Accounting Trace reports, the elapsed time is shown under CLASS 1: NONNESTED ELAPSED TIME and the END TIME is reported as N/P, because QWACESC does not contain a timestamp. In the Accounting FILE GENERAL table, the accumulated elapsed time QWACESC is stored in column CLASS1_ELAPSED and column CLASS1_TIME_END contains a timestamp 1900-01-01-00.00.00.000000.

**Field Name:** QWACESC

**CLASS 1: ELAPSED TIME**

The time covered by this accounting record. If the time cannot be calculated or the value is negative, N/C is printed in this field. Calculated from the DB2 field QWACESC - QWACBSC.

**Field Name:** RT0003ET

**CLASS 1: MVS TCB TIME**

The amount of MVS CPU time used. If the time cannot be calculated or the value is negative, N/C is printed in this field. Calculated from the DB2 field QWACEJST - QWACBJST.

**Field Name:** RT0003TT

**CLASS 1: BEGINNING MVS TCB TIME**

The beginning MVS CPU time for all environments (such as: CICS, IMS, RRSAF, or TSO). This CPU time is not affected by an IBM specialty engine. Binary zero means that no time value is available.

**Field Name:** QWACBJST

**CLASS 1: ENDING MVS TCB TIME**

The ending MVS CPU time. This CPU time is not affected by an IBM specialty engine. Binary zero means that no time value is available.

**Field Name:** QWACEJST

**CLASS 1: STORED PROC ELAPSED TIME**

The total elapsed time spent by the allied agent in stored procedures. A stored procedure may initiate a trigger or invoke a user-defined function. The time spent there is not included in this counter.

**Note:** This field is not normally shown in the short layouts but can be included with UTR.

**Field Name:** QWACSPEA
CLASS 1: CONVERSION FACTOR

The CPU service unit conversion factor allows for converting CPU time to a common unit, which is called service unit (SU). The conversion factor depends on the machine being used. With the SU, you can add up CPU execution times across multiple DB2 systems running on different machines. It is a raw value for RECORDTRACE and Accounting FILE data. For Accounting SAVE data it cannot be determined.

Field Name: QWACSUCV

CLASS 1: STORED PROCEDURE TCB TIME

The TCB time accumulated in DB2 for processing SQL CALL statements in the stored procedures or WLM address space. This time is only calculated if accounting class 1 is active.

SQL procedure times are included in this time if the SQL procedure was called on a nested task and was not invoked by the main application execution unit. This time does not include CPU time consumed on an IBM specialty engine.

Field Name: QWACSPCP

CLASS 1: PAR.TASKS

The number of parallel child agents, or Accounting intervals rolled up, or autonomous procedures rolled up. The value depends on the record type:

- For a non-rollup parent record, this value is the number of parallel child agents that were created.
- For a non-rollup child agent record, this value is 0.
- For a parallel query rollup record, this value is the number of parallel child agents rolled into the record.
- For a DDF/RRSAF rollup record, this value is the number of Accounting intervals that were rolled into the record for the corresponding end user.
- For an autonomous procedure rollup record, this value is the number of autonomous procedures rolled into the record.

Field Name: QWACPCNT

CLASS 1: PAR.TOKEN

Token used to correlate parallel task, utility task records, or autonomous procedure rollup records with the records of the originating task or main utility task.

Field Name: QWACPACE

CLASS 1: UDF ELAPSED TIME

The total elapsed time spent by the allied agent in UDF functions processed in a DB2 stored procedure or WLM address space. A user-defined function may initiate a trigger or invoke a stored procedure. Non-inline UDF times are included in this time if the native UDF was called on a nested task and was not invoked by the main application execution unit.

This time includes time executing SQL.

Note: With user-tailored reporting (UTR) you can include this field in the short layouts of Accounting.

Field Name: QWACUDEA
CLASS 1: COMMITS

The number of successful two-phase (units of recovery) or single-phase (syncs) commit requests. It indicates the number of units of recovery that are completed successfully, and for which the associated commit duration locks were released. It represents the total number of commit requests processed by the DB2 subsystem, whether the request was an explicit or implicit external request from an IMS or a CICS connection, or an implicit internal request within DB2 when DB2 was the commit coordinator or conducted read-only commit processing as a commit participant on phase-1 calls from an IMS or CICS connection.

For parallel queries, only the commits from the initiating (parent) thread are recorded by this counter.

Field Name: QWACCOMM

This is an exception field.

CLASS 1: SVPT REQ.

The number of named SAVEPOINTs set within a transaction.

Field Name: QWACSVPT

CLASS 1: UDF TCB TIME

The accumulated CPU time used to satisfy UDF requests processed in a DB2 stored procedure or WLM address space. Non-inline UDF times are included in this time if the native UDF was called on a nested task and was not invoked by the main application execution unit.

This time is only calculated if accounting class 1 is active.

This time does not include the CPU time consumed on an IBM specialty engine.

Field Name: QWACUDCP

CLASS 1: ROLLBACKS

The number of rollback requests. This is the number of units that were backed out, including rollbacks from attaches.

Special Considerations: This field contains the number of:
- Application program abends
- Application rollback requests
- Application deadlocks on database records
- Applications canceled by operator
- Thread abends due to resource shortage

Field Name: QWACABRT

This is an exception field.

CLASS 1: SVPT RLB.

The number of ROLLBACK TO SAVEPOINT statements executed.

Field Name: QWACRBSV

CLASS 1: NETWORK ID VALUE

The network ID. It is used with IMS and CICS.

Field Name: QWACNID
CLASS 1: PROGRAMS

The number of packages or DBRMs for which accounting data was collected.

Field Name: QWACPKGN

CLASS 1: SVPT REL.

The number of RELEASE SAVEPOINT statements executed.

Background and Tuning Information

Release savepoints as soon as possible. Outstanding savepoints block SQL operations that resolve remote locations. DB2 always releases outstanding savepoints when a transaction ends.

Field Name: QWACRLSV

This is an exception field.

CLASS 1: REASON ACCT INVOKED

The reason for termination, that is, for producing a DB2 accounting record.

Field Name: QWACRINV

This is an exception field.

CLASS 1: SE CPU TIME

The accumulated CPU time that is consumed while running on an IBM specialty engine in all environments. This value may be 0 when QWACRINV is greater than or equal to 20.

Field Name: QWACCLS1_ZIIP

CLASS 1/2 STORED PROC SE TCB TIME

The accumulated CPU time that is consumed while running stored procedure requests on the main application execution unit on an IBM specialty engine. As these SPs run entirely within DB2, this time represents class 1 and class 2 time.

Field Name: QWACSPNF_ZIIP

CLASS 1/2 STORED PROC ELAPSED TIME

The accumulated elapsed time that is consumed on an IBM specialty engine for executing stored procedure requests on the main application execution unit. As these stored procedures run entirely in DB2, this time represents class 1 and class 2 time.

Field Name: QWACSPNF_ELAP

CLASS 1/2 STORED PROC CP ELAPSED TIME

The accumulated CPU time that is used for executing stored procedure requests on the main application execution unit. This time does not include the time that is consumed on an IBM specialty engine. As these stored procedures run entirely in DB2, this time represents class 1 and class 2 time.

Field Name: QWACSPNF_CP

CLASS 1/2 UDF NF SE CPU TIME
Accumulated CPU time consumed executing user-defined functions on the main application execution unit on an IBM specialty engine. Since these UDFs run entirely within DB2, this time represents class 1 and class 2 time.

Field Name: QWACUDFNF_ZIIP

CLASS 1/2 UDF NF ELAPSED TIME

Accumulated elapsed time consumed executing user-defined functions on the main application execution unit. Since these UDFs run entirely within DB2, this time represents class 1 and class 2 time.

Field Name: QWACUDFNF_ELAP

CLASS 1/2 UDF NF CP CPU TIME

Accumulated CPU time consumed executing user-defined functions on the main application execution unit. This time does not include CPU consumed on an IBM specialty engine. Since these UDFs run entirely within DB2, this time represents class 1 and class 2 time.

Field Name: QWACUDFNF_CP

CLASS 2: DB2 ELAPSED TIME

The class 2 elapsed time for nonnested activity accumulated in DB2 for the allied agent. This time does not include the time spent in DB2 processing SQL statements issued by stored procedures, user-defined functions, or triggers.

Special Considerations

- The time for most thread allocation and certain abend conditions is not reflected in this time.
- The elapsed time for distributed processing is included in the elapsed time of allied-distributed threads.
- In query CP, sysplex query, or utility parallelism, this is the time shown in the originating record, which overlaps the elapsed times shown in the parallel records.

Note: This field is not normally shown in the short layouts but can be included with UTR.

Field Name: QWACASC

CLASS 2: DB2 ENTRY/EXIT EVENTS

The total number of DB2 entry and exit events processed by the allied address space to calculate the elapsed time in DB2 and the processor time. This counter does not include the SQL entry and exit events processed by stored procedures.

Field Name: QWACARNA

This is an exception field.

CLASS 2: TCB TIME

The accumulated MVS CPU time that is spent in DB2. This CPU time does not include the:
- CPU time that is consumed on an IBM specialty engine
- CPU time that is consumed while processing SQL statements in a stored procedure
Field Name: QWACAJST

CLASS 2: NON-ZERO CLASS 2

This data section shows whether there is nonzero accounting class 2 data. Yes indicates that accounting class 2 or 7 was active during the life of the agent when a class 2 event occurred.

Field Name: QWACCLS2

CLASS 2: STORED PROC ELAPSED TIME

The total elapsed time that the allied agent spent executing SQL in the stored procedures or WLM address space.

A stored procedure may initiate a trigger or invoke a user-defined function; this time is not included in this counter.

Note: This field is not normally shown in the short layouts but can be included with UTR.

Field Name: QWACDEB

CLASS 2: DATA COLLECTED

The accounting class 2 data was being collected when this accounting record was written.

Field Name: QWACCL2O

CLASS 2: STORED PROCEDURE TCB TIME

The TCB time accumulated in DB2 for processing SQL statements issued by stored procedures. This time is only calculated if accounting class 2 is active.

Field Name: QWACSPTT

CLASS 2: STORED PROC. ENTRY/EXITS

The number of SQL entry or exit events performed by stored procedures. This number is only calculated if accounting class 2 is active.

Field Name: QWACSPNE

CLASS 2: UDF ELAPSED TIME

The total elapsed time spent by the allied agent executing SQL using UDF requests processed in a DB2 stored procedure or WLM address space. A user-defined function may initiate a trigger or invoke a stored procedure. Any time spent there is not included in this counter. This time includes time needed to connect and disconnect the UDF task. Non-inline UDF times are included in this time if the native UDF was called on a nested task and was not invoked by the main application execution unit.

Note: With user-tailored reporting (UTR) you can include this field in the short layouts of Accounting.

Field Name: QWACUDEB

CLASS 2: UDF SQL ENTRY/EXITS EVENTS

The number of SQL entry/exit events performed by user-defined functions. This is only calculated if accounting class 2 is active.

Field Name: QWACUDNE
CLASS 2: CP CPU TIME UDF

The accumulated CPU time consumed in DB2 when processing SQL statements that were issued by UDF(s) processed in a DB2 stored procedure or WLM address space.

This time also includes the DB2 time required to connect and disconnect the UDF task. Non-inline UDF times are included in this time if the native UDF was called on a nested task and was not invoked by the main application execution unit.

This time is a subset of QWACUDCP and is only calculated if accounting class 2 is active.

This time does not include CPU consumed on an IBM specialty engine.

Field Name: QWACUDTT

CLASS 2: SE CPU TIME

The accumulated and consumed class 2 time on an IBM specialty engine (SE) that consists of times for non-nested, stored procedures, user-defined functions, triggers, and parallel tasks.

Note: All CPU times of an IBM specialty engine that are reported in DB2 trace records are already normalized by DB2 to the speed of the general purpose processor.

Field Name: QWACCLS2_ZIIP

CLASS 2: TRIG ELAP TIME UNDER ENCLAVE

The accumulated elapsed time used for executing triggers under an enclave.

Field Name: QWACTREE

CLASS 2: SE ELIGIBLE CP CPU TIME

The accumulated CPU time that is consumed on a standard CP for work eligible on an IBM specialty engine.

For records for the parent tasks in parallel queries, this value reflects zIIP-eligible time for the parent and the child tasks. Child task records have a value of 0.

Field Name: QWACZIIP_ELIGIBLE

CLASS 2: TRIG TCB TIME UNDER ENCLAVE

The accumulated CPU time used for executing triggers on a nested task. This time does not include CPU consumed on an IBM specialty engine.

Field Name: QWACTRTE

CLASS 2: QWACTRTT_ZIIP

The accumulated CPU time consumed on an IBM specialty engine while running triggers on a nested task or on the main application execution unit.

Field Name: QWACTRTT_ZIIP

CLASS 2: TRIG ELAP TIME NOT UNDER ENCLAVE
The accumulated elapsed time used when executing under the control of a trigger. This does not include the time used while in user-defined functions or stored procedures that are called from the trigger.

Field Name: QWACTRET

CLASS 2: ELAPSED TIME ELIGIBLE FOR ACCEL

The accumulated elapsed time spent processing SQL in DB2 that may be eligible for execution on an accelerator.

Field Name: QWAC_ACCEL_ELIG_ELA

CLASS 2: TRIG TCB TIME NOT UNDER ENCLAVE

The accumulated TCB time that is used when running under the control of a trigger. This does not include the time that is used while running in user-defined functions or stored procedures that are called from the trigger. This CPU time does not include the CPU time that is consumed on an IBM specialty engine.

Field Name: QWACTTRTT

This is an exception field.

CLASS 2: CP CPU TIME ELIGIBLE FOR ACCEL

The accumulated CPU time spent processing SQL in DB2 that may be eligible for execution on an accelerator.

Field Name: QWAC_ACCEL_ELIG_CP

CLASS 2: SE CPU TIME ELIGIBLE FOR ACCEL

The accumulated CPU time consumed on an IBM specialty engine while processing SQL in DB2 that may be eligible for execution on an accelerator.

Field Name: QWAC_ACCEL_ELIG_SE

CLASS 2: TRIG TCB TIME NOT UNDER ENCLAVE

The accumulated TCB time that is used when running under the control of a trigger. This does not include the time that is used while running in user-defined functions or stored procedures that are called from the trigger. This CPU time does not include the CPU time that is consumed on an IBM specialty engine.

Field Name: QWACTTRTT

This is an exception field.

CLASS 3: ACCU LOCK ELAPSED TIME

The accumulated wait time because of local contention for locks. The term local contention is used to differentiate from global contention (which is reported in QWACAWTL). Local contention does not require intersystem communication. The contention is detected and resolved entirely within this subsystem.

Field Name: QWACAWTL

This is an exception field.

CLASS 3: WAIT TRACE EVENTS

The number of wait trace events processed for waits for local contention for locks.
Field Name: QWACARNL

CLASS 3: DB2 LATCH SUSP TIME
The accumulated wait time because of latch contention.

Field Name: QWACAWLH

CLASS 3: LATCH WAIT TRACE EVENTS
The number of wait trace events processed for waits for latch contention.

Field Name: QWACARLH

CLASS 3: SYNCHRONOUS I/O SUSP TIME
The accumulated I/O elapsed wait time for database I/O done under this thread. This field is for synchronous I/O only. It includes synchronous read and write I/O. This value is an average.

Field Name: QWACAWTI

CLASS 3: SYNCHRONOUS I/O SUSP EVENTS
The number of wait trace events processed for I/O.

Field Name: QWACARNE

CLASS 3: LOG WRITE I/O SUSP TIME
The accumulated wait time for log write I/O.
This value is an average.

Field Name: QWACAWLG

CLASS 3: LOG WRITE I/O SUSP EVENTS
The number of log I/O suspensions.

Field Name: QWACARLG

CLASS 3: OTHER READ SUSP TIME
The accumulated waiting time due to a read I/O that performed under a thread other than the one being reported. The time does not represent the total duration of the subject read I/O. It includes:
- Sequential prefetch
- List prefetch
- Dynamic Prefetch
- Synchronous read I/O performed by a thread other than the one being reported

Field Name: QWACAWTR
This is an exception field.

CLASS 3: OTHER READ SUSP EVENTS
The number of suspensions due to read I/O.

Field Name: QWACARNR

CLASS 3: OTHER WRITE SUSP TIME
The accumulated waiting time due to a write I/O that performed under a thread other than the one being reported. This time does not represent the total duration of the subject write I/O. It includes:
- An asynchronous write I/O
A synchronous write I/O performed by a thread other than the one being reported

- Frequent system checkpoints and low settings for deferred write thresholds
- When updating a page that is being written, the first thread wait is captured under Other Write I/O
- Other concurrent threads on the same DB2 subsystem will encounter Page latch suspension.

**Field Name:** QWACAWTW

This is an *exception* field.

**CLASS 3: OTHER WRITE SUSP EVENTS**

The number of suspensions due to write I/O.

**Field Name:** QWACARNW

**CLASS 3: UPDATE COMMIT SUSP TIME**

The accumulated wait time because of synchronous execution unit switch for DB2 Phase 2 commit, abort, or deallocation. This includes wait time for Phase 2 commit Log writes and database writes for LOB with LOG NO. For data sharing environment Page P-locks unlocks for updated pages and GBP writes.

**Field Name:** QWACAWTE

**CLASS 3: UPDATE COMMIT SUSP EVENTS**

The number of update commit suspensions.

**Field Name:** QWACARNS

**CLASS 3: PAGE LATCH (DB2+IRLM) SUSP TIME**

Page latch suspension could be due to concurrent threads that try to update a hot page that is frequently written because of a low deferred write threshold.

In the data sharing environment, within the same member, the first thread gets a P-lock (such as: Index leaf page P-Lock or P-Lock for Space map page or data page P-Lock for Row level locking) during high INSERT activity. Performance trace for IFCID 226 and 227 provide more information for detailed analysis.

With a high number of concurrent threads, for subsequent threads in the same member for the same resource, contention is reported as encountering a page latch contention. Randomizing the Index key helps minimizing page latch contentions for the Index leaf page.

If the page latch is for a space map page and an incremental image copy is not used, use the DDL TRACKMOD NO option to avoid frequent updates to the space map page. The Member Cluster option reduces page latch contention for a space map page.

**Field Name:** QWACAWTP

**CLASS 3: PAGE LATCH (DB2+IRLM) SUSP EVENTS**

The number of page latch wait trace events processed.

**Field Name:** QWACARNH

**CLASS 3: NOTIFY MESSAGES SUSP TIME**
The accumulated elapsed waiting time due to suspensions caused by sending notify messages to other members in the data sharing group. Messages are sent, for example, when the database descriptors are changed due to DDL.

**Field Name:** QWACAWTG

**CLASS 3: NOTIFY MESSAGES EVENTS**

The number of wait trace events processed for sending notify messages to other members in the data sharing group.

**Field Name:** QWACARNG

**CLASS 3: GLOB CONT PARENT L-LOCK TIME**

The accumulated global contention wait time for parent L-locks.

A parent L-lock can be one of the following types:
- Database
- Tablespace
- Table
- Partition

**Background and Tuning Information**

Performance Expert might adjust this value if the thread was suspended when performance data was gathered.

**Field Name:** QWACAWTJ

**CLASS 3: GLOB CONT PARENT L-LOCK EVENTS**

The number of wait trace events processed for group-level contentions in a data sharing environment.

**Field Name:** QWACARNJ

**CLASS 3: GLOB CONT CHILD L-LOCK TIME**

The accumulated global contention wait time for child L-locks.

A child L-lock type can be:
- Page
- Row

**Field Name:** QWACAWTK

**CLASS 3: GLOB CONT CHILD L-LOCK EVENTS**

The number of wait trace events processed for waits due to global contention for child L-locks.

**Field Name:** QWACARNK

**CLASS 3: GLOB CONT OTHER L-LOCK TIME**

The accumulated global contention wait time for other L-locks. Global extend lock is acquired in exclusive mode by Inserters before an extend service task switch.

**Field Name:** QWACAWTM

**CLASS 3: GLOB CONT OTHER L-LOCK EVENTS**

The number of wait trace events processed for waits due to global contention for other L-locks.
Field Name: QWACARNM

**CLASS 3: GLOB CONT PGSET/PART P-LOCK TIME**

The accumulated global contention time for pageset and partition P-locks.

Field Name: QWACAWTN

**CLASS 3: GLOB CONT PGSET/PART P-LOCK EVENTS**

The number of wait trace events processed for waits due to global contention for page set or partition P-locks.

Field Name: QWACARNN

**CLASS 3: GLOB CONT PAGE P-LOCK TIME**

The accumulated global contention wait time for page P-locks.

Field Name: QWACAWTO

**CLASS 3: GLOB CONT PAGE P-LOCK EVENTS**

The number of wait trace events processed for waits due to global contention for page P-locks.

Field Name: QWACARNO

**CLASS 3: GLOB CONT OTHER P-LOCK TIME**

The accumulated global contention wait time for other P-locks. Includes suspension for Castout P-Locks and DBET locks. It could be because of Index Split processing which can be minimized if the Index key size is not large. If you can minimize the number of Index Keys in the Index, it will help to reduce the number of Index splits.

Field Name: QWACAWTQ

**CLASS 3: GLOB CONT OTHER P-LOCK EVENTS**

The number of wait trace events processed for waits due to global contention for other P-locks.

Field Name: QWACARNQ

**CLASS 3: SCHED. STOR PROC SUSP TIME**

The total elapsed waiting time for an available TCB before the stored procedure could be scheduled.

Field Name: QWACCAST

**CLASS 3: STORED PROCEDURE EVENTS**

The number of wait trace events processed for an unavailable TCB needed for a stored procedure.

Field Name: QWACCANM

**CLASS 3: SCHED. UDF SUSP TIME**

The total elapsed time spent waiting for an available TCB before the user-defined function could be scheduled.

Field Name: QWACUDST

**CLASS 3: NON-ZERO CLASS 3**

CLASS 3 DATA IN THIS RECORD: Y/N

Field Name: QWACCLS3
CLASS 3: TCP/IP LOB XML TIME

The accumulated wait time for TCP/IP LOB and XML (storing large object and XML) materialization.

Field Name: QWACALBW

CLASS 3: TCP/IP LOB XML EVENTS

The number of wait trace events that were processed for waits for TCP/IP LOB and XML materialization.

Field Name: QWACALBC

CLASS 3: ACCELERATOR SUSP TIME

The accumulated wait time for requests to an accelerator.

Field Name: QWACAACW

CLASS 3: ACCELERATOR EVENTS

The number of wait trace events processed for requests to an accelerator.

Field Name: QWACAACC

CLASS 3: AUTON PROC WAIT TIME

The accumulated time waiting for autonomous procedures to complete.

Field Name: QWAC_AT_WAIT

CLASS 3: AUTON PROC EVENTS

The number of autonomous procedures that were executed:
1. For non-rollup records, this value is the number of autonomous procedures that were executed.
2. For a parallel query rollup record, this value is 0.
3. For a DDF or RRSAF rollup record, this value is the number of autonomous procedures that were executed. These procedures are NOT counted in QWACPCNT.
4. For autonomous procedures rollup records, this value is 0.

Field Name: QWAC_AT_COUNT

CLASS 3: PARALLEL QUERY SYNC WAIT TIME

The accumulated time waiting for parallel queries to synchronize between parent and child tasks.

Field Name: QWAC_PQS_WAIT

CLASS 3: PARALLEL QUERY SYNC WAIT EVENTS

The number of times the parallel query processing had to suspend because it was waiting for the synchronization of parent or child.

Field Name: QWAC_PQS_COUNT

CLASS 3: CLASS 3 DATA COLLECTED

The accounting class 3 data was being collected when this accounting record was written.

Field Name: QWACCL3O

CLASS 7: DATA COLLECTED
The accounting class 7 data was being collected when this accounting record was written.

Field Name: QWACCL7O

CLASS 8: DATA COLLECTED

The accounting class 8 data was being collected when this accounting record was written.

Field Name: QWACCL8O

MAX WORKFILE BLOCKS

The maximum number of work-file blocks that are used by this agent at any given point in time (traditional work-file blocks, declared global temporary tables (DGTT) and DGTT indexes) (DB2 field QWAC_WORKFILE_MAX).

Field Name: QWAC_WORKFILE_MAX

CURR WORKFILE BLOCKS

The current number of work-file blocks that are used by this agent (traditional workfile use, declared global temporary tables (DGTT) and DGTT indexes).

Field Name: QWAC_WORKFILE_CURR

WLM SERVICE CLASS

The MVS workload manager service class name. This field is used for database access threads on MVS 5.2 or later.

Field Name: QWACWLME

PARALLEL CHILDREN ROLLED INTO RECORD

The number of parallel child agents rolled into this record. The value depends on the record type:
1. For all non-rollup records, this value is 0.
2. For a parallel query rollup record, this value is the number of parallel child agents rolled into this record.
3. For a DDF/RRSAF rollup record, this value is the number of parallel query child agents rolled into this record. These agents are NOT counted in QWACPCNT.
4. For an autonomous procedure rollup record, this value is 0.

Field Name: QWAC_PT_COUNT

ROLLUP DATA FOR PARALLEL CHILD TASKS

The field indicates whether to roll up accumulate query parallel task's accounting trace into originating task's accounting trace. Possible values are:

YES  Originating task cut an additional accounting trace record with all roll-up values from parallel tasks.

NO   Each parallel task will produce its own accounting trace record.

Field Name: QWACPARR

PARALLEL QUERY ROLLUP DATA

This record contains parallel query rollup data.
Field Name: QWAC_RU_PARQRY

AUTON PROC ROLLUP DATA

This record contains autonomous procedure rollup data.

Field Name: QWAC_RU_AT
Record trace - IFCID 003 - Instrumentation Accounting Data Overflow

The field labels shown in the following sample layout of “Record Trace - IFCID 003 - Instrumentation Accounting Data Overflow” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>

Field Name: QWAXALOG
This is an exception field.

Field Name: QWAXALCT

Field Name: QWAXAAR

Field Name: QWAXANAR

Field Name: QWAXAWDR
This is an exception field.
DRAIN LOCK SUSP EVENTS
The number of wait trace events processed for waits for drain locks.
Field Name: QWAXARND

CLAIM RELEASE SUSP TIME
The accumulated waiting time for a drain waiting for claims to be released. After the drain lock is acquired, the drainer must wait for claim holders to release the object.
Field Name: QWAXAWCL
This is an exception field.

CLAIM RELEASE SUSP EVENTS
The number of wait trace events processed for waits for claims to be released.
Field Name: QWAXARNC

I/O SERVICE TASK SUSP TIME
Accumulated waiting time for a synchronous execution unit switch to the DB2 OPEN/CLOSE data set service for the HSM recall service.
This value is an average.
Field Name: QWAXOCSE

I/O SERVICE TASK SUSP EVENTS
Number of wait trace events processed of waits for synchronous execution unit switching to the Open/Close service.
Field Name: QWAXOCNS

SYSLGRNG SUSP TIME
Accumulated wait time for a synchronous execution unit switch to the DB2 SYSLGRNG recording service. This service is sometimes used for Level ID checking for downlevel detection.
This value is an average.
Field Name: QWAXSLSE

SYSLGRNG SUSP EVENTS
Number of wait trace events for a synchronous execution unit switch to the DB2 SYSLGRNG recording service.
Field Name: QWAXSLNS

DS MANAGER SUSP TIME
Accumulated wait time for a synchronous execution unit switch to the DB2 data space manager services. This includes DEFINE DATA SET, EXTEND DATA SET, DELETE DATA SET, RESET DATA SET, and VSAM CATALOG ACCESS.
This value is an average.
Field Name: QWAXDSSE

DS MANAGER SUSP EVENTS
Number of wait trace events for waits for synchronous execution unit switching to the DB2 data space manager services.

Field Name: QWAXDSNS

OTHER SERVICE SUSP TIME

Could be due to a VSAM catalog update. In the distributed environment, it includes the waiting time for the response from the server system. Performance trace for IFCID 46 to 50, 170, and 171 provide more detailed information for analysis.

Field Name: QWAXOTSE

OTHER SERVICE SUSP EVENTS

Number of wait trace events for a synchronous execution unit switch to other DB2 service tasks.

Field Name: QWAXOTNS

COMMIT PH1 WRITE I/O TIME

The accumulated time waiting for phase 1 commit write I/O. An example for this suspension is LOB Table Space with LOG NO Phase 1 commit database synchronous write I/O processing.

Field Name: QWAXAWFC

COMMIT PH1 WRITE I/O EVENTS

The total number of wait trace events for commit phase 1 I/O.

Field Name: ADFCSUSC

ASYNC. IXL REQ. TIME

The accumulated wait time for IXLCACHE and IXLFCOMP requests.

Field Name: QWAXIXLT

ASYNC. IXL EVENTS

Number of wait trace events processed for asynchronous IXLCACHE or IXLFCOMP invocations.

Field Name: QWAXIXLE

LOB COMPRESSION SUSP TIME

The accumulated time waiting for a compression of DB2 large objects (LOB) (DB2 field QWAX_LOBCOMP_WAIT).

Field Name: QWAX_LOBCOMP_WAIT

LOB COMPRESSION SUSP EVENTS

The number of wait trace events processed for DB2 large object (LOB) compressions.

Field Name: QWAX_LOBCOMP_COUNT

FAST INSERT PIPE WAIT TIME

The accumulated wait time for pipe wait (DB2 field QWAXPIPE_WAIT).

Field Name: QWAX_PIPE_WAIT

FAST INSERT PIPE WAIT EVENTS
The number of wait trace events that were processed for pipe wait (DB2 field QWAX_PIPEWAIT_COUNT).

Field Name: QWAX_PIPEWAIT_COUNT
IFCID 003 - Locking Data

IFCID 003 - Locking Data
This topic shows detailed information about “Record Trace - IFCID 003 - Locking Data”.

Record trace - IFCID 003 - Locking Data
The field labels shown in the following sample layout of “Record Trace - IFCID 003 - Locking Data” are described in the following section.

<table>
<thead>
<tr>

</tbody>
</table>

DEADLOCKS
The number of times deadlocks were detected. This number should be low, ideally 0.

Background and Tuning Information
Deadlocks occur when two or more application processes each hold locks on resources that the others need, without which they cannot proceed. Ensure that all applications accessing the same tables access them in the same order.

To improve concurrency:
- Use row level locking instead of page level locking to minimize deadlocks.
- For small tables use page level locking with MAXROWS 1.

To minimize deadlocks:
- Delay updates to just before commit.
- Use SELECT with the FOR UPDATE clause to use U lock.
- Adjust the deadlock detection cycle parameter DEADLOK in the IRLM procedure.

This field is incremented once for each deadlock encountered. There is no correlation between this field and the deadlock events reported in the Locking report set or the number of IFCID 172 records written. This field reports all deadlocks, regardless of how they were resolved. The locking report and record trace IFCID 172 show only those deadlocks that were resolved by DB2.

Field Name: QTXADEA
This is an exception field.

LOCK REQUEST
The number of requests to lock a resource.

Field Name: QTXALOCK
This is an exception field.

LOCK SUSPENSIONS
The number of times a lock could not be obtained and the unit of work was suspended.

Background and Tuning Information
This number should be low, ideally 0.
The number of lock suspensions is a function of the lock requests. Lock suspensions (or conflicts) can happen on either LOCK REQUEST or CHANGE REQUEST.

Suspensions are highly dependent on the application and table space locking protocols.

Field Name: QTXASLOC
This is an exception field.

CLAIM REQUESTS
The number of claim requests.

Field Name: QTXACLNO
This is an exception field.

TIMEOUTS
The number of times a unit of work was suspended for a time exceeding the timeout value. This number should be low, ideally 0.

Field Name: QTXATIM
This is an exception field.

UNLOCK REQUEST
The number of requests to unlock a resource.

This value can be less than the number of lock requests because DB2 can release several locks with a single unlock request.

Field Name: QTXAUNLK

IRLM LATCH SUSPENS.
The number of latch suspensions.

Field Name: QTXASLAT

CLAIM REQ. FAILED
The number of unsuccessful claim requests.

Field Name: QTXACLUN

ESCALATIONS(SHR)
The number of times the maximum page locks per table space are exceeded, and the table space lock escalates from a page lock (IS) to a table space lock (S) for this thread. You can specify the number of locks allowed per table space with the LOCKS PER TABLE(SPACE) parameter on the DB2 install panel DSNTPJ.

Background and Tuning Information
Escalations can cause unpredictable response times. Lock escalations should only happen when an application process updates or references (if repeatable read is used) more pages than normal.

Field Name: QTXALES
This is an exception field.

QUERY REQUEST
The number of query requests.
IFCID 003 - Locking Data

Field Name: QTXAQR
This is an exception field.

OTHER SUSPENSIONS
The number of suspensions caused by something other than lock or latch.
Field Name: QTXASOTH
This is an exception field.

DRAIN REQUESTS
The number of drain requests.
Field Name: QTXADRNO
This is an exception field.

ESCALATIONS(EXC)
The number of times the maximum page locks per table space are exceeded and the table space lock escalates from a page lock (IX) to a table space lock (X).

Background and Tuning Information
Escalations can cause unpredictable response times. Lock escalations should only happen when an application process updates or references (if repeatable read is used) more pages than it normally does.

A useful rule of thumb is to compare the number of escalations (shared and exclusive) to the successful escalations (those that did not cause deadlocks and timeouts). If this value, or the number Lock escalations - shared and if the number of timeouts or deadlocks is also not 0, the timeout or deadlock is probably caused by the escalation.

If many escalations cause deadlocks and timeouts, the recommendation is to change the escalation threshold value. Use of ANY is extremely useful to prevent unnecessary and expensive page locks, for example locking all pages in a tablespace.

Lock escalations, shared or exclusive, should not be expected in a transaction environment.
Field Name: QTXALEX
This is an exception field.

CHANGE REQUEST
The number of change requests.
Field Name: QTXACHG
This is an exception field.

DRAIN REQ. FAILED
The number of unsuccessful drain requests.
Field Name: QTXADRUN
This is an exception field.

MAXIMUM PAGE/ROW LOCKS HELD
The maximum number of page or row locks concurrently held against all table spaces by a single application during its execution. This count is a high-water mark. It cannot exceed the LOCKS PER USER parameter on panel DSNTIPJ.

**Field Name:** QTXANPL

This is an *exception* field.

**OTHER REQUEST**

The number of requests to IRLM to perform a function other than LOCK, UNLOCK, QUERY, or CHANGE.

**Field Name:** QTXAIRLM

This is an *exception* field.
IFCID 003 - Logging

This topic shows detailed information about “Record Trace - IFCID 003 - Logging”.

Record trace - IFCID 003 - Logging

UDF TIMEOUTS
The number of times a user-defined function timed out while waiting to be scheduled.

Field Name: QXCAUDTO
This is an exception field.

UDF REJECTS
The number of times a user-defined function was rejected.

Field Name: QXCAUDRJ
This is an exception field.

STMT TRIGGER
The number of times a statement trigger was activated.

Field Name: QXSTTRG
This is an exception field.

ROW TRIGGER
The number of times a row trigger was activated.

Field Name: QXROWTRG
This is an exception field.

SQL ERROR TRIGGER
The number of times an SQL error occurred during the execution of a triggered action. This includes errors that occur in user-defined functions or stored procedures that are called from triggers and that pass back a negative SQLCODE.

Field Name: QXTRGERR
This is an exception field.
IFCID 003 - Query Parallelism

This topic shows detailed information about “Record Trace - IFCID 003 - Query Parallelism”.

This report has the same layout as “IFCID 002 - Query Parallelism” on page 40-131.
IFCID 003 - Resource Limit Facility

This topic shows detailed information about “Record Trace - IFCID 003 - Resource Limit Facility”.

Record trace - IFCID 003 - Resource Limit Facility

The field labels shown in the following sample layout of “Record Trace - IFCID 003 - Resource Limit Facility” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES LIMIT SCOPE</td>
<td>Indicates how the resource limit was established. A value of 0 shows that</td>
</tr>
<tr>
<td></td>
<td>the resource limit facility was not started.</td>
</tr>
<tr>
<td>RLF TABLE ID</td>
<td>The identifier of the resource limit specification table.</td>
</tr>
<tr>
<td>LIMIT IN CPU 16 MICROSEC</td>
<td>The CPU time limit, in microseconds, set by the resource limit facility.</td>
</tr>
<tr>
<td>RES LIMIT TYPE</td>
<td>Indicates how the type of resource limit was established: infinite, zero,</td>
</tr>
<tr>
<td></td>
<td>or limit.</td>
</tr>
<tr>
<td>LIMIT IN SERVICE UNITS</td>
<td>The maximum number of CPU service units to be used. Normally, the value</td>
</tr>
<tr>
<td></td>
<td>is not 0 if the RES LIMIT TYPE is LIMIT. A value of 0 indicates no limit.</td>

Record trace - ICCID 003 - Rollup Accounting Correlation Block

The field labels shown in the following sample layout of “Record Trace - ICCID 003 - Rollup Accounting Correlation Block” are described in the following section.

TOKEN

The agent token for the transaction rolled into the record. This can be used to correlate to records written with the same QWHSACE value during the time of the transaction (QWARBSC to QWARESC).

Field Name: QWARACE

START

The beginning time for the transaction.

Field Name: QWARBSC

END

The end time for the transaction.

Field Name: QWARESC
Record trace - IFCID 003 - ROWID

The field labels shown in the following sample layout of “Record Trace - IFCID 003 - ROWID” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ROWID</td>
<td>The number of times that direct row access was successful.</td>
</tr>
<tr>
<td>DIRECT ACCESS</td>
<td>The number of times that direct row access was successful.</td>
</tr>
<tr>
<td>INDEX USED</td>
<td>The number of times an index was used to find a record.</td>
</tr>
<tr>
<td>TABLE SPACE SCAN USED</td>
<td>The number of times that an attempt to use direct row access reverted to using a table-space scan because DB2 was unable to use a matching index scan.</td>
</tr>
</tbody>
</table>

Background and Tuning Information

Ideally, this value should be 0.

Table-space scans can happen, for example, when a REORG is performed between the read of the ROWID column and the use of the host variable in the WHERE clause of the SQL statement. This causes the RID value in the host variable to be incorrect. DB2 first tries a matching-index scan before using a table-space scan.

To avoid table space scans, you can force the access path of an unsuccessful direct row access to use a matching index scan on the primary-index key by adding PKCOL to the WHERE clause in the SQL statement. .... WHERE ROWIDCOL=:HVROWID AND PKCOL=:HVPK

IFCID 006 - Read I/O Start

This topic shows detailed information about “Record Trace - IFCID 006 - Read I/O Start”.

Record trace - IFCID 006 - Read I/O Start

The field labels shown in the following sample layout of “Record Trace - IFCID 006 - Read I/O Start” are described in the following section.

| DBID: TDKUSD | POOL ID: 100 | ACE: 1 |
| OBID: TDKURTS1 | FIRST: X'01000012' | READTYPE: R |
| PAGE NUMBERING: ABS |
| TABLE_SPACE_TYPE: V | PARTITION NUMBER: 1 |

DBID

The page set ID. This page set can be either a table space or an index space. If it is a table space, use this value to match column PSID in SYSIBM.SYSTABLESPACE to find the name of the table space. If it is an index space, use this value to match column ISOBID SYSIBM.SYSINDEXES to find the internal name of the index space. This is deduced from the DB2 fields QW0006OB, and QW0105TN or QW0107TN.

When present, the database name is shown, otherwise the decimal identifier from QW0006DB is shown, or N/A when this value is 0.

Field Name: RT0006DB

POOL ID

The internal identifier of the buffer pool. The values 0 through 49 are the identifiers for BP0 through BP49. The values 80 through 89 are the identifiers for BP32K through BP32K9.

Field Name: QW0006BP

ACE

The agent control element (ACE) token of the requester.

The relative number of the agent control element address in the ACE cross-reference table. This table is printed at the end of each location for every trace specified.

Field Name: QW0006AC

OBID

The page set ID. This page set can be either a table space or an index space. If it is a table space, use this value to match column PSID in SYSIBM.SYSTABLESPACE to find the name of the table space. If it is an index space, use this value to match column ISOBID SYSIBM.SYSINDEXES to find the internal name of the index space. This is deduced from the DB2 fields QW0006OB, and QW0105TN or QW0107TN.

When present, the name of the object is shown, otherwise the decimal identifier from QW0006OB is shown, or N/A when this value is 0.

Field Name: RT0006OB

FIRST

The hexadecimal number of the first page to be read for a table space that is not defined as large.
IFCID 006 - Read I/O Start

Field Name: QW0006PN

READTYPE

The type of read performed:

S  Sequential prefetch request
L  List prefetch request
D  Dynamic sequential prefetch request
R  Synchronous read request

Field Name: QW0006F

PAGE NUMBERING

<table>
<thead>
<tr>

**DBID**

The database ID. Deduced from the DB2 fields QW0010DB, and QW0105DN or QW0107DN.

When present the database name is shown, otherwise the decimal identifier from QW0010DB is shown, or N/A when this value is 0.

Field Name: RT0010DB

**REC ID**

The decimal identifier of the DB2 table OBID.

Field Name: QW0013OB

**OBID**

The object ID. Deduced from the DB2 fields QW0013OB, QW0105TN or QW0107TN.

When present, the name of the object is shown, otherwise the decimal identifier from QW0013OB is shown or N/A when this value is 0.

Field Name: RT0013OB

**COLUMN1**

The first column number.

Field Name: QW0013C1

**OPER**

The logical operator:

NE  Not equal to
GT  Greater than
GE  Greater than or equal to
LE  Less than or equal to
E   Equal
L   Less than
LT  Less than
LI  Like
NL  Not like
Field Name: QW0013OP

COL/VAL
Column data is printed in decimal. Value data is printed in hexadecimal.

Field Name: QW0013VA

CONN
The connector value:

A And
O Or
NONE Not specified

Field Name: QW0013CO

TRUE/FALSE
Indicates whether the comparison is true:

T True
F False
NONE Not specified

Field Name: QW0013TF
Record trace - IFCID 014 - Hash Scan End

The field labels shown in the following sample layout of “Record Trace - IFCID 014 - Hash Scan End” are described in the following section.

RETURN
QW0014RE  0

RETURN

The return code.

Field Name: QW0014RT
IFCID 015 - Index Scan Begin

This topic shows detailed information about “Record Trace - IFCID 015 - Index Scan Begin”.

Record trace - IFCID 015 - Index Scan Begin

**DBID**

The database ID. Deduced from the DB2 fields QW0016DB, QW0105DN, or QW0107DN.

When present, the database name is shown, otherwise the decimal identifier from QW0016DB is shown, or N/A when this value is 0.

**Field Name:** RT0016DB

**REC ID**

The decimal identifier of the DB2 table OBID.

**Field Name:** QW0016OB

**SQL TYPE**

Possible values are:

- **I** INSERT
- **U** UPDATE
  - Insert into a transition table for an UPDATE.
- **D** DELETE
  - Insert into a transition table for a DELETE.
- **R** RI
  - Insert into a transition table for a DELETE SET NULL for referential integrity.

**Field Name:** QW0016ST

**OBID**

The object ID. Deduced from the DB2 fields QW0016OB, QW0105TN or QW0107TN.

When present, the name of the object is shown, otherwise the decimal identifier from QW0016OB is shown, or N/A when this value is 0.

**Field Name:** RT0016OB

**TRIGGER LEVEL**

Depth of the trigger in the range 0 (no triggers) through 16.

**Field Name:** QW0016TL

**WORKFILE TYPE**

Possible values are:
IFCID 016 - Insert Scan Begin

WF  Workfile
TT  Temporary Table
TR  Transition table
NW  Non-workfile

Field Name: QW0016WT

CUB

The hexadecimal address of the CUB token.

Field Name: QW0016AC

INTEGRITY TYPE

BLANK

S  SET NULL
   This can occur when SQL TYPE=U

C  CASCADE DELETE
   This can occur when SQL TYPE=D

Field Name: QW0016RI

- ?? Unknown operator

Field Name: QW0017OP

**COL/VAL**

Column data is printed in decimal. Value data is printed in hexadecimal.

Field Name: QW0017VA

**CONN**

The connector type:
- **A** And
- **O** Or
- **NONE** Not specified

Field Name: QW0017CO

**TRUE/FALSE**

Indicates whether the comparison is true:
- **T** True
- **F** False
- **NONE** Not specified

Field Name: QW0017TF
IFCID 018 - Scan End

This topic shows detailed information about “Record Trace - IFCID 018 - Scan End”.

Record trace - IFCID 018 - Scan End

The field labels shown in the following sample layout of “Record Trace - IFCID 018 - Scan End” are described in the following section.

```
22.CKPA 'BLANK' 09:30:13.61943014 10 1 18 SCAN END <= NETWORKID: DEIBMIPS LUNAME: IPSAQC11 LUWSEQ: 1
201 0.00005981
-------------------------------------------------------------
CUB X'00000000'
QW0018RT 4 QW0018RE 13172737
-------------------------------------------------------------
DATA TYPE INDX ROW PROC 0 ROW EXAM 0 STG1-QUAL 0 STG2-QUAL 0 ROW INSRT 0
ROW UPDTE 0 ROW DELET 0 PAGES 2 RI SCAN 0 RI DELET 0 ROW SKIP 0
FST INSRT 0 N-PIPE IN 0 PIPE RE 0 INS WAIT 0
```

Field Name: QW0018AC

**DATA TYPE**

The scan type identification:

- **INDX**: Index scan
- **SEQD**: Sequential data scan
- **SEQR**: Transition table sequential data scan
- **SEQT**: Temporary table sequential data scan
- **SEQW**: Work-file sequential data scan

Field Name: QW0018ID

**ROW PROC**

The number of rows processed.

Field Name: QW0018RP

**ROW EXAM**

The number of rows examined. If DATA TYPE shows **INDX**, this number is the number of index entries (not rows) scanned.

Field Name: QW0018LA

**STG1-QUAL**

The number of rows qualified at stage 1.

Field Name: QW0018DQ

**STG2-QUAL**

The number of rows qualified at stage 2.

Field Name: QW0018RQ

**ROW INSRT**

The number of rows inserted.

Field Name: QW0018IN
ROW UPDATE

The number of rows updated.
Field Name: QW0018UP

ROW DELET

The number of rows deleted. If the delete was a mass delete, the indicator MASS is printed.
Field Name: QW0018DE

PAGES

The number of get page requests issued by the data manager to the buffer manager. Note that for an index scan the value includes the number of index pages scanned.
Field Name: QW0018PS

RI SCAN

The number of additional pages scanned for referential integrity.
Field Name: QW0018PR

RI DELET

The number of additional rows deleted for referential integrity.
Field Name: QW0018DR

ROW SKIP

The number of rows skipped due to an incompatible hold lock.
Field Name: QW0018SK

FST INSRT

The number of rows inserted using the fast insert algorithm. This value is usually 1, but it is more than 1 for insert with subselect.
Field Name: QW0018FI

N-PIPE IN

The number of times that fast insert could not be used for the insert operation, so a non-pipe insert algorithm was used instead.
Field Name: QW0018FS

PIPE RE

The number of times that the fast insert pipe was refilled for the insert operation.
Field Name: QW0018FA

INS WAIT

The number of times that the insert operation waited for the fast insert pipe to fill.
Field Name: QW0018FW
IFCID 019 - Edit Exit to Decode

This topic shows detailed information about “Record Trace - IFCID 019 - Edit Exit to Decode”.

Record trace - IFCID 019 - Edit Exit to Decode

The field labels shown in the following sample layout of “Record Trace - IFCID 019 - Edit Exit to Decode” are described in the following section.

<table>
<thead>
<tr>
<th>Field</th>

<td>'X'00000000'</td>
</tr>
</tbody>
</table>

DBID

The database ID. Deduced from the DB2 fields QW0019DB, QW0105DN or QW0107DN.

When present, the database name is shown, otherwise the decimal identifier from QW0019DB is shown, or N/A when this value is 0.

Field Name: RT0019DB

REC ID

The decimal identifier of the DB2 table OBID.

Field Name: QW0019OB

OBID

The object ID. Deduced from the DB2 fields QW0019OB, QW0105TN or QW0107TN.

When present, the name of the object is shown, otherwise the decimal identifier from QW0019OB is shown, or N/A when this value is 0.

Field Name: RT0019OB

TIME

The time at which the exit was called.

Field Name: QW0019TM

RETURN

The return code (EXPLRC1) from the user edit exit.

Field Name: QW0019RT

REASON

The reason code (EXPLRC2) from the user edit exit.

Field Name: QW0019RE
IFCID 020 - Lock Summary

This topic shows detailed information about “Record Trace - IFCID 020 - Lock Summary”.

This record has a variable format. It contains one data section for each table table space section present in the record.

Record trace - IFCID 020 - Lock Summary

The field labels shown in the following sample layout of “Record Trace - IFCID 020 - Lock Summary” are described in the following section.

MAXNO: 12
SHARED: 0 EXCL: 0
DBID : FIJ1DB01 OBID : FIJ50010 MAX LOCK: 0
TABLESPACE TYPE: PARTIT.-SPL ESCALATED: 0
LOCK SIZE : TABLESPACE OR TABLE
HISTATE: INTENT SHARE PRESTATE: NO LOCK ESCALATION

MAXNO
The maximum number of page, row and LOB locks held concurrently for the thread across all tables spaces and index spaces.

Field Name: QW0020TP

SHARED
The number of escalations to shared mode for the thread:
• For segmented table spaces, the number of tables that have escalated
• For partitioned table spaces using selective partition locking (SPL), the number of partitions that have escalated
• For simple and partitioned table spaces, the number of table spaces that have escalated

Field Name: QW0020TS

EXCL
The number of escalations to exclusive mode for the thread:
• For segmented table spaces, the number of tables that have escalated
• For partitioned table spaces using selective partition locking (SPL), the number of partitions that have escalated
• For simple and partitioned table spaces, the number of table spaces that have escalated

Field Name: QW0020TX

Table space sections
The record contains one data section for each relevant table space. These sections are only printed if they are present in the record.

Field Name: QW0020N

DBID
The database ID. Deduced from the DB2 fields QW0020PD, QW0105DN or QW0107DN.

When present, the database name is shown, otherwise the decimal identifier from QW0020PD is shown, or N/A when this value is 0.

Field Name: RT0020DB
OBID

The object ID. Deduced from the DB2 fields QW0020PP, QW0105TN or QW0107TN.

When present, the name of the object is shown, otherwise the decimal identifier from QW0020PP is shown, or N/A when this value is 0.

Field Name: RT0020OB

MAX LOCK

The maximum number of either page, row or LOB locks held by the thread.

Field Name: QW0020PL

ESCALATED

The number of escalations:
- For segmented table spaces, the number of tables that have escalated within the table space
- For partitioned table spaces using selective partition locking (SPL), the number of partitions that have escalated
- For table spaces using SPL, the number of partitions that have escalated

If the value in TABLESPACE TYPE is SIMPLE or PARTITIONED, this field is not printed.

Field Name: QW0020PC

LOCK SIZE

The lock size used.

Field Name: QW0020PR

HISTATE

The highest table space lock state. This field is printed for simple table spaces and partitioned table spaces not using SPL.

Field Name: QW0020PS

PRESTATE

The table space lock state before escalation. This field is printed for simple table spaces and partitioned table spaces not using SPL.

Field Name: QW0020PE
Record trace - IFCID 021 - Lock Detail

The field labels shown in the following sample layout of “Record Trace - IFCID 021 - Lock Detail” are described in the following section.

LOCK RES TYPE

The locked resource type.

Note: For data sharing, SKELETON CURSOR TABLE LOCKING and SKELETON PACKAGE TABLE LOCK are LP-locks (an LP-lock has an L-lock component and a P-lock component).

Field Name: QW0021KT

DBID

The database ID. This field is not applicable if the value in LOCK RES TYPE is:

SKELETON CURSOR TABLE LOCKING
UTILITY SERIALIZATION LOCK
SKELETON PACKAGE TABLE LOCK
COLLECTION
BINDLOCK
ALTER BUFFER POOL
GROUP BUFFERPOOL START/STOP LOCK
GROUP BUFFER POOL LEV CASTOUT P-LOCK
CATMAINT MIGRATION LOCK
CATMAINT CONVERT CATALOG LOCK
CATMAINT CONVERT DIRECTORY LOCK

Field Name: QW0021KD

OBID

The object ID. This field is not applicable if the value in LOCK RES TYPE is:

SKELETON CURSOR TABLE LOCKING
UTILITY SERIALIZATION LOCK
SKELETON PACKAGE TABLE LOCK
COLLECTION
BINDLOCK
ALTER BUFFER POOL
GROUP BUFFERPOOL START/STOP LOCK
DDF CDB P-LOCK
GROUP BUFFER POOL LEV CASTOUT P-LOCK
DBD P-LOCK
CATMAINT MIGRATION LOCK
CATMAINT CONVERT CATALOG LOCK
CATMAINT CONVERT DIRECTORY LOCK

Field Name: QW0021KP

RESOURCE ID
The hexadecimal identifier of the small resource. If LOCK RES TYPE is:

DATA PAGE LOCKING
    First 3 bytes are the page number

PARTITION LOCKING
    Last byte is the partition number

INDEX PAGE LOCKING
    First 3 bytes are the page number

HASH ANCHOR LOCK
    First 3 bytes are the page number and the last byte is the anchor point ID

CS-READ DRAIN
    Last byte is the partition number (optional)

RR-READ DRAIN
    Last byte is the partition number (optional)

WRITE DRAIN
    Last byte is the partition number (optional)

ROW LOCK
    First 3 bytes are the page number and the last byte is the row ID of the record

INDEX END OF FILE LOCK
    Last byte is the partition number (optional)

PAGESET/PARTITION P-LOCK
    First byte is the 1-based partition number (optional)

PAGE P-LOCK
    First byte is the 1-based partition number (optional) and the last 3 bytes are the relative page number

PAGESET/PARTITION LEV CASTOUT P-LOCK
    First byte is the 1-based partition number (optional)

Note:

- In large partitioned table spaces, the page number covers 4 bytes instead of 3.
- If table spaces use relative page numbers, the resource ID covers 7 bytes. It contains the partition number in the first 2 bytes, the page number in the next 4 bytes, and the record ID in the seventh byte.

For all other lock resource types, the resource ID is not applicable.

Field Name: QW0021KR

NAME

The plan name or collection name. This field is only printed if the value in LOCK RES TYPE is SKELETON CURSOR TABLE LOCKING or COLLECTION.

Deduced from the DB2 field QW0021KD, QW0021KP, and QW0021KR. when the locked resource type is skeleton cursor table locking.

Field Name: RT21NAME
IFCID 021 - Lock Detail

The collection identifier. This field is only printed if the value in LOCK RES TYPE is SKELETON PACKAGE TABLE LOCK.

The package identifier. This field is only printed if the value in LOCK RES TYPE is SKELETON PACKAGE TABLE LOCK.

The consistency token. This field is only printed if the value in LOCK RES TYPE is SKELETON PACKAGE TABLE LOCK.

Field Name: QW0021RN

BPID

The buffer pool ID. This field is only printed if the value in LOCK RES TYPE is:

- ALTER BUFFER POOL
- GROUP BUFFERPOOL START/STOP LOCK
- PAGESET/PARTITION P-LOCK
- PAGE P-LOCK
- GROUP BUFFERPOOL LEV CASTOUT P-LOCK
- PAGESET/PARTITION LEV CASTOUT P-LOCK

For ALTER BUFFER POOL, deduced from QW0021KD || QW0021KP.
For GROUP BUFFERPOOL START/STOP LOCK, deduced from QW0021KD || QW0021KP.
For PAGESET/PARTITION P-LOCK, deduced from QW0021P1.
For PAGE P-LOCK, deduced from QW0021P1.
For GROUP BUFFERPOOL LEV CASTOUT P-LOCK deduced from QW0021P1.
For PAGESET/PARTITION LEV CASTOUT P-LOCK, deduced from QW0021P1.

Field Name: RT21BPID

IRLM FUNC CODE

The IRLM function code.

Field Name: QW0021FC

RETURN TOKEN

The IRLM returned token.

Field Name: QW0021FT

REQUEST TOKEN

The lock request token. If the value in IRLM FUNC CODE is LOCK, this field shows "BLANK". If the value in IRLM FUNC CODE is UNLOCK or CHANGE, this field contains a 0 or a non-zero value. A 0 indicates that the lock name is used to identify the object that is to be unlocked or changed. A non-zero value is the same as the value in RETURN TOKEN. It associates the unlock or change request with the locked object.

Field Name: QW0021RT

LOCK STATE

The lock state.

Field Name: QW0021ST

DB2 TOKEN
The DB2 token which identifies the subsystem.

Field Name: QW0021TK

IRLM RETURN CODE

The return code from IRLM:

0  The request completed successfully.
4  The request completed successfully, but the lock state remained unchanged.
8  The request completed unsuccessfully because of a system error or condition.
12 The request completed unsuccessfully because of a logic error in the request.
16 The request completed unsuccessfully because of an invalid request specification.
20 The request completed unsuccessfully because IRLM resources are not available.

Field Name: QW0021RC

LOCK ATTRIBUTES

This field shows various lock attributes.

Field Name: QW0021FL

PROP TO XES

Indicates whether the request was propagated to XES by IRLM.

Field Name: QW0021Y1

ASYN TO XES

Indicates whether IRLM sent the request to XES asynchronously.

Field Name: QW0021Y2

LOCK DURATION

The lock duration:

MANUAL  Varies depending on the ISOLATION parameter (QW0021DR= x'20')

MANUAL+1  Temporary change of consistency level from CS to RR during bind and DDL (QW0021DR= x'21')

COMMIT  Until commit (QW0021DR=x '40')

COMMIT+1  Past commit; applies to locks needed to maintain the position for a cursor opened WITH HOLD (QW0021DR=x '41')

ALLOCATION  Until deallocation (QW0021DR=x '60')

PLAN  For the duration of the plan (QW0021DR=x '80')

UTIL  For the duration of the utility execution (QW0021DR=x '81')
IFCID 021 - Lock Detail

INTEREST
Duration used for P-locks (QW0021DR=x 'FE')

FREE ALL
Until all locks are freed (QW0021DR=x 'FF')

N/A Not applicable for NOTIFY SUSPEND

Field Name: QW0021DR

REQUEST TYPE
Indicates whether it was a P-lock or L-lock request.

Field Name: QW0021Z1

IRLM RETURN SUBCODE
The IRLM return subcode.

Field Name: QW0021SC

PARENT TOKEN
The parent lock token for explicit hierarchical locking. This token is only significant when DB2 is a member of a data sharing group. If the value in this field is not 0, then this request is for a child of a parent that has already been locked. This value must match the RETURN TOKEN field of the previously locked parent. This field is only applicable if the value in IRLM FUNC CODE is LOCK.

Field Name: QW0021PT

GLOBAL/LOCAL
Indicates whether this is a global or local lock.

Field Name: QW0021GF

OWNER
The DB2 member name of either of the following:
• The owner of an incompatible retained lock on this resource that caused this request to be denied
• The owner of an incompatible held lock on this resource that caused this request to timeout

Field Name: QW0021SN

CACHED STATE
The cached state of the P-lock. This field is only applicable if the value in REQUEST TYPE is P-LOCK, and the value in LOCK RES TYPE is PAGESET/PARTITION P-LOCK.

Field Name: QW0021CS

LOCK HASH VALUE
The hash value of the locked resource.

Field Name: QW0021LH
**IFCID 022 - Minibind**

This topic shows detailed information about “Record Trace - IFCID 022 - Minibind”.

Minibind record shows information about mini plans, which are generated by the optimizer at bind and SQL prepare time. One mini plan is generated for each table and for each subselect block in the query. This means that if your query uses subqueries, more than one mini plan record is written.

**Note:**
- When interpreting this record, relate table and mini plans by table name.
- The order of the mini plans might not be the same as the order of the table as written in the SQL statement.
- When you are not sure about the accessing order of the tables, use EXPLAIN to get the query block number and plan number.
- This IFCID shows whether sequential prefetch is used.
- This mini plan block is written for each query and repeated for each subsequent subquery.
- If the query or subquery uses index scan (INDEX_NUMBER > 0), information is provided for each index used.

**Record trace - IFCID 022 - Minibind**

The field labels shown in the following sample layout of “Record Trace - IFCID 022 - Minibind” are described in the following section.

</table>

**QUERYNO**

The number identifying the statement to be prepared.

**Field Name:** QW0022QN

**PLANNAME**

The plan name or package ID.

**Field Name:** QW0022PN
COST

The relative cost of the SQL statement. It might not relate to the actual CPU or elapsed time for the query.

Field Name: QW0022OS

PARALLELISM_DISABLED

Indicates whether query parallelism is disabled by the resource limit facility (RLF) for dynamic queries:

NO  The RLF does not affect this statement. (QW0022RP=x '00')

I/O ONLY  Query I/O parallelism is disabled. (QW0022RP=x '01')

CP ONLY  Query CP parallelism is disabled. (QW0022RP=x '02')

CP + I/O  Query I/O and CP parallelism is disabled. (QW0022RP=x '03')

X  Sysplex query parallelism is disabled. (QW0022RP=x '04')

X + I/O  Sysplex query and query I/O parallelism is disabled. (QW0022RP=x '05')

X + CP  Sysplex query and query CP parallelism is disabled. (QW0022RP=x '06')

YES  The entire query parallelism (I/O, CP, and sysplex) is disabled. (QW0022RP=x '07')

N/A  Query parallelism does not apply to this statement. (QW0022RP=x 'FF')

Field Name: QW0022RP

QBLOCKNO

The position of the query in the statement.

Field Name: QW0022QB

COLLID

The collection ID of the package.

Field Name: QW0022CI

PROGNAME

The name of the package containing the statement to be prepared.

Field Name: QW0022PG

CONSISTENCY_TOKEN

The consistency token.

Field Name: QW0022CT

APPLNAME

The name of the application plan.

Field Name: QW0022AL

WHEN_OPTIMIZE
Indicates when the access path of the SQL statement is optimized:

DEFAULT
The access path is determined at bind time using default values.

BIND
The access path is determined at bind time using default values, but it is reoptimized at runtime using values of input variables.

RUN
The access path is determined at runtime using values of input variables.

REOPT
The access path is reoptimized at runtime because the value of the host variable or parameter marker changes.

Field Name: QW0022RX
OPT_HINT_IDENT
Access path hint value.
Field Name: QW0022QO

OPTIMIZE_HINTS_USED
Indicates whether the query used access path hints.
Field Name: QW0022HT

UNITS
Estimated processor cost in service units for the SQL statement.
Field Name: QW0022AS
MILLI_SEC
Estimated processor cost in milliseconds for the SQL statement.
Field Name: QW0022CE
COSTCATEGORY
The cost category for the statement can be one of the following:
A This SQL statement is a category A statement.
B This SQL statement is a category B statement.
'BLANK'
Indicates that there is no processor cost estimate for this trace record.
Field Name: QW0022CC

PARENT_Q_BLOCKNO
Parent query block number.
Field Name: QW0022PQ
MEMBER
The member name of the DB2 that executed EXPLAIN. The column is blank if the DB2 subsystem was not in a data sharing environment when EXPLAIN was executed.
Field Name: QW0022GM
STATEMENT_TYPE
For each query block, the type of operation performed. For the outermost query, the statement type. Possible values:

- SELECT
- INSERT
- UPDATE
- DELETE
- SELUPD (SELECT for UPDATE)
- DELCUR (DELETE current of cursor)
- UPDCUR (UPDATE current of cursor)
- CORSUB (Correlated subquery)
- NCOSUB (Noncorrelated subquery)

**Field Name:** QW0022QT

**TIMESTAMP**

The timestamp at which the row is processed.

**Field Name:** QW0022TS

**BIND_TIME**

The date and time at which the plan or package to which this statement belongs was bound.

**Field Name:** QW0022BT

**VERSION**

The version ID of the package.

**Field Name:** QW0022VN

**PREDICATE #**

If the REASON field has a value of REOPT, the predicate number that triggers the REOPT decision is shown.

**Field Name:** QW0022PD

**REASON**

Reason code for cost category B. This value is blank if the cost category is not B. Possible values are:

- **HOST VARIABLES**
  If there are host variables, parameter markers, or special registers in range or between predicates.

- **TABLE CARDINALITY**
  If the table cardinality is missing for one or more tables.
TRIGGERS
If there are insert, update, or delete triggers defined on the target table.

UDF
If there are user-defined functions referenced in the SQL statement.

REFERENTIAL CONSTRAINTS
If a table that is the target of a delete has referential constraints defined on it.

HAVING CLAUSE
If a having clause causes an SQL statement to be assigned to cost category B.

Field Name: QW0022RS

PLANNO
The plan number of the step in which the query is processed.

Field Name: QW0022PL

METHOD or NEXTSTEP
The join method used for the step.

Note: NEXTSTEP is shown if this field has one of the following values 0, 4, 8, 12, 1, 5, 9, 13, 2, 6, 10, 14, 3, 7, 11, or 15. Otherwise, METHOD is displayed.

Field Name: QW0022OD

SORTN_UNIQ
Indicates whether the new table is sorted to remove duplicate rows.

Field Name: QW0022UN

SORTC_UNIQ
Indicates whether the composite table is sorted to remove duplicate rows.

Field Name: QW0022N

DATABASE
The database ID.

Field Name: QW0022DD

SORTN_JOIN
Indicates whether the new table is sorted for a merge scan join or hybrid join. For a hybrid join, this is a sort of the RID list.

Field Name: QW0022IN

SORTC_JOIN
Indicates whether the composite table is sorted for a nested loop join, merge scan join, or hybrid join.

Field Name: QW0022J

OBJECT
The internal ID of the table in hexadecimal (2 bytes). Use this value to match column "OBID" in SYSIBM.SYSTABLES to find the name of the table. For example, X'2A' is 42, which is table SYSDATABASE.
Field Name: QW0022OB

ACCESSTYPE
The method of accessing the new table. N/P is printed if there is no access type.

Field Name: QW0022YP

SORTN_ORDERBY
Indicates whether the new table is sorted for ORDER BY.

Field Name: QW0022DB

SORTC_ORDERBY
Indicates whether the composite table is sorted for ORDER BY.

Field Name: QW0022O

CREATOR
The creator of the new table accessed in this step.

Field Name: QW0022CR

PAGE_RANGE
Whether the table qualifies for page range screening, so that plans scan only the partitions that are needed. Y = Yes; N = No.

Field Name: QW0022PR

SORTN_GROUPBY
Indicates whether the new table is sorted for GROUP BY.

Field Name: QW0022PB

SORTC_GROUPBY
Indicates whether the composite table is sorted for GROUP BY.

Field Name: QW0022G

TNAME
The name of the table accessed in this step, without qualifier. This field is blank if a view is used instead of a real table.

Field Name: QW0022TN

JOIN_TYPE
The type of join:
F FULL OUTER JOIN
L LEFT OUTER JOIN
S STAR JOIN
blank INNER JOIN or no join
RIGHT OUTER JOIN converts to a LEFT OUTER JOIN when you use it, so that JOIN_TYPE contains L.

Field Name: QW0022JT

SORTN_PGROUP_ID
The parallel group identifier for the parallel sort of the new table.
<table>
<thead>
<tr>
<th>Field Name:</th>
<th>QW0022P6</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>SORTC_PGROUP_ID</strong></td>
<td></td>
</tr>
<tr>
<td>The parallel group identifier for the parallel sort of the composite table.</td>
<td></td>
</tr>
<tr>
<td>Field Name:</td>
<td>QW0022P7</td>
</tr>
<tr>
<td><strong>CORRELATION_NAME</strong></td>
<td></td>
</tr>
<tr>
<td>The correlation name of a table or view that is specified in the statement. If there is no correlation name, then the column is blank.</td>
<td></td>
</tr>
<tr>
<td>Field Name:</td>
<td>QW0022CN</td>
</tr>
<tr>
<td><strong>MERGE_JOIN_COLS</strong></td>
<td></td>

<tr>
<td>The number of parallel tasks or operations activated by a query.</td>
<td></td>
</tr>
<tr>
<td>Field Name:</td>
<td>QW0022P1</td>
</tr>
<tr>
<td><strong>JOIN_DEGREE</strong></td>
<td></td>
</tr>
<tr>
<td>The number of parallel tasks or operations used in joining the composite table with the new table.</td>
<td></td>
</tr>
<tr>
<td>Field Name:</td>
<td>QW0022P3</td>
</tr>
<tr>
<td><strong>TSLOCKMODE</strong></td>
<td></td>
</tr>
<tr>
<td>Indicates the lock mode to be acquired on the new table or its table space.</td>
<td></td>
</tr>
<tr>
<td>If the isolation can be determined at bind time, possible values are:</td>
<td></td>
</tr>
<tr>
<td><strong>IS</strong></td>
<td>Intent share lock</td>
</tr>
<tr>
<td><strong>IX</strong></td>
<td>Intent exclusive lock</td>
</tr>
<tr>
<td><strong>S</strong></td>
<td>Share lock</td>
</tr>
<tr>
<td><strong>U</strong></td>
<td>Update lock</td>
</tr>
<tr>
<td><strong>X</strong></td>
<td>Exclusive lock</td>
</tr>
<tr>
<td><strong>SIX</strong></td>
<td>Share with intent exclusive lock</td>
</tr>
<tr>
<td><strong>N</strong></td>
<td>UR isolation, no lock</td>
</tr>
<tr>
<td>If the isolation cannot be determined at bind time, the lock mode determined by the isolation at run time is shown by the following values:</td>
<td></td>
</tr>
<tr>
<td><strong>NS</strong></td>
<td>For UR isolation: no lock. For CS or RR isolation: an S lock.</td>
</tr>
<tr>
<td><strong>NIS</strong></td>
<td>For UR isolation: no lock. For CS or RR isolation: an IS lock.</td>
</tr>
<tr>
<td><strong>NSS</strong></td>
<td>For UR isolation: no lock. For CS isolation: an IS lock. For RR isolation: an S lock.</td>
</tr>
<tr>
<td><strong>SS</strong></td>
<td>For UR or CS isolation: no lock. For RR isolation: an S lock.</td>
</tr>
<tr>
<td>The data in this column is right-justified.</td>
<td></td>
</tr>
<tr>
<td>Field Name:</td>
<td>QW0022LM</td>
</tr>
<tr>
<td><strong>PARALLELISM_MODE</strong></td>
<td></td>
</tr>
</tbody>
</table>
The kind of parallelism, if any, that is used at bind time:

I  Query I/O parallelism
C  Query CP parallelism
X  Sysplex query parallelism

Field Name: QW0022PM

ACCESS_PGROUP_ID

The ID of the parallel group for accessing the new table.
Field Name: QW0022P2

JOIN_PGROUP_ID

The ID of the parallel group for joining the composite table with the new table.
Field Name: QW0022P4

AGGREGATE_FUNCT

Indicates when an SQL column function is evaluated. Possible values are:

R  Column function is evaluated during data retrieval.
S  Column function is evaluated during SORT.

Field Name: QW0022Z

INDEX_NUMBER

Number of index access operations.
Field Name: QW0022MN

PREFETCH

The number of PREFETCH requests.
Field Name: QW0022EF

DIRECT_ROW_ACC

Indicates whether DB2 can use direct row access to a table row without a table space or index scan:

YES  Direct row access was used
NO   Direct row access was not used

Field Name: QW0022PA

PAGES_FOR_TABLE

The number of pages for the table. A value of "-1" indicates that statistics are not available.
Field Name: QW0022NP

TAB_CARDINALITY

Table cardinality in floating point.
Field Name: QW0022CY

STARJOIN

Indicates whether star join was used, possible values are:
YES  Star join was used
NO   Star join was not used

Field Name: QW0022SJ

TABLE_TYPE
The table type can be:
T   Table
F   Table function
W   Workfile
Q   Table queue (not materialized)

Field Name: QW0022TT

INDEXONLY
Indicates what kind of prefetch of the data is used:
SEQ  Sequential prefetch
LIST List prefetch
NO   No prefetch

Field Name: QW0022XO

MATCHCOLS
The number of index keys used in an index scan. This field is 0 if either no
index is used or an index is used that has no matching columns.

Field Name: QW0022XM

MIXOPSEQ
The sequence number of a step in a multiple index operation.

Field Name: QW0022MS

PREFETCH_INDEX
Indicates whether data pages are to be read in advance by a prefetch.

Field Name: QW0022XF

OPERATION
The type of index access operation.

Field Name: QW0022MO

ACCESS_NAME
The index name. This field applies only to index scans. N/A is printed for
table space scans or when no index is used.

Field Name: QW0022XN

ACCESS_CREATOR
The index creator.

Field Name: QW0022XC
This topic shows detailed information about “Record Trace - IFCID 023 - Utility Start”.

</table>
Field Name: QW0025JN

STEPNAME
The step name of the utility job.

Field Name: QW0025JS

ELAPSED TIME
The utility elapsed time at termination. This field and the following time fields are in time-of-day format. If this field contains binary zeroes, no data is available for this field or for the following time fields. For example, this is the case for subphase termination records.

Field Name: QW0025UE

SUBTASKS
The final subtask count.

Field Name: QW0025R1

DFSORT
DFSORT was invoked at least once. Possible values are Y or N.

Field Name: QW0025DF

DB2SORT
DB2 SORT was invoked at least once. Possible values are Y or N.

Field Name: QW0025DS

DATA SORTS
The number of parallel data sorts.

Field Name: QW0025DA

INDEX SORTS
The number of parallel index sorts.

Field Name: QW0025IX

OTHER SORTS
The number of other sorts.

Field Name: QW0025OS

SHRLEVEL
The SHRLEVEL value of the utility. Possible values are: NONE, REFERENCE, CHANGE, or N/A.

Field Name: QW0025SL

CPU TIME
The CPU time of the utility.

Field Name: QW0025UC

ZIIP TIME
The total utility ZIIP time (if Accounting class 1 trace is activated).

Field Name: QW0025UZ

SORT CPU
IFCID 025 - Utility End

The Sort CPU time.

Field Name: QW0025SC

SORT ZIIP

The Sort ZIIP time (if provided by the Sort program).

Field Name: QW0025SZ
This topic shows detailed information about “Record Trace - IFCID 026 - IBM Service Record”.

This record is for IBM service use.
IFCID 027 - Sort Workfile Records

This topic shows detailed information about “Record Trace - IFCID 027 - Sort Workfile Records”.

Record trace - IFCID 027 - Sort Workfile Records

The field labels shown in the following sample layout of “Record Trace - IFCID 027 - Sort Workfile Records” are described in the following section.

RECORDS IN NEW WORKFILE

The number of records in the new work file.

Field Name: QW0027NR

SPARSE INDEX SPACE USED (KB)

The size of the in-memory work file in kilobytes (KB).

Field Name: QW0027OZ

ESTIMATED SIZE ALL IN-MEM (KB)

The APS estimated size of all sparse indexes in a query if they are all in the in-memory part (in KB).

Field Name: QW0027TZ

ESTIMATED RECORDS IN SP INDEX

The APS estimated number of records in the current sparse index.

Field Name: QW0027IR

SKIP FACTOR

The skip factor if sparse index records are found in the work file. It shows a value of 1 if found in the in-memory part.

Field Name: QW0027SF

RECORDS IN IN-MEMORY PART

The number of records in the in-memory part of the sparse index.

Field Name: QW0027IE

RECORDS IN WORKFILE PART

The number of records in the work-file part of the sparse index.

Field Name: QW0027WE

DATA AREA SIZE (BYTES)

The data area size for a sparse index (in bytes).

Field Name: QW0027DS

KEY SIZE SP IDX (BYTES)
The key size for a sparse index (in bytes).

Field Name: QW0027KS

TOTAL NR OF IDX IN QUERY
The total number of sparse indexes in the query.

Field Name: QW0027TS

CURRENT IDX IN PROCESS
The current sparse index that is processed.

Field Name: QW0027SC

TYPE OF RECORD
The type of record. Possible values are:

B  Indicates that a sparse index combination of hash and work file is used (both in-memory and physical work file).
H  Indicates a sparse index hash is used (in-memory work file only).
O  Indicates that a sparse index binary is used (in-memory work file only).
S  Indicates that no sparse index is used because of storage constraints.
T  Indicates that a sparse index work-file is used.
W  Indicates that no sparse index is used.

Field Name: QW0027SP
IFCID 028 - Sort Phase Detail

This topic shows detailed information about “Record Trace - IFCID 028 - Sort Phase Detail”.

Record trace - IFCID 028 - Sort Phase Detail

The field labels shown in the following sample layout of “Record Trace - IFCID 028 - Sort Phase Detail” are described in the following section.

NETWORKID: DEIBMIPS
```

IWORK

The number of work files created during the sort input phase. If the rows to be sorted are already in order, there is one work file. The number of work files needed depends on the distribution of the sort key. The maximum number of work files is limited by the buffer pool size. This field is valid if TYPE equals I.

Field Name: QW0028NP

WORKFILES REQ

The number of work files requested from the buffer manager at the beginning of each merge pass (MVS/ESA 3.1.3). It is valid if TYPE equals S.

If this field is greater than WORKFILES ACQ, there is another merge pass. If both fields are equal, this is the last or only merge pass.

Field Name: QW0028WA

TYPE

The type of IFCID 28. It indicates the phase when the IFCID 28 record is issued. Valid values are:

I  The end of the input phase
S  The start of a merge pass
E  The end of a merge pass
Z  The start of output work file partitioning
W  During the output work file partitioning
X  The end of output work file partitioning
K  The start of last merge pass partitioning
M  During last merge pass partitioning
L  The end of last merge pass partitioning
T  The start of one record partitioning
O  During one record partitioning
U  The end of one record partitioning
The start of presorted records partitioning

During presorted records partitioning

The end of presorted records partitioning

Field Name: QW0028TY

PASS

The current merge pass. It is issued at the end of the merge pass and, therefore, valid if TYPE equals E.

Field Name: QW0028MP

WORKFILES ACQ

The number of work files actually acquired from the buffer manager at the beginning of each merge pass (MVS/ESA 3.1.3). It is valid if TYPE equals S.

Field Name: QW0028WG

PARALLELISM DEGREE

The partition work file number. The value in this field is 0 if partitioning is not requested. If partitioning is requested, the value can be from 1 to $n$, where $n$ is the degree of parallelism. It is valid if TYPE equals Z, W, X, K, M, L, T, O, U, V, P, or Y.

Field Name: QW0028PW

WORKFILE RECORDS

The number of records in the partition work file. It is valid if TYPE equals Z, W, X, K, M, L, T, O, U, V, P, or Y.

Field Name: QW0028PN

RECS SORTED AFT INS PHASE

The number of records sorted into work files after the sort input phase.

Field Name: QW0028NR

MULTIPLE DISTINCT SORTS

Total number of multiple distinct sorts.

Field Name: QW0028DS

MULTIPLE DISTINCT READ

The number of records read into a group at the start of the GROUPBY phase for a multiple distinct sort.

Field Name: QW0028DR

MULTIPLE DISTINCT GROUPS

The total number of multiple distinct sort groups.

Field Name: QW0028DG

CURRENT MULTIPLE DISTINCT SORT

The multiple distinct sort currently being processed.

Field Name: QW0028DC

Field Name: QW0029ID

DBID

The database ID. Deduced from the DB2 fields QW0029DB, QW0105DN or QW0107DN.

When present, the database name is shown, otherwise the decimal identifier from QW0029DB is shown, or N/A when this value is 0.

Field Name: RT0029DB

DB LGTH

The length of the section associated with this DBD.

Field Name: QW0029DL

PLAN
The plan name for the CT or XT request.

**Field Name:** QW0029PL

**RDS**

The RDS identifier number. Special cases are:

- `00000001`
  - SKCT header
- `FFFFFFFE`
  - SKCT directory

**Field Name:** QW0029KN

**SEQNO**

The sequence number within the RDS number. This is QW0029SN for CT or QW0029GN for PT.

**Field Name:** RT0029SN

**CT LGTH**

The length of the CT or XT sections in bytes.

**Field Name:** QW0029CL

**LOCATION**

The name of the package location. This field shows 'BLANK' if the local location name is not defined.

**Field Name:** QW0029LN

**COLLECTN**

The collection identifier of the package.

**Field Name:** QW0029CI

**PCKG ID**

The package identifier.

**Field Name:** QW0029PI

**CONSISTENCY TOKEN**

The consistency token of the package.

**Field Name:** QW0029CT

**PT LGTH**

The length of the PT section in bytes.

**Field Name:** QW0029GL

**SCHEMA NAME**

The name of the schema.

**Field Name:** QW0029SC

**HASH ID**

The hash ID.

**Field Name:** QW0029QH

**Field Name:** QW0035AC
This topic shows detailed information about “Record Trace - IFCID 036 - Log Non I/O Start”.

Record trace - IFCID 036 - Log Non I/O Start

The field labels shown in the following sample layout of “Record Trace - IFCID 036 - Log Non I/O Start” are described in the following section.

**DSID**

The data set identifier of the log manager.

Field Name: QW0036DI

**EVENT ID**

The event identifier:

- **ALLC**  Allocation
- **DTAU**  Data set unavailable
- **OPEN**  Open
- **CLOS**  Close
- **DEAL**  Deallocate
- **CLOC**  Wait for the catalog to be located
- **WTOR**  Wait for reply from write-to-operator
- **HSMR**  Wait for HSM recall
- **UUNI**  Wait for unavailable tape unit
- **URST**  Wait for unavailable reader service task
- **MDSV**  Wait for multi-data set volume
- **POSI**  Wait for tape volume positioning

Field Name: QW0036EI

**REQUEST TYPE**

The request type:

- **ALLD**  Demand allocation
- **ALLL**  Look ahead (premount) allocation

Field Name: QW0036RT

**ACE**

The relative number of the agent control element address in the ACE cross-reference table. This table is printed at the end of each location for every trace specified.

Field Name: QW0036AC
This topic shows detailed information about “Record Trace - IFCID 037 - Log Non I/O End”.

The number of blocks written.

Field Name: QW0041BW
IFCID 042 - Checkpoint Start

This topic shows detailed information about “Record Trace - IFCID 042 - Checkpoint Start”.

When present, data is printed in dump format, otherwise NO DATA is printed.
IFCID 043 - Checkpoint End

This topic shows detailed information about “Record Trace - IFCID 043 - Checkpoint End”.

Record trace - IFCID 043 - Checkpoint End

The field labels shown in the following sample layout of “Record Trace - IFCID 043 - Checkpoint End” are described in the following section.

RBA X'0000008F65341288'

RBA

The beginning checkpoint RBA.

Field Name: QW0043BC
IFCID 044 - Lock Suspend

This topic shows detailed information about “Record Trace - IFCID 044 - Lock Suspend”.

Record trace - IFCID 044 - Lock Suspend

The field labels shown in the following sample layout of “Record Trace - IFCID 044 - Lock Suspend” are described in the following section.

```
LOCK RES TYPE: LPL RECOVERY
IRLM FUNC CODE: LOCK (NAME)
REQ TOKEN: X'00000000' LOCK ATTRIBUTES: L-LOCK GLOBAL NOMODIFY NOFORCE
PARENT TOKEN: X'7F6906D8' LOCK HASH VALUE: X'0001840A'
QW0044CL: X'00' QW0044FL: X'30'
```

**LOCK RES TYPE**

The locked resource type.

**Note:** For data sharing, SKELETON CURSOR TABLE LOCKING and SKELETON PACKAGE TABLE LOCK are LP-locks (an LP-lock has an L-lock component and a P-lock component).

**Field Name:** QW0044KT

**NAME**

The plan name or collection name. This field is only printed if the value in LOCK RES TYPE is SKELETON CURSOR TABLE LOCKING or COLLECTION.

Deduced from the DB2 field QW0021KD, QW0021KP, and QW0021KR. when the locked resource type is skeleton cursor table locking.

**Field Name:** RT21NAME

**BPID**

The buffer pool ID. This field is only printed if the value in LOCK RES TYPE is:

- ALTER BUFFER POOL
- GROUP BUFFERPOOL START/STOP LOCK
- PAGES/PARTITION P-LOCK
- PAGE P-LOCK
- GROUP BUFFERPOOL LEV CASTOUT P-LOCK
- PAGE/PARTITION LEV CASTOUT P-LOCK

For ALTER BUFFER POOL, deduced from QW0021KD || QW0021KP.
For GROUP BUFFERPOOL START/STOP LOCK, deduced from QW0021KD || QW0021KP.
For PAGES/PARTITION P-LOCK, deduced from QW0021P1.
For PAGE P-LOCK, deduced from QW0021P1.
For GROUP BUFFERPOOL LEV CASTOUT P-LOCK deduced from QW0021P1.
For PAGES/PARTITION LEV CASTOUT P-LOCK, deduced from QW0021P1.

**Field Name:** RT21BPID

**DBID**

The database ID. This field is not applicable if the value in LOCK RES TYPE is:
IFCID 044 - Lock Suspend

SKELETON CURSOR TABLE LOCKING
SKELETON PACKAGE TABLE LOCK
COLLECTION
ALTER BUFFER POOL

Deduced from the DB2 fields QW0044KD, QW0105DN or QW0107DN.
When present, the database name is shown, otherwise the decimal identifier from QW0044KD is shown, or N/A when this value is 0.

Field Name: RT0044DB

OBID

The object ID of the table space or page set. This field is not applicable if the value in LOCK RES TYPE is:
SKELETON CURSOR TABLE LOCKING
SKELETON PACKAGE TABLE LOCK
COLLECTION
ALTER BUFFER POOL

Deduced from the DB2 fields QW0044OB, QW0105TN, QW0107TN, QW0105OB, or QW0107OB.
The table space or object name is shown, when present, otherwise the decimal identifier from QW0044OB is shown, or N/A when this value is 0.
Field Name: RT0044OB

RESOURCE ID

The hexadecimal identifier of the small resource. If LOCK RES TYPE is:
DATA PAGE LOCKING
First 3 bytes are the page number

DATA SET LOCKING (PARTITION)
Last byte is the partition number

INDEX PAGE LOCKING
First 3 bytes are the page number

HASH ANCHOR LOCK
First 3 bytes are the page number and the last byte is the anchor point ID

CS-READ DRAIN
Last byte is the partition number (optional)

RR-READ DRAIN
Last byte is the partition number (optional)

WRITE DRAIN
Last byte is the partition number (optional)

ROW LOCK
First 3 bytes are the page number and the last byte is the row ID of the record

INDEX END OF FILE LOCK
Last byte is the partition number (optional)

Note:

- In large partitioned table spaces, the page number covers 4 bytes instead of 3.
• If table spaces use relative page numbers, the resource ID covers 7 bytes. It contains the partition number in the first 2 bytes, the page number in the next 4 bytes, and the record ID in the seventh byte.

This field is not applicable if the value in LOCK RES TYPE is SKELETON CURSOR TABLE LOCKING, SKELETON PACKAGE TABLE LOCK, COLLECTION, TABLE LOCK, or ALTER BUFFER POOL. If the value is UTILITY SERIALIZATION LOCK or BINDLOCK, N/A is printed.

Field Name: QW0044KR

COLL

The collection identifier. This field is only printed if the value in LOCK RES TYPE is SKELETON PACKAGE TABLE LOCKING.

The package identifier. This field is only printed if the value in LOCK RES TYPE is SKELETON PACKAGE TABLE LOCKING.

The consistency token. This field is only printed if the value in LOCK RES TYPE is SKELETON PACKAGE TABLE LOCKING.

The buffer pool ID. This field is only printed if the value in LOCK RES TYPE is ALTER BUFFER POOL.

Field Name: QW0044RN

IRLM FUNC CODE

The IRLM function code.

Field Name: QW0044FC

STATE

The lock state.

Field Name: QW0044ST

DURATION

The lock duration:

MANUAL Varies depending on the ISOLATION parameter (QW0044DR=x '20')

MANUAL+1 Temporary change of consistency level from CS to RR during bind and DDL (QW0044DR=x '21')

COMMIT Until commit (QW0044DR=x '40')

COMMIT+1 Past commit; applies to locks needed to maintain the position for a cursor opened WITH HOLD (QW0044DR=x '41')

ALLOCATION Until deallocation (QW0044DR= '60')

PLAN For the duration of the plan (QW0044DR=x '80')

UTIL For the duration of the utility execution (QW0044DR=x '81')

INTEREST Duration used for P-locks (QW0044DR=x 'FE')

FREE ALL Until all locks are freed (QW0044DR=x 'FF')
IFCID 044 - Lock Suspend

Field Name: QW0044DR

REASON SUSB

The reason for the suspend:
- LC  IRLM latch contention
- IQ  IRLM queued request
- LR  Local resource contention
- GR  Global resource contention
- IS  Intersystem communication
- N  Notify message sent
- LS  No longer used
- RL  Contention with a retained lock

Field Name: QW0044WS

REQ TOKEN

The IRLM lock request token.

Field Name: QW0044RT

LOCK ATTRIBUTES

The lock attributes.

Field Name: QW0044FO

PROP TO XES

Indicates whether the request was propagated to XES by IRLM.

Field Name: QW0044Y1

ASYN TO XES

Indicates whether the request was sent to XES asynchronously by IRLM.

Field Name: QW0044Y2

PARENT TOKEN

The parent token for explicit hierarchical locking. This field is valid if the DB2 subsystem is a member of a data sharing group.

Field Name: QW0044PT

LOCK HASH VALUE

The hash value of the locked resource.

Field Name: QW0044LH
IFCID 045 - Lock Resume

This topic shows detailed information about “Record Trace - IFCID 045 - Lock Resume”.

Record trace - IFCID 045 - Lock Resume

The field labels shown in the following sample layout of “Record Trace - IFCID 045 - Lock Resume” are described in the following section.

**REASON FOR RESUME**: NORMAL RESUME

**REASON FOR SUSPEND**: X'08'
- IRLM LATCH CONTENTION: NO
- IRLM QUEUED REQUEST: NO
- LOCAL RESOURCE CONTENTION: NO
- RETAINED LOCK CONTENTION: NO
- GLOBAL RESOURCE CONTENTION: YES
- INTER-SYSTEM MESSAGE SENDING: NO
- GLOBAL CONTENTION EXTENT: X'F0'
- XES GLOBAL CONTENTION: NO
- IRLM GLOBAL CONTENTION: YES
- FALSE CONT OR CONV: NO

**REASON FOR RESUME**

The reason for the lock resume.

**Field Name**: QW0045R

**REASON FOR SUSPEND**

The reason for the suspension. The nonserviceability values are:

**IRLM LATCH CONTENTION**
Indicates whether IRLM latch contention occurred. (QW0045W1)

**IRLM QUEUED REQUEST**
Indicates whether there was an IRLM queued request. (QW0045W2)

**LOCAL RESOURCE CONTENTION**
Indicates whether local resource contention occurred. (QW0045W3)

**RETAINED LOCK CONTENTION**
Indicates whether there was contention with a retained lock. (QW0045W4)

**GLOBAL RESOURCE CONTENTION**
Indicates whether intersystem communication was required to resolve an IRLM request. (QW0045W5)

**INTER-SYSTEM MESSAGE SENDING**
Indicates whether any intersystem message was sent. (QW0045W7)

**Field Name**: QW0045SR

**GLOBAL CONTENTION EXTENT**

The extent of global contention. This is applicable if the value in the GLOBAL RESOURCE CONTENTION field is YES. The nonserviceability values are:
IFCID 045 - Lock Resume

**XES GLOBAL CONTENTION**
Indicates whether XES global contention occurred. DB2 field QW0045X3.

**IRLM GLOBAL CONTENTION**
Indicates whether IRLM global contention occurred. DB2 field QW0045X4.

**FALSE CONT OR CONV**
Indicates whether XES global contention or IRLM global contention occurred. DB2 field QW0045X4.

</tbody>
</table>
The ID of the query command.
Field Name: QW0053QID

QUERY INSTANCE ID
The ID of the query instance.
Field Name: QW0053CID

SQL REQUEST TYPE
The type of SQL request.
Field Name: QW0053TOS

EXPANSION REASON
The reason for the expansion. It can have the following values:

GET_ARCHIVE
Expansion caused by built-in SYSIBMADM.GET_ARCHIVE global variable.

TEMPORAL BUSINESS_TIME
Expansion caused by the current temporal BUSINESS_TIME special register.

TEMPORAL SYSTEM_TIME
Expansion caused by the current temporal SYSTEM_TIME special register.

TEMPORAL SYSTEM_TIME & BUSINESS_TIME
Expansion caused by the current temporal SYSTEM_TIME & current temporal BUSINESS_TIME special registers.

NO EXPANSION
The query does not contain any expansion.
Field Name: QW0053ER

SQLCA CONTENTS
This section contains the SQLCA fields. It is only printed if the value in the ENTRY/EXIT TYPE field is RETURNED.
Field Name: QW0053SQ

DATA TYPE
The scan type identification:

INDEX Index scan
SEQD Sequential data scan
SEQW Sequential data work-file scan

Field Name: QW0053ID

ROW PROC
The number of rows processed.
Field Name: QW0053RP

ROW EXAM
The number of rows examined. If DATA TYPE shows INDEX, this number is the number of index entries (not rows) scanned.
Field Name: QW0053LA

STG1-QUAL
The number of rows qualified at stage 1.

Field Name: QW0053DQ

STG2-QUAL
The number of rows qualified at stage 2.

Field Name: QW0053RQ

ROW INSRT
The number of rows inserted.

Field Name: QW0053IN

ROW UPDTE
The number of rows updated.

Field Name: QW0053UP

ROW DELET
The number of rows deleted. If the delete was a mass delete, the indicator MASS is printed.

Field Name: QW0053DE

PAGES
The number of get page requests issued by the data manager to the buffer manager. Note that for an index scan the value includes the number of index pages scanned.

Field Name: QW0053PS

RI SCAN
The number of additional pages scanned for referential integrity.

Field Name: QW0053PR

RI DELET
The number of additional rows deleted for referential integrity.

Field Name: QW0053DR
IFCID 055 - Set SQLID

This topic shows detailed information about “Record Trace - IFCID 055 - Set SQLID”.

This IFCID is written when a SET CURRENT SQLID STATEMENT is issued. It shows the previous SQLID, the new SQLID, and whether the statement succeeded. This record is only written at the application server when DRDA protocol is used.

This record is written when performance trace class 3 is on. This record is written when audit class 7 is on. MONITOR1 privilege is required for reading via ifi.

The SQLID is the SQL authorization ID of the process. This is:
- The authorization ID used for authorization checking on dynamically prepared CREATE, GRANT, and REVOKE SQL statements
- The owner of a table space, database, storage group, or synonym created by a dynamically issued CREATE statement
- The implicit qualifier of all table, view, alias, and index names specified in dynamic SQL statements.

The initial value of CURRENT SQLID can be provided by the connection or sign-on exit routine, otherwise the initial value is the primary authorization ID of the process.

Record trace - IFCID 055 - Set SQLID

The reason for the expansion. It can have the following values:

GET_ARCHIVE
Expansion caused by built-in SYSIBMADM.GET_ARCHIVE global variable.

TEMPORAL BUSINESS_TIME
Expansion caused by the current temporal BUSINESS_TIME special register.

TEMPORAL SYSTEM_TIME
Expansion caused by the current temporal SYSTEM_TIME special register.

TEMPORAL SYSTEM_TIME & BUSINESS_TIME
Expansion caused by the current temporal SYSTEM_TIME & current temporal BUSINESS_TIME special registers.

NO EXPANSION
The query does not contain any expansion.
Field Name: QW0058EXR

SQLCA CONTENTS
This section contains the SQLCA fields. It is only printed if the value in the ENTRY/EXIT TYPE field is RETURNED.
Field Name: QW0058SQ

DATA TYPE
The scan type identification.
INDX  Index scan
SEQD  Sequential data scan
SEQW  Sequential data work-file scan
Field Name: QW0058ID

ROW PROC
The number of rows processed.
Field Name: QW0058RP

ROW EXAM
The number of rows examined. If DATA TYPE shows INDX, this number is the number of index entries (not rows) scanned.

*Field Name:* QW0058LA

**STG1-QUAL**

The number of rows qualified at stage 1.

*Field Name:* QW0058DQ

**STG2-QUAL**

The number of rows qualified at stage 2.

*Field Name:* QW0058RQ

**ROW INSRT**

The number of rows inserted.

*Field Name:* QW0058IN

**ROW UPDTE**

The number of rows updated.

*Field Name:* QW0058UP

**ROW DELET**

The number of rows deleted. If the delete was a mass delete, the indicator MASS is printed.

*Field Name:* QW0058DE

**PAGES**

The number of get page requests issued by the data manager to the buffer manager. Note that for an index scan, the value includes the number of index pages scanned.

*Field Name:* QW0058PS

**RI SCAN**

The number of additional pages scanned for referential integrity.

*Field Name:* QW0058PR

**RI DELET**

The number of additional rows deleted for referential integrity.

*Field Name:* QW0058DR

**LOB SCAN**

Additional pages scanned in a LOB table space.

*Field Name:* QW0058PL

**LOB UPDTE**

Number of LOB data pages updated by SQL INSERT or SQL UPDATE.

*Field Name:* QW0058UL

**IN-DB2 ELAPSED**

The accumulated in-DB2 elapsed time.

*Field Name:* QW0058ET
IN-DB2 CPU

The accumulated in-DB2 CPU time. It includes CPU time consumed on an IBM specialty engine.

Field Name: QW0058CP

WAIT FOR SYNC I/O

The accumulated wait for synchronous I/O.

Field Name: QW0058SI

WAIT FOR LOCK/LATCH

The accumulated wait time for locks.

Field Name: QW0058LK

SYNC EXEC UNIT SWITCH

The accumulated wait time for the synchronous execution unit switches.

Field Name: QW0058EU

WT FOR GLOBAL LOCKS

The accumulated wait time for global locks.

Field Name: QW0058GL

WT FOR READ BY OTHER THR

The accumulated wait time for read activity done by another thread.

Field Name: QW0058OR

WT FOR WRITE BY OTHER THR

The accumulated wait time for write activity done by another thread.

Field Name: QW0058OW

NBR EXCEEDS DB2 LIMITS

The number of times RID list was not used because the number of RIDS would have exceeded DB2 limits.

Field Name: QW0058RL

NOT ENOUGH STORAGE

The number of time a RID list was not used because there is not enough storage available to hold the list of RIDS.

Field Name: QW0058RS

WAIT FOR LATCH

The accumulated wait for latch.

Field Name: QW0058LH

WAIT FOR PAGE LATCH

The accumulated wait time for page latch.

Field Name: QW0058PA

WAIT FOR DRAIN LOCK

The accumulated wait time for drain lock.
Field Name: QW0058DA

WAIT FOR CLAIM COUNT
The accumulated wait time for claim count.

Field Name: QW0058CL

WAIT FOR LOG WRITER
The accumulated wait time for log writer.

Field Name: QW0058LG

WAIT FOR CHILD L-LOCKS
The accumulated wait time for global child L-locks.

Field Name: QW0058AHTK

WAIT FOR PAGESET L-LOCKS
The accumulated wait time for global Pageset or Partition L-locks.

Field Name: QW0058AWTN

WAIT FOR OTHER L-LOCKS
The accumulated wait time for global other L-locks.

Field Name: QW0058AWTM

WAIT FOR PAGE P-LOCKS
The accumulated wait time for global page P-locks.

Field Name: QW0058AWTO

WAIT FOR OTHER P-LOCKS
The accumulated wait time for global other P-locks.

Field Name: QW0058AWTQ

WAIT FOR PIPE
The accumulated wait time for pipe.

Field Name: QW0058PW

WT FOR PARENT CHILD SYNC
The accumulated time waiting for parallel queries to synchronize between parent and child tasks.

Field Name: QW0058PQ
IFCID 059 - Fetch Start

This topic shows detailed information about “Record Trace - IFCID 059 - Fetch Start”.

Record trace - IFCID 059 - Fetch Start

The field labels shown in the following sample layout of “Record Trace - IFCID 059 - Fetch Start” are described in the following section.

START LOCATION NAME : PM05D851

PKG COLLECTION ID

The package collection identifier.

Field Name: QW0059PC

PROGRAM NAME

The program name.

Field Name: QW0059PN

CURSOR NAME

The name of the cursor used by the FETCH statement.

Field Name: QW0059CN

CONSISTENCY TOKEN

The consistency token.

Field Name: QW0059TS

STATEMENT NUMBER

The statement number.

Field Name: QW0059SN

STATEMENT TYPE

The statement type. X'01' indicates FETCH.

Field Name: QW0059ST

QUERY COMMAND ID

The ID of the query command.
Field Name: QW0059CID

QUERY INSTANCE ID
The ID of the query instance.

Field Name: QW0059QID

FETCH SENSITIVITY
Identifies the fetch sensitivity. It can be one of the following:
- Sensitive
- Insensitive
- Unspecified

Field Name: QW0059FS

FETCH ORIENTATION
Identifies the fetch orientation. It can be one of the following:
- First
- Last
- Before
- After
- Next
- Previous
- Current
- Absolute
- Relative
- Unspecified

Field Name: QW0059FO
IFCID 060 - Select Start

This topic shows detailed information about “Record Trace - IFCID 060 - Select Start”.

Record trace - IFCID 060 - Select Start

The field labels shown in the following sample layout of “Record Trace - IFCID 060 - Select Start” are described in the following section.

<table>

LOCATION NAME

The location name.

Field Name: QW0060LN

PKG COLLECTION ID

The package collection identifier.

Field Name: QW0060PC

PROGRAM NAME

The program name.

Field Name: QW0060PN

CONSISTENCY TOKEN

The consistency token.

Field Name: QW0060TS

STATEMENT NUMBER

The statement number of the statement executed.

Field Name: QW0060SN

STATEMENT TYPE

The statement type. X'00' indicates SELECT.

Field Name: QW0060ST

QUERY COMMAND ID

The ID of the query command.

Field Name: QW0060CID

QUERY INSTANCE ID

The ID of the query instance.

Field Name: QW0060QID

ISOLATION
IFCID 060 - Select Start

The isolation level:

**RR**  Repeatable read

**CS**  Cursor stability

**RS**  Read stability

**UR**  Uncommitted read

Field Name: QW0060I

**REOPTIMIZATION**

Indicates whether the access path of the SQL statement was reoptimized at runtime.

Field Name: QW0060RO
IFCID 061 - Insert/Update/Delete Start

This topic shows detailed information about “Record Trace - IFCID 061 - Insert/Update/Delete Start”.

Record trace - IFCID 061 - Insert/Update/Delete Start

The field labels shown in the following sample layout of “Record Trace - IFCID 061 - Insert/Update/Delete Start” are described in the following section.

LOCATION NAME

The location name.

Field Name: QW0061LN

PKG COLLECTION ID

The package collection ID.

Field Name: QW0061PC

PROGRAM NAME

The program name.

Field Name: QW0061PN

CONSISTENCY TOKEN

The consistency token.

Field Name: QW0061TS

STATEMENT NUMBER

The statement number of the statement executed.

Field Name: QW0061SN

STATEMENT TYPE

The statement type. Possible values are:

• STATEMENT TYPE
• INSERT TYPE
• UPDATE TYPE- NON CURSOR
• UPDATE TYPE- CURSOR
• MERGE TYPE
• DELETE TYPE- NON CURSOR
• DELETE TYPE- CURSOR
• TRUNCATE TYPE

Field Name: QW0061ST
IFCID 061 - Insert/Update/Delete Start

CURSOR NAME
The name of the cursor.
Field Name: QW0061CN

QUERY COMMAND ID
The ID of the query command.
Field Name: QW0061CI

QUERY INSTANCE ID
The ID of the query instance.
Field Name: QW0061QI

ISOLATION
The isolation level:
RR Repeatable read
CS Cursor stability
RS Read stability
Field Name: QW0061I

REOPTIMIZATION
Indicates whether the access path of the SQL statement was reoptimized at run time.
Field Name: QW0061RO
IFCID 062 - DDL Start

This topic shows detailed information about “Record Trace - IFCID 062 - DDL Start”.

Record trace - IFCID 062 - DDL Start

The field labels shown in the following sample layout of “Record Trace - IFCID 062 - DDL Start” are described in the following section.

START STATEMENT TYPE: ALTER VIEW
OBJECT TYPE: TABLESPACE
OBJECT NAME: HSRPD5BU

STATEMENT TYPE

The type of statement that is processed. Possible values are:
- ALTER JAR
- ALTER MASK
- ALTER PERMISSION
- ALTER SEQUENCES
- ALTER TRUSTED CONTEXT
- CREATE JAR
- CREATE MASK
- CREATE PERMISSION
- CREATE ROLE
- CREATE SEQUENCES
- CREATE TRUSTED CONTEXT
- DROP JAR
- DROP MASK
- DROP PERMISSION
- DROP ROLE
- DROP SEQUENCES
- DROP TRUSTED CONTEXT
- RENAME INDEX
- TRANSFER OWNERSHIP

Field Name: QW0062ST

OBJECT TYPE

The type of object that is processed. Possible values are:
- COLUMN MASK
- JAR
- SEQUENCES
- TRUSTED CONTEXT
- ROLE
- ROW PERMISSION

Field Name: QW0062OT

OBJECT NAME

The object name. The name does not include high-level qualifiers.
Field Name: QW0062ON
IFCID 063 - SQL Statement

This topic shows detailed information about “Record Trace - IFCID 063 - SQL Statement”.

Record trace - IFCID 063 - SQL Statement

The field labels shown in the following sample layout of “Record Trace - IFCID 063 - SQL Statement” are described in the following section.

SQL STATEMENT

NETWORKID: DEIBMIPS LUNAME: IPSAU851 LUWSEQ: 1 OPTIONS: 'X'04' HOST LANG: N/A

SQL STATEMENT:

```
SELECT L.PLANNAME, L.SEQNO, K.*, HEX(CONTOKEN)
FROM SYSIBM.SYSPACKLIST L, SYSIBM.SYSPACKage K
WHERE L.PLANNAME = 'HSRTEP2L' AND (L.LOCATION = '*' OR L.LOCATION = ' ') AND K.LOCATION = ' ' AND K.COLLID = L.COLLID AND K.NAME = L.NAME
UNION ALL
SELECT L.PLANNAME, L.SEQNO, K.*, HEX(CONTOKEN)
FROM SYSIBM.SYSPACKLIST L, SYSIBM.SYSPACKage K
WHERE L.PLANNAME = 'HSRTEP2L' AND (L.LOCATION = '*' OR L.LOCATION = ' ') AND K.LOCATION = ' ' AND L.COLLID = '*' AND K.NAME = L.NAME
UNION ALL
SELECT L.PLANNAME, L.SEQNO, K.*, HEX(CONTOKEN)
FROM SYSIBM.SYSPACKLIST L, SYSIBM.SYSPACKage K
WHERE L.PLANNAME = 'HSRTEP2L' AND (L.LOCATION = '*' OR L.LOCATION = ' ') AND L.COLLID = '*' AND L.NAME = '*'
UNION ALL
SELECT L.PLANNAME, L.SEQNO, K.*, HEX(CONTOKEN)

