           n         n         n
Waits: Pool lock Buf lock
           n         n
```

System action: Processing continues.

User response: The statistics are described in detail in the DFHXQS2D data area. The individual fields have the following meanings:

- Buffers:

- Total** Number of buffers in the pool.
- Max used**
Highest number ever used (not affected by reset).
- Active** Buffers currently in use.
- On LRU**
Buffers with valid contents on LRU chain to allow reuse.
- Empty** Buffers previously used but now empty.
- Requests:
 - Gets** Requests to get a buffer.
 - Puts** Requests to put back a buffer with valid contents.
 - Keeps** Requests to put back a buffer with modified contents. (This function is not currently used by the queue server).
 - Frees** Requests to put back a buffer as empty.
 - Purges** Requests to discard contents of a previously valid buffer.
- Results (Get):
 - Got hit** Request found a valid match on the LRU chain.
 - Got free**
Request obtained an empty buffer.
 - Got new**
Request obtained a buffer not previously used.
 - Got LRU**
Request discarded and reused the oldest valid buffer.
 - No buff**
Request failed to obtain a buffer.
- Errors:
 - Not freed**
Request tried to free a buffer which it did not own. (This can occur during error recovery).
 - No purge**
A purge request did not find any matching buffer.
 - Not owned**
A purge request hit a buffer owned by another task.
- Waits:
 - Pool lock**
Number of waits for the buffer pool header lock.
 - Buf lock**
Number of waits because another request owned the buffer.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHXQBF

DFHXQ0601I Starting statistics collection for interval since *lasttime*.

Explanation: The queue server is about to collect interval, end of day or closedown statistics. This message identifies the start of the time interval to which the statistics apply, which is either the time that the server was started up or the time of the last reset, which occurs whenever interval or end of day statistics are produced. The format of the timestamp is yyyy-mm-dd hh

System action: The queue server proceeds with statistics collection.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHXQST

DFHXQ0602I Statistics collection completed, reset performed.

Explanation: Queue server statistics have been collected and counters have been reset. This occurs for interval or end of day statistics.

System action: Processing continues.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHXQST

DFHXQ0603I Statistics collection completed.

Explanation: Queue server statistics have been collected but counters have not been reset. This normally occurs at server closedown.

System action: Processing continues.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHXQST

DFHXQ0604 Timer SET failed, return code *retcode*, reason code *rsncode*.

Explanation: An attempt by the queue server statistics subtask to set up a timer wait interval failed.

System action: The interval statistics function is terminated with message DFHXQ0606.

User response: Check the return code and reason code. A return code of 4 indicates an attempt to set up more than one concurrent timer interval, which indicates a logic error in the server. A return code of 8 indicates that the MVS STIMERM macro failed, in which case the reason code indicates the return code received from STIMERM SET.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHXQST

DFHXQ0605 Timer CANCEL failed, return code *retcode*, reason code *rsncode*.

Explanation: An attempt by the queue server statistics subtask to cancel a timer wait interval failed.

System action: The interval statistics function is terminated with message DFHXQ0606.

User response: Check the return code and reason code. A return code of 4 indicates an attempt to cancel a nonexistent timer interval, which indicates a logic error in the server. A return code of 8 indicates that the MVS STIMERM macro failed, in which case the reason code indicates the return code received from STIMERM CANCEL.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHXQST

DFHXQ0606 Statistics collection function is no longer available.

Explanation: The queue server statistics collection subtask was unable to continue processing and has terminated. The reason will have been indicated by an earlier message.

System action: The interval statistics subtask terminates and no further interval statistics or end of day statistics will be produced for this run of the server.

User response: See the earlier message indicating the reason for the termination of the subtask.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHXQST

DFHXQ0610I Statistics written to SMF, return code was *retcode*.

Explanation: Queue server statistics have been sent to SMF. The return code from the SMFEWTM macro is indicated in this message. A non-zero return code usually indicates that SMF recording was suppressed because of current SMF options or an installation exit.

System action: Processing continues.

User response: If the return code is non-zero but SMF statistics were expected to be successfully written, see the SMFEWTM macro in *MVS/ESA System Management Facilities (SMF)* (GC28-1457) for more information about return codes.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHXQST

DFHXQ0701I Shared TS queue pool *poolname* is to be unloaded.

Explanation: The server program has been started with the UNLOAD option requesting that the queue pool is unloaded to a sequential data set.

System action: The server starts to process the unload request. In this case, the rest of cross-memory server initialization is bypassed as it will not be needed.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHXQUL

DFHXQ0702I Shared TS queue pool *poolname* has been successfully unloaded.

Explanation: The queue pool has been unloaded successfully.

System action: The server closes down normally.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHXQUL

DFHXQ0703I Number of unloaded queues: *queues*.
Blocks written: *blocks*.

Explanation: This message provides additional information about the results of the unload process, giving the number of queues which were unloaded and the number of 4K data blocks written to the unloaded queue pool data set.

System action: Server termination continues.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHXQUL

DFHXQ0704 DFHXQUL data set for unload could not be opened.

Explanation: The data set to contain the unloaded queue pool could not be opened.

System action: Unload processing is terminated and the server is closed down with message DFHXQ0706.

User response: Check that the DFHXQUL DD statement is present in the JCL for the unload job.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHXQUL

DFHXQ0705 Unload access to CF structure *strname* failed with response *response*.

Explanation: The unload process failed because of a problem with coupling facility access.

System action: Unload processing is terminated and the server is closed down with message DFHXQ0706.

User response: If the response code is 8, this indicates that an unexpected IXLLIST error occurred, for which a previous error message will have been issued. Any other response code indicates an internal logic error.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHXQUL

DFHXQ0706 Unload for shared TS queue pool *poolname* was unsuccessful.

Explanation: The queue pool unload process failed. The reason will have been described in a previous message.

System action: The server is terminated.

User response: See the previous message giving the reason for the unload failure. Note that any unload data set produced in this case will be incomplete and will not be valid for reload purposes.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHXQUL

DFHXQ0801I Shared TS queue pool *poolname* is to be reloaded.

Explanation: The server program has been started with the RELOAD option requesting that the queue pool is to be reloaded from a sequential data set produced using the UNLOAD option.

System action: The server starts to process the reload request. In this case, the rest of cross-memory server initialization is bypassed as it will not be needed.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHXQRL

DFHXQ0802I Shared TS queue pool *poolname* has been successfully reloaded.

Explanation: The queue pool has been reloaded successfully.

System action: The server closes down normally.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHXQRL

DFHXQ0803I Queues reloaded: *queues*. Queues bypassed: *duplicates*. Blocks read: *blocks*.

Explanation: This message provides additional information about the results of the reload process. Queues on the unloaded data set are bypassed during reload processing if they already exist in the pool (for example as a result of a previous reload which could not be completed due to lack of space).

System action: Server termination processing continues.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHXQRL

DFHXQ0804 DFHXQRL data set for reload could not be opened.

Explanation: The data set containing the queue pool to be reloaded could not be opened.

System action: Reload processing is terminated and the server is closed down with message DFHXQ0808.

User response: Check that the DFHXQRL DD statement is present in the JCL for the reload job.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHXQRL

DFHXQ0805 Reload access to CF structure *strname* failed with response *response*.

Explanation: The reload process failed because of a problem with coupling facility access.

System action: Reload processing is terminated and the server is closed down with message DFHXQ0808.

User response: If the response code is 8, this indicates that an unexpected IXLLIST error occurred, for which a previous message DFHXQ0441 will have been issued. Any other response code indicates an internal logic error.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHXQRL

DFHXQ0806 Unexpected end of file encountered on reload data set.

Explanation: End of file was encountered on the unloaded data set before the logical end of the unloaded data was encountered.

System action: Reload processing is terminated and the server is closed down with message DFHXQ0808.

User response: This indicates that the unloaded data set is incomplete, perhaps because the unload process was abnormally terminated.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHXQRL

DFHXQ0807 Reload data set contains incorrect data near block *block*, offset *offset*.

Explanation: The reload process failed because the unloaded queue pool data set is not in the correct format.

System action: Reload processing is terminated and the server is closed down with message DFHXQ0808.

User response: Check that the correct data set is being used and that the unload process completed normally.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHXQRL

DFHXQ0808 Reload for shared TS queue pool *poolname* was unsuccessful.

Explanation: The queue pool reload process could not be completed. The reason will have been described in a previous message.

System action: The program is terminated.

User response: See the previous message giving the reason for the reload failure.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHXQRL

DFHXQ0809 Reload for CF structure *strname* failed, structure is full.

Explanation: Reload processing failed because there are insufficient free entries or elements to store the new data in the structure.

System action: Reload processing is terminated and the server is closed down with message DFHXQ0808.

User response: If the structure is not at its maximum size, use the MVS SETXCF FORCE to delete the structure, then change the reload parameters to specify a larger POOLSIZE parameter and rerun the reload job. The approximate amount of information which could not be reloaded can be estimated by comparing the numbers of blocks read and queues reloaded, as described by following message DFHXQ0803, with the corresponding numbers from message DFHXQ0703 in the unload job.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHXQRL

DFHXQ0810 Reload for CF structure *strname* failed, all lists are in use.

Explanation: Reload processing failed because all list headers defined in the structure are now in use.

System action: Reload processing is terminated and the server is closed down with message DFHXQ0808.

User response: Use the MVS SETXCF FORCE to delete the structure, then change the reload MAXQUEUES parameter to a large value and rerun the reload job.

Note: This message cannot be changed with the message editing utility.

DFHXQ0999I Trace *text*

Explanation: This message is used for non-specific debugging traces in multiple modules, for use by service personnel. It should not appear in normal execution unless debugging traces were deliberately activated.

System action: Processing continues.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: various

message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

Next, look up the CICS alphanumeric code in this manual. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHXSAD, DFHXSCS, DFHXSDM, DFHXSFL, DFHXSIS, DFHXSLU, DFHXSPW, DFHXSRC, DFHXSST, DFHXSXM

XMEOUT Parameters: *applid, aaa/bbbb, X'offset', modname*

DFHXS0002 *applid* **A severe error (code X'code')** has occurred in module *modname*.

Explanation: An error has been detected in module *modname*. The code X'code' is the exception trace point id which uniquely identifies what the error is and where the error was detected.

System action: An exception entry (code X'code' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient

time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHXSAD, DFHXSCS, DFHXSDM, DFHXSFL, DFHXSIS, DFHXSLU, DFHXSPW, DFHXSRC, DFHXSST, DFHXSXM

XMEOUT Parameters: *applid, X'code', modname*

DFHXS0004 *applid* **A possible loop has been detected at offset X'offset' in module modname.**

Explanation: A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset X'offset'. This is the offset of the instruction which was executing at the time the error was detected.

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Notify the system programmer. If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module *modname* in the message is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname*, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHXSAD, DFHXSCL, DFHXSADM, DFHXSFL, DFHXSIS, DFHXSLS, DFHXSPL, DFHXSRC, DFHXSST, DFHXSXM

XMEOUT Parameters: *applid, X'offset', modname*

DFHXS0006 *applid* **Insufficient storage to satisfy Getmain (code X'code') in module modname. MVS code mvscode.**

Explanation: An MVS GETMAIN was issued by module *modname*, but there was insufficient storage available to satisfy the request.

The code X'code' is the exception trace point ID which uniquely identifies the place where the error was detected.

The code *mvscode* is the MVS GETMAIN return code.

System action: An exception entry is made in the trace table (code X'code'). A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: If CICS has been terminated by another module, look out for the relevant termination messages (from, for example, the domain manager), and look up the user response suggested for these messages.

If CICS is still running, the problem may be a temporary one which rights itself if more storage becomes available. If you can manage without module *modname*, you may decide to continue and bring CICS down at a convenient time to resolve the problem. If the message recurs or if you cannot run without the full use of all CICS modules, you should bring CICS down in a controlled shutdown.

You can get diagnostic information about the MVS return code by consulting the relevant MVS codes manual which is listed in the book list at the front of this book.

Try decreasing the size limits of the DSAs or EDSAs. Or, try increasing the size of the whole region, if it is not already at maximum size. See the *CICS System Definition Guide* or the *CICS Performance Guide* for

further information on CICS storage.

Destination: Console

Modules: DFHXSAD, DFHXSCL, DFHXSADM, DFHXSFL, DFHXSIS, DFHXSLS, DFHXSPL, DFHXSRC, DFHXSST, DFHXSXM

XMEOUT Parameters: *applid, X'code', modname, mvscode*

DFHXS0200I *date time applid* **External security initialization has been successfully tracked.**

Explanation: An external security initialization performed on an active CICS system (via CEMT PERFORM SECURITY, or EXEC CICS SECURITY REBUILD) has been tracked to the XRF alternate system, and has completed successfully.

System action: None.

User response: None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Destination: Console

Modules: DFHXSWM

XMEOUT Parameters: *date, time, applid*

DFHXS0201I *date time applid* **External security initialization has been tracked, and has failed with return code X'xx' and reason code X'yy'.**

Explanation: An external security initialization was performed on an active CICS system by use of a CEMT PERFORM SECURITY, or EXEC CICS SECURITY REBUILD.

The external security initialization has been tracked to the XRF alternate system, but has failed with return code *xx* and reason code *yy*.

xx and *yy* are the values placed in registers 15 and 0 by the external security manager.

System action: CICS provides a system dump of the XRF alternate system, and continues tracking security initializations.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: The security characteristics of the alternate system no longer match those of the active system. Either shut down the alternate system, perform a security rebuild at takeover, or accept the difference.

Use the return codes in the message, to determine why the security initialization failed.

If the codes are invalid, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHXSWM

XMEOUT Parameters: *date, time,applid, X'xx', X'yy'*

DFHXS0202 *date time applid* **An attempt to track external security initialization has failed, tracking data could not be sent.**

Explanation: An external security initialization was performed on an active CICS system (via CEMT PERFORM SECURITY, or EXEC CICS SECURITY REBUILD).

It has not been tracked to an alternate system because the tracking data could not be sent.

System action: CICS provides a system dump of the active, and continues tracking security initializations.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: The security characteristics of the alternate will no longer match those of the active. Either shut down the alternate, perform a security rebuild at takeover, or accept the difference.

Destination: CSCS

Modules: DFHXSWM

XMEOUT Parameters: *date, time,applid*

DFHXS0203 *date time applid* **An attempt to track external security initialization has failed, tracking data could not be received.**

Explanation: An external security initialization was performed on an active CICS system (via CEMT PERFORM SECURITY, or EXEC CICS SECURITY REBUILD).

The external security initialization has not been tracked to an alternate system because the tracking data could not be received.

Message DFHME0116 is normally produced containing the symptom string for this problem.

System action: CICS provides a system dump of the alternate system, and ceases to track the security initializations.

User response: The security characteristics of the alternate system no longer match those of the active system. Either shut down the alternate system, perform a security rebuild at takeover, or accept the difference.

Destination: CSCS

Modules: DFHXSWM

XMEOUT Parameters: *date, time,applid*

DFHXS0204 *date time applid* **An attempt to track external security initialization has failed, tracking data was corrupted.**

Explanation: An external security initialization was performed on an active CICS system (via CEMT PERFORM SECURITY, or EXEC CICS SECURITY REBUILD).

It has been tracked to an alternate system but the tracking data was corrupted in transit.

System action: CICS provides a system dump of the alternate systems, and ceases to track the security initializations.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: The security characteristics of the alternate system no longer match those of the active system. Either shut down the alternate system, perform a security rebuild at takeover, or accept the difference.

Destination: CSCS

Modules: DFHXSWM

XMEOUT Parameters: *date, time,applid*

DFHXS1100I *applid* **Security initialization has started.**

Explanation: This is an informational message indicating that security domain initialization has started.

XMEOUT Parameter: *applid*

DFHXS1103I *applid* Default security for userid *dftuser* has been established.

Explanation: CICS has established a security environment for the default userid *dftuser*.

System action: The authorities that are assigned to this userid by the external security manager will be used in CICS resource checks whenever no other userid has been established.

User response: None.

Destination: Console Routecodes 2, 9 and 11

Modules: DFHXSDM

XMEOUT Parameters: *applid, dftuser*

DFHXS1104 *applid* Default security could not be established for userid *dftuser*. The security domain cannot continue, so CICS is terminated. SAF codes are (*X'safresp',X'safreas'*). ESM codes are (*X'esmresp',X'esmreas'*).

Explanation: CICS could not establish a security environment for the default userid *dftuser*. The security domain cannot continue without a default user. The response and reason codes (*safresp* and *safreas*) returned by the system authorization facility (SAF), and the response and reason codes (*esmresp* and *esmreas*) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=VERIFY macro.

System action: CICS terminates.

User response: Use the external security manager codes to determine why the RACROUTE REQUEST=VERIFY operation failed. Then, either correct the errors for the failing default user and restart CICS, or restart CICS with a different default userid.

Destination: Console Routecodes 2, 9, 10 and 11

Modules: DFHXSDM

XMEOUT Parameters: *applid, dftuser, X'safresp', X'safreas', X'esmresp',X'esmreas'*

DFHXS1105 *applid* Resource profiles for class *classname* have been built.

Explanation: The security resource profiles for the class *classname* have been successfully loaded into storage by the external security manager.

System action: The profiles are used in subsequent resource checks to determine users' authorizations to access resources in the named class.

User response: None.

Destination: Console Routecodes 2, 9, 10 and 11

Modules: DFHXSRC

XMEOUT Parameters: *applid, classname*

DFHXS1106 *applid* Resource profiles could not be built for class *classname*. CICS is terminated. SAF codes are (*X'safresp',X'safreas'*). ESM codes are (*X'esmresp',X'esmreas'*).

Explanation: The security resource profiles for the class *classname* could not be loaded into storage by the external security manager. The response and reason codes (*safresp* and *safreas*) returned by the system authorization facility (SAF), and the response and reason codes (*esmresp* and *esmreas*) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=LIST macro.

The build of the profiles was requested by one of the following:

- The initialization of the security domain
- The CEMT command PERFORM SECURITY REBUILD
- A user-supplied transaction invoking the EXEC CICS PERFORM SECURITY REBUILD command.

System action: CICS is unable to provide reliable resource security, so it terminates.

User response: Use the external security manager codes to determine why the RACROUTE REQUEST=LIST operation failed. Rectify the problem in the external security manager, then restart CICS.

Destination: Console Routecodes 2, 9, 10 and 11

Modules: DFHXSRC

XMEOUT Parameters: *applid, classname, X'safresp', X'safreas', X'esmresp', X'esmreas'*

DFHXS1107 *applid* Partner-LU profiles for class APPCLU have been built.

Explanation: The partner-LU profiles for the class APPCLU have been successfully loaded into storage by the external security manager.

System action: The profiles are used in subsequent bind authorization checks for LU6.2 sessions whose

CONNECTION definition specifies BINDSECURITY(YES).

User response: None.

Destination: Console Routecodes 2, 9, 10 and 11

Modules: DFHXSRC

XMEOUT Parameter: *applid*

DFHXS1108 *applid* **Partner-LU profiles could not be built for class APPCLU. SAF codes are (X'safresp',X'safreas'). ESM codes are (X'esmresp',X'esmreas').**

Explanation: The partner-LU profiles for the class APPCLU could not be loaded into storage by the external security manager. CICS therefore has no APPCLU security profiles. The response and reason codes (*safresp* and *safreas*) returned by the system authorization facility (SAF), and the response and reason codes (*esmresp* and *esmreas*) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=LIST macro.

The build of the profiles was requested by one of the following:

- The initialization of VTAM support in terminal control
- The CEMT command SET VTAM OPEN
- The CEMT command PERFORM SECURITY REBUILD
- A user-supplied transaction invoking the EXEC CICS SET VTAM OPEN command.
- A user-supplied transaction invoking the EXEC CICS PERFORM SECURITY REBUILD command.

System action: If the failure occurs during CICS initialization or PERFORM SECURITY REBUILD, CICS terminates. If the failure occurs during SET VTAM OPEN, the VTAM ACB is closed and CICS continues.

User response: Use the external security manager codes to determine why the RACROUTE REQUEST=LIST operation failed. Rectify the problem in the external security manager, then restart CICS.

Destination: Console Routecodes 2, 9, 10 and 11

Modules: DFHXSIS, DFHXSRC

XMEOUT Parameters: *applid*, *X'safresp'*, *X'safreas'*, *X'esmresp'*, *X'esmreas'*

DFHXS1109 *applid* **APPC PROFILE profile COULD NOT BE AUDITED. SAF CODES ARE (X'safresp',X'safreas'). ESM CODES ARE (X'esmresp',X'esmreas').**

Explanation: An audit request for a partner-LU verification check has failed for profile *profile*.

During the start-up of an APPC session, each partner

can validate the other. During this validation process, the system:

- Retrieves the relevant APPCLU profile from the external security manager
- Checks that the session key is still usable
- Requests the external security manager to write audit records concerning this profile and the validation to the system management facility (SMF).

The following events are audited:

- Whether the session partner was correctly validated
- Whether the session partner failed validation
- Whether the session key will expire in less than six days
- Whether the retrieved profile is "locked"
- Whether the session key is null, or all zero
- Whether the session key has expired.

The response and reason codes (*safresp* and *safreas*) returned by the system authorization facility (SAF), and the response and reason codes (*esmresp* and *esmreas*) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=AUDIT macro.

System action: The CICS system is not affected by this event, and CICS continues.

User response: Use the external security manager codes to determine why the RACROUTE REQUEST=AUDIT operation failed. Correct the problem in the external security manager, then perform a security rebuild, if appropriate.

Note: This message cannot be changed with the message editing utility.

Destination: Console Routecode 9

Modules: DFHXSIS

DFHXS1110 *applid* **Security is requested, but the external security manager is inactive.**

Explanation: Security was requested for this region, but the external security manager (ESM) was found to be inactive. The SEC system initialization parameter was specified as YES or left as its default value. CICS cannot initialize its security manager unless the ESM is active.

System action: CICS terminates.

User response: If you have an ESM installed on your system, ensure that it is active before attempting to start CICS. Otherwise, restart CICS without security by specifying SEC=NO as a system initialization parameter. Note that the SEC parameter cannot be entered as a console override.

Destination: Console Routecodes 1, 9, 10 and 11

Modules: DFHXSIS

XMEOUT Parameter: *applid*

DFHXS1111 *date time applid tranid* **Security violation by user *userid*{ at netname | at console } portname for resource *resource* in class *classname*. SAF codes are (*X'safresp'*,*X'safreas'*). ESM codes are (*X'esmresp'*,*X'esmreas'*).**

Explanation: CICS has detected a security violation by user *userid* while performing an authority check for resource *resource* in resource class *classname*.

If the *userid* causing the violation is signed on at a VTAM terminal, the phrase "at netname *portname*" reports the netname at which the violation occurred. If the *userid* causing the violation is signed on at a console, the phrase "at console *portname*" reports the console name at which the violation occurred. If the *userid* causing the violation is not signed on or this is a non terminal task, the entry port does not appear in this message as it is not available.

The response and reason codes (*safresp* and *safreas*) returned by the system authorization facility (SAF), and the response and reason codes (*esmresp* and *esmreas*) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=FASTAUTH or RACROUTE REQUEST=AUTH macros. These return codes are described in the *OS/390 MVS Programming: Authorized Assembler Services Guide* and in *External Security Interface (RACROUTE) Macro Reference for MVS and VM (SC28-1366)*.

CICS can also issue this message when you use the EXEC CICS QUERY SECURITY command with the LOGMESSAGE(LOG) option.

System action: CICS abnormally terminates the task requesting the invalid access except under one of the following conditions:

- The command is issued within the scope of an EXEC CICS HANDLE NOTAUTH command.
- The command is issued as a result of an EXEC CICS QUERY SECURITY command.

User response: Note the security violation.

Destination: CSCS

Modules: DFHXSRC

XMEOUT Parameters: *date, time, applid, tranid, userid, {1= at netname , 2= at console }, portname, resource, classname, X'safresp', X'safreas', X'esmresp', X'esmreas'*

DFHXS1112 *applid* **The CICS region userid and groupid could not be determined. SAF codes are (*X'safresp'*,*X'safreas'*). ESM codes are (*X'esmresp'*,*X'esmreas'*).**

Explanation: CICS could not determine the *userid* and *groupid* for this CICS region.

The response and reason codes (*safresp* and *safreas*) returned by the system authorization facility (SAF), and

the response and reason codes (*esmresp* and *esmreas*) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=EXTRACT macro.

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

User response: Use the external security manager codes to determine why the RACROUTE REQUEST=EXTRACT operation failed. Then, either correct the errors for the failing region *userid* and *groupid*, and restart CICS, or restart CICS with a different *userid* and *groupid*.

Destination: Console Routecodes 2, 9, 10 and 11

Modules: DFHXSIS

XMEOUT Parameters: *applid, X'safresp', X'safreas', X'esmresp', X'esmreas'*

DFHXS1113 *applid* **The region *userid* cannot access system transaction *tranid*. CICS will terminate. SAF codes are (*X'safresp'*,*X'safreas'*). ESM codes are (*X'esmresp'*,*X'esmreas'*).**

Explanation: The region *userid* for this CICS system is not authorized to attach the system transaction *tranid*. It is a CICS requirement that the region *userid* must be able to access this transaction.

The response and reason codes (*safresp* and *safreas*) returned by the system authorization facility (SAF), and the response and reason codes (*esmresp* and *esmreas*) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=FASTAUTH or AUTH macro.

System action: CICS terminates.

User response: Authorize the CICS region *userid* to access all the required CICS system transactions, or specify a different region *userid* that does have the required authority. (The required transactions are documented as the 'Category 1' transactions in the *CICS RACF Security Guide*. To authorize the region *userid* to use these transactions, you should execute the sample clist DFH\$CAT1, as described in the *CICS Transaction Server for z/OS Installation Guide*.)

Then restart CICS.

Destination: Console Routecodes 2, 9, 10 and 11

Modules: DFHXSRC

XMEOUT Parameters: *applid, tranid, X'safresp', X'safreas', X'esmresp', X'esmreas'*

DFHXS1114I I *date time applid* User *userid* is not authorized to invoke method *methodName(signature)* from bean *beanName* in CORBAServer *corbaServer*.

Explanation: The user is not authorized to invoke the named method. The *userid* is not authorized to use any of the roles specified in the <method-permission> section of the deployment descriptor for this method.

System action: CICS does not execute the specified method. CICS also issues message DFHXS1115 to the system console, which contains further information about the roles to which access is required.

User response: Determine whether the user *userid* should be authorized to execute the specified method, and if so, grant the user appropriate permission.

Destination: CSCS

Modules: DFHXSEJ

XMEOUT Parameters: *date, time,applid, userid, methodName(signature), beanName, corbaServer*

DFHXS1115 *applid* USER *userid* IS NOT AUTHORIZED TO INVOKE {HOME | REMOTE} METHOD *method-name* FROM BEAN *bean-name* {FOR APPLICATION *application-name*} IN CORBASERVER *cs-name*. USER HAS NO ACCESS TO ANY OF THESE ROLES {FOR METHOD(*)}: *role-name-list*

Explanation: The user *userid* is not authorized to invoke the method named *method-name* within the Enterprise Java Bean named *bean_name*, which is deployed in the Corbaserver named *cs-name*. If the optional text "FOR APPLICATION *application-name*" appears in the message, the JAR containing the bean is identified in the deployment descriptor by a <display-name> tag containing *application-name*.

The user is not authorized to invoke the method because *userid* does not have READ access to at least one of the roles specified in the <method-permission> section of the deployment descriptor. These roles are listed in *role-name-list* (which may be empty).

If the optional text "FOR METHOD(*)" appears in the message, the roles in *role-name-list* apply to the generic method (*), because there are no specific role definitions for *method-name* in the deployment descriptor.

System action: CICS does not execute the specified method, and writes a type 80 SMF record to record the violation.

User response: Determine whether the user *userid* should be authorized to execute the specified method, and if so, grant the *userid* READ access to one of the roles named in *role-name-list*, or add new roles to the deployment descriptor and re-install the DJAR.

Note: This message cannot be changed with the message editing utility.

Destination: Console Routecode 9

Modules: DFHXSSF

DFHXS1201 *date time applid* The password supplied in the verification request for *userid* was invalid. This occurred in transaction *transid* when *userid* *userid* was signed on at netname *netname*.

Explanation: An invalid password was supplied for user verification.

System action: The external security manager also issues a message on the MVS/ESA security console.

CICS continues. No dump is taken.

User response: Supply the correct password, or contact your security administrator for assistance. If you continue to supply incorrect passwords, the *userid* may be revoked by the external security manager. A revoked *userid* can only be reinstated by a security administrator.

Destination: CSCS

Modules: DFHXSPW

XMEOUT Parameters: *date, time,applid, userid, transid, userid, netname*

DFHXS1202 *date time applid* The password supplied in the verification request for *userid* has expired. This occurred in transaction *transid* when *userid* *userid* was signed on at netname *netname*.

Explanation: An expired password was supplied for user verification.

System action: CICS continues. No dump is taken.

User response: Change the password using the CICS signon process, the EXEC CICS CHANGE PASSWORD API, or any other method available to you. Alternatively, contact your security administrator for assistance.

Destination: CSCS

Modules: DFHXSPW

XMEOUT Parameters: *date, time,applid, userid, transid, userid, netname*

DFHXS1203 *date time applid* The *userid* supplied in the verification request for *userid* *userid* is revoked. This occurred in transaction *transid* when *userid* *userid* was signed on at netname *netname*.

Explanation: A revoked *userid* was supplied for user verification.

System action: CICS continues. No dump is taken.

User response: Contact your security administrator for assistance.

Destination: CSCS

Modules: DFHXSPW

XMEOUT Parameters: *date, time,applid, userid, tranid, userid, netname*

DFHXS1205 *date time applid* **The userid *userid* supplied in a verification request is not defined in the ESM. This occurred in transaction *tranid* at netname *netname*.**

Explanation: An undefined userid was supplied for user verification.

System action: CICS continues. No dump is taken.

User response: Contact your security administrator for assistance.

Destination: CSCS

Modules: DFHXSPW

XMEOUT Parameters: *date, time,applid, userid, tranid, netname*

DFHXS1211 *date time applid* **The password supplied in a change password request for userid *userid* was invalid. This occurred in transaction *tranid* when userid *userid* was signed on at netname *netname*.**

Explanation: An invalid password was supplied for change password processing.

System action: The external security manager also issues a message on the MVS security console.

CICS continues. No dump is taken.

User response: Supply the correct password or contact your security administrator for assistance. If you continue to supply incorrect passwords, the userid may be revoked by the external security manager. A revoked userid can only be reinstated by a security administrator.

Destination: CSCS

Modules: DFHXSPW

XMEOUT Parameters: *date, time,applid, userid, tranid, userid, netname*

DFHXS1213 *date time applid* **The userid supplied in a change password request for userid *userid* is revoked. This occurred in transaction *tranid* when userid *userid* was signed on at netname *netname*.**

Explanation: A revoked userid was supplied on a password change request

System action: CICS continues. No dump is taken.

User response: You should have the userid reinstated before it can be used. Contact your security administrator for assistance.

Destination: CSCS

Modules: DFHXSPW

XMEOUT Parameters: *date, time,applid, userid, tranid, userid, netname*

DFHXS1214 *date time applid* **The new password supplied in a change password request for userid *userid* was not accepted. This occurred in transaction *tranid* when userid *userid* was signed on at netname *netname*.**

Explanation: An invalid new password was supplied on a password change request.

System action: CICS continues. No dump is taken.

User response: Select a suitable new password and try again. If necessary, contact your security administrator for assistance.

Destination: CSCS

Modules: DFHXSPW

XMEOUT Parameters: *date, time,applid, userid, tranid, userid, netname*

DFHXS1215 *date time applid* **The userid *userid* supplied in a change password request is not defined in the ESM. This occurred in transaction *tranid* at netname *netname*.**

Explanation: An undefined userid was supplied on a password change request

System action: CICS continues. No dump is taken.

User response: Contact your security administrator for assistance.

Destination: CSCS

Modules: DFHXSPW

XMEOUT Parameters: *date, time,applid, userid, tranid, netname*

DFHXS1216 *date time applid* **The userid *userid* supplied in a change password request has a revoked connection to the default group in the ESM. This occurred in transaction *tranid* at netname *netname*.**

Explanation: The userid supplied on a password change request is revoked in the ESM connection to the default group.

System action: CICS continues. No dump is taken.

User response: Contact your security administrator for assistance.

Destination: CSCS

Modules: DFHXSPW

XMEOUT Parameters: *date, time, applid, userid, tranid, netname*

| **DFHXS1217** *date time applid* **A client certificate has been successfully registered for user *userid*.**

| **Explanation:** A client using the client authentication protocol of Secure Sockets Layer has presented a valid X.509 client certificate and a valid *userid* and password. CICS has successfully registered the certificate with the specified *userid*.

| **System action:** The certificate is permanently associated with *userid* in the external security manager's database.

| **User response:** Whenever the client certificate is used again, *userid* will be assigned to it without further prompting for a *userid* and password.

| **Destination:** CSCS

| **Modules:** DFHXSPW

| **XMEOUT Parameters:** *date, time, applid, userid*

| **DFHXS1218** *applid* **The CICS region *userid* is not authorized to access key ring *keyring*.**

| **Explanation:** The KEYRING system initialization parameter has been used to specify a key ring named *keyring*, but the CICS region *userid* (*userid*) does not have sufficient authority to access it.

| **System action:** If the PARMERR=ABEND system initialization parameter is specified, CICS initialization terminates.

| If the PARMERR=IGNORE system initialization parameter is specified, CICS initialization continues without a key ring. CICS does not initialize support for secure sockets layer, is not able to install TCPIP SERVICES that specify SSL(YES) or SSL(CLIENTAUTH), or CORBASERVERs that specify CERTIFICATE.

| If the PARMERR=INTERACT system initialization parameter is specified, you are prompted to enter a new key ring name, but you can only reply with a blank name, which causes CICS to continue initialization without a key ring.

| **User response:** If CICS is to use the secure sockets layer, the CICS region *userid* must be given READ access to the IRR.DIGTCERT.LIST and IRR.DIGTCERT.LISTRING resources in the FACILITY class. For further information, see the *CICS RACF Security Guide*.

| **Destination:** Console Routecodes 2, 9, 10 and 11

| **Modules:** DFHXSIS

| **XMEOUT Parameters:** *applid, userid, keyring*

DFHZCxxxx messages

Messages that are generated because the VTAM SYNAD and LERAD exits have been entered are followed by VTAM RETURN CODE *xyyy* where *xx* is the VTAM recovery action return code and *yy* is the VTAM specific error return code, each obtained from fields of the RPL.

Messages that are generated because system or user sense data has been received, are followed by SENSE RECEIVED *xyyy zzzz* where *xx* is the VTAM system sense information byte, *yy* is the VTAM system sense modifier byte, and *zzzz* represents 2 bytes of user sense information.

Values for *xx*, *yy*, and *zzzz* are hexadecimal. The VTAM system sense information byte, *xx*, can have the following values:

<i>xx</i>	meaning
X'00'	User sense data only (see <i>zzzz</i>)
X'08'	Request reject
X'10'	Request error
X'20'	State error
X'40'	Request header (RH) usage error
X'80'	Path error

For the meaning of *yy*, see the *SNA Formats* manual.

The *sense* insert is not included in DFHZCxxxx messages when no meaningful feedback is available.

The *instance* field on some DFHZCxxxx messages is for IBM internal use only.

DFHZC0001 *applid* **An abend (code *aaa/bbbb*) has occurred at offset *X'offset'* in module *modname*.**

Explanation: An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the *OS/390 MVS System Codes* manual.

Next, look up the CICS abend code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

For further information about *code*, see the *CICS Problem Determination Guide*.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination*

Guide for guidance on how to proceed.

Destination: Console

Modules: DFHZGBM, DFHZGCA, DFHZGCC, DFHZGCN, DFHZGDA, DFHZGPC, DFHZGRP, DFHZGSL, DFHZGUB

XMEOUT Parameters: *applid*, *aaa/bbbb*, *X'offset'*, *modname*

DFHZC0002 *applid* **A severe error (code *X'code'*) has occurred in module *modname*.**

Explanation: An error has been detected in module *modname*. The code *X'code'* is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

System action: An exception entry (code *X'code'* in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHZGCA, DFHZGCC, DFHZGCN, DFHZGDA, DFHZGPC, DFHZGRP, DFHZGSL, DFHZGUB

XMEOUT Parameters: *applid*, *X'code'*, *modname*

DFHHC0003 *applid* **Insufficient storage (code X'code') in module modname.**

Explanation: A CICS GETMAIN was issued by module *modname*, but there was insufficient storage available to satisfy the request.

The code X'code' is the exception trace point ID which uniquely identifies the place where the error was detected.

System action: An exception entry is made in the trace table (code X'code' in the message). A system dump is taken, unless you have specifically suppressed dumps in the dump table. CICS will continue unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller. A message will be issued to this effect. Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Inform the system programmer.

Try increasing the size of the DSA or EDSA. See the *CICS System Definition Guide* or the *CICS Performance Guide* for more information on CICS storage.

Destination: Console

Modules: DFHTCRP, DFHZGRP

XMEOUT Parameters: *applid*, X'code', *modname*

DFHHC0004 *applid* **A possible loop has been detected at offset X'offset' in module modname.**

Explanation: A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset X'offset'. This is the offset of the instruction which was executing at the time the error was detected.

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Notify the system programmer. If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error

here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module *modname* in the message is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname*, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules:

XMEOUT Parameters: *applid*, X'offset', *modname*

DFHHC0101I *date time applid* **A predatory takeover has forced VTAM to allow another application to open the ACB which CICS was using.**

Explanation: A predatory takeover is occurring. This means that a job is initializing which has the same *applid* as the CICS system. This initiates a takeover of the network. As a normal part of this process, VTAM drives the TPEND exit.

System action: All requests on VTAM sessions are abnormally terminated and the sessions closed. The VTAM ACB is then opened by the application which is using the same APPLID as the CICS region. The new system recovers any persisting sessions.

User response: If this takeover of the network was unintentional, you can prevent it happening in future by using RACF to protect the APPLID. Refer to the VTAM application security section in the *VTAM Network Implementation Guide*, SC31-6434 for details of how to do this.

Destination: Console and Transient Data Queue CSNE

Modules: DFHZNCA

XMEOUT Parameters: *date*, *time*, *applid*

DFHHC0110 *date time applid* **The LU6.2 NIB and the TCTTE/BIND data for session *sessid* did not match during a persistent sessions restart. Reason code X'n'.**

Explanation: A node initialization block (NIB) has been passed to CICS by VTAM during a persistent

sessions restart. An attempt was made by CICS to match the NIB to a session TCTTE. The reason code explains the cause of the mismatch.

Reason Explanation

- 1 Single/parallel session indication did not match.
- 2 LU type did not match.
- 3 LU type and single/parallel session did not match.

System action: The attempt to match a persisting session with a TCTTE has failed. The session is unbound. CICS ignores this session and continues with the next session if there is one.

User response: The production of this message means that there is no suitable global catalog record to match the NIB which VTAM has passed in. This implies that the wrong global catalog is being used for this initialization of CICS, or that the catalog records are corrupted. Ensure that the global catalog being used is correct.

Destination: CSNE

Modules: DFHZGPC

XMEOUT Parameters: *date, time, applid, sessid, X'n'*

DFHZC0111 *date time applid* **No session TCTTE is available to match sysid *sysid* for modename *modename* because VTAM has returned more NIBs than the CNOS session limit values require.**

Explanation: During persistent sessions restart VTAM has returned more node initialization blocks (NIBs) than the current CNOS session limit values require. This is probably because a CNOS from a high session limit to a lower session limit was in progress when CICS failed.

System action: The process NIB function is terminated. The session is unbound. CICS ignores this session and continues with the next session if there is one.

This situation has no effect on the restored CICS. The last catalogued CNOS values are restored.

User response: None.

Destination: CSNE

Modules: DFHZGPC

XMEOUT Parameters: *date, time, applid, sysid, modename*

DFHZC0112 *date time applid* **No TCTME was found for sysid *sysid* modename *modename* during a persistent sessions restart.**

Explanation: An error has occurred during persistent sessions restart. VTAM passed a NIB to CICS

containing the named modename, but CICS was unable to locate the corresponding TCTME.

System action: The attempt to match the NIB to a TCTTE is terminated. The session is unbound.

A system dump is produced.

The CNOS values not related to this modegroup are restored, but the named modegroup cannot be recovered.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSNE

Modules: DFHZGPC

XMEOUT Parameters: *date, time, applid, sysid, modename*

DFHZC0120I *applid* **VTAM sessions persisted for a cold or initial start. Sessions terminated. Inquire issued *icount*, sessions persisting *spcount*, sessions terminated *stcount*.**

Explanation: CICS is initializing with a cold or initial start, but some VTAM sessions have persisted from a previous CICS with a nonzero PSDI value.

CICS has attempted to terminate all persisting sessions. The message inserts are as follows:

- *icount* is the number of VTAM INQUIRE OPTCD=PERSESS commands issued.
- *spcount* is the number of VTAM sessions that persisted.
- *stcount* is the number of sessions that CICS has terminated with a CLSDST or TERMSSESS macro. This should be equal to *spcount*. If it is not, persistent session recovery probably failed. Earlier messages explain why.

If there are no earlier messages, it is possible that the count obtained from the VTAM INQUIRE counts macro, indicating the number of active sessions, was not equal to the number of sessions that VTAM held persisting. This is not a problem.

System action: CICS continues.

User response: None.

Destination: Console

Modules: DFHZGRP

XMEOUT Parameters: *applid, icount, spcount, stcount*

DFHZC0121I *applid* **VTAM sessions persisted for a WARM start. Sessions terminated. Inquires issued *icount*, sessions persisting *spcount*, sessions terminated *stcount*.**

Explanation: CICS is initializing with a WARM start, but some VTAM sessions unexpectedly persisted from

a previous CICS with a nonzero PSDI value.

CICS has attempted to terminate all persisting sessions. The message inserts are as follows:

- *icount* is the number of VTAM INQUIRE OPTCD=PERSESS commands issued.
- *spcount* is the number of VTAM sessions that persisted.
- *stcount* is the number of sessions that CICS has terminated with a CLSDST or TERMSESS macro. This should be equal to *spcount*. If it is not, persistent session recovery probably failed. Earlier messages explain why.

If there are no earlier messages, it is possible that the count obtained from the VTAM INQUIRE counts macro, indicating the number of active sessions, was not equal to the number of sessions that VTAM held persisting. This is not a problem.

System action: CICS continues.

User response: Examine the JOBLLOG from the previous run to determine why sessions persisted despite a WARM shut down.

Destination: Console

Modules: DFHZGRP

XMEOUT Parameters: *applid, icount, spcount, stcount*

DFHZC0122I *applid* VTAM sessions persisted for an EMERGENCY, XRF=YES start. Sessions terminated. Inquires issued *icount*, sessions persisting *spcount*, sessions terminated *stcount*.

Explanation: CICS is initializing with an EMERGENCY start, but XRF = YES has been specified and some VTAM sessions persisted unexpectedly from a previous CICS with a nonzero PSDI value.

CICS has attempted to close all persisting sessions. The message inserts are as follows:

- *icount* is the number of VTAM INQUIRE OPTCD=PERSESS commands issued.
- *spcount* is the number of VTAM sessions that persisted.
- *stcount* is the number of sessions that CICS has terminated with a CLSDST or TERMSESS macro. This should be equal to *spcount*. If it is not, persistent session recovery probably failed. Earlier messages explain why.

If there are no earlier messages, it is possible that the count obtained from the VTAM INQUIRE counts macro, indicating the number of active sessions, was not equal to the number of sessions that VTAM held persisting. This is not a problem.

System action: CICS continues.

User response: You should not mix XRF and

persistent sessions. If you wish to use XRF, do a cold or initial start.

Destination: Console

Modules: DFHZGRP

XMEOUT Parameters: *applid, icount, spcount, stcount*

DFHZC0123I *applid* VTAM sessions persisted when OPEN VTAM ACB issued. Sessions terminated. Inquires issued *icount*, sessions persisting *spcount*, sessions terminated *stcount*.

Explanation: The VTAM ACB has been opened while CICS is running, however some VTAM sessions persisted either from a previous CICS with a nonzero PSDI value, or when the VTAM ACB was closed.

Persisting sessions have been terminated. The message inserts are as follows:

- *icount* is the number of VTAM INQUIRE OPTCD=PERSESS commands issued.
- *spcount* is the number of VTAM sessions that persisted.
- *stcount* is the number of sessions that CICS terminated with a CLSDST or TERMSESS macro. This should be equal to *spcount*. If it is not, persistent session recovery probably failed. Earlier messages explain the reason.

If there are no earlier messages, it is possible that the count obtained from the VTAM INQUIRE counts macro, indicating the number of active sessions, was not equal to the number of sessions that VTAM held persisting. This is not a problem.

System action: CICS continues.

User response: None.

Destination: Console

Modules: DFHZGRP

XMEOUT Parameters: *applid, icount, spcount, stcount*

DFHZC0124I *applid* VTAM sessions persisted for an EMERGENCY start. Inquires issued *icount*, sessions persisting *spcount*, sessions terminated *stcount*, sessions OPNDSTed *socount*, sessions in error *secount*.

Explanation: CICS was initializing with an EMERGENCY start and some VTAM sessions persisted from a previous CICS with a nonzero PSDI value.

Each of the persisting sessions has been restored or terminated. The message inserts are as follows:

- *icount* is the number of VTAM INQUIRE OPTCD=PERSESS commands issued.
- *spcount* is the number of VTAM sessions that persisted.

- *stcount* is the number of sessions that CICS terminated with a CLSDST or TERMSESS macro. If an OPNDST failure occurred for an entire NIBLIST (see message DFHZC0129), the sessions in the NIBLIST have been terminated and this count includes these sessions.
- *socount* is the number of VTAM sessions that CICS restored successfully with an OPNDST OPTCD=RESTORE macro.
- *secount* is the number of sessions that CICS failed to restore.

System action: CICS continues.

User response: None.

Destination: Console

Modules: DFHZGRP

XMEOUT Parameters: *applid, icount, spcount, stcount, socount, secount*

DFHZC0125 *date time applid netname* **persistent session will be terminated.** *sense ((instance) Module name: {DFHZGRP})*

Explanation: CICS was initializing with an EMERGENCY start and some VTAM sessions persisted from a previous CICS with a nonzero PSDI value.

However, the session with a NETNAME of *netname* is terminated for one of the following reasons as indicated by the *instance* in the message. An AP exception trace entry is made for each *instance* as follows.

Instance

Point ID and Explanation

- | | |
|---|---|
| 1 | X'FB21' There is not enough storage to recover an APPC session. |
| 2 | X'FB22' There is not enough storage to recover a terminal session. |
| 3 | X'FB25' The NIB and the TCTTE with the same NETNAME were not of the same LU TYPE. |

System action: An AP exception trace with a point ID as above is issued. The session is terminated and CICS continues.

User response: The exception trace point identifies where the message was issued and determines the action to take.

Destination: CSNE

Modules: DFHZGRP

XMEOUT Parameters: *date, time, applid, netname, sense, instance, {1=DFHZGRP, 2=DFHZGRP, 3=DFHZGRP}*

DFHZC0126I *applid* **No VTAM sessions persisted for an EMERGENCY restart.**

Explanation: CICS was initializing with an EMERGENCY start but no VTAM sessions persisted from a previous CICS run. Possible reasons are:

- No persistence was specified in the previous run.
- CICS crashed with the ACB open but no sessions were in use.
- The PSDI value expired.
- An error occurred before DFHZGRP could determine if any sessions persist.

System action: CICS continues.

User response: None.

Destination: Console

Modules: DFHZGRP

XMEOUT Parameter: *applid*

DFHZC0127 *applid* **Cannot reestablish persisting sessions - VTAM ACB is closed.** **Code:** *X'code'*. **Module name:** *module*

Explanation: The VTAM ACB has been opened and CICS is processing VTAM persisting sessions, however the ACB was closed, or is being closed by operator action before all the sessions could be restored or terminated.

System action: CICS continues to close the VTAM ACB and then runs without VTAM support.

User response: Determine why the operator closed the ACB and either continue without VTAM, dynamically open the ACB, or shut CICS down normally and restart it.

X'code' is the AP exception trace entry that determines which VTAM macro diagnosed the ACB as being closed and where it was issued.

Destination: Console

Modules: DFHZGRP DFHZGUB

XMEOUT Parameters: *applid, X'code', module*

DFHZC0128 *applid* **Cannot reestablish persisting sessions - VTAM not responding.** **Module name:** *module*

Explanation: CICS is processing VTAM persisting sessions. However it has issued a VTAM macro and has waited for 8 minutes for the response.

System action: If this occurs during start up, CICS terminates. If this occurs during dynamic open, the VTAM ACB is closed and CICS continues without VTAM.

A dump is taken for this message in both cases.

User response: You can restart CICS again immediately, or wait for the persistent sessions to time out and then restart CICS.

If this problem recurs you need to find out why VTAM is not responding to the INQUIRE or OPNDST macro (if the message is issued by DFHZGRP), or the CLSDST or TERMSESS macro (if the message is issued by DFHZGUB).

You can determine which macro is not responding by examining the TCP section of the dump and looking at the RPLs in the PS POOL labeled PS_RPL. The first RPL is for use by INQUIRE or OPNDST, the next 10 by CLSDST or TERMSESS.

Destination: Console

Modules: DFHZGRP, DFHZGUB

XMEOUT Parameters: *applid, module*

DFHZC0129 *applid* VTAM OPNDST RESTORE failed. All sessions in the NIBLIST will be terminated instead. RTNCD,FDB2: *X'rc',X'fd'*. Code: *X'code'*

Explanation: CICS is processing VTAM persistent sessions during an EMERGENCY restart but VTAM returned a RTNCD,FDB2 of *rc,fd* in response to the OPNDST OPTCD=RESTORE macro.

System action: An AP exception trace entry, *X'code'*, is made.

A system dump is taken on the first occurrence of this problem unless dumps have been specifically suppressed in the dump table.

CICS attempts to terminate all the sessions in the NIBLIST instead of restoring them.

User response: Use the dump taken on the first occurrence of this problem or the exception trace entry and the *VTAM programming manual* to determine the meaning of the RTNCD,FDB2 and the actions necessary to correct it.

Destination: Console

Modules: DFHZGRP

XMEOUT Parameters: *applid, X'rc',X'fd', X'code'*

DFHZC0130 *applid* VTAM INQUIRE PERSESS failed. Cannot restore any persisting sessions. RTNCD,FDB2: *X'rc',X'fd'*. Code: *X'code'*

Explanation: CICS is processing VTAM persistent sessions but VTAM returned a RTNCD,FDB2 of *rc,fd* in response to the INQUIRE OPTCD=PERSESS macro.

System action: An AP exception trace entry, *X'code'*, is made.

A system dump is taken unless dumps have been specifically suppressed in the dump table.

If this occurs during initialization, CICS terminates.

If this occurs during a dynamic open of the ACB, CICS closes the ACB and continues to run without VTAM.

The sessions persist until the PSDI value times out or until VTAM operator commands are issued to terminate the sessions.

User response: Use the dump or the exception trace entry and the *VTAM programming manual* to determine the meaning of the RTNCD,FDB2 and the actions necessary to correct it.

If the problem occurs during initialization, try to correct the error and then retry the start up, or wait until the PSDI value time expires and restart CICS.

If the problem occurs when the ACB was opened dynamically, you can repeat the command to open the VTAM ACB, or wait until the PSDI time expires and then repeat it.

Destination: Console

Modules: DFHZGRP

XMEOUT Parameters: *applid, X'rc',X'fd', X'code'*

DFHZC0131 *date time applid netname termid* VTAM OPNDST RESTORE failed.

Explanation: CICS is processing VTAM persistent sessions and has issued an OPNDST OPTCD=RESTORE against a NIBLIST. However, the NIB identified by *netname* and a session or termid of *termid* failed to open successfully. This is probably because the session was terminated by the VTAM operator after INQUIRE OPTCD=PERSESS was issued.

System action: CICS continues.

User response: Reopen the session in the normal way.

Destination: CSNE

Modules: DFHZGRP

XMEOUT Parameters: *date, time,applid, netname, termid*

DFHZC0132 *applid* VTAM INQUIRE PERSESS failed. Cannot restore some persisting sessions. Network only partially restored. RTNCD,FDB2: *X'rc',X'fd'*. Code: *X'code'*

Explanation: CICS is processing VTAM persistent sessions but VTAM returned a RTNCD,FDB2 of *rc,fd* in response to a subsequent INQUIRE OPTCD=PERSESS macro.

System action: An AP exception trace entry, *X'code'*, is made.

A system dump is taken unless you have specifically suppressed dumps in the dump table.

CICS continues with a partial network. Some of the sessions are usable, others are not until the PSDI value

times out or the VTAM operator terminates the sessions that failed.

User response: Use the dump or the exception trace entry and the *VTAM programming manual* to determine the meaning of the RTNCD,FDB2 and the actions necessary to correct it.

If enough of the network is available, wait until the PSDI value expires or use VTAM operator commands to terminate the sessions.

If the network is unusable, either close and reopen the VTAM ACB, or restart CICS.

Destination: Console

Modules: DFHZGRP

XMEOUT Parameters: *applid, X'rc',X'fd', X'code'*

DFHZC0133A *applid* Persistent session recovery failed.

Explanation: CICS was initializing when an attempt to process VTAM persistent session failed. The reasons are given in earlier messages.

System action: CICS terminates.

User response: Examine earlier messages and exception trace entries to determine the reason for failure.

Destination: Console

Modules: DFHSII1

XMEOUT Parameter: *applid*

DFHZC0134I *applid* VTAM sessions persisted when OPEN ACB issued. Inquires issued *icount*, sessions persisting *spcount*, sessions terminated *stcount*, sessions OPNDSTed *socount*, sessions in error *secount*.

Explanation: The VTAM ACB has been opened while CICS is running, and some VTAM sessions persisted after VTAM abended.

Each of the persisting sessions has been restored or terminated. The message inserts are as follows:

- *icount* is the number of VTAM INQUIRE OPTCD=PERSESS commands issued.
- *spcount* is the number of VTAM sessions that persisted.
- *stcount* is the number of sessions that CICS terminated with a CLSDST or TERMSESS macro. If an OPNDST failure occurred for an entire NIBLIST (see message DFHZC0129), the sessions in the NIBLIST have been terminated and this count includes these sessions.

- *socount* is the number of VTAM sessions that CICS restored successfully with an OPNDST OPTCD=RESTORE macro.
- *secount* is the number of sessions that CICS failed to restore.

System action: CICS continues.

User response: None.

Destination: Console

Modules: DFHZGRP

XMEOUT Parameters: *applid, icount,spcount, stcount, socount, secount*

DFHZC0136 *applid* PSDI value indicated persistence but the run time VTAM does not support persistent sessions.

Explanation: The PSDI value is nonzero. This specifies that VTAM sessions are to persist across CICS failures. However, this release of VTAM does not support persistent sessions.

System action: CICS sets the PSDI value to 0 and continues without persistent session support.

User response: ACF/VTAM Release 3 Version 4 Modification 1 or higher must be used in order to take advantage of CICS persistent session support.

To prevent this message being issued when using an earlier release of VTAM, set the PSDINT system initialization parameter to zero, and when using the EXEC CICS SET VTAM command, either omit, or specify a value of zero for the PSDINTERVAL operand.

Destination: Console

Modules: DFHZSLS

XMEOUT Parameter: *applid*

DFHZC0137 *applid* PSDI value indicated persistence but the TCT assemble time VTAM does not support persistent sessions.

Explanation: The PSDI value is nonzero. This specifies that VTAM sessions are to persist across CICS failures. However, DFHTCTxx was assembled against a release of VTAM that cannot support persistent sessions.

System action: CICS sets the PSDI value to 0 and continues without persistent session support.

User response: Reassemble the TCT against ACF/VTAM Release 3 Version 4 Modification 1 or higher in order to take advantage of CICS persistent session support.

To prevent this message being issued when using an earlier release of VTAM, set the PSDINT system initialization parameter to zero, and when using the EXEC CICS SET VTAM command, either omit, or specify a value of zero for the PSDINTERVAL operand.

Destination: Console

Modules: DFHZSLS

XMEOUT Parameter: *applid*

DFHZC0140 *applid* SETLOGON PERSIST failed.
RTNCD,FDB2: *X'rc',X'fd'*. Code: *X'code'*

Explanation: CICS was opening the VTAM ACB, setting the PSDI value from an operator command or doing a WARM shut down. It attempted to issue the VTAM command SETLOGON OPTCD=PERSIST or OPTCD=NPERSIST. However, VTAM returned a RTNCD,FDB2 of *rc,fd*.

System action: An AP exception trace entry, *code*, is made.

A system dump is taken unless you have specifically suppressed dumps in the dump table.

If the ACB was being opened, no VTAM sessions persist and the PSDI value is set to 0.

If just the PSDI value was being changed, either by the operator or during termination, the value is unchanged, both to CICS and to VTAM.

If this occurs during a VTAM shut down and some sessions are not closed, sessions may exist on VTAM start-up and are terminated then.

User response: Use the dump taken or the exception trace entry *code* and the *VTAM programming manual* to determine the meaning of the RTNCD,FDB2 and the actions necessary to correct it.

Destination: Console

Modules: DFHZGSL

XMEOUT Parameters: *applid, X'rc',X'fd', X'code'*

DFHZC0144 *date time applid sysid termid* Synclevel 2 conversation started by *netname* before completion of exchange lognames. *sense ((instance) Module name: {DFHZGDA})*

Explanation: CICS has received an attach FMH5 for a synclevel 2 conversation from a partner with *netname* before exchange lognames processing is complete.

System action: A Deallocate(Abend) with sense code 08640001 is issued for the conversation.

User response: No further APPC synclevel 2 conversations can be started by the partner until exchange lognames has completed. Use CEMT to inquire on the status of the connection in order to determine whether exchange lognames has completed (see the *CICS Supplied Transactions* for more information).

Destination: CSNE

Modules: DFHZGDA

XMEOUT Parameters: *date, time,applid, sysid, termid, netname, sense, instance, {1=DFHZGDA}*

DFHZC0145 *date time applid netname termid* Synclevel 2 APPC conversation started before Exchange Lognames completed. Error occurred executing Deallocate(Abend). *sense ((instance) Module name: {DFHZGDA})*

Explanation: The APPC session *termid* with *netname* persisted during a CICS persistent sessions restart. The partner initiated a new synclevel 2 conversation before Exchange Lognames processing had completed. CICS attempted to issue a Deallocate(Abend) for the conversation. The Deallocate(Abend) could not be completed for the reason indicated by the *instance* in the message as follows.

Instance

Explanation

- | | |
|----|--|
| 01 | DFHZGDA called with chain Finite State Machine in unexpected state. |
| 02 | DFHZGDA called with bracket Finite State Machine in unexpected state |

For the meaning of the sense data, see "DFHZCxxxx messages" on page 1040.

System action: The state of the session after the persistent sessions restart cannot be determined, and the session is deactivated in order to reset the states. The sessions are reactivated.

User response: If the session is not successfully reactivated, check the CSNE log for messages indicating why the new BIND failed. The session may have been set out of service by the VTAM operator.

Destination: CSNE

Modules: DFHZGDA

XMEOUT Parameters: *date, time,applid, netname, termid, sense, instance, {1=DFHZGDA, 2=DFHZGDA}*

DFHZC0146 *date time applid* VTAM session for *termid* successfully recovered following a persistent sessions restart *sense ((instance) Module name: {DFHZXRC})*

Explanation: CICS has restored the VTAM persistent session for terminal *termid* following a persistent sessions restart.

The equivalent message for APPC sessions is DFHZC0156.

System action: If recovery notification is specified for this terminal, the recovery message is sent to the terminal, or the transaction requested to run at recovery notification time is started.

User response: If required, code an NEP to override

the recovery notification option originally specified in the TYPETERM definition for this session. See the *CICS Resource Definition Guide* and the *CICS Customization Guide* for more information.

Destination: CSNE

Modules: DFHZXRC

XMEOUT Parameters: *date, time, applid, termid, sense, instance, {1=DFHZXRC}*

DFHZC0147 *date time applid sysid termid* **Error occurred recovering persisting session.** *sense ((instance) Module name: {DFHZGDA})*

Explanation: An error has prevented the recovery of an APPC conversation which persisted across an emergency restart.

The session with a termid of *termid* is terminated. The reason and the corresponding AP exception trace entry are indicated by the *instance* in the message;

Instance

	Point ID and explanation
1	X'FB79' SEND not executed due to invalid bracket state.
2	X'FB7B' Insufficient storage for session recovery.
3	X'FB76' Recovery status byte TCTE_PRSS contains an unexpected value.
4	X'FB7A' RECEIVE not executed due to invalid bracket state.
5	X'FB78' Unexpected sense received during persistent sessions recovery.

System action:

An AP exception trace with a point ID as above is issued. The session is terminated and CICS continues.

User response: If recovery failed due to insufficient storage, try increasing the DSA or EDSA size limits (see the *CICS Customization Guide*). If any of the other instances occur, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

DFHZC0148 *date time applid sysid termid* **VTAM send or receive failed during persistent sessions recovery.** *sense ((instance) Module name: {DFHZGDA})*

Explanation: As part of session recovery following a

persistent session restart CICS issued a VTAM SEND or RECEIVE. The VTAM request failed leaving the session in an unknown state.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: The session is terminated.

User response: To determine the cause of the problem, see the associated DFHZCxxxx message in the CSNE log. This message gives further diagnostic information on the failing VTAM request.

Destination: CSNE

Modules: DFHZGDA

XMEOUT Parameters: *date, time, applid, sysid, termid, sense, instance, {1=DFHZGDA, 2=DFHZGDA}*

DFHZC0149 *date time applid termid* **Connection failure occurred during a persistent sessions restart** *sense ((instance) Module name: {DFHZNSP})*

Explanation: During a persistent sessions restart, CICS has been notified of the failure of a session initiation request issued during the previous instance of CICS.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: Processing continues.

User response: None

Destination: CSNE

Modules: DFHZNSP

XMEOUT Parameters: *date, time, applid, termid, sense, instance, {1=DFHZNSP}*

DFHZC0150 *date time applid termid* **Error processing the session state data returned after a persistent sessions restart.** *sense ((instance) Module name: {DFHZXRC})*

Explanation: The VTAM session for terminal *termid* persisted during a CICS persistent sessions restart, but an error occurred while processing the session state data returned by VTAM. The reason is indicated by the *instance* in the message as follows.

Instance

	Explanation
01	DFHZXRC called with an invalid request.
02	TCTTEDA contains null characters instead of the expected address.
03	Reserved
04	The vector key of the data passed by VTAM is not correct.
05	The length of the vector_29 data is too short.

- 06 Unidentified cleanup action detected.
- 07 Unidentified recovery option detected.
- 08 Invalid cleanup action for RECOVOPTION(NONE).
- 09 Invalid cleanup action for RECOVOPTION(MESSAGE).
- 10 Invalid cleanup action for RECOVOPTION(TRANSACTION).
- 11 Reserved.
- 12 DFHZXRC has been driven to process an LU6 session.
- 13 Neither XRF nor persistent sessions recovery is in progress DFHZXRC has been called in error.

For the meaning of the sense data, see "DFHZCxxxx messages" on page 1040.

System action: The state of the session after the persistent sessions restart cannot be determined, and the session is terminated in order to reset the states. Non-APPC sessions are restarted.

User response: If the session is not successfully restarted, check the CSNE log for messages indicating why the new BIND failed. The session may have been set out of service by the VTAM operator.

| **DFHZC0153** *date time applid* **A catalog write failed in the restart timer program.**

| **Explanation:** The restart timer program DFHZRTP has failed in an attempt to write a timer record to the catalog. If no timer records are written to the catalog terminals will not be signed on again after a Persistent Sessions restart.

| **System action:** An exception trace is output.

| **User response:** Investigate the cause of the error. There may be a problem with the global catalog. Look for other messages confirming this.

| **Destination:** CSNE

| **Modules:** DFHZRTP

| **XMEOUT Parameters:** *date, time,applid*

DFHZC0154	<i>date time applid</i> Timed start or cancellation of the restart timer program failed.		The TCTE_PRSS status byte was set to 0 but reject attach processing was not taking place. This session state is not valid for entry to DFHZXPS.
	Explanation: A timed start or cancellation of the restart timer program DFHZRTP failed. This means that no timer records will be written to the global catalog and terminals will be timed out if a Persistent Sessions restart occurs.	4	X'FBE4'
	System action: CICS initialization continues. In the event of a Persistent Sessions restart terminals will not be signed on.	5	X'FBD2'
	User response: Look for earlier messages and trace entries output by the timer domain which may indicate the reason for the failure. The most likely reason is that CICS is short on storage.		An error occurred during DEALLOCATE ABEND processing. This will have been handled by DFHZGDA so no dump is taken but the session is terminated.
	Destination: CSNE		
	Modules: DFHTCRP, DFHZPCT		
	XMEOUT Parameters: <i>date, time, applid</i>	6	X'FBE6'
		7	X'FBD3'
DFHZC0155	<i>date time applid sysid termid</i> Error occurred during processing of session state data returned after restart of persisting session. <i>sense</i> ((<i>instance</i>) Module name: {DFHZXPS})		The TCTE_PRSS_CV29_PTR (pointer to data returned by VTAM) contained zeroes on entry to DFHZXPS.
	Explanation: The VTAM APPC session <i>sysid termid</i> persisted during a CICS persistent session restart, but an error occurred while processing the session state data returned by VTAM following an OPNDST OPTCD=RESTORE.	8	X'FBD4'
	If the error needs further investigation, a dump is taken.		The CV29 data returned from VTAM had a zero length on entry to DFHZXPS.
	No dump is taken if one has already been taken for an earlier problem, or if the problem is known as one for which a session cannot be allowed to persist. An example of this is bind security processing not completing for this session when CICS terminated.	9	X'FBD4'
	The reason and the corresponding AP exception trace entry are indicated by the <i>instance</i> in the message.		The BIS flow data returned by VTAM showed BIS RQE1 received but the outbound BIS flow was not consistent with this.
	Instance	10	X'FBD4'
	Point ID and Explanation		The BIS flow data returned by VTAM showed that no BIS flow had been received but the outbound BIS flow was not consistent with this.
1	X'FBFD'	11	X'FBD4'
	During reject attach processing a call was made to DFHZGDA but DFHZGDA rejected the call with invalid format or invalid function.		The BIS flow data returned from VTAM was not recognized.
2	X'FBFD'	12	X'FBD5'
	An error occurred during reject attach processing. The session is in an unknown state.		The bid flow data returned by VTAM showed a request that was not recognized where this session is the contention winner.
3	X'FBD2'	13	X'FBD5'
			The bid flow data returned by VTAM showed that a negative X'088B' response had been sent but there was nothing to indicate that the session was closing down. This session is the contention winner.
		14	X'FBD5'

	The bid flow data returned by VTAM		The RU category returned by VTAM in the
	contained a response that was not recognized		CV29 data was not valid for LU6.2. (This
	where this session is the contention winner.		session was the secondary and the last flow
			was an inbound request.)
15	X'FBD5'		
	The bid flow data returned by VTAM was not	26	X'FBD8'
	recognized. This session is the contention		The RU category returned by VTAM in the

	CV29 data was not valid for LU6.2. (This		secondary and started the current bracket.
	session was the primary and the last flow was		
	an inbound response).	35	X'FBDA'
			The last inbound flow was a response that was
24	X'FBD9'		not for this bracket. (This session is the
	DFHZXPS could not determine the direction of		primary and did not start the current bracket).
	the last flow from the CV29 data returned by		
	VTAM. (This session was the primary).	36	X'FBDA'
25	X'FBD8'		

	The last inbound flow was a response that was not for this bracket. (This session is the secondary and did not start the current bracket).		The last flow was a negative response inbound to a command that could not be identified.
	37 X'FBDA'		50 X'FBDC'
	The last flow was a positive response outbound and was not for the previous request.		The last flow was a positive response outbound to BIS that was not consistent with the BIS flow data.
	38 X'FBDB'		51 X'FBDD'
	The last flow was an inbound LUSTAT command that could not be identified.		The last flow was a positive response outbound to a command that could not be identified.
	39 X'FBDB'		52 X'FBDC'
	The last flow was an inbound RTR that was not processed by the bid analysis routine.		The last flow was a negative response outbound to BIS that was not consistent with the BIS flow data.
	40 X'FBDB'		53 X'FBDD'
	The last flow was an inbound command that could not be identified.		The last flow was an outbound negative response to a command that could not be identified.
	41 X'FBDB'		54 X'FBE1'
	The last flow was an outbound LUSTAT command that could not be identified.		The last request to flow was SIGNAL (expedited flow) but no normal flow data appears in the CV29 normal flow data area.
	42 X'FBDB'		55 X'FBE1'
	The last flow was an outbound RTR request that was not processed by the bid analysis routine.		The last flow was a SIGNAL request (expedited flow). However analysis of the normal flow data shows both sides sending which is not possible. (Outbound flow was with EC.)
	43 X'FEDB'		56 X'FBE1'
	The last flow was an outbound command request that could not be identified.		The last flow was a SIGNAL request (expedited flow). However analysis of the normal flow data shows both sides sending which is not possible. (Outbound flow was in chain.)
	44 X'FBDC'		57 X'FBD5'
	The last flow was an inbound response to BIS that was not processed with the BIS flow data.		The tctewin/tctelse bits in the TCTTE have not been set correctly.
	45 X'FBDD'		58 X'FBDF'
	The last flow was an inbound positive response to a command that could not be identified.		The session is not in CS mode when analysis of the CV29 data shows that a call to DFHZGDA to ABEND the current transaction is required.
	46 X'FBDA'		59 X'FBE7'
	The last flow was an inbound response to an LUSTAT command but there was no corresponding outbound request.		A SEND_FMH7 call to DFHZGDA was rejected with invalid_format or invalid_function.
	47 X'FBDA'		60 X'FBE7'
	The last flow was an inbound negative response to an LUSTAT request which could not be identified.		
	48 X'FBDC'		
	The last flow was a negative response inbound to a BIS request that did not show up in the BIS flow data.		
	49 X'FBDD'		

| A SEND_FMH7 call to DFHZGDA was
 | rejected because of a disastrous error in
 | DFHZGDA.

| 61 X'FBE7'

| A RECEIVE_FMH7 call to DFHZGDA was
 | rejected with invalid_format or
 | invalid_function.

| 62 X'FBE7'

| A RECEIVE_FMH7 call to DFHZGDA was
 | rejected because of a disastrous error in
 | DFHZGDA.

| 63 X'FBE0'

| Internal DFHZXPS logic error. The input
 | parameters are invalid when a call is about to
 | be made to DFHZGDA.

| 64 X'FBE5'

| An invalid return code was received from a
 | call to DFHTCPCL with ENTRY=DFHZRST1.

| 65 X'FBDE'

| The tcte_bid_status byte contained an
 | unrecognized value.

System action: An AP exception trace with a point ID is issued. The state of the session after the restart cannot be determined, and the session is terminated in order to reset the states. The session is restarted. A system dump is produced for all instances except 04.

User response: If the session is not successfully restarted, check the CSNE log for messages indicating why the new BIND failed. The session may have been set out of service by the VTAM operator.

Destination: CSNE

Modules: DFHZXPS

61=DFHZXPS, 62=DFHZXPS, 63=DFHZXPS,
 64=DFHZXPS, 65=DFHZXPS}

DFHZC0156 *date time applid sysid VTAM APPC session termid* **successfully recovered following a persistent sessions restart.**
sense ((instance) Module name: {DFHZXPS})

Explanation: CICS has restored the VTAM APPC persisting session for *sysid termid* following a persistent sessions restart.

The equivalent message for non-APPC sessions is DFHZC0146. Note that the RECOVNOTIFY option that applies to message DFHZC0146 is not applicable to APPC sessions.

System action: Processing continues.

User response: None.

Destination: CSNE

Modules: DFHZXPS

XMEOUT Parameters: *date, time,applid, sysid, termid, sense, instance, {1=DFHZXPS, 2=DFHZXPS}*

DFHZC0157 *date time applid sysid VTAM APPC session termid* **could not be recovered following a persistent sessions restart.**
The session will be unbound.*sense ((instance) Module name: {DFHZXPS})*

Explanation: CICS was unable to restore the APPC persisting session for *sysid termid* following a persistent sessions restart. There are three possible reasons for this:

1. The BIND processing was incomplete when CICS failed.
2. Resynchronization was in progress for the session when CICS failed.
3. The recovery data returned by VTAM for the session was capable of more than one interpretation.

The TCTTE and TIOA are output for information only.

System action: The session is unbound and rebound.

User response: None.

Destination: CSNE

Modules: DFHZXPS

XMEOUT Parameters: *date, time,applid, sysid, termid, sense, instance, {1=DFHZXPS}*

DFHZC0158 *date time applid* **Persistent sessions signon data for terminal termid could not be written to the catalog.**

Explanation: CICS was attempting to write signon data for *termid* to the global catalog so that the signon

| status could be recovered after a persistent sessions
| restart, but the catalog write failed.

| **System action:** An exception trace is output. Loss of
| the data may mean that *termid* will not be signed on or
| off correctly after a persistent sessions restart.

| **User response:** Investigate the cause of the error. Look
| for earlier messages and trace entries from the catalog
| domain indicating the cause of the error, for example
| the catalog may be full.

| **Destination:** CSNE

| **Modules:** DFHZSGN, DFHZPCT, DFHSNTU

| **XMEOUT Parameters:** *date, time,applid, termid*

DFHZC0160 *date time applid tranid* **CNOS changes for
modename *modename* to node *netname*
connection *sysid* are incomplete.**

Explanation: CICS has made two attempts to
implement the change number of sessions (CNOS)
command for the modename *modename* on the APPC
connection *sysid*. The command was not successful
because of other activity on the modegroup. This only
happens on modegroups which are very busy. The state
of one or more of the sessions has changed during the
processing of the CNOS request.

The CNOS command results from a connection acquire,
a connection release, or a request for a specific
modename on this system or the connected system. If
the connected system is not CICS, commands specific
to that system may have been used.

System action: The modegroup is left in the state
reached after the second attempt to implement the
changes.

User response: Use the CEMT INQUIRE
MODENAME command to determine the current state
of the modegroup. The command may show the
modegroup as you expect for successful CNOS
completion. This is because the command only shows
data for available and active sessions. CICS may have
had problems with CNOS values for loser sessions,
which would not be apparent by using CEMT. If the
values are not as required, re-issue the original
command.

Destination: CSNE

Modules: DFHZGCA

XMEOUT Parameters: *date, time,applid, tranid,
modename, netname, sysid*

DFHZC0161 *date time applid tranid* **CNOS command
for modename *modename* to node *netname*
connection *sysid* has failed with code
X'code'.**

Explanation: CICS has encountered an error while
attempting to execute a change number of sessions

(CNOS) command for the modename *modename* on the
APPC connection *sysid*. The failure code *X'code'* is one
of the following:

X'FBA2'

The request to create a lock manager lock for
modename failed.

X'FBA3'

CICS could not allocate a session for the
CNOS negotiation conversation.

X'FBA6'

The request to obtain a lock manager lock for
modename failed.

X'FBAA'

modename was not found or has been defined
with one of the reserved names SNASVCMG
or CPSVCMG.

X'FBAB'

sysid is known, but not as a connection.

X'FBAC'

The specified connection *sysid* has no
modegroups. This is probably caused by a
storage overwrite.

X'FBAD'

The first modegroup on the specified
connection *sysid* has no sessions. This is
probably caused by a storage overwrite.

X'FBAF'

The receive command for the CNOS reply
failed.

X'FBB1'

The send command for the CNOS command
or CNOS reply failed.

X'FBB2'

The session for the single-session connection
could not be found. This is probably caused by
a storage overwrite.

X'FBB3'

sysid is not a known connection name.

X'FBB4'

The connection is defined to CICS as not
supporting CNOS. This is probably caused by
a storage overwrite.

X'FBB9'

CICS sent a CNOS command for a specific
modename but the partner system returned a
CNOS reply indicating all modegroups. This is
a protocol violation.

System action: CICS makes an exception trace with ID
AP *xxxx*; where *xxxx* is the code in the message. CICS
takes a system dump for all failure codes except
X'FBA2', X'FBA3', X'FBA6', X'FBAF', X'FBB1', and
X'FBB9'. CICS continues without completing the
request. The task does not abend. Message DFHME0116

is normally produced containing the symptom string for this problem.

User response: This depends on the error code as follows:

X'FBA2'

Follow the guidance given for the lock manager console message that precedes this.

X'FBA3'

If all the sessions are busy, make one available and retry.

X'FBA6'

Follow the guidance given for the lock manager message that precedes this.

X'FBAA'

Reissue the request with the correct modename.

X'FBAB'

Reissue the request with the correct connection name.

X'FBAC'

See the *CICS Problem Determination Guide* for further guidance on storage problems.

X'FBAD'

Same as for X'FBAC'.

X'FBAF'

The connected system, or the link to it, has failed. Determine the reason for this from any other messages produced.

X'FBB1'

Same as for X'FBAF'.

X'FBB2'

Same as for X'FBAC'.

X'FBB3'

Reissue the request with the correct connection name.

X'FBB4'

Same as for X'FBAC'.

X'FBB9'

Investigate why the connected system is not following the APPC protocols.

Destination: CSNE

Modules: DFHZGCM

XMEOUT Parameters: *date, time, applid, tranid, modename, netname, sysid, X'code'*

| **DFHZC0162** *date time applid tranid CNOS transaction*
| **for connection *sysid* has failed with code**
| ***X'code'* subcode *X'subcode'*.**

| **Explanation:** The change number of sessions (CNOS)
| transaction program DFHZLS1 could not complete

| successfully. The error code *X'code'* is one of the
| following:

| **X'FB92'**

| The transaction was not started as an IC
| request with data or by an attach flow from a
| connected system. The insert *subcode* is the
| start code from XMIQ_START_CODE.

| **X'FB93'**

| The transaction was started with data, but no
| data was found.

| **X'FB94'**

| The transaction was started with data, but the
| data was not in the form of the correct
| parameter list.

| **X'FB95'**

| The transaction was started with the correct
| format parameter list, but the function code
| was invalid.

| **X'FB96'**

| The transaction was started by an attach from
| a connected system but there was no CNOS
| data.

| **X'FB97'**

| The transaction was started by an attach from
| a connected system but the associated data
| was not a CNOS command.

| **X'FB9E'**

| The transaction was started but CICS is
| shutting down and the VTAM ACB is closed.

| This may have occurred because a number of
| CLS1 tasks were started before shutdown was
| issued but are held up because CICS was at
| MAXTASK. During shutdown the VTAM ACB
| was closed and this task was then started.

| **System action:** CICS produces an exception trace, and
| except for in the case of an invalid start, a system
| dump is taken. The task terminates. Message
| DFHME0116 is normally produced containing the
| symptom string for this problem.

| **User response:** This depends on the error code as
| follows:

| **X'FB92'**

| The transaction was probably started by
| entering the transaction ID at a terminal. This
| is not allowed.

| **X'FB93'**

| Analyze the dump to determine why IC could
| not find the data.

| **X'FB94'**

| Analyze the dump to determine what the data
| was.

| X'FB95'
| Analyze the dump to determine what the data
| was.

| X'FB96'
| Analyze the dump to determine why no data
| was available.

| X'FB97'
| Analyze the dump to determine why the
| correct data was not sent with the attach.

| X'FB9E'
| No action to take.

| **XMEOUT Parameters:** *date, time,applid, termid, termid*

| **DFHZC0167** *date time applid termid* **An attempt to sign**
| **off a user at termid termid failed**
| **following a multinode persistent**
| **sessions restart. Response code rc1 and**
| **reason code rc2 were received.**

| **Explanation:** CICS attempted to sign off a user at
| termid *termid* because of a signon timeout following a
| multinode persistent sessions restart. An exception or
| disaster response was received from the signon
| program DFHSNTU with one of the following reason
| codes:

| **Reason code**

	Explanation
002	There is no active ESM.
003	The ESM is not responding.
010	The terminal type is invalid for this operation.
017	The terminal has preset security.
019	Security is not active for this CICS.
022	The terminal is a surrogate terminal.
028	The ESM returned a response which was not recognized by the CICS security domain.
038	The signon program went into recovery following an ABEND.
048	The signon program detected a loop and went into recovery.
052	The signon program received a bad response from transaction manager.

| **System action:** An AP exception trace with point ID
| FB9D is issued.

| **User response:** Reason codes 002, 003, 019 and 028
| indicate a problem with the ESM or the security
| domain. The remaining reason codes may indicate an
| internal error in CICS. Look for messages output earlier
| by the ESM or the security domain. If security was
| active when the problem occurred and there was no
| problem with the ESM or the security domain contact
| your IBM support center.

| **Destination:** CSNE

| **Explanation:** CICS has deregistered from VTAM
| generic resource group *grname*.

| **System action:** None. CICS will not reregister to the
| generic resource until the VTAM ACB has been closed
| and opened again.

| **User response:** None.

| **Destination:** Console

| **Modules:** DFHZGSL

| **XMEOUT Parameters:** *applid, grname*

| **DFHZC0173** *applid* CICS deregistration from VTAM
| generic resource name *grname* failed.
| VTAM return code: X'rc'. FDB2: X'fd'.

| **Explanation:** CICS failed to deregister from VTAM
| generic resource group *grname*.

| VTAM returned a RTNCD,FDB2 of *rcfd* in response to
| the SETLOGON OPTCD=GNAMEDEL macro.

| This may be due to a hardware failure in another part
| of the sysplex or to corruption of the TCT prefix
| causing CICS to attempt to deregister with the wrong
| name.

| **System action:** An AP exception trace entry is output
| with a trace point of X'FB8E'.

| **User response:** Use the *VTAM Programming Manual* to
| determine the meaning of the register 15 and register 0
| values output by VTAM. If the problem is not caused
| by use of the wrong version of VTAM, you will need
| further assistance from IBM. See Part 4 of the *CICS*
| *Problem Determination Guide* for guidance on how to
| proceed.

| **Destination:** Console

| **Modules:** DFHZGSL

| **XMEOUT Parameters:** *applid, grname,X'rc', X'fd'*

| **DFHZC0174** *applid* Control block initialization has
| failed. Generic resource registration or
| deregistration will not be attempted.
| Return codes *r15,r0*.

| **Explanation:** A call to a VTAM macro to initialize the
| node initialization block (NIB) before registering or
| deregistering as a VTAM generic resource has failed.

| A possible explanation is that the wrong level of VTAM
| is being used.

| **System action:** The values of register 15 and register 0
| returned by VTAM are output.

| An exception trace is output with trace point X'FBED'.

| If registration was about to be attempted, CICS
| continues without generic resource support.

| If deregistration was about to be attempted, ACB
| shutdown continues. VTAM removes CICS as a
| member for the generic resource name when the ACB
| is closed.

| **User response:** Use the *VTAM Programming Manual* to
| determine the meaning of the register 15 and register 0
| values output by VTAM. If the problem is not caused
| by use of the wrong version of VTAM, you will need
| further assistance from IBM. See Part 4 of the *CICS*
| *Problem Determination Guide* for guidance on how to
| proceed.

| **Destination:** Console

| **Modules:** DFHZGSL

| XMEOUT Parameters: *applid, r15,r0*

| **DFHZC0175** *applid* A value was specified for
| GRNAME but the assemble time or run
| time VTAM does not support generic
| resource registration.

| **Explanation:** A value was specified for the GRNAME
| system initialization parameter. This indicates that CICS
| is to register as a VTAM generic resource. However,
| either DFHTCTxx was assembled against a release of
| VTAM that cannot support generic resource
| registration, or CICS is running on a VTAM earlier than
| release 4 version 2.

| **System action:** CICS sets the generic resource name to
| blanks and continues without attempting generic
| resource registration.

| **User response:** If you are running with ACF/VTAM
| Release 4 Version 2 or higher, reassemble the TCT
| against this level of VTAM in order to take advantage
| of CICS support for generic resource registration.

| To prevent this message being issued when using an
| earlier release of VTAM, do not specify a value for the
| GRNAME system initialization parameter.

| **Destination:** Console

| **Modules:** DFHZSLS

| **XMEOUT Parameter:** *applid*

| **DFHZC0176** *date time applid* VTAM was unable to
| execute a CHANGE
| OPTCD=ENDAFFIN macro to end an
| affinity between this application, which
| is a member of generic resource *grname*,
| and a remote LU with netid *netid*
| netname *netname*. VTAM return code:
| *X'rc'*, FDB2: *X'fd'*, R15: *X'r15'*.

| **Explanation:** An attempt was made to end an affinity
| between this CICS, which is a member of generic
| resource *grname*, and a remote LU with netid *netid* and
| netname *netname* by means of a SET CONNECTION
| ENDAFFINITY or PERFORM ENDAFFINITY
| command. The attempt has failed because a problem
| with VTAM prevented the VTAM CHANGE
| OPTCD=ENDAFFINITY macro from being issued.

| VTAM has issued the return code-feedback
| (RTNCD,FDB2) *X'rc'*,*X'fd'* in response to the CHANGE
| OPTCD=ENDAFFINITY macro.

| R15 *r15* is the register 15 value returned by VTAM.

| **System action:** Processing continues. VTAM has made
| no attempt to end the affinity.

| **User response:** See the *VTAM programming manual* for
| the meaning of the RTNCD,FDB2 and for guidance on
| correcting the problem.

| When the problem has been corrected retry the
| command.

| **Destination:** CSNE

| **Modules:** DFHZGCH

| **XMEOUT Parameters:** *date, time,applid, grname, netid,*
| *netname, X'rc', X'fd', X'r15'*

| **DFHZC0177** *date time applid* Connection *sysid* has
| created an affinity between this
| application, which is a member of
| generic resource *grname*, and a remote
| LU with netid *netid* netname *netname*.

| **Explanation:** A generic resource member has
| established an APPC synclevel 2, APPC limited
| resource, or LU6.1 connection with another LU. For
| connections of these types VTAM creates affinities
| which are owned by CICS and have to be ended by the
| CICS operator using the SET CONNECTION
| ENDAFFINITY or PERFORM ENDAFFINITY
| command. The message is output whenever the
| connection is acquired but the affinity is not recreated
| for each acquire unless it has been ended in the
| meantime.

| **System action:** Processing continues.

| **User response:** None, but note that the affinity has to
| be ended before the partner LU can establish a
| connection with another generic resource member.

| The affinity may be ended automatically by the
| connection quiesce transaction when the connection is
| released. However, it is not done if the system crashes
| or is shut down 'immediate' whilst the connection is
| still acquired.

| **Destination:** CSNE

| **Modules:** DFHZNAC

| **XMEOUT Parameters:** *date, time,applid, sysid, grname,*
| *netid, netname*

| **DFHZC0178** *date time applid* An attempt to end an
| affinity between this application, which
| is a member of generic resource *grname*,
| and a remote LU with netid *netid*
| netname *netname* was rejected by VTAM.
| VTAM return code: *X'rc'*. FDB2: *X'fd'*.

| **Explanation:** An attempt was made to end an affinity
| between this CICS, which is a member of generic
| resource *grname*, and a remote LU with netid *netid* and
| netname *netname* using a SET CONNECTION
| ENDAFFINITY or PERFORM ENDAFFINITY
| command. The request has been rejected by VTAM.

| VTAM has issued the return code-feedback
| (RTNCD,FDB2) *X'rc'*,*X'fd'* in response to the CHANGE
| OPTCD=ENDAFFINITY macro.

| **System action:** Processing continues.

| **User response:** See the *VTAM programming manual* for the meaning of the RTNCD,FDB2 code and for guidance on correcting the problem.

| When the problem has been corrected, retry the command if appropriate.

| **Destination:** CSNE

| **Modules:** DFHZGCH

| **XMEOUT Parameters:** *date, time,applid, grname, netid, netname, X'rc', X'fd'*

| **DFHZC0179 I** *date time applid* **Connection** *sysid*
| **netname netname is a link to generic**
| **resource grname member membername.**

| **Explanation:** A connection *sysid* from netname *netname* to generic resource *grname* has been established.

| The message is issued once for each connection acquire.

| **System action:** Processing continues.

| **User response:** None.

| **Destination:** CSNE

| **Modules:** DFHZNAC

| **XMEOUT Parameters:** *date, time,applid, sysid, netname, grname, membername*

| **DFHZC0180** *date time applid* **An affinity between this**
| **application, which is a member of**
| **generic resource grname, and a remote**
| **LU with netid netid netname netname has**
| **ended successfully.**

| **Explanation:** VTAM has responded positively to an attempt to end an affinity with remote LU netid *netid*, netname *netname*. The affinity was ended implicitly by the connection quiesce transaction when the connection was released or explicitly by a SET CONNECTION ENDAFFINITY or PERFORM ENDAFFINITY command.

| **System action:** Processing continues. The remote LU can now establish a connection with a different generic resource member.

| **User response:** None.

| **Destination:** CSNE

| **Modules:** DFHZGCH

| **XMEOUT Parameters:** *date, time,applid, grname, netid, netname*

| **DFHZC0181** *date time applid* **No affinity exists**
| **between this application, which is a**
| **member of generic resource grname, and**
| **a remote LU with netid netid netname**
| **netname. VTAM return code: X'14', FDB2:**
| **X'88'.**

| **Explanation:** An unsuccessful attempt was made to end an affinity between this CICS, which is a member of generic resource *grname*, and a remote LU with netid *netid* and netname *netname* using a SET CONNECTION ENDAFFINITY or PERFORM ENDAFFINITY command. VTAM has issued return code-feedback (RTNCD,FDB2) of X'14',X'88' in response to the CHANGE OPTCD=ENDAFFINITY macro indicating that no such affinity exists.

| **System action:** Processing continues.

| **User response:** Ensure that the values input to the SET CONNECTION ENDAFFINITY or PERFORM ENDAFFINITY command are correct.

| **Destination:** CSNE

| **Modules:** DFHZGCH

| **XMEOUT Parameters:** *date, time,applid, grname, netid, netname*

| **DFHZC0182** *date time applid* **VTAM was unable to**
| **execute an INQUIRE OPTCD=NQN**
| **macro to determine the network**
| **qualified netname of logical unit luname.**
| **VTAM return code: X'rc', FDB2: X'fd',**
| **R15: X'r15'.**

| **Explanation:** CICS has attempted to determine the network qualified netname of logical unit *luname*. The attempt has failed because a problem with VTAM prevented the VTAM INQUIRE OPTCD=NQN macro from being issued.

| VTAM has issued the return code-feedback (RTNCD,FDB2) *X'rc',X'fd'* in response to the INQUIRE OPTCD=NQN macro.

| R15 *r15* is the register 15 value returned by VTAM.

| **System action:** The CICS component which requires the network qualified netname of the logical unit determines whether any further action is called for.

| **User response:** See the *VTAM Programming manual* for the meaning of the RTNCD,FDB2 and for guidance on correcting the problem.

| **Destination:** CSNE

| **Modules:** DFHZGIN

| **XMEOUT Parameters:** *date, time,applid, luname, X'rc', X'fd', X'r15'*

| **DFHZC0183** *date time applid* **An attempt to determine**
| **the network qualified name of logical**
| **unit luname was rejected by VTAM.**
| **VTAM return code: X'rc'. FDB2: X'fd'.**

| **Explanation:** CICS has attempted to determine the network qualified name of logical unit *luname*. The request has been rejected by VTAM.

| VTAM has issued the return code-feedback

| (RTNCD,FDB2) *X'rc',X'fd'* in response to the INQUIRE
 | OPTCD=NQN macro.

| **System action:** The CICS component which requires
 | the network qualified name of the logical unit decides
 | whether further action is called for.

| **User response:** See the *VTAM Programming* manual for
 | the meaning of the RTNCD,FDB2 code and for
 | guidance on correcting the problem.

| **Destination:** CSNE

| **Modules:** DFHZGIN

| **XMEOUT Parameters:** *date, time,applid, luname, X'rc',
 | X'fd'*

| **DFHZC0184** *date time applid* **VTAM was unable to
 | execute an INQUIRE
 | OPTCD=SESSNAME macro to
 | determine the member of generic
 | resource set *grname* to which logical unit
 | *netid.luname* is logged on. VTAM return
 | code: *X'rc'*, **FDB2:** *X'fd'*, **R15:** *X'r15'*.**

| **Explanation:** CICS has attempted to determine the
 | member of a generic resource set *grname* to which
 | logical unit *netid.luname* is logged on. The attempt has
 | failed because a problem with VTAM prevented the
 | VTAM INQUIRE OPTCD=SESSNAME macro from
 | being issued.

| VTAM has issued the return code-feedback
 | (RTNCD,FDB2) *X'rc',X'fd'* in response to the INQUIRE
 | OPTCD=NQN macro.

| R15 *r15* is the register 15 value returned by VTAM.

| **System action:** The CICS component which needs to
 | know where the logical unit is logged on determines
 | whether any further action is called for.

| **User response:** See the *VTAM Programming* manual for
 | the meaning of the RTNCD,FDB2 and for guidance on
 | correcting the problem.

| **Destination:** CSNE

| **Modules:** DFHZGIN

| **XMEOUT Parameters:** *date, time,applid, grname, netid,
 | luname, X'rc', X'fd', X'r15'*

| **DFHZC0185** *date time applid* **An attempt to determine
 | the member of generic resource set
 | *grname* to which logical unit *netid.luname*
 | is logged on was rejected by VTAM.
 | VTAM return code: *X'rc'*. **FDB2:** *X'fd'*.**

| **Explanation:** CICS has attempted to determine the
 | member of generic resource set to which *grname* logical
 | unit *netid.luname* is logged on. The request has been
 | rejected by VTAM.

| VTAM has issued the return code-feedback
 | (RTNCD,FDB2) *X'rc',X'fd'* in response to the INQUIRE

| OPTCD=SESSNAME macro.

| **System action:** The CICS component which requires
 | the member name decides whether further action is
 | called for.

| **User response:** See the *VTAM Programming* manual for
 | the meaning of the RTNCD,FDB2 code and for
 | guidance on correcting the problem.

| **Destination:** CSNE

| **Modules:** DFHZGIN

| **XMEOUT Parameters:** *date, time,applid, grname, netid,
 | luname, X'rc', X'fd'*

| **DFHZC0186** *date time applid* **Connection *sysid* which is
 | a member of generic resource *grname* has
 | a duplicate remote LU netname *netname*.
 | sense ((*instance*)) **Module name:**
 | {DFHZOPN})**

| **Explanation:** Node *nodeid* attempted to log on to CICS
 | but the logon is invalid.

| The *nodeid* in the message always starts with the
 | netname of the node attempting to connect to CICS.
 | For some instances of the message resulting from an
 | APPC log on, the modename of the session is
 | concatenated to the netname with a dot separator. Since
 | a string consisting of eight blanks is the default
 | modename, this can lead to idiosyncratic formatting of
 | the message.

| If the message is issued by DFHZATA, CICS has failed
 | in its attempt to autoinstall the terminal or connection.

| The instance *instance* is one of the following:

- | 1 During the acquire process for a secondary
 | session CICS attempted to add the
 | membername of the partner to a table but this
 | name already exists for a different generic
 | resource connection.
- | 2 During the acquire process for a secondary
 | session CICS attempted to add the
 | membername of the partner to a table but this
 | name has just been used as the netname of a
 | terminal by an install occurring at the same
 | time as the install of this connection.

| **System action:** The acquire of the connection
 | continues.

| **User response:** Use the instance number to determine
 | why the netname already exists:

- | 1 Use the CEMT INQUIRE CONNECTION API
 | to see which generic resource has the same
 | membername.
 |
 | Since this problem should not occur under
 | normal circumstances, you may need further
 | assistance from IBM.
- | 2 Investigate why the LU name of the partner is

the same as the LU name of a terminal and remove one of the definitions.

Destination: CSNE

Modules: DFHZOPN, DFHZOPN

XMEOUT Parameters: *date, time, applid, sysid, grname, netname, sense, instance, {1=DFHZOPN, 2=DFHZOPN}*

DFHZC0187 *date time applid* **Reset of connection *sysid* failed following the ending of an affinity between this a pplication and a remote LU with generic resource name *grname* member name *applid*. The connection was locked by task *taskid*, transaction *tranid*.**

Explanation: CICS has failed to reset connection *sysid* after an affinity was ended successfully. A lock was held by task *taskid*, transaction *tranid*.

System action: Processing continues but the state of the connection is undetermined.

User response: If appropriate, use the information in the message to find out why there was a lock on the connection. If the connection is left in a state where it cannot be acquired, delete and reinstall it.

Destination: CSNE

Modules: DFHZGCH

XMEOUT Parameters: *date, time, applid, sysid, grname, applid, taskid, tranid*

DFHZC0199 **CICS has recovered after a system failure. Execute recovery procedures. { Already signed on. | Please sign on. }**

Explanation: This message is sent to a terminal when the associated VTAM session is successfully recovered following a persistent sessions restart of CICS.

This is the default message issued by CICS if RECOVNOTIFY(MESSAGE) is specified on the TYPETERM for a device (see the *CICS Resource Definition Guide*), or in the node error program (see the *CICS Customization Guide*). If RECOVNOTIFY(MESSAGE) is used, it is recommended that the CICS supplied sample mapset DFHXMSG be tailored to meet the installation recovery requirements.

System action: Processing continues.

User response: Sign on if required, and take any recovery actions required.

Note: This message cannot be changed with the message editing utility.

Destination: Terminal End User

Modules: DFHZNAC

DFHZC0200 *applid* **An attempt by the COVR transaction to OPEN VTAM has failed with return code X'*retcode*'; CICS will retry.**

Explanation: The COVR transaction has attempted an EXEC CICS SET VTAM OPEN, but the operation failed with the return code *retcode* from the OPEN ACB.

System action: CICS continues. The COVR transaction retries the operation every 5 seconds. This message is reissued every minute until the operation succeeds, or until 10 minutes has passed, in which case message DFHZC0201 is issued.

User response: Investigate the reason for VTAM being unavailable. See the *VTAM Programming* manual for an explanation of the ACB return code.

Destination: Console

Modules: DFHZCOVER

XMEOUT Parameters: *applid, X'*retcode*'*

DFHZC0201 *applid* **An attempt by the COVR transaction to OPEN VTAM has failed with return code X'*retcode*'; the COVR transaction will terminate.**

Explanation: The COVR transaction has repeatedly attempted an EXEC CICS SET VTAM OPEN, but the operations have failed. The OPEN ACB has issued the return code *retcode*.

System action: CICS continues. The COVR transaction terminates and the SET VTAM OPEN is not retried.

User response: Investigate the reason for VTAM being unavailable. See the *VTAM Programming* manual for an explanation of the ACB return code.

Destination: Console

Modules: DFHZCOVER

XMEOUT Parameters: *applid, X'*retcode*'*

DFHZC2109 *E date time applid* **Unexpected response from Recovery Manager following resynchronization of LU6.1 session *termid* with remote system *sysid*.**

Explanation: Recovery manager was invoked during resynchronization of an LU6.1 session, but gave an unexpected response. This is due to an internal logic error.

System action: A system dump is taken unless dumps have been specifically suppressed in the dump table.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, sysid*

DFHZC2114 E *date time applid termid tranid* **A SEND response failed during receive-any processing.** *sense ((instance) Module name: {DFHZRAC})*

Explanation: A SEND response issued on a receive-any RPL failed, or was not accepted by VTAM.

For the meaning of the sense data, see "DFHZCxxxx messages" on page 1040.

System action: If a task is attached, it is abnormally terminated with a transaction dump. Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: A subsequent message in the log indicates the reasons for the failure. Refer to this message for further information and guidance.

Destination: CSNE

Modules: DFHZRAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRAC, 2=DFHZRAC}*

DFHZC2115 *applid termid* **Potential CICS hang detected following a SEND to node netname, CID X'cid'. Investigation is required.** *((instance) Module name: {DFHZRAC})*

Explanation: CICS has issued a VTAM SEND macro to send a response but no notification has been received that the response has completed. Until this SEND operation completes, one of the limited number of receive-any RPLs remains unusable (the number of receive-any RPLs is defined by the RAPOOL system initialization parameter).

This is a serious condition. If all the receive-any RPLs become unusable in this way, CICS is unable to accept any new requests from VTAM. Similarly, a reduction in the number of available receive-any RPLs can adversely affect terminal performance and transaction throughput.

Additionally, while the RPL is hanging, a normal CICS shutdown might be unable to complete.

The CID is the 32-bit VTAM communication identifier which was assigned when the session was established.

System action: CICS continues to monitor for the SEND operation to complete. Until this happens, CICS reissues this message at approximately three minute intervals.

User response: This problem is usually caused by a failure in the network which stops the SEND completing. Check the session and the associated

logical unit to ensure that there is no error condition which stops VTAM completing the SEND request.

Destination: Console

Modules: DFHZRAC

XMEOUT Parameters: *applid, termid, netname, X'cid', instance, {1=DFHZRAC}*

DFHZC2116 E *date time applid* **Resynchronization of LU6.1 session termid with remote system sysid failed.**

Explanation: Resynchronization of an LU6.1 session with a remote system has failed to complete for one of the following reasons:

1. There is an apparent inconsistency between the sequence numbers in the two systems
2. There was a protocol error during the exchange of the sequence numbers
3. Neither system requested resynchronization, but there was a shunted unit of work associated with the session.

System action:

1. A system dump is taken unless dumps have been specifically suppressed in the dump table.
2. The TCTTE for the session on which the error occurred is printed. The local system's sequence numbers, and the numbers or responses received from the remote system can be found in the TCTTE.
3. The failure of resynchronization is reported to recovery manager. Recovery manager issues diagnostics relating to any unit of work affected by the failure.

User response:

1. Determine whether changes to data in the local and remote system are synchronized. Diagnostics issued by recovery manager will help you to do this. If necessary, take action to resynchronize the data.
2. Determine why the resynchronization failure happened. You will normally need assistance from IBM to do this. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSNE

Modules: DFHZRSY, DFHZSCX, DFHZSEX

XMEOUT Parameters: *date, time, applid, termid, sysid*

DFHZC2117 E *date time applid termid tranid* **Data received on pipeline session exceeds RAIA size.** *((instance) Module name: {DFHZRAC})*

Explanation: CICS has received data on a pipeline session which is larger than the initial I/O area allocated for the receive any RPL. The size of the

| receive any input area (RAIA) is specified on the
| RAMAX system initialization parameter.

| **System action:** CICS ends the session which sent the
| data and marks it out of service. CICS will also attempt
| to abnormally terminate any running transactions
| which were initiated from this session.

| **User response:** Increase the value of the RAMAX
| system initialization parameter so that it is at least
| equal to the largest RUSIZE (from the CINIT) specified
| for a pipeline session.

| **Destination:** CSNE

| **Modules:** DFHZRAC

| **XMEOUT Parameters:** *date, time,applid, termid, tranid,*
| *instance, {1=DFHZRAC}*

DFHZC2118 *applid* **Receive Any stall for netname**
netname.

Explanation: All the CICS Receive Any RPLs have
been posted but the TCTTE for each one is waiting for
a response from a VTAM terminal or session. All the
Receive Any RPLs have been stalled for 10 dispatches
of the TCP task (CSTP). This message is produced for
each session that is in this situation. A VTAM session
has not responded to a command such as BID or
SHUTD sent by CICS. This is typically caused by a
protocol error.

System action: CICS is NOT running with system
initialization parameter RAPOOL=(n,n,FORCE) so CICS
VTAM activity is held up until one of the commands
completes.

User response:

Issue the VTAM command V NET,INACT,ID=*netname*,I
for one or more of the sessions indicated by *netname*, to
try and free a Receive Any RPL. Note - if the sessions
are LU6.2 then the above command will inactivate the
partner APPLID to VTAM.

Investigate why the CICS terminal control commands
that have caused the stall have not completed. If this is
due to a protocol error from the partner or device,
attempt to get the protocol error corrected.

Consider increasing the number of Receive Any RPLs
specified in the RAPOOL System Initialization
parameter. For instance, if you were using the old
default of 2, increase this to the new default of 50.

If you still get this message after changing the
RAPOOL value consider running CICS with system
initialization parameter RAPOOL=(n,n,FORCE), which
attempts to issue CLSDST for all the offending sessions
or terminals and to re-issue the Receive Any RPLs.

Destination: Console

Modules: DFHZRAC

XMEOUT Parameters: *applid, netname*

DFHZC2119 E *date time applid termid tranid* **LUSTAT**
received on pipeline session incorrectly
requests a definite response. (*instance*)
Module name: {DFHZRAC}

Explanation: CICS has received data on a pipeline
session that violates the pipeline protocol. An LUSTAT
SENSE 08310000 'Device Powered Off' was received
from the device requesting a definite response, but only
EXC responses are allowed.

System action: CICS ends the session that sent the
data and marks it out of service. CICS also attempts to
abnormally terminate any running transactions initiated
from this session.

User response: Determine why the pool pipeline
terminal is violating the protocol.

Destination: CSNE

Modules: DFHZRAC

XMEOUT Parameters: *date, time,applid, termid, tranid,*
instance, {1=DFHZRAC}

| **DFHZC2300** *applid* **Recovery action requested for**
| **connection** *sysid.*

| **Explanation:** The XZIQUE global user exit program
| has been invoked by CICS because of a potential
| problem with the connection. The global user exit has
| used return code UERCAKLL indicating that
| throughput on the connection is abnormally low and
| some exceptional action is required. The poor
| performance of the connection can be caused by:
| • Poor response on the receiving end
| • Increased load on the sending end.

| The condition may be intermittent. Message
| DFHZC2301 may follow indicating that the connection
| has recovered.

| This message may also occur when the XZIQUE global
| user exit is disabled but the connection has been at the
| QUEUELIMIT for MAXQTIME where both parameters
| are specified in the connection definition.

System action: CICS cancels all transactions which
have outstanding queued requests to use the
connection.

User response: Investigate the cause of the poor
performance of the connection. Check the availability
and condition of the connected system.