WHERE L.PLANNAME = 'HSRTEP2L' AND (L.LOCATION = '*' OR L.LOCATION = ' ') AND K.COLLID = L.COLLID AND L.NAME = '*'
ORDER BY 1, 2
FOR FETCH ONLY
```

STATEMENT IDENTIFIER: 29011

TYPE OF STATEMENT : DYNAMIC CCSID: 1208

OPTIONS

This field consists of 8 bits. The bits indicate the parser options and the host language. The four most significant bits describe the parser options:

- **Bit 7**: String delimiter (0 = apostrophe; 1 = quotation mark)
- **Bit 6**: Decimal separator (0 = period; 1 = comma)
- **Bit 5**: SQL delimiter (0 = apostrophe; 1 = quotation mark)
- **Bit 4**: Mixed data (0 = no; 1 = yes)
- **Bits 0 to 2**: Reserved

The three least significant bits (0 to 2) are the host language bit mask. The hexadecimal value indicates the host language:

- **001**: Host language is Assembler
- **010**: Host language is COBOL
- **011**: Host language is PL/I
- **100**: Host language is Dynamic SQL
- **101**: Host language is FORTRAN
- **110**: Host language is COBOL2
Look at HOST LANG field

Field Name: QW0063OT

HOST LANG

Additional host language option. This field is optional. When the OPTIONS host language bit mask is x'7', it indicates the host language.

Field Name: QW0063HL

SQL STATEMENT

The SQL statement being processed.

Note:

• SQL text longer than 5000 characters is truncated.
• Host variables are represented as :H

Field Name: QW0063ST

STATEMENT IDENTIFIER

The type of statement.

Field Name: QW0063TY

TYPE OF STATEMENT

The statement identifier.

Field Name: QW0063SI

CCSID

The coded character set identifier (CCSID).

Field Name: QW0063CC
IFCID 064 - Prepare Start

This topic shows detailed information about “Record Trace - IFCID 064 - Prepare Start”.

Record trace - IFCID 064 - Prepare Start

The field labels shown in the following sample layout of “Record Trace - IFCID 064 - Prepare Start” are described in the following section.

START LOCATION NAME : PM050851
PKG COLLECTION ID: HSRTEP2VL1XXXXXXXXX2XXXXXXXX3XXXX
XXXXXXXX4XXXXXXXXX5XXXXXXXXX6XXXXXXXX
X7XXXXXXXX8XXXXXXXXX9XXXXXXXXX0XX
XXXXXXXX1XXXXXXXXX2XXXXXXXXXZ

STATEMENT NUMBER : 1550
STATEMENT TYPE : X'81'
CURSOR NAME : C1
QUERY COMMAND ID : QRYCMD01
QUERY INSTANCE ID: QRYINS01

LOCATION NAME

The location name.

Field Name: QW0064LN

PKG COLLECTION ID

The package collection identifier.

Field Name: QW0064CI

PROGRAM NAME

The program name.

Field Name: QW0064PN

TIME STAMP

The hexadecimal value of the precompiler timestamp.

Field Name: QW0064TS

STATEMENT NUMBER

The statement number.

Field Name: QW0064SN

STATEMENT TYPE

The statement types:

x'81' Prepare a cursor section.

x'80' Prepare a noncursor section.

x'C1' Implicit prepare of a cursor section.

x'C0' Implicit prepare of a noncursor section.

Field Name: QW0064ST

CURSOR NAME

The name of the cursor used by the PREPARE statement.
Field Name: QW0064CN

QUERY COMMAND ID
The ID of the query command.

Field Name: QW0064CID

QUERY INSTANCE ID
The ID of the query instance.

Field Name: QW0064QID
IFCID 065 - Open Cursor

This topic shows detailed information about “Record Trace - IFCID 065 - Open Cursor”.

Record trace - IFCID 065 - Open Cursor

LOCATION NAME

The location name.

Field Name: QW0065LN

PKG COLLECTION ID

The package collection identifier.

Field Name: QW0065PC

PROGRAM NAME

The program name.

Field Name: QW0065PC

CONSISTENCY TOKEN

The consistency token.

Field Name: QW0065TS

STATEMENT NUMBER

The statement number.

Field Name: QW0065SN

STATEMENT TYPE

The statement type. X'91' indicates OPEN.

Field Name: QW0065ST

CURSOR NAME

The name of the cursor used by the OPEN cursor statement.
IFCID 065 - Open Cursor

Field Name: QW0065CN

QUERY COMMAND ID
The ID of the query command.
Field Name: QW0065CID

QUERY INSTANCE ID
The ID of the query instance.
Field Name: QW0065QID

ISOLATION
The isolation level:
RR Repeatable read
CS Cursor stability
RS Read stability
UR Uncommitted read
XR Repeatable read with X lock
XS Read stability with X lock
Field Name: QW0065I

REOPTIMIZATION
Indicates whether the access path of the SQL statement was reoptimized at run time.
Field Name: QW0065RO

CURSOR SCROLLABILITY
Identifies the cursor scrollability. It can be one of the following:
• Scroll
• None-scroll
Field Name: QW0065SC

CURSOR SENSITIVITY
Identifies the cursor sensitivity. It can be one of the following:
• Sensitive
• Insensitive
• Unspecified
Field Name: QW0065SV

CURR RESULT TABLE TYPE
Identifies the type of the cursor result table. It can be one of the following:
• Static
• Dynamic
• Unspecified
Field Name: QW0065RT

CURSOR CLOSE COMMIT
The cursor attribute implicit commit, which closed the cursor. Possible values are:

- IMPLICIT COMMIT
- NO IMPLICIT COMMIT
- N/A

Otherwise the values are shown in hexadecimal.

Field Name: QW0065TY
IFCID 066 - Close Cursor

This topic shows detailed information about “Record Trace - IFCID 066 - Close Cursor”.

Record trace - IFCID 066 - Close Cursor

The field labels shown in the following sample layout of “Record Trace - IFCID 066 - Close Cursor” are described in the following section.

The package collection identifier.
Field Name: QW0066PC

PROGRAM NAME

The program name.
Field Name: QW0066PN

CONSISTENCY TOKEN

The consistency token.
Field Name: QW0066TS

STATEMENT NUMBER

The statement number.
Field Name: QW0066SN

STATEMENT TYPE

The statement type. X'A1' indicates CLOSE.
Field Name: QW0066ST

CURSOR NAME

The name of the cursor used by the CLOSE cursor statement.
Field Name: QW0066CN

CLOSE STMT TYPE

The Close statement type. Possible values are:
Otherwise the values are shown in hexadecimal.

**QUERY COMMAND ID**

The ID of the query command.

**Field Name:** QW0066TY

**QUERY INSTANCE ID**

The ID of the query instance.

**Field Name:** QW0066CID
This topic shows detailed information about “Record Trace - IFCID 067 - Accounting”.

When present, data is printed in dump format, otherwise NO DATA is printed.
IFCID 068 - Rollback Start

This topic shows detailed information about “Record Trace - IFCID 068 - Rollback Start”.

Record trace - IFCID 068 - Rollback Start

The field labels shown in the following sample layout of “Record Trace - IFCID 068 - Rollback Start” are described in the following section.

PSWKEY '80'
QW0068FR X'007C6428'
PSWKEY

The PSW key of the holder.

Field Name: QW0068CK
IFCID 069 - IBM Service Record

This topic shows detailed information about “Record Trace - IFCID 069 - IBM Service Record”.

This record is for IBM service use.
IFCID 070 - Commit Phase 2 Start

This topic shows detailed information about “Record Trace - IFCID 070 - Commit Phase 2 Start”.

Record trace - IFCID 070 - Commit Phase 2 Start

The field labels shown in the following sample layout of “Record Trace - IFCID 070 - Commit Phase 2 Start” are described in the following section.

<table>
<thead>

QW0075CO 'E2EB05C3'
IFCID 076 - End of Memory Start

This topic shows detailed information about “Record Trace - IFCID 076 - End of Memory Start”.

Record trace - IFCID 076 - End of Memory Start

The field labels shown in the following sample layout of “Record Trace - IFCID 076 - End of Memory Start” are described in the following section.

PSWKEY

The PSW key of the SSI caller.

Field Name: QW0076CK

FLGS

SSI caller flags:

X'80'  SSI caller problem state (P-bit)
X'40'  A-bit SSI caller AMODE 31 (A-bit)
X'20'  Abnormal end of memory

Field Name: QW0076F1

ASID

The identifier of the end of memory address space.

Field Name: QW0076ID
IFCID 077 - End of Memory End

This topic shows detailed information about “Record Trace - IFCID 077 - End of Memory End”.

Record trace - IFCID 077 - End of Memory End

The field labels shown in the following sample layout of “Record Trace - IFCID 077 - End of Memory End” are described in the following section.

RETURN 0 PROCESSED END OF MEMORY?: YES

RETURN

The return code. This field is always 0.

Field Name: QW0077R0

PROCESSED END OF MEMORY?

Indicates whether end of memory was processed.

Field Name: QW0077PR
ICFID 078 - End of Task Start

This topic shows detailed information about “Record Trace - IFCID 078 - End of Task Start”.

Record trace - IFCID 078 - End of Task Start

The field labels shown in the following sample layout of “Record Trace - IFCID 078 - End of Task Start” are described in the following section.

ACE 2
QW0078AS X'0089F328' QW0078AG X'00B226C8'

ACE

The relative number of the agent control element address in the ACE cross-reference table. This table is printed at the end of each location for every trace specified.

Field Name: QW0078AC
IFCID 079 - End of Task End

This topic shows detailed information about “Record Trace - IFCID 079 - End of Task End”.

When present, data is printed in dump format, otherwise NO DATA is printed.
IFCID 080 - IBM Service Record

This topic shows detailed information about “Record Trace - IFCID 080 - IBM Service Record”.

This record is for IBM service use.
This topic shows detailed information about “Record Trace - IFCID 081 - IBM Service Record”.

This record is for IBM service use.
IFCID 082 - Identify Start

This topic shows detailed information about “Record Trace - IFCID 082 - Identify Start”.

Record trace - IFCID 082 - Identify Start

The field labels shown in the following sample layout of “Record Trace - IFCID 082 - Identify Start” are described in the following section.

RECOPT

The record coordination option specification.

Field Name: QW0083RO

ACCESS

The success or failure of the attempted authorization change. Possible values are:

SUCCESSFUL
The access is permitted.

DENIED BY IDENTIFY AUTH EXIT
The access is denied by the authorization exit.

DENIED BY SAF/SECURITY SYSTEM
The access is denied by the security authorization facility or security system.

Field Name: QW0083AD

CURR SQLID

The current SQL authorization ID.

Field Name: QW0083QD

ORIG AUTHID

The original primary authorization ID.

Field Name: QW0083OP

SECONDARY AUTHORIZATION IDS

A list of the secondary authorization IDs. This list is only produced if there are secondary authorization IDs.

Field Name: QW0083SA

ACEE UTOKEN

The ACEE UTOKEN.

Field Name: QW0083UT
IFCID 084 - Prepare Start

ACCESS

The success or failure of the attempted access. Possible values are:

SUCCESSFUL
If the access is permitted.

DENIED BY SIGNON AUTH EXIT
If the access was denied by the signon authorization exit.

Field Name: QW0087AD

CURRENT SQLID

The value of the authorization ID as set by the IDENTIFY or SIGNON exit.

Field Name: QW0087QD

ORIGINAL AUTHID

The original value of the authorization ID, as passed to the IDENTIFY or SIGNON authorization exit.

Field Name: QW0087OP

SECONDARY AUTHORIZATION IDS

Lists the secondary authorization IDs set by the IDENTIFY or SIGNON authorization exits. If no secondary authorization IDs exist, this line is not printed. Secondary authorization IDs are printed in rows of five, up to a maximum of 49 rows (245 AUTHIDs).

Field Name: QW0087SA

ACEE UTOKEN

The ACEE UTOKEN.

Field Name: QW0087UT
IFCID 088 - Synch Start

This topic shows detailed information about “Record Trace - IFCID 088 - Synch Start”.

Record trace - IFCID 088 - Synch Start

The field labels shown in the following sample layout of “Record Trace - IFCID 088 - Synch Start” are described in the following section.

<table>
<thead>
<tr>
<th>PSWKEY</th>
<th>X’00’</th>
<th>QW0088FR</th>
<th>X’00000000’</th>

**COLLECTION ID**

The package collection ID for the query that invokes sort.

**Field Name:** QW0096PC

**PROGRAM NAME**

The program name for the query that invokes sort.

**Field Name:** QW0096PN

**RECNO**

The number of records sorted.

**Field Name:** QW0096NR

**AREA**

The sort data area size in bytes.

**Field Name:** QW0096DL

**KEYSZ**

The sort key size in bytes.

**Field Name:** QW0096KL

**SIZE**

The sort record size in bytes (the sort key size and the data area size).

**Field Name:** QW0096WR

**WORK**

The number of work files used for both input and merge phases.

**Field Name:** QW0096WF

**RET**

The sort return code:

0 Successful
4  Empty - sort successful
8  Resource unavailable
12  Sort key too long
16  Error detected by fetch routine during input phase
20  Serious processing error

Field Name: QW0096RC

IWORK

The number of initial work files. The sorting of records can take more than one work file. The number of work files needed depends on the distribution of sort key values. The maximum number of work files is limited by the buffer pool size.

Field Name: QW0096IR

ROW DEL

The number of rows deleted because records were merged for the evaluation of column functions with GROUP BY.

Field Name: QW0096RL

PASSES

The number of merge passes during sort processing.

Field Name: QW0096MP

SORT KEYS

The number of sort keys.

Field Name: QW0096SK

STMTNO

The statement number for the query that invokes sort.

Field Name: QW0096SN

WORKFILES

The number of work files, equal to the degree of parallelism, that sort has partitioned.

Field Name: QW0096PW

SORT COLUMNS

The number of sort columns.

Field Name: QW0096SC

PARTITIONING BY SORT

Indicates whether the sorted records were partitioned.

Field Name: QW0096PP

SORT IN ADDITION

Indicates whether the input records were only partitioned or partitioned and sorted:

YES  The records were only partitioned.
Field Name: QW0096PO

TYPE

The type of sort that occurred. The possible values are:

- **ESA**: ORDER BY sort using the ESA sort hardware instructions
- **ESAG**: GROUP BY sort using the ESA sort hardware instructions
- **ESAT**: ESA tag sort using the ESA sort hardware instructions
- **RCYC**: GROUP RECYCLING sort using the ESA sort hardware instructions
- **REG**: Regular sort
- **NONE**: No sort occurred.

Field Name: QW0096TS

PARTITIONING OCCURRED

Indicates when partitioning took place:

- **W**: The work file was partitioned at the end of the input phase. No merge occurred.
- **M**: The output was partitioned during the last merge pass.
- **O**: One record was put into one partition.
- **P**: The records were presorted before being partitioned.
- **N**: The work file was not partitioned.

Field Name: QW0096PT

<thead>
<tr>
<th>DBID: 5 DATABASE NAME: DSND807</th>
</tr>
</thead>
<tbody>
<tr>
<td>OBID: 24 OBJECT NAME: DSNSX02</td>
</tr>
</tbody>
</table>

**DBID**

The decimal identifier of the database.

**Field Name:** QW0105DB

**DATABASE NAME**

The database name.

**Field Name:** QW0105DN

**OBID**

The decimal identifier of the object. Examples of objects are table space and index space.

**Field Name:** QW0105OB

**OBJECT NAME**

The name of the object. Examples of objects are table space and index space.

**Field Name:** QW0105TN
IFCID 106 - System Parameters

IFCID 106 shows the data from system parameters.

“IFCID 106 - Application Programming Defaults” on page 40-384

This topic shows detailed information about “Record Trace - IFCID 106 - VSAM Catalog Name Qualifier”.

IFCID 106 - Application Programming Defaults

This topic shows detailed information about “Record Trace - IFCID 106 - Application Programming Defaults”.

This block shows application programming defaults.

The values shown are used as default values by the program preparation panels, program preparation CLIST (DSNH), and precompiler. They can also be used as defaults by other programs, such as Query Management Facility (QMF).

Changing some of these defaults is not recommended because changes can make the syntax of existing SQL statements invalid or affect the way application programs run.

Values set here are contained in load module DSNHDECP, in library prefix.SDSNEXIT, which can be loaded and accessed by application programs. When modifying DSNHDECP, do so only by changing and running the installation CLIST.

Do not modify the data in DSNHDECP. If you modify any installation parameters by changing job DSNTIJUZ directly, these values are not recorded for later updates, new installations, or migrations.

Record trace - IFCID 106 - Application Programming Defaults

The field labels shown in the following sample layout of “Record Trace - IFCID 106 - Application Programming Defaults” are described in the following section.

</table>

**VERSION**

The version, release, and modification level.

Field Name: QWPBREL

**DECIMAL POINT OPT**

Indicates whether the decimal contains a comma (,) or a period (.). This parameter is used for dynamic SQL and COBOL programs. It is not used or supported by other languages.

Install parameter DECIMAL POINT IS on panel DSNTIPF, or ZPARM DECIMAL in DSNHDECP.

Derivation: DB2 field QWPBDE

Field Name: QWPBDE

**EBCDIC SBCS CCSID**

The EBCDIC single-byte coded character set ID.
A coded character set identifier (CCSID) must be specified when DDF STARTUP OPTION field on panel DSNTIPR is set to AUTO or COMMAND, or when the MIXED DATA field on panel DSNTIPF is set to YES. When mixed data is used, valid Mixed Data CCSID must also be specified.

A nonexistent CCSID causes an error.

An incorrect CCSID can corrupt data.

Install parameter EBCDIC CCSID on panel DSNTIPF, or ZPARM SCCSID in DSNHDECP.

Field Name: QWPBSID

DEFAULT SUBSYSTEM

The MVS subsystem name for DB2. The name is used in member IEFSSN xx of SYS1.PARMLIB.

A valid name has 1-4 characters, the first must be A-Z, #, $, or @. Others must be A-Z, 1-9, #, $, or @. Default is DSN1.

Install parameter SUBSYSTEM NAME on panel DSNTIPM, or ZPARM SSID in DSNHDECP.

Field Name: QWPBSSID

DEFLT ENC SCHEME

The default encoding scheme, which can be ASCII or EBCDIC, or UNICODE.

Install parameter DEF ENCODING SCHEME on panel DSNTIPF, or ZPARM ENSCHEME in DSNHDECP.

Derivation: DB2 field QWPBENS

Field Name: QWPBENS

EBCDIC MBCS CCSID

The EBCDIC mixed coded character set ID.

A coded character set identifier (CCSID) must be specified when DDF STARTUP OPTION field on panel DSNTIPR is set to AUTO or COMMAND, or when the MIXED DATA field on panel DSNTIPF is set to YES. When mixed data is used, valid Mixed Data CCSID must also be specified.

A nonexistent CCSID causes an error.

An incorrect CCSID can corrupt data.

Install parameter EBCDIC CCSID on panel DSNTIPF, or ZPARM MCCSID in DSNHDECP.

Field Name: QWPBMID

DEFAULT HOST LANG

The default programming language for your site. This can be:

• ASM
• C
• CPP
• COBOL
**ICID 106 - Application Programming Defaults**

- COB2
- IBMCOB
- FORTRAN
- PLI

When this is C or C++, you can fold SQL identifiers to uppercase.

Install parameter `LANGUAGE DEFAULT` on panel `DSNTIPF`, or `ZPARM DEFLANG` in `DSNHDECFP`.

**Field Name:** QWPBLANG

**DISTR SQL STR DEL**

The SQL delimiter for bind operations at this DB2 if the requester does not provide DB2 with this information.

**Field Name:** QWPBDSD

**EBCDIC GBCS CCSID**

The EBCDIC graphic coded character set ID.

A coded character set identifier (CCSID) must be specified when DDF `STARTUP OPTION` field on panel `DSNTIPR` is set to `AUTO` or `COMMAND`, or when the `MIXED DATA` field on panel `DSNTIPF` is set to `YES`. When mixed data is used, valid Mixed Data CCSID must also be specified.

A nonexistent CCSID causes an error.

An incorrect CCSID can corrupt data.

Install parameter `EBCDIC CCSID` on panel `DSNTIPF`, or `ZPARM GCCSID` in `DSNHDECFP`.

**Field Name:** QWPBGID

**DECFLOAT RND MODE**

The default rounding mode for the decimal floating point type. Possible values are:

- `X'80'` ROUND_CEILING
- `X'40'` ROUND_DOWN
- `X'20'` ROUND_FLOOR
- `X'10'` ROUND_HALF_DOWN
- `X'08'` ROUND_HALF_EVEN
- `X'04'` ROUND_HALF_UP
- `X'02'` ROUND_UP

Otherwise this field shows 'BLANK'.

Install parameter `DEC_DEFAULT_DECFLOAT_ROUND_MODE` in `DSNHDECFP`.

**Field Name:** QWPBDDRM

**DEFLT DEC ARITHM**

Indicates the rules of precision for a decimal field.

Install parameter `DECIMAL ARITHMETIC` on panel `DSNTIP4`, or `ZPARM DECARTH` in `DSNHDECFP`.

**Field Name:** QWPBDDRM
Derivation: DB2 field QWPBAR

Field Name: QWPBAR

ASCII SBCS CCSID
The ASCII single-byte coded character set ID.
The default (0) means the installation has no ASCII databases, table spaces, or tables.
Install parameter ASCII CCSID on panel DSNTIPF, or ZPARM ASCCSID in DSNHDECP.
Field Name: QWPBASID

DEFAULT DELIMITER
Shows the string delimiter for COBOL. Default string delimiter is the quotation mark. This option is applicable to all types of COBOL.
Install parameter STRING DELIMITER on panel DSNTIPF, or ZPARM DELIM in DSNHDECP.
Field Name: QWPBDL

DEFLT MIXED GRAPH
Indicates whether the code points X'0E' and X'0F' are the shift-out and shift-in controls for character strings that include double-byte characters.
Install parameter MIXED DATA on panel DSNTIPF, or ZPARM MIXED in DSNHDECP.
Field Name: QWPBGRA

ASCII MBCS CCSID
Indicates the ASCII mixed coded character set ID.
The default (0) means the installation has no ASCII databases, table spaces, or tables.
Install parameter ASCII CCSID on panel DSNTIPF, or ZPARM AMCCSID in DSNHDECP.
Field Name: QWPBAMID

DEFLT SQL DELIMIT
The string delimiter for SQL.
Install parameter SQL STRING DELIMITER on panel DSNTIPF, or ZPARM SQLDELI in DSNHDECP.
Derivation: DB2 field QWPBSDL
Field Name: QWPBSDL

SQL LANG SUPP LVL
Shows whether SQL, the language standard used by applications, conforms to 1986 ANSI SQL standard.

YES Conforms to the 1986 ANSI SQL standard
NO Conforms to the SQL language defined by DB2
86 Conforms to the 1986 ANSI SQL standard
Install parameter STD SQL LANGUAGE on panel DSNTIP4, or ZPARM STDSQL in DSNHDECP.

Field Name: QWPBSQL

ASCII GBCS CCSID

Indicates the ASCII graphic coded character set ID.

The default (0) means the installation has no ASCII databases, table spaces, or tables.

Install parameter ASCII CCSID on panel DSNTIPF, or ZPARM AGCCSID in DSNHDECP.

Field Name: QWPBAGID

DATE FORMAT

Default output format for dates.

Valid formats are ISO (yyyy-mm-dd), USA (mm/dd/yyyy), EUR (dd.mm.yyyy), JIS (yyyy-mm-dd), or LOCAL (your choice, defined by a date exit routine). DB2 interprets the input date from the punctuation and converts the output date to the required format.

Install parameter DATE FORMAT on panel DSNTIP4, or ZPARM DATE in DSNHDECP.

Field Name: QWPBDDATE

USE FOR DYN RULES

Shows whether DB2 uses the application programming defaults specified on this panel or those of the DB2 precompiler options for dynamic SQL statements bound using DYNAMICRULES bind, define, or invoke behavior.

When YES, the application programming (DSNHDECP) defaults are used for dynamic SQL statements in plans or packages bound using DYNAMICRULES bind, define, or invoke behavior.

The following defaults are affected:

- DECIMAL POINT IS
- STRING DELIMITER
- SQL STRING DELIMITER
- MIXED DATA
- DECIMAL ARITHMETIC

When NO, values of the precompiler options are used for dynamic SQL statements in plans or packages bound with DYNAMICRULES(BIND).

Install parameter USE FOR DYNAMICRULES on panel DSNTIP4, or ZPARM DYNRULS in DSNHDECP.

Field Name: QWPBDRLS

UNICOD SBCS CCSID

Unicode Single Byte Character Set identification.

Parameter UNICODE CCSID in installation panel DSNTIPF, or ZPARM USCCSID in macro DSNHDECP.

Field Name: QWPBUSID
**TIME FORMAT**

Indicates the default output format for times.

Valid values are ISO (hh:mm:ss), USA (hh:mm AM), EUR (hh:mm:ss), JIS (hh:mm:ss), or LOCAL (your choice, defined by a time exit routine). DB2 interprets the input time from the punctuation and converts the output time to the required format.

Install parameter TIME FORMAT on panel DSNTIP4, or ZPARM TIME in DSNHDECP.

Field Name: QWPBTIME

**DB2 DECP INDICATE**

Indicates that DECP is supplied by DB2.

Using a DB2 supplied DECP could cause data corruption due to applications using wrong CCSIDs.

Field Name: QWPBDB2S

**UNICODE MBCS CCSID**

Unicode Mixed Character Set identification.

Parameter UNICODE CCSID in installation panel DSNTIPF, or ZPARM UMCCSID in macro DSNHDECP.

Field Name: QWPBUMID

**IMP TIMEZONE**

The implicit time zone that is associated with DB2 table columns and routine parameters that are declared as time stamp with time zone.

For IFCID 106 - Application Programming Defaults, this field is displayed twice, with its hex value and in a readable string.

This field corresponds to DSNHDECP field IMPLICIT_TIMEZONE.

Field Name: QWPBIMTZ

**LOCAL DATE LENGTH**

Shows the length of the longest field required to hold a locally defined date.

The default (0) indicates an IBM-supplied format (ISO, JIS, USA, or EUR).

Install parameter LOCAL DATE LENGTH on panel DSNTIP4, or ZPARM DATELEN in DSNHDECP.

Field Name: QWPBDLEN

**UNICODE GBCS CCSID**

Unicode graphics character set identification.

Parameter UNICODE CCSID in installation panel DSNTIPF, or ZPARM UGCCSID in macro DSNHDECP.

Field Name: QWPBUGID

**IMP TIMEZONE (HEX)**

The implicit time zone that is associated with DB2 table columns and routine parameters that are declared as time stamp with time zone.
For IFCID 106 - Application Programming Defaults, this field is displayed twice, with its hex value and in a readable string.

This field corresponds to DSNHDECP field IMPLICIT_TIMEZONE.

**Field Name:** QWPBIMTZ

**LOCAL TIME LENGTH**

Shows the length of the longest field required to hold a time when a locally defined time format is used.

The default (0) indicates an IBM-supplied format (ISO, JIS, USA, or EUR).

Install parameter LOCAL TIME LENGTH on panel DSNTIP4, or ZPARM TIMELEN in DSNHDECP.

**Field Name:** QWPBTLEN

**NEWFUN CUR REL**

If YES, the DB2 subsystem/group is running in New Function Mode. At this mode/catalog level, the New Function Mode is enabled and available. The DB2 catalog is completely Unicode (UTF-8) and long names can be used.

Install parameter INSTALL TYPE on panel DSNTIPA1, or ZPARM NEWFUN in DSNHDECP.

**Field Name:** QWPBNEWF

**APPLIC ENCODING**

Application encoding scheme.

Install parameter APPLICATION ENCODING on installation panel DSNTIPF, or ZPARM APPENSCH in DSNHDECP.

**Field Name:** QWPBAPSC

**PAD NULL-TERMIN**

Shows whether output host variables that are NULL-terminated strings are padded with blanks and a NULL terminator.

When NO, NULL-terminated output host variables have the NULL terminator placed at the end of actual data returned in the host variable. When YES, NULL-terminated output host variables have the NULL terminator placed at the end of the string, after the string has been padded with blanks from the end of the actual data to the declared length of the output host variable.

Install parameter PAD NUL-TERMINATED on installation panel DSNTIP4, or ZPARM PADNTSTR in DSNHDECP.

**Field Name:** QWPBPAD

**NEWFUN CUR REL-1**

Shows the current release minus one of the new-function mode (NEWFUN).

**Field Name:** QWPBNEWFN1

**DSNHDECP DS NAME**

Shows the fully qualified DECP name of the data set from which the DSNHDECP module was loaded.
Field Name: QWPBLNM

NEWFUN CUR REL-2

Shows the current release minus two of the new-function mode (NEWFUN).

Field Name: QWPBNEWFN2

DEFAULT LOCALE

The system LOCALE LC_CTYPE.

A locale is the part of the system environment that depends on language and cultural conventions. An LC_TYPE is a subset of a locale that applies to character functions. The UPPER, LOWER, and TRANSLATE scalar functions use the CURRENT LOCALE LC_CTYPE system default or special register. The results of these functions can vary, depending on the setting of the locale.

The following values are possible:

BLANK

The source field is empty.

This is the default, unless it is necessary to run the UPPER, LOWER, or TRANSLATE functions for data that must be interpreted using the rules provided by specific locales, for example, En_US or Fr_CA.

1st word

The source field contains left-justified word(s), where each byte of a word is > X'40'. It can be a single word or several ones, delimited by bytes <= X'40'.

Note: These hexadecimal codes do not represent printable characters.

N/P

The source field contains regular words that are not left-justified. This means that the first bytes are <= X'40'. N/P is also shown if the whole source field only consists of bytes < X'40', such as zeros.

Install parameter LOCALE LC_CTYPE on panel DSNTIPF, or ZPARAM LC_TYPE in DSNHDECP.

Field Name: QWPBLCTP

DSNHDECP DS NAME

The system LOCALE LC_CTYPE.

A locale is the part of the system environment that depends on language and cultural conventions. An LC_TYPE is a subset of a locale that applies to character functions. The UPPER, LOWER, and TRANSLATE scalar functions use the CURRENT LOCALE LC_CTYPE system default or special register. The results of these functions can vary, depending on the setting of the locale.

The following values are possible:

BLANK

The source field is empty.
This is the default, unless it is necessary to run the UPPER, LOWER, or TRANSLATE functions for data that must be interpreted using the rules provided by specific locales, for example, En_US or Fr_CA.

1st word
The source field contains left-justified word(s), where each byte of a word is > X'40'. It can be a single word or several ones, delimited by bytes <= X'40'.

Note: These hexadecimal codes do not represent printable characters.

N/P The source field contains regular words that are not left-justified. This means that the first bytes are <= X'40'. N/P is also shown if the whole source field only consists of bytes < X'40', such as zeros.

Install parameter LOCALE LC_CTYPE on panel DSNTIPF, or ZPARM LC_TYPE in DSNHDECP.

Field Name: DSNHDECP

QWPBLVL
This field is for IBM service.

Field Name: QWPBLVL

QWPBLLEN
Shows the length of the control block.

Field Name: QWPBLLEN

QWPBHEYE
Shows the control block eyecatcher (DECP).

Field Name: QWPBHEYE

QWPBCHAR
Shows the default character set, ALPHANUM or KATAKANA.

ZPARM CHARSET in DSNHDECP.

Field Name: QWPBCHAR
IFCID 106 - Data Sharing Parameters

This topic shows detailed information about “Record Trace - IFCID 106 - Data Sharing Parameters”.

This block shows the members in a data-sharing group.

DB2 subsystems that share data must belong to a DB2 data sharing group, which runs on a Parallel Sysplex®. A data sharing group is a collection of one or more DB2 subsystems that access shared DB2 data. A Parallel Sysplex is a collection of MVS systems that communicate and cooperate with each other.

Record trace - IFCID 106 - Data Sharing Parameters

The field labels shown in the following sample layout of “Record Trace - IFCID 106 - Data Sharing Parameters” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GROUP NAME</td>
<td>The name of the DB2 data sharing group. The group name encompasses the entire data sharing group and is the basis for the coupling facility structure names. N/A means this DB2 is not part of a data sharing group. Install parameter GROUP NAME on panel DSNTIPK, or ZPARM GRPNAME in DSN6GRP.</td>
</tr>
<tr>
<td>DATA SHARING ENAB</td>
<td>Indicates whether data sharing is enabled.</td>
</tr>
<tr>
<td>MAX # OF MEMBERS</td>
<td>The maximum number of members possible in a data sharing group. This is a constant (248) and is not shown on any installation panel.</td>
</tr>
<tr>
<td>MEMBER NAME</td>
<td>The member name of this DB2. N/A means this DB2 is not part of a data sharing group. Install parameter MEMBER NAME on panel DSNTIPK, or ZPARM MEMBNNAME in DSN6GRP.</td>
</tr>
<tr>
<td>IMMEDWRITE FLAG</td>
<td>Indicates how DB2 updates group buffer pool dependent pages. This is only valid in a data-sharing environment. Group buffer pool dependent pages can be written to DASD or SYSTEM pagesets.</td>
</tr>
</tbody>
</table>
Values shown are:

**NO** DB2 uses normal write activity for updates, this is the default. Pages are written out at, or before phase 2 commit, or at the end of an abend for transactions that have rolled back.

**PH1** Pages are written out at, or before phase 1 commit.

If a transaction subsequently rolls back, the pages are updated in the group buffer pool at the end of the rollback and are written out at the end of the abend.

**YES** Pages are written out to the coupling facility as soon as the buffer update commits. Pages are written out regardless of whether the update occurs during forward progress or rollback of the transaction.

This option can affect performance due to coupling facility overhead.

Install parameter IMMEDIATE WRITE on panel DSNTIP8, or ZPARM IMMEDWR1 in DSN6GRP.

**Field Name:** QWPAIMMW

**CONVERSION FACTOR**

The CPU service unit conversion factor for this CPU.

This factor allows conversion CPU time in seconds to a common unit, called service unit (SU). The conversion factor used depends on the machine. Service units allow you to calculate CPU execution times across a data sharing group.

The conversion factor is used as follows:

\[
CP \text{ secs} \times 16,000,000 \div \text{Conversion Factor} = \text{SUs}
\]

\[
\text{SUs} \times \text{Conversion Factor} \div 16,000,000 = CP \text{ secs}
\]

This field does not map to an installation panel.

**Field Name:** QWPASUCV

**RANDOM ATTACH**

Specifies a random group attach flag:

**N** Not eligible for random group attach.

**NOT N** Eligible for random group attach.

This field corresponds to field RANDOM ATTACH on installation panel DSNTIPK. The ZPARM name is RANDOMATT in DSN6GRP.

**Field Name:** QWPARAND

**PEER RECOVERY**

Specifies whether this data sharing member is to participate in data sharing peer recovery.

**NONE** None.

**RECOVER** This member is recovered by a peer member in case it fails.
ASSIST
This member attempts to initiate peer recovery for other failed members. When this member detects a failure, it will attempt to initiate a LIGHT(YES) restart for the failed member if it has not been initiated to recover the retained locks.

BOTH  Both RECOVER and ASSIST options are activated for this member.

Field Name: QWPAPEERREC

QWPACOOR
Shows whether this DB2 member can coordinate parallel processing on other members of the group.
When NO, a query can be processed by this DB2 member only.
When YES, a read-only query running on this DB2 member can be processed in part on other members of the group.
N/A means this DB2 is not part of a data sharing group.
Install parameter COORDINATOR on panel DSNTIPK or ZPARM COORDNTR in DSN6GRP.

Field Name: QWPACOOR

QWPAASST
Shows whether this DB2 member can assist a parallelism coordinator with parallel processing.
When YES, this member is considered an assistant at both bind and run time. To be a viable assistant at run time, both the VPPSEQT and VPXPSEQT buffer pool thresholds of this member must be greater than 0.
N/A means this DB2 is not part of a data sharing group.
Install parameter ASSISTANT on panel DSNTIPK or ZPARM ASSIST in DSN6GRP.

Field Name: QWPAASST
IFCID 106 - Databases/Spaces Automatically Deferred

This topic shows detailed information about “Record Trace - IFCID 106 - Databases/Spaces Automatically Deferred”.

Record trace - IFCID 106 - Databases/Spaces Automatically Deferred

The field labels shown in the following sample layout of “Record Trace - IFCID 106 - Databases/Spaces Automatically Deferred” are described in the following section.

DATABASES/SPACES STARTED AUTOMATICALLY ALL

Tablespace Names

Contains the name of a table space or index space that is to be started automatically.

Field Name: QWP8SPNM
IFCID 106 - Databases/Spaces Automatically Restarted

This topic shows detailed information about “Record Trace - IFCID 106 - Databases/Spaces Automatically Restarted”.

Database Names

The name of a database that is to be started automatically.

Field Name: QWP8DBNM
IFCID 106 - Databases/Spaces Automatically Started

This topic shows detailed information about “Record Trace - IFCID 106 - Databases/Spaces Automatically Started”.

Record trace - IFCID 106 - Databases/Spaces Automatically Started

The field labels shown in the following sample layout of “Record Trace - IFCID 106 - Databases/Spaces Automatically Started” are described in the following section.

DATABASES/SPACES STARTED AUTOMATICALLY ALL

Database names

The name of a database that is to be started automatically.

Field Name: QWP8DBNM

Tablespace names

Contains the name of a table space or index space that is to be started automatically.

Field Name: QWP8SPNM
IFCID 106 - Distributed Data Facility Parameters

This topic shows detailed information about “Record Trace - IFCID 106 - Distributed Data Facility Parameters”.

This block shows how Distributed Data Facility (DDF) was started and the protocols used.

To use DDF, you must have VTAM installed, even if you use TCP/IP connections only.

Record trace - IFCID 106 - Distributed Data Facility Parameters

The field labels shown in the following sample layout of “Record Trace - IFCID 106 - Distributed Data Facility Parameters” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FACILITY NAME</td>
<td>The name of the DDF facility.</td>
</tr>
<tr>
<td>TCP/IP VERIFIED</td>
<td>Indicates whether DB2 accepts TCP/IP connection requests containing only a user ID.</td>
</tr>
</tbody>
</table>

FACILITY NAME

The name of the DDF facility.

Field Name: QWP9NAME

FACILITY START

Indicates whether DDF is loaded, and if so, how it was started.

When NO, DDF was not loaded at DB2 startup and cannot be started.

AUTO means DDF was loaded and started automatically when DB2 was started. The DDF address space was started as part of DDF initialization.

COMMAND means DDF was initialized and the DDF address space was started at DB2 startup. If DDF is running, it was started from the console with the -DSN1 START DDF command. If it is not running, it can be started with this command.

Install parameter DDF STARTUP OPTION on panel DSNTIPR, or ZPARM DDF in DSN6FAC.

Field Name: QWP9STRT

TCP/IP VERIFIED

Indicates whether DB2 accepts TCP/IP connection requests containing only a user ID.

When YES, a connection request is accepted with a user ID only. This value must be the same for all members of a data sharing group.

When NO (default), TCP/IP clients must provide authentication information (password, RACF PassTicket, or Kerberos ticket) to gain access to DB2.

Install parameter TCP/IP ALREADY VERIFIED on panel DSNTIP5, or ZPARM TCPALVER in DSN6FAC.

Field Name: QWP9TCPA
IFCID 106 - Distributed Data Facility Parameters

DBAT STATUS

Shows whether DB2 inactivates threads that have successfully committed or rolled back, and hold no cursors.

ACTIVE provides the best performance but consumes system resources.

INACTIVE is recommended when the installation must support a large number of connections.

When a thread becomes eligible for inactivation, DB2 tries to make it a type 2 inactive thread, which uses less storage than a type 1 inactive thread. If this fails, DB2 tries to make it a type 1 inactive thread. If neither attempt is successful, the thread remains active.

Install parameter DDF THREADS on panel DSNTIPR, or ZPARM CMTSTAT in DSN6FAC.

Field Name: QWP9CMST

RLF DYNAMIC ERROR

Shows what DB2 does when the governor cannot access the resource limit specification table or when no row in the table matches the currently executing statement.

NOLIMIT (default) allows all dynamic SQL statements to run without limit.

NORUN terminates all dynamic SQL statements immediately with an SQL error code.

A number from 1 to 5000000 is the default limit; if the limit is exceeded, the SQL statement is terminated.

Install parameter RLST ACCESS ERROR on panel DSNTIPR, or ZPARM RLFERRD in DSN6FAC (DB2 field QWP9RLER).

Field Name: QWP9RLER

TCP/IP KEEPALIVE

Indicates whether the TCP/IP configuration KeepAlive value has been overwritten.

When ENABLE (default), KeepAlive is enabled, the TCP/IP configuration stack value is used.

When DISABLE, TCP/IP KeepAlive has been disabled.

A value in the range 1 through 65534 means KeepAlive is active, and the TCP/IP stack value has been overridden. The number reported shows the time, in seconds, between TCP/IP probes.

When considering overwriting the keep-alive time, it is recommended to set a value close to the IDLE THREAD TIMEOUT value on installation panel DSNTIPR or the IRLM RESOURCE TIMEOUT value on installation panel DSNTIPI. It is good practice to set all these to about five minutes, or less.

Because KeepAlive detection is accomplished by probing the network at this interval, avoid small values, which can cause excessive network traffic and system resource consumption.
The trick is to find a proper balance that allows network failures to be detected on a timely basis without impacting system and network performance.

Install parameter TCP/IP KEEPALIVE on panel DSNTIP5, ZPARM TCPKFALV in DSN6FAC.

Field Name: QWP9TCKA

**IDLE THR TIMEOUT**

The approximate time, in seconds, that an active server thread can remain idle before it is canceled.

Inactive and indoubt threads are not subject to timeout.

Threads are checked for timeouts every 3 minutes. This means that timeouts might not be honored for up to 3 minutes when the timeout value is less than this.

0 (default) means timeout processing is disabled, idle server threads remain in the system and continue to hold their resources, if any.

Install parameter IDLE THREAD TIMEOUT on panel DSNTIPR, or ZPARM IDTHTOIN in DSN6FAC.

Field Name: QWP9TTO

**RLF STATIC ERROR**

Shows what DB2 does when the governor cannot access the resource limit specification table or when no row in the table matches the currently running statement:

**NOLIMIT**

This is the default. It allows all static SQL statements to run without limit.

**NORUN**

Terminates all static SQL statements immediately with an SQL error code. A number from 1 to 5000000 is the default limit; if the limit is exceeded, the SQL statement is terminated.

Install parameter REMOTE STATIC SQL on panel DSNTIPO4, or ZPARM RLFERRDSTC in DSN6FAC (DB2 field QWP9RLER).

Field Name: RLFERRDSTC

**MAX T1 INACT THR**

Indicates the number of type 1 inactive threads that DB2 allows.

A large number of type 1 inactive threads can adversely affect system performance. Type 1 inactive threads are used for DB2 private protocol. DRDA uses type 2 inactive threads.

Zero indicates that type 1 inactive connections are not allowed. Threads remain active when they become eligible to be made a type 1 inactive thread.

A value greater than zero indicates that type 1 inactive connections are allowed, but are limited to this number. When a thread becomes eligible to be made a type 1 inactive thread, and this threshold is reached, the remote connection is terminated.
When this is equal to MAX REMOTE CONNECTED on panel DSNTIPE, DB2 allows all remote threads to become type 1 inactive threads.

Install parameter MAX INACTIVE DBATS on panel DSNTIPR, or ZPARM MAXTYPE1 in DSN6FAC.

Field Name: QWP9MAX1

POOL THR TIMEOUT

The approximate time, in seconds, that a DBAT can remain idle in the pool before it is terminated.

A DBAT thread in the pool counts as an active thread against MAX REMOTE ACTIVE and can hold locks, but does not have any cursors.

Threads are checked for timeouts every 3 minutes. This means that timeouts might not be honored for up to 3 minutes when the timeout value is less than this. The default is 120.

Install parameter POOL THREAD TIMEOUT on panel DSNTIP5, ZPARM POOLINAC in DSN6FAC.

Field Name: QWP9INAC

PRIVATE PROTOCOL

Shows if it is allowed to use the private protocol. It can have the following values:

YES Allows private-protocol-related plan-owner-based package authorization behavior. Plan-owner-based package execution authorization semantics are honored for DB2 for z/OS DRDA requester systems that might rely on it. Secondary IDs are not used to determine package execution privileges for remote DB2 for z/OS applications.

NO Does not allow any private-protocol-related behavior. Plan-owner-based package execution authorization semantics are not honored. This might affect DB2 for z/OS DRDA requester systems that rely on it. Secondary IDs are used to determine package execution privileges for remote DB2 for z/OS applications.

ZPARM name PRIVATE_PROTOCOL in DSN6FAC.

Field Name: QWP9PRVPA

RESYNCH INTERVAL

The number of minutes between resynchronization periods.

A resynchronization period is the time during which indoubt logical units of work involving this DB2 subsystem and partner logical units are processed.

Install parameter RESYNCR INTERVAL on panel DSNTIPR, or ZPARM RESYNC in DSN6FAC.

Field Name: QWP9RYC

CONN Q MAX DEPTH

The maximum depth of the connection-request queue of connections that are waiting for a DBAT to process a request. If this value is non-zero, and QWP9CMST is active, or the subsystem is not a member of a data sharing...
group, DB2 operates as if this value were 0. This field corresponds to field CONN QUEUE MAX DEPTH on installation panel DSNTIP5. The ZPARM name is MACONQN in DSN6FAC.

Field Name: QWP9MCONQN

ID & PASSWORD REQ

Shows whether user ID and password are required. In addition, one of the following is required:

- The user ID and password and any RACF PassTickets (A PassTicket is a one-time-only password that is generated by a requesting product or function) are Advanced Encryption Standard (AES) encrypted.
- A Kerberos ticket is required.
- The connection is protected by a z/OS Communications Server IP Application Transparent Transport Layer Security (AT-TLS) policy, which is ensured through a DB2 SECPORT.
- The connection is protected by an IPSec tunnel.

Field Name: QWP9TCPVE

SQL INTRPT DISABL

Shows how SQL interrupts are processed. It can have the following values:

- NO  SQL interrupt processing is enabled.
- YES DB2 SQL interrupt support is disabled.

Note: YES should only be used if remote client systems experience failures because of SQL interrupts. In this case, SQL interrupt support should be disabled only until the remote client systems can be modified to tolerate SQL interrupts.

ZPARM name SQLINTRP in DSN6FAC.

Field Name: QWP9SINTD

CONN Q MAX WAIT

The maximum time that a connection waits for a DBAT request. If this value is non-zero, and QWP9CMST is active, or the subsystem is not a member of a data sharing group, DB2 operates as if this value is 0.

This field corresponds to field CONN QUEUE MAX WAIT on installation panel DSNTIP5. The ZPARM name is MAXCONQW in DSN6FAC.

Field Name: QWP9MCONQW

DDF COMP PRIOR V

The DDF compatibility parameter. The DB2 server with new-function mode has not yet been activated. The DDF compatibility parameter causes this server to identify itself to all remote clients as being in new-function mode for the previous version. The format of this field in the trace record is mnr, where mnr is the version of the DB2 server and r is the release.

Field Name: QWP9DDFCIP

SP_PARMS_JV

Specifies that when a Java client application calls a DB2 for z/OS stored procedure, DB2 returns output argument values with data types that match
the data types that were specified in the CallableStatement.registerOutParameter method calls.

If SP_PARMS_JV is not specified, DB2 returns output parameter values with data types that match the data types of the parameters in the stored procedure definition.

ZPARM name DDF_COMPATIBILITY and ZPARM value SP_PARMS_JV in DSN6FAC.

Field Name: QWP9SPPM

SP_PARMS_NJV

Specifies that when a non-Java client application calls a DB2 for z/OS stored procedure, DB2 returns output argument values with data types that match the data types of the corresponding CALL statement arguments, unless one of the following conditions are true:

- The non-Java client is Version 10 or later.
- The stored procedure uses a parameter data type that was introduced in DB2 for z/OS Version 10 (XML, TIMESTAMP WITH TIMEZONE, or TIMESTAMP with precision greater than 6).

If one condition is true, DB2 returns output parameter values with data types that match the data types of the parameters in the stored procedure definition. If SP_PARMS_NJV is not specified, DB2 returns output parameter values with data types that match the data types of the parameters in the stored procedure definition.

ZPARM name DDF_COMPATIBILITY and ZPARM value SP_PARMS_NJV in DSN6FAC.

Field Name: QWP9SPPM

IGNORE_TZ

Shows whether to ignore the time zone (TMZ) in TMZ input for Java.

Field Name: QWP9ITZJ

DSBL_IMPCAST_JV

Specifies whether the DB2 for z/OS server disables implicit casting of input host variables from numeric data types to string data types, or from string data types to numeric data types, when the application is a Java client application that uses the IBM Data Server Driver for JDBC and SQLJ.

If application compatibility is set to:
- V10R1: DB2 uses DISABLE_IMPCAST_JV.
- V11R1 or later: DB2 always does implicit casting.

ZPARM name DDF_COMPATIBILITY ZPARM value DISABLE_IMPCAST_JV in DSN6FAC.

Field Name: QWP9ICIJ

DSBL_IMPCAST_NJV

Specifies that DB2 for z/OS disables implicit casting of input host variables from numeric data types to string data types, or from string data types to numeric data types, when the application is a non-Java client application that uses an IBM Data Server client or driver that is at Version 10.5 or earlier.
ZPARM name DDF_COMPATIBILITY and ZPARM value DISABLE_IMPCAST_NJV in DSN6FAC.

Field Name: QWP9ICIN
IFCID 106 - IRLM Processing Parameters

Record trace - IFCID 106 - IRLM Processing Parameters

The field labels shown in the following sample layout of “Record Trace - IFCID 106 - IRLM Processing Parameters” are described in the following section.

<table>

</tbody>
</table>

PC SPECIFIED

Shows whether the IRLM uses the cross-address-space program call. This parameter determines where the IRLM lock control block structure is stored.

If you run a tightly-controlled environment and virtual storage is not constrained, use PC=NO. PC=YES is the conservative choice where insufficient information about the environment is available to make a well-informed decision.

With PC=NO, locks are managed in extended common service area (ECSA) and it is possible to achieve better CPU performance, because DB2 does not use cross-memory services for IRLM requests. However, ECSA is a limited resource and constrains the size of the private address space area available above the 16-MB line. The demand for ECSA storage to support locks may be excessive when one or more of the following conditions are true:

- Extensive use of row-level locking
- Ineffective lock avoidance
- Infrequent application commits
- Lock escalation via NUMLKTS and LOCKMAX is disabled because the applications cannot tolerate the impact
- Effectively no limit on the number of locks taken by an application (NUMLKUS is set very high)
- Multiple DB2 subsystems with IRLM PC=NO reside on the same z/OS image

Assuming the average lock consumes 536 bytes of storage, a single application which takes 100000 locks before a commit would consume almost 52 MB of ECSA when IRLM is configured with PC=NO. MAXCSA would have to be set to at least 52 MB. If a very large number of locks are held by concurrent application processes, the demand for ECSA may not be able to be supported.

Recommendation: If you run applications that have many of the above characteristics, it is strongly recommended to use PC=YES. Certain ERP vendor applications that run concurrent processes can acquire a very large number of held locks that would require a very large setting for MAXCSA, or cause an ECSA overflow which would adversely impact the availability of the z/OS image.

If PC=NO is selected, MAXCSA should be sized to support the concurrent number of held locks required and to avoid an ECSA overflow condition. When setting MAXCSA, check to ensure that the ECSA setting in
PARMLIB is sufficient to support the aggregate demand from IRLM and other subsystems. The ECSA size for z/OS is specified by the CSA keyword in the IEASSYSnn member in SYS1.PARMLIB.

With PC=YES, locks are managed in the extended private area of the IRLM address space. This can increase the CPU cost of lock and unlock requests relative to PC=NO. However, with reasonable lock avoidance, the total CPU overhead is likely to be limited to 1 to 2%, which is well within measurement noise and therefore not significant.

With PC=YES, the MAXIMUM ECSA option is ignored but must not be zero. The amount of storage allowed for LOCK usage is determined from the extended storage provided to the IRLM address space at startup time. This amount is reduced by 200 MB to allow a buffer for IRLM and z/OS required storage and for DMBS MUST COMPLETE processes. The amount being monitored can be seen in the display message from the irlmprocc,STATUS,STOR command. IRLM still uses CSA and ECSA for other purposes. If you need to create a dump for DB2 diagnostic purposes, you need to ensure that IRLM is included in the dump, and that the dump data sets are large enough to hold IRLM.

PC=NO is a good solution when one or more of the following conditions are true, particularly when running a data sharing configuration:

- Optimal CPU performance is required
- No constraint is necessary on available ECSA
- Significant IRLM lock contention and a very large number of lock requests with ineffective lock avoidance
- Relatively high IRLM SRB time

YES puts the lock control block structure in the IRLM private address space, and the program call instruction is used to address it. IRLM still uses CSA and ECSA for other purposes. With PC=YES, the MAXIMUM ECSA option is ignored.

Field Name: QWP5PCY

DEADLOCK WAIT

Wait time for local deadlock.

Field Name: QWP5DLOK

LOCAL/GLOBAL CYCL

Number of local cycles per global cycle.

Field Name: QWP5DCYC

TIMEOUT INTERVAL

Timeout interval.

Field Name: QWP5TVAL

MAX CSA USAGE

The maximum amount of common service area that can be used by IRLM.

The amount of space needed for the common service area (CSA) below the 16 MB line is less than 40 KB for each DB2 subsystem and 24 KB for each IRLM. High concurrent activity, parallelism, or high contention can require more CSA.
Most of the DB2 common data resides in the extended common service area (ECSA). Most modules, control blocks, and buffers reside in the extended private area. A DB2 subsystem with 200 concurrent users and 2000 open data sets should need less than 2 MB of virtual storage below the 16 MB line.

Field Name: QWP5MCSA

**LOCKTAB HASH ENTR**

The number of z/OS lock table hash entries.

Field Name: QWP5HASH

**MAX 31-BIT STOR**

The maximum amount of 31-bit IRLM private storage that is available of the 2 GB virtual storage limit, for normal operations in IRLM. IRLM reserves an additional 10% of the 2 GB for use by requests in IRLM.

Field Name: QWP5BPM

**PENDING HASH ENTR**

The number of z/OS lock table hash entries pending.

Field Name: QWP5PHSH

**LOCKTAB LIST ENTR**

The number of z/OS lock table list entries.

Field Name: QWP5RLE

**MAX 64-BIT STOR**

The maximum amount of 64-bit IRLM private storage that is available of the total amount of storage that is specified by MEMLIMIT, for normal operations in IRLM. IRLM reserves an additional 10% of the amount that is specified by MEMLIMIT for use by requests in IRLM.

Field Name: QWP5APM
IFCID 106 - Log Initialization Parameters (Part 1)

This topic shows detailed information about “Record Trace - IFCID 106 - Log Initialization Parameters (Part 1)”.

Record trace - IFCID 106 - Log Initialization Parameters (Part 1)

The field labels shown in the following sample layout of “Record Trace - IFCID 106 - Log Initialization Parameters (Part 1)” are described in the following section.

LOG INITIALIZATION PARAMETERS (PART 1)

LOG OUTPUT BUFFER: 4000
MAX ARCH INP UNIT: 2
DEALLOC TIME(MIN): 0
DEALLOC TIME(SEC): 0
READ COPY2 ARCH : NO
MAX ARCH IN BSDS : 10000
OFFLOAD OPTION ..: YES
ACTIVE LOG COPIES: 1
REM COPY SW ACCEL: NO
QWP2LVL ........: DSN1210
QWP2INLM ........: YES
DEALLOC PERIOD: 20
QWP2LBS ........: NO
QWP2LBPF ........: YES

LOG OUTPUT BUFFER

The output log buffer size in kilobytes.

There is only one output log buffer per DB2 subsystem.

Increasing this parameter reduces BSDS I/O updates when there is a buffer wraparound. Frequent wraparounds are likely in LOAD or REORG with logging, and mass insert operations.

Increasing this parameter also helps avoid log write waits for an available buffer during heavy update workload.

When the specified size is not a 4 KB multiple, it is rounded up to the next 4 KB multiple.

Install parameter OUTPUT BUFFER on DSNTIPL, or ZPARM OUTBUFF in DSN6LOGP.

Field Name: QWP2OBPS

MAX ARCH INP UNIT

The maximum number of archive log volumes that can be allocated at the same time.

Field Name: QWP2INLM

DEALLOC TIME(MIN)

The number of minutes an archive read tape unit can remain unused before it is deallocated.

When archive log data is read from tape, this value should be high enough to allow DB2 to optimize tape handling for multiple read applications.

Install parameter DEALLOC PERIOD on panel DSNTIPA, or ZPARM DEALLCT in DSN6LOGP.

Field Name: QWP2DMIN

READ COPY2 ARCH

Indicates whether COPY2 archives should be read first when the DB2 subsystem is started. The default is NO. Install parameter READ COPY2 ARCHIVE on panel DSNTIPO, or ZPARM TRKRSITE in DSN6SPRM.

Field Name: QWP2ARC2

MAX ARCH IN BSDS
The maximum number of archive log volumes that can be recorded in the BSDS.

When this number is exceeded, recording resumes at the beginning of the BSDS.

For dual archive, this value applies to each log data set. As an example, a value of 500 allows 500 COPY-1 and 500 COPY-2 data sets in the BSDS.

You must create image copies of all DB2 objects, probably several times, before the archive log data sets are discarded. If you fail to retain an adequate number of archive log data sets for all the image copies, you might need to cold start or reinstall DB2. In either case, data is lost.

Install parameter RECORDING MAX on panel DSNTIPA, or ZPARM MAXARCH in DSN6LOGP.

Field Name: QWP2ARCL

DEALLOC TIME(SEC)

The deallocation time in seconds.

Field Name: QWP2DSEC

ACTIVE LOG COPIES

The number of copies of the active log being maintained: 2 indicates dual logging.

Field Name: QWP2DUAL

DUAL BSDS MODE

Shows whether two BSDS data sets are used.

A second BSDS (strongly recommended) makes recovery much easier in most situations. In cases that normally require recovery and restart, a second BSDS allows you to continue working. The storage overhead required is small and the data set is relatively inactive.

DB2 parameter TWOBSDS in DSN6LOGP.

Field Name: QWP2DBSD

OFFLOAD OPTION

Shows whether the offload process is initiated online.

ZPARM OFFLOAD in macro DSN6LOGP.

Field Name: QWP2OFFL

ARCH LOG COPIES

The number of copies of the archive log being produced during offloading: 2 indicates dual logging.

Install parameter NUMBER OF COPIES on PANEL DSNTIPH, or ZPARM TWOARCH in DSN6LOGP.

Field Name: QWP2ADL

REM COPY SW ACCEL

Specifies whether DB2 uses software (SW) to control the remote copy process for active log output in peer-to-peer remote copy (PPRC) environments. It can have the following values:

- DISABLE (This is the default value)
• ENABLE

ZPARM REMOTE_COPY_SW_ACCEL in DSN6LOGP.

Field Name: QWP2RCSA
IFCID 106 - Log Initialization Parameters (Part 2)

Record trace - IFCID 106 - Log Initialization Parameters (Part 2)

The field labels shown in the following sample layout of “Record Trace - IFCID 106 - Log Initialization Parameters (Part 2)” are described in the following section.

**DATASET BLOCKSIZE**

The block size of the archive log data set.

The block size must be compatible with the device type used for archive logs. The value is rounded up to the next multiple of 4096 bytes.

If the archive log is written to tape, use the largest possible block size to improve the reading speed.

Recommended block size values are 28672 for tape, 20480 for 3380, and 24576 for 3390 or RAMAC.

Install parameter BLOCK SIZE on panel DSNTIPA, or ZPARM BLKSIZE in DSN6ARVP.

**Field Name:** QWP3BKSZ

**COPY1 DEVICE TYPE**

The device type or unit name for storing archive log data sets.

The value can be any alphanumeric string. If you choose to archive to DASD, you can specify a generic device type with a limited volume range. DB2 requires that all archive log data sets allocated on DASD are cataloged.

If the device type is DASD, CATALOG DATA must be set to YES. If the unit name specifies DASD, the archive log data sets can extend to a maximum of 15 volumes. PRIQTY and SECQTY must be large enough to contain all active log data set data without extending beyond 15 volumes. If the unit name specifies a tape device, DB2 can extend to a maximum of 20 volumes. Default is TAPE.

Install parameter DEVICE TYPE 1 on panel DSNTIPA, or ZPARM UNIT in DSN6ARVP.

**Field Name:** QWP3UNT1

**MSS GROUP NAME 1**

The mass storage system volume group name of the first storage group.

**Field Name:** QWP3MSV1
PRIMARY ALLOCATION

The primary space allocation for archive data sets.

Install parameter PRIMARY QUANTITY on installation panel DSNTIPA, or ZPARM PRIQTY in DSN6ARVP.

Field Name: QWP3RISP

COPY2 DEVICE TYPE

Indicates the device type or unit name for storing the second copy of archive log data sets.

The value can be any alphanumeric string. If you choose to archive to DASD, you can specify a generic device type with a limited volume range. DB2 requires that all archive log data sets allocated on DASD are cataloged.

If the device type is DASD, then CATALOG DATA must be set to YES. If the unit name specifies DASD, the archive log data sets can extend to a maximum of 15 volumes. PRIQTY and SECQTY must be large enough to contain all active log data set data without extending beyond 15 volumes. If the unit name specifies a tape device, DB2 can extend to a maximum of 20 volumes. Default is TAPE.

Install parameter DEVICE TYPE 2 on panel DSNTIPA, or ZPARM UNIT2 in DSN6ARVP.

Field Name: QWP3UNT2

MSS GROUP NAME 2

The mass storage system volume group name of the second storage group.

Field Name: QWP3MSV2

SECONDARY ALLOC.

The amount of DASD secondary space allocation for an archive log data set.

The units used are specified by the ALLOCATION UNITS field. When blank (default), the CLIST calculates this space using block size and size of the log.

Install parameter SECONDARY QTY on panel DSNTIPA, or ZPARM SECQTY in DSN6ARVP.

Field Name: QWP3SECS

COPY 1 PREFIX

The prefix of the first archive log data set.

Install parameter Archive Logs: COPY1 PREFIX on panel DSNTIPH, or ZPARM ARCPFX1 in DSN6ARVP.

Field Name: QWP3RE1N

RETENTION PERIOD

The number of days DB2 keeps archive log data sets.

This value is added to the current date to calculate the expiration date.
The retention period is often used in tape management systems to control the reuse and scratching of data sets and tapes. DB2 uses this as the value for the dynamic allocation parameter DALRETPD when archive log data sets are created.

Install parameter RETENTION PERIOD on panel DSNTIPA, or ZPARM ARCRETN in DSN6ARVP.

Field Name: QWP3RETN

COPY 2 PREFIX

The prefix of the second archive log data set. If single logging is used, this value is a default.

Install parameter Archive Logs: COPY2 PREFIX on panel DSNTIPH, or ZPARM ARCPF2X2 in DSN6ARVP.

Field Name: QWP3RE2N

SINGLE VOLUME

Indicates whether single-volume DASD archives are used.

Install parameter SINGLE VOLUME on panel DSNTIPA, or ZPARM SVOLARC in DSN6ARVP.

Field Name: QWP3SVOL

QUIESCE PERIOD

The maximum amount of time (in seconds) permitted for DB2 to attempt a full system quiesce.

Install parameter QUIESCE PERIOD on panel DSNTIPA, or ZPARM QUIESCE in DSN6ARVP.

Field Name: QWP3MQP

CATALOG ARCH DS

The alias of the VSAM integrated catalog facility user catalog or the name of the master catalog where the DB2 VSAM data sets created during installation are cataloged. The MVS catalog alias is also used as the high-level qualifier for DB2 VSAM data sets.

Install parameter CATALOG ALIAS on panel DSNTIPA, or ZPARM CATALOG in DSN6ARVP.

Field Name: QWP3CTLG

SPACE ALLOC METHOD

The unit used in allocating archive data sets. Possible values are:

CYLINDER
Space allocation by cylinders (QWP3CYL=1)

TRACKS
Space allocation by tracks (QWP3TRCK=1)

BLOCKS
Space allocation by blocks (QWP3CYL=0 and QWP3TRCK=0)

Install parameter ALLOCATION UNITS on panel DSNTIPA, or ZPARM ALCUNIT in DSN6ARVP.

Field Name: RT0106SA
ARCHLOG RACF PROT

Indicates whether archive log data sets are protected with individual RACF profiles when they are created.

When YES, RACF protection must be active for DB2. YES also means that you cannot use RACF generic profiles for archive log data sets. If your archive log is on tape, RACF class TAPEVOL must be active, otherwise, the off-load will fail.

Install parameter ARCHIVE LOG RACF on panel DSNTIPP, or ZPARM PROTECT in DSN6ARVP.

Field Name: QWP3RTCT

WTOR BEF ARCH MNT

Indicates whether DB2 must send a message to the operator and wait for an answer before attempting to mount an archive log data set.

Other DB2 users can be forced to wait while the mount is pending. They are not affected while DB2 is waiting for a response to the message.

When YES, a device such as tape is used that requires long delays for mounts. DEVICE TYPE 1 shows the device type or unit name.

Install parameter WRITE TO OPER on panel DSNTIPA, or ZPARM ARCWTOR in DSN6ARVP.

Field Name: QWP3WTOR

COMPACT DATA

Indicates whether data written to archive logs is compacted.

This option only applies to data written to a 3480 device that has the improved data recording capability (IDRC) feature.

Install parameter COMPACT DATA on panel DSNTIPA, or ZPARM COMPACT in DSN6ARVP.

Field Name: QWP3COMP

TS ARCHLOG DS

Indicates whether the date and time of creation of the DB2 archive log data set is included in the archive log data set name.

Possible values are:

YES (QWP3DTIM=1)

The maximum allowable length of the user-controlled portion of the archive log prefix is reduced from 35 characters to 19 characters. This allows the 16-character timestamp to be added to the archive log data set prefix. The timestamp format is as follows: DyydddThhmmssst, where:

D Starts the date.

yy Is the last two digits of the year.

ddd Is the day of the year.

T Starts the time.

hh Is the hour.

mm Are the minutes.
ss Are the seconds.

 t Is the tenths of a second.

The maximum allowable length of the user-controlled portion of the archive log prefix is reduced from 35 characters to 19 characters. This reduction in size permits the 16-character date and time qualifiers (timestamp) to be added to the archive log data set prefix.

**NO (QWP3DTIM=0 and QWP3DTFM=0)**

The archive data set name does not contain a timestamp.

**EXT (QWP3DTFM=1)**

The archive data set name contains a timestamp with an extended date component in the format: .yyyyyddd. A value of EXT in this field causes the lengths of the values that are entered for field COPY 1 PREFIX and field COPY 2 PREFIX to be audited to ensure that neither exceeds 17 bytes (19 bytes for other settings of TIMESTAMP ARCHIVES).

Install parameter TIMESTAMP ARCHIVES on panel DSNTIPH, or ZPARM TSTAMP in DSN6ARVP.

Field Name: RT0106AL

**QWP3LVL**

This field is for IBM service.

Field Name: QWP3LVL

**QWP3WLST**

This field is for IBM service.

Field Name: QWP3WLST
# IFCID 106 - Miscellaneous Installation Parameters

This topic shows detailed information about “Record Trace - IFCID 106 - Miscellaneous Installation Parameters”.

This block shows values that are not shown on DB2 installation panels. These values are either set internally by DB2, or calculated from other install parameter values.

When this block contains names that are too long for the space available, they are truncated. The full name is shown in the list of long names, which is printed at the end of this block. When present, the list shows the parameter identifier, in alphabetic order, and the complete name. If the name is too long for one line, it continues on the next line.

## Record trace - IFCID 106 - Miscellaneous Installation Parameters

Chapter 40. IFCID Record Blocks 40-417
**EDM POOL SIZE**

The size (in kilobytes) of the environmental descriptor manager (EDM) pool.

This can be the value calculated by the CLIST, based on input from previous panels, or the value entered in the Override column at installation time.

Install parameter EDMPOOL STORAGE SIZE on panel DSNTIPC, or ZPARM EDMPOOL in DSN6SPRM.
IFCID 106 - Miscellaneous Installation Parameters

Field Name: QWP4EDPL

IRLM PROCEDURE
The name of the IRLM procedure invoked by MVS if AUTO START is YES.
The name cannot be the same as the subsystem name given for SUBSYSTEM NAME.
Install parameter PROC NAME on panel DSNTIPI, or ZPARM IRLMPRC in DSN6SPRM.

Field Name: QWP4IPRC

TAB OWNER
The owner of the application registration table and the object registration table.
This identifier can be a long string. If there is insufficient space to show the complete string, the string is truncated in the report block. The complete string is shown in a separate list of long names at the end of the report.
Install parameter REGISTRATION OWNER on panel DSNTIPZ, or ZPARM RGFCOLID in DSN6SPRM.

Field Name: QWP4REGC

INST DD CTRL SUPT
Indicates whether data definition support has been installed.
Install parameter INSTALL DD CONTROL SUPT on panel DSNTIPZ, or ZPARM RGFINSTL in DSN6SPRM.

Field Name: QWP4REGI

IRLM MODULE NAME
The IRLM subsystem name defined to MVS.
This is used for communication between DB2 and the IRLM. It is included in the MVS subsystem table IEFSSN xx, where xx is the value of SUBSYSTEM MEMBER on installation panel DSNTIPM.
If the IRLM for IMS is installed, the DB2 IRLM name is different because two IRLMs on the same MVS system must have unique names.
Install parameter SUBSYSTEM NAME on panel DSNTIPI, or ZPARM IRLMSID in DSN6SPRM.

Field Name: QWP4ISID

APPL TABLE
The name of the application registration table.
Install parameter APPL REGISTRATION TABLE on panel DSNTIPZ or ZPARM RGFNMPRT in DSN6SPRM.

Field Name: QWP4REGA

CTRL ALL APPLIC
Indicates that the DB2 system is completely controlled by a set of closed applications identified in the application registration table.
Closed applications require their DB2 objects to be managed solely through the plans or packages registered in the application registration table.
IFCID 106 - Miscellaneous Installation Parameters

Install parameter CONTROL ALL APPLICATIONS on panel DSNTIPZ, or ZPARM RGFDEDPL in DSN6SPRM.

Field Name: QWP4REGD

IRLM START TIME

The IRLM wait time in seconds.
DB2 autostart abends if IRLM does not start within this time.
Install parameter TIME TO AUTOSTART on panel DSNTIPI, or ZPARM IRLMSWT in DSN6SPRM.

Field Name: QWP4ISWT

OBJ TABLE

The name of the object registration table.
Install parameter OBJT REGISTRATION TABLE on panel DSNTIPZ, or ZPARM RGFNMORT in DSN6SPRM.

Field Name: QWP4REGO

REQ FULL NAMES

Indicates whether registered objects require fully qualified names.
Install parameter REQUIRE FULL NAMES on panel DSNTIPZ, or ZPARM RGFFULLQ in DSN6SPRM.

Field Name: QWP4REGQ

IRLM INIT TIME

The number of seconds DB2 waits before querying whether IRLM has completed initialization.
DB2 parameter SPRMISWI in DSNMSPRM.

Field Name: QWP4ISWI

INSTALL SYSADM

One of two authorization IDs with SYSADM authority. SYSADM users can access to DB2 in all cases.
This identifier can be a long string. If there is insufficient space to show the complete string, the string is truncated in the report block. The complete string is shown in a separate list of long names at the end of the report.
Install parameter SYSTEM ADMIN 1 on panel DSNTIPP, or ZPARM SYSADM in DSN6SPRM.

Field Name: QWP4SADM

UNREGIST DDL DFLT

The action taken for DDL that names an unregistered object.
Options are REJECT, ACCEPT, or APPL, which rejects the DDL when the current application is not registered.
Install parameter UNREGISTERED DDL DEFAULT on panel DSNTIPZ, or ZPARM RGFDEFLT in DSN6SPRM.

Field Name: QWP4REGU

IRLM AUTOSTART
Indicates whether IRLM is started automatically by DB2.
Install parameter AUTO START on panel DSNTIPI, or ZPARM IRLMAUT in DSN6SPRM.

**Field Name:** QWP4IAUT

**SYSADM ID 2**
One of two authorization IDs with SYSADM authority. SYSADM users can access to DB2 in all cases.
This identifier can be a long string. If there is insufficient space to show the complete string, the string is truncated in the report block. The complete string is shown in a separate list of long names at the end of the report.
Install parameter SYSTEM ADMIN 2 on panel DSNTIPP, or ZPARM SYSADM2 in DSN6SPRM.

**Field Name:** QWP4ADM2

**UTILITY FACTOR**
Shows how much longer utilities can wait for a resource than SQL applications can.
This is the number of RESOURCE TIMEOUT units that a utility or utility command can wait for a lock or for all claims on a resource of a particular claim class to be released. The default value is 6, meaning a utility can wait 6 times longer than an SQL application for a resource.
Install parameter UTILITY TIMEOUT on panel DSNTIPI, or ZPARM UTIMOUT in DSN6SPRM.

**Field Name:** QWP4UTO

**IRLM TIMEOUT**
The number of seconds before a timeout is detected.
This is an integer multiple of DEADLOCK TIME on panel DSNTIPJ.
Timeout means that a lock request has waited for a resource (or for claims on a resource for a particular claim class to be released) longer than this time.
For data sharing, the actual timeout period is longer than the timeout value.
Install parameter RESOURCE TIMEOUT on panel DSNTIPI, or ZPARM IRLMRWT in DSN6SPRM.

**Field Name:** QWP4TOU

**DEFAULT USERID**
The authorization ID used if RACF is not available for batch access and USER= is not specified in the job statement.
This identifier can be a long string. If there is insufficient space to show the complete string, the string is truncated in the report block. The complete string is shown in a separate list of long names at the end of the report.
Install parameter UNKNOWN AUTHID on panel DSNTIPP, or ZPARM DEFLTID in DSN6SPRM.

**Field Name:** QWP4DFID
EXPLAIN AUTOBIND
Indicates whether EXPLAIN processing occurs during automatic rebind.
YES means EXPLAIN processing happens during automatic rebind of a plan or package that has EXPLAIN(YES) as a bind option. If the PLAN_TABLE does not exist, automatic rebind continues, but there is no EXPLAIN output. Explain processing does not happen for a plan or package with EXPLAIN(NO).
Install parameter EXPLAIN PROCESSING on panel DSNTIPO, or ZPARM ABEXP in DSN6SPRM.
Field Name: QWP4ABX

MAXIMUM DATASETS
The maximum number of data sets that can be open at one time.
The practical limit can be less than the MVS limit of 32727, depending on available storage below the line.
Install parameter DSMAX on panel DSNTIPC, or ZPARM DSMAX in DSN6SPRM.
Field Name: QWP4DSMX

DATABASE NAME
The name of the database that contains the registration tables.
Install parameter REGISTRATION DATABASE on panel DSNTIPZ, or ZPARM RGFDBNAM in DSN6SPRM.
Field Name: QWP4REGN

ENABLE DATA CAPT
Indicates whether change data capture is enabled.
Install parameter DPROP SUPPORT on panel DSNTIPO. ZPARM name is CHGDC in DSN6SPRM.
Field Name: QWP4CDC

ASYNC DRAIN START
The percentage below 100% DSMAX that open data sets can reach before an asynchronous drain is started. The default is 1, meaning that asynchronous drain starts when the number of open data sets reaches 99% of DSMAX.

DB2 defers closing and deallocating the table spaces or indexes until the number of open data sets reaches one of the following limits:
• The MVS limit for the number of concurrently open data sets.
• 99% (default) of the value that you specified for DSMAX.

When one of these limits is reached, DB2 closes a number of data sets not in use equal to 3% (default) of the value DSMAX. Thus, DSMAX controls not only the limit of open data sets, but also the number of data sets that are closed when that limit is reached.

DB2 parameter SPRMTDD in DSN6SPRM.
Field Name: QWP4TDDN

SYSOPER ID
One of two authorization IDs with SYSOPR authority. SYSOPR users can access DB2 even if the DB2 catalog is unavailable.

This identifier can be a long string. If there is insufficient space to show the complete string, the string is truncated in the report block. The complete string is shown in a separate list of long names at the end of the report.

Install parameter SYSTEM OPERATOR 1 on panel DSNTIPP, or ZPARM SYSOPR1 in DSN6SPRM.

**Field Name:** QWP4OPR1

**SITE TYPE**

Shows whether this system is at a local site or a recovery site.

**LOCALSITE**

This is the site of the current system. Multiple image copies are made and are operational here. This is the default.

**RECOVERYSITE**

This an alternative site for recovery purposes.

The RECOVER utility uses this parameter to determine what site the current system is on and recovers everything from the copies of data registered at that site.

The RECOVER and MERGECOPY utilities use this to determine whether COPYDDN or RECOVERDDN is allowed with NEWCOPY NO.

Install parameter SITE TYPE on panel DSNTIPO, or ZPARM SITETYPE in DSN6SPRM.

**Field Name:** QWP4MSTY

**ASYNC DRAIN STOP**

The percentage of maximum open data sets until the asynchronous drain operations are stopped.

DB2 parameter SPRMMDD in DSNDSPRM.

**Field Name:** QWP4MDDN

**SYSOPER ID 2**

One of two authorization IDs with SYSOPR authority. SYSOPR users can access DB2 even if the DB2 catalog is unavailable.

This identifier can be a long string. If there is insufficient space to show the complete string, the string is truncated in the report block. The complete string is shown in a separate list of long names at the end of the report.

Install parameter SYSTEM OPERATOR 2 on panel DSNTIPP, or ZPARM SYSOPR2 in DSN6SPRM.

**Field Name:** QWP4OPR2

**TRACKER SITE**

Indicates whether this subsystem is a remote tracker site for another DB2 subsystem.

When YES, this is a tracker site.

A DB2 tracker site is a separate DB2 subsystem or data sharing group that exists solely for the purpose of keeping shadow copies of your primary site's data. No independent work can be run on the tracker site.
Install parameter TRACKER TYPE on panel DSNTIPO, or ZPARM TRKRSITE in DSN6SPRM.

Field Name: QWP4TRKR

ENFORCE DPROP

Shows whether DataPropagator NonRelational (DPROP) is used to propagate SQL changes made to tables defined with DATA CAPTURE CHANGES.

1  No changes are propagated.

2  DPROP propagates SQL changes, and those changes made to tables defined with DATA CAPTURE CHANGES are only allowed when monitor trace class 6 is active, DPROP is installed, and the DB2 application is running in an IMS environment. If any of these conditions are not met, no changes to the DB2 table are permitted.

3  Data propagation occurs when monitor trace class 6 is active, DPROP is installed, and the DB2 application is running in an IMS environment. In this instance, an application that is not running in an IMS environment can update DB2 tables defined with DATA CAPTURE CHANGES. However, these changes are not propagated to IMS.

ANY  Allows subsystems to propagate some data with DPROP and other data with a different propagation program.

Tables that should only be updated by DB2 applications running in an IMS environment can be protected using the following methods:

- Use the ENABLE parameter on BIND to specify a specific attachment facility through which updates to data propagation tables can be made.
- Define a validation procedure for data propagation tables to define which plans can update those tables.
- Allow update authority for data propagation tables to a group of authorization IDs that can only run in IMS.

Install parameter DPROP SUPPORT on panel DSNTIPO, or ZPARM EDPROP and CHGDC in DSN6SPRM.

Field Name: QWP4ENF

DDCS ESCAPE CHAR

The escape character used in the application registration table (ART) or object registration table (ORT).

Sets of names in the ART and ORT can be represented by patterns that use the underscore (_) and percent sign (%) characters in the same way as in an SQL LIKE predicate.

Install parameter ART/ORT ESCAPE CHARACTER on panel DSNTIPZ, or ZPARM RGFESCP in DSN6SPRM.

Field Name: QWP4ESC

WAIT RETAIN LOCKS

Indicates whether a request is suspended until an incompatible retained lock becomes available.

This value is only significant in a data sharing environment. It indicates how long a transaction should wait for a lock on a resource if another DB2
in the data sharing group has failed and is holding an incompatible lock on that resource. Locks held by failed DB2 members are called retained locks.

This value is a multiplier that is applied to the connection's normal timeout value. For example, if the retained lock multiplier is 2, then the timeout period for a call attachment connection that is waiting for a retained lock is twice the normal CAF timeout period. The default is 0, meaning applications do not wait for incompatible retained locks, the lock request is immediately rejected and the application receives a "resource unavailable" SQLCODE.

Install parameter RETAINED LOCK TIMEOUT on panel DSNTIPI, or ZPARM RETLWAIT in DSN6SPRM.

Field Name: QWP4WAIT

**IMS/BMP TIMEOUT**

The number of RESOURCE TIMEOUT units that an IMS BMP connection waits for a lock to be released.

The default value is 4, meaning that an IMS BMP connection can wait 4 times the resource timeout value for a resource.

Install parameter IMS BMP TIMEOUT on panel DSNTIPI, or ZPARM BMPTOUT in DSN6SPRM.

Field Name: QWP4WBMP

**BIND NEW PACKAGE**

Shows whether BIND or BINDADD authority is required to BIND a new version of an existing package.

When BINDADD (default), only users with BINDADD system privilege can create a new package.

BIND users with BIND privilege for a package or collection can create a new version of an existing package when they bind it. This also allows users with PACKADM authority to add a new package or a new version of a package to a collection.

Install parameter BIND NEW PACKAGE on panel DSNTIPP, or ZPARM BINDNV in DSN6SPRM.

Field Name: QWP4BNV

**AUTO BIND**

Indicates whether autobind is enabled. Values are:

**YES**

Allows automatic rebinding operations to be performed when a plan/package:

- Was marked “invalid”.
- Was bound on DB2 Vn, but is now running on DB2 Vn-1
- After use on DB2 Vn-1 (as previously described), is later used again on DB2 Vn

**NO**

Prevent DB2 from performing any automatic rebinding operations under any circumstances.

**COEXIST**

Allows automatic rebinding operation to be performed in a DB2 Data Sharing coexistence environment when the plan/package:
IFCID 106 - Miscellaneous Installation Parameters

- Is marked “invalid” or
- Was last bound in DB2 Vn and is running on DB2 Vn-1

Install parameter AUTO BIND on panel DSNTIPO, or ZPARM ABIND in DSN6SPRM.

Field Name: QWP4ABN

IMS/DLI TIMEOUT

The number of RESOURCE TIMEOUT units that a DL/I batch connection waits for a lock to be released.

The default value is 6, meaning that an IMS BMP connection can wait 4 times the resource timeout value for a resource.

Install parameter DL/I BATCH TIMEOUT on panel DSNTIPI, or ZPARM DLITOUT in DSN6SPRM.

Field Name: QWP4WDLI

ENABLE DB2 AUTH

Shows whether DB2 performs authorization checking.

When all authorization checking by DB2 is disabled, the GRANT statement is also disabled (granting every privilege to PUBLIC); this is not recommended.

Install parameter USE PROTECTION on panel DSNTIPP, or ZPARM AUTH in DSN6SPRM.

Field Name: QWP4AUTH

MAX APPL LOCKS

The maximum number of page or row locks that a single application can hold concurrently on all table spaces.

This includes locks on data pages, index pages, and rows that the program acquires when it accesses table spaces.

The limit applies to all table spaces defined with the LOCKSIZE PAGE, LOCKSIZE ROW, or LOCKSIZE ANY options. 0 means that there is no limit to the number of page and row locks a program can acquire.

DB2 assumes that 250 bytes of storage are required for each lock. If NO is specified for CROSS MEMORY, the value of this field has to take into account the available lock space. If referential constraints between tables is defined, the value of this field might need to be increased.

Install parameter LOCKS PER USER on panel DSNTIPJ, or ZPARM NUMLKUS in DSN6SPRM.

Field Name: QWP4LKUS

CACHE DYNAMIC SQL

Indicates whether prepared dynamic SQL statements are saved for later use by eligible application processes in the EDM pool.

Install parameter CACHE DYNAMIC SQL on panel DSNTIPI, or ZPARM CACHEDYN in DSN6SPRM.

Field Name: QWP4CDYN

AUTH CACHE SIZE
The size of the authorization cache to be used if no CACHESIZE is specified on the BIND PLAN subcommand.

The size of the cache is 32 bytes of overhead + (8 bytes of storage X number of concurrent users).

0 means authorization caching is not used.

Install parameter PLAN AUTH CACHE on panel DSNTIPP, or ZPARM AUTHCACH in DSN6SPRM.

Field Name: QWP4AUCA

**REP READ U LOCK**

Indicates whether the U (UPDATE) lock is used when using repeatable read (RR) or read stability (RS) isolation to access a table.

When YES, the U lock is used for an updated cursor with repeatable read or read stability.

When NO, the S lock is used for an updated cursor with repeatable read or read stability. If the cursor in the running applications includes the clause FOR UPDATE OF, but updates are infrequent, S locks generally provide better performance.

Install parameter U LOCK FOR RR/RS on panel DSNTIPI, or ZPARM RRULOCK in DSN6SPRM.

Field Name: QWP4RRU

**MAX KEPT DYN STMT**

Shows the total number of prepared dynamic SQL statements that are saved past a commit point.

0 means that prepared dynamic SQL statements are not saved past commit points.

Install parameter MAX KEPT DYN STMTS on panel DSNTIPE, or ZPARM MAXKEEPD in DSN6SPRM.

Field Name: QWP4MXKD

**ACCEL MODELING**

The ACCELMODEL subsystem parameter determines whether to enable modeling of query workload for evaluating potential savings for both the accumulated elapsed time and CPU time if the plan is executed on an accelerator.

Only queries that are deemed eligible for execution on an accelerator by DB2 will be included in accelerator-related fields of Accounting trace IFCID 3:

| No | Specifies that no modeling is to be performed. This is the default setting. |
| Yes | Specifies that modeling is to be performed. Consider acceleration eligibility for an SQL statement and update the new Accounting fields accordingly. |

To enable modeling, the IBM DB2 Analytics Accelerator for z/OS special register CURRENT QUERY ACCELERATION and ZPARM QUERY_ACCELERATION (set by the CURRENT QUERY ACCEL) must be set to NONE for accelerator modeling. All other values for the special
register and ZPARM will take the existing logic of IBM DB2 Analytics Accelerator for z/OS. This means that existing queries that already execute on the accelerator with CURRENT QUERY ACCELERATION = ENABLE, ENABLE WITH FAILBACK, ELIGIBLE, or ALL will not be part of the accelerator-related Accounting fields.

Field Name: QWP4ACMO

MAX TSPACE LOCK

The default (SYSTEM) for the LOCKMAX clause of the SQL statements CREATE TABLESPACE and ALTER TABLESPACE.

Install parameter LOCKS PER TABLESPACE on panel DSNTIPJ, or ZPARM NUMLKTS in DSN6SPRM.

Field Name: QWP4LKTS

CURRENT DEGREE

Shows the default for the CURRENT DEGREE special register when no degree is explicitly set with SET CURRENT DEGREE.

The default disables query parallelism.

Install parameter CURRENT DEGREE on panel DSNTIP8, or ZPARM CDSSRDEF in DSN6SPRM.

Field Name: QWP4CDEG

OPT HINTS ALLOWED

Shows whether DB2 can use optimization hints from the PLAN_TABLE to influence the access paths used for certain queries.

Install parameter OPTIMIZATION HINTS on panel DSNTIP8, or ZPARM OPTHINTS in DSN6SPRM.

Field Name: QWP4HINT

SORT POOL SIZE

Indicates the amount of storage needed for the sort pool.

This can be the value calculated by the CLIST, based on input from previous panels, or the value entered in the Override column at installation time.

Install parameter SORT POOL SIZE on panel DSNTIPC, or ZPARM SRTPPOOL in DSN6SPRM.

Field Name: QWP4SPOL

STATIC DESCRIBE

Shows whether DB2 builds a DESCRIBE SQLDA when binding static SQL statements.

A DESCRIBE cannot be issued against a static SQL statement except:

• In a distributed environment, where DB2 for z/OS is the server and the requester supports extended dynamic SQL. In this instance, a DESCRIBE on an SQL statement in the extended dynamic package appears to DB2 as a DESCRIBE on a static SQL statement in the DB2 package.

• When an application uses a stored procedure result set, the application must allocate a cursor for that result set. The application can do this using a DESCRIBE CURSOR statement. The SQL statement actually
described is the one with the cursor declared in the stored procedure. If that statement is static, a static SQL statement must be described.

When NO (default), DB2 does not generate a DESCRIBE SQLDA at BIND time for static SQL statements. If a DESCRIBE request is received at execution time, DB2 generates an error. However, if the describe request comes from a DESCRIBE CURSOR statement, DB2 satisfies the request but is only able to provide data type and length information. Column names are not provided.

When YES, DB2 generates a DESCRIBE SQLDA at BIND time so that DESCRIBE requests for static SQL can be satisfied during execution.

Note: You must rebind packages after this value has been set to YES.

This option increases the size of some packages because the DESCRIBE SQLDA is now stored with each statically-bound SQL SELECT statement.

Install parameter DESCRIBE FOR STATIC on panel DSNTIP4, or ZPARM DESCSTAT in DSN6SPRM.

Field Name: QWP4DSST

RIDPOOL SIZE (KB)

The amount of storage needed for the RID pool.

This can be the value calculated by the CLIST, based on input from previous panels, or the value entered in the Override column at installation time.

When 0, DB2 does not use access paths or join methods that depend on RID pool storage.

Install parameter RID POOL SIZE on panel DSNTIPC, or ZPARM MAXRBLK in DSN6SPRM.

Field Name: QWP4RMAX

PACK AUTH CACHE

The amount of storage allocated for caching authorization information for all packages on this DB2 member.

32 KB hold about 375 collection-ID.package-IDs. The cache is stored in the DSN1DBM1 address space.

Install parameter PACKAGE AUTH CACHE on panel DSNTIPP, or ZPARM CACHEPAC in DSN6SPRM.

Field Name: QWP4PAC

CONTR THREAD STOR

In DB2 12 this field is a serviceability field.

Indicates whether DB2 returns unused thread storage at commit. Possible values are:

YES DB2 checks threads at commit points and periodically returns unused storage to the system.

NO DB2 does not check threads at commit points and returns acquired storage on deallocation.
Install parameter CONTRACT THREAD STG on panel DSNTIPE, or ZP ARM CONTSTOR in DSN6SPRM.

Field Name: QWP4CONT

MAX DEG OF PARALL
Indicates the upper limit on the degree of parallelism for a parallel group.
This field has a value of 0. This means PARAMDEG is not set and DB2 can set a default maximum degree of parallelism based on the system configuration.

Install parameter MAX DEGREE on panel DSNTIP8, or ZP ARM PARAMDEG in DSN6SPRM.

Field Name: QWP4MDEG

RTN AUTH W/O CAT
The amount of storage allocated for caching authorization information for all routines on this DB2 member.
Routines include stored procedures and user-defined functions.
32 KB hold about 380 schema.routine.type entries.

Install parameter ROUTINE AUTH CACHE on panel DSNTIPP, or ZP ARM CACHERAC in DSN6SPRM.

Field Name: QWP4RAC

USE X LOCK
The locking method used when performing a searched UPDATE or DELETE.

When NO, DB2 uses an S or U lock when scanning for qualifying rows. For any qualifying rows or pages the lock is upgraded to an X lock before performing the update or delete. For nonqualifying rows or pages the lock is released if using ISOLATION(CS). For ISOLATION(RS), or ISOLATION(RR), an S lock is retained on the rows or pages until the next commit point. This option is used to achieve higher rates of concurrency.

When YES, DB2 gets an X lock on qualifying rows or pages. For ISOLATION(CS), the lock is released if the rows or pages are not updated or deleted. For ISOLATION(RS) or ISOLATION(RR), an X lock is retained until the next commit point. This is beneficial in a data sharing environment when most or all searched updates and deletes use an index. The downside is that if searched updates or deletes result in a tablespace scan, the likelihood of timeouts and deadlocks greatly increases.

Install parameter X LOCK FOR SEARCHED U/D on panel DSNTIPI, or ZP ARM XLKUPDLT in DSN6SPRM.

Field Name: QWP4XLUD

STAR JOIN ENABL
Star join enable indicator. Possible values are:

-1 (DISABLE)
   Star join is disabled. This is the default.

0 (ENABLE)
   Star join is enabled when the join meets the conditions described in the DB2 administration information for performance.
Star join is enabled without comparing the ratio of the fact-table cardinality to the cardinality of the largest dimension table. The table with the largest cardinality is the fact table.

This is the star join fact table and the largest dimension table ratio. The lowest ratio of the cardinality of the fact table compared to the cardinality of the largest dimension table for which star join is used. $2 < N <= 32768$.

Install parameter STAR JOIN QUERIES on panel DSNTIP8, or ZPARM STARJOIN in DSN6SPRM.

Background and Tuning Information

This parameter allows you to set the star join ratio to increase or decrease the dimension table and fact table ratio rule according to application needs.

This parameter also allows you to disable star join if needed for performance reasons. The default is to allow star join if star join detection is successful.

Star join technique is only used when these conditions exist:

- At least two dimensions exist.
- The join predicates are between the fact table and the dimension tables only. (No join predicates lie between the dimension tables.)
- The join predicates are equijoin predicates.
- No correlated subqueries cross dimensions.
- No cycles within the dimensions exist. This means that no predicate can reference more than one candidate dimension table with respect to the same column of the fact table.
- No outer join exists.
- The data type and length of the join predicates are the same.
- The fact table is larger than the dimension table.

Field Name: QWP4SJRT

**NPAGES THRESHOLD**

This parameter allows you to specify the optimizer threshold for qualifying a table as small.

-1 Every table qualifies as small.
0 No table qualifies as small (this is the default).
1 Only tables with zero pages qualify as small.
2 Tables with less than two pages qualify as small.
10 Tables with less than ten pages qualify as small.
502 Tables with less than 502 pages, and tables that have not had statistics collected qualify as small. For example, when NPAGES = -1.

DB2 parameter NPGTHRSH in DSN6SPRM.

Background and Tuning Information

Tables can be populated using insert just prior to their use by queries and then cleared immediately on completion of the queries. These tables are permanent even though the data they contain is transient.
This can cause problems when RUNSTATS is run overnight, or at other times when these tables are empty. This gives the optimizer the false indication that these tables contain no data when in fact, the tables will contain data when the query executes. This causes the optimizer to pick an inefficient access path. Usually the optimizer chooses to do a table scan, which would be the most efficient access path if the table were truly empty. Because the table is not empty when the query executes, it would be more efficient to use matching index access.

With this parameter, you can force the optimizer to treat tables containing no data as small tables. For these tables, the optimizer will:

- Select a matching index access rather than a table space scan and non-matching index access.
- Select the index with the most matching columns when more than one index qualifies for matching index access.
- Select indexes with the same number of matching columns on cost.

**Field Name:** QWP4NPAG

**DBADM CREATE VIEW**

Shows whether a DB2 administrator can create a view or alias for another user. Possible values are YES or NO. The default is NO.

Install parameter DBADM CREATE AUTH on panel DSNTIPP. ZPARM DBACRvw in macro DSN6SPRM.

**Field Name:** QWP4CRVW

**MAX # LE TOKENS**

The maximum number of LE tokens active at any time. When zero, no tokens are available.

A token is used each time one of the following is used: trigonometry functions, degrees, radians, rand, exp, power, log functions, upper, lower, translate.

Install parameter MAXIMUM LE TOKENS on panel DSNTIP7, or ZPARM LEMAX in DSN6SPRM.

**Field Name:** QWP4LEM

**MAX EXT SERV TASK**

Maximum number of extended service tasks.

**Field Name:** QWP4EST

**PROJ Z INS THRESH**

Project z insertion threshold.

**Field Name:** QWP4ZTN

**MAX NOT FOUND-HSH**

The maximum number of NOT FOUND hash records.

**Field Name:** QWP4KNFC

**FIELD PROCS T BLK**

The number of field procedures for the DESCRIBE TABLE block.

ZPARM SPRMFDP.
Field Name: QWP4FDP

MANAGE THREAD STO

In DB2 12 this field is a serviceability field.

Shows whether DB2 uses storage management to optimize the amount of working storage consumed by individual threads.

Install parameter MANAGE THREAD STORAGE on panel DSNTIPE, or ZPARM MINSTOR in DSN6SPRM.

For best performance, this parameter should be NO, meaning DB2 does not manage thread storage.

When YES, DB2 uses best fit algorithm to manage and assign thread storage. This can help on systems that have many long-running threads and that are constrained on DBM1 address space.

Field Name: QWP4MSTG

EVAL UNCOMMITTED

Shows whether stage 1 predicate evaluation during table access can proceed upon uncommitted data or not.

This applies to isolation levels of Read Stability and Cursor Stability only.

When NO (default), predicate evaluation occurs only on committed data (or on the application’s own uncommitted changes). NO ensures that all qualifying data is always included in the answer set.

When YES, predicate evaluation can occur upon uncommitted data. Only committed data is returned to the query. However, a decision can be made to omit a row from the answer set based on uncommitted data. Later, undo processing (statement rollback or statement failure) could cause the data to revert to a state that satisfies the predicate.

When YES, DB2 can request fewer locks than in previous versions when processing isolation level Read Stability and Cursor Stability queries. The number of locks avoided is related to the access path of the query, the number of rows evaluated when processing the stage 1 predicate of the query, and the number of those rows that are overflow rows. Specifically, for isolation level Read Stability and Cursor Stability queries, locks are avoided for rows that do not satisfy the stage 1 predicate, provided they are not overflow rows. Table access includes table space scans and index-to-data access, including ridlist-to-data access. For isolation Cursor Stability ridlist production, all row/page locking is avoided.

Install parameter EVALUATE UNCOMMITTED on panel DSNTIP8, or ZPARM EVALUNC in DSN6SPRM.

Field Name: QWP4EVUN

STATISTICS ROLLUP

Shows whether RUNSTATS utility aggregates the partition level statistics, even though some parts may not contain data.

This should be YES for DB2 systems that have large partitioned table spaces, index spaces, or both. This enables the aggregation of part level statistics and helps the optimizer to choose a better access path.

Install parameter STATISTICS ROLLUP on panel DSNTIPO, or ZPARM STATROLL in DSN6SPRM.
Field Name: QWP4STRL

STATISTICS HIST
Shows which inserts and updates are recorded in catalog history tables.
The report can show the following values:

N / NONE
Changes in the catalog are not recorded. This is the default.

A / ALL
All inserts and updates in the catalog are recorded.

P / ACCESSPATH
All inserts and updates to access path related catalog statistics are recorded.

S / SPACE
All inserts and updates to space related catalog statistics are recorded.
Install parameter STATISTICS HISTORY on panel DSNTIPO, or ZPARM STATHIST in DSN6SPRM.

Field Name: QWP4STHT

SUPPRESS SOF ERR
Shows whether the recording of errors, such as invalid decimal data and arithmetic exceptions, in the operating system data set SYS1.LOGREC is suppressed.

When YES, these exceptions are not recorded in the LOGREC data set.
Install parameter SUPPRESS SOFT ERRORS on panel DSNTIPM or ZPARM SUPERRS in DSN6SPRM.

Field Name: QWP4SAE

REAL TIME STATS
The time interval that DB2 waits before it attempts to write out page set statistics to the real-time statistics tables. This value is between 1 and 65535 minutes.
Install parameter REAL TIME STATS on panel DSNTIPO, or ZPARM STATSINT in DSN6SPRM.

Field Name: QWP4INTE

EDM STATMNT CACHE
The size of the statement cache that can be used by the Environmental Descriptor Manager (EDM). This value is used at DB2 startup time as the minimum value. You can increase and subsequently decrease this value with the SET SYSPARM command. This value cannot be decreased below the value that is specified at DB2 startup. The CLIST calculates a statement cache size. This storage pool is located above the 2 GB bar.

The value used at DB2 startup time is either calculated by the CLIST based on input from other installation information or an override value.
For record trace, this value is shown in bytes. For other reports, the value is shown in kilobytes.
Install parameter EDM STATEMENT CACHE on panel DSNTIPC, or ZPARM EDMSTMTC in DSN6SPRM.

Field Name: QWP4ESTC

STAR JOIN THRESH

The minimum number of tables in the star schema query block, including the fact table, dimensions tables, and snowflake tables. This value is considered only if the subsystem parameter STARJOIN qualifies the query for star join.

Possible values are:

0  Star join is disabled. This is the default.
1, 2, or 3  Star join is always considered.
4 through 255  Star join is considered if the query block has at least the specified number of tables.
256 and greater  Star join is never considered.

DB2 parameter SJTABLES in DSN6SPRM.

Background and Tuning Information

Although star join can reduce bind time significantly it does not provide optimal performance in all cases. Performance of star join depends on a number of factors such as the available indexes on the fact table, the cluster ratio of the indexes, and the selectivity of rows through local and join predicates. Follow these general guidelines for setting the value of SJTABLES:

• If you have star schema queries with less than 10 tables and you want to make the star join method applicable to all qualified queries, set the value of SJTABLES to a low number, such as 5.
• If you have some star schema queries that are not necessarily suitable for star join but want to use star join for relatively large queries, use the default. The star join method will be considered for all qualified queries that have 10 or more tables.
• If you have star schema queries but normally do not want to use star join, you could increase SJTABLES, say to 15. This will greatly cut the bind time for large queries and avoid a potential bind time SQL return code -101 for large qualified queries.

Field Name: QWP4SJTB

ZOSMETRICS

YES indicates that gathering of z/OS metrics using the RMF interface is enabled. ZPARM ZOSMETRICS in DSN6SPRM.

Field Name: QWP4METE

EDM DBD CACHE

The minimum size of the DBD cache that can be used by the Environmental Descriptor Manager (EDM). This value is used at DB2 startup time as the minimum value. You can increase and subsequently decrease the value with the SET SYSPARM command. This value cannot be
decreased below the value that is specified at DB2 startup. This storage pool is located above the 2 GB bar. The CLIST calculates the DBD cache size.

The value used at DB2 startup time is either calculated by the CLIST based on input from other installation information or an override value.

Install parameter EDM DBD CACHE on panel DSNTIPC, or ZPARM EDMDBDC in DSN6SPRM.

Field Name: QWP4EDBC

**LONG RUNNING READ**

Shows the number of minutes that a read claim can be held by an agent before DB2 reports it as a long-running reader. Valid values are 0 (default) through 1439.

Install parameter LONG-RUNNING READER on installation panel DSNTIPE, or ZPARM LRDRTHLD in DSN6SYSP.

Field Name: QWP4LRTH

**MAX OPEN CURSORS**

Shows the maximum number of cursors, including allocated cursors, that are open at a given DB2 site per thread. RDS keeps a total of currently open cursors. If an application attempts to open a thread after the maximum is reached, the statement will fail.

In a data sharing group, this parameter is shown at member scope.

Install parameter MAX OPEN CURSORS on panel DSNTIPX, or ZPARM MAX_NUM_CUR in DSN6SPRM.

Field Name: QWP4MXNC

**EDM SKEL POOLSIZE**

The minimum size of the EDM pool for skeleton package and skeleton cursor tables. For record trace, this value is shown in bytes. For other reports, the value is shown in kilobytes.

Install parameter EDM SKELETON POOL SIZE on panel DSNTIPC or ZPARM EDM_SKELETON_POOL in DSN6SPRM.

Field Name: QWP4SKLC

**CUR MAINT TYPE**

Shows the default special register for the CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION statement when no value is explicitly set. Possible values are:

- ALL
- NONE
- SYSTEM (default)
- USER

The default allows query rewrite using system-maintained materialized query tables (SYSTEM) when CURRENT REFRESH AGE is set to ANY. When USER, query rewrite is done using user-maintained materialized query tables when CURRENT REFRESH AGE is set to ANY. ALL means that query rewrite uses both system-maintained and user-maintained materialized query tables.
IFCID 106 - Miscellaneous Installation Parameters

Install parameter CURRENT MAINT TYPES on panel DSNTIP8, or ZPARM MAINTYPE in DSN6SPRM.

Field Name: QWP4MNTY

PAD IDX BY DEFLT

Shows whether new indexes are be padded by default.

- YES indicates that a new index is padded unless the NOT PADDED option is specified on the CREATE INDEX statement.
- The default value, NO, indicates that a new index is not padded unless the PADDED option is specified on the CREATE INDEX statement.

Install parameter PAD INDEXES BY DEFAULT on installation panel DSNTIPE, or ZPARM PADIX in DSN6SPRM.

Field Name: QWP4PDIX

MIN DIVIDE SCALE

The minimum scale for the result of a decimal division. The values for this parameter are none (the default), 3, or 6. If 3 or 6 is specified, this parameter overrides the DECDIV3 parameter.

Field Name: QWP4MDSC

FREE CACHED STMTS

Indicates whether DB2 can free statements from the local dynamic statement cache to relieve storage constraints below the 2 GB bar. This parameter applies only for packages or plans that are bound with KEEPDYNAMIC(YES). Possible values are:

- 0  DB2 cannot free statements from the local cache
- 1  DB2 can free statements from the local cache

DB2 parameter CACHEDYN_FREELOCAL in DSN6SPRM.

Field Name: QWP4FRLC

TEMP UNIT NAME

Shows the device type or unit name for allocating temporary data sets. It is the direct access or disk unit name used for the precompiler, compiler, assembler, sort, linkage editor, and utility work-files in the tailored jobs and CLISTS.

It can be any device type acceptable to the DYNALLOC parameter of the SORT or OPTION options for DFSORT.

The default is SYSDA.

Install parameter TEMPORARY UNIT NAME on DSNTIPA2, or ZPARM VOLTDEVT in DSN6SPRM.

Field Name: QWP4VDTY

CUR REFRESH AGE

Shows the default for the CURRENT REFRESH AGE special register deferred materialized query tables.

Install parameter CURRENT REFRESH AGE on panel DSNTIP8, or ZPARM REFSHAGE in DSN6SPRM.

Field Name: QWP4RFSH
IFCID 106 - Miscellaneous Installation Parameters

MAX DATA CACHING

The maximum amount of virtual memory in megabytes (MB) that is allocated for data caching.

Install parameter MAX DATA CACHING on panel DSNTIP8, or ZPARM MXDTCACH in DSN6SPRM.

Field Name: QWP4MXDC

ONL ZPARM TYPE

The type of DB2 system parameter changed by the last SET SYSPARM statement.

Field Name: QWP4OZTP

RESTORE/RECOVER

If YES, the system-level backup that is the recovery base, is from a dump on tape. Otherwise NO is shown.

Install parameter RESTORE/RECOVER on installation panel DSNTIP6, or ZPARM RESTORE_RECOVER_FROMDUMP in DSN6SPRM.

Field Name: QWP4RRFD

MAX STORED PROCS

Shows the maximum number of stored procedures per thread. If an application attempts to call a stored procedure after this is reached, the statement will fail. In a data sharing group, this parameter is shown as member scope.

Install parameter MAX STORED PROCS on panel DSNTIPX, or ZPARM MAX_ST_PROC in DSN6SPRM.

Field Name: QWP4MXSP

ONL ZPARM USER ID

The user ID that made the last online change to DB2 system settings.

Field Name: QWP4OZUS

INDEX I/O PARALL

In DB2 12 this field is a serviceability field.

The enablement of the index I/O parallelism ZPARM.

Field Name: QWP4IIOP

MAX TEMP STORAGE

The maximum amount of temporary storage in megabytes (MB) for each agent.

Install parameter MAX TEMP STORAGE on panel DSNTIP6 or ZPARM MAXTEMPS in DSNTIP9.

Field Name: QWP4WFAL

ONL ZPARM CORID

The correlation ID of the online application that made the last change to DB2 system settings.

Field Name: QWP4OZCI
REVOKE DEP PRIVIL

Include dependent privileges on REVOKE. Possible values are:

Y  If INCLUDING DEPENDENT PRIVILEGES is enforced.
N  If NOT INCLUDING DEPENDENT PRIVILEGES is enforced.
S  If specified in a REVOKE statement.

Field Name: QWP4RVDP

MAX CONC AUTOBIND

The maximum number of package requests that can be processed simultaneously.

DB2 parameter MAX_CONCURRENT_PKG OPS in DSN6SPRM.

Field Name: QWP4MXAB

ONL ZPARM TIME

Time of the last online change made to DB2 system settings.

Field Name: QWP4OZTM

PLANMGMT

Shows if and how access path information is stored in the repository. Possible values are:

O  On
F  Off
B  Basic
E  Extended

Field Name: QWP4PMGT

ADM SCHED JCLPROC

The name of the JCL procedure for starting the DB2 administrative scheduler task address space.

DB2 parameter ADMTPROC in DSN6SPRM.

Field Name: QWP4ADMT

SYS-LEVEL BACKUP

Shows if RECOVER uses system level backups as the recovery base.

Install parameter SYSTEM-LEVEL BACKUPS on installation panel DSNTIP6, or ZPARM SYSTEM_LEVEL_BACKUPS in DSN6SPRM.

Field Name: QWP4SLBU

PLANMGMTSCOPE

Controls which queries are populated in the access path repository (ZPARM parameter PLANMGMTSCOPE). Possible values are:

A  ALL: Includes static and dynamic SQL queries.
S  STATIC: Includes static SQL queries only. This is the default.
D  DYNAMIC: Includes dynamic SQL queries only.

Field Name: QWP4PMSC
DUMP CLASS NAME
The name of the DFSMSHSM dump class used by the restore system utility to restore from a system-level backup that has been dumped to tape.

Install parameter DUMP CLASS NAME on installation panel DSNTIP6, or ZPARM UTILS_DUMP_CLASS_NAME in DSN6SPRM.

Field Name: QWP4RSDC

MAX TAPE UNITS
The maximum number of tape units or tape drives that the restore system utility can use to restore from a system-level backup that has been dumped to tape.

Install parameter MAXIMUM TAPE UNITS on installation panel DSNTIP6, or ZPARM RESTORE_TAPEUNITS in DSN6SPRM.

Field Name: QWP4RSMT

SEPARATE SECURITY
Separate security tasks. Possible values are:

Y  SYSADM/SYSCTRL cannot GRANT/REVOKE
N  SYSADM/SYSCTRL can GRANT/REVOKE

Field Name: QWP4SEPSD

SECDM1 ID
Security administrator 1.

Field Name: QWP4SECA1

SECDM1 TYPE
Security administrator 1 type. Possible values are:

' '  Blank indicates that the authorization ID (AUTH ID) is used.
'L'  Indicates that ROLE is used.

This field corresponds to field SEC ADMIN 1 TYPE on installation panel DSNTIPP1, or ZPARM SECADM1_TYPE in DSN6SPRM.

Field Name: QWP4SECA1_TYPE

MAX TEMP RID
The maximum number of RID blocks of temporary storage in the Workfile database that a single RID list can use at any point in time. This field corresponds to field MAX TEMP RID on installation panel DSNTIP9. The ZPARM name is MAXTEMPS_RID.

It can have the following values:

-1 if MAXTEMPS_RID=NONE
0 if MAXTEMPS_RID=NOLIMIT
1 to 329166 otherwise

Field Name: QWP4WFRD

SECDM2 ID
Security administrator 2.

Field Name: QWP4SECA2
SECADM2 TYPE

Security administrator 2 type. Possible values are:

'blank' Indicates that the authorization ID (AUTH ID) is used.

'L' Indicates that ROLE is used.

This field corresponds to field SEC ADMIN 2 TYPE on installation panel DSNTIPP1, or ZPARM SECADM2_TYPE in DSN6SPRM.

Field Name: QWP4SECA2_TYPE

SKIP UNCOMM INS

YES indicates that uncommitted inserts are treated as if they have not yet been executed. The ZPARM name is SKIPUNCI.

Field Name: QWP4SKUI

GET ACCEL ARCHIVE

Determines the default value that is to be used for the CURRENT GET_ACCEL_ARCHIVE special register:

NO Indicates that if a table is archived in an accelerator server, and a query references that table, the query does not use the data that is archived.

YES Indicates that if a table is archived in an accelerator server, and a query references that table, the query uses the data that is archived.

ZPARM name GET_ACCEL_ARCHIVE in macro DSN6SPRM.

Field Name: QWP4CGAA

LMT CONV PART TAB

Shows whether to include all columns in the partitioning key during conversion from index-controlled partitioning to table-controlled partitioning:

NO Includes all columns

YES Includes trailing columns only if they affect partitioning

This field corresponds to field EXCLUDE PART KEY ELEMENTS on installation panel DSNTIP71. The ZPARM name is IX_TB_PART_CONV_EXCLUDE in DSN6SPRM.

Field Name: QWP4XPKE

DDL TIMEOUT FACT

Shows the time out factor of the SQL data definition. The time out value is the product of this value and the IRLMRWT value.

ZPARM name DDLTOX in DSN6SPRM.

Field Name: QWP4DDLTO

CUR QUERY ACCEL

Determines the default value that is to be used for the CURRENT QUERY ACCELERATION special register. Possible values are:
NONE
Indicates that no query acceleration is done. This is the default value.

ENABLE
Indicates that queries are accelerated only if DB2 determines that it is advantageous to do so. If there is an accelerator failure while a query is running, or the accelerator returns an error, DB2 returns a negative SQLCODE to the application.

ENABLE_WITH_FAILBACK
Indicates that queries are accelerated only if DB2 determines that it is advantageous to do so. If the accelerator returns an error during the PREPARE or first OPEN for the query, DB2 executes the query without the accelerator. If the accelerator returns an error during a FETCH or a subsequent OPEN, DB2 returns the error to the user, and does not execute the query.

ELIGIBLE
Indicates that queries are accelerated if they are eligible for acceleration. DB2 does not use cost information to determine whether to accelerate the queries. Queries that are not eligible for acceleration are executed by DB2. If there is an accelerator failure while a query is running, or the accelerator returns an error, DB2 returns a negative SQLCODE to the application.

ALL
Indicates that queries are accelerated if they are eligible for acceleration. DB2 does not use cost information to determine whether to accelerate the queries. Queries that are not eligible for acceleration are not executed by DB2, and an SQL error is returned. If there is an accelerator failure while a query is running, or the accelerator returns an error, DB2 returns a negative SQLCODE to the application.

ZPARM name QUERY_ACCELERATION in DSN6SPRM.

Field Name: QWP4CQAC

REORG SORT NPSI
Specifies the default method of building a non-partitioned secondary index during the REORG tablespace part. This setting is used when the SORTNPSI keyword is not specified in a utility control statement.

Possible values are:
• Auto
• Disable
• Enable

This field corresponds to field REORG PART SORT NPSI in installation panel DSNTIP61. The ZPARM name is REORG_PART_SORT_NPSI in DSN6SPRM.

Field Name: QWP4RPSN

MAX UTIL PARALL
The maximum degree of utility parallelism.

Field Name: QWP4UMD

ACCEL STARTUP OPT
Specifies whether to enable accelerator servers. Possible values are:

AUTO
   Enable and start accelerator servers.

COMMAND
   Enable but do not start accelerator servers.

NO
   Do not enable accelerator servers.

This field corresponds to field ACCEL STARTUP on installation panel DSNTIP81. ZPARM name is ACCEL in DSN6SPRM.

Field Name: QWP4ACCS

REORG IGN FREESP

YES indicates that REORG tablespace does not use the PCTFREE and FREEPAGE values when it reloads data rows into a partition-by-growth (PBG) table space if:

• A subset of the partitions is reorganized.
• The associated table contains LOB columns that cause a REORG AUX NO REQUEST to fail.

This field corresponds to field REORG IGNORE FREESPACE in installation panel DSNTIP61. ZPARM name is REORG_IGNORE_FREESPACE in DSN6SPRM.

Field Name: QWP4RIFS

MULT INDEX ACCESS

Specifies whether to enable or disable multiple index access for queries that have subquery predicates:

NO
   Disables multiple index access for queries.

YES
   Enables multiple index access for queries.

The ZPARM name is SUBQ_MIDX IN DSN6SPRM.

Field Name: QWP4SQMX

QUERY ACCEL OPT

Specifies additional types of SQL queries that are eligible for acceleration.

NONE
   Indicates that no additional types of SQL queries are eligible. Therefore, the types of queries that are described in the other available values for this parameter are not eligible for acceleration. This is the default value.

1
   Indicates that queries that include data that is encoded with the EBCDIC mixed or graphic encoding schemes are eligible for acceleration.

2
   Indicates that an INSERT with SELECT statement is eligible for acceleration. However, only the SELECT operation of the query is processed by the accelerator server.

3
   Indicates that queries that contain built-in functions for which DB2 processes each byte of the input string, rather than each character of the input string, can run on an accelerator server.

4
   The queries that reference an expression with a DATE data type
that uses a LOCAL format are not blocked from executing on IBM DB2 Analytics Accelerator for z/OS. IBM DB2 Analytics Accelerator for z/OS will use the dd/mm/yyyy format to interpret the input and output date value. Specify option 4 only when you also specify LOCAL as the setting for the DSNHDEC.P.DA parameter and your LOCAL date exit defines the specific dd/mm/yyyy date format. Otherwise, queries may return unpredictable results.

5 Allow OFFLOAD of SYSTEM_TIME temporal queries.

6 Allow OFFLOAD of queries that reference timestamp columns with a precision of up to 12.

7 OFFLOAD uses YYYYMMDD date format.

ZPARM name QUERY_ACCEL_OPTIONS in macro DSN6SPRM.

Field Name: QWP4QACO

REORG TABSPACE LIST

Specifies the default value for the REORG TABLESPACE PARALLEL option.

- Parallel
- Serial

The ZPARM name is REORG_LIST_PROCESSING in DSN6SPRM.

Field Name: QWP4RLPR

OPT 1 ROW-NO SORT

Specifies whether DB2 explicitly blocks sort operations when the OPTIMIZE FOR 1 ROW clause is specified on a query:

NO = DISABLE

Means that when OPTIMIZE FOR 1 ROW is specified, DB2 avoids access paths that involve sorts. If an access path that avoids a sort exists, it is possible, although unlikely, that an access path that involves a sort is chosen instead. This behavior is used in DB2 9 and earlier releases.

YES = ENABLE

Means that when OPTIMIZE FOR 1 ROW is specified, DB2 chooses access paths that avoid sorts whenever such a path is available.

ZPARM name is OPT1ROWBLOCKSORT in DSN6SPRM.

Field Name: QWP4O1RBS

AUTH EXIT CHECK

Specifies whether the DB2 authorization ID or the RACF primary authorization ID is to be used for authorization checks, when the access control authorization exit is active:

Primary

DB2 provides:

- The ACEE of the package owner to perform statement authorization checks during AUTOMATIC REBIND, BIND, and REBIND processing
- The ACEE of the package owner, routine definer, or routine invoker, as determined by the dynamic rules behavior for
dynamic SQL authorization checking, when a DYNAMICRULES
BIND option value other than run is in effect.

The access control authorization exit uses the ACEE for the
XAPLUCHK authorization ID field to perform the authorization.
The authorization ID in XAPLUCHK must be defined as a RACF
user and must have the privileges required to execute the SQL
statements in the package.

**DB2**

DB2 provides the ACEE of the primary authorization ID for
performing all authorization checks. The primary authorization ID
must have the privileges required to execute the SQL statements in
the package. This field corresponds to field "RACF AUTH CHECK"
on installation panel DSNTIPP. ZPARM name is
RACF_AUTHCHECK in DSN6SPRM.

**Field Name:** QWP4RACK

**REORG MAPPING DB**

The default database in which REORG TABLESPACE SHRLEVEL change
implicitly creates the mapping table. This field corresponds to field
RECORD MAPPING DB on installation panel DSNTIP61. The ZPARM
name RECORD_MAPPING_TABLE in DSN6SPRM.

**Field Name:** QWP4RMDB

**UTIL OBJ CONVERSR**

This field can have the following values:

**NONE (QWP4UTOC1=0 and QWP4UTOC2=0)**

No conversion is performed. This option is the default setting of
this parameter. NONE is allowed regardless of the OBJECT
CREATE FORMAT setting.

**BASIC (QWP4UTOC1=1 and QWP4UTOC2=0)**

Existing table spaces and indexes that use extended 10-byte page
format are converted to basic 6-byte page format. BASIC is allowed
only if the OBJECT CREATE FORMAT field is also set to BASIC.

**EXTENDED (QWP4UTOC1=0 and QWP4UTOC2=1)**

Existing table spaces and indexes that use 6-byte page format are
converted to extended 10-byte page format. EXTENDED is allowed
only if the OBJECT CREATE FORMAT field is also set to
EXTENDED.

**NO BASIC (QWP4UTOC1=1 and QWP4UTOC2=1)**

Prevents the conversion of table spaces and indexes in extended
page format to basic page format and disallows a utility that
accepts the RBALRSN_CONVERSION utility keyword from
running on an object in basic page format unless it converts it to
extended page format. This setting is permitted only when
OBJECT_CREATE_FORMAT=EXTENDED is set.

The ZPARM name is UTILITY_OBJECT_CONVERSION in DSN6SPRM.

**Field Name:** RT0106OC

**AUTHEX CACHE REF**
Specifies whether the package authorization cache, routine authorization cache, and dynamic statement cache entries are refreshed when an access control authorization exit is active, and the user profile is changed in RACF. Possible values are:

- All
- None

This field corresponds to field AUTH EXIT CACHE REFRESH in installation panel DSNTIPP. ZPARM name is AUTHEXIT_CACHEREFRESH in DSN6SPRM.

**Field Name:** QWP4AECR

**REORG DROP PARTS**

If YES, REORG completes, REORG drops empty, and trailing partitions are set in a PARTITION-BY-GROWTH table space.

This field corresponds to field REORG DROP PBG PARTS on INSTALLATION panel DSNTIP61. The ZPARM name is REORG_DROP_PBG_PARTS in DSN6SPRM.

**Field Name:** QWP4RPBG

**OBJ CREATE FORMAT**

Creates new table spaces and indexes in the following log record format:

- **EXTENDED**
  
  Creates new table spaces and indexes in extended log record format.

- **BASIC**
  
  Creates new table spaces and indexes in basic log record format.

**Field Name:** QWP4OBCF

**PKG RELEASE COMMIT**

YES indicates that the following operations on a package that are bound with RELEASE(DEALLOCATE) are permitted while the package is active and allocated by DB2:

- BIND and REBIND requests, including AUTOMATIC REBIND
- Data definition language changes to objects that are statically referenced by the package

The ZPARM name is PKGREL_COMMIT in DSN6SPRM.

**Field Name:** QWP4PKRC

**REORG KEEP DICT**

Indicates that KEEPDICTIONARY is used when a REORG converts a table space from basic row format (BRF) to reordered row format (RRF).

**Field Name:** QWP4HKEEPD

**TEMPLATE TIME**

Specifies the default setting for the TIME option of the template utility control statement. Possible values are:

- UTC (utility control)
- Local
This field corresponds to field TEMPLATE TIME on installation panel DSNTIP6. The ZPARM name is TEMPLATE_TIME in DSN6SPRM.

**Field Name:** QWP4TPTM

**MAX IN-MEM SORT**

The maximum amount of storage in kilobytes to allocate for sorting the results of each query that contains the order by clause, the group by clause, or both. This field corresponds to field MAX IN-MEMORY SORT SIZE in installation panel DSNTIPC. The ZPARM name is MAXSORT_IN_MEMORY in DSN6SPRM.

**Field Name:** QWP4MIMTS

**STATIST FEEDBACK**

Specifies the scope of SQL statements for which DB2 is to recommend statistics. Possible values are:

- All
- Dynamic
- None
- Static

This value corresponds to field STATISTICS FEEDBACK on installation panel DSNTIPO. The ZPARM name is STATFDBK_SCOPE in DSN6SPRM.

**Field Name:** QWP4SFBS

**MAX PARA DEG DPSI**

The maximum degree of parallelism for a parallel group in which a data-partitioned secondary index is used to control parallelism. This field corresponds to field MAX DEGREE FOR DPSI on installation panel DSNTIP81. The ZPARM name is PARAMDEG_DPSI in DSN6SPRM.

**Field Name:** QWP4DEGD

**APPL COMPAT**

Specifies the DB2 level for downward compatibility with applications. The ZPARM name is APPLCOMPAT in DSN6SPRM.

**Field Name:** QWP4APCO_VAR

**PCTFREE UPDATE**

Specifies the default percentage of each page that DB2 leaves as free space in a table space when a table in this table space is populated. This value applies only to table spaces whose definitions do not include PCTFREE and for UPDATE.

This value corresponds to field PERCENT FREE FOR UPDATE on installation panel DSNTIP71. The ZPARM name is PCTFREE_UPD in DSN6SPRM.

**Field Name:** QWP4PFUP

**WF DB AGNT THRESH**

Specifies the percentage of space that is used in the Workfile Database by a single agent when DB2 issues a warning message.
This value corresponds to field AGENT LEVEL THRESHOLD on installation panel DSNTIP91. The ZPARM name is WFSTGUSE_AGENT_THRESHOLD in DSN6SPRM.

**Field Name:** QWP4WFSAT

**LIKE BLANK INSIGN**

YES indicates that blanks are not significant when DB2 applies the LIKE predicate to a string. Blanks are significant in DB2 10.

This setting corresponds to field LIKE BLANK INSIGNIFICANT on installation panel DSNTIP41. The ZPARM name is LIKE_Blank_INSIGNIFICANT in DSN6SPRM.

**Field Name:** QWP4LBIN

**IDX CLEANUP THRDS**

The maximum number of threads that can be created to clean up pseudo-deleted index entries on a data sharing member of a subsystem. This field corresponds to field INDEX CLEANUP THREADS on installation panel DSNTIPE1. The ZPARM name is INDEX_CLEANUP_THREADS in DSN6SPRM.

**Field Name:** QWP4IXCU

**WF DB SYS THRESH**

Specifies the percentage of space that is used in the Workfile Database by all agents in a DB2 subsystem or data sharing member when DB2 issues a warning message.

This value corresponds to field SYSTEM LEVEL THRESHOLD on installation panel DSNTIP91. The ZPARM name is WFSTGUSE_SYSTEM_THRESHOLD in DSN6SPRM.

**Field Name:** QWP4WFSST

**D.STMT CACHE STOR**

Specifies the number of gigabytes of storage that DB2 allocates for hashing entries in the dynamic statement cache. This parameter can avoid storage shortages for long-running threads. The storage is allocated above the bar.

The ZPARM name is CACHE_DEP_TRACK_STOR_LIM in DSN6SPRM.

**Field Name:** QWP4CDTSL

**SPT01 MAX LENGTH**

The maximum length in bytes of LOB columns in the SPT01 directory space that are maintained in the base table. This field corresponds to field SPT01 INLINE LENGTH on installation panel DSNTIPA2. The ZPARM name is SPT01_INLINE_LENGTH in DSN6SPRM.

**Field Name:** QWP4S1IL

**SIMULATED CPUS**

The number of CPUs that are online.

**Field Name:** QWP4NCPU

**MSEC OF TASK/SRB**

Microseconds of task or SRB (service request block) execution time for each service unit (SU).
Field Name: QWP4CPUM
COMPRESS SPT01

Enables the compression of SPT01.

Field Name: QWP4CS01
UT SORT DS ALLOC

In DB2 12 this field is a serviceability field.

YES indicates that utilities invoke a SORT use and a space prediction algorithm for dynamically allocated SORT work data sets. The ZPARM name is UTSORTAL in DSN6SPRM.

Field Name: QWP4SRAL
MAX ZL DICT ENTR

The maximum number of ZIVLEMPLE dictionary entries.

Field Name: QWP4MDE
I/O SCHEDULING

Determines whether the I/O scheduling feature is activated. DB2 parameter SPRMIOP in DSN6SPRM.

Field Name: QWP4IOP
UT DB2 SORT USE

In DB2 12 this field is a serviceability field.

Enables the use of DB2 SORT.

Field Name: QWP4DB2SRT
ENABLE DB CHECK

Enable database checking.

Field Name: QWP4DBCK
IGN SORTNUM STMT

Ignores SORTNUM clause in utility control statements. The ZPARM name is IGNSORTN in DSN6SPRM.

Field Name: QWP4IGSN
UT TEMP STORCLASS

Specifies the name of the SMS storage class that DB2 uses for defining temporary shadow data sets. A blank value indicates that the temporary shadow data sets a defined in the same storage class as the production page set. This field corresponds to field "UTIL TEMP STORCLAS" on installation panel DSNTIP6. The ZPARM name is UTIL_TEMP_STORCLAS in DSN6SPRM.

Field Name: QWP4CHEC
BIF COMPATIBILITY

The BIF_COMPATIBILITY subsystem parameter specifies whether the built-in functions and specifications are to return results in the DB2 10 format or revert to the pre-Version 10 format. It can have the following values:

• CURRENT
IFCID 106 - Miscellaneous Installation Parameters

- V9
- V9_TRIM
- V9_DECIMAL_VARCHAR (default for migration)
- N/P (default for new installation)

This field corresponds to field BIF COMPATIBILITY on installation panel DSNTIPX.

ZPARM name BIF_COMPATIBILITY in DSN6SPRM.

Field Name: QWP4_BIF_COMPAT

FAST REPLICATION

The FASTREPLICATION type for check utilities:
- N=NONE
- P=PREFERRED
- R=REQUIRED

This field corresponds to field "Fast replication" in installation panel DSNTIP6. The ZPARM name is CHECK_FASTREPLICATION in DSN6SPRM.

Field Name: QWP4CFRP

FLASHCOPY PPRC

Specifies the behavior for DFSMSdss FLASHCOPY requests when the target disk storage volume is the primary device in a peer-to-peer remote copy (metro mirror) relationship (DB2 field: QWP4FCPPRC). This field corresponds to field "FLASHCOPY PPRC" on installation panel DSNTIP6. The ZPARM name is FLASHCOPY_PPRC.

Field Name: QWP4FCPPRC

CAT DAT DATACLASS

The SMS data class for DB2 catalog data sets. This field corresponds to column SMS data class in field "Directory and catalog data" on installation panel DSNTIPA3. The ZPARM name is CATDDACL in DSN6SPRM.

Field Name: QWP4CDDC

FAST RESTORE

Specifies how the Recover utility directs DFSMSdss copy to restore an image copy that was created with FLASHCOPY. This field corresponds to field "Fast restore" on installation panel DSNTIP6. The ZPARM name is REC_FASTREPLICATION.

Field Name: QWP4RFRP

FLASHCOPY COPY

YES indicates that the Copy utility uses the subsystem parameter settings for FLASHCOPY and FCCOPYDDN when those keywords are not present in the utility control statement. The ZPARM name is FLASHCOPY_COPY in DSN6SPRM.

Field Name: QWP4FCCP

CAT DAT MGMTCLASS
The SMS management class for DB2 catalog data sets. This field corresponds to column SMS MGMT class in field "Directory and catalog data" on installation panel DSNTIPA3. The ZPARM name is CATDMGCL in DSN6SPRM.

**Field Name:** QWP4CDMC

**RESTRICT ALT COL DCC**

A value of YES prevents the use of ALTER table ALTER column with SET DATA TYPE, SET DEFAULT, and DROP DEFAULT when data capture changes is enabled on the target table. The ZPARM name is RESTRICT_ALT_COL_FOR_DCC in DSN6SPRM.

**Field Name:** QWP4RACD

**FLASHCOPY LOAD**

YES indicates that the load utility uses the subsystem parameter settings for FLASHCOPY, FCCOPYDD, and FCAUXOBJS when those keywords are not present in the utility control statement. ZPARM NAME: FLASHCOPY_LOAD IN DSN6SPRM.

**Field Name:** QWP4FCLD

**CAT DAT STORCLASS**

The SMS storage class for DB2 catalog data sets. This field corresponds to column SMS STOR class in field "Directory and catalog data" on installation panel DSNTIPA3. The ZPARM name is CATDSTCL in DSN6SPRM.

**Field Name:** QWP4CDSC

**SET CHECK PENDING**

In DB2 12 this field is a serviceability field.

YES sets the object in check-pending status when the check utility detects an inconsistency. This field corresponds to field "Set check pending" on installation panel DSNTIP61. The ZPARM name is CHECK_SETCHKP in DSN6SPRM.

**Field Name:** QWP4CSCP

**FLASHCOPY REB IX**

YES indicates that the Rebuild Index utility uses the subsystem parameter settings for FLASHCOPY and FCCOPYDDN when those keywords are not present in the utility control statement (DB2 field: QWP4FCRBI). The ZPARM name is FLASHCOPY_REBUILD_INDEX in DSN6SPRM.

**Field Name:** QWP4FCRBI

**CAT IDX DATACLASS**

The SMS data class for DB2 catalog index data sets. This field corresponds to column SMS data class in field "Directory and catalog indexes" on installation panel DSNTIPA3. The ZPARM name is CATXDACL in DSN6SPRM.

**Field Name:** QWP4CXDC

**DISABLE EDM RTS**

Hexadecimal (X'01'). YES disables the use of EDM real-time Statistics. The ZPARM name is DISABLE_EDMRTS in DSN6SPRM.
IFCID 106 - Miscellaneous Installation Parameters

Field Name: QWP4DEDR

FLASHCOPY REORG TS
YES indicates that the Reorg Tablespace utility uses the subsystem parameter settings for FLASHCOPY, FCCOPYDDN, and FCAUXOJBJS when these keywords are not present in the utility control statement. The ZPARM name is FLASHCOPY_REORG_TS in DSN6SPRM.

Field Name: QWP4FCROT

CAT IDX MGMTCLASS
The SMS management class for DB2 catalog index data sets. This field corresponds to column SMS MGMT class in field "Directory and catalog indexes" on installation panel DSNTIPA3. The ZPARM name is CATXMGCL in DSN6SPRM.

Field Name: QWP4CXMC

DRDA RESOLV ALIAS
YES means that in SQL statements, DB2 replaces aliases that refer to three-part names with qualified object names before it sends the statements to the remote location. This substitution is done in the following cases:
- When PREPARE or EXECUTE IMMEDIATE is performed
- When REMOTE BIND of a package is performed.

ZPARM name DRDA_RESOLVE_ALIAS in DSN6SPRM.

Field Name: QWP4RSLV

FLASHCOPY REBUILD IX
YES indicates that the Rebuild Index utility uses the subsystem parameter settings for FLASHCOPY and FCCOPYDDN when those keywords are not present in the utility control statement (DB2 field: QWP4FCRBI). The ZPARM name is FLASHCOPY_REBUILD_INDEX in DSN6SPRM.

Field Name: QWP4FCRBI

CAT IDX STORCLASS
The SMS storage class for DB2 catalog index data sets. This field corresponds to column SMS STOR class in field "Directory and catalog indexes" on installation panel DSNTIPA3. The ZPARM name is CATXSTCL in DSN6SPRM.

Field Name: QWP4CXSC

MANAGE REAL STOR
Specifies whether DB2 manages real storage consumption. This field corresponds to field MANAGE REAL STORAGE on installation panel DSNTIPE. The ZPARM name is REALSTORAGE_MANAGEMENT in DSN6SPRM.

Field Name: QWP4STMN

MAX REAL+AUX STOR
The maximum amount of real plus auxiliary storage that can be used. The ZPARM name is REALSTORAGE_MAX in DSN6SPRM.

Field Name: QWP4RSMX

PARALL EFFICIENCY
The parallelism efficiency factor. This field corresponds to field "Parallelism efficiency" on installation panel DSNTIP8. The ZPARM name is PARA_EFF in DSN6SPRM.

Field Name: QWP4PAEF

REORDERD ROW FORM

In DB2 12 this field is a serviceability field.

A value of YES shows that reordered row format is enabled.

This field corresponds to field REORDERED ROW FORMAT on installation panel DSNTIP7. The ZPARM name is RRF in DSN6SPRM.

Field Name: QWP4RRF

SEPAR WORK FILES

YES directs processing of declared temporary tables only to DB2-managed table spaces that are defined with SECQTY>0 (DB2 field: QWP4WFDBSEP). It directs all other processing to DB2-managed table spaces that are defined with SECQTY=0 or to user-managed table spaces. This field corresponds to field "Separate Work Files" in installation panel DSNTIP9. The ZPARM name is WFDBSEP in DSN6SPRM.

Field Name: QWP4WFDBSEP

PREVENT ALTER LMT

Determines whether DB2 disallows altering the limit key by using an ALTER TABLE statement for index-controlled partitioned table spaces. This alter operation places the table space in REORG-pending (REORP) restrictive status, and the data is not available until the affected partitions are reorganized. Use PREVENT_ALTERTB_LIMITKEY to avoid this data unavailability.

NO Specifies that you can alter a limit key by using an ALTER TABLE statement for index-controlled partitioned table spaces. NO is the default.

YES Specifies that it is not permitted to alter a limit key by using an ALTER TABLE statement for index-controlled partitioned table spaces. An ALTER TABLE statement must not attempt to alter the limit key for an index-controlled partitioned table.

Install parameter PREVENT ALTER LIMITKEY on panel DSNTIP71, or ZPARM: PREVENT_ALTERTB_LIMITKEY in DSN6SPRM.

Field Name: QWP4PALK

PREVENT IDX PART

Determines whether DB2 does not allow the creation of new index-controlled partitioned tables. This subsystem parameter ensures that new partitioned tables use table-controlled partitioning, which is the preferred partitioning method for non-universal table spaces.

NO Specifies that new index-controlled partitioned tables can be created. NO is the default value.

YES Specifies that new partitioned table spaces must use table-controlled partitioning. A CREATE INDEX statement must not attempt to create an index-controlled partitioned table.
IFCID 106 - Miscellaneous Installation Parameters

Install parameter PREVENT INDEX PART CREATE on panel DSNTIP71, or ZPARM: PREVENT_NEW_IXCTRL_PART in DSN6PRM.

Field Name: QWP4PCIP

RETRY STOPPED OBJ

Specifies whether DB2 should immediately reject requests for a stopped object or retry them, up to the IRLM timeout limit, if the object is restarted.

NO  This is the default. It indicates that DB2 immediately rejects requests for a stopped object.

YES  DB2 retries such requests, up to the IRLM timeout setting, if the stopped object is restarted.

Install parameter RETRY STOPPED OBJECTS on panel DSNTIP72, or ZPARM RETRY_STOPPED_OBJECTS in DSN6PRM.

Field Name: QWP4RSO

EMPTY XML ELEMENT

Indicates whether empty XML elements are serialized:

NO  Serialization of empty XML elements is not defined.

YES  Empty XML elements are serialized using a start-element tag followed by an end-element tag.

ZPARM name is XML_RESTRICT_EMPTY_TAG in DSN6PRM.

Field Name: QWP4NOET

RENAME TABLE

Specifies whether the RENAME TABLE statement should extend to tables that are referenced in a view definition or the definition of an SQL table function:

YES  ALLOW_DEP_VIEW_SQLTUDF

NO  DISALLOW_DEP_VIEW_SQLTUDF

Install parameter RENAME TABLE on panel DSNTIP72, or ZPARM RENAMETABLE in DSN6PRM.

Field Name: QWP4ERTS

ALTERNATE CPYPOOL

Specifies an optional alternate SMS copy pool for the DB2 BACKUP SYSTEM utility.

This field corresponds to field ALTERNATE COPYPOOL on INSTALLATION panel DSNTIP62. The ZPARM name is ALTERNATE_CP in DSN6PRM.

Field Name: QWP4BSACP

DB BAK STG GRP

Specifies an optional backup SMS storage group to be used by the DB2 BACKUP SYSTEM utility for the DB copy pool.

This field corresponds to field DB BACKUP STG GROUP on INSTALLATION panel DSNTIP62. The ZPARM name is UTIL_DBBSG in DSN6PRM.
Field Name: QWP4UDBSG

LOG BAK STG GRP

Specifies an optional backup SMS storage group to be used by the DB2 BACKUP SYSTEM utility for the LOG copy pool.

This field corresponds to field LOG BACKUP STG GRP on INSTALLATION panel DSNTIP62. The ZPARM name is UTIL_LGBSG in DSN6SPRM.

Field Name: QWP4ULBSG

COPY FAST REPLIC

Specifies whether FlashCopy fast replication is preferred, required, or should not be used.

This field corresponds to field COPY FAST REPLICATION on INSTALLATION panel DSNTIP61. The ZPARM name is COPY_FASTREPLICATION in DSN6SPRM.

Field Name: QWP4CYFR

PAGE NUMBERING

Specifies whether range-partitioned table spaces and associated indexes will be created to use absolute page numbers across partitions or relative page numbers.

A Absolute page numbers
R Relative page numbers

Install parameter PAGE SET PAGE NUMBERING on panel DSNTIP71, or ZPARM PAGESET_PAGENUM in DSN6SPRM.

Field Name: QWP4PSPN

COMPRESS_DIRLOB

Specifies whether DB2 compresses large object (LOB) table spaces in the DB2 directory the next time that the table spaces are reorganized.

* 0 indicates NO
* 1 indicates YES

This value corresponds to field COMPRESS DB2 DIR LOBS on installation panel DSNTIPA2. ZPARM name: COMPRESS_DIRLOB in DSN6SPRM.

Field Name: QWP4CDRL

CACHE DYN STABIL

Specifies when dynamic SQL statements can be captured for stabilization. When a statement is stabilized, the current SQLID, statement text, and runtime structures are written to catalog tables. If a dynamic SQL statement is not present in the dynamic SQL statement cache, DB2 will load the runtime structures from catalog table rather than performing a full prepare. This extends the stability and reliability of performance of a dynamic SQL. It can have the following values:

CAPTURE

Statements may be stabilized through the -START DYNAQUERY command using both MONITOR(NO) and MONITOR(YES). DB2 will not load stabilized statements from SYSDYNQRY.
IFCID 106 - Miscellaneous Installation Parameters

LOAD
Statements may not be stabilized via any means. The -START DYNQUERY command will fail, and any MONITOR(YES) commands in progress will not stabilize statements, even if stabilization criteria are matched. During long prepare, DB2 will attempt to load stabilized statements from SYSDYNQRY with which to run.

BOTH Statements may be stabilized through the -START DYNQUERY command via both MONITOR(NO) and MONITOR(YES). During long prepare, DB2 will attempt to load stabilized statements from SYSDYNQRY with which to run. BOTH is the default setting.

NONE
Statements may not be stabilized via any means. The -START DYNQUERY command will fail, and any MONITOR(YES) commands in progress will not stabilize statements, even if stabilization criteria are matched. DB2 will not load stabilized statements from SYSDYNQRY.

This field corresponds to field CACHE DYN STABILITY on installation panel DSNTIP8. The ZPARM name is CACHEDYN_STABILIZATION in DSNTIP8.

Field Name: QWP4CDST

SELECT FOR UNLOAD
Shows the AUTH_COMPATIBILITY ZPARM values (DB2 field: QWP4AUTCSU):

1 The unload utility checks whether the user has the SELECT privilege on the target table.

0 The unload utility checks whether the user has the UNLOAD privilege on the target table.

Field Name: QWP4ACSU

DDL MATERIALIZATN
Specifies when DB2 materializes changes to the definition of an object. This value corresponds to field DDL_MATERIALIZATION on installation panel DSNTIP71. ZPARM name is DDL_MATERIALIZATION in DSN6SPRM.

Field Name: QWP4DDLM

INDEX MEMORY CTRL
Shows the amount of memory that DB2 should allocate for fast traversing of DB2 indexes:

-1 = AUTO
Specifies that DB2 sets the upper limit of the storage to 20% of the currently allocated buffer pools.

0 = DISABLE
Specifies that DB2 returns any existing storage allocated for fast index traversal and does not allocate any further storage for this purpose.

500 - 200000
Indicates the storage limit for fast index traversal.

The ZPARM name is INDEX_MEMORY_CONTROL in DSN6SPRM.
Field Name: QWP4IXMC

HSM MSG DS HLQ

Shows the high level qualifier (HLQ) for data sets (DS) to be allocated by
the DB2 BACKUP SYSTEM and RESTORE SYSTEM utilities to receive
messages from the Data Facility Hierarchical Storage Manager (DFHSM)
and the IBM Data Facility Data Set Services (DFDSS) (DB2 field:
QWP4UHMDH).

This value corresponds to field HSM MESSAGE DS HLQ on installation
panel DSNTIP62. ZPARM name: UTILS_HSM_MSGDS_HLQ in
DSN6SPRM.

Field Name: QWP4UHMDH

DLT INSERT ALG

Specifies the default algorithm for inserting data into table spaces. This
value corresponds to the field DEFAULT INSERT ALGORITHM on
installation panel DSNTIP71. The ZPARM name
DEFAULT_INSERT_ALGORITHM is in DSN6SPRM.

Field Name: QWP4DINA

STATFDBK PROFILE

Specifies whether Statistics recommendations that are identified during
query optimization cause DB2 to modify to Statistics profiles.
- 0 indicates NO
- 1 indicates YES

This value corresponds to field STATS PROFILE FEEDBACK on installation
panel DSNTIP8. ZPARM name: STATFDBK_PROFILE in DSN6SPRM.

Field Name: QWP4SFPFR

MAT NODET SQLTUDF

DB2 materializes the result of a user-defined SQL table function that is
defined as not deterministic.
- 0=NO
- 1=YES

ZPARM name is MATERIALIZE_NODET_SQLTUDF in DSN6SPRM.

Field Name: QWP4MNSU
IFCID 106 - Stored Procedures Parameters

Record trace - IFCID 106 - Stored Procedures Parameters

This topic shows detailed information about “Record Trace - IFCID 106 - Stored Procedures Parameters”.

MVS PROCEDURE NAME

The name of the MVS JCL procedure used to start the DB2 stored procedures address space.

Install parameter DB2 PROC NAME on panel DSNTIPX, or ZPARM STORPROC in DSN6SYSP.

Field Name: QWP1SPPN

ALLOWABLE ABENDS

The number of times a stored procedure is allowed to terminate abnormally, after which SQL CALL statements for the stored procedure are rejected.

Install parameter MAX ABEND COUNT on panel DSNTIPX, or ZPARM STORMXAB in DSN6SYSP.

Field Name: QWP1SPAB

TIMEOUT VALUE

The number of seconds before DB2 stops waiting for an SQL CALL statement to be assigned to one of the TCBs in the DB2 stored procedures address space.

Install parameter TIMEOUT VALUE on panel DSNTIPX, or ZPARM STORTIME in DSN6SYSP.

Field Name: QWP1SPTO
ICCID 106 - System Initialization Parameters

ICCID 106 - System Initialization Parameters

This topic shows detailed information about “Record Trace - ICCID 106 - System Initialization Parameters”.

When this block contains names that are too long for the space available, they are truncated. The full name is shown in the list of long names, which is printed at the end of this block. When present, the list shows the parameter identifier, in alphabetic order, and the complete name. If the name is too long for one line, it continues on the next.

ICCID 106 - System Initialization Parameters

Record trace - ICCID 106 - System Initialization Parameters

The field labels shown in the following sample layout of “Record Trace - ICCID 106 - System Initialization Parameters” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Value</th>

</tr>
<tr>
<td>WTO ROUTE CODES</td>
<td>X'8000'</td>
</tr>
<tr>
<td>CHECKPOINT FREQ</td>
<td>YES</td>
</tr>
</tbody>
</table>

**CHECKPOINT FREQUENCY**

Checkpoint frequency. This shows either the number of minutes (1 through 60) or the number of DB2 log records between the start of successive checkpoints. DB2 starts a new checkpoint when this value is reached.

You can use the SET LOG command to change the number of log records between checkpoints dynamically. Valid values are 1-60 when specifying a time value and 200-16000000 when specifying a number of records.

Install parameter CHECKPOINT FREQ on panel DSNPLP, ZPARM CHKFREQ in DSN6YSYP.

**Field Name**: QWP1LOGL

**TRACETAB SIZE(4K)**

Shows the size of the RES trace table in 4 KB blocks. A value of 16 means 64 KB have been allocated for this table.

This is the default destination for the global trace records in DB2. Most trace records require 32-byte entries; events with more than three data items require 64-byte entries.

Install parameter TRACE SIZE on panel DSNP, or ZPARM TRACETBL in DSN6YSYP.
Field Name: QWP1TRSZ

GLOBAL CLASSES

Shows whether the global trace is started automatically when DB2 is started.

When YES, the global trace starts for the default classes (classes 1, 2, and 3) whenever DB2 is started, and additional data consistency checks are made whenever a data page or index page is modified. When ALL, the global trace is automatically started for all classes.

The global trace is used to diagnose problems in DB2 but it also impacts DB2 performance. If you have production systems requiring high performance, you might consider turning off global trace. If you do this, be aware that this presents a serviceability exposure. In the event of a system failure, IBM service personnel will ask you to turn on global trace and attempt to recreate the problem.

Install parameter TRACE AUTO START on panel DSNTIPN, or ZPARM TRACSTR in DSN6SYSP.

Field Name: QWP1TRST

WTO ROUTE CODES

The MVS console routing codes.

These codes are assigned to messages that are not solicited from a specific console. Up to 16 comma-separated codes can be shown.

Install parameter WTO ROUTE CODES on panel DSNTIPO, or ZPARM ROUTCDE in DSN6SYSP.

Field Name: QWP1SMRC

LOCAL TRACETAB SZ

The size of the local trace tables in multiples of 4 KB. ZPARM name TRACLOC in DSN6SYSP.

Field Name: QWP1TLSZ

STATS CLASSES

Shows whether a Statistics trace was started automatically at DB2 startup time.

The classes started are shown separated by commas.

DB2 sends collected trace data to SMF. The SMFPRM xx member of SYS1.PARMLIB must be set to allow SMF to write the records.

Install parameter SMF STATISTICS on panel DSNTIPN, or ZPARM SMFSTAT in DSN6SYSP.

Field Name: QWP1SMFS

BACKGROUND IDS

The maximum allowed number of concurrent connections for batch jobs and utilities. This includes:

- All batch jobs using QMF.
- All batch jobs using the DSN command processor.
- All tasks connected to DB2 through call attach facility (CAF) running in batch. This can include:
- Batch jobs using QMF
- APPC applications
- TCP/IP FTP connections

When the number of batch jobs reaches this limit, further requests are rejected.

Install parameter MAX BATCH CONNECT on panel DSNTIPE, or ZPARM IDBACK in DSN6SYSP.

**Field Name:** QWP1IDB

**MONITOR BUF SIZE**

The default number of bytes allocated for the monitor trace buffer.

Install parameter MONITOR SIZE on panel DSNTIPN, or ZPARM MONSIZ in DSN6SYSP.

**Field Name:** QWP1MONS

**ACCOUNT CLASSES**

Shows whether DB2 sends accounting data to SMF automatically when DB2 is started. Numeric values show what classes are sent. When YES, the default class (class 1) is sent. When ALL, accounting classes one through five are started.

The SMFPRM xx member of SYS1.PARMLIB must also be set to allow SMF to write the records.

Install parameter SMF ACCOUNTING on panel DSNTIPN, or ZPARM SMFACCT in DSN6SYSP.

**Field Name:** QWP1SMFA

**FOREGROUND IDS**

The maximum number of concurrent TSO foreground connections (QMF, DSN, DB2I, and SPUFI).

Each of the following is a separate user:
- Each TSO foreground user executing a DSN command.
- Each TSO foreground user connected to DB2 through the call attachment facility (CAF). This can include QMF users running in TSO foreground or user-written CAF applications running in TSO foreground.

When the number of TSO users attempting to access DB2 exceeds this limit, connection requests are rejected.

There is no subsystem parameter to control the maximum concurrent connections for IMS and CICS. These are controlled by using IMS and CICS facilities. For CICS attachment, the maximum number of connections to DB2 can be controlled using the resource control table (RCT) TYPE=INIT THRDMAX value.

Install parameter MAX TSO CONNECT on panel DSNTIPE, or ZPARM IDFORE in DSN6SYSP.

**Field Name:** QWP1IDF

**STATS INTERVAL**

The time interval, in minutes, between statistics collections. Statistics records are written approximately at the end of this interval.
IFCID 106 - System Initialization Parameters

Install parameter STATISTICS TIME on panel DSNTIPN, or ZPARM STATTIME in DSN6SYSP.

Field Name: QWP1STIM

AUDIT CLASSES

Shows whether the audit trace is started automatically when DB2 is started.

When YES, the audit trace is started for the default class (class 1) whenever DB2 is started. When ALL, an audit trace is automatically started for all classes.

Install parameter AUDIT TRACE on panel DSNTIPN, or ZPARM AUDITST in DSN6SYSP.

Field Name: QWP1AUDT

RLIMIT TABLE ID

The default resource limit specification table (RLST) suffix.

This suffix is used when the resource limit facility (governor) is automatically started or when the governor is started without specifying a suffix.

Install parameter RLST NAME SUFFIX on panel DSNTIPO4, or ZPARM RLFTBL in DSN6SYSP.

Prior to DB2 12: Install parameter RLST NAME SUFFIX on panel DSNTIPO4, or ZPARM RLFTBL in DSN6SYSP.

Field Name: QWP1RLFT

PSEUDOCLOSE CHCKP

The number of consecutive DB2 checkpoints that a page set or partition can remain in read/write mode since it was last updated. When this limit or the RO SWITCH TIME is reached, DB2 changes the page set or partition to read only.

This can improve performance for recovery, logging, and data-sharing processing.

Install parameter RO SWITCH CHKPTS on panel DSNTIPL, or ZPARM PCLOSEN in DSN6SYSP.

Field Name: QWP1FREQ

MONITOR CLASSES

Shows whether the monitor trace is started automatically when DB2 is started. When YES, the default (trace class 1) is started. Numeric values show which classes are started. When ALL, monitor trace classes 1 through 8 are started.

Install parameter MONITOR TRACE on panel DSNTIPN, or ZPARM MON in DSN6SYSP.

Field Name: QWP1MON

RLIMIT TAB AUTHID

The authorization ID used for the resource limit facility (governor).
This identifier can be a long string. If there is insufficient space to show the complete string, the string is truncated in the report block. The complete string is shown in a separate list of long names at the end of the report.

Install parameter RESOURCE AUTHID on panel DSNTIPP, or ZP ARM RLF AUTH in DSN6SYSP.

**Field Name:** QWP1RLFA

**PESEODCLOSE MIN**

The number of minutes that a page set or partition can remain in read-write mode since it was last updated. When this limit or the RO SWITCH CHKPTS is reached, DB2 changes the page set or partition to read-only.

This can improve performance for recovery, logging, and data-sharing processing.

Install parameter RO SWITCH TIME on panel DSNTIPL, or ZP ARM PCLOSET in DSN6SYSP.

**Field Name:** QWP1TMR

**REM THRDS(ACTIVE)**

The maximum number of database access threads (DBATs) that can be active concurrently.

When this limit has been reached, DB2 uses the value of DDF THREADS on panel DSNTIPR to decide how to handle a new allocation request.

When DDF THREADS is ACTIVE and MAX REMOTE CONNECTED has not been reached, the allocation request is allowed but any further processing for the connection is queued waiting for an active database access thread to terminate.

When DDF THREADS is INACTIVE and MAX REMOTE CONNECTED has not been reached, the allocation request is allowed and is processed when DB2 can assign an unused database access thread slot to the connection.

The total number of threads accessing data concurrently is the sum of MAX USERS and MAX REMOTE ACTIVE. The maximum allowable value for this sum is 2000.

Install parameter MAX REMOTE ACTIVE on panel DSNTIPE, or ZP ARM MAXDBAT in DSN6SYSP.

**Field Name:** QWP1RMT

**RLF DYNAMIC ERROR**

Shows whether the resource limit facility (governor) is automatically started when DB2 is started.

Install parameter RLF AUTO START on panel DSNTIPO4, or ZP ARM RLF in DSN6SYSP.

**Field Name:** QWP1RLF

**CONCURR THREADS**

The maximum number of allied threads (threads started at the local subsystem) that can be allocated concurrently.

Separate threads are created for each occurrence of the following:
IFCID 106 - System Initialization Parameters

- TSO user (whether running a DSN command or a DB2 request from QMF)
- Batch job (whether running a DSN command or a DB2 utility)
- IMS region that can access DB2
- Active CICS transaction that can access DB2
- Task connected to DB2 through the call attachment facility.

Install parameter MAX USERS on panel DSNTIPE, or ZPARM CTHREAD in DSN6SYSP.

Field Name: QWP1CT

REM THRDS(CONN)

The maximum allowed number of concurrent remote connections.

When this limit is reached, any new connection request is rejected.

Install parameter MAX REMOTE CONNECTED on panel DSNTIPE, or ZPARM CONDBAT in DSN6SYSP.

Field Name: QWP1CDB

UR LOG THRESHOLD

Shows the number of log records that are to be written by an uncommitted unit of recovery (UR) before DB2 issues a warning message to the console. This provides notification of a long-running UR. Long-running URs might result in a lengthy DB2 restart or a lengthy recovery situation for critical tables. Log records are specified in 1-K (1000 log records) increments. A value of 0 indicates that no write check is to be performed.

Install parameter UR LOG WRITE CHECK on panel DSNTIPL, ZPARM URLGWTH in DSN6SYSP.

Field Name: QWP1LWCK

LIMIT BACKOUT

Shows whether some backward log processing should be postponed.

When NO, DB2 backward log processing processes all inflight units of recovery (URs) and URs for abending transactions.

When YES, DB2 postpones backout processing for some units of work until the command RECOVER POSTPONED is issued.

AUTO (default) postpones some backout processing but automatically starts the backout processing when DB2 restarts and begins accepting new work.

When YES or AUTO, backout processing runs concurrently with new work. Page sets or partitions with backout work pending are unavailable until their backout work is complete.

Install parameter LIMIT BACKOUT on panel DSNTIPL, or ZPARM LBACKOUT in DSN6SYSP.

Field Name: QWP1LMBO

EXTENDED SECURITY

Extended security options.

When YES (strongly recommended), detailed reason codes are returned to a DRDA level 3 client when a DDF connection request fails because of
security errors. When using SNA protocols, the requester must have included a product that supports the extended security sense codes, such as DB2 Connect™ version 5 and subsequent releases.

RACF users can change their passwords using the DRDA change password function. This support is only for DRDA level 3 requesters that have implemented support for changing passwords.

YES allows properly enabled DRDA clients to determine the cause of security failures without requiring DB2 operator support.

When NO, generic error codes are returned to the clients and RACF users are prevented from changing their passwords.

Install parameter EXTENDED SECURITY on panel DSNTIPR, or ZPARM EXTSEC in DSN6SYSP.

Field Name: QWP1SCER

UR CHECK FREQ

Shows the number of checkpoint cycles to complete before DB2 issues a warning message to the console and writes an IFCID 313 record for an uncommitted, indoubt, or inflight unit of recovery (UR). The default is 0, which disables this option.

Install parameter UR CHECK FREQ on panel DSNTIPL, or ZPARM URCHKTH in DSN6SYSP.

Field Name: QWP1URCK

BACKOUT DURATION

Indicates how much of the log to process for backout when LIMIT BACKOUT = YES or AUTO.

During restart, backward log processing continues until both of the following events occur:

- All inflight and inabort URs with update activity against the catalog or directory are backed out.
- The number of log records processed is equal to the number specified in BACKOUT DURATION times the value of CHECKPOINT FREQ. If the checkpoint frequency is specified in minutes, the number of records processed is the default of 50000 records multiplied by the value of CHECKPOINT FREQ.

In-flight and in-abort URs that are not completely backed out during restart are converted to postponed-abort status. Page sets or partitions with postponed-backout work are put into restart pending (RESTP). This state blocks all access to the object other than access by the command RECOVER POSTPONED or by automatic backout processing performed by DB2 when LIMITED BACKOUT = AUTO.

A table space might be in restart pending mode, without the associated index spaces also in restart pending mode. This happens if a postponed abort UR makes updates only to non-indexed fields of a table in a table space. In this case, the indexes are accessible to SQL (for index-only queries), even though the table space is inaccessible.

Install parameter BACKOUT DURATION on panel DSNTIPL, or ZPARM BACKODUR in DSN6SYSP.

Field Name: QWP1BDUR
IFCID 106 - System Initialization Parameters

WLM ENVIRONMENT

Workload manager environment.

Install parameter WLM ENVIRONMENT on panel DSNTIPX, or ZPARM WLMENV in DSN6SYSP.

Field Name: QWP1WLME

ROLLUP PARAL THRD

Indicates whether DB2 generates a trace record at the originating task level that summarizes accounting information for all parallel tasks.

DB2 parameter PTASKROL in DSN6SYSP.

Field Name: QWP1PROL

UNIT PRICE TRACK

Specifies whether DB2 performs detailed tracking for measured usage pricing. You can select the following values:

- **YES**: DB2 does detailed measured usage tracking if SMF type 89 records are activated. When SMF89 is set to YES, DB2 invokes a z/OS service on every entry into or exit out of DB2 to ensure accurate tracking.

- **NO (the default value)**: DB2 does not do detailed measured usage tracking. If the SMF type 89 record is activated, only high-level tracking is recorded in the SMF type 89 record. Selecting NO reduces CPU usage, but also increases the amount of time spent in DB2 as measured by SMF 89.

**Note**: Select SMF89 YES only if you use measured usage pricing.

DB2 parameter SMF89.

Field Name: QWP1SM89

OTC LIC ACCEPTED

Indicates that the one-time charge (OTC) license terms are accepted for this DB2 installation.

DB2 parameter OTC_LICENSE.

Field Name: QWP1OLAC

LEVEL ID CHECKPS

How often, in checkpoints, the level ID of a page set or partition is updated. When zero (0), downlevel detection is disabled.

Use the following criteria to decide on a suitable value for this parameter:

- **How often are backup and restore methods used outside of the DB2 control (such as DSN1COPY or DFDSS dump and restore)?** If rarely used, there is no need to update the level ID frequently.

- **How many page sets are open for update at the same time?** If DB2 updates level IDs frequently, there is extra protection against downlevel page sets. However, a performance degradation can occur if the level IDs for many page sets must be set at every checkpoint.

- **How often does the subsystem take checkpoints?** If the DB2 subsystem takes frequent system checkpoints, set the level ID frequency to a higher value.
Install parameter LEVELID UPDATE FREQ on panel DSNTIPL, or ZPARM DLDFREQ in DSN6SYSYP.

Field Name: QWP1DFRQ

USER LOB VAL STOR
The maximum amount of storage (KB) each user can use for LOB values.
Install parameter USER LOB VALUE STORAGE on panel DSNTIP7, or ZPARM LOBVALA in DSN6SYSYP.

Field Name: QWP1LVA

USER XML VAL (KB)
The maximum amount of memory in kilobytes (KB) for each user for storing XML values.
ZPARM XMLVALA in DSN6SYSYP.

Field Name: QWP1XVA

DEF 4K BP U.DATA
The name of the 4 KB buffer pool for user table spaces.
Install parameter DEFAULT BUFFER POOL FOR USER DATA on installation panel DSNTIP1, or ZPARM TBSBPOOL in DSN6SYSYP.

Field Name: QWP1TBPL

SYS LOB VAL STOR
The maximum amount of storage (MB) each system can use for LOB values.
Install parameter SYSTEM LOB VALUE STORAGE on panel DSNTIP7, or ZPARM LOBVALS in DSN6SYSYP.

Field Name: QWP1TBPL

SYS XML VAL (MB)
The maximum amount of memory in megabytes (MB) for each system for storing XML values.
ZPARM XMLVALS in DSN6SYSYP.

Field Name: QWP1XVS

DEF 8K BP U.DATA
The default 8 KB buffer pool for:
• Table spaces with an 8 KB page size in implicitly created databases
• Explicitly created table spaces with an 8 KB page size, but without a buffer pool clause that is specified in the create table space statement.
Install parameter DEFAULT 8-KB BUFFER POOL FOR USER DATA on panel DSNTIP1 or ZPARM TBSBP8K in DSN6SYSYP.

Field Name: QWP1TP8

LOB INLINE LENGTH
Default inline length for any new storing large object (LOB) column in a Universal Table Space on the DB2 subsystem. The valid values are from 0 to 32680 inclusive (in bytes). The default value for this ZPARM is 0, which
indicates that no inline attribute is desired for any LOB column (BLOB, CLOB or DBCLOB) created on this subsystem.

Field Name: QWP1LBIL

RANDOM XML DOCID

Specifies whether DB2 generates document ID elements sequentially or randomly. Possible values are:

YES  Sequentially
NO    Randomly

ZPARM name XMLRANDOMIZEDOCID in DSN6SYSP.

Field Name: QWP1XRDI

DEF 16K BP U.DA

The default 16 KB buffer pool for:

- Table spaces with a 16 KB page size in implicitly created databases
- Explicitly created table spaces with a 16 KB page size, but without a buffer pool clause that is specified in the create table space statement.

Install parameter DEFAULT 16-KB BUFFER POOL FOR USER DATA on panel DSNTIP1 or ZPARM TBSBP16K in DSN6SYSP.

Field Name: QWP1TP16

EXTRA BLOCKS SRV

The maximum number of extra DRDA query blocks DB2 returns to a DRDA client.

The default is 100.

This controls the total amount of data that can be transmitted on any given network exchange. It does not limit the size of the SQL query answer set.

Install parameter EXTRA BLOCKS SRV on panel DSNTIP5, ZPARM EXTRASRV in DSN6SYSP.

Field Name: QWP1EXBS

SYNCVAL W/IN HOUR

Shows whether DB2 statistics recording is synchronized with some part of the hour. The installation can specify that the DB2 statistics recording interval be synchronized with the beginning of the hour (00 minutes past the hour) or any number of minutes past the hour up to 59. Possible values are: 0-59, which indicate the synchronization point. When NO or N/A is shown, synchronization is disabled, this is the default.

If STATISTICS TIME INTERVAL IN MINUTES (STATIME) is greater than 60, NO or N/A is shown.

Install parameter STATISTICS SYNC on panel DSNTIPN, or ZPARM SYNCHVAL in DSN6SYSP.

Field Name: QWP1SYNV

DEF 32K BP U.DA

The default 32 KB buffer pool for:

- Table spaces with a 32 KB page size in implicitly created databases
 Explicitly created table spaces with a 32 KB page size, but without a buffer pool clause that is specified in the create table space statement.

Install parameter DEFAULT 32-KB BUFFER POOL FOR USER DATA on panel DSNTIP1 or ZPARM TBSP32K in DSN6SYSP.

Field Name: QWP1TP32

EXTRA BLOCKS REQ

The maximum number of extra DRDA query blocks DB2 requests from a remote DRDA server.

The default is 100.

This controls the total amount of data that can be transmitted on any given network exchange. It does not limit the size of the SQL query answer set.

Install parameter EXTRA BLOCKS REQ on panel DSNTIP5, ZPARM EXTRAREQ in DSN6SYSP.

Field Name: QWP1EXBR

SYNCHR FLAG

Interval synchronization flag, shows whether the synchronization is enabled. The default is NO. When YES, the DB2 statistics are synchronized to the value shown in INTERVAL SYNCHR W/IN HOUR.

Field Name: QWP1SYFL

DEF BP USER INDEX

The name of the 4 KB buffer pool used for indexes on user data.

Install parameter DEFAULT BUFFER POOL FOR USER INDEXES on installation panel DSNTIP1, or ZPARM IDXBOOL in DSN6SYSP.

Field Name: QWP1IXPL

DDF/RRSAF ACCUM

Shows whether DB2 accounting data for DDF and RRSAF threads is accumulated by end user.

When NO, DB2 writes an accounting record when a DDF thread is made inactive, or when signon occurs for an RRSAF thread. A value in the range 2 through 65535 shows the number of times an end-user identifier should occur before DB2 writes an accounting record. An end-user identifier is the concatenation of the end-user user ID, end-user transaction name, and the end-user workstation name.

These values can be set by DDF threads using SERVER CONNECT and SET CLIENT calls, and by RRSAF threads using the RRSAF SIGN, AUTH SIGNON, and CONTEXT SIGNON functions.

An accounting record might be written prior to the number of end user occurrences in the following instances:

• When an internal storage threshold is reached for the accounting RRSAF signon call.

• When the thread deallocates, the accumulated accounting data for all end users on this thread is written (one record per end user).

• When this parameter is dynamically changed to deactivate accounting accumulation. In this instance, the next end-UR (for DDF thread) or
signon (for a RRSAF thread) causes DB2 to write the accumulated accounting data for all end users on this thread (one record per end user).

Install parameter DDF/RRSAF ACCUM on installation panel DSNTIPN, or ZPARM ACCUMACC in DSN6SYSP.

Field Name: QWP1ACCU

TY ALLOCATION

Shows the amount of space in KB for primary and secondary space allocation for DB2-defined data sets for table spaces created without the USING clause. 0 indicates that DB2 uses standard defaults.

Install parameter TABLE SPACE ALLOCATION on panel DSNTIP7, or ZPARM TSQTY in DSN6SYSP.

Field Name: QWP1TSQT

DEF BP IMPL LOB

The name of the buffer pool that is used for implicitly created LOB table spaces. This field corresponds to field default buffer pool for USER LOB DATA on installation panel DSNTIP1. The ZPARM name is TBSBPLOB in DSN6SYSP.

Field Name: QWP1TPLB

DSET STATS TIME

The time interval, in minutes, before DB2 resets data set statistics collected for the online performance monitors. Online performance monitors can request DB2 data set statistics for the current interval with an IFI READS request for IFCID 199.

Install parameter DATASET STATS TIME on panel DSNTIPN, or ZPARM DSSTIME in DSN6SYSP.

Field Name: QWP1DTIM

IX ALLOCATION

Shows the amount of space in KB for primary and secondary space allocation for DB2-defined data sets for index spaces created without the USING clause. 0 indicates that DB2 uses standard defaults.

Install parameter INDEX SPACE ALLOCATION on panel DSNTIP7, or ZPARM IXQTY in DSN6SYSP.

Field Name: QWP1IXQT

DEF BP IMPL XML

The name of the buffer pool that is used for XML table spaces. This field corresponds to field default buffer pool for USER XML DATA on installation panel DSNTIP1. The ZPARM name is TBSBPXML in DSN6SYSP.

Field Name: QWP1TPXM

UNICODE IFCIDS

Shows whether output from IFC records should include Unicode information. Only a subset of the character fields (identified in the IFCID record definition by a %U in the comment area to the right of the field.
declaration in the DSNDQWxx copy files) are encoded in Unicode. The remaining fields maintain the same encoding of previous releases.

Install parameter UNICODE IFCIDS on panel DSNTIPN, or ZPARM UIFCIDS in DSN6SYSP.

Field Name: QWP1_UNICODE

OPT EXTENT SIZING

Indicates whether DB2 uses sliding secondary quantity for DB2 managed data sets to optimize extent sizing.

Install parameter OPTIMIZE EXTENT SIZING on panel DSNTIP7, or ZPARM MGEXTSZ in DSN6SYSP.

Field Name: QWP1MESZ

VARY DS CTRL INTV

Indicates whether DB2 optimizes VSAM CONTROL INTERVAL to page size for data set allocation.

Install parameter VARY DS CONTROL INTERVAL on panel DSNTIP7, or ZPARM DSVCI in DSN6SYSP.

Field Name: QWP1VVCI

DEL CF STRUCTS

Shows whether to:

• Delete change-data (CD) structures during restart
• Attempt to delete coupling-facility (CF) structures, including shared communications area (SCA) structures, internal resource lock manager (IRLM lock) structures, and allocated group buffer pools.

This field corresponds to field DEL CF STRUCTS on installation panel DSNTIPK.

ZPARM name DEL_CFSTRUCTS_ON_RESTART in DSN6SYSP.

Field Name: QWP1DCFS

DEF PART SEGSIZE

The default segment size to be used for a partitioned table space when the CREATE TABLESPACE statement does not include the SEGSIZE parameter. This field corresponds to field DEFAULT PARTITION SEGSIZE on installation panel DSNTIP7. The ZPARM name is DPSEGSZ IN DSN6SYSP.

Field Name: QWP1DPSS

AGGREGATION FLDS

Shows the aggregation fields used for DDF and RRSAF accounting rollup. Values are defined as follows:

0  End user ID, transaction name, and workstation name
1  End user ID
2  End user transaction name
3  End user workstation name
4  End user ID and transaction name
5  End user ID and workstation name
IFCID 106 - System Initialization Parameters

6 End user transaction name and workstation name

This value is ignored if DDF or RRSAF accounting are not used. DB2 writes individual accounting threads for threads that do not have all aggregation fields populated that are specified by this parameter.

Install parameter AGGREGATION FIELDS on installation panel DSNTIPN, or ZPARM ACCUMUID in DSN6SYSP.

Field Name: QWP1ACID

USE DATA COMPRESSION

Shows whether data compression in table spaces in implicitly defined databases is used.

Install parameter USE DATA COMPRESSION on panel DSNTIP7 or ZPARM IMPTSCMP in DSN6SYSP.

Field Name: QWP1CITS

DSSIZE IMPL TS

Shows the maximum DSSIZE in gigabytes that DB2 uses for creating each partition of an implicitly created base table space.

This field corresponds to field DEFAULT DSSIZE on installation panel DSNTIP7. The ZPARM name is IMPDSSIZE in DSN6SPRM.

Field Name: QWP1DSSZ

DEFINE DATA SETS

Defines the underlying data sets when a table space (TS) that is contained in an implicitly created database is created.

Install parameter DEFINE DATA SETS on panel DSNTIP7 or ZPARM IMPDSDSF in DSN6SYSP.

Field Name: QWP1DIDS

COMPRESS SMF RECS

Shows the COMPRESS DEST(SMF) TRACE records. This field corresponds to field COMPRESS SMF RECS on installation panel DSNTIPN. ZPARM name: SMFCOMP in DSN6SYSP.

Field Name: QWP1CSMF

TRACKMOD IMPL TS

Shows whether you have specified the TRACKMOD option on ALTER TABLESPACE for an implicitly created table space.

This field corresponds to field TRACK MODIFIED PAGES on installation panel DSNTIP7. The ZPARM name is IMPTKMOD in DSN6SPRM.

Field Name: QWP1TKMD

PARAMETER MODULE

Shows the name of the active subsystem parameter module.

This field corresponds to field PARAMETER MODULE on installation panel DSNTIPO3.

Field Name: QWP1ZPNM

MAX OPEN FILE REF
The maximum number of concurrently open data sets for processing LOB file references.

Install parameter MAX OPEN FILE REFS on panel DSNTIPE or ZPARM MAXOFILR in DSN6SYSP.

Field Name: QWP1MOFR

RESERV Z/OS SPACE
The amount of space reserved for MVS functions.

Field Name: QWP1DB1M

ACCESS CONTROL
Shows the name of the default access control exit module.

This field corresponds to field ACCESS CONTROL on installation panel DSNTIP03. The ZPARM name is ACCESS_CNTL_MODULE in DSN6SYSP.

Field Name: QWP1DXAC

CHECKPOINT TYPE
Shows the LOG checkpoint type. It can have the following values:

SINGLE
Either records or minutes.

BOTH
Both records and minutes, as specified by Records Between Checkpoint (QWP1LOGR) and Mins Between Checkpoint (QWP1LOGM).

ZPARM CHKTYPE in DSN6SYSP.

Field Name: QWP1LOGT

RESERV CRIT SPACE
The amount of space reserved for critical work that must be completed.

Field Name: QWP1CRIT

IDENTIFY/AUTH
Shows the name of the default identify or authorization exit module.

This field corresponds to field IDENTIFY/AUTH on installation panel DSNTIP03. The ZPARM name is IDAUTH_MODULE in DSN6SYSP.

Field Name: QWP1DATH

RECORDS/CHECKP
Shows the number of records between log checkpoints if the LOG checkpoint type is BOTH (records and minutes).

This field corresponds to field RECORDS/CHECKPOINT on installation panel DSNTIPL1, or ZPARM name CHKLOGR in DSN6SYSP.

Field Name: QWP1LOGR

RESERV SOS SPACE
The amount of space above z/OS and critical (QWP1DB1M + QWP1CRIT) that DB2 tries to leave available.

Field Name: QWP1SOS
IFCID 106 - System Initialization Parameters

SIGNON

Shows the name of the default signon exit module.

This field corresponds to field SIGNON on installation panel DSNTIPO3. The ZPARM name is SIGNON_MODULE in DSN6SYSP.

Field Name: QWP1DSGN

MINUTES/CHECKP

Shows the number of minutes between log checkpoints if the LOG checkpoint type is BOTH (records and minutes).

This field corresponds to field MINUTES/CHECKPOINT on installation panel DSNTIPL1, or ZPARM name CHKMINS in DSN6SYSP.

Field Name: QWP1LOGM

PROFILE AUTOSTART

Specifies whether START PROFILE command processing is automatically initiated as part of DB2 startup (DB2 field: QWP1PFASY):

- 0 indicates NO
- 1 indicates YES

This field corresponds to field PROFILE_AUTOSTART on installation panel DSNTIPO. ZPARM name: PROFILE_AUTOSTART in DSN6SYSP.

Field Name: QWP1PFASY

QWP1LVLVC

This field is for IBM service use.

Field Name: QWP1LVLVC

QWP1LVL

Level of this block. It is used to detect parameters or code that is out of sync.

Field Name: QWP1LVL

QWP1DON'T

Indicates whether the resource limit facility (RLF) is started automatically by DB2.

Field Name: QWP1DON'T
IFCID 106 - VSAM Catalog Name Qualifier

This topic shows detailed information about “Record Trace - IFCID 106 - VSAM Catalog Name Qualifier”.

Record trace - IFCID 106 - VSAM Catalog Name Qualifier

The field labels shown in the following sample layout of “Record Trace - IFCID 106 - VSAM Catalog Name Qualifier” are described in the following section.

VSAM CATALOG NAME QUALIFIER
DSNB51

Qualifiers

The high-order qualifier name of all DB2 system data sets.

Field Name: QWP6CATN
IFCID 107 - Open/Close

This topic shows detailed information about “Record Trace - IFCID 107 - Open/Close”.

Record trace - IFCID 107 - Open/Close

The field labels shown in the following sample layout of “Record Trace - IFCID 107 - Open/Close” are described in the following section.

DBID: 5  DATABASE NAME: DSND807
OBID: 24  OBJECT NAME: DSNDX02

DBID

The decimal identifier of the database.

Field Name: QW0107DB

DATABASE NAME

The name of the database.

Field Name: QW0107DN

OBID

The decimal identifier of the object. Examples of objects are table space and index space.

Field Name: QW0107OB

OBJECT NAME

The name of the object. Examples of objects are table space and index space.

Field Name: QW0107TN
This topic shows detailed information about “Record Trace - IFCID 108 - Bind Start”.

Record trace - IFCID 108 - Bind Start

The field labels shown in the following sample layout of “Record Trace - IFCID 108 - Bind Start” are described in the following section.

<table>
<thead>
<tr>
<th>Location</th>
<th>The package location.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field Name</td>
<td>QW0108NL</td>
</tr>
</tbody>
</table>

SQLERROR
Indicates whether a package is created if SQL errors are encountered:

**CONTIN** A package is created even if SQL errors are encountered.

**NOPACK** A package is not created if SQL errors are encountered.

Field Name: QW0108E

REBIND PLAN(*)
Indicates whether a plan is rebound.

Field Name: QW0108S

ISOLATION
The isolation level for plans and packages:

- **RR**: Repeatable read
- **CS**: Cursor stability
- **RS**: Read stability
- **UR**: Uncommitted read

For packages only:

- **DF**: Default (at run time, assumes the isolation level of the current plan)

Field Name: QW0108I

RELEASE
Indicates when to release the locks:

- **COMMIT**: Release locks at commit time.
- **DEALLOC**: Release locks at deallocation time.

| Field Name        |
|-------------------|----------------------------------------|
| LOCATION          |
| Field Name        | QW0108NL                               |
| SQLERROR          |
| Field Name        | QW0108E                                |
| REBIND PLAN(*)    |
| Field Name        | QW0108S                                |
| ISOLATION         |
| Field Name        | QW0108I                                |
| RELEASE           |
| Field Name        | QW0108I                                |
For packages only:

**DEFAULT**
Release locks at run time, which is the default.

Field Name: QW0108R

**COLLECT ID**
The collection identifier of the package.
Field Name: QW0108NC

**DEGREE**
The degree bind option:
- **ANY** Degree(any)
- **1** Degree(1)
Field Name: QW0108PL

**EXPLAIN**
Indicates whether EXPLAIN was specified.
Field Name: QW0108X

**TYPE**
The type of bind.
Field Name: QW0108T

**QUALIFIER**
The qualifier used for unqualified object names.
Field Name: QW0108QL

**PACKAGE ID**
The package identifier.
Field Name: QW0108NI

**SQLRULES**
The SQL rules option.
Field Name: QW0108SR

**OWNER**
The plan or package owner.
Field Name: QW0108OW

**ACTION**
Indicates whether the plan or package replaces an existing plan or package with the same name or is new. This field only applies to BIND activities.
Field Name: QW0108A

**CACHE SIZE**
The authorization cache size. A value of 0 indicates that DB2 determines the size.
Field Name: QW0108CA
TOKEN
The consistency token of the package.
Field Name: QW0108NT

DISCONNECT
The disconnect option:
- EXPL  Explicit
- AUTO  Automatic
- COND  Conditional
Field Name: QW0108DC

OBJECT TYPE
The type of object bound or rebound.
Field Name: QW0108TY

VALIDATION
The time of validation:
- RUN  Validate at run time.
- BIND  Validate at bind time.
Field Name: QW0108V

REOPT
Indicates whether reoptimization was requested:
- YES  REOPT(VARS) was specified to reoptimize the access path of the SQL statement at run time.
- NO   NOREOPT(VARS) was specified to optimize the access path of the SQL statement only at bind time.
Field Name: QW0108RO

PLAN NAME
The plan name. 'BLANK' indicates that a test bind was performed.
Field Name: QW0108PN

DYNAMICRULES
The value of the DYNAMICRULES option on the BIND/REBIND command:
- RUN  Run-time rules apply to a dynamic SQL statement for authorization checking and object qualification at run time.
- BIND  Bind-time rules apply to a dynamic SQL statement for authorization checking and object qualification at run time.
- N/P  DYNAMICRULES was not specified.
Field Name: QW0108DY

CURRENTDATA
Controls the data currency for ambiguous cursors:
IFCID 108 - Bind Start

**ACQUIRE**
Indicates when to acquire the locks:
- **ALLOC**: Acquire the locks when the plan is allocated.
- **USE**: Acquire the locks when the application first accesses them.

**KEEPDYNAMIC**
Indicates whether DB2 keeps (KEEPDYNAMIC(YES)) or discards (KEEPDYNAMIC(NO)) prepared SQL statements at commit points.

**DBPROTOCOL**
Database protocol option. Possible values are:
- **DRDA**: DRDA protocol
- **PRIVATE**: DB2 private protocol

**DEFERPREPARE**
Indicates whether preparation of dynamic SQL statements was deferred. Possible values are:
- **YES**: Dynamic SQL statement preparation was deferred.
- **NO**: Dynamic SQL statements were prepared immediately.

**OPT_HINT_IDENT**
Query optimization hint identifier, the default is blanks.

**IMMEDWRITE**
Indicates how DB2 updates group buffer pool dependent pages. This is only valid in a data-sharing environment.
Group buffer pool dependent pages can be written out to DASD or SYSTEM pagesets. Values shown are:
- **NO**: DB2 uses normal write activity for updates, this is the default. Pages are written out at, or before phase 2 commit, or at the end of an abort for transactions that have rolled back.
- **PH1**: Pages are written out at, or before phase 1 commit.
If a transaction subsequently rolls back, the pages are updated in the group buffer pool at the end of the rollback, and are written out at the end of the abort.

**YES**  Pages are written out to the coupling facility as soon as the buffer update commits. Pages are written out regardless of whether the update occurs during forward progress or rollback of the transaction.

This option can affect DB2 performance due to coupling facility overhead.

**N/P**  The DB2 subsystem is not part of a data sharing group.

**Field Name:** QW0108WI

**VERSION**

The version.

**Field Name:** QW0108VN
IFCID 109 - Bind End

IFCID 109 - Bind End

This topic shows detailed information about “Record Trace - IFCID 109 - Bind End”.

Record trace - IFCID 109 - Bind End

The field labels shown in the following sample layout of “Record Trace - IFCID 109 - Bind End” are described in the following section.

RETURN

RETURN

The bind return code:

0   Successful bind/rebind
4   Warning
8   Error

Field Name: QW0109RC
IFCID 110 - Bind Free Start

This topic shows detailed information about “Record Trace - IFCID 110 - Bind Free Start”.

**Field Name:** QW0111RC
IFCID 112 - Thread Allocate

This topic shows detailed information about “Record Trace - IFCID 112 - Thread Allocate”.

Record trace - IFCID 112 - Thread Allocate

The field labels shown in the following sample layout of “Record Trace - IFCID 112 - Thread Allocate” are described in the following section.

THREAD --> NETWORKID: DEIBMIPS LUNAME: IPSAUB51 LUWSEQ: 1
ALLOCATE PLAN NAME: DSNBIND ACQUIRE: ALLOCATION
ISOLATION: CS RELEASE: DEALLOCATION
DYNAMICRULES: RUN REOPT: NO
KEEPDYNAMIC: NO PREPARE: NO
DBPROTOCOL: PRIVATE
HINTID: 'BLANK'
IMMEDWRITE: NO

PLAN NAME

The plan name for the thread.

Field Name: QW0112PN

ACQUIRE

Indicates when to acquire locks:

ALLOCATION
Acquire the locks when the plan is allocated.

USE
Acquire the locks when the application first accesses them.

Field Name: QW0112Q

ISOLATION

The isolation level:

RR
Repeatable read

CS
Cursor stability

RS
Read stability

UR
Uncommitted read

Field Name: QW0112I

RELEASE

Indicates when to release locks:

COMMIT
Release locks at commit time.

DEALLOCATION
Release locks at deallocation time.

Field Name: QW0112R

DYNAMICRULES

The value of the DYNAMICRULES option on the BIND/REBIND command:

RUN
Run-time rules apply to a dynamic SQL statement for authorization checking and object qualification at run time.
### BIND
Bind-time rules apply to a dynamic SQL statement for authorization checking and object qualification at run time.

### N/P
DYNAMICRULES was not specified.

**Field Name:** QW0112DY

### REOPT
Indicates whether reoptimization was requested:

- **YES**  
  REOPT(VARS) was specified to reoptimize the access path of the SQL statement at run time.

- **NO**  
  NOREOPT(VARS) was specified to optimize the access path of the SQL statement only at bind time.

**Field Name:** QW0112RO

### KEEP_DYNAMIC
Indicates whether DB2 keeps (KEEP_DYNAMIC(YES)) or discards (KEEP_DYNAMIC(NO)) prepared SQL statements at commit points.

**Field Name:** QW0112KD

### DBPROTOCOL
Database protocol option. Possible values are:

- **DRDA**
- **PRIVATE**

**Field Name:** QW0112PR

### PREPARE
Indicates whether preparation of dynamic SQL statements was deferred. Possible values are:

- **YES**  
  Dynamic SQL statement preparation was deferred.

- **NO**  
  Dynamic SQL statements were prepared immediately.

**Field Name:** QW0112DP

### HINTID
Query optimization hint identifier, the default is blanks.

**Field Name:** QW0112OH

### IMMEDWRITE
Indicates how DB2 updates group buffer pool dependent pages. This is only valid in a data-sharing environment.

Group buffer pool dependent pages can be written out to DASD or SYSTEM pagesets. Values shown are:

- **NO**  
  DB2 uses normal write activity for updates, this is the default. Pages are written out at, or before phase 2 commit, or at the end of an abort for transactions that have rolled back.

- **PH1**  
  Pages are written out at, or before phase 1 commit.
  
  If a transaction subsequently rolls back, the pages are updated in the group buffer pool at the end of the rollback, and are written out at the end of the abort.
YES  Pages are written out to the coupling facility as soon as the buffer update commits. Pages are written out regardless of whether the update occurs during forward progress or rollback of the transaction.

This option can affect DB2 performance due to coupling facility overhead.

N/P  The DB2 subsystem is not part of a data sharing group.

IFCID 113 - Agent Allocate

Record trace - IFCID 113 - Agent Allocate

The field labels shown in the following sample layout of “Record Trace - IFCID 113 - Agent Allocate” are described in the following section.

ALLOCATE PLAN NAME: BCT ACQUIRE: ALLOCATION
ISOLATION: CS RELEASE: DEALLOCATION
DYNAMICRULES: RUN REOPT: NO
KEEPDYNAMIC: NO PREPARE: NO
DBPROTOCOL: PRIVATE HINTID: 'BLANK'
IMMEDWRITE: NO

PLAN NAME
The plan name for the thread.
Field Name: QW0113PN

ACQUIRE
Indicates when to acquire locks:

ALLOCATION
Acquire the locks when the plan is allocated.
USE
Acquire the locks when the application first accesses them.
Field Name: QW0113Q

ISOLATION
The isolation level:
RR Repeatable read
CS Cursor stability
RS Read stability
UR Uncommitted read
Field Name: QW0113I

RELEASE
Indicates when to release locks:

COMMIT
Release locks at commit time.
DEALLOCATION
Release locks at deallocation time.
Field Name: QW0113R

DYNAMICRULES
The value of the DYNAMICRULES option on the BIND/REBIND command:
RUN
Run-time rules apply to a dynamic SQL statement for authorization checking and object qualification at run time.
BIND
Bind-time rules apply to a dynamic SQL statement for authorization checking and object qualification at run time.
N/P  DYNAMICRULES was not specified.

Field Name: QW0113DY

REOPT
Indicates whether reoptimization was requested:

YES  REOPT(VARS) was specified to reoptimize the access path of the SQL statement at run time.

NO   NOREOPT(VARS) was specified to optimize the access path of the SQL statement only at bind time.

Field Name: QW0113RO

KEEPDYNAMIC
Indicates whether DB2 keeps (KEEPDYNAMIC(YES)) or discards (KEEPDYNAMIC(NO)) prepared SQL statements at commit points.

Field Name: QW0113KD

DBPROTOCOL
Database protocol option. Possible values are:

DRDA
PRIVATE

Field Name: QW0113PR

PREPARE
Indicates whether preparation of dynamic SQL statements was deferred. Possible values are:

YES  Dynamic SQL statement preparation was deferred.

NO   Dynamic SQL statements were prepared immediately.

Field Name: QW0113DP

HINTID
Query optimization hint identifier, the default is blanks.

Field Name: QW0113OH

IMMEDWRITE
Indicates how DB2 updates group buffer pool dependent pages. This is only valid in a data-sharing environment.

Group buffer pool dependent pages can be written out to DASD or SYSTEM pagesets. Values shown are:

NO   DB2 uses normal write activity for updates, this is the default. Pages are written out at, or before phase 2 commit, or at the end of an abort for transactions that have rolled back.

PH1  Pages are written out at, or before phase 1 commit.
If a transaction subsequently rolls back, the pages are updated in the group buffer pool at the end of the rollback, and are written out at the end of the abort.

YES  Pages are written out to the coupling facility as soon as the buffer
update commits. Pages are written out regardless of whether the update occurs during forward progress or rollback of the transaction.

This option can affect DB2 performance due to coupling facility overhead.

N/P The DB2 subsystem is not part of a data sharing group.

The data set identifier.

**Field Name: QW0119DI**

**ACE**

The relative number of the agent control element address in the ACE cross-reference table. This table is printed at the end of each location for every trace specified.

**Field Name: QW0119AC**
IFCID 120 - BSDS Write End

This topic shows detailed information about “Record Trace - IFCID 120 - BSDS Write End”.

Record trace - IFCID 120 - BSDS Write End

The field labels shown in the following sample layout of “Record Trace - IFCID 120 - BSDS Write End” are described in the following section.

RETURN 0 ACE 17

RETURN

The return code.

Field Name: QW0120RT

ACE

The relative number of the agent control element address in the ACE cross-reference table. This table is printed at the end of each location for every trace specified.

Field Name: QW0120AC
This topic shows detailed information about “Record Trace - IFCID 121 - IBM Service Record”.

This record is for IBM service use.
IFCID 122 - IBM Service Record

This topic shows detailed information about “Record Trace - IFCID 122 - IBM Service Record”.

This record is for IBM service use.
IFCID 123 - SRV Record

This topic shows detailed information about “Record Trace - IFCID 123 - SRV Record”.

Record trace - IFCID 123 - SRV Record

The field labels shown in the following sample layout of “Record Trace - IFCID 123 - SRV Record” are described in the following section.

LENGTH 7

Field Name: QW0123FR

IFCID 2

Field Name: QWO0123ID

The IFCID of the original entry.

LENGTH

The length of the area.

Field Name: QW0123LN
IFCID 124 - SQL Statement Record

This topic shows detailed information about “Record Trace - IFCID 124 - SQL Statement Record”.

Record trace - IFCID 124 - SQL Statement Record

The field labels shown in the following sample layout of “Record Trace - IFCID 124 - SQL Statement Record” are described in the following section.

CONNECTION TYPE
The connection type. 'BLANK' indicates that there is no connection type.

Field Name: QW01246Y

ACE TOKEN
The ACE token in hexadecimal.

Field Name: QW01246A

THREAD ASID
The ASID of the thread in hexadecimal.

Field Name: QW01246S

ASCB TOKEN
The ASCB token in hexadecimal.

Field Name: QW01246C

APPL REQ COUNT
The number of calls to DB2 in decimal.

Field Name: QW01246Q

AGENT NAME
When an agent is running a stored procedure, trigger, or user-defined function, this is the unqualified name of the routine. Otherwise, this field is blank.

Field Name: QW01246P

THREAD STATUS
The status of the thread.

Field Name: QW01246I

TCB TOKEN
The TCB token in hexadecimal.

Field Name: QW01246T

THREAD TYPE
The type of thread.
IFCID 124 - SQL Statement Record

Field Name: QW01246D

AGENT TYPE
The type of the agent.
Field Name: QW0124AF

STATEMENT TYPE
The statement type.
Field Name: QW0124TK

STATEMENT IDENTIFIER
The statement ID (former Cached Dynamic SQL Identifier).
Field Name: QW0124ST

LOCATION
The name of the location where the thread executes the package.
Field Name: QW0124LN

COLLECTION
The collection name.
Field Name: QW0124CI

PACKAGE
The package identifier.
Field Name: QW0124PN

TOKEN
The consistency token.
Field Name: QW0124CN

NETWORKID
The network identifier.
Field Name: QW0124NI

LUNAME
The logical unit name.
Field Name: QW0124LM

UNIQUENESS VALUE
The instance number.
Field Name: QW0124UV

LUWSEQ
The LUW sequence number.
Field Name: QW0124CC

ENDUSER
The user ID at the end user's workstation.
Field Name: QW0124EI
WSNAME

The workstation name of the end user.

Field Name: QW0124EW

TRANSACT

The transaction name of the end user.

Field Name: QW0124ET
IFCID 125 - RID Pool Processing

This topic shows detailed information about “Record Trace - IFCID 125 - RID Pool Processing”.

This record is written when performance class 8 is ON. Monitor privilege is required for reading via IFI. The record contains standard information and one section for each index used to obtain candidate record identifiers (RIDs).

Record trace - IFCID 125 - RID Pool Processing

The field labels shown in the following sample layout of “Record Trace - IFCID 125 - RID Pool Processing” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>

</tbody>
</table>

COLLECTION

Package collection identifier for this query.
Field Name: QW0125PC

PLAN NAME

Plan name for this query.
Field Name: QW0125PL

PROG NAME

Program name for this query.
Field Name: QW0125PN

STATEMENT NUMB

Statement number for this query.
Field Name: QW0125SN

CONSISTENCY TOKEN

Consitancey token for this query.
Field Name: QW0125TS

USED

Indicates whether multiple index access paths are used, or whether RID pool processing is invoked.
Field Name: QW0125AT

NOT USED

Indicates why multiple index access paths are not used, or whether RID pool processing is not invoked.
Field Name: QW0125MR
LEGS REORDERED

Indicates that the legs of a multiple index access path are reordered. It can have the following values:

- Yes
- No

Field Name: QW0125RE

ADAPT IDX PROCESS

Indicates whether adaptive index processing was done. It can have the following values:

- Yes
- No

Field Name: QW0125AD

RIDS IN FINAL LIST

The number of record identifiers in the final index list. It indicates how many RID sections are printed. Each RID section contains one set of DBID, INDEX RID, OBID, and THRESHOLD data.

This field can also contain NO STORAGE, or MAX EXCEEDED.

Field Name: QW0125NR

DBID

The database ID. Deduced from the DB2 fields QW0125DB, QW0105DN or QW0107DN.

When present, the database name is shown, otherwise the decimal identifier from QW0125DB is shown, or N/A when this value is 0.

Field Name: RT0125DB

INDEX RIDS

The number of record identifiers in the index. This field can also contain one of the following values:

- NO RETRIEVAL
- NO STORAGE
- LIMIT EXCEEDED
- N/P

Field Name: QW0125RI

OBID

The object ID. Deduced from the DB2 fields QW0125OB, QW0105TN or QW0107TN.

When present, the name of the object is shown, otherwise the decimal identifier from QW0125OB is shown, or N/A when this value is 0.

Field Name: RT0125OB

THRESHOLD

The highest value of RIDs allowed for this index.

Field Name: QW0125TH
IFCID 126 - Log Buffer Write

This topic shows detailed information about “Record Trace - IFCID 126 - Log Buffer Write”.

Record trace - IFCID 126 - Log Buffer Write

The field labels shown in the following sample layout of “Record Trace - IFCID 126 - Log Buffer Write” are described in the following section.

| QW0126NS | 2   | QW0126S1 | X'0003' | QW0126S2 | X'0004' | QW01260F | X'0005' | QW0126XX | X'08' |

</tr>
<tr>
<td>POOL ID</td>
<td>0</td>
<td>ACE: 1</td>
</tr>
<tr>
<td>TABLE SPACE TYPE</td>
<td>L</td>
<td></td>
</tr>
</tbody>
</table>

**DBID**

The database ID. Deduced from the DB2 fields QW0127DB, QW0105DN or QW0107DN.

When present, the database name is shown, otherwise the decimal identifier from QW0127DB is shown, or N/A when this value is 0.

Field Name: RT0127DB

**OBID / PSID**

For classic segmented table spaces, this value shows the table OBID. For partitioned table spaces, it is the PSID of the table space. Deduced from the DB2 fields QW0127OB, QW0105TN, or QW0107TN.

When present, the name of the object is shown, otherwise the decimal identifier from QW0127OB is shown, or N/A when this value is 0.

Field Name: RT0127OB

**PAGE NUMBER**

The number of the page being read or written.

Field Name: QW0127PN

**PAGE NUMBERING**

Indicates how page numbers are shown for partitioned tables:

- REL Indicates that relative page numbers are shown in the partition.
- ABS Indicates that absolute page numbers are shown in the partition.
- N/A Not applicable.

Field Name: QW0127P1

**PARTITION**

Shows the partition number or 0 if non-partitioned.

Field Name: QW0127PT

**TYPE OF I/O**

The type of I/O process.

Field Name: QW0127F

**POOL ID**
The buffer pool internal identifier. The values 0 through 49 are the identifiers for BP0 through BP49. The values 80 through 89 are the identifiers for BP32K through BP32K9.

**Field Name:** QW0127BP

**ACE**

The relative number of the agent control element address in the ACE cross-reference table. This table is printed at the end of each location for every trace specified.

**Field Name:** QW0127AC

**TABLE SPACE TYPE**

The type of the table space:

- **L** Non-EA large table
- **N** Non-large table
- **V** EA-enabled large table

**Field Name:** QW0127FG
IFCID 128 - Page Wait I/O In Prog (End)

This topic shows detailed information about “Record Trace - IFCID 128 - Page Wait I/O In Prog (End)”.

Record trace - IFCID 128 - Page Wait I/O In Prog (End)

The field labels shown in the following sample layout of “Record Trace - IFCID 128 - Page Wait I/O In Prog (End)” are described in the following section.

<table>

</tbody>
</table>

**DBID**

The database ID. Deduced from the DB2 fields QW0128DB, QW0105DN or QW0107DN.

When present, the database name is shown, otherwise the decimal identifier from QW0128DB is shown, or N/A when this value is 0.

Field Name: RT0128DB

**OBID / PSID**

For classic segmented table spaces, this value shows the table OBID. For partitioned table spaces, it is the PSID of the table space. Deduced from the DB2 fields QW0128OB, QW0105TN, or QW0107TN.

When present, the name of the object is shown, otherwise the decimal identifier from QW0128OB is shown, or N/A when this value is 0.

Field Name: RT0128OB

**PAGE NUMBER**

The number of the page being read or written.

Field Name: QW0128PN

**PAGE NUMBERING**

Indicates how page numbers are shown for partitioned tables:

- REL Indicates that relative page numbers are shown in the partition.
- ABS Indicates that absolute page numbers are shown in the partition.
- N/A Not applicable.

Field Name: QW0128P1

**PARTITION**

Shows the partition number or 0 if non-partitioned.

Field Name: QW0128PT

**TYPE OF I/O**

The type of I/O process.

Field Name: QW0128F

**ACE**
The relative number of the agent control element address in the ACE cross-reference table. This table is printed at the end of each location for every trace specified.

**Field Name:** QW0128AC

**STATUS FL**

The status flag indicating whether the I/O process was canceled.

**Field Name:** QW0128S

**TABLE SPACE TYPE**

The type of the table space:

- L  Non-EA large table
- N  Non-large table
- V  EA-enabled large table

**Field Name:** QW0128FG
IFCID 129 - CI-S Obtained via IFI Reads

This topic shows detailed information about “Record Trace - IFCID 129 - CI-S Obtained via IFI Reads”.

Record trace - IFCID 129 - CI-S Obtained via IFI Reads

The field labels shown in the following sample layout of “Record Trace - IFCID 129 - CI-S Obtained via IFI Reads” are described in the following section.
IFCID 140 - Audit Auth Failures

This topic shows detailed information about “Record Trace - IFCID 140 - Audit Auth Failures”.

Record trace - IFCID 140 - Audit Auth Failures

The field labels shown in the following sample layout of “Record Trace - IFCID 140 - Audit Auth Failures” are described in the following section.

AUTH CHECKED: DB2PM
REASON: 0
PRIV CHECKED: CREATE TABLE
OBJECT: DATABASE OPTIONS: X'040000000000000000000000'
SOURCE OBJECT: DB2PM
SOURCE OWNER: DB2PM
TARGET OBJECT: GRANT
TARGET OWNER: DB2PM
SQL STMT:
ACEE UTOKEN: 'BLANK'
RID OF ROW: 'BLANK'
SECLABEL OF ROW: 'BLANK'
AUTH ID TYPE: PRIMARY OR SECONDARY AUTH ID

AUTH CHECKED

The authorization ID being checked.

Field Name: QW0140UR

REASON

The user-defined reason code from the access control authorization exit routine.

Field Name: QW0140RS

STATMNT LENGTH

Is the length of the failing SQL statement plus 4. It is zero (0) if no SQL statement exists.

Field Name: QW0140LL

PRIV CHECKED

The privilege that was checked. Possible values are provided in the DB2 macro DSNDQW02.

Field Name: QW0140PR

RETCOD

The return code from the access control authorization exit routine.

Field Name: QW0140RC

OBJECT

The object type. N/P is printed if there is no object type. Possible values are:

- ACEE
- APPLICATION PLAN
- BUFFERPOOL
- COLLECTION
- DATABASE
Field Name: QW0140OB

OPTIONS

The options used in the host to check the SQL statement. The bits of this field are used as indicators. If all bits are 0, the statement is not an SQL statement. The values are:

**Bit 1**  Host language character string delimiter

0  Apostrophe
1  Quote

**Bit 2**  Decimal point symbol

0  Period
1  Comma

**Bit 3**  SQL character string delimiter

0  Apostrophe
1  Quote

**Bit 4**  Mixed character string indicator

0  No
1  Yes

**Bit 5**  Host language options indicator

0  Do not use host language options
1  Use host language options

**Bits 6 to 8**  Host language indicator

001  Assembler
010  Cobol
011  PL/I
100  None - Dynamic SQL
101  Fortran
IFCID 140 - Audit Auth Failures

110  Cobol2
111  Null - See bits 17 to 24 for the language

Bits 9 to 16
Character set being used
00000000  Alphanumeric
00000001  Katakana

Bits 17 to 24
Alternate host language field
B  Assembler
C  Cobol
P  PL/I
F  Fortran
2  Cobol2
D  C

Bits 25 to 28
Time option
0000  None
1000  Local
0100  JIS
0010  ISO/EUR
0001  USA

Bits 29 to 32
Date option
0000  None
1000  Local
0100  EUR
0010  ISO/JIS
0001  USA

Bit 33
Decimal
0  No
1  Yes

Bits 34 to 40
Unused

Bits 41 to 48
Remote option
00000001  SQL(ALL)
00000010  SQL(DB2)
Bits 49 to 56
SQL flag option

00000000
No SQLFLAG option

00000001
SQLFLAG(SAA)

Field Name: QW0140HO

SOURCE OBJECT
The source object name.
Field Name: QW0140SN

SOURCE OWNER
The source object owner.
Field Name: QW0140SC

TARGET OBJECT
The target object name.
Field Name: QW0140TN

TARGET OWNER
The target object owner.
Field Name: QW0140TC

SQL STMT
The SQL statement text. Long SQL text can be truncated.
Field Name: QW0140SQ

ACEE UTOKEN
Shows the ACEE UTOKEN, if it is available. If it is not available, the first word of this field contains one of the following values:

0 The UTOKEN cannot be accessed
-1 An abend occurred during the attempt to access the ACEE.

Field Name: QW0140UT

RID OF ROW
Shows the RID of the row that is updated or deleted if the table has multilevel security.
Field Name: QW0140ID

SECLABEL OF ROW
Shows the security label of the row, for a table with multilevel security.
Field Name: QW0140RL

AUTH ID TYPE
The authorization ID type. Possible values are:

L A ROLE is used.
IFCID 140 - Audit Auth Failures

*blank* The user ID of the primary or the secondary authorization ID is used.

N/P A blank is shown in the performance database.

N/A A blank is shown in the performance database.

**Field Name:** QW0140AT
IFCID 141 - Audit DDL Grant/Revoke

This topic shows detailed information about “Record Trace - IFCID 141 - Audit DDL Grant/Revoke”.

Record trace - IFCID 141 - Audit DDL Grant/Revoke

The field labels shown in the following sample layout of “Record Trace - IFCID 141 - Audit DDL Grant/Revoke” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GRANTOR/REVOKER</td>
<td>The authorization ID of the user (grantor/revoker) who received access.</td>
</tr>
<tr>
<td></td>
<td>Possible values are:</td>
</tr>
<tr>
<td>L</td>
<td>A ROLE is used.</td>
</tr>
<tr>
<td>blank</td>
<td>The user ID of the primary or the secondary authorization ID is used.</td>
</tr>
<tr>
<td>N/P</td>
<td>A blank is shown in the performance database.</td>
</tr>
<tr>
<td>N/A</td>
<td>A blank is shown in the performance database.</td>
</tr>
</tbody>
</table>

Field Name: QW0141OR

REASON

The reason why access was granted.

In the Audit report set this field is only valid for GRANTs. It indicates the authorization level of the grantor. For REVOKEs and unsuccessful GRANTs, N/A is printed.

Possible values are:
- PACKADMA (abbreviation for PACKADM ON ALL COLLECTIONS)
- DBCTRL
- DBADM
- SECADM
- ACCCTRL (abbreviation for ACCESSCTRL)
- SYSCtrl
- DBMAINT
- SYSOPR
- PACKADMS (abbreviation for PACKADM ON A SPECIFIC COLLECTION-ID)
- SYSADM

Field Name: QW0141RE

RETURN

The SQL return code.
Field Name: QW0141CO

OBJECT
The object type. Possible values are:

BUFFERPOOL
Buffer Pool

COLLECTION
Collection

DATABASE
Database

DISTINCT TYPE
Distinct Type

FUNCTION
Function

PACKAGE
Package

SCHEMA
Schema

PROCEDURE
Procedure

APPLICATION PLAN
Application Plan

TABLESPACE
Table Space

STORAGE GROUP
Storage Group

TABLE OR VIEW
Table or View

USER AUTH
System privileges, such as SYSADM or SYSOPR

Field Name: QW0141OB

OPTIONS
The options used in the host to check the SQL statement. The bits of this field are used as indicators. If all bits are 0, the statement is not an SQL statement. The values are:

Bit 1  Host language character string delimiter
   0    Apostrophe
   1    Quote

Bit 2  Decimal point symbol
   0    Period
   1    Comma

Bit 3  SQL character string delimiter
   0    Apostrophe
Bit 4  Mixed character string indicator
0    No
1    Yes

Bit 5  Host language options indicator
0    Do not use host language options
1    Use host language options

Bits 6 to 8
Host language indicator
001  Assembler
010  Cobol
011  PL/I
100  None - Dynamic SQL
101  Fortran
110  Cobol2
111  Null - See bits 17 to 24 for the language

Bits 9 to 16
Character set being used
00000000  Alphanumeric
00000001  Katakana

Bits 17 to 24
Alternate host language field
B    Assembler

0000  None
IFCID 141 - Audit DDL Grant/Revoke

1000  Local
0100  EUR
0010  ISO/JIS
0001  USA

Bit 33  Decimal
0  No
1  Yes

Bits 34 to 40
Unused

Bits 41 to 48
Remote option
00000001  SQL(ALL)
00000010  SQL(DB2)

Bits 49 to 56
SQL flag option
00000000  No SQLFLAG option
00000001  SQLFLAG(SAA)

Field Name: QW0141HO

GRANTOR TYPE/REVOKE TYPE

The authorization ID of the owner. Possible values are:

A ROLE or ROLE
A role is used.

PRIMARY OR SECONDARY AUTH ID or PRIM/SECOND AUTHID
The user ID of the primary or the secondary authorization ID is used.

N/P or N/A
The field is not present or not applicable. String NONE is shown in the performance database.

N/A  A blank is shown in the performance database.

Field Name: QW0141OT

SQL STMT

The SQL statement text. Long SQL text can be truncated.

Field Name: QW0141TX
IFCID 142 - Audit DDL Create/Alter/Drop

This topic shows detailed information about “Record Trace - IFCID 142 - Audit DDL Create/Alter/Drop”.

Audit DDL reports on SQL CREATE, ALTER, and DROP statements executed against an auditable object.

The SQL statement types are AUDIT DDL CREATE, AUDIT DDL ALTER, or AUDIT DDL DROP. These statements are all reported in the same format.

Record trace - IFCID 142 - Audit DDL Create/Alter/Drop

The field labels shown in the following sample layout of “Record Trace - IFCID 142 - Audit DDL Create/Alter/Drop” are described in the following section.

AUDIT DDL NETWORKID: DEIBMIPS LUNAME: IPSAU851 LUWSEQ: 1 UNKNOWN TABLE NAME : AUDTB1 TABLE OWNER : PRL TABLE CREATOR: PRL TABLE OWNER TYPE:N/A OPTIONS : X'0400000000000000' DATABASE : 264 TABLE OBID : 3 SECLABEL OF MLS TABLE: N/P MULTILEVEL SECURITY : N/P ROW/CLMN ACCESS CTRL : B SQL STMT: CREATE TABLE PRL.AUDTB1 (IDCOLUMN INTEGER GENERATED ALWAYS AS IDENTITY, NNAME VARCHAR(50) NOT NULL, VNAME CHAR(10) NOT NULL, ANZAHL INTEGER NOT NULL) AUDIT ALL IN

TABLE NAME

The table name being created, altered, or dropped.

Field Name: QW0142TN

TABLE OWNER

The table owner (same as table qualifier).

Field Name: QW0142OW

TABLE CREATOR

The table creator.

Field Name: QW0142CR

TABLE OWNER TYPE

The type of the table owner (grantor or revoker). Possible values are:

L A ROLE is used.

blank The user ID of the primary or the secondary authorization ID is used.

N/P A blank is shown in the performance database.

N/A A blank is shown in the performance database.

Field Name: QW0142OR

OPTIONS
The options used in the host to check the SQL statement. The bits of this field are used as indicators. If all bits are 0, the statement is not an SQL statement. The values are:

**Bit 1**  Host language character string delimiter  
0  Apostrophe  
1  Quote  

**Bit 2**  Decimal point symbol  
0  Period

00000000  No SQLFLAG option

00000001  SQLFLAG(SAA)

Field Name: QW0142HO

DATABASE

The database ID. Deduced from the DB2 fields QW0142DB, QW0105DN or QW0107DN.

When present, the database name is shown, otherwise the decimal identifier from QW0142DB is shown, or N/A when this value is 0.

Field Name: RT0142DB

TABLE OBID
The object ID. Deduced from the DB2 fields QW0142OB, QW0105TN or QW0107TN.
When present, the name of the object is shown, otherwise the decimal identifier from QW0142OB is shown, or N/A when this value is 0.

Field Name: RT0142OB

SECLABEL OF MLS TABLE
The security label that is used when the table is defined.

Field Name: QW0142SL

MULTILEVEL SECURITY
The Multilevel Security (MLS) table can contain the following values:

YES  For a Create or Drop operation of a table that has multilevel security, or for an Alter operation of a table to add a security label column.
NO   For an Alter operation of a table that has multilevel security.
NON MLS TABLE
The table does not have multilevel security.
N/P  Not present. A blank is shown in the performance database.
N/A  A blank is shown in the performance database.

Field Name: QW0142ML

ROW/CLMN ACCESS CTRL
The access control field contains data about ROW-LEVEL and COLUMN-LEVEL (R/C) ACCESS CONTROL in DDL. It can have the following values:

'R' (ROW)
Activates row-level access control.

'C' (COLUMN)
Activates column-level access control.

'B' (BOTH)
Activates row-level and column-level access control.

' ' (NONE)
Activates no access control.

Field Name: QW0142RC

SQL STMT
The SQL statement text. Long SQL text can be truncated.

Field Name: QW0142TX
IFCID 143 - Audit First Write

This topic shows detailed information about “Record Trace - IFCID 143 - Audit First Write”.

Record trace - IFCID 143 - Audit First Write

The field labels shown in the following sample layout of “Record Trace - IFCID 143 - Audit First Write” are described in the following section.

DATABASE:

The database ID. Deduced from the DB2 fields QW0143DB, QW0105DN or QW0107DN.

When present, the database name is shown, otherwise the decimal identifier from QW0143DB is shown, or N/A when this value is 0.

Field Name: RT0143DB

LOGRBA

The identifier of the unit of recovery.

Field Name: QW0143UR

PAGESET

The page set name or decimal identifier.

Field Name: RT0143PS

TABLE OBID

The object ID. Deduced from the DB2 fields QW0143OB, QW0105TN or QW0107TN.

When present, the name of the object is shown, otherwise the decimal identifier from QW0143OB is shown or N/A when this value is 0.

Field Name: RT0143OB
IFCID 144 - Audit First Read

This topic shows detailed information about “Record Trace - IFCID 144 - Audit First Read”.

Record trace - IFCID 144 - Audit First Read

The field labels shown in the following sample layout of “Record Trace - IFCID 144 - Audit First Read” are described in the following section.

DATABASE

The database ID. Deduced from the DB2 fields QW0144DB, QW0105DN or QW0107DN.

When present, the database name is shown, otherwise the decimal identifier from QW0144DB is shown, or N/A when this value is 0.

Field Name: RT0144DB

LOGRBA

The identifier of the unit of recovery.

Field Name: QW0144UR

PAGESET

The page set name or decimal identifier.

Field Name: QW0144PS
IFCID 145 - Audit DML Statement

This topic shows detailed information about “Record Trace - IFCID 145 - Audit DML Statement”.

Record trace - IFCID 145 - Audit DML Statement

The field labels shown in the following sample layout of “Record Trace - IFCID 145 - Audit DML Statement” are described in the following section.

*** AUDIT LOG RECORD ***

SECTION 1 - AUDIT INFORMATION:

LOCATION NAME: DB0B
PKG COLLECT ID: DSNTEP2
PROGRAM NAME: DSNTEP2
STMT TIME: X'18CABFE7160A11C0'
HOST OPTIONS: X'0400000000000000'
SQL CODE: 0
STMT #: 1829
STMT ID: 50
DBID/OBID #: 1
MASK/PERM #: 2

LOCATION NAME (LONG): DB0B
PKG COLLECT ID (LONG): DSNTEP2
PROGRAM NAME (LONG): DSNTEP2

SECTION 2 - AUDIT OBJECTS:

DATABASE: 353
TABLE OBID: 3

SECTION 3 - ROW/COLUMN ACCESS CTRL OBJECTS:

SCHEMA NAME: DB0BSECA
OBJECT NAME: INCOME_BRANCH

SCHEMA NAME: DB0BSECA
OBJECT NAME: RA01_CUSTOMERS

SECTION 4 - SQL STATEMENT TEXT:

SELECT * FROM DB2R5.CUSTOMER

LOCATION NAME
The location name.
Field Name: QW0145LN

PKG COLLECT ID
The package collection identifier.
Field Name: QW0145PC

PROGRAM NAME
The program name.
Field Name: QW0145PN

STMT TIME
The hexadecimal value of the precompiler timestamp.
Field Name: QW0145TS

TYPE
The SQL statement type.
Field Name: QW0145ST

ISOLATION
The isolation level of the DML statement:
RR  Repeatable read
**Field Name:** QW0145IS

**HOST OPTIONS**

The options used in the host to check the SQL statement. The bits of this field are used as indicators. If all bits are 0, the statement is not an SQL statement. The values are:

**Bit 1** Host language character string delimiter
- 0 Apostrophe
- 1 Quote

**Bit 2** Decimal point symbol
- 0 Period
- 1 Comma

**Bit 3** SQL character string delimiter
- 0 Apostrophe
- 1 Quote

**Bit 4** Mixed character string indicator
- 0 No
- 1 Yes

**Bit 5** Host language options indicator
- 0 Do not use host language options
- 1 Use host language options

**Bits 6 to 8** Host language indicator
- 001 Assembler
- 010 Cobol
- 011 PL/I
- 100 None - Dynamic SQL
- 101 Fortran
- 110 Cobol2
- 111 Null - See bits 17 to 24 for the language

**Bits 9 to 16** Character set being used
- 00000000 Alphanumeric
00000001
Katakana

Bits 17 to 24
Alternate host language field
B Assembler
C Cobol
P PL/I
F Fortran
2 Cobol2
D C

Bits 25 to 28
Time Option
0000 None
1000 Local
0100 JIS
0010 ISO/EUR
0001 USA

Bits 29 to 32
Date Option
0000 None
1000 Local
0100 EUR
0010 ISO/JIS
0001 USA

Bit 33
Decimal
0 No
1 Yes

Bits 34 to 40
Unused

Bits 41 to 48
Remote option
00000001
SQL(ALL)
00000010
SQL(DB2)

Bits 49 to 56
SQL flag option
00000000
No SQLFLAG option
00000001
SQLFLAG(SAA)
IFCID 145 - Audit DML Statement

Field Name: QW0145HO

SQL CODE
The SQLCODE of the SQL statement.
Field Name: QW0145SC

STMT #
The precompiler statement number.
Field Name: QW0145SN

STMT ID
The SQL unique statement ID.
Field Name: QW0145SI

DBID/OBID #
The number of unique non-zero DBID and OBID in the audited statement.
Field Name: QW0145OB_NUM

MASK/PERM #
The number of masks or permissions enforced in the audited statement.
Field Name: QW0145AC_NUM

LOCATION NAME (LONG)
The location name.
Field Name: QW0145LN

PKG COLLECT ID (LONG)
The package collection identifier.
Field Name: QW0145PC

PROGRAM NAME (LONG)
The program name.
Field Name: QW0145PN

DATABASE
The audit log table DBID in hexadecimal.
Field Name: QW0145DB

TABLE OBID
The audit log table OBID in hexadecimal.
Field Name: QW0145OB

SCHEMA NAME
The name of the access control schema.
Field Name: QW0145AS

OBJECT NAME
The name of the access control object.
Field Name: QW0145AO
SECTION 4 - SQL STATEMENT TEXT (NO LABEL)

The SQL statement text associated with the BIND. If SQL text is not present, N/P is printed. Long SQL text can be truncated.

Field Name: QW0145RT
IFCID 146 - User Record

This topic shows detailed information about “Record Trace - IFCID 146 - User Record”.

When present, the IFCID 146 record is printed in the standard hexadecimal dump format. The character format is on the right.
This record only contains data from an Online Monitor trace data set.

“IFCID 147 - Data Sharing Accounting Data” on page 40-534
This topic shows detailed information about “Record Trace - IFCID 147 - Data Sharing Accounting Data”.

“IFCID 147 - Distributed Header Data” on page 40-535
This topic shows detailed information about “Record Trace - IFCID 147 - Distributed Header Data”.

“IFCID 147 - Instrumentation Accounting Data” on page 40-537
This topic shows detailed information about “Record Trace - IFCID 147 - Instrumentation Accounting Data”.

“IFCID 147 - Instrumentation Accounting Data Overflow” on page 40-538
This topic shows detailed information about “Record Trace - IFCID 147 - Instrumentation Accounting Data Overflow”.

“IFCID 147 - Logging” on page 40-542
This topic shows detailed information about “Record Trace - IFCID 147 - Logging”.

“IFCID 147 - Monitor Detail Data” on page 40-543
This topic shows detailed information about “Record Trace - IFCID 147 - Monitor Detail Data”.

“IFCID 147 - Thread Correlation Data” on page 40-549
This topic shows detailed information about “Record Trace - IFCID 147 - Thread Correlation Data”.

IFCID 147 - Data Sharing Accounting Data

This topic shows detailed information about “Record Trace - IFCID 147 - Data Sharing Accounting Data”.

Record trace - IFCID 147 - Data Sharing Accounting Data

The field labels shown in the following sample layout of “Record Trace - IFCID 147 - Data Sharing Accounting Data” are described in the following section.

DATA SHARING ACCOUNTING DATA

MEMBER NAMES: N/P

FIELD NAMES

For an assisting task, the name of the parallelism coordinator. For a coordinating task, the name of each assisting member.

Field Name: QWDAXCQO
IFCID 147 - Distributed Header Data

This topic shows detailed information about “Record Trace - IFCID 147 - Distributed Header Data”.

Place text here

Record trace - IFCID 147 - Distributed Header Data

The field labels shown in the following sample layout of “Record Trace - IFCID 147 - Distributed Header Data” are described in the following section.

DISTRIBUTED HEADER DATA
REQUESTING LOCATION : REQUESTLOCATION1
AR NAME : SRVNAMPARAMETER1
REQUESTING TIMESTAMP : N/P PRDID : PRO VID R0 M1

REQUESTING LOCATION

The location name of the requester. If the thread is an allied thread (no distributed requests) or the thread is an allied-distributed thread (this location is the requestor), OMEGAMON XE for DB2 PE sets this field equal to the local location. If the thread is a database access thread (this location is a server).

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup. For parallel query rollup records, the value will be derived from the parent record.

Field Name: QWHDRQNM

AR NAME

The application requester name.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup. For parallel query rollup records, the value will be derived from the parent record.

Field Name: QWHDSVNM

REQUESTING TIMESTAMP

The timestamp for database access thread (DBAT) records.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup. For parallel query rollup records, the value will be derived from the parent record.

Field Name: QWHDTSTP

PRDID

Shows the product identifier (ID) of the requester. It can have the following values:

DB2 For DB2 UDB for z/OS
SQL/DS For DB2 UDB for VSE and VM
JDBC DRIVER For Universal JDBC driver
COMMON SERV For DB2 UDB for Linux, UNIX, Windows
IFCID 147 - Distributed Header Data

DB2/400
For DB2 UDB for iSeries
Otherwise, it shows the first 3 characters of the product ID, or N/P if the record was written at the application requester location.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup. For parallel query rollup records, the value will be derived from the parent record.

Field Name: QWHDPRID
IFCID 147 - Instrumentation Accounting Data

This topic shows detailed information about “Record Trace - IFCID 147 - Instrumentation Accounting Data”.

Note: This report has the same layout as IFCID 003, for details refer to “IFCID 003 - Instrumentation Accounting Data” on page 40-190.
IFCID 147 - Instrumentation Accounting Data Overflow

IFCID 147 - Instrumentation Accounting Data Overflow

This topic shows detailed information about “Record Trace - IFCID 147 - Instrumentation Accounting Data Overflow”.

Note: This report has the same layout as IFCID 003, for details refer to “IFCID 003 - Instrumentation Accounting Data Overflow” on page 40-206.

Record trace - IFCID 147 - Instrumentation Accounting Data Overflow

The field labels shown in the following sample layout of “Record Trace - IFCID 147 - Instrumentation Accounting Data Overflow” are described in the following section.