Destination: Console

Modules: DFHZISP

XMEOUT Parameters: *applid, sysid*

DFHHC2301I *applid* **Connection *sysid* operating normally following recovery action.**

Explanation: Message DFHHC2300 has been issued for this connection. The connection has now recovered and is operating normally.

System action: Processing continues.

User response: None

Destination: Console

Modules: DFHZISP

XMEOUT Parameters: *applid, sysid*

DFHHC2302 *applid* **SETLOGON start command rejected**

Explanation: CICS issues the SETLOGON START command after a successful OPEN VTAM ACB. The SETLOGON START command is rejected in the following cases:

- The CICS OPEN VTAM ACB was successful, but VTAM subsequently terminated abnormally, or
- The CICS OPEN VTAM ACB was successful, but insufficient system storage was available to satisfy the SETLOGON START command, or
- The CICS OPEN VTAM ACB was successful, but VTAM was subsequently terminated by a VTAM HALT QUICK command.

System action: If the error occurs during CICS initialization, CICS abnormally terminates with a U2302 abend and a system dump.

If the error occurs as a result of a CEMT or EXEC CICS SET VTAM OPEN, CICS terminates the task abnormally with abend code ATC2 and a transaction dump, and the VTAM ACB is closed.

User response: The VTAM return code can be found in RTNCD-FDBK2 in the first RPL in the RA pool addressed from TCTVRVRA in the system dump or the transaction dump.

Use the *VTAM Programming* manual, (SC23-0115-3), to determine the cause of the error and the actions necessary to correct it.

After correcting the error, either reinitialize CICS (for abend U2302) or follow the suggestions documented for abend ATC2.

Destination: Console

Modules: DFHZSLS

XMEOUT Parameter: *applid*

DFHHC2303 *applid* **No storage available when initiating RECEIVE-ANY's. Code: X'code'**

Explanation: While trying to acquire receive-any I/O areas, the SETLOGON START VTAM command found that storage was not available.

System action: CICS terminates with a dump. An exception entry *code* is made in the trace table.

A system dump is taken unless dumps have been specifically suppressed in the dump table.

Message DFHHC0133 is issued.

User response: Reduce the size of the RAMAX value in the system initialization table (SIT).

For further information, see the *CICS Performance Guide*.

Destination: Console

Modules: DFHZGRP

XMEOUT Parameters: *applid, X'code'*

DFHHC2304 *applid* **RECEIVE-ANY command rejected. Code: X'code'**

Explanation: This message is issued when the ACB has been opened either during initialization or dynamic open. DFHZGRP was initiating the VTAM RECEIVE-ANY's but VTAM was short on storage or the VTAM HALT QUICK command was issued.

System action: An exception entry *code* is made in the trace table.

A system dump is taken unless you have specifically suppressed dumps in the dump table.

If the error occurs during CICS initialization, CICS issues message DFHHC0133 and terminates.

If the error occurs as a result of a CEMT or EXEC CICS SET VTAM OPEN, CICS closes the VTAM ACB.

User response: The VTAM return code can be found in RTNCD-FDBK2 in the RPL, which is either in the exception trace entry *code*, or in the RA pool addressed from TCTVRVRA in the system dump.

Use the *VTAM Programming* manual, (SC31-6436), to determine the cause of the error and the actions necessary to correct it.

After correcting the error, either reinitialize CICS or reopen the VTAM ACB.

Destination: Console

Modules: DFHZGRP

XMEOUT Parameters: *applid, X'code'*

DFHZC2305I *applid* **Termination of VTAM sessions beginning**

Explanation: Either CICS or VTAM is being terminated, or a dynamic close of the VTAM ACB has been requested.

System action: All CICS-VTAM sessions are closed and the ACB is closed. If termination is not orderly, active transactions are abnormally terminated.

User response: When VTAM is active, communication may be resumed by using the master terminal operator command CEMT SET VTAM OPEN.

Destination: Console

Modules: DFHZSHU

XMEOUT Parameter: *applid*

DFHZC2307 *applid* **CICS VTAM ABNORMALLY QUIESCING** (*modname*).

Explanation: An RPL request has completed without a TCTTE token, for other than a VTAM storage shortage.

System action: CICS performs a FORCECLOSE of the ACB.

CICS may produce this message twice as both module DFHZRAC and module DFHZSYX may detect the condition.

User response: When VTAM has been restarted, issue a CEMT SET VTAM OPEN.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Modules: DFHZRAC, DFHZSYX

DFHZC2308 *applid* **TCP Task WAIT failed. Unexpected response from DSSR WAIT_OLDW call (RESPONSE X'xx', REASON X'yy').**

Explanation: The TCP task wait has failed. The TCP dispatcher module, DFHZDSP, has received an unexpected response, with response code X'xx' and reason code X'yy' from the DSSR WAIT_OLDW call.

System action: CICS abends with abend U1800 and a system dump is produced.

User response: Determine the cause of the TCP task wait failure. Investigate the dump in conjunction with any other accompanying error messages or exception trace entries which may have been issued by dispatcher domain.

Destination: Console

Modules: DFHZDSP

XMEOUT Parameters: *applid, X'xx', X'yy'*

1066 CICS TS for z/OS: CICS Messages and Codes

DFHZC2309 *applid* **Recovery action requested for connection *sysid* using mode group *modename*.**

Explanation: The XZIQUE global user exit program has been invoked by CICS because of a potential problem with the connection. The global user exit has used return code UERCAKLM indicating that throughput on the connection is abnormally low and some exceptional action is required. The poor performance of the connection can be caused by:

- Poor response on the receiving end
- Increased load on the sending end.

The condition may be intermittent. Message DFHZC2310 may follow indicating that the mode group has recovered.

System action: CICS cancels all transactions which have outstanding queued requests to use this mode group.

User response: Investigate the cause of the poor performance of the mode group. Check the availability and condition of the connected system.

Destination: Console

Modules: DFHZISP

XMEOUT Parameters: *applid, sysid, modename*

DFHZC2310I *applid* **Connection *sysid* using mode group *modename* operating normally following recovery action.**

Explanation: Message DFHZC2309 has been issued for this mode group. The mode group has now recovered and is operating normally.

System action: Processing continues.

User response: None

Destination: Console

Modules: DFHZISP

XMEOUT Parameters: *applid, sysid, modename*

DFHZC2312 * WELCOME TO CICS *****

Explanation: This is the CICS default good morning message for VTAM LUs. It is displayed unless an alternative GMTEXT has been specified as a system initialization parameter, or the typeterm definition logon message (LOGONMSG) has been set to NO.

System action: Processing continues.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Terminal End User

Modules: DFHSIT

DFHZC2316 *applid* VTAM ACB is closed

Explanation: CICS and VTAM have been disconnected. This may be because:

- CICS is terminating, or
- VTAM is terminating, or
- The CICS master terminal operator has issued

```
SET VTAM {CLOSED|IMMCLOSE|FORCECLOSE}
```

System action: The VTAM ACB is closed.

User response: If VTAM has not terminated, connection with VTAM can be reestablished by using master terminal operator commands.

Destination: Console

Modules: DFHZSHU

XMEOUT Parameter: *applid*

DFHZC2318 *applid* The autoinstall user program *progrname* is not enabled. Module *modname*.

Explanation: While opening the VTAM ACB, CICS found that no installed program definition exists for the autoinstall user-program *progrname* specified in the SIT.

System action: Other processing continues.

User response: If you want to use autoinstall, produce an installed program definition for the autoinstall user-program *progrname* specified in the SIT.

Destination: Console

Modules: DFHSIJ1, DFHZOPA

XMEOUT Parameters: *applid, progrname, modname*

DFHZC2319 *applid* Unable to close VTAM ACB RC=*xx* error code=*yy*

Explanation: The VTAM ACB CLOSE request failed.

System action: CICS continues as if the ACB is closed. (It is not really closed.)

User response: Refer to the *VTAM Programming* manual for an explanation of the return and error codes.

The return code *xx* is the VTAM return code in Register 15. The error code *yy* is the ACB error flag 'ACBERFLG'.

Destination: Console

Modules: DFHZSHU

XMEOUT Parameters: *applid, xx,yy*

DFHZC2320 CORRUPTED TCTTE ADDRESS FOUND DURING SHUTDOWN.

Explanation: A DFHTC CTYPE=LOCATE macro has returned an error indication while shutting down VTAM. This implies that the TCTTE chain has been corrupted, possibly by an overlay of the table manager control blocks.

System action: CICS is abnormally terminated with a system dump.

User response: Investigate the dump to determine the cause of the problem.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Modules: DFHZSHU

DFHZC2350A *date time applid* CICS Terminal Control shutdown threshold (*mm* minutes) exceeded. Sessions still active: *sesslist* (*instance*) Module name: {DFHZSHU}

Explanation: CICS' attempt to shut down the network has not been completed within the time period allowed. This time period, the terminal control shutdown wait threshold, is specified by the TCSWAIT system initialization parameter.

In the message, *mm* is the value of TCSWAIT, and *sesslist* is the VTAM network names of the first 10 (if there are that many) hung VTAM terminals.

System action:

CICS issues this message to both the CSNE transient data queue and the operating system console. This message is issued to the operating system console with an MVS write to operator (WTO) message descriptor code of 2. This means that the message is held by the operating system (that is, it does not roll off the screen) until the operator deletes it. For each hung VTAM session, message DFHZC2351 is also issued. DFHZC2351 gives further details of the session and is issued only to the CSNE transient data queue. CICS may attempt a FORCECLOSE on the session (see message DFHZC2351 for further details) but otherwise CICS terminal control shutdown continues as normal.

This message, DFHZC2350, is not processed by DFHZNAC (node abnormal condition program), so the condition cannot be intercepted by the installation's DFHZNEP (node error program). Note however that DFHZC2351 is processed by DFHZNAC and may be intercepted by the installation's DFHZNEP.

User response: Note the message, then delete it from the operating system console using the MVS CONTROL E (or K E) system command. See message DFHZC2351 for further guidance.

Destination: Console and Transient Data Queue CSNE

Modules: DFHZSHU

XMEOUT Parameters: *date, time,applid, mm, sesslist, instance, {1=DFHZSHU}*

DFHZC2351 *date time applid termid netname* **Session still active after TC shutdown threshold expired. Reason:** {01 Request in progress | 02 Task still active | 03 Waiting for SHUTC | 04 Waiting for BIS | 05 Waiting for UNBIND | 06 Waiting for RTR | 07 BID in progress | 08 Other TC work pending | 99 Undetermined} *sense ((instance) Module name: {DFHZSHU})*

Explanation: CICS' attempt to shut down the network has not been completed within the time period allowed. The time period, the terminal control shutdown wait threshold, is specified by the TCSWAIT system initialization parameter. This message is issued for each VTAM terminal that is still active (not shut down) after the time period has expired.

In the message *termid* and *netname* are respectively, the CICS terminal identifier, and the VTAM network name of the hung terminal. One of the following is also included in the message to indicate the reason for the hang:

01	Request in progress
02	Task still active
03	Waiting for SHUTC
04	Waiting for BIS
05	Waiting for UNBIND
06	Waiting for RTR
07	BID in progress
08	Other TC work pending
99	Undetermined

System action: CICS may attempt a FORCECLOSE on the session but otherwise CICS terminal control shutdown continues normally. Whether CICS attempts a FORCECLOSE depends upon:

- The coding of the TCSACTN system initialization parameter, and
- How the installation's DFHZNEP (node error program) handles this condition.

If either of the following conditions is true:

- TCSACTN=UNBIND, and this action is not changed by DFHZNEP,
- TCSACTN=NONE, and this action is changed to FORCECLOSE (UNBIND) by DFHZNEP

CICS terminal control issues a VTAM CLSDST and sends an SNA UNBIND command. If neither of the conditions is true, no special action is taken.

Note: CLSDST is not guaranteed to work in all circumstances.

The first 10 terminals (if there are that many) reported by this message are also included in message DFHZC2350.

User response: Check the state of the terminal. Check whether the associated DFHZC3437 message includes CLSDST. If DFHZC3437 does not include CLSDST, or it does but the CLSDST still fails to complete, take appropriate action outside of CICS to shut down the terminal.

If after a reasonable interval, terminal control shutdown still fails to complete (message DFHZC2316 is not displayed), take one of the following actions:

- FORCECLOSE the CICS/VTAM ACB.
- Perform a CICS CEMT PERFORM SHUTDOWN IMMEDIATE.
- Cancel the CICS job from the operating system console.

Warning: Do not perform one of these actions unless there are no other suitable actions to take.

The reason why the terminal does not shutdown is more likely to be a problem with the terminal device or the network, than with CICS.

If messages DFHZC2350, DFHZC2351, and DFHZC2352 are issued too early or too late in the shutdown process, take appropriate steps to change the TCSWAIT system initialization parameter on future runs of CICS. Once CICS has initialized, TCSWAIT cannot be changed.

Destination: CSNE

Modules: DFHZSHU

XMEOUT Parameters: *date, time,applid, termid, netname, {1=01 Request in progress, 2=02 Task still active, 3=03 Waiting for SHUTC, 4=04 Waiting for BIS,5=05 Waiting for UNBIND, 6=06 Waiting for RTR, 7=07 BID in progress, 8=08 Other TC work pending,99=99 Undetermined}, sense, instance, {1=DFHZSHU}*

DFHZC2352 *date time applid sysid netname* **Intersystem parallel connection still active after TC shutdown threshold expired. ((instance) Module {DFHZSHU})**

Explanation: CICS' attempt to shut down the network has not been completed within the time period allowed. The time period, the terminal control shutdown wait threshold, is specified by the TCSWAIT system initialization parameter. This message is issued for the first VTAM intersystem parallel session in each connection (LU Type 6.1 and LU Type 6.2, but not LU Type 6.2 single-session APPC terminals) that is still active (not shut down) after the time period has expired.

In the message *sysid* and *netname* are respectively, the CICS system identifier and the VTAM network name.

System action: If the TCSACTN=FORCE system initialization parameter has been specified CICS will attempt to force close the CICS VTAM ACB, provided that CNOS close processing has completed for LU Type 6.2 parallel session connections, otherwise CICS terminal control shutdown continues as normal. This message is not processed by DFHZNAC (node abnormal condition program), so the condition cannot be intercepted by the installation's DFHZNEP (node error program). Parallel connections reported by this message are not included in message DFHZC2350.

User response: If the TCSACTN=FORCE system initialization parameter has not been specified, or has been specified but the VTAM ACB still does not close, check the state of the connection. Take appropriate action outside of this CICS system to shut down the connection.

If messages DFHZC2350, DFHZC2351, and DFHZC2352 are issued too early or too late in the shutdown process, take appropriate steps to change the TCSWAIT system initialization parameter on future runs of CICS. Once CICS has initialized TCSWAIT cannot be changed.

Destination: Console and Transient Data Queue CSNE

Modules: DFHZSHU

XMEOUT Parameters: *date, time,applid, sysid, netname, instance, {1=DFHZSHU}*

DFHZC2400 E *date time applid termid tranid* **Error not supported. sense ((instance) Module name: {DFHZSYX})**

Explanation: CICS received an unexpected error code from VTAM.

For the meaning of the sense data, see "DFHZCxxxx messages" on page 1040.

System action: CICS terminates the session. If a task is attached, it is abnormally terminated with a transaction dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Use the symptom string, and if necessary the transaction dump, to determine the source of the error.

Destination: CSNE

Modules: DFHZSYX

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZSYX, 2=DFHZSYX, 3=DFHZSYX, 4=DFHZSYX, 5=DFHZSYX, 6=DFHZSYX, 7=DFHZSYX, 8=DFHZSYX, 9=DFHZSYX, 10=DFHZSYX}*

DFHZC2401 E *date time applid termid tranid* **RPL Active. sense ((instance) Module name: {DFHZRVL | DFHZRVS | DFHZSDA | DFHZSDL | DFHZSDR | DFHZSDS | DFHZSES | DFHZSKR})**

Explanation: CICS attempted to request VTAM services using a request parameter list (RPL) that is currently active.

For the meaning of the sense data, see "DFHZCxxxx messages" on page 1040.

System action: CICS terminates the session. If a task is attached, it is abnormally terminated with a transaction dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Use the symptom string, and if necessary, the transaction dump to determine the source of the error.

Destination: CSNE

Modules: DFHZRVS, DFHZSDA, DFHZSDR, DFHZSDS, DFHZSES, DFHZSDL, DFHZRVL, DFHZSKR

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZRVS, 2=DFHZSDA, 3=DFHZSDL, 4=DFHZSDS, 5=DFHZSES, 6=DFHZSKR, 7=DFHZRVL, 8=DFHZSDR, 9=DFHZRVL, 10=DFHZRVL, 11=DFHZRVL, 12=DFHZSDL}*

DFHZC2402 I *date time applid termid tranid netname* **VTAM has returned error on synchronous receive. sense ((instance) Module name: {DFHZRAS})**

Explanation: VTAM has indicated that a synchronous receive issued by DFHZRAS during receive-any slow-down processing did not complete successfully. This indicates a serious mismatch between CICS's view of the state of the session and that of VTAM.

For the meaning of the sense data, see "DFHZCxxxx messages" on page 1040.

System action: The request is ignored. CICS prints the associated session TCTTE on the CSNE transient data destination. The RPL returned by VTAM is included in exception trace entry AP FCA2.

User response: Determine from the RPL in the exception trace why VTAM raised the error.

Destination: CSNE

Modules: DFHZRAS

XMEOUT Parameters: *date, time,applid, termid, tranid, netname, sense, instance, {1=DFHZRAS}*

DFHZC2403 E *date time applid termid trandid* **Bind failure. sense ((instance) Module name: {DFHZSYX})**

Explanation: An attempt to establish a session has failed. This could be because a physical path to the device could not be found, because the device does not exist or has been defined incorrectly, or because the device has rejected the bind.

For the meaning of the sense data, see "DFHZCxxxx messages" on page 1040.

If this is an LU62 or LU61 session and the partner LU has sent sense bytes of X'08350000' and 0000 is the offset of the NETNAME in the BIND, this indicates that the partner LU was unable to find a suitable session.

If the sense bytes are X'08010000', this may mean that the partner LU has failed to autoinstall a connection.

If the VTAM RETURN CODE FEEDBACK is X'1018' then Generic Resourc is in use but the coupling facility is unavailable.

Instance 1 with sense code '0805' - If this system (TOR2) is a member of a generic resource (GR) and the partner (AOR) is not and an affinity already exists between another member (TOR1) of the same generic resource (GR) and the AOR then this indicates that it is not valid to acquire this connection. This message is normally accompanied by DFHZC2411 instance 36 for the equivalent sessions in the AOR. The DFHZC2411 message is saying that the AOR cannot find a connection defined with the real name of TOR2. The AOR connection is defined with the Generic Resource name of the TOR.

System action: Because communication cannot be established with a node, a VTAM CLSDST macro is issued to release any control blocks previously built, and the node could be placed out of service.

User response: Use the VTAM sense code given in the message to determine the cause of failure. If appropriate, ensure that the node name was included in the network control program/virtual storage (NCP/VS) generation deck and investigate for a possible bad communication line.

If the sense bytes were X'08350000' (where 0000 is the offset of the NETNAME in the BIND), the partner LU has been unable to find a suitable session. If the partner LU is CICS, look in the partner LU's log for DFHZC2411 and previous messages for the same session. This should give some indication as to why no session could be found.

If LU62 autoinstall is in use and the sense bytes were X'08010000' look in the partner LU's log for message DFHZC2411 and message DFHZC69xx which should indicate the reason for failure to autoinstall a connection.

If the VTAM RETURN CODE FEEDBACK is X'1018':

the logon can be retried once the coupling facility becomes available.

Instance 1 sense X'0805' - Determine if TOR2 was started intentionally with a different APPLID and the same Generic Resource name and if not, correct the problem. If it was and you need a connection between these two systems then you need to end the affinity between AOR and TOR1. The affinity can be ended by:

1. Bring up TOR1, acquire the connection and release it or
2. bring up TOR1 and use ENDAFFIN via CEMT or EXEC CICS or
3. use a batch program described in 'Writing a batch program to end affinities' in the CICS Intercommunication Guide.

However, if the AOR is within the same sysplex as the TOR you should be using MRO connections rather than APPC - you then get no problems with affinities.

If the AOR is outside the sysplex and the connection is acquired from the TOR then you need to use a HUB as described in 'Using a HUB' in the CICS Intercommunication Guide to prevent two TORs from attempting to connect to one AOR using the generic resource name.

Alternatively you can change the AOR connection to address TOR2 by its real name as opposed to its generic resource name and always acquire the connection from the AOR. This implies that you must not use AUTOCONNECT in the TOR connection.

You should release the connection as soon as possible.

Destination: CSNE

Modules: DFHZSYX

XMEOUT Parameters: *date, time,applid, termid, trandid, sense, instance, {1=DFHZSYX, 2=DFHZSYX}*

DFHZC2404 E *date time applid termid trandid* **VTAM Detected Logic Error. sense ((instance) Module name: {DFHZLEX})**

Explanation: VTAM detected an error in a request. The request was either incomplete or not executable.

For the meaning of the sense data, see "DFHZCxxxx messages" on page 1040.

System action: CICS breaks communication with the node (CLSDST), abnormally terminates any attached task, places the node out of service and produces a transaction dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Ensure that all application programs running concurrently have proper addressability, thereby avoiding alteration of CICS control blocks such as the TCTTE or the RPL. If this message occurs during

normal system execution, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

This message may also occur if VTAM is terminating. Under these conditions it is not a serious problem, and usually no response is necessary.

Destination: CSNE

Modules: DFHZLEX

XMEOUT Parameters: *date, time,applid, termid, trandid, sense, instance, {1=DFHZLEX, 2=DFHZLEX, 3=DFHZLEX, 4=DFHZLEX, 5=DFHZLEX, 6=DFHZLEX}*

DFHZC2405 E *date time applid termid trandid Node netname not activated. sense ((instance) Module name: {DFHZSIM | DFHZSIX | DFHZSYX})*

Explanation: The node was not activated, or was deactivated by the network operator, or a generic resource affinity already exists with another system in the same generic resource.

Instance 6 - If the partner is a member of a generic resource (TOR2) and this system (AOR) is not and an affinity already exists between the AOR and another member of the same generic resource (TOR1) because TOR1 crashed, then VTAM has indicated that you cannot acquire this connection.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: All outstanding SEND and RECEIVE requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. A VTAM CLSDST macro is issued to halt communication with the node, and internal LOGONs are prevented.

If this message is issued during takeover, the acquire is retried at intervals of 1, 2, 4 and 8 minutes after the first attempt. This allows time for sessions which require manual intervention before the acquire can succeed.

User response: Use the VTAM VARY command to activate the node before using it in the network. Alternatively, for ISC with IMS, enable IMS for LOGONs.

It is possible that the node in question has previously been used as a generic APPLID (or in VTAM terms – a USERVAR). Use the VTAM operator command DISPLAY USERVAR to see if this is the case. If it is, you can use MODIFY USERVAR,OPTION=DELETE,ID=node to delete the USERVAR.

Instance 6 - Determine if TOR2 was started intentionally with a different APPLID and the same GR name and if not, correct the problem. If it was and you need a connection between these two systems then you need to end the affinity between the AOR and TOR1.

The affinity can be ended by:

1. Bring up TOR1, acquire the connection and release it cleanly or
2. Bring up TOR1 and use ENDAFFIN via CEMT or EXEC CICS or
3. Use a batch program described in ‘Writing a batch program to end affinities’ in the CICS Intercommunication Guide.

However, if the AOR is within the same sysplex as the TOR you should be using MRO connections rather than APPC - you then get no problems with affinities.

If the AOR is outside the sysplex and the connection is acquired from the TOR then you need to use a HUB as described in ‘Using a HUB’ in the CICS Intercommunication Guide to prevent two TORs from attempting to connect to one AOR using the generic resource name.

Alternatively you can change the AOR connection to address TOR2 by its real name as opposed to its generic resource name and always acquire the connection from the AOR. This implies that you must not use AUTOCONNECT in the TOR2 connection.

XMEOUT Parameters: *date, time,applid, termid, trandid, netname, sense, instance, {1=DFHZSIM, 2=DFHZSIM, 3=DFHZSIM, 4=DFHZSIM, 5=DFHZSIM, 6=DFHZSYX, 7=DFHZSYX, 8=DFHZSYX, 9=DFHZSIX, 10=DFHZSYX, 11=DFHZSYX}*

DFHZC2406 E *date time applid termid trandid Terminate self command received. sense ((instance) Module name: {DFHZSYX})*

Explanation: The logical unit (LU) has requested termination of the session.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: The VTAM CLSDST macro is issued to stop communications with the node. If a task is attached, it is abnormally terminated with a transaction dump.

User response: None.

Destination: CSNE

Modules: DFHZSYX

XMEOUT Parameters: *date, time,applid, termid, trandid, sense, instance, {1=DFHZSYX}*

DFHHC2407 E *date time applid termid tranid* **Permanent channel failure. sense ((instance) Module name: {DFHHSYX})**

Explanation: Network Control Program/Virtual Storage (NCP/VS) was either shut down by the network operator or was abnormally terminated. Alternatively, there could have been a channel failure.

For the meaning of the sense data, see "DFHHCxxxx messages" on page 1040.

System action: Since communication with the logical unit was broken, the VTAM CLSDST macro instruction is issued to release control blocks previously built by VTAM. If a task is attached, it is abnormally terminated with a transaction dump.

User response: Use the supplied dump to check for a possible NCP/VS or channel problem.

Destination: CSNE

Modules: DFHHSYX

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHHSYX, 2=DFHHSYX}*

DFHHC2408 E *date time applid termid tranid* **Apparent VTAM Error. sense ((instance) Module name: {DFHHSYX})**

Explanation: VTAM encountered an error during its own processing.

For the meaning of the sense data, see "DFHHCxxxx messages" on page 1040.

System action: If a task is attached, it is abnormally terminated with a transaction dump. The node is placed out of service.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Use the sense data to determine the nature of the error.

Destination: CSNE

Modules: DFHHSYX

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHHSYX, 2=DFHHSYX, 3=DFHHSYX, 4=DFHHSYX}*

DFHHC2409 I *date time applid termid tranid* **VTAM Recovered Node. LOSTERM Error Code X'xx'. sense ((instance) Module name: {DFHHLTX})**

Explanation: VTAM successfully reestablished communication with a node. The reason for entering the LOSTERM exit is given by *xx*, which has one of the following values:

Value Meaning

- 0 Dial-disconnect on dial-in.
- 4 Dial-disconnect on dial-out.
- 0C Deactivate immediate.
- 14 Unconditional terminate self.
- 1C Segmenting error.
- 20 Conditional terminate self.
- 24 BUFLIM value exceeded.

For the meaning of the sense data, see "DFHHCxxxx messages" on page 1040.

System action: CICS reestablishes communication and places the node in service.

User response: None.

Destination: CSNE

Modules: DFHHLTX

XMEOUT Parameters: *date, time,applid, termid, tranid, X'xx', sense, instance, {1=DFHHLTX, 2=DFHHLTX}*

DFHHC2410 E *date time applid termid tranid* **Node Unrecoverable. VTAM LOSTERM Error Code X'xx'. sense ((instance) Module name: {DFHHLTX})**

Explanation: Communication with a node was interrupted and cannot be reestablished by VTAM. The reason for entering the LOSTERM exit is given by the error code *X'xx'*.

For the meaning of the sense data, see "DFHHCxxxx messages" on page 1040.

System action: The VTAM CLSDST macro is issued to release any control blocks previously built for the node. If a task is attached, it is abnormally terminated with a transaction dump.

User response: See the appropriate *VTAM Programming* manual for an explanation of the error code.

Destination: CSNE

Modules: DFHHLTX

XMEOUT Parameters: *date, time,applid, termid, tranid, X'xx', sense, instance, {1=DFHHLTX, 2=DFHHLTX, 3=DFHHLTX, 4=DFHHLTX}*

DFHHC2411 E *date time applid termid tranid nodeid* **attempted invalid logon. sense ((instance) Module name: {DFHHTFP | DFHZZATA | DFHZZBLX | DFHZZLGX | DFHZZSCX | RESERVE})**

Explanation: Node *nodeid* attempted to log on to CICS but the logon is invalid.

The *nodeid* in the message will always start with the

'netname' of the node attempting to connect to CICS. For some instances of the message resulting from an LU6.2 log on, the modename of the session will be concatenated to the 'netname' with a dot separator. Since a string consisting of eight blanks is the default modename, this can lead to idiosyncratic formatting of the message.

If the message is issued by DFHZATA, CICS has failed in its attempt to autoinstall the terminal or connection.

The instance *instance* is one of the following:

- | | |
|----|---|
| 1 | For LU6.1 no suitable TCTTE can be found, or no session TCTTE exists This could occur for one of the following reasons: |
| | 1. The bind did not contain a modename. |
| | 2. There is an RDO definition for a member name connection in a generic resource communicating with another generic resource over an LU6.1 link. |
| 2 | No PLUNAME has been found in the LU6.2 bind processed by CICS. |
| 3 | An attempt to autoinstall a member name connection in a generic resource system has failed because the bind was not for a SNA service manager. |
| 4 | Autoinstall is not allowed because the system is terminating. |
| 5 | Autoinstall is not allowed because the VTAM ACB is closing. |
| 6 | ISC support is not present because ISC=NO specified in the SIT. |
| 7 | Used by DFHZATA for several reasons, for example BIND bad and user exit bad. |
| 8 | The TCTTE address restored and the address found by NIBSEARCH do not agree. |
| 9 | The system is terminating. |
| 10 | VTAM is terminating. |
| 11 | RESERVED. |
| 12 | RESERVED. |
| 13 | No address is present in the RPL. |
| 14 | LU6.1 cannot autoinstall.

If both CICS systems are registered as different generic resources, the LU61 connections must be defined with each other's generic resource netnames; they cannot communicate by member name. In this case CICS looked for the generic resource netname and was unable to find it. |
| 15 | ISC support is not present. |
| 16 | A CINIT arrived for an APPC parallel session. This is not supported All input for an APPC |

- | | |
|----|--|
| 17 | parallel session should be via a BIND. Also, no connection exists with this NETNAME. |
| 18 | Session is not bound. |
| 19 | Not used. |
| 20 | LU is not enabled. Typically it is an XRF alternate CICS. |
| 21 | A second CINIT with the same netname has arrived. |
| 22 | Logon rejected due to CATA abend. |
| 23 | A CINIT initiated by SIMLOGON occurred for an APPC parallel session. A matching connection exists, but it is being deleted. This should not occur because either the delete should have been cancelled (if it had been scheduled but not started) or the SIMLOGON should have been queued until the delete was attempted and fails because there is SIMLOGON activity. |
| 24 | A BIND was received for an LU6.1 connection. This CICS is registered as a generic resource but the partner addressed CICS by its MEMBER name instead of its generic resource name.

Change the partner's connection definition for this system to use a NETNAME of this system's generic resource name. |
| 25 | Not used. |
| 26 | A CINIT was received for an LU6.1 connection. This CICS is registered as a generic resource but the partner addressed CICS by its MEMBER name instead of its generic resource name.

Change the partner's connection definition for this system to use a NETNAME of this system's generic resource name. |
| 27 | A BIND was received for an LU6.1 connection. This CICS is registered as the same generic resource as the partner. However, the partner addressed CICS by the generic resource name instead of the member name which it should use for intra-plex communication.

Change the partner's connection definition for this system to use a NETNAME of this system's member name. |
| 28 | A CINIT was received for an LU6.1 connection. This CICS is registered as the same generic resource as the partner. However, the partner addressed CICS by the generic resource name rather than the member name which it should use for intra-plex communication. |

Change the partner's connection definition for this system to use a NETNAME of this system's member name.

- | 28 An LU62 bind was received for the netname
| specified. CICS has found a connection with
| the relevant netname but the connection was
| not defined as APPC.
- 29 A system entry for the connection indicated by
the bind has been found but none of its
sessions are usable.
- 30 No modename field UDSS02 was found in the
bind.
- 31 Examination of the session tctte has indicated
it to be out of service, a non-SNA service
manager session and to have the associated
connection released.
- 32 An attempt to autoinstall a GR name or XRF
connection has failed because the bind was not
for a SNA service manager.
- 33 This bind is a SNA service manager request
for an existing partner.
- 34 There is a problem with the user data supplied
in the bind. Specifically one of the following.
- There is no user data.
 - The user data supplied is too short.
 - The user data is not architected.
- 35 A delete is pending for the connection found.
This delete is for a non-transient terminal
definition and has been requested explicitly.
- 36 For a non-generic resource request,
examination of the bind has indicated that it is
not for a SNA service manager.
- This instance also indicates that you should
not acquire this connection if the partner is a
member of a generic resource, and this system
is not, and an affinity already exists between
this system and another member of the same
generic resource. See message DFHZC2403,
which is issued for the partner's equivalent
sessions, for how you correct the situation.
- 37 The current session count has exceeded the
maximum session count indicated in the mode
group entry.
- This can be caused by a VTAM LU definition
with a duplicate netname. At session initiation
time VTAM cannot detect that there may be
two Independant Logical Units (ILUs) with the
same netname. This can lead to CICS being
requested to bind more sessions than specified
in the mode group.
- 38 An attempt to acquire a generic resource
connection failed because there is a member

name connection defined for the generic
resource member to which VTAM has chosen
to route it.

- | 39 This CICS has deregistered from a generic
| resource but a remote partner is attempting to
| bind an APPC session using a generic resource
| name. This indicates that VTAM affinities have
| not been ended on both sides.
- | 40 This CICS has deregistered from a generic
| resource but a remote partner is attempting to
| bind an LU6.1 session using a generic resource
| name. This indicates that VTAM affinities have
| not been ended on both sides.

For the meaning of the sense data, see "DFHZCxxxx
messages" on page 1040.

If ???????? is displayed in the second half of the *nodeid*
field, the BIND may contain a SESSION QUALIFIER or
MODENAME with an invalid length.

System action: The logon is rejected. If the reject is
from DFHZSCX via the dummy TCTTE, an attempt is
made to print the failing BIND and sense code with
which it was rejected as part of the message.

User response: Use the instance number to determine
why the attempted logon has been rejected and take
the appropriate action.

DFHZC2412 E *date time applid termid tranid Receive*
any request failed. sense ((instance)
Module name: (DFHZRAC)

Explanation: A receive-any request to VTAM failed.
VTAM was terminated.

For the meaning of the sense data, see "DFHZCxxxx
messages" on page 1040.

System action: The VTAM RPL control block is logged
to the CSMT log for visual inspection.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Determine the reason why the receive-any failed. First, check to see if the VTAM RPL has been altered. If it has been altered, check to see if the alterations could have caused any problems. Correct any obvious errors. It may be useful to refer to the *VTAM Programming* manual, (SC23-0115), during problem determination.

Modules: DFHZRAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRAC, 2=DFHZRAC}*

DFHZC2413 E *date time applid termid tranid nodeid*
CLSDST failed. *sense ((instance) Module*
name: {DFHTFP | DFHZATA |
DFHZLGX})

Explanation: A CLSDST request for the node identified by *nodeid* failed. VTAM may not have sufficient space to respond to the request.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: No further communication with the node is initiated.

User response: Inspect the CSNE, CSMT and CSTL logs for indication of a VTAM storage problem or error message. Also check for any messages indicating an I/O problem.

Destination: CSNE

Modules: DFHTFP, DFHZATA, DFHZLGX

XMEOUT Parameters: *date, time, applid, termid, tranid, nodeid, sense, instance, {1=DFHZATA, 2=DFHZLGX, 3=DFHTFP}*

DFHZC2414 E *date time applid termid tranid* **Temporary**
VTAM Storage Problem. *sense ((instance)*
Module name: {DFHZSYX})

Explanation: Temporary VTAM storage problem. VTAM is currently short of storage.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: The failing VTAM request is retried until VTAM is able to accept it.

User response: Increase the VTAM working buffer storage if this condition recurs and causes undue problems.

Destination: CSNE

Modules: DFHZSYX

XMEOUT Parameters: *date, time, applid, termid, tranid,*

sense, instance, {1=DFHZSYX}

DFHZC2415 E *date time applid termid tranid* **Node**
netname out of service. *sense ((instance)*
Module name: {DFHZNAC})

Explanation: A node error condition has occurred on node *nodeid*.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: CICS places the node out of service.

User response: Use the sense data to determine the nature of the error.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZNAC}*

DFHZC2416 E *date time applid termid tranid* **VTAM is**
halting. *sense ((instance) Module name:*
{DFHZSYX})

Explanation: A VTAM HALT command was entered by the network operator while a SIMLOGON or OPNDST request was in progress. The instance number indicates what type of halt was requested:

- 1 Orderly shutdown
- 2 Quick shutdown.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: The VTAM network is quiesced to prevent further requests and the node is placed out of service.

User response: None.

Destination: CSNE

Modules: DFHZSYX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSYX, 2=DFHZSYX}*

DFHXC2420 E *date time applid termid tranid* **Unknown command in RPL. sense ((instance))**
Module name: {DFHZSAX}

Explanation: An unknown command was detected in the request parameter list (RPL) by the send-data-flow asynchronous exit routine. The RPL address could be invalid or the RPL could have been altered.

For the meaning of the sense data, see "DFHXCxxxx messages" on page 1040.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

A VTAM CLSDST macro is issued to halt communication with the node, and the node is placed out of service.

User response: In the first instance, check if the VTAM RPL has an invalid address. If the address is

valid, check to see if the RPL has been altered. If it has been altered, check to see if the alterations could have caused any problems. Correct any obvious errors. It may be useful to refer to the *VTAM Programming manual*, (SC23-0115), while carrying out problem determination.

Destination: CSNE

Modules: DFHZSAX

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZSAX}*

DFHZC2421 E *date time applid termid tranid*
Unsupported command received. *sense*
((instance) Module name: {DFHZRAC | DFHZRLP | DFHZRVX})

Explanation: An unknown command or request was detected, or the RPL contains logical unit (LU) status.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: If an invalid command or request was detected, all outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. A VTAM CLSDST macro is issued to halt communication with the node.

For ISC sessions, this error may be caused by specifying incompatible session types at each node. (For example, SESSIONTYPE=SEND in one node and SESSIONTYPE=FASTRECV in the other node.)

If the RPL contains logical unit (LU) status, one of the following messages is issued: DFHZC2461, DFHZC2462, DFHZC2464, DFHZC2465, or DFHZC2466.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: An invalid command or request indicates inconsistencies or errors in the definitions of the named terminals/sessions in CICS, VTAM or the connected system for LU6 sessions. Ensure that these definitions are consistent and correct for the device or session characteristics.

Destination: CSNE

Modules: DFHZRAC, DFHZRVX, DFHZRLP

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZRLP, 2=DFHZRLP, 3=DFHZRVX, 4=DFHZRVX, 5=DFHZRAC, 6=DFHZRAC, 7=DFHZRAC, 8=DFHZRAC, 9=DFHZRAC}*

DFHZC2422 E *date time applid termid tranid ZCP Logic*
Error. *sense ((instance) Module name: {DFHZARL | DFHZDET | DFHZERH | DFHZEV1 | DFHZEV2 | DFHZNAC | DFHZOPN | DFHZRAC | DFHZRVS | DFHZSDS | DFHZSIM | DFHZSKR | DFHZSLX | DFHZSSX})*

Explanation: During terminal processing, CICS detected an invalid internal state in DFHZCP.

Instance 1 of the message could be caused by a loss of data following a persistent sessions restart in a partner system. In this case, no logic error has occurred because any updates are backed out. This normally follows an AZCD for the same session and the message DFHZC0144 for the partner session.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: All outstanding send and receive requests are purged, and the task is abnormally terminated with a transaction dump. The node is placed out of service and the TCTTE, RPL, and action flags are logged to the CSMT destination for debugging purposes.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Ensure that the application programs running concurrently do not alter the TCTTE. If the TCTTE is not being altered, use the dump to locate the source of the error.

It may be useful to examine the debugging data printed on the CSMT log for clues about what possibly went wrong.

Destination: CSNE

Modules: DFHZARL, DFHZDET, DFHZERH, DFHZEV1, DFHZEV2, DFHZOPN, DFHZRAC, DFHZRVS, DFHZSDS, DFHZSIM, DFHZSKR, DFHZSLX, DFHZNAC, DFHZSSX

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZDET, 2=DFHZSIM, 3=DFHZSIM, 4=DFHZERH, 5=DFHZERH, 6=DFHZERH, 7=DFHZERH, 8=DFHZERH, 9=DFHZERH, 10=DFHZERH, 11=DFHZERH, 12=DFHZERH, 13=DFHZERH, 14=DFHZNAC, 15=DFHZERH, 16=DFHZERH, 17=DFHZERH, 18=DFHZERH, 19=DFHZSDS, 20=DFHZEV1, 21=DFHZEV1, 22=DFHZOPN, 23=DFHZOPN, 24=DFHZRVS, 25=DFHZRVS, 26=DFHZSKR, 27=DFHZSSX, 28=DFHZSLX, 29=DFHZSLX, 30=DFHZRAC, 31=DFHZRAC, 32=DFHZRAC, 33=DFHZRAC, 34=DFHZRAC, 35=DFHZRAC, 36=DFHZRAC, 37=DFHZRAC, 38=DFHZRAC, 39=DFHZARL, 40=DFHZARL, 41=DFHZEV2, 42=DFHZEV2, 43=DFHZRAC, 44=DFHZRAC, 45=DFHZOPN}*

DFHHC2423 E *date time applid termid trandid* **Attempted to send unsupported command.** *sense ((instance) Module name: {DFHZSDS})*

Explanation: A request to send data synchronously was incomplete. Possible reasons are as follows:

1. The TCTTE was altered.
2. A logic error was encountered.
3. The TCTTE was inadvertently placed on the send-synchronous queue.

For the meaning of the sense data, see "DFHHCxxxx messages" on page 1040.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing the VTAM CLSDST macro instruction.

User response: For reasons 1 to 3 listed above, ensure that application programs running concurrently do not alter the TCTTE.

If you suspect a logic error (2), check that the VTAM RPL has not been corrupted. If you still cannot resolve the problem, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSNE

Modules: DFHZSDS

XMEOUT Parameters: *date, time,applid, termid, trandid, sense, instance, {1=DFHZSDS}*

DFHHC2424 E *date time applid termid trandid* **SESSIONC command request invalid.** *sense ((instance) Module name: {DFHZSES | RESERVE})*

Explanation: A SESSIONC request is incomplete or invalid. Possible reasons are as follows:

1. The TCTTE was altered.
2. The command request bits are incomplete. DFHZSES checks TCTEISDT for a Start Data Traffic (SDT) command, TCTEISTS for a Set and Test Sequence Number (STSN) command, and TCTEICLR for a CLEAR command. If it does not find any of these, DFHZSES causes the message to be issued.
3. The wrong request was queued to SESSIONC.

For the meaning of the sense data, see "DFHHCxxxx messages" on page 1040.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

Communication with the node is terminated by issuing

the VTAM CLSDST macro instruction.

User response: Ensure that application programs running concurrently do not alter the TCTTE.

If the TCTTE is not altered, check for conditions 2 or 3.

Destination: CSNE

Modules: DFHZSES

XMEOUT Parameters: *date, time,applid, termid, trandid, sense, instance, {1=DFHZSES, 2=DFHZSES, 3=RESERVE}*

DFHHC2425 E *date time applid termid trandid* **ASYNCR command request invalid.** *sense ((instance) Module name: {DFHZSDA})*

Explanation: A request to send data asynchronously was incomplete or invalid. This condition can be caused by the TCTTE being altered.

For the meaning of the sense data, see "DFHHCxxxx messages" on page 1040.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

Communication with the node is terminated by issuing the VTAM CLSDST macro instruction.

User response: Check the TCTTE. Ensure that application programs running concurrently do not alter the TCTTE.

Destination: CSNE

Modules: DFHZSDA

XMEOUT Parameters: *date, time,applid, termid, trandid, sense, instance, {1=DFHZSDA, 2=DFHZSDA}*

DFHHC2426 E *date time applid termid trandid* **Node Status Error. Node is out of service or receive only.** *sense ((instance) Module name: {DFHZATT})*

Explanation: Input was received from a node identified either as output-only or as permanently out of service.

For the meaning of the sense data, see "DFHHCxxxx messages" on page 1040.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User response: Change the terminal entry in the TCT to indicate that the node is not an output-only device. If the node is out of service, the master terminal operator should place the node back into service.

Destination: CSNE

Modules: DFHZATT

DFHZC2429 E *date time applid termid tranid RESETSR request invalid RTYPE. sense ((instance) Module name: {DFHZRST})*

Explanation: An invalid RESETSR request was made in the VTAM macro issued by CICS. The invalid request can be because an RTYPE was not specified or

was incorrectly specified, or the TCTTE was altered.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: All outstanding receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Check the VTAM RPL for obvious errors. Ensure that application programs running concurrently do not alter the TCTTE. If the TCTTE is not being altered, use the symptom string, and if necessary the dump, to determine the source of the error.

Destination: CSNE

Modules: DFHZRST

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZRST, 2=DFHZRST, 3=DFHZRST}*

DFHZC2430 E *date time applid termid tranid Send response command request invalid. sense ((instance) Module name: {DFHZSDR})*

Explanation: A send-response request was invalid. Either the request did not specify the response level (DR1 or DR2), or the TCTTE was altered.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: All outstanding send requests are purged. If a task is attached, it is abnormally terminated with a transaction dump and the node is placed out of service.

User response: Check the VTAM RPL for obvious errors. Ensure that application programs running concurrently do not alter the TCTTE. If the TCTTE is not being altered, use the dump to determine the source of the error.

Destination: CSNE

Modules: DFHZSDR

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZSDR}*

DFHZC2431 E *date time applid termid tranid Request to a released node. sense ((instance) Module name: {DFHZSYX})*

Explanation: CICS requested VTAM to perform a close destination for a node currently “owned” by CICS.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

| **System action:** If the CICS ACB is open, all

| outstanding requests are purged and the task is
| abnormally terminated with a transaction dump if a
| task is attached.

User response: If the CICS ACB is open, use the dump to determine the source of the error. Check that the TCTTE is valid.

Destination: CSNE

Modules: DFHZSYX

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZSYX}*

DFHZC2432 E *date time applid termid tranid* **Exception response received.** *sense ((instance) Module name: {DFHZRAC | DFHZRVX | DFHZSSX})*

Explanation: CICS has received an exception response.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: Another CICS message is issued in conjunction with this message.

User response: Perform the action specified for the associated CICS message.

Destination: CSNE

Modules: DFHZRAC, DFHZRVX, DFHZSSX

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZRVX, 2=DFHZRVX, 3=DFHZRVX, 4=DFHZRVX, 5=DFHZRVX, 6=DFHZRVX, 7=DFHZRVX, 8=DFHZSSX, 9=DFHZSSX, 10=DFHZSSX, 11=DFHZSSX, 12=DFHZRAC, 13=DFHZRAC, 14=DFHZRAC, 15=DFHZRAC, 16=DFHZRAC, 17=DFHZRAC, 18=DFHZRAC, 19=DFHZRAC, 20=DFHZRAC, 21=DFHZRAC, 22=DFHZRAC, 23=DFHZRAC}*

DFHZC2433 E *date time applid termid tranid nodeid* **Logon has failed because autoinstall is disabled.** *sense ((instance) Module name: {DFHZBLX | DFHZLGX})*

Explanation: Node *nodeid* attempted to log on to CICS. The logon has failed because autoinstall is disabled. Possible reasons are:

- Autoinstall system initialization parameters have been incorrectly defined.
- An error has been detected in CICS terminal attach processing.
- The system is short on storage. Autoinstall is reenabled once the SOS condition ends.

System action: The logon is rejected.

User response: Ensure that the value for the AIQMAX system initialization parameter is greater than zero. If an autoinstall user program has been specified for system initialization parameter AIEXIT, check that the

program name has been defined to CICS. See the *CICS System Definition Guide* for further information about autoinstall parameters.

If the system is short on storage, see the associated messages for further guidance.

Destination: CSNE

Modules: DFHZLGX, DFHZSCX, DFHZBLX

XMEOUT Parameters: *date, time,applid, termid, tranid, nodeid, sense, instance, {1=DFHZLGX, 2=DFHZLGX, 3=DFHZBLX, 4=DFHZBLX}*

DFHZC2434 E *date time applid termid tranid* **Invalid copy request - Copy not supported.** *sense ((instance) Module name: {DFHZARQ})*

Explanation: A DFHTC TYPE=COPY request has been issued to a 3270 compatibility mode logical unit. The request is invalid because the 3270 COPY command is not supported by a 3270 compatibility mode logical unit.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: The task abends.

User response: Change the application program to avoid issuing a COPY request.

Destination: CSNE

Modules: DFHZARQ

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZARQ}*

DFHZC2435 E *date time applid termid tranid* **RPL missing.** *sense ((instance) Module name: {DFHZRVS})*

Explanation: CICS issued a receive-specific request VTAM without specifying a request parameter list (RPL). This condition could result from one of the following reasons:

- An RPL was not allocated
- An RPL was allocated, but later freed
- TCTERPLA was altered.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: All outstanding receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. A CLSDST macro is issued to terminate communication with the node.

User response: Use the dump to determine whether the TCTTE was altered by an application program. If it was, correct the error. If the TCTTE has not been altered, check for potential RPL problems.

Destination: CSNE

Modules: DFHZRVS

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZRVS}*

DFHZC2436 E *date time applid termid tranid* **TIOA missing, sense ((instance) Module name: {DFHZRVS | DFHZRVX})**

Explanation: The TIOA was missing while a receive-specific request was being processed. This condition could result from the TIOA being freed or TCTTEDA being altered.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: All outstanding receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User response: Use the dump to determine if the TCTTE was altered by an application program.

Destination: CSNE

Modules: DFHZRVS, DFHZRVX

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZRVS, 2=DFHZRVX, 3=DFHZRVS}*

DFHZC2437 E *date time applid termid tranid* **Invalid WRITE request to an input only device, sense ((instance) Module name: {DFHZSDS})**

Explanation: An output request was issued to a VTAM terminal that is defined as an input-only device. Either the TCTTETS was altered or a task that was attached issued a send request.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: All outstanding send requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. The terminal status remains unchanged.

User response: Either ensure that the node is defined correctly in the TCTTE, or prevent the task from issuing an output request to the node.

Destination: CSNE

Modules: DFHZSDS

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZSDS}*

DFHZC2438 E *date time applid termid tranid* **Invalid READ request to an output only device, sense ((instance) Module name: {DFHZRVS | DFHZSDS})**

Explanation: An input request was issued to a VTAM

terminal that is identified as an output-only device. Either the TCTTETS was altered or a task was attached that issued a read request.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: All outstanding receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. The terminal status remains unchanged.

User response: Either change the definition of the terminal in the TCTTE, or prevent the task from issuing input requests to the node.

Destination: CSNE

Modules: DFHZRVS, DFHZSDS

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZRVS, 2=DFHZSDS}*

DFHZC2439 E *date time applid termid tranid* **Invalid RESUME request, sense ((instance) Module name: {DFHZACT})**

Explanation: An invalid resume request was received. The CICS activate-scan function detected a resume request in a TCTTE, but the TCTTE was not part of any transaction.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: The TCTTE is printed and logged to the CSNE destination for debugging purposes.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Use the symptom string to determine the cause of the problem. Check the TCTTE data printed and logged to the CSNE destination for obvious alterations and errors.

Destination: CSNE

Modules: DFHZACT

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZACT}*

DFHZC2440 I *date time applid termid tranid* **CICS quiesced by node, sense ((instance) Module name: {DFHZASX})**

Explanation: A VTAM logical unit has requested CICS to quiesce all I/O activity with that node.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: All data transmission to the node is halted until CICS receives a release-quiesce indicator.

User response: None.

Destination: CSNE

Modules: DFHZASX

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZASX}*

DFHZC2441 I *date time applid termid tranid CICS released by node. sense ((instance) Module name: {DFHZASX})*

Explanation: CICS received a release-quietse indicator from a VTAM logical unit that had previously quiesced CICS.

For the meaning of the sense data, see "DFHZCxxxx messages" on page 1040.

System action: Data transmission to the node is resumed by CICS.

User response: None.

Destination: CSNE

Modules: DFHZASX

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZASX}*

DFHZC2442 E *date time applid termid tranid Exception response received to a definite response send. sense ((instance) Module name: {DFHZRVX})*

Explanation: An exception response was received when a definite response protocol was requested.

For the meaning of the sense data, see "DFHZCxxxx messages" on page 1040.

System action: CICS issues a second message in conjunction with this message that explains the reason for the exception response.

User response: Perform the action specified for the second CICS message received.

Destination: CSNE

Modules: DFHZRVX

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZRVX, 2=DFHZRVX}*

DFHZC2443 E *date time applid termid tranid Request outstanding when node released. sense ((instance) Module name: {DFHZRVL | DFHZRVS | DFHZSDL | DFHZSDS | DFHZSHU})*

Explanation: CICS received a request from an application program, when its node was either not in session or queued to be CLSDSTed.

For the meaning of the sense data, see "DFHZCxxxx messages" on page 1040.

System action: All outstanding requests are ignored. If

a task is attached, it is abnormally terminated with a transaction dump.

User response: None.