```
INSTRUMENTATION ACCOUNTING DATA OVERFLOW

ARCH.LOG(QUIES) SUSP TIME
ARCH.LOG(QUIES) SUSP EVENTS
DRAIN LOCK SUSP TIME
DRAIN LOCK SUSP EVENTS
CLAIM RELEASE SUSP TIME
CLAIM RELEASE SUSP EVENTS
I/O SERVICE TASK SUSP TIME
I/O SERVICE TASK SUSP EVENTS
SYSLOG R SUSP TIME
SYSLOG R SUSP EVENTS
DS MANAGER SUSP TIME
DS MANAGER SUSP EVENTS
OTHER SERVICE SUSP TIME
OTHER SERVICE SUSP EVENTS
COMMIT PH1 WRITE I/O TIME
COMMIT PH1 WRITE I/O EVENTS
ASYNCH. IXL REQ. TIME
ASYNCH. IXL EVENTS
LOB COMPRESSION SUSP TIME
LOB COMPRESSION SUSP EVENTS
FAST INSERT PIPE WAIT TIME
FAST INSERT PIPE WAIT EVENTS
```

ARCH.LOG(QUIES) SUSP TIME

The accumulated waiting time due to the processing of ARCHIVE LOG MODE(QUIESCE) commands.

This time does not represent the time required to perform the entire command.

Field Name: QWAXALOG

This is an exception field.

ARCH.LOG(QUIES) SUSP EVENTS

The number of ARCHIVE LOG MODE (QUIESCE) commands issued.

Field Name: QWAXALCT

ACCUM. READ SUSP TIME

The accumulated wait time for:
- Archive Log reads
- Active Log reads
- Active Log prefetch reads
- Fast Log apply log reads

Field Name: QWAXAWAR

WAIT TRACE READ EVENTS

DB2 V8: The number of wait trace events processed for archive reads, active reads, and active log prefetch reads.

Field Name: QWAXANAR

DRAIN LOCK SUSP TIME

The accumulated waiting time for a drain lock. This is the time the requester is suspended while waiting to acquire the drain lock.
Field Name: QWAXAWDR
This is an exception field.

DRAIN LOCK SUSP EVENTS
The number of wait trace events processed for waits for drain locks.
Field Name: QWAXARND

CLAIM RELEASE SUSP TIME
The accumulated waiting time for a drain waiting for claims to be released. After the drain lock is acquired, the drainer must wait for claim holders to release the object.
Field Name: QWAXAWCL
This is an exception field.

CLAIM RELEASE SUSP EVENTS
The number of wait trace events processed for waits for claims to be released.
Field Name: QWAXARNC

I/O SERVICE TASK SUSP TIME
Accumulated waiting time for a synchronous execution unit switch to the DB2 OPEN/CLOSE data set service for the HSM recall service.
This value is an average.
Field Name: QWAXOCSE

I/O SERVICE TASK SUSP EVENTS
Number of wait trace events processed of waits for synchronous execution unit switching to the Open/Close service.
Field Name: QWAXOCNS

SYSLGRNG SUSP TIME
Accumulated wait time for a synchronous execution unit switch to the DB2 SYSLGRNG recording service. This service is sometimes used for Level ID checking for downlevel detection.
This value is an average.
Field Name: QWAXSLSE

SYSLGRNG SUSP EVENTS
Number of wait trace events for a synchronous execution unit switch to the DB2 SYSLGRNG recording service.
Field Name: QWAXSLNS

DS MANAGER SUSP TIME
Accumulated wait time for a synchronous execution unit switch to the DB2 data space manager services. This includes DEFINE DATA SET, EXTEND DATA SET, DELETE DATA SET, RESET DATA SET, and VSAM CATALOG ACCESS.
This value is an average.
Field Name: QWAXDSSE
IFCID 147 - Instrumentation Accounting Data Overflow

DS MANAGER SUSP EVENTS
Number of wait trace events for waits for synchronous execution unit switching to the DB2 data space manager services.

Field Name: QWAXDSNS

OTHER SERVICE SUSP TIME
Could be due to a VSAM catalog update. In the distributed environment, it includes the waiting time for the response from the server system.
Performance trace for IFCID 46 to 50, 170, and 171 provide more detailed information for analysis.

Field Name: QWAXOTSE

OTHER SERVICE SUSP EVENTS
Number of wait trace events for a synchronous execution unit switch to other DB2 service tasks.

Field Name: QWAXOTNS

COMMIT PH1 WRITE I/O TIME
The accumulated time waiting for phase 1 commit write I/O. An example for this suspension is LOB Table Space with LOG NO Phase 1 commit database synchronous write I/O processing.

Field Name: QWAXAWFC

COMMIT PH1 WRITE I/O EVENTS
The total number of wait trace events for commit phase 1 I/O.

Field Name: ADFCSUSC

ASYNC. IXL REQ. TIME
The accumulated wait time for IXLCACHE and IXLFCOMP requests.

Field Name: QWAXIXLT

ASYNC. IXL EVENTS
Number of wait trace events processed for asynchronous IXLCACHE or IXLFCOMP invocations.

Field Name: QWAXIXLE

LOB COMPRESSION SUSP TIME
The accumulated time waiting for a compression of DB2 large objects (LOB) (DB2 field QWAX_LOBCOMP_WAIT).

Field Name: QWAX_LOBCOMP_WAIT

LOB COMPRESSION SUSP EVENTS
The number of wait trace events processed for DB2 large object (LOB) compressions.

Field Name: QWAX_LOBCOMP_COUNT

FAST INSERT PIPE WAIT TIME
The accumulated wait time for a pipe while this package was executed (DB2 field QPAC_PIPE_WAIT).

Field Name: QPAC_PIPE_WAIT
FAST INSERT PIPE WAIT EVENTS

The number of wait trace events that were processed for waits for a pipe while this package was executed (DB2 field QPAC_PIPEWAIT_COUNT).

Field Name: QPAC_PIPEWAIT_COUNT
ICCID 147 - Logging

ICCID 147 - Logging
This topic shows detailed information about “Record Trace - ICCID 147 - Logging”.

Record trace - ICCID 147 - Logging
The field labels shown in the following sample layout of “Record Trace - ICCID 147 - Logging” are described in the following section.

<table>
<thead>
<tr>
<th>LOG RECORDS WRITTEN</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>BYTES LOGGED</td>
<td>0</td>
</tr>
</tbody>
</table>

LOG RECORDS WRITTEN
The number of log records written.
Field Name: QWACLRN

BYTES LOGGED
The number of log record bytes written. This field is calculated from DB2 fields QWACLRAB x QWACLRN.
Field Name: RT0147BW
IFCID 147 - Monitor Detail Data

This topic shows detailed information about “Record Trace - IFCID 147 - Monitor Detail Data”.

Record trace - IFCID 147 - Monitor Detail Data

The field labels shown in the following sample layout of “Record Trace - IFCID 147 - Monitor Detail Data” are described in the following section.

API BEGIN ELAPSED TIME

The API begin elapsed time in the format day, hour, minute, second, and millionth of a second. If the value is 0, N/P is printed.

Field Name: QW0148AB

API ENDING ELAPSED TIME

The API ending elapsed time in the format day, hour, minute, second, and millionth of a second. If the value is 0, N/P is printed.

Field Name: QW0148AE

API BEGIN CPU TIME

The API beginning CPU time in the format minute, second, and millionth of a second. If the value is 0, N/P is printed.

Field Name: QW0148UB

API ENDING CPU TIME

The API ending CPU time in the format minute, second, and millionth of a second. If the value is 0, N/P is printed.

Field Name: QW0148UE

API BEGIN SRB TIME

The API beginning SRB time in the format minute, second, and millionth of a second. If the value is 0, N/P is printed.

Field Name: QW0148SB

API ENDING SRB TIME
The API ending SRB time in the format minute, second, and millionth of a second. If the value is 0, N/P is printed.

Field Name: QW0148SE

IFI BEGIN ELAPSED TIME

The IFI begin elapsed time in the format day, hour, minute, second, and millionth of a second. If the value is 0, N/P is printed.

Field Name: QW148IAB

IFI ENDING ELAPSED TIME

The IFI ending elapsed time in the format day, hour, minute, second, and millionth of a second. If the value is 0, N/P is printed.

Field Name: QW148IAE

IFI BEGIN CPU TIME

The IFI beginning CPU time in the format minute, second, and millionth of a second. If the value is 0, N/P is printed.

Field Name: QW148IUB

IFI ENDING CPU TIME

The IFI ending CPU time in the format minute, second, and millionth of a second. If the value is 0, N/P is printed.

Field Name: QW148IUE

BEGIN/RESUME CPU TIME

The start or resume CPU time for a stored procedure, user-defined function, or trigger.

Field Name: QW148ATC

TCB TIME BEFORE ENCLAVE

The accumulated TCB time that is used when running under the control of a trigger. This does not include the time that is used while running in user-defined functions or stored procedures that are called from the trigger. This CPU time does not include the CPU time that is consumed on an IBM specialty engine.

Field Name: QWACTRIT

This is an exception field.

BEGIN/RESUME TOD TIME

The start or resume TOD time for a stored procedure, user-defined function, or trigger.

Field Name: QW148AOD

LOCK - I/O - LATCH BEGIN TIME

The beginning time of the I/O including lock and latch use in the format day, hour, minute, second, and millionth of a second. If the value is 0, N/P is printed.

Field Name: QW0148LB

LOCK - I/O - LATCH ENDING TIME
The ending time of the I/O including lock and latch use in the format day, hour, minute, second, and millionth of a second. If the value is 0, N/P is printed.

Field Name: QW0148LE

END-OF-TASK CPU TIME

The CPU time from DSN3EOT0 in the format minute, second, and millionth of a second. If the value is 0, N/P is printed.

Field Name: QW0148EO

ACCOUNTING ENTRY CPU TIME

The CPU time at entry to a monitoring or accounting class 2 or class 3 wait, in the format minute, second, and millionth of a second. If the value is 0, N/P is printed.

Field Name: QW0148LW

EU SWITCH BEGIN ELAPSED TIME

The beginning of the elapsed time of the wait for the execution unit switch. If the value is 0, N/P is printed.

Field Name: QW0148EB

EU SWITCH ENDING ELAPSED TIME

The end of the elapsed time of the wait for the execution unit switch. If the value is 0, N/P is printed.

Field Name: QW0148EE

ARCH LOG (QUIESCE) BEGIN TIME

The beginning of the elapsed time of the wait for the ARCHIVE LOG MODE (QUIESCE) command. If the value is 0, N/P is printed.

Field Name: QW0148RB

ARCH LOG (QUIESCE) ENDING TIME

The end of the elapsed time of the wait for the ARCHIVE LOG MODE (QUIESCE) command. The end time minus begin time should be the total time the agent is suspended due to the ARCHIVE LOG MODE (QUIESCE) command. If the value is 0, N/P is printed.

Field Name: QW0148RE

ACE TOKEN

The hexadecimal address of the agent control element. Indicates the thread reported here. If the value is 0, N/P is printed.

Field Name: QW0148AC

APPL REQUEST COUNT

The number of attachment facility calls to DB2.

Field Name: QW0148RQ

ASCB TOKEN

The ASCB token in hexadecimal. If the value is 0, N/P is printed.

Field Name: QW0148MA
IFCID 147 - Monitor Detail Data

LATCH TOKEN
The latch token. If the value is 0, N/P is printed.
Field Name: QW0148LA

TCB TOKEN
The TCB token. If the value is 0, N/P is printed.
Field Name: QW0148MT

AGENT ASID
The ASID of the thread.
Field Name: QW0148AS

STATUS INDICATOR 1
Indicates whether the thread is at plan or signon/identify level.
Field Name: QW0148CD

CONNECTION TYPE
The connection type.
Field Name: QW0148TY

LATEST IFCID
The latest IFCID processed.
Field Name: QW0148IL

STATUS INDICATOR 2
Indicates whether the agent is in end-of-task processing.
Field Name: QW0148ES

DBID
The database ID. Deduced from the DB2 fields QW0148DB, QW0105DN or QW0107DN.
When present, the database name is shown, otherwise the decimal identifier from QW0148DB is shown, or N/A when this value is 0.
Field Name: RT0148DB

PREVIOUS IFCID
The previous IFCID processed.
Field Name: QW0148IP

STATUS INDICATOR 3
Indicates whether the create thread request is queued.
Field Name: QW0148CQ

OBID
The object ID. Deduced from the DB2 fields QW0148OB, QW0105TN or QW0107TN.
If present, the name of the object is shown, otherwise the decimal identifier from QW0148OB is shown, or N/A if this value is 0.
Field Name: RT0148OB
LATCH CLASS
The latch class in hexadecimal.
Field Name: QW0148LC

TSO CONNECTION TYPE
The TSO connection type.
Field Name: QW0148TS

THREAD TYPE
The type of thread being processed.
Field Name: QW0148DD

THREAD STATUS
The status of the thread being processed.
Field Name: QW0148AI

STATUS INDICATOR 5
Indicates whether the agent is queued for end-of-task processing.
Field Name: QW0148EQ

THREAD TOKEN
The thread token. This token uniquely identifies a specific thread and also appears in the display thread command response.
Field Name: QW148TTK

LUWSEQ
The LUW sequence number.
Field Name: QW0148CC

STATUS INDICATOR 6
Indicates whether the thread is running a stored procedure in DB2.
Field Name: QW0148SN

NESTING.LVL
Nesting level of the stored procedure, user-defined function or trigger, in the range 1 through 16.
Field Name: QW148ALV

STATUS INDICATOR 7
Indicates whether the thread is queued waiting for a stored procedure to be scheduled.
Field Name: QW0148SQ

NESTING ACTIVITY
Nesting activity of the stored procedure, user-defined function or trigger, if any.
Field Name: QW148AFG

CONS_TOKEN
The consistency token.
IFCID 147 - Monitor Detail Data

Field Name: QW0148CN

NETWORKID
The network identifier.
Field Name: QW0148NI

LUNAME
The logical unit name.
Field Name: QW0148LM

UNIQUENESS VALUE
The instance number.
Field Name: QW0148UV

ENCL.TOKEN
The enclave token, if under enclave, otherwise zero.
Field Name: QW148ETK

LOCATION
The name of the location where the thread executes the package.
Field Name: QW0148LN

COLLECTION
The collection name.
Field Name: QW0148CI

PACKAGE
The package identifier.
Field Name: QW0148PN

STORED PROCEDURE NAME
The stored procedure name.
Field Name: QW0148SP

SCHEMA NAME
Schema name, under which a stored procedure, user-define function or trigger is executing.
Field Name: QW148SCH

TOKEN
The consistency token.
Field Name: QW0148CN
IFCID 147 - Thread Correlation Data

This topic shows detailed information about “Record Trace - IFCID 147 - Thread Correlation Data”.

Record trace - IFCID 147 - Thread Correlation Data

The field labels shown in the following sample layout of “Record Trace - IFCID 147 - Thread Correlation Data” are described in the following section.

<table>
<thead>
<tr>
<th>Thread Correlation Data</th>
</tr>
</thead>
</table>

Thread CORRELATION DATA

ORIGINAL AUTHID

The original authorization ID. Possible values are:

- For TSO: the logon ID
- For batch: the user ID on the job statement
- For IMS (message-driven regions): the signon ID, LTERM, ASXBUSR, or PSB name
- For IMS (control regions): the user ID on the job statement, or the RACF started procedure entry if RACF is used
- For CICS: the user ID, TERM ID, TRAN ID, or as specified in the resource control table
- For MVS operator commands and DB2 system internal agents: SYSOPR
- For a distributed application server (AS):
  - If the application requester (AR) is a DB2 system, then this is the same value that was assigned at the AR.
  - If the application requester is not a DB2 system, then this is the user ID used to make the initial connection with the application server.

Field Name: QWHCOPID

PRIMARY AUTHID

The primary authorization ID from a connection or signon. The connection authorization exit and the signon authorization exit can change the primary authorization ID so that it differs from the original primary authorization ID (ORIGAUTH). Distributed authorization ID translation can also change the primary authorization ID.

Field Name: QWHCAID

END USER ID

The user ID of the workstation end user. This user ID can be different from the authorization ID used to connect to DB2. This field contains blanks if the client does not supply this information.

Field Name: QWHCEUID

AUTHORIZATION ID

The primary authorization ID from a connection or signon. The connection authorization exit and the signon authorization exit can change the primary authorization ID so that it differs from the original primary authorization ID (ORIGAUTH). Distributed authorization ID translation can also change the primary authorization ID.

Field Name: QWHCAID

CONNECTION NAME
The connection name. Possible values are:
- For batch: BATCH
- For TSO: TSO
- For QMF: DB2CALL
- For utilities: UTILITY
- For DB2 private protocol this is the DB2 subsystem ID
- For IMS: the IMS ID
- For CICS, this is the CICS ID
- For DRDA connections from non-DB2 requesters: SERVER

Field Name: QWHCCN
This is an exception field.

CORRELATION VALUE
Correlation ID value:

FOR BATCH
Job name

FOR TSO
Logon ID

FOR IMS/VS
PST#.PSBNAME

FOR CICS
CONNECTION_TYPE.THREAD_TYPE.THREAD_#.TRAN-ID

FOR RRSAF
CORRELATION-ID VALUE FROM SIGNON FUNCTION

For threads using the DB2 private protocol or DRDA from a DB2 requester
This field contains the correlation-id name of the thread at the requesting location.

For threads using DRDA from a non-DB2 requester
This field contains the first 12 characters in the DDM external name (EXTNAM) parameter of the DDM EXCSAT command received as part of the SQL connect.

Field Name: QWHCCV

PLAN NAME
The plan name. It is blank for a DB2 command thread; otherwise:

DSNESPRR
For SPUFI with repeatable read.
DSNESPCS
   For SPUFI with cursor stability.

DSNUTIL
   For utilities.

DSNTEP2
   For DSNTEP2.

DSNBIND
   For binding.

The application plan name
   For IMS.

The application plan name
   For CICS.

A blank plan name
   For IMS and CICS commands.

DSQPLAN
   For QMF.

The first 8 bytes of the application name
   For DRDA connections to the common servers.

Field Name: QWHCPLAN
   This is an exception field.

ORIGINAL AUTH ID

   The original authorization ID. Possible values are:
   • For TSO: the logon ID
   • For batch: the user ID on the job statement
   • For IMS (message-driven regions): the signon ID, LTERM, ASXBUSR, or PSB name
   • For IMS (control regions): the user ID on the job statement, or the RACF started procedure entry if RACF is used
   • For CICS: the user ID, TERM ID, TRAN ID, or as specified in the resource control table
   • For MVS operator commands and DB2 system internal agents: SYSOPR
   • For a distributed application server (AS):
     - If the application requester (AR) is a DB2 system, then this is the same value that was assigned at the AR.
     - If the application requester is not a DB2 system, then this is the user ID used to make the initial connection with the application server.

Field Name: QWHCOPID

CONNECTION TYPE

   The connecting system type code (in hexadecimal). This field can have a null value. Utilities, for example, do not have a connecting system type.

Field Name: QWHCATYP

ACCOUNTING TOKEN

   Accounting correlation token.
IFCID 147 - Thread Correlation Data

This field applies only if CONNECTION TYPE equals CICS ATTACH or RRSAF ATTACH, otherwise N/A is shown.

If connection type is CICS ATTACH, the first eight bytes identify the network name (right padded with blanks), the second eight bytes identify the LU name (right padded with blanks), the final six bytes are the uniqueness value.

If the connection type is RRSAF ATTACH, the field is the value of the parameter accounting token in the RRSAF signon function.

This field is shown as both a character and a hexadecimal string.

Field Name: QWHCTOKN

TOKEN IN HEX

Accounting correlation token.

This field applies only if CONNECTION TYPE equals CICS ATTACH or RRSAF ATTACH, otherwise N/A is shown.

If connection type is CICS ATTACH, the first eight bytes identify the network name (right padded with blanks), the second eight bytes identify the LU name (right padded with blanks), the final six bytes are the uniqueness value.

If the connection type is RRSAF ATTACH, the field is the value of the parameter accounting token in the RRSAF signon function.

This field is shown as both a character and a hexadecimal string.

Field Name: QWHCTOKN

END USER ID

The user ID of the workstation end user. This user ID can be different from the authorization ID used to connect to DB2. This field contains blanks if the client does not supply this information.

Field Name: QWHCEUID

TRANSACTION

The transaction or application name that is run.

Field Name: QWHCEUTX

JOBSTEP NAME

If the thread that is currently running is a TCB, this value is the step name in the JCL that is running the batch job.

Field Name: QWHCJOBSTEP

END USER WST

The end user's workstation name.

Field Name: QWHCEUWN
This record only contains data from an Online Monitor trace data set.

**Note:** This report has the same layout as IFCID 150, for details refer to “IFCID 150 - Thread Locking” on page 40-554.

Record trace - IFCID 150 - Global Interest Data

The field labels shown in the following sample layout of “Record Trace - IFCID 150 - Global Interest Data” are described in the following section.

GLOBAL INTEREST DATA

A PLOCK IS HELD
Indicates if a P-lock is held. It can have one of the following values:
• YES
• NO
• N/P

Field Name: QW01505P

RESULTANT REQUESTED STATE
The result of the requested lock state. It can have one of the following values:
• UNPROTECTED SHARE
• INTENTION SHARE
• INTENTION EXCLUSIVE
• SHARE
• UPDATE
• SHARE AND INTENTION EXCLUSIVE
• NON-SHARED UPDATE
• EXCLUSIVE
• INTENTION SHARE, LOWER LEVEL PLOCKS ACQUIRED
• INTENTION EXCLUSIVE, LOWER LEVEL PLOCKS ACQUIRED
• SHARED AND INTENTION EXCLUSIVE, LOWER LEVEL PLOCKS ACQUIRED

Field Name: QW01505R

SUBSYSTEM NAME
The name of the subsystem.

Field Name: QW01505S

RESULTANT HELD STATE
The result of the requested P-lock held state. It can have one of the following values:
• UNPROTECTED SHARE
• INTENTION SHARE
• INTENTION EXCLUSIVE
• SHARE
• UPDATE
• SHARE AND INTENTION EXCLUSIVE
IFCID 150 - Global Interest Data

- NON-SHARED UPDATE
- EXCLUSIVE
- INTENTION SHARE, LOWER LEVEL PLOCKS ACQUIRED
- INTENTION EXCLUSIVE, LOWER LEVEL PLOCKS ACQUIRED
- SHARED AND INTENTION EXCLUSIVE, LOWER LEVEL PLOCKS ACQUIRED

Field Name: QW01505H
IFCID 150 - Held Lock Data

This topic shows detailed information about “Record Trace - IFCID 150 - Held Lock Data”.

Record trace - IFCID 150 - Held Lock Data

The field labels shown in the following sample layout of “Record Trace - IFCID 150 - Held Lock Data” are described in the following section.

HELD LOCK DATA
LOCK REQUEST TOKEN : X'0C000002'  LOCK STATE : X'80'  SUBSYSTEM NAME : SYS00003
ACE TOKEN : X'00000089'  LOCK TYPE : P-LOCK  FUNCTION : LOCK
LOCK DURATION : X'80'
QW01506: X'0C000002'
QW0150SC: (1)  0  (2)  0  (3)  0  (4)  0  (5)  0  (6)  0  (7)  0  (8)  0

LOCK REQUEST TOKEN

The lock request token in hexadecimal.

Field Name: QW0150R3

LOCK STATE

The lock state.

Field Name: QW0150ST

SUBSYSTEM NAME

The name of the subsystem.

Field Name: QW0150N4

ACE TOKEN

The hexadecimal address of the agent control element indicating the holder of this lock.

Field Name: QW0150A3

LOCK TYPE

The type of lock.

Field Name: QW0150TL

FUNCTION

The lock function.

Field Name: QW0150F4

LOCK DURATION

The duration for which the lock is held:

MANUAL  Varies depending on the ISOLATION parameter

MANUAL+1  Temporary change of consistency level from CS to RR during bind and DDL

COMMIT  Until commit

COMMIT+1  Past commit; applies to locks needed to maintain the position for a cursor opened WITH HOLD

ALLOCATION  Until deallocation
IFCID 150 - Held Lock Data

PLAN  For the duration of the plan
FREE ALL LOCKS  Until all locks are freed

Field Name: QW0150D4
IFCID 150 - Lock Resource Data

This topic shows detailed information about “Record Trace - IFCID 150 - Lock Resource Data”.

Record trace - IFCID 150 - Lock Resource Data

The field labels shown in the following sample layout of “Record Trace - IFCID 150 - Lock Resource Data” are described in the following section.

LOCK RES TYPE

The locked resource type.

Note: For data sharing, SKELETON CURSOR TABLE LOCKING and SKELETON PACKAGE TABLE LOCK are LP-locks (an LP-lock has an L-lock component and a P-lock component).

Field Name: QW0150KT

DBID

The database ID. This field is not applicable if the value in LOCK RES TYPE is SKELETON CURSOR TABLE LOCKING, SKELETON PACKAGE TABLE LOCK, COLLECTION, or ALTER BUFFER POOL.

Deduced from the DB2 fields QW0150DB, QW0105DN, or QW0107DN.

If present, the database name is shown, otherwise the decimal identifier from QW0150DB is shown, or N/A if this value is 0.

Field Name: RT0150DB

OBID

The object ID of the table space or pageset involved in the lock. This field is not applicable if the value in LOCK RES TYPE is SKELETON CURSOR TABLE LOCKING, SKELETON PACKAGE TABLE LOCK, or COLLECTION.

Deduced from the DB2 fields QW0149KP, QW0105TN, QW0107TN, QW0149KP, QW0105OB or QW0107OB.

If present, then name of the object is shown. Otherwise the decimal identifier from QW0150KP is shown, or N/A if this value is 0.

Field Name: RT0150OB

RESOURCE ID

The hexadecimal identifier of the small resource. If LOCK RES TYPE is:

DATA SET LOCKING (PARTITION)

Last byte is the partition number

DATA PAGE LOCKING

First 3 bytes are the page number

INDEX PAGE LOCKING

First 3 bytes are the page number

HASH ANCHOR LOCK

First 3 bytes are the page number and the last byte is the anchor point ID
IFCID 150 - Lock Resource Data

**CS-READ DRAIN**
Last byte is the partition number (optional)

**RR-READ DRAIN**
Last byte is the partition number (optional)

**WRITE DRAIN**
Last byte is the partition number (optional)

**ROW LOCK**
First 3 bytes are the page number and the last byte is the row ID of the record

**INDEX END OF FILE LOCK**
Last byte is the partition number (optional)

**Note:**
- In large partitioned table spaces, the page number covers 4 bytes instead of 3.
- If table spaces use relative page numbers, the resource ID covers 7 bytes. It contains the partition number in the first 2 bytes, the page number in the next 4 bytes, and the record ID in the seventh byte.

This field is not applicable if the value in LOCK RES TYPE is SKELETON CURSOR TABLE LOCKING, SKELETON PACKAGE TABLE LOCK, TABLE LOCK, COLLECTION, ALTER BUFFER POOL, or PAGESET LOCK. If the value is UTILITY SERIALIZATION LOCK or BINDLOCK, N/A is printed.

**Field Name:** QW0150KR

**HASH TOKEN**

The hash token of the resource name.

**Field Name:** QW0150LH
IFCID 150 - Retained Lock Data

This topic shows detailed information about “Record Trace - IFCID 150 - Retained Lock Data”.

Record trace - IFCID 150 - Retained Lock Data

The field labels shown in the following sample layout of “Record Trace - IFCID 150 - Retained Lock Data” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOCK REQUEST TOKEN</td>

</tr>
</tbody>
</table>

**LOCK REQUEST TOKEN**

The lock request token in hexadecimal.

Field Name: QW0150R3

**LOCK STATE**

The lock state.

Field Name: QW0150ST

**SUBSYSTEM NAME**

The name of the subsystem.

Field Name: QW0150N4

**ACE TOKEN**

The hexadecimal address of the agent control element indicating the holder of this lock.

Field Name: QW0150A3

**LOCK TYPE**

The type of lock.

Field Name: QW0150TL

**FUNCTION**

The lock function.

Field Name: QW0150F4

**LOCK DURATION**

The duration for which the lock is held:

- **MANUAL**: Varies depending on the ISOLATION parameter
- **MANUAL+1**: Temporary change of consistency level from CS to RR during bind and DDL
- **COMMIT**: Until commit
- **COMMIT+1**: Past commit; applies to locks needed to maintain the position for a cursor opened WITH HOLD
- **ALLOCATION**: Until deallocation
PLAN    For the duration of the plan
FREE ALL LOCKS
       Until all locks are freed

This topic shows detailed information about “Record Trace - IFCID 166 - IBM Service Record”.

This record is for IBM service use.
IFCID 167 - Conv Alloc Req Queued

This topic shows detailed information about “Record Trace - IFCID 167 - Conv Alloc Req Queued”.

Record trace - IFCID 167 - Conv Alloc Req Queued

The field labels shown in the following sample layout of “Record Trace - IFCID 167 - Conv Alloc Req Queued” are described in the following section.

```
CONVID  X'00000000'  LU NAME:  LUNAME12
CONV ALLOC  24  MODE NAME:  MODENAME
CONV QUEUED  15  CONV LIMIT  25

CONVID
The conversation identifier.
Field Name: QW0167CI

LU NAME
The logical unit name.
Field Name: QW0167LU

CONV ALLOC
The conversation allocated.
Field Name: QW0167CA

MODE NAME
The mode name.
Field Name: QW0167MO

CONV QUEUED
The conversation queued.
Field Name: QW0167CQ

CONV LIMIT
The conversation limit.
Field Name: QW0167CL
```
This topic shows detailed information about “Record Trace - IFCID 168 - IBM Service Record”.

This record is for IBM service use.
IFCID 169 - DIST Authid Translation

This topic shows detailed information about “Record Trace - IFCID 169 - DIST Authid Translation”.

Record trace - IFCID 169 - DIST Authid Translation

The field labels shown in the following sample layout of “Record Trace - IFCID 169 - DIST Authid Translation” are described in the following section.

IDENTIFIER TYPE
Identifier type of the source ID. Possible values are:

A AUTHID
L LOCATION ALIAS
D DATABASE ALIAS
S TRUSTED CONTEXT SYSTEM AUTHID

Field Name: QW0169ID

TRANSL TYPE
The type of translation:

INBOUND
The responding DB2 site translates the AUTHID after receiving the data.

OUTBOUND
The requesting DB2 site translates the AUTHID before sending the data.

Field Name: QW0169TY

RESPOND LINKNAME
The logical unit name.

If the value of TRANSLATION TYPE is INBOUND, this is the VTAM LU name of the requester location or row in SYSIBM.SYSIPNAMES.

If the value of TRANSLATION TYPE is OUTBOUND, this is the VTAM LU name of the remote server or

Field Name: QW0169LU

RESPOND LOC
If the value of TRANSLATION TYPE is INBOUND, this is the service location name regardless of whether the server is another DB2. If the value of TRANSLATION TYPE is OUTBOUND, this field contains one of the following values:

• The name of the requesting DB2 location
• <LUNAME>
• NNN.NNN.NNN.NNN
Field Name: QW0169LO

SYST AUTHID

Either authorization ID or location or alias before translation. Depending on the translation type OUTBOUND and identifier type TRUSTED CONTEXT, this field contains the original value of the authorization ID or the system authorization ID.

Field Name: QW0169AU

TRANS AUTHID

The new value of the authorization ID, location, or alias. Depending on the translation type OUTBOUND and identifier type TRUSTED CONTEXT, this field contains the value of the authorization ID or the translated system authorization ID.

Field Name: QW0169NE
IFCID 170 - Suspend of Agent

This topic shows detailed information about “Record Trace - IFCID 170 - Suspend of Agent”.

Record trace - IFCID 170 - Suspend of Agent

The field labels shown in the following sample layout of “Record Trace - IFCID 170 - Suspend of Agent” are described in the following section.

ACE: 1
QW0170ID X'01'  QW0170FC X'05'

ACE

Indicates the requester. The relative number of the agent control element address in the ACE cross-reference table. This table is printed at the end of each location for every trace specified.

Field Name: QW0170AC
This topic shows detailed information about “Record Trace - IFCID 171 - IBM Service Record”.

This record is for IBM service use.
IFCID 172 - Deadlock Data

This topic shows the records available for deadlock data.

“IFCID 172 - Deadlock Header” on page 40-587
This topic shows detailed information about “Record Trace - IFCID 172 - Deadlock Header”.

“IFCID 172 - Unit of Work - Resource” on page 40-588
This topic shows detailed information about “Record Trace - IFCID 172 - Unit of Work - Resource”.

“IFCID 172 - Unit of Work - Blocker” on page 40-590
This topic shows detailed information about “Record Trace - IFCID 172 - Unit of Work - Blocker”.

“IFCID 172 - Unit of Work - Waiter” on page 40-593
This topic shows detailed information about “Record Trace - IFCID 172 - Unit of Work - Waiter”.
IFCID 172 - Deadlock Header

This topic shows detailed information about “Record Trace - IFCID 172 - Deadlock Header”.

This record is written every time that DB2 takes action to resolve a deadlock. This record details all of the units of work involved in the deadlock, the resource for which they were contending, and the attributes of their requests. One record is written for each locked resource in the deadlock.

Statistics class 3 or performance class 6 trace must be active.

DB2 can resolve a deadlock either by rolling back a unit of work for one of the agents involved, or by requesting a process to terminate.

There is no correlation between the number of IFCID 172 records written and the number of deadlocks counted by IFCIDs 2 and 3. Deadlocks can be broken without intervention by DB2, as an example when a process times out. Also, multiple IFCID 172 records can be written for a single deadlock.

Record trace - IFCID 172 - Deadlock Header

The field labels shown in the following sample layout of “Record Trace - IFCID 172 - Deadlock Header” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INTERVAL COUNT</td>
<td>The deadlock interval counter.</td>
</tr>
<tr>
<td>WAITERS INVOLVED</td>
<td>The number of waiters involved in the deadlock.</td>
</tr>
<tr>
<td>TIME DETECTED</td>
<td>The date and time when the deadlock was detected.</td>
</tr>
</tbody>
</table>

DEADLOCK HEADER

INTERVAL COUNT: 230681 WAITERS INVOLVED: 2 TIME DETECTED: 10/22/08 15:46:20.704974

Field Name: QW0172IT

Field Name: QW0172NR

Field Name: QW0172TD
IFCID 172 - Unit of Work - Resource

IFCID 172 - Unit of Work - Resource

This topic shows detailed information about “Record Trace - IFCID 172 - Unit of Work - Resource”.

The content of the LOCK RES TYPE field determines which other fields are printed in this record.

Blocker and waiter information is shown for each resource involved in the deadlock.

Record trace - IFCID 172 - Unit of Work - Resource

The field labels shown in the following sample layout of “Record Trace - IFCID 172 - Unit of Work - Resource” are described in the following section.

<table>
<thead>
<tr>
<th>LOCK RES TYPE</th>
<th>DBID: 1</th>
<th>OBID: 2</th>
<th>RESOURCE ID: X'00000313123456'</th>
</tr>
</thead>
</table>

LOCK RES TYPE

The locked resource type.

**Note:** For data sharing, SKELETON CURSOR TABLE LOCKING and SKELETON PACKAGE TABLE LOCK are LP-locks (an LP-lock has an L-lock component and a P-lock component).

**Field Name:** QW0172FR

DBID

The database ID. This field is not applicable if the value in LOCK RES TYPE is SKELETON CURSOR TABLE LOCKING, SKELETON PACKAGE TABLE LOCK, or COLLECTION. Deduced from the DB2 fields QW0172DB, QW0105DN, or QW0107DN.

If present, the database name is shown, otherwise the decimal identifier from QW0172DB is shown, or N/A if this value is 0.

**Field Name:** RT0172DB

OBID

The object ID of the resource involved in the lock. This field is not applicable if the value in LOCK RES TYPE is SKELETON CURSOR TABLE LOCKING, SKELETON PACKAGE TABLE LOCK, or COLLECTION.

Deduced from the DB2 fields QW0172KP, QW0105TN, QW0107TN, QW0172KP, QW0105OB, or QW0107OB.

If present, then name of the object is shown. Otherwise the decimal identifier from QW0172KP is shown, or N/A if this value is 0.

**Field Name:** RT0172OB

RESOURCE ID

The hexadecimal identifier of the small resource. If LOCK RES TYPE is:

**DATA PAGE LOCKING**

First 3 bytes are the page number

**DATA SET LOCKING (PARTITION)**

Last byte is the partition number
INDEX PAGE LOCKING
   First 3 bytes are the page number

HASH ANCHOR LOCK
   First 3 bytes are the page number and the last byte is the anchor point ID

CS-READ DRAIN
   Last byte is the partition number (optional)

RR-READ DRAIN
   Last byte is the partition number (optional)

WRITE DRAIN
   Last byte is the partition number (optional)

ROW LOCK
   First 3 bytes are the page number and the last byte is the row ID of the record

INDEX END OF FILE LOCK
   Last byte is the partition number (optional)

Note:
   • In large partitioned table spaces, the page number covers 4 bytes instead of 3.
   • If table spaces use relative page numbers, the resource ID covers 7 bytes.
      It contains the partition number in the first 2 bytes, the page number in the next 4 bytes, and the record ID in the seventh byte.

This field is not applicable if the value in LOCK RES TYPE is SKELETON CURSOR TABLE LOCKING, SKELETON PACKAGE TABLE LOCK, TABLE LOCK, COLLECTION, or ALTER BUFFER POOL. If the value is UTILITY SERIALIZATION LOCK or BINDLOCK, N/A is printed.

Field Name: QW0172KR

LOCK HASH VALUE

The hash value of the locked resource.

Field Name: QW0172LH
IFCID 172 - Unit of Work - Blocker

IFCID 172 - Unit of Work - Blocker

This topic shows detailed information about “Record Trace - IFCID 172 - Unit of Work - Blocker”.

A blocker is a thread that prevents its victim from acquiring its lock. The blocker might be a holder of the lock, or it might be another waiter (that came in before the victim) that is incompatible with the holder's lock.

Note: If the fields PLAN NAME, CORR ID, CONN, and NETWORKID show an asterisk (*), the blocking request was released by the requester or was timed out between the detection and reporting of the deadlock.

Record trace - IFCID 172 - Unit of Work - Blocker

The field labels shown in the following sample layout of “Record Trace - IFCID 172 - Unit of Work - Blocker” are described in the following section.

PRIMAUTH

The authorization ID of the thread holding the resource.

Field Name: QW0172HB

PLAN NAME

The plan name of the blocker.

Field Name: QW0172HP

CORR ID

The correlation name of the blocker.

Field Name: QW0172HR

CONN ID

The connection ID of the blocker.

Field Name: QW0172HN

NETWORKID

Provides the following information:

- The logical unit of work identifier of the blocker. The data shown is only valid for distributed threads.
- The logical unit name of the blocker. The data shown is only valid for distributed threads.
- The uniqueness value of the blocker. The data shown is only valid for distributed threads.

Field Name: QW0172HL

LUNAME

Provides the following information:
Field Name: QW0172HL

OWNING WORK UNIT

The owning unit of work of the blocker.

Field Name: QW0172HO

UNIQUENESS VALUE

Provides the following information:

- The logical unit of work identifier of the blocker. The data shown is only valid for distributed threads.
- The logical unit name of the blocker. The data shown is only valid for distributed threads.
- The uniqueness value of the blocker. The data shown is only valid for distributed threads.

Field Name: QW0172HL

MEMBER

The DB2 member name.

Field Name: QW0172HI

DURATION

The lock duration of the thread blocking the resource.

Field Name: QW0172HD

STATE

The lock state of the thread holding the resource.

Field Name: QW0172HS

ACE

The owning unit of work of the blocker.

Field Name: QW0172HO

TRANSACTION

The transaction or application name that is run.

Field Name: QWHCEUTX

WS_NAME

The end user's workstation name.

Field Name: QWHCEUWN

END_USER

The user ID of the workstation end user. This user ID can be different from the authorization ID used to connect to DB2. This field contains blanks if the client does not supply this information.
IFCID 172 - Unit of Work - Blocker

Field Name: QWHCEUID

PROGRAM NAME
The name of the program that is in control at the time of the deadlock. It need not be the program that acquired the lock.

Field Name: QW0172Q1

LOCATION
Location of the program that is in control at the time of the deadlock. It need not be the program that acquired the lock.

Field Name: QW0172Q3

PKG/_COLL ID
Package collection ID of the program that is in control at the time of the deadlock. It need not be the program that acquired the lock.

Field Name: QW0172Q2

CONS TOKEN
Consistency token of the program that is in control at the time of the deadlock. It need not be the program that acquired the lock.

Field Name: QW0172Q4

STMT ID
Shows the cached statement ID for the thread holding the resource. This field contains zero (0) if the client does not supply this information.

Field Name: QW0172H9

STMT ID
The holder statement ID.

Field Name: QW0172HZ

TYPE
The holder statement information.

Field Name: QW0172HY

STATUS
The status of the blocker.

WAIT The blocker is waiting for the resource.

HOLD The blocker is holding the resource.

Field Name: QW0172H2
IFCID 172 - Unit of Work - Waiter

This topic shows detailed information about “Record Trace - IFCID 172 - Unit of Work - Waiter”.

Record trace - IFCID 172 - Unit of Work - Waiter

The field labels shown in the following sample layout of “Record Trace - IFCID 172 - Unit of Work - Waiter” are described in the following section.

<table>

WORTH : X'11' QW0172WG: X'10'
```
OWNING WORK UNIT
The owning unit of work of the waiter.

Field Name: QW0172WO

UNIQUENESS VALUE
Provides the following information:
• The logical unit of work identifier of the waiter. The data shown is only valid for distributed threads.
• The logical unit name of the waiter. The data shown is only valid for distributed threads.
• The uniqueness value of the waiter. The data shown is only valid for distributed threads.

Field Name: QW0172WL

MEMBER
The waiter's DB2 member name.

Field Name: QW0172WI

DURATION
The lock duration of the thread waiting for the resource.

MANUAL Varies depending on the ISOLATION parameter (QW0172DR=x'20')
MANUAL+1 Temporary change of consistency level from CS to RR during bind and DDL (QW0172DR=x'21')
COMMIT Until commit (QW0172DR=x'40')
COMMIT+1 Past commit; applies to locks needed to maintain the position for a cursor opened WITH HOLD (QW0172DR=x'41')
ALLOCATION Until deallocation (QW0172DR=x'60')
PLAN For the duration of the plan (QW0172DR=x'80')
UTIL For the duration of the utility execution (QW0172DR=x'81')
INTEREST Duration used for P-locks (QW0172DR=x'FE')
FREE ALL Until all locks are freed (QW0172DR=x'FF')
N/A Not applicable for NOTIFY SUSPEND

Field Name: QW0172WD

STATE
The lock state of the thread waiting for the resource.

Field Name: QW0172WS

ACE
The owning unit of work of the waiter.

Field Name: QW0172WO
TRANSACTION
The transaction or application name that is run.
Field Name: QWHCEUTX

WS_NAME
The end user's workstation name.
Field Name: QWHCEUWN

END_USER
The user ID of the workstation end user. This user ID can be different from the authorization ID used to connect to DB2. This field contains blanks if the client does not supply this information.
Field Name: QWHCEUID

PROGRAM NAME
The name of the program that is in control at the time of the deadlock. It need not be the program that acquired the lock.
Field Name: QW0172Q5

LOCATION
Package collection ID of the program that is in control at the time of the deadlock. It need not be the program that acquired the lock.
Field Name: QW0172Q6

PCKG/COLL ID
Location of the program that is in control at the time of the deadlock. It need not be the program that acquired the lock.
Field Name: QW0172Q7

CONS TOKEN
Consistency token of the program that is in control at the time of the deadlock. It need not be the program that acquired the lock.
Field Name: QW0172Q8

STMT ID
Shows the cached statement ID for the thread waiting for the resource. This field contains zero (0) if the client does not supply this information.
Field Name: QW0172W9

STMT ID
The waiter statement ID.
Field Name: QW0172WZ

TYPE
The waiter statement information.
Field Name: QW0172WY

DB2S ASIC
The DB2S ASIC of the waiter. A unique number allocated to the requesting work unit of the waiter. The EB pointer of the waiter.
IFCID 172 - Unit of Work - Waiter

Field Name: QW0172AS
REQ WORK UNIT
The waiter's requesting work unit.
Field Name: QW0172UW
EB PTR
The EB pointer of the waiter.
Field Name: QW0172WE
REQ FUNCTION
The function requested by the waiter.
Field Name: QW0172WF
WORTH
The worth value DB2 assigns to the waiter.
Field Name: QW0172WA
IFCID 173 - Class 2 Time

This topic shows detailed information about “Record Trace - IFCID 173 - Class 2 Time”.

When present, data for this IFCID is printed in dump format, otherwise NO DATA is printed.

Record trace - IFCID 173 - Class 2 Time

The field labels shown in the following sample layout of “Record Trace - IFCID 173 - Class 2 Time” are described in the following section.

AUTH ID

The authorization ID.

Field Name: QW0173ID

PACKAGE COLL ID

The package collection ID.

Field Name: QW0173PC

PACKAGE NAME

The package name.

Field Name: QW0173PK

CURSOR NAME

The cursor name, if there is a cursor.

Field Name: QW0173CN

PLAN NAME

The plan name.

Field Name: QW0173PL

SECTION NUMBER

The section number in the plan.

Field Name: QW0173SN

STATEMENT NUMBER

The statement number in the plan.

Field Name: QW0173ST

CACHED STMNT ID

The cached statement ID. Zero (0) indicates that this information is not supplied.

Field Name: QW0173CS
IFCID 174 - Arch Log CMD Sus Start

This topic shows detailed information about “Record Trace - IFCID 174 - Arch Log CMD Sus Start”.

Record trace - IFCID 174 - Arch Log CMD Sus Start

The field labels shown in the following sample layout of “Record Trace - IFCID 174 - Arch Log CMD Sus Start” are described in the following section.

ACE: 1
QW0174EB X'024391B8' QW0174UR X'0242C168'

ACE

The relative number of the agent control element address in the ACE cross-reference table. This table is printed at the end of each location for every trace specified.

Field Name: QW0174AC
IFCID 175 - Arch Log CMD Sus End

This topic shows detailed information about “Record Trace - IFCID 175 - Arch Log CMD Sus End”.

Record trace - IFCID 175 - Arch Log CMD Sus End

The field labels shown in the following sample layout of “Record Trace - IFCID 175 - Arch Log CMD Sus End” are described in the following section.

ACE: 1
QW0175EB X'024391B8' QW0175UR X'0242C168'

ACE

The relative number of the agent control element address in the ACE cross-reference table. This table is printed at the end of each location for every trace specified.

Field Name: QW0175AC
IFCID 177 - Package Allocation

This topic shows detailed information about “Record Trace - IFCID 177 - Package Allocation”.

Record trace - IFCID 177 - Package Allocation

The field labels shown in the following sample layout of “Record Trace - IFCID 177 - Package Allocation” are described in the following section.

PACKAGE NETWORKID: G91E81D0 LUNAME: D179 LUWSEQ: 2
ALLOCATION REQUESTING LOCATION: 9.30.129.208
REQUESTING TIMESTAMP: N/P
AR NAME: gixer PROID: CLNT/SER V8 R1 M4
ACCTKN X'C7F9F1C5F8F1C4F04BC4F1F7F9000F92022652404040'
LOCATION : DSND81B
COLLECTION ID : AIXPQMS
PACKAGE ID : SQLEMBT
CONSISTENCY TOKEN: X'5A4276344E644C54'
VERSION NAME : N/P
DYNAMICRULES : RUN
PLAN : DISTSERV
ISOLATION : CS
ACQUIRE : USE
RELEASE : COMMIT
REOPTIMIZATION : NO
DEFERPREPARE : NO
KEEPDYNAMIC : NO
DBPROTOCOL : DRDA
OPT_HINT_IDENT : 'BLANK'
IMMEDWRITE : NO

LOCATION
The location of the package. This field shows 'BLANK' if the local location is not defined.

Field Name: QW0177LO

COLLECTION ID
The collection name.

Field Name: QW0177CO

PACKAGE ID
The package identifier.

Field Name: QW0177PI

CONSISTENCY TOKEN
The consistency token (timestamp) of the program.

Field Name: QW0177CT

VERSION NAME
The version. This field shows N/P if the record does not contain a valid version.

Field Name: QW0177VN

DYNAMICRULES
The value of the DYNAMICRULES option on the BIND/REBIND command:
RUN  Runtime rules apply to a dynamic SQL statement for authorization checking and object qualification at run time.

BIND  Bind-time rules apply to a dynamic SQL statement for authorization checking and object qualification at run time.

N/P in this field indicates that DYNAMICRULES was not specified.

Field Name: QW0177DY

PLAN  The name of the plan under which the package is running.

Field Name: QW0177PL

ISOLATION  The isolation level of the package:

RR  Repeatable read
CS  Cursor stability
RS  Read stability
UR  Uncommitted read

Field Name: QW0177IS

ACQUIRE  The acquire level of the package.

Field Name: QW0177AQ

RELEASE  The release level of the package.

Field Name: QW0177RL

REOPTIMIZATION  Indicates whether reoptimization was requested:

YES  REOPT(VARS) was specified to reoptimize the access path of the SQL statement at run time.
NO  NOREOPT(VARS) was specified to optimize the access path of the SQL statement only at bind time.

Field Name: QW0177RO

DEFERPREPARE  Indicates whether the preparation of dynamic SQL statements was deferred:

YES  DEFER(PREPARE) was specified to defer the preparation of the dynamic SQL statements that refer to remote objects until run time.
NO  NODEFER(PREPARE) was specified to prepare the dynamic SQL statements at bind time.

Field Name: QW0177DP

KEEPDYNAMIC  Indicates whether DB2 keeps (KEEPDYNAMIC(YES)) or discards (KEEPDYNAMIC(NO)) prepared SQL statements at commit points.
Field Name: QW0177KD

DBPROTOCOL

Protocol. Possible values are:

DRDA
PRIVATE

Field Name: QW0177PR

OPT_HINT_IDENT

Query optimization hint identifier, the default is blanks.

Field Name: QW0177OH

IMMEDWRITE

Indicates how DB2 updates group buffer pool dependent pages. This is only valid in a data-sharing environment.

Group buffer pool dependent pages can be written out to DASD or SYSTEM pagesets. Values shown are:

NO DB2 uses normal write activity for updates, this is the default. Pages are written out at, or before phase 2 commit, or at the end of an abort for transactions that have rolled back.

PH1 Pages are written out at, or before phase 1 commit.

If a transaction subsequently rolls back, the pages are updated in the group buffer pool at the end of the rollback, and are written out at the end of the abort.

YES Pages are written out to the coupling facility as soon as the buffer update commits. Pages are written out regardless of whether the update occurs during forward progress or rollback of the transaction.

This option can affect DB2 performance due to coupling facility overhead.

N/P The DB2 subsystem is not part of a data sharing group.

Field Name: QW0177WI
IFCID 178 - IBM Service Record

This topic shows detailed information about “Record Trace - IFCID 178 - IBM Service Record”.

This record is for IBM service use.
This topic shows detailed information about “Record Trace - IFCID 179 - IBM Service Record”.

This record is for IBM service use.
IFCID 180 - DC Communication Buffers

This topic shows detailed information about “Record Trace - IFCID 180 - DC Communication Buffers”.

The format of this record depends on the format of the network protocol.

Record trace - IFCID 180 - DC Communication Buffers

The field labels shown in the following sample layout of “Record Trace - IFCID 180 - DC Communication Buffers” are described in the following section.

**IF SNA:**

---

**TYPE OF EVENT**: RECEIVED DISTRIBUTED DATA MESSAGE  
**NETWORK PROTOCOL**: TCP/IP V4  
**SOCKET DESCRIPTOR**: X’00000010  
**IP ADDRESS**: X’1000000000000000D3D4E7E7E7E7E9’  
**LOCAL PORT**: X’A7A7’  
**PARTNER PORT**: X’A7A7’  
**MSG LENGTH**: 52  
**MSG/FMH-5**: TRACEXXXX1XXXXXXXXX2XXXXXXXXX3XXXXXXXXX4XXXXXXXXXZ

**IF TCP/IP V6:**

-------------

**TYPE OF EVENT**: RECEIVED A DISTRIBUTED DATA MESSAGE  
**NETWORK PROTOCOL**: TCP/IP V6  
**SOCKET DESCRIPTOR**: X’00000010  
**IP ADDRESS**: X’1000000000000000D3D4E7E7E7E7E9’  
**LOCAL PORT**: X’A7A7’  
**PARTNER PORT**: X’A7A7’  
**MSG LENGTH**: 52  
**MSG/FMH-5**: TRACEXXXX1XXXXXXXXX2XXXXXXXXX3XXXXXXXXX4XXXXXXXXXZ

**TYPE OF EVENT**

The type of event:

- **R** A distributed data message was received.
- **S** A distributed data message was sent.
- **F** An FMH-5 on an incoming conversation was received (only possible for VTAM conversations).
- **A** An FMH-5 to allocate a conversation was sent (only possible for VTAM conversations).

**Field Name**: QW0180E

**NETWORK PROTOCOL**

The type of network protocol:

- SNA
- TCP/IP IPV4
- TCP/IP IPV6

**Field Name**: QW0180NP

**SESSION ID or IP ADDRESS(V4), LOCAL PORT(V4), PARTNER PORT(V4)**

For SNA: this field contains the session ID. For TCP/IP: If QWH5RN is lower than 91, this field contains the 32-bit IPV4 IP address, followed by the 16-bit local port number, followed by the 16-bit partner port number.

**Field Name**: QW0180SI
IPADDRESS (V6)

The IP address for TCP/IP:
- If QWHSRN is lower than or equal to 91, this field contains the IP address in internal form.
- IF QW0180NP is equal to '01'B, this field contains an IPV4 IP address, which can be mapped.
- If QW0180NP is equal to '10'B, this field contains a 128-bit IPV6 IP address.

Field Name: QW0180IP

MODE

For SNA: the entry name of the log mode.

Field Name: QW0180LM

LOCAL PORT (V6)

The local port.

Field Name: QW0180LP

PARTNER PORT (V6)

The partner port.

Field Name: QW0180PP

MSG LENGTH

The length of the variable length area mapped by QW0180DS.

Field Name: QW0180DL

MSG/FMH-5

The variable length message or FMH-5 data. (The password in the FMH-5 or the TCP/IP message is changed to blanks.)

Field Name: QW0180DS
This topic shows detailed information about “Record Trace - IFCID 181 - IBM Service Record”.

This record is for IBM service use.
This topic shows detailed information about “Record Trace - IFCID 182 - IBM Service Record”.

This record is for IBM service use.
IFCID 183 - DRDS RDS/SCC Interface

This topic shows detailed information about “Record Trace - IFCID 183 - DRDS RDS/SCC Interface”.

This record provides information about the type of request being processed at the requester.

This record is produced only for DRDA requests.

Record trace - IFCID 183 - DRDS RDS/SCC Interface

The field labels shown in the following sample layout of “Record Trace - IFCID 183 - DRDS RDS/SCC Interface” are described in the following section.

DRDS RDS/SCC ‘BLANK’ INTERFACE NETWORKID: DEIBMIPS LUNAME: IPSAR721 LUWSEQ: 1

</tbody>
</table>

REQUEST TYPE

The type of request from the WQALCDCD field of the IFI qualification area.

Field Name: QW0188TP

READS REQUEST FLAG

The reads request flag. If the value is x'40', reads were required because more data was available than would fit in the user return area. If this occurs frequently, consider increasing the size of the user return area.

Field Name: QW0188FL

DESCRIBES

The number of data capture describes.

Field Name: QW0188MB

LONGEST LOG READ

The portion of the log read that took the longest amount of time.

Field Name: QW0188PL

BEGIN REQUEST RBA

The beginning RBA of the requested log range.

Field Name: QW0188BR

DESCRIBE ELAPSED

The elapsed time of the data capture describe.

Field Name: QW0188BT

LOG READS RETURNED

The total number of log records from which data rows are returned for this single READs request.

Field Name: QW0188RD

END REQUEST RBA

The end RBA of the requested log range.

Field Name: QW0188ER

LOG READS PERFORMED
IFCID 188 - READs Data Capture End

The number of log reads performed.

Field Name: QW0188LR

TABLES RETURNED

The number of data capture tables returned.

Field Name: QW0188TB

LOG READ ELAPSED

The elapsed time of the longest log read.

Field Name: QW0188LL

LOG RECS RETURNED

The total number of log records retrieved by one or more reads requests for IFCID 185 for a single SQL change. If the value in this field is less than the value in LOG RECS CAPTURED, then additional log records must be retrieved to obtain all log records involved in the SQL change.

Field Name: QW0188RR

DATA ROWS RETURNED

The number of data rows returned.

Field Name: QW0188DR

LOG EXTRACT ELAPSED

The log extraction elapsed time for IFCID 185 requests.

Field Name: QW0188LT

LOG RECS CAPTURED

The total number of log records captured on the log for this particular SQL change.

Field Name: QW0188LC

DATA DESCRIPTIVERET

The number of data descriptions returned.

Field Name: QW0188DD
This topic shows detailed information about “Record Trace - IFCID 190 - IBM Service Record”.

This record is for IBM service use.
This record can contain six types of data section. One header section and one 6B DSS section are always present. The other sections are only printed if they are present.

“IFCID 191 - Command and/or Reply Section” on page 40-619
This topic shows detailed information about “Record Trace - IFCID 191 - Command and/or Reply Section”.

“IFCID 191 - DB2 ZEDA” on page 40-621
This topic shows detailed information about “Record Trace - IFCID 191 - DB2 ZEDA”.

“IFCID 191 - Header Section” on page 40-622
This topic shows detailed information about “Record Trace - IFCID 191 - Header Section”.

“IFCID 191 - Late Descriptor Section” on page 40-624
This topic shows detailed information about “Record Trace - IFCID 191 - Late Descriptor Section”.

IFCID 191 - Command and/or Reply Section

This topic shows detailed information about “Record Trace - IFCID 191 - Command and/or Reply Section”.

Record trace - IFCID 191 - Command and/or Reply Section

The field labels shown in the following sample layout of “Record Trace - IFCID 191 - Command and/or Reply Section” are described in the following section.

| Field Name: QW0191RE |

**FIELD NAME**

- **QW0191RE**: Field Name: QW0191RE

**PARSE STATUS**

- **DRDASUCC**: The parse is successful.
- **DRDAFAIL**: The parse is unsuccessful.

**FIELD NAME**: QW0191PS

**CODE POINT**

- **QW0191C3**: Field Name: QW0191C3

**RELATIVE NUMBER**

- **QW0191NM**: The relative number of the data stream structure carrier.
  - **QW0191NM**: Field Name: QW0191NM

**RPY/RQS/OBJ**

- **QW0191OF**: Offset to the start of RPY/RQS/OBJ DSS within the IFCID 191 record.
  - **QW0191OF**: Field Name: QW0191OF

**PARSE FAIL**

- **QW0191RE**: Field Name: QW0191RE
IFCID 191 - Command and/or Reply Section

Offset relative to the IFCID 191 record point at which parse failed.

Field Name: QW0191FO

FD SECTION
Offset relative to the IFCID 191 record to the LATE DESCRIPTOR section.

Field Name: QW0191D1

RT SECTION
Offset relative to the IFCID 191 record to the RDTA DATA section.

Field Name: QW0191D2

LT SECTION
Offset relative to the IFCID 191 record to the FD LIDLST section.

Field Name: QW0191D3

EA SECTION
Offset relative to the IFCID 191 record to the ZEDA DATA section.

Field Name: QW0191D4
IFCID 191 - DB2 ZEDA

This topic shows detailed information about “Record Trace - IFCID 191 - DB2 ZEDA”.

DB2 ZEDA is available if the pointer EA SECTION is set on the COMMAND AND/OR REPLY section.

Record trace - IFCID 191 - DB2 ZEDA

Record trace - IFCID 191 - Header Section

The field labels shown in the following sample layout of “Record Trace - IFCID 191 - Header Section” are described in the following section.

LOCATION

The name of the remote location.

Field Name: QW0191LN

VERSION

The version number for all sections.

Field Name: QW0191VS

OBJ LEN.

The length of the failed object.

Field Name: QW0191FL

REASON

The reason code.

Field Name: QW0191RS

RECORD

The sequence number for this IFCID 191 record out of the total number of IFCID 191 records.

Field Name: QW0191NO

OF TOTAL

The total number of IFCID 191 records.

Field Name: QW0191TO

MODULE

The module name.

Field Name: QW0191MN

SOURCE

The source ID in the module.

Field Name: QW0191MI

ERROR TOKEN

The unique error token.

Field Name: QW0191TK

DDM COMMAND CODE POINT

LOCATION

The name of the remote location.

Field Name: QW0191LN

VERSION

The version number for all sections.

Field Name: QW0191VS

OBJ LEN.

The length of the failed object.

Field Name: QW0191FL

REASON

The reason code.

Field Name: QW0191RS

RECORD

The sequence number for this IFCID 191 record out of the total number of IFCID 191 records.

Field Name: QW0191NO

OF TOTAL

The total number of IFCID 191 records.

Field Name: QW0191TO

MODULE

The module name.

Field Name: QW0191MN

SOURCE

The source ID in the module.

Field Name: QW0191MI

ERROR TOKEN

The unique error token.

Field Name: QW0191TK

DDM COMMAND CODE POINT
The DDM command code point.

Field Name: QW0191C1

DB2 PARSE STATE

The DB2 parse state:

P1 Application requester parse
P2 Application server parse

Field Name: QW0191PA

RN RECEIVED

The number of relay messages received.

Field Name: QW0191RN

OBJDSS RECEIVED

The number of object data stream structures received.

Field Name: QW0191ON

DSS TOTAL

The total number of data stream structures.

Field Name: QW0191DN

ERROR TYPE

The type of error:

0 SQLSTATE is SQLCA generated
1 Reply message sent

Field Name: QW0191ER

DIMENSION

The dimension of PARSE TRACE ARRAY.

Field Name: QW0191TN

PARSE TRACE ARRAY

The last five top level parse traces. These are shown in the format STATE, EVENTS.

Field Name: QW0191PT
IFCID 191 - Late Descriptor Section

This topic shows detailed information about “Record Trace - IFCID 191 - Late Descriptor Section”.

Record trace - IFCID 191 - Late Descriptor Section

The field labels shown in the following sample layout of “Record Trace - IFCID 191 - Late Descriptor Section” are described in the following section.

| LATE DESCRIPTORS PROCESSED | 1 SQLDTAGRPTRIPLETS | 1 L1 X'D0' L2 X'D0' L3 X'E4' L4 X'F0' |

**LATE DESCRIPTORS PROCESSED**

The number of late environmental descriptors processed.

**Field Name:** QW0191LD

**SQLDTAGRPTRIPLETS**

The total number of data stream structures.

**Field Name:** QW0191GN

**L1**

SQLDTAGRPT local ID extracted.

**Field Name:** QW0191L1

**L2**

SQLCADTA local ID extracted.

**Field Name:** QW0191L2

**L3**

SQLDTA local ID extracted.

**Field Name:** QW0191L3

**L4**

SQLDTARD local ID extracted.

**Field Name:** QW0191L4

**GEOMETRY STATUS**

The FD:OCA geometry status. This field is a bit mask. The hexadecimal value of the field is printed.

- If bit 0 is on, the status of SQLDTAGRPT is OK.
- If bit 1 is on, the status of SQLCADTA is OK.
- If bit 2 is on, the status of SQLDTA is OK.
- If bit 3 is on, the status of SQLDTARD is OK.

**Field Name:** QW0191GO

IFCID 192 - DDM Level 6A Header Errors

DDM level 6A header errors show the data from IFCID 192.

“IFCID 192 - Current 6A Header” on page 40-627
This topic shows detailed information about “Record Trace - IFCID 192 - Current 6A Header”.

“IFCID 192 - DDM Level 6A Header Errors” on page 40-628
This topic shows detailed information about “Record Trace - IFCID 192 - DDM Level 6A Header Errors”.

“IFCID 192 - Previous 6A Header” on page 40-629
This topic shows detailed information about “Record Trace - IFCID 192 - Previous 6A Header”.

IFCID 192 - Current 6A Header

This topic shows detailed information about “Record Trace - IFCID 192 - Current 6A Header”.

OFFSET
Offset into the data stream of the current DDM level 6A header (that is, the invalid DDM header).
Field Name: QW0192CO

GDS LENGTH
Generalized data stream (GDS) length field.
Field Name: QW0192CL

DDM CONST
The DDM constant.
Field Name: QW0192CI

FLAG
The DDM flag byte.
Field Name: QW0192CF

REQ CORR
The DDM request correlator.
Field Name: QW0192CC
IFCID 192 - DDM Level 6A Header Errors

IFCID 192 - DDM Level 6A Header Errors

This topic shows detailed information about “Record Trace - IFCID 192 - DDM Level 6A Header Errors”.

Record trace - IFCID 192 - DDM Level 6A Header Errors

The field labels shown in the following sample layout of “Record Trace - IFCID 192 - DDM Level 6A Header Errors” are described in the following section.

REMOTE LOCATION

The name of the remote location.

Field Name: QW0192LN

VERSION NUMBER

The version number for the IFCID 192 records.

Field Name: QW0192VN

CSECT

The CSECT that detected the error.

Field Name: QW0192CS

ERROR TYPE

The DDM error type returned.

Field Name: QW0192ER

SEVERITY

The DDM severity code returned.

Field Name: QW0192SV

ERROR CODE

The DDM error code returned. For DDM protocol errors, this is the DDM PRCCNVCD value. For DDM syntax errors, this is the DDM SYNERRCD value.

Field Name: QW0192CD
IFCID 192 - Previous 6A Header

This topic shows detailed information about “Record Trace - IFCID 192 - Previous 6A Header”.

OFFSET
Offset into the data stream of the current DDM level 6A header (that is, the last valid DDM header).
Field Name: QW0192PO

GDS LENGTH
Generalized data stream (GDS) length field.
Field Name: QW0192PL

DDM CONST
The DDM constant.
Field Name: QW0192PI

FLAG
The DDM flag byte.
Field Name: QW0192PF

REQ CORR
The DDM request correlator.
Field Name: QW0192PC
IFCID 193 - UOW/SQCLCODE Mismatch

This topic shows detailed information about “Record Trace - IFCID 193 - UOW/SQCLCODE Mismatch”.

Record trace - IFCID 193 - UOW/SQCLCODE Mismatch

The field labels shown in the following sample layout of “Record Trace - IFCID 193 - UOW/SQCLCODE Mismatch” are described in the following section.

REMOTE LOCATION: SYD1
VERSION: 1
CSECT: TDG

REMOTE LOCATION
The location name of the server.
Field Name: QW0193LN

VERSION
The version number of this trace record.
Field Name: QW0193VS

CSECT
The CSECT that detected the error.
Field Name: QW0193CS

SQLCODE
The SQL code returned by the server.
Field Name: QW0193SC

COMMAND SENT
The command sent to the server.
Field Name: QW0193CO

UOW DISPOSITION
The unit of work (UOW) disposition reported by the server.
Field Name: QW0193UW
IFCID 194 - Invalid SNA FMH-5 Received

This topic shows detailed information about “Record Trace - IFCID 194 - Invalid SNA FMH-5 Received”.

Record trace - IFCID 194 - Invalid SNA FMH-5 Received

The field labels shown in the following sample layout of “Record Trace - IFCID 194 - Invalid SNA FMH-5 Received” are described in the following section.

REMOTE LOCATION
   The name of the remote location.
   Field Name: QW0194LN

VERSION NUMBER
   The version number of this trace record.
   Field Name: QW0194VN

CSECT
   The CSECT that detected the error.
   Field Name: QW0194CS

SNA SENSE CODE
   The SNA sense code describing the error.
   Field Name: QW0194SN

FMH5 DATA
   The invalid SNA FMH-5 record.
   Field Name: QW0194DS
IFCID 195 - SQLDA Discrepancy

This topic shows detailed information about “Record Trace - IFCID 195 - SQLDA Discrepancy”.

Record trace - IFCID 195 - SQLDA Discrepancy

The field labels shown in the following sample layout of “Record Trace - IFCID 195 - SQLDA Discrepancy” are described in the following section.

REMOTE LOCATION

The name of the remote location.

Field Name: QW0195LN

VERSION

The version number of this trace record.

Field Name: QW0195VI

MODULE

The name of the module.

Field Name: QW0195MN

ID

The source ID in the module.

Field Name: QW0195UI

FIELD IN ERROR

The field in error:

SQLD  The number of entries in SQLD

SQLTYPE  Data type

SQLLEN  Data length

SQLDATA  CCSID

Field Name: QW0195FD

COLUMN

The column number for the field in error.

Field Name: QW0195NO

EXISTING SQLDA

The contents in the existing SQLDA field.

Field Name: QW0195SE

NEW SQLDA

The contents in the new SQLDA field.
Field Name: QW0195SN
IFCID 196 - Timeout Data

IFCID 196 provides information on a lock request that resulted in the timeout of its DB2 task because one or more other tasks were holding incompatible locks on the requested resource. DB2 always obtains (GETMAIN$) storage for this record even if the user did not activate Statistics trace class 3 or performance trace class 6.

This topic shows detailed information about “Record Trace - IFCID 196 - Holder”.

This topic shows detailed information about “Record Trace - IFCID 196 - Timeout Header”.
IFCID 196 - Holder

This topic shows detailed information about “Record Trace - IFCID 196 - Holder”.

The header label is "H O L D E R" when the task holds the lock. The header label is "W A I T E R" when the task is a higher priority waiter of the lock.

Record trace - IFCID 196 - Holder

The field labels shown in the following sample layout of “Record Trace - IFCID 196 - Holder” are described in the following section.

**PRIMAUTH**

The authorization ID of the thread holding the resource.

Field Name: QW0196HB

**PLAN NAME**

The holder's plan name or, if there is contention with a retained lock, the word SYSTEM.

Field Name: QW0196HP

**CORR ID**

The holder's correlation ID or, if there is contention with a retained lock, the word SYSTEM.

Field Name: QW0196HR

**CONN**

The holder's connection ID or, if there is contention with a retained lock, the word SYSTEM.

Field Name: QW0196HN

**LUWID - NETWORKID, LUNAME, INSTANCE**

This field contains an asterisk (*) if the lock holder is not a database access thread (DBAT). It provides the input for the:

- Holder's network ID or, if there is contention with a retained lock, the word SYSTEM.
- Holder's LU name or, if there is contention with a retained lock, the word SYSTEM.
- Holder's LUW instance or, if there is contention with a retained lock, the word SYSTEM.

Note: This field is only valid for distributed threads.

Field Name: QW0196HL

**OWNING WORK UNIT**

The holder's owning work unit. This value is printed in hexadecimal.

If there is contention with a retained lock, this field is set to X'00'.
Field Name: QW0196HO

LOCK STATE

The holder’s lock state.

Field Name: QW0196HS

LOCK DURATION

The lock duration of the holder:

MANUAL
Varies depending on the ISOLATION parameter
(QW0196HD=x’20’)

MANUAL+1
Temporary change of consistency level from CS to RR during bind
and DDL (QW0196HD=x’21’)

COMMIT
Until commit (QW0196HD=x’40’)

COMMIT+1
Past commit; applies to locks needed to maintain the position for a
cursor opened WITH HOLD (QW0196HD=x’41’)

ALLOCATION
Until deallocation (QW0196HD=x’60’)

PLAN
For the duration of the plan (QW0196HD=x’80’)

UTIL
For the duration of the utility execution (QW0196HD=x’81’)

INTEREST
Duration used for P-locks (QW0196HD=x’FE’)

FREE ALL
Until all locks are freed (QW0196HD=x’FF’)

x’00’
Contention with a retained lock (QW0196HD=x’00’)

Field Name: QW0196HD

MEMBER

The holder’s DB2 member name. For non-data sharing environments, N/P
is shown in this field.

Field Name: QW0196HI

TRANSACT

The transaction or application name that is run.

Field Name: QWHCEUTX

WS_NAME

The end user’s workstation name.

Field Name: QWHCEUWN

END_USER

The user ID of the workstation end user. This user ID can be different from
the authorization ID used to connect to DB2. This field contains blanks if
the client does not supply this information.
Field Name: QWHCEUID

**STMT ID**

The cached statement ID for the statement holding the resource. A value of zero indicates that the client did not supply this information.

Field Name: QW0196H9

**STMT TYPE**

**STATIC**

The statement is of type static.

**DYNAMIC**

The statement is of type dynamic.

Field Name: QW0196HY
IFCID 196 - Timeout Header

This topic shows detailed information about “Record Trace - IFCID 196 - Timeout Header”.

Record trace - IFCID 196 - Timeout Header

The field labels shown in the following sample layout of “Record Trace - IFCID 196 - Timeout Header” are described in the following section.

NUMBER OF HOLDERS/WAITERS

The number of agents causing the timeout.

Field Name: QW0196NU

LOCK HASH VALUE

The hash value of the locked resource.

Field Name: QW0196RH

LOCK RES TYPE

The locked resource type.

Note: For data sharing, SKELETON CURSOR TABLE LOCKING and SKELETON PACKAGE TABLE LOCK are LP-locks (an LP-lock has an L-lock component and a P-lock component).

Field Name: QW0196RN

DBID

The database ID. This field is not applicable if the value in LOCK RES TYPE is SKELETON CURSOR TABLE LOCKING, SKELETON PACKAGE TABLE LOCK, COLLECTION, or ALTER BUFFER POOL.

Deduced from the DB2 fields QW0196KD, QW0105DN or QW0107DN.

If present, the database name is shown, otherwise the decimal identifier from QW0196KD is shown or N/A if this value is 0.

Field Name: RT0196DB

OBID

The object ID. This field is not applicable if the value in LOCK RES TYPE is SKELETON CURSOR TABLE LOCKING, SKELETON PACKAGE TABLE LOCK, COLLECTION, or ALTER BUFFER POOL.

Deduced from the DB2 fields QW0196KP, QW0105TN or QW0107TN.

If present, the object name is shown, otherwise the decimal identifier from QW0196KP is shown or N/A if this value is 0.

Field Name: RT0196OB

RESOURCE ID

The hexadecimal identifier of the small resource. If LOCK RES TYPE is:
DATA PAGE LOCKING  
First 3 bytes are the page number

DATA SET LOCKING (PARTITION)  
Last byte is the partition number

INDEX PAGE LOCKING  
First 3 bytes are the page number

HASH ANCHOR LOCK  
First 3 bytes are the page number and the last byte is the anchor point ID

CS-READ DRAIN  
Last byte is the partition number (optional)

RR-READ DRAIN  
Last byte is the partition number (optional)

WRITE DRAIN  
Last byte is the partition number (optional)

ROW LOCK  
First 3 bytes are the page number and the last byte is the row ID of the record

INDEX END OF FILE LOCK  
Last byte is the partition number (optional)

Note:
- In large partitioned table spaces, the page number covers 4 bytes instead of 3.
- If table spaces use relative page numbers, the resource ID covers 7 bytes. It contains the partition number in the first 2 bytes, the page number in the next 4 bytes, and the record ID in the seventh byte.

This field is not applicable if the value in LOCK RES TYPE is SKELETON CURSOR TABLE LOCKING, SKELETON PACKAGE TABLE LOCK, COLLECTION, TABLE LOCK, or ALTER BUFFER POOL. If the value is UTILITY SERIALIZATION LOCK or BINDLOCK, N/A is printed.

Field Name: QW0196KR

REQUESTED FUNCTION  
The victim's type of request.

Field Name: QW0196WU

REQUESTED STATE  
The victim's lock state.

Field Name: QW0196WS

REQUESTED DURATION  
The victim's lock duration.

Field Name: QW0196WD

REQUESTED FLAGS  
The victim's lock flag.

Field Name: QW0196WF
REQUESTED OWNING WORK UNIT
The victim's owning work unit.
Field Name: QW0196WO

ZPARM INTERVAL
The timeout interval of the ZPARM value.
Field Name: QW0196TI

INTERVAL COUNTER
The timeout counter for this thread.
Field Name: QW0196TC

WTR STMT ID
The cached statement ID for the statement waiting for the resource. A value of zero indicates that the client did not supply this information.
Field Name: QW0196W9

WTR STMT TYPE
The waiter statement information. Possible values are:

STATIC
The statement is of type static.

DYNAMIC
The statement is of type dynamic.
Field Name: QW0196WY
IFCID 197 - DB2 Messages

This topic shows detailed information about “Record Trace - IFCID 197 - DB2 Messages”.

This IFCID enables monitoring of DB2 messages. If this trace is enabled, all console messages will be written to IFCID 197 records. This record is written when performance trace class 18 is on.

Note: Not all messages are written to the message log. DISPLAY commands, for example, are filtered out and are not shown in the log.

Record trace - IFCID 197 - DB2 Messages

The field labels shown in the following sample layout of “Record Trace - IFCID 197 - DB2 Messages” are described in the following section.

MESSAGE ID : DSNJ003I
MESSAGE TEXT: 861 DSNJ0FF3 FULL ARCHIVE LOG VOLUME DSNB61.ARCHLOG1.D11109.T0855474.A00025B6,
STARTRBA=0026D1E34000, ENDRBA=0026D6483FFF, STARTTIME=C7A4992E13D6, ENDTIME=C7A49938F9E5,
UNIT=DASD, COPY1VOL=OMPSM2, VOLSVPAN=00, CATLG=YES.

MESSAGE ID
The message ID.

Field Name: QW0197ID

MESSAGE Text
The message text can consist of up to 2500 bytes.

Field Name: QW0197TX
IFCID 198 - Buffer Manager Page Access

This topic shows detailed information about “Record Trace - IFCID 198 - Buffer Manager Page Access”.

Record trace - IFCID 198 - Buffer Manager Page Access

The field labels shown in the following sample layout of “Record Trace - IFCID 198 - Buffer Manager Page Access” are described in the following section.

Field Name: DBID

The database ID. Deduced from the DB2 fields QW0198DB, QW0105DN or QW0107DN.

When present, the database name is shown, otherwise the decimal identifier from QW0198DB is shown or N/A if this value is 0.

Field Name: PSID

The page set object identifier. When present, this is the page set object name, otherwise the decimal identifier from QW0198OB is shown.

Field Name: BPID

The buffer pool identifier.

Field Name: FUNCTION

The page request function code.

Field Name: PAGE STATUS

The page status in the buffer pool.

Field Name: ACCESS

The page access type. This is only applicable if the value in FUNCTION is GET PAGE or RELEASE PAGE.

Field Name: PAGE

The page number.

Field Name: ACE

The relative number of the agent control element address in the ACE cross-reference table. This table is printed at the end of each location for every trace specified.
Field Name: QW0198AC

PAGE REFRESH
Page refresh status in case of a missed page in the virtual buffer pool.
Possible values:
- FROM GROUP BUFFER POOL
- FROM DASD

Field Name: QW0198PR

PARTITION
The partition number. This field contains 0 if the request is non-partitioned.

Field Name: QW0198PT

PAGE NUMBERING
Indicates how page numbers are shown:
- REL Indicates that relative page numbers are shown in the partition.
- ABS Indicates that absolute page numbers are shown in the partition.
- N/A Not applicable.

Field Name: QW0198P1
The field labels shown in the following sample layout of “Record Trace - IFCID 199 - Buffer Pool Statistics at Data Set Level” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INTERVAL STATIME COMPLETED</td>
<td>Stores the clock value at the end of the statistics interval.</td>
</tr>
<tr>
<td>DBID</td>
<td>Internal identifier of the database where the tablespace or indexspace resides.</td>
</tr>
<tr>
<td>DBNAME</td>
<td>Internal identifier of the database where the tablespace or indexspace resides.</td>
</tr>
<tr>
<td>GBP DEPENDENT</td>
<td>Indicates whether the pageset is group buffer pool dependent. This is possible only if DB2 has been set up for data sharing.</td>
</tr>
<tr>
<td>LAST IN SEQUENCE</td>
<td>Indicates if this is the last IFCID 0199 record.</td>
</tr>
<tr>
<td>OBID</td>
<td>Internal identifier of the tablespace or indexspace.</td>
</tr>
</tbody>
</table>

**INTERVAL STATIME COMPLETED**

Stores the clock value at the end of the statistics interval.

**Field Name:** QW0199TS

**DBID**

Internal identifier of the database where the tablespace or indexspace resides.

The ID can be used to match column DBID of table SYSIBM.SYSDATABASE in the DB2 catalog.

Be aware the value in the catalog may have changed since the time the DB2 trace record was written.

**Field Name:** QW0199DB

**DBNAME**

Internal identifier of the database where the tablespace or indexspace resides.

The ID can be used to match column DBID of table SYSIBM.SYSDATABASE in the DB2 catalog.

Be aware the value in the catalog may have changed since the time the DB2 trace record was written.

**Field Name:** QW0199DB

**GBP DEPENDENT**

Indicates whether the pageset is group buffer pool dependent. This is possible only if DB2 has been set up for data sharing.

**Field Name:** QW0199GD

**LAST IN SEQUENCE**

Indicates if this is the last IFCID 0199 record.

**Field Name:** QW0199LS

**OBID**
The internal identifier of the pageset. This can be either a table space or an index space.
For a table space the ID can be used to match column 'PSID' in SYSIBM.SYSTABLESPACE of the catalog.
For an index space the ID can be used to match column 'ISOBID' in SYSIBM.SYSINDEXES.
Be aware the value in the catalog may have changed since the time the DB2 trace record was written.
Field Name: QW0199OB

OBNAME

The internal identifier of the pageset. This can be either a table space or an index space.
For a table space the ID can be used to match column 'PSID' in SYSIBM.SYSTABLESPACE of the catalog.
For an index space the ID can be used to match column 'ISOBID' in SYSIBM.SYSINDEXES.
Be aware the value in the catalog may have changed since the time the DB2 trace record was written.
Field Name: QW0199OB

TYPE OF DATASET

Indicates whether the data set is a data table or an index space.
Field Name: QW0199ID

BPID

Identifies the buffer pool to which the information in this section refers:
- Values 0 through 49 are identifiers for BP0 through BP49.
- Values 80 through 89 are identifiers for BP32K through BP32K9.
- Values 100 through 109 are identifiers for BP8K through BP8K9.
- Values 120 through 129 are identifiers for BP16K through BP16K9.
Field Name: QW0199BP

SHADOW COPY

Indicates if it is a shadow data set.
Field Name: QW0199SD

PARTITION

For a partitioned table space or index space, this is the partition number.
For a nonpartitioned table space or index space, this is the data set number.
Field Name: QW0199DN

LAST STATISTICS

The timestamp of the last time this data set was externalized in the data set Statistics record. If this is the first time, this data set appears in the Statistics record, this timestamp represents the time when the data set was opened.
Field Name: QW0199SC
SYNC.I/O FOR WRITE AND READ - AVG. DELAY I/O (MS)
Average synchronous I/O delay for pages in the pageset, in milliseconds.
Field Name: QW0199SV
SYNC.I/O FOR WRITE AND READ - MAX. DELAY I/O (MS)
Maximum synchronous I/O delay for pages in the pageset, in milliseconds.
Field Name: QW0199SX
SYNC.I/O FOR WRITE AND READ - TOTAL I/O PAGES
The number of synchronous I/Os for the pageset in the reported interval.
Field Name: QW0199SP
ASYNC.I/ASYNC.I/O FOR WRITE, READ, CASTOUT - AVG. DELAY I/O (MS)
Average asynchronous I/O delay for pages in the pageset, in milliseconds.
Field Name: QW0199AD
ASYNC.I/ASYNC.I/O FOR WRITE, READ, CASTOUT - MAX. DELAY I/O (MS)
The maximum asynchronous I/O delay for pages in the pageset, in milliseconds.
Field Name: QW0199AX
ASYNC.I/ASYNC.I/O FOR WRITE, READ, CASTOUT - TOTAL I/O PAGES
Number of pages read or written asynchronously for the pageset in the reported interval.
Field Name: QW0199AP
ASYNC.I/ASYNC.I/O FOR WRITE, READ, CASTOUT - TOTAL I/O COUNT
The number of asynchronous I/Os for the pageset during the reported interval.
Field Name: QW0199AC
BUFFER POOLCached PAGES - VPOOL CACHE CURR.
Number of pageset pages in the virtual buffer pool.
Field Name: QW0199VP
BUFFER POOLCached PAGES - VPOOL CACHED CHANGED
Number of changed page set pages in the virtual buffer pool.
Field Name: QW0199VD
CURRENT GETPAGES
The current number of Getpage requests.
Field Name: QW0199GP
IFCID 201 - Alter Buffer Pool

This topic shows detailed information about “Record Trace - IFCID 201 - Alter Buffer Pool”.

This IFCID records the status of a buffer pool before and after an ALTER BUFFERPOOL command.

Record trace - IFCID 201 - Alter Buffer Pool

The field labels shown in the following sample layout of “Record Trace - IFCID 201 - Alter Buffer Pool” are described in the following section.

<table>
<thead>
<tr>
<th>FIELD NAME</th>
<th>DATA TYPE</th>
<th>DESCRIPTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>BUFFERPOOL ID</td>
<td>BP25</td>
<td>The buffer pool internal identifier. The values 0 through 49 are the identifiers for BP0 through BP49. The values 80 through 89 are the identifiers for BF32K through BF32K9.</td>
</tr>
<tr>
<td>NAME</td>
<td></td>
<td>Buffer pool name.</td>
</tr>
<tr>
<td>ALTER COMMAND</td>
<td></td>
<td>This field indicates how the buffer pool was altered. Possible values:</td>
</tr>
<tr>

IFCID 201 - Alter Buffer Pool

VPOOL SIZE (OLD)
The size of the old virtual pool.
Field Name: QW0201OP

VPOOL SIZE (NEW)
The size of the new virtual buffer pool.
Field Name: QW0201NP

VPOOL SEQ THRESH
The old and new virtual pool sequential steal threshold.
Old status taken from the DB2 field QW0201OT.
New status taken from the DB2 field QW0201NT.
Field Name: RT0201VS

VPOOL DWT THRESH
The old and new virtual pool deferred write threshold (DWT).
Old status taken from the DB2 field QW0201OD.
New status taken from the DB2 field QW0201ND.
Field Name: RT0201VD

VPOOL VDWT THRESH - PERCENTAGE
The vertical deferred write threshold for the virtual buffer pool expressed as percentage.
Old status taken from the DB2 field QW0201OV.
New status taken from the DB2 field QW0201NV.
Field Name: RT0201PC

VPOOL VDWT THRESH - BUFFERS
The vertical deferred write threshold for the virtual buffer pool expressed as an absolute number of buffers. It is only used if VERTICAL DEFERRED WRITE THRESHOLD (PERCENTAGE) is 0.
Old status taken from the DB2 field QW0201OJ.
New status taken from the DB2 field QW0201NJ.
Field Name: RT0201BU

VPOOL PLL SEQ THRESH
The old and new virtual pool parallel sequential threshold.
Old status taken from the DB2 field QW0201OQ.
New status taken from the DB2 field QW0201NQ.
Field Name: RT0201VP

ASSISTAN. SEQ THRESH
The assisting parallel sequential threshold before and after the ALTER BUFFERPOOL command was issued.
Old status taken from the DB2 field QW0201OX.
New status taken from the DB2 field QW0201NX.
Field Name: RT0201AS

PAGE STEAL METHOD

Identifies the page stealing algorithm (PGSTEAL) that is used for the virtual buffer pool. It controls when and whether performance-critical objects in buffer pools are removed from buffer pools when the space is needed by other objects. Possible values are:

- **LRU** Least recently used (LRU) objects are removed first. This means it takes away pages that are not used so that more recently used pages can remain in the virtual buffer pool. This is used by default.

- **FIFO** First-In-First-Out (FIFO) means that the oldest objects are removed first. This results in a small decrease in the cost of a Getpage operation. It can reduce internal DB2 latch contention in environments that require very high concurrency.

- **NONE** Objects are not removed from buffer pool (no page stealing). This setting provides the highest availability for business-critical objects.

Old status taken from the DB2 field QW0201OK.
New status taken from the DB2 field QW0201NK.

Field Name: RT0201PS

AUTOSIZE

The old and new status of the AUTOSIZE attribute.
Old status taken from the DB2 field QW0201OZ.
New status taken from the DB2 field QW0201NZ.

Field Name: RT0201AT

FRAMESIZE (OLD)

The size of the old frame (4 KB, 1 MB, or 2 GB).

Field Name: QW0201OC

FRAMESIZE (NEW)

The new frame size (4 KB, 1 MB, or 2 GB).

Field Name: QW0201NC

VPOOL SIZE MIN (OLD)

The minimum size of the old virtual pool.

Field Name: QW0201OA

VPOOL SIZE MIN (NEW)

The minimum size of the new virtual pool.

Field Name: QW0201NA

VPOOL SIZE MAX (OLD)

The maximum size of the old virtual pool.

Field Name: QW0201OB

VPOOL SIZE MAX (NEW)

The maximum size of the new virtual pool.
IFCID 201 - Alter Buffer Pool

Field Name: QW0201NB

SIM POOL SIZE (OLD)

The old number of simulated buffers specified for the simulated buffer pool.

Field Name: QW0201OS

SIM POOL SIZE (NEW)

The new number of simulated buffers specified for the simulated buffer pool.

Field Name: QW0201NS

SIM POOL SEQ THRESH (OLD)

The old sequential steal threshold for the simulated buffer pool, expressed as a percentage of the total simulated buffer pool size.

Field Name: QW0201OH

SIM POOL SEQ THRESH (NEW)

The new sequential steal threshold for the simulated buffer pool, expressed as a percentage of the total simulated buffer pool size.

Field Name: QW0201NH
# IFCID 202 - Buffer Pool Attributes

This topic shows detailed information about “Record Trace - IFCID 202 - Buffer Pool Attributes”.

## Record trace - IFCID 202 - Buffer Pool Attributes

The field labels shown in the following sample layout of “Record Trace - IFCID 202 - Buffer Pool Attributes” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BUFFERPOOL ID</td>
<td>Buffer pool name.</td>
</tr>
<tr>
<td>VPOOL SIZE</td>
<td>The size of the virtual buffer pool.</td>
</tr>
<tr>
<td>VPOOL VDWT THRESH BUF</td>
<td>The vertical deferred write threshold (VDWQT), shown as the number of buffers in the virtual buffer pool that might be occupied by updated pages from a single page set.</td>
</tr>
<tr>
<td>PSTEAL METHOD</td>
<td>Identifies the page stealing algorithm (PGSTEAL) that is used for the virtual buffer pool. It controls when and whether performance-critical objects in buffer pools are removed from buffer pools when the space is needed by other objects. Possible values are:</td>
</tr>
<tr>
<td>LRU</td>
<td>Least recently used (LRU) objects are removed first. This means it takes away pages that are not used so that more recently used pages can remain in the virtual buffer pool. This is used by default.</td>

## BUFFERPOOL ID

Buffer pool name.

Field Name: QDBPNM

## VPOOL SIZE

The size of the virtual buffer pool.

Old status taken from the DB2 field QW0201OP.

New status taken from the DB2 field QW0201NP.

Field Name: QDBPVPSZ

## VPOOL VDWT THRESH BUF

The vertical deferred write threshold (VDWQT), shown as the number of buffers in the virtual buffer pool that might be occupied by updated pages from a single page set.

Field Name: QDBPVQDB

## PSTEAL METHOD

Identifies the page stealing algorithm (PGSTEAL) that is used for the virtual buffer pool. It controls when and whether performance-critical objects in buffer pools are removed from buffer pools when the space is needed by other objects. Possible values are:

- **LRU**: Least recently used (LRU) objects are removed first. This means it takes away pages that are not used so that more recently used pages can remain in the virtual buffer pool. This is used by default.

- **FIFO**: First-In-First-Out (FIFO) means that the oldest objects are removed first. This results in a small decrease in the cost of a Getpage operation. It can reduce internal DB2 latch contention in environments that require very high concurrency.

- **NONE**: Objects are not removed from buffer pool (no page stealing). This setting provides the highest availability for business-critical objects.

Field Name: QDBPPGST

## VPOOL SEQ THRESH

Field Name: QDBPVSEQ

Chapter 40. IFCID Record Blocks  40-651
Virtual pool sequential threshold (VPSEQT). This threshold is a percentage of the virtual buffer pool that might be occupied by sequentially accessed pages. The pages can be in the state updated, in use, or available. Therefore, each page might count regarding exceeding any other buffer pool threshold.

The default value for VPSEQT is 80%. You can change this value to a value from 0% to 100% by using the VPSEQT option of the ALTER BUFFERPOOL command.

VPSEQT is checked before stealing a buffer for a sequentially accessed page instead of accessing the page in the virtual buffer pool. If the threshold is exceeded, DB2 tries to steal a buffer that holds a sequentially accessed page rather than one that holds a randomly accessed page.

If you set VPSEQT to 0%, sequential pages cannot occupy space in the virtual buffer pool. In this case, prefetch is disabled, and sequentially accessed pages are discarded when they are released. You can, however, set the value for HPSEQT to a value above zero and the value for VPSEQT to zero. If you set VPSEQT to 100%, sequential pages can monopolize the entire virtual buffer pool.

Field Name: QDBPVPSSH

VPOOL VDWT THRESH (%)

Vertical deferred write threshold (VDWQT). This threshold is similar to the deferred write threshold but it applies to the number of updated pages for one single page set in the buffer pool. If the percentage or number of updated pages for the data set exceeds the threshold, writes up to 128 pages are scheduled for that data set.

VDWQT can be specified in one of the following ways:

- As a percentage of the virtual buffer pool that might be occupied by updated pages from one single page set. The default value for this threshold is 5%. You can change the percentage to any value from 0% to 90%.

- As the total number of buffers in the virtual buffer pool that might be occupied by updated pages from one single page set. You can specify the number of buffers from 0 to 9999. If you want to use the number of buffers as your threshold, you must set the percentage threshold to 0.

Field Name: QDBPVDQT

PGFIX ATTRIB

Indicates whether a page is fixed in real storage when it is first used. It can have one of the following values: YES or NO.

Field Name: QDBPPFIX

PARALLEL SEQ THRESH

Virtual buffer pool parallel sequential threshold (VPPSEQT). This threshold is a part of the virtual buffer pool that might support parallel operations. It is measured as a percentage of the sequential steal threshold (VPSEQT). Setting VPPSEQT to zero disables parallel operation.

The default value for this threshold is 50% of the sequential steal threshold (VPSEQT). You can change the default value to any value from 0% to 100% by using the VPPSEQT option on the ALTER BUFFERPOOL command.

Field Name: QDBPPSQT
VPOOL DWT THRESH

This threshold is a percentage of the virtual buffer pool that might be occupied by unavailable pages, including updated pages and pages in use.

The default value for QWQT is 30%. You can change this value to any value from 0% to 90% using the DWQT option of the ALTER BUFFERPOOL command.

DB2 checks QWQT when an update to a page is complete. If the percentage of unavailable pages in the virtual buffer pool exceeds QWQT, write operations are scheduled for up to 128 pages per data set to decrease the number of unavailable buffers to 10% below QWQT. For example, if QWQT is 50%, the number of unavailable buffers is reduced to 40%.

When the limit of QWQT is reached, data sets containing the oldest updated pages are written asynchronously. DB2 continues to write pages until the ratio goes below the QWQT.

Field Name: QDBPDWQT

AUTOSIZE

Indicates if the AUTOSIZE option is activated on the ALTER BUFFERPOOL command.

Field Name: QDBPASIZ

ASS PAR SEQ THRESH

Virtual buffer pool assisting parallel sequential threshold (VPXPSEQT). This threshold is a part of the virtual buffer pool that might support parallel operations initiated from another DB2 in the data sharing group. It is measured as a percentage of VPPSEQT.

Setting VPXPSEQT to zero (default) prevents DB2 from supporting sysplex query parallelism at run time for queries that use this buffer pool.

You can change the default value to any value from 0% to 100% using the VPXPSEQT option of the ALTER BUFFERPOOL command.

Field Name: QDBPXSQT

FRAMESIZE

The frame size.

Field Name: QDBPFRAM

VPOOL SIZE MIN

The minimum size of the virtual pool.

Field Name: QDBPVPMI

VPOOL SIZE MAX

The maximum size of the virtual pool.

Field Name: QDBVPVMA

SIM POOL SIZE

The number of simulated buffers allocated in the simulated buffer pool.

Field Name: QDBPSPSZ

SIM POOL SEQ THRESH
IFCID 202 - Buffer Pool Attributes

The sequential steal threshold for the simulated buffer pool, expressed as a percentage of the total simulated buffer pool size.

Field Name: QDBSPST

QDBPSLA (Prior to DB2 11)

This field is for IBM service.

Field Name: QDBPSLA
IFCID 203 - DDF Heuristic COMMIT/ROLLBK

This topic shows detailed information about “Record Trace - IFCID 203 - DDF Heuristic COMMIT/ROLLBK”.

This record reports a heuristic decision that has forced a COMMIT or ROLLBACK for a distributed indoubt thread. The record is produced when a RECOVER INDOUBT command is issued and a remote participant in a distributed thread reports a heuristic rollback or commit during the resynchronization process.

Record trace - IFCID 203 - DDF Heuristic COMMIT/ROLLBK

The field labels shown in the following sample layout of “Record Trace - IFCID 203 - DDF Heuristic COMMIT/ROLLBK” are described in the following section.

DECISION SOURCE: LOCAL  DECISION REPORTED: COMMIT  REMOTE DECISION LOCATION: 'BLANK'

AFFECTED THREAD:    NETID: USIBMSY  LUNAME: SY00CDB2  INSTANCE: X'A73916396F69'  LUW SEQ:  1  URID: X'0000154E0AA4'

COORDINATOR LOCATION: M05EC00C
PARTICIPANT LOCATIONS:
N/P

DECISION SOURCE
The source of the decision.
Field Name: QW0203LR

DECISION REPORTED
The decision that was reported.
Field Name: QW0203CA

REMOTE DECISION LOCATION
The location, LU name, or IP address (NNN.NNN.NNN) of the location that sent the decision.
Field Name: QW0203LO

NETID
The NETID portion of logical unit of work ID (LUWID).
Field Name: QW0203NT

LUNAME
The LU name portion of the logical unit of work ID (LUWID).
Field Name: QW0203LU

INSTANCE
The instance number portion of the logical unit of work ID (LUWID).
Field Name: QW0203IN

LUW SEQ
The LUW sequence number (commit count) portion of the logical unit of work ID (LUWID).
Field Name: QW0203CM

URID
The recovery log RBA (URID) for the thread.
FIELD NAME: QW0203UR

COORDINATOR LOCATION

The location name, LU name, or IP address (NNN.NNN.NNN) of the coordinator.

FIELD NAME: QW0203CO

PARTICIPANT LOCATIONS

The location name of the participants in this unit of work that were accessed directly by this DB2 subsystem.

FIELD NAME: QW0203PA
IFCID 204 - DDF Partner Cold Start

This topic shows detailed information about “Record Trace - IFCID 204 - DDF Partner Cold Start”.

This record is written when DB2 tries to reconnect to a remote system that requests a cold start. A cold start means that the remote system has no memory of the work that was in progress when the previous connection failed. This record is only produced when DB2 has memory of threads whose outcome must be resolved.

Record trace - IFCID 204 - DDF Partner Cold Start

The field labels shown in the following sample layout of “Record Trace - IFCID 204 - DDF Partner Cold Start” are described in the following section.

LOCATION
The location, LU name, or IP address (NNN.NNN.NNN) of the remote partner that had the cold start.

Field Name: QW0204LO

OLD RECOVERY LOG
The partner’s recovery log name before the cold start.

Field Name: QW0204OR

NEW RECOVERY LOG
The partner’s recovery log name after the cold start.

Field Name: QW0204NR

NETID
The NETID portion of the logical unit of work ID (LUWID).

Field Name: QW0204NT

LUNAME
The LU name portion of the logical unit of work ID (LUWID).

Field Name: QW0204LU

INSTANCE
The instance number portion of the logical unit of work ID (LUWID).

Field Name: QW0204IN

LUW SEQ
The LUW sequence number (commit count) portion of the logical unit of work ID (LUWID).

Field Name: QW0204CM

TOKEN
The local token representing the logical unit of work ID (LUWID).

Field Name: QW0204TK
URID
The recovery log RBA (URID) for the thread.
Field Name: QW0204UR

ROLE
The role of DB2 in the LUW.
Field Name: QW0204RL

STATUS
The status of the local DB2 thread.
Field Name: QW0204TS
This topic shows the data available for IFCID 205.

“IFCID 205 - As Remembered by DB2” on page 40-660
This topic shows detailed information about “Record Trace - IFCID 205 - As Remembered by DB2”.

“IFCID 205 - As Remembered by Partner” on page 40-661
This topic shows detailed information about “Record Trace - IFCID 205 - As Remembered by Partner”.

“IFCID 205 - DDF Warm Start Log Name Error” on page 40-662
This topic shows detailed information about “Record Trace - IFCID 205 - DDF Warm Start Log Name Error”.
IFCID 205 - As Remembered by DB2

IFCID 205 - As Remembered by DB2

This topic shows detailed information about “Record Trace - IFCID 205 - As Remembered by DB2”.

Record trace - IFCID 205 - As Remembered by DB2

The field labels shown in the following sample layout of “Record Trace - IFCID 205 - As Remembered by DB2” are described in the following section.

AS REMEMBERED BY DB2  PROTOCOL: PRESUMED ROLLBACK PS HEADER USE: FLAGS LUNAME EXCHANGE: YES

PROTOCOL

The protocol used previously as remembered by DB2.

Field Name: QW0205DP

PS HEADER USE

Indicates how the PS header was previously used as remembered by DB2.

Field Name: QW0205DF

LUNAME EXCHANGE

Indicates whether the LU name of the conversation correlator was exchanged in the sync point protocol previously used as remembered by DB2.

Field Name: QW0205DC
IFCID 205 - As Remembered by Partner

This topic shows detailed information about “Record Trace - IFCID 205 - As Remembered by Partner”.

Record trace - IFCID 205 - As Remembered by Partner

The field labels shown in the following sample layout of “Record Trace - IFCID 205 - As Remembered by Partner” are described in the following section.

AS REMEMBERED BY PARTNER  PROTOCOL: PRESUMED NOTHING  PS HEADER USE: NONE  LUNAME EXCHANGE: NO

PROTOCOL

The protocol used previously as remembered by the partner.

Field Name: QW0205PP

PS HEADER USE

Indicates how the PS header was previously used as remembered by the partner.

Field Name: QW0205PF

LUNAME EXCHANGE

Indicates whether the LU name of the conversation correlator was exchanged in the sync point protocol previously used as remembered by the partner.

Field Name: QW0205PC
IFCID 205 - DDF Warm Start Log Name Error

This topic shows detailed information about “Record Trace - IFCID 205 - DDF Warm Start Log Name Error”.

This record is written when a remote site uses a recovery log name that is different to the last log name used.

Record trace - IFCID 205 - DDF Warm Start Log Name Error

The field labels shown in the following sample layout of “Record Trace - IFCID 205 - DDF Warm Start Log Name Error” are described in the following section.

LOCATION

The location or LU name of the remote partner that had the warm start.

Field Name: QW0205LO

OUR RECOVERY LOG

The name of the local DB2 subsystem's recovery log.

Field Name: QW0205OR

OUR LOG AS REMEMBERED

The name of the local DB2 subsystem's recovery log as remembered by the partner. This field shows 'BLANK' unless the exchange of log names was initiated by the partner.

Field Name: QW0205NR

PARTNER WARM START LOG

The name of the partner's warm start recovery log.

Field Name: QW0205WR

PARTNER PREVIOUS LOG

The name of the partner's previous recovery log.

Field Name: QW0205PR
IFCID 206 - DDF Protocol Error

This topic shows detailed information about “Record Trace - IFCID 206 - DDF Protocol Error”.

Record trace - IFCID 206 - DDF Protocol Error

The field labels shown in the following sample layout of “Record Trace - IFCID 206 - DDF Protocol Error” are described in the following section.

REMOTE LOCATION: USIBMSYSDBASE

LAST OPERATION: SEND  DB2 ROLE: PARTICIPANT  DETECTING SITE: REMOTE

AFFECTED THREAD: NETID: THENETID  LUNAME: T_LUNAME  INSTANCE: X'C9D5E2D5D6

COMMOT COUNT: S  TOKEN: X'FFFFFFFF'  URID: X'E409C9C4F0F6'

REMOTE LOCATION:
The location name or LU name of the remote partner involved in the protocol error.

Field Name: QW0206LO

LAST OPERATION:
Indicates whether the last network operation was a send or receive.

Field Name: QW0206SR

DB2 ROLE:
The role of DB2 in the logical unit of work (LUW).

Field Name: QW0206RL

DETECTING SITE:
The site which detected the error.

Field Name: QW0206DT

NETID:
The NETID portion of the logical unit of work ID (LUWID).

Field Name: QW0206NT

LUNAME:
The LU name portion of the logical unit of work ID (LUWID).

Field Name: QW0206LU

INSTANCE:
Field Name: QW0206IN

COMMIT COUNT
The LUW sequence number (commit count) portion of the logical unit of work ID (LUWID).
Field Name: QW0206CM

TOKEN
The local token representing the logical unit of work ID (LUWID).
Field Name: QW0206TK

URID
The recovery log RBA (URID) for the thread.
Field Name: QW0206UR

SENT
The last message sent by this DB2 site during the compare states exchange.
Field Name: QW0206MS

RCVD
The last message received by this DB2 site during the compare states exchange.
Field Name: QW0206MR

VTAM RPL
The VTAM RPL associated with the last compare states message received during the compare states exchange.
Field Name: QW0206VR

EXT
The VTAM RPL extension which describes the LU 6.2 verb indicators for the last message received.
Field Name: QW0206VX
IFCID 207 - DDF Heuristic Damage

This topic shows detailed information about “Record Trace - IFCID 207 - DDF Heuristic Damage”.

This record reports when heuristic damage is detected during the two-phase commit resynchronization. Heuristic damage occurs when a user forces an indoubt unit of work to commit or roll back and the user’s choice conflicts with the outcome chosen by the coordinator of the unit of work.

Record trace - IFCID 207 - DDF Heuristic Damage

The field labels shown in the following sample layout of “Record Trace - IFCID 207 - DDF Heuristic Damage” are described in the following section.

WHERE OCCURRED
The location, LU name, or IP address (NNN.NNN.NNN) of the location where heuristic damage occurred.

Field Name: QW0207HN

LOCAL LOCATION
The name of this location (the location writing this IFCID).

Field Name: QW0207TN

UPSTREAM COORDINATOR
The location, LU name, or IP address (NNN.NNN.NNN) of the upstream coordinator of this location. This field shows 'BLANK' if this location has no upstream coordinator.

Field Name: QW0207UN

CICS/IMS COORDINATOR
The connection name of the local CICS or IMS coordinator. This field shows 'BLANK' if no local CICS or IMS coordinator exists.

Field Name: QW0207CO

NETID
The NETID portion of the logical unit of work ID (LUWID).

Field Name: QW0207NT

LUNAME
The LU name portion of the logical unit of work ID (LUWID).

Field Name: QW0207LU

INSTANCE
The instance number portion of the logical unit of work ID (LUWID).

Field Name: QW0207IN
IFCID 207 - DDF Heuristic Damage

LUW SEQ

The LUW sequence number (commit count) portion of the logical unit of work ID (LUWID).

Field Name: QW0207CM

TOKEN

The local token representing the logical unit of work ID (LUWID).

Field Name: QW0207TK

URID

The recovery log RBA (URID) for the thread.

Field Name: QW0207UI

ROLE

The role of DB2 in the LUW.

Field Name: QW0207RL

DAMAGE SITE ACTION

The action taken by the site with the heuristic damage.

Field Name: QW0207HA

LOCAL SITE ACTION

The action taken by the local site.

Field Name: QW0207TA

UPSTREAM SITE ACTION

The action taken by the upstream coordinator if one exists.

Field Name: QW0207UA

DAMAGE SITE RECOVERY LOG

The recovery log name of the site where the heuristic damage occurred.

Field Name: QW0207HR

LOCAL SITE RECOVERY LOG

The recovery log name of the local location.

Field Name: QW0207TR

UPSTREAM SITE RECOVERY LOG

The recovery log name of the upstream coordinator (if an upstream coordinator exists).

Field Name: QW0207UR
IFCID 208 - DDF Syncpoint Protocol Error

This topic shows detailed information about “Record Trace - IFCID 208 - DDF Syncpoint Protocol Error”.

Record trace - IFCID 208 - DDF Syncpoint Protocol Error

The field labels shown in the following sample layout of “Record Trace - IFCID 208 - DDF Syncpoint Protocol Error” are described in the following section.

- **REMOTE LOCATION**: The location name or LU name of the remote partner involved in the protocol error.
  - **Field Name**: QW0208LO

- **LAST OPERATION**: Indicates whether the last network operation was a send or receive.
  - **Field Name**: QW0208SR

- **DB2 ROLE**: The role of DB2 in the LUW.
  - **Field Name**: QW0208RL

- **DETECTING SITE**: The site which detected the error.
  - **Field Name**: QW0208DT

- **LOCAL THREAD STATUS**: The status of the local DB2 thread.
  - **Field Name**: QW0208TS

- **ASSUMED REMOTE THREAD STATUS**: The assumed status of the remote thread.
  - **Field Name**: QW0208PS

- **NETID**: The NETID portion of the logical unit of work ID (LUWID).
  - **Field Name**: QW0208NT
IFCID 208 - DDF Syncpoint Protocol Error

LUNAME
The LU name portion of the logical unit of work ID (LUWID).
Field Name: QW0208LU

INSTANCE
The instance number portion of the logical unit of work ID (LUWID).
Field Name: QW0208IN

COMMIT COUNT
The LUW sequence number (commit count) portion of the logical unit of work ID (LUWID).
Field Name: QW0208CM

TOKEN
The local token representing the logical unit of work ID (LUWID).
Field Name: QW0208TK

URID
The recovery log RBA (URID) for the thread.
Field Name: QW0208UR

SENT
The last message sent by this DB2 site during sync point processing.
Field Name: QW0208MS

RCVD
The last message received by this DB2 site during sync point processing.
Field Name: QW0208MR

VTAM RPL
The VTAM RPL associated with the last compare states message received during the compare states exchange.
Field Name: QW0208VR

EXT
The VTAM RPL extension which describes the LU 6.2 verb indicators for the last message received.
Field Name: QW0208VX
IFCID 209 - DDF Syncpoint Comm Failure

This topic shows detailed information about “Record Trace - IFCID 209 - DDF Syncpoint Comm Failure”.

This record is written when a communication failure occurs after phase 1 of the SNA commit process. The thread that experiences the communication failure might still be indoubt at the participant location.

Record trace - IFCID 209 - DDF Syncpoint Comm Failure

The field labels shown in the following sample layout of “Record Trace - IFCID 209 - DDF Syncpoint Comm Failure” are described in the following section.

REMOTE PARTNER LOCATION
The location, LU name, or IP address (NNN.NNN.NNN) of the remote partner involved in the communication error.
Field Name: QW0209LO

NETID
The NETID portion of the logical unit of work ID (LUWID).
Field Name: QW0209NT

LUNAME
The LU name portion of the logical unit of work ID (LUWID).
Field Name: QW0209LU

INSTANCE
The instance number portion of the logical unit of work ID (LUWID).
Field Name: QW0209IN

LUW SEQ
The LUW sequence number (commit count) portion of the logical unit of work ID (LUWID).
Field Name: QW0209CM

TOKEN
The local token representing the logical unit of work ID (LUWID).
Field Name: QW0209TK

URID
The recovery log RBA (URID) for the thread.
Field Name: QW0209UR

ROLE
The role of DB2 in the logical unit of work (LUW).
Field Name: QW0209RL

LOCAL THREAD STATUS
IFCID 209 - DDF Syncpoint Comm Failure

The status of the local DB2 thread.

Field Name: QW0209TS
IFCID 210 - Warm Start Log Name Change

This topic shows detailed information about “Record Trace - IFCID 210 - Warm Start Log Name Change”.

This record is written when a remote site warm starts with a recovery log name that is different from its previous recovery log name. DB2 has no threads that require resolution, so the new recovery log name is accepted.

Record trace - IFCID 210 - Warm Start Log Name Change

The field labels shown in the following sample layout of “Record Trace - IFCID 210 - Warm Start Log Name Change” are described in the following section.

LOCATION: SYD2
WARM START RECOVERY LOG: CURRENT RECOVERY LOG
PREVIOUS RECOVERY LOG: PREVIOUS RECOVERY LOG

LOCATION

The location, LU name, or IP address (NNN.NNN.NNN) of the remote partner that sent the warm start indication.

Field Name: QW0210LO

WARM START RECOVERY LOG

The name of the partner's warm start recovery log.

Field Name: QW0210WR

PREVIOUS RECOVERY LOG

The name of the partner's previous recovery log.

Field Name: QW0210PR
IFCID 211 - Claim Data

This topic shows detailed information about “Record Trace - IFCID 211 - Claim Data”.

This record contains information about making and releasing a claim. One record is written for each request to make a claim or release a claim.

Record trace - IFCID 211 - Claim Data

The field labels shown in the following sample layout of “Record Trace - IFCID 211 - Claim Data” are described in the following section.

**DBID**

The database identifier of the object of the claim request. This field contains 0 if the request is for a release of all claims.

Field Name: QW0211DB

**PSID**

The page set identifier of the object of the claim request. This field contains 0 if the request is for a release of all claims.

Field Name: QW0211PS

**PARTITION NO.**

The partition number of the object of the claim request. This field contains 0 if the request is for a release of all claims or if the table space or index space is not partitioned (and the claim request is at the page set level rather than the logical partition level).

Field Name: QW0211PT

**CLAIM REQUEST TYPE**

The claim request type.

Field Name: QW0211RQ

**CLAIM CLASS**

The claim class.

Field Name: QW0211CC

**CLAIM DURATION**

The claim duration. This field shows 'BLANK' if the claim is released.

Field Name: QW0211DU

**CLAIM RESULT**

The result of the claim request.

Field Name: QW0211RC

**REASON IF CLAIM UNSUCCESSFUL**

The reason for an unsuccessful claim. This field is only printed if the value in CLAIM RESULT is UNSUCCESSFUL.

Field Name: QW0211RS
This topic shows detailed information about “Record Trace - IFCID 212 - Drain Data”.

This record contains information about requesting and releasing a drain or a pseudo drain. One record is written for each drain or release request on a claim class. Another record is written for a drain that is only waiting for the claimers to release claims and not acquiring a drain lock (pseudo drain).

**Record trace - IFCID 212 - Drain Data**

The field labels shown in the following sample layout of “Record Trace - IFCID 212 - Drain Data” are described in the following section.

Field Name: QW0212RS
IFCID 213 - Drain Lock Wait Start

This topic shows detailed information about “Record Trace - IFCID 213 - Drain Lock Wait Start”.

This record contains information about the beginning of a wait for a drain lock. For drain locks, this record is written instead of IFCID 44.

Record trace - IFCID 213 - Drain Lock Wait Start

The field labels shown in the following sample layout of “Record Trace - IFCID 213 - Drain Lock Wait Start” are described in the following section.

LOCK HASH VALUE: X'00000000'
LOCK RES TYPE: CS-READ DRAIN LOCK
IRLM FUNCTION: LOCK
REASON SUSP: LATCH CONTENTION
QW0213FL  X'00'

LOCK HASH VALUE
The hash value of the locked resource.
Field Name: QW0213LH

LOCK NAME LENGTH
The length of the lock name.
Field Name: QW0213LK

LOCK QUALIFIER
The lock qualifier.
Field Name: QW0213KQ

LOCK RES TYPE
The locked resource type or the type of locking operation.
Field Name: QW0213KT

DBID
The database ID of the object of the claim request.
Field Name: QW0213DB

PSID
The page set identifier of the object of the claim request.
Field Name: QW0213PS

PARTITION NO.
The partition number of the object of the lock request. This field contains 0 if the table space or index space is not partitioned (and the lock request is at the page set level rather than the logical partition level).
Field Name: QW0213PT

IRLM FUNCTION
The IRLM function.
Field Name: QW0213FC

STATE
IFCID 213 - Drain Lock Wait Start

The lock state.

Field Name: QW0213ST

REASON SUSP

The reason for the suspension.

Field Name: QW0213WS
IFCID 214 - Drain Lock Wait End

This topic shows detailed information about “Record Trace - IFCID 214 - Drain Lock Wait End”.

This record contains information about the end of a wait for a drain lock. For drain locks, this record is written instead of IFCID 45.

Record trace - IFCID 214 - Drain Lock Wait End

The field labels shown in the following sample layout of “Record Trace - IFCID 214 - Drain Lock Wait End” are described in the following section.

<table>

REASON FOR RESUME

The reason for the lock resume.

Field Name: QW0214R

REASON FOR SUSPEND

The reason for the suspension. The nonserviceability values are:

Field Name: QW0214SR

IRLM LATCH CONTENTION

Indicates whether IRLM latch contention occurred.

Field Name: QW0214W1

IRLM QUEUED REQUEST

Indicates whether IRLM queued request occurred.

Field Name: QW0214W2

LOCAL RESOURCE CONTENTION

Indicates whether local resource contention occurred.

Field Name: QW0214W3

GLOBAL RESOURCE CONTENTION

Indicates whether intersystem communication was required to resolve an IRLM request.

Field Name: QW0214W5

INTER-SYSTEM MESSAGE SENDING

Chapter 40. IFCID Record Blocks  40-677
Indicates whether any intersystem messages were sent.

**Field Name:** QW0214W7

**GLOBAL CONTENTION EXTENT**

The extent of global contention. This is applicable only if the value in GLOBAL RESOURCE CONTENTION is YES. The nonserviceability values are:

**Field Name:** QW0214XR

**XES GLOBAL CONTENTION**

Indicates whether XES global resource contention occurred.

**Field Name:** QW0214X3

**IRLM GLOBAL CONTENTION**

Indicates whether IRLM global resource contention occurred.

Indicates whether there was IRLM or XES global resource contention.

**Field Name:** QW0214X4
IFCID 215 - Claim Count 0 Wait Start

This topic shows detailed information about “Record Trace - IFCID 215 - Claim Count 0 Wait Start”.

This IFCID records the beginning of a wait for the number of pending claims to reach 0.

Record trace - IFCID 215 - Claim Count 0 Wait Start

The field labels shown in the following sample layout of “Record Trace - IFCID 215 - Claim Count 0 Wait Start” are described in the following section.

CLAIM CNT 0--> 'BLANK'
WAIT START  NETWORKID: DEIBMIPS LUNAME: IPSAQ811 LUWSEQ: 1
DBID: 1   PSID: 2   PARTITION NO. 3
CLAIM CLASS: RR READ  CLAIM COUNT: 20

DBID

The database identifier of the object of the drain request.

Field Name: QW0215DB

PSID

The page set identifier of the object of the drain request.

Field Name: QW0215PS

PARTITION NO.

The partition number of the object of the drain request. This field contains 0 if the object is a non-partitioned table space or non-partitioned index being drained at the page set level.

Field Name: QW0215PT

CLAIM CLASS

The claim class.

Field Name: QW0215CC

CLAIM COUNT

The number of claims pending for this resource.

Field Name: QW0215CT
IFCID 216 - Claim Count 0 Wait End

This topic shows detailed information about “Record Trace - IFCID 216 - Claim Count 0 Wait End”.

This IFCID records the end of a wait for a claim count to reach 0.

Record trace - IFCID 216 - Claim Count 0 Wait End

The field labels shown in the following sample layout of “Record Trace - IFCID 216 - Claim Count 0 Wait End” are described in the following section.

CLAIM CNT 0<-- 'BLANK'
WAIT END       NETWORKID: DEIBMIPS LUNAME: IPSAQ811 LUWSEQ: 1
DBID: 1        PSID: 2        PARTITION NO. 3
CLAIM CLASS: RR READ  REASON FOR RESUME: TIMEOUT

DBID
The database identifier of the object of the drain request.
Field Name: QW0216DB

PSID
The page set identifier of the object of the drain request.
Field Name: QW0216PS

PARTITION NO.
The partition number of the object of the drain request. This field contains 0 if the object is a non-partitioned table space or non-partitioned index being drained at the page set level.
Field Name: QW0216PT

CLAIM CLASS
The claim class.
Field Name: QW0216CC

REASON FOR RESUME
The reason for the resume.
Field Name: QW0216R
IFCID 217 - Storage Pools

This record only contains data for IFCID 217.

“IFCID 217 - Agent Local Storage Pool Sizes” on page 40-682
This topic shows detailed information about “Record Trace - IFCID 217 - Agent Local Storage Pool Sizes”.

“IFCID 217 - DBM1 Storage Pool Sizes” on page 40-685
This topic shows detailed information about “Record Trace - IFCID 217 - DBM1 Storage Pool Sizes”.

“IFCID 217 - Storage Manager Pool Statistics” on page 40-687
This topic shows detailed information about “Record Trace - IFCID 217 - Storage Manager Pool Statistics”.

</table>

**TOTAL POOL STORAGE**

Total storage in the agent local pool.

**Field Name**: QW02173T

**STORAGE CLASS**

Storage class for agent local pools.

**Field Name**: QW02173L

**CONNECTION NAME**

The connection name. Possible values are:
- For batch: BATCH
- For TSO: TSO
- For QMF: DB2CALL
- For utilities: UTILITY
- For DB2 private protocol this is the DB2 subsystem ID
- For IMS: the IMS ID
- For CICS, this is the CICS ID
- For DRDA connections from non-DB2 requesters: SERVER

**Field Name**: QW0217QN

**CORRELATION ID**

Correlation identifier.

**Field Name**: QW0217QR

**PLAN NAME**

The plan name. It is blank for a DB2 command thread; otherwise:

- **DSNESPRR**
  For SPUFI with repeatable read.

- **DSNESPSC**
  For SPUFI with cursor stability.

- **DSNUTIL**
  For utilities.

- **DSNTEP2**
  For DSNTEP2.
DSNBIND
  For binding.

The application plan name
  For IMS.

The application plan name
  For CICS.

A blank plan name
  For IMS and CICS commands.

DSQPLAN
  For QMF.

The first 8 bytes of the application name
  For DRDA connections to the common servers.

Field Name: QW0217QP

WORKSTATION NAME
  The end user’s workstation name.
Field Name: QW0217QW

TRANSACTION NAME
  The transaction or application name that is run.
Field Name: QW0217QX

MVS SUBPOOL
  MVS subpool.
Field Name: QW0217BP

FIXED STORAGE POOL
  Indicates if the storage pool is fixed.
Field Name: QW02173X

VARIA STORAGE POOL
  Indicates if the storage pool is variable.
Field Name: QW02173R

AUTHORIZATION ID
  The primary authorization ID from a connection or signon. The connection
  authorization exit and the signon authorization exit can change the
  primary authorization ID so that it differs from the original primary
  authorization ID (ORIGAUTH). Distributed authorization ID translation
  can also change the primary authorization ID.
Field Name: QW0217QC

USERID
  The user ID of the workstation end user. This user ID can be different from
  the authorization ID used to connect to DB2. This field contains blanks if
  the client does not supply this information.
Field Name: QW0217QD

QW02173H
IFCID 217 - Agent Local Storage Pool Sizes

This field is for IBM service.

Field Name: QW02173H

QW02173F

Storage pool flags:
• Fixed storage pool
• Variable storage pool
• More agent storage pool data in one or more ifcid 0217 records after this one.
• This is the last ifcid 0217 record in this sequence of agent storage pool data.
• This is a parent task for parallelism.
• This is a child task for parallelism.

Field Name: QW02173F

QW02173C

This field is for IBM service.

Field Name: QW02173C
IFCID 217 - DBM1 Storage Pool Sizes

This topic shows detailed information about “Record Trace - IFCID 217 - DBM1 Storage Pool Sizes”.

Record trace - IFCID 217 - DBM1 Storage Pool Sizes

More DBM1 local data follows, in one or more ifcid 0217 records after this one.

This is the last ifcid 0217 record in this sequence of local DBM1 data. ifcid 0217 records with agent local storage pool data follow.
IFCID 217 - DBM1 Storage Pool Sizes

Field Name: QW0217FL
IFCID 217 - Storage Manager Pool Statistics

This topic shows detailed information about “Record Trace - IFCID 217 - Storage Manager Pool Statistics”.

Record trace - IFCID 217 - Storage Manager Pool Statistics

The field labels shown in the following sample layout of “Record Trace - IFCID 217 - Storage Manager Pool Statistics” are described in the following section.

STORAGE MANAGER POOL STATISTICS

DB2 V10 TOKEN : 0

DB2 V10 TOKEN

The size of the common storage area (CSA) above the 16 MB line.

Field Name: QW0217TK
IFCID 218 - Lock Avoidance Summary

This topic shows detailed information about “Record Trace - IFCID 218 - Lock Avoidance Summary”.

This record indicates whether a successful lock avoidance test occurred during a given unit of work. The record is externalized at the agent at each commit or rollback.

Record trace - IFCID 218 - Lock Avoidance Summary

The field labels shown in the following sample layout of “Record Trace - IFCID 218 - Lock Avoidance Summary” are described in the following section.

LOCK AVOID DURING UNIT OF WORK: YES | NO. PAGE SET SUBRECORDS: | 4
DBID: INSQDB | PSID: EVENTS | LOCK AVOID DURING UNIT OF WORK: YES
DBID: DSNDB06 | PSID: SYSDBAUT | LOCK AVOID DURING UNIT OF WORK: NO

LOCK AVOID DURING UNIT OF WORK
Indicates whether there was a successful lock avoidance test during this unit of work.

Field Name: QW0218CT

NO. PAGE SET SUBRECORDS
The number of page set subrecords contained in this record. The fields DBID, PSID, and LOCK AVOID DURING UNIT OF WORK are repeated for each page set that has a lock avoidance test.

Field Name: QW0218N

DBID
The database ID.

Field Name: QW0218PD

PSID
The page set ID.

Field Name: QW0218PP

LOCK AVOID DURING UNIT OF WORK
Indicates whether there was a successful lock avoidance test for this page set during this unit of work.

Field Name: QW0218PC
IFCID 219 - Utility LISTDEF List Information

This topic shows detailed information about “Record Trace - IFCID 219 - Utility LISTDEF List Information”.

Record trace - IFCID 219 - Utility LISTDEF List Information

The field labels shown in the following sample layout of “Record Trace - IFCID 219 - Utility LISTDEF List Information” are described in the following section.

LIST NAME: LOCATION_NUMBER001 LIST TYPE: T LIST SIZE: 69287

LIST NAME

Name of list definition information.

Field Name: QW0219LN

LIST TYPE

Type of LISTDEF information:

T  Table space list.
I  Index space list.
M  Mixed list.

Field Name: QW0219LT

LIST SIZE

Number of entries in the LISTDEF.

Field Name: QW0219LS
IFCID 220 - Utility Data Set Information

This topic shows detailed information about “Record Trace - IFCID 220 - Utility Data Set Information”.

This record is written when a data set is closed.

Record trace - IFCID 220 - Utility Data Set Information

The field labels shown in the following sample layout of “Record Trace - IFCID 220 - Utility Data Set Information” are described in the following section.

DD NAME
Data definition.
Field Name: QW0220DD

DATA SET NAME
Data set name.
Field Name: QW0220DN

TEMPLATE NAME
Template name.
Field Name: QW0220TN

NO. READS
Number of READ operations.
Field Name: QW0220RD

NO. WRITES
Number of WRITE operations.
Field Name: QW0220WR

NO. CHECKS
Number of checks.
Field Name: QW0220CH

NO. EOVS
Number of End of Volumes.
Field Name: QW0220EV

I/O WAIT TIME
I/O wait time in milliseconds.
Field Name: QW0220WT

OPEN TIME STAMP
Time the data set was opened.
Field Name: QW0220OT

DEVICE TYPE
Device type:

D   DASD.
T   Tape.

Field Name: QW0220DT
IFCID 221 - Parallel Group Execution

This topic shows the data available for IFCID 221.

“IFCID 221 - Buffer Pool Constrained Data (Section Type C)” on page 40-693
This topic shows detailed information about “Record Trace - IFCID 221 - Buffer Pool Constrained Data (Section Type C)”.

“IFCID 221 - Detail Buffer Pool Constrained Data (Section Type E)” on page 40-694
This topic shows detailed information about “Record Trace - IFCID 221 - Detail Buffer Pool Constrained Data (Section Type E)”.

“IFCID 221 - Parallel Data” on page 40-695
This topic shows detailed information about “Record Trace - IFCID 221 - Parallel Data”.

“IFCID 221 - Section Type D” on page 40-698
This topic shows detailed information about “Record Trace - IFCID 221 - Section Type D”.

### IFCID 221 - Buffer Pool Constrained Data (Section Type C)

This topic shows detailed information about “Record Trace - IFCID 221 - Buffer Pool Constrained Data (Section Type C)”.

#### Record trace - IFCID 221 - Buffer Pool Constrained Data (Section Type C)

The field labels shown in the following sample layout of “Record Trace - IFCID 221 - Buffer Pool Constrained Data (Section Type C)” are described in the following section.

```
BUFFERPOOL CONstrained DATA
LENGTH: X'0010'
DBID     PSID   TYPE    BPID   WITH_SECT.E
0        0      W       7      0
0        0      W       7      0
```

**LENGTH**

The total length of all entries.

**Field Name:** QW0221CL

**DBID**

The database identifier.

**Field Name:** QW0221DB

**PSID**

The page set identifier.

**Field Name:** QW0221PS

**TYPE**

The type of page set:

<table>
<thead>
<tr>
<th>T</th>
<th>Table space</th>
</tr>
</thead>
<tbody>
<tr>
<td>I</td>
<td>Index</td>
</tr>
<tr>
<td>W</td>
<td>Work file</td>
</tr>
</tbody>
</table>

**Field Name:** QW0221TY

**BPID**

The buffer pool identifier.

**Field Name:** QW0221BP

**WITH_SECT.E**

The number of detail buffer pool constrained data sections to follow in section type E.

**Field Name:** QW0221DN
IFCID 221 - Detail Buffer Pool Constrained Data (Section Type E)

This topic shows detailed information about “Record Trace - IFCID 221 - Detail Buffer Pool Constrained Data (Section Type E)”.

LENGTH

The total length of all entries.

Field Name: QW0221CL

DB2_MEMBER

The name of the DB2 member.

Field Name: QW0221MN

CONSTRAINED

Indicates whether the DB2 member is constrained.

Field Name: QW0221CS
IFCID 221 - Parallel Data

This topic shows detailed information about “Record Trace - IFCID 221 - Parallel Data”.

Record trace - IFCID 221 - Parallel Data

The field labels shown in the following sample layout of “Record Trace - IFCID 221 - Parallel Data” are described in the following section.

LOCATION NAME
The location name or RDB name.
Field Name: QW0221LN

PKG COLLECTION ID
The package collection ID.
Field Name: QW0221PC

PROGRAM NAME
The program name.
Field Name: QW0221PN

STMT.NO
The statement number. It is the same as the QUERYNO in the PLAN_TABLE, if the PLAN_TABLE exists.
Field Name: QW0221SN

QUERYBLOCK NUMBER
The query block number. It is the same as the QBLOCKNO in the PLAN_TABLE, if the PLAN_TABLE exists.
Field Name: QW0221QN

CONS.TOKEN
The timestamp (consistency token).
Field Name: QW0221TS

PLANNED(BIND) DEGREE
The planned degree of parallelism at bind time. Parallelism decisions are made at bind time. However, the value in this field is 0 if the statement has host variables, because host variables cause the parallelism decision to be made at run time. See field PLANNED(RUN) DEGREE.
Field Name: QW0221PD

REP.SECTION TYPE
The type of the repeating section.
Field Name: QW0221TP
PARALL.GROUP NO

The parallel group number.

Field Name: QW0221GN

PLANNED(RUN) DEGREE

The planned degree of parallelism at run time. The value in this field is equal to the value in PLANNED(BIND) DEGREE unless the statement contains host variables.

Field Name: QW0221RD

ACTUAL(RUN) DEGREE

The actual degree of parallelism at run time, taking into account only those DB2 members that have enough buffer pool storage.

Field Name: QW0221AD

REP.SECTIONS

The number of repeating sections contained in this record.

Field Name: QW0221N

TYPE OF PARALLELISM

The type of parallelism:

CP CPU query parallelism

I/O I/O query parallelism

SYS Sysplex query parallelism

Field Name: QW0221MO

NUMBER OF MEMBERS

The number of DB2 members on which a query was executed during sysplex query parallel processing.

Field Name: QW0221XC

REASON

The reason for deriving the planned (runtime) degree of parallelism:

NORMAL The planned runtime degree is derived from the planned bind time degree.

HOSTVAR Host variable partitioning.

NO ESA No ESA sort support.

CURSOR The cursor might be used for an update or deletion.

EMPTY The parallel group is empty.

MVS/ESA MVS/ESA enclave services are not available.

Field Name: QW0221RN

RECORD

The position of this record in the series of IFCID 221 records.

Field Name: QW0221TR
The total number of IFCID 221 records in this series.

Field Name: QW0221NR

**HI/LO PARTITION TYPE**

Type of partition for low and high pages in the partition range. Possible values are:

**LOGICAL**

Logical low and high pages.

**PHYSICAL**

Physical low and high pages.

Field Name: QW0221ZZ
IFCID 221 - Section Type D

This topic shows detailed information about “Record Trace - IFCID 221 - Section Type D”.

Record trace - IFCID 221 - Section Type D

The field labels shown in the following sample layout of “Record Trace - IFCID 221 - Section Type D” are described in the following section.

LOW PAGE RANGE

If the partitioning scheme uses a page range, the low page number of the page range.

Field Name: QW0221PL

STATUS

The status of this partition range:

NORMAL A parallel task is created for this partition range.

EMPTY No parallel task is created for this page range.

Field Name: QW0221AN

LOW KEY RANGE

If the partitioning scheme uses a key range, the first 240 bytes of the low boundary key range.

Field Name: QW0221KL

HIGH PAGE RANGE

If the partitioning scheme uses a page range, the high page number of the page range.

Field Name: QW0221PH

HIGH KEY RANGE

If the partitioning scheme uses a key range, the first 240 bytes of the high boundary key range.

Field Name: QW0221KH
IFCID 222 - Parallel Group Elapsed Time

This topic shows detailed information about “Record Trace - IFCID 222 - Parallel Group Elapsed Time”.

This record contains parallel group elapsed time information.

Record trace - IFCID 222 - Parallel Group Elapsed Time

The field labels shown in the following sample layout of “Record Trace - IFCID 222 - Parallel Group Elapsed Time” are described in the following section.

RECORD

The position of this record in the series of IFCID 222 records.

Field Name: QW0222TR

OF

The total number of IFCID 222 records in this series.

Field Name: QW0222NR

LOCATION

The location name or RDB name.

Field Name: QW0222LN

PACKAGE

The package collection ID.

Field Name: QW0222PC

PROGRAM

The program name.

Field Name: QW0222PN

CON.TOKEN

The timestamp (consistency token).

Field Name: QW0222TS

STATEMENT NO

The statement number.

Field Name: QW0222SN

QUERY BLOCK NO

The query block number.

Field Name: QW0222QN
IFCID 222 - Parallel Group Elapsed Time

PARALLEL GROUP NO
The parallel group number.
Field Name: QW0222GN

REPEAT.GRPS
The number of repeat groups in the section.
Field Name: QW0222RN

PIPE CREATION
The time of pipe creation in DB2 timestamp format.
Field Name: QW0222PS

PIPE TERMINATION
The time of pipe termination in DB2 timestamp format.
The elapsed time between pipe creation and pipe termination in DB2
timestamp format.
Field Name: QW0222PE

SUB-PIPE CREATION
The time of subpipe creation in DB2 timestamp format.
Field Name: QW0222SS

SUB-PIPE ELAPSED
The elapsed time between subpipe creation and subpipe termination in
DB2 timestamp format.
The time of subpipe termination in DB2 timestamp format.
Field Name: QW0222SE

TASK TOKEN
The task token associated with the subpipe.
Field Name: QW0222TK

MEMBER
The name of the DB2 member that supplies the data.
Field Name: QW0222SM
IFCID 223 - Lock Avoidance Detail

This topic shows detailed information about “Record Trace - IFCID 223 - Lock Avoidance Detail”.

This record shows lock avoidance information for each successful test.

Record trace - IFCID 223 - Lock Avoidance Detail

The field labels shown in the following sample layout of “Record Trace - IFCID 223 - Lock Avoidance Detail” are described in the following section.

LOCK RES TYPE: ROW LOCK

DBID: DSND06

TABLE_SPACE_TYPE: N

RESOURCE ID: X'000000313'

PARTITION: 0

PAGE NUMBERING: ABS

QW0223U X'008500331ACA3460'

QW0223O X'008500331ACA33A0'

QW0223CL X'00'

LOCK RES TYPE

The resource type being accessed.

Field Name: QW0223KT

DBID

The database ID.

Field Name: QW0223KD

OBID

Object id of the page set or table record.

Field Name: QW0223KP

TABLE_SPACE_TYPE

The type of the table space:

L Non-EA large table

N Non-large table

R Partitioned by range (PBR) universal table spaces (UTS) that use relative page numbers

V EA-enabled large table

Field Name: QW0223TY

RESOURCE ID

The ID of the small resource.

Field Name: QW0223KR

PARTITION

Shows the partition number or 0 if non-partitioned.

Field Name: QW0223PT

PAGE NUMBERING

Indicates how page numbers are shown for partitioned tables:
**IFCID 223 - Lock Avoidance Detail**

<table>
<thead>
<tr>
<th></th>
<th>REL</th>
<th>Indicates that relative page numbers are shown in the partition.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>ABS</td>
<td>Indicates that absolute page numbers are shown in the partition.</td>
</tr>
<tr>
<td></td>
<td>N/A</td>
<td>Not applicable.</td>
</tr>
</tbody>
</table>

**Field Name:** QW0223P1
IFCID 224 - Select Procedure Bypassed

This topic shows detailed information about “Record Trace - IFCID 224 - Select Procedure Bypassed”.

This record is written at the end of a unit of work. It records the total columns for which an invalid select procedure was encountered. Invalid select procedures are bypassed by DB2 and can cause performance degradation.

Record trace - IFCID 224 - Select Procedure Bypassed

The field labels shown in the following sample layout of “Record Trace - IFCID 224 - Select Procedure Bypassed” are described in the following section.

IFCID 224 - Select Procedure Bypassed

This record is written at the end of a unit of work. It records the total columns for which an invalid select procedure was encountered. Invalid select procedures are bypassed by DB2 and can cause performance degradation.

Record trace - IFCID 224 - Select Procedure Bypassed

The field labels shown in the following sample layout of “Record Trace - IFCID 224 - Select Procedure Bypassed” are described in the following section.

SPROC BYPASSED 'BLANK'
NETWORKID: DEIBMIPS LUNAME: IPSAR721 LUWSEQ: 1
PACKAGE : PLANNAM2
COLLECTION: COLLECTIONNAME0002
COLUMNS : 128

COLUMNS

The select procedure bypass column count. This is the total number of columns (rows * columns) for which a select procedure was bypassed because the select procedure was invalidated by applying service to DB2.

Field Name: QW0224CL

PACKAGE

Package name.

Field Name: QW0224PN

COLLECTION ID

Collection identifier.

Field Name: QW0224CI
IFCID 225 - Storage MGR Pool Summary

This topic shows the data available for IFCID 225.

</table>

EXTENDED REGION SIZE (MAX)

The maximum amount of MVS private storage available above the 16 MB line.

Field Name: QW0225RG

24-BIT LOW PRIVATE

The amount of private MVS storage below the 16 MB line. This storage is obtained from bottom upward, usually for unauthorized programs.

Field Name: QW0225LO

24-BIT HIGH PRIVATE

The amount of private MVS storage below the 16 MB line. This storage is obtained from top downward, usually for authorized programs.

Field Name: QW0225HI

31-BIT EXTENDED LOW PRIVATE

The amount of private MVS storage above the 16 MB line. This storage is obtained from bottom upward, usually for unauthorized programs.

Field Name: QW0225EL

31-BIT EXTENDED HIGH PRIVATE

The amount of private MVS storage above the 16 MB line. This storage is obtained from top downward, usually for authorized programs.

Field Name: QW0225EH

CURR HIGH ADDR 24-BIT PRIV REGION

The current high address of the 24-bit private region.

Field Name: QW0225TP
CURR HIGH ADDR 31-BIT PRIV REGION
The current high address of the 31-bit private region.

Field Name: QW0225EP

31-BIT RESERVED FOR MUST COMPLETE
Storage reserved for operation that must complete before DB2 is allowed to stop.

Field Name: QW0225CR

31-BIT RESERVED FOR MVS
The amount of storage available for operating system activity.

Field Name: QW0225MV

STORAGE CUSHION WARNING TO CONTRACT
The amount of free storage, in megabytes, available in the DBM1 data space.

Field Name: QW0225SO

TOTAL 31-BIT GETMAINED STACK
Total GETMAINED storage allocated for program stack use.

Field Name: QW0225GS

TOTAL 31-BIT STACK IN USE
The amount of stack storage that is in use.

Field Name: QW0225SU

TOTAL 31-BIT VARIABLE POOL
Total storage used by all variable pools. This includes storage used by:

- System agents
- Local agents
- RID pool
- Pipe manager subpool
- Local dynamic statement cache control blocks
- Local dynamic statement cache statement pool
- Buffer and data manager trace tables
- A list of objects in restricted state including the new PRO state. If consumption of this storage pool is high, review restrictive exception state of database objects and check whether they can be resolved or reduced.

Field Name: QW0225VR

TOTAL 31-BIT FIXED POOL
Total amount of fixed storage.

Field Name: QW0225FX

TOTAL 31-BIT GETMAINED
Total storage acquired by GETMAIN. This includes space for virtual pools, EDM pool, compression dictionary, castout buffers, and the data space lookaside buffer, and data space buffer pool control blocks.
This figure can be different from the sum of GETMAIN storage items shown in the statistics DBM1 storage, because DB2 does not produce grouping statistics for all GETMAIN storage.

Field Name: QW0225GM

**AMOUNT OF AVAILABLE 31-BIT**

The total amount of storage available for storage manager pools.

Field Name: QW0225AV

**SYSTEM AGENT STACK STORAGE IN USE**

The amount of 31-bit stack storage that is in use for system agents. This is a subset of QW0225SU.

Field Name: QW0225SS

**TOTAL 64-BIT VARIABLE POOL**

Amount of variable storage available above the 2 GB bar.

Field Name: QW0225VA

**TOTAL 64-BIT FIXED**

The total amount of fixed storage above the 2 GB bar.

Field Name: QW0225FA

**TOTAL 64-BIT GETMAINED**

Total storage acquired by GETMAIN. This includes space for the compression dictionary, and statement and DBD cache that can be used by the Environmental Descriptor Manager (EDM).

This figure can be different from the sum of GETMAIN storage items shown in the statistics DBM1 storage, because DB2 does not produce grouping statistics for all GETMAIN storage.

Field Name: QW0225GA

**TOTAL 64-BIT PRIVATE FOR STOR MANAG**

Total 64-bit storage allocated for storage manager control structures.

Field Name: QW0225SM

**REAL 4K FRAMES IN USE**

Number of real-storage frames (4K) in use for 31- and 64-bit private pools.

Field Name: QW0225RL

**AUXILIARY SLOTS IN USE**

Number of auxiliary slots (4K) in use for 31- and 64-bit private pools.

Field Name: QW0225AX

**64-BIT REAL 4K FRAMES IN USE**

The number of real 4K frames in use for 64-bit private pools.

Note: This value is available from z/OS V1.11.

Field Name: QW0225HVPAGESINREAL

**64-BIT 4K AUX SLOTS IN USE**
The number of auxiliary 4K slots in use for 64-bit private pools.

Note: This value is available from z/OS V1.11.

Field Name: QW0225HVAUXSLOTS

**ABOVE VALUE W/O BP STORAGE**

Number of real-storage frames (4K) in use for 64-bit private pools. This is a subset of QW0225HVPagesInReal and does not include buffer pool storage.

Note: This field is available in z/OS 1.10 (and maintenance) or later.

Field Name: QW0225PRISTG_REAL

**ABOVE VALUE W/O BP STORAGE**

Number of auxiliary slots (4K) in use for 64-bit private pools. This does not include buffer pool storage. This field only includes auxiliary slots occupied by pages that are paged out.

Note: This field is available in z/OS 1.10 (and maintenance) or later.

Field Name: QW0225PRISTG_AUX

**HWM 64-BIT REAL 4K FRAMES IN USE**

The number of real 4K frames in use for 64-bit private pools.

Note: This value is available from z/OS V1.11.

Field Name: QW0225HVPAGESINREAL

**HWM 64-BIT AUX SLOTS IN USE**

High water mark for the number of auxiliary 4K slots in use for 64-bit private pools.

Note: This value is available from z/OS V1.11.

Field Name: QW0225HVGAUXSLOTS

**QW0225CTLP (S)**

This field is for IBM service.

Field Name: QW0225CTLP

**QW0225CTLS (S)**

This field is for IBM service.

Field Name: QW0225CTLS
IFCID 225 - IRLM Pool Statistics

This topic shows detailed information about “Record Trace - IFCID 225 - IRLM Pool Statistics”.

Record trace - IFCID 225 - IRLM Pool Statistics

The field labels shown in the following sample layout of “Record Trace - IFCID 225 - IRLM Pool Statistics” are described in the following section.

</tbody>
</table>

ATB CSA CURRENT

The total amount of 64-bit common storage that is currently in use by IRLM pools.

Field Name: QW0225I_ABCSA

ATB CSA HIGH WATER MARK

The high-water mark of 64-bit common storage allocated by IRLM pools.

Field Name: QW0225I_ABCSH

ATB PRIVATE CURRENT

The total amount of 64-bit private storage in use by IRLM pools.

Field Name: QW0225I_ABPVT

ATB PRIVATE HIGH WATER MARK

The high-water mark of 64-bit private storage allocated by IRLM pools.

Field Name: QW0225I_ABPVH

ATB PRIVATE MAX AVAILABILITY

The threshold of virtual 64-bit private storage available for normal IRLM execution. Only requests for storage by ’must complete’ tasks will be granted if this threshold is exceeded.

Field Name: QW0225I_APMAX

BTB PRIVATE CURRENT

The total amount of 31-bit private storage currently in use by IRLM pools.

Field Name: QW0225I_BBPVT

BTB PRIVATE HIGH WATER MARK

The high-water mark of 31-bit private storage allocated by IRLM pools.

Field Name: QW0225I_BBPVH

BTB PRIVATE MAX AVAILABILITY

The threshold of 31-bit private storage available for normal IRLM execution. Only requests for storage by "must complete" tasks will be granted if this threshold is exceeded.
Field Name: QW0225I_BPMAX

**ECSA CURRENT**

The total amount of Extended Common Service Area (ECSA) storage in use by IRLM pools.

Field Name: QW0225I_BBECSA

**ECSA HIGH WATER MARK**

The high-water mark of ECSA storage allocated by IRLM pools.

Field Name: QW0225I_BBECSAH
Record trace - IFCID 225 - Statement Cache / XPROC Detail

HWM ALLOCATED 31-BIT XPROC DYNAMIC SQL : 0

ALLOCATED STOR FOR DYN SQL STMTS

The total shareable storage allocated for dynamic SQL statements used by active threads.

**Field Name:** QW0225SC

REQUESTED STOR FOR DYN SQL STMTS

The total shareable storage requested for dynamic SQL statements used by active threads.

**Field Name:** QW0225LS

ALLOCATED STOR FOR STATIC SQL STMTS

The total shareable storage allocated for static SQL statements.

**Field Name:** QW0225SX

HWM REQUESTED STOR FOR DYN SQL STMTS

A statistics interval high-water mark of requested shareable storage for dynamic SQL statements used by active threads.

**Field Name:** QW0225HS

ALLOCATED STOR FOR STMT DEPENDENCIES

The amount of storage allocated above the 2 GB bar to support object dependencies on statements that are in the Dynamic Statement Cache.

**Field Name:** QW0225DM

TOTAL 31-BIT XPROC DYNAMIC SQL

The amount of storage allocated for the local cache storage pool below the bar.

**Note:** For DB2 10, the storage is allocated for executable code sequences of dynamic SQL statements.

**Field Name:** QW0225SC

ALLOCATED 31-BIT XPROC DYNAMIC SQL
The amount of storage used for thread copies in the local cache storage pool below the bar. This is a subset of the total allocated storage for thread copies QW0225SC.

Note: For DB2 10, the storage is used for executable code sequences of dynamic SQL statements.

Field Name: QW0225LS

TOTAL 31-BIT XPROC STATIC SQL

The amount of storage allocated below the bar for executable code sequences of static SQL statements.

Field Name: QW0225SX

HWM ALLOCATED 31-BIT XPROC DYNAMIC SQL

A statistics interval high-water mark of allocated storage for thread copies in the local cache storage pool below the bar.

Note: For DB2 10, the high water mark is related to executable code sequences of dynamic SQL statements.

Field Name: QW0225HS

STATEMENTS IN 64-BIT AGENT LOCAL POOLS (ALP)

The number of dynamic SQL local cache statements used by active threads. This value is related to shared agent local variable pools above the bar.

Field Name: QW0225LC

HWM STMT COUNT IN 64-BIT ALP AT HIGH STOR TIME

The number of dynamic SQL local cache statements used by active threads at high storage time. This value is related to shared agent local variable pools above the bar.

Field Name: QW0225HC

ALLOCATED STMT CACHE IN 64-BIT ALP

The total non-shareable storage requested for dynamic SQL statements used by active threads. This value is related to shared agent local variable pools above the bar.

Field Name: QW0225L2

HWM ALLOCATED STMT CACHE 64-BIT ALP

This value is related to shared agent local variable pools above the bar.

Field Name: QW0225H2

TIMESTAMP OF HWM AFTER LAST 225 REC

The timestamp at high-water storage.

Field Name: QW0225HT

TOTAL 64-BIT STMT CACHE BLKS 2G

The total statement cache storage blocks above the bar (64-bit shared variable pool).

Field Name: QW0225S2

QW0225F1
IFCID 225 - Statement Cache / XPROC Detail

This field is for IBM service.

**31-BIT COMMON FIXED POOL STORAGE**

The amount of storage allocated for 31-bit common fixed pool storage.

**Field Name:** QW0225FC

**31-BIT COMMON VARIABLE POOL STORAGE**

The amount of storage allocated for 31-bit common variable pool storage.

**Field Name:** QW0225VC

**31-BIT COMMON GETMAINED STORAGE**

The amount of storage allocated for 31-bit common getmained storage.

**Field Name:** QW0225GC

**EXTENDED CSA SIZE**

The size of the common storage area (CSA) above the 16 MB line.

**Field Name:** QW0225EC

**64-BIT COMMON FIXED POOL STORAGE**

The amount of storage allocated for 64-bit common fixed pool storage.

**Field Name:** QW0225FCG

**64-BIT COMMON VARIABLE POOL STORAGE**

The amount of storage allocated for 64-bit common variable pool storage.

**Field Name:** QW0225VCG
64-BIT COMMON GETMAINED STORAGE
The amount of storage allocated for 64-bit common getmained storage.
Field Name: QW0225GCG

64-BIT COMMON STORAGE-STOR MGR CTRL
The amount of storage allocated for 64-bit common storage for storage manager control structures.
Field Name: QW0225SMC

64-BIT SHARED VARIABLE POOL STORAGE
The amount of virtual shared variable storage above the 2 GB bar.
Field Name: QW0225SV

64-BIT SHARED FIXED POOL STORAGE
The amount of total fixed virtual shared storage above the 2 GB bar.
Field Name: QW0225SF

64-BIT SHARED GETMAINED STORAGE
The amount of virtual shared storage acquired by GETMAIN above the 2 GB bar.
Field Name: QW0225SG

64-BIT SHARED STORAGE-STOR MGR CTRL
The amount of 64-bit shared storage allocated for storage manager control structures.
Field Name: QW0225SMS

64-BIT SHARED SYSTEM AGENT STACK (AS)
The amount of 64-bit shared storage allocated for system agent stack use.
Field Name: QW0225GSG_SYS

64-BIT SHARED SYSTEM AS IN USE
The amount of 64-bit shared system agent stack that is in use.
Field Name: QW0225SUG_SYS

64-BIT SHARED NON-SYSTEM AS
The amount of 64-bit shared storage allocated for non-system agent stack use.
Field Name: QW0225GSG

64-BIT SHARED NON-SYSTEM AS IN USE
The amount of 64-bit shared non-system agent stack that is in use.
Field Name: QW0225SUG

SHARED MEMORY OBJECTS
The number of shared memory objects allocated for this MVS LPAR.
Field Name: QW0225SHRNMOMB

64-BIT SHARED MEMORY PAGES
The number of 64-bit shared memory pages allocated for this MVS LPAR (this count includes hidden pages).

Field Name: QW0225SHRPAGES

**HWM FOR 64-BIT SHARED BYTES**

High water mark for number of 64-bit shared bytes for this MVS LPAR.

Field Name: QW0225SHRRGBABytes

**64-BIT SHARED PAGES BACKED IN REAL**

The number of 64-bit shared pages backed in real storage (4K pages) for this MVS LPAR.

Field Name: QW0225SHRINREAL

**AUX SLOTS USED FOR 64-BIT SHARED STOR**

The number of auxiliary slots used for 64-bit shared storage for this MVS LPAR.

Field Name: QW0225SHRAUXSLOTS

**64-BIT PAGES PAGED IN FROM AUX STOR**

The number of 64-bit shared pages paged in from auxiliary storage for this MVS LPAR.

Field Name: QW0225SHRPAGEINS

**64-BIT PAGES PAGED OUT TO AUX STOR**

The number of 64-bit shared pages paged out to auxiliary storage for this MVS LPAR.

Field Name: QW0225SHRPAGEOUTS

**64-BIT SHARED STG REAL 4K FRMS IN USE**

The number of real-storage frames (4K) in use for 64-bit shared storage. This does not include shared stack storage. This is recorded at the subsystem level.

Note: This field is available in z/OS 1.10 (and maintenance) or later.

Field Name: QW0225SHRSTG_REAL

**64-BIT SHARED STG 4K AUX SLOTS IN USE**

The number of auxiliary slots (4K) in use for 64-bit shared storage. This does not include shared stack storage. This is recorded at the subsystem level. This field only includes auxiliary slots occupied by pages that are paged out.

Note: This field is available in z/OS 1.10 (and maintenance) or later.

Field Name: QW0225SHRSTG_AUX

**64-BIT STACK STG REAL 4K FRMS IN USE**

The number of real-storage frames (4K) in use for 64-bit shared stack storage. This is recorded at the subsystem level.

Note: This field is available in z/OS 1.10 (and maintenance) or later.

Field Name: QW0225SHRSTKSTG_REAL
IFCID 225 - Shared/Common Storage Summary

64-BIT STACK STG 4K AUX SLOTS IN USE
The number of auxiliary slots (4K) in use for 64-bit shared stack storage. This is recorded at the subsystem level. This field only includes auxiliary slots occupied by pages that are paged out.

Note: This field is available in z/OS 1.10 (and maintenance) or later.

Field Name: QW0225SHRSTKSTG_AUX

64-BIT COMMON STG REAL 4K FRMS IN USE
The number of real-storage frames (4K) in use for 64-bit common storage. This is recorded at the subsystem level.

Note: This field is available in z/OS 1.10 (and maintenance) or later.

Field Name: QW0225COMSTG_REAL

64-BIT COMMON STG 4K AUX SLOTS IN USE
The number of auxiliary slots (4K) in use for 64-bit common storage. This is recorded at the subsystem level. This field only includes auxiliary slots occupied by pages that are paged out.

Note: This field is available in z/OS 1.10 (and maintenance) or later.

Field Name: QW0225COMSTG_AUX

LOG MGR WRITE BUFFER FRAMES IN REAL
The number of real-storage frames (4K) in the 64-bit common area in use for Log Manager write buffers.

Field Name: QW0225_LMWRITE_REAL

LOG MANAGER CONTROL FRAMES IN REAL
The number of real-storage frames (4K) in the 64-bit common area in use for Log Manager control blocks.

Field Name: QW0225_LMCTRL_REAL

LOG MGR WRITE BUFFER FRAMES IN AUX
The number of auxiliary slots (4K) in the 64-bit common area in use for Log Manager write buffers.

Field Name: QW0225_LMWRITE_AUX

LOG MANAGER CONTROL FRAMES IN AUX
The number of auxiliary slots (4K) in the 64-bit common area in use for Log Manager control blocks.

Field Name: QW0225_LMCTRL_AUX

QW0225_ECSA_CONV
This field is for IBM service.

Field Name: QW0225_ECSA_CONV

QW0225LFAREA
This field is for IBM service (DB2 Field: QW0225LFAREA).

Field Name: QW0225LFAREA
QW0225_RS

This field is for IBM service (DB2 field: QW0225_RS).

Field Name: QW0225_RS
ICCID 225 - Storage Pool Details

This topic shows detailed information about “Record Trace - ICCID 225 - Storage Pool Details”.

Record trace - ICCID 225 - Storage Pool Details

The field labels shown in the following sample layout of “Record Trace - ICCID 225 - Storage Pool Details” are described in the following section.

STORAGE POOL DETAILS

31-BIT DBM1 PRIVATE VARIABLE POOLS:
AGENT LOCAL STORAGE : 2162688
BUFFER MANAGER STORAGE BLOCKS : 651264

64-BIT POOLS:
SHARED AGENT LOCAL (VARIABLE POOL) : 27615232
SHARED SYSTEM AGENT (VARIABLE POOL) : 26210304
RID POOL STORAGE (FIXED POOL) : 0
ARRAY VARIABLE STORAGE : 0

AGENT LOCAL STORAGE

The amount of storage allocated for agent-related local storage. This storage is used for operations such as sort.

Background and Tuning Information

Sorting requires a large amount of virtual storage because there can be multiple copies of the data being sorted at a given time.

DB2 Sort uses two kinds of storage pool for various internal control structures and data records, an agent-related local storage pool and a global sort pool. To take advantage of the 64-bit addressability for larger storage pool, some high level sort control structures are kept in agent-related storage below the 2 GB bar, which contain 64-bit pointers to areas in the global sort pool above the 2 GB bar. The sort pool above 2 GB contains sort tree nodes and data buffers.

Field Name: QW0225AL

SYSTEM AGENT STORAGE

Storage used by system agents.

Field Name: QW0225AS

BUFFER MANAGER STORAGE BLOCKS

Storage used for page set control blocks.

Field Name: QW0225BB

SHARED AGENT LOCAL (VARIABLE POOL)

The amount of storage allocated for agent-related 64-bit local storage (DB2 field: QW0225ALG).

Field Name: QW0225ALG

SHARED SYSTEM AGENT (VARIABLE POOL)

The amount of 64-bit storage used by system agents (DB2 field: QW0225ASG).

Field Name: QW0225ASG

RID POOL STORAGE (FIXED POOL)

Storage for RID list processing such as list prefetch, index ANDing, and ORing.
Field Name: QW0225RP

COMPRESSION DICT (DBM1 PRIVATE)

Storage space allocated for the compression dictionary.

Field Name: QW0225CD

ARRAY VARIABLE STORAGE

The amount of storage in use for array variables.

Field Name: QW0225AR
IFCID 225 - Thread Information

This topic shows detailed information about “Record Trace - IFCID 225 - Thread Information”.

Record trace - IFCID 225 - Thread Information

The field labels shown in the following sample layout of “Record Trace - IFCID 225 - Thread Information” are described in the following section.

<table>
<thead>
<tr>
<th>THREAD INFORMATION</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>ACTIVE THREADS</td>
<td>2</td>
</tr>
<tr>
<td>CASTOUT ENGINES</td>
<td>0</td>
</tr>
<tr>
<td>GBP WRITE ENGINES</td>
<td>0</td>
</tr>
<tr>
<td>P-LOCK/NOTIFY EXIT ENGINES</td>
<td>0</td>
</tr>
</tbody>
</table>

ACTIVE THREADS

The number of active allied threads.

Field Name: QW0225AT

ACTIVE AND DISCONNECTED DBATS

The number of active and disconnected DBAT threads.

Field Name: QW0225DB

CASTOUT ENGINES

Number of engines available for data-sharing castout processing.

Field Name: QW0225CE

DEFERRED WRITE ENGINES

Number of engines used for deferred write operations.

Field Name: QW0225DW

GBP WRITE ENGINES

Number of engines for group buffer pool writes.

Field Name: QW0225GW

PREFETCH ENGINES

Number of engines used for sequential, list, and dynamic prefetch.

Field Name: QW0225PF

P-LOCK/NOTIFY EXIT ENGINES

Number of data sharing P-Lock engines and Notify Exit engines.

Field Name: QW0225PL

PARALLEL CHILD THREADS

The number of active parallel child threads.

Field Name: QW0225PT
IFCID 226 - Page Latch Contention Start

This topic shows detailed information about “Record Trace - IFCID 226 - Page Latch Contention Start”.

This IFCID records the beginning of an agent suspend to wait for a page latch that is currently held by another agent.

Record trace - IFCID 226 - Page Latch Contention Start

The field labels shown in the following sample layout of “Record Trace - IFCID 226 - Page Latch Contention Start” are described in the following section.

DBID: DSND07
PSID: DSNK00
PAGE NUMBER: X'000001'
PARTITION: 0
TABLE_SPACE_TYPE: N
BUFFERPOOL ID: 7
ACE TOKEN: 1

DBID
The database ID. Deduced from the DB2 fields QW0226DB, QW0105DN or QW0107DN.
When present, the database name is shown, otherwise the decimal identifier from QW0226DB is shown or N/A when this value is 0.
Field Name: RT0226DB

PSID
The page set object identifier. When present, this is the page set object name, otherwise the decimal identifier from QW0226OB is shown.
Field Name: RT0226OB

PAGE NUMBER
The number of the page being read or written. If the value in TABLE_SPACE_TYPE is L or V, the page number covers 4 bytes instead of 3.
Field Name: QW0226PN

LATCH TYPE
The type of latch.
Field Name: QW0226F

PARTITION
Shows the partition number or 0 if non-partitioned.
Field Name: QW0226PT

PAGE NUMBERING
Indicates how page numbers are shown for partitioned tables:

| REL  | Indicates that relative page numbers are shown in the partition. |
| ABS  | Indicates that absolute page numbers are shown in the partition. |
| N/A  | Not applicable. |
Field Name: QW0226P1

TABLE SPACE TYPE
The type of the table space:

L  Non-EA large table
N  Non-large table
R  Partitioned by range (PBR) universal table spaces (UTS) that use relative page numbers
V  EA-enabled large table

Field Name: QW0226FG

BUFFEROOPOOL ID

The buffer pool internal identifier. The values 0 through 49 are the identifiers for BP0 through BP49. The values 80 through 89 are the identifiers for BP32K through BP32K9.

Field Name: QW0226BP

ACE TOKEN

The agent control element token of the requester.