Destination: CSNE

Modules: DFHZSDS, DFHZRVL, DFHZRVS, DFHZSDL, DFHZSHU

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZRVS, 2=DFHZSDL, 3=DFHZSDS, 4=DFHZSDS, 5=DFHZSDS, 6=DFHZSHU, 7=DFHZSHU, 8=DFHZRVL, 9=DFHZSHU}*

DFHZC2444 E *date time applid termid tranid CICS bracket state error. sense ((instance) Module name: {DFHZRVS | DFHZSDS})*

Explanation: A CICS application program violated bracket protocol. It is possible that the application program issued an I/O request following a write (last) request.

For the meaning of the sense data, see "DFHZCxxxx messages" on page 1040.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User response: Correct the application program.

Destination: CSNE

Modules: DFHZRVS, DFHZSDS

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZRVS, 2=DFHZSDS}*

DFHZC2445 E *date time applid termid tranid Output area exceeded. sense ((instance) Module name: {DFHZSDS})*

Explanation: The TIOA was not large enough to hold all the output data. The application program either set up the TIOA incorrectly or it overran the TIOA.

For the meaning of the sense data, see "DFHZCxxxx messages" on page 1040.

System action: All outstanding send requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User response: Correct the application program to acquire a larger TIOA.

Destination: CSNE

Modules: DFHZSDS

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZSDS, 2=DFHZSDS}*

DFHZC2446 E *date time applid termid tranid* **Invalid response to a bid.** *sense ((instance) Module name: {DFHZRAC | DFHZRVX | DFHZSSX})*

Explanation: An invalid response was received for a bid request. A normal response was received in response to a bid indicator while the transaction was in bracket state. The controller application program is in error.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: All outstanding requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing a VTAM CLSDST macro instruction, and the node is placed out of service.

User response: Correct the controller application program to return an exception response to a bid indicator when in the bracket state, followed by a ready-to-receive indicator when ready to honor the bid.

Destination: CSNE

Modules: DFHZRAC, DFHZRVX, DFHZSSX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRVX, 2=DFHZSSX, 3=DFHZRAC}*

DFHZC2447 E *date time applid termid tranid* **A severe error has occurred as a result of a previous failure.** *sense ((instance) Module name: {DFHZACT | DFHZFRE | DFHZGET | DFHZOPN | DFHZRAC | DFHZRLP | DFHZRVS | DFHZSDA})*

Explanation: A domain call failed and the response could not be handled by module *modname* because of a previous failure. The domain concerned should have issued a message to the console which gives further information about the failure.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: All outstanding send and receive requests for terminal *termid* are purged. If a task is attached, it is abnormally terminated with a transaction dump. Terminal *termid* is placed out of service and the TCTTE is logged to the CSNE destination.

User response: Refer to the message issued by the domain that is in error. It indicates the source of the original error.

Destination: CSNE

Modules: DFHZRAC, DFHZRVS, DFHZSDA, DFHZOPN, DFHZFRE, DFHZRLP, DFHZACT, DFHZGET

XMEOUT Parameters: *date, time, applid, termid, tranid,*

sense, instance, {1=DFHZOPN, 2=DFHZRVS, 3=DFHZSDA, 4=DFHZRAC, 5=DFHZRAC, 6=DFHZOPN, 7=DFHZOPN, 8=DFHZFRE, 9=DFHZRLP, 10=DFHZACT, 11=DFHZGET, 12=DFHZGET, 13=DFHZOPN}

DFHZC2448 E *date time applid termid tranid* **Invalid response requested.** *sense ((instance) Module name: {DFHZRAC | DFHZRVX})*

Explanation: An invalid response was requested. An application program transmitted data to CICS without requesting a response from CICS.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: All outstanding receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing a VTAM CLSDST macro, and the node is placed out of service.

User response: Correct the application program.

Destination: CSNE

Modules: DFHZRAC, DFHZRVX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRVX, 2=DFHZRAC, 3=DFHZRAC}*

DFHZC2449 E *date time applid termid tranid* **Bracket Error.** *sense ((instance) Module name: {DFHZRAC | DFHZRVX})*

Explanation: The application program either sent a begin-bracket indicator while the transaction was in bracket state, or sent an end-bracket indicator.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing the VTAM CLSDST macro, and the node is placed out of service.

User response: Correct the application program.

Destination: CSNE

Modules: DFHZRAC, DFHZRVX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRVX, 2=DFHZRVX, 3=DFHZRAC, 4=DFHZRAC}*

DFHZC2450 E *date time applid termid tranid* **Bid issued but ATI cancelled.** *sense ((instance) Module name: {DFHZRAC | DFHZRVX | DFHZSSX})*

Explanation: An automatic task initiation (ATI)

request was issued without an ATI pending for that terminal.

For the meaning of the sense data, see “DFHXCxxxx messages” on page 1040.

System action: CICS will satisfy the BB pending condition by sending a standalone BB-EB.

User response: If ATI is time-initiated, increase the timer value.

Destination: CSNE

Modules: DFHZRAC, DFHZRVX, DFHZSSX

XMEOUT Parameters: *date, time,applid, termid, trandid, sense, instance, {1=DFHZRVX, 2=DFHZRVX, 3=DFHZRVX, 4=DFHZSSX, 5=DFHZSSX, 6=DFHZSSX, 7=DFHZRAC, 8=DFHZRAC, 9=DFHZRAC}*

DFHXC2451 E *date time applid termid trandid*
Outstanding request when clear was issued. *sense ((instance) Module name: {DFHXSX})*

Explanation: A request was outstanding when clear was issued. A receive-specific request was pending when a clear indicator was issued. A clear indicator is sent when any of the following occurs:

- The logical unit is lost (LOSTERM).
- CICS issues a VTAM CLSDST macro.
- CICS issues the clear during message resynchronization.

For the meaning of the sense data, see “DFHXCxxxx messages” on page 1040.

System action: All outstanding requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User response: None.

Destination: CSNE

Modules: DFHXSX

XMEOUT Parameters: *date, time,applid, termid, trandid, sense, instance, {1=DFHXSX}*

DFHXC2452 E *date time applid termid trandid*
Invalid command received. *sense ((instance) Module name: {DFHXCX})*

Explanation: CICS received an invalid command (VTAM indicator). The CICS session-control input exit-routine (SCIP) encountered an indicator other than request-recovery. This routine should be scheduled only when a request-recovery indicator is received from the controller application program.

For the meaning of the sense data, see “DFHXCxxxx messages” on page 1040.

System action: If a task is attached, it is abnormally terminated with a transaction dump. The session is

terminated and the node is placed out of service.

User response: Check the VTAM RPL for obvious errors. Use the dump to help determine the source of the problem.

Destination: CSNE

Modules: DFHXCX

XMEOUT Parameters: *date, time,applid, termid, trandid, sense, instance, {1=DFHXCX}*

DFHXC2453 E *date time applid termid trandid*
Request recovery received. *sense ((instance) Module name: {DFHXCX})*

Explanation: A request for recovery was received. The secondary logical unit requested message resynchronization by sending a request-recovery indicator, but a message sequence number is inconsistent with the sequence number maintained by the 3601 application program.

For the meaning of the sense data, see “DFHXCxxxx messages” on page 1040.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Message resynchronization is then initiated by CICS.

User response: None.

Destination: CSNE

Modules: DFHXCX

XMEOUT Parameters: *date, time,applid, termid, trandid, sense, instance, {1=DFHXCX}*

DFHXC2454 E *date time applid termid trandid*
Exception in chain. *sense ((instance) Module name: {DFHXSX})*

Explanation: An exception response was returned on a POST=RESP chain-data send. CICS normally does not send chained data using POST=RESP.

For the meaning of the sense data, see “DFHXCxxxx messages” on page 1040.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Use the symptom string, and if necessary the transaction dump, to determine the source of the error.

Destination: CSNE

Modules: DFHXSX

XMEOUT Parameters: *date, time,applid, termid, trandid, sense, instance, {1=DFHXSX}*

DFHHC2455 E *date time applid termid tranid* **In CA mode - Task attached.** *sense ((instance) Module name: {DFHZATT})*

Explanation: An attempt to attach a task to a logical unit (LU) was made, despite the task being in continue-any (CA) mode. However, terminal *termid* already had a task attached to it.

For the meaning of the sense data, see “DFHHCxxxx messages” on page 1040.

System action: The task that is already attached to terminal *termid* is abnormally terminated with a transaction dump.

Message DFHME0116 is normally produced containing the symptom string for this problem. Communication with the node is terminated by issuing the VTAM CLSDST macro. CICS then reestablishes communication with the node by issuing the SIMLOGON macro.

User response: Use the symptom string, and if necessary the dump, to determine the source of the error. Try to determine why there was an attempt to attach a task to terminal *termid* while it already had a task attached to it.

Destination: CSNE

Modules: DFHZATT

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZATT}*

DFHHC2456 E *date time applid termid tranid* **Exception response received to a command.** *sense ((instance) Module name: {DFHZRAC | DFHZSYX})*

Explanation: CICS received an exception response to a command (VTAM indicator) that it sent to a logical unit.

For the meaning of the sense data, see “DFHHCxxxx messages” on page 1040.

System action: In conjunction with this message, CICS issues a second message that explains the reason for the exception response.

User response: Perform the action specified in the second CICS message received.

Destination: CSNE

Modules: DFHZSYX, DFHZSSX

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZSYX, 2=DFHZSYX, 3=DFHZSYX, 4=DFHZRAC}*

DFHHC2457 E *date time applid termid tranid* **Multiple Errors Encountered.** *sense ((instance) Module name: {DFHZEMW | DFHZRAC | DFHZSYX})*

Explanation: A node encountered consecutive errors. That is, the node abnormal condition program, NACP, encountered a second error while processing the first error.

For the meaning of the sense data, see “DFHHCxxxx messages” on page 1040.

System action: If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing a VTAM CLSDST macro. The first error is accompanied by an error message.

User response: Use the dump to determine the source of the errors. Refer to the error message produced by the first problem and to any VTAM messages that may have been issued.

Destination: CSNE

Modules: DFHZRAC, DFHZSYX, DFHZEMW

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZEMW, 2=DFHZSYX, 3=DFHZSYX, 4=DFHZRAC, 5=DFHZRAC}*

DFHHC2458 E *date time applid termid tranid* **Exception response received to an exception response send.** *sense ((instance) Module name: {DFHZRAC | DFHZRVX})*

Explanation: CICS received an exception response to a send for which an exception response was requested.

For the meaning of the sense data, see “DFHHCxxxx messages” on page 1040.

System action: In conjunction with this message, CICS issues a second message that explains the reason for the exception response.

User response: Perform the action specified in the second CICS message received.

Destination: CSNE

Modules: DFHZRAC, DFHZRVX

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZRVX, 2=DFHZRVX, 3=DFHZRVX, 4=DFHZRVX, 5=DFHZRAC, 6=DFHZRAC, 7=DFHZRAC, 8=DFHZRAC, 9=DFHZRAC, 10=DFHZRAC, 11=DFHZRAC, 12=DFHZRAC}*

DFHXC2459 E *date time applid termid tranid* **No TIOA available for send.** *sense ((instance)*
Module name: {DFHZSDS})

Explanation: TCTTEDA was not loaded before issuing a DFHTC TYPE=WRITE, or it was inadvertently cleared.

For the meaning of the sense data, see “DFHXCxxxx messages” on page 1040.

System action: If a task is attached, it is abnormally terminated with a transaction dump. The send is purged.

User response: Ensure that TCTTEDA is loaded with the TIOA address before issuing the write.

Destination: CSNE

Modules: DFHZSDS

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZSDS, 2=DFHZSDS}*

DFHXC2460 E *date time applid termid tranid* **Sense receive not supported.** *sense ((instance)*
Module name: {DFHZNAC})

Explanation: Sense codes not supported by CICS were received from the logical unit.

For the meaning of the sense data, see “DFHXCxxxx messages” on page 1040.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing a VTAM CLSDST macro, and the node is placed out of service.

User response: The user’s node error program (DFHZNPE) can process the sense codes.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHXC2461 E *date time applid termid tranid* **Intervention required.** *sense ((instance)*
Module name: {DFHZNAC})

Explanation: Operator action is requested for a physical component of terminal *termid* before a request can be completed.

For the meaning of the sense data, see “DFHXCxxxx messages” on page 1040.

System action: The request is retried, unless the device is one that sends a logical unit status message after intervention is required. In the latter case, the relevant system action is taken.

User response: Correct the problem with the device.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHXC2462 E *date time applid termid tranid* **Bracket Error.** *sense ((instance)* **Module name:**
{DFHZNAC})

Explanation: The secondary logical unit and CICS both sent a begin-bracket indicator concurrently.

For the meaning of the sense data, see “DFHXCxxxx messages” on page 1040.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing the VTAM CLSDST macro.

User response: Correct the controller application program so that it cannot send a begin-bracket indicator.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHXC2463 E *date time applid termid tranid* **Node nodeid resource pending deletion, connection request rejected.** *sense ((instance)* **Module name:** {DFHZBLX | DFHZLGX})

Explanation: Node *nodeid* tried to connect to CICS. CICS rejected the request because it was deleting the terminal definition for *termid*.

For the meaning of the sense data, see “DFHXCxxxx messages” on page 1040.

System action: CICS continues with the resource alteration, or for instance 3 of the message, the autoinstall delete transaction, CATD, is restarted.

User response: When the resource alteration is complete, retry the connection or logon request.

Destination: CSNE

Modules: DFHZSCX, DFHZBLX, DFHZLGX

XMEOUT Parameters: *date, time,applid, termid, tranid, nodeid, sense, instance, {1=DFHZBLX, 2=DFHZBLX, 3=DFHZLGX}*

DFHZC2464 E *date time applid termid trandid* **Terminate chain.** *sense ((instance)* **Module name:** {DFHZNAC})

Explanation: The secondary logical unit asked CICS to terminate transmission of further data in the current chain.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. A cancel indicator is issued to the logical unit permitting discard of the data in the current chain.

User response: Use the supplied dump to determine why the logical unit requested the chain to be discarded.

For the meaning of the sense data, refer to the explanatory paragraph in message DFHZC2461.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time,applid, termid, trandid, sense, instance, {1=DFHZNAC}*

DFHZC2465 E *date time applid termid trandid* **Insufficient resources.** *sense ((instance)* **Module name:** {DFHZNAC})

Explanation: The subsystem controller application program has insufficient resources to handle the request. For instance, in the case of 3601, the 3601 diskette might be full, or the data segment in the 3601 might not be large enough to handle the data set.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: The subsystem is temporarily suspended.

User response: Determine why the controller application program encountered this condition. For the meaning of the sense data, refer to the explanatory paragraph in message DFHZC2461.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time,applid, termid, trandid, sense, instance, {1=DFHZNAC}*

DFHZC2466 E *date time applid termid trandid* **Function not executable.** *sense ((instance)* **Module name:** {DFHZNAC})

Explanation: The controller application program cannot transmit a message to terminal *termid*. Either a data check occurred, or the node is not available.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Terminal status remains unchanged.

User response: Use the supplied dump to determine why the application program could not execute the request.

For the meaning of the sense data, refer to the explanatory paragraph in message DFHZC2461.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time,applid, termid, trandid, sense, instance, {1=DFHZNAC}*

DFHZC2467 E *date time applid termid trandid* **Invalid communications ID (CID) detected.** *sense ((instance)* **Module name:** {DFHZLEX})

Explanation: CICS issued a VTAM request containing a communications identifier (CID) which VTAM did not recognize. This may be due to the TCTECID field having been altered. Alternatively, it may mean that the session is in the process of being closed down by VTAM and that CICS has tried to use it before the process was complete.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

| **System action:** All outstanding send and receive
| requests are purged. If a task is attached, it is
| abnormally terminated with a transaction dump. If the
| losterm exit was driven with return code X'0C', X'10',
| or X'14', CICS issues a CLSDST to VTAM.

User response: Ensure that application programs running concurrently do not alter the TCTECID field in the TCTTE. Also check that the session is still active; that is, that the system being communicated with is still functioning.

Destination: CSNE

Modules: DFHZLEX

XMEOUT Parameters: *date, time,applid, termid, trandid, sense, instance, {1=DFHZLEX}*

DFHZC2468 E *date time applid termid trandid* **Name netname unknown or vary activate required.** *sense ((instance)* **Module name:** {DFHZLEX})

Explanation: Either the node has not been activated by VARY ACTIVATE or CICS issued a VTAM request containing an invalid symbolic node name where:

- The name may have been altered in the node initialization block (NIB)

- The name was specified during VTAM definition and does not agree with the name in the TCT.

For the meaning of the sense data, see “DFHXCxxxx messages” on page 1040.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. The node is placed out of service.

User response: Either issue VARY ACTIVATE for the node, or ensure that application programs running concurrently do not alter the NIB name. Names specified during VTAM definition must agree with those in the TCT.

Destination: CSNE

Modules: DFHZLEX

XMEOUT Parameters: *date, time,applid, termid, trandid, netname, sense, instance, {1=DFHZLEX}*

DFHXC2469 E *date time applid termid trandid* **Exception response received.** *sense ((instance) Module name: {DFHXSIX})*

Explanation: An exception response (negative response) was sent by the secondary logical unit.

For the meaning of the sense data, see “DFHXCxxxx messages” on page 1040.

System action: For a non-3270 device, an exception response is returned to the node, along with the sense codes supplied by VTAM in the request parameter list (RPL) for the inbound message. For a 3270 device, the exception request contains 3270 sense/status.

User response: Analyze the sense codes in DFHXSNEP.

Destination: CSNE

Modules: DFHXSIX

XMEOUT Parameters: *date, time,applid, termid, trandid, sense, instance, {1=DFHXSIX, 2=DFHXSIX}*

DFHXC2470 E *date time applid termid trandid* **Task active at Shutdown.** *sense ((instance) Module name: {DFHXSIX})*

Explanation: One of the following has occurred:

- A request shutdown indicator was received from the controller application program on behalf of the node while a task was still attached.
- During VTAM shutdown, a shutdown complete indicator was received from the controller application program on behalf of the node while a task was still attached
- During VTAM shutdown, a task was still attached to a VTAM 3270 (which cannot send request shutdown or shutdown complete).

For the meaning of the sense data, see “DFHXCxxxx messages” on page 1040.

System action: In the first two cases, CICS honors the command. In all cases, all outstanding send and receive requests are purged, and if a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing a VTAM CLSDST macro.

User response: None.

Destination: CSNE

Modules: DFHXSIX

XMEOUT Parameters: *date, time,applid, termid, trandid, sense, instance, {1=DFHXSIX}*

DFHXC2471 E *date time applid termid trandid* **FMH length error.** *sense ((instance) Module name: {DFHXSIX | DFHXSIX})*

Explanation: The function management header (FMH) length was greater than that of the data received from the logical unit.

For the meaning of the sense data, see “DFHXCxxxx messages” on page 1040.

System action: All data received is purged. If a task is attached, it is abnormally terminated with a transaction dump.

User response: Correct the application program in the logical unit.

Note: The first 16 bytes of the I/O area in error are put to the CSNE log data set to aid in error determination.

Destination: CSNE

Modules: DFHXSIX, DFHXSIX

XMEOUT Parameters: *date, time,applid, termid, trandid, sense, instance, {1=DFHXSIX, 2=DFHXSIX, 3=DFHXSIX, 4=DFHXSIX, 5=DFHXSIX, 6=DFHXSIX}*

DFHXC2472 E *date time applid termid trandid* **Unable to retrieve overlength data.** *sense ((instance) Module name: {DFHXSIX})*

Explanation: The receive request for the remainder of data in excess of the input area for the receive-any module was not accepted by VTAM.

For the meaning of the sense data, see “DFHXCxxxx messages” on page 1040.

System action: All associated data is purged.

User response: A subsequent message follows in the log, indicating reasons for the request failing. Refer to this message for further information and guidance.

Destination: CSNE

Modules: DFHZRAC

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZRAC, 2=DFHZRAC}*

DFHZC2473 E *date time applid termid tranid* **Outbound chaining not supported.** *sense ((instance) Module name: {DFHZSDS})*

Explanation: The application program has attempted to send more data than the generated maximum allowable length.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: All send requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User response: Correct the application program so that it is sensitive to the maximum allowable length of data that can be sent to the terminal (such as checking the device type), providing the terminal does not support outbound chaining of data (such as a pipeline session).

Note: The generated maximum allowable length is specified in the TCTTE.

Destination: CSNE

Modules: DFHZSDS

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZSDS, 2=DFHZSDS}*

DFHZC2475 E *date time applid termid tranid* **Function cancelled by LU device.** *sense ((instance) Module name: {DFHZNAC})*

Explanation: The logical unit (LU) has terminated all processing connected with one of its components.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: All send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User response: Correct the problem with the LU component and bring it back online. Possible causes of the problem include the following:

- Power for the device is switched off
- A line that is down
- A hardware problem
- In the case of an LU6 link, the connected transaction, for example, CSMI, has terminated abnormally.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC2476 E *date time applid termid tranid* **Resource unavailable.** *sense ((instance) Module name: {DFHZNAC})*

Explanation: A component of the logical unit (LU) is no longer available.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: All send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User response: Correct the problem with the LU component and bring it back online. Possible causes of the problem include the following.

- Power for the device is switched off.
- A line that is down.
- A hardware problem.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC2477 E *date time applid termid tranid* **Chaining not supported.** *sense ((instance) Module name: {DFHZNAC})*

Explanation: The logical unit (LU) does not support chaining of data from the host.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: All send requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User response: Ensure that the maximum amount of data being transmitted to the LU does not exceed the length specified in the buffer parameter of the DFHTCT macro instruction.

Note: The buffer parameter value can be increased only to the maximum acceptable limit of the LU.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC2478 E *date time applid termid tranid* **Invalid FMH.** *sense ((instance) Module name: {DFHZNAC})*

Explanation: The function management header (FMH) transmitted to the logical unit (LU) had no counterpart on the translate table.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: All send and receive requests are purged. If the batch data interchange program is not being used, the transaction is abnormally terminated with a transaction dump. The first part of the TIOA, containing the FMH, is written to the CSNE log.

User response: Correct the application program so that the LU has a counterpart on the translate table.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC2479 E *date time applid termid tranid* **Function not supported.** *sense ((instance) Module name: {DFHZNAC})*

Explanation: The response unit (RU) received by the logical unit (LU) contains a request that this device does not support.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: All send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User response: Ensure that the terminal control table (TCT) generation specifications for the device are valid as well as able to accommodate the application requests. (For example, a read-only device being defined as transceive, yet having a bid sent to it.)

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC2480 E *date time applid termid tranid* **Retry requested.** *sense ((instance) Module name: {DFHZNAC})*

Explanation: The logical unit (LU) has indicated, via sense codes contained in an exception response or an LU status message, that it requires the data to be retransmitted.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: Retransmission of data will be attempted only in the case of protected tasks (message integrity). If the exception response containing the retry sense codes is received for an unprotected task while in chain processing, a cancel command will be sent to the LU and the task will be resumed. If CICS is not in chain processing, the transaction will be resumed.

User response: If message retransmission is necessary for the LU, ensure that the retry sense codes are imbedded in the exception response. Also ensure that

the host transaction is defined as a protected task (message integrity).

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC2481 E *date time applid termid tranid* **RU Error.** *sense ((instance) Module name: {DFHZNAC})*

Explanation: The response unit (RU) received by the logical unit (LU) was either not translatable or had an invalid length.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: All send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User response: Retrying the request a number of times by use of the node error program (NEP) mechanism may be necessary. This is because this type of error may stem from a bad communication line. If this fails, check for possible invalid or inappropriate terminal specifications at terminal control table (TCT) generation time.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC2482 E *date time applid termid tranid* **Pipeline session bracket error.** *sense ((instance) Module name: {DFHZATT})*

Explanation: Terminal *termid* was defined in the terminal control table (TCT) as running in pipeline session mode. However, the BRACKET operand in that definition was either omitted or was specified as BRACKET=YES. Bracket protocol is not enforced on a pipeline session terminal.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: All send and receive requests are purged and the session is terminated. If a task is attached, it is abnormally terminated with a transaction dump.

User response: Correct the TCT entry by inserting the BRACKET=NO operand.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZATT}*

DFHZC2483 E *date time applid termid tranid* **Receiver in transmit mode. sense ((instance) Module name: {DFHZNAC})**

Explanation: Normal data flow has been interrupted.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: Processing continues.

User response: Retry the WRITE.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC2484 E *date time applid termid tranid* **Component not available. sense ((instance) Module name: {DFHZNAC})**

Explanation: An application request could not be satisfied because the required component was not available.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: If a task is attached, it is abnormally terminated with a transaction dump. All outstanding send and receive requests are purged.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Check the terminal environment, or use the symptom string, and if necessary the dump, to determine the cause of the error.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC2485 E *date time applid termid tranid* **Cancel received in 'CS'-mode. sense ((instance) Module name: {DFHZRVX})**

Explanation: A CANCEL indicator was received while a task was active.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: If a task is attached, it is abnormally terminated with a transaction dump. All outstanding send and receive requests purged.

User response: None.

Destination: CSNE

Modules: DFHZRVX

XMEOUT Parameters: *date, time,applid, termid, tranid,*

sense, instance, {1=DFHZRVX}

DFHZC2486 E *date time applid termid tranid* **Cancel received in 'CA'-mode. sense ((instance) Module name: {DFHZRAC})**

Explanation: A CANCEL indicator was received while no task was active.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: Processing continues.

User response: None.

Destination: CSNE

Modules: DFHZRAC

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZRAC}*

DFHZC2487 E *date time applid termid tranid nodeid* **Session connection failed. Node unavailability return code returncode. sense ((instance) Module name: {DFHZBLX | DFHZLGX | DFHZSCX})**

Explanation: A connection request was rejected. CICS is temporarily unable to carry out the connection request. The TCTE for node *nodeid* indicated that the session could not be established. *returncode* gives the reason, as follows:

1. The CLSDST macro has been scheduled for this node
2. The node is in an abnormal condition
3. The node has an error condition raised against it
4. The node is already in use
5. CICS is terminating
6. VTAM is terminating.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: The connection request is rejected.

User response: Retry the connection request when the node becomes available. See the *CICS Customization Guide* for more information on the CLSDST macro and for an explanation of abnormal node conditions.

Destination: CSNE

Modules: DFHZLGX, DFHZSCX, DFHZBLX

XMEOUT Parameters: *date, time,applid, termid, tranid, nodeid, returncode, sense, instance, {1=DFHZSCX, 2=DFHZSCX, 3=DFHZSCX,4=DFHZSCX, 5=DFHZSCX, 6=DFHZSCX,7=DFHZBLX, 8=DFHZBLX, 9=DFHZLGX,10=DFHZLGX, 11=DFHZLGX, 12=DFHZLGX,13=DFHZLGX, 14=DFHZLGX, 15=DFHZLGX,16=DFHZLGX}*

DFHHC2488 E *date time applid termid tranid nodeid*
logon request rejected as terminal
recovery is in progress. *sense ((instance)*
Module name: {DFHZBLX | DFHZLGX
| DFHZSCX})

Explanation: A connection request was rejected because the CICS terminal recovery program was still executing.

For the meaning of the sense data, see “DFHHCxxxx messages” on page 1040.

System action: The connection request is rejected.

User response: Retry the connection request. Message DFHRU2800 is produced when the recovery program has completed processing.

Destination: CSNE

Modules: DFHZLGX, DFHZSCX, DFHZBLX

XMEOUT Parameters: *date, time,applid, termid, tranid, nodeid, sense, instance, {1=DFHZLGX, 2=DFHZSCX, 3=DFHZBLX}*

DFHHC2489 E *date time applid termid tranid 3270 -*
Invalid copy request. *sense ((instance)*
Module name: {DFHZARQ})

Explanation: The terminal control table terminal entry (TCTTE) of the device from which the information is to be copied (“from” device) did not specify the COPY feature. Alternatively, the “from” device:

- Is not defined in the TCT, or
- Is not a 3270, or
- Is not connected to CICS via VTAM.

For the meaning of the sense data, see “DFHHCxxxx messages” on page 1040.

System action: If a task is attached, it is abnormally terminated with a transaction dump.

User response: Ensure that the application program is aware of the device configuration. Furthermore, ensure that the “from” device is defined in the TCT as a 3270 device AND is connected to CICS.

Destination: CSNE

Modules: DFHZARQ

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZARQ, 2=DFHZARQ, 3=DFHZARQ}*

DFHHC2490 E *date time applid termid tranid* **Request**
for TOLTEP. *sense ((instance) Module*
name: {DFHHSYX})

Explanation: On a request for TOLTEP, a receive request completes in error.

For the meaning of the sense data, see “DFHHCxxxx messages” on page 1040.

System action: If a transaction is currently attached, it is abnormally terminated. The terminal is disconnected from CICS by a VTAM CLSDST macro, and is queued for logon to CICS when TOLTEP has finished.

User response: None.

Destination: CSNE

Modules: DFHHSYX

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHHSYX}*

DFHHC2492 E *date time applid termid tranid*
Intervention required on 3270 printer.
sense ((instance) Module name:
{DFHZNAC})

Explanation: This message is sent to the CSNE message log when an INTERVENTION REQUIRED condition is detected on a 3270 printer. This condition could occur for any of the reasons listed below.

- A transaction has requested the use of a printer that does not exist.
- The printer adapter feature is not present.
- There is no paper in the printer.
- The printer cover is open.
- The printer is offline.

For the meaning of the sense data, see “DFHHCxxxx messages” on page 1040.

System action: No action is performed except printing of the RPL and the TCTTE.

User response: Check that the terminal control table (TCT) is properly defined and that the transaction requests proper printer operations. If this is correct, check that the printer itself is in proper working order.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHHC2493 E *date time applid termid tranid*
Intervention required on 3270 device.
sense ((instance) Module name:
{DFHZNAC})

Explanation: This message occurs when an INTERVENTION REQUIRED condition arises on the 3270 Information Display System.

For the meaning of the sense data, see “DFHHCxxxx messages” on page 1040.

System action: No action is performed.

User response: Correct the intervention condition.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC2494 E *date time applid termid tranid Error status sense received from 3270.*
((instance) Module name: {DFHZNAC})

Explanation: An error status message *sense* was received from a 3270 Information Display System. An INTERVENTION REQUIRED condition causes an “intervention required” message to be output instead of this message.

System action: If a task is attached, it is abnormally terminated with a transaction dump. If bad data, sent by Basic Mapping Support (BMS), causes an operation check, the bad data is purged.

User response: Analyze the error status codes to determine the proper course of action required to correct the unit error or program error.

For non-SNA 3270 devices, the sense code is 0000 xxxx, where xxxx is sense data returned by the control unit to which the 3270 device is attached. Datastream errors are rejected with an Operation Check, and commands with a Command Reject. Details of error status codes are given in the *IBM 3270 Information Display System 3274 Control Unit Description and Programmer's Guide*.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC2495 E *date time applid termid tranid Printer Outserv/int reqd/ineligible. Req queued. sense ((instance) Module name: {DFHZNAC})*

Explanation: DFHZNAC has performed an interval control PUT to a 3270 printer on behalf of a DFHZC2497 “unavailable printer” condition. The printer is:

- Out of service,
- Has an intervention situation, or
- Does not have a RECEIVE or TRANSCEIVE status.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: Other processing continues.

User response: Determine why the printer is unavailable. If the terminal is out of service, put it back into service. If the terminal has an intervention situation, determine what this situation is and correct it. If the terminal does not have a RECEIVE or

TRANSCEIVE status, place it into RECEIVE or TRANSCEIVE status.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC2496 E *date time applid termid tranid IC put to printer failed/ | IOERROR | TRNIDER | TRMIDER | INVREQ). sense ((instance) Module name: {DFHZNAC})*

Explanation: DFHZNAC has attempted to perform a DFHIC TYPE=PUT macro as the result of a DFHZC2497 “unavailable printer” condition and has failed. This message is written to the CSNE log.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: DFHZNEP is recalled by DFHZNAC to allow for further processing.

User response: Ensure that:

- The interval control program (ICP) is capable of handling the request that DFHZNAC is issuing for the IOERROR and INVREQ errors
- CSPP is an installed transaction definition for the TRNIDER error
- DFHZNEP is passing DFHZNAC as a valid terminal address for the TRMIDER error.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time,applid, termid, tranid, {1= , 2= IOERROR, 3= TRNIDER, 4=TRMIDER, 5= INVREQ), sense, instance, {1=DFHZNAC}*

DFHZC2497 E *date time applid termid tranid Unavailable printer. sense ((instance) Module name: {DFHZARQ})*

Explanation: A print function was requested on a 3270 display device. Neither the PRINTTO or the ALTPRT printer was available to receive the information.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: If no NEP action is specified, the print request is halted.

User response: A possible solution is to route the data available at TCTTEDA in the provided terminal entry to a transient data queue that causes automatic task initiation later to a printer. This would be done in DFHZNEP. For more information, see the *CICS Customization Guide*.

Destination: CSNE

Modules: DFHZARQ

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZARQ}*

DFHZC2498 E *date time applid termid tranid* **IC put to printer failed. sense ((instance) Module name: {DFHZARQ})**

Explanation: A 3270 print request has failed because transaction CSPP could not be initiated. Either transaction CSPP is not an installed transaction definition, or the message to be printed cannot be written to temporary storage.

For the meaning of the sense data, see "DFHZCxxxx messages" on page 1040.

System action: Processing continues.

User response: Check that transaction CSPP is an installed transaction definition and that you have sufficient temporary storage to accommodate the data to be printed.

Destination: CSNE

Modules: DFHZARQ

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZARQ}*

DFHZC2499 *date time applid* **The following message was destined for a read only terminal. The text is 'msgtext'**

Explanation: The user has entered an invalid entry, the entry is rejected, and the request is backed out.

System action: Terminal Control backs out the request and issues this message with the error information contained in *msgtext*.

User response: Read the error information that is contained in *msgtext* and reenter the request.

XMEOUT Parameters: *date, time,applid, msgtext*

DFHZC3202 E *date time applid* **Transaction CCIN - VTAM netname netname. The value codepage in the codepage parameter is not supported.**

Explanation: A CCIN transaction has been run from a CICS client. The codepage which the CICS client has requested is not supported.

netname is the VTAM netname of the CICS client.

System action: CICS cannot perform the translations required to support the CICS client with the requested character set and codepage. CICS continues but uses a default codepage instead of the supplied one. For details of the default codepage, see the *CICS Family: Communicating from CICS on System/390*[®] manual.

The request to install the CICS client continues, but uses the default codepage. A response code of

EXCEPTION and a reason code of INVALIDCODEPAGE is sent to the client.

User response: See the *CICS Family: Communicating from CICS on System/390* manual for a list of the client codepage values which are supported. It may be necessary to reconfigure the client locale.

Destination: CSCC

Modules: DFHZCN2

XMEOUT Parameters: *date, time,applid, netname, codepage*

DFHZC3203 E *date time applid* **Transaction CCIN - VTAM netname netname. The capabilities parameter is not valid.**

Explanation: A CCIN transaction has been run from a CICS client. The capabilities which have been received are not valid. The CICS client has specified that it supports features which no CICS client is supposed to support. The CICS client is violating the CICS client communications architecture.

netname is the VTAM netname of the CICS client.

System action: Exception trace point AP301A is written.

The request to install the CICS client is rejected. A response code of DISASTER and a reason code of INVALIDREQUEST is sent to the client.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSCC

Modules: DFHZCN2

XMEOUT Parameters: *date, time,applid, netname*

DFHZC3204 E *date time applid* **Transaction CCIN - VTAM netname netname. The codepage parameter has not been specified.**

Explanation: A CCIN transaction has been run from a CICS client. One of the parameters which must be supplied is the codepage which the CICS client intends to use. This parameter is missing.

netname is the VTAM netname of the CICS client.

System action: Exception trace point AP301B is written.

The request to install the CICS client is rejected. A response code of DISASTER and a reason code of INVALIDREQUEST is sent to the client.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSCC

Modules: DFHZCN1

XMEOUT Parameters: *date, time,applid, netname*

DFHZC3205 E *date time applid* **Transaction CTIN - virtual terminal termid VTAM netname netname. CICS cannot support the {n.a. | n.a. | n.a. | combination of client and virtual terminal codepage. | client codepage. | virtual terminal codepage.}**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation.

CICS was checking the codepage specified by the CICS client and the codepage specified by the virtual terminal. However one of the following occurred:

- 1 – 3 *n.a.* - not applicable and should not occur.
- 4 *unsupported combination of CICS client and virtual terminal codepage.* indicates that the two codepages above are known about but CICS does not support data conversion between the CICS client codepage and the virtual terminal codepage.
- 5 *unsupported CICS client codepage* indicates that CICS is unable to support the codepage supplied by the CICS client in the CCIN or CTIN transaction.
- 6 *unsupported virtual terminal codepage* indicates that the CGCSGID parameter defining the virtual terminal codepage is not supported for CICS data conversion. If the virtual terminal was autoinstalled, CGCSGID was specified in the autoinstall model requested by the CICS client. If the virtual terminal was defined, CGCSGID was defined in the TYPETERM named by the virtual terminal definition.

CICS cannot perform the translations required to support the CICS client with the requested codepage.

netname is the VTAM netname of the CICS client.

System action: Exception trace point AP3035 is written.

- 4 *unsupported combination of CICS client and virtual terminal codepage.*
A response code of ERROR and a reason code of INSTALLCANCELLED is sent to the client. The virtual terminal is NOT installed.
- 5 *unsupported CICS client codepage.*
The request to install the virtual terminal continues and the invalid codepage is replaced by a default as specified in the *CICS Family: Communicating from CICS on System/390* manual.

A response code of EXCEPTION and a reason code of INVALIDCODEPAGE is sent to the client.

- 6 *unsupported virtual terminal codepage.*

A response code of ERROR and a reason code of INSTALLCANCELLED is sent to the client. The virtual terminal is NOT installed.

User response: See the *CICS Family: Communicating from CICS on System/390* manual and check the list of the client codepage values then reconfigure the workstation locale or correct the virtual terminal TYPETERM definition.

The exception trace point AP3035 contains the CICS client codepage and the virtual terminal CGCSGID values.

Destination: CSCC

Modules: DFHZCT1

XMEOUT Parameters: *date, time,applid, termid, netname, {1=n.a., 2=n.a., 3=n.a., 4=combination of client and virtual terminal codepage., 5=client codepage., 6=virtual terminal codepage.}*

DFHZC3206 E *date time applid* **Transaction CTIN - virtual terminal termid VTAM netname netname. The client's terminal install limit has been exceeded.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. However the CICS client whose VTAM netname is *netname* already has 512 virtual terminals.

termid is the name that would have been given to the new virtual terminal. If the CICS client did not supply the name it is blank.

System action: The request to install the virtual terminal is rejected. A response code of DISASTER and a reason code of INVALIDREQUEST is sent to the client.

User response: Check why the CICS client has sent so many CTIN installs without corresponding CTIN uninstall functions.

To correct the problem the CICS client must send a CTIN uninstall for each virtual terminal that needs to be deleted.

Destination: CSCC

Modules: DFHZCT1

XMEOUT Parameters: *date, time,applid, termid, netname*

DFHZC3207 E *date time applid* **Transaction CTIN - VTAM netname *netname*. The request has failed because CCIN has not been run.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. However there was no previous CCIN install request for the CICS client with the VTAM netname of *netname*. CCIN must always run before CTIN.

This may have been caused by a CICS restart.

netname is the VTAM netname of the CICS client.

System action: If the request was to install a virtual terminal then it is rejected with a response code of CTIN_ERROR and a reason code of CTIN_CCIN_INACTIVE.

User response: The CICS client must carry out CCIN uninstall/install before the next CTIN install.

Destination: CSCC

Modules: DFHZCT1

XMEOUT Parameters: *date, time,applid, netname*

DFHZC3208 E *date time applid* **Transaction CTIN - virtual terminal *termid* VTAM netname *netname*. Model *modelid* cannot be found.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. However CICS was unable to find the model *modelid* which was specified in the CICS_EpiAddTerminal DEVTYPE parameter or terminal emulator ModelId parameter.

netname is the VTAM netname of the CICS client.

System action: The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of UNKNOWNMODEL is sent to the client.

User response: Either correct the DevType in the CICS_EpiAddTerminal function or terminal emulator parameter or install a model of this name using RDO to define the autoinstall model with the RDO TERMINAL and TYPETERM definitions.

Destination: CSCC

Modules: DFHZCT1

XMEOUT Parameters: *date, time,applid, termid, netname, modelid*

DFHZC3209 E *date time applid* **Transaction CTIN - VTAM netname *netname*. CICS cannot supply a terminal name because all available names are in use.**

Explanation: A CTIN install request has been received from a CICS client as as a result of a CICS_EpiAddTerminal function or terminal emulator operation. The parameter list did not supply a NetName indicating that CICS should supply the name. However there are only 46,656 possible names available and they are all currently in use.

netname is the VTAM netname of the CICS client.

System action:

The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of INSTALLCANCELLED is sent to the client.

User response: As CICS clients issue CTIN uninstalls for autoinstalled virtual terminals these termids will be freed.

It is possible that some of the CICS clients were switched off leaving autoinstalled virtual terminals around. When these are switched back on again they should issue CCIN install which will free the virtual terminals if they are not in use.

DISCARD can be used to delete a virtual terminal - but this should be done with discretion.

If the SIT VTPREFIX coincides with the first character of the termid allocated to a normal autoinstall terminal by the autoinstall URM (default DFHZATDX), there may be some names reserved because the autoinstall terminal existed when CTIN install tried to use the same name. Avoid doing this if possible because the only way to free these names is to restart CICS.

Destination: CSCC

Modules: DFHZCT1

XMEOUT Parameters: *date, time,applid, netname*

DFHZC3210 E *date time applid* **Transaction CTIN - virtual terminal *termid* VTAM netname *netname*. CICS cannot attach the CITS transaction.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. As part of the installation process the CITS transaction is called to create a virtual terminal *termid*. However CICS was unable to attach the CITS transaction.

netname is the VTAM netname of the CICS client.

System action: Exception trace point AP3025 is written.

The request to install the virtual terminal is rejected. A

response code of ERROR and a reason code of INSTALLCANCELLED is sent to the client.

User response: Check that the CITS transaction and the DFHZATS program are defined correctly as specified in the DFHSPI IBM supplied group and are installed.

Destination: CSCC

Modules: DFHZCT1

XMEOUT Parameters: *date, time,applid, termid, netname*

DFHZC3211 E *date time applid* Transaction CTIN - virtual terminal *termid* VTAM *netname netname*. The NetName parameter starts with an invalid character.

Explanation: A CTIN install request has been received from a CICS client as a result of a

CICS_EpiAddTerminal function or terminal emulator operation. The NetName parameter *termid* starts or ends with a character that conflicts with CICS standards.

netname is the VTAM netname of the CICS client.

System action: The request to install the virtual terminal is rejected. A response code of DISASTER and a reason code of INVALIDTERMID is sent to the client.

| **User response:** Change the NetName to start or end with a different character. It can start with any character that is valid for a normal terminal name except for <,> or -. It cannot end with an -. If the NetName was specified correctly, check the input to the CTIN transaction.

Destination: CSCC

Modules: DFHZCT1

XMEOUT Parameters: *date, time,applid, termid, netname*

DFHZC3212 E *date time applid* Transaction CTIN - virtual terminal *termid* VTAM *netname netname*. The transaction has timed out waiting for CITS to run.

Explanation: A CTIN install request has been received from a CICS client as a result of a

CICS_EpiAddTerminal function or terminal emulator operation. As part of the installation process the CITS transaction is called to create virtual terminal *termid*. However the CTIN transaction has waited for two minutes for the CITS transaction to run.

netname is the VTAM netname of the CICS client.

System action: Exception trace point AP3027 is written.

The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of INSTALLCANCELLED is sent to the client.

User response: Investigate why the CITS transaction was unable to start or was hanging.

You may need to increase MAXTASK or the CITS TRANCLASS allocation.

Destination: CSCC

Modules: DFHZCT1

XMEOUT Parameters: *date, time,applid, termid, netname*

DFHZC3213 E *date time applid* Transaction CTIN - virtual terminal *termid* VTAM *netname netname*. CICS cannot attach the CDTS transaction.

Explanation: A CTIN uninstall request has been received from a CICS client as a result of a CICS_EpiDelTerminal function or terminal emulator operation. As part of the delete process the CDTS transaction is called to delete virtual terminal *termid*. However CICS was unable to attach the CDTS transaction.

netname is the VTAM netname of the CICS client.

System action: Exception trace point AP3028 is written. The attempt to delete the virtual terminal is rejected.

User response: Check to see if the CDTS transaction and the DFHZATS program are defined correctly as specified in IBM supplied group DFHSPI and that they are installed.

Destination: CSCC

Modules: DFHZCT1

XMEOUT Parameters: *date, time,applid, termid, netname*

DFHZC3214 E *date time applid* Transaction CTIN - virtual terminal *termid* VTAM *netname netname*. The CTIN transaction has timed out waiting for CDTS to run.

Explanation: A CTIN uninstall request has been received from a CICS client as a result of a CICS_EpiDelTerminal function or terminal emulator operation. As part of the installation process the CDTS transaction is called to delete virtual terminal *termid*. However the CTIN transaction has waited for the CDTS transaction for two minutes and so ends with this message.

netname is the VTAM netname of the CICS client.

System action: Exception trace point AP3029 is written. The CDTS attempt to delete the virtual terminal continues and will occur when the CDTS transaction starts or is 'unsuspended'.

User response: Check to see why the CDTS transaction was unable to start or was hanging.

You may need to increase MAXTASK or the CDTS TRANCLASS allocation.

Destination: CSCC

Modules: DFHZCT1

XMEOUT Parameters: *date, time,applid, termid, netname*

DFHZC3215 E *date time applid* **Transaction CTIN - virtual terminal *termid* VTAM netname *netname*. The terminal is in use by another transaction.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. However the virtual terminal *termid* is in use, that is the surrogate TCTTE indicates that a transaction is still running against this terminal.

netname is the VTAM netname of the CICS client.

System action: Exception trace point AP302E is written.

The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of ALREADYINSTALLED is sent to the client.

User response: Investigate why a transaction is still running for the virtual terminal.

Destination: CSCC

Modules: DFHZCT1

XMEOUT Parameters: *date, time,applid, termid, netname*

DFHZC3216 E *date time applid* **Transaction CTIN - virtual terminal *termid* VTAM netname *netname*. CICS cannot find the terminal.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. CTIN specified that a pre defined virtual terminal *termid* should be used, but CICS cannot find it and no ModelId was provided (DevType) so an autoinstall was not attempted.

netname is the VTAM netname of the CICS client.

System action: The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of UNKNOWNTERMINAL is sent to the client.

User response: Ensure that there is an installed predefined terminal for *termid* that has a remote system parameter (REMOTESYSTEM) specifying the name of this CICS clients connection and that the VTAM NETNAMEs match. Then install the definition with the correct parameters.

Destination: CSCC

Modules: DFHZCT1

XMEOUT Parameters: *date, time,applid, termid, netname*

DFHZC3217 E *date time applid* **Transaction CTIN - VTAM netname *netname*. The specified function is not valid.**

Explanation: A CTIN request has been received from a CICS client with a VTAM netname of *netname*. However the function specified was not INSTALL or UNINSTALL.

System action: Exception trace point AP3034 is written. The CTIN transaction abnormally terminates with abend code AZAI.

User response: Determine where the request originated. Ensure that the input has not been corrupted. You may need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSCC

Modules: DFHZCT1

XMEOUT Parameters: *date, time,applid, netname*

DFHZC3218 E *date time applid* **Transaction CTIN - virtual terminal *termid* VTAM netname *netname*. A resource with the same name as the terminal is already installed.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. CTIN specified that a virtual terminal *termid* should be autoinstalled. However another resource was installed with the same name after the CTIN transaction had ensured that the name was free.

netname is the VTAM netname of the CICS client.

System action: Exception trace point AP3026 is written.

The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of ALREADYINSTALLED is sent to the client.

User response: Investigate where the duplicate resource came from. It is possible that the terminal/APPC autoinstall URM created the name dynamically. If NetName was specified in the CTIN parameters, ensure that the CICS client names do not conflict with existing CICS terminal or connection names. If NetName was not specified, examine the SIT VTPREFIX override to check that the URM does not create names starting with the VTPREFIX character.

Destination: CSCC

Modules: DFHZCT1

XMEOUT Parameters: *date, time,applid, termid, netname*

DFHZC3219 E *date time applid* **Transaction CTIN - virtual terminal *termid* VTAM netname *netname*. The terminal is already in use.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. CTIN supplied a NetName *termid* but CICS found a resource with the same name which is either an existing virtual terminal for this client, an existing virtual terminal for another client or another CICS terminal or connection resource.

netname is the VTAM netname of the CICS client.

System action: The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of ALREADYINSTALLED is sent to the client.

User response: Investigate where the duplicate resource came from. It is possible that the terminal/APPC autoinstall URM created the name dynamically and that the CICS client used a name that clashes with the URM.

It is also possible that a client created the virtual terminal and then tried to reuse it without an intervening uninstall, via CCIN or CTIN.

Destination: CSCC

Modules: DFHZCT1

XMEOUT Parameters: *date, time, applid, termid, netname*

DFHZC3220 E *date time applid* **Transaction CTIN - virtual terminal *termid* VTAM netname *netname*. The terminal has already been installed.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. CTIN specified that the virtual terminal *termid* should be autoinstalled. However, the virtual terminal was already installed.

netname is the VTAM netname of the CICS client.

System action: The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of ALREADYINSTALLED is sent to the client.

User response: The CICS client should issue CTIN uninstall before any attempt to issue another CTIN install for the same NetName.

Destination: CSCC

Modules: DFHZCT1

XMEOUT Parameters: *date, time, applid, termid, netname*

DFHZC3221 E *date time applid* **Transaction CTIN - virtual terminal *termid* VTAM netname *netname*. The name specified is already in use by another CICS resource.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. CTIN specified that the virtual terminal *termid* should be autoinstalled. However, the name specified is already in use by another CICS resource.

netname is the VTAM netname of the CICS client.

System action: The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of ALREADYINSTALLED is sent to the client.

User response: Investigate where the duplicate resource came from. It is possible that the terminal/APPC autoinstall URM created the name dynamically.

If NetName was specified on the CTIN install ensure that NetName does not conflict with other CICS resources.

If NetName was not specified, examine the SIT VTPREFIX override to check that the URM does not create names starting with the VTPREFIX character.

Destination: CSCC

Modules: DFHZCT1

XMEOUT Parameters: *date, time, applid, termid, netname*

DFHZC3222 E *date time applid* **Transaction CTIN - virtual terminal *termid* VTAM netname *netname*. The CITS task has terminated abnormally.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. CICS attempted to autoinstall the virtual terminal *termid*. However, the CITS task which was attached to install the virtual terminal, abended.

If this ABEND was an AZVE, this is because a resource already exists with that name. However, this only occurs if the duplicate resource was added after this CTIN transaction started and checked for any duplicate.

netname is the VTAM netname of the CICS client.

System action: Exception trace point AP3030 is written.

The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of INSTALLCANCELLED is sent to the client.

User response: Investigate where the duplicate resource came from. It is possible that the

terminal/APPC autoinstall URM created the name dynamically.

If NetName was specified on the CTIN install, ensure that the names do not conflict.

If NetName was not specified, examine the SIT VTPREFIX override to check that the URM does not create names starting with the VTPREFIX character.

For any other abend, see the description of the abend code for further guidance.

Destination: CSCC

Modules: DFHZCT1

XMEOUT Parameters: *date, time,applid, termid, netname*

DFHZC3223 E *date time applid* **Transaction CTIN - virtual terminal termid VTAM netname netname. The surrogate TCTTE is in use and cannot be deleted.**

Explanation: A CTIN uninstall request has been received from a CICS client as a result of a CICS_EpiDelTerminal function or terminal emulator operation. However, the surrogate TCTTE attached to the virtual terminal is still in use and cannot be deleted.

netname is the VTAM netname of the CICS client.

System action: Exception trace point AP302F is written. The attempt to delete the virtual terminal is rejected.

User response: Either wait for the transaction to finish or PURGE the transaction. Once the transaction has ended the virtual terminal will be deleted when the client issues CCIN install or uninstall.

Destination: CSCC

Modules: DFHZCT1

XMEOUT Parameters: *date, time,applid, termid, netname*

DFHZC3224 E *date time applid* **Transaction CTIN - virtual terminal termid VTAM netname netname. The terminal specified for deletion cannot be found.**

Explanation: A CTIN uninstall request has been received from a CICS client as a result of a CICS_EpiDelTerminal function or terminal emulator operation. However the virtual terminal *termid* does not exist as a remote terminal for this CICS client.

netname is the VTAM netname of the CICS client.

System action: The attempt to delete the virtual terminal is rejected.

User response: Determine why a CICS client requested that a non-existent virtual terminal be deleted.

If the CTIN uninstall was issued correctly and the virtual terminal should exist, examine the CICS log for message DFHZC5966 and for DFHZC32xx messages referring to this terminal.

Destination: CSCC

Modules: DFHZCT1

XMEOUT Parameters: *date, time,applid, termid, netname*

DFHZC3225 E *date time applid* **Transaction CTIN - VTAM netname netname. The terminal cannot be deleted because the NetName parameter is missing.**

Explanation: A CTIN uninstall request has been received from a CICS client as a result of a CICS_EpiDelTerminal function or terminal emulator operation. However the NetName parameter, defining which virtual terminal is to be deleted, is missing.

netname is the VTAM netname of the CICS client.

System action: Exception trace point AP3037 is written – data 2 contains the data received. The attempt to delete the virtual terminal is rejected.

User response: Examine the input to CTIN. You may need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSCC

Modules: DFHZCT1

XMEOUT Parameters: *date, time,applid, netname*

DFHZC3226 E *date time applid* **Transaction CTIN - virtual terminal termid VTAM netname netname. CICS cannot access the builder parameter set.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. CICS is attempting to extract the details from the virtual terminal that has just been created and return them back to the CICS client. However the attempt to extract the details in the form of a builder parameter set (BPS) failed.

netname is the VTAM netname of the CICS client.

System action: Exception trace point AP3031 is written.

The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of INSTALLCANCELLED is sent to the client.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSCC

Modules: DFHZCT1

XMEOUT Parameters: *date, time,applid, termid, netname*

DFHZC3227 E *date time applid* **Transaction CTIN - VTAM netname *netname*. The client data is longer than expected.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. However the data received was longer than expected. *netname* is the VTAM netname of the CICS client.

System action: Exception trace point AP302D is written – data 2 contains the length that was received. The CTIN transaction abnormally terminates with abend code AZAI.

User response: Examine the data sent to CICS from the CICS client. You may need to contact IBM for assistance. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZCT1

XMEOUT Parameters: *date, time,applid, netname*

DFHZC3228 E *date time applid* **Transaction CTIN - VTAM netname *netname*. The client header data contains an invalid group.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. However the header contains an invalid group. *netname* is the VTAM netname of the CICS client.

System action: Exception trace point AP3024 is written – data 2 contains the data received. The CTIN transaction abnormally terminates with abend code AZAI.

User response: Examine the data sent to CICS from the CICS client. You may need to contact IBM for assistance. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSCC

Modules: DFHZCT1

XMEOUT Parameters: *date, time,applid, netname*

DFHZC3229 E *date time applid* **Transaction CTIN - VTAM netname *netname*. CICS has received invalid data from the client.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. CICS attempted to parse this data but found

a discrepancy between the number of parameters, the length of the parameters and the length of the data received. *netname* is the VTAM netname of the CICS client.

System action: Exception trace point AP3033 is written – data 2 contains the data received. The CTIN transaction abnormally terminates with abend code AZAI.

User response: Examine the data sent to CICS from the CICS client. You may need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSCC

Modules: DFHZCT1

XMEOUT Parameters: *date, time,applid, netname*

DFHZC3230 E *date time applid* **Transaction CTIN - VTAM netname *netname*. CICS has received a client request on an unsupported sync level.**

Explanation: A CTIN request has been received on a conversation which is not at synchronization level 0 or 1. *netname* is the VTAM netname of the CICS client.

System action: Exception trace point AP302B is written. The CTIN transaction abnormally terminates with abend code AZAI.

User response: Ensure that the CICS client converses at sync level 0 or 1.

Destination: CSCC

Modules: DFHZCT1

XMEOUT Parameters: *date, time,applid, netname*

DFHZC3231 E *date time applid* **Transaction CTIN - VTAM netname *netname*. The client header data contains an invalid version number.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. However there is an invalid version number in the header. *netname* is the VTAM netname of the CICS client.

System action: Exception trace point AP3036 is written – data 2 contains the data received. The CTIN transaction abnormally terminates with abend code AZAI.

User response: Since the version used in the CICS client must match with the version used by the server, one or the other is at the wrong level and should be changed. You may need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSCC

Modules: DFHZCT1

XMEOUT Parameters: *date, time,applid, netname*

DFHZC3240 E *date time applid* **Transaction CCIN - VTAM netname *netname*. CICS has received a client request on an unsupported sync level.**

Explanation: A CCIN request has been received on a conversation which is not at synchronization level 0 or 1. *netname* is the VTAM netname of the CICS client.

System action: Exception trace point AP3003 is written. The CCIN transaction abnormally terminates with abend code AZAF.

User response: Ensure that the CICS client converses at sync level 0 or 1.

Destination: CSCC

Modules: DFHZCN1

XMEOUT Parameters: *date, time,applid, netname*

DFHZC3241 E *date time applid* **Transaction CCIN - VTAM netname *netname*. The client data is longer than expected.**

Explanation: A CCIN install request has been received from a CICS client. However the data received was longer than expected. *netname* is the VTAM netname of the CICS client.

System action: Exception trace point AP3004 is written – data 2 contains the length that was received. The CCIN transaction abnormally terminates with abend code AZAF.

User response: Examine the data sent to CICS from the CICS client. You may need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSCC

Modules: DFHZCN1

XMEOUT Parameters: *date, time,applid, netname*

DFHZC3242 E *date time applid* **Transaction CCIN - VTAM netname *netname*. The client header data contains an invalid group.**

Explanation: A CCIN request has been received from a CICS client. However there is an invalid group in the header. *netname* is the VTAM netname of the CICS client.

System action: Exception trace point AP3002 is written – data 2 contains the data received. The CCIN transaction abnormally terminates with abend code AZAF.

User response: Examine the data sent to CICS from the CICS client.

Destination: CSCC

Modules: DFHZCN1

XMEOUT Parameters: *date, time,applid, netname*

DFHZC3243 E *date time applid* **Transaction CCIN - VTAM netname *netname*. The client header data contains an invalid version number.**

Explanation: A CCIN install request has been received from a CICS client. However the header contains an invalid version value. *netname* is the VTAM netname of the CICS client.

Either the CICS client is setting up the CCIN header incorrectly or a new version of the CICS client software is being used which is not supported on CICS Transaction Server for z/OS, Version 3 Release 1.

System action: Exception trace point AP300B is written – data 2 contains the data received. The CCIN transaction abnormally terminates with abend code AZAF.

User response: Since the version used in the CICS client must match with the version used by the server, one or the other is at the wrong level and should be changed. You may need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSCC

Modules: DFHZCN1

XMEOUT Parameters: *date, time,applid, netname*

DFHZC3244 E *date time applid* **Transaction CCIN - VTAM netname *netname*. The client header data contains an invalid function.**

Explanation: A CCIN request has been received from a CICS client. However there is an invalid function in the header. *netname* is the VTAM netname of the CICS client.

System action: Exception trace point AP3002 is written - data 2 contains the data received. The CCIN transaction abnormally terminates with abend code AZAF.

User response: Investigate why the CICS client has sent an unknown function call to CCIN. You may need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSCC

Modules: DFHZCN1

XMEOUT Parameters: *date, time, applid, netname*

DFHZC3245 E *date time applid* Transaction CCIN - VTAM netname *netname*. The capabilities parameter has not been specified.

Explanation: A CCIN transaction has been run from a CICS client. One of the parameters which must be supplied is the CAPABILITIES parameter which specifies the capabilities the CICS client can support. This parameter is missing.

netname is the VTAM netname of the CICS client.

System action: The request to install a CICS client is rejected. A response code of DISASTER and a reason code of INVALIDREQUEST is sent to the client.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSCC

Modules: DFHZCN1

XMEOUT Parameters: *date, time, applid, netname*

DFHZC3246 *date time applid* Transaction CCIN - virtual terminal *termid* VTAM netname *netname*. CICS cannot attach the CDTS transaction.

Explanation: A CCIN request has been received from a CICS client. As part of the processing, the CDTS transaction was called to delete virtual terminal *termid*. However CICS was unable to attach the CDTS transaction.

netname is the VTAM netname of the CICS client.

System action: The attempt to delete the virtual terminal fails. If this is a CCIN install request, the install continues.

User response: Ensure that the CDTS transaction and the DFHZATS program are defined correctly as specified in IBM supplied group DFHSP1 and that they are installed.

Destination: CSCC

Modules: DFHZCN2

XMEOUT Parameters: *date, time, applid, termid, netname*

DFHZC3247 *date time applid* Transaction CCIN - virtual terminal *termid* VTAM netname *netname*. The CCIN transaction has timed out waiting for CDTS to run.

Explanation: A CCIN request has been received from a CICS client. As part of the processing, the CDTS transaction is called to delete virtual terminal *termid*. However the CCIN transaction has waited for the

CDTS transaction for two minutes and has timed out.

netname is the VTAM netname of the CICS client.

System action: The CDTS attempt to delete the virtual terminal continues and occurs when the CDTS transaction starts or is 'unsuspended'.

If this is a CCIN install request, the install continues.

User response: Check to see why the CDTS transaction was unable to start or was hanging.

You may need to increase MAXTASK or the CITS TRANCLASS allocation.

Destination: CSCC

Modules: DFHZCN2

XMEOUT Parameters: *date, time, applid, termid, netname*

DFHZC3248 E *date time applid* Transaction CCIN - virtual terminal *termid* VTAM netname *netname*. The surrogate TCTTE is in use and cannot be deleted.

Explanation: A CCIN request has been received from a CICS client. There should not be any virtual terminals installed, however, one or more were located. The surrogate TCTTE attached to the virtual terminal is still in use and cannot be deleted. If this was caused by an immediate shut down of the client the transaction abend might not have completed before CICS attempted to delete the client.

netname is the VTAM netname of the CICS client.

System action: Exception trace point AP301C is written. The attempt to delete the virtual terminal is rejected.

If this is a CCIN install request, the install continues.

User response: Determine why the virtual terminal was installed when CCIN was run.

Either wait for the transaction to finish or PURGE the transaction. Once the transaction completes the virtual terminal will be deleted at the next CCIN install/uninstall.

Destination: CSCC

Modules: DFHZCN2

XMEOUT Parameters: *date, time, applid, termid, netname*

DFHZC3249 E *date time applid* Transaction CCIN - VTAM netname *netname*. CICS has received invalid data from the client.

Explanation: A CCIN install request has been received from a CICS client. CICS attempted to parse this data but found a discrepancy between the number of parameters, the length of the parameters, and the length of the data received. *netname* is the VTAM netname of the CICS client.

System action: Exception trace point AP300E is written – data 2 contains the data received. The CCIN transaction abnormally terminates with abend code AZAF.

User response: Examine the data sent to CICS from the CICS client. You may need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSCC

Modules: DFHZCN1

XMEOUT Parameters: *date, time,applid, netname*

DFHZC3400 E *date time applid termid tranid* **Chain exceeds max chain size.** *sense ((instance) Module name: {DFHZRAC | DFHZRVS | DFHZRVX})*

Explanation: If chain assembly (BUILDCHAIN) has been specified in the TCTTE, the chain being assembled does not fit into the IOAREALEN for a maximum chain (IOAREALEN Value 2). The remaining space in the IOAREALEN for a maximum chain is smaller than the maximum RECEIVESIZE.

If chain assembly (BUILDCHAIN) has been specified in the TCTTE, but maximum chain value equals zero, either the maximum chain value has been set incorrectly at build time or the value has been overwritten.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: If a task is attached, it is abnormally terminated with a transaction dump.

User response: Ensure that the maximum chain size, generated in CEDA TYPETERM with IOAREALEN (value 2) keyword, is large enough for the maximum chain expected.

Destination: CSNE

Modules: DFHZRVS, DFHZRVX, DFHZRAC

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZRVS, 2=DFHZRVS, 3=DFHZRVS, 4=DFHZRVS, 5=DFHZRVS, 6=DFHZRVX, 7=DFHZRAC, 8=DFHZRAC}*

DFHZC3401 I *date time applid termid tranid* **Resource now available.** *sense ((instance) Module name: {DFHZNAC})*

Explanation: A resource of the logical unit (LU) is now available. It had previously been temporarily unavailable or had required intervention.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: Any outstanding read or write operation is retried.

User response: None.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3402 E *date time applid termid tranid* **Invalid READ with outbound chain control.** *sense ((instance) Module name: {DFHZRVS})*

Explanation: A DFHTC TYPE=READ request is being processed, although the previously issued DFHTC TYPE=WRITE request did not complete a chain.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: All outstanding receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User response: Correct the application program.

Destination: CSNE

Modules: DFHZRVS

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZRVS}*

DFHZC3405 E *date time applid termid tranid* **Catastrophic bracket error.** *sense ((instance) Module name: {DFHZNAC})*

Explanation: The logical unit detected a failure of CICS to enforce bracket rules.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. The session is terminated.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Use the symptom string, a VTAM trace, and if necessary the dump, to determine the source of the problem.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3406 E *date time applid termid tranid* **Parameter error.** *sense ((instance)* **Module name:** {DFHZNAC})

Explanation: The request/response unit (RU) received by the logical unit (LU) contains a control function with invalid parameters.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: All send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. A portion of the TIOA is put to the CSNE log.

User response: Correct the application program.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3407 E *date time applid termid tranid* **READ command does not carry change direction indicator.** *sense ((instance)* **Module name:** {DFHZNAC})

Explanation: A request for input (for example, a READBUF command) sent to a logical unit (LU) type 2 (3270 compatibility mode logical unit) must carry the SNA change direction indicator. The LU has received such a request, but the indicator is not set.

Since the setting of the change direction indicator is controlled by terminal control, this message indicates that an internal logic error may have occurred. The error is not necessarily in terminal control, but may be in the logical unit or some other element of the network.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: The task and the VTAM session for the logical unit are abnormally terminated.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Identify the request that caused the error, and locate the element of the network responsible.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3408 E *date time applid termid tranid* **Presentation space integrity lost.** *sense ((instance)* **Module name:** {DFHZNAC})

Explanation: The contents of data for screen presentation by a logical unit has been altered. This is usually due to operator action. For example, the TEST/NORMAL key may have been used or the 3270 SYS REQ key may have been pressed.

It may also have been caused by factors other than operator action, for example, 3270 regeneration buffer failure.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: Any outstanding requests are canceled. If a task is attached, it is abnormally terminated with a transaction dump.

User response: Determine reason for failure at the remote terminal.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3409 E *date time applid termid tranid* **Unexpected negative response received.** *sense ((instance)* **Module name:** {DFHZRAC})

Explanation: CICS received a negative response to a command for which a negative response would not normally be expected.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. The node is placed out of service and the TCTTE, RPL, and action flags are logged to CSNE.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Ensure that the application programs running concurrently do not alter the TCTTE. Check that the SNA flows on the session are valid and that the logical unit is not violating SNA protocols.

Destination: CSNE

Modules: DFHZRAC

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZRAC}*

DFHXC3410 E *date time applid termid trandid* **Invalid input when LU status expected.** *sense ((instance) Module name: {DFHXRVC})*

Explanation: Input (other than a logical unit status message) was received after a request was rejected with a system sense code indicating a possibly rectifiable error condition at the terminal node: for example, Intervention Required. The subsequent LU status message indicates that the error situation has now been corrected, or that the request is permanently not executable.

For the meaning of the sense data, see "DFHXCxxxx messages" on page 1040.

System action: If a task is attached, it is abnormally terminated with a transaction dump.

User response: Conform to SNA protocol by ensuring that the next transmission is an LUSTATUS message with a system sense for either Resource Available (0001) or Function Not Executable (081C).

Destination: CSNE

Modules: DFHXRVC

XMEOUT Parameters: *date, time,applid, termid, trandid, sense, instance, {1=DFHXRVC, 2=DFHXRVC, 3=DFHXRVC}*

DFHXC3411 E *date time applid termid trandid* **Resource temporarily unavailable.** *sense ((instance) Module name: {DFHZNAC})*

Explanation: A terminal resource required to complete a request is temporarily unavailable.

For the meaning of the sense data, see "DFHXCxxxx messages" on page 1040.

System action: The request is retried unless the device is one that sends an LUSTATUS message after receiving a "resource temporarily unavailable" notification.

If "resource temporarily unavailable" notification is received, an associated VTAM message is usually issued.

User response: Refer to the associated VTAM message, if applicable, and follow the guidance provided.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time,applid, termid, trandid, sense, instance, {1=DFHZNAC}*

DFHXC3412 E *date time applid termid trandid* **Intervention required on secondary resource.** *sense ((instance) Module name: {DFHZNAC})*

Explanation: Operator action is requested for the

secondary resource of a logical unit (LU). However, no such resource is immediately available. In the case of a 3270-compatible LU, this message means that the printer most likely to be available for a PRINT request has an Intervention Required status.

For the meaning of the sense data, see "DFHXCxxxx messages" on page 1040.

System action: The system waits for a logical unit status message and, when this is received, takes appropriate system action.

User response: Correct the problem that relates to the device.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time,applid, termid, trandid, sense, instance, {1=DFHZNAC}*

DFHXC3413 E *date time applid termid trandid* **Logical Unit busy.** *sense ((instance) Module name: {DFHZNAC})*

Explanation: The logical unit has rejected a request because its resources are busy (for example, it is communicating with the system services control point (SSCP)), and thus is unable to process the request.

For the meaning of the sense data, see "DFHXCxxxx messages" on page 1040.

System action: The system waits for a logical unit status message and then takes appropriate action.

User response: None.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time,applid, termid, trandid, sense, instance, {1=DFHZNAC}*

DFHXC3414 E *date time applid termid trandid* **Request not executable. Secondary resource unavailable.** *sense ((instance) Module name: {DFHZNAC})*

Explanation: The secondary resource of a logical unit is permanently unavailable to complete a request. For a 3270-compatible LU, this means that a printer was not available for a PRINT request.

For the meaning of the sense data, see "DFHXCxxxx messages" on page 1040.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User response: Determine the reason why the resource is not available at the remote terminal.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3415 E *date time applid termid tranid* **No data available. sense ((instance) Module name: {DFHZNAC})**

Explanation: A receive request has been rejected by the logical unit because it has no data to send for one of the following reasons:

- The device is not capable of input (for instance, it is a printer)
- The logical unit is not capable of sending data at the time. For example, a requested 3790 data set is not available at the time.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: The receive request is halted. If a task is attached, it is abnormally terminated with a transaction dump.

User response: Verify that the request was issued to the correct device and that the device is capable of data transmission.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3416 E *date time applid termid tranid* **Session failure. A connection request for an invalid node *nodeid* could not be terminated. sense ((instance) Module name: {DFHZSCX})**

Explanation: The requested logon was to be rejected, but the attempt to send a negative response was rejected by VTAM.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: No further attempts are made to communicate with the invalid node.

User response: Inspect the CSNE, CSMT and CSTL logs for an indication of a VTAM storage problem or error message. Determine whether the node was invalid. If it was valid, update the CICS TCT for that node.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time,applid, termid, tranid, nodeid, sense, instance, {1=DFHZSCX}*

DFHZC3417 E *date time applid termid tranid* **Session processing error. A request for synchronization has been ignored. sense ((instance) Module name: {DFHZSDR})**

Explanation: A request for a sync point to be taken was ignored. COMMIT or ABORT has not been issued.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: If a task is attached, it is abnormally terminated with a transaction dump.

User response: To determine the cause of the problem, inspect the CSNE, CSMT and CSTL logs for further diagnostic information. Also inspect transaction *tranid*.

Destination: CSNE

Modules: DFHZSDR

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZSDR}*

DFHZC3418 E *date time applid termid tranid* **System generation error. The *netname* logon request was rejected. sense ((instance) Module name: {DFHZBLX | DFHZLGX | DFHZSCX})**

Explanation: A logon request was rejected because the TCTTE for the ISC session had been generated with an incompatible SESSIONTYPE.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: The request is rejected.

User response: Change the TCTTE generation to specify a secondary logical unit at one end of the connection, and a primary logical unit at the other end.

A primary logical unit should have SESSIONTYPE=SEND or SESSIONTYPE=FASTSEND, and a secondary logical unit should have SESSIONTYPE=RECEIVE or SESSIONTYPE=FASTRECV.

Destination: CSNE

Modules: DFHZSCX, DFHZLGX, DFHZBLX

XMEOUT Parameters: *date, time,applid, termid, tranid, netname, sense, instance, {1=DFHZSCX, 2=DFHZBLX, 3=DFHZLGX}*

DFHZC3419 E *date time applid termid tranid* **Session failure. The bind parameter for node *netname* is unacceptable. sense ((instance) Module name: {DFHZBLX | DFHZSCX | RESERVE})**

Explanation: A connection request was rejected because the characteristics specified for the connecting system were unacceptable.

Possible reasons for the rejection are:

- For a MEMBER name connection, the network identifier (NETID) passed to CICS is different from that already stored in the system entry (instance 39).
- For a MEMBER name connection, the GRNAME specified in the sessions bind - UDSS04 - is different from that already stored in the system entry (instance 40).
- For a GR name connection, the network identifier (NETID) passed to CICS is different from that already stored in the connections system entry (instance 41).

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: The request is rejected. The bind parameter is printed on the CSNE log.

User response: Determine whether the connecting system has specified its characteristics correctly. If it has not, correct the requesting system.

Destination: CSNE

Modules: DFHZSCX

XMEOUT Parameters: *date, time,applid, termid, tranid, netname, sense, instance, {1=RESERVE, 2=DFHZBLX, 3=DFHZSCX, 4=DFHZSCX, 5=DFHZBLX, 6=DFHZBLX, 7=DFHZSCX, 8=DFHZBLX, 9=DFHZBLX, 10=DFHZBLX, 11=DFHZBLX, 12=DFHZBLX, 13=DFHZBLX, 14=DFHZBLX, 15=DFHZBLX, 16=DFHZBLX, 17=DFHZBLX, 18=DFHZBLX, 19=DFHZSCX, 20=DFHZBLX, 21=DFHZBLX, 22=DFHZBLX, 23=DFHZBLX, 24=DFHZBLX, 25=DFHZBLX, 26=DFHZBLX, 27=DFHZBLX, 28=DFHZBLX, 29=DFHZSCX, 30=DFHZBLX, 31=DFHZBLX, 32=DFHZBLX, 33=DFHZBLX, 34=DFHZBLX, 35=DFHZBLX, 36=DFHZBLX, 37=DFHZBLX, 38=DFHZBLX, 39=DFHZBLX, 40=DFHZBLX, 41=DFHZBLX}*

DFHZC3420 E *date time applid termid tranid* **Session connection error. Node *netname* is out of service. *sense ((instance) Module name: {DFHZBLX | DFHZOPN})***

Explanation: A logon request was rejected because the TCTTE is out of service.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: The request is rejected.

User response: Place the terminal in service by using the master terminal program and reissuing the connection request.

Destination: CSNE

Modules: DFHZSCX, DFHZOPN, DFHZBLX

XMEOUT Parameters: *date, time,applid, termid, tranid,*

netname, sense, instance, {1=DFHZOPN, 2=DFHZBLX, 3=DFHZBLX}

DFHZC3421 E *date time applid termid tranid* **Session shutdown request received. Node *netname* is receiving orderly shutdown. *sense ((instance) Module name: {DFHZASX})***

Explanation: A shutdown request was received for the system. An orderly termination procedure has begun.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: Orderly termination of the session is started. Access to the remote system is stopped after the current transaction has finished.

User response: None.

Destination: CSNE

Modules: DFHZASX

XMEOUT Parameters: *date, time,applid, termid, tranid, netname, sense, instance, {1=DFHZASX}*

DFHZC3422 E *date time applid termid tranid* **Connection failure. Request rejected before a session could be started. *sense ((instance) Module name: {DFHZNSP})***

Explanation: An error occurred while trying to connect the two systems. The request was terminated before a session had been established.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: The request is terminated.

User response: Determine the cause of the problem by inspecting the VTAM logs. If the problem is due to a shortage of storage or another temporary error, reissue the request when the system is less heavily loaded.

Destination: CSNE

Modules: DFHZNSP

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZNSP, 2=DFHZNSP}*

DFHZC3423I *date time applid termid tranid* **FM function not supported. A function requested in an FMD RU is not supported by the receiver. *sense ((instance) Module Name: {DFHZNAC})***

Explanation: CICS has received a negative response (VTAM sense code 0826). The receiver does not support the function requested by the sender.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: All outstanding SENDs and RECEIVES are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User response: Investigate the reason for issuing a request for a function that the receiver does not support.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3424 E *date time applid termid tranid* **Session failure. Session terminated immediately.** *sense ((instance) Module name: {DFHZNSP})*

Explanation: Communication with a node was interrupted during a session because a session outage was detected, or because a VTAM VARY INACT command was issued.

Error messages produced for the same session after this message may be caused by the session failure and may not be the reason for it. If this is the case, they can be ignored.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: The session is canceled. The session may be recovered later by VTAM. See also messages DFHZC2409 and DFHZC2410.

User response: Check if the failure was caused by an operator-issued VTAM VARY INACT. If this is not the case, use the sense data and any associated messages to investigate the reason for the failure.

Destination: CSNE

Modules: DFHZNSP

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNSP, 2=DFHZNSP, 3=DFHZNSP}*

DFHZC3426 E *date time applid termid tranid* **Resource unknown.** *sense ((instance) Module name: {DFHZNAC})*

Explanation: During intersystem connection, no matching TCTTE could be found.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: The request is terminated.

User response: Ensure that the name of the requested TCTTE is correctly specified in the requesting system.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3427 E *date time applid termid tranid* **Invalid parameter in bind area.** *sense ((instance) Module name: {DFHZNAC})*

Explanation: During intersystem connection, either one or more parameters contained in the bind area of the request were invalid, or were not supported.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: The request is terminated.

User response: Determine which parameters in the bind area are incorrect, and correct them.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3429 E *date time applid termid tranid* **Resynch error - CICS did not resynchronize, other logical unit was expecting resynch.** *sense ((instance) Module name: {DFHZRSY | DFHZSYX})*

Explanation: CICS did not go through a resynchronization process that was expected to occur by the other LU.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: Processing continues.

User response: Check whether this resynchronization mismatch is acceptable.

Destination: CSNE

Modules: DFHZRSY, DFHZSYX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRSY, 2=DFHZRSY, 3=DFHZRSY, 4=DFHZRSY, 5=DFHZSYX}*

DFHZC3433 E *date time applid termid tranid* **FMH7 was received on ISC session. Sense code is : xxxxxxxx{Error log data is : | No error log data received. | No error log data available. }xxxxxxx** *sense ((instance) Module name: {DFHZERH | DFHZRAC | DFHZRVX})*

Explanation: The transaction is communicating with a logical unit (LU) type LU6.1 or LU6.2.

The logical unit sent an FMH7 which may carry error log data. If error log data is included, then the text is inserted in this message.

For the meaning of the sense data, see "DFHXCxxx messages" on page 1040.

System action: The action taken depends upon the sense code.

User response: If the receiving transaction is designed to handle this situation, no action is necessary. However, if this is not the case, use the sense code and any error log data to determine why the connected logical unit sent the FMH7.

If the connected LU is another CICS system, the error log data is a CICS message.

If the connected LU is not a CICS system, see that product's documentation for details of error log data. Some products permit the user to define the contents of error log data.

Destination: CSNE

Modules: DFHZRVX, DFHZRAC, DFHZERH

XMEOUT Parameters: *date, time,applid, termid, tranid, xxxxxxxx, {1= Error log data is : , 2=No error log data received. , 3=No error log data available. }, xxxxxxxx, sense, instance, {1=DFHZRVX, 2=DFHZRAC, 3=DFHZRAC, 4=DFHZERH}*

DFHXC3434 E *date time applid termid tranid* **Unbind received while session still active.** *sense ((instance) Module name: {DFHXCSCX})*

Explanation: One side of the intersystem link (secondary) received an unbind command without normal termination protocol being observed. This means an abnormal termination of the session was performed, possibly caused by the other side of the intersystem link abnormally terminating.

For the meaning of the sense data, see "DFHXCxxx messages" on page 1040.

System action: The session is terminated.

User response: Determine the cause of the termination by using CICS Trace and the diagnostic information available on the CSNE log. Try to reestablish the session.

Destination: CSNE

Modules: DFHXCSCX

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHXCSCX, 2=DFHXCSCX, 3=DFHXCSCX, 4=DFHXCSCX, 5=DFHXCSCX, 6=DFHXCSCX, 7=DFHXCSCX, 8=DFHXCSCX, 9=DFHXCSCX, 10=DFHXCSCX}*

DFHXC3435 E *date time applid termid tranid* **Path error detected. Device cannot be contacted.** *sense ((instance) Module name: {DFHXCNAC})*

Explanation: VTAM can no longer transmit to a

device because there is no access path to that device. This usually occurs because the device or 3270 has been powered off.

For the meaning of the sense data, see "DFHXCxxx messages" on page 1040.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing a VTAM CLSDST macro, and the node is placed out of service. The session is terminated.

User response: Determine the cause of the termination. Try to reestablish the session.

Destination: CSNE

Modules: DFHXCNAC

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHXCNAC}*

DFHXC3436 E *date time applid termid tranid* **End user not authorized.** *sense ((instance) Module name: {DFHXCNAC})*

Explanation: A sense code has been received specifying that an unauthorized request was made to the remote node. The request was rejected.

For the meaning of the sense data, see "DFHXCxxx messages" on page 1040.

System action: The session is terminated.

User response: Determine why the end user is not authorized to perform the request.

Destination: CSNE

Modules: DFHXCNAC

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHXCNAC}*

DFHXC3437 I *date time applid termid tranid* **Node netname action taken:** *action ((instance) Module name: {DFHXCNAC})*

Explanation: After an error has been processed by DFHXCNAC, certain actions may be taken to correct the error. This message indicates the actions that were set. The actions taken can differ from the actions set, depending on the type and state of the node at the time of the error.

System action:

Action Effect

ABRECV
Cancel receive.

ABSEND
Cancel send.

ABTASK
Abend task

CLSDST
Close session.

GMM Send good morning message.

OUTSRV
Place session out of service.

CREATE
Allow ATI to acquire the session if required.

NOCREATE
Do not allow ATI to acquire the session.

NEG RESP
Send an exception response.

SIMLOGON
Generate SIMLOGON request for the session.

CNTASK
Cancel the task.

SYSDUMP
Take a system dump.

PURGEBMS
Purge any BMS pages.

User response: The user action depends on what action has been taken by the system. This is indicated by *action* in the message text.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, netname, action, instance, {1=DFHZNAC}*

DFHZC3438 E *date time applid termid tranid* **Device powered off.** *sense ((instance) Module name: {DFHZNAC})*

Explanation: A request has been rejected by the logical unit because the associated device has been powered off. This message may be caused by operator action. For example, the TEST/NORMAL key may have been used.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: The system waits for a logical unit status message and, when the message has been received, takes appropriate system action.

User response: Correct the problem that relates to the device.

For the meaning of the sense codes, refer to the explanatory paragraph in message DFHZC2461.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid,*

sense, instance, {1=DFHZNAC}

DFHZC3439 E *date time applid termid tranid* **Negative response received to SDT.** *sense ((instance) Module name: {DFHZNAC})*

Explanation: A negative response has been received to the START DATA TRAFFIC (SDT) command.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: Processing continues.

User response: None.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3440 E *date time applid termid tranid* **Unable to send error message - session in free status.** *sense ((instance) Module name: {DFHZEMW})*

Explanation: DFHZEMW was attempting to write a message to another node, but was unable to do so because the session was in “between bracket” status.

In this state, it is not possible to send the message in the normal way. The session was in free status, probably because the application program had issued a SEND command with the LAST option.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: Processing continues.

User response: Check to see why the other node sent its request EXCEPTION response mode. Change the response mode to DEFINITE if error messages are to be sent.

Destination: CSNE

Modules: DFHZEMW

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZEMW, 2=DFHZEMW}*

DFHZC3441 I *date time applid* **Orderly termination of VTAM sessions requested.** *sense ((instance) Module name: {DFHZSHU})*

Explanation: A request for an orderly close of VTAM sessions and subsequent close of CICS VTAM ACB has been received. The request may have been initiated by the CICS master terminal command or by the VTAM network closing down.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: All nodes are quiesced and each

session is closed as it becomes inactive. When all sessions have been closed, the ACB is closed.

User response: None.

Destination: CSNE

Modules: DFHZSHU

XMEOUT Parameters: *date, time,applid, sense, instance, {1=DFHZSHU}*

DFHZC3442 I *date time applid* **Immediate termination of VTAM sessions requested.** *sense ((instance) Module name: {DFHZSHU | DFHZTPX | RESERVE})*

Explanation: A request for an immediate close of all VTAM sessions and subsequent close of CICS VTAM ACB has been received. The request may have been initiated by the CICS master terminal command or by the VTAM network closing down.

This message is also issued if V NET,ID=...,INACT is issued by the VTAM operator.

For the meaning of the sense data, see "DFHZCxxxx messages" on page 1040.

System action: All requests on a VTAM session are abnormally terminated and the session is closed. The VTAM ACB is then closed.

If V NET,ID=...,INACT was issued by the VTAM operator, VTAM waits for all sessions to be closed before informing CICS. In this case there are no sessions to be abnormally terminated. This message may be issued twice, once by DFHZTPX and once by DFHZSHU. The messages will have different instance numbers.

User response: None.

Destination: CSNE

Modules: DFHZSHU, DFHZTPX

XMEOUT Parameters: *date, time,applid, sense, instance, {1=DFHZSHU, 2=RESERVE, 3=RESERVE,4=DFHZTPX, 5=DFHZSHU}*

DFHZC3443 I *date time applid* **VTAM has been cancelled or the ACB has been forced closed. VTAM sessions terminated.** *sense ((instance) Module name: {DFHZSHU | DFHZSYX | DFHZTPX})*

Explanation: VTAM has been cancelled or force closed by the CICS/VTAM operator.

For the meaning of the sense data, see "DFHZCxxxx messages" on page 1040.

System action: CICS will close its ACB. All transactions running on VTAM sessions are abnormally terminated.

User response: None.

Destination: CSNE

Modules: DFHZSHU, DFHZTPX, DFHZSYX

XMEOUT Parameters: *date, time,applid, sense, instance, {1=DFHZSHU, 3=DFHZSYX, 4=DFHZTPX,5=DFHZSHU}*

DFHZC3444 E *date time applid termid tranid* **Unexpected condition detected during RECEIVE processing.** *sense ((instance) Module name: {DFHZRAC | DFHZRVS})*

| **Explanation:** CICS has detected that more than 32k of
| data has been transmitted while receiving data from
| terminal "termid".

For the meaning of the sense data, see "DFHZCxxxx messages" on page 1040.

System action: CICS terminates the session and places the terminal out of service. If a task is attached, it is abnormally terminated with a transaction dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: To determine the cause of this error,

- Check for a terminal malfunction, for example the device may be sending the same data repeatedly, or
- Check for a network problem.

Destination: CSNE

| **Modules:** DFHZRVS, DFHZRAC

| **XMEOUT Parameters:** *date, time,applid, termid, tranid, sense, instance, {1=DFHZRVS, 2=DFHZRAC}*

DFHZC3445 E *date time applid termid tranid* **State error.** *sense ((instance) Module name: {DFHZNAC})*

Explanation: CICS has received a state error negative response (VTAM sense code 20yy).

For the meaning of the sense data, see "DFHZCxxxx messages" on page 1040.

System action:

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing a VTAM CLSDST macro, and the node is placed out of service.

User response: Determine the reason for the error before restarting the session.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZNAC3446 E *date time applid termid tranid* **Request error.** *sense ((instance))* **Module name:** {DFHZNAC}

Explanation: CICS has received a request error negative response (VTAM sense code 10yy) for which it does not recognize the minor code yy.

For the meaning of the sense data, see “DFHZNACxxxx messages” on page 1040.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing a VTAM CLSDST macro, and the node is placed out of service.

User response: Determine the reason for the error.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZNAC3447 E *date time applid termid tranid* **Request reject error.** *sense ((instance))* **Module name:** {DFHZNAC}

Explanation: CICS has received a request reject negative response (VTAM sense code 08yy) for which it does not recognize the minor code yy.

For the meaning of the sense data, see “DFHZNACxxxx messages” on page 1040.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing a VTAM CLSDST macro, and the node is placed out of service.

User response: Determine the reason for the error.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZNAC3448 E *date time applid termid tranid* **Security identification error.** *sense ((instance))* **Module name:** {DFHZNAC}

Explanation: CICS has received a negative response to a request to access a resource because it was not authorized. If it was an OPNDST (BIND) request, CICS did not send the authorization sequence expected by a

logical unit. CICS does not support the security feature in the bind.

For the meaning of the sense data, see “DFHZNACxxxx messages” on page 1040.

System action: The logical unit is placed out of service and the session is closed.

User response: CICS does not support the security feature in the bind. Modify the authorization parameters in the remote logical unit so that it does not require authorization to initiate a session.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZNAC3449 I *date time applid termid tranid* **Leaving unattended mode.** *sense ((instance))* **Module name:** {DFHZNAC}

Explanation: CICS has received a status message from a logical unit indicating that the terminal is now attended.

Note that this is the default mode of operation.

For the meaning of the sense data, see “DFHZNACxxxx messages” on page 1040.

System action: The mode of operation bit TCTEMOPU is reset in the TCTTE.

User response: For logical units that can operate in unattended mode, the application programmer should test the mode of operation before starting a conversational sequence with the terminal operator. If the bit is on, no operator action can be expected.

For command level, use the EXEC CICS ASSIGN UNATTEND (data area) command to obtain the value of TCTEMOPU.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZNAC3450 I *date time applid termid tranid* **Entering unattended mode.** *sense ((instance))* **Module name:** {DFHZNAC}

Explanation: CICS has received a status message from a logical unit indicating that the terminal is no longer attended.

For the meaning of the sense data, see “DFHZNACxxxx messages” on page 1040.

System action: The mode of operation bit TCTEMOPU is set in the TCTTE.

User response: For logical units that can operate in

unattended mode, the application programmer should test the mode of operation before starting a conversational sequence with the terminal operator. If the bit is on, no operator action can be expected.

For command level, use the EXEC CICS ASSIGN UNATTEND (data area) command to obtain the value of TCTEMOPU.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3451 I *date time applid termid tranid* **Currently no data to send. sense ((instance) Module name: {DFHZNAC})**

Explanation: Following the issue of a READ command to a logical unit, or the completion of a transaction associated with the logical unit, CICS has received a status message from the logical unit indicating that it currently has no data to send.

For the meaning of the sense data, see "DFHZCxxxx messages" on page 1040.

System action: If a data interchange (DFHDI) receive request is outstanding, it will complete with DSSTAT condition and a response code X'15'.

If no task is active and no work is outstanding for the terminal, the soft CLSDEST action flag is set and DFHZNEP is called. Unless it is reset by DFHZNEP, the session is terminated.

User response: Ensure that no more receive requests are issued to the terminal.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3452 E *date time applid termid tranid* **Signal received - Code xxxx. sense ((instance) Module name: {DFHZASX})**

Explanation: CICS has received a SIGNAL command from a logical unit. The SIGNAL codes received with the SIGNAL command are made available to the DFHZNEP user program.

If a task is active, the SIGNAL condition is raised on return to the application program. This message is produced only when SIGNAL codes are passed to the node abnormal condition program (DFHZNAC). CICS does this for Type 4 logical units only.

For the meaning of the sense data, see "DFHZCxxxx messages" on page 1040.

System action: If the SIGNAL code is 0001 0000

(request change direction), any further output request will cause the IGREQCD condition to be raised. All SIGNAL codes will cause the SIGNAL condition to be raised.

User response: For logical units for which CICS enforces SIGNAL request change direction, if the code is 0001 0000, issue a receive request or terminate transaction *tranid*.

If the code is NOT 0001 0000, terminate transaction *tranid* and refer to the *VTAM Programming manual* for further guidance.

Destination: CSNE

Modules: DFHZASX

XMEOUT Parameters: *date, time,applid, termid, tranid, xxxx, sense, instance, {1=DFHZASX, 2=DFHZASX}*

DFHZC3453 E *date time applid termid tranid* **RH usage error. sense ((instance) Module name: {DFHZNAC})**

Explanation: CICS has received a request header (RH) usage error negative response for which it does not recognize the minor code *yy*.

For the meaning of the sense data, see "DFHZCxxxx messages" on page 1040.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing a VTAM CLSDST macro, and the node is placed out of service.

User response: None.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3454 E *date time applid termid tranid* **Session initiation failure. Bind response from node *netname* is unacceptable. sense ((instance) Module name: {DFHZOPX})**

Explanation: A remote secondary's response to a negotiable bind contained unacceptable parameters.

For the meaning of the sense data, see "DFHZCxxxx messages" on page 1040.

System action: Session initialization fails. The sent and received bind parameters are printed on the CSNE log.

User response: Look at the parameters printed on the CSNE log. Ensure that the remote system has correctly specified its characteristics. If there is an invalid format, change it to LEN PSQ LEN SSQ.

Destination: CSNE

Modules: DFHZOPX

XMEOUT Parameters: *date, time,applid, termid, tranid, netname, sense, instance, {1=DFHZOPX, 2=DFHZOPX, 3=DFHZOPX, 4=DFHZOPX, 5=DFHZOPX, 6=DFHZOPX, 7=DFHZOPX, 8=DFHZOPX, 9=DFHZOPX, 10=DFHZOPX, 11=DFHZOPX, 12=DFHZOPX, 13=DFHZOPX, 14=DFHZOPX, 15=DFHZOPX, 16=DFHZOPX, 17=DFHZOPX, 18=DFHZOPX, 19=DFHZOPX, 20=DFHZOPX, 21=DFHZOPX, 22=DFHZOPX, 23=DFHZOPX, 24=DFHZOPX, 25=DFHZOPX, 26=DFHZOPX, 27=DFHZOPX, 28=DFHZOPX, 29=DFHZOPX, 30=DFHZOPX, 31=DFHZOPX, 32=DFHZOPX, 33=DFHZOPX, 34=DFHZOPX, 35=DFHZOPX, 36=DFHZOPX, 37=DFHZOPX, 38=DFHZOPX, 39=DFHZOPX, 40=DFHZOPX, 41=DFHZOPX, 42=DFHZOPX, 43=DFHZOPX, 44=DFHZOPX, 45=DFHZOPX}*

DFHZC3455 E *date time applid termid tranid* **Session initiation failure. Bind response from node *netname* contains an invalid session qualifier pair.** *sense ((instance) Module name: {DFHZOPX})*

Explanation: A remote secondary's response to a negotiable bind contained an invalid session qualifier pair in the user data field. Either it had an invalid format, or the primary SQ had been altered.

For the meaning of the sense data, see "DFHZCxxxx messages" on page 1040.

System action: Session initialization fails. The sent and received bind images are printed on the CSNE log.

User response: Correct the error in the remote system. If there is an invalid format, change it to LEN PSQ LEN SSQ.

Destination: CSNE

Modules: DFHZOPX

XMEOUT Parameters: *date, time,applid, termid, tranid, netname, sense, instance, {1=DFHZOPX, 2=DFHZOPX, 3=DFHZOPX}*

DFHZC3456 E *date time applid termid tranid* **No outboard formats loaded.** *sense ((instance) Module name: {DFHZNAC})*

Explanation: An outboard format has been referenced, but no outboard formats are loaded on this logical unit.

System action: Transaction *tranid* is abnormally terminated with a transaction dump.

User response: Load the necessary outboard formats.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time,applid, termid, tranid,*

sense, instance, {1=DFHZNAC}

DFHZC3457 E *date time applid termid tranid* **Requested outboard format not loaded.** *sense ((instance) Module name: {DFHZNAC})*

Explanation: An outboard format has been referenced, but the requested format is not loaded on this logical unit.

For the meaning of the sense data, see "DFHZCxxxx messages" on page 1040.

System action: Transaction *tranid* is abnormally terminated with a transaction dump.

User response: Load the requested outboard format.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3458 E *date time applid termid tranid* **Requested format group not loaded.** *sense ((instance) Module name: {DFHZNAC})*

Explanation: An outbound format group has been referenced, but that format group is not loaded on this logical unit.

For the meaning of the sense data, see "DFHZCxxxx messages" on page 1040.

System action: Transaction *tranid* is abnormally terminated with a transaction dump.

User response: Load the required format group.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3459 E *date time applid termid tranid* **Unsupported data stream.** *sense ((instance) Module name: {DFHZNAC})*

Explanation: The data stream sent to the device contains control data for functions that the device does not support.

For the meaning of the sense data, see "DFHZCxxxx messages" on page 1040.

System action: Transaction *tranid* is abnormally terminated.

User response: Either ensure that transaction *tranid* is not run against the terminal, or change the terminal to one that supports the data stream.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3460 E *date time applid termid tranid* **Requested character set not present.** *sense ((instance) Module name: {DFHZNAC})*

Explanation: The Referenced Logical Character Set Identifier (LCID) specified in the define alternate character set is not known.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: Transaction *tranid* is abnormally terminated with a transaction dump.

User response: Ensure that the character set referenced by the LCID is loaded.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3461 I *date time applid termid tranid* **Node netname session started.** *sense ((instance) Module name: {DFHZE1 | DFHZE2 | DFHZOPX})*

Explanation: CICS has successfully issued or received a bind to the node *netname*.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: Processing continues.

User response: None.

Destination: CSNE

Modules: DFHZOPX, DFHZE1, DFHZE2

XMEOUT Parameters: *date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZOPX, 2=DFHZOPX, 3=DFHZE1, 4=DFHZE2}*

DFHZC3462 I *date time applid termid tranid* **Node netname session terminated.** *sense ((instance) Module name: {DFHZCLS})*

Explanation: A session with node *netname* has been closed.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: Processing continues.

User response: None.

Destination: CSNE

Modules: DFHZCLS

XMEOUT Parameters: *date, time, applid, termid, tranid,*

netname, sense, instance, {1=DFHZCLS, 2=DFHZCLS}

DFHZC3463 I *date time applid* **VTAM ACB opened.** **VTAM Return Code = X'rc'.** **Time = time** *sense ((instance) Module name: {DFHZOPA})*

Explanation: The master terminal operator issued a CEMT or CSMT command to open the VTAM ACB.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: Processing continues.

User response: This depends on the return code:

- | • If the value is zero, VTAM sessions can be enabled.
- | • If the value is 1, this is not a VTAM return code. It is inserted by DFHZOPA if a VTAM OPEN is received when the ACB is already open.
- | • If the return code is some other value, the operation has failed. See the section on *Open Macroinstructions* in the *VTAM Programming* manual to determine why the VTAM ACB was not opened.

Destination: CSNE

Modules: DFHZOPA

XMEOUT Parameters: *date, time, applid, X'rc', time, sense, instance, {1=DFHZOPA}*

DFHZC3464 I *date time applid termid tranid* **Node netname released by MT Operator/LU Services Manager.** *sense ((instance) Module name: {DFHZSTU})*

Explanation: The master terminal operator issued a CEMT command to release the logical unit (LU).

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: The LU is closed. Any task associated with the LU is terminated either abnormally (if the master terminal operator so desired) or normally.

User response: None.

Destination: CSNE

Modules: DFHZSTU

XMEOUT Parameters: *date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZSTU}*

DFHZC3465 E *date time applid termid tranid* **Unexpected response received.** *sense ((instance) Module name: {DFHZRAC | DFHZRLP | DFHZRVX})*

Explanation: CICS received a positive response in one of the following circumstances:

- The response was to data sent with exception response

- The response was to a command sent with exception response
- The response was to a send to which a response has already been sent.

For the meaning of the sense data, see “DFHXCxxxx messages” on page 1040.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. The node is placed out of service and the TCTTE, RPL, and action flags are logged to CSNE.

User response: Ensure that the application programs running concurrently do not alter the TCTTE. Check that the SNA flows on the session are valid and that the logical unit is not violating SNA protocols.

Destination: CSNE

Modules: DFHZRVX, DFHZRAC, DFHZRLP

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZRLP, 2=DFHZRVX, 3=DFHZRVX, 4=DFHZRVX, 5=DFHZRVX, 6=DFHZRAC, 7=DFHZRAC, 8=DFHZRAC, 9=DFHZRAC, 10=DFHZRAC, 11=DFHZRAC, 12=DFHZRAC}*

DFHXC3466 E *date time applid termid tranid* **Out of session during session start up** .sense ((instance) **Module name:** {DFHZSEX | DFHZSKR})

Explanation: A CICS master terminal command was used to put terminal *termid* out of service while session startup was taking place.

For the meaning of the sense data, see “DFHXCxxxx messages” on page 1040.

System action: The session is terminated and the TCTTE for terminal *termid* is left out of service.

User response: To establish the session for use, the master terminal operator should issue the command CEMT SET TER (XXXX) INS ACQ. This puts the terminal back in service, and start up the session for use.

Destination: CSNE

Modules: DFHZSEX, DFHZSKR

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZSEX, 2=DFHZSKR}*

DFHXC3467 E *date time applid termid tranid* **Permanent insufficient resource.** sense ((instance) **Module name:** {DFHZNAC})

Explanation: The PS buffer resource required by load PS is not available.

For the meaning of the sense data, see “DFHXCxxxx messages” on page 1040.

System action: If a task is attached, it is abnormally terminated with a transaction dump.

User response: Look at the CSNE log. A second message with a sense received code of 084C should have been issued. Refer to this message in the *VTAM Programming manual* for full details.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHXC3468 E *date time applid termid tranid* **CLEAR command received.** sense ((instance) **Module name:** {DFHZSCX})

Explanation: An SNA clear command was received by the node. The other end of the session was unable to handle the current requests for some reason, and purged any outstanding messages on the session.

For the meaning of the sense data, see “DFHXCxxxx messages” on page 1040.

System action: The session is canceled immediately, and any transaction executing on that session is also abnormally terminated and a transaction dump is produced.

User response: Check the other end of the session to determine why the clear command was sent. It may be due to a lack of buffers in the VTAM region attached to the other session.

Destination: CSNE

Modules: DFHZSCX

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZSCX}*

DFHXC3469 E *date time applid termid tranid* **Session re-establishment being awaited.** sense ((instance) **Module name:** {DFHZSCX})

Explanation: The secondary LU is being passed to a new application program via CLSDST(PASS).

For the meaning of the sense data, see “DFHXCxxxx messages” on page 1040.

System action: If a task is attached, it is abnormally terminated with a transaction dump.

User response: None.

Destination: CSNE

Modules: DFHZSCX

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZSCX}*

DFHZC3470 E *date time applid termid tranid LU session failure caused by: {restart/takeover. LU does not support ACTLU(ERP). | route extension to cluster failed. | LU abend, discontact, DACTPU or ANS. }sense ((instance) Module name: {DFHZSCX})*

Explanation: An LU session has failed because an UNBIND command has been received.

Possible reasons are:

- Restart or takeover. LU does not support ACTLU(ERP)
- Route extension to cluster failed
- Session failed due to LU abend, disconnect, DACTPU, or ANS.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: If a task is attached, it is abnormally terminated with a transaction dump.

User response: Use the symptom string, a VTAM trace, and the dump, if available, to determine the source of the UNBIND before attempting to reestablish the session.

Destination: CSNE

Modules: DFHZSCX

XMEOUT Parameters: *date, time,applid, termid, tranid, {1=restart/takeover. LU does not support ACTLU(ERP).,2=route extension to cluster failed., 3=LU abend, discontact, DACTPU or ANS. }, sense,instance, {1=DFHZSCX, 2=DFHZSCX, 3=DFHZSCX, 4=DFHZSCX}*

DFHZC3471 E *date time applid termid tranid Virtual route inoperative. sense ((instance) Module name: {DFHZSCX})*

Explanation: The session has been broken because the virtual route it was using has failed.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: If a task is attached, it is abnormally terminated with a transaction dump. For APPC sessions, CICS attempts to reestablish the failing session.

User response: None.

Destination: CSNE

Modules: DFHZSCX

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZSCX}*

DFHZC3472 E *date time applid termid tranid Device end received. sense ((instance) Module name: {DFHZSYX})*

Explanation: Device end was received from a non-SNA VTAM supported 3270

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: The good morning message is displayed, unless the terminal is associated with an active task.

User response: None.

Destination: CSNE

Modules: DFHZSYX

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZSYX}*

DFHZC3474 E *date time applid termid tranid Virtual route deactivated. sense ((instance) Module name: {DFHZSCX})*

Explanation: The session has had to be deactivated because of a forced deactivation of the virtual route being used.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: If a task is attached, it is abnormally terminated with a transaction dump. Afterwards CICS attempts to reestablish the session.

User response: Determine the cause of the session failure and attempt to reestablish the session.

Destination: CSNE

Modules: DFHZSCX

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZSCX}*

DFHZC3475 E *date time applid termid tranid Unrecoverable LU failure. sense ((instance) Module name: {DFHZSCX})*

Explanation: The session has had to be deactivated because of an abnormal termination of an LU.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: If a task is attached, it is abnormally terminated with a transaction dump. Session reinitiation is not attempted.

User response: None.

Destination: CSNE

Modules: DFHZSCX

XMEOUT Parameters: *date, time,applid, termid, tranid,*

sense, instance, {1=DFHZSCX}

DFHZC3476 E *date time applid termid tranid*
Recoverable LU failure. sense ((instance)
Module name: {DFHZSCX})

Explanation: The session has had to be deactivated because of an abnormal termination of an LU; recovery of the session may be possible.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: If a task is attached, it is abnormally terminated with a transaction dump. CICS attempts to reinitiate the session.

User response: None.