Field Name: QW0226AC
IFCID 227 - Page Latch Contention End

This topic shows detailed information about “Record Trace - IFCID 227 - Page Latch Contention End”.

This IFCID records the end of an agent suspend wait for a page latch that was currently held by another agent.

Record trace - IFCID 227 - Page Latch Contention End

The field labels shown in the following sample layout of “Record Trace - IFCID 227 - Page Latch Contention End” are described in the following section.

DBID: DSNDB07   PSID: DSN4K00
PAGE NUMBER: X'000001'   CANCEL STATUS: N
PARTITION: 1   PAGE NUMBERING: ABS
ACE TOKEN: 1   TABLE_SPACE_TYPE: N

DBID
The database ID. Deduced from the DB2 fields QW0227DB, QW0105DN or QW0107DN.
When present, the database name is shown, otherwise the decimal identifier from QW0227DB is shown or N/A when this value is 0.
Field Name: RT0227DB

PSID
The page set object identifier. When present this is the page set object name, otherwise it is the decimal identifier from QW0227OB.
Field Name: RT0227OB

PAGE NUMBER
The number of the page being read or written. If the value in TABLE_SPACE_TYPE is L or V, the page number covers 4 bytes instead of 3.
Field Name: QW0227PN

CANCEL STATUS
Indicates whether the latch requester was canceled.
Field Name: QW0227F

PARTITION
Shows the partition number or 0 if non-partitioned.
Field Name: QW0227PT

PAGE NUMBERING
Indicates how page numbers are shown for partitioned tables:

- REL Indicates that relative page numbers are shown in the partition.
- ABS Indicates that absolute page numbers are shown in the partition.
- N/A Not applicable.
Field Name: QW0227P1

ACE TOKEN
IFCID 227 - Page Latch Contention End

The agent control element token of the requester.

Field Name: QW0227AC

TABLE SPACE TYPE

The type of the table space:

L  Non-EA large table
N  Non-large table
V  EA-enabled large table

Field Name: QW0227FG
IFCID 228 - Archive Deallocation Start

This topic shows detailed information about “Record Trace - IFCID 228 - Archive Deallocation Start”.

Record trace - IFCID 228 - Archive Deallocation Start

The field labels shown in the following sample layout of “Record Trace - IFCID 228 - Archive Deallocation Start” are described in the following section.

QW0228DV  1  QW0228DI  'C6D9C5C4F1404040'
IFCID 229 - Archive Deallocation End

This topic shows detailed information about “Record Trace - IFCID 229 - Archive Deallocation End”.

Record trace - IFCID 229 - Archive Deallocation End

The field labels shown in the following sample layout of “Record Trace - IFCID 229 - Archive Deallocation End” are described in the following section.

QW0229DV 1 QW0229CC 'BLANK'
IFCID 230 - Group Buffer Pool Attributes

This topic shows detailed information about “Record Trace - IFCID 230 - Group Buffer Pool Attributes”.

Each repeating section contains information about each group buffer pool to which this DB2 data sharing member is currently connected.

Record trace - IFCID 230 - Group Buffer Pool Attributes

The field labels shown in the following sample layout of “Record Trace - IFCID 230 - Group Buffer Pool Attributes” are described in the following section.

GROUP BUFFERPOOL ID
Group buffer pool name.
Field Name: QBGBGN

ERROR FLAGS
Indicates whether errors occurred during data collection:

X'00'  There were no errors.
X'01'  An error occurred when the group buffer pool attributes were read from the SCA.
X'02'  An addressing error occurred when the DB2 control blocks were accessed. The data collection process did not obtain serialization.

Field Name: QBGBFLGS

ALLOCATED GBPOOL SIZE (4K)
The allocated size of the group buffer pool in 4 KB blocks.
Field Name: QBGBGSZ

CURRENT DIR TO DATA RATIO
The current directory entry to data entry ratio.
For ALTER GROUPBUFFERPOOL commands, this field reports the value specified in the RATIO keyword.
Field Name: QBGBGR1

CLASS CASTOUT THRESH (%)
The threshold at which the class castout is to be initiated. It is expressed as a percentage of the size of the group buffer pool.
For ALTER GROUPBUFFERPOOL commands, it reports the value specified in the CLASST keyword.
Field Name: QBGBGCT

ACTUAL # OF DIR ENTRIES
The actual number of allocated directory entries.
Field Name: QBGBGDR

PENDING DIR TO DATA RATIO

The pending directory entry to data entry ratio.

Field Name: QBGBGR2

CLASS CASTOUT THRESH (PGS)

The threshold at which the castout is to be initiated for the group buffer pool. It is expressed as a percentage of the size of the group buffer pool.

For ALTER GROUPBUFFERPOOL commands, it reports the value specified in the GBPOOLT keyword.

Field Name: QBGBGTT

ACTUAL # OF DATA ENTRIES

The actual number of allocated data entries.

Field Name: QBGBGDT

GBP CHECKPOINT INTERVAL (MIN)

The time interval, in minutes, between successive group buffer pool checkpoints.

For ALTER GROUPBUFFERPOOL commands, it reports the value specified in the GBPCHKPT keyword.

Field Name: QBGBGCK

GBP CASTOUT THRESH (%)

The threshold at which the castout is to be initiated for the group buffer pool. It is expressed as a percentage of the size of the group buffer pool.

For ALTER GROUPBUFFERPOOL commands, it reports the value specified in the GBPOOLT keyword.

Field Name: QBGBGTT

DIRECTORY-ENTRY-RECLAIM

The number of times that a page name assignment required that a coupling facility directory entry be reclaimed (stolen).

Field Name: QBGBDRR

DATA-ENTRY-RECLAIM

The number of times that a page name assignment required that a coupling facility data entry be reclaimed (stolen).

Field Name: QBGBDTR

AUTOREC

Indicates whether automatic recovery takes place in the event of a structure failure or a loss of connectivity. When automatic recovery is active, all members of the group are recovered to the group buffer pool.

Field Name: QBGBGAS

TOTAL-CHANGED

The number of allocated data entries that are currently in changed state. This is a snapshot value and is not cumulative.
FIELD NAME: QBGBTCC

**XI-DIRECTORY-ENTRY-RECLAIM**

The number of times that a directory entry was stolen and one or more XI signals had to be sent because the page in the directory was cached in one or more DB2 buffer pools.

FIELD NAME: QBGBRXI

**GBP CACHE**

GBP cache attribute. Possible values are:

- **YES**  GBP is used for both data caching and cross-invalidation.
- **NO**  GBP is used for cross-invalidation only.

FIELD NAME: QBGBGCS

**MODE**

Simplex or duplex mode indicator.

FIELD NAME: QBGBDUP

**SEC-GBP ALLOC**

The allocated size of the secondary GBP when the GBP is DUPLEX.

This field is not shown when MODE is SIMPLEX.

FIELD NAME: QBGBGSZ2

**SEC-GBP ALLOC DIRECTORIES**

Number of allocated directory entries in the secondary GBP when MODE is DUPLEX.

FIELD NAME: QBGBGDR2

**SEC-GBP DATA ENTRIES**

The allocated data entries in the secondary GBP when MODE is DUPLEX.

FIELD NAME: QBGBGDT2
IFCID 231 - Parallel Group Task Time

This topic shows detailed information about “Record Trace - IFCID 231 - Parallel Group Task Time”.

Place text here

Record trace - IFCID 231 - Parallel Group Task Time

The field labels shown in the following sample layout of “Record Trace - IFCID 231 - Parallel Group Task Time” are described in the following section.

STATEMENT NO: 1224  QUERY BLOCK NO: 1  PARALLEL GROUP NO: 1  REPEAT.GRPS: 2  RECORD 1 OF 1

MEMBER : Q42Q CPU SU CONS : 31515 QW0231AC 311862600

STATEMENT NO
The statement number. If the PLAN_TABLE exists, this is the same as QUERYNO in the PLAN_TABLE.
Field Name: QW0231SN

QUERY BLOCK NO
The query block number. If the PLAN_TABLE exists, this is the same as QBLOCKNO in the PLAN_TABLE.
Field Name: QW0231QN

PARALLEL GROUP NO
The parallel group number. If the PLAN_TABLE exists, this is the same as ACCESS_PGROUP_ID in the PLAN_TABLE.
Field Name: QW0231GN

REPEAT.GRPS
The number of repeat groups in the section.
Field Name: QW0231RN

RECORD
The position of this record in the series of IFCID 222 records.
Field Name: QW0231TR

OF
The total number of IFCID 231 records in this series.
Field Name: QW0231NR

GROUP CREATION
The time of group creation in DB2 timestamp format.
Field Name: QW0231CT

GROUP TERMINATION
The time of group termination in DB2 timestamp format.
FIELD NAME: QW0231ET

GROUP ELAPSED
The elapsed time between group creation and group termination in DB2 timestamp format.

FIELD NAME: RT0231GE

TASK SEQ. NUMBER
The task sequence number.

FIELD NAME: QW0231TQ

TASK TOKEN
The task token.

FIELD NAME: QW0231TK

TASK CREATION
The time of task creation in DB2 timestamp format.

FIELD NAME: QW0231TC

TASK ELAPSED
The elapsed time between task creation and task termination in DB2 timestamp format. If this value is negative, N/C is printed.

FIELD NAME: RT0231EL

TASK TERMINATION
The time of task termination in DB2 timestamp format.

FIELD NAME: QW0231TT

CPU TIME
Task CPU execution time.

FIELD NAME: QW0231TX

MEMBER
The name of the DB2 member on which the task was executed.

FIELD NAME: QW0231TM

CPU SU CONS
The CPU service units that the task consumed.

FIELD NAME: QW0231SU
IFCID 233 - Call User Routine

IFCID 233 signals the start or end of a call to a user routine (stored procedure or user-defined function) at a DB2 server.

This record is written when performance trace class 3 is active. MONITOR PRIVILEGE is required for reading via IFI.

This record traces the caller's information.

Record trace - IFCID 233 - Call User Routine

The field labels shown in the following sample layout of “Record Trace - IFCID 233 - Call User Routine” are described in the following section.

LOCATION NAME

The location name.
Field Name: QW0233LN

COLLECTION ID

The package collection identifier.
Field Name: QW0233PC

PROGRAM NAME

The program name.
Field Name: QW0233PN

SCHEMA NAME

The name of the schema associated with this routine.
Field Name: QW0233SC

ROUTINE NAME

The specific name of the routine.
Field Name: QW0233PR

VERSION NAME

The name of the version.
Field Name: QW0233VER

ROUTINE TYPE

The routine type can have the following values:
PROCEDURE
The routine is a stored procedure

FUNCTION
The routine is a User-Defined Function

Field Name: QW0233TY

CONSISTENCY TOKEN
The consistency token.

Field Name: QW0233TS

ENTRY/EXIT TYPE
The entry or exit event type can have the following values:

ENTERING
The agent is entering a routine.

RETURNED
The agent has returned from a routine.

Field Name: QW0233EX

NESTING LEVEL
The nesting level of the routine.

Field Name: QW0233NL

STATEMENT NO
The statement number of the statement executed.

Field Name: QW0233SN

TYPE
The statement type. Possible values are DYNAMIC or STATIC.

Field Name: QW0233STY

ROUTINE ID
The routine identifier.

Field Name: QW0233RID

STATEMENT ID
The unique identifier of the currently executing statement. It is shown as an integer and in hexadecimal format.

Field Name: QW0233SID

CONV INTO HEX
The unique identifier of the currently executing statement. It is shown as an integer and in hexadecimal format.

Field Name: QW0233SID
IFCID 234 - Calling Agent Auth IDs

This topic shows detailed information about “Record Trace - IFCID 234 - Calling Agent Auth IDs”.

This IFCID returns the authorization ID information for the calling agent.

Record trace - IFCID 234 - Calling Agent Auth IDs

The field labels shown in the following sample layout of “Record Trace - IFCID 234 - Calling Agent Auth IDs” are described in the following section.

<table>
<thead>
<tr>
<th>Field Label</th>
<th>Field Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>PRIM AUTHID</td>
<td>USERID01</td>
</tr>
<tr>
<td>SQL AUTHID</td>
<td>SQLAUTHID01</td>
</tr>
<tr>
<td>SEC AUTHID</td>
<td>SQLAUTHID02</td>
</tr>
<tr>
<td>SEC AUTHID</td>
<td>SQLAUTHID03</td>
</tr>
</tbody>
</table>

**PRIM AUTHID**

The primary authorization ID.

Field Name: QW0234PN

**SQL AUTHID**

The SQL authorization ID.

Field Name: QW0234AN

**SEC AUTHID**

The secondary authorization ID.

Field Name: QW0234SN
IFCID 236 - DDF SNA XLN Protocol Error

This topic shows detailed information about “Record Trace - IFCID 236 - DDF SNA XLN Protocol Error”.

Record trace - IFCID 236 - DDF SNA XLN Protocol Error

The field labels shown in the following sample layout of “Record Trace - IFCID 236 - DDF SNA XLN Protocol Error” are described in the following section.

REMOTE LOCATION
The location name or LU name of the remote partner involved in the protocol error.

Field Name: QW0236LO

LAST OPERATION
Indicates whether the last network operation was a send or receive.

Field Name: QW0236SR

SENT
The last message sent by this DB2 site during the XLN exchange.

Field Name: QW0236MS

RCVD
The last message received by this DB2 site during the XLN exchange.

Field Name: QW0236MR

VTAM RPL
The VTAM RPL associated with the last XLN message received during the exchange log names (XLN).

Field Name: QW0236VR

EXT
The VTAM RPL extension which describes the LU 6.2 verb indicators for the last message received.

Field Name: QW0236VX
This topic shows detailed information about “Record Trace - IFCID 237 - Set Current Degree”.

This record is generated when an SQL SET CURRENT DEGREE statement is executed.

**Record trace - IFCID 237 - Set Current Degree**

The field labels shown in the following sample layout of “Record Trace - IFCID 237 - Set Current Degree” are described in the following section.

**PREV DEGREE**

The previous (current) degree.

**Field Name:** QW0237OI

**NEW DEGREE**

The new (attempted) degree.

**Field Name:** QW0237NI

**STATUS**

The status of the statement.

**Field Name:** QW0237ST
This topic shows detailed information about “Record Trace - IFCID 238 - IBM Service Record”.

This record is for IBM service use.
IFCID 239 - Overflow Package/DBRM

This topic shows the data available for IFCID 239.

"IFCID 239 - Buffer Manager Accounting Data” on page 40-741
This topic shows detailed information about “Record Trace - IFCID 239 - Buffer Manager Accounting Data”.

"IFCID 239 - General Package Overflow Accounting Data” on page 40-745
This topic shows detailed information about “Record Trace - IFCID 239 - General Package Overflow Accounting Data”.

"IFCID 239 - Locking Data” on page 40-746
This topic shows detailed information about “Record Trace - IFCID 239 - Locking Data”.

IFCID 239 - Buffer Manager Accounting Data

This topic shows detailed information about “Record Trace - IFCID 239 - Buffer Manager Accounting Data”.

Record trace - IFCID 239 - Buffer Manager Accounting Data

The field labels shown in the following sample layout of “Record Trace - IFCID 239 - Buffer Manager Accounting Data” are described in the following section.

<table>
<thead>
<tr>
<th>BUFFER MANAGER ACCOUNTING DATA</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>BUFFER POOL ID</td>
<td>1</td>
</tr>
<tr>
<td>GETPAGES</td>
<td>2</td>
</tr>
<tr>
<td>GETPAGES FAILED</td>
<td>14</td>
</tr>
<tr>
<td>BUFFER UPDATES</td>
<td>3</td>
</tr>
<tr>
<td>SYNCHRON.WRITE</td>
<td>7</td>
</tr>
</tbody>
</table>

**Field Name:** QBACPID

**SYNCHRON. READ**

The number of synchronous read I/O operations. DB2 increments this counter for each media manager synchronous physical read. Asynchronous I/O requests are not counted.

**Field Name:** QBACRIO

**GETPAGES**

The number of Getpage requests. This counter is incremented by successful Getpage requests for queries processed in parallel for each thread and for all successful and unsuccessful Getpage requests for queries that are not processed in parallel.

**Background and Tuning Information**

Reducing the number of Getpages can improve DB2 performance by reducing the number of synchronous page reads. With fewer Getpages, the requested page is more likely to be returned from the buffer pool. CPU usage is also reduced.

Check the ratio of Getpages to SQL DML statements, as a rule of thumb, try and keep this ratio below six for a typical online transaction SQL.

You might need to modify the database and query design, for example:

- Add indexes to tables to reduce the number of pages scanned.
- Reassess the number of tables used and denormalize them, if necessary. As an example, a large table with many columns can result in several pages being fetched to satisfy a simple query requesting just a few columns. Splitting such a table into several tables with fewer columns, tailored to queries, will result in fewer pages returned for each query.
- Use correlated rather than non-correlated queries to force the use of an index.

**Field Name:** QBACGET

This is an exception field.

**SEQ. PREFETCH**
The number of SEQUENTIAL PREFETCH requests. This is incremented for each PREFETCH request. Each request can result in an I/O read. If it does, up to 64 pages can be read for SQL and up to 128 pages for utilities. For SQL, depending on the buffer pool size, a request does not result in an I/O if all the requested pages are already in the buffer pool.

DB2 can use sequential prefetch if the data is accessed in sequential order even though sequential prefetch was not requested at bind time. This is known as sequential detection and is not included in the sequential prefetch count. Sequential detection is included in dynamic prefetch requests field.

Background and Tuning Information
Table space scans and nonmatching index scans generally use sequential prefetch.

Field Name: QBACSEQ
This is an exception field.

GETPAGES FAILED
The number of times that a page requested for a query processed in parallel was unavailable because an I/O was in progress or the page was not found in the buffer pool. The agent does not wait, but control returns to the agent.

This counter is used only when queries are processed in parallel.

Background and Tuning Information
If this value is close to zero, most pages are already in the buffer pool, and wait time for synchronous I/O is small.

This counter can be high when, for example, there is a cluster index scan and the data is not truly clustered by the index key. In this instance, data pages are not accessed in their true order and the cluster ratio is not valid. Use the Runstats utility to update it.

The value of this field is also used to determine how many sequential prefetches of one page were scheduled.

Field Name: QBACNGT

LIST PREFETCH
The number of LIST PREFETCH requests.

Special Considerations:
1. List prefetch allows DB2 to access data pages efficiently even if the needed data pages are not contiguous. It can be used with single index access and is always used with multiple index access.
2. List prefetch is always used to access data from the inner table during a hybrid join.
3. Data pages are read in quantities equal to the sequential prefetch quantity, which depends on the buffer pool size and is usually 64 pages.
4. During bind time DB2 does not use list prefetch if the estimated number of RIDs to be processed would take more than 50% of the RID pool. During execution time, list prefetch processing terminates if DB2 detects that more than 25% of the rows in the table need to be accessed. If list prefetch is terminated, it is indicated in IFCID 125.
Field Name: QBACLPF
This is an exception field.

BUFFER UPDATES
The number of times a buffer update occurs. This is incremented every time a page is updated and is ready to be written to DASD. If the same page is updated twice, for example, the number is incremented by 2.
This number is kept for all types of pages including data pages and work-file pages.

Background and Tuning Information
A nonzero value indicates any of the following activities:
• SQL INSERT, UPDATE, or DELETE
• Merge scan join
• Internal sort activity on the work files
Check the access path to determine whether sort activity can be minimized or avoided.

Field Name: QBACSWS
This is an exception field.

DYNAMIC PREFETCH
The number of (dynamic) PREFETCH requests. This is triggered by sequential detection. This includes prefetches for segmented table spaces.

Background and Tuning Information
Dynamic prefetch is typically used for a SELECT or UPDATE that is run repeatedly, accessing the index for each access.
If sequential prefetch, list prefetch, and dynamic prefetch reads have large values, check whether the access path can be improved.

Field Name: QBACDPF
This is an exception field.

SYNCHRON. WRITE
The number of immediate (synchronous) write I/O operations.

Background and Tuning Information
Although an immediate write is rare, a small nonzero value is acceptable.
A large value indicates that the system needs tuning.

Field Name: QBACIMW
This is an exception field.

PAGES READ ASYN-PAR
The number of asynchronous pages read by prefetch that the agent triggered.

Background and Tuning Information
This is used to determine the buffer pool hit ratio: (Getpage requests - Synchronous reads - Asynchronous pages read) / Getpage requests.

Field Name: QBACSIO
This is an *exception* field.
IFCID 239 - General Package Overflow Accounting Data

This topic shows detailed information about “Record Trace - IFCID 239 - General Package Overflow Accounting Data”.

Record trace - IFCID 239 - General Package Overflow Accounting Data

The field labels shown in the following sample layout of “Record Trace - IFCID 239 - General Package Overflow Accounting Data” are described in the following section.

GENERAL PACKAGE OVERFLOW ACCOUNTING DATA
NUMBER OF PACKAGES  1  FIRST SECTION  2  LAST SECTION  3

NUMBER OF PACKAGES
The number of packages.
Field Name: QPKGPKGN

FIRST SECTION
The number of the first section in this record.
Field Name: QPKGPKNF

LAST SECTION
The number of the last section in this record.
Field Name: QPKGPKNL
IFCID 239 - Locking Data

This topic shows detailed information about “Record Trace - IFCID 239 - Locking Data”.

Record trace - IFCID 239 - Locking Data

The field labels shown in the following sample layout of “Record Trace - IFCID 239 - Locking Data” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEADLOCKS</td>
<td>The number of times deadlocks were detected. This number should be low, ideally 0.</td>
</tr>
<tr>
<td>TIMEOUTS</td>
<td>The number of requests to lock a resource.</td>
</tr>
<tr>
<td>ESCALATIONS(SHR)</td>
<td>The number of times a lock could not be obtained and the unit of work was suspended.</td>
</tr>
<tr>
<td>ESCALATIONS(EXC)</td>
<td></td>
</tr>
<tr>
<td>MAXIMUM PAGE/ROW LOCKS HELD</td>
<td></td>
</tr>
</tbody>
</table>

Background and Tuning Information

Deadlocks occur when two or more application processes each hold locks on resources that the others need, without which they cannot proceed. Ensure that all applications accessing the same tables access them in the same order.

- To improve concurrency:
  - Use row level locking instead of page level locking to minimize deadlocks.
  - For small tables use page level locking with MAXROWS 1.

- To minimize deadlocks:
  - Delay updates to just before commit.
  - Use SELECT with the FOR UPDATE clause to use U lock.
  - Adjust the deadlock detection cycle parameter DEADLOK in the IRLM procedure.

This field is incremented once for each deadlock encountered. There is no correlation between this field and the deadlock events reported in the Locking report set or the number of IFCID 172 records written. This field reports all deadlocks, regardless of how they were resolved. The locking report and record trace IFCID 172 show only those deadlocks that were resolved by DB2.

Field Name: QTXADEA

This is an exception field.

Field Name: QTXALOCK

This is an exception field.
The number of lock suspensions is a function of the lock requests. Lock suspensions (or conflicts) can happen on either LOCK REQUEST or CHANGE REQUEST. Suspensions are highly dependent on the application and table space locking protocols.

**Field Name:** QTXASLOC
This is an *exception* field.

**CLAIM REQUESTS**
The number of claim requests.

**Field Name:** QTXACLNO
This is an *exception* field.

**TIMEOUTS**
The number of times a unit of work was suspended for a time exceeding the timeout value. This number should be low, ideally 0.

**Field Name:** QTXATIM
This is an *exception* field.

**UNLOCK REQUEST**
The number of requests to unlock a resource.

This value can be less than the number of lock requests because DB2 can release several locks with a single unlock request.

**Field Name:** QTXAUNLK

**IRLM LATCH SUSPENS.**
The number of latch suspensions.

**Field Name:** QTXASLAT

**CLAIM REQ. FAILED**
The number of unsuccessful claim requests.

**Field Name:** QTXACLUN

**ESCALATIONS(SHR)**
The number of times the maximum page locks per table space are exceeded, and the table space lock escalates from a page lock (IS) to a table space lock (S) for this thread. You can specify the number of locks allowed per table space with the LOCKS PER TABLE(SPACE) parameter on the DB2 install panel DSNTIPJ.

**Background and Tuning Information**
Escalations can cause unpredictable response times. Lock escalations should only happen when an application process updates or references (if repeatable read is used) more pages than normal.

**Field Name:** QTXALES
This is an *exception* field.

**QUERY REQUEST**
The number of query requests.
Field Name: QTXAQR
This is an exception field.

OTHER SUSPENSIONS
The number of suspensions caused by something other than lock or latch.
Field Name: QTXASOTH
This is an exception field.

DRAIN REQUESTS
The number of drain requests.
Field Name: QTXADRNO
This is an exception field.

ESCALATIONS(EXC)
The number of times the maximum page locks per table space are exceeded and the table space lock escalates from a page lock (IX) to a table space lock (X).

Background and Tuning Information
Escalations can cause unpredictable response times. Lock escalations should only happen when an application process updates or references (if repeatable read is used) more pages than it normally does.

A useful rule of thumb is to compare the number of escalations (shared and exclusive) to the successful escalations (those that did not cause deadlocks and timeouts). If this value, or the number Lock escalations - shared and if the number of timeouts or deadlocks is also not 0, the timeout or deadlock is probably caused by the escalation.

If many escalations cause deadlocks and timeouts, the recommendation is to change the escalation threshold value. Use of ANY is extremely useful to prevent unnecessary and expensive page locks, for example locking all pages in a table space.

Lock escalations, shared or exclusive, should not be expected in a transaction environment.

Field Name: QTXALEX
This is an exception field.

CHANGE REQUEST
The number of change requests.
Field Name: QTXACHG
This is an exception field.

DRAIN REQ. FAILED
The number of unsuccessful drain requests.
Field Name: QTXADRUN
This is an exception field.

MAXIMUM PAGE/ROW LOCKS HELD
The maximum number of page or row locks concurrently held against all table spaces by a single application during its execution. This count is a high-water mark. It cannot exceed the LOCKS PER USER parameter on panel DSNTIPJ.

**Field Name:** QTXANPL

This is an exception field.

**OTHER REQUEST**

The number of requests to IRLM to perform a function other than LOCK, UNLOCK, QUERY, or CHANGE.

**Field Name:** QTXAIRM

This is an exception field.
 Record trace - IFCID 239 - Package/DBRM Accounting Data

The field labels shown in the following sample layout of “Record Trace - IFCID 239 - Package/DBRM Accounting Data” are described in the following section.

LOCATION

The location name.

If this field is blank in trace or report, the package or DBRM was executed locally. If it is not blank, all times represent the time spent locally to execute the remote package for this APPL_DIR requester.

This field is invalid (N/P) if summary rollup data is present.

Field Name: QPACLOCN

This is an exception field.

COLLECTION

The package collection ID. This field does not apply to DBRMs. If the program name cannot be identified, this field is not present in report or trace.

This field is invalid if summary rollup data is present. It can have the following value in:

- Accounting trace and report: N/P
- The Accounting FILE and SAVE PROGRAM table: blank

Field Name: QPACCOLN

This is an exception field.

PACKAGE ID

The program name (package ID or DBRM name).
In the case of rollup data (Accounting data of DDF/RRSAF threads and parallel tasks accumulated by DB2), the following value is shown "ROLSUM".

**Field Name:** QPACPKID

This is an *exception* field.

**TOKEN**

The program (package or DBRM) consistency token.

This field is invalid (0) if summary rollup data is present.

**Field Name:** QPACCONT

**SECTION NMB**

The number of this particular data section in the series.

**Field Name:** QPACRECN

**TYPE**

The program type. It can be DBRM (field name QPACDBRM) or package (field name QPACPACK).

**Field Name:** QPACFLGS

**SCHEMA NAME**

Schema name of the nested activity.

If the package is defined for a trigger, stored procedure, or user-defined function, then this field contains the name of the schema to which the nested activity belongs. It can have the following value in:

- Accounting Trace and Report: N/P
- The Accounting FILE and SAVE PROGRAM tables: blank

This field is invalid if summary rollup data is present.

**Field Name:** QPACASCH

**SQL STMTS**

The number of SQL statements issued in this package or DBRM.

This number may not be equal to the total number of SQL statements in the QXST data section because QXST does not count all SQL statements. For example, it does not count commit or rollback statements.

**Note:** This field is shown for the following field labels in Accounting trace:

- SQL STMT - TOTAL
- SQL STMT - AVERAGE:

**Field Name:** QPACSQLC

This is an *exception* field.

**USED BY STOR.PROC**

Indicates whether this package was loaded by a stored procedure.

This field is invalid if unique or summary rollup data is present.

**Field Name:** QPACINSP

**NON-ZERO CLASS 8**
Indicates if Class 8 data is in this record.

**Field Name:** QPACCLS8

**ACTIVITY NAME**

The name of the nested activity.

This field contains the name of the nested activity if the package is defined for a:
- Trigger
- Stored procedure
- User-defined function (UDF)
- Native SQL procedure
- Non-inline UDF

In a data block that reports totals it is set to ALL NAMES.

This field is invalid if summary rollup data is present.

It can have the following value in:
- Accounting Trace and Report: N/P
- The Accounting FILE and SAVE PROGRAM tables: blank

**Field Name:** QPACAANM

**Succ Auth Check**

Indicates whether a successful package EXECUTE authorization check was made and DB2 catalog access was avoided.

This field is invalid if unique or summary rollup data is present.

**Field Name:** QPACPAC

**Last Executed**

This package or DBRM is either currently executing or is the most recently executed package or DBRM. This field is invalid if unique or summary rollup data is present.

**Field Name:** QPACCRNT

**Non-Zero Class 7**

There is nonzero accounting class 7 data in this QPAC data instance.

**Field Name:** QPACCLS7

**Activity Type**

The type of activity. The following values indicate how the package was loaded:

**ALL TYPES**

In a data block that reports totals it is set to ALL TYPES.

**STORED PROC**

When running an external procedure

**TRIGGER**

When running a trigger

**UDF**

When running a user-defined function

**NATIVE SQL PROC**

When running a native SQL procedure
NATIVE UDF
When running a native UDF procedure (a non-inline user-defined function)

NONNESTED
Indicates that none of the above values is true

MULTIPLE
Indicates that packages with the same key but with different activity types were running

N/P Invalidated in case of rollup summary

The nested activity values that are shown in column NEST_ACTIVITY_TYPE of the table DB2PMFACCT_PROGRAM are:

S For Stored Procedure
T For Trigger
U For UDF
Q For native SQL procedure
D For Native UDF
N For nonnested (other)
blank For invalidated in case of rollup summary

This field is invalid if unique or summary rollup data is present.

Field Name: QPACAAFG

PACKAGE SWITCH
The number of times package was invoked from a different package. For the first package run by an application, the initial call counts as a package switch. If this package called a nested package (such as a trigger, UDF, or stored procedure), a switch will not be counted upon return from such a package.

Field Name: QPACSWITCH

ROLLED NBR THREADS
This value can be one of the following:

- In general, the number of threads to roll data into this QPAC data section. Non-rollup QPACs have a value of 1 and rollup QPACs have a value of 1 or more. This number is used as a divisor for calculating averages for package class 7, 8, or 10 times and events.
- If REPORT ORDER (ACTNAME) is specified, the number of threads to roll data into this QPAC data section of a special activity type depends on the following:
  - If IFCID 233 or 380 is available, the number of threads to roll data into this QPAC data section for stored procedures (SP) is counted based on the available IFCID. If both IFCIDs are available, IFCID 380 is the preferred one for SP reporting. Subprograms called by these SPs are not taken into account.
  - If IFCID 233 or 381 is available, the number of threads to roll data into this QPAC data section for user-defined functions (UDF) is counted based on the available IFCID. If both IFCIDs are available,
IFCID 381 is the preferred one for UDF reporting. Subprograms called by these UDFs are not taken into account.

- If neither IFCID 233, 380, nor 381, is collected, the total number of threads to roll data into this QPAC data section is counted. The sum also includes the number of subprograms.

Field Name: QPACRLNU

CLASS 7: BEGINNING STORE CLOCK TIME

The store clock time at entry to DB2 for the most recent execution of this package or DBRM.

This field is invalid if unique or summary rollup data is present.

Field Name: QPACSCB

CLASS 7: ENDING STORE CLOCK TIME

The store clock time at exit from DB2 after the most recent execution of this package or DBRM.

This field is invalid if unique or summary rollup data is present.

Field Name: QPACSCCE

CLASS 7: BEGINNING TCB CPU TIME

The CPU time at entry to DB2 for the most recent execution of this package or DBRM. This time does not include the CPU time consumed on an IBM specialty engine.

This field is invalid if unique or summary rollup data is present.

Field Name: QPACBJST

CLASS 7: ENDING TCB CPU TIME

The CPU time at exit from DB2 for the most recent execution of this package or DBRM. This time does not include CPU consumed on an IBM specialty engine.

This field is invalid if unique or summary rollup data is present.

Field Name: QPACEJST

CLASS 7: TOTAL ELAPSED TIME

The total elapsed time for executing the package or DBRM.

Field Name: QPACSCCT

CLASS 7: DB2 ENTRY/EXIT

The number of DB2 entries or exits processed during the execution of the package or DBRM.

In Accounting reports this is shown twice; as a total and as an average.

Field Name: QPACARNA

CLASS 7: TOTAL TCB TIME

The class 7 CPU time for all executions of the package or DBRM. This time does not include the:

- Class 7 time for parallel tasks
- CPU time that is consumed on an IBM specialty engine

Field Name: QPACTJST
This is an exception field.

**CLASS 7: SE CPU TIME**

The total CPU time for all executions of this package or DBRM that was consumed on an IBM specialty engine (SE).

**Note:** All CPU times of an IBM specialty engine that are reported in DB2 trace records are already normalized by DB2 to the speed of the general purpose processor.

**Field Name:** QPACCLS7_ZIIP

**CLASS 8: LOCK/LATCH SUSP TIME**

The accumulated lock elapsed wait time that occurred while executing this package.

**Background and Tuning Information**

OMEGAMON XE for DB2 PE might adjust this value if the thread was suspended when performance data was gathered.

If the suspension time is high, investigate locking activity.

**Field Name:** QPACAWTL

This is an exception field.

**CLASS 8: LOCK/LATCH SUSP EVENTS**

The number of wait trace events processed for waits for lock while executing this package.

**Field Name:** QPACARNL

**CLASS 8: WAIT TIME LOCAL LOCKS**

The accumulated latch elapsed wait time for latch suspensions that occurred while executing this package.

**Field Name:** QPACAWLH

**CLASS 8: LOCAL LOCK WAIT TRACE EVENTS**

The number of wait trace events processed for page latch contention while executing this package.

**Field Name:** QPACANLH

**CLASS 8: DB2 LATCH SUSP TIME**

The accumulated lock elapsed wait time that occurred while executing this package.

**Background and Tuning Information**

OMEGAMON XE for DB2 PE might adjust this value if the thread was suspended when performance data was gathered.

If the suspension time is high, investigate locking activity.

**Field Name:** QPACAWTL

This is an exception field.

**CLASS 8: LATCH WAIT TRACE EVENTS**

The number of wait trace events processed for waits for lock while executing this package.
Field Name: QPACARNL

CLASS 8: SYNCHRONOUS I/O SUSP TIME

The accumulated elapsed wait time for I/O suspensions under this thread during the execution of the package or DBRM.

Background and Tuning Information

OMEGAMON XE for DB2 PE might adjust this value if the thread was suspended when its performance data was gathered.

Field Name: QPACAWTI

This is an exception field.

CLASS 8: SYNCHRONOUS I/O SUSP EVENTS

The number of wait trace events processed for I/O.

Field Name: QPACARNE

CLASS 8: OTHER READ SUSP TIME

The accumulated waiting time for a read I/O performed under a thread other than this one during the execution of the package or DBRM.

Background and Tuning Information

OMEGAMON XE for DB2 PE might adjust this value if the thread was suspended when performance data was gathered.

This field includes waits caused by sequential prefetch, list prefetch, dynamic prefetch, and synchronous read I/O performed by other threads.

If the value in this field is high, the problem could be an I/O bound query using prefetch or an I/O contention. The application is accessing data from a busy data set, volume, or control unit and is continually being suspended. Consult the DBA and MVS systems programmer.

Field Name: QPACAWTR

This is an exception field.

CLASS 8: OTHER READ SUSP EVENTS

The number of suspensions due to read I/O.

Field Name: QPACARNR

CLASS 8: OTHER WRITE SUSP TIME

The accumulated waiting time due to a write I/O performed for another thread during the execution of a package or DBRM.

Background and Tuning Information

If the value in this field is high, the problem could be I/O contention. The application is accessing data from a busy data set, volume, or control unit and is continually being suspended. Consult the DBA and MVS systems programmer to resolve possible data set placement problems.

Field Name: QPACAWTW

This is an exception field.

CLASS 8: OTHER WRITE SUSP EVENTS

The number of suspensions due to write I/O.
Field Name: QPACARNW

CLASS 8: SERV.TASK SWITCH SUSP TIME

The accumulated waiting time due to a synchronous execution unit switch to DB2 services from this thread during the execution of the package or DBRM.

Background and Tuning Information

OMEGAMON XE for DB2 PE might adjust this value if the thread was suspended when its performance data was gathered.

This value includes the waits because of an OPEN/CLOSE data set, SYSLGRNG update, DATASPACE MANAGER services, DEFINE, EXTEND, and DELETE data set, AUTONOMOUS PROCEDURE, and DDF Requester waiting for Server reply and VSAM Catalog update.

Field Name: QPACAWTE

This is an exception field.

CLASS 8: SERV.TASK SWITCH SUSP EVENTS

The number of wait trace events processed for DB2 service tasks.

Field Name: QPACARNS

CLASS 8: ARCH.LOG(QUIES) SUSP TIME

The accumulated waiting time caused by processing ARCHIVE LOG(QUIESCE) commands during the execution of the package or DBRM. This number represents the amount of time that an individual thread was suspended because of the command, not the time it took for the entire command to complete.

Background and Tuning Information

OMEGAMON XE for DB2 PE might adjust this value if the thread was suspended when its performance data was gathered.

Avoid issuing the -ARCHIVE LOG QUIESCE command during peak periods.

Field Name: QPACALOG

CLASS 8: ARCH.LOG(QUIES) SUSP EVENTS

The number of ARCHIVE LOG MODE (QUIESCE) commands issued.

Field Name: QPACALCT

CLASS 8: DRAIN LOCK SUSP TIME

The accumulated waiting time due to a drain lock.

Field Name: QPACAWDR

CLASS 8: DRAIN LOCK SUSP EVENTS

The number of wait trace events processed for waits for drain locks.

Field Name: QPACARND

CLASS 8: CLAIM RELEASE SUSP TIME

The accumulated waiting time for a drain waiting for claims to be released during the execution of the package or DBRM.

Background and Tuning Information
OMEGAMON XE for DB2 PE might adjust this value if the thread was suspended when its performance data was gathered.

Field Name: QPACAWCL

**CLASS 8: CLAIM RELEASE SUSP EVENTS**
The number of wait trace events processed for waits for claims to be released.

Field Name: QPACARNC

**CLASS 8: PAGE LATCH SUSP TIME**
The accumulated waiting time caused by a page latch contention.

Field Name: QPACAWTP

**CLASS 8: PAGE LATCH SUSP EVENTS**
The number of page latch wait trace events processed.

Field Name: QPACARNH

**CLASS 8: NOTIFY MESSAGES SUSP TIME**
The accumulated elapsed waiting time due to suspensions caused by sending notify messages to other members in the data sharing group. Messages are sent, for example, when database descriptors are changed due to DDL.

This value is only calculated if accounting class 8 is active and DB2 is a member of a DB2 data sharing group.

Field Name: QPACAWTG

**CLASS 8: NOTIFY MESSAGES EVENTS**
The number of wait trace events processed for sending notify messages to other members in the data sharing group.

Field Name: QPACARNG

**CLASS 8: GLOBAL CONTENT. PARENT SUSP TIME**
The accumulated wait time due to global contention for parent L-Locks. Parent L-Locks are any of the following L-Lock types: database, tablespace, table, or partition.

Field Name: QPACAWTJ

**CLASS 8: GLOBAL CONTENT. PARENT EVENTS**
The number of wait trace entry/exit events processed for waits for global lock contention for parent L-Locks.

Field Name: QPACARNJ

**CLASS 8: UDF EXECUTED**
The number of user-defined functions scheduled.

Field Name: QPACUDNU

**CLASS 8: STORED PROCEDURE EXECUTED**
The number of stored procedures scheduled.

Field Name: QPACSPNS

**CLASS 8: TCP/IP LOB XML TIME**
The number of wait trace events that were processed for waits for TCP/IP LOB and XML materialization while this package or DBRM was running.

**Field Name:** QPACALBC

**CLASS 8: TCP/IP LOB XML EVENTS**

The accumulated wait time for TCP/IP LOB and XML materialization while running this package or DBRM.

**Field Name:** QPACALBW

**ACCELERATOR SUSP TIME**

The accumulated wait time for requests to an accelerator while executing this package.

**Field Name:** QPACAACW

**ACCELERATOR EVENTS**

The number of wait trace events processed for requests to an accelerator while executing this package.

**Field Name:** QPACAACC

**PARALLEL QUERY SYNC WAIT TIME**

The accumulated time waiting for parallel query processing to synchronize between parent and child tasks.

**Field Name:** QPAC_PQS_WAIT

**PARALLEL QUERY SYNC WAIT EVENTS**

The number of times the parallel query processing suspended because it was waiting for the synchronization of the parent/child.

**Field Name:** QPAC_PQS_COUNT

**FAST INSERT PIPE WAIT TIME**

The accumulated wait time for a pipe while this package was executed (DB2 field QPACPIPE_WAIT).

**Field Name:** QPAC_PIPEGWAIT

**FAST INSERT PIPE WAIT EVENTS**

The number of wait trace events that were processed for waits for a pipe while this package was executed (DB2 field QPAC_PIPEWAIT_COUNT).

**Field Name:** QPAC_PIPEGWAIT_COUNT
IFCID 239 - RDS Package Accounting

IFCID 239 - RDS Package Accounting

This topic shows detailed information about “Record Trace - IFCID 239 - RDS Package Accounting”.

Record trace - IFCID 239 - RDS Package Accounting

The field labels shown in the following sample layout of “Record Trace - IFCID 239 - RDS Package Accounting” are described in the following section.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>SELECTS</td>
<td>1</td>

<tr>
<td>LOCK TABLES</td>
<td>6</td>
</tr>
<tr>
<td>SQL CALLS</td>
<td>9</td>
</tr>
</tbody>
</table>

SELECTS

The number of SQL SELECT statements executed.

Field Name: QPSELECT

This is an exception field.

INSERTS

The number of INSERT statements executed.

Field Name: QPINSRT

This is an exception field.

UPDATES

The number of UPDATE statements executed.

Field Name: QPUPDTE

This is an exception field.

DELETES

The number of DELETE statements executed.

Field Name: QPDELET

This is an exception field.

DESCRIBES

The number of data capture describes.

Field Name: QPDESC

PREPARES

The number of full prepare requests.

Field Name: QPPREP

OPENS

The number of full open requests.

Field Name: QPOPN

CLOSES

The number of close requests.

Field Name: QPCLOSE

FETCHS

The number of fetch requests.
Field Name: QPFETCH

LOCK TABLES
The number of lock tables.

Field Name: QPLOCK

SQL CALLS
The number of SQL calls.

Field Name: QPCALL
IFCID 239 - Resource Limit Facility

This topic shows detailed information about “Record Trace - IFCID 239 - Resource Limit Facility”.

Record trace - IFCID 239 - Resource Limit Facility

The field labels shown in the following sample layout of “Record Trace - IFCID 239 - Resource Limit Facility” are described in the following section.

<table>
<thead>
<tr>
<th>RES LIMIT FACILITY</th>
<th>RLF TABLE ID</th>
<th>NN</th>
<th>LIMIT IN CPU 16 MICROSEC</th>
<th>9</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES LIMIT SCOPE</td>
<td></td>
<td></td>
<td>LIMIT IN SERVICE UNITS</td>
<td>8</td>

<td>HIGHEST CPU 16 MICROSEC USED</td>
<td>10</td>
</tr>
<tr>
<td>QTXAFLG1 (S)</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

RES LIMIT SCOPE

Indicates how the resource limit was established. A value of 0 shows that the resource limit facility was not started.

Field Name: QTXAPREC

RLF TABLE ID

The identifier of the resource limit specification table.

Field Name: QTXARLID

LIMIT IN CPU 16 MICROSEC

The CPU time limit, in microseconds, set by the resource limit facility.

Field Name: QTXACLMT

RES LIMIT TYPE

Indicates how the type of resource limit was established: infinite, zero, or limit.

Note: Label QTXAFLG1 presents the first flag byte in hexadecimal:

'X'80': Infinite limit

'X'40': No run or zero limit

Field Name: QTXAFLG1

LIMIT IN SERVICE UNITS

The maximum number of CPU service units to be used. Normally, the value is not 0 if the RES LIMIT TYPE is LIMIT. A value of 0 indicates no limit.

Field Name: QTXASLMT

HIGHEST CPU 16 MICROSEC USED

The highest CPU time used by a single DB2 call, in microseconds. Note that there can be many DB2 calls for one SQL statement.

Field Name: QTXACHUS

QTXAFLG1 (S)

Indicates how the type of resource limit was established: infinite, zero, or limit.

Note: Label QTXAFLG1 presents the first flag byte in hexadecimal:

'X'80': Infinite limit
X'40'  No run or zero limit

Field Name: QTXAFLG1
IFCID 247 - SQLDA Data and Input Host Variable Data

This topic shows detailed information about “Record Trace - IFCID 247 - SQLDA Data and Input Host Variable Data”.

IFCID 247 records SQLDA data and INPUT HOST VARIABLE data are related to a user application program. Each host variable is traced individually as it is moved from the user application area to the DB2 address space.

For dynamic SQL statements of length 5000 or less, you can use these records in combination with records from IFCID 064 and IFCID 063 to determine which statements are associated with which host variables. To do this, you need to match the statement number in this record to the statement number in an IFCID 064 record. An IFCID 063 Record that follows the IFCID 064 record that has the same CORRELATION ID and ACE values contains the SQL statement associated with the host variables.

Record trace - IFCID 247 - SQLDA Data and Input Host Variable Data

The field labels shown in the following sample layout of “Record Trace - IFCID 247 - SQLDA Data and Input Host Variable Data” are described in the following section.

<table>
<thead>
<tr>
<th>LOCATION NAME</th>
<th>Field Name: QW0247LN</th>
</tr>
</thead>
<tbody>
<tr>

LOCATION NAME

Location name.

Field Name: QW0247LN

COLLECTION ID

Package collection identifier.

Field Name: QW0247PC

PROGRAM NAME

Program name.

Field Name: QW0247PN

STATEMENT NUMBER

Statement number.

Field Name: QW0247SN

CONSISTENCY TOKEN

The consistency token.

Field Name: QW0247TS

LOCATION NAME

Location name.

Field Name: QW0247LN

COLLECTION ID

Package collection identifier.

Field Name: QW0247PC

PROGRAM NAME

Program name.

Field Name: QW0247PN

STATEMENT NUMBER

Statement number.

Field Name: QW0247SN

CONSISTENCY TOKEN

The consistency token.

Field Name: QW0247TS
LENGTH EACH SQLDA ENTRY
Length of each SQLDA entry.
Field Name: QW0247LE

NUMBER ENTRIES IN SQLDA
Number of entries in the SQL data area.
Field Name: QW0247NE

FORMAT SQLDA
The format of the SQLDA. Possible values are:
0 - COMPRESSED
   Is a compressed form of the SQLDA.
1 - COMPLETE
   Is a complete SQLDA containing the data type, address, and address of the indicator variable for each host variable.
2 - FIXED LENGTH
   Is a variable length character format containing the length of the string and text.
? - UNKNOWN
   Is shown, if none of the above field names is used.

Field Name: QW0247FE

SQLDA NAME
SQLDA name, if Format 1 SQLDA. The first two bytes are the length of the NAME and are not shown.
Field Name: QW0247NA

SQLDA ENTRY NUMBER
SQLDA entry number.
Field Name: QW0247NO

DATA TYPE
Is derived as described in DB2 SQL Reference, based on the SQLTYPE:
384, 385
   DATE
388, 389
   TIME
392, 393
   TIMESTAMP
448, 449
   VARYING LENGTH CHARACTER STRING
452, 453
   FIXED-LENGTH CHARACTER STRING
456, 457
   LONG VARYING CHARACTER STRING
480, 481
   FLOATING POINT
IFCID 247 - SQLDA Data and Input Host Variable Data

484, 485
PACKED DECIMAL

496, 497
LARGE INTEGER

500, 501
SMALL INTEGER

Note:
• Any other SQLTYPES are shown as: NON DISPLAYABLE DATA
• Values are shown in DB2 internal format.

Field Name: QW0247TY
LENGTH
Length of data for this entry. If the field type is decimal (484 or 485), the length is not applicable.

Field Name: QW0247LD
ADDRESS TO DATA
The address of the host variable in the application address space.

Field Name: QW0247PT
PRECISION (IF DEC)
If the field type is decimal (484 or 485), this is the precision.

Field Name: QW0247LP
SCALE (ID DEC)
If the field is decimal (484 or 485), this is the scale.

Field Name: QW0247LS
ADDRESS TO NULL INDICATOR
The address of the indicator variable, if the value in QW0247TY is odd (NULLABLE).

Field Name: QW0247IN
NULL INDICATOR
Null indicator values:
• YES, if X'00'
• NO, if X'FF'

Field Name: QW0247NL
LENGTH OF DATAREA
Field Name: QW0247LL
SQLDA DATA
Field Name: QW0247DA
This topic shows detailed information about “Record Trace - IFCID 248 - IBM Service Record”.

This record is for IBM service use.
IFCID 249 - EDM Pool Invalidate DBD

This topic shows detailed information about “Record Trace - IFCID 249 - EDM Pool Invalidate DBD”.

This record traces DBD invalidations. A DBD is invalidated in the data sharing environment when one DB2 subsystem changes a DBD that needed, it is read, resulting in multiple copies of the DBD in the EDM pool.

Record trace - IFCID 249 - EDM Pool Invalidate DBD

The field labels shown in the following sample layout of “Record Trace - IFCID 249 - EDM Pool Invalidate DBD” are described in the following section.

DBID

The database ID. Deduced from the DB2 fields QW0249ID, and QW0105DN or QW0107DN. When present, the database name is shown, otherwise the decimal identifier from QW0249ID is shown or N/A when this value is 0.

Field Name: RT0249DB

DATABASE NAME

The database name.

Field Name: QW0249NM

DB2 MEMBER NAME

The name of the DB2 member causing the invalidation.

Field Name: QW0249MC
IFCID 250 - Connect/Rebuild Connect/Disconnect Group Bpool

This topic shows detailed information about “Record Trace - IFCID 250 - Connect/Rebuild Connect/Disconnect Group Bpool”.

This record is written for a group buffer pool (coupling facility cache structure) connect, rebuild, or disconnect event.

The DESCRIPTION column indicates what event occurred. The format of this record and data shown depends on the event being reported.

Record trace - IFCID 250 - Connect/Rebuild Connect/Disconnect Group Bpool

The field labels shown in the following sample layout of “Record Trace - IFCID 250 - Connect/Rebuild Connect/Disconnect Group Bpool” are described in the following section.

STRUCTURE NAME
The name of the coupling facility structure.

Field Name: QW0250SN

GROUP BP NAME
The group buffer pool name.

Field Name: QW0250GN

RETURN CODE
The return code.

The reason code.

Field Name: QW0250RC

STRUCTURE SIZE
The structure size, that is, the number of 4 KB blocks. The actual size might be less than the requested size due to insufficient space in the preference list facilities.

Field Name: QW0250SZ

DIRECTORY ENTRIES
The number of allocated directory entries.
Field Name: QW0250DR

ALLOCATION
Indicates whether this connect caused a structure allocation.
Field Name: QW0250CA

MAX NUMBER CASTOUT
The maximum number of castout classes.
Field Name: QW0250CO

DATA ELEMENTS
The number of data elements allocated. For DB2 group buffer pools, the size of the data elements is 4 KB. Each data entry consists of one or more data elements.
Field Name: QW0250DT

MAX STRUCTURE SIZE
The maximum structure size saved at the time the structure was allocated. The maximum structure size is obtained from the active policy at the time the structure is allocated.
Field Name: QW0250SM

CONNECT TYPE
The type of connection.
Field Name: QW0250CD

EXCLUSION LIST HONORED
Indicates whether the exclusion list was honored.
This field is only applicable if the value in ALLOCATION is YES. Otherwise, N/A is printed in this field.
Field Name: QW0250F2

SAF RETURN CODE
The system authorization facility (SAF) return code.
Field Name: QW0250X1

SAF REASON CODE
The SAF reason code.
Field Name: QW0250X2

COUPLING FACILITY NAME
The coupling facility name.
Field Name: QW0250ZN
COUPLING FACILITY REASON
The reason why the coupling facility was not suitable.
Field Name: QW0250ZR

MIN CONTROL SPACE
The minimum control space required (in 4 KB blocks) to allocate the structure for which connect was requested.
Field Name: QW0250ZM

TOTAL SPACE
The total space in the coupling facility in 4 KB blocks, including control and noncontrol space.
Field Name: QW0250ZG

TOTAL CONTROL SPACE
The total control space in the coupling facility in 4 KB blocks.
Field Name: QW0250ZH

TOTAL FREE SPACE
The total free space in 4 KB blocks, including control and noncontrol space.
Field Name: QW0250ZI

FREE CONTROL SPACE
The free control space in 4 KB blocks.
Field Name: QW0250ZJ

STORAGE SIZE
The storage increment size in 4 KB blocks.
Field Name: QW0250ZK

MAXIMUM ELEMENT
The maximum element characteristic. DB2 always requests a 4 KB element size. Therefore, this field should always equal 4.
Field Name: QW0250ZL

MAXIMUM CASTOUT
The maximum number of castout classes for a structure using this coupling facility.
Field Name: QW0250ZO

DISCONNECT TYPE
The type of disconnect.
Field Name: QW0250DD
IFCID 251 - Buffer Manager PSET/Part P-Lock Request

This topic shows detailed information about “Record Trace - IFCID 251 - Buffer Manager PSET/Part P-Lock Request”.

Record trace - IFCID 251 - Buffer Manager PSET/Part P-Lock Request

The field labels shown in the following sample layout of “Record Trace - IFCID 251 - Buffer Manager PSET/Part P-Lock Request” are described in the following section.

- **P-Lock Type**: The P-lock type.
  - **Field Name**: QW0251KT

- **DBID**: The database ID. Deduced from the DB2 fields QW0251KD, and QW0105DN or QW0107DN.
  - When present, the database name is shown, otherwise the decimal identifier from QW0251KD is shown or N/A when this value is 0.
  - **Field Name**: RT0251DB

- **OBID**: The object ID. Deduced from the DB2 fields QW0251KP, QW0105TN or QW0107TN.
  - When present, the name of the object is shown, otherwise the decimal identifier from QW0251KP is shown or N/A if this value is 0.
  - **Field Name**: RT0251OB

- **Partition NMBR.**: The partition number. If this is a non-partitioned page set, 0 is printed in this field.
  - **Field Name**: QW0251KR

- **BP ID**: The internal buffer pool ID (0-49 and 80-89).
  - **Field Name**: QW0251KU

- **IRLM Func Code**: The IRLM function code.
  - **Field Name**: QW0251IF

- **Object Type**: The object type.
  - **Field Name**: QW0251OB
REQUESTED STATE

The requested lock state if the value in IRLM FUNC CODE is LOCK or CHANGE. If the value is CHANGE FROM P-LOCK EXIT, then this is the P-lock state requested by the other member causing the P-lock exit of this member. In this case, this field is 0 if the request from the other member was not in conflict with the state of this member.

Field Name: QW0251ST

CONDITIONAL

Indicates whether the request was conditional.

Field Name: QW0251C1

RESTART

Indicates whether there was a restart lock request.

If the lock is currently retained on behalf of this DB2, a restart request causes the lock to be changed from retained to active. If the lock is not retained, the lock grant process is as normal.

Field Name: QW0251C6

MODIFY

Indicates whether this is a modify lock.

Field Name: QW0251C7

DATABASE NAME

The database name.

Field Name: QW0251DN

PAGESET NAME

The page set name.

Field Name: QW0251PN

DB2 MEMBER NAME

The DB2 member name that depends on the value in IRLM FUNC CODE:

- When CHANGE FROM P-LOCK EXIT this is the name of the database in conflict with the P-lock state currently held by this member.
- If it is not CHANGE FROM P-LOCK EXIT and the P-lock was rejected, this is the name of the database in conflict with this request

Field Name: QW0251DB

HELD STATE

Old and new P-lock held state. Old state taken from the DB2 field QW0251OS. New state taken from the DB2 field QW0251NS.

Field Name: RT251HS

CACHED STATE

Old and new P-lock cached state. Old state taken from the DB2 field QW0251OC. New state taken from the DB2 field QW0251NC.

Field Name: RT251CS
This topic shows detailed information about “Record Trace - IFCID 252 - IBM Service Record”.

This record is for IBM service use.
IFCID 254 - Coupling Facility Cache Structure Statistics

This topic shows detailed information about “Record Trace - IFCID 254 - Coupling Facility Cache Structure Statistics”.

Record trace - IFCID 254 - Coupling Facility Cache Structure Statistics

The field labels shown in the following sample layout of “Record Trace - IFCID 254 - Coupling Facility Cache Structure Statistics” are described in the following section.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

GROUP BUFFER POOL NAME

The name of the group buffer pool.

Field Name: QW0254GN

EXPLICIT XI COUNTER

The number of times a request was made to the group coupling facility to explicitly cross invalidate a page and a number of XI signals were sent because the page was cached in one or more DB2 buffer pools.

Field Name: QW0254CI

READ HIT

The number of coupling facility read requests in which data was returned.

Field Name: QW0254RH

CHANGED PAGE WRITE HIT

The number of coupling facility write requests for changed pages that has successfully completed.

Field Name: QW0254WH

XI DIRECTORY ENTRY RECLAIM

The number of times that a directory entry was stolen and XI signals had to be sent because the page for the directory entry was cached in one or more DB2 buffer pools.

Field Name: QW0254XR

READ MISS DIRECTORY HIT

The number of coupling facility read requests for a page in which data was not returned but the page name was already assigned in the coupling facility directory (SES did not have to assign a directory entry for the page).

Field Name: QW0254RD

CLEAN PAGE WRITE HIT

The number of facility write requests for clean pages successfully completed.
Field Name: QW0254WC

CASTOUT
The number of castout operations performed.

Field Name: QW0254CC

READ MISS ASSIGNMENT SUPPRESSED
The number of times that a coupling facility read request specified a page for which no directory entry exists and no directory entry is created. DB2 does not create a directory entry if it does not need to register the page to the coupling facility for cross invalidation (XI); that is when no other DB2 member in the group has R/W interest in the page set/partition.

Field Name: QW0254RS

WRITE MISS CACHE FULL
The number of coupling facility write requests that could not complete due to a lack of coupling facility storage resources.

Field Name: QW0254WF

DIRECTORY ENTRY
The number of allocated directory entries (not cumulative).

Field Name: QW0254DE

READ MISS NAME ASSIGNED
The number of times that a coupling facility read request specified a page for which a directory entry was created.

Field Name: QW0254RN

DIRECTORY ENTRY RECLAIM
The number of times that a page name assignment required a coupling facility directory entry to be reclaimed (stolen).

Field Name: QW0254DR

DATA ENTRY
The number of allocated data entries (not cumulative).

Field Name: QW0254TE

READ MISS CACHE FULL
The number of times that a coupling facility read request specified a page for which no directory entry exists and no directory entry is created due to the lack of storage in the group buffer pool. A non-zero value in this field indicates that the backing coupling facility cache structure size might be too small to support the current workload.

Field Name: QW0254RF

DATA ENTRY RECLAIM
The number of times that a page name assignment required a coupling facility data entry to be reclaimed (stolen).

Field Name: QW0254TR

TOTAL CHANGED
The snapshot value of the current number of changed pages.

**Field Name:** QW0254TC

**SEC-GBP CHANGED PAGE WRITE HIT**

The number of successful coupling facility write requests for changed pages.

**Field Name:** QW02542W

**SEC-GBP WRITE MISS CACHE FULL**

The number of unsuccessful coupling facility write requests because of insufficient coupling facility storage resources.

**Field Name:** QW02542F

**SEC-GBP DIRECTORY ENTRY**

The number of allocated directory entries. This is a snapshot value.

**Field Name:** QW02542D

**SEC-GBP DATA ENTRY**

The number of allocated data entries. This is a snapshot value.

The number of allocated data entries that are currently in *changed* state. This is a snapshot value.

**Field Name:** QW02542C
This topic shows detailed information about “Record Trace - IFCID 255 - Buffer Refresh Due to XI”.

This record is written when a buffer refresh was caused by the cross invalidation (XI) of a data page in the group buffer pool. Cross invalidation occurs when a DB2 member of a data sharing group updates a data page and writes the newly changed page to the group buffer pool. All DB2 members that have this data page cached in their buffer pools are notified that the page was invalidated. If a member needs that data page, it must be refreshed.

Record trace - IFCID 255 - Buffer Refresh Due to XI

The field labels shown in the following sample layout of “Record Trace - IFCID 255 - Buffer Refresh Due to XI” are described in the following section.

```plaintext
DBID: NO PIECE NUMBER: X'00'
OBID: 4 PAGE NUMBER : X'000002'
BPID: 0 ACE TOKEN : N/P
TYPE: SYCH FROM: GBPOOL
```

**DBID**

The database ID. Deduced from the DB2 fields QW0255DB, QW0105DN or QW0107DN.

When present, the database name is shown, otherwise the decimal identifier from QW0225DB is shown or N/A when this value is 0.

**Field Name:** RT0255DB

**PIECE NUMBER**

The data set number of the page set.

**Field Name:** QW0255PN

**OBID**

The object ID. Deduced from the DB2 fields QW0255OB, QW0105TN or QW0107TN.

When present, the name of the object is shown, otherwise the decimal identifier from QW0142OB is shown or N/A if this value is 0.

**Field Name:** RT0255OB

**PAGE NUMBER**

The relative page number within the data set.

**Field Name:** QW0255PG

**BPID**

The internal buffer pool ID.

**Field Name:** QW0255BP

**ACE TOKEN**

Ace token of the requester. This address ties the coupling facility read requests for prefetch to the allied agent or database access thread.

**Field Name:** QW0255AC

**TYPE**
Indicates whether the buffer refresh was synchronous or asynchronous.

**Field Name:** QW0255AS

**FROM**

Indicates whether data was returned from the group buffer pool or DASD.

**Field Name:** QW0255DR
IFCID 256 - Alter Group Buffer Pool

This topic shows detailed information about “Record Trace - IFCID 256 - Alter Group Buffer Pool”.

This record shows the old and the new status of the altered group buffer pool.

Record trace - IFCID 256 - Alter Group Buffer Pool

The field labels shown in the following sample layout of “Record Trace - IFCID 256 - Alter Group Buffer Pool” are described in the following section.

GROUP BUFFER POOL ID

The DB2 group buffer pool ID.

Field Name: QW0256GB

DIRECTORY TO DATA RATIO

The directory entry to data entry ratio. This is the value specified in the RATIO keyword of the ALTER GROUPBUFFERPOOL command.

New status deduced from the DB2 field QW0256NR.

Old status deduced from the DB2 field QW0256OR.

Field Name: RT0256DR

CLASS CASTOUT THRESHOLD (%)

The threshold at which the class castout is to be initiated. It is expressed as a percentage of the group buffer pool size. This is the value specified in the CLASST keyword of the ALTER GROUPBUFFERPOOL command.

New status deduced from the DB2 field QW0256NC.

Old status deduced from the DB2 field QW0256OC.

Field Name: RT0256CT

CLASS CASTOUT THRESHOLD (PAGES) (OLD)

The old class castout threshold based on the number of pages.

Field Name: QW0256ON

CLASS CASTOUT THRESHOLD (PAGES) (NEW)

The new class castout threshold based on the number of pages.

Field Name: QW0256NN

GBP CASTOUT THRESHOLD (%)

The threshold at which the castout is to be initiated for the group buffer pool. This is the value specified in the GBPOOLT keyword of the ALTER GROUPBUFFERPOOL command.
New status deduced from the DB2 field QW0256NG.
Old status deduced from the DB2 field QW0256OG.

**Field Name:** RT0256GT

**GBP CHECKPOINT INTERVAL (MIN)**

The time interval (in minutes) between successive group buffer pool checkpoints. This is the value specified in the GBPCHKPT keyword of the ALTER GROUPBUFFERPOOL command.

New status deduced from the DB2 field QW0256NK.
Old status deduced from the DB2 field QW0256OK.

**Field Name:** RT0256CI

**GBP CACHE SETTING**

GBP CACHE value before and after the ALTER GROUPBUFFERPOOL command was issued. This field specifies whether DB2 should write changed pages for the group buffer pool dependant pageset or partitions directly to DASD and use the group buffer pool only for sending XI signals.

New status deduced from the DB2 field QW0256NB.
Old status deduced from the DB2 field QW0256OB.

**Field Name:** RT0256CS

**AUTOREC**

A flag indicating how the AUTOREC option of the ALTER GROUPBUFFERPOOL command has been set. It specifies whether DB2 should automatically recover if GBP fails. The old value specifies the AUTOREC value before the ALTER GBP command was issued. The new value specifies the AUTOREC value after the ALTER GBP command was issued.

New status deduced from the DB2 field QW0256NA.
Old status deduced from the DB2 field QW0256OA.

**Field Name:** RT0256AR
Record trace - IFCID 257 - IRLM Notify Req Detail

The field labels shown in the following sample layout of “Record Trace - IFCID 257 - IRLM Notify Req Detail” are described in the following section.

LOCK RES TYPE

The locked resource type.

**Note:** For data sharing, SKELETON CURSOR TABLE LOCKING and SKELETON PACKAGE TABLE LOCK are LP-locks (an LP-lock has an L-lock component and a P-lock component).

Field Name: QW0021KT

DBID

The database ID. This field is not applicable if the value in LOCK RES TYPE is:

- SKELETON CURSOR TABLE LOCKING
- UTILITY SERIALIZATION LOCK
- SKELETON PACKAGE TABLE LOCK
- COLLECTION
- BINDLOCK
- ALTER BUFFER POOL
- GROUP BUFFERPOOL START/STOP LOCK
- GROUP BUFFER POOL LEV CASTOUT P-LOCK
- CATMAINT MIGRATION LOCK
- CATMAINT CONVERT CATALOG LOCK
- CATMAINT CONVERT DIRECTORY LOCK

Field Name: QW0021KD

OBID

The object ID. This field is not applicable if the value in LOCK RES TYPE is:

- SKELETON CURSOR TABLE LOCKING
- UTILITY SERIALIZATION LOCK
- SKELETON PACKAGE TABLE LOCK
- COLLECTION
- BINDLOCK
- ALTER BUFFER POOL
- GROUP BUFFERPOOL START/STOP LOCK
- DDF CDB P-LOCK
- GROUP BUFFER POOL LEV CASTOUT P-LOCK
**Field Name:** QW0021KP

**RESOURCE ID**

The hexadecimal identifier of the small resource. If LOCK RES TYPE is:

**DATA PAGE LOCKING**
First 3 bytes are the page number

**PARTITION LOCKING**
Last byte is the partition number

**INDEX PAGE LOCKING**
First 3 bytes are the page number

**HASH ANCHOR LOCK**
First 3 bytes are the page number and the last byte is the anchor point ID

**CS-READ DRAIN**
Last byte is the partition number (optional)

**RR-READ DRAIN**
Last byte is the partition number (optional)

**WRITE DRAIN**
Last byte is the partition number (optional)

**ROW LOCK**
First 3 bytes are the page number and the last byte is the row ID of the record

**INDEX END OF FILE LOCK**
Last byte is the partition number (optional)

**PAGESET/PARTITION P-LOCK**
First byte is the 1-based partition number (optional)

**PAGE P-LOCK**
First byte is the 1-based partition number (optional) and the last 3 bytes are the relative page number

**PAGESET/PARTITION LEVEL CASTOUT P-LOCK**
First byte is the 1-based partition number (optional)

**Note:**

- In large partitioned table spaces, the page number covers 4 bytes instead of 3.
- If table spaces use relative page numbers, the resource ID covers 7 bytes. It contains the partition number in the first 2 bytes, the page number in the next 4 bytes, and the record ID in the seventh byte.

For all other lock resource types, the resource ID is not applicable.

**Field Name:** QW0021KR

**STATE**

The lock state. This field is only applicable if the value in OPERATION is SEND. Otherwise, N/A is printed in this field.
Field Name: QW0257ST

NUMBER OF HOLDERS

The number of lock holders notified. This field is only applicable if the value in OPERATION is SEND. Otherwise, N/A is printed in this field.

Field Name: QW0257NU

OPERATION

The notify operation.

Field Name: QW0257OP

REQUEST

Indicates whether the request was synchronous or asynchronous. This field is only applicable if the value in OPERATION is SEND. Otherwise, N/A is printed in this field.

Field Name: QW0257FL
IFCID 258 - Data Set Extend Activity

This topic shows detailed information about “Record Trace - IFCID 258 - Data Set Extend Activity”.

This record is written every time a data set is extended.

Record trace - IFCID 258 - Data Set Extend Activity

The field labels shown in the following sample layout of “Record Trace - IFCID 258 - Data Set Extend Activity” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DATA SET NAME</td>
<td>Data set name.</td>
</tr>
<tr>
<td>DATABASE NAME</td>
<td>Database name.</td>
</tr>
<tr>
<td>TABLESPACE NAME</td>
<td>Table or index space name.</td>
</tr>
<tr>
<td>PSID</td>
<td>Page set identifier.</td>
</tr>
<tr>
<td>PRIMARY QUANTITY</td>
<td>Primary allocation quantity in 4 KB units.</td>
</tr>
<tr>
<td>SEC. QUANTITY</td>
<td>Secondary allocation quantity in 4 KB units.</td>
</tr>
<tr>
<td>HIGH ALLOC BEFORE</td>
<td>High allocated space before the extend in 4KB units.</td>
</tr>
</tbody>
</table>

DATA SET NAME
Data set name.

Field Name: QW0258DS

TIMESTAMP
The timestamp when the Data Set Extend Activity is completed. It shows the date and time in DB2 timestamp format.

Field Name: QW0258TS

DATABASE NAME
Database name.

Field Name: QW0258DN

DBID
Database identifier.

Field Name: QW0258DB

TABLESPACE NAME
Table or index space name.

Field Name: QW0258TN

PSID
Page set identifier.

Field Name: QW0258PS

PRIMARY QUANTITY
Primary allocation quantity in 4 KB units.

Field Name: QW0258PQ

SEC. QUANTITY
Secondary allocation quantity in 4 KB units.

Field Name: QW0258SQ

HIGH ALLOC BEFORE
High allocated space before the extend in 4KB units.
IFCID 258 - Data Set Extend Activity

Field Name: QW0258HB

HIGH ALLOC AFTER
High allocated space after the extend in 4 KB units.

Field Name: QW0258HA

MAX DS SIZE
Maximum size for the data set in 4 KB units.

Field Name: QW0258MS

EXTENTS BEFORE
Number of extents before the reported extend.

Field Name: QW0258XB

EXTENTS AFTER
Number of extents after the reported extend.

Field Name: QW0258XA

MAX EXTENTS
The maximum number of extents for the VSAM data set.

Field Name: QW0258XM

VOLUMES BEFORE
Number of volumes before the extend.

Field Name: QW0258VB

VOLUMES AFTER
Number of volumes after the extend.

Field Name: QW0258VA

MAX VOLUMES
Maximum number of volumes in the VSAM data set.

Field Name: QW0258VM
IFCID 259 - Buffer Manager Pg P-Lock Req

This topic shows detailed information about “Record Trace - IFCID 259 - Buffer Manager Pg P-Lock Req”.

Record trace - IFCID 259 - Buffer Manager Pg P-Lock Req

The field labels shown in the following sample layout of “Record Trace - IFCID 259 - Buffer Manager Pg P-Lock Req” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>P-LOCK TYPE</td>
<td>The P-lock type. This field can only have one value: PAGE.</td>
</tr>
<tr>
<td>DBID</td>
<td>The database ID. Deduced from the DB2 fields QW0259KD, QW0105DN or QW0107DN.</td>
</tr>
<tr>
<td>OBID</td>
<td>The database ID. Deduced from the DB2 fields QW0259KP, QW0105TN or QW0107TN.</td>
</tr>
<tr>
<td>PARTITION NMBR</td>
<td>The partition number. If this is a nonpartitioned page set, 0 is printed in this field.</td>
</tr>
<tr>
<td>BP ID</td>
<td>The internal buffer pool ID (0-49 and 80-89).</td>
</tr>
<tr>
<td>IRLM FUNC CODE</td>
<td>The IRLM function code.</td>
</tr>
<tr>
<td>OBJECT TYPE</td>
<td>The object type.</td>
</tr>
<tr>
<td>MODIFY</td>
<td>Indicates whether this is a modify lock.</td>
</tr>
</tbody>
</table>
Field Name: QW0259C7

PAGE NMBR
The relative page number.

Field Name: QW0259KQ

DB2 MEMBER NAME
The DB2 member name that depends on the value in IRLM FUNC CODE:
- When CHANGE FROM P-LOCK EXIT this is the name of the database in conflict with the P-lock state currently held by this member.
- If it is not CHANGE FROM P-LOCK EXIT and the P-lock was rejected, this is the name of the database in conflict with this request

Field Name: QW0259DB

CONDITIONAL
Indicates whether the request was conditional.

Field Name: QW0259C1

RESTART
Indicates whether there was a restart lock request.

If the lock is currently retained on behalf of this DB2, a restart request causes the lock to be changed from retained to active. If the lock is not retained, the lock grant process is as normal.

Field Name: QW0259C6

REQUESTED STATE
The requested lock state if the value in IRLM FUNC CODE is LOCK or CHANGE. If the value is CHANGE FROM P-LOCK EXIT, then this is the P-lock state requested by the other member causing the P-lock exit of this member.

Field Name: QW0259ST

OLD HELD STATE
The previously held P-LOCK state.

Field Name: QW0259PS

NEW HELD STATE
The newly held P-LOCK state.

Field Name: QW0259NS
IFCID 260 - IBM Service Record

This topic shows detailed information about “Record Trace - IFCID 260 - IBM Service Record”.

This record is for IBM service use.
IFCID 261 - Group Buffer Pool Checkpoint

This topic shows detailed information about “Record Trace - IFCID 261 - Group Buffer Pool Checkpoint”.

Record trace - IFCID 261 - Group Buffer Pool Checkpoint

The field labels shown in the following sample layout of “Record Trace - IFCID 261 - Group Buffer Pool Checkpoint” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BUFFERPOOL ID</td>
<td>The internal identifier of the buffer pool. The values 0 through 49 are the identifiers for BP0 through BP49. The values 80 through 89 are the identifiers for BP32K through BP32K9.</td>
</tr>
<tr>
<td>CASTOUT P-LOCKS</td>
<td>The number of page sets or partition castout P-locks obtained by the GBP checkpoint process.</td>
</tr>
<tr>
<td>NEW RECOVERY LRSN</td>
<td>The global recovery record sequence number (LRSN) for this GBP checkpoint.</td>
</tr>
<tr>
<td>START TIME</td>
<td>The date and time at which GBP checkpoint processing started. The RECORD TIME field shows when processing ended.</td>
</tr>
<tr>
<td>INIT BY SPECIAL CASTOUT</td>
<td>The number of page sets and partitions for which a castout had to be initiated by a special castout process because the castout owner did not exist for the page set or partition.</td>
</tr>
<tr>
<td>OLD RECOVERY LRSN</td>
<td>The global recovery log record sequence number (LRSN) of the GBP checkpoint prior to this one.</td>
</tr>
<tr>
<td>ELAPSED TIME</td>
<td>The duration of the GBP checkpoint process. Calculated by QW0261TS - QWHSSSTCK.</td>
</tr>
</tbody>
</table>
The number of page sets and partitions for which a castout was locally initiated without a message being sent.

Field Name: QW0261PL

NEW MINIMUM LRSN
The minimum restart/redo point for this GBP checkpoint.

Field Name: QW0261NM

READ DIRECTORY INFO
The number of coupling facility requests to read directory information.

Field Name: QW0261RD

INIT BY SENDING MSG
The number of page sets and partitions for which a castout was initiated by sending a message to the castout owner.

Field Name: QW0261PN

OLD MINIMUM LRSN
The minimum restart/redo point of the GBP checkpoint prior to this one.

Field Name: QW0261OM

DIRECTORY ENTRIES
The number of directory entries for changed pages processed.

Field Name: QW0261DP
IFCID 262 - GBPOOLT Castout Threshold Processing

This topic shows detailed information about “Record Trace - IFCID 262 - GBPOOLT Castout Threshold Processing”.

GBPOOLT castout threshold processing shows the data from IFCID 262. This IFCID contains statistics related to the GBPOOLT castout threshold processing for a GBP. It is only written if the GBPOOLT threshold has been reached.

This record is only written in a data sharing environment.

Record trace - IFCID 262 - GBPOOLT Castout Threshold Processing

The field labels shown in the following sample layout of “Record Trace - IFCID 262 - GBPOOLT Castout Threshold Processing” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BUFFERPOOL ID</td>
<td>The internal identifier of the buffer pool. The values 0 through 49 are the identifiers for BP0 through BP49. The values 80 through 89 are the identifiers for BP32K through BP32K9.</td>
</tr>
<tr>
<td>READ CASTOUT CLASS</td>
<td>The number of coupling facility read castout class requests.</td>
</tr>
<tr>
<td>CASTOUT P-LOCKS</td>
<td>The number of page set or partitions castout P-locks obtained by the GBPOOLT process.</td>
</tr>
<tr>
<td>START TIME</td>
<td>The date and time at which the GBP castout started. The RECORD TIME field shows when processing ended.</td>
</tr>
<tr>
<td>READ CASTOUT STATISTICS</td>
<td>The number of coupling facility requests to cast out statistics.</td>
</tr>
<tr>
<td>CHANGED PAGES CASTOUT</td>
<td>The number of changed page names that were passed to the page set and partition castout owner for castout.</td>
</tr>
<tr>
<td>ELAPSED TIME</td>
<td>The duration of the GBP castout process. Calculated by QW0262TS - QWHSSSTCK.</td>
</tr>
</tbody>
</table>

BUFFERPOOL ID

The internal identifier of the buffer pool. The values 0 through 49 are the identifiers for BP0 through BP49. The values 80 through 89 are the identifiers for BP32K through BP32K9.

Field Name: QW0262BP

READ CASTOUT CLASS

The number of coupling facility read castout class requests.

Field Name: QW0262RC

CASTOUT P-LOCKS

The number of page set or partitions castout P-locks obtained by the GBPOOLT process.

Field Name: QW0262PD

START TIME

The date and time at which the GBP castout started. The RECORD TIME field shows when processing ended.

Field Name: QW0262TS

READ CASTOUT STATISTICS

The number of coupling facility requests to cast out statistics.

Field Name: QW0262RS

CHANGED PAGES CASTOUT

The number of changed page names that were passed to the page set and partition castout owner for castout.

Field Name: QW0262CP

ELAPSED TIME

The duration of the GBP castout process. Calculated by QW0262TS - QWHSSSTCK.
Field Name: RT0262ET

INIT BY SENDING MSG
The number of page sets and partitions for which castout was initiated by sending a notify message to the castout owner.

Field Name: QW0262PN

CHANGED PAGES IN GBP
The number of changed pages in group buffer pool.

Field Name: QW0262DP

FIRST CASTOUT CLASS
The first castout class processed.

Field Name: QW0262FC

INIT W/O SENDING MSG
The number of changed pages and partitions for which castout was locally initiated without a message being sent to the castout owner.

Field Name: QW0262PL

CHANGED PAGES GBPOOLT
The number of changed pages required to reach the GBPOOLT.

Field Name: QW0262GT

LAST CASTOUT CLASS
The last castout class processed. Sometimes the value in this field is smaller than the one in the FIRST CASTOUT CLASS field. This can happen if DB2 wraps around at the end of the castout class numbers.

Field Name: QW0262LC
This topic shows detailed information about “Record Trace - IFCID 263 - Page Set and Partition Castout Detail”.

This record shows page set and partition castout statistics. It is written by the page set or partition castout owner after the castout engine completed servicing the castout request.

This record is only written in a data sharing environment.

The field labels shown in the following sample layout of “Record Trace - IFCID 263 - Page Set and Partition Castout Detail” are described in the following section.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BUFFERPOOL ID</td>
<td>The internal identifier of the buffer pool. The values 0 through 49 are the identifiers for BP0 through BP49. The values 80 through 89 are the identifiers for BP32K through BP32K9.</td>
</tr>
<tr>
<td>CASTOUT REASON</td>
<td>The reason why the castout was invoked.</td>
</tr>
<tr>
<td>DATABASE ID</td>
<td>The ID of the database.</td>
</tr>
<tr>
<td>PARTITION NUMBER</td>
<td>The partition number. It is 0 if this is a non-partitioned page set.</td>
</tr>
<tr>
<td>CASTOUT DATA REQUESTS</td>
<td>The number of data requests made during the castout.</td>
</tr>
<tr>
<td>DELETE NAME REQUESTS</td>
<td>The number of delete name requests made during the castout.</td>
</tr>
<tr>
<td>CASTOUT DATA REQUESTS</td>
<td>The number of unlock for castout requests made during the castout.</td>
</tr>
<tr>
<td>CASTOUT DATA REQUESTS</td>
<td>The number of read castout requests made during the castout.</td>
</tr>
<tr>
<td>ELAPSED TIME</td>
<td>The time elapsed since the start of castout processing.</td>
</tr>
<tr>
<td>CASTOUT DATA REQUESTS</td>
<td>The number of write I/O requests made during the castout.</td>
</tr>
<tr>
<td>SEC-GBP DEL NAME LIST</td>
<td>The number of SEC-GBP Del Name List requests made during the castout.</td>
</tr>
<tr>
<td>TIME DEL-NAME GBP</td>
<td>The time when the first delete name operation was performed.</td>
</tr>
<tr>
<td>TIME DEL-NAME SEC-GBP</td>
<td>The time when the first SEC-GBP delete name operation was performed.</td>
</tr>
<tr>
<td>QW0263FL</td>
<td>The format of the page set object name.</td>
</tr>
</tbody>
</table>

**BUFFERPOOL ID**

The internal identifier of the buffer pool. The values 0 through 49 are the identifiers for BP0 through BP49. The values 80 through 89 are the identifiers for BP32K through BP32K9.

**Field Name**: QW0263BP

**CASTOUT REASON**

The reason why the castout was invoked.

- CLASS THRESHOLD
- GROUP BUFFER POOLT THRESHOLD
- GROUP BUFFER POOL CHECKPOINT
- GROUP BUFFER REBUILD
- SYNCHRONOUS CASTOUT
- CONVERTED TO NON-GBP-DEPENDENT OR ASYNCH. CASTOUT

**Field Name**: QW0263RS

**DATABASE ID**

The ID of the database.

**Field Name**: QW0263DB

**PAGE SET OBJECT ID**

The ID of the page set object.

**Field Name**: QW0263PS

**START TIME**

The date and time at which castout processing started.

**Field Name**: QW0263TS

**PARTITION NUMBER**

The partition number. It is 0 if this is a non-partitioned page set.
Field Name: QW0263PT

PRIVATE BUFFER
The number of private buffer allocated to this engine (in 4K increments).
Field Name: QW0263PB

ELAPSED TIME
The duration of the castout process. The RECORD TIME field shows when this process ended. Calculated by QW0263TS - QWHSSTCK.
Field Name: RT0263ET

CASTOUT DATA REQUESTS
The number of coupling facility requests to cast out data.
Field Name: QW0263CD

UNLOCK FOR CASTOUT
The number of coupling facility requests to unlock for a castout.
Field Name: QW0263UN

READ CASTOUT CLASS
The number of coupling facility requests to read a castout class.
Field Name: QW0263RC

DELETE NAME REQUESTS
The number of coupling facility requests to delete a name.
Field Name: QW0263DN

WRITE I/O REQUESTS
The number of write I/O requests.
Field Name: QW0263IO

GBP DEL NAME LIST
The number of IXLCACHE delete_name_list requests to the secondary group buffer pool when the GBP MODE is DUPLEX.
Field Name: QW02632D

TIME DEL-NAME GBP
Duration of DELETE_NAME to primary GBP.
Field Name: QW0263TD

DEL-NAME GBP
The number of times a DELETE_NAME request was reissued to the primary GBP.
Field Name: QW0263RD

TIME DEL-NAME SEC-GBP
Duration of DELETE_NAME to the secondary GBP.
Field Name: QW02632T

DEL-NAME SEC-GBP
The number of times a DELETE_NAME request was reissued to the secondary GBP for duplexing.

Field Name: QW02632R
IFCID 265 - IBM Service Record

This topic shows detailed information about “Record Trace - IFCID 265 - IBM Service Record”.

This record is for IBM service use.
This topic shows detailed information about “Record Trace - IFCID 266 - IBM Service Record”.

This record is for IBM service use.
IFCID 267 - CF Rebuild/Alter/Start

This topic shows detailed information about “Record Trace - IFCID 267 - CF Rebuild/Alter/Start”.

This record shows the start of a coupling facility (CF) rebuild or alter, which is indicated by the OPERATION field. A rebuild or alter is reported in the same format.

Record trace - IFCID 267 - CF Rebuild/Alter/Start

The field labels shown in the following sample layout of “Record Trace - IFCID 267 - CF Rebuild/Alter/Start” are described in the following section.

OPERATION: X
STRUCTURE NAME: XXXXXXXXXXXXXX
REQUESTED SIZE: nnnnnnnn
QW0267ME  nnnnnnnn  QW0267ML  nnnnnnnn
QW0267F1  X'hh'  QW0267ER  X'hhhh'
QW0267LR  X'hhhh'  QW0267F2  X'hhhh'

The operation for the DB2 data sharing coupling facility structures:

F  The rebuild due to the coupling facility structure failure or loss of connectivity to the coupling facility.
O  The MVS rebuild initiated by the MVS operator command SETXCF START, REBUILD
M  The rebuild caused by the maximum number of lock structure users being reached.
A  The dynamic expansion or contraction initiated by the MVS operator command SETXCF START, ALTERN
D  Rebuild started to establish DUPLEX
P  Duplexing being stopped, falling back to primary.
W  Duplexing being stopped, switching to secondary.
S  Dynamic expand/contract initiated by MVS SETXCF START, ALTERN operator command against a secondary group buffer pool.

Field Name: QW0267RS

STRUCTURE NAME

The name of the CF structure.

Field Name: QW0267NM

REQUESTED SIZE

The requested size of the CF structure in 4 KB increments. This field is valid only if the value in the REASON is ALTER COMMAND.

Field Name: QW0267SZ
IFCID 268 - CF Rebuild/Alter End

This topic shows detailed information about “Record Trace - IFCID 268 - CF Rebuild/Alter End”.

This record shows the end of a coupling facility (CF) alter or rebuild. This end record matches the start record, IFCID 267.

Record trace - IFCID 268 - CF Rebuild/Alter End

The field labels shown in the following sample layout of “Record Trace - IFCID 268 - CF Rebuild/Alter End” are described in the following section.

**OPERATION**

The operation for the DB2 data sharing coupling facility structures:

- **F** The rebuild due to the coupling facility structure failure or loss of connectivity to the coupling facility.
- **O** The MVS rebuild initiated by the MVS operator command SETXCF START, REBUILD
- **M** The rebuild caused by the maximum number of lock structure users being reached.
- **A** The dynamic expansion or contraction by the MVS operator command SETXCF START, REBUILD
- **D** Rebuild started to establish DUPLEX
- **P** Duplexing being stopped, falling back to primary.
- **W** Duplexing being stopped, switching to secondary.
- **S** Dynamic expand/contract initiated by MVS SETXCF START,ALTER operator command against a secondary group buffer pool.

**Field Name:** QW0268FC

**START TIME**

The date and time of the start of the rebuild.

**Field Name:** QW0268BT

**OPERATION RESULT**

The result of the operation:

- **O** The operation completed successfully.
- **N** The expansion or contraction completed successfully, however, the allocated size is smaller than the requested size.
- **S** The rebuild, expansion, or contraction was stopped.

**Field Name:** QW0268RC

**REASON STOPPED**
The reason why the rebuild, expansion, or contraction was stopped:

C Duplexing rebuild stopped because of insufficient connectivity due to a change in the set of connectors
F Structure failed before the operation completed
G An MVS service failed before the operation completed
I New structure does not provide connectivity which is better than or equivalent to the current structure
J The structure alter request could not complete due to a rebuild initiated for the structure
K Rebuild process was stopped because of failure on connect to the new structure
L Lost connectivity to the structure
N New structure does not provide better connectivity than the current structure for a LossConn rebuild
O Operator requested to stop
P Duplexing was stopped by new CFRM policy
R Resource manager requested to stop
S Invalid ratio specified
T Rebuild process was stopped because the new lock structure is full
U Rebuild process was stopped because of failure of a required IRLM in the group
W Rebuild stopped due to successful group function level change--complete rebuild is not required
X Rebuild stopped due to unsuccessful completion of group function level change

This field is only valid if the value in OPERATION RESULT is S.

Field Name: QW0268RS

DIRECTORY COUNT

If the structure was altered, this is the current directory count of the directory entries. If the GBP was rebuilt, this field is not used. For the SCA and lock structure, this is a serviceability field.

Field Name: QW0268DN

STRUCTURE NAME

The name of the CF structure.

Field Name: QW0268NM

ELEMENT COUNT

If the structure was altered, this is the current count of the elements. For an GBP with a 8 KB page size, the element count equals the data entry count. For a GBP with a 16 KB page size, the element count is eight times the data entry count. If the GBP was rebuilt, this field is not used. For the SCA and lock structure, this is a serviceability field.

Field Name: QW0268TN
MINIMUM SIZE

If the structure was altered, this is the current minimum structure in increments of 4 KB. If the GBP was rebuilt, this is number of pages cast out by this member.

Field Name: QW0268MS

CURRENT SIZE

If the structure was altered, this is the current structure size in increments of 4 KB. If the GBP was rebuild, this is number of pages written to the new structure by this member.

Field Name: QW0268CS
IFCID 269 - Trusted/Context Trace

This topic shows detailed information about “Record Trace - IFCID 269 - Trusted/Context Trace”.

This record is produced, if a trusted connection is established or reused.

Record trace - IFCID 269 - Trusted/Context Trace

The field labels shown in the following sample layout of “Record Trace - IFCID 269 - Trusted/Context Trace” are described in the following section.

```
CONNECTION TYPE: ESTABLISHED STATUS: FAILED SQLCODE: 20360 OBJECT OWNER: N/P
```
IFCID 269 - Trusted/Context Trace

AUTHID
The AUTHORIZATION ID.
Field Name: QW0269OT

SECURITY LABEL
The security label.
Field Name: QW0269SL

TRUSTED CONTEXT NAME
The trusted context name.
Field Name: QW0269TC

SYSTEM AUTHID USED
The system authorization ID that is used to establish the trusted connection.
Field Name: QW0269SA

ROLE ASSOCIATED
The default role associated with the context.
Field Name: QW0269RC

TCP/IP ADDRESS
The actual communication TCP/IP address used for connection.
Field Name: QW0269AD

SERVAUTH NAME
The SERVAUTH name of the TCP/IP security zone.
Field Name: QW0269SR

ENCRYPTION
The encryption value to be associated with the encryption trust attribute for a trusted context. Possible values are:
• NONE
• LOW
• HIGH
Field Name: QW0269EC

JOB NAME
The job name for a local application.
Field Name: QW0269JN

REUSE AUTHID
The authorization ID under which a trusted connection is reused.
Field Name: QW0269RA

USER ROLE
The user role.
Field Name: QW0269RU

PROFILE NAME
The RACF profile name that contains the authorization IDs that can use the connection in the trusted context.

**Field Name:** QW0269PR
IFCID 270 - Trusted/Context Trace

This topic shows detailed information about “Record Trace - IFCID 270 - Trusted/Context Trace”.

This record is produced, if a trusted connection is created or altered.

Record trace - IFCID 270 - Trusted/Context Trace

The field labels shown in the following sample layout of “Record Trace - IFCID 270 - Trusted/Context Trace” are described in the following section.

STATEMENT TYPE: CREATE  SQLCODE: 11  SQL STMT LENGTH: 12
SQL STATEMENT : CREATE MYTAB

STATEMENT TYPE

The type of trusted context. Possible values are:

CREATE TRUSTED CONTEXT or CREATE
If a trusted context is created.

ALTER TRUSTED CONTEXT or ALTER
If a trusted context is altered.

Field Name: QW0270TY

SQLCODE

The SQL return code from the CREATE or ALTER TRUSTED CONTEXT statement.

Field Name: QW0270SQ

SQL STMT LENGTH

The length of the SQL statement.

Field Name: QW0270SL

SQL STATEMENT

The SQL statement (truncated at 4000 bytes).

Field Name: QW0270SS
IFCID 271 - Row Level and Column Level Access Control

This topic shows detailed information about “Record Trace - IFCID 271 - Row Level and Column Level Access Control”.

This IFCID records the following events:
- When a row permission or column mask is created.
- When a row permission or column mask is dropped.
- When a row permission or column mask is altered.

Record trace - IFCID 271 - Row Level and Column Level Access Control

The field labels shown in the following sample layout of “Record Trace - IFCID 271 - Row Level and Column Level Access Control” are described in the following section.

<table>
<thead>
<tr>
<th>STATEMENT TYPE: CREATE</th>
<th>OBJECT .......: ROW PERMISSION</th>
<th>SQLCODE ........: -1</th>
<th>STMT LENGTH ..: 78</th>
</tr>
</thead>
<tbody>
<tr>
<td>SQL STATEMENT: THIS IS A SQL STATEMENT TEXT TO VERIFY ITS CORRECT PRESENTATION IN BATCH AUDIT</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**TYPE**

Identifies the SQL statement type:
- **CREATE** or **C**
  Creates row permission or column mask.
- **DROP** or **D**
  Drops row permission or column mask.
- **ALTER** or **A**
  Alters row permission or column mask.

Otherwise, a hexadecimal value is shown.

**Field Name:** QW0271TY

**OBJECT**

Identifies the object type:
- Row permission (R)
- Column mask (M)

Otherwise, a hexadecimal value is shown.

**Field Name:** QW0271OB

**SQLCODE**

The SQL code from the execution of the CREATE, DROP, or ALTER statement.

**Field Name:** QW0271SQ

**STMT LENGTH**

The length of the SQL statement.

**Field Name:** QW0271SL

**SQL STATEMENT**

The SQL statement text associated with the table access. The maximum length is 4000 bytes. Long SQL text can be truncated.
Field Name: QW0271SS
IFCID 272 - Associate Locators

This topic shows detailed information about “Record Trace - IFCID 272 - Associate Locators”.

Record trace - IFCID 272 - Associate Locators

The field labels shown in the following sample layout of “Record Trace - IFCID 272 - Associate Locators” are described in the following section.

LOCATION
The location name where the stored procedure executes.
Field Name: QW0272LN

PKG COLLECTION ID
The Package collection identifier. This is BLANK when the statement executes without a package.
Field Name: QW0272PC

PROGRAM NAME
The program name.
Field Name: QW0272PG

STO PROC LOCATION
The location of the stored procedure.
Field Name: QW0272LP

STO PROC QUALIFIER
The qualifier of the stored procedure.
Field Name: QW0272QN

STO PROC NAME
The name of the stored procedure.
Field Name: QW0272PN

STATEMENT NUMBER
The statement number of ASSOCIATE LOCATORS statement.
Field Name: QW0272SN

NUMBER OF LOCATORS
The number of locators referenced in the ASSOCIATE LOCATORS statement.
Field Name: QW0272NL
IFCID 272 - Associate Locators

CONSISTENCY TOKEN

The consistency token.

Field Name: QW0272TS
IFCID 273 - Allocate Cursor

This topic shows detailed information about “Record Trace - IFCID 273 - Allocate Cursor”.

Record trace - IFCID 273 - Allocate Cursor

The field labels shown in the following sample layout of “Record Trace - IFCID 273 - Allocate Cursor” are described in the following section.

LOCATION NAME
The location name where the stored procedure executes.
Field Name: QW0273LN

PKG COLLECTION ID
The Package collection identificator. This is BLANK when the statement executes without a package.
Field Name: QW0273PC

PROGRAM NAME
The program name.
Field Name: QW0273PG

STO PROC LOCATION
The location of the stored procedure.
Field Name: QW0273LP

STO PROC QUALIFIER
The qualifier of the stored procedure.
Field Name: QW0273QN

STO PROC NAME
The name of the stored procedure.
Field Name: QW0273PN

ALLOCATED CURSOR
The name of the ALLOCATE CURSOR statement.
Field Name: QW0273CN

REAL CURSOR NAME
The name of cursor in the stored procedure.
IFCID 273 - Allocate Cursor

Field Name: QW0273RN

STATEMENT NUMBER
The statement number of ALLOCATE CURSOR statement.
From QW0273SN or QW0273TS.

Field Name: RT0325SN

LOCATOR VALUE
The value of the locator associated with the result set for which this cursor is defined.

Field Name: QW0273LV

CONSISTENCY TOKEN
The consistency token.

Field Name: QW0273TS

QUERY COMMAND ID
The ID of the query command.

Field Name: QW0273CID

QUERY INSTANCE ID
The ID of the query instance.

Field Name: QW0273QID
IFCID 305 - Table Check Constraint

This topic shows detailed information about “Record Trace - IFCID 305 - Table Check Constraint”.

Record trace - IFCID 305 - Table Check Constraint

The field labels shown in the following sample layout of “Record Trace - IFCID 305 - Table Check Constraint” are described in the following section.

NAME

The check constraint name.

Field Name: QW0305CN

TEXT

The first 30 characters of the check constraint text.

Field Name: QW0305CT

DBID

The DBID of the database for the table on which the check constraint is defined.

Field Name: QW0305DB

OBID

The OBID of the table on which the check constraint is defined.

Field Name: QW0305OB

OPERATION

The operation that is utilizing the check constraint function:

CREATE A check constraint is defined with a CREATE TABLE operation.

ALTER ADD A check constraint is defined with an ALTER TABLE operation.

ALTER ADD ENFORCE A check constraint is enforced during an ALTER TABLE operation.

ALTER DROP A check constraint is removed with an ALTER TABLE operation.
ENFORCE
A check constraint is enforced. DB2 checks that a row does not violate a check constraint.

Field Name: QW0305OP

RESULT
The result of the enforced check constraint:

REJ  The check constraint was rejected due to a check constraint violation.
OK   No check constraint was violated.

Field Name: QW0305RS

RECORD IDENTIFIER
The record identifier (RID) of the record that failed the check constraint. This field is only valid if the value in RESULT is REJ.

Field Name: QW0305ID

TABLE_SPACE_TYPE
The type of the table space:

L     Non-EA large table
N     Non-large table
R     Partitioned by range (PBR) universal table spaces (UTS) that use relative page numbers
V     EA-enabled large table

Field Name: QW0305TY

PARTITION
Shows the partition number if TABLE_SPACE_TYPE is R.

Field Name: QW0305PT

CHARACTERS
The first 30 characters of the rejected record (shown in text and hexadecimal format) that failed the check constraint condition. This field is only valid if the value in RESULT is REJ. Otherwise, N/A is printed in this field.

Field Name: QW0305RR
IFCID 311 - Global Temp Table Usage

This topic shows detailed information about “Record Trace - IFCID 311 - Global Temp Table Usage”.

Record trace - IFCID 311 - Global Temp Table Usage

The field labels shown in the following sample layout of “Record Trace - IFCID 311 - Global Temp Table Usage” are described in the following section.

<table>

</table>

TEMP TAB CREATOR
The creator of the global temporary table.
Field Name: QW0311QN

TEMP TABLE NAME
The name of the global temporary table.
Field Name: QW0311TN

PACK LOCATION NAME
The package location name for the query that uses the global temporary table.
Field Name: QW0311LN

PROGRAM NAME
The program name for the query that uses the global temporary table.
Field Name: QW0311PN

CURSOR NAME
The cursor name for fetches. This field is only applicable if the value in WORKFILE TYPE is RC. Otherwise, N/A is printed.
Field Name: QW0311CN

PACK COLLECTION ID
The package collection identifier for the query that uses the global temporary table.
Field Name: QW0311PC

PACK VERSION
The package version for the query that uses the global temporary table.
Field Name: QW311PVF

CURSOR HOLD STATUS
The cursor hold status:

HO The cursor is held through commit.

'BLANK' The cursor is not held through commit.
Field Name: QW0311HO

WORKFILE TYPE

The work-file type:

TT Temporary table
C Cursor on a temporary table
TR Transition table
CT Cursor on transition table.

Field Name: QW0311TY

OPERATION

The operation using the global temporary table:

AT Alter the temporary table.
CI Create the temporary table instantiation. A work file is created for
the temporary table.
OC Open the cursor on a temporary table.
D Delete work files for temporary table.
DA Delete all rows from the temporary table, but leave the work-file
structures intact.
CC Close cursor on the temporary table.

Field Name: QW0311OP

QW0311CA

This field is for IBM service use.

Field Name: QW0311CA

QW0311TA

This field is for IBM service use.

Field Name: QW0311TA
IFCID 313 - Uncommitted Unit of Recovery

This topic shows detailed information about “Record Trace - IFCID 313 - Uncommitted Unit of Recovery”.

Uncommitted unit of recovery (UR) shows data from IFCID 313. It reflects the same information given in the DB2 messages DSNR035I and DSNR036I.

Record trace - IFCID 313 - Uncommitted Unit of Recovery

The field labels shown in the following sample layout of “Record Trace - IFCID 313 - Uncommitted Unit of Recovery” are described in the following section.

UNCOMMITTED URID

The ID of the uncommitted unit of recovery.

Field Name: QW0313ID

CHKPTS TAKEN

For inflight units of recovery (UR), the number of checkpoints taken since the beginning of the UR. For indoubt URs, this field is set to -1.

Field Name: QW0313CK

TYPE OF UR/UW

The type of uncommitted unit of recovery (UR/UW):

FL  Inflight UR
DU  Indoubt UR
RR  Repeatable read

Field Name: QW0313TY

LUWID - NETWORKID, LUNAME, INSTANCE, COMMIT COUNT

The logical unit of work ID (LUWID) identifies the thread within the network. It consists of the:

- Fully qualified network name
- Logical unit name
- Logical unit of work (LUW) instance number
- Logical unit of work (LUW) sequence number which identifies the last COMMIT scope, in which the logical unit participated

Field Name: QW0313LU

CONNECTION ID

The connection ID.

Field Name: QW0313CN

CORRELATION ID

Field Name: QW0313CN

Chapter 40. IFCID Record Blocks 40-817
IFCID 313 - Uncommitted Unit of Recovery

The correlation ID.

Field Name: QW0313CR

MESSAGE NUMBER

The number of the DB2 message reflecting the information in this IFCID.

Field Name: QW0313MG

PLAN NAME

Plan Name from URE, if the UR is active, from RURE, if the UR is inactive (indoubt).

Field Name: QW0313PN

LOG RECS WRTN

Shows one of the following:
- The number of log records written
- The total number of minutes that the reader has been running

Field Name: QW0313LW

THRESHOLD TYPE

The type of threshold reached:
- C  Checkpoints
- L  Log records

Field Name: QW0313TH

AUTHORIZATION ID

Authorization ID from URE, if the UR is active, from RURE, if the UR is inactive (indoubt).

Field Name: QW0313AI

END USER USERID

End-user ID from CCB, if the UR is active. End user information is not available for indoubt URs.

Field Name: QW0313EU

TRANSACTION

End-user transaction name from CCB, if the UR is active. End user information is not available for indoubt URs.

Field Name: QW0313ET

WORKSTATION

End-user workstation name from CCB if the UR is active. End user information is not available for indoubt URs.

Field Name: QW0313EW
IFCID 314 - Authorization Exit Parameters

This topic shows detailed information about “Record Trace - IFCID 314 - Authorization Exit Parameters”.

It is generated after the authorization exit is called and shows the contents of the parameter list.

This record can be useful when debugging an authorization exit.

Record trace - IFCID 314 - Authorization Exit Parameters

The field labels shown in the following sample layout of “Record Trace - IFCID 314 - Authorization Exit Parameters” are described in the following section.

ADDRESS EXPL : X'000000AA'
EXIT RETURN CODE: 4
STD CLOCK BEFORE EXIT CALL: 02-05-34 00:29:23.181759
ADDRESS WORK AREA: X'000000BB'
EXIT RETURN CODE: 8
STD CLOCK AFTER EXIT CALL: 02-05-34 00:29:23.182511
AUTH ID : N/P
UNQUALIFIED OBJECT NAME: N/P
OBJECT OWNER : N/P
RELATED INFO 1 : N/P
RELATED INFO 2 : N/P
LENGTH WORK AREA : 204
ACEE UTOKEN : UTOKEN01XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXZ

ADDRESS EXPL
The address of the exit parameter list.
Field Name: QW0314EL

EXIT RETURN CODE
The return code from the exit:
0  Access allowed.
4  Check the DB2 authorization.
8  Access denied.
12 Unable to determine authorization. Do not call the exit again.
Field Name: QW0314RC

STO CLOCK BEFORE EXIT CALL
The store clock value before the exit was called.
Field Name: QW0314BC

ADDRESS WORK AREA
The address of the work area.
Field Name: QW0314WA

EXIT REASON CODE
The reason code from the user-defined exit.
Field Name: QW0314RS

STO CLOCK AFTER EXIT CALL
IFCID 314 - Authorization Exit Parameters

The store clock value after the exit was called.

Field Name: QW0314AC

AUTH ID

The authorization ID that is checked by DB2.

Field Name: QW0314UN

UNQUALIFIED OBJECT NAME

The unqualified object name.

Field Name: QW0314BN

OBJECT OWNER

The object owner or qualifier.

Field Name: QW0314ON

RELATED INFO 1

Shows other related information in field 1.

Field Name: QW03141N

RELATED INFO 2

Shows other related information in field 2.

Field Name: QW03142N

LENGTH WORK AREA

The length of the work area.

Field Name: QW0314WL

ACEE UTOKEN

Shows the ACEE UTOKEN, if it is available. If it is not available, the first word of this field contains one of the following values:

0 The UTOKEN cannot be accessed

-1 An abend occurred during the attempt to access the ACEE.

Field Name: QW0314UT

PARAMETER LIST

The list of parameters specific to the exit.

Field Name: QW0314PL
IFCID 316 - SQL Statement Statistics

This topic shows detailed information about “Record Trace - IFCID 316 - SQL Statement Statistics”.

IFCID 316 reports on the contents of the prepared SQL statement cache. This record is only written when an IFI application requests IFCID 316 through the READS interface.

It provides one record for each qualifying SQL statement in the cache. These multiple records are placed in the output area provided by the IFI application. The IFI application can specify qualification criteria for which statements should be reported.

Record trace - IFCID 316 - SQL Statement Statistics

The field labels shown in the following sample layout of “Record Trace - IFCID 316 - SQL Statement Statistics” are described in the following section.

```
STATEMENT NAME: X'00650876845364483A2A490000003C'

<tr>
<td>TIME STATISTICS COLLECTION START</td>
<td></td>
</tr>
</tbody>
</table>
Shows the time stamp when the statistics collection began.

Field Name: QW0316TS

TIME STATEMENT STORED IN CACHE
The date and time when the statement was inserted into the cache (in DB2 timestamp format).

Field Name: QW0316TM

IN STORE CLOCK FORMAT
The date or time when the statement was inserted into the cache (in store clock format) (DB2 field: QW0316TM2).

Field Name: RT316TM2

TIME STATEMENT UPDATED IN CACHE
The date and time when the statement was updated, in internal format (DB2 field: QW0316UT2).

Field Name: RT316UT2

IN STORE CLOCK FORMAT
The date or time when the statement statistic was updated (in store clock format) (DB2 field: QW0316UT1).

Field Name: RT316UT1

STATEMENT COPIES
The number of copies of the statement owned by all threads in the system.

Note: This includes QW0316US and any copies owned by plans or packages bound with KEEPDYNAMIC(YES) that were not used in their current unit of work. These users prepared the statement in a previous unit of work and still have it in a prepared state.

Field Name: QW0316CP

STATEMENT EXECUTIONS
The number of statement executions.

Note: For a cursor statement, this is the number of OPENS.

Field Name: QW0316NE

SYNCH BUFFER READS
The number of synchronous buffer read operations performed for the statement.

Field Name: QW0316NB

SYNCH BUFFER WRITES
The number of synchronous buffer write-operations performed for statement.

Field Name: QW0316NW

CURRENT USERS
Number of current users of the SQL statement.
Note: These users have prepared or executed the statement during their current unit of work.

Field Name: QW0316US

GETPAGE OPERATIONS
The number of Getpage operations performed for a statement.
Field Name: QW0316NG

TABLESPACE SCANS
The number of scan operations for table spaces that are performed for a statement.
Field Name: QW0316NT

PARALLEL GROUPS CREATED
The number of parallel groups that are created for a statement.
Field Name: QW0316NL

ROWS EXAMINED
The number of rows that are examined for the statement.
Field Name: QW0316NR

ROWS PROCESSED
The number of rows that are processed for the statement. For example, the number of rows returned for a SELECT statement, or the number of rows affected by an INSERT, UPDATE, or DELETE statement.
Field Name: QW0316NP

SORTS
The number of sort operations performed for a statement.
Field Name: QW0316NS

INDEX SCANS
The number of index scans performed for a statement.
Field Name: QW0316NI

ACCUMULATED CPU TIME
The accumulated CPU time.
Field Name: QW0316CT

ACCUMULATED ELAPSED TIME
Shows the accumulated elapsed time used for a statement.
Field Name: QW0316AE

STABILIZED STMT ID
The ID of the dynamic statement that could be stabilized by the catalog (DB2 field: QW0316_SDQ_STMTID).
Field Name: Q316SDQI

HASH-ID VERSION
The version of the hash ID of the dynamic query (DB2 field: QW0316_QUERY_HASH_VER).

Field Name: Q316QHVE

HASH-ID

The hash ID of a stabilized dynamic query.

Field Name: Q316QHID

STABILIZATION GROUP NAME

The name of the stabilization group. This is the group ID of the stabilization dynamic query (DB2 field: QW0316_STBLGRP).

Field Name: Q316STBG

RL NOT USED LIMIT EXCEEDED

The number of times that a RID list was not used, because the number of:
- RIDs would have exceeded one or more internal DB2 limits
- RID blocks exceeded the value set by the MAXTEMPS_RID system parameter.

Field Name: QW0316RT

RL NOT USED NO STOR AVAIL

The number of times that a RID list was not used because there was not enough storage. This also applies if the work file storage was not available.

Field Name: QW0316RS

RL OV - NO POOL STOR AVAIL

The number of times a RID list was overflowed to a work file because no RID pool storage was available to hold the list of RIDs (DB2 field: QW0316WFRIDS).

Field Name: RT316IDS

RL OV - RIDS EXCEED LIMIT

The number of times a RID list was overflowed to a work file because the number of RIDs exceeded one or more internal limits (DB2 field: QW0316WFRIDT).

Field Name: RT316IDT

HJA - NO POOL STOR AVAIL

The number of times a RID list append for a hybrid join was interrupted because no RID pool storage was available to hold the list of RIDs (DB2 field: QW0316HJINCS). For example, the number of times DB2 interrupted the RID phase and switched to the data phase.

Field Name: RT316NCS

HJA - RIDS EXCEED LIMIT

The number of times a RID list append for a hybrid join was interrupted because the number of RIDs exceeded one or more internal limits (DB2 field: QW0316HJINCT). For example, it shows the number of times DB2 interrupted the RID phase and switched to the data phase.

Field Name: RT316NCT
RL RETRIEVAL IA SKIPPED

The number of times a RID list retrieval for multiple index access was skipped because DB2 predetermined the outcome of index ANDing or ORing (DB2 field: QW0316RSMIAP).
Field Name: RT316IAP

READ BY OTHER THREAD

The accumulated wait time for a read activity that is performed by another thread.
Field Name: QW0316W5

SYNCH EXECUTION UNIT SWITCH

The accumulated wait time for a synchronous execution unit switch.
Field Name: QW0316W3

WRITE BY OTHER THREAD

The accumulated wait time for a write activity that is performed by another thread.
Field Name: QW0316W6

SYNCHRONOUS I/O

The accumulated wait time for a synchronous I/O.

Note: This wait time and the following wait times are only collected if a CLASS 3 accounting trace is started.
Field Name: QW0316W1

GLOBAL LOCKS

The accumulated wait time for global locks.
Field Name: QW0316W4

LOCK AND LATCH REQ

The accumulated wait time for lock and latch requests.
Field Name: QW0316W2

LATCH REQUEST

The accumulated wait time for lock requests.
Field Name: QW0316W7

PAGE LATCH

The accumulated wait time for page latches.
Field Name: QW0316W8

DRAIN LOCK

The accumulated wait time for drain locks.
Field Name: QW0316W9

DRAIN WAITING FOR CLAIM REL

The accumulated wait time for drains when waiting for claims to be released.
Field Name: QW0316WA

LOG WRITER
The accumulated wait time for log writers.

Field Name: QW0316WB

WAIT CHILD L-LOCKS
The accumulated wait time for child L-locks for the statement.

Field Name: QW0316WC

WAIT OTHER L-LOCKS
The accumulated wait time for other L-locks for the statement.

Field Name: QW0316WD

WAIT P/P P-LOCKS
The accumulated wait time for P/P P-locks for the statement.

Field Name: QW0316WE

WAIT PAGE P-LOCKS
The accumulated wait time for page P-locks for the statement.

Field Name: QW0316WF

WAIT OTHER P-LOCKS
The accumulated wait time for other P-locks for the statement.

Field Name: QW0316WG

WAIT PIPE
The accumulated wait time for pipe wait (DB2 field: QW0316_PIPE_WAIT).

Field Name: Q316PIPW

WAIT PARALLEL QUERIES
The accumulated time waiting for parallel queries to synchronize between parent and child tasks (DB2 field: QW0316_PQS_WAIT).

Field Name: Q316PQSW

CURRENT DATA BIND OPTION
The CURRENTDATA bind option. It can be one of the following:
- YES
- NO

Field Name: QW0316X7

CURSOR WITH HOLD
Shows if the position for a cursor opened WITH HOLD. It can be one of the following:
- YES
- NO

Field Name: QW0316XC

CURRENT PRECISION SPEC REG
IFCID 316 - SQL Statement Statistics

Shows the CURRENT PRECISION special register. It can be one of the following:
- DEC31
- DEC15

Field Name: QW0316XB

DYNAMIC RULES BIND OPTION

Shows the dynamic rules bind option. It can be one of the following:
- BIND
- RUN

Field Name: QW0316X8

CURRENT DEGREE SPECIAL REG

Shows value of the CURRENT DEGREE special register. It can be one of the following:
- ANY
- 1

Field Name: QW0316X9

ISOLATION BIND OPTION

The value of the ISOLATION bind option that is in effect for the initial PREPARE statement. It can be one of the following:
- UNCOMMITTED READ
- CURSOR STABILITY
- READ STABILITY
- REPEATABLE READ

Note: This value does not reflect if it is specified in a WITH clause.

Field Name: QW0316X6

CURRENT RULES SPECIAL REG

Shows the value of the CURRENT RULES special register. It can be one of the following:
- DB2
- SQL

Field Name: QW0316XA

DSG MEMBER

The data sharing DB2 member that cached the SQL statement (DB2 field: QW0316MBR).

Field Name: RT316MBR

TRANSACTION NAME

The text of the transaction name.

Field Name: QW0316T2

SIGNON USER ID

The End User ID is provided during RRS signon or resignon for initial prepare.
Field Name: QW0316XE

WORKSTATION ID
The Workstation ID is provided during RRS signon or resignon for initial prepare.
Field Name: QW0316XF

PROGRAM NAME
The text of the program name.
Field Name: QW0316T1

USER ID
The user ID.
Field Name: QW0316T3

USER GROUP
The name of the user group. The user group is the current SQLID of the user who started the initial PREPARE statement.
Field Name: QW0316X4

OBJECT QUALIFIER
The qualifier that is used for unqualified table names.
Field Name: QW0316X5

REFERENCED TABLE QUALIFIER
The qualifier of the referenced table name.
Field Name: QW0316QD

REFERENCED TABLE NAME
The name of the referenced table.
Field Name: QW0316TD

USER PROVIDED ID STRING
The identification (ID) string provided by the user.
Field Name: QW0316UI

CURRENT SCHEMA
The special register text of the current schema.
Field Name: QW0316SC

LENGTH OF SQL STATEMENT
The length of the entire statement.
Field Name: QW0316LN

SQL STATEMENT - FIRST 60 BYTES
The first 60 bytes of the SQL statement text.
Field Name: QW0316TX

ACCELERATOR NAME
The accelerator name (DB2 field: QW0316ANM).
Field Name: 316ANM

TIME STATEMENT STORED IN CACHE
The date or time when the statement was inserted into the cache (in DB2 timestamp format) (DB2 field: QW0316ATM).

Field Name: 316ATM

STATEMENT IDENTIFIER
The statement identifier, for correlation with IFCID 316 data section 1 (DB2 field: QW0316AID).

Field Name: 316AID

MEMBER NAME
The member name in case of a data sharing group (DSG). It is used for correlation with IFCID data section 1 (if DSG) (DB2 field: QW0316AMBR).

Field Name: 316AMBR

ACCELERATOR EXECUTIONS
The number of executions on this accelerator (DB2 field: QW0316AEXEC).

Field Name: 316AEXEC

ACCUMULATED # ROWS RETURNED
Shows the accumulated number of rows returned for the SELECT statement (DB2 field: QW0316AROW).

For completed queries, this is the total number of rows returned that were computed by the accelerator (this is not necessarily the number of rows returned to DB2 in case DB2 does not fetch all rows).

For in-process queries, this is the number of rows that have been sent so far (and more rows may still be coming).

This value is always set to 0 for DML statements (INSERT, UPDATE, DELETE) because these wait times do not occur for DML statements.

Field Name: 316AROW

ACCUMULATED CPU TIME
Shows the accumulated CPU time spent in the accelerator when processing the query request for the statement.

This value reflects parallel processing such that the CPU value may exceed the accumulated elapsed time (DB2 field: QW0316ACPU).

For completed queries, this is the CPU time from the initial request to the last row being returned to DB2. For in-process queries, this is the time from the initial request to the current point in time. The counter includes the CPU time spent in the accelerator and also the CPU time spent in the Netezza® backend (on the coordinator node and all worker nodes).

Field Name: 316ACPU

ACCUMULATED # BYTES RETURNED
Shows the accumulated number of bytes returned for the SELECT statement (DB2 field: QW0316ABYT).
For completed queries, this is the total number of bytes returned and produced by the accelerator (this is not necessarily the total number of bytes returned to DB2 in case DB2 does not fetch all the data).

For in-process queries, this is the number of bytes that have been sent so far (and more bytes may still be coming).

This value is always set to 0 for DML statements (INSERT, UPDATE, DELETE) because no such wait times occurs.

**Field Name:** 316ABYT

**ACCUMULATED ELAPSED TIME**

Shows the accumulated elapsed time spend in the accelerator processing the query request for the statement (DB2 field: QW0316AELA).

For completed queries, this is the time from the initial request to the last row that is returned to DB2. For in-process queries, this is the time from the initial request to the current point in time.

**Field Name:** 316AELA

**ACCUMULATED EXECUTION TIME**

Shows the accumulated execution time spent in processing the query request for the statement (DB2 field: QW0316AEXE).

For completed queries, this is the time spent since starting the query execution until the query execution has finished. Subsequent processing and transfer of the result set is not included, but there may be an overlapping time window in which result set processing (fetching) and query execution takes place.

For in-process queries, it is the time measured from starting query execution inside the accelerator up to the current point in time or until query execution has finished and only result set processing and transfer remains (whichever occurs earlier).

This time is measured for the actual execution time spent for the query. Compared to the total elapsed time (QW0316AELA and QW0401AELA), it does not include any preprocessing done in the accelerator (such as PREPARE), and it does not include time spent, such as in spill-to-disk or other things, related to the final query result processing.

**Field Name:** 316AEXE

**ACCUMULATED QUEUE WAIT TIME**

Shows the accumulated queue wait time for the statement (DB2 field: QW0316AWAT).

For completed queries, this is the time that the query has spent in queues, waiting to be processed.

For in-process queries, the value is only available once the query execution itself has finished and only result processing remains. Until then, the value will be (nearly) 0.

**Field Name:** 316AWAT

**WAIT TIME FOR DB2**

Shows the total time the accelerator waited for DB2 to request query results (DB2 field: QW0316ATWDB2).
ICID 316 - SQL Statement Statistics

For completed queries, this is from the time when the first row of the result set was produced by the accelerator until the last row was sent to DB2. For in-process queries, it is 0 (if the accelerator has not yet computed a result row) or the time from computing the first row to the current point in time (if at least one result row is available).

This value is always set to 0 for DML statements (INSERT, UPDATE, DELETE) because these wait times do not occur for DML statements.

**Field Name:** 316ATWDB

**WAIT TIME FOR 1ST ROW**

Shows the time waited for first row of query result to be available (DB2 field: QW0316ATW1R).

For completed queries, this is the time from receiving the query in the accelerator until the first row of the result set was computed. For in-process queries, this is the time from receiving the query in the accelerator to the current point in time (if no result rows are available yet) or until the first row of the result set was computed (if at least one result row is available).

This value is always set to 0 for DML statements (INSERT, UPDATE, DELETE) because no such wait times occurs.

**Field Name:** 316ATW1R
IFCID 317 - SQL Statement String

This topic shows detailed information about “Record Trace - IFCID 317 - SQL Statement String”.

Record trace - IFCID 317 - SQL Statement String

The field labels shown in the following sample layout of “Record Trace - IFCID 317 - SQL Statement String” are described in the following section.

SQL STATEMENT NAME
The name of the SQL statement.
Field Name: QW0317NM

SQL STATEMENT IDENTIFIER
The identifier of the SQL statement in hexadecimal.
Field Name: QW0317ID

SQL STATEMENT LENGTH
The length of the SQL statement.
Field Name: QW0317LN

SQL STATEMENT TEXT
The text of the SQL statement.
Field Name: QW0317TX

ATTRIBUTE STRING LENGTH
The length of the attribute string.
Field Name: QW03172LN

ATTRIBUTE STRING TEXT
The text of the attribute string.
Field Name: QW03172TX
IFCID 319 - Audit Security Record

This topic shows detailed information about “Record Trace - IFCID 319 - Audit Security Record”.

When a local DB2 receives a non-RACF identity that represents a user, it maps that name to a local user ID for use in connection processing. This record traces the mapping. This record provides an audit trail for security processing.

Record trace - IFCID 319 - Audit Security Record

The field labels shown in the following sample layout of “Record Trace - IFCID 319 - Audit Security Record” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>REQ COMMUNICATION ADDR</td>
<td>Requesting communication address. For SNA, this field shows the LU name, for TCP/IP, this shows the dotted decimal IP address.</td>
</tr>
<tr>
<td>COMMUNICATION ADDR TYPE</td>
<td>Type of communication address: SNA or TCP/IP.</td>
</tr>
<tr>
<td>CLIENT PRODUCT ID</td>
<td>The identification of the client product.</td>
</tr>
<tr>
<td>DERIVED LOCAL USERID</td>
<td>Local user ID mapped by DB2.</td>
</tr>
<tr>
<td>SECURITY TYPE</td>
<td>The type of security identity. Possible values are:</td>
</tr>
<tr>
<td>SECURITY MECHANISM</td>
<td>The security mechanism used. Possible values are:</td>
</tr>
</tbody>
</table>

The field labels shown in the following sample layout of “Record Trace - IFCID 319 - Audit Security Record” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>REQ COMMUNICATION ADDR</td>
<td>Requesting communication address. For SNA, this field shows the LU name, for TCP/IP, this shows the dotted decimal IP address.</td>

</tbody>
</table>
• Encrypted UID, PW, and new PW
• Encrypted UID and data
• Encrypted UID, PW, and data
• Encrypted UID, PW, new PW, and data
• Encrypted UID only

Field Name: QW0319SM

FLAGS - USER REGISTRY NAME
This flag shows if the caller passed the user registry name.

Field Name: QW0319UR

FLAGS - AES IS USED
This flag shows if Advanced Encryption Standard (AES) is used for encryption.

Field Name: QW0319AE

IPV6 ADDRESS
If the type of the communication address is TCP/IP, it is the 16 byte hexadecimal (\texttt{HLHLHLHLHLHLHLHLHLHLHLHLHLHLHLHL}) IP address of the internal 128 bit format, where:
• \texttt{H} represents the high order half byte value
• \texttt{L} represents the low order half byte value

Field Name: QW0319IPA

PRINCIPAL NAME LENGTH
Length of principal name.

Field Name: QW0319L1

PRINCIPAL NAME
The requesting principal name. This can be up to 256 characters and can contain lowercase characters.

Field Name: QW0319D1

PORT-INTERNAL FORMAT
If the type of the communication address is TCP/IP, this field shows the 16 bit port number in internal format.

Field Name: QW0319PRT
IFCID 321 - Force-at-Commit Begin

This topic shows detailed information about “Record Trace - IFCID 321 - Force-at-Commit Begin”.

Record trace - IFCID 321 - Force-at-Commit Begin

The field labels shown in the following sample layout of “Record Trace - IFCID 321 - Force-at-Commit Begin” are described in the following section.

**TARGET LOCATION FOR WRITE**

- The target location for write.

**Field Name:** QW0321LO
IFCID 322 - Force-at-Commit End

This topic shows detailed information about “Record Trace - IFCID 322 - Force-at-Commit End”.

Record trace - IFCID 322 - Force-at-Commit End

The field labels shown in the following sample layout of “Record Trace - IFCID 322 - Force-at-Commit End” are described in the following section.

PAGES_WRITTEN : 22

PAGES_WRITTEN

The number of pages written.

Field Name: QW0322NP
IFCID 324 - Function Resolution

This topic shows detailed information about “Record Trace - IFCID 324 - Function Resolution”.

Record trace - IFCID 324 - Function Resolution

The field labels shown in the following sample layout of “Record Trace - IFCID 324 - Function Resolution” are described in the following section.

QUERYNO: 100

Field Name: QW0324QN

PLANNAME

The plan name.

Field Name: QW0324PN

COLLECTION_ID

The collection ID.

Field Name: QW0324CI

APPLNAME

The name of the application.

Field Name: QW0324AL

PROGNAME

The program name.

Field Name: QW0324PG

CONSIS_TOKEN

The consistency token.

Field Name: QW0324CT

BIND_TIME

The time stamp of the bind time.

Field Name: QW0324TS

VERSION

The version ID.

Field Name: QW0324VN

CURRENT_PATH

The current path.

Field Name: QW0324CP
FUNCT_SCHEMA
A short SQL identifier, either ordinary or delimited, following the concept of qualified names consistent with the ANSI/ISO SQL.92 standard.
Field Name: QW0324FS

FUNCT_NAME
The name of a function without a qualifier.
Field Name: QW0324FN

SPECIFIC_NAME
Identifies the particular function. The specific name must identify a specific function name in the explicitly or implicitly specified schema.
Field Name: QW0324FI

FUNCT_TYPE
The classification of the function:
SU  Scalar UDF
TU  Table UDF
Field Name: QW0324FY

VIEW_CREATOR
The name of the view creator if the function is referenced in a view definition.
Field Name: QW0324CV

VIEW_NAME
The name of the view if the function is referenced in a view definition.
Field Name: QW0324NV

QUERY_BLOCKNO
A number that identifies the query block number being explained.
Field Name: QW0324QB

FUNCT_TEXT
Contains the text of the function reference, function name, and parameters. It can be up to 254 characters long.
Field Name: QW0324FT
**ICCID 325 - Trigger Activation**

This topic shows detailed information about “Record Trace - ICCID 325 - Trigger Activation”.

**Record trace - ICCID 325 - Trigger Activation**

The field labels shown in the following sample layout of “Record Trace - ICCID 325 - Trigger Activation” are described in the following section.

**STATEMENT NO:**

The statement number of the SQL statement that activated the trigger.

**Field Name:** QW0325SN

**SQL STATEMENT**

Triggering SQL statement. Possible values are:

- D  DELETE
- I  INSERT
- U  UPDATE

**Field Name:** QW0325SS

**COLLECTION ID**

The collection ID of the package containing the statement that activated the trigger.

**Field Name:** QW0325CO

**PROG NAME**

Program or package containing the statement that activated the trigger.

**Field Name:** QW0325PR

**TRIGGER NAME**

Trigger name.

**Field Name:** QW0325NM

**EXT.TRIGGER NAME**

External trigger name.

**Field Name:** QW0325TX

**SCHEMA NAME**
Schema name of the trigger.

**Field Name:** QW0325SC

**TIMESTAMP**
Trigger timestamp.

**Field Name:** QW0325TS

**ACTIVATION TIME**
Possible values are:

- **A** Trigger activation time is AFTER.
- **B** Trigger activation time is BEFORE.

**Field Name:** QW0325AC

**ENTRY/EXIT TYPE**
Possible values are:

- **E** Trigger is starting.
- **X** Trigger is ending.

**Field Name:** QW0325ET

**GRANULARITY**
Possible values are:

- **R** Trigger granularity is FOR EACH ROW.
- **S** Trigger granularity is FOR EACH STATEMENT.

**Field Name:** QW0325GR

**EVALUATION**
Triggered action condition evaluation. Possible values are:

- **T** Triggered action tested TRUE
- **F** Triggered action tested FALSE
- **N** No triggered action condition.

**Field Name:** QW0325CN

**NESTING LEVEL**
Nesting level of the trigger.

**Field Name:** QW0325NL

**SQLCA CONTENTS**
This section contains the SQLCA fields. It is only printed if the value in the ENTRY/EXIT TYPE field is RETURNED.

**Field Name:** QW0325SQ
## IFCID 329 - IXL Suspensions

This topic shows detailed information about “Record Trace - IFCID 329 - IXL Suspensions”.

### Record trace - IFCID 329 - IXL Suspensions

The field labels shown in the following sample layout of “Record Trace - IFCID 329 - IXL Suspensions” are described in the following section.

<table>
<thead>
<tr>
<th>GBP NAME</th>
<th>REQUEST TYPE</th>
<th>ASYNC. WAIT TIME</th>
</tr>
</thead>
<tbody>
<tr>
<td>XXXXXXXXXX</td>
<td>XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX</td>
<td>9999999999</td>
</tr>
</tbody>
</table>

**GBP NAME**

Name of the group buffer pool.

**Field Name:** QW0329GB

**REQUEST TYPE**

The request type can be one of the following:

- READ-DIRINFO (IXLCACHE)
- READ-COCLASS (IXLCACHE)
- CASTOUT-DATA (IXLCACHE)
- DELETE-NAME (IXLCACHE)
- RESET-REFBIT (IXLCACHE)
- FORCE (IXLFORCE)
- CONNECT (IXLCONN)
- DISCONNECT (IXLDISC)
- PROCESS-REFLIST (IXLCACHE)
- READ-DATA (IXLCACHE)
- READ-STGST (IXLCACHE)
- READ-COST (IXLCACHE)
- UNLOCK-CASTOUT (IXLCACHE)
- SET-RECLVCTR (IXLCACHE)
- WRITE-DATA (IXLCACHE)
- X-INVALIDATE (IXLCACHE)
- REGISTER-PAGE-LIST (IXLCACHE)
- WRITE-DATA TO SECONDARY (IXLCACHE)
- DELETE-NAME-LIST TO SECONDARY (IXLCACHE)
- DELETE-NAME TO SECONDARY (IXLCACHE)
- READ-STGST (IXLCACHE)

**Field Name:** QW0329RT

**ASYNC. WAIT TIME**

Asynchronous wait time in microseconds.

**Field Name:** QW0329ST
IFCID 330 - Active Log Space Shortage

This topic shows detailed information about “Record Trace - IFCID 330 - Active Log Space Shortage”.

This record is written of each group buffer pool present. Each repeating section contains information about each group buffer pool to which this DB2 data sharing member is currently connected.

Record trace - IFCID 330 - Active Log Space Shortage

The field labels shown in the following sample layout of “Record Trace - IFCID 330 - Active Log Space Shortage” are described in the following section.

ACTIVE LOG COPY NUMBER: X

LAST LOG DATA SET USAGE: 999%

ACTIVE LOG COPY NUMBER

Active log copy number (1 or 2).

Field Name: QW0330CP

LAST LOG DATA SET USAGE

Percentage of the last available active log data set for this log copy that is used.

Field Name: QW0330PC
This topic shows detailed information about “Record Trace - IFCID 331 - IBM Service Record”.

This record is for IBM service use.
IFCID 332 - IBM Service Record

This topic shows detailed information about “Record Trace - IFCID 332 - IBM Service Record”.

This record is for IBM service use.
This topic shows detailed information about “Record Trace - IFCID 333 - IBM Service Record”.

This record is for IBM service use.
IFCID 335 - System Event Stalled

This topic shows detailed information about “Record Trace - IFCID 335 - System Event Stalled”.

This IFCID records information about stalled system events. These records include the checkpoint process or a log offload task.

Record trace - IFCID 335 - System Event Stalled

The field labels shown in the following sample layout of “Record Trace - IFCID 335 - System Event Stalled” are described in the following section.

STALLED SYST EVT

The stalled system event can be:

- **CKPT** System checkpoint processor
- **0FLD** Log offload task

**Field Name:** QW0335SE

TIMESTAMP

The timestamp of the previous event.

**Field Name:** QW0335TS

LOG RBA PRIO EVT

The log RBA of the previous event.

**Field Name:** QW0335PR

CURRENT LOG RBA

The current, highest-written log RBA.

**Field Name:** QW0335CR
IFCID 337 - Lock Escalation Occurrences

This topic shows detailed information about "Record Trace - IFCID 337 - Lock Escalation Occurrences".

When performance trace class 6 or statistics trace class 3 is on, a record is written each time a lock escalation occurs.

Record trace - IFCID 337 - Lock Escalation Occurrences

The field labels shown in the following sample layout of “Record Trace - IFCID 337 - Lock Escalation Occurrences” are described in the following section.

DATABASE ID

Database name.

Field Name: QW0337DB

PAGESET/TABLE ID

Page set name or table OBID.

Field Name: QW0337OB

STATEMENT NUMBER

Statement number.

Field Name: QW0337SN

LOCK STATE

New state to which the lock was escalated. This is not shown if selective partition locking is used.

Field Name: QW0337LS

LOWER LOCK TYPE

Type of lower level lock used. This can be:
- Page lock
- Row lock
- LOB lock

Field Name: QW0337LL

NUMBER LOWER LOCKS

Number of held lower-level locks that were released by escalation.

Field Name: QW0337LH

WAITERS STMT ID

The waiter statement ID.

Field Name: QW0337SI

WAITER TYPE

The waiter statement information. Possible values:
STATIC
The statement is of type static.

DYNAMIC
The statement is of type dynamic.

NONE (NO ID, NO TYPE)
No statement ID, no type.

Field Name: QW0337TY

COLLECTION ID
Collection identifier.

Field Name: QW0337CN

PACKAGE NAME
The package name.

Field Name: QW0337PK
IFCID 342 - WF/TEMP DB Usage

This topic shows detailed information about “Record Trace - IFCID 342 - WF/TEMP DB Usage”.

Record trace - IFCID 342 - WF/TEMP DB Usage

The field labels shown in the following sample layout of “Record Trace - IFCID 342 - WF/TEMP DB Usage” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>DATABASE TYPE</td>
<td>WFDB</td>

<td>101</td>
</tr>
<tr>
<td>MAX NO INDEX BLOCKS</td>
<td>1000</td>
</tr>
</tbody>
</table>

DATABASE TYPE

The database type.

Field Name: QW0342TY

DBID OF DB

The database ID (DBID).

Field Name: QW0342DB

PSID OF SPACE

The page set object identifier (PSID) of the database.

Field Name: QW0342PS

AGENT TOKEN

The agent token.

Field Name: QW0342AT

CURRENT NO TABLE BLOCKS

The current space for tables that is used by the agent in the database (in KB).

Field Name: QW0342CT

MAX NO TABLE BLOCKS

The maximum space for tables that is used by the agent in the database (in KB).

Field Name: QW0342MT

PARENT TOKEN

The parent token.

Field Name: QW0342PT

CURRENT NO INDEX BLOCKS

The current space for indexes on the tables used by the agent in the database (in KB).
Field Name: QW0342CI

MAX NO INDEX BLOCKS

The maximum space for indexes on the tables used by the agent in the database (in KB).

Field Name: QW0342MI
IFCID 343 - MAXTEMPS Limit/Exceeded

This topic shows detailed information about “Record Trace - IFCID 343 - MAXTEMPS Limit/Exceeded”.

This record is written if the MAXTEMPS zparm limit for an agent is exceeded.

Record trace - IFCID 343 - MAXTEMPS Limit/Exceeded

The field labels shown in the following sample layout of “Record Trace - IFCID 343 - MAXTEMPS Limit/Exceeded” are described in the following section.

<table>
<thead>
<tr>
<th>Field</th>

IFCID 345 - Trace Data / SP/UDF

This topic shows detailed information about “Record Trace - IFCID 345 - Trace Data / SP/UDF”.

Record trace - IFCID 345 - Trace Data / SP/UDF

The field labels shown in the following sample layout of “Record Trace - IFCID 345 - Trace Data / SP/UDF” are described in the following section.

TRACE BUFFER LENGTH:
Length of the trace buffer.

Field Name: QW0345TR_LEN

TRACE BUFFER
Trace buffer.

Field Name: QW0345TR
### Record trace - IFCID 346 - Package/DBRM Detail

The field labels shown in the following sample layout of “Record Trace - IFCID 346 - Package/DBRM Detail” are described in the following section.

<table>

</tbody>
</table>

**LOCATION**

The location name.

If this field is blank in trace or report, the package or DBRM was executed locally. If it is not blank, all times represent the time spent locally to execute the remote package for this APPL_DIR requester.

This field is invalid (N/P) if summary rollup data is present.

**Field Name:** QPACLLOCN

This is an exception field.

**COLLECTION**

The package collection ID. This field does not apply to DBRMs. If the program name cannot be identified, this field is not present in report or trace.

This field is invalid if summary rollup data is present. It can have the following value in:

- Accounting trace and report: N/P
- The Accounting FILE and SAVE PROGRAM table: blank

**Field Name:** QPACCOLN

This is an exception field.

**PACKAGE ID**

The program name (package ID or DBRM name).
In the case of rollup data (Accounting data of DDF/RRSAF threads and parallel tasks accumulated by DB2), the following value is shown "ROLSUM".

**Field Name:** QPACPKID

This is an *exception* field.

**TOKEN**

The program (package or DBRM) consistency token.

This field is invalid (0) if summary rollup data is present.

**Field Name:** QPACCONT

**SECTION NMB**

The number of this particular data section in the series.

**Field Name:** QPACRECN

**TYPE**

The program type. It can be DBRM (field name QPACDBRM) or package (field name QPACPACK).

**Field Name:** QPACFLGS

**SCHEMA NAME**

Schema name of the nested activity.

If the package is defined for a trigger, stored procedure, or user-defined function, then this field contains the name of the schema to which the nested activity belongs. It can have the following value in:

- Accounting Trace and Report: N/P
- The Accounting FILE and SAVE PROGRAM tables: blank

This field is invalid if summary rollup data is present.

**Field Name:** QPACASCH

**SQL STMTS**

The number of SQL statements issued in this package or DBRM.

This number may not be equal to the total number of SQL statements in the QXST data section because QXST does not count all SQL statements. For example, it does not count commit or rollback statements.

**Note:** This field is shown for the following field labels in Accounting trace:

- SQL STMT - TOTAL
- SQL STMT - AVERAGE:

**Field Name:** QPACSQLC

This is an *exception* field.

**USED BY STOR.PROC**

Indicates whether this package was loaded by a stored procedure.

This field is invalid if unique or summary rollup data is present.

**Field Name:** QPACINSP

**NON-ZERO CLASS 8**
Indicates if Class 8 data is in this record.

Field Name: QPACCLS8

ACTIVITY NAME
The name of the nested activity.
This field contains the name of the nested activity if the package is defined for a:
- Trigger
- Stored procedure
- User-defined function (UDF)
- Native SQL procedure
- Non-inline UDF

In a data block that reports totals it is set to ALL NAMES.
This field is invalid if summary rollup data is present.
It can have the following value in:
- Accounting Trace and Report: N/P
- The Accounting FILE and SAVE PROGRAM tables: blank

Field Name: QPACAANM

SUCC AUTH CHECK
Indicates whether a successful package EXECUTE authorization check was made and DB2 catalog access was avoided.
This field is invalid if unique or summary rollup data is present.

Field Name: QPACPCAC

LAST EXECUTED
This package or DBRM is either currently executing or is the most recently executed package or DBRM. This field is invalid if unique or summary rollup data is present.

Field Name: QPACCRNT

NON-ZERO CLASS 7
There is nonzero accounting class 7 data in this QPAC data instance.

Field Name: QPACCLS7

ACTIVITY TYPE
The type of activity. The following values indicate how the package was loaded:

ALL TYPES
- In a data block that reports totals it is set to ALL TYPES.

STORED PROC
- When running an external procedure

TRIGGER
- When running a trigger

UDF
- When running a user-defined function

NATIVE SQL PROC
- When running a native SQL procedure
NATIVE UDF
When running a native UDF procedure (a non-inline user-defined function)

NONNESTED
Indicates that none of the above values is true

MULTIPLE
Indicates that packages with the same key but with different activity types were running

N/P
Invalidated in case of rollup summary

The nested activity values that are shown in column NEST_ACTIVITY_TYPE of the table DB2PMFACCT_PROGRAM are:

S  For Stored Procedure
T  For Trigger
U  For UDF
Q  For native SQL procedure
D  For Native UDF
N  For nonnested (other)
blank  For invalidated in case of rollup summary

This field is invalid if unique or summary rollup data is present.

Field Name: QPACAAGF

PACKAGE SWITCH

The number of times package was invoked from a different package. For the first package run by an application, the initial call counts as a package switch. If this package called a nested package (such as a trigger, UDF, or stored procedure), a switch will not be counted upon return from such a package.

Field Name: QPACSWITCH

ROLLED NBR THREADS

This value can be one of the following:

- In general, the number of threads to roll data into this QPAC data section. Non-rollup QPACs have a value of 1 and rollup QPACs have a value of 1 or more. This number is used as a divisor for calculating averages for package class 7, 8, or 10 times and events.
- If REPORT ORDER (ACTNAME) is specified, the number of threads to roll data into this QPAC data section of a special activity type depends on the following:
  - If IFCID 233 or 380 is available, the number of threads to roll data into this QPAC data section for stored procedures (SP) is counted based on the available IFCID. If both IFCIDs are available, IFCID 380 is the preferred one for SP reporting. Subprograms called by these SPs are not taken into account.
  - If IFCID 233 or 381 is available, the number of threads to roll data into this QPAC data section for user-defined functions (UDF) is counted based on the available IFCID. If both IFCIDs are available,
IFCID 381 is the preferred one for UDF reporting. Subprograms called by these UDFs are not taken into account.

- If neither IFCID 233, 380, nor 381, is collected, the total number of threads to roll data into this QPAC data section is counted. The sum also includes the number of subprograms.

Field Name: QPACRLNU

ACE

ACE token. You can use this value to correlate this record with other monitor trace records.

Field Name: QW0346_ACE

HREF HREF

ACE token. You can use this value to correlate this record with other monitor trace records.

Field Name: HREF

CLASS 7: BEGINNING STORE CLOCK TIME

The store clock time at entry to DB2 for the most recent execution of this package or DBRM. This field is invalid if unique or summary rollup data is present.

Field Name: QPACSCB

CLASS 7: ENDING STORE CLOCK TIME

The store clock time at exit from DB2 after the most recent execution of this package or DBRM. This field is invalid if unique or summary rollup data is present.

Field Name: QPACSCE

CLASS 7: BEGINNING TCB CPU TIME

The CPU time at entry to DB2 for the most recent execution of this package or DBRM. This time does not include the CPU time consumed on an IBM specialty engine. This field is invalid if unique or summary rollup data is present.

Field Name: QPACBJST

CLASS 7: ENDING TCB CPU TIME

The CPU time at exit from DB2 for the most recent execution of this package or DBRM. This time does not include CPU consumed on an IBM specialty engine. This field is invalid if unique or summary rollup data is present.

Field Name: QPACEJST

CLASS 7: TOTAL ELAPSED TIME

The total elapsed time for executing the package or DBRM.

Field Name: QPACSCT

CLASS 7: DB2 ENTRY/EXIT

The number of DB2 entries or exits processed during the execution of the package or DBRM.
In Accounting reports this is shown twice; as a total and as an average.

**Field Name:** QPACARNA

**CLASS 7: TOTAL TCB TIME**

The class 7 CPU time for all executions of the package or DBRM. This time does not include the:

- Class 7 time for parallel tasks
- CPU time that is consumed on an IBM specialty engine

**Field Name:** QPACTJST

This is an *exception* field.

**CLASS 7: SE CPU TIME**

The total CPU time for all executions of this package or DBRM that was consumed on an IBM specialty engine (SE).

**Note:** All CPU times of an IBM specialty engine that are reported in DB2 trace records are already normalized by DB2 to the speed of the general purpose processor.

**Field Name:** QPACCLS7_ZIIP

**CLASS 8: LOCK/LATCH SUSP TIME**

The accumulated lock elapsed wait time that occurred while executing this package.

**Background and Tuning Information**

OMEGAMON XE for DB2 PE might adjust this value if the thread was suspended when performance data was gathered.

If the suspension time is high, investigate locking activity.

**Field Name:** QPACAWTL

This is an *exception* field.

**CLASS 8: LOCK/LATCH SUSP EVENTS**

The number of wait trace events processed for waits for lock while executing this package.

**Field Name:** QPACARNL

**CLASS 8: WAIT TIME LOCAL LOCKS**

The accumulated latch elapsed wait time for latch suspensions that occurred while executing this package.

**Field Name:** QPACAWLH

**CLASS 8: LOCAL LOCK WAIT TRACE EVENTS**

The number of wait trace events processed for page latch contention while executing this package.

**Field Name:** QPACANLH

**CLASS 8: DB2 LATCH SUSP TIME**

The accumulated lock elapsed wait time that occurred while executing this package.

**Background and Tuning Information**
OMEGAMON XE for DB2 PE might adjust this value if the thread was suspended when performance data was gathered.

If the suspension time is high, investigate locking activity.

**Field Name:** QPACAWTL

This is an *exception* field.

**CLASS 8: LATCH WAIT TRACE EVENTS**

The number of wait trace events processed for waits for lock while executing this package.

**Field Name:** QPACARNL

**CLASS 8: SYNCHRONOUS I/O SUSP TIME**

The accumulated elapsed wait time for I/O suspensions under this thread during the execution of the package or DBRM.

**Background and Tuning Information**

OMEGAMON XE for DB2 PE might adjust this value if the thread was suspended when its performance data was gathered.

**Field Name:** QPACAWTI

This is an *exception* field.

**CLASS 8: SYNCHRONOUS I/O SUSP EVENTS**

The number of wait trace events processed for I/O.

**Field Name:** QPACARNE

**CLASS 8: OTHER READ SUSP TIME**

The accumulated waiting time for a read I/O performed under a thread other than this one during the execution of the package or DBRM.

**Background and Tuning Information**

OMEGAMON XE for DB2 PE might adjust this value if the thread was suspended when performance data was gathered.

This field includes waits caused by sequential prefetch, list prefetch, dynamic prefetch, and synchronous read I/O performed by other threads.

If the value in this field is high, the problem could be an I/O bound query using prefetch or an I/O contention. The application is accessing data from a busy data set, volume, or control unit and is continually being suspended. Consult the DBA and MVS systems programmer.

**Field Name:** QPACAWTR

This is an *exception* field.

**CLASS 8: OTHER READ SUSP EVENTS**

The number of suspensions due to read I/O.

**Field Name:** QPACARNR

**CLASS 8: OTHER WRITE SUSP TIME**

The accumulated waiting time due to a write I/O performed for another thread during the execution of a package or DBRM.

**Background and Tuning Information**
If the value in this field is high, the problem could be I/O contention. The application is accessing data from a busy data set, volume, or control unit and is continually being suspended. Consult the DBA and MVS systems programmer to resolve possible data set placement problems.

Field Name: QPACAWTW
This is an exception field.

CLASS 8: OTHER WRITE SUSP EVENTS
The number of suspensions due to write I/O.
Field Name: QPACARNW

CLASS 8: SERV.TASK SWITCH SUSP TIME
The accumulated waiting time due to a synchronous execution unit switch to DB2 services from this thread during the execution of the package or DBRM.

Background and Tuning Information
OMEGAMON XE for DB2 PE might adjust this value if the thread was suspended when its performance data was gathered.

This value includes the waits because of an OPEN/CLOSE data set, SYSLGRNG update, DATASPACEMANAGER services, DEFINE, EXTEND, and DELETE data set, AUTONOMOUS PROCEDURE, and DDF Requester waiting for Server reply and VSAM Catalog update.

Field Name: QPACAWTE
This is an exception field.

CLASS 8: SERV.TASK SWITCH SUSP EVENTS
The number of wait trace events processed for DB2 service tasks.
Field Name: QPACARNS

CLASS 8: ARCH.LOG(QUIES) SUSP TIME
The accumulated waiting time caused by processing ARCHIVE LOG(QUIESCE) commands during the execution of the package or DBRM. This number represents the amount of time that an individual thread was suspended because of the command, not the time it took for the entire command to complete.

Background and Tuning Information
OMEGAMON XE for DB2 PE might adjust this value if the thread was suspended when its performance data was gathered.

Avoid issuing the -ARCHIVE LOG QUIESCE command during peak periods.
Field Name: QPACALOG

CLASS 8: ARCH.LOG(QUIES) SUSP EVENTS
The number of ARCHIVE LOG MODE (QUIESCE) commands issued.
Field Name: QPACALCT

CLASS 8: DRAIN LOCK SUSP TIME
The accumulated waiting time due to a drain lock.
Field Name: QPACAWDR

CLASS 8: DRAIN LOCK SUSP EVENTS

The number of wait trace events processed for waits for drain locks.

Field Name: QPACARND

CLASS 8: CLAIM RELEASE SUSP TIME

The accumulated waiting time for a drain waiting for claims to be released during the execution of the package or DBRM.

Background and Tuning Information

OMEGAMON XE for DB2 PE might adjust this value if the thread was suspended when its performance data was gathered.

Field Name: QPACAWCL

CLASS 8: CLAIM RELEASE SUSP EVENTS

The number of wait trace events processed for waits for claims to be released.

Field Name: QPACARNC

CLASS 8: PAGE LATCH SUSP TIME

The accumulated waiting time caused by a page latch contention.

Field Name: QPACAWTP

CLASS 8: PAGE LATCH SUSP EVENTS

The number of page latch wait trace events processed.

Field Name: QPACARNH

CLASS 8: NOTIFY MESSAGES SUSP TIME

The accumulated elapsed waiting time due to suspensions caused by sending notify messages to other members in the data sharing group. Messages are sent, for example, when database descriptors are changed due to DDL.

This value is only calculated if accounting class 8 is active and DB2 is a member of a DB2 data sharing group.

Field Name: QPACAWTG

CLASS 8: NOTIFY MESSAGES EVENTS

The number of wait trace events processed for sending notify messages to other members in the data sharing group.

Field Name: QPACARNG

CLASS 8: GLOBAL CONTENT. PARENT SUSP TIME

The accumulated wait time due to global contention for parent L-Locks. Parent L-Locks are any of the following L-Lock types: database, tablespace, table, or partition.

Field Name: QPACAWTJ

CLASS 8: GLOBAL CONTENT. PARENT EVENTS

The number of wait trace entry/exit events processed for waits for global lock contention for parent L-Locks.
Field Name: QPACARNJ

CLASS 8: UDF EXECUTED
The number of user-defined functions scheduled.

Field Name: QPACUDNU

CLASS 8: STORED PROCEDURE EXECUTED
The number of stored procedures scheduled.

Field Name: QPACSPNS

CLASS 8: TCP/IP LOB XML TIME
The number of wait trace events that were processed for waits for TCP/IP LOB and XML materialization while this package or DBRM was running.

Field Name: QPACALBC

CLASS 8: TCP/IP LOB XML EVENTS
The accumulated wait time for TCP/IP LOB and XML materialization while running this package or DBRM.

Field Name: QPACALBW

ACCELERATOR SUSP TIME
The accumulated wait time for requests to an accelerator while executing this package.

Field Name: QPACAACW

ACCELERATOR EVENTS
The number of wait trace events processed for requests to an accelerator while executing this package.

Field Name: QPACAACC

PARALLEL QUERY SYNC WAIT TIME
The accumulated time waiting for parallel query processing to synchronize between parent and child tasks.

Field Name: QPAC_PQS_WAIT

PARALLEL QUERY SYNC WAIT EVENTS
The number of times the parallel query processing suspended because it was waiting for the synchronization of the parent/child.

Field Name: QPAC_PQS_COUNT

FAST INSERT PIPE WAIT TIME
The accumulated wait time for a pipe while this package was executed (DB2 field QPAC_PIPE_WAIT).

Field Name: QPAC_PIPE_WAIT

FAST INSERT PIPE WAIT EVENTS
The number of wait trace events that were processed for waits for a pipe while this package was executed (DB2 field QPAC_PIPE_WAIT_COUNT).

Field Name: QPAC_PIPEWAIT_COUNT
IFCID 350 - SQL Statement

This topic shows detailed information about “Record Trace - IFCID 350 - SQL Statement”.

IFCID 350 records the complete text of a parsed SQL statement. These records are written when a static or dynamic SQL statement is bound.

Record trace - IFCID 350 - SQL Statement

The field labels shown in the following sample layout of “Record Trace - IFCID 350 - SQL Statement” are described in the following section.

OPTIONS

Shows the parser options and host language.

Field Name: QW0350OT

HOST LANG

Determines the host language. It can have the following values:

- ASSEMBLER
- COBOL
- C
- FORTRAN
- PL/I
- COBOL II
- IBM COBOL
- C++

Field Name: QW0350HL

SQL SEGMENT

Shows the first, the last, the complete, or a portion of the SQL statement.

Field Name: QW0350FG

STMT ID

The statement identifier.

Field Name: QW0350SI

STMT TYPE

The statement type. Possible values are DYNAMIC, STATIC, or N/P.

Field Name: QW0350TY

CCSID

The coded character set identifier (CCSID).

Field Name: QW0350CC

SQL LENGTH
The total length of the SQL statement. The maximum length is 5000 bytes.

**Field Name:** QW0350TL

**SQL STATEMENT**

Shows the complete SQL statement that is being parsed or only a part of it.

**Note:** Host variables in this field are represented by :h.

**Field Name:** QW0350SP
**IFCID 351 - Wait TCPIP LOB**

This topic shows detailed information about “Record Trace - IFCID 351 - Wait TCPIP LOB”.

IFCID 0351 is generated at the beginning of the time that is spent waiting for TCP/IP to materialize a LOB. You can activate this trace by starting accounting trace class 3 or 8.

**Record trace - IFCID 351 - Wait TCPIP LOB**

The field labels shown in the following sample layout of “Record Trace - IFCID 351 - Wait TCPIP LOB” are described in the following section.

**REQUEST TYPE**

The request type. Possible values are:

- **GET**    Materialize a LOB/XML value into the database.
- **CLOSE**  Receive and discard a LOB/XML value from the network.
- **CLOSEALL** Receive and discard all the LOB/XML values for this request.

**Field Name:** QW0351RT
This topic shows detailed information about “Record Trace - IFCID 353 - IBM Service Record”.

This record is for IBM service use.
This topic shows detailed information about “Record Trace - IFCID 354 - IBM Service Record”.

This record is for IBM service use.
IFCID 357 - Beginning of an Index I/O Parallel INSERT

This topic shows detailed information about “Record Trace - IFCID 357 - Beginning of an Index I/O Parallel INSERT”.

IFCID 357 records the beginning of data insertion into an index, with I/O parallelism. This record is written when performance trace class 4 is active.

Record trace - IFCID 357 - Beginning of an Index I/O Parallel INSERT

The field labels shown in the following sample layout of “Record Trace - IFCID 357 - Beginning of an Index I/O Parallel INSERT” are described in the following section.

DATABASE ID

The database identifier (ID) of the first index involved in the I/O parallel INSERT.

Field Name: QW0357DB

TABLE OBID

The object identifier (OBID) of the table involved in the INSERT.

Field Name: QW0357TB

IDX SPACE PG SET ID

The page set ID of the first index.

Field Name: QW0357PS
IFCID 358 - End of an Index I/O Parallel INSERT

This topic shows detailed information about “Record Trace - IFCID 358 - End of an Index I/O Parallel INSERT”.

IFCID 358 records the end of data insertion into an index, with I/O parallelism. This record is written when performance trace class 4 is active.

Record trace - IFCID 358 - End of an Index I/O Parallel INSERT

The field labels shown in the following sample layout of “Record Trace - IFCID 358 - End of an Index I/O Parallel INSERT” are described in the following section.

| DATABASE ID:  DB123456 | TABLE OBID:  TB1234567B | IDX SPACE PG SET ID:  x'1234' | PARALL. DEGREE:  12345678 |

DATABASE ID

The database ID of the last index involved in the I/O parallel INSERT.

Field Name: QW0358DB

TABLE OBID

The object identifier (OBID) of the table involved in the INSERT.

Field Name: QW0358TB

IDX SPACE PG SET ID

The page set ID of the last index.

Field Name: QW0358PS

PARALL. DEGREE

The degree of I/O parallelism on the INSERT.

Field Name: QW0358DE
IFCID 359 - Index Page Split

This topic shows detailed information about “Record Trace - IFCID 359 - Index Page Split”.

IFCID 359 records information about index page splits. This record is written when performance trace class 4 is active.

Record trace - IFCID 359 - Index Page Split

The field labels shown in the following sample layout of “Record Trace - IFCID 359 - Index Page Split” are described in the following section.

DATABASE ID

The database ID of the splitting index.

Field Name: QW0359DB

INDEX PAGE SET ID

The page set ID of the splitting index.

Field Name: QW0359OB

PARTITION NUMBER

The partition number of the splitting index.

Field Name: QW0359PT

SPLITTING PAGE NUMBER

The page number of the splitting index.

Field Name: QW0359PG

FLAGS

Shows if the index depends on the group buffer pool (GBP).

Field Name: QW0359FL

TIMESTAMP BEGIN

The time stamp when index splitting started.

Field Name: QW0359TS

TIMESTAMP END

The time stamp when index splitting stopped.

Field Name: QW0359TE
IFCID 360 - Incrementally Rebound Queries

This topic shows detailed information about “Record Trace - IFCID 360 - Incrementally Rebound Queries”.

IFCID 360 records information about queries that are incrementally rebound, because parallelism was chosen in packages that were created before DB2 10. This record is written when performance trace class 3 or 10 is on.

Record trace - IFCID 360 - Incrementally Rebound Queries

The field labels shown in the following sample layout of “Record Trace - IFCID 360 - Incrementally Rebound Queries” are described in the following section.

<table>

</table>

 PLAN NAME

The name of the plan.
 Field Name: QW0360PLAN

QUERY STMT NUMBER

The query statement number.
 Field Name: QW0360STMTNO

QUERY SECT NUMBER

The query section number.
 Field Name: QW0360SECTN

COLLECTION NAME

The name of the package collection ID.
 Field Name: QW0360COLLIDN

PACKAGE NAME

The name of the package.
 Field Name: QW0360PGIDN

PKG CONSIST TOKEN

The package consistency token.
 Field Name: QW0360CONTK
IFCID 361 - Audit Admin Authorities

This topic shows detailed information about “Record Trace - IFCID 361 - Audit Admin Authorities”.

Record trace - IFCID 361 - Audit Admin Authorities

The field labels shown in the following sample layout of “Record Trace - IFCID 361 - Audit Admin Authorities” are described in the following section.

```
AUTHORITY TYPE: SYSADM
PRIVILEGE CHECKED: 284
AUTHORIZATION ID: ADMF001
SOURCE OBJ QUALIF: N/P
SOURCE OBJ NAME: N/P
TARGET OBJ QUALIF: ADMF001
TARGET OBJ NAME: N/P
OTHER OBJ NAME: N/P

SQL STATEMENT:
GRANT DBADM TO OMVSADM
```

AUTHORITY TYPE

The authority type.

Possible values are:
- SYSDBADM (System DBADM)
- DBCTRL
- DBADM
- SECADM
- ACCSCTRL (ACCESSCTRL)
- SYSADMIN (Installation SYSADMI)
- SQLADM
- SYSCTRL
- DBMAINT
- SYSOPR
- PACKADM
- SYSOPR (Installation SYSOPR)
- SYSADM
- DATAACC (DATAACCESS)
- USER

**Field Name:** QW0361AT

AUTHID TYPE

The authorization ID type. Possible values are:

**AUTHORIZATION ID**

Indicates that the authorization ID (AUTH ID) is used.

L Indicates that ROLE is used.

**Field Name:** QW0361IT

PRIVILEGE CHECKED

The privilege that was checked. Possible values are provided in the DB2 macro DSNDQW05.

**Field Name:** QW0361PR
OBJECT TYPE

The DB2 object type.
Possible values are:
- ACEE
- BUFFER (Bufferpool)
- COLLECT (Collection)
- DATABASE
- DISTTYPE (Distinct Type)
- FUNCTION
- SESSIONV (Session Variable)
- JAR
- PACKAGE
- ROLE
- SCHEMA
- TRUSTCTX (Trusted Context)
- PROCEDUR (Procedure)
- APPLPLAN (Application Plan)
- LOBTS (LOB Tablespace)
- STOGROUP (Storage Group)
- TAB/VIEW (Table or View)
- USERAUTH (User Auth)
- SEQUENCE
- ROW

Field Name: QW0361OT

AUTHORIZATION ID

The authorization ID or the role that has the authority.

Field Name: QW0361ID

SOURCE OBJ QUALIF

The source object qualifier or owner.

Field Name: QW0361SC

SOURCE OBJ NAME

The source object name.

Field Name: QW0361SN

TARGET OBJ QUALIF

The target object qualifier or owner.

Field Name: QW0361TC

TARGET OBJ NAME

The target object name.

Field Name: QW0361TN

OTHER OBJ NAME

The other object name or subsystem parameter.
Field Name: QW0361ON

SQL STATEMENT
The SQL statement (truncated at 4000 bytes).
Field Name: QW0361SQ
This topic shows detailed information about “Record Trace - IFCID 362 - Start Trace and Stop Trace with Audit Policy”.

The field labels shown in the following sample layout of “Record Trace - IFCID 362 - Start Trace and Stop Trace with Audit Policy” are described in the following section.

### STATUS
Status.
Possible values are:

- **S** Success
- **F** Failed

Field Name: QW0362ST

### TYPE
The type. It can have a value of ‘S’ for Start Trace.

Field Name: QW0362TY

### REASON CODE
The reason code.

Field Name: QW0362RN

### DB2 START UP
The DB2 start up.

Field Name: QW0362DS

### DATABASE NAME
The database name.

Field Name: QW0362DB

### CHECKING
The CHECKING category.

Field Name: QW0362CH

### VALIDATE
The VALIDATE category.
FIELD NAME: QW0362VA

OBJMAINT
The OBJMAINT category.
FIELD NAME: QW0362OB

EXECUTE
The EXECUTE category.
FIELD NAME: QW0362EX

CONTENT
The CONTEXT category.
FIELD NAME: QW0362CX

SECMAINT
The SECMAINT category.
FIELD NAME: QW0362SM

AUDIT POLICY NAME
The audit policy name.
FIELD NAME: QW0362AP

TABLE SCHEMA NAME
The table schema name.
FIELD NAME: QW0362TS

TABLE NAME
The table name.
FIELD NAME: QW0362TB

SYSADM CAT VALUES
The SYSADMIN category values.
FIELD NAME: QW0362SA

DBADM CAT VALUES
The DBADMIN category values.
FIELD NAME: QW0362DA

COLLECTION ID
The collection ID.
FIELD NAME: QW0362CO

TABLE NAMES
The list of table names traced up to 4K bytes. Each table name is mapped to field QW0362TN_Var.
FIELD NAME: QW0362TN
IFCID 363 - Parallel Straw Model Performance Trace

IFCID 363 consists of the following data sections: QW0363 and QW0363E.

“IFCID 363 - Data Section QW0363” on page 40-879
This topic shows detailed information about “Record Trace - IFCID 363 - Data Section QW0363”.

“IFCID 363 - Data Section QW0363E” on page 40-881
This topic shows detailed information about “Record Trace - IFCID 363 - Data Section QW0363E”.
IFCID 363 - Data Section QW0363

This topic shows detailed information about “Record Trace - IFCID 363 - Data Section QW0363”.

Record trace - IFCID 363 - Data Section QW0363

The field labels shown in the following sample layout of “Record Trace - IFCID 363 - Data Section QW0363” are described in the following section.

LOCATION NAME
The location name.
Field Name: QW0363LN

PACKAGE NAME
The package name.
Field Name: QW0363PC

PROGRAM NAME
The program name.
Field Name: QW0363PN

CONSISTENCY TOKEN
The time stamp.
Field Name: QW0363TS

STATEMENT NO
The statement number.
Field Name: QW0363SN

QUERY BLOCK NO
The query block number.
Field Name: QW0363QN

PAR. GROUP NO
The parallel group number.
Field Name: QW0363GN

PLANNED DEGREE
The planned (bind time) degree.
Field Name: QW0363BD

PARTITION KIND
The partition kind of the parallel.
**Field Name:** QW0363RK

**RECORDS ORDER**

The record order: descending or ascending.

**Field Name:** QW0363OD

**IN MEM WORKFILE**

Record in memory work file.

**Field Name:** QW0363IW

**INPUT RID IN WKF**

Input RID in work file.

**Field Name:** QW0363RI

**OUTPUT RID IN WKF**

Output RID in work file.

**Field Name:** QW0363RO

**TOTAL INPT ELEM #**

The total number of elements.

**Field Name:** QW0363NE

**TOTAL RECORDS #**

The total number of records.

**Field Name:** QW0363NR

**ACTUAL USED WIOEs**

Number of actual elements.

**Field Name:** QW0363AE

**PIPE DEGREE**

The pipe degree.

**Field Name:** QW0363AE

**PIPE CREATION**

The start time of the pipe.

**Field Name:** QW0363PS

**PIPE TERMINATION**

The end time of the pipe.

**Field Name:** QW0363PT

**PIPE ELAPSED**

The time elapsed between the start and end time of the pipe.

**Field Name:** RT0363PE
IFCID 363 - Data Section QW0363E

This topic shows detailed information about “Record Trace - IFCID 363 - Data Section QW0363E”.

WORKLOAD ELEMENT INDEX
Identifies the number of the workload element (nth one).
Field Name: QW0363IX

TASK NO
The task number of the subpipe index.
Field Name: QW0363PI

SUB-PIPE CREATION
The subpipe start time.
Field Name: QW0363PB

SUB-PIPE TERMINATION
The end time of the subpipe.
Field Name: QW0363PE

SUB-PIPE ELAPSED
The time elapsed between the start and end time of the subpipe.
Field Name: RT0363SE

LOW BOUND PAGE NO
The page number of low bound of logical partition.
Field Name: QW0363LP

HIGH BOUND PAGE NO
The page number of high bound of logical partition.
Field Name: QW0363HP

LOW KEY BUFFER DATA
The low key buffer.
Field Name: QW0363LB

HIGH KEY BUFFER DATA
The high key buffer.
Field Name: QW0363HB

NBR OF ROWS CONSUMED
The number of rows consumed.
Field Name: QW0363NI

NBR OF ROWS PRODUCED
The number of rows produced.
Field Name: QW0363NO

QW0363CN
This field is for IBM service.
IFCID 363 - Data Section QW0363E

Field Name: QW0363CN

QW0363BI
This field is for IBM service.

Field Name: QW0363BI

QW0363EI
This field is for IBM service.

Field Name: QW0363EI
IFCID 365 - Remote Location Statistics

This topic shows detailed information about “Record Trace - IFCID 365 - Remote Location Statistics”.

IFCID 0365 records detailed statistics about the remote locations with which a DB2 subsystem communicates using the DRDA protocol. This record is written when Statistics trace class 7 is on. The DDF DATA BY LOCATION section is shown for each location with which the DB2 subsystem communicates.

Record trace - IFCID 365 - Remote Location Statistics

The field labels shown in the following sample layout of “Record Trace - IFCID 365 - Remote Location Statistics” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SECTIONS IN RECORD</td>
<td>Provides the number of QLST sections that are part of this IFCID 365 record.</td>
</tr>
<tr>
<td>ANOTHER IFCID365 FOLLOWS</td>
<td>This bitcounter indicates if another IFCID 365 is shown in the DB2 trace data.</td>
</tr>
<tr>
<td>LOCATION NAME (SHORT)</td>
<td>The name of the remote location.</td>
</tr>
<tr>
<td>LOCATION NAME (LONG)</td>
<td>The name of the remote location.</td>
</tr>
<tr>
<td>PRDID REMOTE LOCATION</td>
<td>The product ID and version of the remote location.</td>
</tr>
<tr>
<td>INITIATED CONVERSATIONS</td>
<td>The number of conversations that were initiated from the requester location. This value is maintained at the requester location.</td>
</tr>
</tbody>
</table>

  - 0
A conversation is a specific instance of using TCP/IP or SNA LU 6.2 to transfer information between a requester and a server. A conversation is a logical connection between a requester and a server.

Field Name: QLSTCNVS

DEALLOCATED CONVERSATIONS

The number of conversations that were deallocated from this site to the remote site.

Field Name: QLSTCNVT

INITIATED FROM REMOTE SITE

The number of conversations that were initiated from the requester to the server location. This value is updated at the server location.

Field Name: QLSTCNVR

MESSAGES SENT TO REMOTE

The number of messages sent to the remote location. A message is a group of characters and control bit sequences transferred on a single TCP/IP or SNA API call. This value is maintained at the location where the messages originated.

Field Name: QLSTMSGS

MESSAGES RECEIVED FROM REMOTE

The number of messages received by VTAM from the remote location. This value is maintained at the location where the messages were received.

More messages might be sent from the server location than are received by the requester due to the manner in which distributed SQL statements are processed internally.

Field Name: QLSTMSGR

SQL STATEMENTS SENT TO REMOTE

The number of SQL statements sent to the remote server. This value is updated at the requester location.

Field Name: QLSTSQLS

SQL STATEMENTS RECEIVED FROM REMOTE

The number of SQL statements received from the requester location. This value is updated at the server location.

Field Name: QLSTSQLR

BYTES SENT TO REMOTE

The number of bytes of data sent to the requester location. This value is maintained at the server location.

Field Name: QLSTBYTES

BYTES RECEIVED FROM REMOTE

The number of bytes of data received from the server location. This value is maintained at the requester location.

More bytes of data might be sent from the server location than are received by the requester due to the manner in which distributed SQL statements are processed internally.
Field Name: QLSTBYTR

ROWS SENT TO REMOTE
The number of data rows sent to the requester location (includes SQLDA). This value is updated at the server location.

Field Name: QLSTROWS

ROWS RETRIEVED FR REMOTE
The number of data rows received from the server location. This value is maintained at the requester location.

Note:
• This value does not include any SQLDA or SQLCA transmitted.
• Block fetch can significantly affect the number of rows sent across the network. When used with nonupdate cursors, block fetch groups as many rows as possible into the message buffer, and transmits the buffer over the network without requiring a VTAM message. Consequently, more rows of data might be sent from the server location than are received by the requester location.

  This is especially true when DB2 private protocol is used because multiple blocks can be transmitted from the server with no intervening messages from the requester.

Field Name: QLSTROWR

BLOCKS TRANSMITTED
The number of blocks transmitted using block fetch. This value is maintained at the server location.

Field Name: QLSTBTBF

BLOCKS RECEIVED
The number of blocks received from the remote location using block fetch. This value is maintained at the requester location.

Field Name: QLSTBRBF
IFCID 366 - Incompatible Functions Executed

This topic shows detailed information about “Record Trace - IFCID 366 - Incompatible Functions Executed”.

Record trace - IFCID 366 - Incompatible Functions Executed

The field labels shown in the following sample layout of “Record Trace - IFCID 366 - Incompatible Functions Executed” are described in the following section.

<table>

**COLLECTION ID**

The package collection ID.

Field Name: QW0366PC

**PROGRAM NAME**

The program name.

Field Name: QW0366PN

**TYPE**

The change indicator is incompatible. It can have the following values:

1 V9 SYSIBM.CHAR(decimal-expr) function

2 V9 SYSIBM.VARCHAR(decimal-expr) function. CAST (decimal as VARCHAR or CHAR)

3 Unsupported character string representation of a timestamp

1101 Insert into an XML column without XMLDOCUMENT function

1102 XPath evaluation error

1103 RLF governing

1104 Long CLIENT_ACCTNG Special Reg value

1105 Long CLIENT_APPLNAME Special Reg value

1106 Long CLIENT_USERID Special Reg value

1107 Long CLIENT_WRKSTNNNAME Special Reg value

1108 Long client Special Reg value for RLF

1109 CAST(string AS TIMESTAMP)

1110 SPACE integer argument greater than 32764

1111 VARCHAR int argument greater than 32764

**Note**: REASON shows the description of the incompatible change indicator according to the DB2 macro. If the indicator is not known, N/A is shown in the report.

Field Name: QW0366FN

**REASON**
The change indicator is incompatible. It can have the following values:

1  V9 SYSIBM.CHAR(decimal-expr) function
2  V9 SYSIBM.VARCHAR(decimal-expr) function. CAST (decimal as VARCHAR or CHAR)
3  Unsupported character string representation of a timestamp

1101 Insert into an XML column without XMLDOCUMENT function
1102 XPath evaluation error
1103 RLF governing
1104 Long CLIENT_ACCTNG Special Reg value
1105 Long CLIENT_APPLNAME Special Reg value
1106 Long CLIENT_USERID Special Reg value
1107 Long CLIENT_WRKSTNNAME Special Reg value
1108 Long client Special Reg value for RLF
1109 CAST(string AS TIMESTAMP)
1110 SPACE integer argument greater than 32764
1111 VARCHAR int argument greater than 32764

Note: REASON shows the description of the incompatible change indicator according to the DB2 macro. If the indicator is not known, N/A is shown in the report.

Field Name: QW0366FN

STMT NBR QUERY
The statement number of the query.
Field Name: QW0366SN

SECTION
The section number.
Field Name: QW0366SE

PLAN NAME QUERY
The plan name of the query.
Field Name: QW0366PL

STMT ID
The statement identifier.
Field Name: QW0366SI

STMT TYPE
The statement information. It can be a DYNAMIC or STATIC statement.
Field Name: QW0366TY

CONTOKEN (TS)
The consistency token is shown in hexadecimal format.
Field Name: QW0366TS
IFCID 366 - Incompatible Functions Executed

VERSION LENGTH
The version length.

VERSION
The version.
Field Name: QW0366VN
### IFCID 376 - Incompatible Functions Executed

This topic shows detailed information about “Record Trace - IFCID 376 - Incompatible Functions Executed”.

This trace record is written once for each unique dynamic cached statement and static statement. It is similar to IFCID 366, however IFCID 366 can be written more frequently.

### Record trace - IFCID 376 - Incompatible Functions Executed

The field labels shown in the following sample layout of “Record Trace - IFCID 376 - Incompatible Functions Executed” are described in the following section.

### IFCID 369 - Aggregated Accounting Statistics

This topic shows detailed information about “Record Trace - IFCID 369 - Aggregated Accounting Statistics”.

IFCID 369 contains aggregated Accounting data listed by connection type. It is shown at Statistics intervals, for more information refer to “Aggregated Accounting Statistics” on page 49-20.

The following data sections provide information for each connection type that is listed in DATA SECTION 2 - CONNECTION TYPES:

- DATA SECTION 3: ACCOUNTING DATA - “IFCID 003 - Instrumentation Accounting Data” on page 40-190
- DATA SECTION 4: ACCOUNTING DATA OVERFLOW - “IFCID 003 - Instrumentation Accounting Data Overflow” on page 40-206

</table>

DATABASE ID

The database ID of the index for which entries are cleaned up.

Field Name: QW0377DB

INDEX PAGE NUMBER

The page number of the index page that was cleaned up.

Field Name: QW0377PG

PARTITION NUMBER

The index partition number.

Field Name: QW0377PT

INDEX PAGE SET ID

The page set ID of the index.

Field Name: QW0377OB

PD ENTRIES REMOVED

The number of pseudo-deleted entries that were removed.

Field Name: QW0377NU

FLAG

The reason for the page removal:

- A page is deleted from an index (DB2 field: QW0377DL)
- A page is cleaned up (DB2 field: QW0377CL)

Field Name: RW0377DL
IFCID 378 - Accel. Call Event Begin

This topic shows detailed information about “Record Trace - IFCID 378 - Accel. Call Event Begin”.

Record trace - IFCID 378 - Accel. Call Event Begin

The field labels shown in the following sample layout of “Record Trace - IFCID 378 - Accel. Call Event Begin” are described in the following section.

IFCID 380 - Stored Procedure Detail Record

This topic shows detailed information about “Record Trace - IFCID 380 - Stored Procedure Detail Record”.

IFCID 380 (Stored procedure detail record) and IFCID 381 (UDF detail record) have the same mapping structure.

Both records are written at the beginning and the end of a stored procedure or UDF.

The first data section of IFCID 380 shows fields provided with IFCID 233. The second data section starting with CURRENT TOTAL NESTED CLASS 1 CP TIME shows additional fields for IFCID 380 and IFCID 381.

Record trace - IFCID 380 - Stored Procedure Detail Record

The field labels shown in the following sample layout of “Record Trace - IFCID 380 - Stored Procedure Detail Record” are described in the following section.

LOCATION NAME
The location name.

Field Name: QW0233LN

COLLECTION ID
The package collection identifier.

Field Name: QW0233PC

PROGRAM NAME
The program name.

Field Name: QW0233PN

SCHEMA NAME
The name of the schema associated with this routine.

Field Name: QW0233SC

ROUTINE NAME
The specific name of the routine.

Field Name: QW0233PR
VERSION NAME
  The name of the version.
  Field Name: QW0233VER

ROUTINE TYPE
  The routine type can have the following values:
  
  PROCEDURE
    The routine is a stored procedure
  
  FUNCTION
    The routine is a User-Defined Function
  
  Field Name: QW0233TY

CONSISTENCY TOKEN
  The consistency token.
  Field Name: QW0233TS

ENTRY/EXIT TYPE
  The entry or exit event type can have the following values:
  
  ENTERING
    The agent is entering a routine.
  
  RETURNED
    The agent has returned from a routine.
  
  Field Name: QW0233EX

NESTING LEVEL
  The nesting level of the routine.
  Field Name: QW0233NL

STATEMENT NO
  The statement number of the statement executed.
  Field Name: QW0233SN

TYPE
  The statement type. Possible values are DYNAMIC or STATIC.
  Field Name: QW0233STY

ROUTINE ID
  The routine identifier.
  Field Name: QW0233RID

STATEMENT ID
  The unique identifier of the currently executing statement. It is shown as an integer and in hexadecimal format.
  Field Name: QW0233SID

CONV INTO HEX
  The unique identifier of the currently executing statement. It is shown as an integer and in hexadecimal format.
Field Name: QW0233SID

CURRENT TOTAL NESTED CLASS 1 CP TIME
The current, total, nested class 1 CP time. This does not include time spent executing on an IBM specialty engine.

Field Name: QW0380_CLS1CP

CURRENT TOTAL NESTED CLASS 1 SE TIME
The current, total, nested class 1 specialty engine time.

Field Name: QW0380_CLS1SE

CURRENT TOTAL NESTED CLASS 2 CP TIME
The current, total, nested class 2 CP time. This is time in the DB2 processing SQL statements. This time also includes in DB2 time needed to connect and disconnect the SP task for non-SQL procedure stored procedures. This does not include time spent executing on an IBM specialty engine.

Field Name: QW0380_CLS2CP

CURRENT TOTAL NESTED CLASS 2 SE TIME
The current, total, nested class 2 specialty engine time. This is the time in DB2 processing SQL statements.

Field Name: QW0380_CLS2SE

CURRENT TOTAL NESTED ELAPSED CLASS 2 TIME
The current, total, nested elapsed class 2 time. This is the time in DB2 processing SQL statements. This time also includes in DB2 time needed to connect and disconnect the SP task for non-SQL procedure stored procedures.

Field Name: QW0380_CLS2ELAP
IFCID 381 - UDF Detail Record

This topic shows detailed information about “Record Trace - IFCID 381 - UDF Detail Record”.

IFCID 380 (Stored procedure detail record) and IFCID 381 (UDF detail record) have the same mapping structure.

Both records are written at the beginning and the end of a stored procedure or UDF.

The first data section of IFCID 380 shows fields provided with IFCID 233. The second data section starting with CURRENT TOTAL NESTED CLASS 1 CP TIME shows additional fields for IFCID 380 and IFCID 381.

Record trace - IFCID 381 - UDF Detail Record

The field labels shown in the following sample layout of “Record Trace - IFCID 381 - UDF Detail Record” are described in the following section.

LOCATION NAME
The location name.
Field Name: QW0233LN

COLLECTION ID
The package collection identifier.
Field Name: QW0233PC

PROGRAM NAME
The program name.
Field Name: QW0233PN

SCHEMA NAME
The name of the schema associated with this routine.
Field Name: QW0233SC

ROUTINE NAME
The specific name of the routine.
Field Name: QW0233PR

VERSION NAME
The name of the version.
Field Name: QW0233VER

ROUTINE TYPE
The routine type can have the following values:

PROCEDURE
The routine is a stored procedure

FUNCTION
The routine is a User-Defined Function
Field Name: QW0233TY

CONSISTENCY TOKEN
The consistency token.
Field Name: QW0233TS

ENTRY/EXIT TYPE
The entry or exit event type can have the following values:

ENTERING
The agent is entering a routine.

RETURNED
The agent has returned from a routine.
Field Name: QW0233EX

NESTING LEVEL
The nesting level of the routine.
Field Name: QW0233NL

STATEMENT NO
The statement number of the statement executed.
Field Name: QW0233SN

TYPE
The statement type. Possible values are DYNAMIC or STATIC.
Field Name: QW0233STY

ROUTINE ID
The routine identifier.
Field Name: QW0233RID

STATEMENT ID
The unique identifier of the currently executing statement. It is shown as an integer and in hexadecimal format.
Field Name: QW0233SID

CONV INTO HEX
The unique identifier of the currently executing statement. It is shown as an integer and in hexadecimal format.
Field Name: QW0233SID
CURRENT TOTAL NESTED CLASS 1 CP TIME

The current, total, nested class 1 CP time. This does not include time spent executing on an IBM specialty engine.

Field Name: QW0380_CLS1CP

CURRENT TOTAL NESTED CLASS 1 SE TIME

The current, total, nested class 1 specialty engine time.

Field Name: QW0380_CLS1SE

CURRENT TOTAL NESTED CLASS 2 CP TIME

The current, total, nested class 2 CP time. This is time in the DB2 processing SQL statements. This time also includes in DB2 time needed to connect and disconnect the SP task for non-SQL procedure stored procedures. This does not include time spent executing on an IBM specialty engine.

Field Name: QW0380_CLS2CP

CURRENT TOTAL NESTED CLASS 2 SE TIME

The current, total, nested class 2 specialty engine time. This is the time in DB2 processing SQL statements.

Field Name: QW0380_CLS2SE

CURRENT TOTAL NESTED ELAPSED CLASS 2 TIME

The current, total, nested elapsed class 2 time. This is the time in DB2 processing SQL statements. This time also includes in DB2 time needed to connect and disconnect the SP task for non-SQL procedure stored procedures.

Field Name: QW0380_CLS2ELAP
This topic shows detailed information about “Record Trace - IFCID 384 - IBM Service Record”.

This record is for IBM service use.
This topic shows detailed information about “Record Trace - IFCID 385 - IBM Service Record”.

This record is for IBM service use.
This topic shows detailed information about “Record Trace - IFCID 386 - IBM Service Record”.

This record is for IBM service use.
IFCID 389 - FTB Indexes

This topic shows detailed information about “Record Trace - IFCID 389 - FTB Indexes”.

IFCID 389 traces indexes with structures for fast index traversal (FTB). This record is written when the Statistics class 8 trace is on.

Record trace - IFCID 389 - FTB Indexes

The field labels shown in the following sample layout of “Record Trace - IFCID 389 - FTB Indexes” are described in the following section.

<table>
<thead>

</tr>
</tbody>
</table>

Number of Indexes

The number of indexes with fast traversal blocks.

Field Name: QW0389NU

DBID

The database ID.

Field Name: QW0389DB

PSID

The index page set ID.

Field Name: QW0389OB

Partition No

The partition number.

Field Name: QW0389PT

Index Levels

The number of index levels in the fast traversal block.

Field Name: QW0389LV

FTB Size

Indicates the size of the fast traversal block (FTB), in bytes.

Field Name: QW0389SZ
This topic shows detailed information about “Record Trace - IFCID 390 - IBM Service Record”.

This record is for IBM service use.
This topic shows detailed information about “Record Trace - IFCID 391 - IBM Service Record”.

This record is for IBM service use.
IFCID 397 - IBM Service Record

This topic shows detailed information about “Record Trace - IFCID 397 - IBM Service Record”.

This record is for IBM service use.
IFCID 398 - IBM Service Record

This topic shows detailed information about “Record Trace - IFCID 398 - IBM Service Record”.

This record is for IBM service use.
IFCID 399 - IBM Service Record

This topic shows detailed information about “Record Trace - IFCID 399 - IBM Service Record”.

This record is for IBM service use.
IFCID 401 - Static Statements in EDM Pool

This topic shows detailed information about “Record Trace - IFCID 401 - Static Statements in EDM Pool”.

IFCID 401 has READS and READA capability. It supports threshold value filtering.

Record trace - IFCID 401 - Static Statements in EDM Pool

The field labels shown in the following sample layout of “Record Trace - IFCID 401 - Static Statements in EDM Pool” are described in the following section.

---

### Field Descriptions

**PACKAGE NAME**

The package name.

**Field Name:** QW0401PK

**COLLECTION ID**

The collection ID.

**Field Name:** QW0401CL

**DATE/TIME WHEN INSERTED**

The date or time when the statement was inserted into the EDM Pool.

**Field Name:** QW0401TM

**STORE CLOCK FORMAT**

The date or time when the statement was inserted into the EDM Pool (in store clock format) (DB2 field: QW0401TM2).
FIELD NAME: RT401TM2

DATE/TIME WHEN UPDATED
The date or time when statement statistics were updated (in external format) (DB2 field: QW0401UT2).

FIELD NAME: RT401UT2

STORE CLOCK FORMAT
The date or time when statement statistics were updated (in store clock format) (DB2 field: QW0401UT1).

FIELD NAME: RT401UT1

CONSISTENCY TOKEN
The consistency token of the package.

FIELD NAME: QW0401CT

STATEMENT IDENTIFIER
The statement identifier.

FIELD NAME: QW0401ID

ELIGIBLE FOR ACCELERATOR
The statement is eligible for the execution on an accelerator (DB2 field: QW0401ELI).

FIELD NAME: 401ELI

NBR OF EXECUTIONS
The number of executions.

FIELD NAME: QW0401EX

NBR OF SYNC BUFFER READS
The number of synchronous buffer reads.

FIELD NAME: QW0401SR

NBR OF GETPAGES
The number of Getpages.

FIELD NAME: QW0401GP

NBR OF ROWS EXAMINED
The number of rows examined.

FIELD NAME: QW0401ER

NBR OF ROWS PROCESSED
The number of rows processed.

FIELD NAME: QW0401PR

NBR OF SORTS
The number of sorts.

FIELD NAME: QW0401ST

NBR OF INDEX SCANS

The number of index scans.
Field Name: QW0401IX

NBR OF TABLESPACE SCANS
The number of tablespace scans.
Field Name: QW0401TB

NBR OF BUFFER WRITES
The number of buffer writes.
Field Name: QW0401WT

NBR OF PAR. GRPS CREATED
The number of parallel groups created.
Field Name: QW0401PG

IN-DB2 ELAPSED
Accumulated in-DB2 elapsed time.
Field Name: QW0401ET

IN-DB2 CPU
The accumulated in-DB2 CPU time. This time includes CPU consumed on an IBM specialty engine.
Field Name: QW0401CP

WAIT FOR SYNC I/O
The accumulated wait time for synchronous I/O.
Field Name: QW0401SI

WAIT FOR LOCK/LATCH
The accumulated wait time for locks.
Field Name: QW0401LK

SYNC EXEC UNIT SWITCH
The accumulated wait time for synchronous execution unit switch.
Field Name: QW0401EU

WT FOR GLOBAL LOCKS
The accumulated wait time for global locks.
Field Name: QW0401GL

WT FOR READ BY OTHER THR
The accumulated wait time for a read activity done by another thread.
Field Name: QW0401OR

WT FOR WRITE BY OTHER THR
The accumulated wait time for a write activity done by another thread.
Field Name: QW0401OW

WAIT FOR LATCH REQ
The accumulated wait time for a latch request.
IFCID 401 - Static Statements in EDM Pool

Field Name: QW0401LH
WAIT FOR PAGE LATCH
The accumulated wait time for a page latch.
Field Name: QW0401PL
WAIT FOR DRAIN LOCK
The accumulated wait time for a drain lock.
Field Name: QW0401DL
WAIT FOR CLAIM RELEASE
The accumulated wait time for a drain lock that is waiting for claims to be released.
Field Name: QW0401CM
WAIT FOR LOG WRITER
The accumulated wait time for a log writer.
Field Name: QW0401LW
WAIT CHILD L-LOCKS
The accumulated wait time for child L-locks for the statement.
Field Name: QW0401WC
WAIT OTHER L-LOCKS
The accumulated wait time for other L-locks for the statement.
Field Name: QW0401WD
WAIT P/P P-LOCKS
The accumulated wait time for P/P P-locks for the statement.
Field Name: QW0401WE
WAIT PAGE P-LOCKS
The accumulated wait time for page P-locks for the statement.
Field Name: QW0401WF
WAIT OTHER P-LOCKS
The accumulated wait time for other P-locks for the statement.
Field Name: QW0401WG
FAST INSERT PIPE WAIT TIME
The accumulated wait time for pipe wait.
Field Name: QW0401WH
PARENT CHILD WAIT TIME
The accumulated time waiting for parallel queries to synchronize between parent and child tasks.
Field Name: QW0401WPQS
RL NOT USED LIMIT EXCEEDED
The number of times RID list was not used because the number of:
• RIDS would have exceeded the DB2 limits
• RID blocks exceeded the value set by the MAXTEMPS_RID system parameter

Field Name: QW0401RL

RL NOT USED NO STOR AVAIL

The number of time a RID list was not used because there is not enough storage available to hold the list of RIDs. This also applies if the work file storage was not available.

Field Name: QW0401RS

RL OV - NO POOL STOR AVAIL

The number of times a RID list was overflowed to a work file because no RID pool storage was available to hold the list of RIDs (DB2 field: QW0401WFRIDS).

Field Name: RT401IDS

RL OV - RIDS EXCEED LIMIT

The number of times a RID list was overflowed to a work file because the number of RIDs exceeded one or more internal limits (DB2 field: QW0401WFRIDT).

Field Name: RT401IDT

HJA - NO POOL STOR AVAIL

The number of times a RID list append for a hybrid join was interrupted because no RID pool storage was available to hold the list of RIDs. It shows the number of times DB2 interrupted the RID phase and switched to the data phase (DB2 field: QW0401HJINCS).

Field Name: RT401NCS

HJA - RIDS EXCEED LIMIT

The number of times a RID list append for a hybrid join was interrupted because the number of RIDs exceeded one or more internal limits. It shows the number of times DB2 interrupted the RID phase and switched to the data phase (DB2 field: QW0401HJINCT).

Field Name: RT401NCT

RL RETRIEVAL IA SKIPPED

The number of times a RID list retrieval for multiple index access was skipped because DB2 predetermined the outcome of index ANDing or ORing (DB2 field: QW0401RSMIAP).

Field Name: RT401IAP

ACCELERATOR NAME

The accelerator name (DB2 field: QW0401ANM).

Field Name: 401ANM

STATEMENT IDENTIFIER

The statement identifier, for correlation with IFCID 401 data section 1 (DB2 field: QW0401AID).

Field Name: 401AID
ACCELERATOR EXECUTIONS

The number of executions on this accelerator (DB2 field: QW0401AEXEC).

Field Name: 401AEXEC

ACCUMULATED # ROWS RETURNED

Shows the accumulated number of rows returned for the SELECT statement (DB2 field: QW0401AROW).

For completed queries, this is the total number of rows returned that were computed by the accelerator (this is not necessarily the number of rows returned to DB2 in case DB2 does not fetch all rows).

For in-process queries, this is the number of rows that have been sent so far (and more rows may still be coming).

This value is always set to 0 for DML statements (INSERT, UPDATE, DELETE) because these wait times do not occur for DML statements.

Field Name: 401AROW

ACCUMULATED CPU TIME

Shows the accumulated CPU time spent in the accelerator when processing the query request for the statement.

This value reflects parallel processing such that the CPU value may exceed the accumulated elapsed time (DB2 field: QW0401ACPU).

For completed queries, this is the CPU time from the initial request to the last row being returned to DB2. For in-process queries, this is the time from the initial request to the current point in time. The counter includes the CPU time spent in the accelerator and also the CPU time spent in the Netezza backend (on the coordinator node and all worker nodes).

Field Name: 401ACPU

ACCUMULATED # BYTES RETURNED

Shows the accumulated number of bytes returned for the SELECT statement (DB2 field: QW0401ABYT).

For completed queries, this is the total number of bytes returned and produced by the accelerator (this is not necessarily the total number of bytes returned to DB2 in case DB2 does not fetch all the data).

For in-process queries, this is the number of bytes that have been sent so far (and more bytes may still be coming).

This value is always set to 0 for DML statements (INSERT, UPDATE, DELETE) because no such wait times occurs.

Field Name: 401ABYT

ACCUMULATED ELAPSED TIME

Shows the accumulated elapsed time spend in the accelerator processing the query request for the statement (DB2 field: QW0401AELA).

For completed queries, this is the time from the initial request to the last row that is returned to DB2. For in-process queries, this is the time from the initial request to the current point in time.

Field Name: 401AELA

ACCUMULATED EXECUTION TIME
Shows the accumulated execution time spent in processing the query request for the statement (DB2 field: QW0401AEXE).

For completed queries, this is the time spent since starting the query execution until the query execution has finished. Subsequent processing and transfer of the result set is not included, but there may be an overlapping time window in which result set processing (fetching) and query execution takes place.

For in-process queries, it is the time measured from starting query execution inside the accelerator up to the current point in time or until query execution has finished and only result set processing and transfer remains (whichever occurs earlier).

This time is measured for the actual execution time spent for the query. Compared to the total elapsed time (QW0316AELA and QW0401AELA), it does not include any preprocessing done in the accelerator (such as PREPARE), and it does not include time spent, such as in spill-to-disk or other things, related to the final query result processing.

**Field Name:** 401AEXE

**ACCUMULATED QUEUE WAIT TIME**

Shows the accumulated queue wait time for the statement (DB2 field: QW0401AWAT).

For completed queries, this is the time that the query has spent in queues, waiting to be processed.

For in-process queries, the value is only available once the query execution itself has finished and only result processing remains. Until then, the value will be (nearly) 0.

**Field Name:** 401AWAT

**WAIT TIME FOR DB2**

Shows the total time the accelerator waited for DB2 to request query results (DB2 field: QW0401ATWDB2).

For completed queries, this is from the time when the first row of the result set was produced by the accelerator until the last row was sent to DB2. For in-process queries, it is 0 (if the accelerator has not yet computed a result row) or the time from computing the first row to the current point in time (if at least one result row is available).

This value is always set to 0 for DML statements (INSERT, UPDATE, DELETE) because these wait times do not occur for DML statements.

**Field Name:** 401ATWDB

**WAIT TIME FOR 1ST ROW**

Shows the time waited for first row of query result to be available (DB2 field: QW0401ATW1R).

For completed queries, this is the time from receiving the query in the accelerator until the first row of the result set was computed. For in-process queries, this is the time from receiving the query in the accelerator to the current point in time (if no result rows are available yet) or until the first row of the result set was computed (if at least one result row is available).
This value is always set to 0 for DML statements (INSERT, UPDATE, DELETE) because no such wait times occurs.

Field Name: 401ATW1R
IFCID 402 - System Profile - Monitoring Statistics

This topic shows detailed information about “Record Trace - IFCID 402 - System Profile - Monitoring Statistics”.

IFCID 402 records information about any profile warnings or exception conditions that occurred during a Statistics interval. Each trace record can contain information for up to 500 unique profiles. Multiple trace records are written if profile thresholds are exceeded for more than 500 unique profiles during a given Statistics interval.

This record is written when Statistics class 4 is on.

Record trace - IFCID 402 - System Profile - Monitoring Statistics

The field labels shown in the following sample layout of “Record Trace - IFCID 402 - System Profile - Monitoring Statistics” are described in the following section.

<table>

PROFILE ID

The profile ID.

Field Name: QW0402PI

THR EXC TSH EXCEEDED

The accumulated counter of thread exception threshold that was exceeded.

Field Name: QW0402TE

THR QUEUED/SUSP WHEN EXC TSH WAS EXCEEDED

The accumulated counter of the thread that was queued or suspended when the thread exception threshold was exceeded.

Field Name: QW0402TQ

REQUEST FAILED WHEN THR EXC TSH WAS EXCEEDED

The accumulated counter of the request that failed when the thread exception threshold was exceeded.

Field Name: QW0402TF

THR WARNING TSH BEING EXCEEDED

The accumulated counter of thread warning threshold that was exceeded.

Field Name: QW0402TW

CONNECTION EXC TSH BEING EXCEEDED

Accumulated counter of the connection exception threshold that was exceeded.

Field Name: QW0402CE

CONNECTION WARN TSH BEING EXCEEDED
IFCID 402 - System Profile - Monitoring Statistics

The accumulated counter of the connection warning threshold that was exceeded.

**Field Name:** QW0402CW

**IDLE THR EXC TSH BEING EXCEEDED**

The accumulated counter of the idle thread exception threshold that was exceeded.

**Field Name:** QW0402OE

**IDLE THR WARN TSH BEING EXCEEDED**

The accumulated counter of the idle thread warning threshold that was exceeded.

**Field Name:** QW0402OW
This record is for IBM service use.

**Record trace - IFCID 404 - IBM Service Record**

The field labels shown in the following sample layout of “Record Trace - IFCID 404 - IBM Service Record” are described in the following section.

This topic shows detailed information about “Record Trace - IFCID 413 - Beginning of Wait for Pipe Suspend”.

This IFCID records the beginning of a wait for a pipe suspend. If Accounting class 3 or Monitor class 3 is on, or if Accounting class 8, Monitor class 8, or Monitor class 29 is on, this IFCID signals the beginning of this wait. The time spent for this wait is reported in IFCID 3 when the wait ends. MONITOR1 privilege is required for reading using the instrumentation facility interface (IFI).

**Record trace - IFCID 413 - Beginning of Wait for Pipe Suspend**

The field labels shown in the following sample layout of “Record Trace - IFCID 413 - Beginning of Wait for Pipe Suspend” are described in the following section.

**PRC NAME**

The procedure name that started the pipe wait.

*Field Name: QW0413PN*

**DB ID**

The database ID that started the pipe wait.

*Field Name: QW0413DB*

**PAGESET ID**

The pageset ID that started the pipe wait.

*Field Name: QW0413PS*

**PARTITION**

The partition number that started the pipe wait.

*Field Name: QW0413PT*
IFCID 414 - End of Wait for Pipe Suspend

This topic shows detailed information about “Record Trace - IFCID 414 - End of Wait for Pipe Suspend”.

This IFCID records the end of the wait for pipe suspend. If Accounting class 3 or Monitor class 3 is on, or if Accounting class 8, Monitor class 8, or Monitor class 29 is on, this IFCID signals the end of this wait. The time spent for this wait is reported in IFCID 3. MONITOR1 privilege is required for reading using the Instrumentation Facility Interface (IFI).

Record trace - IFCID 414 - End of Wait for Pipe Suspend

The field labels shown in the following sample layout of “Record Trace - IFCID 414 - End of Wait for Pipe Suspend” are described in the following section.

PIPE RESUME REASON : B
QW0414FL : 'X'0000'

PIPE RESUME REASON

The reason why the pipe resumed.

Field Name: QW0414R
IFCID 477 - FTB IDX ALLOC

This topic shows detailed information about “Record Trace - IFCID 477 - FTB IDX ALLOC”.

IFCID 477 shows the allocation and deallocation of structures for fast index traversal (FTB). This record is written when the performance class 4 trace is on.

Record trace - IFCID 477 - FTB IDX ALLOC

The field labels shown in the following sample layout of “Record Trace - IFCID 477 - FTB IDX ALLOC” are described in the following section.

**ACTION**

Shows the allocation and deallocation for fast index traversal. It can have the following values:

- Create
- Free

**Field Name:** QW0477FL

**DBID**

Shows the database ID.

**Field Name:** QW0477DB

**PSID**

Shows the index page set ID.

**Field Name:** QW0477OB

**PARTITION NO**

Shows the partition number.

**Field Name:** QW0477PT

**INDEX LEVELS**

Shows the number of index levels in the fast traversal block (FTB).

**Field Name:** QW0477LV

**FTB SIZE**

Shows the size of the fast traversal block (FTB) in bytes.

**Field Name:** QW0477SZ
IFCID 497 - Non Nested Statement ID Record

This topic shows detailed information about “Record Trace - IFCID 497 - Non Nested Statement ID Record”.

IFCID 497 (Non Nested Statement ID Record), IFCID 498 (UDF Statement ID Record), and IFCID 499 (Stored Procedure Statement ID Record) have the same mapping structure comprising two data sections.

Record trace - IFCID 497 - Non Nested Statement ID Record

The field labels shown in the following sample layout of “Record Trace - IFCID 497 - Non Nested Statement ID Record” are described in the following section.

REASON IFCID WAS EXTERNALIZED

Identifies the reason why this IFCID was externalized.

Field Name: QW0499RS

STATEMENT ID

The unique statement identifier. It is shown as an integer and in hexadecimal format.

Field Name: QW0499SID

CONV INTO HEX

The unique statement identifier. It is shown as an integer and in hexadecimal format.

Field Name: QW0499SID

EXECUTIONS

The number of executions.

Field Name: QW0499NEC

TYPE

The statement type. Possible values are DYNAMIC or STATIC. In addition, the statement type of IFCID 499 can also have the values STATIC CALL or DYNAMIC CALL.

Field Name: QW0499STY
IFCID 498 - UDF Statement ID Record

This topic shows detailed information about “Record Trace - IFCID 498 - UDF Statement ID Record”.

IFCID 497 (Non Nested Statement ID Record), IFCID 498 (UDF Statement ID Record), and IFCID 499 (Stored Procedure Statement ID Record) have the same mapping structure comprising two data sections.

Record trace - IFCID 498 - UDF Statement ID Record

Chapter 41. The Record Trace File Data Set and Output Records

The record trace file data set is a sequential data set of formatted records suitable for loading into the performance database using the DB2 load utility and from which reports can be produced using a reporting facility such as Query Management Facility (QMF).

The output of the FILE subcommand is a sequential variable blocked data set. The content of the output data set is determined by the FILE command options you specify, and by the input SMF/GTF records processed.

This data set contains SQL statement records and RID pool records.

Descriptions of the Record Trace File data sets and the fields contained can be found in the RKO2SAMP library under the following names:

**DGONDFMB**
For Minibind (IFCID 022) records

**DGONDFSQ**
For SQL Statement (IFCID 063) records

**DGONDFSE**
For Sort End (IFCID 096) records

**DGONDFRP**
For RID Pool (IFCID 125) records

**DGONDFDL**
For Deadlock (IFCID 172) records

**DGONDFTI**
For Timeout (IFCID 196) records

**DGONDFDS**
For Dynamic SQL Statement Statistics (IFCID 316) records

**DGONDFRL**
For Remote Location (IFCID 365) records

**DGONDFSS**
For Static Statements in EDM Pool (IFCID 401) records
Record Trace Report
Part 8. SQL Activity Report Set

These topics provide information about the SQL activity reports.

Note:
1. Refer also to the sections of the Reporting User’s Guide that deal with SQL Activity.
2. For an introduction to the SQL Activity report set and general SQL Activity information refer to the Reporting User’s Guide.

Chapter 42, “Introduction to the SQL Activity Report Set,” on page 42-1
The SQL Activity report set consists of reports and traces and provides information on the SQL activity taking place during the processing of a DB2 application. The reports show the processing of an SQL statement and all the related DB2 activity, known as workload, related to that statement.

Chapter 43, “General SQL Activity Information,” on page 43-1
Here you find information common to all SQL Activity reports and traces.

Chapter 44, “The SQL Activity Report,” on page 44-1
This topic shows examples of SQL Activity reports and the commands used to generate them.

Chapter 45, “The SQL Activity Trace,” on page 45-1
This topic contains examples of SQL Activity traces and the commands used to generate them.

Chapter 46, “SQL Activity Report and Trace Blocks,” on page 46-1
Here you find the blocks reported by SQL Activity report and trace.
SQL Activity Report
Chapter 42. Introduction to the SQL Activity Report Set

The SQL Activity report set consists of reports and traces and provides information on the SQL activity taking place during the processing of a DB2 application. The reports show the processing of an SQL statement and all the related DB2 activity, known as workload, related to that statement.

Also included in these reports are trigger and nesting level information. When the appropriate IFCID 003 is present, Accounting Trace is also reported.

In most situations, an SQL Activity trace gives details on either a DB2 thread or part of a reused thread between two signons. In CP query and sysplex query parallelism, an originating thread and multiple parallel threads are created to execute an SQL statement. Data from parallel threads can also be included in the originating thread if you specify an INPUDDD containing the relevant data in your JCL. The term thread is used to include the originating and the parallel threads. The trace is a collection of threads presented in logical unit of work ID (LUWID) sequence with an index to help you find a particular thread.

An SQL Activity report is an aggregation of threads ordered by the combination of OMEGAMON XE for DB2 PE identifiers you specify. If you specify no OMEGAMON XE for DB2 PE identifiers with ORDER, the default order of PRIMAUTH and PLANNAME is used. The report is a summary of all the work belonging to, and ordered by, those identifiers.

The following information is collected for each thread provided that the appropriate IFCIDs are available:

- Thread identification (OMEGAMON XE for DB2 PE identifiers, DB2 logical unit of work ID (LUWID), CICS logical unit of work ID (LUWID), ACE, thread start and stop time, thread type, and location)
- Programs (DBRMs and packages), stored procedures, cursors used, UDF, and triggers.
- SQL statements executed within the thread with their workload detail
- Events and time spent in DDF processing
- Time spent in signon processing
- Time spent creating and terminating threads
- Time spent in autobind processing
- Accounting information

You can control the level of summarization, the sorting of events, and the workload detail within a unit of reporting.

**Explanation of short and long fields**

To improve the evaluation of SQL activities, DB2 supports both, short and long fields. If the field value exceeds the available field length (such as long values in the header information), the string is truncated, depending on the space available. Truncated values are then listed at the end of each logical report unit, together with their full values.
A "greater than" sign (>) indicates whether a value is truncated. When a value is truncated, the "greater than" sign (>) is printed instead of a colon (:) following the label name. The full value starts with a "greater than" sign followed by the label. For example:

Tname > This value is truncated
... 
&Tname : This value was truncated - now you see its full length
...

If truncated values are listed, the "greater than" sign (>) is shown at the end of each value, because there is no colon (:) as a delimiter between the label and the value. In lists the label is used as a column heading.

**Note:** The mapping between truncated and full values remains the same for multiple reports from the same input data. This mapping is not supported for multiple reports from different input data. The printing of abbreviations and full text can cause inaccurate results in Batch SQL Activity output.

Here are examples of SQL Activity layouts with truncated values:

### SQL Activity - Minibind:

<table>

Chapter 43. General SQL Activity Information

Here you find information common to all SQL Activity reports and traces.

**Explanation of short and long fields**

To improve the evaluation of SQL activities, DB2 supports both, short and long fields. If the field value exceeds the available field length (such as long values in the header information), the string is truncated, depending on the space available. Truncated values are then listed at the end of each logical report unit, together with their full values.

A "greater than" sign (>) indicates whether a value is truncated. When a value is truncated, the "greater than" sign (>) is printed instead of a colon (:) following the label name. The full value starts with a "greater than" sign followed by the label. For example:

```
Tname  > This value is truncated
...  
>Tname : This value was truncated - now you see its full length
...  
```

If truncated values are listed, the "greater than" sign (>) is shown at the end of each value, because there is no colon (:) as a delimiter between the label and the value. In lists the label is used as a column heading.

**Note:** The mapping between truncated and full values remains the same for multiple reports from the same input data. This mapping is not supported for multiple reports from different input data. The printing of abbreviations and full text can cause inaccurate results in Batch SQL Activity output.

Here are examples of SQL Activity layouts with truncated values:

- **SQL Activity - Minibind:**

  ```
  ACCESS_CREATOR  ACCESS_NAME  MATCHCOLS  INDEXONLY  PREFETCH_INDEX  OPERATION  MIXOPSEQ
  TDK_LONG>      IX_OMPE_FIRST_LONG>  0  YES  SEQUENTIAL  SCAN  1
  ...
  >ACCESS_CREATOR : TDK_LONG_NAMED_COLLECTION_FOR_LONG_NAMED_OBJECTS
  >ACCESS_NAME    : IX_OMPE_FIRST_LONG_NAMED_TABLE_FOR_UNCOMMITTED_READ
  ```

- **SQL Activity trace, where WSNAME and TRANSACT, and the OMEGAMON XE for DB2 PE identifiers, PRIMAUTH and ORIGAUTH, are truncated.**

  ```

  DB2 VERSION: V10
  
  SUMMARIZED BY OCCURRENCE, WITH ALL WORKLOAD
  
  -PRIMAUTH: ccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccc
  -ORIGAUTH: ccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccc
  -ENDUSER : ccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccc
  -WSNAME : dddddddddddddddddddddddddddddddddddddddddddddddddddddddddddddddddddddddddddddddddddddddddddddddddddddddddddddd
  -TRANSACT: 
  ```
When you summarize statements, statements with similar characteristics are merged into a single record. As an example, if you were to summarize by statement number and you had 3 occurrences of statement 777, one of 778 and four of 779 in the same package, one for each statement number would be created.

This topic explains how to sort events in a summarized report or trace.

The workload figures are applied to the event being summarized.

A header is printed at the top of every SQL Activity trace, report, and index page.
Summarization

When you summarize statements, statements with similar characteristics are merged into a single record. As an example, if you were to summarize by statement number and you had 3 occurrences of statement 777, one of 778 and four of 779 in the same package, one for each statement number would be created.

You can summarize the SQL events by any combination of:

**Cursor**
Statements with the same cursor name in the same DBRM or package name are grouped into one record.

**Occurrence**
All SQL statement occurrences are shown as separate records. Statements are not merged. This is valid for traces only, and is the default. When summarization by occurrence is shown, the nesting level of the trigger or user-defined function is also shown.

**Program**
Statements with the same DBRM or package name are grouped into one record. This is the default for reports.

**Statement number**
Statements with the same statement number in the same DBRM or package name are grouped into one record.

**Statement type**
Statements of the same statement type are grouped into one record.

SQL Activity trace automatically includes a summary by thread and, if there is more than one thread per location, a summary by location.

**Note:**
1. The statement number is printed in a summary by cursor if an SQL statement does not include the cursor name, or if summarization by cursor is not appropriate for that statement. The following SQL statements are not summarized by cursor:
   - CALL
   - DELETE (noncursor or noncurrent of cursor)
   - DESCRIBE
   - INSERT
   - PREPARE
   - SQL COMMIT
   - SQL ROLLBACK
   - SQL statement at application requester using DRDA
   - UPDATE (noncursor or noncurrent of cursor).
   In a summary by cursor, these statements are organized by the statement number.
2. The statement type is printed in a summary by cursor and a summary by statement number if an SQL statement does not include the statement number or cursor name.
3. If DDL and DCL statements are present in a summary by cursor or a summary by statement number, they are organized by statement type.
SQL Activity prints all the SQL it receives. If some SQL cannot be summarized at the requested level, it is presented in the closest possible summary format.
This topic explains how to sort events in a summarized report or trace.

They can be sorted by:
- Average elapsed time
- Average TCB time
- Default
- Exits
- Exit time
- I/O requests
- I/O time
- Lock suspensions
- Lock suspension time
- Number of scans
- Pages scanned
- Records sorted
- Rows processed
- Sort workfiles

If DEFAULT is used, the sort order is dictated by the summarization, as follows:

**Cursor**
Sorted in alphabetical order within program

**Occurrence**
Sorted in timestamp order (trace default)

**Program**
Sorted in alphabetical order of package or DBRM name (report default)

**Statement number**
Sorted in numerical order within program

**Statement type**
Sorted in alphabetical order.
Workload Detail

The workload figures are applied to the event being summarized.

Any combination of the following workload detail can be requested:
- Accounting, see 2
- All
- Data capture activity
- Exit activity
- I/O activity
- Locking activity
- Minibind, see 3
- None
- Scan, RID list, and query parallelism activity
- Sort activity
- UDF, see 4
- Vars
- Workload highlights

None is the default.

Note:
1. The amount of processing required depend on the level of detail you request. IBM recommends that you do not specify WORKLOAD(ALL) with a large amount of input data unless absolutely necessary.
2. When IFCID 003 is included in the input, Accounting Trace activity is automatically included as part of the workload detail.
3. When IFCID 022 is included in the input, minibind activity is included automatically as part of the workload detail.
4. When IFCID 324 is included in the input, UDF activity is automatically included as part of the workload detail.
Headers Used in SQL Activity

A header is printed at the top of every SQL Activity trace, report, and index page.

The following topics provide additional information:
- “SQL Activity Report Header” on page 43-10
- “SQL Activity Trace Header” on page 43-11
- “SQL Activity Trace Index Header” on page 43-12

The report headers contain the standard OMEGAMON XE for DB2 PE header information and the following additional data:

**SORTED BY**
The event by which the report or trace is sorted, which can be the default or as specified in the SORTBY option.

**WITH detail WORKLOAD**
The workload details included in the report or trace as specified in the WORKLOAD option.

**OMEGAMON XE for DB2 PE identifiers**
The identifiers define the order of the SQL Activity data printed. If you specify no OMEGAMON XE for DB2 PE identifiers with ORDER, the default order of PRIMAUTH-PLANNAME is used.

**TRACE #**
Each trace occurrence and thread within the TRACE subcommand is numbered sequentially in the format x:yyyyy, where:
- x can be 1 through 5, representing the five TRACE subcommands
- yyyyy can be 1 through 99 999, representing each thread being traced.

**DB2 LUWID**
The identifier of the logical unit of work. The following parts of this identifier are printed:
- The network ID
- The name of the logical unit, which is the name by which VTAM recognizes the DB2 subsystem
- The instance number

**ACE ADDRESS**
The agent control element absolute address in hexadecimal.

**START TIME**
The timestamp showing when the startup of the thread ended or, if the REQUESTED FROM time is after the thread begin, the REQUESTED FROM timestamp.

**START ELAPSED**
The thread start elapsed time, if calculable.

**START REASON**
The event that started the thread:
- CREATE THREAD
- CREATE DBAT
- NEW USER
- RESIGNON
- IN PROGRESS, no thread start IFCID present.
STOP TIME
The timestamp showing when the thread stopped or, if the REQUESTED TO time is after the thread end, the REQUESTED TO timestamp.

STOP ELAPSED
The thread stop elapsed time, if calculable.

STOP REASON
The event that stopped the thread:
- TERMINATE THREAD
- DEALLOCATE DBAT
- NEW USER
- RESIGNON
- ACCOUNTING FOUND-the thread terminated with the accounting record
- LOCATION CHANGED-the thread was terminated due to a location change
- END OF FILE-the thread was terminated because there were no records left to process.

START AET
The average thread start elapsed time.

STOP AET
The average thread stop elapsed time.

AUTOBIND AET
The average autobind elapsed time, if present.

ARCHIVE LOG AET
The average archive log (quiesce) elapsed time, if present.

Explanation of short and long fields

To improve the evaluation of SQL activities, DB2 supports both, short and long fields. If the field value exceeds the available field length (such as long values in the header information), the string is truncated, depending on the space available. Truncated values are then listed at the end of each logical report unit, together with their full values.

A "greater than" sign (>) indicates whether a value is truncated. When a value is truncated, the "greater than" sign (>) is printed instead of a colon (:) following the label name. The full value starts with a "greater than" sign followed by the label. For example:

<table>
<thead>
<tr>
<th>Label</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tname</td>
<td>&gt; This value is truncated</td>
</tr>
<tr>
<td></td>
<td>...</td>
</tr>
<tr>
<td></td>
<td>&gt; Tname: This value was truncated - now you see its full length</td>
</tr>
<tr>
<td></td>
<td>...</td>
</tr>
</tbody>
</table>

If truncated values are listed, the "greater than" sign (>) is shown at the end of each value, because there is no colon (:) as a delimiter between the label and the value. In lists the label is used as a column heading.

Note: The mapping between truncated and full values remains the same for multiple reports from the same input data. This mapping is not supported for multiple reports from different input data. The printing of abbreviations and full text can cause inaccurate results in Batch SQL Activity output.
Here are examples of SQL Activity layouts with truncated values:

- **SQL Activity - Minibind:**

  ACCESS_CREATOR  ACCESS_NAME  MATCHCOLS  INDEXONLY  PREFETCH_INDEX  OPERATION  MIXOPSEQ  
  TDK_LONG>  IX_OMPE_FIRST_LONG>  0  YES  SEQUENTIAL  SCAN  1

  >ACCESS_CREATOR : TDK_LONG_NAMED_COLLECTION_FOR_LONG_NAMED_OBJECTS
  >ACCESS_NAME : IX_OMPE_FIRST_LONG_NAMED_TABLE_FOR_UNCOMMITTED_READ

- **SQL Activity trace, where WSNNAME and TRANSACT, and the OMEGAMON XE for DB2 PE identifiers, PRIMAUTH and ORIGAUTH, are truncated.**

```

Chapter 44. The SQL Activity Report

This topic shows examples of SQL Activity reports and the commands used to generate them.

These example reports are summarized and sorted at the following levels:
- All
- Cursor
- Statement ID
- Statement number
- Statement type
- Program
- Thread

The SQL Activity report groups SQL Activity according to a combination of up to three OMEGAMON XE for DB2 PE identifiers. This grouping is applied to any SUMMARIZEBY, SORTBY, or WORKLOAD options you specify.

The ORDER subcommand specifies by which OMEGAMON XE for DB2 PE identifiers, and in which order, the SQL Activity is reported. If you specify no OMEGAMON XE for DB2 PE identifiers with ORDER, the default order of PRIMAUTH and PLANNAME is used.

“Examples of an SQL Activity Report” on page 44-2
This topic shows examples of an SQL Activity report.

“Example of an SQL Activity Report with Workload” on page 44-6
The following examples show excerpts of an SQL Activity report with workload detail.
Examples of an SQL Activity Report

This topic shows examples of an SQL Activity report.

"Summarized by Statement Number" to "Summarized by Statement Type" on page 44-4 show excerpts of an SQL Activity report summarized by all. The layout of the report is similar for each of the possible summary levels. The order is plan name within primary authorization ID, by default.

Summarized by Statement Number

This summary level presents totals for each statement number belonging to the selected combination of OMEGAMON XE for DB2 PE identifiers. The events are qualified by package name.

By default, the package names are sorted alphabetically and the statement numbers within packages are sorted numerically, in ascending order.

Note: Not every statement can be summarized by statement number. DDL, for example, has no statement numbers. An event name is chosen from the closest possible level of summarization, which is the statement type LOCK in this example.

The following command produces an SQL Activity report summarized by Statement Number:

```
SQLACTIVITY REPORT SUMMARIZEBY (STMTNO)
```

This is an example for an SQL Activity report summarized by statement number.

```
LOCATION: SYS1DSN2 OMEGAMON XE FOR DB2 PE & PM: Report Reference

0.002837 0.000635
```

Summarized by Cursor

This summary level shows totals for each cursor name belonging to the selected combination of OMEGAMON XE for DB2 PE identifiers that are qualified by package name. By default, the package names and the events within each package are sorted alphabetically.

This is an example for an SQL Activity report summarized by cursor.

```
LOCATION: STLEC1 OMEGAMON XE FOR DB2 PE & PM: Report Reference
GROUP: N/P SQL ACTIVITY - REPORT
MEMBER: N/P ORDER: PRIMAUTH-PLANNAME
REQUESTED FROM: NOT SPECIFIED
requested TO: NOT SPECIFIED
```

44-2 OMEGAMON XE for DB2 PE & PM: Report Reference
This activity report provides a summary of SQL activity for the specified period. The report is organized by program and statement ID. Each program entry includes a count of SQL statements, along with the elapsed time and CPU usage. The summary details are further broken down by statement ID, allowing for a detailed analysis of individual queries.

**Summarized by Program**

This summary level presents totals for all programs belonging to the selected combination of OMEGAMON XE for DB2 PE identifiers. Package names are embedded in the summary details.

This is an example for an SQL Activity report summarized by program.

**Summarized by Statement ID**

This summary level groups statements by ID.

The following command produces an SQL Activity report summarized by ID:

```
SQLACTIVITY REPORT SUMMARIZE BY (STMTID)
```
**SQL Activity Report Complete**

### Summarized by Statement Type

This summary level shows totals for each cursor name belonging to the selected combination of OMEGAMON XE for DB2 PE identifiers that are qualified by package name. By default, the package names and the events within each package are sorted alphabetically.

This is an example for an SQL Activity report summarized by statement type.

### Summarized by Thread

This summary level presents totals for each statement type executed by this combination of OMEGAMON XE for DB2 PE identifiers. By default, the events are sorted alphabetically. There is no further qualification at this level.
This is an example for an SQL Activity report summarized by thread.

Chapter 45. The SQL Activity Trace

This topic contains examples of SQL Activity traces and the commands used to generate them.

These traces are summarized at different levels. They can be summarized at the following levels:

- All
- Cursor
- Occurrence
- Program
- Statement number
- Statement type

Note: The trace also automatically includes a summary by thread and, if there is more than one thread per location, a summary by location. Each summary begins on a new page of the trace.

“Example of an SQL Activity Trace” on page 45-2
The following examples show excerpts of an SQL Activity trace summarized at all levels.

“The SQL Activity Trace Index” on page 45-10
The SQL Activity trace index provides a page index to the threads traced during the execution of an SQLACTIVITY command. An SQL Activity trace index is produced for each TRACE subcommand and is printed on a new page at the end of the trace output.
Example of an SQL Activity Trace

The following examples show excerpts of an SQL Activity trace summarized at all levels.

They are generated by the following command:

```
SQLACTIVITY
   TRACE
   SUMMARIZE BY (ALL)
```

### SQL Activity Trace Summarized by All

This summary level shows totals for each cursor name belonging to the thread that is qualified by package name. By default, the package names and the events within each package are sorted alphabetically.

This is an example of an SQL Activity Trace Summarized by All

SQL Activity Trace Summarized by Occurrence

Summary by occurrence shows individual SQL statement occurrences. In this thread the SQL statements belong to one package, the name of which is printed at the head of its work. When present, SQL text and DDF information is embedded in the events. Commits appear as standalone events. The events are, by default, sorted in timestamp sequence.

This is an example of an SQL Activity Trace Summarized by Occurrence.

Chapter 45. The SQL Activity Trace

45-5
SQL Activity Trace Summarized by Occurrence, sorted by ELAPSEDTIME

This summary level sorts the SQL activity trace that belongs to the thread, by elapsed time. The section number field (SECT#) provides the section number of the Relational Data System Input parameter list (RDI).

This is an example of an SQL Activity Trace Summarized by Occurrence, sorted by ELAPSEDTIME.

SQL Activity Trace Summarized by Occurrence with All Workload

Summary by occurrence with all workload shows individual SQL statement occurrences. It also shows workload highlights, scan activity and minbind activity.

This is an example of an SQL Activity Trace Summarized by Occurrence with All Workload.
SQL Activity Trace Summarized by Program

This summary level presents totals for each program name belonging to the thread.

This is an example of an SQL Activity Trace Summarized by Program.

SQL Activity Trace Summarized by Statement Number

This summary level presents totals for each statement number belonging to the thread. The events are qualified by the package name.

From this level on, timestamps are not appropriate so the second column becomes a count of the occurrences of each event. SQL text is omitted.

By default, the package names are printed alphabetically and the statement numbers are sorted numerically within each package.

Note: Not every statement can be summarized by statement number. DCL, for example, has no statement number. An event name is chosen from the closest possible level of summarization, which is the statement type GRANT in this example.
This is an example of an SQL Activity Trace Summarized by Statement Number (STMTNO).

SQL Activity Trace Summarized by Statement Type

This summary level presents totals for each statement type executed by the thread. By default, the events are sorted alphabetically. There is no further qualification at this level.
Chapter 45. The SQL Activity Trace
The SQL Activity Trace Index

The SQL Activity trace index provides a page index to the threads traced during the execution of an SQLACTIVITY command. An SQL Activity trace index is produced for each TRACE subcommand and is printed on a new page at the end of the trace output.

Each thread on the trace is listed in timestamp order followed by various OMEGAMON XE for DB2 PE identifiers.

If a thread satisfies the selection criteria for more than one TRACE subcommand, it is presented on each relevant trace, and is indexed accordingly.

SQL Activity Trace Index

The following example represents the trace index for location SYS1DSN2. From this page you can see the following:

- This trace is the result of the first TRACE subcommand.
- There are four threads.
- There were no dates or times specified on the TRACE subcommand or on the GLOBAL command.
- Both allied threads and DBATs are present. For allied threads, the requester location is the same as the local location (for example, the first entry shown in "SQL Activity Trace Index"). For DBATs, the requester location is different to the local location (for example, the second entry shown in "SQL Activity Trace Index").

</table>

Field description

Here is a description of the field labels shown in the trace summary index:

TRACE START

The start time of the trace of the thread.

OMEGAMON XE for DB2 PE identifiers

The identifiers define the order of the SQL Activity data printed. If you specify no OMEGAMON XE for DB2 PE identifiers with ORDER, the default order of PRIMAUTH and PLANNAME is used.

SERVER

Reported in the same column as REQUESTER. All server locations involved are listed in alphabetical sequence below the requester location.

TRACE NO

The number of the thread, in the format x.yyyyy, where x is the number of the TRACE subcommand and yyyyy is the number of the thread reported as a result of that TRACE subcommand.
STARTS PAGE NO
The number of the page on which the beginning of the thread is reported. It is shown in the format x-yyyy, where x is the location number and yyyyy is the page number within the location.

Note: If more than one summary level is selected, STARTS PAGE NO relates to the first summary printed for that thread.
Chapter 46. SQL Activity Report and Trace Blocks

Here you find the blocks reported by SQL Activity report and trace.

**Note:** In query CP and sysplex query parallelism, the TCB time in the reports and traces only reflects the TCB time of the originating record. For the TCB time of the parallel records, refer to the query parallelism workload detail block described in “Query Parallelism” on page 46-32.

“SQL Detail Section” on page 46-2
This section shows the report and trace detail portions for each SQL statement type.

“Report and Trace Details” on page 46-3
This section described the report and trace details for SQL activities.

“Workload Detail” on page 46-12
Workload detail is available on all summary levels. The workload figures are applied to the event being summarized.
SQL Detail Section

This section shows the report and trace detail portions for each SQL statement type.

Field descriptions are shown in “Field Descriptions of SQL Activity Detail Report and Trace Details” on page 46-5.

DDF information is included in all SQL Activity summaries, when present.

When an SQL statement type is not recognized, other is printed.

The report and details blocks are divided into columns. The column labels vary for report and trace and for the summarization used. The following column labels are used:

- **NL**: Nesting level of stored procedures, triggers and user-defined functions. This is valid for trace only. Values are summarized by occurrence.

- **EVENT**: The event being reported or traced, such as the cursor name in a summary by cursor or the program name in a summary by program.

- **COUNT**: The number of occurrences of this event.

- **TIMESTAMP**: The timestamp of the event begin.

- **TOT.ELAPS**: The total elapsed time of the event, that is the elapsed time for all statements within the event.

- **AET/EVENT**: The average elapsed time of the event.

- **TOTAL TCB**: The total TCB time of the event, that is the TCB time for all statements within the event.

- **TCB/EVENT**: The average TCB time of the event.

- **ELAPTIME**: The elapsed time of the event.

- **TCB TIME**: The TCB time of the event.
Report and Trace Details

This section described the report and trace details for SQL activities.

SQL Activity Trace Package Detail

The first line of PACKAGE details shows the fully-qualified package name, if applicable. It consists of:
- The location name of the DB2 subsystem where the package was bound
- The name of the package collection
- The name of the program
- The consistency token generated by the DB2 precompiler, if present
- The version ID of the package, if present

To avoid duplication, the package name is not embedded in the detail when the events are sorted in default sequence. It is printed once at the head of its work.

For details of other fields shown for package, see “Field Descriptions of SQL Activity Detail Report and Trace Details” on page 46-5.

Here is an example of an SQL Activity Trace Package Detail.

</tbody>
</table>

The following list shows the fields displayed in the SQL Activity detail report and trace details, in alphabetical order.

“Field Descriptions of SQL Activity Detail Report and Trace Details” on page 46-5
Field Descriptions of SQL Activity Detail Report and Trace Details

The following list shows the fields displayed in the SQL Activity detail report and trace details, in alphabetical order.

**ACQUIRE**

The acquire level of the package showing USE or ALLOCATE.

**AET/OCCUR**

The average elapsed time for each occurrence.

**ACT_TIME**

Trigger activation time.

- **BEFORE**
- **AFTER**

**BUFFER WRITES**

The number of buffer writes.

**CHILD L LOCK**

The accumulated wait time for global child L-locks.

**CLAIM COUNT**

The accumulated wait time for claim count.

**CLOSE TYPE**

The Close statement type. Possible values are:

- **IMPLICIT**
- **EXPLICIT**
- **N/A**

Otherwise the values are shown in hexadecimal.

**COLLID**

Collection identifier.

**COMMITS**

The total number of the following statements for the requester:

- Rollback
- Commit phase 2
- Sync

The total number of the following statements for the server:

- Commit request received
- Backout request received

**COUNT**

The number of occurrences as derived from the statement type.

**CURSOR**

The name of the cursor, if applicable.

**CURSOR_NAME**

Allocate cursor name.

**DBRM**

The name of the program, if applicable.

To avoid duplication, the DBRM name is not embedded in the detail when the events are sorted in default sequence. It is printed once at the head of its work.
**DRAIN LOCK**
The accumulated wait time for drain lock.

**DYNAMICRULES**
The value of the DYNAMICRULES option on the BIND/REBIND command:

- **RUN**  run time rules apply to a dynamic SQL statement for authorization checking and object qualification at run time.
- **BIND**  Bind-time rules apply to a dynamic SQL statement for authorization checking and object qualification at run time.
- **N/P**  DYNAMICRULES was not specified.

**ELAPTIME**
Duration of trigger activity.

**EVAL**  Triggered action condition. Possible values are:
- TRUE
- FALSE
- NONE

**EXT_NAM**
External trigger name.

**FUNCTION**
Function name.

**GET PAGES**
The number of Getpages.

**GLOBAL LOCK**
The accumulated wait time for global locks.

**GRAN**
Trigger granularity. Possible values are:
- ROW
- STMT

**IMMEDWRITE**
Indicates how DB2 updates group buffer pool dependent pages. This is only valid in a data sharing environment.

Group buffer pool dependent pages can be written to DASD or SYSTEM pagesets.

Values shown are:

- **NO**  DB2 uses normal write activity for updates, this is the default. Pages are written out at, or before phase 2 commit, or at the end of an abort for transactions that have rolled back.

- **PH1**  Pages are written out at, or before phase 1 commit.
  If a transaction subsequently rolls back, the pages are updated in the group buffer pool at the end of the rollback and are written out at the end of the abort.

- **YES**  Pages are written out to the coupling facility as soon as the buffer update commits. Pages are written out regardless of whether the update occurs during forward progress or rollback of the transaction.
This option can affect performance due to coupling facility overhead.

**IMPLICIT COMMIT**
The cursor attribute implicit commit, which closed the cursor. It can be YES or NO.

**IN-DB2 CPU**
The accumulated In-DB2 CPU time. This time includes CPU time that was consumed on an IBM specialty engine.

**IN-DB2 ELAPSED**
The accumulated In-DB2 elapsed time.

**INDEX SCANS**
The number of index scans.

**ISOLATION or ISO**
The isolation level of the statement:

- **CS** Cursor stability
- **RS** Read stability
- **RR** Repeatable read
- **UR** Uncommitted read

**KEEPDYNAMIC**
Indicates whether DB2 keeps (KEEPDYNAMIC(YES)) or discards (KEEPDYNAMIC(NO)) prepared SQL statements at commit points.

**KEEP UPDATE LOCKS; KEEP UPD. LOCKS**
Indicates whether X locks are used. X locks can only be used for SQL OPEN CURSOR statements and an isolation level of RS and RR.

**LATCH**
The accumulated wait for latch.

**LOCAL**
The number of statements that were distributed without going through VTAM.

**LOCKS**
The accumulated wait for locks.

**# LOCATORS**
The number of locators.

**# LOCATOR VAL**
The number of locators.

**LOG WRITER**
The accumulated wait time for log writer.

**NAME**
The object name, without qualifier, in the DDL statement.

**NEW DEGREE**
The requested degree of parallelism regardless of whether the request is successful.

**NEW SQLID**
The requested SQL ID regardless of whether the request is successful.
OPTHINT
Value of optimization hints, if used.

OTHER L LOCK
The accumulated wait time for global other L-locks.

OTHER P LOCK
The accumulated wait time for global other P-locks.

PACKAGE
Package name (UDF only).

PAGE LATCH
The accumulated wait time for page latch.

PAGE P LOCK
The accumulated wait time for global page P-locks.

PAGESET L LOCK
The accumulated wait time for global Pageset or Partition L-locks.

PARALLEL GRP Creates
The number of parallel groups creates.

PARENT CHILD SYN
The accumulated time waiting for parallel queries to synchronize between parent and child tasks.

PIPE
The accumulated wait time for pipe.

PREPARE
Indicates whether the preparation of dynamic SQL statements was deferred:

DEFER
The preparation of the dynamic SQL statements that refer to remote objects was deferred until run time.

NODEFER
The dynamic SQL statements were prepared at bind time.

PREVIOUS DEGREE
The previous or current degree of parallelism.

If the statement executed successfully, this is the previous degree of parallelism. If it executed unsuccessfully, this is the current degree of parallelism.

PREVIOUS SQLID
The previous or current SQL ID.

If the request to change the SQL ID is successful, this is the user’s previous SQL ID. If it is unsuccessful, this is the user’s current SQL ID.

PROCEDURE
The unqualified stored procedure name.

PROC_LOC
Location of stored procedure.

PROC_NAME
Name of stored procedure.

PROC_QUALIF
Qualifier of stored procedure.
PROGRAM
    Program or package name.

PROTOCOL
    DB protocol:
    DRDA
        Convert three-part names to DRDA
    PRIVATE
        Three-part names use private protocol
    NOT_SPEC
        DB protocol was not specified.

READ-OTH. THREAD
    The accumulated wait time for read activity by another thread.

RELEASE
    The release level of the package, showing the option COMMIT or DEALLOCATE, if available.

REMOTE
    The number of statements that went through VTAM.

REOPTIMIZED or REOPT
    Indicates whether the access path of the SQL statement was reoptimized:
    YES or Y
        The access path was reoptimized at run time.
    NO or N
        The access path was only optimized at bind time.

RID-LIMIT EXC.
    The number of times RID list was not used because the number of RIDs would have exceeded DB2 limits.

RID-NO STORAGE
    The number of time a RID list was not used because there is not enough storage available to hold the list of RIDs.

ROWS EXAMINED
    The number of rows examined.

ROWS PROCESSED
    The number of rows processed.

SCHEDULE TCB
    The TCB time for scheduling the stored procedure.

SCHEDULE TIME
    The elapsed time for scheduling the stored procedure. This field also includes the time for processing application logic, if any, up to the first SQL statement within the stored procedure.

SCHEMA
    Schema name.

SCROLL
    Identifies the cursor scrollability. It can be one of the following:
    • Scroll
    • None-scroll
SECT#

The section number of the Relational Data system Input parameter list (RDI).

SENSITIVE

The cursor sensitivity. It can be one of the following:
- Sensitive
- Insensitive
- Unspecified

SERVER

The server location in a distributed transaction. If there are multiple server locations, an asterisk (*) is printed.

SORTS

The number of sorts.

SQLCODE or SQLCO

The return code from the SQL event. Obtained from the DB2 SQLCODE which remaps the DB2 field.

SQLSTATE or SQLST

The SQL state.

STATUS

The status of the statement:
- SUCCESSFUL
- FAILED
- SYSADM — Although authorization validation failed, the statement is successful because the user had SYSADM authority.

STMT

Triggering SQL statement.
- UPDATE
- INSERT
- DELETE

STMT#

The number of the statement executed.

Note: For implicit connects, the statement number shown is the number of the SQL statement that caused the connect.

STMT ID

The statement identifier.

STMT TYPE

The statement type.

Note: In a summary by statement number, you find the statement number instead of the statement type.

SYNC BUFF READS

The number of synchronous buffer reads.

SYNCHRON. I/O

The accumulated wait for synchronous I/O.

TABLE

The cursor result table type. It can be one of the following:
- Static
- Dynamic
- Unspecified

**TABLESPACE SCANS**
The number of tablespace scans.

**TCB/OCCUR**
The average TCB time for each occurrence. It is the TCB time spent at the location being traced or reported on this line. For requester locations, it shows only the small amount of processing done at the requester.

**TCB TIME**
Duration of trigger activity.

**TEXT**
The text of the SQL statement, if present.

**Note:**
1. The text is only printed in a summary by occurrence if it is a dynamic SQL.
2. Text exceeding 5000 characters is truncated.
3. Host variables are presented as :H.

**TIMESTAMP**
Trigger timestamp.

**TRIGGER**
Trigger name.

**TYPE**
The type of object in the DDL statement.

**UNIT SWITCH**
The accumulated wait time for synchronous execution unit switches.

**WRITE-OTH. THREAD**
The accumulated wait time for write activity by another thread.
Workload Detail

Workload detail is available on all summary levels. The workload figures are applied to the event being summarized.

Any workload performed during thread creation is shown on the first SQL statement occurrence encountered in a thread.

“Accounting” on page 46-13
The layout of the accounting section is identical to the accounting long report or trace, depending on whether an SQL Activity report or trace has been requested.

“Data Capture Activity” on page 46-14
This block shows the average data capture activity performed by the event.

“Exit Activity” on page 46-15
This block shows the exits performed by the event.

“Function Resolution Activity” on page 46-16
This section shows the layout of a function resolutions block and its field descriptions.

“I/O Activity” on page 46-18
This block shows the I/O activity for each object performed by the event.

“Lock Suspension Activity” on page 46-20
This block shows the lock suspension activity for each object performed by the event.

“Minibind Activity” on page 46-22
The minibind activity block shows information about mini plans, which are generated by the optimizer at bind and SQL prepare time. This block is written once for each IFCID 022 encountered. The block consists of a header followed by one or more repeating sections.

“Page and Row Locking Activity” on page 46-29
This block shows the page locking, row locking, and lock avoidance activity for each object, performed by the event.

“Query Parallelism” on page 46-32
This section introduces the Query Parallelism block.

“RID List Processing” on page 46-34
This block shows the record ID (RID) list activity performed by the event.

“Scan Activity” on page 46-35
This block shows the total scan activity for each object, performed by the event.

“Sort Activity” on page 46-38
This block shows sort activity for each sort performed by the event.

“Host Variables” on page 46-44
This block shows the host variables to represent the values that will be sent to or received from the SQL statement.

“Workload Highlight” on page 46-47
This block shows the highlights of the workload activity performed by the event. All workload fields available in the SORTBY option are included.
Accounting

The layout of the accounting section is identical to the accounting long report or trace, depending on whether an SQL Activity report or trace has been requested.

For explanations of the blocks and fields shown in the accounting section, see “Accounting Report and Trace Blocks” on page 5-206.
Data Capture Activity

This block shows the average data capture activity performed by the event.

Data Capture Workload Block Example

Here is an example of the data capture workload block.

--- DATA_CAPTURE -----------------------------------------------
DESCRIBES : 3.14 MAX READ TIME: 1.928397 DATA DESC RETURNED: 3.77
AET/DESCRIBE : 0.023837 RECS RETURNED: 24.86 TABLES RETURNED : 0.00
LOG READS : 5.20 RECS CAPTURED: 29.15
AET/EXTRACTION: 1.04382 ROWS RETURNED: 132.50

Field description

Here is a description of the field labels shown in the data capture workload block:

DESCRIBES
The average number of data capture describes.

AET/DESCRIBE
The average elapsed time of data capture describes.

LOG READS
The average number of log reads performed.

AET/EXTRACTION
The average elapsed time of log extraction.

MAX READ TIME
The longest elapsed time of a log read.

RECS RETURNED
The average number of log records returned.

RECS CAPTURED
The average number of records that were captured for this update. To perform all data capture updates, all captured log records need to be returned.

ROWS RETURNED
The average number of data rows returned.

DATA DESC RETURNED
The average number of data capture data descriptions returned.

TABLES RETURNED
The average number of data capture tables returned.
Exit Activity

This block shows the exits performed by the event.

Exits Workload Block Example

Here is an example of an exits workload block:

<table>
<thead>
<tr>
<th>MEMBER</th>
<th>VALIDATION TOTAL</th>
<th>AET/EXIT</th>
<th>EDIT TOTAL</th>
<th>AET/EXIT</th>
</tr>
</thead>
<tbody>
<tr>
<td>SE11</td>
<td>1</td>
<td>N/C</td>
<td>0</td>
<td>0.000060</td>
</tr>
</tbody>
</table>

Field description

Here is a description of the field labels shown in the exits workload block:

**MEMBER**

The name of the DB2 member within the DB2 data sharing group.

**VALIDATION TOTAL**

The number of results of a validation exit call written for every validation row.

**VALIDATION AET/EXIT**

The summarized elapsed validation time divided by the value in VALIDATION TOTAL.

**EDIT TOTAL**

The summary of results of an edit exit call to encode a record written for every row edited and the results of an edit exit call to decode a record written for every row decoded.

**EDIT AET/EXIT**

The summarized elapsed edit time divided by the value in EDIT TOTAL.
Function Resolution Activity

This section shows the layout of a function resolutions block and its field descriptions.

SQL Activity Function Resolutions Workload Block

The following figure shows the layout of the function resolutions block.

Field description

Here is a description of the field labels shown in the function resolutions block:

**QUERYNO**
The query number.

**PLANNAME**
The plan name.

**COLLECTION_ID**
The collection ID.

**APPLNAME**
The name of the application.

**PROGNAME**
The program name.

**CONSIS_TOKEN**
The consistency token.

**BIND_TIME**
The time stamp of the bind time.

**VERSION**
The version ID.

**CURRENT_PATH**
The current path.

**FUNCT_SCHEMA**
A short SQL identifier, either ordinary or delimited, following the concept of qualified names consistent with the ANSI/ISO SQL92 standard.

**FUNCT_NAME**
The name of a function without a qualifier.
SPECIFIC_NAME
Identifies the particular function. The specific name must identify a specific function name in the explicitly or implicitly specified schema.

FUNCT_TYPE
The classification of the function:
SCALAR  Scalar UDF
TABLE  Table UDF

VIEW_CREATOR
The name of the view creator if the function is referenced in a view definition.

VIEW_NAME
The name of the view if the function is referenced in a view definition.

QUERY_BLOCKNO
A number that identifies the query block number being explained.

FUNCT_TEXT
Contains the text of the function reference, function name, and parameters. It can be up to 254 characters long.
I/O Activity

This block shows the I/O activity for each object performed by the event.

I/O Activity Workload Block Example

The following example shows the I/O activity workload block.

<table>
<thead>
<tr>
<th>DATABASE</th>
<th>MEMBER</th>
<th>I/O REQUEST</th>
<th>READ REQUEST</th>
<th>WRITE REQUEST</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBPALL</td>
<td>BP4</td>
<td>3</td>
<td>3 SYNCH</td>
<td></td>
</tr>
<tr>
<td>W RKSE12</td>
<td>DSN4K01</td>
<td>102</td>
<td>102 SYNCH</td>
<td></td>
</tr>
</tbody>
</table>

Field description

Here is a description of the field labels shown in the I/O activity workload block:

DATABASE
The database name. If the name is not available, the decimal DBID/OBID is printed.

PAGESET
The page set name. If the name is not available, the decimal DBID/OBID is printed.

MEMBER
The name of the DB2 member within the DB2 data sharing group. This field shows N/P in a non-data-sharing environment.

BP
The buffer pool name.

I/O REQUEST TOTAL
The total number of I/O requests.

I/O REQUEST AET
The average elapsed time for each I/O request.

READ REQUEST TOTAL
The number of read I/O requests of a specific type.

READ REQUEST TYPE
The type of read request:

SYNCH
Synchronous read request

SEQPF
Sequential prefetch request

DYNPF
Dynamic prefetch request

LSTPF
List prefetch request

READ REQUEST AET/WITH
The average elapsed time for a read with I/O of a specific type.

READ REQUEST %WITH
The percentage of total read requests with I/O for a particular type.

READ REQUEST PAGE/WITH
The pages read for each read request with I/O of a particular type.
READ REQUEST %WITHOUT
The percentage of total read requests without I/O for a particular type. This can occur because all the pages requested by a prefetch read were already in the buffer pool.

WRITE REQUEST TOTAL
The number of write I/O requests.

WRITE REQUEST TYPE
The type of write request.

WRITE REQUEST CAST
Indicates whether the write operations were initiated due to a coupling facility castout.

WRITE REQUEST AET
The average elapsed time for each write.

WRITE REQUEST PAGE/WRITE
The number of pages written.
SQL Activity - Lock Suspension

Lock Suspension Activity

This block shows the lock suspension activity for each object performed by the event.

Lock Suspension Activity Workload Block Example

The field labels shown in the following sample layout of "Lock Suspension Activity Workload Block" are described in the following section.

<table>
<thead>
<tr>
<th>RESOURCE NAME</th>
<th>TYPE</th>
<th>REQUEST</th>
<th>LOCAL LATCH</th>
<th>IRLM GROUP</th>
<th>NOTIF</th>
<th>OTHER</th>
<th>COUNT</th>
<th>AET COUNT</th>
<th>AET COUNT</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBPARALL</td>
<td>TSPAR</td>
<td>DATAPAGE</td>
<td>NOTIFY</td>
<td>0</td>
<td>0</td>
<td>24</td>
<td>24</td>
<td>0</td>
<td>0.74382</td>
</tr>
<tr>
<td>SE11</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>N/C</td>
<td>0</td>
</tr>
<tr>
<td>DBPARALL</td>
<td>TSPAR</td>
<td>DATAPAGE</td>
<td>LOCK</td>
<td>0</td>
<td>3</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0.04096</td>
</tr>
<tr>
<td>SE11</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>N/C</td>
<td>0</td>
</tr>
<tr>
<td>DBPARALL</td>
<td>TSPAR</td>
<td>DATAPAGE</td>
<td>LOCK</td>
<td>0</td>
<td>5</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0.06957</td>
</tr>
<tr>
<td>SE12</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>N/C</td>
<td>0</td>
</tr>
<tr>
<td>DBPARALL</td>
<td>TSPAR</td>
<td>DATAPAGE</td>
<td>UNLOCK</td>
<td>0</td>
<td>1</td>
<td>0</td>
<td>2</td>
<td>0</td>
<td>0.59058</td>
</tr>
<tr>
<td>SE21</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>N/C</td>
<td>0</td>
</tr>
</tbody>
</table>

The following list describes the fields in the lock suspension activity workload block:

Field   Description

RESOURCE NAME
The name of the resource on which the suspended request is made. The content of the field depends on the resource type:

- The plan name for SKCT
- The collection and package IDs for SKPT
- The collection ID for COLLECT
- The database name for DATABASE, CDB PLK, DBD PLCK
- The buffer pool ID for ALTERBUF, GBP S/S, P/P PLCK, PAGEPLCK, GBP CAST, P/P CAST
- The anchor point ID for HASH-ANC
- The row ID for ROW
- N/A for MASS, UTILITY, BINDLOCK, ALTERBUF, CATM MIG, CATM CAT, CATM DIR
- The database and page set names for all others

The database and page set names are translations obtained from the IFCIDs 105 and 107. If these records are unavailable, the decimal DBIDs and OBIDs are printed.

MEMBER
The name of the DB2 member within the DB2 data sharing group.

TYPE
The type of the locked resource. Possible values are shown in Table 33-1 on page 33-3

REQUEST
The type of request that has been suspended:

LOCK   IRLM lock request
UNLOCK IRLM unlock request
CHANGE IRLM change request
QUERY
  IRLM query request
NOTIFY
  IRLM notify request
DRAIN
  Drain request
LATCH
  Latch request

SUSPEND REASON LOCAL
  The number of suspensions due to local resource contentions.

SUSPEND REASON LATCH
  The number of suspensions due to IRLM latch contentions.

SUSPEND REASON IRLMQ
  The number of suspensions due to IRLM queued requests.

SUSPEND REASON GROUP
  The number of suspensions due to global contention.

SUSPEND REASON NOTIFY
  The number of suspensions due to intersystem message sending.

SUSPEND REASON OTHER
  The number of suspensions due to reasons other than those listed previously.

  Note: For drain suspensions, the suspension reason is always “waiting for the claim count to reach zero” and is categorized as OTHER.

NORML RESUME COUNT
  The number of suspensions that ended in the task, resuming normal processing after the lock request has completed.

NORML RESUME AET
  The normal resume average elapsed time. This is the normal resume elapsed time divided by the NORML RESUME COUNT.

TIMEO RESUME COUNT
  The number of suspensions that ended in a timeout.

TIMEO RESUME AET
  The average elapsed timeout time. This is the elapsed timeout time divided by the TIMEO RESUME COUNT.

DEADL RESUME COUNT
  The number of suspensions that ended in a deadlock.

  Note: Drain suspensions do not end in a deadlock.

DEADL RESUME AET
  The average elapsed deadlock time. This is the elapsed deadlock time divided by the DEADL RESUME COUNT.
Minibind Activity

The minibind activity block shows information about mini plans, which are generated by the optimizer at bind and SQL prepare time. This block is written once for each IFCID 022 encountered. The block consists of a header followed by one or more repeating sections.

One mini plan is generated for each table and for each subselect block in the query. This means that if your query uses subqueries, more than one mini plan record is written.

Note:
1. This block is shown for SQL Activity trace only.
2. When interpreting this record, relate table and mini plans by table name.
3. The order of the mini plans might not be the same as the order of the table as written in the SQL statement.
4. When you are not sure about the accessing order of the tables, use EXPLAIN to get the query block number and plan number.
5. This block also shows whether sequential prefetch is used.

If the IFCIDs 105 and 107 are present before IFCID 022, the DBID and OBID can be translated.

Explanation of short and long fields

To improve the evaluation of SQL activities, DB2 supports both, short and long fields. If the field value exceeds the available field length (such as long values in the header information), the string is truncated, depending on the space available. Truncated values are then listed at the end of each logical report unit, together with their full values.

A "greater than" sign (>) indicates whether a value is truncated. When a value is truncated, the "greater than" sign (>) is printed instead of a colon (:) following the label name. The full value starts with a "greater than" sign followed by the label. For example:

Tname   > This value is truncated
...  
...  
>Tname  : This value was truncated - now you see its full length
...  

If truncated values are listed, the "greater than" sign (>) is shown at the end of each value, because there is no colon (;) as a delimiter between the label and the value. In lists the label is used as a column heading.

Note: The mapping between truncated and full values remains the same for multiple reports from the same input data. This mapping is not supported for multiple reports from different input data. The printing of abbreviations and full text can cause inaccurate results in Batch SQL Activity output.

Here are examples of SQL Activity layouts with truncated values:

- SQL Activity - Minibind:

<table>
<thead>
<tr>
<th>ACCESS_CREATOR</th>
<th>ACCESS_NAME</th>
<th>MATCHCOLS</th>
<th>INDEXONLY</th>
<th>PREFETCH_INDEX</th>
<th>OPERATION</th>
<th>MIXOPSEQ</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>...</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>ACCESS_CREATOR  : TDK_LONG_NAMED_COLLECTION_FOR_LONG_NAMED_OBJECTS</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>ACCESS_NAME     : IX_OMPE_FIRST_LONG_NAMED_TABLE_FOR_UNCOMMITED_READ</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Minibind Workload Block Example

Here is an example of the minibind workload block.

Field description

Here is a description of the field labels shown in the minibind workload block.

| QUERYNO | The number identifying the statement to be prepared. |
PLANNNAME
   The plan name or package ID.

COST  The relative cost of the SQL statement. It might not relate to the actual
       CPU or elapsed time for the query.

PARALLELISM_DISABLED
   Indicates whether query parallelism is disabled by the resource limit
   facility (RLF) for dynamic queries:
   NO   The RLF does not affect this statement.
   I/O ONLY
       Query I/O parallelism is disabled.
   CP ONLY
       Query CP parallelism is disabled.
   CP + I/O
       Query I/O and CP parallelism is disabled.
   X    Sysplex query parallelism is disabled.
   X + I/O
       Sysplex query and query I/O parallelism is disabled.
   X + CP
       Sysplex query and query CP parallelism is disabled.
   YES  The entire query parallelism (I/O, CP, and Sysplex) is disabled.
   N/A  Query parallelism does not apply to this statement.

QBLOCKNO
   The position of the query in the statement.

COLLID
   The collection ID of the package.

PROGNAME
   The name of the package containing the statement to be prepared.

CONSISTENCY_TOKEN
   The consistency token.

APPLNAME
   The name of the application plan.

WHEN_OPTIMIZE
   Indicates when the access path of the SQL statement is optimized and
   determined:
   BIND   The access path is determined at bind and run time.
   DEFAULT
       The access path is determined at bind time.
   REOPT
       The statement is bound with REOPT. The access path is
       determined at run time.
   RUN    The access path is determined at run time.

OPT_HINT_IDENT
   Access path hint value.
OPTIMIZE_HINTS_USED
   Indicates whether the query used access path hints.

UNITS
   Cost in CPU units.

MILLI_SEC
   Cost in milliseconds.

COST_CATEGORY
   Cost category.

BIND_TIME
   The date and time at which the plan or package to which the SQL statement belongs was bound.

VERSION
   The version ID of the package (64 characters).

PLANNO
   The number of the step in which the query is processed.

METHOD
   The join method used for the step.

SORTN_UNIQ
   Indicates whether the new table is sorted to remove duplicate rows.

SORTC_UNIQ
   Indicates whether the composite table is sorted to remove duplicate rows.

DATABASE
   The database ID.

NEXTSTEP
   The next step in a join.
   NOT APPLICABLE is printed if this is the last step of a join, or if this is not a join.

SORTN_JOIN
   Indicates whether the new table is sorted for a merge scan join or hybrid join. For a hybrid join, this is a sort of the RID list.

SORTC_JOIN
   Indicates whether the composite table is sorted for a nested loop join, merge scan join, or hybrid join.

OBJECT
   The internal ID of the table space.

ACCESSSTYPE
   The method of accessing the new table. N/P is printed if there is no access type.

SORTN_ORDERBY
   Indicates whether the new table is sorted for ORDER BY.

SORTC_ORDERBY
   Indicates whether the composite table is sorted for ORDER BY.

CREATOR
   The creator of the new table accessed in this step.
PAGE_RANGE
Indicates whether the table qualifies for page range screening so that plans scan only the partitions that are needed.

SORTN_GROUPBY
Indicates whether the new table is sorted for GROUP BY.

SORTC_GROUPBY
Indicates whether the composite table is sorted for GROUP BY.

TNAME
The name of the table accessed in this step, without qualifier. This field is blank if a view is used instead of a real table.

JOIN_TYPE
The type of join enabled:
- LEFT  Left outer join
- FULL  Full outer join
- INNER  Inner join
- STAR  Star join
- N/A  Not applicable is shown if DB2 never produces a counter value in a specific context.

SORTN_PGROUP_ID
The parallel group ID for the parallel sort of the new table.
A parallel group is the collective term for consecutive operations (in this case a sort) executed in parallel that have the same number of parallel tasks.

SORTC_PGROUP_ID
The parallel group ID for the parallel sort of the composite table.

CORRELATION_NAME
The correlation name of a table or view that is specified in the statement. If no correlation name is specified, the field is blank.

MERGE_JOIN_COLS
The number of columns that are joined during a merge scan join.

ACCESS_DEGREE
The number of parallel tasks or operations activated by a query.

JOIN_DEGREE
The number of parallel tasks or operations used in joining the composite table with the new table.

TSLOCKMODE
Indicates the lock mode to be acquired on the new table or its table space.
If the isolation can be determined at bind time, possible values are:
- IS  Intent share lock
- IX  Intent exclusive lock
- S  Share lock
- U  Update lock
- X  Exclusive lock
SIX Share with intent exclusive lock
N UR isolation, no lock

If the isolation cannot be determined at bind time, the lock mode
determined by the isolation at run time is shown by the following values:
NS For UR isolation: no lock. For CS or RR isolation: an S lock.
NIS For UR isolation: no lock. For CS or RR isolation: an IS lock.
NSS For UR isolation: no lock. For CS isolation: an IS lock. For RR
isolation: an S lock.
SS For UR or CS isolation: no lock. For RR isolation: an S lock.

PARALLELISM_MODE
The kind of parallelism used at bind time:
I/O Query I/O parallelism
CP Query CP parallelism
X Sysplex query parallelism
NO No parallelism was used.

ACCESS_PGROUP_ID
The ID of the parallel group for accessing the new table.

JOIN_PGROUP_ID
The ID of the parallel group for joining the composite table with the new
table.

ACCESS_NAME
The index name. This field applies only to index scans. N/A is printed for
table space scans or when no index is used.

ACCESS_CREATOR
The index creator.

STATEMENT_CACHE
Statement cache flag. Possible values are:
YES The prepared statement is retrieved from the prepared statement
cache.
NO The prepared statement is not retrieved from the prepared
statement cache.

MATCHCOLS
The number of index keys used in an index scan. This field is 0 if either no
index is used or an index is used that has no matching columns.

PREFETCH
Indicates what kind of prefetch of the data is used:
SEQ Sequential prefetch
LIST List prefetch
No No prefetch

OPERATION
The type of index access operation.

PREFETCH_INDEX
Indicates whether data pages are to be read in advance by a prefetch.
SQL Activity - Minibind

MIXOPSEQ
The sequence number of a step in a multiple index operation.

INDEXONLY
Indicates whether the access to an index alone is sufficient to carry out the step.

COLUMN_FN_EVAL
Indicates when an SQL column function is evaluated.

PAGES_FOR_TABLE
Pages for table.

TAB_CARDINALITY
Table cardinality.

DIRECT_ROW_ACC
Indicates whether direct row access was used, possible values are:

YES    Direct row access was used
NO     Direct row access was not used

STARJOIN
Indicates whether star join was used, possible values are:

YES    Star join was used
NO     Star join was not used
N/A    Not applicable
Page and Row Locking Activity

This block shows the page locking, row locking, and lock avoidance activity for each object, performed by the event.

The page and row locking activity block is only printed if a commit occurred or a thread terminated.

In summary by occurrence, page and row locking activity information generated for explicit commits is shown on the relevant commit events.

In summaries by cursor or program, any explicit commits occurring during the life of that cursor or program are counted. Page and row locking activity caused by those commits is shown on the relevant cursor or program.

In summaries by statement number or statement type, commits are not counted. Because page and row locking activity is not relevant for these summary levels, it is not printed.

Any page or row locking activity occurring when a thread terminated is shown in the summary by thread. This activity is added to any page or row locking which took place in the body of the thread. Therefore, page and row locking figures in summary by thread can be greater than the sum of page locking figures shown in the body of the thread. The difference is the page and row locking activity occurring at thread termination.

Page and Row Locking Workload Block Example

Here is an example of the page and row locking workload block.

```
--- PAGE & ROW LOCKING

<table>
<thead>

<td></td>
<td></td>
<td></td>
<td></td>
<td>0</td>
</tr>
</tbody>
</table>
```

Note:
1. The DBID and OBID are obtained from IFCID 020.
2. The values in MAX PAGE OR ROW LOCKS HELD, LOCK ESCALATIONS SHARED, and LOCK ESCALATIONS EXCLUSIVE are accumulated within a subsystem. They are reset only at thread deallocation or when a new user signon occurs.
3. The values in MAXIMUM PAGE OR ROW LOCKS, HIGHEST LOCK, and # LOCK ESCAL are reset at commit time for dynamic BINDs and for static BINDs for which release (commit) is specified. Otherwise, these values accumulate until thread deallocation or until a new user signon occurs.
4. IFCID 218 is an additional lock summary record, written for lock avoidance. It indicates whether a successful lock avoidance test occurred during a given unit of work. The record is externalized for the agent at each commit or rollback.
5. For each event, the relevant IFCID 020 and 218 records are processed. If there is a DBID/OBID combination present for IFCID 218 but not for IFCID 020, the
IFCID 020 fields show N/P. If there is a DBID/OBID combination present for IFCID 020 but not for IFCID 218, the IFCID 218 field (LOCK AVOID SUCCESSFUL) shows N/P.

Field description

Here is a description of the field labels shown in the page and row locking workload block.

MEMBER
The name of the DB2 member within the DB2 data sharing group.

DATABASE
The database name, if available.
If the name is not available, the decimal DBID is printed instead.

PAGESET
The page set name, if available.
If the name is not available, the decimal OBID is printed instead.

COUNT
The number of page locking or row locking occurrences for each page set.
- Specific database and page set:
  - At commit time: always 1
  - At thread termination: the number of times this database and page set occurred on a commit record
- TOTAL
  - At commit time: the total number of page sets listed
  - At thread termination: the sum of the values for all page sets

LOCK SIZE
The lock size used:
PAGE  Page lock
ROW   Row lock
TABLE  Table space or table lock
LOB   LOB lock
UNKN  Unknown lock
*     Multiple lock sizes

MAXIMUM PAGE OR ROW LOCKS
The maximum number of either page locks or row locks held at one time against this object.

# LOCK ESCAL
The number of lock escalations:
- 0 if no escalations occur
- For simple table spaces and partitioned table spaces not using selective partition locking (SPL): 1 if any escalation occurred for this table space in this logical unit of work
- For segmented table spaces: the number of tables within the table space that have experienced lock escalations
- For partitioned table spaces using SPL: the number of partitions for which locks escalated within the table space
The TOTAL contains the sum of all values in this column.

HIGHEST LOCK
The highest table space lock state.

If the table space is simple or partitioned not using SPL, it is the highest lock state for this database or page set. At trace end, it is the largest value from any commit for this object. The following values are possible:

IS   Intent share
IX   Intent exclusive
S    Share
U    Update share
SIX  Share with intent exclusive
X    Exclusive

If the table space is segmented or partitioned using SPL, this field is blank.

TS TYPE
The table space type:

SIMPL   Simple table space
SEG     Segmented table space
PARTI    Partitioned table space
SPL     Partitioned table space using selective partition locking (SPL)
LOB     LOB table space

LOCK AVOID SUCCESSFUL
Indicates whether there was a successful lock avoidance test during the unit of work.

If the state of this field changed during the summarization period, an asterisk (*) is shown.

MAX PAGE OR ROW LOCKS HELD
The maximum number of page locks and row locks held at one time across all objects.

LOCK ESCALATIONS: SHARED
The total of shared lock escalations.

LOCK ESCALATIONS: EXCLUSIVE
The total of exclusive lock escalations.
SQL Activity - Query Parallelism

Query Parallelism

This section introduces the Query Parallelism block.

This block shows query parallelism activity performed by the event.

Note: In query CP and sysplex query parallelism, this is the only place where the TCB time of the parallel records is shown.

Query Parallelism Workload Block Example

Here is an example of a Query Parallelism Workload block.

<table>
<thead>
<tr>
<th>QUERY BLOCK</th>
<th>PARALLEL GROUP</th>
<th>PLANNED AT BIND</th>
<th>PLANNED AT RUN</th>
<th>NEGOTIATED AT RUN</th>
<th>PIPE</th>
<th>TASK</th>
<th>NUMBER OF MEMBERS</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1</td>
<td>3</td>
<td>3</td>
<td>3</td>
<td>0.895716</td>
<td>0.043467</td>
<td>3</td>
</tr>
</tbody>
</table>

Field description

An example of a query parallelism workload block is shown in "Query Parallelism Workload Block Example."

The fields in the query parallelism workload block are:

**QUERY BLOCK**

The query block number.

**PARALLEL GROUP**

The parallel group number.

**PLANNED AT BIND**

The degree of parallelism planned at bind time.

This field contains 0 if host variables in the statement caused the parallelism decision to be made at bind time.

**PLANNED AT RUN**

The degree of parallelism planned at run time.

**NEGOTIATED AT RUN**

The degree of parallelism negotiated at run time, which depends on buffer pool availability.

If the value in this field is 1, the plan for parallel I/O processing falls back to sequential execution mode.

**REASON**

The reason for deriving the planned run time degree of parallelism:

**NORMAL**

The planned run time degree is derived from planned bind-time degree.

**HOSTVAR**

Host variable partitioning

**NOESA**

No ESA sort support

**CURSOR**

Cursor that can be used for update and delete.

**EMPTY**

Empty parallel group
ENCLUNAV
MVS/ESA enclave services are not available

UNKNOWN
None of the above

PIPE ELAPSED TIME
The time of pipe creation subtracted from the time of pipe termination.

TASK CPU TIME
The sum of the normalized CPU times spent for the parallel tasks. In sysplex query parallelism, the CPU times are normalized by the conversion factor that is derived from IFCID 106 and related to the conversion factor of the originating task.

If IFCID 106 is not present, asterisks are printed.

The task CPU time is calculated as follows:

- Let $CV_O$ be the conversion factor for the member where the originating thread is running.
- Let $CV_P$ be the conversion factor for the member where the parallel thread is running.
- Let $TCB_p$ be the TCB time that is recorded by DB2 for an activity of the parallel thread.

Then the following formula applies:

$\text{Normalized TCB time for that activity} = (TCB_p \times \frac{CV_O}{CV_P})$

TYPE
The type of parallelism:

- CP CP parallelism
- I/O I/O parallelism
- SYS Sysplex query parallelism

NUMBER OF MEMBERS
The number of members on which the query executed.
RID List Processing

This block shows the record ID (RID) list activity performed by the event.

RID List Processing Workload Block Example

Here is an example of the RID list processing workload block.

```
--- RID LIST PROCESSING
RIDS IN FINAL LIST: 38
RID LIST USED: 2
UNUSED (LIMIT EXCEEDED): 5
UNUSED (NO STORAGE): 1
DATABASE PAGESET THRESHOLD RIDS OBTAINED RIDS EXCEEDED LIMIT
NHDBASE1 NHINDEX1 4075 36 3
NHDBASE2 NHINDEX2 36000 87 2
AVERAGE 20037.50 61.50 2.50
```

Field description

Here is a description of the field labels shown in the RID List Processing Workload Block.

**RIDS IN FINAL LIST**
The number of RIDs in the final list.

**RID LIST USED**
The number of times RID list was used.

**UNUSED (LIMIT EXCEEDED)**
The number of RID lists not used because the number of RIDs exceeded the maximum limit.

**UNUSED (NO STORAGE)**
The number of RID lists not used because no RID storage was available.

**DATABASE**
The database name for the index.

**PAGESET**
The internal identifier index fan-set descriptor for the index.

**THRESHOLD**
The threshold value for the index.

The threshold value for list prefetch and ORing multiple indexes for access is the maximum of 25 percent of the table size (in bytes) or the number of RIDs that one RID block can hold. For ANDing multiple indexes, it is 25 percent of the table size.

The average is the total value of this field divided by the number of indexes (database/page set combinations).

**RIDS OBTAINED**
The number of RIDs obtained from an index.

The average is the total value of this field divided by the number of indexes (database/page set combinations).

**RIDS EXCEEDED LIMIT**
The number of RIDs which exceeded the maximum limit.

The average is the total value of this field divided by the number of indexes (database/page set combinations).
Scan Activity

This block shows the total scan activity for each object, performed by the event.

The database name and page set name for each scan are printed if they are available. These do not usually occur in DB2 trace records. The decimal database ID (DBID) and object ID (OBID) occur instead. When possible, OMEGAMON XE for DB2 PE translates the DBID and OBID into database names and page set names. If the translation does not work, the DBID or OBID decimal number is printed instead.

Field description

Here is a description of the field labels shown in the Scan Activity Workload Block.

**DATABASE**

The database name.

If the name is not available, the decimal DBID is printed.

If IFCID 058 is not present, DBID information is not available and therefore the field is left blank.

**MEMBER**

The name of the DB2 member within the DB2 data sharing group. This field shows N/P in a non-data-sharing environment.

**PAGESET**

The page set name.

**TYPE**

Indicates whether the scan performed by the data manager is an index file (INDX), a sequential data file (SEQD), or a sequential work file (SEQW).

**SCANS**

The total number of scans performed by the data manager.

**ROWS PROCESS**

Number of rows of all record types processed by a scan. As an example:

SELECT A1 FROM TABLE_A WHERE A1=3
SQL Activity - Scan

Where the table space that contains TABLE_A also contains TABLE_B and TABLE_C. Note that this does not include partitioned table spaces because a partitioned table space can have only one table.

For a simple table space, this is a count of all scanned rows from all three tables.

This field is identical to ROWS EXAMINE when the table space is segmented, or when the scan is an index scan.

FST INS
The number of rows inserted using the fast insert algorithm. This value is usually 1, but it is more than 1 for insert with subselect.

ROWS EXAMINE
The number of rows of a specific record type processed by the scan. If the table space contains more than one table, scanned rows from the specific table only are counted.

For index scans, this value represents the number of index entries processed.

For a table space containing only one table, the value of ROWS EXAMINE is the same as the value of ROWS PROCESS.

N-PIPE
The number of times that fast insert could not be used for the insert operation, so a non-pipe insert algorithm was used instead.

QUALIFIED AT STAGE 1
The total number of rows that were qualified at stage 1.

PIPE RE
The number of times that the fast insert pipe was refilled for the insert operation.

QUALIFIED AT STAGE 2
The total number of rows that were qualified at stage 2. The value in this field cannot be greater than the value in QUALIFIED AT STAGE 1.

INS WAIT
The number of times that the insert operation waited for the fast insert pipe to fill.

ROWS INSERTS
The number of rows inserted by the data manager.

ROWS UPDATES
The number of rows updated by the data manager.

ROWS DELETES
The number of rows deleted by the data manager.

PAGES SCANNED
The number of Getpage requests the data manager issued to the buffer manager. For an index scan, the field shows the number of Getpage requests on index pages.

RI SCANS
The number of additional Getpage requests the data manager issued to the buffer manager to enforce referential constraints.
RI DELETES
The number of additional rows deleted or set to null due to referential integrity.
Sort Activity

This block shows sort activity for each sort performed by the event.

The sort activity is divided into the following sections:

- "Sort Activity - QW0095/96" on page 46-39, which describes the sort activity recorded by IFCID 095 and 096 (Sort Start and Sort End) pairs.
- "Sort Activity - QW0028" on page 46-42, which describes the multiple distinct sort activity recorded by IFCID 028.

This topic shows detailed information about “COMPO - Sort Activity - QW0095/96”.

This topic shows detailed information about “COMPO - Sort Activity - QW0028”.

SQL Activity - Sort
Sort Activity - QW0095/96

This topic shows detailed information about “COMPO - Sort Activity - QW0095/96”.

Sort Activity - QW0095/96

The field labels shown in the following sample layout of “COMPO - Sort Activity - QW0095/96” are described in the following section.

MEMBER

The member name of this DB2.

N/A means this DB2 is not part of a data sharing group.

Install parameter MEMBER NAME on panel DSNTIPK, or ZPARM MEMBNAME in DSN6GRP.

Field Name: QWPAMBRN

MAX RETURN CODE

The sort return code:

0   Successful
4   Empty - sort successful
8   Resource unavailable
12  Sort key too long
16  Error detected by fetch routine during input phase
20  Serious processing error

Field Name: QW0096RC

WORKFILES

The number of work files used for both input and merge phases.

Field Name: QW0096WF

RECORDS

The number of records sorted.

Field Name: QW0096NR

TOTAL SORTS

The total number of sorts that occurred during the reporting period.

Field Name: SQLTOTSO

INITIAL WORKFILES

The number of initial work files. The sorting of records can take more than one work file. The number of work files needed depends on the distribution of sort key values. The maximum number of work files is limited by the buffer pool size.

Field Name: QW0096IR

RECORD SIZE
The sort record size in bytes (the sort key size and the data area size).

**Field Name:** QW0096WR

**SORT TYPE**

The type of sort that occurred. The possible values are:

- **ESA** ORDER BY sort using the ESA sort hardware instructions
- **ESAG** GROUP BY sort using the ESA sort hardware instructions
- **ESAT** ESA tag sort using the ESA sort hardware instructions
- **RCYC** GROUP RECYCLING sort using the ESA sort hardware instructions
- **REG** Regular sort
- **NONE** No sort occurred.

**Field Name:** QW0096TS

**SORT KEYS**

The number of sort keys.

**Field Name:** QW0096SK

**SORT COLUMNS**

The number of sort columns.

**Field Name:** QW0096SC

**KEY SIZE**

The sort key size in bytes.

**Field Name:** QW0096KL

**MERGE PASSES**

The number of merge passes during sort processing.

**Field Name:** QW0096MP

**AET/SORT**

The average elapsed time per sort.

**Field Name:** SQLAVTSO

**DATA SIZE**

The sort data area size in bytes.

**Field Name:** QW0096DL

**ROWS DELETED**

The number of rows deleted because records were merged for the evaluation of column functions with GROUP BY.

**Field Name:** QW0096RL

**PARTITIONING**

Indicates whether the sorted records were partitioned.

**Field Name:** QW0096PP

**PARTITION TYPE**
Indicates when partitioning took place:

W  The work file was partitioned at the end of the input phase. No
    merge occurred.
M  The output was partitioned during the last merge pass.
O  One record was put into one partition.
P  The records were presorted before being partitioned.
N  The work file was not partitioned.

Field Name: QW0096PT

W-FILES PART

The number of work files, equal to the degree of parallelism, that sort has
partitioned.

Field Name: QW0096PW

PARTIT & SORTING

Indicates whether the input records were only partitioned or partitioned
and sorted:

YES  The records were only partitioned.
NO   The records were partitioned and sorted.

Field Name: QW0096PO
Sort Activity - QW0028

This topic shows detailed information about “COMPO - Sort Activity - QW0028”.

Sort Activity - QW0028

The field labels shown in the following sample layout of “COMPO - Sort Activity - QW0028” are described in the following section.

<table>

</tbody>
</table>

NO. OF WORKFILES

The number of records sorted into work files after the sort input phase.

Field Name: QW0028NR

TOTAL MULTIPLE DS

Total number of multiple distinct sorts.

Field Name: QW0028DS

MULTIPLE_DISTINCT SORTS

The multiple distinct sort currently being processed.

Field Name: QW0028DC

REQUESTED WORKFILES

The number of work files requested from the buffer manager at the beginning of each merge pass (MVS/ESA 3.1.3). It is valid if TYPE equals S.

If this field is greater than WORKFILES ACQ, there is another merge pass. If both fields are equal, this is the last or only merge pass.

Field Name: QW0028WA

ACTUAL WORKFILES

The number of work files actually acquired from the buffer manager at the beginning of each merge pass (MVS/ESA 3.1.3). It is valid if TYPE equals S.

Field Name: QW0028WG

RECORDS IN WORKFILE

The number of records in the work file during work file partitioning.

Field Name: SQ28TYZ

PARTITION PARALLEL

The partition work file number. The value in this field is 0 if partitioning is not requested. If partitioning is requested, the value can be from 1 to n, where n is the degree of parallelism. It is valid if TYPE equals Z, W, X, K, M, L, T, 0, U, V, P, or Y.

Field Name: QW0028PW

RECORDS LAST MERGE

The number of sort records in the partition work file during the last merge.
Field Name: SQ28TYQ

PARTITIONING ONE RECORD

The number of times that partitioning occurred when only one record was sorted and put into a partition work file.

Field Name: SQ28TYT

PRE-SORTED RECORDS

The number of times partitioning occurred when presorted records are put into multiple work files.

Field Name: SQ28TYV

RECORDS MDS GROUPS

The number multiple distinct loops containing a number of multiple distinct sorts.

Field Name: SQ28TYB

CURRENT MERGE PASS

The current merge pass. It is issued at the end of the merge pass and, therefore, valid if TYPE equals E.

Field Name: QW0028MP

TOTAL MDS GROUPS

The total number of multiple distinct sort groups.

Field Name: QW0028DG

RECORDS MDS GROUPBY

The number of records read into a group at the start of the GROUPBY phase for a multiple distinct sort.

Field Name: SQ28TYD

MAX REQUESTED

The maximum number of work files requested from buffer manager during merge passes.

Field Name: SQ28MAXR

AVG REQUESTED

The average number of work files requested from buffer manager during merge passes.

Field Name: SQ28AVRQ

MAX NOT ACQUIRED

The maximum number of work files requested but not received from buffer manager during merge passes.

Field Name: SQ28MXNA

AVG NOT ACQUIRED

The average of work files requested but not received from buffer manager during merge passes.

Field Name: SQ28AVNA
Host Variables

This block shows the host variables to represent the values that will be sent to or received from the SQL statement.

Note:
1. The number of shown host variables is limited to 100.
2. A warning message is issued in DPMLOG, if the limit is reached or if SQLDA entries are missing.

Workload Host Variables Example

Here is an example of the workload host variables.

--- HOST VARIABLES ---
LOCATION : SYSdsn1 COLLID : PMDEMO PROGNAME : DYXSEL08 CONSIS_TOKEN : X'6A427634E644C54'
STMT_NO : 133 FORMAT : 1 - COMPLETE NO.SQLDA ENTRIES : 3

ENTRY_NO. : 1 NAME : NULL_indicator : NO SQLTYPE : 452
DATA_TYPE : FIXED-LENGTH CHARACTER STRING DATA_LENGTH : 6
PRECISION : N/A SCALE : N/A ADDR_HOST_VAR : X'00064DD0' ADDR_IND_VAR : X'000650A8'
DATA : 000001

ENTRY_NO. : 2 NAME : NULL_indicator : NO SQLTYPE : 452
DATA_TYPE : FIXED-LENGTH CHARACTER STRING DATA_LENGTH : 6
PRECISION : N/A SCALE : N/A ADDR_HOST_VAR : X'00064DD0' ADDR_IND_VAR : X'000650A8'
DATA : 000001

ENTRY_NO. : 3 NAME : NULL_indicator : NO SQLTYPE : 452
DATA_TYPE : FIXED-LENGTH CHARACTER STRING DATA_LENGTH : 6
PRECISION : N/A SCALE : N/A ADDR_HOST_VAR : X'00064DD0' ADDR_IND_VAR : X'000650A8'
DATA : 000001

Field description

Here is a description of the field labels shown in the workload host variables block.

LOCATION

Location name.
Field Name: QW0247LN

COLLID

Package collection identifier.
Field Name: QW0247PC

PROGNAME

Program name.
Field Name: QW0247PN

CONSIS_TOKEN

Not present (N/P) is shown for this field if the value is X'40' or X'00'; otherwise the hexadecimal value of the field is shown.
Field Name: QW0247TS

STMT_NO

Statement number.
Field Name: QW0247SN

FORMAT
The format of the SQLDA. Possible values are:

*B'1000'*

0 - **COMPRESSED**
Is a compressed form of the SQLDA.

*B'0100'*

1 - **COMPLETE**
Is a complete SQLDA containing the data type, address, and address of the indicator variable for each host variable.

*B'0010'*

2 - **FIXED LENGTH**
Is a variable length character format containing the length of the string and text.

? - **UNKNOWN**
Is shown, if none of the above field names is used.

**Field Name:** QW0247FE

**ENTRY_NO.**
SQLDA entry number.

**Field Name:** QW0247NO

**NAME**
SQLDA name, if Format 1 SQLDA. The first two bytes are the length of the NAME and are not shown.

**Field Name:** QW0247NA

**NULL_INDICATOR**
Null indicator values:
• YES, if X'00'
• NO, if X'FF'

**Field Name:** QW0247NL

**SQLTYPE**
SQL type (see DB2 SQL Reference).

**Field Name:** QW0247TY

**DATA TYPE**
DATA TYPE is derived as described in DB2 SQL Reference, based on the SQLTYPE:

384, 385
**DATE**

388, 389
**TIME**

392, 393
**TIMESTAMP**

448, 449
**VARYING LENGTH CHARACTER STRING**
SQL Activity - Host Variables

452, 453
   FIXED-LENGTH CHARACTER STRING

456, 457
   LONG VARYING CHARACTER STRING

480, 481
   FLOATING POINT

484, 485
   PACKED DECIMAL

496, 497
   LARGE INTEGER

500, 501
   SMALL INTEGER

Note:
1. Any other SQL TYPES are shown as: NON DISPLAYABLE DATA
2. Values are shown in DB2 internal format.

Field Name: QW0247TY

**PRECISION**

If the field is decimal (484 or 485), this is the precision.

Field Name: QW0247LP

**SCALE**

If the field is decimal (484 or 485), this is the scale.

Field Name: QW0247LS

**ADDR_HOST_VAR**

The address of the host variable in the application address space.

Field Name: QW0247PT

**ADDR_IND_VAR**

The address of the indicator variable, if the value in QW0247TY is odd (NULLABLE).

Field Name: QW0247IN

**DATA**

The host variable data.

Field Name: QW0247DA
Workload Highlight

This block shows the highlights of the workload activity performed by the event. All workload fields available in the SORTBY option are included.

Workload Highlights (HILITE) Block Example

Here is an example of the workload highlight (HILITE) block.

--- WORKLOAD HILITE ------------------------------------------------------------------------------------------
SCANS : 8  RECS/SORT: 3.00  I/O REQS: 1  SUSPENDS : 2  EXITS : 2  AMS : 1
ROWSPROC: 8  WORK/SORT: 2.00  AET/I/O : 1.374752  AET/SUSP : 0.485483  AET/EXIT : 0.048234  AET/AMS : 0.094745
PAGESCAN: 47  PASS/SORT: 2.00  DATACAPT: YES  RIDS UNUSED: 2  CHECKCON : REJECTED  DEGREE REDUCTION : 3
LOB_PAGESCAN: 12345  LOB_UPD_PAGE: 12345

Field description

Here is a description of the field labels shown in the workload highlight (HILITE) block.

SCANS
The total number of scans performed by the data manager.

RECS/SORT
The average number of records per sort.

I/O REQS
The number of SYNCHRONOUS and ASYNCHRONOUS READ and SYNCHRONOUS WRITE I/O requests per event.

SUSPENDS
The number of LOCK SUSPENSIONS per event.

EXITS
The number of validation, encode edit, and decode edit exits per event.

AMS
The number of times Access Method Services (AMS) was invoked within the event. AMS can be invoked by:

- Creating a DB2 page set (table space, table partition, index space)
- Expanding an existing DB2 page set
- Deleting a DB2 page set

ROWSPROC
The number of rows processed (of all record types).

WORK/SORT
The average number of work files per sort.

AET/I/O
The average elapsed time I/O requests.

AET/SUSP
The average elapsed time for LOCK SUSPENSIONS.

AET/EXIT
The average elapsed time per EXIT invocation.

AET/AMS
The average elapsed time of the AMS invocations within the event.

PAGESCAN
The number of pages scanned.

DATACAPT
The data capture indicator; shows whether IFCID 188 is present.
RIDS UNUSED
The number of times RID list processing was not used because nor RID storage was available or the number of RIDs exceeded the maximum limit.

CHECKCON
Indicates that a table check constraint was performed for the current SQL event:

OK    The check constraint was ok.

REJECTED
The row to be inserted or updated was rejected due to a check constraint.

N/P   No check was performed.

DEGREE REDUCTION
The difference between planned and negotiated run time degree.

LOB_PAGSCAN
The number of LOB pages scanned.

LOB_UPD_PAGE
The number of LOB pages updated.

SYSPLEX QUERY PARALLELISM USED
This field is shown if the query is executed on more than one member, this field shows the number of members. Otherwise this field is blank.

Note:
1. All fields in the highlight block are printed. If other detail blocks are requested, then some of the highlights are shown twice, once in the highlight block and again in the detail block.
2. If the records required for a field are not present, N/P is printed for that field. N/A is printed if the field is not relevant to the level of DB2.

These topics provide information about the Statistics reports.

This section provides examples of the statistics default layout for SHORT and LONG. Descriptions of the fields in the layout are described in the next section. Because the layout of the report and trace is the same (with the exception of the highlights block), only a report example is reproduced here.

When data from a particular DB2 version is processed, N/A is printed for all fields in the report that are not applicable to that version.

You can use the user-tailored reporting (UTR) facility to modify the layouts and store the changes. If you do this, store your layouts under a different name to avoid confusion and keep the layouts relevant to this documentation.

Note: For an introduction to the Statistics report set and general Statistics information refer to the Reporting User's Guide. It also provides information on input to Statistics reports.

Chapter 47, “Statistics Short Report,” on page 47-1
This topic introduces the short version of the Statistics reports.

This topic introduces the long version of the Statistics reports.

Chapter 49, “Statistics Report and Trace Blocks,” on page 49-1
Chapter 50, “The Statistics Save-File Utility,” on page 50-1
Use the Save-File utility to migrate and convert Statistics Save data sets into a format suitable for OMEGAMON XE for DB2 PE V5.4.0.

Chapter 51, “The Statistics File Data Set and Output Records,” on page 51-1
Use the FILE subcommand to format DB2 Statistics records and write them to sequential data sets suitable for use by the DB2 load utility. You can store unreduced Statistics data into the performance database. Use the performance database to produce tailored reports using a reporting facility such as Query Management Facility (QMF).
Chapter 47. Statistics Short Report

This topic introduces the short version of the Statistics reports.

The SHORT layout presents selected data from all Statistics categories using the following blocks of data:

- “Accounting Rollup” on page 49-19
- “Buffer Pool General” on page 49-25
- “Buffer Pool Write” on page 49-42
- “CPU Times” on page 49-53
- “Data Sharing Locking” on page 49-60
- “EDM Pool Activity” on page 49-95
- “Global DDF Activity” on page 49-100
- “Group Buffer Pool Activity” on page 49-105
- “Highlights” on page 49-117
- “Locking Activity” on page 49-135
- “Log Activity” on page 49-139
- “Miscellaneous” on page 49-144
- “Open/Close Activity” on page 49-147
- “Plan/Package Activity” on page 49-149
- “Query Parallelism” on page 49-154
- “RID List Processing” on page 49-163
- “ROWID” on page 49-167
- “SQL DCL” on page 49-180
- “SQL DDL” on page 49-182
- “SQL DML” on page 49-188
- “Stored Procedures” on page 49-171
- “Subsystem Services” on page 49-172
- “Triggers” on page 49-190
- “Use Currently Committed” on page 49-191
- “User-Defined Functions” on page 49-192
- “Workfile Database” on page 49-193

Use the following command to print a Statistics short report:

```
STATISTICS
REPORT
LAYOUT (SHORT)
```

© Copyright IBM Corp. 1985, 2016
Chapter 48. Statistics Long Report

This topic introduces the long version of the Statistics reports.

The following report is an example of a member-scope statistics long report, produced with the command:

```
: STATISTICS REPORT
  DSESTAT LAYOUT(LONG)
```

### Statistics Long Report

This is an example of a long report for Statistics.

### Summary

**Buffers:**

- **BP16k WRITE OPERATIONS:**
  - Pages Written: 0.00

**系统配置和性能统计**

- **缓冲器使用情况:**
  - 当前活动缓冲器: 79.68
  - 不可用缓冲器 - VPool 全部: 0.00

- **数据集打开情况:**
  - 数量: 14.00

- **缓冲器分配 - VPool:**
  - 总计: 9017.00

- **DFS/M 优化数据集:**
  - 数量: 0.00

- **DFS/M 回叫时间:**
  - 次数: 0.00

- **VPool 扩展或收缩:**
  - 次数: 0.00

- **VPool 扩张失败:**
  - 次数: 0.00

- **并发 préf./10 流程 - 硬件:**
  - 次数: 0.00

- **预快速/IO 流程减少:**
  - 次数: 0.00

- **并行查询请求:**
  - 次数: 0.00

- **预快速量减少到 1/2:**
  - 次数: 0.00

- **预快速量减少到 1/4:**
  - 次数: 0.00

- **L1P 插入数量:**
  - 次数: 0.00

- **最小缓冲器 SLRU:**
  - 次数: 0.00

- **最大缓冲器 SLRU:**
  - 次数: 0.00

- **SLRU 长度等于 VPSEQ:**
  - 次数: 0.00

- **GetPage 要求随机 SLRU:**
  - 次数: 0.00

---

**DB2 统计报告 - 长**

- **页面读取:**
  - 通过 dyn-prefetch: 2.00
  - D.PRF: 2.00
  - Pref disables - no read eng: 0.00

- **请求减少:**
  - 对于读取: 2.00

**Summary**

- **Interval Start:** 08/24/16 07:01:00.00
- **Interval End:** 08/24/16 10:01:00.00
- **Total Days:** 37
- **Total Commits:** 11098

**Notes**

- The system was processing requests at a rate of 2457 per minute, with an average query time of 0.23 seconds.
- The cache hit ratio was high at 99.96%, indicating efficient data retrieval.
- The system managed 2937 prepare requests, with a hit ratio of 99.96%.
- The database operates successfully without any reported errors.

STATISTICS REPORT COMPLETE
Chapter 49. Statistics Report and Trace Blocks

This section shows the individual blocks presented by OMEGAMON XE for DB2 PE reports and traces together with a short explanation of each field. The examples shown are taken from the statistics long reports and traces.

The layout of the Statistics report and trace blocks is the same. Statistics traces show times and events as delta records describing the activity between two consecutive DB2 record pairs. Statistics reports show times and events over a user-specified period of time.

Each block is presented in the default layout. Some block can have columns, rows or fields that are not included in the default layout. You can include columns, rows, and fields not shown in the default layouts with user-tailored reporting (UTR).

In the short report and trace, field names can differ slightly from the names shown in the long report or trace.

If a counter value or specific information in reports, in windows, or on panels is not shown, the following notation is used to indicate the reason:

N/A  Not applicable is shown if DB2 never produces a counter value in a specific context. Examples are:
     • A counter is not available in one DB2 version.
     • Counters are mutually exclusive.

N/C  Not calculated is shown for a derived field where the value cannot be calculated or is useless. Examples are:
     • A divide by zero (percentages, ratios).
     • Suppression of negative elapsed time values.
     • Required counter values for calculation marked as N/A or N/P.
     • Insufficient data or small counter values to allow significant statements (meaningless or misleading averages).

N/P  Not present is shown for a field where DB2 can present values, but does not in this instance. Examples are:
     • When counter values are not generated because of operational conditions (a trace class is not active).
     • An application does not provide a value because it is optional.

Accelerator Data Overview

This topic shows Accelerator Data report and trace blocks that are provided for the following versions of IBM DB2 Analytics Accelerator for z/OS.

“Accelerator Data - Prior to Version 4” on page 49-6
This topic shows detailed information about “Statistics - Accelerator Data - Prior to Version 4”.

“Accelerator Data - Version 4 or later” on page 49-11
This topic shows detailed information about “Statistics - Accelerator Data - Version 4 or later”. 
Accelerator Data - Prior to Version 4

This topic shows detailed information about “Statistics - Accelerator Data - Prior to Version 4”.

Note: This topic only refers to IBM DB2 Analytics Accelerator for z/OS prior to version 4.

The Statistics Accelerator report block is shown for each accelerator that provided services to the DB2 subsystem or to the DB2 data sharing group within the reported interval. The accelerator name is shown in the header line of each column together with the labels ACCELERATION and CONTINUED.

Note:
- The DB2 subsystem is connected with an accelerator via DRDA when submitting SQL queries. The performance counters of the DRDA connection (rows from CONNECTS TO ACCELERATOR to ROWS RECEIVED FROM ACCELERATOR and the four time counters at the bottom) are collected and reported on an individual subsystem or member basis.
- The other Statistics counters are collected periodically from the accelerator and reported as single subsystem values or as total data sharing group values if the reported subsystem is a member (with enabled acceleration) of a data sharing group.
- The full accelerator name is shown in the header if it does not exceed 16 characters. Otherwise, the name is replaced by a short name in the header and the long name is displayed at the end of the report.
- The field descriptions of the fields QUERIES SUCCESSFULLY EXECUTED, QUERIES FAILED TO EXECUTE, CURRENTLY EXECUTING QUERIES, and MAXIMUM EXECUTING QUERIES refer to SQL statements passed to the accelerator. For product identifiers of IBM DB2 Analytics Accelerator for z/OS prior to AQT04015, the SQL statements are SELECT queries passed to the accelerator.

Statistics - Accelerator Data - Prior to Version 4

The field labels shown in the following sample layout of “Statistics - Accelerator Data - Prior to Version 4” are described in the following section.

<table>
<thead>
<tr>
<th>VMNPS31 ACCELERATION QUANTITY</th>

</tbody>
</table>

IDENTIFIER

The accelerator server identifier.
Field Name: Q8STNAME

QUERIES SUCCESSFULLY EXECUTED

The number of SQL statements (sent by this DB2 system since accelerator start) that were successfully executed in the accelerator.

Field Name: Q8STSREQ

QUERIES FAILED TO EXECUTE

The number of SQL statements (sent by this DB2 system since accelerator start) that failed to be successfully executed for any reason.

Field Name: Q8STFREQ

ACCELERATOR IN INVALID STATE

The number of queries (sent by this DB2 system since accelerator start) that failed to be successfully executed, for example, because the accelerator was in an invalid state.

Field Name: Q8STFINV

CURRENTLY EXECUTING QUERIES

The number of currently (actively) executing SQL statements in the accelerator on behalf of all DB2 systems (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STACTV_64).

Field Name: Q8STACTV

MAXIMUM EXECUTING QUERIES

The maximum number of SQL statements actively executing in the accelerator concurrently at any time since accelerator start on behalf of all DB2 systems (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STMAXA_64).

Field Name: Q8STMAXA

CONNECTS TO ACCELERATOR

The number of connects to the accelerator from this DB2 system.

Field Name: Q8STCONN

REQUESTS SENT TO ACCELERATOR

The number of Distributed Relational Database Architecture (DRDA) requests sent by this DB2 system to the accelerator.

Field Name: Q8STREQ

TIMED OUT

The number of connections that were timed out when this DB2 system sent requests to the accelerator.

Field Name: Q8STTOUT

FAILED

The number of connections that failed when this DB2 system sent requests to the accelerator.

Field Name: Q8STFAIL

BYTES SENT TO ACCELERATOR
The total number of bytes sent to the accelerator.
Field Name: Q8STBYTS

BYTES RECEIVED FROM ACCELERATOR
The total number of bytes received from the accelerator.
Field Name: Q8STBYTR

MESSAGES SENT TO ACCELERATOR
The total number of messages sent to the accelerator.
Field Name: Q8STMSGS

MESSAGES RECEIVED FROM ACCELERATOR
The total number of messages received from the accelerator.
Field Name: Q8STMSGR

BLOCKS SENT TO ACCELERATOR
The total number of blocks sent to the accelerator.
Field Name: Q8STBLKS

BLOCKS RECEIVED FROM ACCELERATOR
The total number of blocks received from the accelerator.
Field Name: Q8STBLKR

ROWS SENT TO ACCELERATOR
The total number of rows sent to the accelerator.
Field Name: Q8STROWS

ROWS RECEIVED FROM ACCELERATOR
The total number of rows received from the accelerator.
Field Name: Q8STROWR

TCP/IP SERVICES ELAPSED TIME
The accumulated accelerator services TCP/IP elapsed time measured in DB2. It starts when sending the requests to the accelerator and ends when receiving the results from the accelerator.
Field Name: Q8STTELA

WAIT TIME IN ACCELERATOR
The wait time spent in the accelerator when executing requests from the DB2 subsystem.
Field Name: Q8STAWAT

AVG QUEUE LENGTH (LAST 3 HRS)
The average queue length during the last 3 hours at the accelerator.
Field Name: Q8STAVGQ03

AVG QUEUE LENGTH (LAST 24 HRS)
The average queue length during the last 24 hours at the accelerator.
Field Name: Q8STAVGQ24
MAXIMUM QUEUE LENGTH

The high watermark of the queue length at the accelerator (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STMAXQ_64).

Field Name: Q8STMAXQ

AVG QUEUE WAIT ELAPSED TIME

The average wait time at the accelerator queue.

Field Name: Q8STQUEW

MAX QUEUE WAIT ELAPSED TIME

The maximum wait time at the accelerator queue.

Field Name: Q8STQUEM

WORKER NODES

The number of active worker nodes (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STWNOD_64).

Field Name: Q8STWNOD

WORKER NODES AVG CPU UTILIZATION (%)

The current CPU utilization on the accelerator worker nodes. This is a snapshot, which is the average CPU utilization across all worker nodes (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STWCPU_64).

Field Name: Q8STWCPU

COORDINATOR AVG CPU UTILIZATION (%)

The current CPU utilization on the accelerator coordinator node (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STCCPU_64).

Field Name: Q8STCCPU

DISK STORAGE AVAILABLE (MB)

The disk storage (MB) available at the accelerator.

Field Name: Q8STDSDKA

DISK STORAGE AVAILABLE - IN USE (%)

The current disk utilization of the accelerator worker nodes, expressed as percentage of the used I/O channels/resources.

Field Name: Q8STDSDKU

DISK STORAGE AVAILABLE - IN USE FOR DATABASE (MB)

The disk storage in-use for accelerator databases for this DB2 system.

Field Name: Q8STDSDKB

DATA SLICES

The number of data slices at the accelerator. This equals the degree of parallel I/O channels.

Field Name: Q8STNMDS

DATA SKEW
When table data is loaded into the accelerator, it may be unevenly distributed across the different data slices on the disks. This disparity is called data skew. The counter represents the accumulated skew over all tables that belong to the DB2 subsystem. The skew of a table is the ratio that shows how uneven the data slices are, as calculated by ((maximum data slice size - minimum data slice size) / median data slice size).

A high value indicates that data reorganization can improve disk utilization and query performance.

**Field Name: Q8STSKREW**

**PROCESSORS**

The number of CPU cores available on all worker nodes.

**Field Name: Q8STCORS**

**ELAPSED TIME IN ACCELERATOR**

The accumulated elapsed time spent in the accelerator when executing requests from the DB2 subsystem.

**Field Name: Q8STAEAL**

**CPU TIME SPENT IN ACCELERATOR**

The CPU time spent in the accelerator when executing requests from the DB2 subsystem.

**Field Name: Q8STACPU**
Accelerator Data - Version 4 or later

This topic shows detailed information about “Statistics - Accelerator Data - Version 4 or later”.

The Statistics Accelerator report block is shown for each accelerator that provided services to the DB2 subsystem or to the DB2 data sharing group within the reported interval. The left part consists of accelerator performance metrics from a subsystem or data sharing group perspective. The right part contains total values from an accelerator perspective. The accelerator name is shown in the header line of each column.

With IBM DB2 Analytics Accelerator for z/OS version 4 or later, the Statistics report block shows performance data for the replication services which transmit data from DB2 to the accelerator. As for other counters, the replication values are shown in a DB2 subsystem or data sharing group view and in a total accelerator view. Most subsystem- or group-related replication fields are aggregated counters and shown as delta values in TRACE blocks and as apportioned interval values in the REPORT blocks in the left part. On the contrary, the corresponding total accelerator values in the right part are snapshot counters. This is due to the fact, that the replication can be disabled during the reporting period such that the accelerator only summarizes values from enabled replication engines.

In addition, the status of accelerators and replication engines may be unknown, and DB2 externalizes negative values -1 for related performance counters. The Statistics component handles such values as follows:

- Unknown (negative) accelerator values are snapshot counters and presented as zero. This matches the behavior of previous DB2 Accelerator versions, where zero values have been provided in the performance counters.
- Unknown (negative) replication engine values are shown as N/P in Statistics reports and as -1 in the Statistics accelerator table of the Performance Database as long as the status of the replication engine is not known. Once the status is known and non-negative performance values occur, aggregated and snapshot counters are handled as usual. If the replication status becomes unknown again, the aggregated counters are externalized as zero and shown as non-negative delta and interval values once replication has resumed.

Note:

- The DB2 subsystem is connected with an accelerator via DRDA when submitting SQL queries. The performance counters of the DRDA connection (rows from CONNECTS TO ACCELERATOR to WAIT TIME IN ACCELERATOR) are collected and reported on an individual subsystem or member basis in the left part.
- The other Statistics counters are collected periodically from the accelerator and reported as single subsystem values or as total data sharing group values in the left part if the reported subsystem is a member (with enabled acceleration) of a data sharing group.
- The full accelerator name is shown in the header if it does not exceed 16 characters. Otherwise, the name is replaced by a short name in the header and the long name is displayed at the end of the report.
- The descriptions of the fields labelled with SQL STMTS refer to SQL statements passed to the accelerator. For product identifiers of IBM DB2 Analytics Accelerator for z/OS prior to AQT04015, the SQL statements are SELECT queries passed to the accelerator and the fields INSERT STMTS to ROLLBACK STMTS are N/A.
## Statistics - Accelerator Data - Version 4 or later

The field labels shown in the following sample layout of “Statistics - Accelerator Data - Version 4 or later” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>

</tbody>
</table>
Field Name: Q8STMNQS

CPU TIME EXECUTING SQL STMTS

The total CPU cost associated with executing SQL statements in the accelerator on behalf of this DB2 system.

Field Name: Q8STTCQS

CPU TIME LOAD/ARCHIVE/RESTORE

The total CPU cost spent in the accelerator for data maintenance operations from this DB2 system. Replication-related operations are not included.

Field Name: Q8STTCMS

INSERT STMTS SENT TO ACCELERATOR

The number of INSERT statements sent by the DB2 system to the accelerator.

Field Name: Q8STINSC

UPDATE STMTS SENT TO ACCELERATOR

The number of UPDATE statements sent by the DB2 system to the accelerator.

Field Name: Q8STUPDC

DELETE STMTS SENT TO ACCELERATOR

The number of DELETE statements sent by the DB2 system to the accelerator.

Field Name: Q8STDELC

OPEN STMTS SENT TO ACCELERATOR

The number of OPEN statements sent by the DB2 system to the accelerator.

Field Name: Q8STOPNC

CREATE STMTS SENT TO ACCELERATOR

The number of CREATE statements sent by the DB2 system to the accelerator.

Field Name: Q8STCRTC

DROP STMTS SENT TO ACCELERATOR

The number of DROP statements sent by the DB2 system to the accelerator.

Field Name: Q8STDRPC

COMMIT STMTS SENT TO ACCELERATOR

The number of COMMIT statements sent by the DB2 system to the accelerator.

Field Name: Q8STCMTC

ROLLBACK STMTS SENT TO ACCELERATOR

The number of ROLLBACK statements sent by the DB2 system to the accelerator.

Field Name: Q8STRBKC

CONNECTS TO ACCELERATOR
Accelerator Data - Version 4 or later

The number of connects to the accelerator from this DB2 system.

Field Name: Q8STCONN

REQUESTS SENT TO ACCELERATOR
The number of Distributed Relational Database Architecture (DRDA) requests sent by this DB2 system to the accelerator.

Field Name: Q8STREQ

REQUESTS SENT TO ACCELERATOR - TIMED OUT
The number of connections that were timed out when this DB2 system sent requests to the accelerator.

Field Name: Q8STTOUT

REQUESTS SENT TO ACCELERATOR - FAILED
The number of connections that failed when this DB2 system sent requests to the accelerator.

Field Name: Q8STFAIL

BYTES SENT TO ACCELERATOR
The total number of bytes sent to the accelerator.

Field Name: Q8STBYTS

BYTES RECEIVED FROM ACCELERATOR
The total number of bytes received from the accelerator.

Field Name: Q8STBYTR

MESSAGES SENT TO ACCELERATOR
The total number of messages sent to the accelerator.

Field Name: Q8STMSGS

MESSAGES RECEIVED FROM ACCELERATOR
The total number of messages received from the accelerator.

Field Name: Q8STMSGR

BLOCKS SENT TO ACCELERATOR
The total number of blocks sent to the accelerator.

Field Name: Q8STBLKS

BLOCKS RECEIVED FROM ACCELERATOR
The total number of blocks received from the accelerator.

Field Name: Q8STBLKR

ROWS SENT TO ACCELERATOR
The total number of rows sent to the accelerator.

Field Name: Q8STROWS

ROWS RECEIVED FROM ACCELERATOR
The total number of rows received from the accelerator.

Field Name: Q8STROWR
TCP/IP SERVICES ELAPSED TIME

The accumulated accelerator services TCP/IP elapsed time measured in DB2. It starts when sending the requests to the accelerator and ends when receiving the results from the accelerator.

Field Name: Q8STTELA

ELAPSED TIME IN ACCELERATOR

The accumulated elapsed time spent in the accelerator when executing requests from the DB2 subsystem.

Field Name: Q8STAEELA

WAIT TIME IN ACCELERATOR

The wait time spent in the accelerator when executing requests from the DB2 subsystem.

Field Name: Q8STAWAT

CPU TIME FOR REPLIcation

The total CPU cost associated with the replication apply process for this DB2 system.

Field Name: Q8STTCCS

LOG RECORDS READ

The number of log records read by the replication capture agent for this DB2 system.

Field Name: Q8STNLRS

LOG RECORDS READ - LOG RECORDS FOR ACCEL TABLES

The number of log records (read by the replication capture agent for this DB2 system) that are applicable to tables in this accelerator.

Field Name: Q8STNLTS

LOG RECORD BYTES PROCESSED

The number of log record bytes processed by the replication capture agent for this DB2 system.

Field Name: Q8STNBPS

INSERT ROWS FOR ACCEL TABLES

The number of INSERT rows applicable to accelerator tables that were processed by the replication capture agent for this DB2 system.

Field Name: Q8STNIPS

UPDATE ROWS FOR ACCEL TABLES

The number of UPDATE rows applicable to accelerator tables that were processed by the replication capture agent for this DB2 system.

Field Name: Q8STNUS

DELETE ROWS FOR ACCEL TABLES

The number of DELETE rows applicable to accelerator tables that were processed by the replication capture agent for this DB2 system.

Field Name: Q8STNDS
REPLICATION LATENCY

The current replication latency for this DB2 system. Latency is defined as the time difference between the timestamp, when the last log record was applied to the target, compared to the current time.

Field Name: Q8STCRL

REPLICATION STATUS CHANGE

The timestamp when the last change of the accelerator replication state occurred for this DB2 system.

Field Name: Q8STTLSC

SQL STMTS SUCCESSFULLY EXECUTED

The number of SQL statements (sent by all DB2 systems since accelerator start) that successfully executed in the accelerator.

Field Name: Q8STNQSA

SQL STMTS FAILED TO EXECUTE

Shows the number of SQL statements (sent by all DB2 systems since accelerator start) that were not successfully executed for any reason.

Field Name: Q8STNQFA

CURRENTLY EXECUTING SQL STMTS

The number of currently (actively) executing SQL statements in the accelerator on behalf of all DB2 systems (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STACTV_64).

Field Name: Q8STACTV

MAXIMUM EXECUTING SQL STMTS

The maximum number of SQL statements actively executing in the accelerator concurrently at any time since accelerator start on behalf of all DB2 systems (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STMAXA_64).

Field Name: Q8STMAXA

CPU TIME EXECUTING SQL STMTS

The total CPU cost associated with executing SQL statements in the accelerator on behalf of all DB2 systems.

Field Name: Q8STTCQA

CPU TIME LOAD/ARCHIVE/RESTORE

The total CPU cost spent in the accelerator for data maintenance operations from all DB2 systems. Replication-related operations are not included.

Field Name: Q8STTCMA

DISK STORAGE AVAILABLE (MB)

The disk storage (MB) available at the accelerator.

Field Name: Q8STDSKA

DISK STORAGE AVAILABLE - IN USE FOR ACCEL DB - ALL DB2 (MB)

The disk storage (MB) in-use for accelerator databases for all DB2 systems.
Field Name: Q8STDSA

DISK STORAGE AVAILABLE - IN USE FOR ACCEL DB - THIS DB2(MB)

The disk storage in-use for accelerator databases for this DB2 system.

Field Name: Q8STDSKB

MAXIMUM QUEUE LENGTH

The high watermark of the queue length at the accelerator (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STMAXQ_64).

Field Name: Q8STMAXQ

CURRENT QUEUE LENGTH

The current queue length at the accelerator.

Field Name: Q8STCQL

AVG QUEUE WAIT ELAPSED TIME

The average wait time at the accelerator queue.

Field Name: Q8STQUEW

MAX QUEUE WAIT ELAPSED TIME

The maximum wait time at the accelerator queue.

Field Name: Q8STQUEM

WORKER NODES

The number of active worker nodes (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STWNOD_64).

Field Name: Q8STWNOD

WORKER NODES DISK UTILIZATION (%)

The current disk utilization of the accelerator worker nodes, expressed as percentage of the used I/O channels/resources.

Field Name: Q8STDSKU

WORKER NODES AVG CPU UTILIZATION (%)

The current CPU utilization on the accelerator worker nodes. This is a snapshot, which is the average CPU utilization across all worker nodes (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STWCPU_64).

Field Name: Q8STWCPU

COORDINATOR CPU UTILIZATION (%)

The current CPU utilization on the accelerator coordinator node (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STCCPU_64).

Field Name: Q8STCCPU

PROCESSORS

The number of CPU cores available on all worker nodes.

Field Name: Q8STCORS

DATA SLICES
The number of data slices at the accelerator. This equals the degree of parallel I/O channels.

**Field Name:** Q8STNMDS

**CPU TIME FOR REPLICATION**

The total CPU cost associated with the replication apply process for all DB2 systems.

**Field Name:** Q8STTCCA

**LOG RECORDS READ**

The number of log records read by the replication capture agents for all DB2 systems.

**Field Name:** Q8STNLRA

**LOG RECORDS READ - LOG RECORDS FOR ACCEL TABLES**

The number of log records read by the replication capture agents for all DB2 systems that are applicable to tables in this accelerator.

**Field Name:** Q8STNLTA

**LOG RECORD BYTES PROCESSED**

The number of log record bytes processed by the replication capture agents for all DB2 systems.

**Field Name:** Q8STNBA

**INSERT ROWS FOR ACCEL TABLES**

The number of INSERT rows applicable to accelerator tables that were processed by the replication capture agents for all DB2 systems.

**Field Name:** Q8STNIA

**UPDATE ROWS FOR ACCEL TABLES**

The number of UPDATE rows applicable to accelerator tables that were processed by the replication capture agents for all DB2 systems.

**Field Name:** Q8STNUA

**DELETE ROWS FOR ACCEL TABLES**

The number of DELETE rows applicable to accelerator tables that were processed by the replication capture agents for all DB2 systems.

**Field Name:** Q8STNDA

**ACCELERATOR SERVER START**

The timestamp when the accelerator server process started last time.

**Field Name:** Q8STTART

**ACCELERATOR STATUS CHANGE**

The timestamp when the last change of the accelerator occurred.

**Field Name:** Q8STTATC
Accounting Rollup

This topic shows detailed information about “Statistics - Accounting Rollup”.

**Statistics - Accounting Rollup**

The field labels shown in the following sample layout of “Statistics - Accounting Rollup” are described in the following section.

<table>
<thead>
<tr>
<th>ACCOUNTING ROLLUP</th>
<th>QUANTITY</th>
<th>/SECOND</th>
<th>/THREAD</th>
<th>/COMMIT</th>
</tr>
</thead>
<tbody>
<tr>
<td>ROLLUP THRESH RECS WRITTEN</td>

<td>0.00</td>
<td>0.00</td>
<td>N/C</td>
<td>0.00</td>
</tr>
</tbody>
</table>

**ROLLUP THRESH RECS WRITTEN**

The number of roll-up accounting records written due to roll-up threshold exceeded.

Field Name: QWSDARTH

**STORAGE THRESH RECS WRITTEN**

The number of roll-up accounting records written due to roll-up accounting storage threshold exceeded.

Field Name: QWSDARSG

**STALEN THRESH RECS WRITTEN**

The number of roll-up accounting records written due to staleness threshold exceeded.

Field Name: QWSDARST

**RECS UNQUALIFIED FOR ROLLUP**

The number of records that failed to qualify for accounting roll-up because all roll-up key fields are equal to NULL or because of NULL values that are not permitted.

Field Name: QWSDARIR
Aggregated Accounting Statistics

This topic shows detailed information about “Statistics - Aggregated Accounting Statistics”.

IFCID 369 contains aggregated Accounting data from IFCID 3 listed by connection type.

IFCID 369 is started using the START TRACE command for STATISTICS CLASS(9). IFCID 3 must also be enabled (ACCOUNTING CLASS(1)) to get 369 trace records. IFCID 369 values are aggregated each time an IFCID 3 is written and contain total values. In the Statistics reports, IFCID 369 delta values are calculated to show which IFCID 3 events occurred in a Statistics interval.

In contrast to Accounting reports, the IFCID 369 statistics performance metrics cannot distinguish between IFCID 3 records for parallel and non-parallel threads. In Accounting, the elapsed times of parallel threads are derived from IFCID 3 of the originating thread. In IFCID 369, all times (even the elapsed times of the originating thread and parallel subtasks) are aggregated and shown as such in the Statistics report. That is why IFCID 369 can provide more diagnostics on what is currently happening in a DB2 subsystem and whether there are bottlenecks (also for parallel subtasks).

For more information on the Accounting fields referred to in the field descriptions below, see:

• “Times - Class 1 - Application Time” on page 5-360
• “Times - Class 2 - DB2 Time” on page 5-367

**CL1 ELAPSED**

The class 1 elapsed time aggregated by connection type. See also the description of Accounting field ADRECETT.

**Note:** In contrast to ADRECETT, elapsed times of parallel records are included in SDRECETT.

Field Name: SDRECETT

**CL1 CPU**

The class 1 CPU time aggregated by connection type. See also the description of Accounting field ADCPUT.

Field Name: SDCPU

**CL1 SE CPU**
The sum of several accumulated CPU times consumed while running on an IBM specialty engine in all environments and aggregated by connection type. See also the description of Accounting field AWACC1Z.

**Field Name:** SWACC1Z

**CL2 ELAPSED**
The class 2 elapsed time aggregated by connection type. See also the description of Accounting field ADDB2ETT.

**Note:** In contrast to ADDB2ETT, elapsed times of parallel records are included in SDDB2ETT.

**Field Name:** SDDB2ETT

**CL2 CPU**
The class 1 CPU time aggregated by connection type. See also the description of Accounting field ADDBCPUT.

**Field Name:** SDDBCPUT

**CL2 SE CPU**
The accumulated and consumed class 2 time on an IBM specialty engine aggregated by connection type. See also the description of Accounting field AWACC2Z.

**Field Name:** SWACC2Z

**CL3 SUSP**
The waiting time for all types of class 3 suspensions aggregated by connection type. See also the description of Accounting field ADTSUST.

**Field Name:** SDDTSUST

**CL2 NOT ACC**
The time not accounted in DB2 and aggregated by connection type. See also the description of Accounting field ADNOTACC.

**Note:** In contrast to ADNOTACC, unaccounted times of parallel records are included in SDNOTACC.

**Field Name:** SDNOTACC

**QUANTITY**
The number of parallel child agents, Accounting intervals, or autonomous procedures rolled up for all threads of the connection type. See also the description of Accounting field QWACPCNT.

**Field Name:** SWACPCNT
Authorization Management

This topic shows detailed information about “Statistics - Authorization Management”.

There are three authorization caches, located in the EDM pool:

- Plan, one cache per plan
- Package, one per subsystem
- Routine, for stored procedures and user-defined functions, one per subsystem

Allied threads (CICS, IMS, TSO, batch) are checked for EXECUTE authority at plan level. The package, and routine authorization caches only check EXECUTE authority for distributed applications.

The size of the plan authorization cache is set at BIND time, with the option CACHESIZE. When this is not specified, the default is taken from the ZPARM AUTHCACHE.

If you run the plan infrequently, or if authority to run the plan is granted to PUBLIC, you might want to turn off caching for the plan so that DB2 does not use unnecessary storage. In this case specify a value of 0 for the CACHESIZE option.

Any plan that you run repeatedly is a good candidate for tuning by using the CACHESIZE option. Also, if you have a plan that a large number of users run concurrently, you might want to use a larger CACHESIZE.

The size of the package authorization cache is determined by ZPARM CACHEPAC.

The size of the routine authorization cache is determined by ZPARM CACHERAC.

Statistics - Authorization Management

The field labels shown in the following sample layout of “Statistics - Authorization Management” are described in the following section.

</tbody>
</table>

The number of authorization checks performed for plans, packages, and stored procedures since DB2 was started. This includes successful and failed checks.
Field Name: QTAUCHK

TOTAL AUTH SUCC
The number of successful authorization checks performed on plans, packages, and stored procedures, since DB2 was started.

Field Name: QTAUSUC

PLAN-AUTH SUCC-W/O CATALOG
The number of successful authorization checks that do not use the DB2 catalog (including plan cache checks and public checks).

Background and Tuning Information
For transaction level security, ENABLE and DISABLE on BIND PACKAGE should be used to ensure adequate security. Granting execute authority on the plan to public should be adequate.

Field Name: QTAUCCH

PLAN-AUTH SUCC-PUB-W/O CAT
The number of successful authorization checks based on EXECUTE authority granted to PUBLIC.

Field Name: QTAUPUB

PKG-AUTH SUCC-W/O CATALOG
The number of successful package EXECUTE authorization checks without accessing the DB2 catalog.

Field Name: QTPACAUT

PKG-AUTH SUCC-PUB-W/O CAT
The number of successful package EXECUTE authorization checks without accessing the DB2 catalog. Package EXECUTE authority was granted to PUBLIC in the package authorization cache.

Field Name: QTPACPUB

PKG-AUTH UNSUCC-CACHE
The number of unsuccessful package EXECUTE authorization checks in the package authorization cache. No applicable entry was found in the cache and DB2 catalog access was used.

Field Name: QTPACNOT

PKG CACHE OVERWRT - AUTH ID
The number of times an authorization ID was overwritten to add another one to the package authorization cache.

Field Name: QTPACOW1

PKG CACHE OVERWRT - ENTRY
The number of times an entry for a collection-ID or package-ID was overwritten to add another one to the package authorization cache.

Field Name: QTPACOW2

RTN-AUTH SUCC-W/O CATALOG
The number of times the routine authorization cache was checked successfully of EXECUTE authority on a stored procedure or user-defined
function. The DB2 catalog was not accessed. This counter includes the number of PUBLIC authorization checks.

**Field Name:** QTRACAUT

**RTN-AUTH SUCC-PUB-W/O CAT**

Number of successful authorization checks for user-defined function or stored procedure execution authority when that authority is held by PUBLIC. The DB2 catalog was not checked.

**Field Name:** QTRACPUB

**RTN-AUTH UNSUCC-CACHE**

Number of unsuccessful authorization checks for user-defined function or stored procedure EXECUTE authority because no applicable entry was found in the routine authorization cache.

**Field Name:** QTRACNOT

**RTN CACHE OVERWRIT - AUTH ID**

Number of times that DB2 overwrote an authorization ID in the routine authorization cache.

**Field Name:** QTRACOW1

**RTN CACHE OVERWRIT - ENTRY**

Number of times that DB2 overwrote a routine entry in the routine authorization cache.

An entry in the routine authorization cache can refer to a function or procedure or to all functions or procedures within a specific schema.

**Field Name:** QTRACOW2

**RTN CACHE - ENTRY NOT ADDED**

Number of times that DB2 could not add an entry to the routine authorization cache.

An entry in the routine authorization cache can refer to a function or procedure or to all functions or procedures within a specific schema.

**Field Name:** QTRACNAC
Buffer Pool General

This topic shows detailed information about “Statistics - Buffer Pool General”.

This block is only printed when the buffer pool is active. If more than one 4 KB or 32 KB buffer pool block is present, a summary block showing buffer pool totals is also printed. If the report contains both 4 KB and 32 KB buffer pool blocks, a block showing the totals for all buffer pools is printed.

Statistics - Buffer Pool General

</tbody>
</table>

CURRENT ACTIVE BUFFERS

The total number of currently active (nonstealable) buffers. This field is an instantaneous sample of the number of buffers in the buffer pool that were updated or in use at the time this monitor data was requested. Because this field gives a snapshot value at statistics collection time, it only shows a problem if it happens at this time.

Background and Tuning Information

The buffer pool might be too small if the percentage of active pages in the buffer pool is beyond the deferred write threshold (DWQT).

Field Name: QBSTCBA

UNAVAIL.BUFFER-VPOOL FULL

The number of times a usable buffer could not be located in the virtual buffer pool because the virtual buffer pool was full.

Background and Tuning Information
Buffer Pool General

Ideally, this value should be 0. Any other value indicates that the buffer pool is underallocated. In this case, use the ALTER BUFFERPOOL command to increase the virtual buffer pool size until this value remains at 0.

**Field Name:** QBSTXFL

**NUMBER OF DATASET OPENS**

The number of data sets physically opened successfully. This value is cumulative from the start of the DB2 statistics interval.

**Field Name:** QBSTDSO

**BUFFERS ALLOCATED - VPOOL**

The number of buffers allocated for a virtual buffer pool.

**Note:** In DB2 10, the buffer pool size can increase continuously by up to 25% for each DB2 restart. In DB2 11, the AUTOSIZE option of the ALTER BUFFERPOOL command can limit the range within VPSIZEMIN and VPSIZEMAX.

**Background and Tuning Information**

You should monitor the buffer pool hit ratio field to find the optimum size of the buffer pool. Usually the buffer pool hit ratio is improved by increasing the size of the buffer pool. However, paging the buffer pool storage impacts DB2 performance if the virtual buffer pool is too large.

Page-ins Required for Read I/O (QBSTRPI) and Page-ins Required for Write I/O (QBSTWPI) are useful when determining whether paging affects the performance of a certain buffer pool. The Resource Measurement Facility (RMF) also provides reports on MVS paging activity:

**Storage Paging**

When the virtual buffer pool is extended into expanded storage, MVS storage paging activity occurs. If a large buffer pool size results in excessive storage paging, consider allocating more real storage to the LPAR.

**Paging to Auxiliary Storage**

If the virtual buffer pool size requirements exceed the central storage and expanded storage available, the oldest buffer pool pages migrate to auxiliary paging storage. When these pages are accessed subsequently, I/O must bring them back into real storage. This should be avoided. You could have a smaller buffer pool and let DB2 do the I/O rather than use MVS paging with its I/O CPU overhead. This is a situation that you (as the system programmer) should monitor.

You can use the ALTER BUFFERPOOL command to alter the size of the virtual buffer pool.

Changing the size of the virtual buffer pool implicitly changes the buffer pool thresholds. See the Deferred Write Threshold Reached field (QBSTDWT).

**Field Name:** QBSTVPL

**DFHSM MIGRATED DATASET**

The number of times migrated data sets were encountered.
Field Name: QBSTMIG

DFHSM RECALL TIMEOUTS
The number of recall timeouts.

Field Name: QBSTRTO

VPOOL EXPANS. OR CONTRACT.
The number of successful virtual buffer pool expansions or contractions due to the ALTER BUFFERPOOL command. An increase in this counter indicates that buffer-pool-related system parameters have been changed.

Field Name: QBSTVPA
This is an exception field.

VPOOL EXPANS. FAILURES
The total number of virtual buffer pool expansion failures due to the lack of virtual storage space.

Background and Tuning Information
Ideally, this value should be 0. If it is not, check the virtual storage allocation of the DB2 database address space for areas that can be reduced. For example, you can reduce the size of other buffer pools.

Field Name: QBSTXFV
This is an exception field.

CONCUR.PREF I/O STREAMS-HWM
The highest number of concurrent prefetch I/O streams allocated to support a parallel I/O or CP query in this buffer pool. It reflects prefetch activities for non-workfile page sets.

This number only applies to query I/O and CP parallelism.

Field Name: QBSTXIS
This is an exception field.

PREF I/O STREAMS REDUCTION
The total number of requested prefetch I/O streams that were denied because of a lack of buffer pool storage space.

It only applies to query I/O and CP parallelism.

For example, if 100 prefetch I/O streams are requested and only 80 are granted, then 20 is added to the number in this field.

Background and Tuning Information
Consider increasing the size of the buffer pool if this value is not 0.

The ratio of this field and the Reduced parallel query requests field gives the average degree of parallel query processing that was reduced because of insufficient buffer pool space. The Prefetch I/O streams - Concurrent streams - high-water mark field gives the highest degree of parallel query processing that was reduced for one or more queries processed in parallel.

The number in this field reflects the prefetch activities for non-workfile page sets.

Field Name: QBSTJIS
This is an exception field.

**PARALLEL QUERY REQUESTS**

The total number of requests made for parallel query support in this buffer pool. This field only applies to non-workfile page sets in query I/O and CP parallelism.

**Field Name:** QBSTPQO

**PARALL.QUERY REQ.REDUCTION**

The number of times that DB2 could not allocate the requested number of buffer pages to allow a parallel group to run as planned.

This field only applies to non-workfile page sets in query I/O and CP parallelism.

**Background and Tuning Information**

This is caused by a shortage of storage in the buffer pool. A nonzero value could suggest that the buffer pool is too small. You can increase it using the ALTER BUFFERPOOL command.

**Field Name:** QBSTPQF

This is an exception field.

**PREFQUANT.REDUCED TO 1/2**

The total number of times prefetch quantity is reduced from normal to 50% of normal. The normal size depends on the page size of the buffer pool.

This field only applies to query I/O and CP parallelism.

**Background and Tuning Information**

The number in this field indicates when DB2 had to reduce the sequential prefetch quantity to continue executing concurrently with parallel queries in the system. If the number is small, it may be tolerable.

**Field Name:** QBSTPL1

This is an exception field.

**PREFQUANT.REDUCED TO 1/4**

The total number of times prefetch quantity is reduced from 50% to 25% of normal. The normal size depends on the page size of the buffer pool.

This field only applies to query I/O and CP parallelism.

**Background and Tuning Information**

The query response for parallel queries can be significantly degraded if the value in this field is not 0.

**Field Name:** QBSTPL2

This is an exception field.

**NUMBER OF LPL INSERTS**

The number of times that one or more pages were added to the logical page list (LPL).

**Field Name:** QBSTLPL

**MIN BUFFERS ON SLRU**
The minimum number of buffers on the sequential least-recently-used (SLRU) chain in the last statistical period. This is the low-water mark (LWM) within an interval.

**Field Name:** QBSTSMIN

**MAX BUFFERS ON SLRU**

The maximum number of buffers on the sequential least-recently-used (SLRU) chain in the last statistical period. This is the high-water mark (HWM) within an interval.

**Field Name:** QBSTSMAX

**SLRU LENGTH EQUALS VPSEQT**

The number of times when the length of the sequential least-recently-used (SLRU) chain equals the sequential steal threshold VPSEQT.

**Field Name:** QBSTHST

**GETPAGE REQU RANDOM ON SLRU**

The number of times that the random Getpage request has a buffer hit and the buffer is on the least-recently-used (SLRU) chain.

**Field Name:** QBSTRHS
Buffer Pool Read

This topic shows detailed information about “Statistics - Buffer Pool Read”.

This block is only printed when the buffer pool is active. If more than one 4 KB or 32 KB buffer pool block is present, a summary block showing buffer pool totals is also printed. If the report contains both 4 KB and 32 KB buffer pool blocks, a block showing the totals for all buffer pools is printed.

Statistics - Buffer Pool Read

</tbody>
</table>

**BPOOL HIT RATIO (%)**

The percentage of Getpage operations that were satisfied by a page already in the buffer pool.

The value is calculated as the ratio of number of successful Getpage operations minus the number of pages read from DASD (both synchronously and using prefetch), to the number of successful Getpage operations, expressed as a percentage.