Destination: CSNE

Modules: DFHZSCX

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZSCX}*

DFHZC3477 E *date time applid termid tranid* **Cleanup received. sense ((instance) Module name: {DFHZSCX})**

Explanation: The sending LU has reset its half-session before receiving a response from CICS; recovery of the session may be possible.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: If a task is attached, it is abnormally terminated with a transaction dump. CICS attempts to reinitiate the session.

User response: None.

Destination: CSNE

Modules: DFHZSCX

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZSCX}*

DFHZC3479 E *date time applid termid tranid* **Unbind received after session failure detected. sense ((instance) Module name: {DFHZSCX})**

Explanation: The logical unit in session with CICS has detected a session failure, and has unbound the session with CICS.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: The session is terminated, and the transaction using it is abnormally terminated or informed by return code.

User response: Determine the reason for the session failure by using Trace. Check the CSNE log for a

second error message associated with DFHZC3479. This message should be located immediately after DFHZC3479.

Refer to the sense code shown in the associated message.

Destination: CSNE

Modules: DFHZSCX

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZSCX, 2=DFHZSCX}*

DFHZC3480 E *date time applid termid tranid* **Session could not be started due to insufficient CICS nucleus function - ISC not loaded. sense ((instance) Module name: {DFHZBLX | DFHZLGX | DFHZSIM})**

Explanation: A session initiation has been attempted to an APPC system or terminal. The session cannot be established because the CICS ISC nucleus modules are required.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: The session initiation request is rejected.

User response: If APPC connections are to be used, ensure that ISC=NO is not used for CICS initialization.

Destination: CSNE

Modules: DFHZSCX, DFHZLGX, DFHZSIM

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZSIM, 2=DFHZBLX, 3=DFHZLGX}*

DFHZC3481 E *date time applid termid tranid* **3270 Data Stream protocol error. sense ((instance) Module name: {DFHZRAC | DFHZRVX})**

Explanation: CICS has received zero length data from a device defined in the TCT as a 3270 terminal. This violates the protocol for 3270 devices.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: CICS cancels the session and any transactions attached to the terminal.

User response: Determine why zero length data was received from a device purporting to be a 3270 terminal, and correct the error.

The most likely reasons are an incorrect TCT definition for the terminal, or incorrect programming of a terminal that is simulating 3270 protocols.

Destination: CSNE

Modules: DFHZRAC, DFHZRVX

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZRVX, 2=DFHZRAC}*

DFHZC3482 E *date time applid tranid* **Logon from node *nodeid* rejected. Insufficient storage for autoinstall request. sense ((instance) Module name: {DFHZBLX | DFHZLGX | DFHZSCX})**

Explanation: A node *nodeid*, unknown to CICS, attempted to logon. CICS could not obtain sufficient storage to complete autoinstall processing.

For the meaning of the sense data, see "DFHZCxxxx messages" on page 1040.

System action: CICS rejects the logon request.

User response: Retry the logon.

Destination: CSNE

Modules: DFHZLGX, DFHZSCX, DFHZBLX

XMEOUT Parameters: *date, time,applid, tranid, nodeid, sense, instance, {1=DFHZLGX, 2=DFHZLGX, 3=DFHZBLX, 4=DFHZSCX}*

DFHZC3484 I *date time applid netname* **is now connected to *applid*. sense ((instance) Module name: {DFHZNSP})**

Explanation: By successful execution of an ISSUE PASS command, a VTAM logical unit whose network name is *netname* has been passed to the VTAM application whose VTAM APPLID (netname) is *applid*.

For the meaning of the sense data, see "DFHZCxxxx messages" on page 1040.

System action: CICS processing continues.

User response: None.

Destination: CSNE

Modules: DFHZNSP

XMEOUT Parameters: *date, time,applid, netname, applid, sense, instance, {1=DFHZNSP}*

DFHZC3485 E *date time applid netname* **A CLSDST Pass Procedure error occurred at *applid*. Status byte *xx* Reason byte *yy*.sense ((instance) Module name: {DFHZNSP})**

Explanation: In executing an ISSUE PASS command, CICS attempted to pass control of a VTAM logical unit whose network name is *netname*, to a system whose VTAM APPLID is *applid*. VTAM has notified CICS of an error at *applid*.

For the meaning of the sense data, see "DFHZCxxxx messages" on page 1040.

System action: CICS saves the status byte *xx* and reason byte *yy* passed by VTAM in the Notify Request

Unit. CICS processing continues.

User response: The reason for the error can be determined by investigating the status byte *xx* and reason byte *yy* given in the message. These bytes are documented in the NSEXIT routine section of *VTAM Programming* (SC23-0115).

Destination: CSNE

Modules: DFHZNSP

XMEOUT Parameters: *date, time,applid, netname, applid, xx, yy, sense, instance, {1=DFHZNSP}*

DFHZC3486 E *date time applid netname* **The named LU cannot be connected for sessions at *applid*. sense ((instance) Module name: {DFHZSYX})**

Explanation: In executing an ISSUE PASS command, CICS attempted to pass control of a VTAM logical unit whose network name is *netname*, to a system whose VTAM APPLID is *applid*. VTAM has notified CICS that *applid* is currently not available.

For the meaning of the sense data, see "DFHZCxxxx messages" on page 1040.

System action: Processing continues.

User response: None.

Destination: CSNE

Modules: DFHZSYX

XMEOUT Parameters: *date, time,applid, netname, applid, sense, instance, {1=DFHZSYX, 2=DFHZSYX}*

DFHZC3487 E *date time applid netname* **Unable to PASS to node *nodeid*. CLSDST PASS is not authorized. sense ((instance) Module name: {DFHZLEX})**

Explanation: In executing an ISSUE PASS command, CICS attempted to pass control of a VTAM logical unit whose network name is *netname*. VTAM has notified CICS that CICS is not authorized to use this function.

For the meaning of the sense data, see "DFHZCxxxx messages" on page 1040.

System action: CICS continues.

CICS may or may not be able to display the *applid* it was being passed. If CICS can display this *applid*, it appears in the text of this message.

User response: To use the ISSUE PASS command, you must code AUTH=PASS on the VTAM definition of the CICS APPL, then reactivate the APPL.

Destination: CSNE

Modules: DFHZLEX

XMEOUT Parameters: *date, time,applid, netname, nodeid, sense, instance, {1=DFHZLEX, 2=DFHZLEX}*

DFHZC3488 E *date time applid netname* **ISC session connection failure.** *sense ((instance)*
Module name: {DFHZSIX})

Explanation: A simlogon request to an ISC system was rejected because the *netname* was not known. CICS has now issued the INQUIRE OPTCD=USERVAR command in order to determine if *netname* had been defined as a user variable. That INQUIRE command has been rejected because the user variable does not exist in the USERVAR table. This may be because the USERVAR is either not known or invalid, or the MODIFY USERVAR command has not been issued to define the user variable.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: CLSDST is issued to reset the session.

User response: Determine if the netname has been defined correctly to CICS. If the netname is to be used as a user variable then determine why the MODIFY USERVAR command has not been issued to set it.

Destination: CSNE

Modules: DFHZSIX

XMEOUT Parameters: *date, time, applid, netname, sense, instance, {1=DFHZSIX}*

DFHZC3489 E *date time applid netname* **The LU is inhibited for sessions.** *sense ((instance)*
Module name: {DFHZSYX})

Explanation: CICS has attempted to acquire a session to the logical unit (LU), but VTAM has rejected the request because the LU is inhibited for sessions.

The partner LU could be inhibited because it has issued the VTAM macro SETLOGON OPTCD=QUIESCE.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: The request is rejected and the session is set into NOINTLOG state to prevent further requests being issued.

User response: After the partner LU has enabled itself, it can initiate the session request to CICS. Alternatively, the CICS master terminal operator could reset the NOINTLOG state and allow CICS to initiate the session request.

Destination: CSNE

Modules: DFHZSYX

XMEOUT Parameters: *date, time, applid, netname, sense, instance, {1=DFHZSYX}*

DFHZC3490 E *date time applid netname* **Unable to pass to node nodeid.** *sense ((instance)* **Module name:** {DFHZCLX | DFHZLEX | DFHZSYX})

Explanation: In executing an ISSUE PASS command, CICS attempted to pass control of the named VTAM logical unit to a system identified as node *nodeid*. VTAM has notified CICS that this request has failed.

This may occur if the LUNAME specified is a generic resource name and this CICS is the only system registered under this name. You are effectively passing the terminal to yourself.

However, if there is more than one CICS registered under the generic resource name, the terminal should pass successfully to another member (chosen by VTAM) in the same resource.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: A VTAM CLSDST macro is issued to halt communication with the node.

User response: Ensure that the node *nodeid* is defined and active to VTAM.

Destination: CSNE

Modules: DFHZSYX, DFHZLEX, DFHZCLX

XMEOUT Parameters: *date, time, applid, netname, nodeid, sense, instance, {1=DFHZLEX, 2=DFHZSYX, 3=DFHZCLX}*

DFHZC3491 E *date time applid netname* **Unable to make session XRF capable.** *sense ((instance)* **Module name:** {DFHZLEX})

Explanation: The active CICS system has attempted to OPNDST the session as “XRF capable”, but has been refused because the Network Control Program (NCP) has insufficient space to hold the control blocks for a future backup session from the alternate CICS system.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: CICS performs a SIMLOGON, but does not deem the session to be “XRF capable”. CICS therefore treats the terminal as class 2.

User response: No immediate action is necessary. You may need to increase the number of buffers in the NCP.

Destination: CSNE

Modules: DFHZLEX

XMEOUT Parameters: *date, time, applid, netname, sense, instance, {1=DFHZLEX}*

DFHZC3492 E *date time applid tranid* **Logon for node
nodeid contained invalid NIBUSER
token. sense ((instance) Module name:
{DFHZLGX})**

Explanation: DFHZLGX has been driven for SIMLOGON with a token that is no longer a valid TCTTE address.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: An unexpected condition has occurred during SIMLOGON. CICS will continue processing normally.

User response: None.

Destination: CSNE

Modules: DFHZLGX

XMEOUT Parameters: *date, time,applid, tranid, nodeid, sense, instance, {1=DFHZLGX}*

DFHZC3493 E *date time applid termid tranid* **Invalid
device type for a print request. sense
((instance) Module name : {DFHZARQ})**

Explanation: A print function was requested on a 3270 information display system. However, the print function was unable to find an eligible printer because the function does not support the device type.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: If no other action is specified in the Network Error Program (NEP), the print request is halted. CICS processing continues.

User response: Check that the printers specified for the information display system are valid. Valid devices are 3270P and LUTYPE3.

Destination: CSNE

Modules: DFHZARQ

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZARQ}*

DFHZC3494 E *date time applid termid tranid* **Request
error sense ((instance) Module name :
{DFHZNAC})**

Explanation: The request unit (RU) received by the secondary logical unit (LU) contains a request which terminal *termid* cannot handle.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: All send and receive requests are purged and transaction *tranid* is abnormally terminated with a dump.

User response: Check that the TYPETERM

specifications for terminal *termid* are valid. This error could occur if, for example, QUERY was sent to a nonqueriable 3270 defined with QUERY=COLD|ALL.

Destination: CSNE

Modules: DFHZSYX

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3495 E *date time applid* **Logon occurred for
terminal with netname netname before
Notify received sense ((instance) Module
name : {DFHZLGX})**

Explanation: A terminal with netname *netname* has logged on before a NOTIFY request was received for an outstanding CLSDST PASS with CLSDST=NOTIFY.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: CICS processing continues. Any subsequent NOTIFY requests for the terminal identified will be ignored.

User response: It is recommended that any user processing for CLSDST PASS messages incorporates this message.

Destination: CSNE

Modules: DFHZLGX

XMEOUT Parameters: *date, time,applid, netname, sense, instance, {1=DFHZLGX}*

DFHZC3496 E *date time applid* **System dump has been
taken for terminal termid ((instance)
Module name: {DFHZNAC})**

Explanation: Terminal *termid* has been found to be in error by terminal control.

As terminal *termid* had no task attached to it at the time of the error, DFHZNAC was unable to cause a transaction abend with a transaction dump.

The TWAODNTA flag in the DFHZNAC-DFHZNEP commarea is set ON and DFHZNAC produces a system dump for terminal *termid* instead.

System action: An exception trace entry is made in the trace table at trace point FC73.

A system dump is produced unless you have specifically suppressed dumps in the dump table.

User response: To determine the nature of the problem that caused the dump to be taken, refer to the CSNE log. There should be an associated CICS message which will provide further information.

For more information about TWAODNTA, refer to the *CICS Customization Guide*.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, instance, {1=DFHZNAC}*

DFHZC3497 E *date time applid* **Link to module DFHZNEP from DFHZNAC failed because {module DFHZNEP is not AMODE 31. | module DFHZNEP could not be loaded. | module DFHZNEP could not be autoinstalled. | of an unexpected error.} ((instance) Module name: {DFHZNAC})**

Explanation: While processing an error for a VTAM terminal, CICS attempted to link to user-replaceable module DFHZNEP. The link failed.

See message DFHZC3437 for the default action or actions taken.

System action: The default action or actions set by DFHZNAC are taken.

User response: The reason for the failure is specified in the message. Possible solutions are:

- Ensure that DFHZNEP is linked with AMODE 31.
- Ensure that DFHZNEP is contained in one of the data sets concatenated in the DFHRPL DD statement and has the correct name.
- Ensure that there is a valid entry for DFHZNEP in the PPT, and that DFHZNEP can be successfully autoinstalled.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time, applid, {1=module DFHZNEP is not AMODE 31., 2=module DFHZNEP could not be loaded., 3=module DFHZNEP could not be autoinstalled., 4=of an unexpected error.}, instance, {1=DFHZNAC}*

DFHZC3498 E *date time applid* **Abend abcode has occurred in module DFHZNEP. ((instance) Module name: {DFHZNAC})**

Explanation: While processing an error for a VTAM terminal, user-replaceable module DFHZNEP was linked and the program abended with abend code *abcode*. See message DFHZC3437 for the default action or actions that are taken.

System action: Control is passed back to the calling module, DFHZNAC. DFHZNAC reinstates the default actions set before DFHZNEP was called. The actions are then taken.

User response: Refer to abend code *abcode* for details of the original error. Follow the user response given in the abend code to solve the problem.

Destination: CSNE

Modules: DFHZNAC

XMEOUT Parameters: *date, time, applid, abcode, instance, {1=DFHZNAC}*

DFHZC3499 E *date time applid OS* **Getmain failure in module DFHmodname with return code X'return_code' while attempting to process message DFHZCmessage_number. sense ((instance) Module name: {DFHZATA | DFHZLEX | DFHZLGX | DFHZRAC | DFHZSCX | DFHZSHU | DFHZSYX | DFHZTPX})**

Explanation: An error has been detected by module *modname*. The OS GETMAIN request by this module has failed with return code *X'return_code'*, and as a result, the diagnostic information relating to the original error has not been saved and cannot be processed by DFHZNAC.

The only information available for diagnosis of the error is *message_number* which is the number of the message that would have been issued had the OS GETMAIN request not failed.

For the meaning of the sense data, see "DFHZCxxxx messages" on page 1040.

System action: Processing continues normally.

User response: Refer to message *message_number* for further guidance.

Refer to the *MVS System Programming Library: Macro Reference* for the meaning of the OS GETMAIN return code.

Destination: CSNE

Modules: DFHZATA, DFHZLGX, DFHZRAC, DFHZSCX, DFHZSHU, DFHZTPX, DFHZLEX, DFHZSYX

XMEOUT Parameters: *date, time, applid, modname, X'return_code', message_number, sense, instance, {1=DFHZLEX, 2=DFHZSHU, 3=DFHZSCX, 4=DFHZSCX, 5=DFHZSYX, 6=DFHZSYX, 7=DFHZTPX, 8=DFHZRAC, 9=DFHZRAC, 10=DFHZATA, 11=DFHZLGX, 12=DFHZLGX}*

DFHZC4900 I *date time applid termid tranid* **CNOS {sent to | received from} Node netname System sysid Modename modename, Max = n1, Win=n2, {race detected | successful | values amended | modename not recognized | modename closed | CNOS failed}. ((instance) Module name: {DFHZGCN})**

Explanation: A CHANGE-NUMBER-OF-SESSIONS command has been sent or received. The inserts are identified as follows:

- *sysid* is the system identifier.
- *modename* is the modename.
- *n1* is the maximum session count.
- *n2* is the maximum source contention winner sessions.

If the “values amended” option is displayed, the values of the *n1* (maximum session count) and *n2* (maximum source contention winner sessions) have been renegotiated by the target system.

If the “race detected” option is displayed, the CNOS command could not be implemented because the modename *modename* was already locked for a CNOS command from the other system.

| If a modename of ALL is produced, it has been set internally by CICS and all of the modegroups for this connection will be affected by the CNOS command.

| If the “CNOS failed” option is displayed, the CNOS command could not be implemented because the modename lock was still held on the remote system when a second CNOS command was sent by this CICS, as the CNOS race winner, following a previous CNOS race condition.

System action: The negotiated values are applied.

User response: None.

Destination: CSNE

Modules: DFHZGCN

XMEOUT Parameters: *date, time,applid, termid, trandid, {1=sent to, 2=received from}, netname, sysid, modename, n1,n2, {1=race detected, 2=successful, 3=values amended, 4=modename not recognized, 5=modename closed, 6=CNOS failed}, instance, {1=DFHZGCN}*

DFHZC4901 I *date time applid termid trandid Node netname System sysid Modename modename, Negotiated values: Max=n1, Win=n2. ((instance) Module name: {DFHZGCN})*

Explanation:

- *modename* is the modename,
- *n1* is the maximum session count,
- *n2* is the maximum source contention winner sessions.

This message follows message DFHZC4900 when the maximum session count (*n1*) and the maximum source contention winner sessions (*n2*) have been renegotiated.

| If a modename of ALL is produced, it has been set internally by CICS and all of the modegroups for this connection will be affected by the CNOS command.

System action: The negotiated values are applied.

User response: None.

Destination: CSNE

Modules: DFHZGCN

XMEOUT Parameters: *date, time,applid, termid, trandid, netname, sysid, modename, n1,n2, instance, {1=DFHZGCN}*

DFHZC4902 E *date time applid termid trandid Attach FMH or subfield length error. sense ((instance) Module name: {DFHZATT})*

Explanation: A request to attach a task has been received across an APPC link. However, there is an error in the function management header (FMH) length or in the length of one of the subfields. As a result, CICS is unable to determine which task to attach.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: The task is abnormally terminated with a dump.

User response: The remote APPC system is sending an invalid attach header (FMH type 5). Use the supplied dump to determine the error and investigate the cause at the remote system.

Destination: CSNE

Modules: DFHZATT

XMEOUT Parameters: *date, time,applid, termid, trandid, sense, instance, {1=DFHZATT, 2=DFHZATT, 3=DFHZATT, 4=DFHZATT, 5=DFHZATT, 6=DFHZATT, 7=DFHZATT}*

DFHZC4903 E *date time applid termid trandid Attach FMH not found. sense ((instance) Module name: {DFHZATT | DFHZRAC})*

Explanation: A request to attach a task has been received across an APPC link. However, no APPC attach header has been found at the start of the input data stream.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: The task is abnormally terminated with a dump.

User response: The remote APPC system is failing to send a valid attach header (FMH type 5). Use the supplied dump to determine the error and investigate the cause at the remote system.

Destination: CSNE

Modules: DFHZATT, DFHZRAC

XMEOUT Parameters: *date, time,applid, termid, trandid, sense, instance, {1=DFHZATT, 2=DFHZATT, 3=DFHZRAC}*

DFHZC4904 E *date time applid termid trandid Bracket FSM error. sense ((instance) Module name: {DFHZRAC | DFHZRLP | DFHZSDL | DFHZSLX})*

Explanation: The bracket finite state machine (FSM) has reported an error in the use of APPC bracket protocols.

For the meaning of the sense data, see “DFHXCxxxx messages” on page 1040.

System action: The task is abnormally terminated with a dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: If this message occurs after a persistent sessions restart, look for associated messages for more guidance. The problem might be temporary.

If this message occurs during normal system execution, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSNE

Modules: DFHZRAC, DFHZRLP, DFHZSDL, DFHZSLX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRLP, 2=DFHZRLP, 3=DFHZRLP, 4=DFHZRLP, 5=DFHZSDL, 6=DFHZSDL, 7=DFHZSLX, 8=DFHZSLX, 9=DFHZSLX, 10=DFHZSLX, 11=DFHZSLX, 12=DFHZSLX, 13=DFHZRAC, 14=DFHZRAC, 15=DFHZRAC}*

DFHXC4905 E *date time applid termid tranid Chain*
FSM error. sense ((instance) Module
name: {DFHZDET | DFHZERH |
DFHZRAC | DFHZRLP | DFHZSDL |
DFHZSLX})

Explanation: The chain finite state machine (FSM) has reported an error in the use of APPC chaining protocols.

For the meaning of the sense data, see “DFHXCxxxx messages” on page 1040.

System action: The task is abnormally terminated with a dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: If this message occurs after a persistent sessions restart, look for associated messages for more guidance. The problem might be temporary.

If this message occurs during normal system execution, investigate any transactions running on the session at the time of failure because the error can be caused by using both the LAST and WAIT options on an EXEC CICS SEND command in an APPC DTP application. This combination of parameters is not recommended. See the *CICS Distributed Transaction Programming Guide* for more information. If this is not the cause of the problem, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSNE

Modules: DFHZRAC, DFHZRLP, DFHZSDL, DFHZSLX, DFHZERH, DFHZDET

DFHZC4910 E *date time applid termid tranid* **Receive buffer too small.** *sense ((instance) Module name: {DFHZRVL})*

Explanation: The receive buffer passed to DFHRVL is too small to accommodate a maximum size request unit.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: The task will be abnormally terminated with a dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSNE

Modules: DFHZRVL

XMEOUT Parameters: *date, time,applid, termid, tranid,*

sense, instance, {1=DFHZRVL, 2=DFHZRVL, 3=DFHZRVL, 4=DFHZRVL}

DFHZC4911 E *date time applid termid tranid* **LU6.2 exception response received.** *sense ((instance) Module name: {DFHZRPL})*

Explanation: A non-process-level exception response has been received.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: The task is abnormally terminated with a dump.

User response: Incorrect flows have been received on an APPC session. The CICS trace gives further details of the flow. Try to recreate the error by running a VTAM trace TYPE=IO/BUF to obtain complete details of the line flow.

Destination: CSNE

Modules: DFHZRPL

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZRPL}*

DFHZC4912 E *date time applid termid tranid* **BID received with invalid DFC indicators.** *sense ((instance) Module name: {DFHZRAC | DFHZRPL})*

Explanation: BID with data received, but not OIC.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: The task is abnormally terminated.

User response: Incorrect flows have been received on an APPC session. The CICS trace gives further details of the flow. It may help to run a VTAM trace TYPE=IO/BUF and repeat the error to obtain complete details of the line flow.

Destination: CSNE

Modules: DFHZRAC, DFHZRPL

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZRPL, 2=DFHZRAC, 3=DFHZRAC}*

DFHZC4913 E *date time applid termid tranid* **BID with data received with invalid DFC indicators.** *sense ((instance) Module name: {DFHZRPL})*

Explanation: A BID with data was received in an invalid state for rejection.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: The task is abnormally terminated.

User response: Incorrect flows have been received on an APPC session. The CICS trace gives further details of the flow. It may help to run a VTAM trace TYPE=IO/BUF and repeat the error to obtain complete details of the line flow.

Destination: CSNE

Modules: DFHZRLP

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZRLP, 2=DFHZRLP, 3=DFHZRLP, 4=DFHZRLP}*

DFHZC4914 E *date time applid termid tranid Data length exceed max RU size. sense ((instance) Module name: {DFHZRLP})*

Explanation: The record length received exceeds the buffer length.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: The task is abnormally terminated.

User response: Incorrect flows have been received on an APPC session. The CICS trace gives further details of the flow. It may help to run a VTAM trace TYPE=IO/BUF and repeat the error to obtain complete details of the line flow.

Destination: CSNE

Modules: DFHZRLP

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZRLP}*

DFHZC4915 E *date time applid termid tranid EOC received with invalid DFC indicators. sense ((instance) Module name: {DFHZRLP})*

Explanation: An end chain was received with invalid DFC indicators.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: The task is abnormally terminated.

User response: Incorrect flows have been received on an APPC session. The CICS trace gives further details of the flow. It may help to run a VTAM trace TYPE=IO/BUF and repeat the error to obtain complete details of the line flow.

Destination: CSNE

Modules: DFHZRLP

DFHZC4916 E *date time applid termid tranid Send response failed. sense ((instance) Module name: {DFHZRLP})*

Explanation: A response, sent to acknowledge successful receipt of data, was rejected by VTAM.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: The task is abnormally terminated with a dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSNE

Modules: DFHZRLP

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZRLP}*

DFHZC4917 E *date time applid termid tranid BIS received with invalid DFC indicators. sense ((instance) Module name: {DFHZRLP})*

Explanation: Bracket initiation stopped (BIS) received with invalid DFC flags.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: The task is abnormally terminated.

User response: Incorrect flows have been received on an APPC session. The CICS trace will give further details of the flow. It may help to run a VTAM trace TYPE=IO/BUF and repeat the error to obtain complete details of the line flow.

Destination: CSNE

Modules: DFHZRLP

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZRLP, 2=DFHZRLP}*

DFHZC4918 E *date time applid termid tranid Unexpected response received. sense ((instance) Module name: {DFHZRLP})*

Explanation: An unexpected response was received that was either a positive response to data of a previous bracket, or a response to a command that cannot be accepted when the logical unit is in “continue specific” mode.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: The task is abnormally terminated.

User response: Incorrect flows have been received on a APPC session. The CICS trace will give further details of the flow. It may help to run a VTAM trace TYPE=IO/BUF and repeat the error to obtain complete details of the line flow.

Destination: CSNE

Modules: DFHZRLP

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZRLP, 2=DFHZRLP, 3=DFHZRLP, 4=DFHZRLP, 5=DFHZRLP}*

DFHZC4919 E *date time applid termid tranid* **Invalid indicators received.** *sense ((instance) Module name: {DFHZARER | DFHZARL})*

Explanation: An indicator other than CD, CEB, RQD2, or error response has been received.

For the meaning of the sense data, see "DFHZCxxxx messages" on page 1040.

System action: The task is abnormally terminated with a dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSNE

Modules: DFHZARL, DFHZARER, DFHZARL

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZARL, 2=DFHZARL, 3=DFHZARL, 4=DFHZARL, 5=DFHZARER}*

DFHZC4920 E *date time applid termid tranid* **Invalid data received.** *sense ((instance) Module name: {DFHZARER | DFHZARL | DFHZERH})*

Explanation: Data received from the remote system or terminal is not in correct generalized data stream (GDS) format.

For the meaning of the sense data, see "DFHZCxxxx messages" on page 1040.

System action: The task is abnormally terminated with a dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSNE

Modules: DFHZARL, DFHZARER, DFHZERH

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZERH, 2=DFHZERH, 3=DFHZERH, 4=DFHZERH, 5=DFHZERH, 6=DFHZERH, 7=DFHZARL, 8=DFHZARL, 9=DFHZARL, 10=DFHZARER, 11=DFHZARER, 12=DFHZARER}*

DFHZC4921 E *date time applid sysid* **LU services manager failure.** **R15 =X'xxxxx' R0 =X'yyyyy'**

Explanation: An error situation has been detected during the operation of the LU services manager transaction program (DFHLUP).

Registers 15 and 0 are set to indicate the nature of the error as shown below:

Register 15 = X'0' Task invalidly started ...
Register 0 = X'3' ... via a perm transid.
Register 0 = X'4' ... by a TD trigger.
Register 0 = X'5' ... without data.
Register 0 = >X'6' ... or is out of range of a valid start code for this service

Register 15 = X'4' Call code did not match a supported function (1-5).
Register 0 = call code

Register 15 = X'8' Invalid parameters passed for this function.
Register 0 = keyword #

Register 15 = X'0C' Function-specific checks failed for this keyword.
Register 0 = keyword #

Register 15 = X'10' No input data supplied.
Register 0 = -0 The IC_GET for the TS START data failed.
Register 0 = X'0' The LUTYPE6.2 RECEIVE returned data length=0.

Register 15 = X'14' The GDS-ID is not for XLN.
Register 0 = GDS-ID

System action: The task is allowed to complete but the required function is not executed.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: If one of the errors mentioned above has occurred, try to discover the reason for the failure. If you fail in this, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSNE

Modules: DFHLUP

XMEOUT Parameters: *date, time,applid, sysid, X'xxxxx', X'yyyyy'*

DFHZC4922 E *date time applid termid tranid* **Single session shutdown with DRAIN=CLOSE.**
sense ((instance) Module name:
{DFHZERH | DFHZGDA | DFHZRAC})

Explanation: The connected logical unit has sent Bracket Initiation Stopped (BIS) and can accept no more work.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: If a conversation was active, it is treated as though rollback had occurred on it for full syncpoint (syncpoint level 2), or as session failure for confirm-level syncpoint (syncpoint level 1).

If there was no conversation, it is treated as a BID failure (as for 0813 sense code).

User response: None.

Destination: CSNE

Modules: DFHZRAC, DFHZGDA, DFHZERH

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZRAC, 2=DFHZGDA, 3=DFHZERH}*

DFHZC4923 I *date time applid termid tranid*
Conversation abnormally terminated by transaction end in system sysid

Explanation: Transaction *tranid*, engaged in an SNA session with a CICS system, issued a command that was inconsistent with the transaction’s current state in the conversation.

System action: The conversation terminates and CICS sends this message to the connected logical unit at the nonfailing end of the conversation.

The application in system *sysid* abnormally terminates with an abend.

User response: Correct the application program. To find the command in error, use the state diagrams in the *CICS Intercommunication Guide*.

Destination: CSMT

Modules: DFHZARL

XMEOUT Parameters: *date, time,applid, termid, tranid, sysid*

DFHZC4924 E *date time applid termid tranid* **Bind security password missing or invalid.**
sense ((instance) Module name:
{DFHZBLX | DFHZOPX | DFHZSCX})

Explanation: Bind-time security data sent to CICS by its partner LU is missing or invalid. CICS’s password for the partner LU system differs from the partner’s password for CICS. This can be caused by an attempt to sign on to CICS by an unauthorized user.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: The bind is rejected.

User response: Check that an unauthorized user has not tried to log on to CICS. Ensure that the unsuccessful connection is correctly defined to CICS (using RDO or the DFHTCT macro) and to its partner LU system. Ensure that the security requirements are equal at both partners, that is, both have security off, or both have security on. A mismatch is one cause of this message.

Destination: CSNE

Modules: DFHZSCX, DFHZOPX, DFHZBLX

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZOPX, 2=DFHZBLX, 3=DFHZBLX, 4=DFHZBLX, 5=DFHZBLX, 6=DFHZOPX, 7=DFHZOPX, 8=DFHZOPX, 9=DFHZOPX, 10=DFHZSCX}*

DFHZC4925 E *date time applid termid tranid*
Inconsistent attach security required.
sense ((instance) Module name:
{DFHZOPN | DFHZOPX})

Explanation: This message can be issued for any of the reasons listed below.

1. CICS has received a bind request specifying attach time security requirements different from those specified in the first bind.
2. CICS has received a bind requesting persistent verification.
3. CICS has received a bind which does not include an SNA functional management header (FMH12).

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: CICS rejects the bind.

User response: CICS does NOT allow subsequent binds to specify different security requirements from the first bind. It will not support persistent verification on input either.

Where applicable, alter your applications to meet these requirements.

Destination: CSNE

Modules: DFHZOPX, DFHZOPN

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZOPX, 2=DFHZOPN, 3=DFHZOPN, 4=DFHZOPX}*

DFHZC4926 E *date time applid termid tranid* **Bind security encryption error.** *sense ((instance) Module name: {DFHZEV1 | DFHZEV2})*

Explanation: CICS detected an error while verifying an encrypted bind security password.

For the meaning of the sense data, see "DFHXCxxx messages" on page 1040.

System action: CICS rejects the bind.

User response: Investigate the CSNE and CSMT logs.

Find out whether an unauthorized user tried to log on to CICS, or whether an authorized user entered his password incorrectly.

Destination: CSNE

Modules: DFHZEVI, DFHZEVI2

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZEVI, 2=DFHZEVI2, 3=DFHZEVI}*

DFHXC4927 E *date time applid termid tranid* **Bind FMH response error. sense ((instance) Module name: {DFHXRAC})**

Explanation: CICS received a bind with bind security without an FMH12.

For the meaning of the sense data, see "DFHXCxxx messages" on page 1040.

System action: CICS rejects the bind.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: This is an error either in CICS or in SNA. Keep the CSNE and CSMT logs. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSNE

Modules: DFHXRAC

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHXRAC, 2=DFHXRAC, 3=DFHXRAC, 4=DFHXRAC}*

DFHXC4928 E *date time applid termid tranid* **Bind security GETMAIN of a TIOA failed. sense ((instance) Module name: {DFHZEVI})**

Explanation: CICS required a TIOA work area for bind security validation, but the GETMAIN failed because insufficient storage was available.

System action: CICS rejects the bind.

User response: Consider increasing the size of the CICS region or reducing the number of concurrent CICS tasks (MXT parameter in the system initialization table).

Destination: CSNE

Modules: DFHZEVI

XMEOUT Parameters: *date, time,applid, termid, tranid,*

sense, instance, {1=DFHZEVI}

DFHXC4929 *date time applid termid tranid* **Invalid or unsupported BIND for logmode logmode. Response X'response', Reason X'reason' ((instance) Module: {DFHZOPN})**

Explanation: CICS has detected an error while validating the BIND supplied by VTAM for a CICS typeterm definition defined with LOGMODE=0 or LOGMODE=logmode.

The *response* code indicates:

- X'04'** The BIND supplied does not match the TCTTE – detected by DFHZBANS.
- X'08'** The BIND supplied is unsupported – detected by DFHZBANV.
- X'0C'** The BIND supplied is invalid – detected by DFHZBANV.

The *reason* code for a response of X'04' is as follows:

- X'1B'** Unsupported TCTTE type or not VTAM
- X'1C'** No NIB descriptor chained from TCTTE
- X'1D'** No BMS extension chained from TCTTE
- X'1E'** Same as for reason code X'1D'
- X'1F'** LU6.2 BIND, but TCTTE does not match.

The *reason* code for a response of X'08' or X'0C' is as follows:

Reason Hex	Invalid byte	Explanation
1	3	Should be hex 02, 03, 04 or 07
2-8	4 5 6 7	Invalid for this FM profile
9	2	Should be hex 00, 02, 03, 04, 07, 13 or 14
0A,0D,10	1	Invalid for LUTYPE 1,2 or 3 - must be hex 01
0B	4 5 6 7	Invalid for LUTYPE 1
0C	22	Invalid for LUTYPE 1
0E	4 5 6 7	Invalid for LUTYPE 2
0F	24	Invalid for LUTYPE 2 should be hex 00, 01, 02, 03, 7E, or 7F
11	4 5 6 7	Invalid for LUTYPE 3
12	24	Invalid for LUTYPE 3 should be hex 00, 01, 02, 03, 7E, or 7F
13	16	Invalid for LUTYPE 6.2
14	23	Invalid for LUTYPE 6.2
15-18	24	Invalid for LUTYPE 6.2
19	15	Should be hex 00 or 02
1A	14	Should be hex 00, 01, 02, 03, 06
1B and over	User Data	The reason code matches the byte position in the BIND for the error detected. These can be: - Session ID length unsupported - should be 3 to 11 - PLU/SLU name length

- unsupported - should be 2 to 19
- PLU/SLU defined twice
- Length invalid
- Session qualifier pairs have inconsistent lengths.

System action: CICS rejects the logon request. The BIND being validated is printed with this message.

User response: Use the response and reason codes and the printed BIND, together with the VTAM definition of the BIND for the relevant LOGMODE to determine the reason for the rejection.

Either change the logmode or use a different one that matches CICS requirements.

Destination: CSMT

Modules: DFHZOPN

XMEOUT Parameters: *date, time, applid, termid, tranid, logmode, X'response', X'reason', instance, {1=DFHZOPN}*

DFHZC4930 E *date time applid termid tranid* **Session unbound following read timeout.** *sense ((instance) Module name: {DFHZARER | DFHZARL})*

Explanation: A READ timeout has occurred on the SNA link. SNA unbinds the session and CICS returns control to the application program. This allows the program to override the system action (for example, the program could free the APPC session).

For the meaning of the sense data, see "DFHZCxxxx messages" on page 1040.

System action: CICS abends the task abnormally with a dump.

User response: This is probably a network problem caused by a high level of network traffic. To avoid this problem, increase the Read Timeout (RTIMOUT) to a sufficiently high value to compensate for the level of network traffic. Alternatively, this problem may have arisen simply because the partner application failed to respond due to a programming error. If this is the case, correct the partner application and retry the request.

Destination: CSNE

Modules: DFHZARL, DFHZARER.

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZARL, 2=DFHZARL, 3=DFHZARER}*

DFHZC4931 E *date time applid termid tranid* **VTAM detected bad logmode name.** *sense ((instance) Module name: {DFHZLEX})*

Explanation: Either a MODENAME passed to VTAM during an attempt to bind an APPC session is not known to VTAM, or the logmode name of a VTAM 3270-type terminal is not valid.

For the meaning of the sense data, see "DFHZCxxxx messages" on page 1040.

System action: CICS places the session permanently out of service and for APPC, the mode entry is flagged unusable.

User response: Either redefine the sessions using a MODENAME that is known to VTAM, or add the MODENAME to the VTAM LOGMODE table. Alternatively, if the logmode name specified for a VTAM terminal is invalid, redefine the terminal entry using the correct name.

Destination: CSNE

Modules: DFHZLEX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZLEX}*

DFHZC4932 E *date time applid termid tranid* **Invalid conversation type requested.** *sense ((instance) Module name: {DFH62XM})*

Explanation: A request to attach a task has been received across an APPC link. However, there is an error in the conversation type field. It must be TYPE=MAPPED or TYPE=UNMAPPED.

For the meaning of the sense data, see "DFHZCxxxx messages" on page 1040.

System action: The task is abended and a dump is produced. The session is unbound.

User response: The remote APPC system sends an invalid attach header (FMH Type 5). Use the supplied dump to determine the error and investigate the cause at the remote system.

Destination: CSNE

| **Modules:** DFH62XM

| **XMEOUT Parameters:** *date, time, applid, termid, tranid, sense, instance, {1=DFH62XM}*

DFHZC4933 E *date time applid termid tranid* **Invalid DBA requested.** *sense ((instance) Module name: {DFH62XM})*

Explanation: A request to attach a task has been received across an APPC link. However, there is an error in the DBA field.

For the meaning of the sense data, see "DFHZCxxxx messages" on page 1040.

System action: The task abends and a dump is produced. The session is unbound.

User response: The remote APPC system sends an invalid attach header (FMH Type 5). Use the supplied dump to determine the error and investigate the cause at the remote system.

Destination: CSNE

| **Modules:** DFH62XM

| **XMEOUT Parameters:** *date, time,applid, termid, tranid, sense, instance, {1=DFH62XM}*

DFH4934 E *date time applid termid tranid* **Invalid syncpoint level requested.** *sense ((instance) Module name: {DFH62XM})*

Explanation: A request to attach a task has been received across an APPC link. However, the synchronization level requested is invalid.

For the meaning of the sense data, see “DFH4934 messages” on page 1040.

System action: The task abends and a dump is produced.

User response: The remote APPC system sends an invalid attach header (FMH Type 5). Use the supplied dump to determine the error and investigate the cause at the remote system.

Check the sync level in the ATTACH header against that in the BIND.

Destination: CSNE

| **Modules:** DFH62XM

| **XMEOUT Parameters:** *date, time,applid, termid, tranid, sense, instance, {1=DFH62XM}*

DFH4935 E *date time applid termid tranid* **Invalid UOWID supplied.** *sense ((instance) Module name: {DFH62XM})*

Explanation: A request to attach a task has been received across an APPC link and either the unit of work ID is invalid, or no UOWID was received when the sync point level required it.

For the meaning of the sense data, see “DFH4935 messages” on page 1040.

System action: The task abends and a dump is produced. The session is unbound.

User response: The remote APPC system sends an invalid attach header (FMH Type 5). Use the supplied dump to determine the error and investigate the cause at the remote system.

Destination: CSNE

| **Modules:** DFH62XM

| **XMEOUT Parameters:** *date, time,applid, termid, tranid, sense, instance, {1=DFH62XM, 2=DFH62XM, 3=DFH62XM, 4=DFH62XM, 5=DFH62XM, 6=DFH62XM}*

DFH4936 E *date time applid termid tranid* **Attach FMH or subfield length error.** *sense ((instance) Module name: {DFH62XM})*

Explanation: A request to attach a task has been received across an APPC link. However, there is an error in the FMH length or in the length of one of the sub-fields. This results in CICS being unable to determine which task to attach.

The instance *instance* is one of the following:

- 1 The FMH Length is not equal to the length of the fixed length portion + the length of all the sub fields.
- 2 The Conversation Correlator length within the FMH is greater than 8.

For the meaning of the sense data, see “DFH4936 messages” on page 1040.

System action: The task abends and a dump is produced.

User response: The remote APPC system sends an invalid attach header (FMH Type 5). Use the supplied dump to determine the error and investigate the cause at the remote system.

Destination: CSNE

| **Modules:** DFH62XM

| **XMEOUT Parameters:** *date, time,applid, termid, tranid, sense, instance, {1=DFH62XM, 2=DFH62XM}*

DFH4937 E *date time applid* **SAF request for LU6.2 bind has been rejected. Return Codes from the Security Manager are: RF= X'rf' and R0= X'r0'** *sense ((instance) Module name: {DFHZE1 | DFHZE2 | DFHZOPN})*

Explanation: A security authorization facility (SAF) request to extract APPC bind-time security information from the external security manager (ESM) has been rejected with return code RF=X'rf'. and RO=X'r0'.

This is due either to the ESM being inactive or to the appropriate APPC profile not being defined to the ESM.

For the meaning of the sense data, see “DFH4937 messages” on page 1040.

System action: CICS rejects the bind.

User response: Refer to the ESM manuals appropriate to your system to obtain information about the meanings of any return codes which may have been produced by the ESM.

If you are using RACF as your security manager, refer to the RACXTRT macro guidance documented in the *System Programming Library RACF* manual for the meaning of the return codes.

If the appropriate APPC profile had not been defined to the ESM, define the profile, perform a CICS security rebuild and then attempt to reestablish the APPC connection.

Destination: CSNE

Modules: DFHZE1, DFHZE2, DFHZOPN

XMEOUT Parameters: *date, time,applid, X'rf', X'r0', sense, instance, {1=DFHZOPN, 2=DFHZOPN, 3=DFHZOPN, 4=DFHZOPN, 5=DFHZOPN, 6=DFHZOPN, 7=DFHZOPN, 8=DFHZOPN, 9=DFHZE1, 10=DFHZE1, 11=DFHZE1, 12=DFHZE1, 13=DFHZE2, 14=DFHZE2, 15=DFHZE2, 16=DFHZE2}*

DFHZA4938 E *date time applid* **SAF request for LU6.2 bind has failed with ESM return code RF= X'rf' and reason code R0= X'r0' sense ((instance) Module name: {DFHZE1 | DFHZE2 | DFHZOPN})**

Explanation: The external security manager (ESM) was attempting to process a security authorization facility (SAF) request. Processing has failed with return code RF=X'rf' and reason code R0=X'r0'.

For the meaning of the sense data, see "DFHZAxxxx messages" on page 1040.

System action: CICS rejects the bind.

User response: Refer to the ESM manuals appropriate to your system to obtain information about the meanings of any return codes or reason codes produced by the ESM.

If you are using RACF as your security manager, refer to the RACXTRT macro guidance documented in the *System Programming Library RACF* manual for the meaning of the return code and the reason code.

Destination: CSNE

Modules: DFHZE1, DFHZE2, DFHZOPN

XMEOUT Parameters: *date, time,applid, X'rf', X'r0', sense, instance, {1=DFHZOPN, 2=DFHZOPN, 3=DFHZE1, 4=DFHZE2}*

DFHZA4939 E *date time applid* **Extraction of LU6.2 security data has failed with ESM returncode RF= X'rf' and reason code R0= X'r0' sense ((instance) Module name: {DFHZE1 | DFHZE2 | DFHZOPN})**

Explanation: A request to extract APPC bind-time security information has failed with return code RF=X'rf' and reason code R0=X'r0'. The profile information which was requested had not been previously defined to the external security manager (ESM).

For the meaning of the sense data, see "DFHZAxxxx messages" on page 1040.

System action: CICS rejects the bind.

User response: Check the profiles defined to the ESM. Create the missing APPC profile entry.

Refer to the ESM manuals appropriate to your system to obtain information about the meanings of any return codes or reason codes produced by the ESM.

If you are using RACF as your security manager, refer to the RACXTRT macro guidance documented in the *System Programming Library RACF* manual for the meaning of the return code and the reason code.

Destination: CSNE

Modules: DFHZE1, DFHZE2, DFHZOPN

XMEOUT Parameters: *date, time,applid, X'rf', X'r0', sense, instance, {1=DFHZOPN, 2=DFHZOPN, 3=DFHZE1, 4=DFHZE2}*

DFHZA4940 E *date time applid* **Bind time failure. No session key found in LU6.2 profile. sense ((instance) Module name: {DFHZE1 | DFHZE2 | DFHZOPN})**

Explanation: APPC bind-time validation has failed. No session key has been found in the requested APPC profile information. When bind-time security has been defined between two logical units (LUs), a valid session key must have been defined for the encryption process. A null session key (that is, when no key is defined) is regarded as an error.

For the meaning of the sense data, see "DFHZAxxxx messages" on page 1040.

System action: CICS rejects the bind.

User response: Check the profiles defined to the external security manager (ESM). Create a valid session key for the appropriate APPC profile entry. DO NOT use the NOSESSKEY ESM option for XAPPC security profiles when using RACF.

Refer to the ESM manuals appropriate to your system to obtain information about the meanings of any return and reason codes which produced by the ESM.

If you are using RACF as your security manager, refer to the RACXTRT macro guidance documented in the *System Programming Library RACF* manual for the meaning of the return code and the reason code.

Destination: CSNE

Modules: DFHZE1, DFHZE2, DFHZOPN

XMEOUT Parameters: *date, time,applid, sense, instance, {1=DFHZOPN, 2=DFHZOPN, 3=DFHZE1, 4=DFHZE2}*

DFHHC4941 E *date time applid* **Bind time failure.**
LU6.2 profile locked. *sense ((instance)*
Module name: {DFHZEVI | DFHZEVI
| DFHZOPN})

Explanation: The external security manager (ESM) has requested profile information during bind-time validation but the requested profile is locked. When a profile is locked no sessions can be established.

For the meaning of the sense data, see “DFHHCxxxx messages” on page 1040.

System action: CICS rejects the bind.

User response: Check the profiles defined to the ESM. The system administrator may have locked the profile. Request that the profile be unlocked. Try once more when the profile has been unlocked.

If you are using RACF as your security manager, refer to the RACXTRT macro guidance documented in the *System Programming Library RACF* manual for further information.

Destination: CSNE

Modules: DFHZEVI, DFHZEVI, DFHZOPN

XMEOUT Parameters: *date, time,applid, sense, instance,*
{1=DFHZOPN, 2=DFHZOPN,
3=DFHZEVI,4=DFHZEVI}

DFHHC4942 E *date time applid* **Bind time failure.**
Expired LU6.2 profile found. *sense*
((instance) **Module name:** {DFHZEVI |
DFHZEVI | DFHZOPN})

Explanation: The external security manager (ESM) has requested profile information during bind-time validation but the requested profile has expired.

For the meaning of the sense data, see “DFHHCxxxx messages” on page 1040.

System action: CICS rejects the bind.

User response: Check the profiles defined to the ESM. The system administrator needs to update the required profile. Request that the profile be updated. Try once more when the profile has been updated.

If you are using RACF as your security manager, refer to the RACXTRT macro guidance documented in the *System Programming Library RACF* manual for further information.

Destination: CSNE

Modules: DFHZEVI, DFHZEVI, DFHZOPN

XMEOUT Parameters: *date, time,applid, sense, instance,*
{1=DFHZOPN, 2=DFHZOPN,
3=DFHZEVI,4=DFHZEVI}

DFHHC4943 E *date time applid termid tranid* **RPL B**
FSM error. *sense ((instance)* **Module**
name: {DFHHSDL})

Explanation: The finite state machine (FSM), for the APPC alternate RPL (RPL 'B'), has detected an error in the use of the RPL.

For the meaning of the sense data, see “DFHHCxxxx messages” on page 1040.

System action: The task is abnormally terminated with abend code ATNI and a dump is produced.

User response: If this message occurs when VTAM is terminating, it is not a serious problem and usually no response is necessary.

If this message occurs during normal system execution, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSNE

Modules: DFHHSDL

XMEOUT Parameters: *date, time,applid, termid, tranid,*
sense, instance, {1=DFHHSDL}

DFHHC4944 *date time applid termid tranid* **Protocol**
Violation detected within bind security
indicators. *sense ((instance)* **MODULE**
NAME: {DFHHSBLX | DFHHSOPX})

Explanation: CICS has detected an error while validating the bind security specification. LOCAL security has been specified, but the bind contains data that indicates NON LOCAL security.

For the meaning of the sense data, see “DFHHCxxxx messages” on page 1040.

System action: CICS rejects the bind.

User response: Ensure that the correct data is sent in the bind for the required type of security.

Destination: CSMT

Modules: DFHHSZCX, DFHHSOPX, DFHHSBLX

XMEOUT Parameters: *date, time,applid, termid, tranid,*
sense, instance, {1=DFHHSBLX, 2=DFHHSBLX,
3=DFHHSOPX, 4=DFHHSOPX}

DFHHC4945 E *date time applid termid tranid* **Session**
unbind request due to the forcepurge of
a task. *sense ((instance)* **Module name:**
{DFHHSARER})

Explanation: A task was purged or forcepurged while it was suspended, waiting for an ISC request to complete.

For the meaning of the sense data, see “DFHHCxxxx messages” on page 1040.

System action: An unbind is requested for the session against which the ISC request was waiting and the task is abended. A FORCEPURGE command causes the task to be abended irrespective of the state of the session. Other VTAM error messages may result from this action.

User response: Investigate the reasons the task was purged or forcepurged because it may have been the result of an application error. In addition, the partner task in the connected CICS system will have session failure notification returned on the next ISC request after the session has been unbound. Check that the partner task has handled the situation.

Destination: CSNE

Modules: DFHZARER

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZARER}*

DFHZC4946 E *date time applid termid tranid* **Invalid attach parameter was received.** *sense ((instance) Module name: {DFH62XM})*

Explanation: A request to attach a task has been received across an APPC link. However there is an error in the FMH attach parameters. An attach parameter is present that is not authorized by the bind security indicators.

The *instance* data can take the following values:

instance

Meaning

- 1 The bind security indicators show that the connection is defined as ATTACHSEC(LOCAL) indicating that this LU does not accept any security parameters in an attach from the partner LU. One or more of the following security parameters has been found: Userid, Password, Profile, AV, PV1 and PV2.
- 2 An already-verified (AV) indicator has been received in an attach from the partner LU, but the bind security indicators show that this LU does not support the receipt of the AV indicator.
- 3 A persistent verification signon (PV2) indicator, or a persistent verification signed-on (PV1) indicator, has been received in an attach from the partner LU, but the bind security indicators show that this LU does not support the receipt of the PV indicators.

System action: The task abends and a dump is produced and the session is unbound. An exception trace point (number 1737) for component TF is issued, tracing the invalid attach header (FMH type 5).

User response: Investigate the cause of the error which is in the remote system. Use the FMH5 in the exception trace to determine why the remote system

sent an invalid attach request.

Destination: CSNE

| **Modules:** DFH62XM

| **XMEOUT Parameters:** *date, time, applid, termid, tranid, sense, instance, {1=DFH62XM, 2=DFH62XM, 3=DFH62XM}*

DFHZC4947 E *date time applid termid tranid* **Attach time security check has failed. Security not valid.** *sense ((instance) Module name: {DFH62XM})*

Explanation: A request to attach a task has been received over an APPC link. However the FMH5 attach parameters do not conform to the APPC protocol.

The *instance* data can take the following values:

instance

Meaning

- 1 Unrecognized access security subfield
- 2 Multiple userid access security subfields present
- 3 Multiple profile access security subfields present
- 4 Multiple password access security subfields present
- 5 Userid required in FMH but not received
- 6 PV1 and PV2 security indicators both present in FMH5
- 7 Password received when AV indicator set
- 8 Password received when PV1 indicator set
- 9 Password required for PV2 but not received.

System action: The attach request is rejected and the session is unbound. An exception trace point (number 1737) for component TF is issued tracing the invalid attach header (FMH type 5).

User response: Investigate the cause of the error which is in the remote system. Use the FMH5 in the exception trace, to determine why the remote system sent an invalid attach request.