**Background and Tuning Information**

The highest possible hit ratio is 100%, that is, when every page requested is always in the buffer pool. If the requested page is not in the buffer pool, the hit ratio is 0% or less. If the hit ratio is negative, this means that prefetch brought pages into the buffer pool that are not subsequently referenced, either because the query stops before it reaches the end of the
table space, or because the prefetched pages are stolen by DB2 for reuse before the query can access them. A low buffer pool hit ratio is not necessarily bad. The hit ratio is a relative value, based on the type of application. For example, an application that browses large data might have a buffer pool hit ratio of 0. Watch for those cases where the hit ratio drops significantly for the same application. Here are some suggestions to increase the buffer hit ratio:

- Run the REORG utility for indexes or table spaces associated with the virtual buffer pool.
- Reserve more pages for random I/O by setting the SEQUENTIAL STEAL THRESHOLD (VPSEQT) to a lower value.
- Increase the buffer pool as long as the cost of paging does not outweigh the benefit of I/O avoidance.
- Establish more separate buffer pools, perhaps to isolate different applications.
- Place the objects that are accessed only sequentially in a separate buffer pool.

When the hit ratio is negative, it means that prefetch has brought pages into the buffer pool that are not subsequently referenced, either because the query stops before it reaches the end of the table space, or because the prefetched pages are stolen by DB2 for reuse before the query can access them.

The hit ratio measurement becomes less meaningful if the buffer pool is used by additional processes, such as utilities or work files.

**Field Name:** SBUFFRAT

**BPOOL HIT RATIO (%) SEQU**

The percentage of sequential Getpage operations that were satisfied by a page already in the buffer pool.

**Field Name:** SBUFFSEQ

**BPOOL HIT RATIO (%) RANDOM**

The percentage of random Getpage operations that were satisfied by a page already in the buffer pool. If this value is low, it indicates that page residency in the buffer pool is too low, therefore the buffer pool may be too small.

**Field Name:** SBUFFRDM

**GETPAGE REQUEST**

The number of Getpage requests including conditional and unconditional requests.

**Field Name:** QBSTGET

**GETPAGE REQ'S-SEQUENTIAL**

The number of Getpage requests issued by sequential access requesters.

**Field Name:** QBSTSGT

**IN-MEM OVFL SEQ REQS**

The number of sequential GETPAGE requests using overflowed buffers.

If this counter has a non-zero value, the buffer pool size should be increased.
Buffer Pool Read

Field Name: QBSTASGE
This is an exception field.

GETPAGE REQS-RANDOM
The number of random Getpage requests.
Field Name: SDGETTRAN

IN-MEM OVFL RND REQS
The number of non-sequential GETPAGE requests using overflowed buffers.
If this counter has a non-zero value, the buffer pool size should be increased.

Field Name: QBSTAGET
This is an exception field.

SYNCHRONOUS READS
The number of synchronous read I/O operations performed by DB2 for applications and utilities.

Background and Tuning Information
This number includes both Synchronous Reads Sequential Access Only (QBSTSIO) and synchronous read operations for non-sequential access.

You can use this value and the value of Synchronous Reads Sequential Access Only to calculate the number of Non-Sequential Synchronous Reads.

Check the buffer pool hit ratio if the number of non-sequential synchronous reads is larger than expected.

Field Name: QBSTRIO
This is an exception field.

SYNC READS-SEQUENTIAL
The number of synchronous read I/O requests issued by sequential access requesters.

Background and Tuning Information
Sequential synchronous read I/Os can occur because:
- Prefetch is disabled (QBSTSPD).
- Prefetch pages could have been stolen from the buffer pool before the Getpage request is issued for those pages. Subsequently the pages are reread synchronously. A negative buffer pool hit ratio can indicate the same problem.
- The pages requested are not consecutive: DB2 estimated the selected range of pages to be so small that prefetch would make no sense. See also Sequential Prefetch Requested (QBSTSEQ).

It is normal to have a small value for SYNC READ I/O (SEQUENTIAL) because before the sequential prefetch is scheduled, the first page of a prefetch is read by SYNC READ I/O. However, if this number is large, consider increasing the size of the buffer pool or reviewing the sequential steal thresholds (VPSEQT and HPSEQT).

Field Name: QBSTSIO
This is an exception field.

**IN-MEM OVFL SEQ READS**

The number of synchronous read I/O operations for sequential GETPAGE requests using overflowed buffers.

If this counter has a non-zero value, the buffer pool size should be increased.

**Field Name:** QBSTA SSE  
This is an exception field.

**SYNC READS-RANDOM**

The number of random synchronous read I/O requests.

**Field Name:** SDST RAN  
This is an exception field.

**IN-MEM OVFL RND READS**

The number of synchronous read I/O operations for non-sequential GETPAGE requests using overflowed buffers.

If this counter has a non-zero value, the buffer pool size should be increased.

**Field Name:** QBSTA SY N  
This is an exception field.

**GETPAGE PER SYN.READ-RANDOM**

The number of random Getpage requests per random synchronous read I/O request.

**Background and Tuning Information**

This ratio is a good indicator of read efficiency in a transaction environment. The higher the number is, the better.

**Field Name:** SBRGPRIO

**SEQUENTIAL PREFETCH REQUEST**

The number of sequential prefetch requests. This counter is incremented for each PREFETCH request (which can result in an I/O read). If the prefetch results in an I/O read, up to 64 pages may be read for SQL, and up to 128 pages for utilities. A request does not result in an I/O read if all pages to be prefetched are already in the buffer pool.

This counter does not include sequential detection, which is recorded in the Dynamic Prefetch - Requested field.

**Background and Tuning Information**

Sequential prefetch reads a sequential set of pages. It allows CP and I/O operations to be overlapped. DB2 determines at BIND time whether sequential prefetch is used or not.

Sequential prefetch is generally used for a table space scan.

The number of prefetch requests by itself is not a good indicator for efficiency of prefetching:

- At run time not every prefetch request results in read I/O: the Sequential Prefetch Reads field (QBSTPIO) shows the number of read
I/O operations caused by sequential prefetch. The Prefetch Disabled No Buffer (QBSTSPD) and Prefetch Disabled No Read Engine fields (QBSTREE) show the number of times prefetch was disabled because buffers and read engines had not been available.

- Check the value in the buffer pool hit ratio. A negative value indicates that prefetched pages are stolen from the buffer pool before they are read. The pages are subsequently reread synchronously. There will be also a large value in the Synchronous Reads Total (QBSTRIO) field.
- Decreasing the size of the buffer pool can reduce the prefetch quantity, leading to a larger number of prefetch requests. See also the Sequential Prefetch Pages Read field (QBSTSPP).

**Field Name:** QBSTSEQ

This is an *exception* field.

**SEQUENTIAL PREFETCH READS**

The number of asynchronous read I/O operations due to normal sequential prefetch (applications and utilities).

**Background and Tuning Information**

Prefetch Read I/O is not activated if one of the following conditions applies:

- All pages in the prefetch range are already in the buffer pool.
- Prefetch is disabled (QBSTSPD).

This means that the value in this field is usually smaller than the number of sequential prefetch requests (QBSTSEQ).

**Field Name:** QBSTPIO

This is an *exception* field.

**PAGES READ VIA SEQ.PREFETCH**

The total number of pages read due to a normal sequential prefetch. A sequential prefetch request does not result in a read I/O if all the desired pages are found in the buffer pool.

**Background and Tuning Information**

For requests issued by application programs, the number of pages per READ I/O primarily depends on the page size and the size of the buffer pool. Normally sixty-four 4 KB pages (or eight 32 KB pages) is the maximum prefetch quantity for table space scans, whether data or index. Utilities use a prefetch quantity of up to 64 pages.

The number of pages per READ I/O can be lower because:

- Pages within the prefetch range may already be in the buffer pool.
- Not enough pages are available because of a buffer shortage.
- A prefetch quantity of 8 pages or less is used for work files.

A small value for this ratio can indicate:

- A good performing buffer pool being so large that most of the pages, which had otherwise to be prefetched, are cached in the buffer pool. In this case, the buffer pool hit ratio should be high.
- A buffer shortage condition, reducing the efficiency of sequential prefetch. This could mean, for example, work-file prefetch quantity
reduction from 8 to 4 to 2, as the number of available buffers shrinks. In this case, you should consider tuning the buffer pool.

**Field Name:** QBSTSSPP

This is an *exception* field.

### S.PREFPAGES READ/S.PREF.READ

The number of sequential prefetch pages read per sequential prefetch read I/O operation.

**Field Name:** SBRPPRIO

This is an *exception* field.

### LIST PREFETCH REQUESTS

The number of list prefetch requests.

List prefetch allows DB2 to access data pages efficiently even when the required data pages are not contiguous. It allows CP and I/O operations to be overlapped.

**Background and Tuning Information**

DB2 determines at BIND time whether sequential prefetch is used. List prefetch is chosen as follows:

- Usually with a single index that has a cluster ratio lower than 80%.
- Sometimes on a single index with a high cluster ratio, if the estimated amount of data to be accessed is too small to make sequential prefetch efficient.
- Always to access data by multiple index access.
- Always to access data from the inner table during a hybrid join.

DB2 never chooses list prefetch if the estimated number of RIDs to be processed takes more than 50% of the RID pool. During execution time, list prefetch processing terminates if more than 25% of the rows (with a minimum of 4075) in the table must be accessed.

Data pages are read in quantities equal to the sequential prefetch quantity (QBSTSEQ), which depends on buffer pool size and is usually 64 pages.

**Field Name:** QBSTLPF

This is an *exception* field.

### LIST PREFETCH READS

The number of asynchronous read I/O operations caused by the list prefetch.

The number of pages read is shown by the List Prefetch Pages Read (QBSTLPP) field.

**Background and Tuning Information**

Prefetch Read I/O is not activated if one of the following conditions apply:

- All pages in the prefetch range are already in the buffer pool.
- Prefetch is disabled (Prefetch Disabled No Read Engine - QBSTREE).

This means that the value in this field is usually less than the number of list prefetch requests (QBSTLPF).

**Field Name:** QBSTLIO
Buffer Pool Read

This is an exception field.

PAGES READ VIA LIST PREFETCH
The number of pages read via list prefetch.
Field Name: QBSTLPP

L.PREF.PAGES READ/L.PREF.READ
The number of list prefetch pages read per list prefetch read I/O.
Field Name: SDLPPPIO
This is an exception field.

DYNAMIC PREFETCH REQUESTED
The number of dynamic prefetch requests. Dynamic prefetch is the process that is triggered because of sequential detection. If the prefetch request results in an I/O read, up to 32 advancing pages can be read at a time.

Background and Tuning Information
Dynamic prefetch reads a sequential set of pages. It allows CP and I/O operations to be overlapped. If DB2 does not choose prefetch at bind time it can sometimes use it at execution time. The method is called sequential detection.

The number of prefetch requests by itself is not a good indicator for efficiency of prefetching because:
• At run time not every prefetch request results in read I/O: the Dynamic Prefetch Reads field shows the number of read I/O operations caused by dynamic prefetch. The Prefetch Disabled No Buffer (QBSTSPD) and Prefetch Disabled No Read Engine (QBSTREE) fields show the number of times prefetch was disabled because buffers and read engines had not been available.
• Prefetch pages can be stolen from the buffer pool before they are read. This is indicated by a negative buffer pool hit ratio. The pages are subsequently reread synchronously. This will also cause an unexpectedly large value for total synchronous reads (QBSTRIO).

Decreasing the size of the buffer pool can reduce the prefetch quantity (QBSTDPP), leading to a larger number of prefetch requests.
Field Name: QBSTDPF
This is an exception field.

DYNAMIC PREFETCH READS
The number of asynchronous read I/Os because of dynamic prefetch. The number of pages read is recorded in the Dynamic Prefetch Pages Read field.

Background and Tuning Information
A prefetch request does not result in an I/O if one of the following conditions apply:
• All pages to be prefetched are already in the buffer pool.
• The prefetch is canceled.

This means that the value in this field is usually smaller than the number of dynamic prefetch requests.
Field Name: QBSTDIO
This is an exception field.

PAGES READ VIA DYN.PREFETCH
The number of pages read because of dynamic prefetch. Dynamic prefetch is the process that is triggered by sequential detection.

Background and Tuning Information
The ratio of Dynamic Prefetch Pages Read to Dynamic Prefetch Reads is between 0 and 32.
DB2 can fetch up to 32 pages per prefetch.
The number of pages per READ I/O can be lower because:
• Pages within the prefetch range are already in the buffer pool.
• Not as many pages are available due to a buffer shortage.
A small value for this ratio can indicate:
• A good performing buffer pool being large enough to contain pages that would otherwise be prefetched. This is indicated by a high buffer pool hit ratio.
• A buffer shortage condition, which reduces the efficiency of dynamic prefetch. In this instance the buffer pool hit ratio will be low. Consider tuning the buffer pool.

Field Name: QBSTDPP
This is an exception field.

D.PRF.PAGES READ/D.PRF.READ
The number of dynamic prefetch pages read per dynamic prefetch read I/O.

Field Name: SDDPPPIO
This is an exception field.

PREFDISABLED-NO BUFFER
The total number of times sequential prefetch was disabled because buffers were not available.

Field Name: QBSTSPD
This is an exception field.

PREFDISABLED-NO READ ENG
The total number of times a prefetch is disabled because of an unavailable read engine.

Background and Tuning Information
Because there are 600 read engines, a maximum of 600 concurrent prefetch operations can be processed at a time. When this maximum is reached, prefetching is disabled and this count is incremented. The value in this field should be close to 0.

Field Name: QBSTREE
This is an exception field.

PAGE-INS REQUIRED FOR READ
Buffer Pool Read

The number of page-ins required for a read I/O.

Note: A non-zero value can be accepted if a buffer pool expansion via ALTER BPSIZE occurs. In other situations, a non-zero value indicates a shortage of real storage relative to the buffer pool size.

Field Name: QBSTRPI

This is an exception field.
Buffer Pool Sort/Merge

This topic shows detailed information about “Statistics - Buffer Pool Sort/Merge”.

This block is only printed when the buffer pool is active. If more than one 4 KB or 32 KB buffer pool block is present, a summary block showing buffer pool totals is also printed. If the report contains both 4 KB and 32 KB buffer pool blocks, a block showing the totals for all buffer pools is printed.

Statistics - Buffer Pool Sort/Merge

The field labels shown in the following sample layout of “Statistics - Buffer Pool Sort/Merge” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAX WORKFILES CONCURR. USED</td>
<td>The maximum number of work files concurrently used during merge processing within this statistics period. Ideally, each work file needs 16 buffers to allow DB2 to perform a sequential prefetch for work files. Field Name: QBSTWFM</td>
</tr>
<tr>
<td>MERGE PASSES REQUESTED</td>
<td>The total number of merge passes for DB2 sort activities. This value reflects how many merge passes were requested for DB2 to determine the number of work files permitted to support each merge pass. Field Name: QBSTWFR</td>
</tr>
</tbody>
</table>
| MERGE PASS DEGRADED-LOW BUF    | The number of times that a merge pass was not efficiently performed due to a shortage of space in the buffer pool. The number in this field is incremented for each merge pass where the maximum number of work files allowed is less than the number of work-files requested. Background and Tuning Information The maximum number of work files allowed is calculated as follows:
  * Buffers consumed = 2 * (work files already allocated)
  * Buffers available = (sequential steal threshold * buffer pool size - buffers consumed)
  * Maximum work files allowed = buffers available / (2 * 8) The default for the sequential steal threshold is 0.8. Ideally, the number in this field should be 0. Otherwise, it indicates a shortage of buffer pool space or that there are too many concurrent work files. |
files. For example, there could be a number of concurrently open cursors that require sorting. Consider increasing the buffer pool size using the ALTER BUFFERPOOL command.

**Field Name:** QBSTWFF  
This is an *exception* field.

**WORKFILE REQ.REJCTD-LOW BUF**

The total number of work files that were rejected during all merge passes because of insufficient buffer resources.

**Background and Tuning Information**

This field and the degraded low buffers field determine the average number of work files that cannot be honored at each merge pass because of insufficient buffer pool space.

Ideally, the number in this field should be 0. Otherwise, it indicates a shortage of buffer pool space or that there are too many concurrent work files. For example, there could be a number of concurrently open cursors that require sorting. Consider increasing the size of the buffer pool using the ALTER BUFFERPOOL command.

Note that, when there are many concurrent sorts or large sorts, it is a good idea to dedicate a separate buffer pool for sort work files. This will greatly facilitate work-file performance tuning.

**Field Name:** QBSTWFD  
This is an *exception* field.

**WORKFILE REQ-ALL MERGE PASS**

The total number of work files requested for all merge passes.

This field and the Merge Passes Requested field determine the average number of work files requested in a single merge pass.

For DB2 to perform an efficient prefetch for work files, each workfile should have at least 16 dedicated buffers. Work files used during sort phase processing or other non-sort-related processing are not included in this number.

**Field Name:** QBSTWFT

**WORKFILE NOT CREATED-NO BUF**

This field is only applicable if DB2 is running under MVS/XA.

The number of times a work file could not be created due to insufficient buffer resources. It indicates that a sort is in progress and limited in regard to the number of work files it can use.

**Background and Tuning Information**

Ideally, this should be 0. Otherwise, it indicates a shortage of buffer pool space or that there are many concurrent work files. For example, there could be a number of open cursors that require sorting.

Generally, sorts are performed more efficiently with additional work files, but there are internal DB2 limits on the number of work files a transaction can have. It is possible that at run time a transaction cannot use as many
work files as it had planned. You can control this by increasing the buffer pool size (ALTER BUFFERPOOL), or changing the transaction so it requires fewer concurrent work files.

Field Name: QBSTMAX

This is an exception field.

WORKFILE PRF NOT SCHEDULED

The number of times a sequential prefetch was not scheduled for a work file because the dynamic prefetch quantity is zero.

Background and Tuning Information

The work-file prefetch checks the dynamic prefetch quantity (normally 1 to 8 pages). When the quantity is zero, the value in this field is incremented. A high number in this field implies that the buffer pool is too small. Ideally, the number in this field should be 0. Otherwise, it indicates a shortage of buffer pool space or that there are many concurrent work files. For example, there could be a number of concurrently open cursors that require sorting.

Consider increasing the size of the buffer pool or allocating a buffer pool specifically for DSNDB07 usage. This can be especially effective with high-use query systems whose reports make extensive use of sort activity.

Field Name: QBSTWKPD

This is an exception field.
Buffer Pool Write

This topic shows detailed information about “Statistics - Buffer Pool Write”.

This block is only printed when the buffer pool is active. If more than one 4 KB or 32 KB buffer pool block is present, a summary block showing buffer pool totals is also printed. If the report contains both 4 KB and 32 KB buffer pool blocks, then a block showing the totals for all buffer pools is printed.

Statistics - Buffer Pool Write

The field labels shown in the following sample layout of “Statistics - Buffer Pool Write” are described in the following section.

<table>

</tbody>
</table>

BUFFER UPDATES

The number of times buffer updates were requested against pages in the buffer pool.

Background and Tuning Information

The ratio of Buffer Updates to Pages Written (QBSTPWS) suggests a high level of efficiency as it increases, because more updates are being externalized per physical write.

Buffer updates per pages written depends strongly on the type of application. For example, a batch program that processes a table in skip sequential mode with a high row update frequency in a dedicated environment can achieve very good update efficiency. In contrast, update efficiency tends to be lower for transaction processing applications, because transaction processing tends to be random.

The following can influence the number of updates per page:

Number of rows per page

A small PCTFREE value gathers more rows on the same page. However, at the same time this can impact concurrency.

Buffer pool size and deferred write thresholds

Increase DWQT and VDWQT or the size of the buffer pool. This causes DB2 to let page updates accumulate in the buffer pool. Therefore, the probability that more updates per page get captured increases. This effect is less significant if the buffer pool is concurrently used by several transactions, it also depends on the type of transaction.

Field Name: QBSTPWS
This is an exception field.

**PAGES WRITTEN**

The number of pages in the buffer pool written to DASD.

**Background and Tuning Information**

Consider the ratio of Pages Written per write I/O. The number of write I/O operations includes Asynchronous Writes (QBSTWIO) and Synchronous Writes (QBSTIMW).

The ratio of pages per write I/O suggests a high level of efficiency as the ratio increases, because more pages are being externalized per physical write.

The following factors impact the ratio of pages written per write I/O:

**Checkpoint frequency**

At checkpoint time, I/Os are scheduled to write all updated pages on the deferred write queue to DASD. If this occurs too frequently, the deferred write queue does not grow large enough to achieve a high ratio of pages written per write I/O.

The checkpoint frequency depends on the number of logs written between two consecutive checkpoints. This number is set at installation time; see the field CHECKPOINT FREQ of installation panel DSNTIPN.

**Frequency of active log switch**

DB2 takes a system checkpoint each time the active log is switched. High frequency of active log switches causes the problem described under checkpoint frequency.

**Buffer pool size and deferred write thresholds**

The deferred write thresholds (VDWQT and DWQT) are a function of buffer pool size. If the buffer pool size is decreased, these thresholds are reached more frequently, causing I/Os to be scheduled more often to write some of the pages on the deferred write queue to DASD. This prevents the deferred write queue from growing large enough to achieve a high ratio of pages written per write I/O.

**Number of data sets, and the spread of updated pages across them**

The efficiency of write I/O also depends on the number of data sets associated with the buffer pool and spread of updated pages across them. Because of the nature of batch processing, the ratio of pages written to write I/Os can be expected to be higher than that expected for transaction type workloads.

To determine update efficiency, use also the value in the Buffer Updates field (QBSTSW) to check the number of buffer updates per page written.

**Field Name:** QBSTPWS

This is an exception field.

**BUFF.UPDATES/PAGES WRITTEN**

The number of buffer updates per page written from the buffer pool to DASD.
The ratio of BUFFER UPDATES (QBSTSWS) to PAGES WRITTEN (QBSTPWS) suggests a high level of efficiency as the ratio increases, because more updates are being externalized per physical write. For example, if there are 10 updates on the same page before it is externalized, then the ratio is 10:1 or 10. If all 10 updates are on 10 distinct pages, then the ratio is 10:10 or 1.

**Background and Tuning Information**

Buffer updates per pages written depends strongly on the type of application. For example, a batch program that processes a table in skip sequential mode with a high row update frequency in a dedicated environment can achieve very good update efficiency. In contrast, update efficiency tends to be lower for transaction processing applications, because transaction processing tends to be random.

The following factors can influence the number of updates per page:

**Number of rows per page**

A small PCTFREE value will gather more rows on the same page. However, at the same time this can have impact on concurrency.

**Buffer pool size and deferred write thresholds**

Increase DWQT and VDWQT or the size of the buffer pool. This would tell DB2 to let page updates accumulate in the buffer pool. This means, the probability that more updates per page get captured increases. This effect is less significant if the buffer pool is concurrently used by multiple transactions, it depends on the type of transaction.

Field Name: SBRBUPW

**SYNCHRONOUS WRITES**

The total number of immediate writes.

Immediate writes occur when:

- An immediate write threshold (IWTH) is reached
- No deferred write engines are available
- More than two checkpoints pass without a page being written.

Sometimes DB2 uses synchronous writes even when the IWTH is not exceeded. As an example, when more than two checkpoints pass without a page being written. This type of situation does not indicate a buffer shortage.

**Background and Tuning Information**

A small number of immediate writes can be expected. Synchronous writes occur if there are too many checkpoints and/or the buffer pool is too small.

If a large number of synchronous writes occur, monitor the DM Critical Threshold Reached (QBSTDMC) field. Reaching Immediate Write Threshold (IWTH-97.5%) implies that the Data Management Threshold (DMTH-95%) has been crossed. You can ignore the value in the immediate write field when DM Critical Threshold Reached is zero. Otherwise consider increasing the size of the buffer pool. You can use the ALTER BUFFERPOOL command.
Check also the System Event Checkpoint field (QWSDCKPT) in the Subsystem Services block to see whether the frequency of DB2 checkpoints should be reduced. To do this, increase the value of ZPARM LOGLOAD.

**Field Name:** QBSTIMW  
This is an *exception* field.

**ASYNCHRONOUS WRITES**

The number of asynchronous write I/O operations performed by media manager to a direct access storage device.

**Field Name:** QBSTWIO  
This is an *exception* field.

**PAGES WRITTEN PER WRITE I/O**

The number of pages written from the buffer pool to DASD per synchronous or asynchronous write I/O. This count does not include preformatting I/O, such as I/O needed to prepare a data set for use.

**Background and Tuning Information**

The following factors impact the ratio of pages written per write I/O:

**Checkpoint frequency**

At checkpoint time, I/Os are scheduled to write all updated pages on the deferred write queue to DASD. If this occurs too frequently, the deferred write queue does not grow large enough to achieve a high ratio of pages written per write I/O.

The checkpoint frequency depends on the number of logs written between two consecutive checkpoints. This number is set at installation time; see the field CHECKPOINT FREQ of installation panel DSNTIPN.

**Frequency of active log switch**

DB2 takes a system checkpoint each time the active log is switched. High frequency of active log switches causes the problem described under checkpoint frequency.

**Buffer pool size and deferred write thresholds**

The deferred write thresholds (VDWQT and DWQT) are a function of buffer pool size. If the buffer pool size is decreased, these thresholds are reached more frequently, causing I/Os to be scheduled more often to write some of the pages on the deferred write queue to DASD. This prevents the deferred write queue from growing large enough to achieve a high ratio of pages written per write I/O.

**Number of data sets, and the spread of updated pages across them**

The efficiency of write I/O also depends on the number of data sets associated with the buffer pool and spread of updated pages across them. Because of the nature of batch processing, the ratio of pages written to write I/Os can be expected to be higher than that expected for transaction type workloads.

To determine update efficiency check also the ratio Buffer Updates / Pages Written (SBRBUPW).

**Field Name:** SBRPWWIO
Buffer Pool Write

PAGES WRTN FOR CASTOUT I/O

The number of pages written for castout I/O operations.

Field Name: QBSTPCO

NUMBER OF CASTOUT I/O

The number of castout I/O operations.

Field Name: QBSTCIO

HORIZ.DEFWRITE THRESHOLD

The number of times the deferred write threshold (DWTH) was reached.

This threshold is a percentage of the virtual buffer pool that might be occupied by unavailable pages, including both updated pages and pages in use. DB2 checks this threshold when an update to a page is completed. If the percentage of unavailable pages in the virtual buffer pool exceeds the threshold, write operations are scheduled for enough data sets (up to 128 pages per data set) to reduce the number of unavailable buffers to 10% below the threshold.

Background and Tuning Information

The default value for this threshold is 30%. You can change that to any value from 0% to 90% by using the DWQT option on the ALTER BUFFERPOOL command.

The deferred write thresholds, DWQT and VDWQT, are specified as a percentage, their absolute value depends on the size of the virtual buffer pool.

Consider the following aspects when changing the deferred write thresholds:

Optimize the ratio of pages written per write I/O

The ratio can be monitored using the Pages Written (QBSTPWS) field.

When the buffer pool is relatively small, the default thresholds could prevent the deferred write queue from growing large enough to achieve a high ratio of pages written per write I/O. Raising these thresholds will, in this instance, reduce the I/O write frequency, increasing the number of pages written per I/O.

Distribute I/O evenly over time

If a virtual buffer pool is very large, it is unlikely that the default values of either DWQT or VDWQT will ever be reached. In this case, write I/Os tend to occur in surges, triggered by DB2 checkpoints. Lowering the VDWQT and the DWQT could improve performance by distributing the write I/Os more evenly over time.

Impact on other buffer pool thresholds

Increasing DWQT and VDWQT allows updated pages to use a larger portion of the virtual buffer pool. Large DWQT and VDWQT can have a significant effect on the other thresholds. For example, in work load where pages are frequently updated, and the updated pages exceed the size of the virtual buffer pool, setting both DWQT and VDWQT to 90% would probably cause frequent threshold-reached events for sequential prefetch (and possibly the data management and immediate write).
Field Name: QBSTDWT

This is an exception field.

VERTI.DEF.WRITE THRESHOLD

The number of times the vertical deferred write threshold (VDWQT) was reached. This threshold is similar to the deferred write threshold but it applies to the number of updated pages for one single page set in the buffer pool. If the percentage or number of updated pages for the data set exceeds the threshold, writes up to 128 pages are scheduled for that data set.

Field Name: QBSTDWV

This is an exception field.

DM THRESHOLD

The number of times the data manager critical threshold (DMTH-95%) was reached.

This field shows how many times a page was immediately released because the data management threshold was reached.

The threshold is checked before a page is read or updated. If the threshold has not been exceeded, DB2 accesses the page in the virtual buffer pool once for each page, no matter how many rows are retrieved or updated in that page. If the threshold has been exceeded, Getpage requests and RELEASEs apply to rows instead of pages. That is, if more than one row is retrieved or updated in a page, more than one Getpage request and RELEASE is performed on that page.

Background and Tuning Information

Avoid reaching this threshold wherever possible because it significantly affects CPU usage. Set virtual buffer pool sizes large enough or reduce the workload on the buffer pool.

Field Name: QBSTDMDMC

This is an exception field.

PAGE-INS REQUIRED FOR WRITE

The number of page-ins required for a write I/O.

Field Name: QBSTWPI
Common Storage Below and Above 2 GB

This topic shows detailed information about “Statistics - Common Storage Below and Above 2 GB”.

Statistics - Common Storage Below and Above 2 GB

EXTENDED CSA SIZE (MB)

The size of the common storage area (CSA) above the 16 MB line.

Field Name: QW0225EC

FIXED POOL BELOW (MB)

The amount of storage allocated for 31-bit common fixed pool storage.

Field Name: QW0225FC

VARIABLE POOL BELOW (MB)

The amount of storage allocated for 31-bit common variable pool storage.

Field Name: QW0225VC

GETMAINED BELOW (MB)

The amount of storage allocated for 31-bit common getmained storage.

Field Name: QW0225GC

FIXED POOL ABOVE (MB)

The amount of storage allocated for 64-bit common fixed pool storage.

Field Name: QW0225FCG

VARIABLE POOL ABOVE (MB)

The amount of storage allocated for 64-bit common variable pool storage.

Field Name: QW0225VCG

GETMAINED ABOVE (MB)
The amount of storage allocated for 64-bit common getmained storage.

Field Name: QW0225GCG

STORAGE MANAGER CONTROL BLOCKS ABOVE (MB)

The amount of storage allocated for 64-bit common storage for storage manager control structures.

Field Name: QW0225SMC

REAL LOG MANAGER WRITE BUFFERS ABOVE (MB)

The amount of real storage in the 64-bit common area in use for Log Manager write buffers.

Field Name: S225LWR

REAL LOG MANAGER CONTROL BLOCKS ABOVE (MB)

The amount of real storage in the 64-bit common area in use for Log Manager control blocks.

Field Name: S225LCR

AUX LOG MANAGER CONTROL BLOCKS ABOVE (MB)

The amount of auxiliary storage in the 64-bit common area in use for Log Manager control blocks.

Field Name: S225LCA

REAL STORAGE IN USE (MB)

The amount of real storage in use for 64-bit common storage. This is recorded at the subsystem level.

Note: This field is available in z/OS 1.10 (and maintenance) or later.

Field Name: S225CSR

AVERAGE THREAD FOOTPRINT (MB)

The current average real storage in use for common storage of active user threads (allied threads + active and pooled DBATs).

Field Name: S225CTFR

AUXILIARY STORAGE IN USE (MB)

The amount of auxiliary storage in use for 64-bit common storage. This is recorded at the subsystem level.

Note: This field is available in z/OS 1.10 (and maintenance) or later.

Field Name: S225CSA
CPU and Storage Metrics

This topic shows detailed information about “Statistics - CPU and Storage Metrics”.

This block shows information about CPU usage and storage metrics gathered by the z/OS Resource Measurement Facility (RMF) interface. The subsystem parameter ZOSMETRICS must be set to YES for enabling DB2 to retrieve data from RMF.

Statistics - CPU and Storage Metrics

CP LPAR

The number of standard central processors (CPs) on the logical partition (LPAR) at the end of the defined Monitor III gatherer time interval (called MINTIME). This value does not include ZIIPs. This value is from Resource Measurement Facility (RMF) field CPUG3_PRCON.

Field Name: QWOSLNCP

CPU UTILIZATION LPAR

The percentage of the MINTIME time interval during which RMF reported that the entire LPAR was in use, averaged for a single processor. This value is calculated using Resource Measurement Facility (RMF) field CPUG3_LOGITI.

Field Name: QWOSLPRU

CPU UTILIZATION DB2

The percentage of the MINTIME time interval during which RMF reported that all DB2 address spaces were in use, calculated for a single processor.

Field Name: QWOSDB2U

CPU UTILIZATION DB2 MSTR

The percentage of the MINTIME time interval during which RMF reported that the DB2 MSTR address space was in use, calculated for a single processor.

Field Name: QWOSMSTU

CPU UTILIZATION DB2 DBM1

The percentage of the MINTIME time interval during which RMF reported that the DB2 DBM1 address space was in use, calculated for a single processor.
The percentage of the MINTIME time interval during which RMF reported that the DB2 DBM1 address space was in use, calculated for a single processor.

**Field Name:** QWOSDBMU

**UNREFERENCED INTERVAL COUNT**

The Unreferenced Interval Count (UIC). This value is RMF field GEIAHUIC_VE.

**Field Name:** QWOSLUIIC

**REAL STORAGE LPAR (MB)**

The total real storage in the LPAR, in MB. This value is derived from RMF field GEIRPOOL_VE, which is the number of online real storage frames.

**Field Name:** QWOSLRST

**FREE REAL STORAGE LPAR (MB)**

The free real storage in the LPAR, in MB. This value is derived from RMF field GEIRAFC, which is the number of available real storage frames.

**Field Name:** QWOSLRSF

**USED REAL STORAGE DB2 (MB)**

The real storage used by DB2 subsystems, in MB. This value is the sum of the following values for all DB2 address spaces in the LPAR, converted to MB:

- The number of frames for swapped-in users. This value is derived from RMF field ASIFMCT_VE.
- The number of frames for idle users. This value is derived from RMF field ASIFMCTI_VE.

**Field Name:** QWOSDRSU

**VIRTUAL STORAGE LPAR (MB)**

The total virtual storage in the LPAR, in MB. This value is the sum of the following values for all address spaces in the LPAR:

- The number of frames for swapped-in users. This value is derived from RMF field ASIFMCT_VE.
- The number of frames for idle users. This value is derived from RMF field ASIFMCTI_VE.
- The number of auxiliary slots. This value is derived from RMF field ASIAUXSC_VE.

**Field Name:** QWOSLVST

**FREE VIRTUAL STOR LPAR (MB)**

The free virtual storage in the LPAR, in MB. This value is the sum of the following values, converted to MB:

- The total real storage in the LPAR (QWOSLRST)
- The number of currently available slots (RMF field GEISLTA)

**Field Name:** QWOSLVSF

**USED VIRTUAL STOR DB2 (MB)**
CPU and Storage Metrics

The virtual storage used by DB2 subsystems, in MB. This value is the sum of the following values for all DB2 address spaces in the LPAR, converted to MB:

- The number of frames for swapped-in users. This value is derived from RMF field ASIFMCT_VE.
- The number of frames for idle users. This value is derived from RMF field ASIFMCTI_VE.

Field Name: QWOSDVSU
This topic shows detailed information about “Statistics - CPU Times”.

This block shows statistics data of CPU timer values for each resource manager and control address space.

DB2 can generate parallel tasks for the efficient execution of queries. Parallel tasks are executable units composed of special SRBs (service request block), which are called preemtatable SRBs. With preemtatable SRBs, the z/OS dispatcher can interrupt a task at any time to run other work at the same or higher dispatching priority. For non-distributed parallel work, parallel tasks run under a type of preemtatable SRB, which is called a client SRB. The client SRB lets the parallel task inherit the importance of the originating address space. For distributed requests, the parallel tasks run under a preemtatable SRB, which is called an enclave SRB.

Statistics - CPU Times

LOG RECORDS CAPTURED

The number of log records retrieved for which data capture processing was invoked.

Field Name: QWSDCDLC

LOG READS PERFORMED

The total number of data capture log reads for processing IFI reads requests for IFCID 185.

Field Name: QWSDCDLR

LOG RECORDS RETURNED

The total number of data capture log records returned.

Field Name: QWSDCDRR

DATA ROWS RETURNED

The total number of data capture data rows returned.

Field Name: QWSDCDDR

DESCRIBES PERFORMED

The total number of data capture describes performed.

A data capture describe is the process of getting descriptive information about a DB2 table from the catalog.

Field Name: QWSDCDMB

DATA DESCRIPTIONS RETURNED

The total number of data capture describes performed.

A data capture describe is the process of getting descriptive information about a DB2 table from the catalog.

Field Name: QWSDCDDD

TABLES RETURNED

The total number of data capture tables returned to the caller of the IFI reads call for IFCID 185.

Field Name: QWSDCDTB
This topic shows detailed information about “Statistics - Data Set Statistics”.

Within IFCID 199, DB2 externalizes data set performance counters for open data sets that had high I/O activities (at least 1 I/O per second) in the last Statistics interval (determined by system parameter STATIME). The metrics are reported with respect to a page set to which a data set belongs and which makes up a DB2 table space or index space. The average values are calculated with respect to the I/O start and end times shown in the report.

You have to use the DSETSTAT report option for creating the data set Statistics report block. The report shows data set metrics from the perspective of buffer pools which are assigned to page sets and related data sets. The DSETSTAT report option is ignored in the Statistics REPORT or SAVE subcommand if an INTERVAL(X) option with X>0 has been specified.

Statistics - Data Set Statistics

The field labels shown in the following sample layout of “Statistics - Data Set Statistics” are described in the following section.

**BPOOL**

The name of the buffer pool to which this information refers.

**Field Name:** S199BPNM

**DATABASE**

Database name.

**Field Name:** S199DBNM

**SPACENAM**

Pageset name, which can be a table space or an index space.

This is derived from the internal pageset identifier. For a table space this is the value in the PSID column in SYSTABLESPACE of the catalog when the DB2 trace record was written. For an index space, this is the value in the ISOBID column in SYSINDEXES.

When OMEGAMON XE for DB2 PE cannot determine the pageset name, the ID is shown in hexadecimal.

**Field Name:** S199OBNM

**PART**
Data Set Statistics

For a partitioned table space or index space, this is the partition number.
For a nonpartitioned table space or index space, this is the data set number.

Field Name: QW0199DN

TYPE

This field indicates whether the pageset is a table space (T or TSP) or an index space (I or IDX).

Field Name: S199TYP

GBP

The value in this field specifies whether the pageset is group buffer pool dependent. This is only possible if DB2 has been set up for data sharing.

Field Name: S199GBP

SHDW

Indicates if it is a shadow data set.

Field Name: QW0199SD

I/O START TIME

The start time of the I/O activities for this data set externalized in the data set Statistics record. The field value is derived from QW0199SC.

Field Name: S199SC

I/O END TIME

The end time of the I/O activities for this dataset externalized in the data set Statistics record.

Field Name: S199EC

SYNCH I/O AVG

Average number of synchronous I/Os for the pageset, per second.

Field Name: S199SPAV

ASYNC I/O AVG

Average number of asynchronous I/Os for the pageset, per second.

Field Name: S199ACAV

ASY I/O PGS AVG

Average number of pageset pages read or written per asynchronous I/O.

Field Name: S199APAV

SYN I/O AVG DELAY

Average synchronous I/O delay for pages in the pageset, in milliseconds.

Field Name: QW0199SV

SYN I/O MAX DELAY

Maximum synchronous I/O delay for pages in the pageset, in milliseconds.

Field Name: QW0199SX

ASYN I/O AVG DELAY
Average asynchronous I/O delay for pages in the pageset, in milliseconds.

Field Name: QW0199AD

**ASYN I/O MAX DELAY**

The maximum asynchronous I/O delay for pages in the pageset, in milliseconds.

Field Name: QW0199AX

**CURRENT PAGES (VP)**

Number of pageset pages in the virtual buffer pool.

Field Name: QW0199VP

**CHANGED PAGES (VP)**

Number of changed page set pages in the virtual buffer pool.

Field Name: QW0199VD

**NUMBER OF GETPAGES**

The current number of Getpage requests.

Field Name: QW0199GP
This topic shows detailed information about “Statistics - Data Sharing Locking”.

In this example, the quantities per thread show as not calculated (N/C) because DB2 threads remained open during the reporting period.

Statistics - Data Sharing Locking

The field labels shown in the following sample layout of “Statistics - Data Sharing Locking” are described in the following section.

</tbody>
</table>

GLOBAL CONTENTION RATE (%)

The total number of suspends because of contention divided by the total number of synchronous requests that went to XES, and the lock requests that were converted from synchronous to asynchronous locks, and the locks because of child lock propagation.

Note: If multiple members from the same data sharing group run on the same LPAR, the global contention rate should be ignored for a member where the QTGSFCN flag is zero. The QTGSFCN flag indicates whether the false contention is reported at the subsystem (=1) or LPAR level (=0).

Field Name: SGLOBRAT

FALSE CONTENTION RATE (%)

The total number of suspends because of false contention divided by the total number of synchronous requests that went to XES, and the lock requests that were converted from synchronous to asynchronous locks, and
the locks because of child lock propagation. A false contention is if two different locks on different resources hash to the same lock entry.

**Note:** If multiple members from the same data sharing group run on the same LPAR, the global contention rate should be ignored for a member where the QTGSFCON flag is zero. The QTGSFCON flag indicates whether the false contention is reported at the subsystem (=1) or LPAR level (=0).

**Background and Tuning Information**

Try to keep the false contention rate to no more than 50% of the total global lock contention.

**Field Name:** SFLSERAT

**P/L-LOCKS XES RATE (%)**

Shows the percentage of P/L-lock requests that were propagated to XES synchronously.

**Background and Tuning Information**

This number reflects the effects of explicit hierarchical locking and other locking optimizations. Assuming a 100% Data Sharing workload, a value of 94% would mean that 6% of all Transaction Locks were not propagated to XES due to Data Sharing locking optimizations.

DB2 has some optimizations to reduce the necessity to go beyond the local IRLM whenever possible:

- Explicit hierarchical locking allows IRLM to grant child locks locally when there is no inter-DB2 R/W interest on the parent.
- If there is a single DB2 with update interest and multiple DB2s with read-only interest, DB2 propagates fewer locks than when all DB2s have update interest in the page set.
- All locks that go beyond the local IRLM are owned by the subsystem, not by an individual work unit. This allows for another optimization. Only the most restrictive lock mode for an object on a given subsystem must be propagated to XES and the coupling facility. A new lock that is equal to or less restrictive than one currently being held is not propagated.

**Field Name:** SLOOCRA

**LOCK REQUESTS (P-LOCKS)**

The number of lock requests for P-locks.

**Field Name:** QTGSLPLK

**UNLOCK REQUESTS (P-LOCKS)**

The number of unlock requests for P-locks.

**Field Name:** QTGSUPLK

**CHANGE REQUESTS (P-LOCKS)**

The number of change requests for P-locks.

**Field Name:** QTGSCPLK

**SYNCH.XES - LOCK REQUESTS**

The number of P/L-lock requests propagated to z/OS XES synchronously.
This number is not incremented if the request is suspended before going to XES.

Field Name: QTGSLSLM

SYNCH.XES - CHANGE REQUESTS

The number of change requests propagated to z/OS XES synchronously, including logical and physical locks.

This number is not incremented if the request is suspended before going to XES.

Field Name: QTGSCSCLM

SYNCH.XES - UNLOCK REQUESTS

The number of unlock requests propagated to z/OS XES synchronously, including logical and physical locks.

This number is not incremented if the request is suspended before going to XES.

Field Name: QTGSUSLM

BACKGROUND.XES - CHILD LOCKS

The number of resources propagated by IRLM to z/OS XES asynchronously, including logical and physical locks.

This can happen when new inter-DB2 interest occurs on a parent resource or when a request completes after the requester’s execution unit was suspended.

Field Name: QTGSKIDS

ASYNCH.XES - CONVERTED LOCKS

The number of synchronous to asynchronous heuristic conversions for LOCK requests in XES. This conversion is done when XES determines that it is more efficient to drive the request asynchronously to the coupling facility (CF).

Field Name: QTGSLSE

SUSPENDS - IRLM GLOBAL CONT

The number of suspensions due to IRLM global resource contention. All IRLM lock states were in conflict on the same resource.

Global contention requires intersystem communication to resolve the lock conflict whereas local contention does not.

Field Name: QTGSICL0

SUSPENDS - XES GLOBAL CONT.

The number of suspensions due to z/OS XES global resource contention. The z/OS XES lock states were in conflict but the IRLM lock states were not.

IRLM has many lock states but XES is only aware of the exclusive and shared lock states.

Field Name: QTGSGLO

SUSPENDS - FALSE CONT. MBR
The total number of false contentions for LOCK and UNLOCK requests. A false contention occurs when different resource names hash to the same entry in the coupling facility (CF) lock table. The CF detects contention within the hash entry, and XES uses intersystem messaging to determine that no actual resource contention exists.

**Note:** The QTGSFCON flag indicates whether the false contention is reported at subsystem (=1) or LPAR level (=0).

**Field Name:** STGSFLM1

**SUSPENDS - FALSE CONT. LPAR**

The total number of false contentions for LOCK and UNLOCK requests. A false contention occurs when different resource names hash to the same entry in the coupling facility (CF) lock table. The CF detects contention within the hash entry, and XES uses intersystem messaging to determine that no actual resource contention exists.

**Note:** The QTGSFCON flag indicates whether the false contention is reported at subsystem (=1) or LPAR level (=0).

**Field Name:** STGSFLM2

**NO DELAY LOCK REQ REJECTS**

The total number of failed DB2 lock requests to XES to process without delay. XES rejects the lock request because it could not process it synchronously.

**Field Name:** QTGSCREJ

**INCOMPATIBLE RETAINED LOCK**

The number of global lock or change requests denied or suspended due to an incompatible retained lock.

**Field Name:** QTGSDRTA

**NOTIFY MESSAGES SENT**

The number of notify messages sent.

**Field Name:** QTGSNTFY

**NOTIFY MESSAGES RECEIVED**

The number of notify messages received.

**Field Name:** QTGSNTFR

**P-LOCK/NOTIFY EXITS ENGINES**

The maximum number of engines available for physical lock exit or notify exit requests.

**Field Name:** QTGSPEMX

**P-LCK/NFY EX.ENGINE UNAVAL**

The number of times an engine is not available for physical lock exit or notify exit requests.

**Field Name:** QTGSPEQW

**PSET/PART P-LCK NEGOTIATION**
Data Sharing Locking

The number of times this DB2 was driven to negotiate a partition or page set physical lock due to changing inter-DB2 interest levels on the partition or page set.

**Field Name:** QTGSPPPE

**PAGE P-LOCK NEGOTIATION**

The number of times this DB2 negotiated a page physical lock because of physical lock contention within DB2.

**Field Name:** QTGSPGPE

**OTHER P-LOCK NEGOTIATION**

The number of times this DB2 was driven to negotiate a physical lock type other than page set, partition, or page.

**Field Name:** QTGSOTPE

**P-LOCK CHANGE DURING NEG.**

The number of times a physical lock change request was issued during physical lock negotiation.

**Field Name:** QTGSCHNP
DBM1 and MVS Storage Below 2 GB

This topic shows detailed information about “Statistics - DBM1 and MVS Storage Below 2 GB”.

This block shows information about storage allocation within the DBM1 address space.

Storage quantities are shown in megabytes, this means that when you want to compare this with absolute values, as stored in the performance database, for example, you need to multiply the value shown by 1048576 (1024*1024). Similarly where a quantity is shown followed by a K, for example 262.1K, the quantity shown is 262.1MB*1000 (262.1*1048576*1000 bytes).

Statistics - DBM1 and MVS Storage Below 2 GB

The field labels shown in the following sample layout of “Statistics - DBM1 and MVS Storage Below 2 GB” are described in the following section.

<table>

</table>

TOTAL DBM1 STORAGE BELOW 2 GB (MB)

Total DBM1 storage. This includes:
- Fixed length storage use
- Getmained storage
- Save areas
- Variables

Field Name: SW0225DB

TOTAL GETMAINED STORAGE (MB)
Total storage acquired by GETMAIN. This includes space for virtual pools, EDM pool, compression dictionary, castout buffers, and the data space lookaside buffer, and data space buffer pool control blocks.

This figure can be different from the sum of GETMAIN storage items shown in the statistics DBM1 storage, because DB2 does not produce grouping statistics for all GETMAIN storage.

Field Name: QW0225GM
TOTAL VARIABLE STORAGE (MB)
Total storage used by all variable pools. This includes storage used by:
- System agents
- Local agents
- RID pool
- Pipe manager subpool
- Local dynamic statement cache control blocks
- Local dynamic statement cache statement pool
- Buffer and data manager trace tables
- A list of objects in restricted state including the new PRO state. If consumption of this storage pool is high, review restrictive exception state of database objects and check whether they can be resolved or reduced.

Field Name: QW0225VR
TOTAL AGENT LOCAL STORAGE (MB)
The amount of storage allocated for agent-related local storage. This storage is used for operations such as sort.

Background and Tuning Information
Sorting requires a large amount of virtual storage because there can be multiple copies of the data being sorted at a given time.

DB2 Sort uses two kinds of storage pool for various internal control structures and data records, an agent-related local storage pool and a global sort pool. To take advantage of the 64-bit addressability for larger storage pool, some high level sort control structures are kept in agent-related storage below the 2 GB bar, which contain 64-bit pointers to areas in the global sort pool above the 2 GB bar. The sort pool above 2 GB contains sort tree nodes and data buffers.

Field Name: QW0225AL
TOTAL AGENT SYSTEM STORAGE (MB)
Storage used by system agents.

Field Name: QW0225AS
NUMBER OF PREFETCH ENGINES
Number of engines used for sequential, list, and dynamic prefetch.

Field Name: QW0225PF
NUMBER OF DEFERRED WRITE ENGINES
Number of engines used for deferred write operations.

Field Name: QW0225DW
NUMBER OF CASTOUT ENGINES
Number of engines available for data-sharing castout processing.
Field Name: QW0225CE

NUMBER OF GBP WRITE ENGINES
Number of engines for group buffer pool writes.
Field Name: QW0225GW

NUMBER OF P-LOCK/NOTIFY EXIT ENGINES
Number of data sharing P-Lock engines and Notify Exit engines.
Field Name: QW0225PL

TOTAL AGENT NON-SYSTEM STORAGE (MB)
Total Agent Non-System Storage. It is the difference between the Total Agent Local Storage (QW0225AL) and the Total Agent System Storage (QW0225AS).
Field Name: SW0225AN

TOTAL NUMBER OF ACTIVE USER THREADS
Total number of active user threads. This includes all active allied threads and the current number of active DBATs.
Field Name: SACUSTHR

NUMBER OF ALLIED THREADS
The number of active allied threads.
Field Name: QW0225AT

NUMBER OF ACTIVE DBATS
The number of active connections, or active and disconnected DBAT threads.
Field Name: SACDBATS

NUMBER OF POOLED DBATS
The current number of disconnected (pooled) DBATs that are available to process type 2 inactive or new connections.
Field Name: QDSTNADS

NUMBER OF PARALLEL CHILD THREADS
The number of active parallel child threads.
Field Name: QW0225PT

SYSTEM COPIES OF CACHED SQL STMTS (MB)
The total shareable storage allocated for dynamic SQL statements used by active threads.
- For DB2 11, this field is derived from QW0225SC8 and related to storage above the bar.
- Prior to DB2 11, this field is derived from QW0225SC and related to storage below the bar. The storage is used for executable code sequences (xPROC).
Field Name: SW0225SC
IN USE STORAGE (MB)

The total shareable storage requested for dynamic SQL statements used by active threads.
- For DB2 11, this field is derived from QW0225LS8 and related to storage above the bar.
- Prior to DB2 11, this field is derived from QW0225LS and related to storage below the bar. The storage is used for executable code sequences (xPROC).

Field Name: SW0225LS

HWM FOR ALLOCATED STATEMENTS (MB)

A statistics interval high-water mark of requested shareable storage for dynamic SQL statements used by active threads.
- For DB2 11, this field is derived from QW0225HS8 and related to storage above the bar.
- Prior to DB2 11, this field is derived from QW0225HS and related to storage below the bar. The storage is used for executable code sequences (xPROC).

Field Name: SW0225HS

SYSTEM COPIES OF STATIC SQL (MB)

The total shareable storage allocated for static SQL statements.
- For DB2 11, this field is derived from QW0225SX8 and related to storage above the bar.
- Prior to DB2 11, this field is derived from QW0225SX and used for storage of executable code sequences (xPROC) below the bar.

Field Name: SW0225SX

IN USE STORAGE (MB)

The total storage requested for shareable static SQL statements.
- For DB2 11, this field is derived from QISEKSPA and related to storage above the bar.
- Prior to DB2 11, this field is derived from QISEKSPA8 and used for storage of executable code sequences (xPROC) below the bar.

Field Name: SISEKSPA

THREAD PLAN AND PACKAGE STORAGE (MB)

The storage allocated to plans and packages below the bar.

Field Name: SINESQB

BUFFER MANAGER STORAGE CNTL BLKS (MB)

Storage used for page set control blocks.

Field Name: QW0225BB

TOTAL FIXED STORAGE (MB)

Total amount of fixed storage.

Field Name: QW0225FX

TOTAL GETMAINED STACK STORAGE (MB)

Total GETMAINED storage allocated for program stack use.
Field Name: QW0225GS

TOTAL STACK STORAGE IN USE (MB)

The amount of stack storage that is in use.

Field Name: QW0225SU

SYSTEM AGENT STACK STORAGE IN USE (MB)

The amount of 31-bit stack storage that is in use for system agents. This is a subset of QW0225SU.

Field Name: QW0225SS

STORAGE CUSHION (MB)

Storage reserved to allow DB2 to complete critical functions while short on storage. This includes the contract warning cushion, storage reserved for must-complete operations, and storage for MVS use.

Field Name: STORCUSH
DBM1 Storage Above 2 GB

This topic shows detailed information about “Statistics - DBM1 Storage Above 2 GB”.

GETMAINED STORAGE (MB)

Total storage acquired by GETMAIN. This includes space for the compression dictionary, and statement and DBD cache that can be used by the Environmental Descriptor Manager (EDM).

This figure can be different from the sum of GETMAIN storage items shown in the statistics DBM1 storage, because DB2 does not produce grouping statistics for all GETMAIN storage.

Field Name: QW0225GA
COMPRESSION DICTIONARY (MB)
Storage space allocated for the compression dictionary.
Field Name: QW0225CD

IN USE EDM DBD POOL (MB)
The amount of storage used by database descriptors in the EDM DBD pool above the 2 GB bar.
Field Name: SISEDDBDP

IN USE EDM STATEMENT POOL (MB)
The amount of storage used by cached dynamic SQL statements in the EDM Statement pool above the 2 GB bar.
Field Name: SISEDYNP

IN USE EDM RDS POOL (MB)
The amount of storage used by objects in the EDM RDS pool above the 2 GB bar.
Field Name: SISECPTA

IN USE EDM SKELETON POOL (MB)
The amount of storage used by objects in the EDM Skeleton pool above the 2 GB bar.
Field Name: SISESKCP

FIXED STORAGE POOL (MB)
The total amount of fixed storage above the 2 GB bar.
Field Name: QW0225FA

VARIABLE STORAGE POOL (MB)
Amount of variable storage available above the 2 GB bar.
Field Name: QW0225VA

STORAGE MANAGER CONTROL BLOCKS (MB)
Total 64-bit storage allocated for storage manager control structures.
Field Name: QW0225SM

VIRTUAL BUFFER POOLS (MB)
Total storage allocated for virtual buffer pools above the 2 GB bar.
Field Name: SVPOOLZ

VIRTUAL POOL CONTROL BLOCKS (MB)
Storage used for primary virtual pool control blocks above the 2 GB bar.
Field Name: SBSTVPLZ

CASTOUT BUFFERS (MB)
Storage used for castout buffers.
Field Name: SW0225C2

SHARED GETMAINED STORAGE (MB)
The amount of virtual shared storage acquired by GETMAIN above the 2 GB bar.

**Field Name:** QW0225SG

### STORAGE FOR STMT DEPENDENCIES (MB)

The amount of storage allocated above the 2 GB bar to support object dependencies on statements that are in the Dynamic Statement Cache (DB2 field: QW0225DMH).

**Field Name:** SW225DMH

### SHARED FIXED STORAGE (MB)

The amount of total fixed virtual shared storage above the 2 GB bar.

**Field Name:** QW0225SF

### RID POOL (MB)

Storage for RID list processing such as list prefetch, index ANDing, and ORing.

**Field Name:** QW0225RP

### SHARED VARIABLE STORAGE (MB)

The amount of virtual shared variable storage above the 2 GB bar.

**Field Name:** QW0225SV

### TOTAL AGENT LOCAL STORAGE (MB)

The amount of storage allocated for agent-related 64-bit local storage (DB2 field: QW0225ALG).

**Field Name:** SW225ALG

### TOTAL AGENT SYSTEM STORAGE (MB)

The amount of 64-bit storage used by system agents (DB2 field: QW0225ASG).

**Field Name:** SW225ASG

### TOTAL AGENT NON-SYSTEM STORAGE (MB)

The amount of 64-bit storage used by non-system agents. It is the difference between the Total Agent Local Storage (QW0225ALG) and the Total Agent System Storage (QW0225ASG).

**Field Name:** SW225ANG

### THREAD COPIES OF CACHED SQL STMTS (MB)

This field is provided for consistency purposes. It has a value of N/A. The value can be estimated by the HWM FOR ALLOCATED STATEMENTS (QW0225H2).

**Field Name:** SW0225DY

### IN USE STORAGE (MB)

The total non-shareable storage requested for dynamic SQL statements used by active threads. This value is related to shared agent local variable pools above the bar.

**Field Name:** QW0225L2
STATMENTS COUNT
The number of dynamic SQL local cache statements used by active threads. This value is related to shared agent local variable pools above the bar.

Field Name: QW0225LC

HWM FOR ALLOCATED STATEMENTS (MB)
This value is related to shared agent local variable pools above the bar.

Field Name: QW0225H2

STATEMENT COUNT AT HWM
The number of dynamic SQL local cache statements used by active threads at high storage time. This value is related to shared agent local variable pools above the bar.

Field Name: QW0225HC

DATE AT HWM
The timestamp at high-water storage.

Field Name: QW0225HT

TIME AT HWM
The timestamp at high-water storage.

Field Name: QW0225HT

DYNAMIC STMT CACHE CNTL BLKS (MB)
The total statement cache storage blocks above the bar (64-bit shared variable pool).

Field Name: QW0225S2

SYSTEM COPIES OF CACHED SQL STMTS (MB)
The total sharable storage allocated for dynamic SQL statements used by active threads.

Field Name: SW0225SC

IN USE STORAGE (MB)
The total sharable storage requested for dynamic SQL statements used by active threads.

Field Name: SW0225LS

HWM FOR ALLOCATED STATEMENTS (MB)
A statistics interval high-water mark of requested shareable storage for dynamic SQL statements used by active threads.

- For DB2 11, this field is derived from QW0225HS8 and related to storage above the bar.
- Prior to DB2 11, this field is derived from QW0225HS and related to storage below the bar. The storage is used for executable code sequences (xPROC).

**Field Name:** SW0225HS

**SYSTEM COPIES OF STATIC SQL (MB)**

The total shareable storage allocated for static SQL statements.

- For DB2 11, this field is derived from QW0225SX8 and related to storage above the bar.
- Prior to DB2 11, this field is derived from QW0225SX and used for storage of executable code sequences (xPROC) below the bar.

**Field Name:** SW0225SX

**IN USE STORAGE (MB)**

The total storage requested for shareable static SQL statements.

- For DB2 11, this field is derived from QISEKSPA and related to storage above the bar.
- Prior to DB2 11, this field is derived from QISEKSPA8 and used for storage of executable code sequences (xPROC) below the bar.

**Field Name:** SISEKSPA

**THREAD PLAN AND PACKAGE STORAGE (MB)**

The storage allocated to plans and packages above the bar.

**Field Name:** SISESQA

**ARRAY VARIABLE STORAGE**

The amount of storage in use for array variables.

**Field Name:** QW0225AR

**SHARED STORAGE MANAGER CNTL BLKS (MB)**

The amount of 64-bit shared storage allocated for storage manager control structures (DB2 field: QW0225SMS).

**Field Name:** SW225SMS

**SHARED SYSTEM AGENT STACK STORAGE (MB)**

The amount of 64-bit shared storage allocated for system agent stack use (DB2 field: QW0225GSG_SYS).

**Field Name:** SW225GSY

**STACK STORAGE IN USE (MB)**

The amount of 64-bit shared system agent stack that is in use (DB2 field: QW0225SUG_SYS).

**Field Name:** SW225SSY

**SHARED NON-SYSTEM AGENT STACK STORAGE (MB)**
The amount of 64-bit shared storage allocated for non-system agent stack use (DB2 field: QW0225GSG).

Field Name: SW225GSG

STACK STORAGE IN USE (MB)

The amount of 64-bit shared non-system agent stack that is in use (DB2 field: QW0225SUG).

Field Name: SW225SUG
Dynamic SQL Statement

This topic shows detailed information about “Statistics - Dynamic SQL Statement”.

Statistics - Dynamic SQL Statement

The field labels shown in the following sample layout of “Statistics - Dynamic SQL Statement” are described in the following section.

</tbody>
</table>

**PREPARE REQUESTS**

The number of requests for prepared statement cache sections.

Field Name: QISEDSG

**PREPARE REQUESTS - FULL PREPARES**

The number of full prepare requests.

A Full Prepare occurs for both Explicit Prepare and Implicit Prepare requests when the skeleton copy of the prepared SQL statement is not found in global dynamic SQL cache in the EDM pool.

Field Name: QISEDSI

**PREPARE REQUESTS - SHORT PREPARES**

The number of short prepare requests.

A Short Prepare is executed for both Explicit Prepare and Implicit Prepare requests when the skeleton copy of the prepared SQL statement is found in global dynamic SQL cache in the EDM pool.

For DB2 12 or later, this number also includes the number of catalog loads to solve a prepare request.

Field Name: SPREPSHT
SHORT PREPARES
The number of short prepare requests.
A Short Prepare is executed for both Explicit Prepare and Implicit Prepare requests when the skeleton copy of the prepared SQL statement is found in global dynamic SQL cache in the EDM pool.
For DB2 12 or later, this number also includes the number of catalog loads to solve a prepare request.
Field Name: SPREPSHT

SHORT PREPARES - BASED ON CACHE
The number of short prepare requests based on cache.
For DB2 12 or later, the number of loads from the catalog is excluded.
Field Name: SCACHSHT

SHORT PREPARES - BASED ON CATALOG
The number of times a dynamic SQL statement is found in a catalog.
Field Name: QISEDPSF

LOOK-UP IN CATALOG
The number of look-ups in a catalog to satisfy a dynamic SQL statement prepare request.
This field is updated when a statement is not found in the cache and the criteria is met to look for it in the catalog table. It is only incremented on the first look up and not if there are multiple rows that might be a match.
This is a system level value so it will be the number of times it has been checked since DB2 was started. It is incremented even if no copies of the statement have been captured.
Field Name: QISEDPSL

CACHE HIT RATIO (%)
The cache hit ratio in percent.
This field is a performance indicator for dynamic SQL statement execution.
If this number is high, many fast Short Prepares cause a good performance.
If this number is low, many slow Full Prepares lower the statement execution.
Field Name: SCACHHRA

CACHE+CATALOG HIT RATIO (%)
The cache and catalog hit ratio in percent.
This field is a performance indicator for dynamic SQL statement execution when DPS (Dynamic Plan Stability) is used. It provides how efficient DB2 loads dynamic statements from the catalog and the cache. Always observe this field in combination with the Cache Hit Ratio to identify how efficient DPS works.
Field Name: STOTCHRA

TOTAL PREPARES
The number of all Explicit and Implicit prepare requests.
An Explicit Prepare occurs when an SQL PREPARE or EXECUTE IMMEDIATE is requested by the application. An Explicit Prepare always results in either a Short Prepare or a Full Prepare.

An Implicit Prepare occurs when the user copy of the prepared SQL statement no longer exists in the local dynamic SQL cache. An Implicit Prepare always results in either a Short Prepare or a Full Prepare.

Field Name: SPREPSUM

TOTAL PREPARES - EXPLICIT PREPARES

The number of SQL PREPARE statements executed. This number at the server location might not match the number at the user application because of the internal processing of the Distributed Data Facility (DDF).

Field Name: QXPREP

TOTAL PREPARES - IMPLICIT PREPARES

An implicit prepare occurs when the user copy of the prepared SQL statement no longer exists in the local dynamic SQL cache and the application plan or package is bound with KEEPDYNAMIC YES.

If the skeleton copy of the prepared SQL statement exists in the global dynamic SQL cache in the EDM pool, a short prepare is executed, otherwise a full prepare is executed.

Field Name: QXSTIPRP

STABILIZED PREPARES

The number of loads from the catalog.

It shows the number of times a PREPARE request was satisfied by making a copy from the stabilized statement in the SYSIBM.SYSDYNQRY catalog table. The stabilized statement search is done only when no matching statement was found in the prepared statement cache. This field should be identical to QISEDPSL, but it is reported from the QXST section (SQL Statement Execution).

Field Name: QXSTSFND

PREPARES AVOIDED

This field indicates the number of times where no SQL PREPARE or EXECUTE IMMEDIATE was issued by the application and a copy of a prepared SQL statement was found in local dynamic SQL cache.

When an application plan or package is bound with KEEPDYNAMIC YES, a copy of each prepared SQL statement for the application thread is held in the local dynamic SQL cache and kept across a commit boundary.

An application thread can save the total cost of a prepare by using a copy of the prepared statement in the local dynamic SQL cache from an earlier prepare by the same thread. To do this, the application must be modified to avoid issuing repetitive SQL PREPAREs for the same SQL statement.

Field Name: QXSTNPRP

CACHE LIMIT EXCEEDED

The number of times statements are invalidated in the local dynamic SQL cache because the MAXKEEPD limit has been reached and prepared SQL statements in the local dynamic SQL cache have to be reclaimed.
Field Name: QXSTDEXP

PREP STMT PURGED

The number of times statements are invalidated in the local dynamic SQL cache because of SQL DDL or updated RUNSTATS information and prepared SQL statements in the local dynamic SQL cache have to be reclaimed.

Field Name: QXSTDINV

LOCAL CACHE HIT RATIO (%)

The local cache hit ratio. This shows the percentage of SQL statements that avoided prepares because the statements were retrieved from the local cache. It indicates the effectiveness of the local SQL statement cache.

A value near to 100 indicates that in most cases DB2 found skeleton copies of prepared statements in local dynamic cache and avoided statement prepares.

A value near to 0 indicates that in most cases skeleton copies of prepared statements were not found in local dynamic cache and implicit prepares were performed.

Field Name: SLCACRAT

CSWL - STMTS PARED

The number of times DB2 parsed dynamic statements because CONCENTRATE STATEMENTS WITH LITERALS behavior was used for the prepare of the statement for the dynamic statement cache.

Field Name: QXSTCWLP

CSWL - LITS REPLACED

The number of times DB2 replaced at least one literal in a dynamic statement because CONCENTRATE STATEMENTS WITH LITERALS was used for the prepare of the statement for dynamic statement cache.

Field Name: QXSTCWLR

CSWL - MATCHES FOUND

The number of times DB2 found a matching reusable copy of a dynamic statement in cache during prepare of a statement that had literals replaced because of CONCENTRATE STATEMENTS WITH LITERALS.

Field Name: QXSTCWLM

CSWL - DUPLS CREATED

The number of times DB2 created a duplicate STMT instance in the statement cache for a dynamic statement that had literals replaced by CONCENTRATE STATEMENTS WITH LITERALS behavior. The duplicate STMT instance was needed because a cache match failed because the literal reusability criteria was not met.

Field Name: QXSTCWLD
This topic shows detailed information about “Statistics - DB2 API”.

**Statistics - DB2 API**

**ABENDS**

The number of instrumentation facility interface (IFI) abends.

Field Name: QWSDSCA

**UNRECOGNIZED**

The number of calls made to IFI using a function that is not recognized by the interface.

Field Name: QWSDSCU

**COMMAND REQUESTS**

The number of calls made to IFI using the COMMAND function.

Field Name: QWSDSCCO

**READA REQUESTS**

The number of calls made to IFI using the READA (read asynchronous data) function.

Field Name: QWSDSCRA

**READS REQUESTS**

The number of calls made to IFI using the READS (read synchronous data) function.

Field Name: QWSDSCRS

**WRITE REQUESTS**

The number of calls made to IFI using the WRITE function.

Field Name: QWSDSCWR

**TOTAL**

The total number of calls made to IFI.

**DISPLAY DATABASE**

The number of DB2 DISPLAY DATABASE commands issued to view objects within one or more DB2 databases. This includes normal and abnormal completion of the command.

**Field Name:** Q9STCTR0

**DISPLAY THREAD**

The number of DB2 DISPLAY THREAD commands issued to view threads active within the DB2 subsystem. This includes normal and abnormal completion of the command.

**Field Name:** Q9STCTR1

**DISPLAY UTILITY**

The number of DB2 DISPLAY UTILITY commands issued to view the status of one or more DB2 utilities. This includes normal and abnormal completion of the command.

**Field Name:** Q9STCTR2

**DISPLAY TRACE**

The number of DB2 DISPLAY TRACE commands issued to determine the currently active DB2 traces. This includes normal and abnormal completion of the command.

**Field Name:** Q9STCTR3

**DISPLAY RLIMIT**

The number of DB2 DISPLAY RLIMIT commands issued to view the current status of the DB2 resource limit facility. This includes normal and abnormal completion of the command.

**Field Name:** Q9STCTR4

**DISPLAY LOCATION**

The number of DB2 DISPLAY LOCATION commands issued to display statistics about threads with a distributed relationship. This includes normal and abnormal completion of the command.

**Field Name:** Q9STCTR5

**DISPLAY ARCHIVE**

The number of DB2 DISPLAY ARCHIVE commands issued. This includes normal and abnormal completion of the command.

**Field Name:** Q9STCTRQ
DISPLAY BUFFERPOOL
The number of DB2 DISPLAY BUFFERPOOL commands issued. This includes normal and abnormal completion of the command.
Field Name: Q9STCTRO

DISPLAY GROUPBUFFERPOOL
The number of DB2 DISPLAY GROUPBUFFERPOOL commands issued. This includes normal and abnormal completion of the command.
Field Name: Q9STCTRT

DISPLAY GROUP
The number of DB2 DISPLAY GROUP commands issued. This includes normal and abnormal completion of the command.
Field Name: Q9STCTRX

DISPLAY PROCEDURE
The number of DB2 DISPLAY PROCEDURE commands executed. This includes normal and abnormal completion of the command.
Field Name: Q9STCTRU

DISPLAY FUNCTION
The number of DB2 DISPLAY FUNCTION commands issued. This includes normal and abnormal completion of the command.
Field Name: Q9STCTRZ

DISPLAY LOG
The number of DB2 DISPLAY LOG commands issued. This includes normal and abnormal completion of the command.
Field Name: Q9STCTX3

DISPLAY DDF
The number of DB2 DISPLAY DDF commands issued. This includes normal and abnormal completion of the command.
Field Name: Q9STCTX5

DISPLAY PROFILE
The number of DB2 DISPLAY PROFILE commands issued. This includes normal and abnormal completion of the command.
Field Name: Q9STCTSD

DISPLAY ACCEL
The number of DB2 DISPLAY ACCEL commands issued. This includes normal and abnormal completion of the command.
Field Name: Q9STCTDA

DISPLAY DYNQUERYCAPTURE
The number of DISPLAY DYNQUERYCAPTURE DB2 commands.
Field Name: Q9STCTDQ

ALTER BUFFERPOOL
DB2 Commands

The number of DB2 ALTER BUFFERPOOL commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTRN

ALTER GROUPBUFFERPOOL

The number of DB2 ALTER GROUPBUFFERPOOL commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTRS

ALTER UTILITY

The number of DB2 ALTER UTILITY commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTRY

START DATABASE

The number of DB2 START DATABASE commands issued to make a database available for use. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR5

START TRACE

The number of DB2 START TRACE commands issued to initiate a DB2 trace. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR6

START DB2

The number of DB2 START DB2 commands issued to bring up a DB2 subsystem. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR7

START RLIMIT

The number of DB2 START RLIMIT commands issued to enable the DB2 resource limit facility. This includes normal and abnormal completion of the command.

Field Name: Q9STCTRE

START DDF

The number of DB2 START DDF commands issued to enable the DB2 distributed data facility. This includes normal and abnormal completion of the command.

Field Name: Q9STCTRI

START PROCEDURE

The number of DB2 START PROCEDURE commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTRV

START FUNCTION

The number of DB2 START FUNCTION commands issued. This includes normal and abnormal completion of the command.
Field Name: Q9STCTX0

START PROFILE
The number of DB2 START PROFILE commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTSS

START ACCEL
The number of DB2 START ACCEL commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTSA

START DYNQUERYCAPTURE
The number of START DYNQUERYCAPTURE DB2 commands.

Field Name: Q9STCTSQ

STOP DATABASE
The number of DB2 STOP DATABASE commands issued to prevent access to a DB2 database. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR8

STOP TRACE
The number of DB2 STOP TRACE commands issued to terminate one or more active DB2 traces. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR9

STOP DB2
The number of DB2 STOP DB2 commands issued to terminate the DB2 subsystem. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR2

STOP RLIMIT
The number of DB2 STOP RLIMIT commands issued to disable the DB2 resource limit facility. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR6

STOP DDF
The number of DB2 STOP DDF commands issued to disable the DB2 distributed data facility. This includes normal and abnormal completion of the command.

Field Name: Q9STCTRJ

STOP PROCEDURE
The number of DB2 STOP PROCEDURE commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR2
The number of DB2 STOP FUNCTION commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTX1

STOP PROFILE
The number of DB2 STOP PROFILE commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTST

STOP ACCEL
The number of DB2 STOP ACCEL commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTXA

STOP DYNQUERYCAPTURE
The number of STOP DYNQUERYCAPTURE DB2 commands.

Field Name: Q9STCTXQ

MODIFY TRACE
The number of DB2 MODIFY TRACE commands issued to alter trace events (IFCID$s) for an active trace. This includes normal and abnormal completion of the command.

Field Name: Q9STCTRH

MODIFY DDF
The number of DB2 MODIFY DDF commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTMD

CANCEL THREAD
The number of DB2 CANCEL THREAD commands issued to cancel a thread. This includes normal and abnormal completion of the command.

Field Name: Q9STCTRK

TERM UTILITY
The number of DB2 TERM UTILITY commands issued to stop execution of a DB2 utility. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR3

RECOVER BSDS
The number of DB2 RECOVER BSDS commands issued to reestablish dual bootstrap data sets after one has been disabled by a data set error. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR3

RECOVER INDOUBT
The number of DB2 RECOVER INDOUBT commands issued to recover threads left indoubt because DB2 or a transaction manager could not automatically recover them. This includes normal and abnormal completion of the command.
Field Name: Q9STCTR4

RESET INDOUBT
The number of DB2 RESET INDOUBT commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTRR

RESET GENERICLU
The number of DB2 RESET GENERICLU commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTRD

ARCHIVE LOG
The number of DB2 ARCHIVE LOG commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTRM

SET ARCHIVE
The number of DB2 SET ARCHIVE commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTRP

SET LOG
The number of DB2 SET LOG commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTX2

SET SYSPARM
The number of DB2 SET SYSPARM commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTX4

ACCESS DATABASE
The number of DB2 ACCESS DATABASE commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTAD

UNRECOGNIZED COMMANDS
The number of commands not recognized by DB2. The number is incremented if the command verb or primary keyword cannot be determined. For example:
  • "-DISPLOX DATABASE(*)" is an unknown verb.
  • "-DISPLAY FATAFASE(*)" is an unknown primary keyword.

Field Name: Q9STEROR

TOTAL
The total number of DB2 commands that were issued.

Field Name: SDSTTOTL
DIST Storage Above 2 GB

This topic shows detailed information about “Statistics - DIST Storage Above 2 GB”.

Statistics - DIST Storage Above 2 GB

The field labels shown in the following sample layout of “Statistics - DIST Storage Above 2 GB” are described in the following section.

<table>
<thead>
<tr>
<th>DIST STORAGE ABOVE 2 GB</th>
<th>QUANTITY</th>
</tr>
</thead>
<tbody>
<tr>
<td>FIXED STORAGE (MB)</td>
<td>0.96</td>
</tr>
<tr>
<td>GETMAINED STORAGE (MB)</td>
<td>0.00</td>
</tr>
<tr>
<td>VARIABLE STORAGE (MB)</td>
<td>40.66</td>
</tr>
<tr>
<td>STORAGE MANAGER CONTROL BLOCKS (MB)</td>
<td>8.47</td>
</tr>
</tbody>
</table>

GETMAINED STORAGE (MB)

Total storage acquired by GETMAIN. This includes space for the compression dictionary, and statement and DBD cache that can be used by the Environmental Descriptor Manager (EDM).

This figure can be different from the sum of GETMAIN storage items shown in the statistics DBM1 storage, because DB2 does not produce grouping statistics for all GETMAIN storage.

Field Name: QW0225GA

FIXED STORAGE (MB)

The total amount of fixed storage above the 2 GB bar.

Field Name: QW0225FA

VARIABLE STORAGE (MB)

Amount of variable storage available above the 2 GB bar.

Field Name: QW0225VA

STORAGE MANAGER CONTROL BLOCKS (MB)

Total 64-bit storage allocated for storage manager control structures.

Field Name: QW0225SM
DIST and MVS Storage Below 2 GB

This topic shows detailed information about “Statistics - DIST and MVS Storage Below 2 GB”.

Statistics - DIST and MVS Storage Below 2 GB

The field labels shown in the following sample layout of “Statistics - DIST and MVS Storage Below 2 GB” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>

<tr>
<td>31 BIT EXTENDED HIGH PRIVATE (MB)</td>
<td>147.14</td>
</tr>
<tr>
<td>31 BIT PRIVATE CURRENT HIGH ADDRESS</td>
<td>0000000018325000</td>
</tr>
<tr>
<td>EXTENDED REGION SIZE (MAX) (MB)</td>
<td>1666.00</td>
</tr>
</tbody>
</table>

TOTAL DIST STORAGE BELOW 2 GB (MB)

Total DIST storage below the bar. This includes:
- Fixed length storage use
- Getmained storage
- Save areas
- Variables

Field Name: SW0225DI

TOTAL GETMAINED STORAGE (MB)

Total storage acquired by GETMAIN. This includes space for virtual pools, EDM pool, compression dictionary, castout buffers, and the data space lookaside buffer, and data space buffer pool control blocks.

This figure can be different from the sum of GETMAIN storage items shown in the statistics DBM1 storage, because DB2 does not produce grouping statistics for all GETMAIN storage.

Field Name: QW0225GM

TOTAL VARIABLE STORAGE (MB)

Total storage used by all variable pools. This includes storage used by:
- System agents
- Local agents
- RID pool
- Pipe manager subpool
- Local dynamic statement cache control blocks
- Local dynamic statement cache statement pool
DIST and MVS Storage Below 2 GB

- Buffer and data manager trace tables
- A list of objects in restricted state including the new PRO state. If consumption of this storage pool is high, review restrictive exception state of database objects and check whether they can be resolved or reduced.

Field Name: QW0225VR

**NUMBER OF ACTIVE CONNECTIONS**

The number of active connections, or active and disconnected DBAT threads.

Field Name: SACDBATS

**NUMBER OF INACTIVE CONNECTIONS**

The current number of type 2 inactive connections.

Field Name: QDSTCIN2

**TOTAL FIXED STORAGE (MB)**

Total amount of fixed storage.

Field Name: QW0225FX

**TOTAL GETMAINED STACK STORAGE (MB)**

Total GETMAINED storage allocated for program stack use.

Field Name: QW0225GS

**TOTAL STACK STORAGE IN USE (MB)**

The amount of stack storage that is in use.

Field Name: QW0225SU

**SYSTEM AGENT STACK STORAGE IN USE (MB)**

The amount of 31-bit stack storage that is in use for system agents. This is a subset of QW0225SU.

Field Name: QW0225SS

**STORAGE CUSHION (MB)**

Storage reserved to allow DB2 to complete critical functions while short on storage. This includes the contract warning cushion, storage reserved for must-complete operations, and storage for MVS use.

Field Name: STORCUSH

**24 BIT LOW PRIVATE (MB)**

The amount of private MVS storage below the 16 MB line. This storage is obtained from bottom upward, usually for unauthorized programs.

Field Name: QW0225LO

**24 BIT HIGH PRIVATE (MB)**

The amount of private MVS storage below the 16 MB line. This storage is obtained from top downward, usually for authorized programs.

Field Name: QW0225HI

**24 BIT PRIVATE CURRENT HIGH ADDRESS**

The current high address of the 24-bit private region.
Field Name: QW0225TP

31 BIT EXTENDED LOW PRIVATE (MB)

The amount of private MVS storage above the 16 MB line. This storage is obtained from bottom upward, usually for unauthorized programs.

Field Name: QW0225EL

31 BIT EXTENDED HIGH PRIVATE (MB)

The amount of private MVS storage above the 16 MB line. This storage is obtained from top downward, usually for authorized programs.

Field Name: QW0225EH

31 BIT PRIVATE CURRENT HIGH ADDRESS

The current high address of the 31-bit private region.

Field Name: QW0225EP

EXTENDED REGION SIZE (MAX) (MB)

The maximum amount of MVS private storage available above the 16 MB line.

Field Name: QW0225RG
DRDA Remote Locations

This topic shows detailed information about “Statistics - DRDA Remote Locations”.

It shows information about remote locations of Distributed Relational Database Architecture (DRDA).

Statistics - DRDA Remote Locations

The field labels shown in the following sample layout of “Statistics - DRDA Remote Locations” are described in the following section.

<table>
<thead>
<tr>
<th>DRDA REMOTE LOC</th>
<th>SENT</th>
<th>RECEIVED</th>
</tr>
</thead>
<tbody>
<tr>

<td>0.00</td>
</tr>
<tr>
<td>THREAD INDOUBT-REM.L.COORD.</td>
<td>0.00</td>
<td></td>
</tr>
</tbody>
</table>

SENT - CONVERSATIONS

The number of conversations that were initiated from the requester location. This value is maintained at the requester location.

A conversation is a specific instance of using TCP/IP or SNA LU 6.2 to transfer information between a requester and a server. A conversation is a logical connection between a requester and a server.

Field Name: QLSTCNVS

SENT - CONVERSATIONS QUEUED

The number of conversation requests queued by the distributed data facility and waiting for allocation. This value is maintained at the requester location.

Background and Tuning Information

When this value is high, increase the limit for the number of conversations.

Field Name: QLSTCNVQ

This is an exception field.

SENT - CONVERSATIONS DEALLOCATED

The number of conversations that were deallocated from this site to the remote site.

Field Name: QLSTCNVT

SENT - SQL STATEMENTS

The number of SQL statements sent to the remote server. This value is updated at the requester location.

Field Name: QLSTSQLS

SENT - COMMITS
The number of commit requests sent to the server (single-phase commit protocol) and the committed requests sent to the participant (two-phase commit protocol).

Field Name: QLSTCOMS

SENT - ROLLBACKS

The number of abort requests sent to the server (single-phase commit protocol) and backout requests sent to the participant (two-phase commit protocol).

Field Name: QLSTABRS

SENT - ROWS

The number of data rows sent to the requester location (includes SQLDA). This value is updated at the server location.

Field Name: QLSTROWS

SENT - MESSAGES

The number of messages sent to the remote location. A message is a group of characters and control bit sequences transferred on a single TCP/IP or SNA API call. This value is maintained at the location where the messages originated.

Field Name: QLSTMSGS

SENT - BYTES

The number of bytes of data sent to the requester location. This value is maintained at the server location.

Field Name: QLSTBYTES

SENT - BLOCKS

The number of blocks transmitted using block fetch. This value is maintained at the server location.

Field Name: QLSTBTBF

SENT - THREAD INDOUBT-REM.L.COORD.

The number of threads that became indoubt with the remote location as the coordinator (two-phase commit operations only). A large value might indicate network problems.

Field Name: QLSTINDT

RECEIVED - CONVERSATIONS

The number of conversations that were initiated from the requester to the server location. This value is updated at the server location.

Field Name: QLSTCNVR

RECEIVED - SQL STATEMENTS

The number of SQL statements received from the requester location. This value is updated at the server location.

Field Name: QLSTSQLR

RECEIVED - COMMITS
The number of commit requests received from the requester (single-phase commit protocol) and committed requests received from the coordinator (two-phase commit protocol).

Field Name: QLSTCOMR

RECEIVED - ROLLBACKS

The number of abort requests received from the requester (single-phase commit protocol) and backout requests received from the coordinator (two-phase commit protocol).

Field Name: QLSTABRR

RECEIVED - ROWS

The number of data rows received from the server location. This value is maintained at the requester location.

Note:
• This value does not include any SQLDA or SQLCA transmitted.
• Block fetch can significantly affect the number of rows sent across the network. When used with nonupdate cursors, block fetch groups as many rows as possible into the message buffer, and transmits the buffer over the network without requiring a VTAM message. Consequently, more rows of data might be sent from the server location than are received by the requester location.

This is especially true when DB2 private protocol is used because multiple blocks can be transmitted from the server with no intervening messages from the requester.

Field Name: QLSTROWR

RECEIVED - MESSAGES

The number of messages received by VTAM from the remote location. This value is maintained at the location where the messages were received.

More messages might be sent from the server location than are received by the requester due to the manner in which distributed SQL statements are processed internally.

Field Name: QLSTMSGR

RECEIVED - BYTES

The number of bytes of data received from the server location. This value is maintained at the requester location.

More bytes of data might be sent from the server location than are received by the requester due to the manner in which distributed SQL statements are processed internally.

Field Name: QLSTBYTR

RECEIVED - BLOCKS

The number of blocks received from the remote location using block fetch. This value is maintained at the requester location.

Field Name: QLSTBRBF
EDM Pool Activity

This topic shows detailed information about “Statistics - EDM Pool Activity”.

**PAGES IN DBD POOL (ABOVE) (Prior to DB2 12)**

This field shows the number of pages in the DBD pool above the 2 GB bar.

**Field Name:** QISEDPGE

**HELD BY DBD**

The current number of pages used for database descriptors (DBDs). This is a snapshot value.

**Field Name:** QISEDBD

**STEALABLE PAGES**

The current number of stealable pages used for database descriptors (DBDs).

**Field Name:** QISEDLRU

**FREE PAGES (Prior to DB2 12)**
EDM Pool Activity

This field shows the number of free pages in the DBD pool above the 2 GB bar.

Field Name: QISEDFRE
This is an exception field.

% PAGES IN USE

The percentage of DBD pages in use expressed as complement of the percentage of available DBD pages (ratio of stealable and free pages to the total number).

Field Name: SISEDPIU

FAILS DUE TO DBD POOL FULL

This field shows the total number of failures because the DBD pool above the 2 GB bar was full.

Field Name: QISEDFAL
This is an exception field.

PAGES IN STMT POOL (ABOVE)

The current number of pages in the EDM Statement pool above the 2 GB bar. This is a snapshot value. For DB2 12 this field shows N/A.

Field Name: QISECPGE

HELD BY STATEMENTS

The number of pages in the EDM Statement pool above the 2 GB bar that is used for cached dynamic SQL statements. This is a snapshot value.

Field Name: QISEDYNP

FREE PAGES

The number of pages currently not used by any object in the EDM Statement pool above the 2 GB bar. For DB2 12 this field shows N/A.

Field Name: QISECFRE

FAILS DUE TO STMT POOL FULL

The total number of failures because the EDM Statement pool above the 2 GB bar was full. For DB2 12 this field shows N/A.

Field Name: QISECFAL

PAGES IN SKEL POOL (ABOVE) (Prior to DB2 12)

The current number of pages in the EDM skeleton pool above the 2 GB bar.

Field Name: QISEKPGE

HELD BY SKCT

The current number of pages used for skeleton cursor tables (SKCTs). This is a snapshot value.

Field Name: QISESKCT

HELD BY SKPT

The current number of pages used for skeleton package tables (SKPTs). This is a snapshot value.
**Field Name:** QISESKPT

**STEALABLE PAGES**

The current number of stealable pages used for skeleton cursor and package tables.

**Field Name:** QISEKLRU

**FREE PAGES (Prior to DB2 12)**

The number of pages currently not used by any object in the EDM skeleton pool above the 2 GB bar.

**Field Name:** QISEKFRE

**% PAGES IN USE**

The percentage of skeleton pages in use expressed as complement of the percentage of available skeleton pages (ratio of stealable and free pages to the total number).

**Field Name:** SISEKPIU

**FAILS DUE TO SKEL POOL FULL**

The total number of failures because the EDM skeleton pool above the 2 GB bar was full.

**Field Name:** QISEKFAL

**DBD REQUESTS**

The number of requests for database descriptors (DBDs).

**Field Name:** QISEDBDG

**DBD NOT FOUND**

The total number of times database descriptors were loaded from DASD.

To find the number of times the DBD was already in the EDM pool, subtract this value from the value of Requests for sections - DBD field.

**Field Name:** QISEDBDL

This is an exception field.

**DBD HIT RATIO (%)**

The ratio of successful requests for database descriptors (DBD) from the EDM pool to the total number of requests for database descriptors expressed as a percentage.

**Field Name:** SERDBLR

This is an exception field.

**CT REQUESTS**

The number of requests for cursor table (CT) sections.

**Field Name:** QISECTG

This is an exception field.

**CT NOT FOUND**

The number of times a cursor table section was loaded from DASD.
To find the number of times the CT was found in the EDM pool, subtract this value from the value of the Requests for sections - CT field.

**Field Name:** QISECTL
This is an exception field.

**CT HIT RATIO (%)**
The ratio of successful requests for cursor tables from the EDM pool to the total number of requests for cursor tables expressed as a percentage.

**Field Name:** SERCTRL
This is an exception field.

**PT REQUESTS**
The number of requests for package table (PT) sections.

**Field Name:** QISEKTG
This is an exception field.

**PT NOT FOUND**
The number of times a package table section was loaded from DASD.
To find the number of times the PT was already in the EDM pool, subtract this value from the value of the Requests for sections - PT field.

**Field Name:** QISEKTL
This is an exception field.

**PT HIT RATIO (%)**
The ratio of successful package table requests from the EDM pool to the total number of package table requests, expressed as a percentage.

**Field Name:** SERPTLR
This is an exception field.

**PKG SEARCH NOT FOUND**
When a package is bound with a wild card (*) for package names, in the form of PKLIST(COL1.*,COL2.*.....), EDM generates a NOT-FOUND record to avoid future I/O if a collection ID/package name combination does not exist.

This field shows how often a cached record was located during package binding.

**Field Name:** QISEKNFM

**PKG SEARCH NOT FOUND INSERT**
When a package is bound with a wild card (*) for package names, in the form of PKLIST(COL1.*,COL2.*.....), EDM generates a NOT-FOUND record to avoid future I/O if a collection ID/package name combination does not exist.

This field shows how often a record was added to the cache during package binding.

**Field Name:** QISEKNFA

**PKG SEARCH NOT FOUND DELETE**
When a package is bound with a wild card (*) for package names, in the form of PKLIST(COL1.*,COL2.*....), EDM generates a NOT-FOUND record to avoid future I/O if a collection ID/package name combination does not exist.

This field shows how often a record was removed from the cache during package binding.

**Field Name:** QISEKNFR

**STATEMENTS IN GLOBAL CACHE**

Number of statements in the global cache.

**Field Name:** QISESTMT
Global DDF Activity

This topic shows detailed information about “Statistics - Global DDF Activity”.

Statistics - Global DDF Activity

</table>

DBAT/CONN QUEUED-MAX ACTIVE

The number of times a DBAT or connection was queued because it reached the ZPARM maximum for active remote threads (MAXDBAT).

Field Name: QDSTQDBT

This is an exception field.

CONN REJECTED-MAX CONNECTED

The number of connections that were rejected because the ZPARM limit for maximum remote connections (CONDBAT) was reached.

Field Name: QDSTQCRT

CONN CLOSED - MAX QUEUED

The number of queued client connections whose TCP/IP sockets were closed because the system parameter MAXCONQN was exceeded.
The socket close only occurs when the DB2 subsystem is a member of a data sharing group and DB2 was started with DDF THREADS set to INACTIVE.

**Field Name:** QDSTNCQC

**CONN CLOSED - MAX WAIT**

The number of queued client connections whose TCP/IP socket were closed due to system parameter MAXCONQW being exceeded.

The socket close only occurs when the DB2 subsystem is a member of a data sharing group and DB2 was started with DDF THREADS set to INACTIVE.

**Field Name:** QDSTNCCW

**COLD START CONNECTIONS**

The number of cold start connections with all remote locations (two-phase commit operations only).

**Field Name:** QDSTCSTR

This is an *exception* field.

**WARM START CONNECTIONS**

The number of warm start connections with all remote locations (two-phase commit operations only).

**Field Name:** QDSTWSTR

This is an *exception* field.

**RESYNCHRONIZATION ATTEMPTED**

The number of resynchronization connections attempted with all remote locations (two-phase commit operations only).

**Background and Tuning Information**

A large value can indicate network or system problems.

**Field Name:** QDSTRSAT

This is an *exception* field.

**RESYNCHRONIZATION SUCCEEDED**

The number of resynchronization connections that succeeded with all remote locations (two-phase commit operations only).

**Background and Tuning Information**

If the value of this field is much less than the number of resynchronizations attempted, network problems might exist.

**Field Name:** QDSTRSSU

This is an *exception* field.

**CUR TYPE 1 INACTIVE DBATS**

The current number of inactive DBATs type 1 (snapshot).

**Field Name:** QDSTQCIT

**HWM TYPE 1 INACTIVE DBATS**

The maximum number of inactive type 1 DBATs.
Global DDF Activity

This value is a high-water mark.

**Field Name:** QDSTQMIT

This is an *exception* field.

**TYPE 1 CONNECTIONS TERMINAT**

The number of threads or connections that were terminated instead of being made type 1 inactive because the maximum number of type 1 inactive threads was reached (MAXTYPE1).

**Field Name:** QDSTNITC

**CUR INACTIVE CONNS (TYPE 2)**

The current number of type 2 inactive connections.

**Field Name:** QDSTCIN2

**HWM INACTIVE CONNS (TYPE 2)**

The maximum number of concurrent type 2 inactive connections that existed.

This value is a high-water mark for QDSTCIN2.

**Field Name:** QDSTMIN2

**ACC QU INACT CONNS (TYPE 2)**

The number of RECEIVE requests on type 2 inactive or new connections that are queued to be serviced by a disconnected (pooled) DBAT.

**Field Name:** QDSTQIN2

**CUR QU INACT CONNS (TYPE 2)**

The current number of type 2 inactive or new connections that are queued waiting for a database access thread (DBAT).

**Field Name:** QDSTNQR2

**MIN QUEUE TIME**

The minimum queue time of a type 2 inactive or new connection that was queued waiting for a database access thread (DBAT) in the last statistical period.

**Field Name:** QDSTNQMN

**MAX QUEUE TIME**

The maximum queue time of a type 2 inactive or new connection that was queued waiting for a database access thread (DBAT) in the last statistical period.

**Field Name:** QDSTNQMX

**AVG QUEUE TIME**

The average queue time of a type 2 inactive or new connection that was queued waiting for a database access thread (DBAT) in the last statistical period.

**Field Name:** QDSTNQAV

**HWM QU INACT CONNS (TYPE 2)**
The maximum number of type 2 inactive or new connections that are queued waiting for a database access thread.

This value is a high-water mark for QDSTNQR2.

**Field Name:** QDSTMQR2

**CUR ACTIVE AND DISCON DBATS**

The current number of active and disconnected (pooled) DBATs.

**Field Name:** QDSTCNAT

**HWM ACTIVE AND DISCON DBATS**

The maximum number of active and disconnected (pooled) DBATs that existed.

This value is a high-water mark for QDSTCNAT.

**Field Name:** QDSTHWAT

This is an *exception* field.

**HWM TOTL REMOTE CONNECTIONS**

The maximum number of active and remote connections. This value is a high-water mark.

**Field Name:** QDSTHWDT

This is an *exception* field.

**CUR DISCON DBATS NOT IN USE**

The current number of disconnected (pooled) DBATs that are available to process type 2 inactive or new connections.

**Field Name:** QDSTNADS

**HWM DISCON DBATS NOT IN USE**

The maximum number of disconnected (pooled) DBATs that are available to process type 2 inactive or new connections.

This value is a high-water mark for QDSTNADS.

**Field Name:** QDSTMADS

**DBATS CREATED**

The number of requests that required a database access thread (DBAT) to be created to process the request.

**Note:** This does not include database access threads created to replace disconnected (pooled) DBATs that terminated because they reached their reuse limit.

**Field Name:** QDSTNDBA

**DISCON (POOL) DBATS REUSED**

The number of requests that were satisfied by assigning a disconnected (pooled) DBAT to process the request.

**Field Name:** QDSTPOOL

**CUR ACTIVE DBATS-BND DEALLC**
Global DDF Activity

The current number of DBATs that are active because the associated packages were bound with RELEASE(DEALLOCATE).

Field Name: QDSTNARD

HWM ACTIVE DBATS-BND DEALLC

The maximum number of DBATs that are active because the associated packages were bound with RELEASE(DEALLOCATE).

Field Name: QDSTMARD
**Group Buffer Pool Activity**

This topic shows detailed information about “Statistics - Group Buffer Pool Activity”.

This block shows activity for the group buffer pool connected to the reported DB2 system. The counters are cumulative from the time when the buffer pool was first connected. If more than one 4 KB or 32 KB group buffer pool block is printed, blocks showing the 4 KB and 32 KB group buffer pool totals are printed. If the report contains both 4 KB and 32 KB group buffer pool blocks, a block showing the totals of all group buffer pools is printed.

**Statistics - Group Buffer Pool Activity**

The field labels shown in the following sample layout of “Statistics - Group Buffer Pool Activity” are described in the following section.

GROUP BP R/W RATIO (%)

The group buffer pool read/write ratio. This reflects the effectiveness of the group buffer pool and whether the GBPCACHE NONE option can be used.

Field Name: SGBRWRAT

GBP SYN.READ(XI) HIT RATIO(%)

The percentage of all requests made to read a page from the group buffer pool because the page was invalidated in the member's buffer pool, which found the data in the group buffer pool and did not have to retrieve the page from DASD.

Background and Tuning Information

For highly active group buffer pools, consider increasing the GBP size if the SYN.READ(XI) HIT RATIO percent is smaller than 90.

Field Name: SGBXIRAT

GBP-DEPENDENT GETPAGES

The number of Getpages made for GBP-dependent objects.

Field Name: QBGLGG

SYN.READ(XI)-DATA RETURNED

The number of requests made to read a page from the group buffer pool because the page was invalidated in the member's buffer pool. The member found the required page in the group buffer pool.

Background and Tuning Information

When you increase the size of the group buffer pool (GBP), the number of pages returned from the GBP can increase. Conversely, decreasing the size of the GBP can cause DB2 to return fewer pages because the GBP cannot hold pages long enough to allow them to be retrieved again.

Field Name: QBGLXD

This is an exception field.

SYN.READ(XI)-NO DATA RETURN
The number of requests to read a page from the group buffer pool that were required because the page was invalidated in the member's buffer pool. The member did not find the data in the group buffer pool and had to retrieve the page from DASD.

Background and Tuning Information

Normally, when the page in a member's buffer is cross invalidated, the buffer is refreshed from the group buffer pool. In this instance, the requested page was not found in the group buffer pool though the page set is still GBP-dependent. The page has been removed from the group buffer pool for one of two reasons:

- Shortage of data pages and consequent reclamation of this page
- Shortage of directory entries and consequent removal of the page together with cross invalidation of that page in the local buffer pools of all members using that page.

If the value in this field is high, you may want to tune the group buffer pool (GBP). Depending on the reason, increase the number of GBP data pages, increase the size of the directory entry space, or increase both the number of GBP data pages and the space for directory entries. Oversizing the group buffer pool can cause unnecessary GBP checkpoint overhead.

Field Name: QBGLXRN

SYN.READ(NF)-DATA RETURNED

The number of requests made to read a page from the group buffer pool because the page was not in the buffer pool of the member. The member found the page in the group buffer pool.

Background and Tuning Information

The requesting member needs a page from a table space or index that is GBP-dependent or has GBPCACHE ALL defined. To get that page, the group buffer pool is checked before the page set on DASD.

If the group buffer pool is used to cache both clean and changed pages (GBPCACHE ALL is used for all data), you can try to get more pages returned from the group buffer pool by increasing the size of the group buffer pool. Do not tune the GBP based on this counter if it is used for caching changed pages only (GBPCACHE CHANGED).

Field Name: QBGLMD

This is an exception field.

SYN.READ(NF)-NO DATA RETURN

The number of requests made to read a page from the group buffer pool because the page was not in the member's buffer pool. The member did not find the required data in the group buffer pool and had to retrieve the page from DASD.

Background and Tuning Information

The requesting member needs a page from a table space or index that is GBP-dependent or has GBPCACHE ALL defined. To get that page, the group buffer pool is checked before the page set on DASD.

You can compare the value in this counter with the number of pages that were returned from the group buffer pool, see Sync.Read (Not Found) - Data Returned. If the group buffer pool is used to cache both clean and
changed pages (GBPCACHE ALL is used for all data), you can try to get more pages returned from the group buffer pool by increasing the size of the group buffer pool. Do not tune the GBP based on this counter if it is used for caching changed pages only (GBPCACHE CHANGED).

Field Name: QBGLMR

UNREGISTER PAGE

The number of times DB2 unregistered interest for a single page. This happens when DB2 steals pages from the member’s buffer pool that belong to GBP-dependent page sets or partitions.

Background and Tuning Information

A large value here indicates that the local buffer pool contains a mixture of GBP-dependent data and non-GBP-dependent data.

The page stolen from the local buffer pool is replaced by a new one. This counter makes a distinction on whether the new page depends on the group buffer pool or not.

Usually a page of a GBP-dependent page set or partition is replaced by a page that is also GBP-dependent. In this instance, the unregister request for the page being stolen is combined with the read and register request for the new page. These combined requests do not contribute to this counter.

If, however, a page of a GBP-dependent page set or partition is replaced by a page that is not GBP-dependent, then only an unregister request is sent to the coupling facility. These separate requests are counted here.

Field Name: QBGLDG

CLEAN PAGES SYNC.WRITTEN

The number of clean pages that were synchronously written to the group buffer pool from the virtual pool.

Background and Tuning Information

Only GBPCACHE ALL causes clean (unchanged) pages to be written to the coupling facility. The pages are written to the coupling facility even if the page set is not GBP-dependent. If group buffer pool caching works effectively for prefetch, the value in this field should be much smaller than the value in Synchronous Read (Not Found) - Data Returned.

Field Name: QBGLWC

This is an exception field.

CLEAN PAGES ASYNC.WRTN

The number of clean pages that were asynchronously written to the group buffer pool from the virtual pool.

Background and Tuning Information

Only GBPCACHE ALL causes clean (unchanged) pages to be written to the group coupling facility. In this instance pages are written even if the page set is not GBP-dependent. Asynchronous write is done under prefetch processing.

If group buffer pool caching works effectively for prefetch, the value in this field should be much smaller than the combined values in:

- Synchronous Read (Not Found) - Data Returned
Asynchronous Reads - Data Returned
Clean pages - Read after register page list

Field Name: QBGLAC
This is an exception field.

REG.PAGE LIST (RPL) REQUEST
The number of register page list (RPL) requests made by prefetch. The group buffer pool must be allocated in a group coupling facility with CFLEVEL=2 or higher.

Background and Tuning Information
Performance might be improved by enabling RPL.

Field Name: QBGLAX
This is an exception field.

NUMBER OF PAGES RETR.FROM GBP
The number of coupling facility reads performed by prefetch to retrieve a changed page from the group buffer pool.

Field Name: QBGLAY
This is an exception field.

PAGES CASTOUT
The number of data pages that were cast out of the group buffer pool of the member.

Castout to a page set or partition is done by the castout owner of the page set or partition. This is normally the DB2 subsystem that had the first update intent on the page set or partition.

Background and Tuning Information
The number of pages written per I/O is normally close to the value of this field divided by the value in Unlock Castout.

For example, if an average of four pages is written per castout write I/O, the number of pages cast out should be four times the number in this field.

Because DB2 usually includes more than one page in the request to write pages to DASD, the number in this field should always be significantly more than Unlock Castout. If it is not (for example, when "unlock castout" is more than half of "pages castout"), the castout write I/O is inefficient; probably because you have random update patterns on the DB2 data or a low castout threshold.

Field Name: QBGLRC
This is an exception field.

UNLOCK CASTOUT
The number of times DB2 issued an unlock request to the coupling facility for completed castout I/Os.

When pages are cast out to DASD, they are locked for castout in the coupling facility. This castout lock is not an IRLM lock; it is to ensure that only one system can cast out a given page at a time.

Background and Tuning Information
The number of pages written per I/O is normally close to the value of pages castout divided by the value of this field.

For example, if an average of four pages is written per castout write I/O, the number of pages cast out should be four times the value in this field.

Because DB2 usually includes more than one page in a write request, the number in this field should always be significantly less than pages castout. If it is not (for example, when "unlock castout" is more than half of "pages castout"), the castout write I/O is inefficient; possibly because you have random update patterns on the DB2 data or a low castout threshold.

Field Name: QBGLUN

READ CASTOUT CLASS

The number of requests made to the group buffer pool to determine which pages, from a particular page set or partition, must be cast out because they are cached as changed pages.

This request is issued either by the page set or partition castout owner, or, when the group buffer pool castout threshold is reached, by the group buffer pool structure owner.

Field Name: QBGLCC

READ DIRECTORY INFO

The number of requests issued by the group buffer pool structure owner to read the directory entries of all changed pages in the group buffer pool.

This request is issued at group buffer pool checkpoints to record the oldest recovery log record sequence number (LRSN). It is used as a basis for recovery if the group buffer pool fails.

Such requests might have to be issued several times for each group buffer pool checkpoint to read the directory entries for all changed pages.

Background and Tuning Information

If the value of this counter appears to be abnormally high, consider upgrading the coupling facility to CFLEVEL=2 or higher to raise the number of directory entries that can be read with one request. You can also increase the group buffer pool checkpoint interval, but this can lengthen the recovery for the group buffer pool.

Field Name: QBGLRD

READ STORAGE STATISTICS

The number of times DB2 requested statistics information from the group buffer pool. It is issued by the group buffer pool structure owner at timed intervals to determine whether the group buffer pool castout threshold (GBPOOLT) has been reached.

Field Name: QBGLOS

REGISTER PAGE

The number of times DB2 registered interest in a single page.

These are "register-only" requests, which means that DB2 is not requesting any data back from the request.
This request is made only to create a directory entry for the page to be used for cross-invalidation when the page set or partition P-lock is downgraded from S to IS mode, or from SIX to IX mode.

Field Name: QBGLRG

DELETE NAME

The number of requests made by DB2 to delete directory and data entries associated with a particular page set or partition from the group buffer pool.

DB2 issues this request when it changes a page set or partition from GBP-dependent to non GBP-dependent. DB2 also issues this request for objects that are defined with GBPCACHE ALL when those objects are first opened.

Background and Tuning Information

This counter is a measure of how often page sets or partitions change between being and not being dependent on the group buffer pool.

You can prevent DB2 going in and out of GBP dependency too often by tuning the following subsystem parameters that affect data sets when they are switched to a different state:

PCLOSEN
Pseudoclose frequency. The number of checkpoints required before a data set that was not updated can be a pseudoclose candidate.

If the PCLOSEN condition is met, the page set or partition is converted from read-write to read-only state. Depending on other concurrent users, this could raise the chance for the page set or partition to go out of GBP dependency.

PCLOSET
Pseudoclose time. The amount of time (in minutes) that must elapse before a data set can be a pseudoclose candidate.

If the PCLOSEN or PCLOSET condition is met, the page set or partition is converted from read-write to read-only state. Depending on other concurrent users, this could raise the chance for the page set or partition to go out of GBP dependency.

LOGLOAD
The number of log records that DB2 writes between successive checkpoints.

These parameters are specified in the CHECKPOINT FREQ field in panel DSNTIPN.

Field Name: QBGLDN

ASYNCH GBP REQUESTS

The number of IXLCACHE invocations for the primary group buffer pool.

Field Name: QBGLHS

EXPLICIT X-INVALIDATIONS

The number of times an explicit coupling facility cross-invalidation request was issued.

Field Name: QBGLE
CASTOUT CLASS THRESHOLD

The number of times group buffer pool castout was initiated because the group buffer pool class castout threshold was detected.

Background and Tuning Information

The class castout threshold is one of two group buffer pool thresholds. In most cases the default value for the class threshold (5 percent) is a good choice. Depending on your workload, altering this value can reduce DASD contention during castout.

Field Name: QBGLCT

This is an exception field.

GROUP BP CASTOUT THRESHOLD

The number of times a group buffer pool castout was initiated because the group buffer pool castout threshold was detected.

Background and Tuning Information

The GBP castout threshold, GBP class castout threshold, and the length of the GBP checkpoint interval determine the castout characteristics of the group buffer pool.

You can consider this threshold a safety margin to protect the group buffer pool from being accidentally flooded by overactive applications.

In most situations, the default value for the group buffer pool castout threshold of 30 percent is a good choice. Use the ALTER GROUPBUFFERPOOL command to tune the group buffer pool thresholds.

Field Name: QBGLGT

This is an exception field.

GBP CHECKPOINTS TRIGGERED

The number of group buffer pool checkpoints triggered by this member.

Background and Tuning Information

The value of this counter depends on the length of the group buffer pool checkpoint interval.

Field Name: QBGLCK

WRITE FAILED-NO STORAGE

The number of coupling facility write requests that could not complete due to a lack of coupling facility storage resources.

Background and Tuning Information

A value greater than zero indicates that the data page resources of the coupling facility are being consumed faster than the DB2 castout processes can free them.

On write failure, the affected DB2 member initiates castout and retries several times, and finally, if it is a changed page, it will be added to the logical page list (LPL) requiring recovery.

If the problem is not simply due to a momentary surge in activity, you need either to decrease the group buffer pool castout thresholds, or to increase the number of data entries in the group buffer pool. To increase the number of data entries, you can do one of the following:
- Increase the total size of the group buffer pool.
- Adjust the ratio of directory entries to data entries in favor of data entries.

**Field Name:** QBGLWF
This is an *exception* field.

**WRITE TO SEC-GBP FAILED**
The number of coupling facility requests to write changed pages to the secondary group buffer pool for duplexing that failed because of a lack of storage in the coupling facility.

**Field Name:** QBGL2F
This is an *exception* field.

**COMPL CHECKS SUSPENDED**
The number of completion checks for writes to the secondary GBP that were suspended because the write had not yet been completed.

**Field Name:** QBGL2S

**DELETE NAME LIST SEC-GBP**
The number of DELETE NAME LIST requests to delete pages from the secondary group buffer pool that have just been cast out from the primary.

**Field Name:** QBGL2D

**DELETE NAME FROM SEC-GBP**
The number of group buffer pool requests to delete a page from the secondary group buffer pool. These requests are issued by the group buffer pool structure owner to delete orphaned data entries in the secondary GBP as part of the garbage collection logic.

**Field Name:** QBGL2N

**UNLOCK CASTOUT STATS SEC-GBP**
The number of coupling facility requests to read the castout statistics for the secondary group buffer pool. These requests are issued by the group buffer pool structure owner to check for orphaned data entries in the secondary group buffer pool.

**Field Name:** QBGL2R

**ASYNCH SEC-GBP REQUESTS**
The number of asynchronous IXLCACHE invocations for the secondary group buffer pool.

**Field Name:** QBGL2H

**WRITE AND REGISTER**
The number of Write and Register requests.

**Field Name:** QBGLWS

**WRITE AND REGISTER MULT**
The number of Write and Register Multiple requests.

**Field Name:** QBGLWM

**CHANGED PGS SYNC.WRTN**
The number of changed pages written synchronously to the group buffer pool.

Pages are written with Write and Register (WAR) requests or Write and Register Multiple (WARM) requests.

At commit time changed pages are forced from the virtual buffer pool of the member to the coupling facility.

**Background and Tuning Information**

In data sharing, changed pages must have been written to the group buffer pool by the time a transaction commits. The pages are written either synchronously (force at commit) or asynchronously, for example, when a local buffer pool threshold is reached or at a member's checkpoint. The number of pages that have to be forced out synchronously (in "burst mode") at commit time can be reduced if asynchronous writes are triggered more frequently.

You can use the vertical deferred write threshold (VDWQT) to reduce the number of pages that have to be forced out synchronously and to increase the number of pages that are asynchronously written before the transaction commits. For GBP-dependent page sets, writes triggered by the vertical deferred write threshold go to the coupling facility. You can cause changed pages to be written out quicker and in smaller increments, by reducing the vertical deferred write threshold (VDWQT).

Field Name: QBGLSW

This is an exception field.

**CHANGED PGS ASYNC.WRTN**

The number of changed pages written asynchronously to the group buffer pool.

Pages are written in response to Write and Register (WAR) and Write and Register Multiple (WARM) requests.

Changed pages can be written from the member's virtual buffer pool to the group coupling facility before the application commits. This happens when, for example, a local buffer pool threshold is reached, or when P-lock negotiation forces the pages on the vertical deferred write queue to be written to the group buffer pool.

**Background and Tuning Information**

In data sharing, changed pages must have been written to the group buffer pool before a transaction commits. The pages are written either synchronously during commit processing or asynchronously before the transaction commits when, for example, a local buffer pool threshold is reached or at a member's checkpoint. See Changed Pages - Written Synchronously for the number of changed pages synchronously written to the group buffer pool.

The vertical deferred write threshold (VDWQT) can be used to reduce the number of pages that have to be forced out synchronously and to increase the number of pages that are asynchronously written before the transaction commits. For GBP-dependent page sets, writes triggered by the vertical deferred write threshold go to the coupling facility. If you want changed pages to be written out quicker and in smaller increments, you can lower the vertical deferred write threshold (VDWQT).
Field Name: QBGLAW
This is an exception field.

PAGES WRITE & REG MULT
The number of pages written using Write and Register Multiple (WARM) requests.
Field Name: QBGLWP

READ FOR CASTOUT
The number of Read For Castout requests. One page read per request.
Field Name: QBGLCR

READ FOR CASTOUT MULT
The number of Read For Castout Multiple requests.
Field Name: QBGLCM

PAGE P-LOCK LOCK REQ
The sum of all page P-lock lock requests.
Field Name: SBGLPLR

SPACE MAP PAGES
The number of page P-lock lock requests for space map pages.
Field Name: QBGLP1

DATA PAGES
The number of page P-lock requests for data pages.
Field Name: QBGLP2

INDEX LEAF PAGES
The number of page P-lock requests for index leaf pages.
Field Name: QBGLP3

PAGE P-LOCK UNLOCK REQ
The number of page P-lock unlock requests.
Field Name: QBGLU1

PAGE P-LOCK LOCK SUSP
The sum of all page P-lock lock suspensions.
Field Name: SBGLPLS

SPACE MAP PAGES
The number of page P-lock suspensions for space map pages.
Field Name: QBGLS1

DATA PAGES
The number of page P-lock suspensions for data pages.
Field Name: QBGLS2

INDEX LEAF PAGES
The number of page P-lock suspensions for index leaf pages.
Group Buffer Pool Activity

Field Name: QBGLS3

PAGE P-LOCK LOCK NEG
The sum of all page P-lock lock negotiations.
Field Name: SBGLPLN

SPACE MAP PAGES
The number of page P-lock negotiations for space map pages.
Field Name: QBGLN1

DATA PAGES
The number of page P-lock negotiations for data pages.
Field Name: QBGLN2

INDEX LEAF PAGES
The number of page P-lock negotiations for index leaf pages.
Field Name: QBGLN3

PAGES IN WRITE-AROUND
The number of changed pages that were written to disk through group buffer pool write-around due to condition write failures to the group buffer pool.
Field Name: QBGLWA
Highlights

This topic shows detailed information about “Statistics - Highlights”.

The sample shows the Statistics Highlights block for the long report. The description also shows additional fields printed with the Statistics short report.

Statistics - Highlights

The field labels shown in the following sample layout of “Statistics - Highlights” are described in the following section.

<table>
<thead>

</tr>
</tbody>
</table>

**INTERVAL START**

The start time of the period represented by this report or trace entry.

For a trace, it is the timestamp of the DB2 Statistics records pair which marks the beginning of the delta record represented by the trace entry.

For the group page of group-scope reports it is the beginning of the earliest interval across reported members.

For SAVE data, it is the timestamp of the first DB2 Statistics report pair used to derive a row in the statistics SAVE and FILE tables.

For FILE, it is the timestamp of the DB2 Statistics records pair which marks the beginning of the delta record represented by a row in the statistics SAVE and FILE tables.

**Field Name:** SDBEGREC

**INTERVAL END**

The end time of the period represented by this report or trace entry.

For a trace, it is the timestamp of the DB2 statistics records pair which marks the end of the delta record represented by the trace entry.

For the group page of group-scope reports it is the ending of the latest interval across reported members.

For SAVE data, it is the timestamp of the last DB2 statistics report pair used to derive a row in the statistics SAVE and FILE tables.

For FILE, it is the timestamp of the DB2 statistics records pair which marks the end of the delta record represented by a row in the statistics SAVE and FILE tables.

**Field Name:** SDENDREC

**INTERVAL ELAPSED**

The elapsed time of the period represented by this report or trace entry.

For a trace, it is the time elapsed between two consecutive DB2 statistics records pairs which mark the beginning and the end of the delta record represented by the trace entry. For a report, it is the elapsed time for the period within the interval record for which the DB2 statistics data is available.

For the group page of group-scope reports it is the average elapsed time of all the reported members.
Field Name: SDELTIME

**SAMPLING START**

The timestamp of the first DB2 statistics records pair used to derive a report entry (an interval record). For example, when INTERVAL(0) is specified, the sampling start coincides with the interval record start time in member-scope reports.

Field Name: SDSAMPST

**SAMPLING END**

The timestamp of the last DB2 statistics records pair used to derive a report entry (an interval record). For example, when INTERVAL(0) is specified, the sampling start coincides with the interval record end time in member-scope reports.

Field Name: SDSAMPEN

**OUTAGE ELAPSED**

The time for which OMEGAMON XE for DB2 PE detected discontinuity in the available DB2 statistics data. The most common reason for this is a stop or start of the reported DB2 system within the reported interval. For the group page of group-scope reports it is the average outage time of all reported members.

Field Name: SDOUTEL

**TOTAL THREADS**

The number of successful create thread requests. It does not include DBATs.

A thread is required before an application can use SQL. When established, a thread can have one or more secondary authorization IDs.

A thread is needed to perform any DB2 activity. For example, a thread is needed to run a DB2 utility to perform an IFI request such as READS, or to process a DB2 command such as -DISPLAY THREAD. However, a thread is not created if the command failed because of a syntax error.

**Background and Tuning Information**

Thread reuse can help improve performance.

The term *thread reuse* only applies to IMS and CICS attachments. In the case of the TSO attachment facility and the call attachment facility (CAF), threads cannot be reused, because the threads are allocated to the user address space.

Thread reuse should be considered in the following cases:

- If transaction volume is high:
  
  High volume transactions should achieve a high percentage of thread reuse. If threads are reused on low volume transactions, the number of threads needed increases because these threads are not automatically terminated by IMS when not being used. This may result in too many idle threads for the level of the DB2 workload. Under CICS, protected threads are terminated after about 45 seconds if no transaction eligible to reuse the thread has been received.

- If thread creation cost is significant:
As a rule of thumb, more than 5% of the total CPU cost of transaction processing is considered significant.

The ACQUIRE and RELEASE parameters of BIND should be specified to minimize the thread creation cost, while providing the needed concurrency:

- If most of the application plan’s SQL statements are executed, then **ACQUIRE(ALLOCATE)** is cheaper than **ACQUIRE(USE)**.
- If only a small number of the SQL statements are executed, **ACQUIRE(USE)** becomes cheaper and improves concurrency, because the required resources are only acquired (locked) when the plan actually references (uses) them. An example would be a generalized plan used by many different transactions. It would contain multiple logic paths referencing different tables.

Note that, when packages are involved, **ACQUIRE(USE)** is always implicitly used.

- Concurrency in thread reuse is based on page locking provided by the IS and IX intent locks, whose duration is governed by ACQUIRE and RELEASE of BIND.
  
**RELEASE(DEALLOCATE)** is strongly recommended for thread-reuse transactions to reduce transaction CPU time.

When thread reuse is implemented, monitor the EDM pool. It should be sufficient in size to accommodate expanding plans where the next transaction requires additional plan sections over those that are already part of the plan.

**Field Name:** Q3STCTHD

This is an exception field.

**TOTAL COMMITS**

The total number of commits during the interval covered by the report or trace. This includes commit, read-only commit, sync, and rollback events. DBATs executed on this location are not included.

**Field Name:** SDCOMMIT

This is an exception field.

**DATA SHARING MEMBER**

In group-scope reports, this field shows the name of the member for which statistics is presented, and, on the group total page, the number of DB2 subsystems in the reported data sharing group. In member-scope reports, this field shows N/A.

**Field Name:** QWHAMEMN

This is an exception field.

**INCREMENTAL BINDS**

The number of incremental binds (excluding prepare). It is incremented by:

- SQL statements with BIND VALIDATE(RUN) that fail at bind time and are bound again at execution time
- Static DDL statements (such as CREATE TABLE, DROP TABLE, LOCK TABLE) that use DB2 private protocol

**Background and Tuning Information**
If a plan is bound with VALIDATE(RUN), DB2 performs validity checks at bind time and rechecks any failures at run time. This can result in catalog contention and degraded application performance, depending on the number of statements flagged and how many times they are executed. Avoid VALIDATE(RUN) if possible. Ensure that all objects are created and all privileges are granted before bind, and select the VALIDATE(BIND) option.

**Field Name:** QXINCRB

This is an *exception* field.

**DBAT QUEUED**

The number of times a DBAT or connection was queued because it reached the ZPARM maximum for active remote threads (MAXDBAT).

**Field Name:** QDSTQDBT

This is an *exception* field.

**AUTH SUCC.W/OUT CATALOG**

The number of successful authorization checks that do not use the DB2 catalog (including plan cache checks and public checks).

**Background and Tuning Information**

For transaction level security, ENABLE and DISABLE on BIND PACKAGE should be used to ensure adequate security. Granting execute authority on the plan to public should be adequate.

**Field Name:** QTAUCCH

**DB2 Command**

The total number of DB2 commands that were issued.

**Field Name:** SDSTTOTL

**BUFF.UPDT/PAGES WRITTEN**

The number of buffer updates per page written from the buffer pool to DASD.

The ratio of BUFFER UPDATES (QBSTWS) to PAGES WRITTEN (QBSTPWS) suggests a high level of efficiency as the ratio increases, because more updates are being externalized per physical write. For example, if there are 10 updates on the same page before it is externalized, then the ratio is 10:1 or 10. If all 10 updates are on 10 distinct pages, then the ratio is 10:10 or 1.

**Background and Tuning Information**

Buffer updates per pages written depends strongly on the type of application. For example, a batch program that processes a table in skip sequential mode with a high row update frequency in a dedicated environment can achieve very good update efficiency. In contrast, update efficiency tends to be lower for transaction processing applications, because transaction processing tends to be random.

The following factors can influence the number of updates per page:

**Number of rows per page**

A small PCTFREE value will gather more rows on the same page. However, at the same time this can have impact on concurrency.
Buffer pool size and deferred write thresholds
Increase DWQT and VDWQT or the size of the buffer pool. This would tell DB2 to let page updates accumulate in the buffer pool. This means, the probability that more updates per page get captured increases. This effect is less significant if the buffer pool is concurrently used by multiple transactions, it depends on the type of transaction.

Field Name: SBRBUPW

TOTAL API
The total number of calls made to IFI.

Field Name: SDIFITOT

PAGES WRITTEN/WRITE I/O
The number of pages written from the buffer pool to DASD per synchronous or asynchronous write I/O. This count does not include preformatting I/O, such as I/O needed to prepare a data set for use.

Background and Tuning Information
The following factors impact the ratio of pages written per write I/O:

Checkpoint frequency
At checkpoint time, I/Os are scheduled to write all updated pages on the deferred write queue to DASD. If this occurs too frequently, the deferred write queue does not grow large enough to achieve a high ratio of pages written per write I/O.

The checkpoint frequency depends on the number of logs written between two consecutive checkpoints. This number is set at installation time; see the field CHECKPOINT FREQ of installation panel DSNTIPN.

Frequency of active log switch
DB2 takes a system checkpoint each time the active log is switched. High frequency of active log switches causes the problem described under checkpoint frequency.

Buffer pool size and deferred write thresholds
The deferred write thresholds (VDWQT and DWQT) are a function of buffer pool size. If the buffer pool size is decreased, these thresholds are reached more frequently, causing I/Os to be scheduled more often to write some of the pages on the deferred write queue to DASD. This prevents the deferred write queue from growing large enough to achieve a high ratio of pages written per write I/O.

Number of data sets, and the spread of updated pages across them
The efficiency of write I/O also depends on the number of data sets associated with the buffer pool and spread of updated pages across them. Because of the nature of batch processing, the ratio of pages written to write I/Os can be expected to be higher than that expected for transaction type workloads.

To determine update efficiency check also the ratio Buffer Updates / Pages Written (SBRBUPW).

Field Name: SBRPWWIO
MEMBER

In group-scope reports, this field shows the name of the member for which statistics is presented, and, on the group total page, the number of DB2 subsystems in the reported data sharing group. In member-scope reports, this field shows N/A.

Field Name: QWHAMEMN
This topic shows detailed information about “Statistics - IFC Destinations”.

### SYSTEM RELATED (WRITTEN)

The number of system-related records written.

Field Name: SDISRRW

### DATABASE RELATED (WRITTEN)

The number of database-related records written.

Field Name: SDIDRRW

### ACCOUNTING (WRITTEN)

The number of accounting records written.

Field Name: SDIACTW

### START TRACE (WRITTEN)

The number of start trace records written.

Field Name: SDISTRW

### STOP TRACE (WRITTEN)

The number of stop trace records written.

Field Name: SDISTPW

### SYSTEM PARAMETERS (WRITTEN)

The number of DB2 system parameter records written.

Field Name: SDIZPIMW

### SYS.PARMS-BPOOLS (WRITTEN)

The number of DB2 system parameter buffer pool records written.

Field Name: SDBSCRSW

### AUDIT (WRITTEN)

The number of DB2 audit records written.

Field Name: SDIAUDW

### TOTAL (WRITTEN)
IFC Record Counts

The total number of records that were successfully written.

Field Name: SDTSCRSW

**SYSTEM RELATED (NOT WRTN)**

The number of system-related records not written. Ideally, this field should be 0 or very small.

Field Name: SDISRRN

**DATABASE RELATED (NOT WRTN)**

The number of database-related records not written. Ideally, this field should be 0 or very small.

Field Name: SDIDRRN

**ACCOUNTING (NOT WRTN)**

The number of accounting records not written. Ideally, this field should be 0 or very small.

Field Name: SDIACTN

**START TRACE (NOT WRTN)**

The number of start trace records not written. Ideally, this field should be 0 or very small.

Field Name: SDISTRN

**STOP TRACE (NOT WRTN)**

The number of stop trace records not written. Ideally, this field should be 0 or very small.

Field Name: SDISTPN

**SYSTEM PARAMETERS (NOT WRTN)**

The number of DB2 system parameter records not written. Ideally, this field should be 0 or very small.

Field Name: SDIZPMN

**SYS.PARMS-BPOOLS (NOT WRTN)**

The number of DB2 system parameter buffer pool records not written. Ideally, this field should be 0 or very small.

Field Name: SDBSCRNW

**AUDIT (NOT WRTN)**

The number of DB2 audit records that were not written.

Field Name: SDIAUDN

**TOTAL (NOT WRTN)**

The total number of records that were not written.

Field Name: SDTSCRNW
IRLM Storage Below and Above 2 GB (DB2 11)

This topic shows detailed information about “Statistics - IRLM Storage Below and Above 2 GB (DB2 11)”.

Statistics - IRLM Storage Below and Above 2 GB (DB2 11)

The field labels shown in the following sample layout of “Statistics - IRLM Storage Below and Above 2 GB (DB2 11)” are described in the following section.

IRLM STORAGE BELOW AND ABOVE 2 GB

--------------------------------------------
EXTENDED CSA SIZE IN USE (MB)
HWM EXTENDED CSA SIZE IN USE (MB)

HWM 64 BIT COMMON IN USE (MB)

EXTENDED CSA SIZE IN USE (MB)

The total amount of Extended Common Service Area (ECSA) storage in use by Internal Resource Lock Manager (IRLM) pools (DB2 field: QW0225I_BBECSA).

Field Name: S225IECU

HWM EXTENDED CSA SIZE IN USE (MB)

The high-water mark of ECSA storage allocated by IRLM pools (DB2 field: QW0225I_BBECSAH).

Field Name: S225IECH

31 BIT PRIVATE IN USE (MB)

The total amount of 31-bit private storage in use by IRLM pools (DB2 field: QW0225I_BBPVT).

Field Name: S225IBPU

HWM 31 BIT PRIVATE IN USE (MB)

The high-water mark of 31-bit private storage allocated by IRLM pools (DB2 field: QW0225I_BBPVH).

Field Name: S225IBPH

THRESHOLD 31 BIT PRIVATE (MB)

The threshold of 31-bit private storage available for normal IRLM execution. Only requests for storage by "must complete" tasks will be granted if this threshold is exceeded (DB2 field: QW0225I_BPMAX).

Field Name: S225IBPT

64 BIT PRIVATE IN USE (MB)

The total amount of 64-bit private storage in use by IRLM pools (DB2 field: QW0225I_ABPVT).
IRLM Storage Below and Above 2 GB

Field Name: S225IAPU

HWM 64 BIT PRIVATE IN USE (MB)

The high-water mark of 64-bit private storage allocated by IRLM pools (DB2 field: QW0225I_ABPVH).

Field Name: S225IAPH

THRESHOLD 64 BIT PRIVATE (MB)

The threshold of 64-bit private storage available for normal IRLM execution. Only requests for storage by "must complete" tasks will be granted if this threshold is exceeded (DB2 field: QW0225I_APMAX).

Field Name: S225IAPT

64 BIT COMMON IN USE (MB)

The total amount of 64-bit common storage in use by IRLM pools (DB2 field: QW0225I_ABCSA).

Field Name: S225IACU

HWM 64 BIT COMMON IN USE (MB)

The high-water mark of 64-bit common storage allocated by IRLM pools (DB2 field: QW0225I_ABCSH).

Field Name: S225IACH
Latch Counters

This topic shows detailed information about “Statistics - Latch Counters”.

The QVLS latch counters represent the number of suspends that were performed by agents that attempted to obtain a latch.

There is not a one-to-one relationship between the QVLS counters and IFCID 56 or 57, because an agent might suspend multiple times or not at all, while trying to obtain a latch. That is why the QVLS counters are not directly related to Accounting Class 3.

Statistics - Latch Counters

The field labels shown in the following sample layout of “Statistics - Latch Counters” are described in the following section.

LC01

This field is infrequently used.

Field Name: QVLSLC01

LC02

The predominant latch usage is: Global authorization cache.

Field Name: QVLSLC02

LC03

The predominant latch usage is: DDF disconnect.

Field Name: QVLSLC03

LC04

The predominant latch usage is: SYSSTRING cache.

Field Name: QVLSLC04

LC05

The predominant latch usage is: IRLM data sharing exits or RLF.

Field Name: QVLSLC05

LC06

The predominant latch usage is: Data sharing index split.

Field Name: QVLSLC06

LC07

The predominant latch usage is: Index lotch and OBD allocation.
Latch Counters

**Field Name:** QVLSLC07

**LC08**

The predominant latch usage is: Query parallelism.

**Field Name:** QVLSLC08

**LC09**

The predominant latch usage is: Utilities or stored procedure URIDs.

**Field Name:** QVLSLC09

**LC10**

The predominant latch usage is for Sequence objects (stand-alone and table-based Identity Column). DB2 12 latch contention can be significantly reduced for the Identity Column in a data-sharing environment because of the reduction in log force write.

**Field Name:** QVLSLC10

**LC11**

The predominant latch usage is for Sequence objects (stand-alone and table-based Identity Column) for concurrent transactions. DB2 12 latch contention can be significantly reduced for the Identity Column in a data-sharing environment because of the reduction in log force write.

**Field Name:** QVLSLC11

**LC12**

The predominant latch usage is database allocation control latch (latch class X'0C') or WebSphere global transaction ID latch (latch class X'4C').

**Field Name:** QVLSLC12

**LC13**

The predominant latch usage is: Pageset operations.

**Field Name:** QVLSLC13

**LC14**

The predominant latch usage is represented by various buffer pool related activities, including buffer pool control block and pool serialization.

**Field Name:** QVLSLC14

**LC15**

The predominant latch usage is: ARCHIVE LOG MODE(QUIESCE).

**Field Name:** QVLSLC15

**LC16**

The predominant latch usage is: UR synonym chain.

**Field Name:** QVLSLC16

**LC17**

The predominant latch usage is: RURE chain.

**Field Name:** QVLSLC17

**LC18**
The predominant latch usage is: DDF resynch list.

Field Name: QVLSLC18

LC19
The predominant latch usage is logical log write (in contrast to physical log write).

Field Name: QVLSLC19

LC20
The predominant latch usage is: System checkpoint.

Field Name: QVLSLC20

LC21
The predominant latch usage is: Accounting rollup.

Field Name: QVLSLC21

LC22
The predominant latch usage is: Internal checkpoint.

Field Name: QVLSLC22

LC23
The predominant latch usage is Buffer Manager latch for page latch contention timer queue or deferred write latch. Both types of latches have latch class X'17'.

Field Name: QVLSLC23

LC24
The predominant latch usage is EDM LRU latch or Buffer Manager prefetch scheduling latch. EDM LRU latch can be identified by latch class X'18' while Buffer Manager prefetch scheduling latch can be identified by latch class X'38' in a latch contention trace.

Field Name: QVLSLC24

LC25
The predominant latch usage is: EDM hash latch.

Field Name: QVLSLC25

LC26
The predominant latch usage is: Dynamic statement cache.

Field Name: QVLSLC26

LC27
The predominant latch usage is: stored procedure queue latch and UDF.

Field Name: QVLSLC27

LC28
The predominant latch usage is: Stored procedures or authorization cache.

Field Name: QVLSLC28

LC29
Latch Counters

The predominant latch usage is: Field procs and DDF transaction manager.
Field Name: QVLSLC29

LC30
The predominant latch usage is: Agent services.
Field Name: QVLSLC30

LC31
The predominant latch usage is: Storage manager.
Field Name: QVLSLC31

LC32
The predominant latch usage is shared storage pool latch.
Field Name: QVLSLC32

LC254
The predominant latch usage is: Index latch.
Field Name: QVLSLC254
Locking Activity

This topic shows detailed information about “Statistics - Locking Activity”.

</tbody>
</table>

SUSPENSIONS (ALL)

The total number of suspensions.

Field Name: SLRSUSP

SUSPENSIONS (LOCK ONLY)

The number of times a lock could not be obtained and the unit of work was suspended.

Background and Tuning Information

This number should be low, ideally 0.

The number of lock suspensions is a function of the lock requests. Lock suspensions (or conflicts) can happen on either LOCK REQUEST or CHANGE REQUEST.

Suspensions are highly dependent on the application and table space locking protocols.

Field Name: QTXASLOC

This is an exception field.

SUSPENSIONS (IRLM LATCH)

The number of latch suspensions.

Field Name: QTXASLAT

This is an exception field.

SUSPENSIONS (OTHER)
Locking Activity

The number of suspensions caused by something other than lock or latch.

Field Name: QTXASOTH
This is an exception field.

TIMEOUTS

The number of times a unit of work was suspended for a time exceeding the timeout value. This number should be low, ideally 0.

Field Name: QTXATIM
This is an exception field.

DEADLOCKS

The number of times deadlocks were detected. This number should be low, ideally 0.

Background and Tuning Information

Deadlocks occur when two or more application processes each hold locks on resources that the others need, without which they cannot proceed. Ensure that all applications accessing the same tables access them in the same order.

To improve concurrency:

- Use row level locking instead of page level locking to minimize deadlocks.
- For small tables use page level locking with MAXROWS 1.

To minimize deadlocks:

- Delay updates to just before commit.
- Use SELECT with the FOR UPDATE clause to use U lock.
- Adjust the deadlock detection cycle parameter DEADLOK in the IRLM procedure.

This field is incremented once for each deadlock encountered. There is no correlation between this field and the deadlock events reported in the Locking report set or the number of IFCID 172 records written. This field reports all deadlocks, regardless of how they were resolved. The locking report and record trace IFCID 172 show only those deadlocks that were resolved by DB2.

Field Name: QTXADEA
This is an exception field.

LOCK REQUESTS

The number of requests to lock a resource.

Field Name: QTXALOCK
This is an exception field.

UNLOCK REQUESTS

The number of requests to unlock a resource.

This value can be less than the number of lock requests because DB2 can release several locks with a single unlock request.

Field Name: QTXAUNLK

QUERY REQUESTS
The number of query requests.

Field Name: QTXAQRY

CHANGE REQUESTS

The number of change requests.

Field Name: QTXACHG

OTHER REQUESTS

The number of requests to IRLM to perform a function other than LOCK, UNLOCK, QUERY, or CHANGE.

Field Name: QTXAIRLM

LOCK ESCALATION (SHARED)

The number of times the maximum page locks per table space are exceeded, and the table space lock escalates from a page lock (IS) to a table space lock (S) for this thread. You can specify the number of locks allowed per table space with the LOCKS PER TABLE(SPACE) parameter on the DB2 install panel DSNTIPJ.

Background and Tuning Information

Escalations can cause unpredictable response times. Lock escalations should only happen when an application process updates or references (if repeatable read is used) more pages than normal.

Field Name: QTXALES

This is an exception field.

LOCK ESCALATION (EXCLUSIVE)

The number of times the maximum page locks per table space are exceeded and the table space lock escalates from a page lock (IX) to a table space lock (X).

Background and Tuning Information

Escalations can cause unpredictable response times. Lock escalations should only happen when an application process updates or references (if repeatable read is used) more pages than it normally does.

A useful rule of thumb is to compare the number of escalations (shared and exclusive) to the successful escalations (those that did not cause deadlocks and timeouts). If this value, or the number Lock escalations - shared and if the number of timeouts or deadlocks is also not 0, the timeout or deadlock is probably caused by the escalation.

If many escalations cause deadlocks and timeouts, the recommendation is to change the escalation threshold value. Use of ANY is extremely useful to prevent unnecessary and expensive page locks, for example locking all pages in a tablespace.

Lock escalations, shared or exclusive, should not be expected in a transaction environment.

Field Name: QTXALEX

This is an exception field.

DRAIN REQUESTS

The number of drain requests.
Locking Activity

Field Name: QTXADRNO
This is an exception field.

DRAIN REQUESTS FAILED
The number of unsuccessful drain requests.

Field Name: QTXADRUN
This is an exception field.

CLAIM REQUESTS
The number of claim requests.

Field Name: QTXACLNO
This is an exception field.

CLAIM REQUESTS FAILED
The number of unsuccessful claim requests.

Field Name: QTXACLUN
This is an exception field.
Log Activity

This topic shows detailed information about “Statistics - Log Activity”.

Statistics - Log Activity

The field labels shown in the following sample layout of “Statistics - Log Activity” are described in the following section.

</table>

READS SATISFIED-OUTPUT BUFF

The number of log reads satisfied from the output buffer.

Background and Tuning Information

This field, together with the reads satisfied from active log and reads satisfied from archive log (QJSTRACT and QJSTRARH) fields indicate how efficiently DB2 retrieves log records. Use these numbers to adjust the number of output buffers and the total active log capacity to maximize DB2 performance.

Field Name: QJSTRBUF

This is an exception field.

READS SATISFIED-OUTP.BUF(%)

The percentage of log reads that were satisfied in the output log buffer.

Field Name: SARLRBUF

READS SATISFIED-ACTIVE LOG

The number of log reads satisfied from the active log data set.

Background and Tuning Information

This field, together with the reads satisfied from archive log and reads satisfied from output buffer fields, indicate how efficiently DB2 retrieves
Log Activity

log records. Use these numbers to adjust the number of output buffers and the total active log capacity to maximize DB2 performance. Ideally, this value should be 0 or very small.

Field Name: QJSTRACT
This is an *exception* field.

**READS SATISFIED-ACTV.LOG(%)**
The percentage of log reads satisfied from the active log.

Field Name: SARLRACT
This is an *exception* field.

**READS SATISFIED-ARCHIVE LOG**
The number of log reads satisfied from the archive log data set.

**Background and Tuning Information**
This field, together with the reads satisfied from active log and reads satisfied from output buffer fields indicate how efficiently DB2 retrieves log records. Use these numbers to adjust the number of output buffers and the total active log capacity to maximize DB2 performance. Ideally, this value should be 0 or very small.

Field Name: QJSTRARH
This is an *exception* field.

**READS SATISFIED-ARCH.LOG(%)**
The percentage of log reads that were satisfied from the archive log data set.

Field Name: SARLRARC
This is an *exception* field.

**TAPE VOLUME CONTENTION WAIT**
The number of read accesses that were delayed because of a tape volume contention when only one reader per tape is possible.

**Background and Tuning Information**
This field shows the number of agents forced to wait because a tape volume was already in use by another. If this number is not 0, increase the read tape units on the archive log data set parameters panel DSNTIP A.

Field Name: QJSTTVC
This is an *exception* field.

**READ DELAYED-UNAVAIL.RESOR**
The number of read accesses delayed due to unavailable resources.

**Background and Tuning Information**
Generally, this can be due to insufficient tape units allocated. If this is so, reissue the SET ARCHIVE command and use a higher value for the count parameter. Another (although unlikely) cause is insufficient archive log read service task availability.

Field Name: QJSTWUR
This is an *exception* field.
ARCHIVE LOG READ ALLOCATION

The number of archive log read allocations.
It indicates the frequency of archive log open and close activity.

Background and Tuning Information
A high number indicates a need for more or larger active log data sets.
This value should be small, ideally 0.
Field Name: QJSTALR
This is an exception field.

ARCHIVE LOG WRITE ALLOCATIONS

The number of archive log write allocations.
It indicates the frequency of archive log open and close activity.

Background and Tuning Information
A high number indicates a need for more or larger active log data sets.
This value should be small, ideally 0.
Field Name: QJSTALW

CONTR.INTERV.OFFLOADED-ARCH

The number of control intervals (CIs) offloaded from the active log to the
archive log.
Field Name: QJSTCIOF

LOOK-AHEAD MOUNT ATTEMPTED

The number of look ahead (tape volume) mounts attempted.

Background and Tuning Information
This field and field QJSTLAMS (label LOOK-AHEAD MOUNT SUCCESSFUL) show the efficiency of look ahead for tape mounts.
Field Name: QJSTLAMA

LOOK-AHEAD MOUNT SUCCESSFUL

The number of successful look-ahead (tape volume) mounts. It indicates
the look-ahead mounting performance gains.

Background and Tuning Information
For maximum performance, this field and field QJSTLAMA (label
LOOK-AHEAD MOUNT ATTEMPTED) should be equal. To find the
number of failed attempts, subtract the value in this field from
LOOK-AHEAD MOUNT ATTEMPTED. Too many failed attempts negate
potential performance gains. This can be caused by not having enough
tape units available. Issue the DISPLAY ARCHIVE command and note the
current count value. Then issue the SET ARCHIVE command using a
higher value for the count parameter.
Field Name: QJSTLAMS

UNAVAILABLE OUTPUT LOG BUFF

The number of waits caused by an unavailable output log buffer.
When DB2 wants to write a log record and the log buffer is not available,
DB2 and the application must wait for an available log buffer.
Log Activity

Background and Tuning Information

Another possible cause is that the size of the write threshold might be too close to the size of the output buffer.

If this field is not 0, increase the number in the output buffer field on installation panel DSNTIPL to increase the number of output buffers or increase the size of the buffer.

Field Name: QJSTWTB

This is an *exception* field.

OUTPUT LOG BUFFER PAGED IN

The number of times an output log buffer had to be paged in before it could be initialized. The log-write latch is held at this point.

Background and Tuning Information

A nonzero value could indicate that the output log buffer size is too large, or there is insufficient real storage to back up the output log buffer size.

Field Name: QJSTBPAG

LOG RECORDS CREATED

The number of log write requests.

The log record is written asynchronously to the log buffer. The application does not wait for the record to be written to the log data set and regains control immediately.

Buffered log records are written to DASD when the buffer threshold is exceeded.

Field Name: QJSTWRNW

LOG CI CREATED

The number of active log output control intervals created.

Background and Tuning Information

Log records are placed sequentially in output log buffers, which are formatted as VSAM control intervals. The control intervals are written to a set of predefined DASD active log data sets, which are used sequentially and recycled.

The ratio of this field to write output log buffers should be low.

Rules of thumb:

The lower the value, the better. A high value indicates that too many I/Os are required for the number of log buffers created.

It is possible that WRTTHRS is set too low. It is also possible that transactions could be arriving so infrequently that at commit time force requests are not queued and each force request is individually triggering an I/O of its log buffers.

Field Name: QJSTBFFL

LOG WRITE I/O REQ (LOG1&2)

The total number of log-write I/O requests (such as media manager calls). This is the sum of the IFCID 038/039 pairs and includes both copy1 and copy2 active log data set writes.
Background and Tuning Information

This value should correspond to the active log write I/O activity in an RMF report.

Field Name: QJSTLOGW

LOG CI WRITTEN (LOG1&2)

The total number of log control intervals (CIs) written. This includes CI rewrites and both copy1 and copy2 active log data set writes. If a given CI is rewritten 5 times, this counter is incremented by 5.

Field Name: QJSTCIWR

LOG RATE FOR 1 LOG (MB)

The log rate for the active log data sets in MB per second. This figure is valid for dual logging, if single logging is used, multiply the value shown by 2.

Background and Tuning Information

To calculate this rate (mega bytes/second) at which data is written to the active log data set, multiply the value of field QJSTCIWR (label LOG CI WRITTEN (LOG1&2)) by 4096 and divide it by 1024 * 1024 * statistics-interval-seconds * 2. When the value exceeds 10MB/sec per log copy, you should examine I/O tuning of log data sets (for example, using faster log devices and/or I/O striping, using variable-length or compressed log record layouts to reduce log data size).

Field Name: SJSTCIWR
This topic shows detailed information about “Statistics - Miscellaneous”.

**Statistics - Miscellaneous**

The field labels shown in the following sample layout of “Statistics - Miscellaneous” are described in the following section.

<table>
<thead>
<tr>

</table>

**HIGH LOG RBA**

The high-used RBA address of the log (DB2 field prior to DB2 11: QWSDLR).

Field Name: QWSDLRG

**BYPASS COL**

The total number of columns (rows x columns) for which an invalid select procedure was encountered.

DB2 bypasses invalid select procedures which can cause some degradation in performance.

Field Name: QISTCOLS

**MAX SQL CASCAD LEVEL**

The maximum level of indirect SQL cascading. This includes cascading because of triggers, UDFs, or stored procedures.

Field Name: QXCASCDP

This is an *exception* field.

**MAX STOR LOB VALUES (MB)**

Maximum storage used for LOB values.

Field Name: QXSTLOBV

This is an *exception* field.

**MAX STOR XML VALUES (MB)**

Maximum storage used for XML values.

Field Name: QXSTXMLV

**ARRAY EXPANSIONS**

The number of times an array variable is expanded beyond 32 KB.

Field Name: QXSTARRAY_EXPANSIONS

**SPARSE IX DISABLED**

The number of times that sparse index was disabled because of insufficient storage.
Field Name: QXSISTOR

**SPARSE IX BUILT WF**

The number of times that sparse-index built a physical work file for probing.

Field Name: QXSIWF
MVS LPAR Shared Storage Above 2 GB

This topic shows detailed information about “Statistics - MVS LPAR Shared Storage Above 2 GB”.

Statistics - MVS LPAR Shared Storage Above 2 GB

The field labels shown in the following sample layout of “Statistics - MVS LPAR Shared Storage Above 2 GB” are described in the following section.

<table>
<thead>
<tr>
<th>MVS LPAR SHARED STORAGE ABOVE 2 GB</th>
<th>QUANTITY</th>
</tr>
</thead>
<tbody>
<tr>
<td>SHARED MEMORY OBJECTS</td>
<td>2.00</td>
</tr>
<tr>
<td>64 BIT SHARED STORAGE (MB)</td>
<td>163840.00</td>
</tr>
<tr>
<td>HWM FOR 64 BIT SHARED STORAGE (MB)</td>
<td>491520.00</td>
</tr>
<tr>
<td>64 BIT SHARED STORAGE BACKED IN REAL (MB)</td>
<td>2240.80</td>

<tr>
<td>64 BIT SHARED STORAGE PAGED OUT TO AUX (MB)</td>
<td>0.00</td>
</tr>
</tbody>
</table>

**SHARED MEMORY OBJECTS**

The number of shared memory objects allocated for this MVS LPAR (DB2 field: QW0225SHRNOMOMB).

*Field Name:* SW225SMO

**64 BIT SHARED STORAGE (MB)**

The amount of 64-bit shared storage allocated for this MVS LPAR (including hidden pages).

*Field Name:* S225SPG

**HWM FOR 64 BIT SHARED STORAGE (MB)**

High water mark of 64-bit shared storage allocated for this MVS LPAR (DB2 field: QW0225SHRGBYTES).

*Field Name:* SW225SGB

**64 BIT SHARED STORAGE BACKED IN REAL (MB)**

The amount of 64-bit shared storage backed in real storage for this MVS LPAR.

*Field Name:* S225SRL

**AUX STORAGE USED FOR 64 BIT SHARED (MB)**

The amount of auxiliary storage used for 64-bit shared storage for this MVS LPAR (including reserved auxiliary slots for pages that are paged in).

*Field Name:* S225SAX

**64 BIT SHARED STORAGE PAGED IN FROM AUX (MB)**

The amount of 64-bit shared storage paged in from auxiliary storage for this MVS LPAR.

*Field Name:* S225SPI

**64 BIT SHARED STORAGE PAGED OUT TO AUX (MB)**

The amount of 64-bit shared storage paged out to auxiliary storage for this MVS LPAR.

*Field Name:* S225SPO
Open/Close Activity

This topic shows detailed information about “Statistics - Open/Close Activity”.

Statistics - Open/Close Activity

The field labels shown in the following sample layout of “Statistics - Open/Close Activity” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OPEN DATASETS - HWM</td>
<td>The maximum number of data sets concurrently open since the last time DB2 was started. This is a high-water mark (HWM).</td>
</tr>
<tr>
<td>Background and Tuning Information</td>
<td></td>
</tr>
<tr>
<td>Monitor this field to see whether you are reaching the maximum number of open data sets permissible.</td>
<td></td>
</tr>
<tr>
<td>Note: The maximum number of open data sets is 200,000. The default is 20,000.</td>
<td></td>
</tr>
<tr>
<td>Field Name: QTMAXDS</td>
<td></td>
</tr>
<tr>
<td>This is an exception field.</td>
<td></td>
</tr>
<tr>
<td>OPEN DATASETS</td>
<td>The number of data sets concurrently open (snapshot).</td>
</tr>
<tr>
<td>Field Name: QTDSOPN</td>
<td></td>
</tr>
<tr>
<td>DS NOT IN USE, NOT CLOSE-HWM</td>
<td>The maximum number of data sets on the deferred close queue. It is a high-water mark representing the maximum number of data sets that are not in use but have not been physically closed yet.</td>
</tr>
<tr>
<td>Field Name: QTMAXPB</td>
<td></td>
</tr>
<tr>
<td>This is an exception field.</td>

<td></td>
</tr>
</tbody>
</table>

Open/Close Activity

Chapter 49. Statistics Report and Trace Blocks  49-147
Open/Close Activity

This is an exception field.

**DSETS CLOSED-THRESH.REACHED**

The number of data sets that were closed because the total number of open data sets reached the deferred close threshold value. The deferred close value is based on the value of DSMAX or the MVS DD limit (whichever is smaller).

**Field Name:** QTDSDRN

This is an exception field.

**DSETS CONVERTED R/W -> R/O**

The number of infrequently updated data sets that are converted from R/W to R/O state. An updated data set is considered infrequently updated when it has not been updated for either 5 consecutive DB2 checkpoints or 60 minutes. For tablespace data sets, the switching from R/W to R/O state means the SYSLGRNG entry is closed.

**Field Name:** QTPCCT

This is an exception field.
Plan/Packet Activity

This topic shows detailed information about “Statistics - Plan/Packet Activity”.

Statistics - Plan/Packet Activity

</tbody>
</table>

INCREMENTAL BINDS

The number of incremental binds (excluding prepare). It is incremented by:

- SQL statements with BIND VALIDATE(RUN) that fail at bind time and are bound again at execution time
- Static DDL statements (such as CREATE TABLE, DROP TABLE, LOCK TABLE) that use DB2 private protocol

Background and Tuning Information

If a plan is bound with VALIDATE(RUN), DB2 performs validity checks at bind time and rechecks any failures at run time. This can result in catalog contention and degraded application performance, depending on the number of statements flagged and how many times they are executed. Avoid VALIDATE(RUN) if possible. Ensure that all objects are created and all privileges are granted before bind, and select the VALIDATE(BIND) option.

Field Name: QXINCRB
Plan/Package Activity

This is an exception field.

**PLAN ALLOCATION ATTEMPTS**

The number of times a request was made to allocate a bound plan for an agent.

It represents the number of times DB2 was requested to create a thread by the attachment facility for the user. This does not include allocations for DB2 system agents.

Field Name: QTALLOCA

This is an exception field.

**PLAN ALLOCATION SUCCESSFUL**

The number of successful plan allocation attempts.

The cause of plan allocation failure could be plan unavailability or attempting to allocate a nonexistent plan.

Field Name: QTALLOC

**PACKAGE ALLOCATION ATTEMPT**

The number of attempts to allocate a package.

Field Name: QTPKALLA

**PACKAGE ALLOCATION SUCCESS**

The number of successful package allocation attempts.

**Background and Tuning Information**

Package allocation failure can occur when a package is unavailable or does not exist.

A high count of the number of packages unsuccessfully allocated (QTPKALLA - QTPKALL) typically occurs when a package list with multiple collections is used and frequently-used packages are found in the back end rather than in the front end of a package list. For example, when a package is found in the tenth collection, QTPKALLA is incremented by 10, one for each collection searched, but QTPKALL is incremented by 1.

A high number of packages unsuccessfully allocated can be accompanied by a high count of the number of unsuccessful checks for package execute authority made using the package authorization check because an application entry was not found in the cache (QTPACNOT). In this case, placing frequently used packages in the front end of a package list would reduce the number of Buffer Manager Getpages to the catalog/directory tablespaces.

Field Name: QTPKALL

**PLANS BOUND**

The number of plans successfully bound and kept for future agent allocations.

This field represents the sum of successful BIND ADD (QTBINDA) and successful BIND REPLACE (QTBINDR) commands. This counter is not incremented for BIND subcommands with no plan ID specified, as identified by QTTTESTB. Note that QTBINDA + QTBINDR is not necessarily equal to this field. It is equal only if all BIND ADD and BIND REPLACE subcommands issued are successful.
Field Name: QTPLNBD

BIND ADD SUBCOMMANDS
The number of successful and unsuccessful BIND ADD subcommands issued.

The sum of QTBINDA, QTBINDR, and QTTESTB equals the total number of BIND subcommands.

Field Name: QTBINDA

BIND REPLACE SUBCOMMANDS
The number of successful and unsuccessful BIND REPLACE subcommands issued.

Field Name: QTBINDR

TEST BINDS NO PLAN-ID
The number of BIND subcommands issued without a plan ID.

Field Name: QTTESTB

PACKAGES BOUND
The number of packages bound and kept for future package allocations.

It is the sum of successful BIND ADD PACKAGE and BIND REPLACE PACKAGE subcommands, but only if all these commands are really issued successfully.

Field Name: QTPKGBD

BIND ADD PACKAGE SUBCOMMAND
The number of successful and unsuccessful BIND ADD PACKAGE subcommands issued.

Field Name: QTBINDPA

BIND REPLACE PACKAGE SUBCOMMAND
The number of successful and unsuccessful BIND REPLACE PACKAGE subcommands issued.

Field Name: QTBINDPR

AUTOMATIC BIND ATTEMPTS
The number of attempts to autobind a plan. This occurs when the plan was invalidated by modifications to the declarations of the data referenced by the programs bound as part of the plan. For example, dropping an index when it is used in the plan results in automatic bind.

Field Name: QTABINDA

AUTOMATIC BINDS SUCCESSFUL
The number of plans successfully autobound.

Field Name: QTABIND

AUTO.BIND INVALID RES. IDS
The number of requests to allocate a nonexistent plan or package. This is the number of all plan and package allocation attempts that failed because the resource was unavailable or the object did not exist.
Plan/Package Activity

Field Name: QTINVRID

AUTO.BIND PACKAGE ATTEMPTS
The number of attempts to autobind a package.

Background and Tuning Information
If YES was specified, or defaulted, for autobind on DB2 install panel DSNTIPB, an autobind occurs when a plan or package:

- Is invalid because declarations of the data referenced by the program or package were modified. For example, when an index used in a package is dropped, an automatic bind occurs when the package is run for the first time after the index was dropped.
- Was bound in a later release and is used in a previous release for the first time.
- Was used in a previous release but is later remigrated and used in a later release for the first time.

Field Name: QTAUTOBA
This is an exception field.

AUTO.BIND PACKAGES SUCCESS
The number of packages successfully autobound.

Field Name: QTPKABND
This is an exception field.

REBIND SUBCOMMANDS
The number of REBIND subcommands issued. More than one plan can be rebound with a single REBIND subcommand. If the value in this field is 1, the number of plans you are attempting to rebind is shown in the Rebind - plan attempts field.

Field Name: QTPREBIND

ATTEMPTS TO REBIND A PLAN
The number of attempts to rebind a plan. This number can be larger than the value shown in the Rebind - plan subcommands field because you can specify more than one plan in a single REBIND subcommand.

Field Name: QTPREBINDA

PLANS REBOUND
The number of rebind attempts that completed successfully. This field is equal to the Rebind - Plan attempts field if all specified plans rebound successfully.

Field Name: QTPLNRBD

REBIND PACKAGE SUBCOMMANDS
The number of REBIND PACKAGE subcommands issued. More than one package can be rebound with a single subcommand. If the value in this field is 1, Rebind - package attempts shows the number of packages you are attempting to rebind.

Field Name: QTPREBINDP

ATTEMPTS TO REBIND PACKAGE
Plan/Packet Activity

The number of attempts to rebind a package. This can be larger than the value shown in Rebind package subcommands because you can rebind more than one package with a single command.

Field Name: QTRBNDPA

PACKAGES REBOUND

The number of packages successfully rebound. If all specified packages were rebound successfully, this field is equal to Rebind package attempts.

Field Name: QTPKGRBD

FREE PLAN SUBCOMMANDS

The number of FREE subcommands issued.

More than one plan can be freed with a single FREE subcommand. If this field is 1, then the number of plans you are trying to free is shown in ATTEMPTS TO FREE A PLAN.

Field Name: QTFREE

ATTEMPTS TO FREE A PLAN

The number of attempts to free a plan.

This value can be larger than FREE PLAN SUBCOMMANDS because multiple plan IDs can be specified in a single FREE subcommand.

Field Name: QTFREEA

PLANS FREED

The number of times a plan was successfully freed.

Freeing a plan can fail if someone else is using the plan and holds a lock on it.

Field Name: QTPLNFRD

FREE PACKAGE SUBCOMMANDS

The number of FREE PACKAGE subcommands issued.

More than one package can be freed with a single FREE subcommand. If the value in this field is 1, then the number of packages you are attempting to free is shown in ATTEMPTS TO FREE A PACKAGE.

Field Name: QTFREEP

ATTEMPTS TO FREE A PACKAGE

The number of attempts to free a package. This number can be larger than FREE PACKAGE SUBCOMMANDS because you can free several packages with a single command.

Field Name: QTFREEAP

PACKAGES FREED

The number of times a package was successfully freed. If all the specified packages were freed successfully, the value of this field is equal to ATTEMPTS TO FREE A PACKAGE.

Field Name: QTPKGFRD
Query Parallelism

This topic shows detailed information about “Statistics - Query Parallelism”.

This block shows information about query parallelism used by DB2 to perform parallel operations in SQL query processing. Dependent on various settings, DB2 may create parallel groups for a query where each parallel group consists of a set of tasks or I/O operations that can be executed in parallel. The degree of parallelism is the number of parallel tasks or I/O operations that DB2 determines. It can be used for the operations on the parallel group.

The DB2 users can limit the maximum number of parallel operations to reduce the resource consumption of a parallelism environment, and even DB2 may decide during execution time to reduce the planned degree of parallelism in order to respond to system limitations.

Statistics - Query Parallelism

The field labels shown in the following sample layout of “Statistics - Query Parallelism” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAX DEGREE - ESTIMATED</td>
<td>The maximum degree of parallelism estimated for a parallel group at bind time based on the cost formula. If the parallel group contains a host variable or parameter marker, then bind time will estimate the parallel group degree based on a valid assumption value.</td>
</tr>
<tr>
<td>MAX DEGREE - PLANNED</td>
<td>The maximum degree of parallelism planned for a parallel group. It is the ideal parallel group degree obtained at execution time after the host variable or parameter marker value is “plug-in” and before buffer pool negotiation and system negotiation are performed.</td>
</tr>
<tr>
<td>MAX DEGREE - EXECUTED</td>
<td>The maximum degree of parallelism executed among all parallel groups to indicate the extent to which queries were processed in parallel.</td>
</tr>
</tbody>
</table>
Field Name: QXMAXDEG

PARALLEL GROUPS EXECUTED
The total number of parallel groups executed.

Field Name: QXTOTGRP

RAN AS PLANNED
The total number of parallel groups that executed in the planned parallel degree. This field is incremented by one for each parallel group that executed in the planned degree of parallelism (as determined by DB2).

Field Name: QXNORGRP

RAN REDUCED-STORAGE
The total number of parallel groups that did not reach the planned parallel degree because of a lack of storage space or contention on the buffer pool.

The exception field name is QXREDGRP.

Background and Tuning Information
If this field is not 0, increase the size of the current buffer pool using the ALTER BUFFERPOOL command or use the ALTER TABLESPACE command to assign table spaces accessed by this query to a different buffer pool.

Field Name: QXREDGRP

This is an exception field.

RAN REDUCED-NEGOTIATION
The total number of parallel groups that did not reach the planned parallel degree due to system negotiation result of system stress level.

Field Name: QXSTOREDGRP

SEQUENTIAL-CURSOR
The total number of parallel groups that fell back to sequential mode due to a cursor that can be used by UPDATE or DELETE.

Field Name: QXDEGCUR

SEQUENTIAL-NO ESA
The total number of parallel groups that fell back to sequential mode due to a lack of ESA sort support.

Field Name: QXDEGES

SEQUENTIAL-NO BUFFER
The total number of parallel groups that fell back to sequential mode due to a storage shortage or contention on the buffer pool.

The exception field name is QXDEGBUF.

Field Name: QXDEGBUF

SEQUENTIAL-AUTONOMOUS PROC
The total number of parallel groups that fell back to sequential mode under an autonomous procedure.

Field Name: QXDEGAT
Query Parallelism

SEQUENTIAL-NEGOTIATION

The total number of parallel groups that fell back to sequential mode due to system negotiation result of system stress level.

Field Name: QXSTODGNGRP

ONE DB2 - COORDINATOR = NO

The total number of parallel groups executed on a single DB2 subsystem due to the COORDINATOR subsystem value being set to NO. When the statement was bound, the COORDINATOR subsystem value was set to YES. This situation can also occur when a package or plan is bound on a DB2 subsystem with COORDINATOR=YES, but is run on a DB2 subsystem with COORDINATOR=NO.

Field Name: QXCOORNO

ONE DB2 - ISOLATION LEVEL

The total number of parallel groups executed on a single DB2 subsystem due to repeatable-read or read-stability isolation.

Field Name: QXISORR

ONE DB2 - DCL TTABLE

The number of parallel groups in a query block that were downgraded to CPU parallelism because they referenced a UDF and a declared temporary table was detected at execution time.

DB2 enforces execution on a single DB2 (CPU parallelism), in this instance, because it cannot determine at incremental bind time for the statement whether the UDF will reference the declared temporary table. Other parallel groups in the same statement are not necessarily downgraded.

Field Name: QXDEGDTT

MEMBER SKIPPED (%)

The percentage of parallel groups that were not distributed over the data sharing group because one or more DB2 members did not have enough buffer pool storage. This only applies to parallel groups that were intended to run in sysplex query parallelism.

Background and Tuning Information

This percentage is only recorded when the buffer pool is defined to allow for parallelism. For example, if VPXPSEQT=0 on an assistant, DB2 does not send parallel work there, and the percentage is not increased.

Field Name: SXXCRAT

REFORM PARAL-CONFIG CHANGED

The total number of parallel groups where DB2 reformulated the parallel portion of the access path because of a change in the number of active members, or because of a change of processor models on which they run, from bind time to run time. This counter is incrementated only on the parallelism coordinator at run time.

Field Name: QXREPOPOP1

REFORM PARAL-NO BUFFER
The total number of parallel groups in which DB2 reformulated the parallel portion of the access path because there were insufficient buffer-pool resources. This counter is incremented only at the parallelism coordinator at run time.

Field Name: QXREPOP2
Real and Auxiliary Storage for DBM1

This topic shows detailed information about “Statistics - Real and Auxiliary Storage for DBM1”.

Statistics - Real and Auxiliary Storage for DBM1

The field labels shown in the following sample layout of “Statistics - Real and Auxiliary Storage for DBM1” are described in the following section.

<table>
<thead>
<tr>
<th>REAL AND AUXILIARY STORAGE FOR DBM1</th>
<th>QUANTITY</th>

**REAL STORAGE IN USE (MB)**

The amount of real storage in use for 31-bit and 64-bit private pools.

**Field Name:** SW0225RL

**31 BIT IN USE (MB)**

The amount of real storage in use for 31-bit private pools.

**Note:** This value is available from z/OS V1.11.

**Field Name:** S225RL31

**64 BIT IN USE (MB)**

The amount of real storage in use for 64-bit private pools.

**Note:** This value is available from z/OS V1.11.

**Field Name:** S225VPR

**64 BIT THREAD AND SYSTEM ONLY (MB)**

The amount of real storage in use for 64-bit private pools that does not include buffer pool storage.

**Note:** This field is available in z/OS 1.10 (and maintenance) or later.

**Field Name:** S225PSR

**HWM 64 BIT REAL STORAGE IN USE (MB)**

High water mark of real storage in use for 64-bit private pools.

**Note:** This value is available from z/OS V1.11.

**Field Name:** S225GPR

**AVERAGE THREAD FOOTPRINT (MB)**
The current average real storage in use for private DBM1 storage of active user threads (allied threads + active and pooled DBATs).

**Field Name:** S225DTFR

**AUXILIARY STORAGE IN USE (MB)**

The amount of auxiliary storage in use for 31-bit and 64-bit private pools.

**Field Name:** SW0225AX

**31 BIT IN USE (MB)**

The amount of auxiliary storage in use for 31-bit private pools.

**Note:** This value is available from z/OS V1.11.

**Field Name:** S225AX31

**64 BIT IN USE (MB)**

The amount of auxiliary storage in use for 64-bit private pools.

**Note:** This value is available from z/OS V1.11.

**Field Name:** S225VAS

**64 BIT THREAD AND SYSTEM ONLY (MB)**

The amount of auxiliary storage in use for 64-bit private pools that does not include buffer pool storage.

**Note:** This field is available in z/OS 1.10 (and maintenance) or later.

**Field Name:** S225PSA

**HWM 64 BIT AUX STORAGE IN USE (MB)**

High water mark of auxiliary storage in use for 64-bit private pools.

**Note:** This value is available from z/OS V1.11.

**Field Name:** S225GAS
Real and Auxiliary Storage for DIST

This topic shows detailed information about “Statistics - Real and Auxiliary Storage for DIST”.

Statistics - Real and Auxiliary Storage for DIST

The field labels shown in the following sample layout of “Statistics - Real and Auxiliary Storage for DIST” are described in the following section.

<table>
<thead>
<tr>

REAL STORAGE IN USE (MB)

The amount of real storage in use for 31-bit and 64-bit private pools.

Field Name: SW0225RL

31 BIT IN USE (MB)

The amount of real storage in use for 31-bit private pools.

Note: This value is available from z/OS V1.11.

Field Name: S225RL31

64 BIT IN USE (MB)

The amount of real storage in use for 64-bit private pools.

Note: This value is available from z/OS V1.11.

Field Name: S225VPR

64 BIT THREAD AND SYSTEM ONLY

The amount of real storage in use for 64-bit private pools that does not include buffer pool storage.

Note: This field is available in z/OS 1.10 (and maintenance) or later.

Field Name: S225PSR

HWM 64 BIT REAL STORAGE IN USE (MB)

High water mark of real storage in use for 64-bit private pools.

Note: This value is available from z/OS V1.11.

Field Name: S225GPR

AVERAGE DBAT FOOTPRINT
The current average real storage in use for private DIST storage of active and pooled DBATs.

**Field Name:** S225DDFR

**AUXILIARY STORAGE IN USE (MB)**

The amount of auxiliary storage in use for 31-bit and 64-bit private pools.

**Field Name:** SW0225AX

**31 BIT IN USE (MB)**

The amount of auxiliary storage in use for 31-bit private pools.

**Note:** This value is available from z/OS V1.11.

**Field Name:** S225AX31

**64 BIT IN USE (MB)**

The amount of auxiliary storage in use for 64-bit private pools.

**Note:** This value is available from z/OS V1.11.

**Field Name:** S225VAS

**64 BIT THREAD AND SYSTEM ONLY**

The amount of auxiliary storage in use for 64-bit private pools that does not include buffer pool storage.

**Note:** This field is available in z/OS 1.10 (and maintenance) or later.

**Field Name:** S225PSA

**HWM 64 BIT AUX STORAGE IN USE (MB)**

High water mark of auxiliary storage in use for 64-bit private pools.

**Note:** This value is available from z/OS V1.11.

**Field Name:** S225GAS
Real Storage in Use - Summary

This topic shows detailed information about “Statistics - Real Storage in Use - Summary”.

Statistics - Real Storage in Use - Summary

The field labels shown in the following sample layout of “Statistics - Real Storage in Use - Summary” are described in the following section.

<table>
<thead>
<tr>
<th>REAL STORAGE IN USE - SUMMARY</th>
<th>QUANTITY</th>
</tr>
</thead>
<tbody>

31/64-BIT PRIVATE (DBM1) (MB)

The amount of real storage in use for 31-bit and 64-bit private pools.

Field Name: SW0225RL

31/64-BIT PRIVATE (DIST) (MB)

The amount of real storage in use for 31-bit and 64-bit private pools.

Field Name: SW0225RL

64-BIT SHARED THREAD AND SYSTEM (MB)

The amount of real storage in use for 64-bit shared storage. This does not include shared stack storage. This is recorded at the subsystem level.

Note: This field is available in z/OS 1.10 (and maintenance) or later.

Field Name: S225SSR

64-BIT SHARED STACK (MB)

The amount of real storage in use for 64-bit shared stack storage. This is recorded at the subsystem level.

Note: This field is available in z/OS 1.10 (and maintenance) or later.

Field Name: S225KSR

64-BIT COMMON (MB)

The amount of real storage in use for 64-bit common storage. This is recorded at the subsystem level.

Note: This field is available in z/OS 1.10 (and maintenance) or later.

Field Name: S225CSR

TOTAL REAL STORAGE IN USE (MB)

The total amount of real storage in use.

Field Name: S225RLTL
RID List Processing

This topic shows detailed information about “Statistics - RID List Processing”.

The RID pool is used for:

- List prefetch
- Multiple index access
- Hybrid joins

DB2 uses a matching index scan to collect those record identifiers (RID) that match the selection criteria and places them in a list in the RID pool. The list is sorted by page number, which is contained in the RID. DB2 then uses the sorted list to access the table by reading up to 32 pages per I/O and attempting to read ahead one block of 32 pages before use.

The RID pool is allocated dynamically as it is needed. The maximum size of the pool is determined by the ZPARM MAXRBLK.

The work file database is used to store a RID list when the RID pool storage cannot contain all the RIDs of the list. When RID pool storage overflow occurs for a RID list, DB2 attempts to store the RID list in work file storage instead of falling back to a relational scan.

The maximum number of RIDs (measured in RID blocks) that DB2 is allowed to store in the work file database is determined by ZPARM MAXTEMPS_RID.

</tbody>
</table>

SUCCESSFUL

The number of times RID list (also called RID pool) processing is used.

During RID (RECORD ID) list processing, DB2 uses an index to produce a list of candidate RIDs, which is called a RID list. The RID list can be sorted and intersected (ANDed) or unioned (ORed) with other RID lists before actually accessing the data pages. RID list processing is used for a single
RID List Processing

index (index access with list prefetch) or for multiple indexes (multiple index access), which is when the RID lists are ANDed and ORed.

This field is incremented once for a given table access when RID list processing is used for index access with list prefetch, for multiple index access, or for both. For multiple index access, if a final RID list is obtained through ANDing and ORing of RID lists, the counter is incremented once, even if not all indexes were used by the RIDs in the multiple index access.

**Background and Tuning Information**

A nonzero value in this field indicates that DB2 has used list prefetch. If this is the case, check the access path selection.

**Field Name:** QXMIAP

This is an exception field.

**NOT USED-NO STORAGE**

The number of times DB2 detected that no storage was available to hold a list of RIDs during a given RID list process involving one index (single index access with list prefetch) or multiple indexes (multiple index access).

This field can be incremented during retrieval, sorting, ANDing, and ORing of RID lists for index access with list prefetch (single index). For single index access, this field can only be incremented once per access. For multiple index access, it can be incremented for every index involved in the ANDing and ORing of RID lists.

**Field Name:** QXNSMIAP

This is an exception field.

**NOT USED-MAX LIMIT**

The number of times DB2 detected that a RID list exceeded one or more internal limits during a given RID list (or RID pool) process involving one index (single index access with list prefetch) or multiple indexes (multiple index access). The internal limits include the physical limitation of the number of RIDs a RID list can hold and threshold values for the retrieval, ORing, and ANDing of RIDs.

For index access with list prefetch (single index), this field can only be incremented during RID list retrieval. For multiple index access, this field can be incremented during RID list retrieval, ANDing, and ORing. This counter reflects the number of times internal limits or threshold values were exceeded for the RID lists obtained directly from an index as well as for RID lists derived during the ANDing and ORing process.

**Background and Tuning Information**

Before you increase the RID list storage size, investigate the cause of the failure using the statistics record or the performance trace. You can specify the desired size for the RID list on the DB2 installation panel DSNTIPC.

**Field Name:** QXMRMIAP

This is an exception field.

**MAX RID BLOCKS ALLOCATED**

The highest number of RID blocks in use at any time since DB2 startup. This is a high-water mark.

**Field Name:** QISTRHIG
This is an exception field.

**CURRENT RID BLOCKS ALLOCAT.**
The number of RID blocks currently in use (snapshot value).

Field Name: QISTRCUR
This is an exception field.

**MAX RID BLOCKS OVERFLOWED**
This field is currently not set by DB2.

Field Name: QISTWFRHIG

**CURRENT RID BLOCKS OVERFL.**
This field is currently not set by DB2.

Field Name: QISTWFRCUR

**STORAGE LIMIT EXCEEDED**
The number of times the DBM1 storage was exhausted during RID list processing.

Background and Tuning Information
This failure occurs when the DBM1 storage limit is reached.

Field Name: QISTRSTG
This is an exception field.

**RDS LIMIT EXCEEDED**
The number of times when the number of RIDs that can fit into the guaranteed number of RID blocks was greater than the maximum limit (25% of table size).

Background and Tuning Information
Ideally, this value should be 0.

The matching index scan part of the RID list processing scanned more than 25% of the index. RID list processing is then terminated, the index scan is abandoned and normally replaced by a tablespace scan.

Reasons for this are:

- Inaccurate or incomplete RUNSTATS statistics. To avoid this, you should collect all statistics on a regular basis, especially simple and correlated column statistics. Using RUNSTATS with SHRLEVEL(CHANGE) does not prevent access to data.
- Optimizer error. In this instance, you could disable RID list processing by adding the clause OPTIMIZE FOR 1 ROW to the SQL statement, or force the access path to index only by adding the necessary columns to the index.

Field Name: QISTRLLM
This is an exception field.

**DM LIMIT EXCEEDED**
The number of times when the number of RID entries was greater than the physical limit of approximately 26 million RIDs.

Field Name: QISTRPLM
RID List Processing

This is an *exception* field.

PROC.LIMIT EXCEEDED

The number of times the maximum RID pool storage was exceeded.

The size is determined by the installation parameter RID POOL SIZE (DB2 install panel DSNTIPC). It can be 0, or between 128 KB and 10 GB. The general formula for calculating the RID pool size is:

(Number of concurrent RID processing activities) x (average number of RIDs) x 2 x (5 bytes per RID).

**Field Name:** QISTRMAX

This is an *exception* field.

OVERFLOWED-NO STORAGE

The number of times a RID list was overflowed to a work file because no RID pool storage was available to hold the list of RIDs.

**Field Name:** QXWFRIDS

OVERFLOWED-MAX LIMIT

The number of times a RID list was overflowed to a work file because the number of RIDs exceeded one or more internal limits.

**Field Name:** QXWFRIDT

INTERRUPTED (HJ)-NO STORAGE

The number of times a RID list append for a hybrid join was interrupted because no RID pool storage was available to hold the list of RIDs.

**Field Name:** QXHJINCS

INTERRUPTED (HJ)-MAX LIMIT

The number of times a RID list append for a hybrid join was interrupted because the number of RIDs exceeded one or more internal limits.

**Field Name:** QXHJINCT

SKIPPED-INDEX KNOWN

The number of times a RID list retrieval for multiple index access was skipped because it was not necessary due to DB2 being able to predetermine the outcome of index ANDing or ORing.

**Field Name:** QXRSMIAP
This topic shows detailed information about “Statistics - ROWID”.

**Statistics - ROWID**

The field labels shown in the following sample layout of “Statistics - ROWID” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ROW ID</td>
<td>The number of times that direct row access was successful.</td>
</tr>
<tr>
<td>DIRECT ACCESS</td>
<td>The number of times that direct row access failed and an index was used</td>
</tr>
<tr>
<td>INDEX USED</td>
<td>to find a record.</td>
</tr>
<tr>
<td>TABLE SPACE SCAN</td>
<td>The number of times that an attempt to use direct row access reverted to</td>
</tr>
<tr>
<td>SCAN USED</td>
<td>using a table-space scan because DB2 was unable to use a matching index</td>
</tr>
<tr>
<td></td>
<td>scan.</td>
</tr>
</tbody>
</table>

**DIRECT ACCESS**

The number of times that direct row access was successful.

**Field Name**: QXROIMAT

**INDEX USED**

The number of times that direct row access failed and an index was used to find a record.

**Background and Tuning Information**

This can happen, for example, when a REORG is performed between the read of the ROWID column and the use of the host variable in the WHERE clause of the SQL statement. This causes the RID value in the host variable to be incorrect.

**Field Name**: QXROIIDX

**TABLE SPACE SCAN USED**

The number of times that an attempt to use direct row access reverted to using a table-space scan because DB2 was unable to use a matching index scan.

**Background and Tuning Information**

Ideally, this value should be 0.

Table-space scans can happen, for example, when a REORG is performed between the read of the ROWID column and the use of the host variable in the WHERE clause of the SQL statement. This causes the RID value in the host variable to be incorrect. DB2 first tries a matching-index scan before using a table-space scan.

To avoid table space scans, you can force the access path of an unsuccessful direct row access to use a matching index scan on the primary-index key by adding PKCOL to the WHERE clause in the SQL statement. ..... WHERE ROWIDCOL=:HVROWID AND PKCOL=:HVPK

**Field Name**: QXROITS
This topic shows detailed information about “Statistics - Short-on-Storage Metrics”.

SIM BP

The buffer pool ID.

Field Name: QBSPBPID

CUR PAGES IN USE

The number of simulated buffers currently in use in the simulated buffer pool.

Field Name: QBSPSUS

MAX PAGES IN USE

The highest number of simulated buffers that were in use in the simulated buffer pool.

Field Name: QBSPHUS

CUR SEQ PAGES IN USE

The number of simulated buffers currently in use for sequential pages in the simulated buffer pool.

Field Name: QBSPSUS

MAX SEQ PAGES IN USE

The highest number of simulated buffers that were in use for sequential pages in the simulated buffer pool.

Field Name: QBSPHUS

SYNC READ I/O (R)

The number of pages found in the simulated buffer pool for a random request that could have avoided a synchronous read I/O from disk.

Field Name: QBSPDRR
Simulated Buffer Pool Statistics

SYNC READ I/O (S)
The number of pages found in the simulated buffer pool for a sequential request that could have avoided a synchronous read I/O from disk.
Field Name: QBSPDRS

ASYNC READ I/O
The number of pages found in the simulated buffer pool for a prefetch request that could have avoided an asynchronous read I/O from disk.
Field Name: QBSPDRA

SYNC GBP READS (R)
The number of pages found in the simulated buffer pool for a random request that could have avoided a synchronous read from GBP.
Field Name: QBSPGRR

SYNC GBP READS (S)
The number of pages found in the simulated buffer pool for a sequential request that could have avoided a synchronous read from GBP.
Field Name: QBSPGRS

ASYNC GBP READS
The number of pages found in the simulated buffer pool for a prefetch request that could have avoided an asynchronous read from GBP.
Field Name: QBSPGRA

PAGES MOVED INTO SIM BP
The number of pages logically moved into the simulated buffer pool from the virtual buffer pool.
Field Name: QBSPMVI

TOTAL SYNC I/O DELAY
The total time waiting for synchronous read I/O from disk for pages found in the simulated buffer pool.
Field Name: QBSPDTM
Stored Procedures

This topic shows detailed information about “Statistics - Stored Procedures”.

**IDENTIFY**

The number of successful connections to DB2 from an allied address space (TSO, BATCH, CICS, IMS, CAF, or UTILITY).

*Field Name: Q3STIDEN*

**CREATE THREAD**

The number of successful create thread requests. It does not include DBATs.

A thread is required before an application can use SQL. When established, a thread can have one or more secondary authorization IDs.

A thread is needed to perform any DB2 activity. For example, a thread is needed to run a DB2 utility to perform an IFI request such as READS, or to process a DB2 command such as -DISPLAY THREAD. However, a thread is not created if the command failed because of a syntax error.

**Background and Tuning Information**

Thread reuse can help improve performance.

The term *thread reuse* only applies to IMS and CICS attachments. In the case of the TSO attachment facility and the call attachment facility (CAF), threads cannot be reused, because the threads are allocated to the user address space.

Thread reuse should be considered in the following cases:

- If transaction volume is high:
  
  High volume transactions should achieve a high percentage of thread reuse. If threads are reused on low volume transactions, the number of
threads needed increases because these threads are not automatically
terminated by IMS when not being used. This may result in too many
idle threads for the level of the DB2 workload. Under CICS, protected
threads are terminated after about 45 seconds if no transaction eligible to
reuse the thread has been received.

- If thread creation cost is significant:
  As a rule of thumb, more than 5% of the total CPU cost of transaction
  processing is considered significant.

The ACQUIRE and RELEASE parameters of BIND should be specified to
minimize the thread creation cost, while providing the needed
concurrency:

- If most of the application plan’s SQL statements are executed, then
  ACQUIRE(ALLOCATE) is cheaper than ACQUIRE(USE).
  
- If only a small number of the SQL statements are executed,
  ACQUIRE(USE) becomes cheaper and improves concurrency, because
  the required resources are only acquired (locked) when the plan actually
  references (uses) them. An example would be a generalized plan used by
  many different transactions. It would contain multiple logic paths
  referencing different tables.

  Note that, when packages are involved, ACQUIRE(USE) is always
  implicitly used.

- Concurrency in thread reuse is based on page locking provided by the IS
  and IX intent locks, whose duration is governed by ACQUIRE and
  RELEASE of BIND.

  RELEASE(DEALLOCATE) is strongly recommended for thread-reuse
  transactions to reduce transaction CPU time.

When thread reuse is implemented, monitor the EDM pool. It should be
sufficient in size to accommodate expanding plans where the next
transaction requires additional plan sections over those that are already
part of the plan.

**Field Name:** Q3STCTHD

This is an *exception* field.

**SIGNON**

The number of signons that identified a new user of an existing thread for
IMS and CICS.

This field is valid only for CICS and IMS (not valid for TSO, CAF, or
UTILITY).

The initial signon does not perform an authorization check because the
thread does not exist yet, but a resignon can.

**Background and Tuning Information**

If the number of signons is greater than the number of create thread
occurrences, some threads have been reused. In the case of the TSO
attachment facility and the call attachment facility (CAF), there is no
sign-on, because the user is identified when the TSO address space is
connected.

**Field Name:** Q3STSIGN

This is an *exception* field.

**TERMINATE**
Subsystem Services

The number of time threads that terminated successfully.

This number does not agree with the create thread count because each level of a thread’s access (IDENTIFY, SIGNON, and CREATE THREAD) must be terminated.

Background and Tuning Information

The value of this field is usually greater than the number of create thread occurrences, because it also includes the termination of connections to DB2 (IDENTIFY) and other internal counts.

Field Name: Q3STTERM

ROLLBACK

The number of times a unit of recovery was successfully rolled back. Some reasons for a rollback include:

- Application program abend
- Application rollback request
- Application deadlock on database records
- Application canceled by operator
- Thread abend due to resource shortage

This number also includes successfully aborted agents associated with threads that use the Recoverable Resource Manager Services Attach Facility (RRSAF).

Field Name: Q3STABRT

This is an exception field.

COMMIT PHASE 1

The number of successful requests for commit phase 1 in a two-phase commit environment such as CICS or IMS. It includes successfully prepared agents associated with threads that use the Recoverable Resource Manager Services Attach Facility (RRSAF). It does not include successful single-phase commits or distributed two-phase commits.

Background and Tuning Information

IMS and CICS applications use the PREPARE and COMMIT sequence to commit work.

Field Name: Q3STPREP

This is an exception field.

COMMIT PHASE 2

The number of successful commit phase 2 in a two-phase environment such as CICS or IMS. It includes successfully committed agents associated with threads that use the Recoverable Resource Manager Services Attach Facility (RRSAF). It does not include successful single-phase commits or distributed two-phase commits.

Background and Tuning Information

IMS and CICS applications use the PREPARE and COMMIT sequence to commit work. A nonzero value for this field indicates that updates have occurred.

Field Name: Q3STCOMM
READ ONLY COMMIT

The number of read-only commits.

There are occasions when CICS or IMS invokes DB2 when no DB2 resource was altered since the completion of the last commit process. When this occurs, DB2 performs both phases of the two-phase commit during the first commit phase and records that the user or job is read-only in relation to its DB2 processing.

Field Name: Q3STRDON

UNITS OF RECOVERY INDOUBT

The number of indoubt units of recovery.

A unit of recovery is indoubt when a failure occurs after a successful prepare but before a successful commit. The failure can occur in the address space of the application, the transaction manager, DB2, or all of these. IMS and CICS applications use the prepare and commit sequence to commit work. Ideally, this value should be 0.

Field Name: Q3STINDT

UNITS OF REC.INDBT RESOLVED

The number of indoubt units of recovery successfully resolved, either automatically or manually. It includes successful indoubt resolutions for agents associated with threads that use the Recoverable Resource Manager Services Attach Facility (RRSAF).

A unit of recovery is indoubt when a failure occurs after a successful prepare but before a successful commit. This number should equal the number of units of recovery gone indoubt. If it is less, then some indoubt units of recovery might still exist.

Field Name: Q3STRIUR

SYNCHS(SINGLE PHASE COMMIT)

The total number of commits in a single-phase commit environment such as TSO, CAF, or UTILITY. IMS applications use the prepare-and-commit sequence; CICS applications use both the synchronized commit request and the prepare-and-commit sequence to commit work.

Note that DBATs executed on this location are not included. For DBAT statistics, see SINGLE PHASE COMMITS received on the DDF activity block.

Field Name: Q3STSYNC

QUEUED AT CREATE THREAD

The number of create thread requests queued (not including DBATs).

The total number of threads accessing data that can be allocated concurrently is the MAX USERS value on the installation panel DSNTIPE. Requests are queued when the MAX USERS value is exceeded. If no threads are queued during peak hours, the maximum number of threads might be set too high.

Background and Tuning Information

As a rule of thumb about 1% thread queuing is acceptable. When this is appreciably higher, increase the value of MAX USERS on the DB2 install panel DSNTIPE.
Subsystem Services

The combined maximum allowed for MAX USERS and MAX REMOTE ACTIVE cannot exceed 2000.

Field Name: Q3STCTHW

This is an exception field.

SUBSYSTEM ALLIED MEMORY EOT

The number of times non-DB2 tasks abended while connected to DB2.

Field Name: Q3STMEOT

This is an exception field.

SUBSYSTEM ALLIED MEMORY EOM

The number of times MVS deleted non-DB2 address space while connected to DB2.

Field Name: Q3STMEOM

This is an exception field.

SYSTEM EVENT CHECKPOINT

The number of checkpoints DB2 has taken.

A checkpoint is a point at which DB2 records internal status information to the DB2 log. This information is used in the recovery process if DB2 abends.

Background and Tuning Information

For Statistics reports only: A checkpoint is taken when the specified number of log records have been written. A checkpoint is also taken each time DB2 switches to a new active log data set. If the Statistics reporting period is 30 minutes and the value of this field is 15, then DB2 is taking checkpoints every 2 minutes.

If the data sets are too small or the value for LOGLOAD is too low, checkpoints occur too frequently. As a result, database writes do not perform efficiently. The frequency of DB2 checkpoints can be decreased by increasing the value of the DSNZPARM LOGLOAD (CHECKPOINT FREQ on the Tracing install panel).

Rule of thumb: In a production environment, DB2 should take checkpoints every 10 minutes or so.

The default value for LOGLOAD is 50000. The actual value that you choose is dependent on the volume and nature of the work performed by your DB2 subsystem. It is a trade-off between the performance efficiency of larger numbers and the longer time to restart DB2 when there is an abnormal termination.

Field Name: QWSDCKPT

This is an exception field.

HIGH WATER MARK IDBACK

The maximum number of connections to a single instance from batch or TSO background tasks.

This is a high-water mark.

Field Name: Q3STHWIB
HIGH WATER MARK IDFORE

The maximum number of connections to a single instance from TSO foreground tasks.

This is a high water-mark.

Field Name: Q3STHWIF

HIGH WATER MARK CTHREAD

The highest number of batch CICS, IMS, and TSO tasks (CTHREAD) to a single instance.

This is a high-water mark.

Field Name: Q3STHWCT
Subsystem Shared Storage Above 2 GB

This topic shows detailed information about “Statistics - Subsystem Shared Storage Above 2 GB”.

Statistics - Subsystem Shared Storage Above 2 GB

The field labels shown in the following sample layout of “Statistics - Subsystem Shared Storage Above 2 GB” are described in the following section.

<table>
<thead>
<tr>
<th>SUBSYSTEM SHARED STORAGE ABOVE 2 GB</th>
<th>QUANTITY</th>
</tr>
</thead>
<tbody>
<tr>
<td>REAL STORAGE IN USE (MB)</td>

</tbody>
</table>

REAL STORAGE IN USE (MB)

The total amount of real storage in use for 64-bit shared storage. This is recorded at the subsystem level.

Note: This field is available in z/OS 1.10 (and maintenance) or later.

Field Name: S225RLU

SHARED THREAD AND SYSTEM (MB)

The amount of real storage in use for 64-bit shared storage. This does not include shared stack storage. This is recorded at the subsystem level.

Note: This field is available in z/OS 1.10 (and maintenance) or later.

Field Name: S225SSR

SHARED STACK STORAGE (MB)

The amount of real storage in use for 64-bit shared stack storage. This is recorded at the subsystem level.

Note: This field is available in z/OS 1.10 (and maintenance) or later.

Field Name: S225KSR

AVERAGE THREAD FOOTPRINT (MB)

The current average real storage in use for subsystem shared storage of active user threads (allied threads + active and pooled DBATs).

Field Name: S225STFR

AUXILIARY STORAGE IN USE (MB)

The total amount of auxiliary storage in use for 64-bit shared storage. This is recorded at the subsystem level.

Note: This field is available in z/OS 1.10 (and maintenance) or later.

Field Name: S225AXU

SHARED THREAD AND SYSTEM (MB)
The amount of auxiliary storage in use for 64-bit shared storage that does not include shared stack storage. This is recorded at the subsystem level.

**Note:** This field is available in z/OS 1.10 (and maintenance) or later.

**Field Name:** S225SSA

**SUBSYSTEM SHARED STORAGE (MB)**

The amount of auxiliary storage in use for 64-bit shared stack storage. This is recorded at the subsystem level.

**Note:** This field is available in z/OS 1.10 (and maintenance) or later.

**Field Name:** S225KSA
This topic shows detailed information about “Statistics - SQL DCL”.

</tbody>
</table>

**SELECT**

The number of SQL SELECT statements executed.

*Field Name:* QXSELECT

**INSERT**

The number of INSERT statements executed.

*Field Name:* QXINSRT

**INSERT - NUMBER OF ROWS**

The number of rows inserted (DB2 field: QXRWSINSRTD).

*Field Name:* SRWINSRT

**UPDATE**

The number of UPDATE statements executed.

*Field Name:* QXUPDTE

**UPDATE - NUMBER OF ROWS**

The number of rows updated (DB2 field: QXRWSUPDTD).

*Field Name:* SRWUPDAT

**MERGE**

The number of times a MERGE statement was executed.

*Field Name:* QXMERGE

**DELETE**

The number of DELETE statements executed.
Field Name: QXDELET

DELETE - NUMBER OF ROWS

The number of rows deleted (DB2 field: QXRWSDELETED).

Field Name: SRWDELETE

PREPARE

The number of SQL PREPARE statements executed. This number at the server location might not match the number at the user application because of the internal processing of the Distributed Data Facility (DDF).

Field Name: QXPREP

DESCRIBE

The number of DESCRIBE, DESCRIBE CURSOR, DESCRIBE INPUT, and DESCRIBE PROCEDURE statements executed. This number at the server location might not match the number at the user application because of the internal processing of the Distributed Data Facility (DDF).

Field Name: QXDESC

DESCRIBE TABLE

The number of DESCRIBE TABLE statements executed.

Field Name: QXDSCRTB

OPEN

The number of OPEN statements executed.

Field Name: QXOPEN

CLOSE

The number of CLOSE statements executed. This number at the server location might not match the number at the user application because of the internal processing of the Distributed Data Facility (DDF).

Field Name: QXCLOSE

FETCH

The number of FETCH statements executed. This number at the server location might not match the number at the user application because of the internal processing of the Distributed Data Facility (DDF).

Field Name: QXFETCH

FETCH - NUMBER OF ROWS

The number of rows fetched (DB2 field: QXRWSFETCHD).

Field Name: SRWFETCH

TOTAL

The total number of SQL DML statements executed.

Field Name: SSCDML

This is an exception field.
Triggers

This topic shows detailed information about “Statistics - Triggers”.

Statistics - Triggers

The field labels shown in the following sample layout of “Statistics - Triggers” are described in the following section.

<table>
<thead>
<tr>
<th>TRIGGERS</th>
<th>QUANTITY</th>
<th>/SECOND</th>
<th>/THREAD</th>
<th>/COMMIT</th>
</tr>
</thead>
<tbody>
<tr>
<td>STATEMENT TRIGGER ACTIVATED</td>

<tr>
<td>SQL ERROR OCCURRED</td>
<td>0.00</td>
<td>0.00</td>
<td>N/C</td>
<td>0.00</td>
</tr>
</tbody>
</table>

**STATEMENT TRIGGER ACTIVATED**

The number of times a statement trigger was activated.

Field Name: QXSTTRG

**ROW TRIGGER ACTIVATED**

The number of times a row trigger was activated.

Field Name: QXROWTRG

**SQL ERROR OCCURRED**

The number of times an SQL error occurred during the execution of a triggered action. This includes errors that occur in user-defined functions or stored procedures that are called from triggers and that pass back a negative SQLCODE.

Field Name: QXTRGERR
Use Currently Committed

This topic shows detailed information about “Statistics - Use Currently Committed”.

Statistics - Use Currently Committed

The field labels shown in the following sample layout of “Statistics - Use Currently Committed” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>INSERT ROWS SKIPPED</th>
<th>DELETE ROWS ACCESSED</th>
<th>UPDATE ROWS ACCESSED</th>

<tr>
<td>/COMMIT</td>
<td>0.00</td>
<td>0.00</td>
<td>0.00</td>
</tr>
</tbody>
</table>

**INSERT ROWS SKIPPED**

The number of rows skipped by read transactions because of uncommitted INSERT operations (using currently committed semantic for FETCH).

Field Name: QISTRCCI

**DELETE ROWS ACCESSED**

The number of rows accessed by read transactions because of uncommitted DELETE operations (using currently committed semantic for FETCH).

Field Name: QISTRCCD

**UPDATE ROWS ACCESSED**

The number of rows accessed by read transactions because of uncommitted UPDATE operations (using currently committed semantic for FETCH).

Field Name: QISTRCCU
User-Defined Functions

This topic shows detailed information about “Statistics - User-Defined Functions”.

Statistics - User-Defined Functions

The field labels shown in the following sample layout of “Statistics - User-Defined Functions” are described in the following section.

<table>
<thead>
<tr>
<th>USER DEFINED FUNCTIONS</th>
<th>QUANTITY /SECOND /THREAD /COMMIT</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXECUTED</td>
<td>0.00</td>
</tr>
<tr>
<td>ABENDED</td>

</tr>
<tr>
<td>TIMED OUT</td>
<td>0.00</td>
</tr>
<tr>
<td>REJECTED</td>
<td>0.00</td>
</tr>
</tbody>
</table>

EXECUTED

The number of user-defined functions executed.

Field Name: QXCAUD

ABENDED

The number of times a user-defined function abended.

Field Name: QXCAUDAB

TIMED OUT

The number of times a user-defined function timed out while waiting to be scheduled.

Field Name: QXCAUDTO

REJECTED

The number of times a user-defined function was rejected.

Field Name: QXCAUDRJ
This topic shows detailed information about “Statistics - Workfile Database”.

This block shows information about the Workfile Database used by DB2 as storage for work files for processing SQL statements, and as storage for created and declared global temporary tables.

The performance metrics in the report block distinguish between work files for declared global temporary tables (DGTTs) and work files for non-DGTT data such as created global temporary tables or sort results. In addition, DB2 supports in-memory work files which are sufficient for performing simple operations and do not require physical allocations. In-memory work files may overflow to physical records in the Workfile Database in case of memory constraints.

**Statistics - Workfile Database**

The field labels shown in the following sample layout of “Statistics - Workfile Database” are described in the following section.

<table>

**TOTAL STORAGE CONFIG (KB)**

The total storage (KB) configured for all table spaces in the Workfile Database.
Workfile Database

Field Name: QISTWSTG
**TOT DGTT STOR CONFIG (KB)**
The total preferred storage (KB) configured for DGTTs in the Workfile Database.

Field Name: QISTDGTTSTG
**TOT WF STOR CONFIG (KB)**
The total preferred storage (KB) configured for non-DGTT work files in the Workfile Database.

Field Name: QISTWFSTG
**TOTAL STORAGE THRESHOLD (%)**
The alert threshold of high space-usage for DGTTs or non-DGTT work files in the Workfile Database (derived from zparm WFSTGUSE_SYSTEM_THRESHOLD).

Field Name: QISTSSTH
**MAX TOTAL STORAGE USED (KB)**
The maximum total amount of storage (KB) ever used in the Workfile Database at system level since DB2 startup.

Field Name: QISTWMXU
**MAX DGTT STOR USED (KB)**
The maximum total amount of storage (KB) ever used for DGTTs in the Workfile Database by all agents on the system since DB2 startup.

Field Name: QISTDGTTMXU
**MAX WF STORAGE USED (KB)**
The maximum total amount of storage (KB) ever used for non-DGTT work files in the Workfile Database by all agents on the system since DB2 startup.

Field Name: QISTWFMXU
**CUR TOTAL STORAGE USED (KB)**
The total amount of storage (KB) currently used in the Workfile Database at system level.

Field Name: QISTWCTO
**CUR DGTT STOR USED (KB)**
The total amount of storage (KB) currently used for DGTTs in the Workfile Database by all agents on the system.

Field Name: QISTDGTTCTO
**CUR WF STORAGE USED (KB)**
The total amount of storage (KB) currently used for non-DGTT work files in the Workfile Database by all agents on the system.

Field Name: QISTWFCTO
**STORAGE IN 4K TS (KB)**
The total amount of storage (KB) currently used for 4 KB table spaces in the Workfile Database.

**Field Name:** QISTW4K

**STORAGE IN 32K TS (KB)**

The total amount of storage (KB) currently used for 32 KB table spaces in the Workfile Database.

**Field Name:** QISTW32K

**4K USED INSTEAD OF 32K TS**

The number of times that space in a 4 KB page table space was used because space in a 32 KB page table space was preferred but not available in the Workfile Database.

**Field Name:** QISTWFP2

**32K USED INSTEAD OF 4K TS**

The number of times that space in a 32 KB page table space was used because space in a 4 KB page table space was preferred but not available in the Workfile Database.

**Field Name:** QISTWFP1

**MAX ACTIVE (DM) IN-MEMORY**

The maximum number of in-memory work files (created by the Data Manager) that were active at any point in time since DB2 startup. This is a high-water mark count.

**Field Name:** QISTIMAH

**MAX ACT (NONSORT) IN-MEM**

The maximum number of non-SORT related in-memory work files created by the Data Manager that were active at any point in time since DB2 startup. This is a high-water mark count.

**Field Name:** QISTI2AH

**CUR ACTIVE (DM) IN-MEMORY**

The number of currently active in-memory work files created by the Data Manager.

**Field Name:** QISTIMAC

**CUR ACT (NONSORT) IN-MEM**

The number of currently active non-SORT related in-memory work files created by the Data Manager.

**Field Name:** QISTI2AC

**MAX STOR (DM) IN-MEM (KB)**

The maximum space used for active in-memory work files created by the Data Manager at any point in time since DB2 startup. This is a high-water mark count.

**Field Name:** QISTIMSH

**CUR STOR (DM) IN-MEM (KB)**
Workfile Database

The total space used for currently active in-memory work files created by the Data Manager.

Field Name: QISTIMSC

MAX ACTIVE (SORT) IN-MEMORY

The maximum number of in-memory work files created by the SORT component that were active at any point in time since DB2 start. This is a high-water mark count.

Field Name: QISTSIAH

CUR ACTIVE (SORT) IN-MEMORY

The number of currently active in-memory work files created by the SORT component.

Field Name: QISTSIAC

MAX STOR (SORT) IN-MEM (KB)

The maximum space used for active in-memory work files created by the SORT component at any point in time since DB2 startup. This is a high-water mark count.

Field Name: QISTSISH

CUR STOR (SORT) IN-MEM (KB)

The total space used for currently active in-memory work files created by the SORT component.

Field Name: QISTSISC

IN-MEM (NONSORT) OVERFLOWED

The number of times non-SORT related in-memory work files overflowed into a physical table space.

Field Name: QISTI2OF

IN-MEM WORKF NOT CREATED

The number of times an in-memory work file was not created due to critical storage conditions.

Field Name: QISTIMNC

AGENT STORAGE CONFIG (KB)

The maximum amount of storage (KB) in the Workfile Database that can be used by each agent (derived from ZPARM MAXTEMPS).

Field Name: QISTWMXA

NUMBER OF LIMIT EXCEEDED

The number of times the maximum amount of storage that an agent can use in the Workfile database was exceeded.

Field Name: QISTWFNE

AGENT STORAGE THRESHOLD (%)

The alert threshold of high space-usage for DGTTs or non-DGTT work files in the Workfile Database by an agent (derived from ZPARM WFSTGUSE_AGENT_THRESHOLD).

Field Name: QISTASTH
MAX AGENT STORAGE USED (KB)

The maximum amount of storage (KB) ever used in the Workfile Database by any thread since DB2 startup.

Field Name: QISTAMXU

DM FAST INSERT PIPES

The number of Data Manager (DM) fast insert pipes that were allocated since DB2 restart.

Field Name: QISTINPA

DM FAST INSERT PIPES DISAB

The number of DM fast insert pipes that have been disabled since DB2 restart.

Field Name: QISTINPD
Workfile Database
Chapter 50. The Statistics Save-File Utility

Use the Save-File utility to migrate and convert Statistics Save data sets into a format suitable for OMEGAMON XE for DB2 PE V5.4.0.

The function performed is specified in a parameter on the EXEC command.

"Migrating Data Sets" on page 50-2
This topic describes how to migrate Statistics Save data sets created by OMEGAMON XE for DB2 PE V5.2.0 or V5.3.0 into the record format of OMEGAMON XE for DB2 PE V5.4.0.

"Converting Data Sets" on page 50-3
To store performance data in Performance Database tables or spreadsheets, you must first convert Statistics Save data sets of OMEGAMON XE for DB2 PE V5.4.0 into sequential data sets that can be used by the DB2 load utility or the Spreadsheet Input-Data Generator of OMEGAMON XE for DB2 PE.

"Save-File Utility DD Statements" on page 50-4
This topic lists the DD statements needed for migration and conversion. All of the DD statements described here are required.
Migrating Data Sets

This topic describes how to migrate Statistics Save data sets created by OMEGAMON XE for DB2 PE V5.2.0 or V5.3.0 into the record format of OMEGAMON XE for DB2 PE V5.4.0.

To migrate Statistics Save data sets:

1. Create a VSAM data set for V520 or V530.
2. Define an OMEGAMON XE for DB2 PE V5.4.0 VSAM data set using IDCAMS as output.
3. Use the MIGRATE function of the Save-File utility to migrate the data sets of OMEGAMON XE for DB2 PE V5.2.0 or V5.3.0.
4. Restore the migrated VSAM data sets in V540 and compare the reports.

The RKO2SAMP library provides the sample job DGOPJSMI, which you can modify to suit your installation.

Note:

- You can only process VSAM data sets in the same version of OMEGAMON XE for DB2 PE as they have been created. For example, if you create a SAVE data set in version 530, it can only be RESTORED in version 530.
- To use a SAVE data set in a higher version, you must migrate the SAVE data set using a migration utility.
- Before you restore or convert SAVE data sets from V5.2.0 or V5.3.0, you must first migrate this data to OMEGAMON XE for DB2 PE V5.4.0 format.
- Restored reports only show fields that are supported by the current version of OMEGAMON XE for DB2 PE.
Converting Data Sets

To store performance data in Performance Database tables or spreadsheets, you must first convert Statistics Save data sets of OMEGAMON XE for DB2 PE V5.4.0 into sequential data sets that can be used by the DB2 load utility or the Spreadsheet Input-Data Generator of OMEGAMON XE for DB2 PE.

You can use the CONVERT function of the Statistics Save-File Utility to convert Statistics Save data sets of OMEGAMON XE for DB2 PE V5.4.0 into sequential data sets. The RKO2SAMP library provides the sample job DGOPJSCO, which you can modify to suit your installation.

You can also use the STATISTICS SAVE subcommand with the CONVERT option to convert and save reduced data into a sequential data set. The output of this subcommand option is a sequential data set, that is specified and requested in SYSIN. The data set attributes are:

**Organization**
PS

**Record format**
VB

**Record length**
9072

**Block size**
9076

For more information about the STATISTICS SAVE subcommand refer to the **Report Command Reference**.

The following list shows the types of records that are created by the CONVERT function (or CONVERT command option) and where to find their layout descriptions in the sample library RKO2SAMP:

- General data records (DGOSDGEN)
- Buffer Pool data records (DGOSDBUF)
- DDF data records (DGOSDDDF)
- Group Buffer Pool records (DGOSDGBP)
- Buffer Pool data set records (DGOSDSET)
- Accelerator data records (DGOSDXCL)
- Aggregated Accounting data records (DGOSDACC)
- Storage data records (DGOSDSTG)

For more information of the Spreadsheet Input-Data Generator refer to the **Reporting User’s Guide**.
Save-File Utility DD Statements

This topic lists the DD statements needed for migration and conversion. All of the DD statements described here are required.

**Input**

The DDNAME of the input data set. This can be an OMEGAMON XE for DB2 PE V5.2.0 or V5.3.0 Statistics Save data set for the MIGRATE function, or an OMEGAMON XE for DB2 PE V5.4.0 Statistics VSAM Save data set for the CONVERT function.

**Output**

The DDNAME of the output data set.

For CONVERT, allocate the data set with the following characteristics:

- **RECFM:** VB
- **LRECL:** 9072
- **BLKSIZE:** 9076

Refer to Chapter 64, “OMEGAMON XE for DB2 PE VSAM Data Sets,” on page 64-1 for details on how to specify the allocated data sets to migrate to OMEGAMON XE for DB2 PE V5.4.0.

**DPMLOG**

OMEGAMON XE for DB2 PE command processor messages and messages indicating exceptional processing conditions are written to DPMLOG. If DPMLOG is not specified, it is dynamically allocated to the SYSOUT message class of the job. Allocate the data set with the following attributes:

- **RECFM:** FBA
- **LRECL:** 133
- **BLKSIZE:** 6251
Chapter 51. The Statistics File Data Set and Output Records

Use the FILE subcommand to format DB2 Statistics records and write them to sequential data sets suitable for use by the DB2 load utility. You can store unreduced Statistics data into the performance database. Use the performance database to produce tailored reports using a reporting facility such as Query Management Facility (QMF).

The format of the output data from the Statistics File data set is identical with that of the CONVERT function of the Save-File utility.

You can also use the File data sets to generate CSV (comma-separated value) input-data. This CSV data can then be transferred to workstations and imported into spreadsheets to improve DB2 performance analysis using graphical representations or pivot tables. For more information refer to Reporting User's Guide.

The Statistics File data set is produced when OMEGAMON XE for DB2 PE Statistics delta records are externalized using the FILE subcommand. Each such delta record represents the period of time between two pairs of DB2 Statistics delta records and can be represented in the File data set by up to 8 types of records. File data is written to a File data set. The following types of records are created. Descriptions of the layouts of these records can be found in the RKO2SAMP library under the following names:

Table 51-1. Record Type and Description for Statistics File Data Sets and Output Records

<table>
<thead>
<tr>
<th>Record type</th>
<th>Description</th>
<th>Layout description in the RKO2SAMP library</th>
</tr>
</thead>
<tbody>
<tr>
<td>General Statistics</td>
<td>Records contain data from IFCID 001 and 002. One general Statistics record is produced for each Statistics delta record.</td>
<td>DGOSDGEN</td>
</tr>
<tr>
<td>Buffer Pool Statistics</td>
<td>Records contain data derived from IFCID 002 records. One buffer pool record is produced for each buffer pool active at the start time of the corresponding delta record. Each OMEGAMON XE for DB2 PE Statistics delta record can produce up to 80 buffer pool Statistics records.</td>
<td>DGOSDBUF</td>
</tr>
<tr>
<td>DDF Statistics</td>
<td>Records contain DDF Statistics originating from IFCID 001. A DDF record is produced for all remote locations that used DRDA (where at least one location used this method at the start time of the delta record).</td>
<td>DGOSDDDF</td>
</tr>
<tr>
<td>Group Buffer Pool Statistics</td>
<td>Records contain data derived from IFCID 002 records. One group buffer pool record is produced for each group buffer pool active at the start time of the corresponding delta record. Each OMEGAMON XE for DB2 PE Statistics delta record can produce up to 80 group buffer pool Statistics records.</td>
<td>DGOSDGBP</td>
</tr>
<tr>
<td>Buffer Pool Data Set</td>
<td>Records contain data derived from IFCID 199. One row is written for each open data set that has an I/O event rate at least one event per second during the reporting interval.</td>
<td>DGOSDSET</td>
</tr>
<tr>
<td>Accelerator</td>
<td>Records contain data derived from IFCID 002. One row is written for each active accelerator attached to the DB2 subsystem that is currently reported.</td>
<td>DGOSDXCL</td>
</tr>
</tbody>

System Parameters Report
Chapter 52. System Parameters Report Header

This section introduces the System Parameters report header.

There are two different types of report headers for system parameters, for:
• MEMBER scope reports.
• GROUP scope reports.

System Parameters Report Header for MEMBER-Scope and GROUP-Scope Reports

Here is an example of a System Parameters report header for MEMBER-scope reports:

LOCATION: STLEC1
GROUP: GRPA
MEMBER: M2
SUBSYSTEM: SSDQ
DB2 VERSION: V10

GROUP: SYSTEM PARAMETERS REPORT
MEMBER: M2
SUBSYSTEM: SSDDQ
ACTUAL FROM: 01/30/15 22:50:03.98

Here is an example of a System Parameters report header for GROUP-scope reports:

LOCATION: SYS1DSN2
GROUP: DSN2
DB2 VERSION: V10

GROUP: SYSTEM PARAMETERS REPORT
MEMBER: N/A
ACTUAL FROM: 01/30/15 06:10:23.14

Field description

The OMEGAMON XE for DB2 PE system parameters report header contains the following information, described line by line:

LOCATION
The DB2 reporting location. If the location name is not available, the DB2 data sharing group name is printed in this field. If the DB2 data sharing group name does not exist, the DB2 subsystem ID is printed.

OMEGAMON XE FOR DB2 PERFORMANCE EXPERT (VnRnMn)
The product name and the version, release, and modification level.

PAGE
The page number in the format lll-nnnnn, where lll denotes the location number within the report and nnnnn the page number within the location.

GROUP
The name of the DB2 data sharing group. This field shows N/A if there is no group name.

SYSTEM PARAMETERS REPORT
The title of the report.

MEMBER
The name of the DB2 data sharing member or the member name of the DB2 subsystem. This field shows N/A if there is no member name.

This field is not printed on the report page showing the GROUP BUFFERPOOLS PARAMETERS.
System Parameters - Report Header

**SUBSYSTEM**
The ID of the DB2 subsystem that generated the data. This field is not printed on the report page showing the GROUP BUFFERPOOLS PARAMETERS.

**ACTUAL FROM/TO**
The date and time of the first and last record included in the log for a location, group, subsystem, or member.

**DB2 VERSION**
The DB2 version number of the subsystem that generated the data.
Chapter 53. Example of the System Parameters Report

This section shows an example of the System Parameters report.

**Example of the System Parameters report**

### System Parameters - Report

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>PLAN AUTHORIZATION CACHE SIZE (AUTHCACHE)</td>
<td>3,072</td>
</tr>
<tr>
<td>PACKAGE AUTHORIZATION CACHE SIZE (CACHEPAC)</td>
<td>5,242,880</td>
</tr>
<tr>
<td>DB2 VERSION</td>
<td>V10</td>
</tr>
<tr>
<td>DB2 RELEASE</td>
<td>53-2</td>
</tr>
</tbody>
</table>

**Plan Authorization Cache Size (AUTHCACHE):**
- Used for temporary storage of plans that are not currently in use.
- Size can be adjusted based on system requirements.

**Package Authorization Cache Size (CACHEPAC):**
- Maintains cached plans for faster access.
- Affects performance by reducing the need to recompile plans.

**DB2 Version:**
- Version 10 of the DB2 database server.

**DB2 Release:**
- Version 53-2, indicating the specific release of the software.

**Other Parameters:**
- **DATA DEFINITION CONTROL SUPPORT (DSNTPF):**
- **INSTALL DD CONTROL (RGNSTNL):**
- **CURRENT DB2 RELEASE (NEWFUN):**
- **CURRENT DB2 RELEASE - 1:**
- **COMPRESS LOB TS FOR DIRECTORY (COMPRESS_DLOB):**
- **DB2 VERSION INSTALL (DSNTPAI):**
- **APPLICATION PROGRAMMING DEFAULTS PANEL 1 (DSNTPP):**
  - **DECFLOAT ROUND MODE:**
  - **DEFAULT CHARSET:**
  - **SQL OBJECT DEFAULTS PANEL (DSNTPP,DSNTP71,DSNTP72):**

**Application Programming Defaults Panel 1 (DSNTPP):**
- Includes options for setting default values for various parameters.
- **ALPHANUM:**
- **DATE:**
- **DECIMAL POINT OPTION:**
- **DEFAULT DELIMITER:**
- **DEFAULT SQL DELIMITER:**
- **DEFAULT MIXED GRAPHIC (MIXED):**
- **EBDIC SBCS CCSID:**
- **ASCII SBCS CCSID:**
- **ASCII UCS CCSID:**
- **UNICODE UCS CCSID:**
- **DEFAULT ENCODING SCHEME:**
- **APPLICATION ENCODING (APPSNC):**
- **LOCATE LC TYPE (LCCTYPE):**
- **DEFAULT ROUND MODE:**
- **DEFAULT CHARSET (CHARSET):**

**SQL Object Defaults Panel (DSNTPP,DSNTP71,DSNTP72):**
- Defines how SQL objects are managed and processed.
- **RENAME TABLE:**
- **UTILITY OBJECT CONVERSION:**
- **TABLE SPACE ALLOCATION (TSOY):**
- **INDEX SPACE ALLOCATION (IXQTY):**
- **OPTIMIZE EXT SIZING (MEGTSZ):**
- **P Audrex By Default:**
- **DEFAULT PARTITION SIZE (DEPSIZE):**
- **PERCENT FREE FOR UPDATE:**
- **DATA COMPRESSION (IMPSCMP):**
- **LIMIT KEY CONV PART TAB (IX TB CONV EXCL):**
- **RENAME TABLE (RENAMETAB):**
- **PREVENT ALTER INDEX:**
- **DDL MATERIALIZATION (DML_MATERIALIZATION):**
- **DEFAULT INSERT ALGORITHM:**

**CACHE DYNAMIC SQL (CACHEDYN):**
- Controls caching of dynamic SQL statements.

**RLST ACCESS ERROR (RLFERR):**
- Error when retrieving list information.

**NO LIMIT RESYNCHRONIZATION INTERVAL IN MINUTES (RESYNC):**
- Specifies the resynchronization interval in minutes.

**DB2 Status (DB2STAT):**
- Indicates the current status of the DB2 instance.

**MAX TYPE 1 INACTIVE THREADS (MAXTYPE1):**
- Limits the number of inactive threads.

**EXTENDED SECURITY (EXTSEC):**
- Enables extended security features.

**SQL NULL INTERVAL PROCESSING DISABLED (SQLINTPF):**
- Disables processing of SQL NULLs.

**PRIVATE_PROTOCOL (PRIVATE_PROTOCOL):**
- Sets the protocol for private communication.

**LOCK ESCALATION PARAMETERS (DSNTPP):**
- Controls lock escalation thresholds.

**CURRENT MAX PAGE OR ROW LOCKS PER TABLE SPACE (NUMLXTS):**
- Limits the number of locks per table space.

**LOG INSTALLATION PARAMETERS (DSNTPPL,DSNTPP):**
- Setting for log file installation.

**DB2 XE for DB2 PERFORMANCE EXPERT (VSAREM):**
- Page 1-3

**SYSTEM PARAMETERS REPORT:**
- Provides a comprehensive view of system parameters.

**OMEGAMON XE for DBZ:**
- Report for DB2 PE & PM.

Chapter 54. System Parameters Report Blocks

This section describes the blocks and fields shown in the system parameters report.

Blocks are listed in alphabetical order, fields are shown in the order they appear in the block.

“Application Programming Defaults Panel 1 (DSNTIPF)” on page 54-4
This topic shows detailed information about “System Parameters - Application Programming Defaults Panel 1 (DSNTIPF)”.

“Application Programming Defaults Panel 2 (DSNTIP4, DSNTIP41)” on page 54-10
This topic shows detailed information about “System Parameters - Application Programming Defaults Panel 2 (DSNTIP4, DSNTIP41)”.

“Archive Log Installation Parameters (DSNTIPA)” on page 54-14
This topic shows detailed information about “System Parameters - Archive Log Installation Parameters (DSNTIPA)”.

“Buffer Pool Parameters (DSNTIP1)” on page 54-18
This topic shows detailed information about “System Parameters - Buffer Pool Parameters (DSNTIP1)”.

“Data Definition Control Support (DSNTIPZ)” on page 54-20
This topic shows detailed information about “System Parameters - Data Definition Control Support (DSNTIPZ)”.

“Define Group or Member (DSNTIPK)” on page 54-23
This topic shows detailed information about “System Parameters - Define Group or Member (DSNTIPK)”.

“Databases and Spaces Started Automatically (DSNTIPS)” on page 54-25
This topic shows detailed information about “System Parameters - Databases and Spaces Started Automatically (DSNTIPS)”.

“Default Startup Modules (DSNTIPO3)” on page 54-26
This topic shows detailed information about “System Parameters - Default Startup Modules (DSNTIPO3)”.

“Distributed Data Facility Panel 1 (DSNTIPR)” on page 54-27
This topic shows detailed information about “System Parameters - Distributed Data Facility Panel 1 (DSNTIPR)”.

“Distributed Data Facility Panel 2 (DSNTIP5)” on page 54-31
This topic shows detailed information about “System Parameters - Distributed Data Facility Panel 2 (DSNTIP5)”.

“DB2 Catalog and Directory Panel (DSNTIPA2)” on page 54-34
This topic shows detailed information about “System Parameters - DB2 Catalog and Directory Panel (DSNTIPA2)”.

“DB2 Utilities Parameters (DSNTIP6, DSNTIP61, DSNTIP62)” on page 54-36
This topic shows detailed information about “System Parameters - DB2 Utilities Parameters (DSNTIP6, DSNTIP61, DSNTIP62)”.

“DB2 Version Install (DSNTIPA1)” on page 54-43
This topic shows detailed information about “System Parameters - DB2 Version Install (DSNTIPA1)”.

“Install DB2 - Resource Limit Facility (DSNTIPO4) (DB2 12)” on page 54-44
This topic shows detailed information about “System Parameters - Install DB2 - Resource Limit Facility (DSNTIPO4) (DB2 12)”.

© Copyright IBM Corp. 1985, 2016
This topic shows detailed information about "System Parameters - Workfile Database Panel (DSNTIP91)".
This topic shows detailed information about “System Parameters - Application Programming Defaults Panel 1 (DSNTIPF)”.  

This block shows application programming defaults.

The values shown are used as default values by the program preparation panels, program preparation CLIST (DSNH), and precompiler. They can also be used as defaults by other programs, such as Query Management Facility (QMF).

Changing some of these defaults is not recommended because changes can make the syntax of existing SQL statements invalid or affect the way application programs run.

Values set here are contained in load module DSNHDECP, in library prefix.SDSNEXIT, which can be loaded and accessed by application programs. When modifying DSNHDECP, do so only by changing and running the installation CLIST.

Do not modify the data in DSNHDECP. If you modify any installation parameters by changing job DSNTIJUZ directly, these values are not recorded for later updates, new installations, or migrations.

Note: The fields shown on this panel depend on the installed DB2 version.

**System Parameters - Application Programming Defaults Panel 1 (DSNTIPF)**

The field labels shown in the following sample layout of “System Parameters - Application Programming Defaults Panel 1 (DSNTIPF)” are described in the following section.

**APPLICATION PROGRAMMING DEFAULTS PANEL 1 (DSNTIPF)**

---

**DEFAULT HOST LANGUAGE (DEFLANG)**

The default programming language for your site. This can be:

- ASM
- C
• CPP
• COBOL
• COB2
• IBMCOB
• FORTRAN
• PLI

When this is C or C++, you can fold SQL identifiers to uppercase.

Install parameter LANGUAGE DEFAULT on panel DSNTIPF, or ZPARM DEF LANG in DSNHDECP.

Field Name: QWPBLANG

DECIMAL POINT OPTION (DECIMAL)

Indicates whether the decimal contains a comma (,) or a period (.). This parameter is used for dynamic SQL and COBOL programs. It is not used or supported by other languages.

Install parameter DECIMAL POINT IS on panel DSNTIPF, or ZPARM DECIMAL in DSNHDECP.

Derivation: DB2 field QWPBDE

Field Name: QWPBDE

DEFAULT DELIMITER (DELIM)

Shows the string delimiter for COBOL. Default string delimiter is the quotation mark. This option is applicable to all types of COBOL.

Install parameter STRING DELIMITER on panel DSNTIPF, or ZPARM DELIM in DSNHDECP.

Field Name: QWPBDL

DEFAULT SQL DELIMITER (SQLDELI)

The string delimiter for SQL.

Install parameter SQL STRING DELIMITER on panel DSNTIPF, or ZPARM SQLDELI in DSNHDECP.

Derivation: DB2 field QWPBSDL

Field Name: QWPBSDL

DIST SQL STRING DELIMITER (DSQLDELI)

Shows the SQL string delimiter used by this DB2 for bind operations when the requester does not give DB2 that information.

Install parameter DIST SQL STR DELIMTR on panel DSNTIPF, or ZPARM DSQLDELI in DSNHDECP.

Field Name: QWPBDSSD

DEFAULT MIXED GRAPHIC (MIXED)

Indicates whether the code points X'0E' and X'0F' are the shift-out and shift-in controls for character strings that include double-byte characters.

Install parameter MIXED DATA on panel DSNTIPF, or ZPARM MIXED in DSNHDECP.

Field Name: QWPBGRA
EBCDIC SBCS CCSID (SCCSID)

The EBCDIC single-byte coded character set ID.

A coded character set identifier (CCSID) must be specified when DDF STARTUP OPTION field on panel DSNTIPR is set to AUTO or COMMAND, or when the MIXED DATA field on panel DSNTIPF is set to YES. When mixed data is used, valid Mixed Data CCSID must also be specified.

A nonexistent CCSID causes an error.

An incorrect CCSID can corrupt data.

Install parameter EBCDIC CCSID on panel DSNTIPF, or ZPARM SCCSID in DSNHDECP.

Field Name: QWPBSID

EBCDIC MBCS CCSID (MCCSID)

The EBCDIC mixed coded character set ID.

A coded character set identifier (CCSID) must be specified when DDF STARTUP OPTION field on panel DSNTIPR is set to AUTO or COMMAND, or when the MIXED DATA field on panel DSNTIPF is set to YES. When mixed data is used, valid Mixed Data CCSID must also be specified.

A nonexistent CCSID causes an error.

An incorrect CCSID can corrupt data.

Install parameter EBCDIC CCSID on panel DSNTIPF, or ZPARM MCCSID in DSNHDECP.

Field Name: QWPBMID

EBCDIC GBCS CCSID (GCCSID)

The EBCDIC graphic coded character set ID.

A coded character set identifier (CCSID) must be specified when DDF STARTUP OPTION field on panel DSNTIPR is set to AUTO or COMMAND, or when the MIXED DATA field on panel DSNTIPF is set to YES. When mixed data is used, valid Mixed Data CCSID must also be specified.

A nonexistent CCSID causes an error.

An incorrect CCSID can corrupt data.

Install parameter EBCDIC CCSID on panel DSNTIPF, or ZPARM GCCSID in DSNHDECP.

Field Name: QWPBGID

ASCII SBCS CCSID (ASCCSID)

The ASCII single-byte coded character set ID.

The default (0) means the installation has no ASCII databases, table spaces, or tables.

Install parameter ASCII CCSID on panel DSNTIPF, or ZPARM ASCCSID in DSNHDECP.

Field Name: QWPBASID
ASCII MBCS CCSID (AMCCSID)

Indicates the ASCII mixed coded character set ID.

The default (0) means the installation has no ASCII databases, table spaces, or tables.

Install parameter ASCII CCSID on panel DSNTIPF, or ZPARM AMCCSID in DSNHDECP.

Field Name: QWPBAMID

ASCII GBCS CCSID (AGCCSID)

Indicates the ASCII graphic coded character set ID.

The default (0) means the installation has no ASCII databases, table spaces, or tables.

Install parameter ASCII CCSID on panel DSNTIPF, or ZPARM AGCCSID in DSNHDECP.

Field Name: QWPBAGID

UNICODE SBCS CCSID (USCCSID)

Unicode Single Byte Character Set identification.

Parameter UNICODE CCSID in installation panel DSNTIPF, or ZPARM USCCSID in macro DSNHDECP.

Field Name: QWPBUSID

UNICODE MBCS CCSID (UMCCSID)

Unicode Mixed Character Set identification.

Parameter UNICODE CCSID in installation panel DSNTIPF, or ZPARM UMCCSID in macro DSNHDECP.

Field Name: QWPBUMID

UNICODE GBCS CCSID (UGCCSID)

Unicode graphics character set identification.

Parameter UNICODE CCSID in installation panel DSNTIPF, or ZPARM UGCCSID in macro DSNHDECP.

Field Name: QWPBUGID

DEFAULT ENCODING SCHEME (ENSCHEME)

The default encoding scheme, which can be ASCII or EBCDIC, or UNICODE.

Install parameter DEF ENCODING SCHEME on panel DSNTIPF, or ZPARM ENSCHEMES in DSNHDECP.

Derivation: DB2 field QWPBENS

Field Name: QWPBENS

APPLICATION ENCODING (APPENSCH)

Application encoding scheme.

Install parameter APPLICATION ENCODING on installation panel DSNTIPF, or ZPARM APPENSCH in DSNHDECP.

Field Name: QWPBAPSC
LOCALE LC_CTYPE (LC_TYPE)

The system LOCALE LC_CTYPE.

A locale is the part of the system environment that depends on language and cultural conventions. An LC_TYPE is a subset of a locale that applies to character functions. The UPPER, LOWER, and TRANSLATE scalar functions use the CURRENT LOCALE LC_CTYPE system default or special register. The results of these functions can vary, depending on the setting of the locale.

The following values are possible:

**BLANK**

The source field is empty.

This is the default, unless it is necessary to run the UPPER, LOWER, or TRANSLATE functions for data that must be interpreted using the rules provided by specific locales, for example, En_US or Fr_CA.

**1st word**

The source field contains left-justified word(s), where each byte of a word is > X'40'. It can be a single word or several ones, delimited by bytes <= X'40'.

**Note:** These hexadecimal codes do not represent printable characters.

**N/P**

The source field contains regular words that are not left-justified. This means that the first bytes are <= X'40'. N/P is also shown if the whole source field only consists of bytes < X'40', such as zeros.

Install parameter LOCALE LC_CTYPE on panel DSNTIPF, or ZPARM LC_TYPE in DSNHDECP.

Field Name: QWPBLCTP

**DECFLOAT ROUND MODE (DEF_DECFLOAT_ROUND_MODE)**

The default rounding mode for the decimal floating point type. Possible values are:

- X'80' \(\text{ROUND_CEILING}\)
- X'40' \(\text{ROUND_DOWN}\)
- X'20' \(\text{ROUND_FLOOR}\)
- X'10' \(\text{ROUND_HALF_DOWN}\)
- X'08' \(\text{ROUND_HALF_EVEN}\)
- X'04' \(\text{ROUND_HALF_UP}\)
- X'02' \(\text{ROUND_UP}\)

Otherwise this field shows 'BLANK'.

ZPARM DEF_DECFLOAT_ROUND_MODE in DSNHDECP.

Field Name: QWPBDDRM

**DEFAULT CHARSET (CHARSET)**

Shows the default character set, ALPHANUM or KATAKANA.
ZPARM CHARSET in DSNHDECP.

Field Name: QWPBCHAR
### Application Programming Defaults Panel 2 (DSNTIP4, DSNTIP41)

This topic shows detailed information about “System Parameters - Application Programming Defaults Panel 2 (DSNTIP4, DSNTIP41)”.

This block is a continuation of DSNTIPF and shows application programming defaults.

The values shown are used as default values by the program preparation panels, the program preparation CLIST (DSNH), and the precompiler. They can also be used as defaults by other programs, such as Query Management Facility (QMF).

Changing some of these defaults is not recommended because changes can make the syntax of existing SQL statements invalid or affect the way application programs run.

#### System Parameters - Application Programming Defaults Panel 2 (DSNTIP4, DSNTIP41)

The field labels shown in the following sample layout of “System Parameters - Application Programming Defaults Panel 2 (DSNTIP4, DSNTIP41)” are described in the following section.

<table>
<thead>
<tr>
<th>Field Label</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MINIMUM DIVIDE SCALE (DECDIV3)</td>
<td>NO</td>
</tr>
<tr>
<td>DECIMAL ARITHMETIC (DECARTH)</td>
<td>DEC15</td>
</tr>
<tr>
<td>USE FOR DYNAMIC RULES (DYNRULS)</td>
<td>YES</td>
</tr>
<tr>
<td>STATIC DESCRIBE (DESCSTAT)</td>
<td>YES</td>
</tr>
<tr>
<td>DATE FORMAT (DATE)</td>
<td>ISO</td>
</tr>
<tr>
<td>TIME FORMAT (TIME)</td>
<td>ISO</td>
</tr>
<tr>
<td>LOCAL DATE LENGTH (DATELEN)</td>
<td>N/A</td>
</tr>
<tr>
<td>LOCAL TIME LENGTH (TIMELEN)</td>
<td>N/A</td>
</tr>
<tr>
<td>IMPLICIT TIMEZONE</td>
<td>CURRENT</td>
</tr>
<tr>
<td>STD SQL LANGUAGE (STDSQL)</td>
<td>NO</td>
</tr>
<tr>
<td>PAD NULL-TERMINATED (PADNTSTR)</td>
<td>NO</td>
</tr>
<tr>
<td>APPL COMPAT LEVEL (APPLCOMPAT)</td>

</tr>
<tr>
<td>LIKE BLANK INSIGNIFICANT (LIKE_BLANK_INSIGNIFICANT)</td>
<td>N/A</td>
</tr>
<tr>
<td>FULLY QUALIFIED NAME OF DSNHDECP LOAD MODULE</td>
<td>SYS1.DSNEXIT(DSNHDECP)</td>
</tr>
</tbody>
</table>

**MINIMUM DIVIDE SCALE (DECDIV3)**

This field is for IBM service use.

**Field Name:** QWP4DIV3

**DECIMAL ARITHMETIC (DECARTH)**

Indicates the rules of precision for a decimal field.

Install parameter DECIMAL ARITHMETIC on panel DSNTIP4, or ZPARM DECARTH in DSNHDECP.

**Derivation:** DB2 field QWPBAR

**Field Name:** QWPBARTH

**USE FOR DYNAMIC RULES (DYNRULS)**

Shows whether DB2 uses the application programming defaults specified on this panel or those of the DB2 precompiler options for dynamic SQL statements bound using DYNAMICRULES bind, define, or invoke behavior.
When YES, the application programming (DSNHDECP) defaults are used for dynamic SQL statements in plans or packages bound using DYNAMICRULES bind, define, or invoke behavior.

The following defaults are affected:

- DECIMAL POINT IS
- STRING DELIMITER
- SQL STRING DELIMITER
- MIXED DATA
- DECIMAL ARITHMETIC

When NO, values of the precompiler options are used for dynamic SQL statements in plans or packages bound with DYNAMICRULES(BIND).

Install parameter USE FOR DYNAMICRULES on panel DSNTIP4, or ZPARM DYNRULS in DSNHDECP.

Field Name: QWPBDRLS

**STATIC DESCRIBE (DESCSTAT)**

Shows whether DB2 builds a DESCRIBE SQLDA when binding static SQL statements.

A DESCRIBE cannot be issued against a static SQL statement except:

- In a distributed environment, where DB2 for z/OS is the server and the requester supports extended dynamic SQL. In this instance, a DESCRIBE on an SQL statement in the extended dynamic package appears to DB2 as a DESCRIBE on a static SQL statement in the DB2 package.
- When an application uses a stored procedure result set, the application must allocate a cursor for that result set. The application can do this using a DESCRIBE CURSOR statement. The SQL statement actually described is the one with the cursor declared in the stored procedure. If that statement is static, a static SQL statement must be described.

When NO (default), DB2 does not generate a DESCRIBE SQLDA at BIND time for static SQL statements. If a DESCRIBE request is received at execution time, DB2 generates an error. However, if the describe request comes from a DESCRIBE CURSOR statement, DB2 satisfies the request but is only able to provide data type and length information. Column names are not provided.

When YES, DB2 generates a DESCRIBE SQLDA at BIND time so that DESCRIBE requests for static SQL can be satisfied during execution.

**Note:** You must rebind packages after this value has been set to YES.

This option increases the size of some packages because the DESCRIBE SQLDA is now stored with each statically-bound SQL SELECT statement.

Install parameter DESCRIBE FOR STATIC on panel DSNTIP4, or ZPARM DESCSTAT in DSN6SPRM.

Field Name: QWP4DSST

**DATE FORMAT (DATE)**

Default output format for dates.

Valid formats are ISO (yyyy-mm-dd), USA (mm/dd/yyyy), EUR (dd.mm.yyyy), JIS (yyyy-mm-dd), or LOCAL (your choice, defined by a
date exit routine). DB2 interprets the input date from the punctuation and converts the output date to the required format.

Install parameter DATE FORMAT on panel DSNTIP4, or ZPARM DATE in DSNHDECP.

Field Name: QWPBDATE

TIME FORMAT (TIME)

Indicates the default output format for times.

Valid values are ISO (hh:mm:ss), USA (hh:mm AM), EUR (hh:mm:ss), JIS (hh:mm:ss), or LOCAL (your choice, defined by a time exit routine). DB2 interprets the input time from the punctuation and converts the output time to the required format.

Install parameter TIME FORMAT on panel DSNTIP4, or ZPARM TIME in DSNHDECP.

Field Name: QWPBTIME

LOCAL DATE LENGTH (DATELEN)

Shows the length of the longest field required to hold a locally defined date.

The default (0) indicates an IBM-supplied format (ISO, JIS, USA, or EUR).

Install parameter LOCAL DATE LENGTH on panel DSNTIP4, or ZPARM DATELEN in DSNHDECP.

Field Name: QWPBDLEN

LOCAL TIME LENGTH (TIMELEN)

Shows the length of the longest field required to hold a time when a locally defined time format is used.

The default (0) indicates an IBM-supplied format (ISO, JIS, USA, or EUR).

Install parameter LOCAL TIME LENGTH on panel DSNTIP4, or ZPARM TIMELEN in DSNHDECP.

Field Name: QWPBTLEN

IMPLICIT TIMEZONE

The implicit time zone that is associated with DB2 table columns and routine parameters that are declared as time stamp with time zone.

For IFCID 106 - Application Programming Defaults, this field is displayed twice, with its hex value and in a readable string.

This field corresponds to DSNHDECP field IMPLICIT_TIMEZONE.

Field Name: QWPBIMTZ

STD SQL LANGUAGE (STDSQL)

Shows whether SQL, the language standard used by applications, conforms to 1986 ANSI SQL standard.

YES Conforms to the 1986 ANSI SQL standard
NO Conforms to the SQL language defined by DB2
86 Conforms to the 1986 ANSI SQL standard
Install parameter STD SQL LANGUAGE on panel DSNTIP4, or ZPARM
STDSQL in DSNHDECP.

Field Name: QWPBSQL

PAD NULL-TERMINATED (PADNTSTR)
Shows whether output host variables that are NULL-terminated strings are
padded with blanks and a NULL terminator.
When NO, NULL-terminated output host variables have the NULL
terminator placed at the end of actual data returned in the host variable.
When YES, NULL-terminated output host variables have the NULL
terminator placed at the end of the string, after the string has been padded
with blanks from the end of the actual data to the declared length of the
output host variable.
Install parameter PAD NUL-TERMINATED on installation panel DSNTIP4,
or ZPARM PADNTSTR in DSNHDECP.

Field Name: QWPBPAD

APPL COMPAT LEVEL (APPLCOMPAT)
Specifies the DB2 level for downward compatibility with applications. The
ZPARM name is APPLCOMPAT in DSN6SPRM.

Field Name: QWP4APCO_VAR

LIKE BLANK INSIGNIFICANT (LIKE_BLANK_INSIGNIFICANT)
YES indicates that blanks are not significant when DB2 applies the LIKE
predicate to a string. Blanks are significant in DB2 10.
This setting corresponds to field LIKE BLANK INSIGNIFICANT on
installation panel DSNTIP41. The ZPARM name is
LIKE_BLANK_INSIGNIFICANT in DSN6SPRM.

Field Name: QWP4LBIN

FULLY QUALIFIED NAME OF DSNHDECP LOAD MODULE
Shows the fully qualified DECP name of the data set from which the
DSNHDECP module was loaded.

Field Name: QWPBLNM
## Archive Log Installation Parameters (DSNTIPA)

This topic shows detailed information about “System Parameters - Archive Log Installation Parameters (DSNTIPA)”.

This block shows the characteristics of archive log data sets.

### System Parameters - Archive Log Installation Parameters (DSNTIPA)

The field labels shown in the following sample layout of “System Parameters - Archive Log Installation Parameters (DSNTIPA)” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>CATALOG ARCHIVE DATASETS (CATALOG)</strong></td>
<td>YES</td>
</tr>
<tr>

<td>5</td>
</tr>
<tr>
<td><strong>SINGLE VOLUME (SVOLARC)</strong></td>
<td>NO</td>
</tr>
</tbody>
</table>

### CATALOG ARCHIVE DATASETS (CATALOG)

The alias of the VSAM integrated catalog facility user catalog or the name of the master catalog where the DB2 VSAM data sets created during installation are cataloged. The MVS catalog alias is also used as the high-level qualifier for DB2 VSAM data sets.

Install parameter CATALOG ALIAS on panel DSNTIPA, or ZPARM CATALOG in DSN6ARVP.

Field Name: QWP3CTLG

### COPY1 ARCHIVE LOG DEVICE TYPE (UNIT)

The device type or unit name for storing archive log data sets.

The value can be any alphanumeric string. If you choose to archive to DASD, you can specify a generic device type with a limited volume range. DB2 requires that all archive log data sets allocated on DASD are cataloged.

If the device type is DASD, CATALOG DATA must be set to YES. If the unit name specifies DASD, the archive log data sets can extend to a maximum of 15 volumes. PRIQTY and SECQTY must be large enough to contain all active log data set data without extending beyond 15 volumes. If the unit name specifies a tape device, DB2 can extend to a maximum of 20 volumes. Default is TAPE.

Install parameter DEVICE TYPE 1 on panel DSNTIPA, or ZPARM UNIT in DSN6ARVP.
Field Name: QWP3UNT1

COPY2 ARCHIVE LOG DEVICE TYPE (UNIT2)

Indicates the device type or unit name for storing the second copy of archive log data sets.

The value can be any alphanumeric string. If you choose to archive to DASD, you can specify a generic device type with a limited volume range. DB2 requires that all archive log data sets allocated on DASD are cataloged.

If the device type is DASD, then CATALOG DATA must be set to YES. If the unit name specifies DASD, the archive log data sets can extend to a maximum of 15 volumes. PRIQTY and SECQTY must be large enough to contain all active log data set data without extending beyond 15 volumes. If the unit name specifies a tape device, DB2 can extend to a maximum of 20 volumes. Default is TAPE.

Install parameter DEVICE TYPE 2 on panel DSNTIP, or ZPARM UNIT2 in DSN6ARVP.

Field Name: QWP3UNT2

SPACE ALLOCATION METHOD (ALCUNIT)

The unit used in allocating archive data sets. Possible values are:

CYLINDER
    Space allocation by cylinders (QWP3CYL=1)

TRACKS
    Space allocation by tracks (QWP3TRCK=1)

BLOCKS
    Space allocation by blocks (QWP3CYL=0 and QWP3TRCK=0)

Install parameter ALLOCATION UNITS on panel DSNTIP, or ZPARM ALCUNIT in DSN6ARVP.

Field Name: RT0106SA

PRIMARY SPACE ALLOCATION (PRIQTY)

The primary space allocation for archive data sets.

Install parameter PRIMARY QUANTITY on installation panel DSNTIP, or ZPARM PRIQTY in DSN6ARVP.

Field Name: QWP3RISP

SECONDARY SPACE ALLOCATION (SECQTY)

The amount of DASD secondary space allocation for an archive log data set.

The units used are specified by the ALLOCATION UNITS field. When blank (default), the CLIST calculates this space using block size and size of the log.

Install parameter SECONDARY QTY on panel DSNTIP, or ZPARM SECQTY in DSN6ARVP.

Field Name: QWP3SECS

ARCHIVE LOG BLOCK SIZE IN BYTES (BLKSIZE)

The block size of the archive log data set.
The block size must be compatible with the device type used for archive logs. The value is rounded up to the next multiple of 4096 bytes.

If the archive log is written to tape, use the largest possible block size to improve the reading speed.

Recommended block size values are 28672 for tape, 20480 for 3380, and 24576 for 3390 or RAMAC.

Install parameter BLOCK SIZE on panel DSNTIPA, or ZPARM BLKSIZE in DSN6ARVP.

Field Name: QWP3BKSZ

MAXIMUM READ TAPE UNITS (MAXRTU)

The maximum number of tape units that can be allocated for archive read purposes.

Install parameter READ TAPE UNITS on panel DSNTIPA, or ZPARM MAXRTU in DSN6LOGP.

Field Name: QWP2MRTU

TAPE UNIT DEALLOCATION PERIOD (DEALLCT)

The number of minutes an archive read tape unit can remain unused before it is deallocated.

When archive log data is read from tape, this value should be high enough to allow DB2 to optimize tape handling for multiple read applications.

Install parameter DEALLOC PERIOD on panel DSNTIPA, or ZPARM DEALLCT in DSN6LOGP.

Field Name: QWP2DMIN

MAX NUMBER OF DATASETS RECORDED IN BSDS (MAXARCH)

The maximum number of archive log volumes that can be recorded in the BSDS.

When this number is exceeded, recording resumes at the beginning of the BSDS.

For dual archive, this value applies to each log data set. As an example, a value of 500 allows 500 COPY-1 and 500 COPY-2 data sets in the BSDS.

You must create image copies of all DB2 objects, probably several times, before the archive log data sets are discarded. If you fail to retain an adequate number of archive log data sets for all the image copies, you might need to cold start or reinstall DB2. In either case, data is lost.

Install parameter RECORDING MAX on panel DSNTIPA, or ZPARM MAXARCH in DSN6LOGP.

Field Name: QWP2ARCL

FIRST ARCHIVE COPY MASS STG GROUP NAME

The mass storage system volume group name of the first storage group.

Field Name: QWP3MSV1

SECOND ARCHIVE COPY MASS STG GROUP NAME

The mass storage system volume group name of the second storage group.

Field Name: QWP3MSV2
DAYS TO RETAIN ARCHIVE LOG DATA SETS (ARCRETN)

The number of days DB2 keeps archive log data sets.
This value is added to the current date to calculate the expiration date.
The retention period is often used in tape management systems to control
the reuse and scratching of data sets and tapes. DB2 uses this as the value
for the dynamic allocation parameter DALRETPD when archive log data
sets are created.
Install parameter RETENTION PERIOD on panel DSNTIPA, or ZPARAM
ARCRETN in DSN6ARVP.
Field Name: QWP3RETN

ISSUE WTOR BEFORE MOUNT FOR ARCHIVE VOLUME (ARCWTOR)

Indicates whether DB2 must send a message to the operator and wait for
an answer before attempting to mount an archive log data set.
Other DB2 users can be forced to wait while the mount is pending. They
are not affected while DB2 is waiting for a response to the message.
When YES, a device such as tape is used that requires long delays for
mounts. DEVICE TYPE 1 shows the device type or unit name.
Install parameter WRITE TO OPER on panel DSNTIPA, or ZPARAM
ARCWTOR in DSN6ARVP.
Field Name: QWP3WTOR

COMPACT DATA (COMPACT)

Indicates whether data written to archive logs is compacted.
This option only applies to data written to a 3480 device that has the
improved data recording capability (IDRC) feature.
Install parameter COMPACT DATA on panel DSNTIPA, or ZPARAM
COMPACT in DSN6ARVP.
Field Name: QWP3COMP

QUIESCE PERIOD (QUIESCE)

The maximum amount of time (in seconds) permitted for DB2 to attempt a
full system quiesce.
Install parameter QUIESCE PERIOD on panel DSNTIPA, or ZPARAM
QUIESCE in DSN6ARVP.
Field Name: QWP3MQP

SINGLE VOLUME (SVOLARC)

Indicates whether single-volume DASD archives are used.
Install parameter SINGLE VOLUME on panel DSNTIPA, or ZPARAM
SVOLARC in DSN6ARVP.
Field Name: QWP3SVOL
Buffer Pool Parameters (DSNTIP1)

This topic shows detailed information about “System Parameters - Buffer Pool Parameters (DSNTIP1)”.

This block shows the default buffer pools for user data and indexes.

System Parameters - Buffer Pool Parameters (DSNTIP1)

The field labels shown in the following sample layout of “System Parameters - Buffer Pool Parameters (DSNTIP1)” are described in the following section.

BUFFER POOL PARAMETERS (DSNTIP1)
------------------------------------------------------------------------------------------------------------------
DEFAULT 4-KB BUFFER POOL FOR USER DATA (TBSBPOOL) ...........BP2
DEFAULT 8-KB BUFFER POOL FOR USER DATA (TBSBP8K) ..........BP8K0
DEFAULT 16-KB BUFFER POOL FOR USER DATA (TBSBP16K) ........BP16K0
DEFAULT 32-KB BUFFER POOL FOR USER DATA (TBSBP32K) ........BP32K
DEFAULT BUFFER POOL FOR USER LOB DATA (TBSBPLOB) ...........BP0
DEFAULT BUFFER POOL FOR USER XML DATA (TBSBPXML) ..........BP16K0
DEFAULT BUFFER POOL FOR USER INDEXES (IDXBPPOOL) ..........BP3

DEFAULT 4-KB BUFFER POOL FOR USER DATA (TBSBPOOL)

The name of the 4 KB buffer pool for user table spaces.

Install parameter DEFAULT BUFFER POOL FOR USER DATA on installation panel DSNTIP1, or ZPARM TBSBPOOL in DSN6SYSP.

Field Name: QWP1TBPL

DEFAULT 8-KB BUFFER POOL FOR USER DATA (TBSBP8K)

The default 8 KB buffer pool for:
- Table spaces with an 8 KB page size in implicitly created databases
- Explicitly created table spaces with an 8 KB page size, but without a buffer pool clause that is specified in the create table space statement.

Install parameter DEFAULT 8-KB BUFFER POOL FOR USER DATA on panel DSNTIP1 or ZPARM TBSBP8K in DSN6SYSP.

Field Name: QWP1TP8

DEFAULT 16-KB BUFFER POOL FOR USER DATA (TBSBP16K)

The default 16 KB buffer pool for:
- Table spaces with a 16 KB page size in implicitly created databases
- Explicitly created table spaces with a 16 KB page size, but without a buffer pool clause that is specified in the create table space statement.

Install parameter DEFAULT 16-KB BUFFER POOL FOR USER DATA on panel DSNTIP1 or ZPARM TBSBP16K in DSN6SYSP.

Field Name: QWP1TP16

DEFAULT 32-KB BUFFER POOL FOR USER DATA (TBSBP32K)

The default 32 KB buffer pool for:
- Table spaces with a 32 KB page size in implicitly created databases
- Explicitly created table spaces with a 32 KB page size, but without a buffer pool clause that is specified in the create table space statement.

Install parameter DEFAULT 32-KB BUFFER POOL FOR USER DATA on panel DSNTIP1 or ZPARM TBSBP32K in DSN6SYSP.
Field Name: QWP1TP32

DEFAULT BUFFER POOL FOR USER LOB DATA (TBSBPLOB)

The name of the buffer pool that is used for implicitly created LOB table spaces. This field corresponds to field default buffer pool for USER LOB DATA on installation panel DSNTIP1. The ZPARM name is TBSBPLOB in DSN6SYSP.

Field Name: QWP1TPLB

DEFAULT BUFFER POOL FOR USER XML DATA (TBSBPXML)

The name of the buffer pool that is used for XML table spaces. This field corresponds to field default buffer pool for USER XML DATA on installation panel DSNTIP1. The ZPARM name is TBSBPXML in DSN6SYSP.

Field Name: QWP1TPXM

DEFAULT BUFFER POOL FOR USER INDEXES (IDXBPOOL)

The name of the 4 KB buffer pool used for indexes on user data.

Install parameter DEFAULT BUFFER POOL FOR USER INDEXES on installation panel DSNTIP1, or ZPARM IDXBPOOL in DSN6SYSP.

Field Name: QWP1IXPL
Data Definition Control Support (DSNTIPZ)

This topic shows detailed information about “System Parameters - Data Definition Control Support (DSNTIPZ)”.

This shows the installation and configuration for data definition control support.

Two SQL tables (application and object registration) are identified and created even if data definition control support is not installed. This simplifies future activation of the facility. Specified application identifiers (DB2 plans or collections of packages) can be registered in the application registration table and, optionally, their associated DB2 object names can be registered in the object registration table. DB2 consults these two tables prior to accepting a given DDL statement to make sure that a particular application identifier and object name are registered.

Fields in this block can contain long names. When a long name exceeds the available space, it is truncated, the parameter identifier and the full name are printed in a separate list at the end of the report.

System Parameters - Data Definition Control Support (DSNTIPZ)

The field labels shown in the following sample layout of “System Parameters - Data Definition Control Support (DSNTIPZ)” are described in the following section.

DATA DEFINITION CONTROL SUPPORT (DSNTIPZ)

-----------------------------------------
INSTALL DD CONTROL (RGFINSTL)..................NO
CONTROL ALL APPLICATIONS (RGFDEDPL)...............NO
REQUIRE FULL NAMES (RGFFULLQ)....................YES
UNREGISTERED DDL DEFAULT (RGFDEFLT)..............ACCEPT
REGISTER TABLE OWNER (RGFCOLID)...................DSNZPARAM
DDL REGISTRATION DATABASE NAME (RGFDSTAM).........DSNRFDB
APPL REGISTRATION TABLE NAME (RGFMNPT)...........DSNZPARAMRGFMNPT
OBJECT REGISTRATION TABLE NAME (RGFOMRT).........DSNZPARAMRGFOMRT
ESCAPE CHARACTER (RGFESCP)......................X'40'

INSTALL DD CONTROL (RGFINSTL)

Indicates whether data definition support has been installed.

Install parameter INSTALL DD CONTROL SUPT on panel DSNTIPZ, or ZPARM RGFINSTL in DSN6SPRM.

Field Name: QWP4REGI

CONTROL ALL APPLICATIONS (RGFDEDPL)

Indicates that the DB2 system is completely controlled by a set of closed applications identified in the application registration table.

Closed applications require their DB2 objects to be managed solely through the plans or packages registered in the application registration table.

Install parameter CONTROL ALL APPLICATIONS on panel DSNTIPZ, or ZPARM RGFDEDPL in DSN6SPRM.

Field Name: QWP4REGD

REQUIRE FULL NAMES (RGFFULLQ)

Indicates whether registered objects require fully qualified names.
Install parameter REQUIRE FULL NAMES on panel DSNTIPZ, or ZPARM RGFFULLQ in DSN6SPRM.

Field Name: QWP4REGQ

UNREGISTERED DDL DEFAULT (RGFDEFLT)

The action taken for DDL that names an unregistered object.

Options are REJECT, ACCEPT, or APPL, which rejects the DDL when the current application is not registered.

Install parameter UNREGISTERED DDL DEFAULT on panel DSNTIPZ, or ZPARM RGFDEFLT in DSN6SPRM.

Field Name: QWP4REGU

REGISTER TABLE OWNER (RGFCOLID)

The owner of the application registration table and the object registration table.

This identifier can be a long string. If there is insufficient space to show the complete string, the string is truncated in the report block. The complete string is shown in a separate list of long names at the end of the report.

Install parameter REGISTRATION OWNER on panel DSNTIPZ, or ZPARM RGFCOLID in DSN6SPRM.

Field Name: QWP4REGC

DDL REGISTRATION DATABASE NAME (RGFDBNAM)

The name of the database that contains the registration tables.

Install parameter REGISTRATION DATABASE on panel DSNTIPZ, or ZPARM RGFDBNAM in DSN6SPRM.

Field Name: QWP4REGN

APPL REGISTRATION TABLE NAME (RGFNMPRT)

The name of the application registration table.

Install parameter APPL REGISTRATION TABLE on panel DSNTIPZ or ZPARM RGFNMPRT in DSN6SPRM.

Field Name: QWP4REGA

OBJECT REGISTRATION TABLE NAME (RGFNORT)

The name of the object registration table.

Install parameter OBJT REGISTRATION TABLE on panel DSNTIPZ, or ZPARM RGFNMORT in DSN6SPRM.

Field Name: QWP4REGO

ESCAPE CHARACTER (RGFESCP)

The escape character used in the application registration table (ART) or object registration table (ORT).

Sets of names in the ART and ORT can be represented by patterns that use the underscore (_) and percent sign (%) characters in the same way as in an SQL LIKE predicate.

Install parameter ART/ORT ESCAPE CHARACTER on panel DSNTIPZ, or ZPARM RGFESCP in DSN6SPRM.
Data Definition Control Support (DSNTIPZ)

Field Name: QWP4ESC
**Define Group or Member (DSNTIPK)**

This topic shows detailed information about “System Parameters - Define Group or Member (DSNTIPK)”. This panel shows the members in a data sharing group.

DB2 subsystems that share data must belong to a DB2 data sharing group, which runs on a Parallel Sysplex. A data sharing group is a collection of one or more DB2 subsystems that access shared DB2 data. A Parallel Sysplex is a collection of MVS systems that communicate and cooperate with each other.

**System Parameters - Define Group or Member (DSNTIPK)**

The field labels shown in the following sample layout of “System Parameters - Define Group or Member (DSNTIPK)” are described in the following section.

```
DEFINE GROUP OR MEMBER (DSNTIPK)
--------------------------------
GROUP NAME (GRPNAME)....................................DSNDBPG
MEMBER NAME (MEMBNAME).....................................DBP0
MAX NUMBER OF MEMBERS.......................................248
RANDOM ATTACH (RANDOMATT)...................................YES
DEL CF STRUCTS (DEL_CFSTRUCTS_ON_RESTART)....................NO
PARALLELISM ASSISTANT (ASSIST)...............................NO
PARALLELISM COORDINATOR (COORDNTR).........................NO
```

**GROUP NAME (GRPNAME)**

The name of the DB2 data sharing group.

The group name encompasses the entire data sharing group and is the basis for the coupling facility structure names.

N/A means this DB2 is not part of a data sharing group.

Install parameter GROUP NAME on panel DSNTIPK, or ZPARM GRPNAME in DSN6GRP.

Field Name: QWPAGRPN

**MEMBER NAME (MEMBNAME)**

The member name of this DB2.

N/A means this DB2 is not part of a data sharing group.

Install parameter MEMBER NAME on panel DSNTIPK, or ZPARM MEMBNAME in DSN6GRP.

Field Name: QWPAMBRN

**MAX NUMBER OF MEMBERS**

The maximum number of members possible in a data sharing group. This is a constant (248) and is not shown on any installation panel.

Field Name: QWPAMAXM

**RANDOM ATTACH (RANDOMATT)**

Specifies a random group attach flag:

- **N** Not eligible for random group attach.
- **NOT N** Eligible for random group attach.
This field corresponds to field RANDOM ATTACH on installation panel DSNTIPK. The ZPARM name is RANDOMATT in DSN6GRP.

**Field Name:** QWPARAND

**DEL CF STRUCTS (DEL_CFSTRUCTS_ON_RESTART)**

Shows whether to:

- Delete change-data (CD) structures during restart
- Attempt to delete coupling-facility (CF) structures, including shared communications area (SCA) structures, internal resource lock manager (IRLM lock) structures, and allocated group buffer pools.

This field corresponds to field DEL CF STRUCTS on installation panel DSNTIPK.

ZPARM name DEL_CFSTRUCTS_ON_RESTART in DSN6SYSP.

**Field Name:** QWP1DCFS

**PARALLELISM ASSISTANT (ASSIST)**

Shows whether this DB2 member can assist a parallelism coordinator with parallel processing.

When YES, this member is considered an assistant at both bind and run time. To be a viable assistant at run time, both the VPPSEQT and VPXPSEQT buffer pool thresholds of this member must be greater than 0.

N/A means this DB2 is not part of a data sharing group.

Install parameter ASSISTANT on panel DSNTIPK or ZPARM ASSIST in DSN6GRP.

**Field Name:** QWPAASST

**PARALLELISM COORDINATOR (COORDNTR)**

Shows whether this DB2 member can coordinate parallel processing on other members of the group.

When NO, a query can be processed by this DB2 member only.

When YES, a read-only query running on this DB2 member can be processed in part on other members of the group.

N/A means this DB2 is not part of a data sharing group.

Install parameter COORDINATOR on panel DSNTIPK or ZPARM COORDNTR in DSN6GRP.

**Field Name:** QWPACOOR
Databases and Spaces Started Automatically (DSNTIPS)

This topic shows detailed information about “System Parameters - Databases and Spaces Started Automatically (DSNTIPS)”.

This block shows the databases, table spaces, and index spaces that are started or restarted automatically when DB2 is started. ZPARM ALL/dbname in DSN6SPRM.

System Parameters - Databases and Spaces Started Automatically (DSNTIPS)

The field labels shown in the following sample layout of “System Parameters - Databases and Spaces Started Automatically (DSNTIPS)” are described in the following section.

DATABASES AND SPACES STARTED AUTOMATICALLY (DSNTIPS)

----------------------------------------------------
ALL

DATABASE NAME

The name of a database that is to be started automatically.

Field Name: QWP8DBNM

SPACE NAME

Contains the name of a table space or index space that is to be started automatically.

Field Name: QWP8SPNM
Default Startup Modules (DSNTIPO3)

This topic shows detailed information about “System Parameters - Default Startup Modules (DSNTIPO3)”.

System Parameters - Default Startup Modules (DSNTIPO3)

The field labels shown in the following sample layout of “System Parameters - Default Startup Modules (DSNTIPO3)” are described in the following section.

DEFAULT STARTUP MODULES (DSNTIPO3)
----------------------------------

PARAMETER MODULE.......................................DSNZPARM
ACCESS CONTROL (ACCESS_CNTL_MODULE)....................DSNX@XAC
IDENTIFY/AUTH (IDAUTH_MODULE)..........................DSN3@ATH
SIGNON (SIGNON MODULE)..................................DSN3@SGN

PARAMETER MODULE

Shows the name of the active subsystem parameter module.

This field corresponds to field PARAMETER MODULE on installation panel DSNTIPO3.

Field Name: QWP1ZPNM

ACCESS CONTROL (ACCESS_CNTL_MODULE)

Shows the name of the default access control exit module.

This field corresponds to field ACCESS CONTROL on installation panel DSNTIPO3. The ZPARM name is ACCESS_CNTL_MODULE in DSN6SYSP.

Field Name: QWP1DXAC

IDENTIFY/AUTH (IDAUTH_MODULE)

Shows the name of the default identify or authorization exit module.

This field corresponds to field IDENTIFY/AUTH on installation panel DSNTIPO3. The ZPARM name is IDAUTH_MODULE in DSN6SYSP.

Field Name: QWP1DATH

SIGNON (SIGNON_MODULE)

Shows the name of the default signon exit module.

This field corresponds to field SIGNON on installation panel DSNTIPO3. The ZPARM name is SIGNON_MODULE in DSN6SYSP.

Field Name: QWP1DSGN
This topic shows detailed information about “System Parameters - Distributed Data Facility Panel 1 (DSNTIPR)”. This block shows how Distributed Data Facility (DDF) was started and the names used to connect another DB2 subsystem.

To use DDF, you must have VTAM installed, even if you use TCP/IP connections only.

System Parameters - Distributed Data Facility Panel 1 (DSNTIPR)

The field labels shown in the following sample layout of “System Parameters - Distributed Data Facility Panel 1 (DSNTIPR)” are described in the following section.

**FACILITY NAME**

The name of the DDF facility.

*Field Name: QWP9NAME*

**DDF STARTUP OPTION (DDF)**

Indicates whether DDF is loaded, and if so, how it was started.

When NO, DDF was not loaded at DB2 startup and cannot be started.

AUTO means DDF was loaded and started automatically when DB2 was started. The DDF address space was started as part of DDF initialization.

COMMAND means DDF was initialized and the DDF address space was started at DB2 startup. IF DDF is running, it was started from the console with the -DSN1 START DDF command. If it is not running, it can be started with this command.

Install parameter DDF STARTUP OPTION on panel DSNTIPR, or ZPARM DDF in DSN6FAC.

*Field Name: QWP9STRT*

**RLST ACCESS ERROR (RLFERRD)**

Shows what DB2 does when the governor cannot access the resource limit specification table or when no row in the table matches the currently executing statement.

NOLIMIT (default) allows all dynamic SQL statements to run without limit.
NORUN terminates all dynamic SQL statements immediately with an SQL error code.

A number from 1 to 5000000 is the default limit; if the limit is exceeded, the SQL statement is terminated.

Install parameter RLST ACCESS ERROR on panel DSNTIPR, or ZPARM RLFERRD in DSN6FAC (DB2 field QWP9RLER).

**Field Name:** QWP9RLER

**RESYNCHRONIZATION INTERVAL IN MINUTES (RESYNC)**

The number of minutes between resynchronization periods.

A resynchronization period is the time during which indoubt logical units of work involving this DB2 subsystem and partner logical units are processed.

Install parameter RESYNC INTERVAL on panel DSNTIPR, or ZPARM RESYNC in DSN6FAC.

**Field Name:** QWP9RYC

**DBAT STATUS (CMTSTAT)**

Shows whether DB2 inactivates threads that have successfully committed or rolled back, and hold no cursors.

ACTIVE provides the best performance but consumes system resources.

INACTIVE is recommended when the installation must support a large number of connections.

When a thread becomes eligible for inactivation, DB2 tries to make it a type 2 inactive thread, which uses less storage than a type 1 inactive thread. If this fails, DB2 tries to make it a type 1 inactive thread. If neither attempt is successful, the thread remains active.

Install parameter DDF THREADS on panel DSNTIPR, or ZPARM CMTSTAT in DSN6FAC.

**Field Name:** QWP9CMST

**MAX TYPE 1 INACTIVE THREADS (MAXTYPE1)**

Indicates the number of type 1 inactive threads that DB2 allows.

A large number of type 1 inactive threads can adversely affect system performance. Type 1 inactive threads are used for DB2 private protocol.

DRDA uses type 2 inactive threads.

Zero indicates that type 1 inactive connections are not allowed. Threads remain active when they become eligible to be made a type 1 inactive thread.

A value greater than zero indicates that type 1 inactive connections are allowed, but are limited to this number. When a thread becomes eligible to be made a type 1 inactive thread, and this threshold is reached, the remote connection is terminated.

When this is equal to MAX REMOTE CONNECTED on panel DSNTIPE, DB2 allows all remote threads to become type 1 inactive threads.

Install parameter MAX INACTIVE DBATS on panel DSNTIPR, or ZPARM MAXTYPE1 in DSN6FAC.
Field Name: QWP9MAX1

**IDLE THREAD TIMEOUT INTERVAL (IDTHTOIN)**

The approximate time, in seconds, that an active server thread can remain idle before it is canceled.

Inactive and indoubt threads are not subject to timeout.

Threads are checked for timeouts every 3 minutes. This means that timeouts might not be honored for up to 3 minutes when the timeout value is less than this.

0 (default) means timeout processing is disabled, idle server threads remain in the system and continue to hold their resources, if any.

Install parameter IDLE THREAD TIMEOUT on panel DSNTIPR, or ZPARM IDTHTOIN in DSN6FAC.

Field Name: QWP9TTO

**EXTENDED SECURITY (EXTSEC)**

Extended security options.

When YES (strongly recommended), detailed reason codes are returned to a DRDA level 3 client when a DDF connection request fails because of security errors. When using SNA protocols, the requester must have included a product that supports the extended security sense codes, such as DB2 Connect version 5 and subsequent releases.

RACF users can change their passwords using the DRDA change password function. This support is only for DRDA level 3 requesters that have implemented support for changing passwords.

YES allows properly enabled DRDA clients to determine the cause of security failures without requiring DB2 operator support.

When NO, generic error codes are returned to the clients and RACF users are prevented from changing their passwords.

Install parameter EXTENDED SECURITY on panel DSNTIPR, or ZPARM EXTSEC in DSN6SYSP.

Field Name: QWP1SCER

**USER ID AND PASSWORD REQUIRED**

Shows whether user ID and password are required. In addition, one of the following is required:

- The user ID and password and any RACF PassTickets (A PassTicket is a one-time-only password that is generated by a requesting product or function) are Advanced Encryption Standard (AES) encrypted.
- A Kerberos ticket is required.
- The connection is protected by a z/OS Communications Server IP Application Transparent Transport Layer Security (AT-TLS) policy, which is ensured through a DB2 SECPORT.
- The connection is protected by an IPSec tunnel.

Field Name: QWP9TCPVE

**SQL INTERRUPT PROCESSING DISABLED (SQLINTRP)**

Shows how SQL interrupts are processed. It can have the following values:
Distributed Data Facility Panel 1 (DSNTPR)

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>NO</td>
<td>SQL interrupt processing is enabled.</td>
</tr>
<tr>
<td>YES</td>
<td>DB2 SQL interrupt support is disabled.</td>
</tr>
</tbody>
</table>

Note: YES should only be used if remote client systems experience failures because of SQL interrupts. In this case, SQL interrupt support should be disabled only until the remote client systems can be modified to tolerate SQL interrupts.

ZPARM name SQLINTRP in DSN6FAC.

Field Name: QWP9SINTD

PRIVATE PROTOCOL (PRIVATE_PROTOCOL)

Shows if it is allowed to use the private protocol. It can have the following values:

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>YES</td>
<td>Allows private-protocol-related plan-owner-based package authorization behavior. Plan-owner-based package execution authorization semantics are honored for DB2 for z/OS DRDA requester systems that might rely on it. Secondary IDs are not used to determine package execution privileges for remote DB2 for z/OS applications.</td>
</tr>
<tr>
<td>NO</td>
<td>Does not allow any private-protocol-related behavior. Plan-owner-based package execution authorization semantics are not honored. This might affect DB2 for z/OS DRDA requester systems that rely on it. Secondary IDs are used to determine package execution privileges for remote DB2 for z/OS applications.</td>
</tr>
</tbody>
</table>

ZPARM name PRIVATE_PROTOCOL in DSN6FAC.

Field Name: QWP9PRVPA
Distributed Data Facility Panel 2 (DSNTIP5)

This topic shows detailed information about “System Parameters - Distributed Data Facility Panel 2 (DSNTIP5)”. This block shows how Distributed Data Facility (DDF) was started and the names used to connect to another DB2 subsystem.

To use DDF, you must have VTAM installed, even if you use TCP/IP connections only.

Note: The fields shown on this panel depend on the installed DB2 version.

System Parameters - Distributed Data Facility Panel 2 (DSNTIP5)

The field labels shown in the following sample layout of “System Parameters - Distributed Data Facility Panel 2 (DSNTIP5)” are described in the following section.

System Parameters - Distributed Data Facility Panel 2 (DSNTIP5)

TCP/IP ALREADY VERIFIED (TCPALVER) ......................YES
EXTRA BLOCKS REQ (EXTRAREQ) ..........................100
EXTRA BLOCKS SRV (EXTRASRV) .........................100
TCP/IP KEEPALIVE (TCPKPALV) ............................120
CONNECTION QUEUE MAX DEPTH (MAXCONQN) .............0
CONNECTION QUEUE MAX WAIT (MAXCONQW) ...............0
POOL THREAD TIMEOUT (POOLINAC) .......................120

TCP/IP ALREADY VERIFIED (TCPALVER)

Indicates whether DB2 accepts TCP/IP connection requests containing only a user ID.

When YES, a connection request is accepted with a user ID only. This value must be the same for all members of a data sharing group.

When NO (default), TCP/IP clients must provide authentication information (password, RACF PassTicket, or Kerberos ticket) to gain access to DB2.

Install parameter TCP/IP ALREADY VERIFIED on panel DSNTIP5, or ZPARM TCPALVER in DSN6FAC.

Field Name: QWP9TCPA

EXTRA BLOCKS REQ (EXTRAREQ)

The maximum number of extra DRDA query blocks DB2 requests from a remote DRDA server.

The default is 100.

This controls the total amount of data that can be transmitted on any given network exchange. It does not limit the size of the SQL query answer set.

Install parameter EXTRA BLOCKS REQ on panel DSNTIP5, ZPARM EXTRAREQ in DSN6SYS.

Field Name: QWP1EXBR

EXTRA BLOCKS SRV (EXTRASRV)

The maximum number of extra DRDA query blocks DB2 returns to a DRDA client.
The default is 100.

This controls the total amount of data that can be transmitted on any given network exchange. It does not limit the size of the SQL query answer set.

Install parameter EXTRA BLOCKS SRV on panel DSNTIP5, ZPARM EXTRASRV in DSN6SYSP.

**Field Name:** QWP1EXBS

**TCP/IP KEEPALIVE (TCPKPALV)**

Indicates whether the TCP/IP configuration KeepAlive value has been overwritten.

When ENABLE (default), KeepAlive is enabled, the TCP/IP configuration stack value is used.

When DISABLE, TCP/IP KeepAlive has been disabled.

A value in the range 1 through 65534 means KeepAlive is active, and the TCP/IP stack value has been overridden. The number reported shows the time, in seconds, between TCP/IP probes.

When considering overwriting the keep-alive time, it is recommended to set a value close to the IDLE THREAD TIMEOUT value on installation panel DSNTIPR or the IRLM RESOURCE TIMEOUT value on installation panel DSNTIPI. It is good practice to set all these to about five minutes, or less.

Because KeepAlive detection is accomplished by probing the network at this interval, avoid small values, which can cause excessive network traffic and system resource consumption.

The trick is to find a proper balance that allows network failures to be detected on a timely basis without impacting system and network performance.

Install parameter TCP/IP KEEPALIVE on panel DSNTIP5, ZPARM TCPKPALV in DSN6FAC.

**Field Name:** QWP9TCKA

**CONNECTION QUEUE MAX DEPTH (MAXCONQN)**

The maximum depth of the connection-request queue of connections that are waiting for a DBAT to process a request. If this value is non-zero, and QWP9CMST is active, or the subsystem is not a member of a data sharing group, DB2 operates as if this value were 0. This field corresponds to field CONN QUEUE MAX DEPTH on installation panel DSNTIP5. The ZPARM name is MACONQN in DSN6FAC.

**Field Name:** QWP9MCONQN

**CONNECTION QUEUE MAX WAIT (MAXCONQW)**

The maximum time that a connection waits for a DBAT request. If this value is non-zero, and QWP9CMST is active, or the subsystem is not a member of a data sharing group, DB2 operates as if this value were 0.

This field corresponds to field CONN QUEUE MAX WAIT on installation panel DSNTIP5. The ZPARM name is MAXCONQW in DSN6FAC.

**Field Name:** QWP9MCONQW

**POOL THREAD TIMEOUT (POOLINAC)**
The approximate time, in seconds, that a DBAT can remain idle in the pool before it is terminated.

A DBAT thread in the pool counts as an active thread against MAX REMOTE ACTIVE and can hold locks, but does not have any cursors.

Threads are checked for timeouts every 3 minutes. This means that timeouts might not be honored for up to 3 minutes when the timeout value is less than this. The default is 120.

Install parameter POOL THREAD TIMEOUT on panel DSNTIP5, ZPARM POOLINAC in DSN6FAC.

**Field Name:** QWP9INAC
DB2 Catalog and Directory Panel (DSNTIPA2)

This topic shows detailed information about “System Parameters - DB2 Catalog and Directory Panel (DSNTIPA2)”.

System Parameters - DB2 Catalog and Directory Panel (DSNTIPA2)

The field labels shown in the following sample layout of “System Parameters - DB2 Catalog and Directory Panel (DSNTIPA2)” are described in the following section.

DB2 CATALOG AND DIRECTORY PANEL (DSNTIPA2)

-------------------------------------------------------
SMS DATA CLASS FOR CATALOG DATA (CATDDACL)..............N/P
SMS MANAGEMENT CLASS FOR CATALOG DATA (CATDMGCL)........N/P
SMS STORAGE CLASS FOR CATALOG DATA (CATDSTCL)............SCPROD
SMS DATA CLASS FOR CATALOG INDEX DATA (CATXDAACL)........N/P
SMS MANAGEMENT CLASS FOR CATALOG INDEX DATA (CATXMGCL)....N/P
SMS STORAGE CLASS FOR CATALOG INDEX DATA (CATXSTCL).......SCPROD
COMPRESSION SPT01 (COMPRESSION_SPT01)....................YES
SPT01 INLINE LENGTH (SPT01_INLINE_LENGTH)..............32,138

SMS DATA CLASS FOR CATALOG DATA (CATDDACL)

The SMS data class for DB2 catalog data sets. This field corresponds to column SMS data class in field "Directory and catalog data" on installation panel DSNTIPA3. The ZPARM name is CATDDACL in DSN6SPRM.

Field Name: QWP4CDDC

SMS MANAGEMENT CLASS FOR CATALOG DATA (CATDMGCL)

The SMS management class for DB2 catalog data sets. This field corresponds to column SMS MGMT class in field "Directory and catalog data" on installation panel DSNTIPA3. The ZPARM name is CATDMGCL in DSN6SPRM.

Field Name: QWP4CDMC

SMS STORAGE CLASS FOR CATALOG DATA (CATDSTCL)

The SMS storage class for DB2 catalog data sets. This field corresponds to column SMS STOR class in field "Directory and catalog data" on installation panel DSNTIPA3. The ZPARM name is CATDSTCL in DSN6SPRM.

Field Name: QWP4CDS

SMS DATA CLASS FOR CATALOG INDEX DATA (CATXDAACL)

The SMS data class for DB2 catalog index data sets. This field corresponds to column SMS data class in field "Directory and catalog indexes" on installation panel DSNTIPA3. The ZPARM name is CATXDAACL in DSN6SPRM.

Field Name: QWP4CXDC

SMS MANAGEMENT CLASS FOR CATALOG INDEX DATA (CATXMGCL)

The SMS management class for DB2 catalog index data sets. This field corresponds to column SMS MGMT class in field "Directory and catalog indexes" on installation panel DSNTIPA3. The ZPARM name is CATXMGCL in DSN6SPRM.

Field Name: QWP4CXMC
SMS STORAGE CLASS FOR CATALOG INDEX DATA (CATXSTCL)

The SMS storage class for DB2 catalog index data sets. This field corresponds to column SMS STOR class in field "Directory and catalog indexes" on installation panel DSNTIPA3. The ZPARM name is CATXSTCL in DSN6SPRM.

Field Name: QWP4CXSC

COMPRESS SPT01 (COMPRESS_SPT01)

Enables the compression of SPT01.

Field Name: QWP4CS01

SPT01 INLINE LENGTH (SPT01_INLINE_LENGTH)

The maximum length in bytes of LOB columns in the SPT01 directory space that are maintained in the base table. This field corresponds to field SPT01 INLINE LENGTH on installation panel DSNTIPA2. The ZPARM name is SPT01_INLINE_LENGTH in DSN6SPRM.

Field Name: QWP4S1IL
DB2 Utilities Parameters (DSNTIP6, DSNTIP61, DSNTIP62)

This topic shows detailed information about “System Parameters - DB2 Utilities Parameters (DSNTIP6, DSNTIP61, DSNTIP62)”.

This block shows the default behavior of enhancements to the BACKUP SYSTEM and other utilities.

System Parameters - DB2 Utilities Parameters (DSNTIP6, DSNTIP61, DSNTIP62)

The field labels shown in the following sample layout of “System Parameters - DB2 Utilities Parameters (DSNTIP6, DSNTIP61, DSNTIP62)” are described in the following section.

DB2 UTILITIES PARAMETERS (DSNTIP6,DSNTIP61,DSNTIP62)

---------------------------------------------------
TEMPORARY UNIT NAME (VOLTDEVT)............................SYSDA

UTIL TEMP STORCLAS (UTIL_TEMP_STORCLAS).....................N/P

STATISTICS HISTORY (STATHist)................................NONE

STATISTICS ROLLUP (STATROLL)..................................YES

UTILITY TIMEOUT FACTOR (UTIMOUT)..............................6

UT SORT DATA SET ALLOCATION (UTSORTAL)......................YES

IGNORE SORTNUM STMT (IGNSORTN)...............................NO

TEMPORARY UNIT NAME (VOLDEVT)

Shows the device type or unit name for allocating temporary data sets. It is the direct access or disk unit name used for the precompiler, compiler, assembler, sort, linkage editor, and utility work-files in the tailored jobs and CLISTS.

It can be any device type acceptable to the DYNALLOC parameter of the SORT or OPTION options for DFSORT.

The default is SYSDA.
Install parameter TEMPORARY UNIT NAME on DSNTIPA2, or ZPARM VOLTDEVT in DSN6SPRM.

**Field Name:** QWP4VDTY

**UTIL TEMP STORCLAS (UTIL_TEMP_STORCLAS)**

Specifies the name of the SMS storage class that DB2 uses for defining temporary shadow data sets. A blank value indicates that the temporary shadow data sets a defined in the same storage class as the production page set. This field corresponds to field "UTIL TEMP STORCLAS" on installation panel DSNTIP6. The ZPARM name is UTIL_TEMP_STORCLAS in DSN6SPRM.

**Field Name:** QWP4CHEC

**STATISTICS HISTORY (STATHIST)**

Shows which inserts and updates are recorded in catalog history tables.

The report can show the following values:

**N / NONE**

Changes in the catalog are not recorded. This is the default.

**A / ALL**

All inserts and updates in the catalog are recorded.

**P / ACCESSPATH**

All inserts and updates to access path related catalog statistics are recorded.

**S / SPACE**

All inserts and updates to space related catalog statistics are recorded.

Install parameter STATISTICS HISTORY on panel DSNTIPO, or ZPARM STATHIST in DSN6SPRM.

**Field Name:** QWP4STHT

**STATISTICS ROLLUP (STATROLL)**

Shows whether RUNSTATS utility aggregates the partition level statistics, even though some parts may not contain data.

This should be YES for DB2 systems that have large partitioned table spaces, index spaces, or both. This enables the aggregation of part level statistics and helps the optimizer to choose a better access path.

Install parameter STATISTICS ROLLUP on panel DSNTIPO, or ZPARM STATROLL in DSN6SPRM.

**Field Name:** QWP4STRL

**UTILITY TIMEOUT FACTOR (UTIMOUT)**

Shows how much longer utilities can wait for a resource than SQL applications can.

This is the number of RESOURCE TIMEOUT units that a utility or utility command can wait for a lock or for all claims on a resource of a particular claim class to be released. The default value is 6, meaning a utility can wait 6 times longer than an SQL application for a resource.

Install parameter UTILITY TIMEOUT on panel DSNTIPI, or ZPARM UTIMOUT in DSN6SPRM.
Field Name: QWP4UTO

UT SORT DATA SET ALLOCATION (UTSORTAL)

In DB2 12 this field is a serviceability field.

YES indicates that utilities invoke a SORT use and a space prediction algorithm for dynamically allocated SORT work data sets. The ZPARM name is UTSORTAL in DSN6SPRM.

Field Name: QWP4SRAL

IGNORE SORNUM STMT (IGNSORTN)

Ignores SORNUM clause in utility control statements. The ZPARM name is IGNSORTN in DSN6SPRM.

Field Name: QWP4IGSN

SET CHECK PENDING (CHECK_SETCHKP)

In DB2 12 this field is a serviceability field.

YES sets the object in check-pending status when the check utility detects an inconsistency. This field corresponds to field "Set check pending" on installation panel DSNTIP61. The ZPARM name is CHECK_SETCHKP in DSN6SPRM.

Field Name: QWP4CSCP

UT DB2 SORT USE (DB2SORT)

In DB2 12 this field is a serviceability field.

Enables the use of DB2 SORT.

Field Name: QWP4DB2SR

TEMPLATE TIME (TEMPLATE_TIME)

Specifies the default setting for the TIME option of the template utility control statement. Possible values are:

- UTC (utility control)
- Local

This field corresponds to field TEMPLATE TIME on installation panel DSNTIP6. The ZPARM name is TEMPLATE_TIME in DSN6SPRM.

Field Name: QWP4TPTM

MAXIMUM DEGREE OF UTILITY PARALLELISM (PARAMDEG_UTIL)

The maximum degree of utility parallelism.

Field Name: QWP4UMD

FAST REPLICATION (CHECK_FASTREPLICATION)

The FASTREPLICATION type for check utilities:

- N=None
- P=PREFERRED
- R=REQUIRED

This field corresponds to field "Fast replication" in installation panel DSNTIP6. The ZPARM name is CHECK_FASTREPLICATION in DSN6SPRM.

Field Name: QWP4CFRP
FAST RESTORE (REC_FASTREPLICATION)

Specifies how the Recover utility directs DFSMSdss copy to restore an image copy that was created with FLASHCOPY. This field corresponds to field "Fast restore" on installation panel DSNTIP6. The ZPARM name is REC_FASTREPLICATION.

Field Name: QWP4RFRP

COPY FAST REPLICATION (COPY_FASTREPLICATION)

Specifies whether FlashCopy fast replication is preferred, required, or should not be used.

This field corresponds to field COPY FAST REPLICATION on INSTALLATION panel DSNTIP61. The ZPARM name is COPY_FASTREPLICATION in DSN6SPRM.

Field Name: QWP4CYFR

FLASHCOPY PPRC (FLASHCOPY_PPRC)

Specifies the behavior for DFSMSdss FLASHCOPY requests when the target disk storage volume is the primary device in a peer-to-peer remote copy (metro mirror) relationship (DB2 field: QWP4FCPPRC). This field corresponds to field "FLASHCOPY PPRC" on installation panel DSNTIP6. The ZPARM name is FLASHCOPY_PPRC.

Field Name: QWP4FCPPRC

DEFAULT TEMPLATE (FCCOPYDDN)

Specifies the default setting of the FCCOPYDDN subsystem parameter for the COPY, LOAD, REBUILD INDEX, REORG INDEX, and REORG TABLESPACE utility control statements when the FLASHCOPY parameter is YES or CONSISTENT. FCCOPYDDN specifies a DB2 utility template data-set name expression that is used to derive the copy data-set name that is allocated by the utility during operation.

This field corresponds to field DEFAULT TEMPLATE on installation panel DSNTIP6. The ZPARM name is FCOPYDDN in DSN6SPRM.

Field Name: QWP4FCCD

FLASHCOPY COPY (FLASHCOPY_COPY)

YES indicates that the Copy utility uses the subsystem parameter settings for FLASHCOPY and FCCOPYDDN when those keywords are not present in the utility control statement. The ZPARM name is FLASHCOPY_COPY in DSN6SPRM.

Field Name: QWP4FCCP

FLASHCOPY LOAD (FLASHCOPY_LOAD)

YES indicates that the load utility uses the subsystem parameter settings for FLASHCOPY, FCCOPYDDN, and FCAUXOBJ when those keywords are not present in the utility control statement. ZPARM NAME: FLASHCOPY_LOAD IN DSN6SPRM.

Field Name: QWP4FCLD

FLASHCOPY REORG TABLESPACE (FLASHCOPY_REORG_TS)

YES indicates that the Reorg Tablespace utility uses the subsystem parameter settings for FLASHCOPY, FCCOPYDDN, and FCAUXOBJ
when these keywords are not present in the utility control statement. The ZPARM name is FLASHCOPY_REORG_TS in DSN6SPRM.

Field Name: QWP4FCRBI

FLASHCOPY REBUILD INDEX (FLASHCOPY_REBUILD_INDEX)

YES indicates that the Rebuild Index utility uses the subsystem parameter settings for FLASHCOPY and FCCOPYDDN when those keywords are not present in the utility control statement (DB2 field: QWP4FCRBI). The ZPARM name is FLASHCOPY_REBUILD_INDEX in DSN6SPRM.

Field Name: QWP4FCRBI

FLASHCOPY REORG INDEX (FLASHCOPY_REORG_INDEX)

YES indicates that the Reorg Index utility uses the subsystem parameter settings for FLASHCOPY and FCCOPYDDN when these keywords are not present in the utility control statement (DB2 field: QWP4FCROI). The ZPARM name is FLASHCOPY_REORG_INDEX in DSN6SPRM.

Field Name: QWP4FCROI

SYSTEM-LEVEL BACKUPS (SYSTEM_LEVEL_BACKUPS)

Shows if RECOVER uses system level backups as the recovery base.

Install parameter SYSTEM-LEVEL BACKUPS on installation panel DSNTIP6, or ZPARM SYSTEM_LEVEL_BACKUPS in DSN6SPRM.

Field Name: QWP4SLBU

RESTORE/RECOVER (RESTORE_RECOVER_FROMDUMP)

If YES, the system-level backup that is the recovery base, is from a dump on tape. Otherwise NO is shown.

Install parameter RESTORE/RECOVER on installation panel DSNTIP6, or ZPARM RESTORE_RECOVER_FROMDUMP in DSN6SPRM.

Field Name: QWP4RRFD

DUMP CLASS NAME (UTILS_DUMP_CLASS_NAME)

The name of the DFSMSHSM dump class used by the restore system utility to restore from a system-level backup that has been dumped to tape.

Install parameter DUMP CLASS NAME on installation panel DSNTIP6, or ZPARM UTILS_DUMP_CLASS_NAME in DSN6SPRM.

Field Name: QWP4RSDC

MAXIMUM TAPE UNITS (RESTORE_TAPEUNITS)

The maximum number of tape units or tape drives that the restore system utility can use to restore from a system-level backup that has been dumped to tape.

Install parameter MAXIMUM TAPE UNITS on installation panel DSNTIP6, or ZPARM RESTORE_TAPEUNITS in DSN6SPRM.

Field Name: QWP4RSMT

REORG PART SORT NPSI (REORG_PART_SORT_NPSI)

Specifies the default method of building a non-partitioned secondary index during the REORG tablespace part. This setting is used when the SORTNPSI keyword is not specified in a utility control statement.
Possible values are:

- Auto
- Disable
- Enable

This field corresponds to field REORG PART SORT NPSI in installation panel DSNTIP61. The ZPARM name is REORG_PART_SORT_NPSI in DSN6SPRM.

Field Name: QWP4RPSN

**REORG LIST PROCESSING (REORG_LIST_PROCESSING)**

Specifies the default value for the REORG TABLESPACE PARALLEL option.

- Parallel
- Serial

The ZPARM name is REORG_LIST_PROCESSING in DSN6SPRM.

Field Name: QWP4RLPR

**REORG MAPPING DATABASE (REORG_MAPPING_DATABASE)**

The default database in which REORG TABLESPACE SHRLEVEL change implicitly creates the mapping table. This field corresponds to field RECORD MAPPING DB on installation panel DSNTIP61. The ZPARM name RECORD_MAPPING_TABLE in DSN6SPRM.

Field Name: QWP4RMDB

**REORG DROP PBG PARTS (REORG_DROP_PBG_PARTS)**

If YES, REORG completes, REORG drops empty, and trailing partitions are set in a PARTITION-BY-GROWTH table space.

This field corresponds to field REORG DROP PBG PARTS on INSTALLATION panel DSNTIP61. The ZPARM name is REORG_DROP_PBG_PARTS in DSN6SPRM.

Field Name: QWP4RPBG

**UTILITY CACHE OPTION (SEQPRES) (DB2 10 only)**

Shows whether utilities that scan a nonpartitioned index followed by an update of a subset of the pages in the index allow data to remain in 3990 cache longer when reading data.

Install parameter UTILITY CACHE OPTION on panel DSNTIPE, or ZPARM SEQPRES in DSN6PRM.

Field Name: QWP4PST

**STATISTICS CLUSTERING (STATCLUS) (DB2 10 only)**

Shows if the RUNSTATS utility uses enhanced or standard clustering statistics: ENHANCED is used if it is on, otherwise STANDARD is shown.

Install parameter STATISTICS CLUSTERING on panel DSNTIP6, or ZPARM STATCLUS in DSN6SPRM.

Field Name: QWP4STCL

**ALTERNATE COPYPOOL (ALTERNATE_CP)**
DB2 Utilities Parameters (DSNTIP6, DSNTIP61, DSNTIP62)

Specifies an optional alternate SMS copy pool for the DB2 BACKUP SYSTEM utility.
This field corresponds to field ALTERNATE COPYPOOL on INSTALLATION panel DSNTIP62. The ZPARM name is ALTERNATE_CP in DSN6SPRM.

**Field Name:** QWP4BSACP

**DB BACKUP STG GROUP (UTIL_DBBSG)**

Specifies an optional backup SMS storage group to be used by the DB2 BACKUP SYSTEM utility for the DB copy pool.
This field corresponds to field DB BACKUP STG GROUP on INSTALLATION panel DSNTIP62. The ZPARM name is UTIL_DBBSG in DSN6SPRM.

**Field Name:** QWP4UDBSG

**LOG BACKUP STG GROUP (UTIL_LGBSG)**

Specifies an optional backup SMS storage group to be used by the DB2 BACKUP SYSTEM utility for the LOG copy pool.
This field corresponds to field LOG BACKUP STG GRP on INSTALLATION panel DSNTIP62. The ZPARM name is UTIL_LGBSG in DSN6SPRM.

**Field Name:** QWP4ULBSG

**HSM MESSAGE DS HLQ (UTILS_HSM_MSGDS_HLQ)**

Shows the high level qualifier (HLQ) for data sets (DS) to be allocated by the DB2 BACKUP SYSTEM and RESTORE SYSTEM utilities to receive messages from the Data Facility Hierarchical Storage Manager (DFHSM) and the IBM Data Facility Data Set Services (DFDSS) (DB2 field: QWP4UHMDH).
This value corresponds to field HSM MESSAGE DS HLQ on installation panel DSNTIP62. ZPARM name: UTILS_HSM_MSGDS_HLQ in DSN6SPRM.

**Field Name:** QWP4UHMDH
DB2 Version Install (DSNTIPA1)

This topic shows detailed information about “System Parameters - DB2 Version Install (DSNTIPA1)”.

System Parameters - DB2 Version Install (DSNTIPA1)

The field labels shown in the following sample layout of “System Parameters - DB2 Version Install (DSNTIPA1)” are described in the following section.

DB2 VERSION INSTALL (DSNTIPA1)

-------------------------------
DATA SHARING ENABLED (DSHARE)...............................YES
CURRENT DB2 RELEASE (NEWFUN)......................................NO
CURRENT DB2 RELEASE - 1.....................................YES
CURRENT DB2 RELEASE - 2......................................NO
COMPRESS LOB TS FOR DIRECTORY (COMPRESS_DIRLOB)..........NO

DATA SHARING ENABLED (DSHARE)

Indicates whether data sharing is enabled.

Install parameter DATA SHARING on panel DSNTIPA1, or ZPARM DSHARE in DSN6GRP.

Field Name: QWP4AIOPT

CURRENT DB2 RELEASE (NEWFUN)

If YES, the DB2 subsystem/group is running in New Function Mode. At this mode/catalog level, the New Function Mode is enabled and available. The DB2 catalog is completely Unicode (UTF-8) and long names can be used.

Install parameter INSTALL TYPE on panel DSNTIPA1, or ZPARM NEWFUN in DSNHDECP.

Field Name: QWPBNEWF

CURRENT DB2 RELEASE - 1

Shows the current release minus one of the new-function mode (NEWFUN).

Field Name: QWPBNF1

CURRENT DB2 RELEASE - 2

Shows the current release minus two of the new-function mode (NEWFUN).

Field Name: QWPBNF2

COMPRESS LOB TS FOR DIRECTORY (COMPRESS_DIRLOB)

Specifies whether DB2 compresses large object (LOB) table spaces in the DB2 directory the next time that the table spaces are reorganized.

• 0 indicates NO
• 1 indicates YES

This value corresponds to field COMPRESS DB2 DIR LOBS on installation panel DSNTIPA2. ZPARM name: COMPRESS_DIRLOB in DSN6SPRM.

Field Name: QWP4CDRL
Install DB2 - Resource Limit Facility (DSNTIPO4) (DB2 12)

This topic shows detailed information about “System Parameters - Install DB2 - Resource Limit Facility (DSNTIPO4) (DB2 12)”.

System Parameters - Install DB2 - Resource Limit Facility (DSNTIPO4) (DB2 12)

The field labels shown in the following sample layout of “System Parameters - Install DB2 - Resource Limit Facility (DSNTIPO4) (DB2 12)” are described in the following section.

**RESOURCE LIMIT FACILITY AUTOMATIC START (RLF)**

Shows whether the resource limit facility (governor) is automatically started when DB2 is started.

Install parameter RLF AUTO START on panel DSNTIPO4, or ZPARM RLF in DSN6SYSP.

**Field Name:** QWP1RLF

**RESOURCE LIMIT SPECIFICATION TABLE SUFFIX (RLFTBL)**

The default resource limit specification table (RLST) suffix.

This suffix is used when the resource limit facility (governor) is automatically started or when the governor is started without specifying a suffix.

Install parameter RLST NAME SUFFIX on panel DSNTIPO4, or ZPARM RLFTBL in DSN6SYSP.

**Prior to DB2 12:** Install parameter RLST NAME SUFFIX on panel DSNTIPO4, or ZPARM RLFTBL in DSN6SYSP.

**Field Name:** QWP1RLFT

**RESOURCE LIMIT DYNAMIC ERROR ACTION (RLFERR)**

The action taken by DB2 when the governor cannot use the resource limit:

**NOLIMIT**

The dynamic SQL statements run without limit.

**NORUN**

The dynamic SQL statements terminated with an SQL error code.

A number from 1 to 5000000 represents the number of CPU service units allowed for a query.

Install parameter DYNAMIC SQL on panel DSNTIPO4, or ZPARM RLFERR in DSN6SYSP.

**Prior to DB2 12:** Install parameter RLST ACCESS ERROR on panel DSNTIPO, or ZPARM RLFERR in DSN6SYSP.
Field Name: RLFERR

RESOURCE LIMIT STATIC ERROR ACTION (RLFERRSTC)

The action taken by DB2 when the governor cannot use the resource limit:

NOLIMIT

The static SQL statements run without limit.

NORUN

The static SQL statements terminated with an SQL error code. A number from 1 to 5000000 represents the number of CPU service units allowed for a query.

Install parameter STATIC SQL on panel DSNTIPO4, or ZPARM RLFERRSTC in DSN6SYSP (DB2 field QWP1RLFR).

Field Name: RLFERRSTC

RLF REMOTE DYNAMIC ERROR ACTION (RLFERRD)

Shows what DB2 does when the governor cannot access the resource limit specification table or when no row in the table matches the currently running statement.

NOLIMIT

This is the default. It allows all dynamic SQL statements to run without limit.

NORUN

Terminates all dynamic SQL statements immediately with an SQL error code. A number from 1 to 5000000 is the default limit. If the limit is exceeded, the SQL statement is terminated.

Install parameter REMOTE DYNAMIC SQL on panel DSNTIPO4, or ZPARM RLFERRD in DSN6FAC (DB2 field QWP9RLER).

Field Name: RLFERRD

RLF REMOTE STATIC ERROR ACTION (RLFERRDSTC)

Shows what DB2 does when the governor cannot access the resource limit specification table or when no row in the table matches the currently running statement:

NOLIMIT

This is the default. It allows all static SQL statements to run without limit.

NORUN

Terminates all static SQL statements immediately with an SQL error code. A number from 1 to 5000000 is the default limit; if the limit is exceeded, the SQL statement is terminated.

Install parameter REMOTE STATIC SQL on panel DSNTIPO4, or ZPARM RLFERRDSTC in DSN6FAC (DB2 field QWP9RLER).

Field Name: RLFERRDSTC

RLF SCOPE (RLFENABLE)

The level of RLF governing:

DYNAMIC

Dynamic SQL only
Install DB2 - Resource Limit Facility (DSNTIPO4)

- **STATIC**
  - Static SQL only
- **ALL**
  - Both, dynamic and static SQL
- Install parameter RLF SCOPE on panel DSNTIPO4, or ZPARM RLFENABLE in DSN65YSP (DB2 field QWP1RLFR).

**Field Name:** RLFENABLE
IRLM Installation Parameters (DSNTIPI)

This topic shows detailed information about “System Parameters - IRLM Installation Parameters (DSNTIPI)”.

This block shows the installation of the internal resource lock manager (IRLM). There is one IRLM for each DB2 subsystem.