If the remote system has an earlier release of CICS or CICS on another platform and the sense value given is 5 then you may need to set USEDFTUSER. See 'Attach Time Security and the USEDFTUSER option' in chapter 12 of the *CICS RACF Security Guide*.

Destination: CSNE

| **Modules:** DFH62XM, DFHZGXA

| **XMEOUT Parameters:** *date, time, applid, termid, tranid, sense, instance, {1=DFH62XM, 2=DFH62XM, 3=DFH62XM, 4=DFH62XM, 5=DFH62XM,}*

| 6=DFH62XM, 7=DFH62XM, 8=DFH62XM,
| 9=DFH62XM)

DFHZC4948 E *date time applid* **An error has been detected when processing an** *{ unknown | inbound | outbound}* **request.** *| Persistent Verify Signoff request. | Persistent Verify Timeout request.* **Transaction tranid is** *{ continuing. | terminating. | terminating abnormally.}* **Error code:** X'xxxxx'
Connection: yyyy

Explanation: An error has been detected during the execution of transaction CLS3. The error code indicates the nature of the error:

- X'01' Transaction CLS3 issued an unsuccessful communications request on an APPC session.
- X'02' Transaction CLS3 was started by a START command with data, but the format of the data was incorrect.
- X'04' Transaction CLS3 is attempting to send a signoff request to a remote system, but the connection to the remote system is not an APPC connection.
- X'06' Transaction CLS3 was not started by terminal input, nor by a START command.
- X'09' Transaction CLS3 was started by a START command with data, but the data could not be retrieved.
- X'0A' Transaction CLS3 is attempting to send a signoff request to a remote system, but there is no connection to the remote system.
- X'0B' Transaction CLS3 unsuccessfully attempted to allocate an APPC session to a remote system.

System action: Depending upon the nature of the event that gave rise to the message, the transaction continues execution, terminates normally, or terminates abnormally. The message text indicates which action is being taken.

User response: This depends upon the error code:

- X'01' Determine why the communications request on the APPC session failed. Possible reasons are:
- There has been a session failure.
 - The connected transaction has abended.
- This error produces an exception trace, which helps to determine the cause of the problem.
- X'02' Ensure that transaction CLS3 was started by CICS-supplied code, and not by application code. If it was started by CICS-supplied code, contact your IBM Support Center.
- X'04' Check the connection definition for the remote system. It should be an APPC connection.

X'06' Ensure that transaction CLS3 was started by CICS-supplied code, and not by application code. If it was started by CICS-supplied code, contact your IBM Support Center.

X'09' Determine why the data could not be retrieved. If you are unable to do so, contact your IBM Support Center

X'0A' Ensure that the connection has been correctly defined

X'0B' Ensure that the connection is acquired and in service

Destination: CSNE

Modules: DFHCLS3

XMEOUT Parameters: *date, time, applid, {1= unknown, 2= inbound, 3= outbound}, {1= request., 2=Persistent Verify Signoff request., 3=Persistent Verify Timeout request.}, tranid, {1= continuing., 2= terminating., 3= terminating abnormally.}, X'xxxxx', yyyy*

| **DFHZC4949 E** *date time applid termid tranid netname*
| **Receive Any stall -** *{data lost. | response lost. | command lost. }* **CLSDST return code X'rc' sense ((instance) Module name: {DFHZRAC})**

| **Explanation:** All the CICS Receive Any RPLs have
| been posted but the TCTTE for each one is waiting for
| a response from a VTAM terminal or session. All the
| Receive Any RPLs have been stalled for 10 dispatches
| of the TCP task (CSTP). This message is produced for
| each session that is in this situation. A VTAM session
| has not responded to a command such as BID or
| SHUTD sent by CICS. This is typically caused by a
| protocol error.

| **System action:** CICS is running with system
| initialization parameter RAPOOL=(n,n,FORCE) causing
| CICS to issue a VTAM CLSDST against the session,
| which causes the TCTTE's RPL to be completed and the
| session to be unbound.

| The default NEP action is CLSDST, which causes CICS
| to clean up the TCTTE after the pending command has
| been terminated.

| The Receive Any data received is discarded and the RA
| RPL is reissued.

| **User response:** Investigate the reason why the
| command has not completed. The TCTTE RPL is
| printed with the message.

| It is important to look at any earlier DFHZC4949
| messages because of the asynchronous nature of
| DFHZNAC. If the CLSDST has not completed, the RPL
| printed will be active and will show the RPL that can
| not complete. If the CLSDST has completed when
| DFHZNAC runs, the RPL printed will have a
| RTNCD/FDB2 of X'0C0B' but RPLREQ still shows
| what command would not complete.

If the CLSDST return code *rc* is non 0, the CLSDST macro has failed in DFHZRAC and the session remains hung. You may be able to free the session by using VTAM command V NET,INACT,ID=*netname*,I. You can find the reason for the CLSDST failure by looking at the RPL in the AP FC90 trace point for the CLSDST.

Destination: CSNE

Modules: DFHZRAC

XMEOUT Parameters: *date, time,applid, termid, tranid, netname, {1=data lost. , 2=response lost. , 3=command lost. }, X'rc', sense, instance, {1=DFHZRAC, 2=DFHZRAC, 3=DFHZRAC}*

DFHZC4950 E *date time applid* **An error has occurred when attempting to attach the outbound Connection Quiesce Protocol transaction CQPO on session *termid*. Release of connection *sysid* is continuing. ((*instance*)**
Module name: {DFHZCLS})

Explanation: An error has been detected while attempting to attach the outbound transaction for the Connection Quiesce Protocol (CQPO) on an APPC session.

System action: The release of the connection continues, but the Connection Quiesce Protocol will take place only if the partner system successfully initiates it.

User response: Determine why transaction CQPO failed to attach. If you have installed the correct definition for the transaction, you should never see this message, and you may need to contact your IBM Support Center for assistance.

If the partner system did not initiate the Connection Quiesce Protocol, you may need to determine if there are units of work awaiting resync, or VTAM affinities to be ended before you can INITIAL start either of the connected systems.

Destination: CSNE

Modules: DFHZCLS

XMEOUT Parameters: *date, time,applid, termid, sysid, instance, {1=DFHZCLS}*

DFHZC4951 E *date time applid* **An error has been detected when processing an{ *unknown* | *inbound* | *outbound*} Connection Quiesce Protocol request. Transaction *tranid* is{ *continuing*. | *terminating*. | *terminating abnormally*.} **Error code: X'xxxxx'**
Connection: *yyyyy***

Explanation: An error has been detected during the execution of transaction *tranid*. The error code indicates the nature of the error:

X'01' Transaction *tranid* was not started by terminal input, nor by an internal CICS command.

X'02' Transaction *tranid* was started by an inbound FMH5, but the TPN was not the correct value for the Connection Quiesce Protocol.

X'03' Transaction *tranid* issued an unsuccessful communications request on an APPC session.

X'04' Transaction *tranid* has been attached by an inbound FMH5. The format of the data received from the remote system did not comply with the architecture for the Connection Quiesce Protocol.

X'05' Transaction *tranid* has received an unexpected response from the Recovery Manager.

X'06' Transaction *tranid* has been attached by an internal CICS command and has sent a Connection Quiesce Protocol request to the remote system. The format of the reply received from the remote system did not comply with the architecture for the Protocol.

X'07' Transaction *tranid* was started, but its principal facility is not a terminal or session.

System action: Depending upon the nature of the event that gave rise to the message, the transaction continues execution, terminates normally, or terminates abnormally. The message text indicates which action is being taken.

User response: This depends upon the error code:

X'01, 02, 07'
 Ensure that transaction *tranid* was started by CICS-supplied code, and not by application code. If it was started by CICS-supplied code, contact your IBM Support Center.

X'03' Determine why the communications request on the APPC session failed. Possible reasons are:

- There has been a session failure.
- The connected transaction has abended.

This error produces an exception trace, which helps to determine the cause of the problem.

In other cases, contact your IBM Support Center.

DFHHC5905 E *date time applid* **Deletion of terminal termid failed. CICS logic error**

Explanation: CICS cannot delete terminal *termid* because the command level interface is still active for this terminal.

System action: CICS continues. A system dump is taken with dumpcode ZC5905. Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Modules: DFHBSSTH

XMEOUT Parameters: *date, time,applid, termid*

DFHHC5906 E *date time applid* **Install failed because 'xxxx' is not a permitted value for a terminal or connection name**

Explanation: A name of hexadecimal zeros has been used for a TERMINAL or CONNECTION definition.

This is a reserved value. CICS has failed to install the terminal or connection.

xxxx is the reserved value converted to printable hexadecimal. The error has probably been made using autoinstall.

System action: CICS continues.

User response: Correct the definition to use a valid name and reinstall the group.

Destination: CSMT

Modules: DFHBSS, DFHBSTZ, DFHBSTZ1, DFHBSTZ2 DFHBSMPP

XMEOUT Parameters: *date, time,applid, xxxx*

DFHZC5907 E *date time applid* **Deletion of remote shipped terminal failed for connection cccc.**

Explanation: During the deletion of connection *cccc*, the connection was found to have shipped remote terminals. The deletion of one or more of these shipped remote terminals has failed.

System action: CICS continues.

User response: See message DFHZC5915 for further information.

Use CEMT to release the connection and put it OUT OF SERVICE, then retry the install of the connection.

Destination: CSMT

Modules: DFHBSSZ

XMEOUT Parameters: *date, time,applid, cccc*

DFHZC5908 E *date time applid* **Install for terminal termid failed. The security manager gave return code retcode**

Explanation: CICS cannot install terminal *termid*. DFHXSMN gave the return code *retcode*.

System action: CICS continues.

User response: Check the value of the return code *retcode* in the *CICS Customization Guide*.

Destination: CSMT

Modules: DFHBSTS

XMEOUT Parameters: *date, time,applid, termid, retcode*

DFHZC5909 E *date time applid* **Install of resource resource failed. Call to DFHIRP irp_function Return_code did not succeed, See DFHIRSDS for return code.**

Explanation: When installing resource *resource*, the CICS module DFHBSSZR made a call to an IR service *irp_function* which failed due to the specified return code,

System action: CICS continues. The MRO connection *resource* is not installed.

User response: For an explanation of the return code, see DFHIRSDS in the *CICS Data Areas* manual.

Also see the user response section of message DFHIR3780. This gives a list of reasons why starting IRC can fail. However, some of the reasons are now also applicable when adding an IRC connection when IRC is OPEN. For instance a return code of E8 is issued if you add an IRC connection when cross memory is requested on the new connection but is not being used on any existing connection and when the CICS DB2 attachment has been initialized.

Destination: CSMT

Modules: DFHBSSZR

XMEOUT Parameters: *date, time,applid, resource, irp_function,Return_code*

DFHZC5911 E *date time applid* **Install for resource resource failed. Connection cccc not found**

Explanation: CICS could not find the connection *cccc* associated with resource *resource*.

System action: CICS continues.

User response: Install connection *cccc*.

Destination: CSMT

Modules: DFHBSMIR

XMEOUT Parameters: *date, time,applid, resource, cccc*

DFHZC5912 E *date time applid* **Install for terminal termid failed. It is incompatible with connection cccc**

Explanation: The terminal *termid* and the connection *cccc* are mutually incompatible.

System action: CICS continues.

User response: Modify your definition of *termid* or *cccc*.

Destination: CSMT

Modules: DFHBSTZ, DFHBSTZ2

XMEOUT Parameters: *date, time,applid, termid, cccc*

DFHZC5913 E *date time applid* **Deletion of node id failed. {A table entry is locked. | A table entry was not found. | There was a logic error.} Table=tablename Key(key) Module(modname) Instance=inst.**

Explanation: CICS cannot delete node *id*. The message explains the reason for the failure.

1. One of its TMP table entries is locked by other tasks.
2. A TMP table entry could not be found, possibly because the node was already deleted by another task.
3. There was a CICS logic error. A DFHTM0002 error message may have been issued as well.

The TMP table entry is identified by *tabname*. The key used in the table has a value *key*. The module that issued the message is identified by *modname* and the instance of the message in that module by *inst*.

System action: The resource is not deleted. If the entry was locked, CICS issues one or more message DFHZC5980.

User response: Choose the action which corresponds to the reason identified in the message:

1. See message DFHZC5980 for further information and guidance.
2. If the node is deleted, no action is needed. If the node exists, determine whether it was replaced while this request was running. If the entry exists and has not been replaced, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.
3. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Modules: DFHBSS, DFHBSSZ, DFHBSTZ, DFHBSTZ1, DFHBSTZ2, DFHBSTZV, DFHBSTZS, DFHBSTZZ

XMEOUT Parameters: *date, time,applid, id, {1=A table entry is locked., 2=A table entry was not found., 3=There was a logic error.}, tabname, key, modname, inst*

DFHZC5914 E *date time applid* **Deletion of terminal *termid* found another deletion of it in progress**

Explanation: CICS has failed to delete terminal *termid* because it is already marked as pending deletion.

It is likely that a CEDA user is installing this terminal.

System action: CICS continues.

User response: Check if a CEDA user is installing the terminal.

Destination: CSMT

Modules: DFHBSMIR, DFHBSMPP, DFHBSS, DFHBSTZ

XMEOUT Parameters: *date, time,applid, termid*

DFHZC5915 E *date time applid* **Deletion of node *id* failed.** *{The node is still in service. | The system entry is still in service. | The node has a task attached.}* **Module(modname).**

Explanation: CICS cannot delete node *id* The reason is identified in the message.

1. The terminal or session is still in service.
2. The system entry of this session is still in service.
3. A task is still attached to this terminal or session.

The module issuing the message is identified as *modname*.

System action: CICS continues and does not delete the node.

User response: Before retrying the deletion or replacement, perform the action which corresponds to the reason given in the message.

1. Set the node OUT OF SERVICE
2. Set the system entry OUT OF SERVICE.
3. Wait for activity to cease for this node.

Destination: CSMT

Modules: DFHBSMIR, DFHBSTZ, DFHBSTZP

XMEOUT Parameters: *date, time,applid, id, {1=The node is still in service., 2=The system entry is still in service., 3=The node has a task attached.}, modname*

DFHZC5916 E *date time applid* **Deletion of terminal *termid* failed. It has pending DFHZCP activity**

Explanation: CICS cannot delete resource *termid* because DFHZCP activity is pending for this terminal. The resource could be a session belonging to a connection or a terminal TCTTE.

System action: CICS continues.

User response: Use exception trace point AP FCDE to determine what sort of activity is pending.

If this indicates that the VTAM CLSDST command is in progress, VTAM could be trying to contact a nonexistent or unavailable resource (indicated by NETNAME in the CEDA definition for the resource). In this case, wait for a few minutes and retry the reinstall or discard. If you have access to the JOBLOG, message DFHZC3462 for the resource in question indicates that the CLSDST has finished.

If the resource is a terminal, put the terminal briefly into service and then take it out of service again, using the CEMT transaction.

Destination: CSMT

Modules: DFHBSTZA

XMEOUT Parameters: *date, time,applid, termid*

DFHZC5917 E *date time applid* **Deletion of terminal *termid* failed. Error message writer still active**

Explanation: CICS cannot delete terminal *termid* because the error message writer is still active for this terminal.

System action: CICS continues.

User response: Put the terminal briefly into service and then take it out of service again, using the CEMT transaction.

Destination: CSMT

Modules: DFHBSSTZE

XMEOUT Parameters: *date, time,applid, termid*

DFHZC5918 E *date time applid* **Deletion of terminal *termid* Console *consname* failed. It has pending DFHZCP activity.**

Explanation: The MVS console *consname* has outstanding activity that prevents its deletion.

System action: CICS continues.

User response: After replying to any outstanding replies requested of this console, put the console briefly into service and then take it out of service again, using the CEMT transaction.

Destination: CSMT

Modules: DFHBSSTZO

XMEOUT Parameters: *date, time,applid, termid, consname*

DFHZC5919 E *date time applid* **Deletion of terminal *termid* failed. CICS logic error**

Explanation: CICS cannot delete terminal *termid* because of an error in disconnecting remote terminals.

System action: CICS continues. A system dump is taken with dumpcode ZC5919. Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Modules: DFHBSZS

XMEOUT Parameters: *date, time,applid, termid*

DFHZC5920 E *date time applid* **Install of terminal *termid* failed. CICS logic error**

Explanation: This CICS system failed to install terminal *termid*. No terminals can be accepted yet because the system does not have a local system entry. There was probably a failure during CICS initialization.

System action: CICS continues. A system dump is taken with dumpcode ZC5920. Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

| **Destination:** CSMT

| **Modules:** DFHBSSTZ

| **XMEOUT Parameters:** *date, time,applid, termid*

DFHZC5921 E *date time applid* **Install of terminal *termid* failed. VTAM support not loaded.**

Explanation: CICS failed to install terminal *termid* because CICS was initialized without VTAM support.

System action: CICS continues processing.

User response: To use VTAM, shut down CICS and restart with the system initialization parameter VTAM=YES, a TCT assembled with ACCESSMETHOD=VTAM, and appropriate RDO terminal definitions.

Destination: CSMT

Modules: DFHBSZZV

XMEOUT Parameters: *date, time,applid, termid*

DFHZC5923 E *date time applid* **Install for terminal *termid* failed. CICS logic error**

Explanation: CICS failed to install terminal *termid* because the bind-image was invalid.

System action: CICS continues. A system dump is taken with dumpcode ZC5923. Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Modules: DFHBSZZV

XMEOUT Parameters: *date, time,applid, termid*

DFHZC5924 E *date time applid* **Install for terminal *termid* failed. CICS logic error**

Explanation: CICS failed to install terminal *termid* because the TCTTE contained no node information block (NIB) descriptor.

System action: CICS continues. A system dump is taken with dumpcode ZC5924. Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Modules: DFHBSZZV

XMEOUT Parameters: *date, time,applid, termid*

DFHZC5925 E *date time applid* **Deletion of connection *cccc* failed. Its AID-Chains are not empty**

Explanation: CICS did not delete connection *cccc* because the AID-chains for the remote system *cccc* are not empty.

System action: CICS continues.

User response: Using the CEMT transaction, put the connection into service to allow the outstanding AIDs to be processed. Then take the connection out of service to allow deletion.

Destination: CSMT

Modules: DFHBSSA

XMEOUT Parameters: *date, time,applid, cccc*

DFHZC5926 E *date time applid* **Install for connection *cccc* failed. CICS logic error**

Explanation: CICS did not install the connection *cccc* because DFHZCP received no DATASTREAM operand.

System action: CICS continues. A system dump is taken with dumpcode ZC5926. Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Modules: DFHBSSZ6

XMEOUT Parameters: *date, time,applid, cccc*

DFHZC5927 E *date time applid* **Install for connection *cccc* failed. CICS logic error**

Explanation: CICS did not install the connection *cccc* because DFHZCP did not receive a RECORDFORMAT operand.

System action: CICS continues. A system dump is taken with dumpcode ZC5927. Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Modules: DFHBSSZ6

XMEOUT Parameters: *date, time,applid, cccc*

DFHZC5930 E *date time applid* **Remote connection (*sysid*) could not be deleted because it was in use by *number* sessions.**

Explanation: When remote connection *sysid* was being deleted, it was still in use by *number* of sessions.

System action: The resource is not deleted. CICS continues.

User response: Wait until access to this remote connection has quiesced and then retry the deletion.

Destination: CSMT

Modules: DFHBSZ2

XMEOUT Parameters: *date, time,applid, sysid, number*

DFHZC5931 E *date time applid* **Install for modename *modename* failed. Maximum number of APPC sessions would have been exceeded**

Explanation: CICS did not install a SESSIONS definition using MODENAME *modename* because it would have exceeded the maximum number of permitted sessions.

| The maximum number of sessions depends on whether
| the PTF shipped for APAR PQ27823 is installed. The
| basic limit is 46656 and the names are in the range
| -AAA to -999. The APAR doubles this limit to 93312
| giving an additional range of AAA- to 999-.

System action: CICS continues.

User response: Either wait for the system to become less busy, or delete some APPC sessions.

| The system programmer should consider increasing the
| number of CICS TORs.

Destination: CSMT

Modules: DFHBSM61

XMEOUT Parameters: *date, time,applid, modename*

DFHZC5932 E *date time applid* **Install for modename *modename* failed. Connection *cccc* not found**

Explanation: CICS did not install a SESSIONS definition using MODENAME *modename* because of an unknown name *cccc* in the CONNECTION parameter.

System action: CICS continues.

User response: Install connection *cccc*.

Destination: CSMT

Modules: DFHBSM62

XMEOUT Parameters: *date, time,applid, modename, cccc*

DFHHC5933 E *date time applid* **Install for modename modename failed. Connection cccc is not valid here**

Explanation: CICS did not install a SESSIONS definition using MODENAME *modename* because the CONNECTION is not valid in this context.

System action: CICS continues.

User response: Modify your definition of remote system *cccc*.

Destination: CSMT

Modules: DFHBSM62

XMEOUT Parameters: *date, time,applid, modename, cccc*

DFHHC5934 E *date time applid* **Install for modename modename failed. Single-session connection cccc is already in use.**

Explanation: CICS did not install a SESSIONS definition using MODENAME *modename* because the single-session CONNECTION *cccc* is already in use.

System action: CICS continues.

User response: Modify the definition of *cccc*.

Destination: CSMT

Modules: DFHBSM61, DFHBSM62

XMEOUT Parameters: *date, time,applid, modename, cccc*

DFHHC5936 E *date time applid* **Install for modename modename failed. Connection cccc has active modegroup xxxx**

Explanation: CICS has not installed a SESSIONS definition with MODENAME *modename* because the connection *cccc* already has an active MODEGROUP, *xxxx*.

System action: CICS continues.

User response: Put the connection briefly into service and then take it out of service again, using the CEMT transaction.

Destination: CSMT

Modules: DFHBSM62

XMEOUT Parameters: *date, time,applid, modename, cccc, xxxx*

DFHHC5937 I *date time applid* **Deletion of modename modename found another deletion of it in progress**

Explanation: CICS has not deleted a SESSIONS definition with MODENAME *modename* because the definition is already pending deletion.

System action: CICS continues.

User response: Check if a CEDA user was installing the SESSIONS definition.

Destination: CSMT

Modules: DFHBSM62

XMEOUT Parameters: *date, time,applid, modename*

DFHHC5938 E *date time applid* **Deletion of modename modename failed. Unable to delete session(s)**

Explanation: CICS is unable to delete a SESSIONS definition with MODENAME *modename* because of one or more errors reported in previous messages.

System action: CICS continues.

User response: Refer to any preceding messages for further information and guidance. Correct the reported errors.

Destination: CSMT

Modules: DFHBSM61

XMEOUT Parameters: *date, time,applid, modename*

DFHHC5939 E *date time applid* **Install for name failed. Duplicate session- or modegroup-name for connection sysid**

Explanation: CICS is unable to install a session or modegroup as the session-name or modegroup-name *name* is duplicated. The duplicate might be another connection, session, modegroup or terminal. However it might also be the local connection which has the name specified by SYSIDNT in the system initialization table.

System action: CICS continues processing, but the session or modegroup is not installed.

User response: Change the duplicated session-name or modegroup-name.

Destination: CSMT

Modules: DFHBSMIR, DFHBSM62

XMEOUT Parameters: *date, time,applid, name, sysid*

DFHHC5940 E *date time applid* **Install for terminal termid failed. Error console cannot be deleted**

Explanation: You have tried to replace the error console, CERR. CICS does not allow this.

System action: CICS continues with original error console.

User response: Note this restriction.

Destination: CSMT

Modules: DFHHCQDL

XMEOUT Parameters: *date, time,applid, termid*

DFHHC5941 E *date time applid* **Install for terminal termid failed. Console consname has a conversation outstanding**

Explanation: CICS was unable to install terminal *termid* because the console *consname* has posted an ECB.

System action: Processing continues.

User response: Put the terminal briefly into service and then take it out of service again, using the CEMT transaction.

Destination: CSMT

Modules: DFHBSSTZO

XMEOUT Parameters: *date, time,applid, termid, consname*

DFHHC5942 E *date time applid* **Node nodeid was not installed. The addition of key key to table tablename failed. RC=X'return'. Module(modname).**

Explanation: CICS cannot install the definition of node *nodeid* because an addition to a TMP table failed. CICS was trying to add the key *key* to the table *tablename*.

The return code from TMP is given in *return*. If the return code is 4, the entry was a duplicate. It is possible that another entry was added at the same time as this entry and used the same key. If this is not the case, CICS has suffered a logic error. The module that issued the message is indicated by *modname*.

System action: CICS does not install the definition.

User response: If the entry was not overlapped by another definition which conflicted with its key, or if the return code is not 4, you will need assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

| **Destination:** CSMT

| **Modules:** DFHBSS, DFHBSSTZ, DFHBSSTZS,
| DFHBSSTZZ, DFHBSSTZ1, DFHBSSTZ2

| **XMEOUT Parameters:** *date, time,applid, nodeid, key, tablename, X'return', modname*

DFHHC5943 E *date time applid* **MRO connection conname could not be deleted because IRC is open.**

Explanation: CICS cannot delete the connection *conname* because it is an MRO connection and interregion communication (IRC) is open.

System action: The connection is not deleted.

User response: Close the IRC definition and retry the Delete or Replace.

Destination: CSMT

Modules: DFHBSS

XMEOUT Parameters: *date, time,applid, conname*

DFHHC5944 E *date time applid* **Install for type(id) has failed. It would make a loop of connection definitions. Module(modname).**

Explanation: CICS cannot install definition of *type* called *id* because it would make a loop of connection definitions. The connection *type* may be an indirect connection or a remote connection. Indirect connections point to other connections with the INDSYS field, and remote connections point to other connections with the REMOTESYSTEM field. The module that issued the message is identified by *modname*.

System action: CICS does not install the definition.

User response: Determine the source of the loop either in the already installed definitions or in this definition, and change it before attempting to reinstall this definition.

Destination: CSMT

Modules: DFHBSSZI, DFHBSSTZ2

XMEOUT Parameters: *date, time,applid, type, id, modname*

DFHHC5945 E *date time applid* **Deletion of sessions ssss failed. Connection cccc is defined to IRC**

Explanation: CICS has not deleted the SESSIONS definition, *ssss*, because the CONNECTION is still defined to IRC.

System action: CICS continues.

User response: Issue a CEMT SET IRC CLOSED command.

Destination: CSMT

Modules: DFHBSSTZR

XMEOUT Parameters: *date, time,applid, ssss, cccc*

DFHHC5946 E *date time applid* **Install for sessions *ssss* failed. Connection *cccc* is defined to IRC**

Explanation: CICS has not installed the SESSIONS definition, *ssss*, because the CONNECTION is already defined to IRC.

System action: CICS continues.

User response: Issue a CEMT SET IRC CLOSED command.

Destination: CSMT

Modules: DFHBSTZR

XMEOUT Parameters: *date, time,applid, ssss, cccc*

DFHHC5947 E *date time applid* **Install for sessions *ssss* failed. CICS logic error**

Explanation: CICS has not installed the SESSIONS definition, *ssss*, because the CONNECTION name is not specified.

System action: CICS continues. A system dump is taken with dumpcode ZC5947. Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Modules: DFHBSMIR, DFHBSTZR

XMEOUT Parameters: *date, time,applid, ssss*

DFHHC5948 E *date time applid* **Install for sessions *ssss* failed. Connection *cccc* is not suitable for IRC**

Explanation: CICS has not installed the SESSIONS definition, *ssss*, because the CONNECTION specified is not suitable for IRC.

System action: CICS continues.

User response: Modify your definition of *cccc*.

Destination: CSMT

Modules: DFHBSTZR

XMEOUT Parameters: *date, time,applid, ssss, cccc*

DFHHC5949 E *date time applid* **Install for sessions *ssss* failed. It is incompatible with connection *cccc***

Explanation: CICS has not installed the SESSIONS definition, *ssss*, because the CONNECTION specified does not support the required type of session. If you are replacing a connection of the same name but of a different type and the install fails for some other reason then this message may occur.

System action: CICS continues.

User response: Modify your definition of *cccc*.

Destination: CSMT

Modules: DFHBSMIR, DFHBSTZS, DFHBSTZR

XMEOUT Parameters: *date, time,applid, ssss, cccc*

DFHHC5950 E *date time applid* **Install for terminal *termid* failed. Console *consname* already exists**

Explanation: CICS has not installed the CONSOLE definition *termid* because the console ID, *consname*, already exists.

System action: CICS continues without installing the terminal.

User response: Use the CEDA transaction to define a different console ID and reinstall the terminal.

| **Destination:** CSMT

| **Modules:** DFHBSTZO

| **XMEOUT Parameters:** *date, time,applid, termid, consname*

DFHHC5951 E *date time applid* **Deletion of connection *ssss* failed. Unable to delete sessions**

Explanation: CICS has not deleted the CONNECTION definition, *ssss*, because it cannot delete one or more sessions. A preceding message or messages should explain this failure.

System action: CICS continues.

User response: Refer to the preceding message for further information and guidance.

Destination: CSMT

Modules: DFHBSSZR, DFHBSSZ6

XMEOUT Parameters: *date, time,applid, ssss*

DFHHC5952 E *date time applid* **Deletion of terminal *termid* failed. It needs to be SET RELEASED**

Explanation: CICS cannot delete terminal *termid* because of its current state.

System action: CICS continues.

User response: Use the CEMT transaction to set terminal *termid* released and out of service.

Destination: CSMT

Modules: DFHBSTZV

XMEOUT Parameters: *date, time,applid, termid*

DFHZC5953 E *date time applid* **CICS logic error**

Explanation: An object being installed did not have a bind-image.

System action: CICS continues. A system dump is taken with dumpcode ZC5953. Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Modules: DFHBSM62

XMEOUT Parameters: *date, time,applid*

DFHZC5954 E *date time applid* **Install for resource
resource failed. Unable to install sessions
component**

Explanation: CICS has failed to install resource *resource*. Previous message(s) should give the reason for the failure.

System action: CICS continues.

User response: Refer to any preceding messages for further information and guidance.

Destination: CSMT

Modules: DFHBSTZC

XMEOUT Parameters: *date, time,applid, resource*

DFHZC5957 E *date time applid* **Arch. User-Data ID
X'xx occurs in bind. CICS logic error**

Explanation: The APPC SESSIONS object being installed is invalid because architected user-data IDs greater than X'02' occur in bind.

System action: CICS does not install the object. A system dump is taken with dumpcode ZC5957. Message DFHME0116 is normally produced containing the symptom string for this problem. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

User response:

Destination: CSMT

Modules: DFHBSM62

XMEOUT Parameters: *date, time,applid, xx*

DFHZC5958 E *date time applid* **Install failed for xxxx.
This is the name of the local system
which must not be replaced.**

Explanation: A terminal or a connection was defined with the same name as the local system entry during

the last run of CICS. This is not allowed as the local system entry cannot be replaced.

During cold or initial start of the current run of CICS, CICS attempted to install the group which included the invalid definition. CICS then issued this message.

System action: CICS continues, but this terminal or connection is not installed.

User response: Use the CEDA transaction to correct the terminal or connection name and install the group.

Destination: CSMT

Modules: DFHBSSZL

XMEOUT Parameters: *date, time,applid, xxxx*

DFHZC5961 E *date time applid* **Deletion of surrogate
xxxx failed. CICS logic error**

Explanation: CICS cannot delete a surrogate TCT entry.

System action: CICS continues. A system dump is taken with dumpcode ZC5961. Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Modules: DFHBSTZ1, DFHBSTZ2

XMEOUT Parameters: *date, time,applid, xxxx*

DFHZC5962 E *date time applid* **Install for resource
resource failed. Modename parameter not
found**

Explanation: CICS has failed to install resource *resource* because the MODENAME parameter is missing.

System action: CICS continues.

User response: Supply the missing parameter.

Destination: CSMT

Modules: DFHBSTZS

XMEOUT Parameters: *date, time,applid, resource*

DFHZC5963 E *date time applid operation* **RUSIZE xxxx
from terminal termid was greater than
TYPETERM RUSIZE yyyy.**

Explanation: An autoinstall has been attempted with terminal *termid* that has a VTAM RECEIVESIZE greater than the corresponding TYPETERM RECEIVESIZE | SENDSIZE.

System action: CICS continues. The autoinstall is rejected.

User response: Increase the TYPETERM RECEIVESIZE or the TYPETERM SENDSIZE, OR decrease the RECEIVESIZES in the VTAM LOGMODE table.

Destination: CSMT

Modules: DFHBSZZV

XMEOUT Parameters: *date, time,applid, operation, xxxx, termid, yyyy*

DFHZC5964 E *date time applid* **Install for sessions ssss failed. CICS logic error.**

Explanation: CICS has failed to install SESSIONS ssss because the length of the BINDPASSWORD exceeds the limit of 8.

System action: CICS continues. A system dump is taken with dumpcode ZC5964. Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Modules: DFHBSSZS

XMEOUT Parameters: *date, time,applid, ssss*

DFHZC5965 *date time applid* **Pool delete for pool poolid failed. Terminal termid was being replaced at the same time.**

Explanation: CICS failed in an attempt to install or delete POOL definition poolid. A terminal termid in the pool was being deleted at the same time as the pool was being installed or deleted. This probably due to changing the terminal from a pooled terminal to a non-pooled terminal, or changing the pool name for a terminal in the same group. CICS cannot continue to modify the pool until the change to the terminal has completed.

System action: CICS continues.

User response: Once the deletion or modification of the terminal has succeeded, retry the installation.

Destination: CADL

Modules: DFHBSMPP

XMEOUT Parameters: *date, time,applid, poolid, termid*

DFHZC5966 I *date time applid {INSTALL | DELETE | RESTORE}* **started for resource (termid) (Module name: modname).**

Explanation: CICS is starting to install, delete or restore resource. The resource may be either a terminal, a connection, a modegroup, a session, or a pool_entry. Other messages are issued after this one if this installation, deletion or restoration fails.

System action: CICS continues.

User response: None.

Destination: CADL

Modules: DFHBSTZ, DFHBSMPP, DFHBSM62, DFHBSS, DFHBSMIR

XMEOUT Parameters: *date, time,applid, {1=INSTALL, 2=DELETE,3=RESTORE}, resource, termid,modname*

DFHZC5967 E *date time applid* **Install for modename modename failed. Unable to install sessions**

Explanation: CICS has failed to install a SESSIONS definition using MODENAME modename. Previous message(s) should give the reason for the failure.

System action: CICS continues.

User response: Refer to the preceding message for further information and guidance.

Destination: CSMT

Modules: DFHBSM61

XMEOUT Parameters: *date, time,applid, modename*

DFHZC5968 E *date time applid* **Unable to install LU Services Manager for modename modename**

Explanation: CICS has failed to install a CONNECTION definition for MODEGROUP modename. Previous message(s) should give the reason for the failure.

System action: CICS continues.

User response: Refer to any preceding messages for further information and guidance.

Destination: CSMT

Modules: DFHBSSZP

XMEOUT Parameters: *date, time,applid, modename*

DFHZC5969 E *date time applid* **Deletion of dependent modename(s) failed for connection modename**

Explanation: CICS has failed to replace a CONNECTION definition for MODEGROUP modename. Previous message(s) should give the reason for the failure.

System action: CICS continues.

User response: Refer to any preceding messages for further information and guidance.

Destination: CSMT

Modules: DFHBSSZS

XMEOUT Parameters: *date, time,applid, modename*

DFHZC5971 E *date time applid* Delete of resource *resource* failed. CICS logic error

Explanation: CICS failed to delete resource *resource* because of an unexpected signon state during the destroy operation.

System action: CICS continues. A system dump is taken with dumpcode ZC5971. Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Modules: DFHBSTS

XMEOUT Parameters: *date, time,applid, resource*

DFHZC5972 E *date time applid* Delete of resource *resource* failed. It is still signed on

Explanation: CICS failed to delete a TERMINAL or SESSIONS resource *resource* because a terminal or session is still signed on.

System action: CICS continues.

User response: Run the signoff transaction CESF and retry.

Destination: CSMT

Modules: DFHBSTS

XMEOUT Parameters: *date, time,applid, resource*

DFHZC5973 E *date time applid* Install for sessions *ssss* failed. Max session-count reached for *modename modename*

Explanation: CICS failed to delete a SESSIONS definition *ssss* because the maximum session-count was reached for MODENAME *modename*.

System action: CICS continues.

User response: Delete some sessions in *modename*, or redefine *modename* with a higher maximum session-count.

Destination: CSMT

Modules: DFHBSTZS

XMEOUT Parameters: *date, time,applid, ssss, modename*

DFHZC5974 E *date time applid* Deletion of pool *pppp* failed. Unable to delete pool entries

Explanation: CICS failed to delete a POOL *pppp*. Previous message(s) should explain the cause of this failure.

1148 CICS TS for z/OS: CICS Messages and Codes

System action: CICS continues.

User response: Refer to any previous messages for further guidance and information.

Destination: CSMT

Modules: DFHBSMPP

XMEOUT Parameters: *date, time,applid, pppp*

DFHZC5975 E *date time applid* Install for resource *pppp* failed. CICS logic error

Explanation: CICS failed to install the POOL definition *pppp* because the required POOLID parameter was missing. This is a CICS logic error (probably in DFHTRZPP).

System action: CICS continues. A system dump is taken with dumpcode ZC5975. Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Modules: DFHBSMPP, DFHBSTZP

XMEOUT Parameters: *date, time,applid, pppp*

DFHZC5976 E *date time applid* CICS logic error

Explanation: CICS failed to install a POOL definition because the required POOLCNT parameter was missing. This is a CICS logic error (probably in DFHTRZPP).

System action: CICS continues. A system dump is taken with dumpcode ZC5976. Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Modules: DFHBSMPP

XMEOUT Parameters: *date, time,applid*

DFHZC5977 E *date time applid* Failure building pool entries

Explanation: CICS failed to install a POOL definition, because of a failure in building pool entries. Previous messages should explain the cause of this failure.

System action: CICS continues.

User response: Refer to any previous messages for further information and guidance.

Destination: CSMT

Modules: DFHBSMPP

XMEOUT Parameters: *date, time,applid*

DFHZC5978 E *date time applid* **Unable to replace pool**
pppp

Explanation: CICS failed in an attempt to install or delete a POOL definition. Previous messages should explain the cause of this failure.

System action: CICS continues.

User response: Refer to previous messages for further information and guidance.

| **Destination:** CSMT

| **Modules:** DFHBSMPP, DFHBSTZP

| **XMEOUT Parameters:** *date, time,applid, pppp*

DFHZC5979 E *date time applid* **Deletion of pool** *pppp*
failed. It still has session *termid*

Explanation: CICS has failed to delete pool *pppp* because the pool still has an active session for terminal *termid*.

System action: CICS continues.

User response: Put the terminal out of service (using the CEMT transaction) and retry.

Destination: CSMT

Modules: DFHBSTZP

XMEOUT Parameters: *date, time,applid, pppp, termid*

DFHZC5980 E *date time applid* **Resource** *resource* **is in**
use by task *taskid* **Transaction** *tranid*

Explanation: The resource *resource* is in use. *taskid* is the task number, and *tranid* is the transaction ID.

System action: CICS continues.

User response: Wait for the termination of task *taskid*, and retry the operation.

| **Destination:** CSMT

| **Modules:** DFHBSS, DFHBSSZ, DFHBSTZ, DFHBSTZ1,
| DFHBSTZ2, DFHBSTZS, DFHBSTZZ, DFHBST2V

| **XMEOUT Parameters:** *date, time,applid, resource, taskid,*
| *tranid*

DFHZC5981 E *date time applid* **Pool** *pppp* **not found**

Explanation: CICS has failed to install a resource because POOL *pppp* does not exist. Previous messages should explain the cause of this failure.

System action: CICS continues.

User response: Refer to the previous messages for further information and guidance.

Destination: CSMT

Modules: DFHBSTZP

XMEOUT Parameters: *date, time,applid, pppp*

DFHZC5982 E *date time applid* **Deletion of pool** *pppp*
failed. Pool entry is in use for *termid*

Explanation: CICS has failed to delete POOL *pppp* because the pool still has an entry in use for terminal *termid*.

System action: CICS continues.

User response: Put the terminal out of service (using the CEMT transaction) and retry.

Destination: CSMT

Modules: DFHBSMPP

XMEOUT Parameters: *date, time,applid, pppp, termid*

DFHZC5983 E *date time applid* **Unable to replace**
resource

Explanation: CICS failed to install resource *resource* either because it already exists, or for reasons explained in previous messages.

Possible causes are:

- Non-VTAM and VTAM terminals defined with the same name. If a non-VTAM terminal is installed, CICS will not autoinstall a VTAM terminal with the same name.
- An attempt to replace your own terminal, or a terminal with the same name as the terminal being used to issue the CEDA command.
- An attempt to replace a terminal with the same REMOTENAME and REMOTESYSTEM as an earlier definition in the same group.

System action: CICS continues.

User response: Refer to previous messages for further information and guidance.

If no previous messages were issued, check your terminal identifiers.

| **Destination:** CSMT

| **Modules:** DFHBSS, DFHBSTZ, DFHBSTZ1,
| DFHBSTZ2

| **XMEOUT Parameters:** *date, time,applid, resource*

DFHZC5984 E *date time applid* **The installation or**
deletion of *restype1 resname1* **has failed.**
Task *taskname taskid* **is updating related**
system definition *sysname*. **Module**
modname.

Explanation: The installation or deletion of the communications resource, *resname1* of resource type

restype1 has failed. This resource refers to a system entry, *sysname*, which is being updated by another task. The other task is identified by *taskname* and *taskid*. The resource type *restype1* can be terminal, remote terminal, connection, remote connection, or indirect connection. The message is issued by module *modname*.

System action: CICS continues but reverses the effects of the installation or deletion.

User response: Wait until the other task has completed then retry the action.

Destination: CSMT

Modules: DFHBSTZ, DFHBSTZ1, DFHBSTZ2, DFHBSSZI

XMEOUT Parameters: *date, time,applid, restype1, resname1, taskname, taskid, sysname, modname*

DFHZC5985 E *date time applid* **Install for resource *resource* failed. Unable to install connection component**

Explanation: CICS has failed to install resource *resource*. Previous message(s) should give the reason for the failure.

System action: CICS continues.

User response: Refer to previous messages for further information and guidance.

Destination: CSMT

Modules: DFHBSTZC

XMEOUT Parameters: *date, time,applid, resource*

DFHZC5986 E *date time applid* **CICS logic error**

Explanation: Either the warm keypoint program (DFHWKP), or the query transaction (DFHQRY), made an invalid request which could not be implemented.

System action: CICS continues. A system dump is taken with dumpcode ZC5986. Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Modules: DFHZCQCH

XMEOUT Parameters: *date, time,applid*

DFHZC5987 E *date time applid* **The install or delete of *restype1 resname1* has failed. Task *taskname taskid* is changing a definition which uses the *restype2 resname2*. Module *modname* .**

Explanation: The installation or deletion of

communications resource *resname1* of resource type *restype1* has failed. Table builder services cannot complete the change because another task is updating a definition which uses the resource *resname2* of resource type *restype2*. The other task is identified by *taskid* and *taskname*. *Restype2* can be a termid, netname, a unique network-qualified ID, or a pipeline terminal pool_name. *Restype1* can be a terminal, a session, a remote terminal, a connection, a remote connection, or a pipeline terminal. The message was issued by module *modname*.

System action: CICS continues but reverses this install or delete.

User response: Wait until the other task has completed and then retry the action.

Destination: CSMT

Modules: DFHBSS, DFHBSTZ, DFHBSTZS, DFHBSTZV, DFHBSTZZ, DFHBSTZ1, DFHBSTZ2, DFHBSMPP, DFHBSTZP

XMEOUT Parameters: *date, time,applid, restype1, resname1, taskname, taskid, restype2, resname2, modname*

DFHZC5988 E *date time applid* **Install for resource *resource* failed. VTAM support not generated**

Explanation: CICS failed to install resource *resource* because CICS was initialized without VTAM support.

System action: CICS continues.

User response: If you want to install VTAM resources urgently, shut down CICS, and restart it with the system initialization parameter ACCESSMETHOD=VTAM, and appropriate TCT or RDO terminal definitions.

Destination: CSMT

Modules: DFHBSSZS, DFHBSSZ6, DFHBSTZV

XMEOUT Parameters: *date, time,applid, resource*

DFHZC5989 E *date time applid* **Deletion of resource *resource* failed. Remote deletion in connection *cccc* failed**

Explanation: CICS failed to delete resource *resource* because a remote delete in system *cccc* failed.

Previous messages should explain the cause of this failure.

System action: CICS continues.

User response: Refer to the previous message for further information and guidance.

Destination: CSMT

Modules: DFHBSTZ1, DFHBSTZ2

XMEOUT Parameters: *date, time,applid, resource, cccc*

DFHHC5990 E *date time applid* **CICS logic error**

Explanation: CICS rejected an INSTALL or DELETE request because it does not recognize the request code.

System action: CICS continues. A system dump is taken with dumpcode ZC5990. Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Modules: DFHHCQ00

XMEOUT Parameters: *date, time,applid*

DFHHC5991 E *date time applid* **CICS logic error**

Explanation: CICS rejected a VALIDATE BIND request because no BIND was supplied.

System action: CICS continues. A system dump is taken with dumpcode ZC5991. Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Modules: DFHHCQ00

XMEOUT Parameters: *date, time,applid*

DFHHC5992 E *date time applid* **Resource Types Table does not support recovery record**

Explanation: CICS rejected RESTORE request because the resource types table (DFHHCQRT) in DFHHCQ is incompatible with the recovery record from the log or CICS catalog.

System action: CICS continues. A system dump is taken with dumpcode ZC5992. Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: CICS is unable to warm start correctly. You should therefore shut CICS down and perform a cold or initial start.

Destination: CSMT

Modules: DFHHCQRS

XMEOUT Parameters: *date, time,applid*

DFHHC5993 E *date time applid* **CICS logic error**

Explanation: CICS rejected a RESTORE request because the resource types table (DFHHCQRT) in DFHHCQ is incompatible with the recovery record from the log or CICS catalog.

System action: CICS continues. A system dump is taken with dumpcode ZC5993. Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Modules: DFHHCQRS

XMEOUT Parameters: *date, time,applid*

DFHHC5994 E *date time applid* **CICS logic error**

Explanation: CICS rejected a RESTORE request because no recovery record was passed.

System action: CICS continues. A system dump is taken with dumpcode ZC5994. Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Modules: DFHHCQRS

XMEOUT Parameters: *date, time,applid*

DFHHC5995 E *date time applid* **CICS logic error.**
Resource Type Code xxxx Subtype yyyy
not recognized with associated bind image

Explanation: CICS failed to install a resource with resource type code (RTC) xxxx and subtype yyyy (from the Builder Parameter Set) because a resource with type code xxxx, sub-type yyyy, and the associated BIND-image, is not a builder resource type. The RTC and subtype are defined in module DFHHCQRT.

This is a CICS logic error (probably in DFHTRZXP).

System action: CICS continues. A system dump is taken with dumpcode ZC5995. Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Modules: DFHHCQIS

XMEOUT Parameters: *date, time,applid, xxxx, yyyy*

DFHZC5996 E *date time applid* CICS logic error

Explanation: CICS has rejected an INSTALL request because the resource type code in the request is zero.

System action: CICS continues. A system dump is taken with dumpcode ZC5996. Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Modules: DFHZCQIS

XMEOUT Parameters: *date, time,applid*

DFHZC5997 E *date time applid* CICS logic error

Explanation: CICS has rejected an INQUIRE request because no TCT entry was passed.

System action: CICS continues. A system dump is taken with dumpcode ZC5997. Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Modules: DFHZCQIQ

XMEOUT Parameters: *date, time,applid*

DFHZC5998 E *date time applid* Install specified a resource that cannot be replaced

Explanation: CICS rejected a DELETE request because the entry passed is of a type that cannot be deleted, for example, a non-VTAM terminal.

System action: CICS continues.

User response: The failing delete/replace was necessitated by an INSTALL request. Correct the resource type in that request.

Destination: CSMT

Modules: DFHZCQCH, DFHZCQDL

XMEOUT Parameters: *date, time,applid*

DFHZC5999 E *date time applid* CICS logic error.

Explanation: If DFHZCQCH issues this message, CICS has rejected a CATALOG request because the required entry parameter was not passed.

If DFHZCQDL issues this message, CICS has rejected a

DELETE request because the required entry parameter was not passed.

System action: CICS continues. A system dump is taken with dumpcode ZC5999. Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Modules: DFHZCQCH, DFHZCQDL

XMEOUT Parameters: *date, time,applid*

DFHZC6201 E *applid* CICS table builder services has detected a severe error in module *modname* code X'*code*'.

Explanation: While executing a request, CICS table builder services detected a severe error. The error is identified by the error code *code* and the module *modname*.

System action: CICS rejects the request and takes a dump. CICS writes an exception trace record identified by *code*, then issues message DFHZC6208 either to the user of the CEDA transaction, or if the request did not originate from CEDA, to the CSMT transient data queue

User response: This failure indicates either an error in CICS, or a storage overlay. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHTBSB, DFHTBSD, DFHTBSBP, DFHTBSDP, DFHTBSL, DFHTBSLP, DFHTBSS

XMEOUT Parameters: *applid, modname,X'code'*

DFHZC6202 E *date time applid* Pattern *pattern* not valid for builder

Explanation: While executing a request, CICS table builder services has detected that the pattern *pattern* cites a builder that is not declared with DFHBSHDR(ENTRY). *pattern* is the name of the pattern as coded in the DFHBSPT macro.

System action: CICS rejects the request. A system dump is taken with dumpcode ZC6202. Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Modules: DFHTBSB, DFHTBSL, DFHTBSQ, DFHTBSR

XMEOUT Parameters: *date, time,applid, pattern*

DFHZC6204 E *date time applid* **Illegal subpattern definition** *pattern*

Explanation: While executing a request, CICS table builder services has detected that the subpattern *pattern* cites a builder that is not declared with DFHBSHDR(ENTRY). *pattern* is the name of the subpattern as coded in the DFHBSPTTE macro.

System action: CICS rejects the request. A system dump is taken with dumpcode ZC6204. Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Modules: DFHTBSBP, DFHTBSDP

XMEOUT Parameters: *date, time,applid, pattern*

DFHZC6205 E *date time applid* **Illegal subpattern definition** *pattern*

Explanation: While executing a request, CICS table builder services has detected that the subpattern *pattern* is invalidly defined. *pattern* is the name of the subpattern as coded in the DFHBSPTTE macro.

System action: CICS rejects the request. A system dump is taken with dumpcode ZC6205. Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Modules: DFHTBSBP, DFHTBSDP

XMEOUT Parameters: *date, time,applid, pattern*

DFHZC6206 E *date time applid* **Pattern *pattern* not valid for destroy**

Explanation: While executing a DESTROY request, CICS table builder services has detected that the pattern *pattern* is not valid for a DESTROY request. *pattern* is the name of the pattern as coded in the DFHBSPTTE macro.

System action: CICS rejects the request. A system dump is taken with dumpcode ZC6206. Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem*

Determination Guide for guidance on how to proceed.

Destination: CSMT

Modules: DFHTBSD

XMEOUT Parameters: *date, time,applid, pattern*

DFHZC6207 E *date time applid* **Catalog key too long or zero. Pattern** *pattern*

Explanation: While executing a request, CICS table builder services has detected that builder cited in the pattern *pattern* has returned an invalid CC key on MAKEKEY. *pattern* is the name of the pattern as coded in the DFHBSPTTE macro.

System action: CICS rejects the request. A system dump is taken with dumpcode ZC6207. Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Modules: DFHTBSBP, DFHTBSDP, DFHTBSL

XMEOUT Parameters: *date, time,applid, pattern*

DFHZC6208 E *date time applid* **CICS table builder services has detected a severe error in module** *modname, code(X'code')*.

Explanation: While executing a request, CICS table builder services detected a severe error. The error is identified by the error code *code* and the module *modname*.

System action: CICS rejects the request. It has already issued message DFHZC6201, written an exception trace record identified by *code*, and taken a dump.

User response: This failure indicates either an error in CICS, or a storage overlay. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Modules: DFHTBSB, DFHTBSD, DFHTBSBP, DFHTBSDP, DFHTBSL, DFHTBSLP, DFHTBSS

XMEOUT Parameters: *date, time,applid, modname, X'code'*

DFHZC6209 E *date time applid* **Invalid ZC catalog request code** *xxxx*

Explanation: While executing a request, CICS table builder services has detected that the code, *xxxx*, for a catalog request is invalid.

System action: CICS rejects the request. A system dump is taken with dumpcode ZC6209. Message

DFHME0116 is normally produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Modules: DFHTBSL

XMEOUT Parameters: *date, time,applid, xxx*

DFHZC6210 E *date time applid* **Table builder could not obtain storage for control block code X'code', module modname.**

Explanation: While executing a BUILD, a DESTROY or a RESTORE request, CICS table builder services could not obtain storage for a control block. The control block could be a RRAB, a RABN, an action_block, a recovery record, or a recovery segment. The error code *code* identifies the element that could not be obtained by the module *modname*.