**Note:** The fields shown on this panel depend on the installed DB2 version.

**System Parameters - IRLM Installation Parameters (DSNTIPI)**

The field labels shown in the following sample layout of “System Parameters - IRLM Installation Parameters (DSNTIPI)” are described in the following section.

```
IRLM INSTALLATION PARAMETERS (DSNTIPI)

---
IRLM SUBSYSTEM NAME (IRLMSID)......................... DJP0
IRLM RESOURCE TIMEOUT IN SECONDS (IRLMRWT)............. 120
IRLM AUTOMATIC START (IRLMAUT).................... YES
IRLM START PROCEDURE NAME (IRLMPRC).................. DBP0IRLM
SECONDS DB2 WILL WAIT FOR IRLM START (IRLMSWT)......... 300
U LOCK FOR REPEATABLE READ OR READ STABILITY (RRULOCK)...... NO
X LOCK FOR SEARCHED UPDATE/DELETE (XLKUPDLT).............. YES
IMS/BMP TIMEOUT FACTOR (BMPTOUT)......................... 4
IMS/DLI TIMEOUT FACTOR (DLITOUT)....................... 6
WAIT FOR RETAINED LOCKS (RETLWAIT)................... 0
ENABLE DB CHECKING....................................... NO
IRLM INITIALIZATION TIME.............................. 1

IRLM SUBSYSTEM NAME (IRLMSID)

The IRLM subsystem name defined to MVS.

This is used for communication between DB2 and the IRLM. It is included in the MVS subsystem table IEFSN xx, where xx is the value of SUBSYSTEM MEMBER on installation panel DSNTIPM.

If the IRLM for IMS is installed, the DB2 IRLM name is different because two IRLMs on the same MVS system must have unique names.

Install parameter SUBSYSTEM NAME on panel DSNTIPI, or ZPARM IRLMSID in DSN6SPRM.

**Field Name:** QWP4ISID

IRLM RESOURCE TIMEOUT IN SECONDS (IRLMRWT)

The number of seconds before a timeout is detected.

This is an integer multiple of DEADLOCK TIME on panel DSNTIPJ.

Timeout means that a lock request has waited for a resource (or for claims on a resource for a particular claim class to be released) longer than this time.

For data sharing, the actual timeout period is longer than the timeout value.

Install parameter RESOURCE TIMEOUT on panel DSNTIPI, or ZPARM IRLMRWT in DSN6SPRM.

**Field Name:** QWP4TOUT

IRLM AUTOMATIC START (IRLMAUT)
Indicates whether IRLM is started automatically by DB2.

Install parameter AUTO START on panel DSNTIPI, or ZPARM IRLMAUT in DSN6SPRM.

**Field Name:** QWP4IAUT

**IRLM START PROCEDURE NAME (IRLMPRC)**

The name of the IRLM procedure invoked by MVS if AUTO START is YES.

The name cannot be the same as the subsystem name given for SUBSYSTEM NAME.

Install parameter PROC NAME on panel DSNTIPI, or ZPARM IRLMPRC in DSN6SPRM.

**Field Name:** QWP4IPRC

**SECONDS DB2 WILL WAIT FOR IRLM START (IRLMSWT)**

The IRLM wait time in seconds.

DB2 autostart abends if IRLM does not start within this time.

Install parameter TIME TO AUTOSTART on panel DSNTIPI, or ZPARM IRLMSWT in DSN6SPRM.

**Field Name:** QWP4ISWT

**U LOCK FOR REPEATABLE READ OR READ STABILITY (RRULOCK)**

Indicates whether the U (UPDATE) lock is used when using repeatable read (RR) or read stability (RS) isolation to access a table.

When YES, the U lock is used for an updated cursor with repeatable read or read stability.

When NO, the S lock is used for an updated cursor with repeatable read or read stability. If the cursor in the running applications includes the clause FOR UPDATE OF, but updates are infrequent, S locks generally provide better performance.

Install parameter U LOCK FOR RR/RS on panel DSNTIPI, or ZPARM RRULOCK in DSN6SPRM.

**Field Name:** QWP4RRU

**X LOCK FOR SEARCHED UPDATE/DELETE (XLKUPDLT)**

The locking method used when performing a searched UPDATE or DELETE.

When NO, DB2 uses an S or U lock when scanning for qualifying rows. For any qualifying rows or pages the lock is upgraded to an X lock before performing the update or delete. For nonqualifying rows or pages the lock is released if using ISOLATION(CS). For ISOLATION(RS), or ISOLATION(RR), an S lock is retained on the rows or pages until the next commit point. This option is used to achieve higher rates of concurrency.

When YES, DB2 gets an X lock on qualifying rows or pages. For ISOLATION(CS), the lock is released if the rows or pages are not updated or deleted. For ISOLATION(RS) or ISOLATION(RR), an X lock is retained until the next commit point. This is beneficial in a data sharing environment when most or all searched updates and deletes use an index. The downside is that if searched updates or deletes result in a tablespace scan, the likelihood of timeouts and deadlocks greatly increases.
Install parameter X LOCK FOR SEARCHED U/D on panel DSNTIPI, or ZPARM XLKUPDLT in DSN6SPRM.

Field Name: QWP4XLUD

IMS/BMP TIMEOUT FACTOR (BMPTOUT)

The number of RESOURCE TIMEOUT units that an IMS BMP connection waits for a lock to be released.

The default value is 4, meaning that an IMS BMP connection can wait 4 times the resource timeout value for a resource.

Install parameter IMS BMP TIMEOUT on panel DSNTIPI, or ZPARM BMPTOUT in DSN6SPRM.

Field Name: QWP4WBMP

IMS/DLI TIMEOUT FACTOR (DLITOUT)

The number of RESOURCE TIMEOUT units that a DL/I batch connection waits for a lock to be released.

The default value is 6, meaning that an IMS BMP connection can wait 4 times the resource timeout value for a resource.

Install parameter DL/I BATCH TIMEOUT on panel DSNTIPI, or ZPARM DLITOUT in DSN6SPRM.

Field Name: QWP4WDLI

WAIT FOR RETAINED LOCKS (RETLWAIT)

Indicates whether a request is suspended until an incompatible retained lock becomes available.

This value is only significant in a data sharing environment. It indicates how long a transaction should wait for a lock on a resource if another DB2 in the data sharing group has failed and is holding an incompatible lock on that resource. Locks held by failed DB2 members are called retained locks.

This value is a multiplier that is applied to the connection's normal timeout value. For example, if the retained lock multiplier is 2, then the timeout period for a call attachment connection that is waiting for a retained lock is twice the normal CAF timeout period. The default is 0, meaning applications do not wait for incompatible retained locks, the lock request is immediately rejected and the application receives a "resource unavailable" SQLCODE.

Install parameter RETAINED LOCK TIMEOUT on panel DSNTIPI, or ZPARM RETLWAIT in DSN6SPRM.

Field Name: QWP4WAIT

ENABLE DB CHECKING

Enable database checking.

Field Name: QWP4DBCK

IRLM INITIALIZATION TIME

The IRLM wait time in seconds.

DB2 autostart abends if IRLM does not start within this time.
IRLM Installation Parameters (DSNTIPI)

Install parameter TIME TO AUTOSTART on panel DSNTIPI, or ZPARM IRLMSWT in DSN6SPRM.

Field Name: QWP4ISWT
IRLM Processing Parameters

This topic shows detailed information about “System Parameters - IRLM Processing Parameters”.

This block shows the system parameters for internal resource lock manager (IRLM) processing.

Note: The fields shown on this panel depend on the installed DB2 version.

System Parameters - IRLM Processing Parameters

The field labels shown in the following sample layout of “System Parameters - IRLM Processing Parameters” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>WAIT TIME FOR LOCAL DEADLOCK</td>
<td>Wait time for local deadlock.</td>
</tr>
<tr>
<td>NUMBER OF LOCAL CYCLES PER GLOBAL CYCLE</td>
<td>Number of local cycles per global cycle.</td>
</tr>
<tr>
<td>TIMEOUT INTERVAL</td>
<td>Timeout interval.</td>
</tr>
<tr>
<td>IRLM MAXIMUM CSA USAGE ALLOWED</td>
<td>The maximum amount of common service area that can be used by IRLM.</td>
</tr>
<tr>
<td>Z/OS LOCK TABLE HASH ENTRIES</td>
<td>The number of z/OS lock table hash entries.</td>
</tr>
<tr>
<td>PENDING NUMBER OF HASH ENTRIES</td>
<td></td>
</tr>
<tr>
<td>Z/OS LOCK TABLE LIST ENTRIES</td>
<td></td>
</tr>
<tr>
<td>MAX 31-BIT IRLM PRIVATE STORAGE</td>
<td></td>
</tr>
<tr>
<td>MAX 64-BIT IRLM PRIVATE STORAGE</td>
<td></td>
</tr>
<tr>
<td>Z/OS LOCK TABLE LIST ENTRIES</td>
<td></td>
</tr>
<tr>
<td>PENDING NUMBER OF HASH ENTRIES</td>
<td></td>
</tr>
<tr>
<td>MAX 31-BIT IRLM PRIVATE STORAGE</td>
<td></td>
</tr>
<tr>
<td>MAX 64-BIT IRLM PRIVATE STORAGE</td>
<td></td>
</tr>
</tbody>
</table>

WAIT TIME FOR LOCAL DEADLOCK

Wait time for local deadlock.

Field Name: QWP5DLOK

NUMBER OF LOCAL CYCLES PER GLOBAL CYCLE

Number of local cycles per global cycle.

Field Name: QWP5DCYC

TIMEOUT INTERVAL

Timeout interval.

Field Name: QWP5TVAL

IRLM MAXIMUM CSA USAGE ALLOWED

The maximum amount of common service area that can be used by IRLM.

The amount of space needed for the common service area (CSA) below the 16 MB line is less than 40 KB for each DB2 subsystem and 24 KB for each IRLM. High concurrent activity, parallelism, or high contention can require more CSA.

Most of the DB2 common data resides in the extended common service area (ECSA). Most modules, control blocks, and buffers reside in the extended private area. A DB2 subsystem with 200 concurrent users and 2000 open data sets should need less than 2 MB of virtual storage below the 16 MB line.

Field Name: QWP5MCSA

Z/OS LOCK TABLE HASH ENTRIES

The number of z/OS lock table hash entries.

Field Name: QWP5HASH
IRLM Processing Parameters

PENDING NUMBER OF HASH ENTRIES

The number of z/OS lock table hash entries pending.

Field Name: QWP5PHSH

Z/OS LOCK TABLE LIST ENTRIES

The number of z/OS lock table list entries.

Field Name: QWP5RLE

MAX 31-BIT IRLM PRIVATE STORAGE

The maximum amount of 31-bit IRLM private storage that is available of the 2 GB virtual storage limit, for normal operations in IRLM. IRLM reserves an additional 10% of the 2 GB for use by requests in IRLM.

Field Name: QWP5BPM

MAX 64-BIT IRLM PRIVATE STORAGE

The maximum amount of 64-bit IRLM private storage that is available of the total amount of storage that is specified by MEMLIMIT, for normal operations in IRLM. IRLM reserves an additional 10% of the amount that is specified by MEMLIMIT for use by requests in IRLM.

Field Name: QWP5APM
Lock Escalation Parameters (DSNTIPJ)

This topic shows detailed information about “System Parameters - Lock Escalation Parameters (DSNTIPJ)”. This panel shows the characteristics of IRLM time-sharing fields and other locking options. The default values are adequate for most sites in normal conditions.

System Parameters - Lock Escalation Parameters (DSNTIPJ)

The field labels shown in the following sample layout of “System Parameters - Lock Escalation Parameters (DSNTIPJ)” are described in the following section.

LOCK ESCALATION PARAMETERS (DSNTIPJ)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAX PAGE OR ROW LOCKS PER TABLE SPACE (NUMLKTS)</td>
<td>1,000</td>
</tr>
<tr>
<td>MAX PAGE OR ROW LOCKS PER USER (NUMLKUS)</td>
<td>10,000</td>
</tr>
</tbody>
</table>

MAX PAGE OR ROW LOCKS PER TABLE SPACE (NUMLKTS)

The default (SYSTEM) for the LOCKMAX clause of the SQL statements CREATE TABLESPACE and ALTER TABLESPACE.

Install parameter LOCKS PER TABLE SPACE (NUMLKTS) on panel DSNTIPJ, or ZPARM NUMLKTS in DSN6SPRM.

Field Name: QWP4LKTS

MAX PAGE OR ROW LOCKS PER USER (NUMLKUS)

The maximum number of page or row locks that a single application can hold concurrently on all table spaces.

This includes locks on data pages, index pages, and rows that the program acquires when it accesses table spaces.

The limit applies to all table spaces defined with the LOCKSIZE PAGE, LOCKSIZE ROW, or LOCKSIZE ANY options. 0 means that there is no limit to the number of page and row locks a program can acquire.

DB2 assumes that 250 bytes of storage are required for each lock. If NO is specified for CROSS MEMORY, the value of this field has to take into account the available lock space. If referential constraints between tables is defined, the value of this field might need to be increased.

Install parameter LOCKS PER USER on panel DSNTIPJ, or ZPARM NUMLKUS in DSN6SPRM.

Field Name: QWP4LKUS
Log Installation Parameters (DSNTIPL, DSNTIPH)

This topic shows detailed information about “System Parameters - Log Installation Parameters (DSNTIPL, DSNTIPH)”.

This block shows the characteristics of active log data sets.

System Parameters - Log Installation Parameters (DSNTIPL, DSNTIPH)

The field labels shown in the following sample layout of “System Parameters - Log Installation Parameters (DSNTIPL, DSNTIPH)” are described in the following section.

LOG INSTALLATION PARAMETERS (DSNTIPL,DSNTIPH)

---------------------------------------------

OUTPUT BUFFER SIZE IN K BYTES (OUTBUFF) .................4,000
CHECKPOINT FREQUENCY (CHKFREQ) .............................500,000
UR CHECK FREQUENCY (URCHKTH) ..............................0
UR LOG RECORD WRITTEN THRESHOLD IN KB (URLGWTH)........0
LIMIT BACKOUT (LBACKOUT) ....................................AUTO
BACKOUT DURATION (BACKODUR) .................................5
PEUDO-CLOSE FREQUENCY (PCLOSEN) ............................5
PEUDO-CLOSE TIMER (PCLOSET) .................................10
CHECKPOINTS BETWEEN LEVEL ID UPDATES (DLDFREQ) ....5
NUMBER OF ACTIVE LOG COPIES (TWOACTV) ....................1
NUMBER OF ARCHIVE LOG COPIES (TWOARCH) .................1
COPY 1 PREFIX (ARCPFX1) ......................................DSN911.ARCHLOG1
COPY 2 PREFIX (ARCPFX2) ......................................DSN911.ARCHLOG2
TIMESTAMP ARCHIVE LOG DATA SETS (TSTAMP) ............YES
CHECKPOINT TYPE (CHKTYPE) ..................................SINGLE
RECORDS/CHECKPOINT (CHKLOGR) ............................N/P
MINUTES/CHECKPOINT (CHKMINS) .............................N/P

OUTPUT BUFFER SIZE IN K BYTES (OUTBUFF)

The output log buffer size in kilobytes.

There is only one output log buffer per DB2 subsystem.

Increasing this parameter reduces BSDS I/O updates when there is a buffer wraparound. Frequent wraparounds are likely in LOAD or REORG with logging, and mass insert operations.

Increasing this parameter also helps avoid log write waits for an available buffer during heavy update workload.

When the specified size is not a 4 KB multiple, it is rounded up to the next 4 KB multiple.

Install parameter OUTPUT BUFFER on DSNTIPL, or ZPARAM OUTBUFF in DSN6LOGP.

Field Name: QWP2OBPS

CHECKPOINT FREQUENCY (CHKFREQ)

Checkpoint frequency. This shows either the number of minutes (1 through 60) or the number of DB2 log records between the start of successive checkpoints. DB2 starts a new checkpoint when this value is reached.

You can use the SET LOG command to change the number of log records between checkpoints dynamically. Valid values are 1-60 when specifying a time value and 200-16000000 when specifying a number of records.
Install parameter CHECKPOINT FREQ on panel DSNTIPL, ZPARM CHKFREQ in DSN6SYSP.

Field Name: QWP1LOGL

UR CHECK FREQUENCY (URCHKTH)
Shows the number of checkpoint cycles to complete before DB2 issues a warning message to the console and writes an IFCID 313 record for an uncommitted, indoubt, or inflight unit of recovery (UR). The default is 0, which disables this option.

Install parameter UR CHECK FREQ on panel DSNTIPL, or ZPARM URCHKTH in DSN6SYSP.

Field Name: QWP1URCK

UR LOG RECORD WRITTEN THRESHOLD IN KB (URLGWTH)
Shows the number of log records that are to be written by an uncommitted unit of recovery (UR) before DB2 issues a warning message to the console. This provides notification of a long-running UR. Long-running URs might result in a lengthy DB2 restart or a lengthy recovery situation for critical tables. Log records are specified in 1-K (1000 log records) increments. A value of 0 indicates that no write check is to be performed.

Install parameter UR LOG WRITE CHECK on panel DSNTIPL, ZPARM URLGWTH in DSN6SYSP.

Field Name: QWP1LWCK

LIMIT BACKOUT (LBACKOUT)
Shows whether some backward log processing should be postponed.

When NO, DB2 backward log processing processes all inflight units of recovery (URs) and URs for abending transactions.

When YES, DB2 postpones backout processing for some units of work until the command RECOVER POSTPONED is issued.

AUTO (default) postpones some backout processing but automatically starts the backout processing when DB2 restarts and begins accepting new work.

When YES or AUTO, backout processing runs concurrently with new work. Page sets or partitions with backout work pending are unavailable until their backout work is complete.

Install parameter LIMIT BACKOUT on panel DSNTIPL, or ZPARM LBACKOUT in DSN6SYSP.

Field Name: QWP1LMBO

BACKOUT DURATION (BACKODUR)
Indicates how much of the log to process for backout when LIMIT BACKOUT = YES or AUTO.

During restart, backward log processing continues until both of the following events occur:

- All inflight and inabort URs with update activity against the catalog or directory are backed out.

- The number of log records processed is equal to the number specified in BACKOUT DURATION times the value of CHECKPOINT FREQ. If the
checkpoint frequency is specified in minutes, the number of records processed is the default of 50000 records multiplied by the value of CHECKPOINT FREQ.

In-flight and in-abort URs that are not completely backed out during restart are converted to postponed-abort status. Page sets or partitions with postponed-backout work are put into restart pending (RESTP). This state blocks all access to the object other than access by the command RECOVER POSTPONED or by automatic backout processing performed by DB2 when LIMITED BACKOUT = AUTO.

A table space might be in restart pending mode, without the associated index spaces also in restart pending mode. This happens if a postponed abort UR makes updates only to non-indexed fields of a table in a table space. In this case, the indexes are accessible to SQL (for index-only queries), even though the table space is inaccessible.

Install parameter BACKOUT DURATION on panel DSNTIPL, or ZPARM BACKODUR in DSN6SYSP.

Field Name: QWP1BDUR

**PSEUDO-CLOSE FREQUENCY (PCLOSEN)**

The number of consecutive DB2 checkpoints that a page set or partition can remain in read/write mode since it was last updated. When this limit or the RO SWITCH TIME is reached, DB2 changes the page set or partition to read only.

This can improve performance for recovery, logging, and data-sharing processing.

Install parameter RO SWITCH CHKPTS on panel DSNTIPL, or ZPARM PCLOSEN in DSN6SYSP.

Field Name: QWP1FREQ

**PSEUDO-CLOSE TIMER (PCLOSET)**

The number of minutes that a page set or partition can remain in read-write mode since it was last updated. When this limit or the RO SWITCH CHKPTS is reached, DB2 changes the page set or partition to read-only.

This can improve performance for recovery, logging, and data-sharing processing.

Install parameter RO SWITCH TIME on panel DSNTIPL, or ZPARM PCLOSET in DSN6SYSP.

Field Name: QWP1TMR

**CHECKPOINTS BETWEEN LEVEL ID UPDATES (DLDFREQ)**

How often, in checkpoints, the level ID of a page set or partition is updated. When zero (0), downlevel detection is disabled.

Use the following criteria to decide on a suitable value for this parameter:

- **How often are backup and restore methods used outside of the DB2 control (such as DSN1COPY or DFDSS dump and restore)?** If rarely used, there is no need to update the level ID frequently.

- **How many page sets are open for update at the same time?** If DB2 updates level IDs frequently, there is extra protection against downlevel
page sets. However, a performance degradation can occur if the level IDs for many page sets must be set at every checkpoint.

- **How often does the subsystem take checkpoints?** If the DB2 subsystem takes frequent system checkpoints, set the level ID frequency to a higher value.

Install parameter LEVELID UPDATE FREQ on panel DSNTIPL, or ZPARM DLDFREQ in DSN6SYSP.

**Field Name:** QWP1DFRQ

**NUMBER OF ACTIVE LOG COPIES (TWOACTV)**

The number of copies of the active log being maintained: 2 indicates dual logging.

**Field Name:** QWP2DUAL

**NUMBER OF ARCHIVE LOG COPIES (TWOARCH)**

The number of copies of the archive log being produced during offloading: 2 indicates dual logging.

Install parameter NUMBER OF COPIES on PANEL DSNTIPH, or ZP ARM TWOARCH in DSN6LOGP.

**Field Name:** QWP2ADL

**COPY 1 PREFIX (ARCPFX1)**

The prefix of the first archive log data set.

Install parameter Archive Logs: COPY1 PREFIX on panel DSNTIPH, or ZP ARM ARCPFX1 in DSN6ARVP.

**Field Name:** QWP3RE1N

**COPY 2 PREFIX (ARCPFX2)**

The prefix of the second archive log data set. If single logging is used, this value is a default.

Install parameter Archive Logs: COPY2 PREFIX on panel DSNTIPH, or ZP ARM ARCPFX2 in DSN6ARVP.

**Field Name:** QWP3RE2N

**TIMESTAMP ARCHIVE LOG DATA SETS (TSTAMP)**

Indicates whether the date and time of creation of the DB2 archive log data set is included in the archive log data set name.

Possible values are:

**YES (QWP3DTIM=1)**

The maximum allowable length of the user-controlled portion of the archive log prefix is reduced from 35 characters to 19 characters. This allows the 16-character timestamp to be added to the archive log data set prefix. The timestamp format is as follows: *DygdddThhmmssT*, where:

- **D** Starts the date.
- **yy** Is the last two digits of the year.
- **ddd** Is the day of the year.
- **T** Starts the time.
Log Installation Parameters (DSNTIPL, DSNTIPH)

\[ hh \]  Is the hour.

\[ mm \]  Are the minutes.

\[ ss \]  Are the seconds.

\[ t \]  Is the tenths of a second.

The maximum allowable length of the user-controlled portion of the archive log prefix is reduced from 35 characters to 19 characters. This reduction in size permits the 16-character date and time qualifiers (timestamp) to be added to the archive log data set prefix.

**NO (QWP3DTIM=0 and QWP3DTFM=0)**

The archive data set name does not contain a timestamp.

**EXT (QWP3DTFM=1)**

The archive data set name contains a timestamp with an extended date component in the format: .Dyyyyddd. A value of EXT in this field causes the lengths of the values that are entered for field COPY 1 PREFIX and field COPY 2 PREFIX to be audited to ensure that neither exceeds 17 bytes (19 bytes for other settings of TIMESTAMP ARCHIVES).

Install parameter TIMESTAMP ARCHIVES on panel DSNTIPH, or ZPARM TSTAMP in DSN6ARVP.

**Field Name:** RT0106AL

**CHECKPOINT TYPE (CHKTYPE)**

Shows the LOG checkpoint type. It can have the following values:

**SINGLE**

Either records or minutes.

**BOTH**

Both records and minutes, as specified by Records Between Checkpoint (QWP1LOGR) and Mins Between Checkpoint (QWP1LOGM).

ZPARM CHKTYPE in DSN6SYSP.

**Field Name:** QWP1LOGT

**RECORDS/CHECKPOINT (CHKLOGR)**

Shows the number of records between log checkpoints if the LOG checkpoint type is BOTH (records and minutes).

This field corresponds to field RECORDS/CHECKPOINT on installation panel DSNTIPL1, or ZPARM name CHKLOGR in DSN6SYSP.

**Field Name:** QWP1LOGR

**MINUTES/CHECKPOINT (CHKMINS)**

Shows the number of minutes between log checkpoints if the LOG checkpoint type is BOTH (records and minutes).

This field corresponds to field MINUTES/CHECKPOINT on installation panel DSNTIPL1, or ZPARM name CHKMINS in DSN6SYSP.

**Field Name:** QWP1LOGM
List of Long Names

This topic shows detailed information about “System Parameters - List of Long Names”.

This block is printed at the end of the system parameters report when the report contains long names that have been truncated. The block shows the parameter identifier, in alphabetic order, and the complete name. If the name is too long to show on one line, it continues on the next.

System Parameters - List of Long Names

The field labels shown in the following sample layout of “System Parameters - List of Long Names” are described in the following section.

<table>
<thead>
<tr>

MVS Parmlib Update Parameters (DSNTIPM)

This topic shows detailed information about “System Parameters - MVS Parmlib Update Parameters (DSNTIPM)”.

This block shows the parameters used to produce the DSNTIJMV job that defined DB2 to MVS and updated the following PARMLIB members:

IEFSSN xx  
- to define DB2 and IRLM as formal MVS subsystems

IEAAPF xx  
- to authorize the prefix.SDSNLOAD, prefix.SDSNLINK, and prefix.SDSNEXIT libraries

LNKLST xx  
- to include the prefix.SDSNLINK library.

System Parameters - MVS Parmlib Update Parameters (DSNTIPM)

The field labels shown in the following sample layout of “System Parameters - MVS Parmlib Update Parameters (DSNTIPM)” are described in the following section.

MVS PARMLIB UPDATE PARAMETERS (DSNTIPM)
----------------------------------------
SUBSYSTEM DEFAULT (SSID) .........................D851
SUPPRESS SOFT ERRORS (SUPERRS) .....................NO

SUBSYSTEM DEFAULT (SSID)

The MVS subsystem name for DB2. The name is used in member IEFSSN xx of SYS1.PARMLIB.

A valid name has 1-4 characters, the first must be A-Z, #, $, or @. Others must be A-Z, 1-9, #, $, or @. Default is DSN1.

Install parameter SUBSYSTEM NAME on panel DSNTIPM, or ZPARM SSID in DSNHDECP.

Field Name: QWPBSSID

SUPPRESS SOFT ERRORS (SUPERRS)

Shows whether the recording of errors, such as invalid decimal data and arithmetic exceptions, in the operating system data set SYS1.LOGREC is suppressed.

When YES, these exceptions are not recorded in the LOGREC data set.

Install parameter SUPPRESS SOFT ERRORS on panel DSNTIPM or ZPARM SUPERRS in DSN6SPRM.

Field Name: QWP4SAE
This topic shows detailed information about “System Parameters - Operator Functions Installation Parameters (DSNTIPO)”.

This block shows various operator functions, such as write-to-operator route codes, automatic recall, and the maximum amount of CPU time allocated for a dynamic SQL statement.

**Note:** The fields shown on this panel depend on the installed DB2 version.

### System Parameters - Operator Functions Installation Parameters (DSNTIPO)

The field labels shown in the following sample layout of “System Parameters - Operator Functions Installation Parameters (DSNTIPO)” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>WTO ROUTE CODES (ROUTCDE)</td>
<td>The MVS console routing codes. These codes are assigned to messages that are not solicited from a specific console. Up to 16 comma-separated codes can be shown. Install parameter WTO ROUTE CODES on panel DSNTIPO, or ZP ARM ROUTCDE in DSN6SYSP.</td>
</tr>
<tr>
<td>RESOURCE LIMIT FACILITY AUTOMATIC START (RLF) (prior to DB2 12)</td>
<td>Shows whether the resource limit facility (governor) is automatically started when DB2 is started. Install parameter RLF AUTO START on panel DSNTIPO4, or ZP ARM RLF in DSN6SYSP.</td>
</tr>
<tr>
<td>RESOURCE LIMIT SPECIFICATION TABLE SUFFIX (RLFTBL) (prior to DB2 12)</td>
<td>The default resource limit specification table (RLST) suffix. This suffix is used when the resource limit facility (governor) is automatically started or when the governor is started without specifying a suffix. Install parameter RLST NAME SUFFIX on panel DSNTIPO4, or ZP ARM RLFTBL in DSN6SYSP.</td>
</tr>
</tbody>
</table>

---

**WTO ROUTE CODES (ROUTCDE)**

The MVS console routing codes.

These codes are assigned to messages that are not solicited from a specific console. Up to 16 comma-separated codes can be shown.

Install parameter WTO ROUTE CODES on panel DSNTIPO, or ZP ARM ROUTCDE in DSN6SYSP.

**Field Name:** QWP1SMRC

**RESOURCE LIMIT FACILITY AUTOMATIC START (RLF) (prior to DB2 12)**

Shows whether the resource limit facility (governor) is automatically started when DB2 is started.

Install parameter RLF AUTO START on panel DSNTIPO4, or ZP ARM RLF in DSN6SYSP.

**Field Name:** QWP1RLF

**RESOURCE LIMIT SPECIFICATION TABLE SUFFIX (RLFTBL) (prior to DB2 12)**

The default resource limit specification table (RLST) suffix.

This suffix is used when the resource limit facility (governor) is automatically started or when the governor is started without specifying a suffix.

Install parameter RLST NAME SUFFIX on panel DSNTIPO4, or ZP ARM RLFTBL in DSN6SYSP.
**Operator Functions Installation Parameters (DSNTIPO)**

**Prior to DB2 12:** Install parameter RLST NAME SUFFIX on panel DSNTIPO4, or ZP ARM RLFTBL in DSN6SYSP.

**Field Name:** QWP1RLFT

**RESOURCE LIMIT SPEC TABLE ERROR ACTION (RLFERR) (prior to DB2 12)**

The action taken by DB2 when the governor cannot use the resource limit:

- **NOLIMIT**
  The dynamic SQL statements run without limit.

- **NORUN**
  The dynamic SQL statements terminated with an SQL error code.
  A number from 1 to 5000000 represents the number of CPU service units allowed for a query.

Install parameter DYNAMIC SQL on panel DSNTIPO4, or ZP ARM RLFERR in DSN6SYSP.

**Prior to DB2 12:** Install parameter RLST ACCESS ERROR on panel DSNTIPO, or ZP ARM RLFERR in DSN6SYSP.

**Field Name:** RLFERR

**AUTO BIND (ABIND)**

Indicates whether autobind is enabled. Values are:

- **YES** Allows automatic rebind operations to be performed when a plan/package:
  - Was marked “invalid”.
  - Was bound on DB2 Vn, but is now running on DB2 Vn-1
  - After use on DB2 Vn-1 (as previously described), is later used again on DB2 Vn

- **NO** Prevent DB2 from performing any automatic rebind operations under any circumstances.

- **COEXIST**
  Allows automatic rebind operation to be performed in a DB2 Data Sharing coexistence environment when the plan/package:
  - Is marked “invalid” or
  - Was last bound in DB2 Vn and is running on DB2 Vn-1

Install parameter AUTO BIND on panel DSNTIPO, or ZP ARM ABIND in DSN6SPRM.

**Field Name:** QWP4ABN

**ALLOW EXPLAIN AT AUTOBIND (ABEXP)**

Indicates whether EXPLAIN processing occurs during automatic rebind.

YES means EXPLAIN processing happens during automatic rebind of a plan or package that has EXPLAIN(YES) as a bind option. If the PLAN_TABLE does not exist, automatic rebind continues, but there is no EXPLAIN output. Explain processing does not happen for a plan or package with EXPLAIN(NO).

Install parameter EXPLAIN PROCESSING on panel DSNTIPO, or ZP ARM ABEXP in DSN6SPRM.

**Field Name:** QWP4ABX
DPROP SUPPORT (EDPROP)

Shows whether DataPropagator NonRelational (DPROP) is used to propagate SQL changes made to tables defined with DATA CAPTURE CHANGES.

1. No changes are propagated.
2. DPROP propagates SQL changes, and those changes made to tables defined with DATA CAPTURE CHANGES are only allowed when monitor trace class 6 is active, DPROP is installed, and the DB2 application is running in an IMS environment. If any of these conditions are not met, no changes to the DB2 table are permitted.
3. Data propagation occurs when monitor trace class 6 is active, DPROP is installed, and the DB2 application is running in an IMS environment. In this instance, an application that is not running in an IMS environment can update DB2 tables defined with DATA CAPTURE CHANGES. However, these changes are not propagated to IMS.

ANY Allows subsystems to propagate some data with DPROP and other data with a different propagation program.

Tables that should only be updated by DB2 applications running in an IMS environment can be protected using the following methods:

- Use the ENABLE parameter on BIND to specify a specific attachment facility through which updates to data propagation tables can be made.
- Define a validation procedure for data propagation tables to define which plans can update those tables.
- Allow update authority for data propagation tables to a group of authorization IDs that can only run in IMS.

Install parameter DPROP SUPPORT on panel DSNTIPO, or ZPARM EDPROP and CHGDC in DSN6SPRM.

Field Name: QWP4ENF

SITE TYPE (SITETYP)

Shows whether this system is at a local site or a recovery site.

LOCALSITE

This is the site of the current system. Multiple image copies are made and are operational here. This is the default.

RECOVERYSITE

This an alternative site for recovery purposes.

The RECOVER utility uses this parameter to determine what site the current system is on and recovers everything from the copies of data registered at that site.

The RECOVER and MERGECOPY utilities use this to determine whether COPYDDN or RECOVERDDN is allowed with NEWCOPY NO.

Install parameter SITE TYPE on panel DSNTIPO, or ZPARM SITETYP in DSN6SPRM.

Field Name: QWP4MSTY

TRACKER SITE (TRKRSITE)
Indicates whether this subsystem is a remote tracker site for another DB2 subsystem.

When YES, this is a tracker site.

A DB2 tracker site is a separate DB2 subsystem or data sharing group that exists solely for the purpose of keeping shadow copies of your primary site's data. No independent work can be run on the tracker site.

Install parameter TRACKER TYPE on panel DSNTIPO, or ZPARM TRKRSITE in DSN6SPRM.

Field Name: QWP4TRKR

READ COPY2 ARCHIVE (ARC2FRST)

This field indicates whether the COPY2 archives should be read first when the DB2 subsystem is started.

Install parameter READ COPY2 ARCHIVE on DSNTIPO, or ZPARM ARC2FRST in DSN6LOGP.

Field Name: QWP2OPT2

REAL TIME STATS (STATSINT)

The time interval that DB2 waits before it attempts to write out page set statistics to the real-time statistics tables. This value is between 1 and 65535 minutes.

Install parameter REAL TIME STATS on panel DSNTIPO, or ZPARM STATSINT in DSN6SPRM.

Field Name: QWP4INTE

STATISTICS FEEDBACK (STATFDBK_SCOPE)

Specifies the scope of SQL statements for which DB2 is to recommend statistics. Possible values are:

- All
- Dynamic
- None
- Static

This value corresponds to field STATISTICS FEEDBACK on installation panel DSNTIPO. The ZPARM name is STATFDBK_SCOPE in DSN6SPRM.

Field Name: QWP4SFBS

PROFILE AUTOSTART (PROFILE_AUTOSTART)

Specifies whether START PROFILE command processing is automatically initiated as part of DB2 startup (DB2 field: QWP1PFASY):

- 0 indicates NO
- 1 indicates YES

This field corresponds to field PROFILE AUTOSTART on installation panel DSNTIPO. ZPARM name: PROFILE_AUTOSTART in DSN6SYSP.

Field Name: QWP1PFASY
## Other System Parameters

This topic shows detailed information about “System Parameters - Other System Parameters”.

This block shows values not shown on other DB2 installation panels. These values are either set internally by DB2, or calculated from other install parameter values.

**Note:** The fields shown on this panel depend on the installed DB2 version.

### System Parameters - Other System Parameters

The field labels shown in the following sample layout of “System Parameters - Other System Parameters” are described in the following section.

### DUAL BSDS MODE (TWOBSDS)

Shows whether two BSDS data sets are used.

A second BSDS (strongly recommended) makes recovery much easier in most situations. In cases that normally require recovery and restart, a
Other System Parameters

second BSDS allows you to continue working. The storage overhead required is small and the data set is relatively inactive.

DB2 parameter TWOBSDS in DSN6LOGP.

**Field Name:** QWP2DBSD

**ROLL UP PARALLEL TASK ACCOUNTING (PTASKROL)**

Indicates whether DB2 generates a trace record at the originating task level that summarizes accounting information for all parallel tasks.

DB2 parameter PTASKROL in DSN6SYSP.

**Field Name:** QWP1PROL

**NO. PAGES SMALL TABLE THRESHOLD (NPGTHRSH)**

This parameter allows you to specify the optimizer threshold for qualifying a table as small.

-1 Every table qualifies as small.
0 No table qualifies as small (this is the default).
1 Only tables with zero pages qualify as small.
2 Tables with less than two pages qualify as small.
10 Tables with less than ten pages qualify as small.
502 Tables with less than 502 pages, and tables that have not had statistics collected qualify as small. For example, when NPAGES = -1.

DB2 parameter NPGTHRSH in DSN6SPRM.

**Background and Tuning Information**

Tables can be populated using insert just prior to their use by queries and then cleared immediately on completion of the queries. These tables are permanent even though the data they contain is transient.

This can cause problems when RUNSTATS is run overnight, or at other times when these tables are empty. This gives the optimizer the false indication that these tables contain no data when in fact, the tables will contain data when the query executes. This causes the optimizer to pick an inefficient access path. Usually the optimizer chooses to do a table scan, which would be the most efficient access path if the table were truly empty. Because the table is not empty when the query executes, it would be more efficient to use matching index access.

With this parameter, you can force the optimizer to treat tables containing no data as small tables. For these tables, the optimizer will:
- Select a matching index access rather than a table space scan and non-matching index access.
- Select the index with the most matching columns when more than one index qualifies for matching index access.
- Select indexes with the same number of matching columns on cost.

**Field Name:** QWP4NPAG

**OFFLOAD OPTION (OFFLOAD)**

Shows whether the offload process is initiated online.

ZPARM OFFLOAD in macro DSN6LOGP.
Field Name: QWP2OFFL

SU CONVERSION FACTOR

The CPU service unit conversion factor for this CPU.

This factor allows conversion CPU time in seconds to a common unit, called service unit (SU). The conversion factor used depends on the machine. Service units allow you to calculate CPU execution times across a data sharing group.

The conversion factor is used as follows:
CP secs * 16,000,000 / Conversion Factor = SUs
SUs * Conversion Factor / 16,000,000 = CP secs

This field does not map to an installation panel.

Field Name: QWPASUCV

MINIMUM DIVIDE SCALE (MINDVSCl)

The minimum scale for the result of a decimal division. The values for this parameter are none (the default), 3, or 6. If 3 or 6 is specified, this parameter overrides the DECDIV3 parameter.

Field Name: QWP4MDSC

STAR JOIN THRESHOLD (SJTABLES)

The minimum number of tables in the star schema query block, including the fact table, dimensions tables, and snowflake tables. This value is considered only if the subsystem parameter STARJOIN qualifies the query for star join.

Possible values are:

0       Star join is disabled. This is the default.
1, 2, or 3          Star join is always considered.
4 through 255     Star join is considered if the query block has at least the specified number of tables.
256 and greater   Star join is never considered.

DB2 parameter SJTABLES in DSN6SPRM.

Background and Tuning Information

Although star join can reduce bind time significantly it does not provide optimal performance in all cases. Performance of star join depends on a number of factors such as the available indexes on the fact table, the cluster ratio of the indexes, and the selectivity of rows through local and join predicates. Follow these general guidelines for setting the value of SJTABLES:

• If you have star schema queries with less than 10 tables and you want to make the star join method applicable to all qualified queries, set the value of SJTABLES to a low number, such as 5.
If you have some star schema queries that are not necessarily suitable for star join but want to use star join for relatively large queries, use the default. The star join method will be considered for all qualified queries that have 10 or more tables.

If you have star schema queries but normally do not want to use star join, you could increase SJTABLES, say to 15. This will greatly cut the bind time for large queries and avoid a potential bind time SQL return code -101 for large qualified queries.

Field Name: QWP4SJTBJ

ONLINE SYSTEM PARM USER ID MONITOR

The user ID that made the last online change to DB2 system settings.

Field Name: QWP4OZUS

ONLINE SYSTEM PARM CORREL ID MONITOR

The correlation ID of the online application that made the last change to DB2 system settings.

Field Name: QWP4OZCI

ONLINE SYSTEM PARM TIME CHANGED

Time of the last online change made to DB2 system settings.

Field Name: QWP4OZTM

ONLINE SYSTEM PARM TYPE

The type of DB2 system parameter changed by the last SET SYSPARM statement.

Field Name: QWP4OZTP

DB2-SUPPLIED DECP INDICATOR

Indicates that DECP is supplied by DB2.

Using a DB2 supplied DECP could cause data corruption due to applications using wrong CCSIDs.

Field Name: QWPBDDB2S

MAX CONCURRENT PKG OPS (MAX_CONCURRENT_PKG_OPS)

The maximum number of package requests that can be processed simultaneously.

DB2 parameter MAX_CONCURRENT_PKG_OPS in DSN6SPRM.

Field Name: QWP4MXAB

ADMIN SCHEDULER JCL PROC NAME (ADMTPROC)

The name of the JCL procedure for starting the DB2 administrative scheduler task address space.

DB2 parameter ADMTPROC in DSN6SPRM.

Field Name: QWP4ADMT

FREE LOCAL CACHED STATEMENTS (CACHEDYN_FREELOCAL)

Indicates whether DB2 can free statements from the local dynamic statement cache to relieve storage constraints below the 2 GB bar. This
parameter applies only for packages or plans that are bound with KEEPDYNAMIC(YES). Possible values are:

0  DB2 cannot free statements from the local cache  
1  DB2 can free statements from the local cache

DB2 parameter CACHEDYN_FREELOCAL in DSN6SPRM.

Field Name:  QWP4FRLC

INDEX I/O PARALLELISM (INDEX_IO_PARALLELISM)

In DB2 12 this field is a serviceability field.  
The enablement of the index I/O parallelism ZPARM.

Field Name:  QWP4IIOP

ZOSMETRICS

YES indicates that gathering of z/OS metrics using the RMF interface is enabled. ZPARM ZOSMETRICS in DSN6SPRM.

Field Name:  QWP4METE

USE TRACKMOD FOR IMPLICIT TS (IMPTKMOD)

Shows whether you have specified the TRACKMOD option on ALTER TABLESPACE for an implicitly created table space.

This field corresponds to field TRACK MODIFIED PAGES on installation panel DSNTIP7. The ZPARM name is IMPTKMOD in DSN6SPRM.

Field Name:  QWP1TKMD

DSSIZE FOR IMPLICIT TS (IMPDSSIZE)

Shows the maximum DSSIZE in gigabytes that DB2 uses for creating each partition of an implicitly created base table space.

This field corresponds to field DEFAULT DSSIZE on installation panel DSNTIP7. The ZPARM name is IMPDSSIZE in DSN6SPRM.

Field Name:  QWP1DSSZ

ENABLE MULTIPLE INDEX ACCESS (SUBQ_MIDX)

Specifies whether to enable or disable multiple index access for queries that have subquery predicates:

NO  Disables multiple index access for queries.  
YES  Enables multiple index access for queries.

The ZPARM name is SUBQ_MIDX IN DSN6SPRM.

Field Name:  QWP4SQMX

SP_PARMS_JV (DDF_COMPATIBILITY)

Specifies that when a Java client application calls a DB2 for z/OS stored procedure, DB2 returns output argument values with data types that match the data types that were specified in the CallableStatement.registerOutParameter method calls.

If SP_PARMS_JV is not specified, DB2 returns output parameter values with data types that match the data types of the parameters in the stored procedure definition.
ZPARM name DDF_COMPATIBILITY and ZPARM value SP_PARMS_JV in DSN6FAC.

**Field Name:** QWP9SPPMJ

**SP_PARMS_NJV (DDF_COMPATIBILITY)**

Specifies that when a non-Java client application calls a DB2 for z/OS stored procedure, DB2 returns output argument values with data types that match the data types of the corresponding CALL statement arguments, unless one of the following conditions are true:

- The non-Java client is Version 10 or later.
- The stored procedure uses a parameter data type that was introduced in DB2 for z/OS Version 10 (XML, TIMESTAMP WITH TIMEZONE, or TIMESTAMP with precision greater than 6).

If one condition is true, DB2 returns output parameter values with data types that match the data types of the parameters in the stored procedure definition. If SP_PARMS_NJV is not specified, DB2 returns output parameter values with data types that match the data types of the parameters in the stored procedure definition.

ZPARM name DDF_COMPATIBILITY and ZPARM value SP_PARMS_NJV in DSN6FAC.

**Field Name:** QWP9SPPM

**DISABLE_IMPCAST_JV (DDF_COMPATIBILITY) (DB2 11 or later)**

Specifies whether the DB2 for z/OS server disables implicit casting of input host variables from numeric data types to string data types, or from string data types to numeric data types, when the application is a Java client application that uses the IBM Data Server Driver for JDBC and SQLJ.

If application compatibility is set to:

- V10R1: DB2 uses DISABLE_IMPCAST_JV.
- V11R1 or later: DB2 always does implicit casting.

ZPARM name DDF_COMPATIBILITY ZPARM value DISABLE_IMPCAST_JV in DSN6FAC.

**Field Name:** QWP9ICIJ

**DISABLE_IMPCAST_NJV (DDF_COMPATIBILITY)**

Specifies that DB2 for z/OS disables implicit casting of input host variables from numeric data types to string data types, or from string data types to numeric data types, when the application is a non-Java client application that uses an IBM Data Server client or driver that is at Version 10.5 or earlier.

ZPARM name DDF_COMPATIBILITY and ZPARM value DISABLE_IMPCAST_NJV in DSN6FAC.

**Field Name:** QWP9ICIN

**IGNORE_TZ (DDF_COMPATIBILITY)**

Shows whether to ignore the time zone (TMZ) in TMZ input for Java.

**Field Name:** QWP9ITZJ

**DDF COMP PRIOR VERSION (DDF_COMPATIBILITY)**
The DDF compatibility parameter. The DB2 server with new-function mode has not yet been activated. The DDF compatibility parameter causes this server to identify itself to all remote clients as being in new-function mode for the previous version. The format of this field in the trace record is \textit{nnr}, where \textit{nn} is the version of the DB2 server and \textit{r} is the release.

Field Name: QWP9DDFCIP

\textbf{DYN STMT CACHE STOR (CACHE\_DEP\_TRACK\_STOR\_LIM)}

Specifies the number of gigabytes of storage that DB2 allocates for hashing entries in the dynamic statement cache. This parameter can avoid storage shortages for long-running threads. The storage is allocated above the bar. The ZPARM name is \textit{CACHE\_DEP\_TRACK\_STOR\_LIM} in DSN6SPRM.

Field Name: QWP4CDTSL

\textbf{ACTIVATE I/O SCHEDULING}

Determines whether the I/O scheduling feature is activated. DB2 parameter SPRMIOP in DSN6SPRM.

Field Name: QWP4IOP

\textbf{VALUE FOR TRIGGER DRAIN}

The percentage below 100\% DSMAX that open data sets can reach before an asynchronous drain is started. The default is 1, meaning that asynchronous drain starts when the number of open data sets reaches 99\% of DSMAX.

DB2 defers closing and deallocating the table spaces or indexes until the number of open data sets reaches one of the following limits:

\begin{itemize}
  \item The MVS limit for the number of concurrently open data sets.
  \item 99\% (default) of the value that you specified for DSMAX.
\end{itemize}

When one of these limits is reached, DB2 closes a number of data sets not in use equal to 3\% (default) of the value DSMAX. Thus, DSMAX controls not only the limit of open data sets, but also the number of data sets that are closed when that limit is reached.

DB2 parameter SPRMTDD in DSN6SPRM.

Field Name: QWP4TDDN

\textbf{MAX NUMBER OF DDS WITH HOLD}

The percentage of maximum open data sets until the asynchronous drain operations are stopped.

DB2 parameter SPRMMDD in DSNDSPRM.

Field Name: QWP4MDDN

\textbf{FIELD PROCS FOR DESCRIBE TABLE BLOCK}

The number of field procedures for the DESCRIBE TABLE block.

ZPARM SPRMFDP.

Field Name: QWP4FDP

\textbf{RESTRICT ALTER COLUMN FOR DCC (RESTRICT\_ALT\_COL\_FOR\_DCC)}

A value of YES prevents the use of ALTER table ALTER column with SET DATA TYPE, SET DEFAULT, and DROP DEFAULT when data capture
changes is enabled on the target table. The ZPARM name is RESTRICT_ALT_COL_FOR_DCC in DSN6SPRM.

Field Name: QWP4RACD

SPACE RESERVED FOR Z/OS FUNCTIONS
The amount of space reserved for MVS functions.

Field Name: QWP1DB1M

SPACE RESERVED FOR CRITICAL WORK
The amount of space reserved for critical work that must be completed.

Field Name: QWP1CRIT

SPACE RESERVED ON TOP OF Z/OS AND CRITICAL SPACE
The amount of space above z/OS and critical (QWP1DB1M + QWP1CRIT) that DB2 tries to leave available.

Field Name: QWP1SOS

DETAILED MEASURED UNIT PRICE TRACKING
Specifies whether DB2 performs detailed tracking for measured usage pricing. You can select the following values:

YES  DB2 does detailed measured usage tracking if SMF type 89 records are activated. When SMF89 is set to YES, DB2 invokes a z/OS service on every entry into or exit out of DB2 to ensure accurate tracking.

NO (the default value)
DB2 does not do detailed measured usage tracking. If the SMF type 89 record is activated, only high-level tracking is recorded in the SMF type 89 record. Selecting NO reduces CPU usage, but also increases the amount of time spent in DB2 as measured by SMF 89.

Note: Select SMF89 YES only if you use measured usage pricing.

DB2 parameter SMF89.

Field Name: QWP1SM89

OTC LICENSE TERMS ACCEPTED
Indicates that the one-time charge (OTC) license terms are accepted for this DB2 installation.

DB2 parameter OTC_LICENSE.

Field Name: QWP1OLAC

SIMULATED CPUS
The number of CPUs that are online.

Field Name: QWP4NCPU

EXECUTION TIME OF TASK/SRB IN MICROSECONDS
The accumulated SRB time for the address space. This value includes both, the preemptable and nonpreemptable SRB time. It does not include CPU time that is consumed on an IBM zIIP.

Field Name: QWSASRBT

MAX 'NOT FOUND' HASH RECORDS
The maximum number of NOT FOUND hash records.

Field Name: QWP4KNFC

MAX EXTEND SERVICE TASKS

Maximum number of extended service tasks.

Field Name: QWP4EST

PROJECT Z INSERTION THRESHOLD

Project z insertion threshold.

Field Name: QWP4ZTN

MAX ZIVLEMPHEL DICTIONARY ENTRIES

The maximum number of ZIVLEMPHEL dictionary entries.

Field Name: QWP4MDE

REORG KEEPDICTIONARY IN BRF TO RRF CONVERSION

Indicates that KEEPDICTIONARY is used when a REORG converts a table space from basic row format (BRF) to reordered row format (RRF).

Field Name: QWP4HKEEPD

DRDA RESOLVE ALIAS (DRDA_RESOLVE_ALIAS)

YES means that in SQL statements, DB2 replaces aliases that refer to three-part names with qualified object names before it sends the statements to the remote location. This substitution is done in the following cases:

• When PREPARE or EXECUTE IMMEDIATE is performed
• When REMOTE BIND of a package is performed.

ZPARM name DRDA_RESOLVE_ALIA$ in DSN6SPRM.

Field Name: QWP4RSLV

PC YES SPECIFIED

Shows whether the IRLM uses the cross-address-space program call. This parameter determines where the IRLM lock control block structure is stored.

If you run a tightly-controlled environment and virtual storage is not constrained, use PC=NO. PC=YES is the conservative choice where insufficient information about the environment is available to make a well-informed decision.

With PC=NO, locks are managed in extended common service area (ECSA) and it is possible to achieve better CPU performance, because DB2 does not use cross-memory services for IRLM requests. However, ECSA is a limited resource and constrains the size of the private address space area available above the 16-MB line. The demand for ECSA storage to support locks may be excessive when one or more of the following conditions are true:

• Extensive use of row-level locking
• Ineffective lock avoidance
• Infrequent application commits
• Lock escalation via NUMLKTS and LOCKMAX is disabled because the applications cannot tolerate the impact
Effectively no limit on the number of locks taken by an application (NUMLKUS is set very high)

Multiple DB2 subsystems with IRLM PC=NO reside on the same z/OS image

Assuming the average lock consumes 536 bytes of storage, a single application which takes 100000 locks before a commit would consume almost 52 MB of ECSA when IRLM is configured with PC=NO. MAXCSA would have to be set to at least 52 MB. If a very large number of locks are held by concurrent application processes, the demand for ECSA may not be able to be supported.

Recommendation: If you run applications that have many of the above characteristics, it is strongly recommended to use PC=YES. Certain ERP vendor applications that run concurrent processes can acquire a very large number of held locks that would require a very large setting for MAXCSA, or cause an ECSA overflow which would adversely impact the availability of the z/OS image.

If PC=NO is selected, MAXCSA should be sized to support the concurrent number of held locks required and to avoid an ECSA overflow condition. When setting MAXCSA, check to ensure that the ECSA setting in PARMILIB is sufficient to support the aggregate demand from IRLM and other subsystems. The ECSA size for z/OS is specified by the CSA keyword in the IEASSYSnn member in SYS1.PARMLIB.

With PC=YES, locks are managed in the extended private area of the IRLM address space. This can increase the CPU cost of lock and unlock requests relative to PC=NO. However, with reasonable lock avoidance, the total CPU overhead is likely to be limited to 1 to 2%, which is well within measurement noise and therefore not significant.

With PC=YES, the MAXIMUM ECSA option is ignored but must not be zero. The amount of storage allowed for LOCK usage is determined from the extended storage provided to the IRLM address space at startup time. This amount is reduced by 200 MB to allow a buffer for IRLM and z/OS required storage and for DMBS MUST COMPLETE processes. The amount being monitored can be seen in the display message from the irlmproc,STATUS,STOR command. IRLM still uses CSA and ECSA for other purposes. If you need to create a dump for DB2 diagnostic purposes, you need to ensure that IRLM is included in the dump, and that the dump data sets are large enough to hold IRLM.

PC=NO is a good solution when one or more of the following conditions are true, particularly when running a data sharing configuration:

- Optimal CPU performance is required
- No constraint is necessary on available ECSA
- Significant IRLM lock contention and a very large number of lock requests with ineffective lock avoidance
- Relatively high IRLM SRB time

YES puts the lock control block structure in the IRLM private address space, and the program call instruction is used to address it. IRLM still uses CSA and ECSA for other purposes. With PC=YES, the MAXIMUM ECSA option is ignored.

Field Name: QWP5PCY

BLOCK OPT 1 ROW SORT (OPT1ROWBLOCKSORT)
Specifies whether DB2 explicitly blocks sort operations when the OPTIMIZE FOR 1 ROW clause is specified on a query:

**NO = DISABLE**

Means that when OPTIMIZE FOR 1 ROW is specified, DB2 avoids access paths that involve sorts. If an access path that avoids a sort exists, it is possible, although unlikely, that an access path that involves a sort is chosen instead. This behavior is used in DB2 9 and earlier releases.

**YES = ENABLE**

Means that when OPTIMIZE FOR 1 ROW is specified, DB2 chooses access paths that avoid sorts whenever such a path is available.

ZPARM name is OPT1ROWBLOCKSORT in DSN6SPRM.

**Field Name:** QWP4O1RBS

**SMS DATACLASS NAME FOR TS (SMSDCFL) (Prior to DB2 11)**

SMS data class for data table spaces. The data class name is a string of one to eight characters. The default is an empty string, which means that the SMS cluster is defined without the DATACLASS parameter.

When a valid data class name is specified, the SMS cluster is specified with the DATACLASS parameter using the name specified. If the name is not valid, SMS returns an error.

DB2 parameter SMSDCFL in DSN6SPRM.

**Field Name:** QWP4DCFS

**SMS DATACLASS NAME FOR IS (SMSDCIX) (Prior to DB2 11)**

SMS data class for index table spaces. The data class name is a string of one to eight characters. The default is an empty string, which means that the SMS cluster is defined without the DATACLASS parameter.

When a valid data class name is specified, the SMS cluster is specified with the DATACLASS parameter using the name specified. If the name is not valid, SMS returns an error.

DB2 parameter SMSDCIX in DSN6SPRM.

**Field Name:** QWP4DCIX

**OUTER JOIN PERFORMANCE ENHANCEMENTS (OJPERFEH) (Prior to DB2 11)**

Indicates whether outer join performance enhancements are enabled.

DB2 parameter OJPERFEH in DSN6SPRM.

**Field Name:** QWP4OJEH

**EMPTY XML ELEMENT (XML_RESTRICT_EMPTY_TAG)**

Indicates whether empty XML elements are serialized:

**NO** Serialization of empty XML elements is not defined.

**YES** Empty XML elements are serialized using a start-element tag followed by an end-element tag.

ZPARM name is XML_RESTRICT_EMPTY_TAG in DSN6SPRM.

**Field Name:** QWP4NOET
SUPPRESS_HINT_SQLCODE_DYN (SUPPRESS_HINT_SQLCODE_DYN)

Specifies whether DB2 suppresses SQLCODE +394 and SQLCODE +395 when specified access paths are applied for dynamic SQL statements.

- **NO** DB2 issues SQLCODEs +394 and +395 for statement-level access paths and PLAN_TABLE access paths. NO is the default value.
- **STMT** DB2 suppresses SQLCODEs +394 and +395 for statement-level access paths for dynamic SQL statements.
- **ALL** DB2 suppresses SQLCODEs +394 and +395 for statement-level access paths and PLAN_TABLE access paths for dynamic SQL statements.

The ZPARM name is SUPPRESS_HINT_SQLCODE_DYN in DSN6SPRM.

**Field Name:** QWP4SHDE

INDEX MEMORY CONTROL (INDEX_MEMORY_CONTROL)

Shows the amount of memory that DB2 should allocate for fast traversing of DB2 indexes:

- **-1 = AUTO** Specifies that DB2 sets the upper limit of the storage to 20% of the currently allocated buffer pools.
- **0 = DISABLE** Specifies that DB2 returns any existing storage allocated for fast index traversal and does not allocate any further storage for this purpose.
- **500 - 200000** Indicates the storage limit for fast index traversal.

The ZPARM name is INDEX_MEMORY_CONTROL in DSN6SPRM.

**Field Name:** QWP4IXMC

SELECT FOR UNLOAD (AUTH_COMPATIBILITY)

Shows the AUTH_COMPATIBILITY ZPARM values (DB2 field: QWP4AUTCSU):

- **1** The unload utility checks whether the user has the SELECT privilege on the target table.
- **0** The unload utility checks whether the user has the UNLOAD privilege on the target table.

**Field Name:** QWP4AUTCSU

MATERIALIZE_NODET_SQLTUDF (MATERIALIZE_NODET_SQLTUDF)

DB2 materializes the result of a user-defined SQL table function that is defined as not deterministic.

- **0=NO**
- **1=YES**

ZPARM name is MATERIALIZE_NODET_SQLTUDF in DSN6SPRM.

**Field Name:** QWP4MNSU
Performance and Optimization (DSNTIP8, DSNTIP81)

This topic shows detailed information about “System Parameters - Performance and Optimization (DSNTIP8, DSNTIP81)”.

Note: The fields shown on this panel depend on the installed DB2 version.

System Parameters - Performance and Optimization (DSNTIP8, DSNTIP81)

The field labels shown in the following sample layout of “System Parameters - Performance and Optimization (DSNTIP8, DSNTIP81)” are described in the following section.

PERFORMANCE AND OPTIMIZATION (DSNTIP8,DSNTIP81)
  ------------------------------
  CACHE DYNAMIC SQL (CACHEDYN)..................................................YES
  CACHE DYN STABILITY (CACHEDYN_STABILIZATION).......................BOTH
  OPTIMIZATION HINTS ALLOWED (OPTHINTS)..............................YES
  EVALUATE UNCOMMITTED (EVALUNC)........................................NO
  SKIP UNCOM Next Inserts (SKIPUNCI)..................................................NO
  IMMEDWRITE OVERRIDE FLAG (IMMEDWRI)..................................................NO
  REBIND PLANMGMT DEFAULT (PLANMGMT)....................................OFF
  PLANMGMTSCOPE DEFAULT (PLANMGMTSCOPE)............................STATIC
  PACKAGE RELEASE COMMIT (PKGREL_COMMIT)........................N/A
  RANDOMIZE XML DOCID (XML RANDOMIZE_DOCID)..........................NO
  DISABLE EDM RTS (DISABLE_EDMRTS)........................................YES
  CURRENT DEGREE (CDSRDEF)..................................................ANY
  MAX DEGREE OF PARALLELISM (PARAMDEG)...............................4
  MAX DEGREE FOR DPSI (PARAMDEG_DPSI).................................N/A
  PARALLELISM EFFICIENCY (PARA_EFF)......................................50
  STAR JOIN ENABLING (STARJOIN)...........................................DISABLE
  MAX DATA CACHING IN MB (MXDTCACH)......................................20
  CURRENT REFRESH AGE (REFSHAGE)...........................................0
  CURRENT MAINT TYPE (MAINTYPE).........................................SYSTEM
  VARCHAR FROM INDEX (RETVLCFK)........................................NO
  STATS PROFILE FEEDBACK (STATDFBKy PROFILE)........................YES

CACHE DYNAMIC SQL (CACHEDYN)

Indicates whether prepared dynamic SQL statements are saved for later use by eligible application processes in the EDM pool.

Install parameter CACHE DYNAMIC SQL on panel DSNTIP8, or ZPARM CACHEDYN in DSN6SPRM.

Field Name: QWP4CDYN

CACHE DYN STABILITY (CACHEDYN_STABILIZATION)

Specifies when dynamic SQL statements can be captured for stabilization. When a statement is stabilized, the current SQLID, statement text, and runtime structures are written to catalog tables. If a dynamic SQL statement is not present in the dynamic SQL statement cache, DB2 will load the runtime structures from catalog table rather than performing a full prepare. This extends the stability and reliability of performance of a dynamic SQL. It can have the following values:

CAPTURE

Statements may be stabilized through the -START DYNQUERY command using both MONITOR(NO) and MONITOR(YES). DB2 will not load stabilized statements from SYSDYNQRY.
LOAD

Statements may not be stabilized via any means. The -START DYNQUERY command will fail, and any MONITOR(YES) commands in progress will not stabilize statements, even if stabilization criteria are matched. During long prepare, DB2 will attempt to load stabilized statements from SYSDYNQRY with which to run.

BOTH

Statements may be stabilized through the -START DYNQUERY command via both MONITOR(NO) and MONITOR(YES). During long prepare, DB2 will attempt to load stabilized statements from SYSDYNQRY with which to run. BOTH is the default setting.

NONE

Statements may not be stabilized via any means. The -START DYNQUERY command will fail, and any MONITOR(YES) commands in progress will not stabilize statements, even if stabilization criteria are matched. DB2 will not load stabilized statements from SYSDYNQRY.

This field corresponds to field CACHE DYN STABILITY on installation panel DSNTIP8. The ZPARM name is CACHEDYN_STABILIZATION in DSNTIP8.

Field Name: QWP4CDST

OPTIMIZATION HINTS ALLOWED (OPTHINTS)

Shows whether DB2 can use optimization hints from the PLAN_TABLE to influence the access paths used for certain queries.

Install parameter OPTIMIZATION HINTS on panel DSNTIP8, or ZPARM OPPTHINTS in DSN6SPRM.

Field Name: QWP4HINT

EVALUATE UNCOMMITTED (EVALUNC)

Shows whether stage 1 predicate evaluation during table access can proceed upon uncommitted data or not.

This applies to isolation levels of Read Stability and Cursor Stability only.

When NO (default), predicate evaluation occurs only on committed data (or on the application’s own uncommitted changes). NO ensures that all qualifying data is always included in the answer set.

When YES, predicate evaluation can occur upon uncommitted data. Only committed data is returned to the query. However, a decision can be made to omit a row from the answer set based on uncommitted data. Later, undo processing (statement rollback or statement failure) could cause the data to revert to a state that satisfies the predicate.

When YES, DB2 can request fewer locks than in previous versions when processing isolation level Read Stability and Cursor Stability queries. The number of locks avoided is related to the access path of the query, the number of rows evaluated when processing the stage 1 predicate of the query, and the number of those rows that are overflow rows. Specifically, for isolation level Read Stability and Cursor Stability queries, locks are avoided for rows that do not satisfy the stage 1 predicate, provided they are not overflow rows. Table access includes table space scans and index-to-data access, including ridlist-to-data access. For isolation Cursor Stability ridlist production, all row/page locking is avoided.
Install parameter EVALUATE UNCOMMITTED on panel DSNTIP8, or
ZPARM EVALUNC in DSN6SPRM.

Field Name: QWP4EVUN

SKIP UNCOMM INSERTS (SKIPUNCI)

YES indicates that uncommitted inserts are treated as if they have not yet been executed. The ZPARM name is SKIPUNCI.

Field Name: QWP4SKUI

IMMEDWRITE OVERRIDE FLAG (IMMEDWRI)

Indicates how DB2 updates group buffer pool dependent pages. This is only valid in a data-sharing environment.

Group buffer pool dependent pages can be written to DASD or SYSTEM pagesets.

Values shown are:

NO  DB2 uses normal write activity for updates, this is the default. Pages are written out at, or before phase 2 commit, or at the end of an abend for transactions that have rolled back.

PH1  Pages are written out at, or before phase 1 commit.

If a transaction subsequently rolls back, the pages are updated in the group buffer pool at the end of the rollback and are written out at the end of the abend.

YES  Pages are written out to the coupling facility as soon as the buffer update commits. Pages are written out regardless of whether the update occurs during forward progress or rollback of the transaction.

This option can affect performance due to coupling facility overhead.

Install parameter IMMEDIATE WRITE on panel DSNTIP8, or ZPARM IMMEDWRI in DSN6GRP.

Field Name: QWP4IMMW

REBIND PLANMGMT DEFAULT (PLANMGMT)

Shows if and how access path information is stored in the repository. Possible values are:

O  On
F  Off
B  Basic
E  Extended

Field Name: QWP4PMGT

PLANMGMTSCOPE DEFAULT (PLANMGMTSCOPE)

Controls which queries are populated in the access path repository (ZPARM parameter PLANMGMTSCOPE). Possible values are:

A  ALL: Includes static and dynamic SQL queries.
S  STATIC: Includes static SQL queries only. This is the default.
DYNAMIC: Includes dynamic SQL queries only.

Field Name: QWP4PMSC

PACKAGE RELEASE COMMIT (PKGREL_COMMIT)

YES indicates that the following operations on a package that are bound with RELEASE(DEALLOCATE) are permitted while the package is active and allocated by DB2:

- BIND and REBIND requests, including AUTOMATIC REBIND
- Data definition language changes to objects that are statically referenced by the package

The ZPARM name is PKGREL_COMMIT in DSN6SPRM.

Field Name: QWP4PKRC

RANDOMIZE XML DOCID (XMLRANDOMIZE_DOCID)

Specifies whether DB2 generates document ID elements sequentially or randomly. Possible values are:

- YES: Sequentially
- NO: Randomly

The ZPARM name is XML_RANDOMIZE_DOCID in DSN6SYSI.

Field Name: QWP1XRDI

DISABLE EDM RTS (DISABLE_EDMRTS)

Hexadecimal (X'01'). YES disables the use of EDM real-time Statistics. The ZPARM name is DISABLE_EDMRTS in DSN6SPRM.

Field Name: QWP4DEDI

CURRENT DEGREE (CDSSRDEF)

Shows the default for the CURRENT DEGREE special register when no degree is explicitly set with SET CURRENT DEGREE.

The default disables query parallelism.

Install parameter CURRENT DEGREE on panel DSNTIP8, or ZPARM CDSSRDEF in DSN6SPRM.

Field Name: QWP4CDEG

MAX DEGREE OF PARALLELISM (PARAMDEG)

Indicates the upper limit on the degree of parallelism for a parallel group.

This field has a value of 0. This means PARAMDEG is not set and DB2 can set a default maximum degree of parallelism based on the system configuration.

Install parameter MAX DEGREE on panel DSNTIP8, or ZPARM PARAMDEG in DSN6SPRM.

Field Name: QWP4MDEG

MAX DEGREE FOR DPSI (PARAMDEG_DPSI)

The maximum degree of parallelism for a parallel group in which a data-partitioned secondary index is used to control parallelism. This field corresponds to field MAX DEGREE FOR DPSI on installation panel DSNTIP81. The ZPARM name is PARAMDEG_DPSI in DSN6SPRM.
Field Name: QWP4DEGD

PARALLELISM EFFICIENCY (PARA_EFF)

The parallelism efficiency factor. This field corresponds to field "Parallelism efficiency" on installation panel DSNTIP8. The ZPARM name is PARA_EFF in DSN6SPRM.

Field Name: QWP4PAEF

STAR JOIN ENABLING (STARJOIN)

Star join enable indicator. Possible values are:

-1 (DISABLE)
   Star join is disabled. This is the default.

0 (ENABLE)
   Star join is enabled when the join meets the conditions described in the DB2 administration information for performance.

1
   Star join is enabled without comparing the ratio of the fact-table cardinality to the cardinality of the largest dimension table. The table with the largest cardinality is the fact table.

n
   This is the star join fact table and the largest dimension table ratio. The lowest ratio of the cardinality of the fact table compared to the cardinality of the largest dimension table for which star join is used. 2 < N <= 32768.

Install parameter STAR JOIN QUERIES on panel DSNTIP8, or ZPARM STARJOIN in DSN6SPRM.

Background and Tuning Information

This parameter allows you to set the star join ratio to increase or decrease the dimension table and fact table ratio rule according to application needs.

This parameter also allows you to disable star join if needed for performance reasons. The default is to allow star join if star join detection is successful.

Star join technique is only used when these conditions exist:
• At least two dimensions exist.
• The join predicates are between the fact table and the dimension tables only. (No join predicates lie between the dimension tables.)
• The join predicates are equijoin predicates.
• No correlated subqueries cross dimensions.
• No cycles within the dimensions exist. This means that no predicate can reference more than one candidate dimension table with respect to the same column of the fact table.
• No outer join exists.
• The data type and length of the join predicates are the same.
• The fact table is larger than the dimension table.

Field Name: QWP4SJRT

MAX DATA CACHING IN MB (MXDTCACH)

The maximum amount of virtual memory in megabytes (MB) that is allocated for data caching.
Install parameter MAX DATA CACHING on panel DSNTIP8, or ZPARM MXDTCACH in DSN6SPRM.

Field Name: QWP4MXDC

CURRENT REFRESH AGE (REFSHAGE)

Shows the default for the CURRENT REFRESH AGE special register deferred materialized query tables.

Install parameter CURRENT REFRESH AGE on panel DSNTIP8, or ZPARM REFSHAGE in DSN6SPRM.

Field Name: QWP4RFSH

CURRENT MAINT TYPE (MAINTYPE)

Shows the default special register for the CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION statement when no value is explicitly set. Possible values are:

- ALL
- NONE
- SYSTEM (default)
- USER

The default allows query rewrite using system-maintained materialized query tables (SYSTEM) when CURRENT REFRESH AGE is set to ANY. When USER, query rewrite is done using user-maintained materialized query tables when CURRENT REFRESH AGE is set to ANY. ALL means that query rewrite uses both system-maintained and user-maintained materialized query tables.

Install parameter CURRENT MAINT TYPES on panel DSNTIP8, or ZPARM MAINTYPE in DSN6SPRM.

Field Name: QWP4MNTY

VARCHAR FROM INDEX (RETVLCFK)

Indicates whether the VARCHAR column is retrieved from the index.

The data sharing scope of this parameter is GROUP.

When NO, index-only access of variable length column data is disabled. DB2 must retrieve data from the data page. Data is retrieved with no padding.

When YES, index-only access of variable length column data is enabled. This can improve performance. Data retrieved from the index is padded with blanks to the maximum length of the column.

Install parameter VARCHAR FROM INDEX on panel DSNTIP8, or ZPARM RETVLCFK in DSN6SPRM.

Field Name: QWP4VCFK

STATS PROFILE FEEDBACK (STATFDBK_PROFILE)

Specifies whether Statistics recommendations that are identified during query optimization cause DB2 to modify to Statistics profiles.

- 0 indicates NO
- 1 indicates YES
This value corresponds to field STATS PROFILE FEEDBACK on installation panel DSNTIP8. ZPARM name: STATFDBK_PROFILE in DSN6SPRM.

Field Name: QWP4SFPR
This topic shows detailed information about “System Parameters - Protection Installation Parameters (DSNTIPP)”.

This block shows security settings.

Data sets, including data sets defined to DFSMS, should be protected by a security manager, such as RACF.

Fields in this block can contain long names. When a long name exceeds the available space, it is truncated, the parameter identifier and the full name are printed in a separate list at the end of the report.

System Parameters - Protection Installation Parameters (DSNTIPP)

The field labels shown in the following sample layout of “System Parameters - Protection Installation Parameters (DSNTIPP)” are described in the following section.

ARCHIVE LOG RACF PROTECTION (PROTECT)..........................NO
DB2 AUTHORIZATION ENABLED (AUTH).............................YES
PLAN AUTHORIZATION CACHE SIZE (AUTHCACH)...............3,072
PACKAGE AUTHORIZATION CACHE SIZE (CACHEPAC).........5,242,880
ROUTINE AUTHORIZATION CACHE SIZE (CACHERAC).......5,242,880
AUTH EXIT CHECK (AUTHEXIT_CHECK).....................PRIMARY
AUTH EXIT CACHE REFRESH (AUTHEXIT_CACHREFRESH)......NONE
SYSTEM ADMINISTRATOR 1 AUTHORIZATION ID (SYSADM).......HELM
SYSTEM ADMINISTRATOR 2 AUTHORIZATION ID (SYSADM2).....SYSADM
SYSTEM OPERATOR 1 AUTHORIZATION ID (SYSOPR1).........HELM
SYSTEM OPERATOR 2 AUTHORIZATION ID (SYSOPR2)..........EMIL
DEFAULT (UNKNOWN) USER AUTHORIZATION ID (DEFLTID).....IBMUSER
RESOURCE LIMIT TABLE CREATOR AUTH ID (RLFAUTH).......SYSIBM
BIND NEW PACKAGE (BINDNV)...............................BINDADD
DBA CREATE VIEW (DBACRvw)..................................NO

ARCHIVE LOG RACF PROTECTION (PROTECT)

Indicates whether archive log data sets are protected with individual RACF profiles when they are created.

When YES, RACF protection must be active for DB2. YES also means that you cannot use RACF generic profiles for archive log data sets. If your archive log is on tape, RACF class TAPEVOL must be active, otherwise, the off-load will fail.

Install parameter ARCHIVE LOG RACF on panel DSNTIPP, or ZPARM PROTECT in DSN6ARVP.

Field Name: QWP3RTCT

DB2 AUTHORIZATION ENABLED (AUTH)

Shows whether DB2 performs authorization checking.

When all authorization checking by DB2 is disabled, the GRANT statement is also disabled (granting every privilege to PUBLIC); this is not recommended.

Install parameter USE PROTECTION on panel DSNTIPP, or ZPARM AUTH in DSN6SPRM.
Field Name: QWP4AUTH

PLAN AUTHORIZATION CACHE SIZE (AUTHCACH)

The size of the authorization cache to be used if no CACHESIZE is specified on the BIND PLAN subcommand.

The size of the cache is 32 bytes of overhead + (8 bytes of storage X number of concurrent users).

0 means authorization caching is not used.

Install parameter PLAN AUTH CACHE on panel DSNTIPP, or ZP ARM AUTHCACH in DSN6SPRM.

Field Name: QWP4AUCA

PACKAGE AUTHORIZATION CACHE SIZE (CACHEPAC)

The amount of storage allocated for caching authorization information for all packages on this DB2 member.

32 KB hold about 375 collection-ID.package-IDs. The cache is stored in the DSN1DBM1 address space.

Install parameter PACKAGE AUTH CACHE on panel DSNTIPP, or ZP ARM CACHEPAC in DSN6SPRM.

Field Name: QWP4PAC

ROUTINE AUTHORIZATION CACHE SIZE (CACHERAC)

The amount of storage allocated for caching authorization information for all routines on this DB2 member.

Routines include stored procedures and user-defined functions.

32 KB hold about 380 schema.routine.type entries.

Install parameter ROUTINE AUTH CACHE on panel DSNTIPP, or ZP ARM CACHERAC in DSN6SPRM.

Field Name: QWP4RAC

AUTH EXIT CHECK (AUTHEXIT_CHECK)

Specifies whether the DB2 authorization ID or the RACF primary authorization ID is to be used for authorization checks, when the access control authorization exit is active:

Primary

DB2 provides:

- The ACEE of the package owner to perform statement authorization checks during AUTOMATIC REBIND, BIND, and REBIND processing
- The ACEE of the package owner, routine definer, or routine invoker, as determined by the dynamic rules behavior for dynamic SQL authorization checking, when a DYNAMICRULES BIND option value other than run is in effect.

The access control authorization exit uses the ACEE for the XAPLUCHK authorization ID field to perform the authorization. The authorization ID in XAPLUCHK must be defined as a RACF user and must have the privileges required to execute the SQL statements in the package.
Protection Installation Parameters (DSNTIPP)

DB2  DB2 provides the ACEE of the primary authorization ID for performing all authorization checks. The primary authorization ID must have the privileges required to execute the SQL statements in the package. This field corresponds to field "RACF AUTH CHECK" on installation panel DSNTIPP. ZPARM name is RACF_AUTHCHECK in DSN6SPRM.

Field Name: QWP4RACK

AUTH EXIT CACHE REFRESH (AUTHEXIT_CACHEREFRESH)

Specifies whether the package authorization cache, routine authorization cache, and dynamic statement cache entries are refreshed when an access control authorization exit is active, and the user profile is changed in RACF. Possible values are:

- All
- None

This field corresponds to field AUTH EXIT CACHE REFR in installation panel DSNTIPP. ZPARM name is AUTHEXIT_CACHEREFRESH in DSN6SPRM.

Field Name: QWP4AECR

SYSTEM ADMINISTRATOR 1 AUTHORIZATION ID (SYSADM)

One of two authorization IDs with SYSADM authority. SYSADM users can access to DB2 in all cases.

This identifier can be a long string. If there is insufficient space to show the complete string, the string is truncated in the report block. The complete string is shown in a separate list of long names at the end of the report.

Install parameter SYSTEM ADMIN 1 on panel DSNTIPP, or ZPARM SYSADM in DSN6SPRM.

Field Name: QWP4SADM

SYSTEM ADMINISTRATOR 2 AUTHORIZATION ID (SYSADM2)

One of two authorization IDs with SYSADM authority. SYSADM users can access to DB2 in all cases.

This identifier can be a long string. If there is insufficient space to show the complete string, the string is truncated in the report block. The complete string is shown in a separate list of long names at the end of the report.

Install parameter SYSTEM ADMIN 2 on panel DSNTIPP, or ZPARM SYSADM2 in DSN6SPRM.

Field Name: QWP4ADM2

SYSTEM OPERATOR 1 AUTHORIZATION ID (SYSOPR1)

One of two authorization IDs with SYSOPR authority. SYSOPR users can access DB2 even if the DB2 catalog is unavailable.

This identifier can be a long string. If there is insufficient space to show the complete string, the string is truncated in the report block. The complete string is shown in a separate list of long names at the end of the report.

Install parameter SYSTEM OPERATOR 1 on panel DSNTIPP, or ZPARM SYSOPR1 in DSN6SPRM.

Field Name: QWP4OPR1
SYSTEM OPERATOR 2 AUTHORIZATION ID (SYSOPR2)

One of two authorization IDs with SYSOPR authority. SYSOPR users can access DB2 even if the DB2 catalog is unavailable.

This identifier can be a long string. If there is insufficient space to show the complete string, the string is truncated in the report block. The complete string is shown in a separate list of long names at the end of the report.

Install parameter SYSTEM OPERATOR 2 on panel DSNTIPP, or ZPARM SYSOPR2 in DSN6SPRM.

Field Name: QWP4OPR2

DEFAULT (UNKNOWN) USER AUTHORIZATION ID (DEFLTID)

The authorization ID used if RACF is not available for batch access and USER= is not specified in the job statement.

This identifier can be a long string. If there is insufficient space to show the complete string, the string is truncated in the report block. The complete string is shown in a separate list of long names at the end of the report.

Install parameter UNKNOWN AUTHID on panel DSNTIPP, or ZPARM DEFLTID in DSN6SPRM.

Field Name: QWP4DFID

RESOURCE LIMIT TABLE CREATOR AUTH ID (RLFAUTH)

The authorization ID used for the resource limit facility (governor).

This identifier can be a long string. If there is insufficient space to show the complete string, the string is truncated in the report block. The complete string is shown in a separate list of long names at the end of the report.

Install parameter RESOURCE AUTHID on panel DSNTIPP, or ZPARM RLFAUTH in DSN6SYSP.

Field Name: QWP1RLFA

BIND NEW PACKAGE (BINDNV)

Shows whether BIND or BINDADD authority is required to BIND a new version of an existing package.

When BINDADD (default), only users with BINDADD system privilege can create a new package.

BIND users with BIND privilege for a package or collection can create a new version of an existing package when they bind it. This also allows users with PACKADM authority to add a new package or a new version of a package to a collection.

Install parameter BIND NEW PACKAGE on panel DSNTIPP, or ZPARM BINDNV in DSN6SPRM.

Field Name: QWP4BNV

DBA CREATE VIEW (DBACRvw)

Shows whether a DB2 administrator can create a view or alias for another user. Possible values are YES or NO. The default is NO.

Install parameter DBADM CREATE AUTH on panel DSNTIPP. ZPARM DBACRvw in macro DSN6SPRM.

Field Name: QWP4CRVw
Protection Panel (DSNTIPP1)

This topic shows detailed information about “System Parameters - Protection Panel (DSNTIPP1)”.

System Parameters - Protection Panel (DSNTIPP1)

The field labels shown in the following sample layout of “System Parameters - Protection Panel (DSNTIPP1)” are described in the following section.

<table>
<thead>
<tr>
<th>PROTECTION PANEL (DSNTIPP1)</th>
</tr>
</thead>
<tbody>
<tr>
<td>SECURITY ADMINISTRATOR 1 AUTHORIZATION ID (SECDADM1)........SECDADM</td>
</tr>
<tr>
<td>SECURITY ADMINISTRATOR 1 TYPE (SECDADM1_TYPE)............AUTHID</td>
</tr>
<tr>
<td>SECURITY ADMINISTRATOR 2 AUTHORIZATION ID (SECDADM2)........SECDADM</td>
</tr>
<tr>
<td>SECURITY ADMINISTRATOR 2 TYPE (SECDADM2_TYPE)............AUTHID</td>
</tr>
<tr>
<td>SEPARATE SECURITY DUTIES (SEPARATE_SECURITY)...............NO</td>
</tr>
<tr>
<td>INCLUDE DEPENDENT PRIVILEGES (REVOKE_DEP_PRIVILEGES)........N</td>
</tr>
</tbody>
</table>

SECURITY ADMINISTRATOR 1 AUTHORIZATION ID (SECDADM1)

Security administrator 1 authorization ID (blank if ROLE).

This field corresponds to field SECURITY ADMIN 1 on installation panel DSNTIPP1, or ZPARM SECADM1 in DSN6SPRM.

Field Name: QWP4SECA1_E

SECURITY ADMINISTRATOR 1 TYPE (SECDADM1_TYPE)

Security administrator 1 type. Possible values are:

' ' Blank indicates that the authorization ID (AUTH ID) is used.

'L' Indicates that ROLE is used.

This field corresponds to field SEC ADMIN 1 TYPE on installation panel DSNTIPP1, or ZPARM SECADM1_TYPE in DSN6SPRM.

Field Name: QWP4SECA1_TYPE

SECURITY ADMINISTRATOR 2 AUTHORIZATION ID (SECDADM2)

Security administrator 2 authorization ID (blank if ROLE).

This field corresponds to field SECURITY ADMIN 2 on installation panel DSNTIPP1, or ZPARM SECADM2 in DSN6SPRM.

Field Name: QWP4SECA2_E

SECURITY ADMINISTRATOR 2 TYPE (SECDADM2_TYPE)

Security administrator 2 type. Possible values are:

'blank' Indicates that the authorization ID (AUTH ID) is used.

'L' Indicates that ROLE is used.

This field corresponds to field SEC ADMIN 2 TYPE on installation panel DSNTIPP1, or ZPARM SECADM2_TYPE in DSN6SPRM.

Field Name: QWP4SECA2_TYPE

SEPARATE SECURITY DUTIES (SEPARATE_SECURITY)

Separate security tasks. Possible values are:

Y SYSADM/SYSCTRL cannot GRANT/REVOKE
N SYSADM/SYSCTRL can GRANT/REVOKE
Field Name: QWP4SEPSD

INCLUDE DEPENDENT PRIVILEGES (REVOKE_DEP_PRIVILEGES)

Include dependent privileges on REVOKE. Possible values are:

Y  If INCLUDING DEPENDENT PRIVILEGES is enforced.
N  If NOT INCLUDING DEPENDENT PRIVILEGES is enforced.
S  If specified in a REVOKE statement.

Field Name: QWP4RVDPR
# Query Accelerator Preferences (DSNTIP82)

This topic shows detailed information about “System Parameters - Query Accelerator Preferences (DSNTIP82)”.

## System Parameters - Query Accelerator Preferences (DSNTIP82)

The field labels shown in the following sample layout of “System Parameters - Query Accelerator Preferences (DSNTIP82)” are described in the following section.

---

**QUERY ACCELERATOR PREFERENCES (DSNTIP82)**

---

**ACCELERATOR STARTUP OPTION (ACCEL)**

Specifies whether to enable accelerator servers. Possible values are:

- **AUTO**
  - Enable and start accelerator servers.

- **COMMAND**
  - Enable but do not start accelerator servers.

- **NO**
  - Do not enable accelerator servers.

This field corresponds to field ACCEL STARTUP on installation panel DSNTIP81. ZPARM name is ACCEL in DSN6SPRM.

**Field Name:** QWP4ACCS

**GET ACCEL ARCHIVE (GET_ACCEL_ARCHIVE)**

Determines the default value that is to be used for the CURRENT GET_ACCEL_ARCHIVE special register:

- **NO**
  - Indicates that if a table is archived in an accelerator server, and a query references that table, the query does not use the data that is archived.

- **YES**
  - Indicates that if a table is archived in an accelerator server, and a query references that table, the query uses the data that is archived.

ZPARM name GET_ACCEL_ARCHIVE in macro DSN6SPRM.

**Field Name:** QWP4CGAA

**ACCELERATION OPTIONS (QUERY_ACCEL_OPTIONS)**

Specifies additional types of SQL queries that are eligible for acceleration.

- **NONE**
  - Indicates that no additional types of SQL queries are eligible. Therefore, the types of queries that are described in the other available values for this parameter are not eligible for acceleration. This is the default value.

- **1**
  - Indicates that queries that include data that is encoded with the EBCDIC mixed or graphic encoding schemes are eligible for acceleration.
Query Accelerator Preferences (DSNTIP82)

2 Indicates that an INSERT with SELECT statement is eligible for acceleration. However, only the SELECT operation of the query is processed by the accelerator server.

3 Indicates that queries that contain built-in functions for which DB2 processes each byte of the input string, rather than each character of the input string, can run on an accelerator server.

4 The queries that reference an expression with a DATE data type that uses a LOCAL format are not blocked from executing on IBM DB2 Analytics Accelerator for z/OS. IBM DB2 Analytics Accelerator for z/OS will use the dd/mm/yyyy format to interpret the input and output date value. Specify option 4 only when you also specify LOCAL as the setting for the DSNHDECP:DATE parameter and your LOCAL date exit defines the specific dd/mm/yyyy date format. Otherwise, queries may return unpredictable results.

5 Allow OFFLOAD of SYSTEM_TIME temporal queries.

6 Allow OFFLOAD of queries that reference timestamp columns with a precision of up to 12.

7 OFFLOAD uses YYYYMMDD date format.

ZPARM name QUERY_ACCEL_OPTIONS in macro DSN6SPRM.

Field Name: QWP4QACO

CURRENT QUERY ACCEL (QUERY_ACCELERATION)

Determines the default value that is to be used for the CURRENT QUERY ACCELERATION special register. Possible values are:

NONE
Indicates that no query acceleration is done. This is the default value.

ENABLE
Indicates that queries are accelerated only if DB2 determines that it is advantageous to do so. If there is an accelerator failure while a query is running, or the accelerator returns an error, DB2 returns a negative SQLCODE to the application.

ENABLE_WITH_FAILBACK
Indicates that queries are accelerated only if DB2 determines that it is advantageous to do so. If the accelerator returns an error during the PREPARE or first OPEN for the query, DB2 executes the query without the accelerator. If the accelerator returns an error during a FETCH or a subsequent OPEN, DB2 returns the error to the user, and does not execute the query.

ELIGIBLE
Indicates that queries are accelerated if they are eligible for acceleration. DB2 does not use cost information to determine whether to accelerate the queries. Queries that are not eligible for acceleration are executed by DB2. If there is an accelerator failure while a query is running, or the accelerator returns an error, DB2 returns a negative SQLCODE to the application.

ALL Indicates that queries are accelerated if they are eligible for acceleration. DB2 does not use cost information to determine whether to accelerate the queries. Queries that are not eligible for acceleration are executed by DB2. If there is an accelerator failure while a query is running, or the accelerator returns an error, DB2 returns a negative SQLCODE to the application.
Query Accelerator Preferences (DSNTIP82)

acceleration are not executed by DB2, and an SQL error is returned. If there is an accelerator failure while a query is running, or the accelerator returns an error, DB2 returns a negative SQLCODE to the application.

ZPARM name QUERY_ACCELERATION in DSN6SPRM.

Field Name: QWP4CQAC

ACCELERATION MODELING (ACCELMODEL)

The ACCELMODEL subsystem parameter determines whether to enable modeling of query workload for evaluating potential savings for both the accumulated elapsed time and CPU time if the plan is executed on an accelerator.

Only queries that are deemed eligible for execution on an accelerator by DB2 will be included in accelerator-related fields of Accounting trace IFCID 3:

No Specifies that no modeling is to be performed. This is the default setting.

Yes Specifies that modeling is to be performed. Consider acceleration eligibility for an SQL statement and update the new Accounting fields accordingly.

To enable modeling, the IBM DB2 Analytics Accelerator for z/OS special register CURRENT QUERY ACCELERATION and ZPARM QUERY_ACCELERATION (set by the CURRENT QUERY ACCEL) must be set to NONE for accelerator modeling. All other values for the special register and ZPARM will take the existing logic of IBM DB2 Analytics Accelerator for z/OS. This means that existing queries that already execute on the accelerator with CURRENT QUERY ACCELERATION = ENABLE, ENABLE WITH FAILBACK, ELIGIBLE, or ALL will not be part of the accelerator-related Accounting fields.

Field Name: QWP4ACMO

REMOTE COPY SW ACCEL (REMOTE_COPY_SW_ACCEL)

Specifies whether DB2 uses software (SW) to control the remote copy process for active log output in peer-to-peer remote copy (PPRC) environments. It can have the following values:

- DISABLE (This is the default value)
- ENABLE

ZPARM REMOTE_COPY_SW_ACCEL in DSN6LOGP.

Field Name: QWP2RCSA
Routine Parameters (DSNTIPX)

This topic shows detailed information about “System Parameters - Routine Parameters (DSNTIPX)”.

This block shows information about the stored procedures address space used to run stored procedures or user-defined functions.

**Note:** The fields shown on this panel depend on the installed DB2 version.

**System Parameters - Routine Parameters (DSNTIPX)**

The field labels shown in the following sample layout of “System Parameters - Routine Parameters (DSNTIPX)” are described in the following section.

**ROUTINE PARAMETERS (DSNTIPX)**

```
MAX ABEND COUNT (STORMXAB)..............................0
TIMEOUT VALUE (STORTIME).................................180
WLM ENVIRONMENT (WLMENV).................................DBPGD800
MAX OPEN CURSORS (MAX_NUM_CUR)..........................500
MAX STORED PROCS (MAX_ST_PROC).........................2,000
MAXIMUM NUMBER OF LE TOKENS (LEMAX)....................20
BIF COMPATIBILITY (BIF_COMPATIBILITY)..............V9_DECIMAL_VARCHAR
```

**MAX ABEND COUNT (STORMXAB)**

The number of times a stored procedure is allowed to terminate abnormally, after which SQL CALL statements for the stored procedure are rejected.

Install parameter MAX ABEND COUNT on panel DSNTIPX, or ZPARM STORMXAB in DSN6SYSP.

**Field Name:** QWP1SPAB

**TIMEOUT VALUE (STORTIME)**

The number of seconds before DB2 stops waiting for an SQL CALL statement to be assigned to one of the TCBs in the DB2 stored procedures address space.

Install parameter TIMEOUT VALUE on panel DSNTIPX, or ZPARM STORTIME in DSN6SYSP.

**Field Name:** QWP1SPTO

**WLM ENVIRONMENT (WLMENV)**

Workload manager environment.

Install parameter WLM ENVIRONMENT on panel DSNTIPX, or ZPARM WLMENV in DSN6SYSP.

**Field Name:** QWP1WLME

**MAX OPEN CURSORS (MAX_NUM_CUR)**

Shows the maximum number of cursors, including allocated cursors, that are open at a given DB2 site per thread. RDS keeps a total of currently open cursors. If an application attempts to open a thread after the maximum is reached, the statement will fail.

In a data sharing group, this parameter is shown at member scope.
**Routine Parameters (DSNTIPX)**

Install parameter MAX OPEN CURSORS on panel DSNTIPX, or ZPARM MAX_NUM_CUR in DSN6SPRM.

**Field Name:** QWP4MXNC

**MAX STORED PROCS (MAX_ST_PROC)**

Shows the maximum number of stored procedures per thread. If an application attempts to call a stored procedure after this is reached, the statement will fail. In a data sharing group, this parameter is shown as member scope.

Install parameter MAX STORED PROCS on panel DSNTIPX, or ZPARM MAX_ST_PROC in DSN6SPRM.

**Field Name:** QWP4MXSP

**MAXIMUM NUMBER OF LE TOKENS (LEMAX)**

The maximum number of LE tokens active at any time. When zero, no tokens are available.

A token is used each time one of the following is used: trigonometry functions, degrees, radians, rand, exp, power, log functions, upper, lower, translate.

Install parameter MAXIMUM LE TOKENS on panel DSNTIP7, or ZPARM LEMAX in DSN6SPRM.

**Field Name:** QWP4LEM

**BIF COMPATIBILITY (BIF_COMPATIBILITY)**

The BIF_COMPATIBILITY subsystem parameter specifies whether the built-in functions and specifications are to return results in the DB2 10 format or revert to the pre-Version 10 format. It can have the following values:

- CURRENT
- V9
- V9_TRIM
- V9_DECIMAL_VARCHAR (default for migration)
- N/P (default for new installation)

This field corresponds to field BIF COMPATIBILITY on installation panel DSNTIPX.

ZPARM name BIF_COMPATIBILITY in DSN6SPRM.

**Field Name:** QWP4_BIF_COMPAT
Sizes Panel 1 (DSNTIPD)

This topic shows detailed information about “System Parameters - Sizes Panel 1 (DSNTIPD)”.

System Parameters - Sizes Panel 1 (DSNTIPD)

The field labels shown in the following sample layout of “System Parameters - Sizes Panel 1 (DSNTIPD)” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOB INLINE LENGTH (LOB_INLINE_LENGTH)</td>
<td>Default inline length for any new storing large object (LOB) column in a Universal Table Space on the DB2 subsystem. The valid values are from 0 to 32680 inclusive (in bytes). The default value for this ZPARM is 0, which indicates that no inline attribute is desired for any LOB column (BLOB, CLOB or DBCLOB) created on this subsystem.</td>
</tr>
<tr>
<td>USER LOB VALUE STORAGE IN KB (LOBVALA)</td>
<td>The maximum amount of storage (KB) each user can use for LOB values. Install parameter USER LOB VALUE STORAGE on panel DSNTIP7, or ZPARM LOBVALA in DSN6SYSP.</td>
</tr>
<tr>
<td>SYSTEM LOB VALUE STORAGE IN MB (LOBVALS)</td>
<td>The maximum amount of storage (MB) each system can use for LOB values. Install parameter SYSTEM LOB VALUE STORAGE on panel DSNTIP7, or ZPARM LOBVALS in DSN6SYSP.</td>
</tr>
<tr>
<td>USER XML VALUE STG IN KB (XMLVALA)</td>
<td>The maximum amount of memory in kilobytes (KB) for each user for storing XML values. ZPARM XMLVALA in DSN6SYSP.</td>
</tr>
</tbody>
</table>
Sizes Panel 1 (DSNTIPD)

Field Name: QWP1XVA

SYSTEM XML VAL STG IN MB (XMLVALS)

The maximum amount of memory in megabytes (MB) for each system for storing XML values.

ZPARM XMLVALS in DSN6SYSP.

Field Name: QWP1XVS
This topic shows detailed information about “System Parameters - SQL Object Defaults Panel (DSNTIP7, DSNTIP71, DSNTIP72)".

This block shows the limits for the amount of storage that can be used for storing large object (LOB) values.

Note: The fields shown on this panel depend on the installed DB2 version.

**System Parameters - SQL Object Defaults Panel (DSNTIP7, DSNTIP71, DSNTIP72)**

The field labels shown in the following sample layout of “System Parameters - SQL Object Defaults Panel (DSNTIP7, DSNTIP71, DSNTIP72)” are described in the following section.

---

**REORDERED ROW FORMAT (RRF)**

In DB2 12 this field is a serviceability field.

A value of YES shows that reordered row format is enabled.

This field corresponds to field REORDERED ROW FORMAT on installation panel DSNTIP7. The ZPARM name is RRF in DSN6SPRM.

Field Name: QWP4RRF

**OBJECT CREATE FORMAT (OBJECT_CREATE_FORMAT)**

Creates new table spaces and indexes in the following log record format:

- **EXTENDED**
  - Creates new table spaces and indexes in extended log record format.

- **BASIC**
  - Creates new table spaces and indexes in basic log record format.

Field Name: QWP4OBCF

**UTILITY OBJECT CONVERSION (UTILITY_OBJECT_CONVERSION)**

This field can have the following values:
NONE (QWP4UTOC1=0 and QWP4UTOC2=0)
No conversion is performed. This option is the default setting of this parameter. NONE is allowed regardless of the OBJECT CREATE FORMAT setting.

BASIC (QWP4UTOC1=1 and QWP4UTOC2=0)
Existing table spaces and indexes that use extended 10-byte page format are converted to basic 6-byte page format. BASIC is allowed only if the OBJECT CREATE FORMAT field is also set to BASIC.

EXTENDED (QWP4UTOC1=0 and QWP4UTOC2=1)
Existing table spaces and indexes that use 6-byte page format are converted to extended 10-byte page format. EXTENDED is allowed only if the OBJECT CREATE FORMAT field is also set to EXTENDED.

NO BASIC (QWP4UTOC1=1 and QWP4UTOC2=1)
Prevents the conversion of table spaces and indexes in extended page format to basic page format and disallows a utility that accepts the RBALRSN_CONVERSION utility keyword from running on an object in basic page format unless it converts it to extended page format. This setting is permitted only when OBJECT_CREATE_FORMAT=EXTENDED is set.

The ZPARM name is UTILITY_OBJECT_CONVERSION in DSN6SPRM.

Field Name: RT0106OC

VARY DS CONTROL INTERVAL (DSVCI)
Indicates whether DB2 optimizes VSAM CONTROL INTERVAL to page size for data set allocation.
Install parameter VARY DS CONTROL INTERVAL on panel DSNTIP7, or ZPARM DSVCI in DSN6SYSP.

Field Name: QWP1VVCI

TABLE SPACE ALLOCATION IN KB (TSQTY)
Shows the amount of space in KB for primary and secondary space allocation for DB2-defined data sets for table spaces created without the USING clause. 0 indicates that DB2 uses standard defaults.
Install parameter TABLE SPACE ALLOCATION on panel DSNTIP7, or ZPARM TSQTY in DSN6SYSP.

Field Name: QWP1TSQT

INDEX SPACE ALLOCATION IN KB (IXQTY)
Shows the amount of space in KB for primary and secondary space allocation for DB2-defined data sets for index spaces created without the USING clause. 0 indicates that DB2 uses standard defaults.
Install parameter INDEX SPACE ALLOCATION on panel DSNTIP7, or ZPARM IXQTY in DSN6SYSP.

Field Name: QWP1IXQT

OPTIMIZE EXTENT SIZING (MGEXTSZ)
Indicates whether DB2 uses sliding secondary quantity for DB2 managed data sets to optimize extent sizing.
Install parameter OPTIMIZE EXTENT SIZING on panel DSNTIP7, or ZPARM MGEXTSZ in DSN6SYSP.

Field Name: QWP1MESZ

PAD INDEX BY DEFAULT (PADIX)

Shows whether new indexes are be padded by default.
- YES indicates that a new index is padded unless the NOT Padded option is specified on the CREATE INDEX statement.
- The default value, NO, indicates that a new index is not padded unless the PADDED option is specified on the CREATE INDEX statement.

Install parameter PAD INDEXES BY DEFAULT on installation panel DSNTIPE, or ZPARM PADIX in DSN6SPRM.

Field Name: QWP4PDIX

DEFAULT PARTITION SEGSIZE (DPSEGSZ)

The default segment size to be used for a partitioned table space when the CREATE TABLESPACE statement does not include the SEGSIZE parameter. This field corresponds to field DEFAULT PARTITION SEGSIZE on installation panel DSNTIP7. The ZPARM name is DPSEGSZ IN DSN6SYSP.

Field Name: QWP1DPSS

PERCENT FREE FOR UPDATE (PCTFREE_UPD)

Specifies the default percentage of each page that DB2 leaves as free space in a table space when a table in this table space is populated. This value applies only to table spaces whose definitions do not include PCTFREE and for UPDATE.

This value corresponds to field PERCENT FREE FOR UPDATE on installation panel DSNTIP71. The ZPARM name is PCTFREE_UPD in DSN6SPRM.

Field Name: QWP4PFUP

DEFINE DATA SETS (IMPDSDEF)

Defines the underlying data sets when a table space (TS) that is contained in an implicitly created database is created.

Install parameter DEFINE DATA SETS on panel DSNTIP7 or ZPARM IMPDSDEF in DSN6SYSP.

Field Name: QWP1DIDS

USE DATA COMPRESSION (IMPTSCMP)

Shows whether data compression in table spaces in implicitly defined databases is used.

Install parameter USE DATA COMPRESSION on panel DSNTIP7 or ZPARM IMPTSCMP in DSN6SYSP.

Field Name: QWP1CITS

LIMIT KEY CONV PART TAB (IX_TB_PART_CONV_EXCLUDE)

Shows whether to include all columns in the partitioning key during conversion from index-controlled partitioning to table-controlled partitioning:

NO  Includes all columns
SQL Object Defaults Panel (DSNTIP7, DSNTIP71)

YES  Includes trailing columns only if they affect partitioning

This field corresponds to field EXCLUDE PART KEY ELEMENTS on installation panel DSNTIP71. The ZPARM name is IX_TB_PART_CONV_EXCLUDE in DSN6SPRM.

Field Name: QWP4XPKE

PAGE SET PAGE NUMBERING (PAGESET_PAGENUM)

Specifies whether range-partitioned table spaces and associated indexes will be created to use absolute page numbers across partitions or relative page numbers.

A  Absolute page numbers
R  Relative page numbers

Install parameter PAGE SET PAGE NUMBERING on panel DSNTIP71, or ZPARM PAGESET_PAGENUM in DSN6SPRM.

Field Name: QWP4PSPN

RETRY STOPPED OBJECTS (RETRY_STOPPED_OBJECTS)

Specifies whether DB2 should immediately reject requests for a stopped object or retry them, up to the IRLM timeout limit, if the object is restarted.

NO  This is the default. It indicates that DB2 immediately rejects requests for a stopped object.
YES  DB2 retries such requests, up to the IRLM timeout setting, if the stopped object is restarted.

Install parameter RETRY STOPPED OBJECTS on panel DSNTIP72, or ZPARM RETRY_STOPPED_OBJECTS in DSN6SPRM.

Field Name: QWP4PSRN

RENAME TABLE (RENAMEOBJECT)

Specifies whether the RENAME TABLE statement should extend to tables that are referenced in a view definition or the definition of an SQL table function:

YES  ALLOW_DEP_VIEW_SQLTUDF
NO   DISALLOW_DEP_VIEW_SQLTUDF

Install parameter RENAME TABLE on panel DSNTIP72, or ZPARM RENAMETABLE in DSN6SPRM.

Field Name: QWP4ERTS

PREVENT ALTER LIMITKEY (PREVENT_ALTERTB_LIMITE KEY)

Determines whether DB2 disallows altering the limit key by using an ALTER TABLE statement for index-controlled partitioned table spaces. This alter operation places the table space in REORG-pending (REORP) restrictive status, and the data is not available until the affected partitions are reorganized. Use PREVENT_ALTERTB_LIMITE KEY to avoid this data unavailability.

NO  Specifies that you can alter a limit key by using an ALTER TABLE statement for index-controlled partitioned table spaces. NO is the default.
YES  Specifies that it is not permitted to alter a limit key by using an
ALTER TABLE statement for index-controlled partitioned table spaces. An ALTER TABLE statement must not attempt to alter the limit key for an index-controlled partitioned table.

Install parameter PREVENT ALTER LIMITKEY on panel DSNTIP71, or ZPARM: PREVENT_ALTERTB_LIMITKEY in DSN6SPRM.

**Field Name:** QWP4PALK

**PREVENT INDEX PART CREATE (PREVENT_NEW_IXCTRL_PART) (DB2 11 or later)**

Determines whether DB2 does not allow the creation of new index-controlled partitioned tables. This subsystem parameter ensures that new partitioned tables use table-controlled partitioning, which is the preferred partitioning method for non-universal table spaces.

**NO** Specifies that new index-controlled partitioned tables can be created. NO is the default value.

**YES** Specifies that new partitioned table spaces must use table-controlled partitioning. A CREATE INDEX statement must not attempt to create an index-controlled partitioned table.

Install parameter PREVENT INDEX PART CREATE on panel DSNTIP71, or ZPARM: PREVENT_NEW_IXCTRL_PART in DSN6SPRM.

**Field Name:** QWP4PCIP

**DDL MATERIALIZATION (DDL_MATERIALIZATION)**

Specifies when DB2 materializes changes to the definition of an object. This value corresponds to field DDL MATERIALIZATION on installation panel DSNTIP71. ZPARM name is DDL_MATERIALIZATION in DSN6SPRM.

**Field Name:** QWP4DDLM

**DEFAULT_INSERT_ALGORITHM (DEFAULT_INSERT_ALGORITHM)**

Specifies the default algorithm for inserting data into table spaces. This value corresponds to the field DEFAULT INSERT ALGORITHM on installation panel DSNTIP71. The ZPARM name DEFAULT_INSERT_ALGORITHM is in DSN6SPRM.

**Field Name:** QWP4DINA
This topic shows detailed information about “System Parameters - Storage Sizes Installation Parms (DSNTIPC, DSNTIPE, DSNTIPE1)”.  

This block shows the storage sizes calculated by the installation CLIST.

These space estimates do not account for cylinder rounding. Base requirements can be 10 to 20% higher depending on the DASD type. Most of the needed virtual storage is in extended private storage (including the buffer pool, the EDM pool, most of the code, and a significant amount of working storage).

**Note:** The fields shown on this panel depend on the installed DB2 version.

---

### System Parameters - Storage Sizes Installation Parms (DSNTIPC, DSNTIPE, DSNTIPE1)

The field labels shown in the following sample layout of “System Parameters - Storage Sizes Installation Parms (DSNTIPC, DSNTIPE, DSNTIPE1)” are described in the following section.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Value</th>
</tr>

</table>

**Field Name:** QWP4DSMX

**EDM STATEMENT CACHE SIZE IN KB (EDMSTMTC)**

The size of the statement cache that can be used by the Environmental Descriptor Manager (EDM). This value is used at DB2 startup time as the minimum value. You can increase and subsequently decrease this value.
Storage Sizes InstallationParms (DSNTIPC, DSNTIPE, DSNTIPE1)

with the SET SYSPARM command. This value cannot be decreased below the value that is specified at DB2 startup. The CLIST calculates a statement cache size. This storage pool is located above the 2 GB bar.

The value used at DB2 startup time is either calculated by the CLIST based on input from other installation information or an override value.

For record trace, this value is shown in bytes. For other reports, the value is shown in kilobytes.

Install parameter EDM STATEMENT CACHE on panel DSNTIPC, or ZPARM EDMSTMTC in DSN6SPRM.

Field Name: QWP4ESTC

EDM DBD CACHE SIZE IN KB (EDMDBDC)

The minimum size of the DBD cache that can be used by the Environmental Descriptor Manager (EDM). This value is used at DB2 startup time as the minimum value. You can increase and subsequently decrease the value with the SET SYSPARM command. This value cannot be decreased below the value that is specified at DB2 startup. This storage pool is located above the 2 GB bar. The CLIST calculates the DBD cache size.

The value used at DB2 startup time is either calculated by the CLIST based on input from other installation information or an override value.

Install parameter EDM DBD CACHE on panel DSNTIPC, or ZPARM EDMDBDC in DSN6SPRM.

Field Name: QWP4EDBC

EDM SKELETON POOL SIZE IN KB (EDM_SKELETON_POOL)

The minimum size of the EDM pool for skeleton package and skeleton cursor tables. For record trace, this value is shown in bytes. For other reports, the value is shown in kilobytes.

Install parameter EDM SKELETON POOL SIZE on panel DSNTIPC or ZPARM EDM_SKELETON_POOL in DSN6SPRM.

Field Name: QWP4SKLC

MAXIMUM SIZE OF EDM POOL IN BYTES (EDMPOOL)

The size (in kilobytes) of the environmental descriptor manager (EDM) pool.

This can be the value calculated by the CLIST, based on input from previous panels, or the value entered in the Override column at installation time.

Install parameter EDMPOOL STORAGE SIZE on panel DSNTIPC, or ZPARM EDMPOOL in DSN6SPRM.

Field Name: QWP4EDPL

MAXIMUM SIZE OF SORT POOL IN BYTES (SRTPool)

Indicates the amount of storage needed for the sort pool.

This can be the value calculated by the CLIST, based on input from previous panels, or the value entered in the Override column at installation time.
Storage Sizes Installation Parms (DSNTIPC, DSNTIPE, DSNTIE1)

Install parameter SORT POOL SIZE on panel DSNTIPC, or ZPARM SRTPPOOL in DSN6SPRM.

Field Name: QWP4SPOL

MAX IN-MEMORY SORT SIZE (MAXSORT_IN_MEMORY)
The maximum amount of storage in kilobytes to allocate for sorting the results of each query that contains the order by clause, the group by clause, or both. This field corresponds to field MAX IN-MEMORY SORT SIZE in installation panel DSNTIPC. The ZPARM name is MAXSORT_IN_MEMORY in DSN6SPRM.

Field Name: QWP4MIMTS

MAXIMUM SIZE OF RID POOL IN KB (MAXRBLK)
The amount of storage needed for the RID pool.
This can be the value calculated by the CLIST, based on input from previous panels, or the value entered in the Override column at installation time.
When 0, DB2 does not use access paths or join methods that depend on RID pool storage.
Install parameter RID POOL SIZE on panel DSNTIPC, or ZPARM MAXRBLK in DSN6SPRM.

Field Name: QWP4RMAX

MAX NO OF USERS CONCURRENTLY RUNNING IN DB2 (CTHREAD)
The maximum number of allied threads (threads started at the local subsystem) that can be allocated concurrently.
Separate threads are created for each occurrence of the following:
- TSO user (whether running a DSN command or a DB2 request from QMF)
- Batch job (whether running a DSN command or a DB2 utility)
- IMS region that can access DB2
- Active CICS transaction that can access DB2
- Task connected to DB2 through the call attachment facility.
Install parameter MAX USERS on panel DSNTIPE, or ZPARM CTHREAD in DSN6SYSP.

Field Name: QWP1CT

MAX NO OF CONCURRENT REMOTE ACTIVE CONNECTIONS (MAXDBAT)
The maximum number of database access threads (DBATs) that can be active concurrently.
When this limit has been reached, DB2 uses the value of DDF THREADS on panel DSNTIPR to decide how to handle a new allocation request.
When DDF THREADS is ACTIVE and MAX REMOTE CONNECTED has not been reached, the allocation request is allowed but any further processing for the connection is queued waiting for an active database access thread to terminate.
Storage Sizes Installation Parms (DSNTIPC, DSNTIPE, DSNTIPE1)

When DDF THREADS is INACTIVE and MAX REMOTE CONNECTED has not been reached, the allocation request is allowed and is processed when DB2 can assign an unused database access thread slot to the connection.

The total number of threads accessing data concurrently is the sum of MAX USERS and MAX REMOTE ACTIVE. The maximum allowable value for this sum is 2000.

Install parameter MAX REMOTE ACTIVE on panel DSNTIPE, or ZPARM MAXDBAT in DSN6SYSP.

Field Name: QWP1RMT

MAX NO OF REMOTE CONNECTIONS (CONDBAT)

The maximum allowed number of concurrent remote connections.

When this limit is reached, any new connection request is rejected.

Install parameter MAX REMOTE CONNECTED on panel DSNTIPE, or ZPARM CONDBAT in DSN6SYSP.

Field Name: QWP1CDB

MAX NO OF TSO CONNECTIONS (IDFORE)

The maximum number of concurrent TSO foreground connections (QMF, DSN, DB2I, and SPUFI).

Each of the following is a separate user:

• Each TSO foreground user executing a DSN command.
• Each TSO foreground user connected to DB2 through the call attachment facility (CAF). This can include QMF users running in TSO foreground or user-written CAF applications running in TSO foreground.

When the number of TSO users attempting to access DB2 exceeds this limit, connection requests are rejected.

There is no subsystem parameter to control the maximum concurrent connections for IMS and CICS. These are controlled by using IMS and CICS facilities. For CICS attachment, the maximum number of connections to DB2 can be controlled using the resource control table (RCT) TYPE=INIT THRDMAX value.

Install parameter MAX TSO CONNECT on panel DSNTIPE, or ZPARM IDFORE in DSN6SYSP.

Field Name: QWP1IDF

MAX NO OF BATCH CONNECTIONS (IDBACK)

The maximum allowed number of concurrent connections for batch jobs and utilities. This includes:

• All batch jobs using QMF.
• All batch jobs using the DSN command processor.
• All tasks connected to DB2 through call attach facility (CAF) running in batch. This can include:
  – Batch jobs using QMF
  – APPC applications
  – TCP/IP FTP connections
When the number of batch jobs reaches this limit, further requests are rejected.

Install parameter MAX BATCH CONNECT on panel DSNTIPE, or ZPARM IDBACK in DSN6SYSYSP.

Field Name: QWP1IDB

MAXIMUM KEPT DYNAMIC STATEMENTS (MAXKEEPD)

Shows the total number of prepared dynamic SQL statements that are saved past a commit point.

0 means that prepared dynamic SQL statements are not saved past commit points.

Install parameter MAX KEPT DYN STMTS on panel DSNTIPE, or ZPARM MAXKEEPD in DSN6SPRM.

Field Name: QWP1IDB

MAX OPEN FILE REFS (MAXOFILR)

The maximum number of concurrently open data sets for processing LOB file references.

Install parameter MAX OPEN FILE REFS on panel DSNTIPE or ZPARM MAXOFILR in DSN6SYSYSP.

Field Name: QWP1MOFR

MANAGE REAL STORAGE (REALSTORAGE_MANAGEMENT)

Specifies whether DB2 manages real storage consumption. This field corresponds to field MANAGE REAL STORAGE on installation panel DSNTIPE. The ZPARM name is REALSTORAGE_MANAGEMENT in DSN6SPRM.

Field Name: QWP4STMN

MAXIMUM REAL STORAGE (REALSTORAGE_MAX)

The maximum amount of real plus auxiliary storage that can be used. The ZPARM name is REALSTORAGE_MAX in DSN6SPRM.

Field Name: QWP4RSMX

CONTRACT THREAD STORAGE (CONTSTOR)

In DB2 12 this field is a serviceability field.

Indicates whether DB2 returns unused thread storage at commit. Possible values are:

YES  DB2 checks threads at commit points and periodically returns unused storage to the system.

NO  DB2 does not check threads at commit points and returns acquired storage on deallocation.

Install parameter CONTRACT THREAD STG on panel DSNTIPE, or ZPARM CONTSTOR in DSN6SPRM.

Field Name: QWP4CONT

MANAGE THREAD STORAGE (MINSTOR)

In DB2 12 this field is a serviceability field.
**Storage Sizes Installation Parms (DSNTIPC, DSNTIPE, DSNTIPE1)**

Shows whether DB2 uses storage management to optimize the amount of working storage consumed by individual threads.

Install parameter MANAGE THREAD STORAGE on panel DSNTIPE, or ZPARM MINSTOR in DSN6SPRM.

For best performance, this parameter should be NO, meaning DB2 does not manage thread storage.

When YES, DB2 uses best fit algorithm to manage and assign thread storage. This can help on systems that have many long-running threads and that are constrained on DBM1 address space.

**Field Name:** QWP4MSTG

**LONG-RUNNING READER IN MINUTES (LRDRTHLD)**

Shows the number of minutes that a read claim can be held by an agent before DB2 reports it as a long-running reader. Valid values are 0 (default) through 1439.

Install parameter LONG-RUNNING READER on installation panel DSNTIPE, or ZPARM LRDRTHLD in DSN6SYSP.

**Field Name:** QWP4LRTH

**DDL TIMEOUT FACTOR (DDLTOX)**

Shows the time out factor of the SQL data definition. The time out value is the product of this value and the IRLMRWT value.

ZPARM name DDLTOX in DSN6SPRM.

**Field Name:** QWP4DDLTO

**INDEX CLEANUP THREADS (INDEX_CLEANUP_THREADS)**

The maximum number of threads that can be created to clean up pseudo-deleted index entries on a data sharing member of a subsystem. This field corresponds to field INDEX CLEANUP THREADS on installation panel DSNTIPE1. The ZPARM name is INDEX_CLEANUP_THREADS in DSN6SPRM.

**Field Name:** QWP4IXCU

**3990 CACHE (SEQCACH)**

Indicates whether DB2 prefetch uses sequential mode to read cached data from a 3990 controller. When BYPASS (default), DB2 prefetch bypasses the cache.

When SEQ, DB2 prefetch uses sequential access for read activity. There is a performance benefit using SEQ with DFSMS or DFP controls with newer 3990 caches.

Install parameter SEQUENTIAL CACHE on panel DSNTIPE, or ZPARM SEQCACH in DSN6SPRM.

**Field Name:** QWP4SCAC
Tracing, Checkpoint & Pseudo-Close Parameters (DSNTIPN)

This topic shows detailed information about “System Parameters - Tracing, Checkpoint & Pseudo-Close Parameters (DSNTIPN)”.

This block shows audit, global, accounting, and monitor trace and checkpoint frequency parameters.

### System Parameters - Tracing, Checkpoint & Pseudo-Close Parameters (DSNTIPN)

The field labels shown in the following sample layout of “System Parameters - Tracing, Checkpoint & Pseudo-Close Parameters (DSNTIPN)” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>START AUDIT TRACE (AUDITST)</strong></td>
<td>Shows whether the audit trace is started automatically when DB2 is started.</td>
</tr>
<tr>
<td><strong>START GLOBAL TRACE (TRACSTR)</strong></td>
<td>Shows whether the global trace is started automatically when DB2 is started.</td>
</tr>
<tr>

<td></td>
</tr>
</tbody>
</table>

#### START AUDIT TRACE (AUDITST)

Shows whether the audit trace is started automatically when DB2 is started.

When YES, the audit trace is started for the default class (class 1) whenever DB2 is started. When ALL, an audit trace is automatically started for all classes.

Install parameter AUDIT TRACE on panel DSNTIPN, or ZPARM AUDITST in DSN6SYSP.

Field Name: QWP1AUDT

#### START GLOBAL TRACE (TRACSTR)

Shows whether the global trace is started automatically when DB2 is started.

When YES, the global trace starts for the default classes (classes 1, 2, and 3) whenever DB2 is started, and additional data consistency checks are made whenever a data page or index page is modified. When ALL, the global trace is automatically started for all classes.

The global trace is used to diagnose problems in DB2 but it also impacts DB2 performance. If you have production systems requiring high performance, you might consider turning off global trace. If you do this, be aware that this presents a serviceability exposure. In the event of a system failure, IBM service personnel will ask you to turn on global trace and attempt to recreate the problem.
Install parameter TRACE AUTO START on panel DSNTIPN, or ZPARM TRACSTR in DSN6SYSP.

Field Name: QWP1TRST

TRACE TABLE SIZE IN 4K BYTES (TRACTBL)
Shows the size of the RES trace table in 4 KB blocks. A value of 16 means 64 KB have been allocated for this table.

This is the default destination for the global trace records in DB2. Most trace records require 32-byte entries; events with more than three data items require 64-byte entries.

Install parameter TRACE SIZE on panel DSNTIPN, or ZPARM TRACTBL in DSN6SYSP.

Field Name: QWP1TRSZ

LOCAL TRACE TABLE SIZE IN 4K BYTES (TRACLOC)
The size of the local trace tables in multiples of 4 KB. ZPARM name TRACLOC in DSN6SYSP.

Field Name: QWP1TLSZ

START SMF ACCOUNTING (SMFACCT)
Shows whether DB2 sends accounting data to SMF automatically when DB2 is started. Numeric values show what classes are sent. When YES, the default class (class 1) is sent. When ALL, accounting classes one through five are started.

The SMFPRM xx member of SYS1.PARMLIB must also be set to allow SMF to write the records.

Install parameter SMF ACCOUNTING on panel DSNTIPN, or ZPARM SMFACCT in DSN6SYSP.

Field Name: QWP1SMFA

START SMF STATISTICS (SMFSTAT)
Shows whether a Statistics trace was started automatically at DB2 startup time.

The classes started are shown separated by commas.

DB2 sends collected trace data to SMF. The SMFPRM xx member of SYS1.PARMLIB must be set to allow SMF to write the records.

Install parameter SMF STATISTICS on panel DSNTIPN, or ZPARM SMFSTAT in DSN6SYSP.

Field Name: QWP1SMFS

STATISTICS TIME INTERVAL IN MINUTES (STATIME)
The time interval, in minutes, between statistics collections. Statistics records are written approximately at the end of this interval.

Install parameter STATISTICS TIME on panel DSNTIPN, or ZPARM STATIME in DSN6SYSP.

Field Name: QWP1STIM

SYNCHRONIZATION INTERVAL WITHIN THE HOUR (SYNCVVAL)
Tracing, Checkpoint & Pseudo-Close Parameters (DSNTIPN)

Shows whether DB2 statistics recording is synchronized with some part of the hour. The installation can specify that the DB2 statistics recording interval be synchronized with the beginning of the hour (00 minutes past the hour) or any number of minutes past the hour up to 59. Possible values are: 0-59, which indicate the synchronization point. When NO or N/A is shown, synchronization is disabled, this is the default.

If STATISTICS TIME INTERVAL IN MINUTES (STATIME) is greater than 60, NO or N/A is shown.

Install parameter STATISTICS SYNC on panel DSNTIPN, or ZPARM SYNCVAL in DSN6SYSP.

Field Name: QWP1SYNV

ONLINE DATASET STATISTICS TIME INTERVAL IN MIN. (DSSTIME)

The time interval, in minutes, before DB2 resets data set statistics collected for the online performance monitors. Online performance monitors can request DB2 data set statistics for the current interval with an IFI READS request for IFCID 199.

Install parameter DATASET STATS TIME on panel DSNTIPN, or ZPARM DSSTIME in DSN6SYSP.

Field Name: QWP1DTIM

START MONITOR TRACE (MON)

Shows whether the monitor trace is started automatically when DB2 is started. When YES, the default (trace class 1) is started. Numeric values show which classes are started. When ALL, monitor trace classes 1 through 8 are started.

Install parameter MONITOR TRACE on panel DSNTIPN, or ZPARM MON in DSN6SYSP.

Field Name: QWP1MON

MONITOR BUFFER SIZE IN BYTES (MONSIZE)

The default number of bytes allocated for the monitor trace buffer.

Install parameter MONITOR SIZE on panel DSNTIPN, or ZPARM MONSIZE in DSN6SYSP.

Field Name: QWP1MONS

UNICODE IFCIDS (UIFCIDS)

Shows whether output from IFC records should include Unicode information. Only a subset of the character fields (identified in the IFCID record definition by a %U in the comment area to the right of the field declaration in the DSNDQWxx copy files) are encoded in Unicode. The remaining fields maintain the same encoding of previous releases.

Install parameter UNICODE IFCIDS on panel DSNTIPN, or ZPARM UIFCIDS in DSN6SYSP.

Field Name: QWP1_UNICODE

DDF/RRSAF ACCUM (ACCUMACC)

Shows whether DB2 accounting data for DDF and RRSAF threads is accumulated by end user.
When NO, DB2 writes an accounting record when a DDF thread is made inactive, or when signon occurs for an RRSAF thread. A value in the range 2 through 65535 shows the number of times an end-user identifier should occur before DB2 writes an accounting record. An end-user identifier is the concatenation of the end-user user ID, end-user transaction name, and the end-user workstation name.

These values can be set by DDF threads using SERVER CONNECT and SET CLIENT calls, and by RRSAF threads using the RRSAF SIGN, AUTH SIGNON, and CONTEXT SIGNON functions.

An accounting record might be written prior to the number of end user occurrences in the following instances:

- When an internal storage threshold is reached for the accounting RRSAF signon call.
- When the thread deallocates, the accumulated accounting data for all end users on this thread is written (one record per end user).
- When this parameter is dynamically changed to deactivate accounting accumulation. In this instance, the next end-UR (for DDF thread) or signon (for a RRSAF thread) causes DB2 to write the accumulated accounting data for all end users on this thread (one record per end user).

Install parameter DDF/RRSAF ACCUM on installation panel DSNTIPN, or ZPARM ACCUMACC in DSN6SYSP.

**Field Name:** QWP1ACCU

**AGGREGATION FIELDS (ACCUMUID)**

Shows the aggregation fields used for DDF and RRSAF accounting rollup. Values are defined as follows:

- 0: End user ID, transaction name, and workstation name
- 1: End user ID
- 2: End user transaction name
- 3: End user workstation name
- 4: End user ID and transaction name
- 5: End user ID and workstation name
- 6: End user transaction name and workstation name

This value is ignored if DDF or RRSAF accounting are not used. DB2 writes individual accounting threads for threads that do not have all aggregation fields populated that are specified by this parameter.

Install parameter AGGREGATION FIELDS on installation panel DSNTIPN, or ZPARM ACCUMUID in DSN6SYSP.

**Field Name:** QWP1ACID

**COMPRESS SMF RECS (SMFCOMP)**

Shows the COMPRESS DEST(SMF) TRACE records. This field corresponds to field COMPRESS SMF RECS on installation panel DSNTIPN. ZPARM name: SMFCOMP in DSN6SYSP.

**Field Name:** QWP1CSMF
### Workfile Database Panel (DSNTIP91)

This topic shows detailed information about “System Parameters - Workfile Database Panel (DSNTIP91)”.

#### System Parameters - Workfile Database Panel (DSNTIP91)

The field labels shown in the following sample layout of “System Parameters - Workfile Database Panel (DSNTIP91)” are described in the following section.

```
WORKFILE DATABASE PANEL (DSNTIP91)
----------------------------------
MAX TEMP STORAGE PER AGENT IN MB (MAXTEMPS)..............25,000
SEPARATE WORK FILES (WFDBSEP)..............................NO
MAX TEMP RID (MAXTEMPS_RID).................................NONE
AGENT LEVEL THRESHOLD (WFSTGUSE_AGENT_THRESHOLD).........N/A
SYSTEM LEVEL THRESHOLD (WFSTGUSE_SYSTEM_THRESHOLD)......N/A
```

**MAX TEMP STORAGE PER AGENT IN MB (MAXTEMPS)**

The maximum amount of temporary storage in megabytes (MB) for each agent.

Install parameter MAX TEMP STORAGE on panel DSNTIP6 or ZPARM MAXTEMPS in DSNTIP9.

Field Name: QWP4WFAL

**SEPARATE WORK FILES (WFDBSEP)**

YES directs processing of declared temporary tables only to DB2-managed table spaces that are defined with SECQTY>0 (DB2 field: QWP4WFDBSEP). It directs all other processing to DB2-managed table spaces that are defined with SECQTY=0 or to user-managed table spaces. This field corresponds to field “Separate Work Files” in installation panel DSNTIP9. The ZPARM name is WFDBSEP in DSN6SPRM.

Field Name: QWP4WFDBSEP

**MAX TEMP RID (MAXTEMPS_RID)**

The maximum number of RID blocks of temporary storage in the Workfile database that a single RID list can use at any point in time. This field corresponds to field MAX TEMP RID on installation panel DSNTIP9. The ZPARM name is MAXTEMPS_RID.

It can have the following values:
- -1 if MAXTEMPS_RID=NONE
- 0 if MAXTEMPS_RID=NOLIMIT
- 1 to 329166 otherwise

Field Name: QWP4WFRD

**AGENT LEVEL THRESHOLD (WFSTGUSE_AGENT_THRESHOLD)**

Specifies the percentage of space that is used in the Workfile Database by a single agent when DB2 issues a warning message.

This value corresponds to field AGENT LEVEL THRESHOLD on installation panel DSNTIP91. The ZPARM name is WFSTGUSE_AGENT_THRESHOLD in DSN6SPRM.

Field Name: QWP4WFSAT

**SYSTEM LEVEL THRESHOLD (WFSTGUSE_SYSTEM_THRESHOLD)**
Specifies the percentage of space that is used in the Workfile Database by all agents in a DB2 subsystem or data sharing member when DB2 issues a warning message.

This value corresponds to field SYSTEM LEVEL THRESHOLD on installation panel DSNTIP91. The ZPARM name is WFSTGUSE_SYSTEM_THRESHOLD in DSN6SPRM.

**Field Name:** QWP4WFSST
Workfile Database Panel (DSNTIP91)
Chapter 55. Alter Buffer Pool Command Issued

This topic shows detailed information about “System Parameters - Alter Buffer Pool Command Issued”.

</table>

BUFFER POOL ID

The buffer pool internal identifier. The values 0 through 49 are the identifiers for BP0 through BP49. The values 80 through 89 are the identifiers for BP32K through BP32K9.

Field Name: QW0201BP

VPOOL SIZE (PAGES) (OLD)

The size of the old virtual pool.

Field Name: QW0201OP

VPOOL SIZE (PAGES) (NEW)

The size of the new virtual buffer pool.

Field Name: QW0201NP

VPOOL SEQ THRESH

The old and new virtual pool sequential steal threshold.

Old status taken from the DB2 field QW0201OT.

New status taken from the DB2 field QW0201NT.

Field Name: RT0201VS

HORIZ DEFER WRITE THRESH

This threshold is a percentage of the virtual buffer pool that might be occupied by unavailable pages, including updated pages and pages in use.

The default value for QWQT is 30%. You can change this value to any value from 0% to 90% using the DWQT option of the ALTER BUFFERPOOL command.

DB2 checks QWQT when an update to a page is complete. If the percentage of unavailable pages in the virtual buffer pool exceeds QWQT,
write operations are scheduled for up to 128 pages per data set to decrease the number of unavailable buffers to 10% below QWQT. For example, if QWQT is 50%, the number of unavailable buffers is reduced to 40%.

When the limit of QWQT is reached, data sets containing the oldest updated pages are written asynchronously. DB2 continues to write pages until the ratio goes below the QWQT.

Field Name: QDBPDWQT

VERT DEFER WRITE THRESH (%)

The vertical deferred write threshold for the virtual buffer pool expressed as percentage.

Old status taken from the DB2 field QW0201OV.
New status taken from the DB2 field QW0201NV.

Field Name: RT0201PC

VERT DEFER WRITE THRESH (BUF)

The vertical deferred write threshold for the virtual buffer pool expressed as an absolute number of buffers. It is only used if VERTICAL DEFERRED WRITE THRESHOLD (PERCENTAGE) is 0.

Old status taken from the DB2 field QW0201OJ.
New status taken from the DB2 field QW0201NJ.

Field Name: RT0201BU

VPOOL PARALLEL SEQ THRESH

The old and new virtual pool parallel sequential threshold.

Old status taken from the DB2 field QW0201OQ.
New status taken from the DB2 field QW0201NQ.

Field Name: RT0201VP

ASSISTING PARALLEL SEQ THRESH

The assisting parallel sequential threshold before and after the ALTER BUFFERPOOL command was issued.

Old status taken from the DB2 field QW0201OX.
New status taken from the DB2 field QW0201NX.

Field Name: RT0201AS

PGFIX ATTRIBUTE

Indicates whether a page is fixed in real storage when it is first used. It can have one of the following values: YES or NO.

Field Name: QDBPPREFIX

PAGE STEAL METHOD

Identifies the page stealing algorithm (PGSTEAL) that is used for the virtual buffer pool. It controls when and whether performance-critical objects in buffer pools are removed from buffer pools when the space is needed by other objects. Possible values are:

LRU  Least recently used (LRU) objects are removed first. This means it
takes away pages that are not used so that more recently used pages can remain in the virtual buffer pool. This is used by default.

**FIFO**  
First-In-First-Out (FIFO) means that the oldest objects are removed first. This results in a small decrease in the cost of a Getpage operation. It can reduce internal DB2 latch contention in environments that require very high concurrency.

**NONE**  
Objects are not removed from buffer pool (no page stealing). This setting provides the highest availability for business-critical objects.

Old status taken from the DB2 field QW0201OK.  
New status taken from the DB2 field QW0201NK.

Field Name: RT0201PS

**AUTOSIZE**  
The old and new status of the AUTOSIZE attribute.

Old status taken from the DB2 field QW0201OZ.  
New status taken from the DB2 field QW0201NZ.

Field Name: RT0201AT

**FRAMESIZE (OLD)**  
The size of the old frame (4 KB, 1 MB, or 2 GB).

Field Name: QW0201OC

**FRAMESIZE (NEW)**  
The new frame size (4 KB, 1 MB, or 2 GB).

Field Name: QW0201NC

**VPOOL SIZE MIN (OLD)**  
The minimum size of the old virtual pool.

Field Name: QW0201OA

**VPOOL SIZE MIN (NEW)**  
The minimum size of the new virtual pool.

Field Name: QW0201NA

**VPOOL SIZE MAX (OLD)**  
The maximum size of the old virtual pool.

Field Name: QW0201OB

**VPOOL SIZE MAX (NEW)**  
The maximum size of the new virtual pool.

Field Name: QW0201NB

**SIM POOL SIZE**  
The number of simulated buffers specified for the simulated buffer pool.  
Old value is taken from the DB2 field QW0201OS. New value is taken from the DB2 field QW0201NS.

Field Name: RT0201SZ
Adjust Buffer Pool Command Issued

**SIM POOL SEQ THRESH**

The sequential steal threshold for the simulated buffer pool, expressed as a percentage of the total simulated buffer pool size. Old value is taken from the DB2 field QW0201OH. New value is taken from the DB2 field QW0201NH.

Field Name: RT0201ST
Chapter 56. Alter Group Buffer Pool Command Issued

This topic shows detailed information about “System Parameters - Alter Group Buffer Pool Command Issued”.

System Parameters - Alter Group Buffer Pool Command Issued

The field labels shown in the following sample layout of “System Parameters - Alter Group Buffer Pool Command Issued” are described in the following section.

GBP ID

The DB2 group buffer pool ID.

Field Name: QW0256GB

CURRENT DIRECTORY TO DATA RATIO

The directory entry to data entry ratio. This is the value specified in the RATIO keyword of the ALTER GROUPBUFFERPOOL command.

New status deduced from the DB2 field QW0256NR.
Old status deduced from the DB2 field QW0256OR.

Field Name: RT0256DR

CLASS CASTOUT THRESHOLD (%)

The threshold at which the class castout is to be initiated. It is expressed as a percentage of the group buffer pool size. This is the value specified in the CLASST keyword of the ALTER GROUPBUFFERPOOL command.

New status deduced from the DB2 field QW0256NC.
Old status deduced from the DB2 field QW0256OC.

Field Name: RT0256CT

CLASS CASTOUT THRESHOLD (PAGES) (OLD)

The old class castout threshold based on the number of pages.

Field Name: QW0256ON

CLASS CASTOUT THRESHOLD (PAGES) (NEW)

The new class castout threshold based on the number of pages.

Field Name: QW0256NN

GBP CASTOUT THRESHOLD (%)

The threshold at which the castout is to be initiated for the group buffer pool. This is the value specified in the GBPOOLT keyword of the ALTER GROUPBUFFERPOOL command.

New status deduced from the DB2 field QW0256NG.

© Copyright IBM Corp. 1985, 2016
Alter Group Buffer Pool Command Issued

Old status deduced from the DB2 field QW0256OG.

Field Name: RT0256GT

GBP CHECKPOINT INTERVAL (MIN)

The time interval (in minutes) between successive group buffer pool checkpoints. This is the value specified in the GBPCHKPT keyword of the ALTER GROUPBUFFERPOOL command.

New status deduced from the DB2 field QW0256NK.

Old status deduced from the DB2 field QW0256OK.

Field Name: RT0256CI

GBP CACHE SETTING

GBPCACHE value before and after the ALTER GROUPBUFFERPOOL command was issued. This field specifies whether DB2 should write changed pages for the group buffer pool dependant pageset or partitions directly to DASD and use the group buffer pool only for sending XI signals.

New status deduced from the DB2 field QW0256NB.

Old status deduced from the DB2 field QW0256OB.

Field Name: RT0256CS

AUTO REC

A flag indicating how the AUTOREC option of the ALTER GROUPBUFFERPOOL command has been set. It specifies whether DB2 should automatically recover if GBP fails. The old value specifies the AUTOREC value before the ALTER GBP command was issued. The new value specifies the AUTOREC value after the ALTER GBP command was issued.

New status deduced from the DB2 field QW0256NA.

Old status deduced from the DB2 field QW0256OA.

Field Name: RT0256AR
Chapter 57. Buffer Pool Parameters

This topic shows detailed information about “System Parameters - Buffer Pool Parameters”.

Normally, buffer pool information is reported once for each buffer pool if the attributes remain the same over the reporting period.

Buffer pool attributes can be changed while DB2 is active using the DB2 ALTER BUFFERPOOL command. If the performance trace class 10 is active, the event is recorded in the system parameters report.

When an ALTER BUFFERPOOL command is recorded, the status of the buffer pool before and after the command is shown.

**Note:** The fields shown on this panel depend on the installed DB2 version.

### System Parameters - Buffer Pool Parameters

The field labels shown in the following sample layout of “System Parameters - Buffer Pool Parameters” are described in the following section.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

**BUFFER POOL ID**

Buffer pool name.

**Field Name:** QDBPNM

**VPOOL SIZE (PAGES)**

The size of the virtual buffer pool.

Old status taken from the DB2 field QW0201OP.

New status taken from the DB2 field QW0201NP.

**Field Name:** QDBPVPSZ

**VPOOL SEQ THRESH**

Virtual pool sequential threshold (VPSEQT). This threshold is a percentage of the virtual buffer pool that might be occupied by sequentially accessed
pages. The pages can be in the state updated, in use, or available. Therefore, each page might count regarding exceeding any other buffer pool threshold.

The default value for VPSEQT is 80%. You can change this value to a value from 0% to 100% by using the VPSEQT option of the ALTER BUFFERPOOL command.

VPSEQT is checked before stealing a buffer for a sequentially accessed page instead of accessing the page in the virtual buffer pool. If the threshold is exceeded, DB2 tries to steal a buffer that holds a sequentially accessed page rather than one that holds a randomly accessed page.

If you set VPSEQT to 0%, sequential pages cannot occupy space in the virtual buffer pool. In this case, prefetch is disabled, and sequentially accessed pages are discarded when they are released. You can, however, set the value for HPSEQT to a value above zero and the value for VPSEQT to zero. If you set VPSEQT to 100%, sequential pages can monopolize the entire virtual buffer pool.

Field Name: QDBPVPSH

HORIZ DEFER WRITE THRESH

This threshold is a percentage of the virtual buffer pool that might be occupied by unavailable pages, including updated pages and pages in use.

The default value for QWQT is 30%. You can change this value to any value from 0% to 90% using the DWQT option of the ALTER BUFFERPOOL command.

DB2 checks QWQT when an update to a page is complete. If the percentage of unavailable pages in the virtual buffer pool exceeds QWQT, write operations are scheduled for up to 128 pages per data set to decrease the number of unavailable buffers to 10% below QWQT. For example, if QWQT is 50%, the number of unavailable buffers is reduced to 40%.

When the limit of QWQT is reached, data sets containing the oldest updated pages are written asynchronously. DB2 continues to write pages until the ratio goes below the QWQT.

Field Name: QDBPDWQT

VERT DEFER WRITE THRESH (%)

Vertical deferred write threshold (VDWQT). This threshold is similar to the deferred write threshold but it applies to the number of updated pages for one single page set in the buffer pool. If the percentage or number of updated pages for the data set exceeds the threshold, writes up to 128 pages are scheduled for that data set.

VDWQT can be specified in one of the following ways:

- As a percentage of the virtual buffer pool that might be occupied by updated pages from one single page set. The default value for this threshold is 5%. You can change the percentage to any value from 0% to 90%.

- As the total number of buffers in the virtual buffer pool that might be occupied by updated pages from one single page set. You can specify the number of buffers from 0 to 9999. If you want to use the number of buffers as your threshold, you must set the percentage threshold to 0.

Field Name: QDBPVDQT
VERT DEFER WRITE THRESH (BUF)

The vertical deferred write threshold (VDWQT), shown as the number of buffers in the virtual buffer pool that might be occupied by updated pages from a single page set.

Field Name: QDBPVDSQB

VPOOL PARALLEL SEQ THRESH

Virtual buffer pool parallel sequential threshold (VPPSEQT). This threshold is a part of the virtual buffer pool that might support parallel operations. It is measured as a percentage of the sequential steal threshold (VPSEQT). Setting VPPSEQT to zero disables parallel operation.

The default value for this threshold is 50% of the sequential steal threshold (VPSEQT). You can change the default value to any value from 0% to 100% by using the VPPSEQT option on the ALTER BUFFERPOOL command.

Field Name: QDBPSPSQT

ASSISTING PARALLEL SEQ THRESH

Virtual buffer pool assisting parallel sequential threshold (VPXPSEQT). This threshold is a part of the virtual buffer pool that might support parallel operations initiated from another DB2 in the data sharing group. It is measured as a percentage of VPPSEQT.

Setting VPXPSEQT to zero (default) prevents DB2 from supporting sysplex query parallelism at run time for queries that use this buffer pool.

You can change the default value to any value from 0% to 100% using the VPXPSEQT option of the ALTER BUFFERPOOL command.

Field Name: QDBPXSQT

PGFIX ATTRIBUTE

Indicates whether a page is fixed in real storage when it is first used. It can have one of the following values: YES or NO.

Field Name: QDBPPFIDX

PAGE STEAL METHOD

Identifies the page stealing algorithm (PGSTEAL) that is used for the virtual buffer pool. It controls when and whether performance-critical objects in buffer pools are removed from buffer pools when the space is needed by other objects. Possible values are:

- LRU  Least recently used (LRU) objects are removed first. This means it takes away pages that are not used so that more recently used pages can remain in the virtual buffer pool. This is used by default.

- FIFO  First-In-First-Out (FIFO) means that the oldest objects are removed first. This results in a small decrease in the cost of a Getpage operation. It can reduce internal DB2 latch contention in environments that require very high concurrency.

- NONE  Objects are not removed from buffer pool (no page stealing). This setting provides the highest availability for business-critical objects.

Old status taken from the DB2 field QW0201OK.
New status taken from the DB2 field QW0201NK.
Buffer Pool Parameters

Field Name: RT0201PS

AUTOSIZE
Indicates if the AUTOSIZE option is activated on the ALTER BUFFERPOOL command.

Field Name: QDBPASIZ

FRAMESIZE
The frame size.

Field Name: QDBPFRAM

VPOOL SIZE MIN
The minimum size of the virtual pool.

Field Name: QDBPVPMI

VPOOL SIZE MAX
The maximum size of the virtual pool.

Field Name: QDBPVPMA

SIM POOL SIZE
The number of simulated buffers allocated in the simulated buffer pool.

Field Name: QDBPSPSZ

SIM POOL SEQ THRESH
The sequential steal threshold for the simulated buffer pool, expressed as a percentage of the total simulated buffer pool size.

Field Name: QDBPSPST
Chapter 58. Group Buffer Pool Parameters

This topic shows detailed information about “System Parameters - Group Buffer Pool Parameters”.

This block shows the merged group buffer pool data from all the members of a DB2 data sharing group. To produce this report, statistics class 5 must be active.

Each time an ALTER GROUPBUFFERPOOL command is issued for a member, an IFCID 230 record is produced showing information about the group buffer pools connected to that particular member of a data sharing group. If the IFCID 230 record indicates that the status of the group buffer pools has changed since the last IFCID 230 record was produced (regardless of which member produced it), or if this is the first IFCID 230 encountered, the new status of the group buffer pools is printed.

The status of the group buffer pools changes if the IFCID 230 record indicates one of the following:

- A member uses a new group buffer pool.
- A member does not use a group buffer pool that it used previously.
- At least one of the group buffer pool attributes has changed.

All the group buffer pools connected to the member, whether or not they have changed, are printed.

System Parameters - Group Buffer Pool Parameters

The field labels shown in the following sample layout of “System Parameters - Group Buffer Pool Parameters” are described in the following section.

<table>

CURRENT DIRECTORY TO DATA RATIO

The current directory entry to data ratio.

For ALTER GROUPBUFFERPOOL commands, this field reports the value specified in the RATIO keyword.
Group Buffer Pool Parameters

Field Name: QBGBGR1

**CLASS CASTOUT THRESHOLD (%)**

The threshold at which the class castout is to be initiated. It is expressed as a percentage of the size of the group buffer pool.

For ALTER GROUPBUFFERPOOL commands, it reports the value specified in the CLASST keyword.

Field Name: QBGBGCT

**GBP ID**

Group buffer pool name.

Field Name: QBGBGN

**DB2 11: CLASS CASTOUT THRESHOLD (PAGES)**

The class castout threshold based on the number of pages.

Field Name: QBGBGCTN

**ALLOCATED GBP SIZE (4K)**

The allocated size of the group buffer pool in 4 KB blocks.

Field Name: QBGBGSZ

**GBP CASTOUT THRESHOLD (%)**

The threshold at which the castout is to be initiated for the group buffer pool. It is expressed as a percentage of the size of the group buffer pool.

For ALTER GROUPBUFFERPOOL commands, it reports the value specified in the GBPOOLT keyword.

Field Name: QBGBGCTN

**ACTUAL DIRECTOR**

The actual number of allocated directory entries.

Field Name: QBGBGDR

**GBP CHECKPOINT INTERVAL (MIN)**

The time interval, in minutes, between successive group buffer pool checkpoints.

For ALTER GROUPBUFFERPOOL commands, it reports the value specified in the GBPCHKPT keyword.

Field Name: QBGBGCK

**ACTUAL DATA ENTRY**

The actual number of allocated data entries.

Field Name: QBGBGDT

**GBP CACHE SETTING**

GBP cache attribute. Possible values are:

- **YES** GBP is used for both data caching and cross-invalidation.
- **NO** GBP is used for cross-invalidation only.

Field Name: QBGBGCS
PENDING DIRECTORY TO DATA RATIO

The pending directory entry to data entry ratio.

Field Name: QBGBGR2

AUTO REC

Indicates whether automatic recovery takes place in the event of a structure failure or a loss of connectivity. When automatic recovery is active, all members of the group are recovered to the group buffer pool.

Field Name: QBGBGAS

MODE

Simplex or duplex mode indicator.

Field Name: QBGBDUP

Prior to DB2 11: SEC-GBP ALLOC

The allocated size of the secondary GBP when the GBP is DUPLEX.
This field is not shown when MODE is SIMPLEX.

Field Name: QBGBGSZ2

Prior to DB2 11: SEC-GBP ALLOC DIRECTORY ENTRY

Number of allocated directory entries in the secondary GBP when MODE is DUPLEX.

Field Name: QBGBGDR2

Prior to DB2 11: SEC-GBP ALLOC DATA ENTRY

The allocated data entries in the secondary GBP when MODE is DUPLEX.

Field Name: QBGBGDT2
Part 11. Utility Activity Report Set

These topics provide information about the Utility Activity reports.

Note: For an introduction to the Utility Activity report set and general Utility Activity information refer to the Reporting User’s Guide. It also provides information on input to Utility Activity reports.

Chapter 59, “Headers Used in Utility Activity,” on page 59-1
OMEGAMON XE for DB2 PE header information is printed at the top of each Utility Activity report or trace page.

Chapter 60, “The Utility Activity Reports,” on page 60-1
This topic describes the Utility Activity report.

Chapter 61, “The Utility Activity Trace,” on page 61-1
This topic introduces the Utility Activity trace.

Chapter 62, “Workload Detail,” on page 62-1
Workload detail blocks are only printed in Utility Activity traces.
Chapter 59. Headers Used in Utility Activity

OMEGAMON XE for DB2 PE header information is printed at the top of each Utility Activity report or trace page.

There are two types of headers:
- The Utility Activity report header
- The Utility Activity trace header.

The report and trace header shows the following information:

**LOCATION**
The DB2 reporting location. If the location name is not available, the DB2 data sharing group name is printed in this field. If the DB2 data sharing group name does not exist, the DB2 subsystem ID is printed.

**OMEGAMON XE FOR DB2 PERFORMANCE EXPERT (VnRnMn)**
The product name and the version, release, and modification level.

**PAGE**
The page number in the format **lll-nnnnnn**, where **lll** denotes the location number within the report and **nnnnnn** the page number within the location.

**GROUP**
The name of the DB2 data sharing group. This field shows N/A if there is no group name.

**REQUESTED FROM and TO**
The FROM and TO dates and times specified in the REPORT or TRACE subcommand.

If both FROM and TO dates and times are omitted from the REPORT subcommand, the FROM and TO dates and times specified in GLOBAL are printed. If only one of the FROM date and time or only the TO date and time has been specified, NOT SPECIFIED is printed for the unspecified value.

If FROM and TO are not specified in REPORT or GLOBAL, NOT SPECIFIED appears for both the FROM and TO values.

If you have specified FROM and TO times without dates in REPORT or GLOBAL, ALL DATES is printed along with the specified times.

**MEMBER**
The name of the DB2 data sharing member or the member name of the DB2 subsystem. This field shows N/A if there is no member name.

This field is not printed on the report page showing the GROUP BUFFERPOOLS PARAMETERS.

**SUBSYSTEM**
The ID of the DB2 subsystem that generated the data. This field is not printed on the report page showing the GROUP BUFFERPOOLS PARAMETERS.

**ORDER**
If the ORDER option of the REPORT or TRACE subcommand was used to arrange the report entries, the selected keywords are shown in this field. Depending on the context, the OMEGAMON XE for DB2 PE identifiers by which lock events are grouped are shown here.
Utility Activity - Report Headers

ACTUAL FROM/TO
The date and time of the first and last record included in the log for a location, group, subsystem, or member.

DB2 VERSION
The DB2 version number of the subsystem that generated the data.

PAGE DATE
The date of the timestamps printed on this page. A page break occurs at the change of the date. This is useful if a trace page contains more than one entry and the date is not shown for each entry.

IDENTIFIED BY
Shows the identifiers specified with the ORDER option.

WITH detail WORKLOAD
The workload details as specified on the WORKLOAD option of the TRACE subcommand.

“Utility Activity Report Header Example” on page 59-3
The Utility Activity reports contain information in the header at the top of each page as shown in the following example.

“Utility Activity Trace Header” on page 59-4
This section introduces the header of the Utility Activity trace.
Utility Activity Report Header Example

The Utility Activity reports contain information in the header at the top of each page as shown in the following example.

LOCATION: USIBMSTDB2
GROUP: DSNCAT
MEMBER: SSDQ
SUBSYSTEM: SSDQ

OMEGAMON XE for DB2 PE & PM: Report Reference
Chapter 60. The Utility Activity Reports

This topic describes the Utility Activity report.

The following command generates the Utility Activity report shown in “Utility Activity Report Example”:

```
UTILITY REPORT
```

This command produces a report including both BIND and UTILITY activity types by default.

**Utility Activity Report Example**

```
LOCATION: PMODA22
GROUP: N/P
MEMBER: N/P
SUBSYSTEM: DA22
DB2 VERSION: V10

OEMEGAMON XE for DB2 PERFORMANCE EXPERT (V5R4M0)
UTILITY ACTIVITY REPORT
REQUESTED FROM: NOT SPECIFIED
TO: NOT SPECIFIED
ORDER: PRIMAUTH-PLANNAME
ACTUAL FROM: 05/11/15 09:01:18.84
TO: 05/11/15 00:00:00.00

PRIMAUTH | PLANNAME | OCCURRENCES | TOT. ELAPSED | TOT. CP | CPU | ACTIVITY TYPE | COUNT | AVG. ELAPSED | AVG. CP | CPU | AVG. ZIP | TOT. ZIIP | TOT. SORTCPU | TOT. SORT ZIP

 | | | | | | | | | | | | | | |
```

**Field description**

The report contains the following fields:

**OMEGAMON XE for DB2 PE identifiers**

Up to three OMEGAMON XE for DB2 PE identifiers can be printed in this column. They are printed whenever they change. The second and third identifiers are indented. If the ORDER option is not used, the default of PLANNAME within PRIMAUTH is shown. Refer to Report Command Reference for more information about the ORDER option.

**OCCURRENCES**

The total number of bind or utility threads for the current combination of OMEGAMON XE for DB2 PE identifiers. A bind thread is identified by the presence of appropriate pairs of IFCIDs 108, 109, 110, 111, 177, and 183. A utility thread is identified by the presence of IFCIDs 023, 024, and 025.

**TOT. ELAPSED**

The time difference between the first bind or utility record and the last bind or utility record.

**AVG. ELAPSED**

The TOT. ELAPSED time divided by OCCURRENCES.

**TOT. CP CPU**

The difference between the CPU time of the first bind or utility record and the CPU time of the last bind or utility record.
Utility Activity - Report

AVG. CP CPU

The TOT. CPUTIME divided by OCCURRENCES.

ACTIVITY TYPE

The name of the activity type and event. The activity type can only be BIND for bind events including remote bind activity, or UTILITY for utility events. All events are indented.

The bind events are as follows:

BIND PLAN

BIND PLAN subcommand issued

BIND PACK

BIND PACKAGE subcommand issued

BIND R-PACK

BIND PACKAGE subcommand issued for a remote location

RBND PLAN

REBIND PLAN subcommand issued

RBND PACK

REBIND PACKAGE subcommand issued

RBND R-PACK

REBIND PACKAGE subcommand issued for a remote location

FREE PLAN

FREE PLAN subcommand issued

FREE PACK

FREE PACKAGE subcommand issued

FREE R-PACK

FREE PACKAGE subcommand issued for a remote location

CONNECT

BIND CONNECT or CONNECT RESET subcommand issued for a remote location.

The utility events are as follows:

CHECKDAT

Identifies the utility as CHECK DATA.

CHECKIDX

Identifies the utility as CHECK INDEX.

COPY

Identifies the utility as COPY.

DIAGNOSE

Identifies the utility as DIAGNOSE.

LOAD

Identifies the utility as LOAD.

MERGECOP

Identifies the utility as MERGECOPY.

MODIFY

Identifies the utility as MODIFY.

QUIESCE

Identifies the utility as QUIESCE.
RECOVER
Identifies the utility as RECOVER TABLESPACE.

RECOVERI
Identifies the utility as RECOVER INDEX.

REBUILDI
Identifies the utility as REBUILD INDEX.

REORG
Identifies the utility as REORG.

REPAIR
Identifies the utility as REPAIR.

REPORT
Identifies the utility as REPORT.

RUNSTATS
Identifies the utility as RUNSTATS.

STOSPACE
Identifies the utility as STOSPACE.

UNLOAD
Identifies the utility as UNLOAD.

COUNT
The number of occurrences of a single bind or utility event.

TOT. ELAPSED
The time difference between the first and last occurrence of a specific bind or utility event.

AVG. ELAPSED
The TOT. ELAPSED time divided by COUNT.

TOT. CP CPU
The difference between the CPU time of the first occurrence of a specific bind or utility event and the CPU time of the UTILEND of the last occurrence of this bind or utility event.

AVG. CP CPU
The TOT. CPU TIME divided by COUNT.

TOT. SORTCPU
The sum of the Sort CPU time for all occurrences of a specific utility event.

TOT. ZIIP
The sum of the total utility ZIIP time for all occurrences of a specific utility event.

AVG. ZIIP
The TOT. ZIIP time divided by COUNT.

SORT ZIIP
The sum of the Sort ZIIP time for all occurrences of a specific utility event.
Utility Activity Report
Chapter 61. The Utility Activity Trace

This topic introduces the Utility Activity trace.

Traces are presented in the order in which the threads complete. Start times might not be shown in ascending order if other threads finished prior to completion of a thread which started earlier.

The Utility Activity trace is generated with the following command:

```
UTILITY
TRACE
ORDER (PRIMAUTH-PLANNAME-INSTANCE)
```

This command produces a trace including both BIND and UTILITY activity types but excluding any workload detail by default.

### Utility Activity Short Trace Example

Here is an example of a Utility Activity Short trace.

```

### Field description

The trace contains the following fields:

© Copyright IBM Corp. 1985, 2016
Utility Activity - Trace

OMEGAMON XE for DB2 PE identifiers
The OMEGAMON XE for DB2 PE identifiers specified in the ORDER
option. They are printed whenever they change. The second and third
identifiers are indented.

PLANNAME
The DB2 application plan name of the thread.

ELAPSED TIME
The time difference between START TIME and the timestamp of the
ENDUTIL of the last bind or utility record of the originating task.

JOB NAME
User-defined job name.

SHRLEVEL
The SHRLEVEL value of the utility. Possible values are: NONE,
REFERENCE, or CHANGE.

START TIME
The timestamp of the first bind or utility record encountered for that
thread.

CPU TIME
The CPU time of the bind or utility event, including the CPU time of any
parallel tasks.

ACTIVITY TYPE
The name of the activity type and event. The activity type can only be
BIND for bind events including remote bind activity, or UTILITY for utility
events. All events are indented.

For a detailed description, of Activity Type, see page "Field description" on
page 60-1.

OBJECT(S)
The description depends on whether it is a utility event, a bind event
referring to a plan, a bind event referring to a package, or a BIND
CONNECT:
• In the case of a utility, it is the database name.object name for each object
  worked on by the utility. Each database name.object name is shown only
  once.
• In the case of a BIND PLAN, RBND PLAN, or FREE PLAN event, it is the
  plan name.
• In the case of a BIND PACK, RBND PACK, FREE PACK, BIND R-PACK,
  RBND R-PACK, or FREE R-PACK event, the following information is
  shown:
  LOCN The location of the package.
  COLL The collection to which the package belongs.
  PKID The package ID.
  VRID The first 53 characters of the version name.
  CONS The consistency token for the package.
  • In the case of a CONNECT, it is LOCN, the location of the package.

TOT. ZIIP
The total utility ZIIP time (if Accounting class 1 trace is activated).
SORT  The following fields provide information about sorting. They are only written for utility events:

DF    Shows if DFSORT was invoked at least once (Y/N).

DB2   Shows if DB2SORT was invoked at least once (Y/N).

DATA  Shows the number of parallel data sorts.

INDEX Shows the number of parallel index sorts.

OTHER Shows the number of other sorts.

SORT CPU Shows the SOR CPU time.

SORT ZIIP Shows the SOR ZIIP time (if provided by the SOR program).
Chapter 62. Workload Detail

Workload detail blocks are only printed in Utility Activity traces.

The workload detail blocks are displayed beneath the thread events.

“Bind Activity” on page 62-2
This topic describes the layout of the Bind Activity block.

“Data Set Information” on page 62-7
This block shows the data set information available for the activity.

“Exit Activity” on page 62-8
This block shows the exits performed by the event.

“I/O Activity” on page 62-9
This block shows the I/O activity for each object performed by the event.

“LISTDEF Information” on page 62-11
This topic describes the workload block of the list definition (LISTDEF) information.

“Lock Suspension Activity” on page 62-12
This topic shows detailed information about “Workload Detail - Lock Suspension Activity”.

“Page and Row Locking Activity” on page 62-14
This block shows the page locking, row locking, and lock avoidance activity for each object, performed by the event.

“Utility Phases” on page 62-17
This block shows the utility phases for each object performed by the event. Its layout depends on whether the utility produces parallel tasks.
Bind Activity

This topic describes the layout of the Bind Activity block.

This block shows the bind activity for:
- BIND PACK
- BND R-PACK
- RBND PACK
- RBND R-PACK
- BIND PLAN
- RBND PLAN

The layout depends on whether it is a package or a plan for which bind activity is shown.

Bind Activity Workload Block Example for Packages or Plans

Here is an example of the Bind Activity Workload Block for Packages.

--- BIND ACTIVITY -----------------------------------------------------------------------------------------------------------
ISOLATION : CS                       TYPE : AUTOMATIC                    ACQUIRE : ALLOCATION                DEGREE : ANY                      VALIDATE : BIND
OWNER      : MANFRED                   CURRENTDATA : YES                  RELEASE : DEALLOCATION              KEEPDYNAMIC : YES                  EXPLAIN : YES
DYNAMICRULES: BIND                    DISCONNECT : CONDITIONAL           PREPARE : NODEFER                    QUALIFIER : HUGOPAUL                REDOPTIMIZE : YES
ACTION      : REPLACE                   SQLERROR : NOPACKAGE                SQLRULES : DB2                       PROTOCOL : NOT_SPEC                   OPTHINT : YES
IMMEDWRITE  : YES                      SENT : 123456                     ELAPSED_TIME: 1234.123456             CPU_TIME: 1234.12345656
STMT. BOUND : 123456                   ELAPSED_TIME: 1234.123456             CPU_TIME: 1234.12345656
STMT. ^BOUND : 123456                  ELAPSED_TIME: 1234.123456             CPU_TIME: 1234.12345656

Here is an example of the Bind Activity Workload Block for Plans.

--- BIND ACTIVITY -----------------------------------------------------------------------------------------------------------
ISOLATION : CS                       TYPE : AUTOMATIC                    ACQUIRE : ALLOCATION                DEGREE : ANY                      VALIDATE : BIND
OWNER      : MANFRED                   CURRENTDATA : YES                  RELEASE : DEALLOCATION              KEEPDYNAMIC : YES                  EXPLAIN : YES
DYNAMICRULES: BIND                    DISCONNECT : CONDITIONAL           PREPARE : NODEFER                    QUALIFIER : HUGOPAUL                REDOPTIMIZE : YES
ACTION      : REPLACE                   CACHESIZE : 4096                   SQLRULES : DB2                       PROTOCOL : NOT_SPEC                   OPTHINT : YES
IMMEDWRITE  : YES                      IMMEDWRITE : PH1

Field description

Here is a description of the field labels shown in the bind activity workload block for both packages and plans.

ISOLATION
Indicates the isolation level of the plan or package.

TYPE
The type of bind.

ACQUIRE
Indicates when to acquire the locks:

ALLOCATION
Acquire the locks when the plan or package is allocated.

USE
Acquire the locks when the application first accesses them.
Utility Activity - Bind Activity

**DEGREE**
Indicates whether DB2 is to attempt to run a query using parallel processing.

- 1  Parallelism is prohibited
- ANY  Parallelism is allowed

**VALIDATE**
The time of validation:

- RUN  Validate at run time.
- BIND  Validate at bind time.

**OWNER**
The plan or package owner.

**CURRENTDATA**
Controls the data currency for ambiguous cursors:

- NO  Data currency is not required for ambiguous cursors. Blocking for ambiguous cursors is allowed.
- YES  Data currency is required for ambiguous cursors. Blocking for ambiguous cursors is inhibited.
- ALL  Data currency is required for all cursors. Applicable to packages only.

**RELEASE**
Indicates when to release the locks:

- COMMIT  Release locks at commit time.
- DEALLOCATION  Release locks at deallocation time.

For packages only:

- DEFAULT  Release locks at run time, which is the default.

**KEEPDYNAMIC**
Indicates whether the prepared dynamic SQL statements are preserved past a commit:

- NO  The prepared dynamic SQL statements are destroyed at each commit.
- YES  The prepared dynamic SQL statements are preserved past a commit. Any subsequent OPEN, EXECUTE, or DESCRIBE assumes that the previous SQL statement is to be executed.

**EXPLAIN**
Indicates whether EXPLAIN was specified for the bind request.

**DYNAMICRULES**
The value of the DYNAMICRULES option on the BIND/REBIND command:

- RUN  Run time rules apply to a dynamic SQL statement for authorization checking and object qualification at run time.
Utility Activity - Bind Activity

BIND  Bind-time rules apply to a dynamic SQL statement for authorization checking and object qualification at run time.

N/P  DYNAMICRULES was not specified.

DISCONNECT
Indicates which remote connections are terminated during commit operations:

EXPLICIT
Only connections in the release state are terminated.

AUTOMATIC
All remote connections are terminated.

CONDITIONAL
All remote connections are terminated provided that an open WITH HOLD cursor is not associated with the connection.

PREPARE
Indicates whether the preparation of dynamic SQL statements was deferred:

DEFER
The preparation of the dynamic SQL statements that refer to remote objects was deferred until run time.

NODEFER
The dynamic SQL statements were prepared at bind time.

QUALIFIER
The qualifier used for unqualified object names.

REOPTIMIZE
Indicates whether reoptimization was requested:

YES  REOPT(VARS) was specified to reoptimize the access path of the SQL statement at run time.

NO   NOREOPT(VARS) was specified to optimize the access path of the SQL statement only at bind time.

ACTION
Specifies whether the plan or package replaces an existing plan or package with the same name or is new:

REPLACE
The existing plan or package is replaced.

ADD  A new plan or package is added.

This field only applies to BIND activities. For all other activities, N/P is printed.

IMMEDWRITE
Indicates how DB2 updates group buffer pool dependent pages. This is only valid in a data sharing environment.

Group buffer pool dependent pages can be written to DASD or SYSTEM pagesets.

Values shown are:

NO  DB2 uses normal write activity for updates, this is the default. Pages are written out at, or before phase 2 commit, or at the end of an abort for transactions that have rolled back.
**PH1**
Pages are written out at, or before phase 1 commit.

If a transaction subsequently rolls back, the pages are updated in the group buffer pool at the end of the rollback and are written out at the end of the abort.

**YES**
Pages are written out to the coupling facility as soon as the buffer update commits. Pages are written out regardless of whether the update occurs during forward progress or rollback of the transaction.

This option can affect performance due to coupling facility overhead.

**SQLERROR**
Indicates whether a package is created if SQL errors are encountered:

**CONTINUE**
A package is created even when SQL errors are encountered.

**NOPACKAGE**
No package is created if SQL errors are encountered.

**CACHE SIZE**
The size (in bytes) of the authorization cache specified for the CACHESIZE keyword. A value of 0 indicates that DB2 determines the size of the authorization cache.

**SQLRULES**
Indicates whether a type-2 CONNECT statement was executed according to the rules of DB2 or the ISO/ANS SQL2 standard:

**DB2**
An error does not occur if CONNECT identifies an existing SQL statement.

**STD**
An error occurs if CONNECT identifies an existing SQL statement.

**PROTOCOL**
Valid values are:

**DRDA**
Protocol is DRDA.

**PRIVATE**
Protocol is a private protocol

**NOT_SPEC**
Protocol was not specified. This is only valid for packages.

**OPTHINT**
Indicates whether optimizations hints are to be used. This can be:

- **YES**
- **NO**

**SENT**
The number of SQL statements sent to be bound at the server, and the elapsed and CPU times spent for that event at the requester site.

This field is only shown for remote events.

**STMT. BOUND**
The number of SQL PARSER events and one or more minibind events that occur between matched BIND or REBIND begin/end record pairs, and the elapsed and CPU times spent for those events.
When a statement is bound, DB2 chooses an access path for the DB2 statement. The only bound DB2 statements are SELECT, UPDATE, INSERT, and DELETE. The other DB2 statements do not require an access path to be generated.

This field shows N/P if the CPU header is not present in the trace data. It is not shown if the IFCIDs 022 and 063 are not available.

**STMT. BOUND**

The number of SQL PARSER events without corresponding minibind events that occur between matched record pairs (BIND or REBIND begin/end), and the elapsed and CPU times spent for those events.

A statement is not bound if DB2 does not calculate an access path. DECLARE CURSOR and CLOSE CURSOR are examples of statements that are not bound.

This field shows N/P if the CPU header is not present in the trace data. It is not shown if the IFCIDs 022 and 063 are not available.
Data Set Information

This block shows the data set information available for the activity.

**Utility Data Set Information Workload Block**

Here is an example of the Utility Data Set Information Workload Block:

```
--- DATA SET INFO ---------------------------------------------
DD NAME: CCCCCC8   DS NAME: CCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCC44  TEMPLATE NAME: CCCCCC8
DURATION : 02:03:05.10  DEVICE TYPE : C  OPEN TIMESTAMP: 01/30/15 18:15:44.38
```

**Field description**

Here is a description of the field labels shown in the Utility Data Set Information Workload Block:

- **DD NAME**
  - Data definition.

- **DS NAME**
  - Data set name.

- **TEMPLATE NAME**
  - Template name.

- **NO.READS**
  - Number of READ operations.

- **NO.WRITES**
  - Number of WRITE operations.

- **NO.CHECKS**
  - Number of checks.

- **NO.EOV**
  - Number of End of Volumes.

- **I/O WAIT TIME**
  - I/O wait time.

- **DURATION**
  - The number of seconds the data set was open.

- **DEVICE TYPE**
  - Device type:
    - D  DASD.
    - T  Tape.

- **OPEN TIMESTAMP**
  - Time the data set was opened.
Exit Activity

This block shows the exits performed by the event.

Exits Workload Block Example

Here is an example of the Exits Workload Block.

Field description

Here is a description of the field labels shown in the Exits Workload Block.

**MEMBER**
The name of the DB2 member within the DB2 data sharing group.

**VALIDATION TOTAL**
The number of results of a validation exit call written for every validation row.

**VALIDATION AET/EXIT**
The summarized elapsed validation time divided by the value in VALIDATION TOTAL.

**EDIT TOTAL**
The summary of results of an edit exit call to encode a record written for every row edited and the results of an edit exit call to decode a record written for every row decoded.

**EDIT AET/EXIT**
The summarized elapsed edit time divided by the value in EDIT TOTAL.
I/O Activity

This block shows the I/O activity for each object performed by the event.

I/O Activity Workload Block Example

This is an example of the I/O Activity Workload Block.

<table>

</tr>
</tbody>
</table>

Field description

Here is a description of the field labels shown in the I/O Activity Workload Block.

DATABASE
The database name. If the name is not available, the decimal DBID/OBID is printed.

PAGESET
The page set name. If the name is not available, the decimal DBID/OBID is printed.

MEMBER
The name of the DB2 member within the DB2 data sharing group.

BP
The buffer pool name.

I/O REQUEST TOTAL
The total number of I/O requests.

I/O REQUEST AET
The average elapsed time for each I/O request.

READ REQUEST TOTAL
The number of read I/O requests of a specific type.

READ REQUEST TYPE
The type of read request:
- SYNCH
  Synchronous read request
- SEQPF
  Sequential prefetch request
- DYNPF
  Dynamic prefetch request
- LSTPF
  List prefetch request

READ REQUEST AET/WITH
The average elapsed time for a read with I/O of a specific type.

READ REQUEST %WITH
The percentage of total read requests with I/O for a particular type.

READ REQUEST PAGE/WITH
The pages read for each read request with I/O of a particular type.
Utility Activity - I/O

READ REQUEST %WITHOUT
The percentage of total read requests without I/O for a particular type. This can occur because all the pages requested by a prefetch read were already in the buffer pool.

WRITE REQUEST TOTAL
The number of write I/O requests.

WRITE REQUEST TYPE
The type of write request.

WRITE REQUEST CAST
Indicates whether the write operations were initiated due to a coupling facility castout.

WRITE REQUEST AET
The average elapsed time for each write.

WRITE REQUEST PAGE/WRITE
The number of pages written.
LISTDEF Information

This topic describes the workload block of the list definition (LISTDEF) information.

LISTDEF Information Workload Block

This is an example of the workload block of the list definition (LISTDEF) information.

```
--- LISTDEF LIST INFO --------------------------------------------------------------------- ---
LIST NAME : CCCCCCCCCCCCCC18 LIST TYPE : M LIST SIZE : 12345
```

Field description

The workload block of the list definition (LISTDEF) information contains the following fields:

LIST NAME

Name of list definition information.

LIST TYPE

Type of LISTDEF information:

- **T** Table space list.
- **I** Index space list.
- **M** Mixed list.
Utility Activity - Lock Suspension

Lock Suspension Activity

This topic shows detailed information about “Workload Detail - Lock Suspension Activity”.

This block shows the lock suspension activity for each object performed by the event.

Lock Suspension Activity Workload Block Example

The field labels shown in the following sample layout of “Lock Suspension Activity Workload Block” are described in the following section.

<table>
<thead>
<tr>
<th>RESOURCE NAME</th>
<th>TYPE</th>
<th>REQUEST</th>
<th>LOCAL LATCH</th>
<th>LRMQ GROUP</th>
<th>NOTIF</th>
<th>COUNT</th>
<th>AET COUNT</th>
<th>AET COUNT</th>
<th>AET</th>
</tr>
</thead>
<tbody>
<tr>

<td>TSPARALL</td>
<td>DATAPAGE</td>
<td>LOCK</td>
<td>0</td>
<td>1</td>
<td>0</td>
<td>2</td>
<td>2</td>
<td>0</td>
</tr>
</tbody>
</table>

The following list describes the fields in the lock suspension activity workload block:

RESOURCE NAME
The name of the resource on which the suspended request is made. The content of the field depends on the resource type:
- The plan name for SKCT
- The collection and package IDs for SKPT
- The collection ID for COLLECT
- The database name for DATABASE, CDB PLK, DBD PLCK
- The buffer pool ID for ALTERBUF, GBP S/S, P/P PLCK, PAGEPLCK, GBP CAST, P/P CAST
- The anchor point ID for HASH-ANC
- The row ID for ROW
- N/A for MASS, UTILITY, BINDLOCK, ALTERBUF, CATM MIG, CATM CAT, CATM DIR
- The database and page set names for all others

The database and page set names are translations obtained from the IFCIDs 105 and 107. If these records are unavailable, the decimal DBIDs and OBIDs are printed.

MEMBER
The name of the DB2 member within the DB2 data sharing group.

TYPE
The type of the locked resource. Possible values are shown in Table 33-1 on page 33-3.

REQUEST
The type of request that has been suspended:
- LOCK  IRLM lock request
- UNLOCK  IRLM unlock request
CHANGE
IRLM change request

QUERY
IRLM query request

NOTIFY
IRLM notify request

DRAIN
Drain request

LATCH
Latch request

SUSPEND REASON LOCAL
The number of suspensions due to local resource contentions.

SUSPEND REASON LATCH
The number of suspensions due to IRLM latch contentions.

SUSPEND REASON IRLMQ
The number of suspensions due to IRLM queued requests.

SUSPEND REASON GROUP
The number of suspensions due to global contention.

SUSPEND REASON NOTIFY
The number of suspensions due to intersystem message sending.

SUSPEND REASON OTHER
The number of suspensions due to reasons other than those listed previously.

Note: For drain suspensions, the suspension reason is always “waiting for the claim count to reach zero” and is categorized as OTHER.

NORML RESUME COUNT
The number of suspensions that ended in the task, resuming normal processing after the lock request has completed.

NORML RESUME AET
The normal resume average elapsed time. This is the normal resume elapsed time divided by the NORML RESUME COUNT.

TIMEO RESUME COUNT
The number of suspensions that ended in a timeout.

TIMEO RESUME AET
The average elapsed timeout time. This is the elapsed timeout time divided by the TIMEO RESUME COUNT.

DEADL RESUME COUNT
The number of suspensions that ended in a deadlock.

Note: Drain suspensions do not end in a deadlock.

DEADL RESUME AET
The average elapsed deadlock time. This is the elapsed deadlock time divided by the DEADL RESUME COUNT.
Page and Row Locking Activity

This block shows the page locking, row locking, and lock avoidance activity for each object, performed by the event.

The page and row locking activity block is only printed if a commit occurred or a thread terminated.

In summary by occurrence, page and row locking activity information generated for explicit commits is shown on the relevant commit events.

In summaries by cursor or program, any explicit commits occurring during the life of that cursor or program are counted. Page and row locking activity caused by those commits is shown on the relevant cursor or program.

In summaries by statement number or statement type, commits are not counted. Because page and row locking activity is not relevant for these summary levels, it is not printed.

Any page or row locking activity occurring when a thread terminated is shown in the summary by thread. This activity is added to any page or row locking which took place in the body of the thread. Therefore, page and row locking figures in summary by thread can be greater than the sum of page locking figures shown in the body of the thread. The difference is the page and row locking activity occurring at thread termination.

An example of the page and row locking workload block is shown in the following example.

Page and Row Locking Workload Block Example

--- PAGE & ROW LOCKING -----------------------------------------------
MEMBER DATABASE PAGESET COUNT SIZE OR ROW LOCKS HELD LOCK MAXIMUM PAGE OR ROW LOCKS HELD hymap ESCAL HIGHEST LOCK TYPE LOCK ESCAL SUCCESSFUL
SE11 DBPARALL TSPARALL 1 PAGE 1 0 SPL YES
SUMMARY : MAX PAGE OR ROW LOCKS HELD 1 LOCK ESCALATIONS : SHARED 0 EXCLUSIVE 0
SE12 DBPARALL TSPARALL 2 PAGE 5 0 SPL YES
SUMMARY : MAX PAGE OR ROW LOCKS HELD 5 LOCK ESCALATIONS : SHARED 0 EXCLUSIVE 0
SE21 DBPARALL TSPARALL 1 PAGE 2 0 SPL YES
SUMMARY : MAX PAGE OR ROW LOCKS HELD 2 LOCK ESCALATIONS : SHARED 0 EXCLUSIVE 0
TOTAL 4 0

Note:
1. The DBID and OBID are obtained from IFCID 020.
2. The values in MAX PAGE OR ROW LOCKS HELD, LOCK ESCALATIONS SHARED, and LOCK ESCALATIONS EXCLUSIVE are accumulated within a subsystem. They are reset only at thread deallocation or when a new user signon occurs.
3. The values in MAXIMUM PAGE OR ROW LOCKS, HIGHEST LOCK, and # LOCK ESCAL are reset at commit time for dynamic BINDs and for static BINDs for which release (commit) is specified. Otherwise, these values accumulate until thread deallocation or until a new user signon occurs.
4. IFCID 218 is an additional lock summary record, written for lock avoidance. It indicates whether a successful lock avoidance test occurred during a given unit of work. The record is externalized for the agent at each commit or rollback.
5. For each event, the relevant IFCID 020 and 218 records are processed. If there is a DBID/OBID combination present for IFCID 218 but not for IFCID 020, the

Note:
1. The DBID and OBID are obtained from IFCID 020.
2. The values in MAX PAGE OR ROW LOCKS HELD, LOCK ESCALATIONS SHARED, and LOCK ESCALATIONS EXCLUSIVE are accumulated within a subsystem. They are reset only at thread deallocation or when a new user signon occurs.
3. The values in MAXIMUM PAGE OR ROW LOCKS, HIGHEST LOCK, and # LOCK ESCAL are reset at commit time for dynamic BINDs and for static BINDs for which release (commit) is specified. Otherwise, these values accumulate until thread deallocation or until a new user signon occurs.
4. IFCID 218 is an additional lock summary record, written for lock avoidance. It indicates whether a successful lock avoidance test occurred during a given unit of work. The record is externalized for the agent at each commit or rollback.
5. For each event, the relevant IFCID 020 and 218 records are processed. If there is a DBID/OBID combination present for IFCID 218 but not for IFCID 020, the
IFCID 020 fields show N/P. If there is a DBID/OBID combination present for IFCID 020 but not for IFCID 218, the IFCID 218 field (LOCK AVOID SUCCESSFUL) shows N/P.

**Field description**

The fields in the page and row locking workload block are:

**MEMBER**
The name of the DB2 member within the DB2 data sharing group.

**DATABASE**
The database name, if available.
If the name is not available, the decimal DBID is printed instead.

**PAGESET**
The page set name, if available.
If the name is not available, the decimal OBID is printed instead.

**COUNT**
The number of page locking or row locking occurrences for each page set.
- Specific database and page set:
  - At commit time: always 1
  - At thread termination: the number of times this database and page set occurred on a commit record
- TOTAL
  - At commit time: the total number of page sets listed
  - At thread termination: the sum of the values for all page sets

**LOCK SIZE**
The lock size used:
- PAGE  Page lock
- ROW   Row lock
- TABLE  Table space or table lock
- LOB   LOB lock
- UNKN  Unknown lock
- * Multiple lock sizes

**MAXIMUM PAGE OR ROW LOCKS**
The maximum number of either page locks or row locks held at one time against this object.

**# LOCK ESCAL**
The number of lock escalations:
- 0 if no escalations occur
- For simple table spaces and partitioned table spaces not using selective partition locking (SPL): 1 if any escalation occurred for this table space in this logical unit of work
- For segmented table spaces: the number of tables within the table space that have experienced lock escalations
- For partitioned table spaces using SPL: the number of partitions for which locks escalated within the table space

The TOTAL contains the sum of all values in this column.
Utility Activity - Page and Row Locking

**HIGHEST LOCK**
The highest table space lock state.
If the table space is simple or partitioned not using SPL, it is the highest lock state for this database or page set. At trace end, it is the largest value from any commit for this object. The following values are possible:

- **IS** Intent share
- **IX** Intent exclusive
- **S** Share
- **U** Update share
- **SIX** Share with intent exclusive
- **X** Exclusive

If the table space is segmented or partitioned using SPL, this field is blank.

**TS TYPE**
The table space type:

- **SIMPL** Simple table space
- **SEG** Segmented table space
- **PARTI** Partitioned table space
- **SPL** Partitioned table space using selective partition locking (SPL)
- **LOB** LOB table space

**LOCK AVOID SUCCESSFUL**
Indicates whether there was a successful lock avoidance test during the unit of work.

If the state of this field changed during the summarization period, an asterisk (*) is shown.

**MAX PAGE OR ROW LOCKS HELD**
The maximum number of page locks and row locks held at one time across all objects.

**LOCK ESCALATIONS: SHARED**
The total of shared lock escalations.

**LOCK ESCALATIONS: EXCLUSIVE**
The total of exclusive lock escalations.
Utility Phases

This block shows the utility phases for each object performed by the event. Its layout depends on whether the utility produces parallel tasks.

**Note:** You can process up to 40 utility phases for each object.

### Phases Workload Block Example without Parallel Tasks

Here is an example of the phases workload block without parallel tasks. An example of the phases workload block with parallel tasks is shown in "Phases Workload Block Example with Parallel Tasks."

---

**Utility Activity - Page and Row Locking**

### Phases Workload Block Example with Parallel Tasks

Here is an example of the phases workload block with parallel tasks.

</tr>
</tbody>
</table>

Note:

1. In LOAD and REORG utility parallelism, the calculation of the elapsed and CPU times for the SORT phase only takes into account the parallel sort, not the originating task.

2. Although not a phase of the LOAD or REORG utility, COPY is reported as a phase when a concurrent COPY was requested for the LOAD or REORG.

3. If the utility runs on several objects or partitions, a TOTAL is shown for each phase.

“Header Fields - Utility Phases” on page 62-19
This topic describes the header fields of the Utility Phases.

“Field description - Utility phases” on page 62-21
This topic describes the fields of the Utility Phases.
Header Fields - Utility Phases

This topic describes the header fields of the Utility Phases.

**START TIME**
Start of the utility. This is the timestamp of the IFCID 023 (Utility Start) for the UTILINIT.

**ELAPSED TIME**
Total elapsed time. This is the difference between the timestamp of the IFCID 025 (Utility End) for the UTILTERM and the timestamp of the IFCID 023 (Utility Start) for the UTILINIT.

**UTILITY-ID**
User–defined utility identifier. This can be up to 16 characters in length.

**JOB NAME**
User-defined job name.

**SHRLEVEL**
The SHRLEVEL value of the utility. Possible values are: NONE, REFERENCE, or CHANGE.

**SUBTASKS**
These three numbers show the following information about parallel subtasks:
1. Requested number of subtasks.
2. Number of actual subtasks.
3. Number of reused subtasks.

_Note:_ You can process up to 40 subtasks.

N/A is printed for both values when no subtasks or parallelism are used.

**CPU TIME**
Total CPU time. This is the difference between the CPU time of the IFCID 025 (Utility End) for the UTILTERM and the CPU time of the IFCID 023 (Utility Start) for the UTILINIT.

**ACTIVITY TYPE**
The name of the activity type and event. The activity type can only be BIND for bind events including remote bind activity, or UTILITY for utility events. All events are indented.

For a detailed description, of Activity Type, see page "Field description" on page 60-1.

**DATABASE.PAGESET**
The page set ID. This field should match the corresponding field of the preceding IFCID 0024 record.

**STEP**
The step name of the utility job.

**TOT. ZIIP**
The total utility ZIIP time (if Accounting class 1 trace is activated).

**SORT**
The type of Sort:
- **DF**  DFSORT was invoked at least once. Possible values: are: Y or N.
- **DB2** DB2 SORT was invoked at least once. Possible values: are: Y or N.
- **DATA** The number of parallel data sorts.
Utility Activity - Workload Header

INDEX
The number of parallel index sorts.

OTHER
The number of other sorts.

SORT CPU
The Sort CPU time.

SORT ZIIP
The Sort ZIIP time (if provided by the Sort program).
Field description - Utility phases

This topic describes the fields of the Utility Phases.

PHASE
The name of the phase used by the utility.

UNLOAD
The unload phase of the maintask or the summary of unload subtasks.

SORT
The sort phase of the maintask or the summary of sort subtasks.

BUILD
The build phase of the maintask or the summary of build subtasks.

DATABASE
The database name of the object.

PAGESET
The table space name or index name of the object.

When the sort or build phase, or both, are running in parallel as part of a subtask, ******** is printed if the number of objects is greater than one.

PARTNO
The number of the partition or data set if the utility is operating on a single partition or data set. Otherwise, the value in this field is 0.

TYPE
The item type for the individual phases.

COUNT
The number of item types processed by the phase for one object.

ELAPSED TIME
The elapsed time of the phase. This is the time between the IFCID 024 (utility change) of the phase and the IFCID 024 of the next phase. For the last phase, this is the time between the IFCID 024 (utility change) of the phase and the IFCID 024 of the UTILTERM.

CPU TIME
The CPU time of the phase. This is the time between the IFCID 024 (utility change) of the phase and the IFCID 024 of the next phase. For the last phase, this is the time between the IFCID 024 (utility change) of the phase and the IFCID 024 of the UTILTERM.

UTILINIT/ UTILTERM
This is the starting and ending time of the utility. This is the sum of the time between the IFCID 023 (Utility start) of the UTILINIT and the IFCID 024 (Utility change) of the first phase and the time between the IFCID 024 and the IFCID 025 (Utility end) of the UTILTERM. This is shown as elapsed time and CPU time.

MAIN TASK TOTAL
The total time spent processing main tasks. This is shown as elapsed time and CPU time.

SUBTASK
For each subtask, the following information is shown:

SUBTASK
The time between the IFCID 023 (utility start) for the subtask and the IFCID 024 (utility change) for the first phase within the subtask. This is shown as elapsed time and CPU time.
Utility phases

**Phase**  The name of the phase and time information. For a single phase, this is the time between the IFCID 024 (utility change) for the phase and the IFCID (utility end) of the subtask.

When a subtask contains multiple phases, the duration of the first and intermediate phases is measured from the IFCID 024 of the phase to the IFCID 024 of the next phase. For the last phase in the subtask, phase duration is taken from the IFCID 024 (utility change) for the phase to the IFCID 025 (utility end) of the subtask.

This is shown as elapsed time and CPU time.

**SUBTASK TOTAL**  
Total time spent processing the subtask. This is the time between the IFCIDs 23 (utility start) and 25 (utility end) for the subtask. This is shown as elapsed time and CPU time.
Part 12. Additional Record Information

These topics provide additional information about reports.

Chapter 63, “DPMOUT Record,” on page 63-1
The externalized DPMOUT data is a sequential data set with variable-length records. The following table outlines the format of the DPMOUT record.

Chapter 64, “OMEGAMON XE for DB2 PE VSAM Data Sets,” on page 64-1
This section explains the VSAM Data Sets of OMEGAMON XE for DB2 PE.

Chapter 65, “Correlation Translation Record,” on page 65-1
This record layout is not intended to be used as programming interface.

Chapter 66, “Location Information Record,” on page 66-1
This topic describes the record format of the location information.

Chapter 67, “MAINPACK Definitions Record,” on page 67-1
This topic describes the record format of the MAINPACK Definitions.
Chapter 63. DPMOUT Record

The externalized DPMOUT data is a sequential data set with variable-length records. The following table outlines the format of the DPMOUT record.

**Note:** Do not use this record as a programming interface.

The DPMOUT record consists of the following sections:
- **Header**
- **Product data section showing:**
  - Instrumentation data
  - CPU data
  - DDF data
  - Data sharing information
- **Repeating section information**
- **DBID and OBID translation information**

The following tables show the layout of the DPMOUT record:

- **DPMOUT header**

Chapter 64. OMEGAMON XE for DB2 PE VSAM Data Sets

This section explains the VSAM Data Sets of OMEGAMON XE for DB2 PE.

OMEGAMON XE for DB2 PE uses the following VSAM data sets:

- A VSAM-Save data set is written when the job stream contains a SAVE subcommand without the CONVERT option.
- A physical sequential data set is written when the job stream contains a SAVE subcommand with a CONVERT option.
- Job summary data sets are written when new data is processed.

All VSAM data sets used in an OMEGAMON XE for DB2 PE job must exist before OMEGAMON XE for DB2 PE is executed. Preallocate the data sets using the IDCAMS command. You can run IDCAMS as an initial step in the OMEGAMON XE for DB2 PE job. The required attributes for VSAM data sets are shown in Table 64-1. An example of the required IDCAMS commands is shown in "IDCAMS Commands."

Refer to the z/OS DFSMS for more information about IDCAMS.

Note:
1. When the SAVE subcommand is specified, the save data set should be empty. If it is not empty, all existing records are deleted. If save and restore use the same physical data set, the restored data is rewritten during save.
2. You need not prime OMEGAMON XE for DB2 PE VSAM data sets.

### Table 64-1. Attributes for OMEGAMON XE for DB2 PE VSAM Data Sets

<table>
<thead>
<tr>
<th>Data Set</th>
<th>Key Length (bytes)</th>
<th>Maximum Record Length (bytes)</th>
<th>Average Record Length (bytes)</th>
<th>Buffer Space (bytes)</th>
<th>Data Control Interval Size (bytes)</th>
<th>Index Control Interval Size (bytes)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accounting SAVE (ACSAVDD)</td>
<td>255</td>
<td>5500</td>
<td>3000</td>
<td>40 960</td>
<td>8192</td>
<td>4096</td>
</tr>
<tr>
<td>Statistics SAVE (STSAVDD)</td>
<td>92</td>
<td>8192</td>
<td>2400</td>
<td>40 960</td>
<td>8192</td>
<td>4096</td>
</tr>
<tr>
<td>Job Summary (JSSRSDD)</td>
<td>52</td>
<td>2462</td>
<td>160</td>
<td>40 960</td>
<td>8192</td>
<td>4096</td>
</tr>
</tbody>
</table>

Note: Buffer space and control interval size are suggestions only. You can modify them to suit the requirements of your installation.

### IDCAMS Commands

In this example, the job deletes the cluster if it already exists, then defines a new cluster with the specified attributes.

//ALCVSAM EXEC PGM=IDCAMS
/SYSPRINT DD SYSLST=* /SYSIN DD * DELETE (cluster.name)
DEFINE - CLUSTER { - NAME (cluster.name) - TRACKS (as required) -
© Copyright IBM Corp. 1985, 2016 64-1
VOLUMES (as required) -
KEYS (keylength 0) -
RECORDSIZE (average maximum) -
BUFFERSPACE (40960) -
REUSE -
) -
DATA ( -
CONTROLINTERVALSIZE (B192) -
) -
INDEX ( -
CONTROLINTERVALSIZE (4096) -
)