System action: CICS rejects the request. It has already written an exception trace record identified by *code*.

User response: This failure may be a symptom of a expanded dynamic storage area (EDSA) that is too small. If so, you can solve the problem by increasing the size of your CICS region. For guidance on estimating the size of the DSA and the CICS region, see the *CICS System Definition Guide* and the *CICS Performance Guide*. You can identify which control block that could not be obtained by formatting the exception trace record.

The failure may also be caused by an error in another transaction, for example, a looping program with an EXEC CICS GETMAIN within the loop.

Destination: CSMT

Modules: DFHTBSB, DFHTBSD, DFHTBSL, DFHTBSBP, DFHTBDP, DFHTBSLP, DFHTBSS

XMEOUT Parameters: *date, time,applid, X'code', modname*

DFHZC6212 E *date time applid* **Level mismatch with catalog record. DFHBS xxx**

Explanation: While executing a request during a warm or emergency start, CICS Table Builder Services has detected that the CC record is not compatible with the pattern it names. *xxx* is the builder ID.

System action: CICS rejects the request.

User response: The CC record was probably written by an earlier level of CICS. That is, you have applied one or more PTF maintenance fixes to the system since the CC record was written. Assuming this is the case, you must either:

- Cold or initial start CICS, or

- Remove the maintenance to enable a warm start or emergency restart.

Destination: CSMT

Modules: DFHTBSR, DFHTBSRP

XMEOUT Parameters: *date, time,applid, xxx*

DFHZC6213 E *date time applid* **Recovery record abandoned. Key is key**

Explanation: While processing a RESTORE request, CICS Table Builder Services detected an error reported in a previous message. *key* is the catalog key for the abandoned record, or, if the key is unknown to CICS, *key* is the single character ?.

System action: See the previously issued message for the cause of the problem, and follow the recommended user action.

Destination: CSMT

Modules: DFHTBSR

XMEOUT Parameters: *date, time,applid, key*

DFHZC6214 E *date time applid* **Unable to obtain recovery record storage**

Explanation: While processing a CATALOG request, CICS Table Builder Services could not obtain recovery record storage.

System action: CICS rejects the request.

User response: This failure may be a symptom of a dynamic storage area (DSA) that is too small. If so, you can solve the problem by increasing the size of your CICS region. For advice on estimating the size of the DSA and the CICS region, see the *CICS System Definition Guide* and the *CICS Performance Guide*.

The failure may also be caused by an error in another transaction, for example, a looping program with an EXEC CICS GETMAIN within the loop.

Destination: CSMT

Modules: DFHTBSLP

XMEOUT Parameters: *date, time,applid*

DFHZC6216 E *date time applid* **Install for restype1 (resname1) failed and caused the backout of the whole set of RDO resources for restype2 (resname2).**

Explanation: The RDO definition for a resource of type *restype1* named *resname1* could not be installed because of an error. This causes the installable set of RDO definitions associated with *restype2* named *resname2* to be backed out.

The resource type of the definition that failed *restype1* can be connection, session, modegroup, pool, or pooled

terminal. The resource type of the associated definition *restype2* can be connection, or a pool_name for pipeline terminals.

System action: CICS backs out the installation of the set of associated RDO definitions and continues without them.

User response: Correct the reason for the failure of the definition, identified by previous DFHZXnnnn messages, and then retry the install.

Destination: CSMT

Modules: DFHTBSB

XMEOUT Parameters: *date, time,applid, restype1, resname1, restype2, resname2*

DFHZC6301 E *date time applid* **Install for tttt failed. Duplicate netname netname for resource rrrr found.**

Explanation: A resource *tttt* was being installed but was found to have the same network name *netname* as resource *rrrr*.

System action: The resource is not installed, CICS continues.

User response: If you want the definitions to be installed, use CEDA to correct the network name and reinstall the definition.

Destination: CSMT

Modules: DFHBSTZV

XMEOUT Parameters: *date, time,applid, tttt, netname, rrrr*

DFHZC6302 E *date time applid* **Install for connection cccc failed. Duplicate netname netname for resource rrrr found.**

Explanation: A connection *cccc* was being installed but was found to have the same network name *netname* as resource *rrrr*.

System action: The resource is not installed, CICS continues.

User response: You cannot have an APPC connection with the same network name as another APPC connection or an LU6.1 connection. That is, you cannot have more than one APPC connection between two systems and an APPC connection cannot be installed with an LU6.1 connection between two systems.

Neither APPC or LU6.1 network names can be the same as a terminal's network name.

Also you cannot have an IRC (or XM) connection with the same network name as another IRC (or XM) connection. However, an IRC network name can be the same as any VTAM network name (APPC or LU61 connection or terminal).

If you want the definitions to be installed, use CEDA to correct the network name and then reinstall the definition.

If you need to replace a connection with a different network name, it must have the same connection name as the one you are replacing.

Destination: CSMT

Modules: DFHBSS

XMEOUT Parameters: *date, time,applid, cccc, netname, rrrr*

DFHZC6303 E *date time applid* **Install for tttt failed. Duplicate netname netname found.**

Explanation: A resource *tttt* was being installed but was found to have a duplicate network name *netname*.

This message occurs:

- If the duplicate NETNAME occurred in the same group as this definition, or
- If two CEDA transactions were run at the same time and the other CEDA transaction added a NETNAME between the BUILD and CONNECT routines of DFHBSTZV.

System action: The resource is not installed; CICS continues.

User response: If you want the definitions to be installed, use CEDA to correct the network name and then reinstall the definition.

Destination: CSMT

Modules: DFHBSTZV

XMEOUT Parameters: *date, time,applid, tttt, netname*

DFHZC6304 W *date time applid* **Deletion of remote terminal termid failed because it is in use by another transaction.**

Explanation: CICS has issued a logoff transaction to the remote terminal *termid* but this terminal cannot be deleted because it is in use by another transaction.

System action: The remote terminal can be reused. CICS continues.

User response: This situation usually occurs because the remote CICS is under stress. Consider allocating more resources. For example, you might need to allocate more storage.

Destination: CSMT

Modules: DFHBSTZ

XMEOUT Parameters: *date, time,applid, termid*

DFHZC6305 E *date time applid* **Install for EXCI generic connection *cccc* failed. Duplicate EXCI generic connection *rrrr* found.**

Explanation: A connection *cccc* specifying protocol(exci) and conntype(generic) was being installed but an existing EXCI generic connection *rrrr* was found.

System action: The resource is not installed. CICS continues.

User response: There can be only one EXCI generic connection installed in a CICS system. Determine which EXCI generic connection definition is required and remove the duplicate definition.

If you need to replace the EXCI generic connection definition, it must have the same connection name as the one you are replacing.

Destination: CSMT

Modules: DFHBSS

XMEOUT Parameters: *date, time,applid, cccc, rrrr*

DFHZC6307 E *date time applid* **Install for connection *cccc* failed. Netname *netname* is the same as the generic resource name.**

Explanation: A connection *cccc* was being installed but the netname *netname* is the same as the generic resource name for this CICS (as defined in the SIT GRNAME parameter).

Communication within a SYSPLEX (intra-plex) must be done using member names.

System action: The resource is not installed, CICS continues.

User response: If this connection is for communication within a sysplex, use CEDA to change the NETNAME to the member name of the connection with which you wish to communicate.

If this is for communication between two sysplexes, change the NETNAME to the generic resource name of the partner sysplex.

Destination: CSMT

Modules: DFHBSS

XMEOUT Parameters: *date, time,applid, cccc, netname*

DFHZC6308 E *date time applid* **Restore for connection *cccc* failed. Netname *netname* is the same as the generic resource name.**

Explanation: During an emergency or warm restart CICS tried to restore connection *cccc*. However its netname *netname* is the same as the generic resource name for this CICS (as defined in the GRNAME system initialization parameter).

This is probably because the GRNAME specified in the SIT has been changed. It should only be changed at INITIAL start time.

System action: Processing continues. The resource is not installed.

User response: If this connection is for communication within a sysplex, use CEDA to change the NETNAME to the member name of the connection with which you wish to communicate.

If this is for communication between two sysplexes, change the NETNAME to the generic resource name of the partner sysplex.

If you need to change the GRNAME parameter, remember to do so only during an INITIAL start.

Destination: CSMT

Modules: DFHBSS

XMEOUT Parameters: *date, time,applid, cccc, netname*

DFHZC6315 E *date time applid* **User *userid* is not authorized to install terminal *tttt* with preset security.**

Explanation: User *userid* was attempting to install terminal *tttt* but the *userid* does not have sufficient authority. This is because the terminal has preset authority (the definition for terminal *tttt* specifies a *userid* value.) Installing a resource with preset security requires special authorization.

System action: Resource security violation messages are logged to the CSCS transient data queue and to the system console. The resource is not installed. CICS continues.

User response: In order to install this resource, do one of the following:

- Use the CESN transaction to sign on with a *userid* that is permitted to install terminals with preset security.
- Ask your security administrator to authorize *userid* *userid* to install terminals with preset security. See the *CICS System Definition Guide* for guidance.
- Remove the USERID specification from the resource definition and install the resource without preset security.

Destination: CSMT

Modules: DFHBSTS

XMEOUT Parameters: *date, time,applid, userid, tttt*

DFHZC6330 E *date time applid* **Install for *tttt* failed. LDCLIST parameter *ldclist* not found.**

Explanation: A resource *tttt* was being installed but was found to have an invalid LDCLIST *ldclist*.

System action: The resource is not installed, CICS continues.

User response: If you want the definition to be installed, use the DFHTCT TYPE=LDCLIST macro to define the listname.

Destination: CSMT

Modules: DFHBSBTL

XMEOUT Parameters: *date, time,applid, tttt, ldclist*

DFHZC6331 E *date time applid* **Install for connection tttt failed. Non-VTAM terminal with same name already exists.**

Explanation: A connection *tttt* was being installed but a non-VTAM terminal with the same name already exists.

System action: The resource is not installed; CICS continues.

User response: Change the name of the connection and reinstall.

Destination: CSMT

Modules: DFHBSS

XMEOUT Parameters: *date, time,applid, tttt*

DFHZC6332 E *date time applid* **Install for terminal tttt failed. Non-VTAM terminal with same name already exists.**

Explanation: A terminal *tttt* was being installed but a non-VTAM terminal with the same name already exists.

System action: The resource is not installed; CICS continues.

User response: Change the name of the terminal and reinstall.

Destination: CSMT

Modules: DFHBSBTL

XMEOUT Parameters: *date, time,applid, tttt*

DFHZC6333 E *date time applid* **INSTALL for modename modename failed. Zero sessions specified**

Explanation: CICS has not installed a mode group *modename* because the maximum number of sessions specified was 0. The CEDA SESSION MAXIMUM parameter cannot be set to 0, so this was possibly caused by a storage overwrite, or by an invalid builder parameter set being shipped into CICS.

System action: The install fails, but CICS continues.

User response: Find the offending builder parameter set and set ZC_MAXSESS_1 to a minimum value of 1.

Destination: CSMT

Modules: DFHBSM61

XMEOUT Parameters: *date, time,applid, modename*

DFHZC6334 E *date time applid* **Install for connection tttt failed. A session with the same name already exists.**

Explanation: A connection *tttt* was being installed but a session with the same name already exists.

System action: The resource is not installed; CICS continues.

User response: Change the name of the connection and reinstall.

Destination: CSMT

Modules: DFHBSS

XMEOUT Parameters: *date, time,applid, tttt*

DFHZC6340 E *date time applid* **CICS has detected an error in delete processing for termid. Module name: modname.**

Explanation: CICS has found terminal input output areas (TIOAs) chained to a TCTTE during deletion of a terminal. This is a CICS logic error.

System action: A system dump is taken, the TCTTE is deleted and CICS continues. Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

It would aid IBM support if you used the system dump to determine why TIOAs are still chained to the TCTTEs. The TIOAs are normally freed before deletion.

Answers to the following questions would also be helpful:

- Is this a shipped TCTTE?
- Why is the TCTTE being deleted?
- Is the correct TCTTE being deleted?

Destination: CADL

Modules: DFHBSBTL

XMEOUT Parameters: *date, time,applid, termid, modname*

DFHZC6341 E *date time applid* **Loop or ABEND has been detected in inmodule by module bymodule.**

Explanation: CICS has previously detected a loop or abend. Module *bymodule* called module *inmodule* which looped or abended.

System action: CICS issues message DFHZC0001 if an

abend is detected or DFHZC0004 if a loop is detected. The install or delete being performed is backed out. CICS continues. Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: See the associated message for more guidance.

Destination: CADL

Modules: DFHBSM61 DFHBSTZS, DFHBSTZR

XMEOUT Parameters: *date, time, applid, inmodule, bymodule*

DFHZC6350 I *date time applid* **The type session name BITMAP was corrupt and has been rebuilt. Error code: AP FB05.**

Explanation: A connection was being installed but the APPC or MRO session name BITMAP which is used to create a session name, was corrupt. The corrupt BITMAP has been rebuilt.

The APPC session name BITMAP is always used for an APPC session, however the MRO session name BITMAP is only used if the session name is prefixed with '<' or '>'.

System action: A dump is taken with dumpcode ZC6350. Trace point ID AP X'FB05' is produced. The install continues. CICS continues.

User response: Use the dump provided to determine the cause of the storage overwrite. See the *CICS Problem Determination Guide* for guidance on dealing with storage problems.

Destination: CSMT

Modules: DFHZGBM

XMEOUT Parameters: *date, time, applid, type*

DFHZC6360 W *date time applid* **A GETMAIN failed to obtain storage for a message set.**

Explanation: A ZCP install has failed. This would normally result in a message being issued. However, the GETMAIN attempting to obtain storage from the CDSA for use as a message area has failed. This means that there is no more free storage available in the CDSA.

System action: The message which should have reported the ZCP install failure cannot be issued. Subsequent messages also cannot be issued while there is no free storage available in the CDSA. However, subsequent messages can be issued if storage becomes available on subsequent GETMAIN attempts.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Use trace to determine the source of the problem. Trace point AP FCDD, the TBSM entry,

gives the message number which should have been issued and the message insert data. Refer to the description of this message for further guidance.

Destination: CSMT

Modules: DFHBSTS, DFHBSTZO, DFHZATA2

XMEOUT Parameters: *date, time, applid*

DFHZC6361 E *date time applid {Install | Signon} for {netname | console | terminal }portname* **with userid userid failed because the preset userid is invalid.**

Explanation: The resource could not be installed or signed on with preset userid *userid* because the userid is not known to the external security manager (ESM).

System action: CICS continues.

User response: Correct the userid, or contact your security administrator to have the unknown userid added to your ESM. Then either reinstall the resource definition, or attempt to send a command to CICS via this console.

Destination: CSMT

Modules: DFHBSTS, DFHBSTZO

XMEOUT Parameters: *date, time, applid, {1=Install, 2=Signon}, {1=netname, 2=console, 3=terminal }, portname, userid*

DFHZC6362 E *date time applid {Install | Signon} for {netname | console | terminal }portname* **with userid userid failed because the preset userid has been revoked.**

Explanation: The resource could not be installed or signed on with preset userid *userid* because the userid has been revoked by the external security manager (ESM).

System action: CICS continues.

User response: Contact your security administrator, who can reauthorize the revoked userid by issuing the ALTUSER RESUME function. Then reinstall the resource definition or try another command from the affected console.

Destination: CSMT

Modules: DFHBSTS, DFHBSTZO

XMEOUT Parameters: *date, time, applid, {1=Install, 2=Signon}, {1=netname, 2=console, 3=terminal }, portname, userid*

DFHZC6363 E *date time applid {Install | Signon} for {netname | console | terminal }portname* **with userid userid failed because the preset userid's group access has been revoked.**

| **Explanation:** The resource could not be installed or signed on with preset userid *userid* because the access of that userid to the group containing it has been revoked by the external security manager (ESM).

| **System action:** CICS continues.

| **User response:** Contact your security administrator who can restore the access of the preset userid to its group by issuing the CONNECT RESUME function. Then reinstall the resource definition or try another command from the console.

| **Destination:** CSMT

| **Modules:** DFHBSTS, DFHBSTZO

| **XMEOUT Parameters:** *date, time,applid, {1=Install, 2=Signon}, {1=netname , 2=console , 3=terminal }, portname, userid*

| **DFHZC6364 E** *date time applid {Install | Signon} for {netname | console |terminal }portname with userid userid failed because the external security manager returned an unrecognized response.*

| **Explanation:** The resource could not be installed or signed on with preset userid *userid* because of unexpected return codes from the external security manager (ESM).

| **System action:** CICS continues. Either message DFHSN1401 or DFHSN1801 is issued.

| **User response:** See the accompanying message for further guidance. Reinstall the resource definition or try another command from the console when you have corrected the problem.

| **Destination:** CSMT

| **Modules:** DFHBSTS, DFHBSTZO

| **XMEOUT Parameters:** *date, time,applid, {1=Install, 2=Signon}, {1=netname , 2=console , 3=terminal }, portname, userid*

| **DFHZC6365 E** *date time applid {Install | Signon} for {netname | console |terminal }portname with userid userid failed because the external security manager is inactive.*

| **Explanation:** The resource could not be installed or signed on with preset userid *userid* because the external security manager (ESM) is no longer active.

| **System action:** CICS continues.

| **User response:** Contact your security administrator to restart the ESM. Reinstall the resource definition or try the command from a console again when the ESM is active again.

| **Destination:** CSMT

| **Modules:** DFHBSTS, DFHBSTZO

| **XMEOUT Parameters:** *date, time,applid, {1=Install, 2=Signon}, {1=netname , 2=console , 3=terminal }, portname, userid*

| **DFHZC6366 E** *date time applid {Install | Signon} for {netname | console |terminal }portname with userid userid failed because the userid is not authorized to access this CICS system.*

| **Explanation:** The resource could not be installed or signed on with a preset userid because the preset userid is not authorized to use application *applid*.

| **System action:** CICS continues.

| **User response:** Contact your security administrator who can authorize the preset userid to access the application *applid* by issuing the PERMIT function for the APPL resource class. Then reinstall the resource definition or try the command again from the console.

| **Destination:** CSMT

| **Modules:** DFHBSTS, DFHBSTZO

| **XMEOUT Parameters:** *date, time,applid, {1=Install, 2=Signon}, {1=netname , 2=console , 3=terminal }, portname, userid*

| **DFHZC6367 E** *date time applid {Install | Signon} for {netname | console |terminal }termid with userid userid failed because the SECLABEL check failed.*

| **Explanation:** The resource could not be installed or signed on with preset userid *userid* because the security label associated with the userid in the external security manager (ESM) does not have the necessary authority.

| **System action:** CICS continues.

| **User response:** Contact your security administrator to assign a new security label to the preset userid. Then reinstall the resource definition or try the command from the console again.

| **Destination:** CSMT

| **Modules:** DFHBSTS, DFHBSTZO

| **XMEOUT Parameters:** *date, time,applid, {1=Install, 2=Signon}, {1=netname , 2=console , 3=terminal }, termid, userid*

| **DFHZC6368 E** *date time applid {Install | Signon} for {netname | console | terminal }portname with userid userid failed because the external security manager is quiesced.*

| **Explanation:** The resource could not be installed or signed on with preset userid *userid* because the external security manager (ESM) has been placed in a "tranquil" state and is not allowing new users to be added to the system.

| **System action:** CICS continues.
| **User response:** Contact your security administrator to
| establish when the ESM will be fully available again.
| When it is, reinstall the resource definition or try the
| command from the console again.

| **Destination:** CSMT

| **Modules:** DFHBSTS, DFHBSTZO

| **XMEOUT Parameters:** *date, time,applid, {1=Install,
| 2=Signon}, {1=netname , 2=console , 3= terminal },
| portname, userid*

| **DFHZC6369 E** *date time applid {Install | Signon} for
| {netname | console |terminal }portname
| failed because national language
| langcode is invalid.*

| **Explanation:** The resource could not be installed or
| signed on because the national language *langcode*
| specified in the resource definition is not recognized.

| **System action:** CICS continues.

| **User response:** Change the national language on the
| resource definition to a valid value and reinstall the
| resource definition.

| **Destination:** CSMT

| **Modules:** DFHBSTS, DFHBSTZO, DFHZSGN

| **XMEOUT Parameters:** *date, time,applid, {1=Install,
| 2=Signon}, {1=netname , 2=console , 3=terminal },
| portname, langcode*

| **DFHZC6370 E** *date time applid {Install | Signon} for
| {netname | console |terminal }portname
| failed because national language
| langcode is unavailable.*

| **Explanation:** The resource could not be installed or
| signed on because the national language *langcode*
| specified in the resource definition is not supported in
| this run of CICS.

| **System action:** CICS continues.

| **User response:** Change the national language in the
| resource definition to one that has been initialized.
| Then reinstall the resource definition.

| **Destination:** CSMT

| **Modules:** DFHBSTS, DFHBSTZO, DFHZSGN

| **XMEOUT Parameters:** *date, time,applid, {1=Install,
| 2=Signon}, {1=netname , 2=console , 3=terminal },
| portname, langcode*

| **DFHZC6371 E** *date time applid {Install | Signon} for
| {netname | console |terminal }portname
| with userid userid failed because the
| userid is not authorized to use this p
| ortname.*

| **Explanation:** The resource could not be installed or
| signed on with preset userid *userid* because the
| specified userid is not authorized to use that resource.

| **System action:** CICS continues. Either message
| DFHSN1401 or DFHSN1801 is issued.

| **User response:** See the accompanying message for
| further guidance. Reinstall the resource definition or
| retry the command from the console when you have
| corrected the problem.

| **Destination:** CSMT

| **Modules:** DFHBSTS, DFHBSTZO

| **XMEOUT Parameters:** *date, time,applid, {1=Install,

| portname, userid*

| **DFHZC6380 E** *date time applid Install for connection
| cccc failed. Netname netname is the same
| as the member name of a generic
| resource connection grcon which is
| already in use.*

| **Explanation:** A connection *cccc* was being installed but
| the netname *netname* is the same as the member name
| of a generic resource connection *grcon* which is already
| in use.

| **System action:** The resource is not installed. CICS
| continues.

| **User response:** If the NETNAME is incorrect, use
| CEDA to change it. Alternatively if you wish to
| communicate with the generic resource member by its
| member name, discard the generic resource connection
| after ending the VTAM affinity and try again.

| **Destination:** CSMT

| **Modules:** DFHBSS

| **XMEOUT Parameters:** *date, time,applid, cccc, netname,
| grcon*

| **DFHZC6590 I** *date time applid termid tranid Node
| netname conversation restarted. sense
| ((instance) Module name: {DFHZXRC})*

| **Explanation:** The node specified has been switched to
| this system following an XRF takeover.

| For the meaning of the sense data, see "DFHZCxxxx
| messages" on page 1040.

| **System action:** Processing continues.

| **User response:** None.

Destination: CSNE

Modules: DFHZXRC

XMEOUT Parameters: *date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZXRC, 2=DFHZXRC, 3=DFHZXRC, 4=DFHZXRC, 5=DFHZXRC}*

DFHZC6591 E *date time applid termid tranid* **Error processing XRF switch command. sense ((instance) Module name: {DFHZXRC})**

Explanation: The terminal has been switched to this CICS system following an XRF takeover, but an error was encountered processing the response data.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: The state of the session at takeover is uncertain and the session is unbound in order to reset the states. The session is simlogged on, and proceeds as a normal emergency restart.

User response: Proceed as for a normal emergency restart.

Destination: CSNE

Modules: DFHZXRC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZXRC, 2=DFHZXRC, 3=DFHZXRC, 4=DFHZXRC, 5=DFHZXRC, 6=DFHZXRC, 7=DFHZXRC, 8=DFHZXRC, 9=DFHZXRC, 10=DFHZXRC, 11=DFHZXRC}*

DFHZC6593 I *date time applid termid tranid* **Node netname backup session started. sense ((instance) Module name: {DFHZOPX})**

Explanation: Node *netname* has successfully issued an OPNDST OPTCD=BACKUP command to the connected LU.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: Processing continues.

User response: None.

Destination: CSNE

Modules: DFHZOPX

XMEOUT Parameters: *date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZOPX, 2=DFHZOPX}*

DFHZC6594 I *date time applid termid tranid* **Node netname backup session reset - active session ended. sense ((instance) Module name: {DFHZSCX})**

Explanation: The backup system has received a “hierarchical reset” UNBIND on the backup session to

the named terminal. This implies that the active session has ended normally.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: CLSDST the backup session.

User response: None.

Destination: CSNE

Modules: DFHZSCX

XMEOUT Parameters: *date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZSCX}*

DFHZC6595 I *date time applid termid tranid* **Node netname backup session not attempted. sense ((instance) Module name: {DFHZOPN})**

Explanation: Before the OPNDST is issued, the backup system has abandoned the attempt to establish a backup session for one of the following reasons:

- There is no XRF support in VTAM (TCTVXRFS), or
- the TCTTE is flagged as a secondary. This CICS receives the BIND, but does not send it (TCTE2RY), or
- the TCTTE indicates that the LOGMODE keyword was specified on the terminal definition.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: If this system takes over, the autoconnect process attempts to acquire a session. In this case, it probably takes longer for the session to become available for use.

User response: Do not attempt a backup session.

Rectify error, or downgrade the recovery option specified for this terminal.

Destination: CSNE

Modules: DFHZOPN

XMEOUT Parameters: *date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZOPN, 2=DFHZOPN, 3=DFHZOPN}*

DFHZC6596 *applid* **CICS terminal control program cannot support XRF functions. sense ((instance) Module name: {DFHZSEX | DFHZSLS})**

Explanation: The VTAM ACB has been opened, and the function level of the terminal control program (ZCP) and VTAM has been examined. It has been determined that XRF terminal functions cannot be supported in this execution of CICS.

This can be because one of the DFHZCx modules, or the TCT, was assembled against a version of VTAM

earlier than 3.1, or because the level of VTAM that has just been opened is pre-3.1.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: Processing continues. Processing continues, but no VTAM XRF functions can be supported.

User response: If VTAM XRF functions are required, check the assembly of each of the DFHZCx modules and the TCT.

If a pre-3.1 release of VTAM was used in the assembly process, then a warning MNOTE will have been issued.

The relevant modules should then be reassembled against the correct level of VTAM.

If the assembly of all modules is correct, then the VTAM used in this execution is at a pre-3.1 level.

Destination: Console

Modules: DFHZSEX,DFHZSLS

XMEOUT Parameters: *applid, sense,instance, {1=DFHZSEX, 2=DFHZSLS}*

DFHZC6598 *applid* **VTAM Shutdown in XRF**
Alternate system. CICS will abend. *sense*
((instance) Module name: {DFHZTPX})

Explanation: The TPEND exit has been driven because VTAM has been shutdown. This is an XRF Alternate system and it cannot continue without VTAM.

For the meaning of the sense data, see “DFHZCxxxx messages” on page 1040.

System action: The system is abnormally terminated.

User response: Determine why and how VTAM was shutdown.

Destination: Console

Modules: DFHZTPX

XMEOUT Parameters: *applid, sense,instance, {1=DFHZTPX}*

DFHZC6901 W *date time applid* **Autoinstall BIND for NETNAME *netname* is invalid. Internal RC(*X'response'*).**

Explanation: The bind passed for AUTOINSTALL of a resource has shown an error in the bind image check call. The fixed part of the BIND is printed (this is the part on which the validation code operates — see the *SNA Network Protocol Formats* for details of the BIND RU). The internal return code *X'code'* identifies the location within the module that invalidated the BIND.

System action: CICS continues but the session is not installed. The request is rejected and message DFHZC2411 is issued. The terminal is not usable until a

VTAM LOGOFF command is issued.

User response: Investigate the fixed part of the BIND data to determine the reason for the rejection. The internal return code gives more information that can be used by IBM to help you to determine the cause of the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

XMEOUT Parameters: *date, time,applid, netname, X'response'*

| **DFHZC6902 E** *date time applid* **Autoinstall failed because no {*terminal* | *console*} models are defined.**

| **Explanation:** An attempt was made to autoinstall either a VTAM device or a console; however, there are no appropriate autoinstall models defined.

| **System action:** CICS processing continues, but the autoinstall logon attempt is rejected.

| **User response:** Use CEDA to define autoinstall model(s). For further information, refer to the *CICS Resource Definition Guide*.

| **Destination:** CADL

| **Modules:** DFHZATA, DFHZATA2

| **XMEOUT Parameters:** *date, time,applid, {1=terminal, 2=console}*

| **DFHZC6903 W** *date time applid* **Autoinstall for resource *resid*, {*netname* | *consolename*} *id* using model *model* failed.**

| **Explanation:** The connection or terminal or console build process failed. The reason is given in a following DFHZC59xx, DFHZC62xx or DFHZC63xx message referring to the same *resid*. These messages are followed by message DFHZC6942.

| **System action:** Processing continues.

| **User response:** Refer to following messages for further information.

| **Destination:** CADL

| **Modules:** DFHZATA, DFHZATA2

| **XMEOUT Parameters:** *date, time,applid, resource, resid, {1=netname, 2=consolename}, id,model*

| **DFHZC6904 W** *date time applid* **Autoinstall for {*netname* | *consolename*} *id* failed. CATA task abended (*abend* *abend*).**

| **Explanation:** Transaction CATA was autoinstalling a terminal or console, *id*, when the task abended with *abend* *abend*. If the resource being autoinstalled was a

| terminal, then the issuing module was DFHZATA.
| Otherwise, the issuing module was DFHZATA2 if the
| resource was a console. The *id* can be either a netname
| or a consolename.

| **System action:** CICS continues but the resource is not
| installed.

| **User response:** Retry the logon attempt. If the abend
| indicates a TIMEOUT and this occurs frequently,
| increase the CATA DTIMOUT value. If you do not
| want the CATA transaction to time out, remove the
| DTIMOUT parameter from the CATA DEFINE
| TRANSACTION command. However, if you do this,
| and if the system is short on storage, a large number of
| CATA transactions running at the same time with no
| other transactions present could cause a deadlock.

| **Destination:** CADL

| **Modules:** DFHZATA, DFHZATA2

| **XMEOUT Parameters:** *date, time,applid, {1=netname,
| 2=consolename}, id, abend*

DFHZC6905 W *date time applid* **Autoinstall delete for
resource resid, {netname | consolename} id
failed. CATD task abended (abend
abend).**

Explanation: Transaction CATD, program DFHZATD
was deleting an autoinstalled *resource resid*, when the
task abended with abend *abend*.

System action: CICS continues. If the resource still
exists, it is reused next time the same TERMID or
SYSID is used.

User response: See the description of abend *abend* for
further guidance.

If the abend indicates a TIMEOUT and this occurs
frequently, increase the CATD DTIMOUT value. If you
do not want the CATD transaction to time out, remove
the DTIMOUT parameter from the CATD DEFINE
TRANSACTION command. However, a large number
of CATD tasks running at the same time with no
purgeable tasks present could cause a deadlock if the
system is also short on storage.

Destination: CADL

Modules: DFHZATD

XMEOUT Parameters: *date, time,applid, resource, resid,
{1=netname, 2=consolename}, id,abend*

DFHZC6906 *date time applid* **Install or delete of
remote terminal termid failed. tranid task
abended (abend abend).**

Explanation: One of the functions of DFHZATS
(transaction CITS, CDTS, CMTS or CFTS) has abended
with abend *abend*.

System action: CICS continues.

For CITS (remote install), if the remote terminal
(skeleton) was actually built, CICS might use it.

For CDTS (remote delete), If the remote terminal
(skeleton) has not been deleted, it might be reused.

For CMTS (remote mass delete), terminals which have
not been deleted by CMTS might be deleted at a later
stage.

For CFTS (remote mass flag), terminals which have
been flagged for deletion might be deleted at a later
stage. If any terminals have not been flagged, attempts
might be made to reuse them. This can have
unpredictable results.

User response: See the description of abend *abend* for
further guidance.

The most likely reason for this message is a timeout of
CITS or CDTS. In the case of CITS, reissue your
transaction if necessary.

If the TIMEOUTs occur frequently, consider increasing
the CITS or CDTS DTIMOUT values. If you do not
want the transactions to time out, remove the
DTIMOUT parameter from the CITS or CDTS DEFINE
TRANSACTION command. However, a large number
of CITS tasks running at the same time with no
purgeable tasks present could cause a deadlock if the
system is also short on storage.

Note that CFTS and CMTS do not have a DTIMOUT
parameter and should not be given one because they
only run once after a warm or emergency restart and
should not be allowed to time out.

Destination: CADL

Modules: DFHZATS

XMEOUT Parameters: *date, time,applid, termid, tranid,
abend*

| **DFHZC6907 I** *date time applid* **Autoinstall starting for
netname netname. Network qualified
name is netid.realnet.**

| **Explanation:** CICS has started to autoinstall a terminal
| or a connection. This message shows the *netname* by
| which CICS will know the device and network
| qualified name *netid.realnet* showing the origin of the
| resource.

| **System action:** CICS continues.

| **User response:** None. This message is for information
| only.

| **Destination:** CADL

| **Modules:** DFHZATA

| **XMEOUT Parameters:** *date, time,applid, netname, netid,
| realnet*

DFHHC6908 I *date time applid* **Autoinstall in progress for netname *netname*. TN3270 IP address is *tnaddr*.**

Explanation: CICS is autoinstalling a terminal. This message shows the *netname* by which CICS will know the device and the TN3270 IP address, port number and host name (if present).

System action: CICS continues.

User response: None. This message is for information only.

Destination: CADL

Modules: DFHZATA

XMEOUT Parameters: *date, time, applid, netname, tnaddr*

DFHHC6910 W *date time applid* **Install for remote terminal *termid* failed.**

Explanation: An INSTALL for the remote terminal *termid* has failed. The reason for the failure is specified in associated DFHHC59xx and DFHHC62xx messages.

System action: DFHZATS terminates abnormally with a CICS transaction dump.

User response: See the associated messages for further guidance.

Destination: CADL

Modules: DFHZATS

XMEOUT Parameters: *date, time, applid, termid*

DFHHC6911 W *date time applid* **Delete for remote terminal *termid* failed.**

Explanation: A DELETE for remote terminal *termid* has failed. Possible causes are that the terminal has already been deleted or that it is in use by another task.

If this message is repeated a number of times, there could be a more serious problem.

System action: If the message is associated with message DFHHC6912, CICS continues normally. If message DFHHC6912 is not issued, DFHZATS is abnormally terminated with a transaction dump.

User response: If the message is associated with message DFHHC6912, no action is necessary. If DFHHC6912 is not issued, see the associated DFHHC59xx, DFHHC62xx and DFHHC63xx messages for the reason for the DELETE failure.

Destination: CADL

Modules: DFHZATS

XMEOUT Parameters: *date, time, applid, termid*

DFHHC6912 I *date time applid* **Unable to delete remote terminal.**

Explanation: This message is issued during a mass delete of remote terminals following a warm or emergency restart. A terminal which had been flagged for deletion could not be deleted. The most likely explanation is that the terminal has already been deleted by another task.

An associated DFHHC6911 message gives the identity of the terminal. This might be associated with one or more DFHHC59xx and DFHHC62xx messages giving the reason for the failure.

System action: Processing continues normally.

User response: See the associated messages for further information.

Destination: CADL

Modules: DFHZATS

XMEOUT Parameters: *date, time, applid*

DFHHC6913 I *date time applid* **Remote delete of terminal *termid* failed. Terminal not found.**

Explanation: A remote DELETE has been attempted for a terminal which has already been deleted by another task.

System action: Processing continues normally.

User response: None.

Destination: CADL

Modules: DFHZATS

XMEOUT Parameters: *date, time, applid, termid*

DFHHC6914 E *date time applid* **Autoinstall for resource *termid*, {*netname* | *consolename*} *id* failed. Bad Return Code (RC = X'*retcode*') from an internal function call.**

Explanation: The TCTTE build process failed due to the failure of an internal function call.

System action: The terminal autoinstall process fails. CICS processing continues.

User response: Retry the logon attempt.

Destination: CADL

Modules: DFHZATA, DFHZATA2

XMEOUT Parameters: *date, time, applid, termid, {1=*netname*, 2=*consolename*}, *id*, X'*retcode*'*

DFHZC6915 E *date time applid* **Unable to sign off remote terminal *termid*. Bad Return Code (RC = X'SNUS_RESPONSE') from signon domain call.**

Explanation: An unexpected response (INVALID, DISASTER or EXCEPTION) has been received on a call by DFHZATS to function SIGNOFF_TERMINAL_USER during sign-off processing for a remote terminal session running under CRTE.

System action: The terminal sign-off process fails to complete and the terminal user remains signed on. CICS processing continues.

User response: See the related message produced by the domain that detected the original error.

Destination: CADL

Modules: DFHZATS

XMEOUT Parameters: *date, time,applid, termid, X'SNUS_RESPONSE'*

DFHZC6920 E *date time applid* **APPC autoinstall for NETNAME *netname* failed. RC *x***

Explanation: An autoinstall attempt to install APPC NETNAME *netname* has failed. The autoinstall program call to the autoinstall control program failed with return code *x*.

The return codes are mapped from the program manager LINK_URM response and reason. More precise reasons for failure can be obtained from trace point PG 0A02.

System action: CICS continues.

User response: The appropriate response depends on the return code as follows:

- 1 The user exit program should be linked with AMODE(31). Ensure that the user exit is linked to the correct AMODE.
- 2 The user exit program has no PPT entry. Ensure that the PPT entry for the user exit program exists and is valid.
- 3 The user exit program could not be loaded. Ensure that the user exit program is contained in one of the data sets concatenated in the DFHRPL DD statement and has the correct name.
- 4 The user exit program has abended. This is a possible error within the user exit program. Check for any abend codes that may have been issued.
- 5 Loading of the user exit program failed for some other reason. Check the DFHPGLU exit trace entry (PG 0A02) to see why the program manager was unable to load the program.

Destination: CADL

Modules: DFHZGAI

XMEOUT Parameters: *date, time,applid, netname, x*

DFHZC6921 W *date time applid* **Autoinstall for NETNAME *netname* has been disallowed by the autoinstall control program. Code X'*code*'**

Explanation: An APPC connection not known to CICS has attempted to connect to CICS. However, the autoinstall control program has given a nonzero return code indicating that the install cannot go ahead.

If you do not support APPC autoinstall, the autoinstall control program (DFHZATDX is the default name) automatically returns a nonzero return code to disallow this function.

System action: The exception trace entry *code* shows the parameter list for the autoinstall control program. The session is terminated. CICS continues.

User response: The failure code X'*code*' is as follows:

X'FA07'

If APPC autoinstall is not supported, use the *netname* to determine which device is attempting autoinstall.

If APPC autoinstall is supported, examine the autoinstall control program to determine why it has not set the return code to allow the install.

Destination: CADL

Modules: DFHZGAI

XMEOUT Parameters: *date, time,applid, netname, X'*code*'*

DFHZC6922 E *date time applid* **Parameter list error during autoinstall for NETNAME *netname*. Code X'*code*'**

Explanation: An APPC connection not known to CICS has attempted to connect to CICS. However, the autoinstall control program has returned an invalid parameter, or a parameter that has led to an invalid template being used.

System action: The exception trace entry *code* shows the parameter list for the autoinstall control program. The session is terminated. CICS continues.

User response: The failure code X'*code*' is one of the following:

X'FA08'

No netname or sysid was supplied for the template. Change the autoinstall control program to supply either the netname or the sysid.

X'FA09'
The sysid for the new connection has invalid characters. It can only contain A-Z a-z 0-9 and £#@ (where £ is X'5B') Redefine the connection name in the autoinstall control program.

X'FA0A'
The sysid for the new connection already exists. Change the autoinstall control program to supply a unique name.

X'FA0B'
CICS is unable to locate the supplied template netname. Change the autoinstall control program to supply the correct template name, or use CEDA to install the template connection.

X'FA0C'
CICS is unable to locate the supplied template sysid. Change the autoinstall control program to supply the correct template sysid or use CEDA to install the template connection.

X'FA0D'
The template is not an APPC connection. Change the autoinstall control program to supply the correct template name, or use CEDA to reinstall the template correctly.

X'FA0E'
The bind indicates that a parallel session connection is required. The template is a single session connection. Change the autoinstall control program to supply the correct template name, or use CEDA to reinstall the template correctly.

X'FA0F'
The bind indicates that a single session connection is required. The template is a parallel session connection. Change the autoinstall control program to supply the correct template name or use CEDA to reinstall the template correctly.

X'FA10'
The modename in the bind does not match the modename in the connection.

For parallel sessions, the SNASVCMG modegroup is missing. The install for the template may have failed - check for any CADL messages mentioning the template name. The template connection may have been corrupted. Try and re-install the template.

For single sessions, the user modegroup name does not match. Change the autoinstall control program to supply the correct template name or use CEDA to reinstall the template correctly.

X'FA11'
The program that attempted to INQUIRE on the template has detected an error in the template and is unable to create a BPS with

which to install the new connection. This problem may be caused by a failure in the initial install of the template. Check the console and CADL log to determine whether the template installed correctly. Also, use CEMT to ensure that the CONNECTION is correct.

X'FA12'
The program that attempted to INQUIRE on a user modegroup for the named template has detected an error in the template and is unable to create a BPS with which to install a user modegroup. This problem may be caused by a failure in the initial install of the template. Check the console and CADL log to determine whether the template installed correctly. Also use CEMT to ensure that the MODEGROUP is correct.

X'FA13'
The template connection has no user modegroup. This problem may be caused by a failure in the initial install of the template. Check the console and the CADL log to determine whether the template installed correctly. Also, use CEMT to ensure that the MODEGROUP is correct.

X'FA14'
The template connection is out of service so this install cannot continue. If the install should have been allowed to continue, put the relevant template connection INSERVICE using CEMT.

X'FA15'
The incoming bind user data does not have a PLUNAME Network Name subfield (id 04). This is required and should have been supplied by the PLU.

X'FA16'
The incoming bind user data does not have a MODENAME Network Name subfield (id 02). This is required and should have been supplied by the PLU.

Modules: DFHZGAI

XMEOUT Parameters: *date, time, applid, netname, X'code'*

DFHZC6923 E *date time applid* **Unacceptable bind parameter during autoinstall for NETNAME netname. Code X'code'**

Explanation: CICS has received a BIND from an unknown APPC node. The autoinstall process was initiated, but an invalid bind parameter has been detected. The parameter in error is indicated by the failure code X'code' which is one of the following:

X'FA18'	There was no session instance ID field in the bind user data.	point ID 'AP xxxx' (where xxxx is X'code') shows the bind that was received. The session is terminated. CICS continues.
X'FA19'	There was no primary logical unit (PLU) name in the bind user data.	User response: Change the definitions on the connecting LU so that the bind parameters are acceptable to CICS.
X'FA1A'	The PLU name in the bind user data is the same as the LU name of this CICS.	Destination: CADL
X'FA1B'	Security information (an encryption seed) was expected, but not present, in the bind user data.	Modules: DFHZGAI
X'FA1C'	Security information (an encryption seed) was found in the bind user data but its length was too high for it to be valid.	XMEOUT Parameters: <i>date, time,applid, netname, X'code'</i>
X'FA1D'	Security information (an encryption seed) was found in the bind user data when none was expected.	<hr/> DFHZC6935 I <i>date time applid</i> Autoinstall for <i>restype resid</i> with <i>{netname consolename}</i> <i>id</i> using model or template <i>model</i> successful. Explanation: CICS has successfully installed resource <i>restype resid</i> , with id <i>id</i> , using model or template <i>model</i> . The <i>restype</i> can be TERMINAL or CONNECTION or CONSOLE depending on whether a terminal, an APPC connection, or a console has just been autoinstalled. System action: CICS continues. User response: None. Destination: CADL Modules: DFHZATA, DFHZATA2 XMEOUT Parameters: <i>date, time,applid, restype, resid,</i> <i>{1=netname, 2=consolename}, id,model</i>
X'FA1E'	The received bind indicated that it was not negotiable. This is not acceptable for an APPC connection.	
X'FA1F'	The received bind specified a primary RU size of zero.	
X'FA20'	The received bind specified a secondary RU size of zero.	<hr/> DFHZC6936 I <i>date time applid</i> Autoinstall for NETNAME <i>netname</i> , model <i>modelname</i> in MTS control vector not known to CICS.
X'FA21'	The received bind contained inconsistent access security indicators.	Explanation: The VTAM MTS control vector contained a model name <i>modelname</i> not defined to CICS.
X'FA22'	Two security information fields (seed and nonce field) were found in the received BIND where only one was expected.	System action: CICS continues. This message is informational.
X'FA23'	The received BIND contained a nonce field with an incorrect length.	User response: There are four possible ways of correcting this problem:
X'FA24'	The received BIND did not contain a nonce field.	<ul style="list-style-type: none"> • Use the CEDA transaction to define and install the autoinstall model • Change the VTAM MTS MDLTAB MODEL= entry to the name of an existing autoinstall model. • Logon to CICS with a MODEL= parameter that defines an existing autoinstall model. • Code an Autoinstall User Program. Examples are given in the Customization Guide in the Sample Programs and Copybooks section.
X'FA25'	The received BINDs security mechanisms field length was smaller than the minimum defined by the Architecture.	Destination: CADL
X'FA26'	The received BINDs security mechanisms field contained an invalid length for the mechanism identifier field.	Modules: DFHZATA
System action:	The exception trace entry with trace	XMEOUT Parameters: <i>date, time,applid, netname, modelname</i>

DFHZC6937 I *date time applid* **Autoinstall for NETNAME *netname*, MTS model *modelname* and bind image mismatch.**

Explanation: An autoinstall attempt occurred using the *modelname* printed. The MODEL BIND (from the CICS model definition) did not match with the incoming bind in CINIT. The MISMATCH_BITS show which bind bits did not match.

System action: CICS continues.

User response: There are four possible ways of correcting this problem:

- Change the CICS autoinstall MODEL *modelname* to produce a bind that matches the incoming CINIT.
- Change the MTS MDLTAB MODEL= entry to a model name defined to CICS whose bind matches the CINIT defined in the LOGMODE for this terminal.
- Change the VTAM LOGMODE for this terminal to match the chosen CICS MODEL_BIND.
- Code an autoinstall user program. Examples are given in the Sample Programs and Copybooks section of the *CICS Customization Guide*.

Destination: CADL

Modules: DFHZATA

XMEOUT Parameters: *date, time,applid, netname, modelname*

DFHZC6939 W *date time applid* **Autoinstall for NETNAME *netname*, Invalid length *nn* found in cinit control vector at offset *offset***

Explanation: CICS verification checks on the format of the control vectors in the CINIT have failed.

offset indicates the first point of failure. This is either a length field greater than 128, or a length field which would cause CICS to overrun the end of a CINIT vector or subvector.

This is either due to incorrect format of the CINIT RU (and therefore probably a VTAM logic error), or due to incorrect parsing of the CINIT RU by DFHZATD, which is a CICS logic error.

System action: CICS continues. The logon request is rejected.

User response: Inspect the format of the CINIT RU as captured by the autoinstall program for all rejected logon requests. The first point of failure may be at *offset* or before it since CICS verification checks are permissive.

If the format is incorrect, the origin of the invalid CINIT should be tracked and the problem resolved there.

If the format is correct, this is a CICS logic error. In this

case you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

XMEOUT Parameters: *date, time,applid, termid, x*

DFHZC6958 W *date time applid* **Autoinstall for {*netname* | *consolename*} *id*, resource *X'termid'* failed. {RESOURCE | PRINTER | ALTPRINTER} ID is invalid. RC=*n*.**

Explanation: The *RESOURCE*, *PRINTER*, or *ALTPRINTER* ID supplied by the AUTOINSTALL exit program is invalid. The return code *n* can be one of the following:

n Meaning

- 1 Invalid blank in column one
- 2 Invalid imbedded blank
- 3 Invalid character used.

System action: CICS continues but does not install the object.

User response: Change the AUTOINSTALL exit program to create IDs that contain only valid characters. These are specified in the *CICS Resource Definition Guide*.

Destination: CADL

Modules: DFHZATA, DFHZATA2

XMEOUT Parameters: *date, time,applid, {1=*netname*, 2=*consolename*}, id, X'termid', {1=RESOURCE, 2=PRINTER, 3=ALTPRINTER}, n*

DFHZC6966 I *date time applid* **Autoinstall delete for *restype resid* with {*netname* | *consolename*} *id* was successful.**

Explanation: CICS has successfully deleted the autoinstalled resource *restype resid*. The *restype* can be a

terminal, an APPC connection, or a console.

System action: CICS continues.

User response: None.

Destination: CADL

Modules: DFHZATD

XMEOUT Parameters: *date, time,applid, restype, resid, {1=netname, 2=consolename}, id*

DFHZC6987 W *date time applid* **Autoinstall best failure for NETNAME *netname* was model *model*.**

Explanation: An autoinstall attempt has failed for lack of an exact match.

netname is the netname of the LU which failed to logon, *model* is the name of the model that gave the best failure (that is, the one that had the fewest bits different from the BIND image supplied by VTAM).

The following associated information is also written to CADL:

xxxxxxx... is a string of hexadecimal digits, where *xx* represents one byte, and each byte position represents the corresponding byte position in the BIND image.

CINIT BIND: *xxxxxxx* is the bind image supplied by VTAM.

MODEL BIND: *xxxxxxx* is the best model.

MISMATCH BITS: *xxxxxxx* represents a comparison of the relevant bits from above. A bit set to '1' indicates a mismatch in that position between the BIND image from VTAM and the BIND image associated with the model.

DFHZExxxx messages

DFHZE2600 **Syst.sense** *sysysense,termid,taskid,*
Unidentified sense information

Explanation: The error message writer (DFHEMW) was scheduled to send an error message, but could not identify the system sense code.

System action: The task is abnormally terminated.

User response: Refer to the associated messages that were issued previously for further information and guidance.

Destination: Terminal End User

Modules: DFHZEMW

DFHZNxxxx messages

System action: CICS continues.

User response:

1. Determine whether the model *model* is suitable. If there are several models which have options, such as TRANSECKEYS, then only the first such model is named in the above message. It will be up to the user-program to make the choice, when the logmode table entry is corrected.
2. Identify the entry in the VTAM logmode table that is being used.
3. Check that this logmode table entry is not successfully in use with other applications, so that to change it might cause this other use of it to fail.
4. Amend the logmode table entry by switching the bits corresponding to '1' bits in the mismatch string. That is, if the bit in the VTAM bind image corresponding to the bit position set to '1' in *xxxxxxx...* is '1', set it to '0'. If it is '0', set it to '1'.

For further information, refer to the *CICS Customization Guide*.

More on the meaning of the various bits in a bind image may be found in *ACF/VTAM Programming manual*, (SC27-0611).

Details of the preparation of VTAM logmode table entries are given in *ACF/VTAM Customization manual*, (SC27-0613).

Destination: CADL

Modules: DFHZATA

XMEOUT Parameters: *date, time,applid, netname, model*

DFHZE2604 **Syst.sense 0811,***termid,taskid,*
Unprocessed data at detach

Explanation: The task to be detached did not completely process the inbound data chain.

System action: Purging of data is done until end-of-chain (EOC) or CANCEL has been received.

User response: None.

Destination: Terminal End User

Modules: DFHZDET

DFHZN2130 *date time applid* **A unit of work has been shunted but the connection with the remote system does not support the shunt protocols. Resources on the remote system may be out of sync with those on this CICS after the UOW is resynchronized. Failure date *mm/dd/yy* failure time *hh:mm:ss* remote system *netname* transaction *tranid* task number *trannum* operator terminal *termid* user *userid* network UOW *netuowid* local UOW *X'localuow'*.**

Explanation: This message is preceded by message DFHAC2231. An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. The coordinator of the syncpoint is not this CICS system but is remote.

Transaction *tranid* has lost contact with its coordinator system during the indoubt period.

System action: In accordance with the transaction definition, the unit of work is not completed. It is allowed to wait for resynchronization with the coordinator system. The transaction is abnormally terminated with abend code ASP1. The unit of work is shunted to await the return of the coordinator system.

As part of this processing, CICS has attempted to pass on the shunt request to another partner system. However, this partner does not support the shunting protocols, and so this partner may backout or commit changes to its resources independently of this shunted unit of work.

User response: Following resynchronization with the coordinator system, determine whether the remote function shipped resources are out of synchronization. The action to take depends on local procedures and the design of the application program. For example, it may be possible to rerun the application but only making updates to remote resources. Refer to the *CICS Intercommunication Guide* for information on design considerations in a distributed environment.

Destination: CSMT

Modules: DFHCR2U

XMEOUT Parameters: *date, time,applid, mm/dd/yy, hh:mm:ss, netname, tranid,trannum, termid, userid, netuowid, X'localuow'*

DFHZN2131 *date time applid* **Intersystem session failure during CICS synclevel one commit. Local resources may be out of sync with those on the remote system. Failure date *mm/dd/yy* failure time *hh:mm:ss* remote system *netname* transaction *tranid* task number *trannum* operator terminal *termid* user *userid* network UOW *netuowid* local UOW *X'localuowid'*.**

Explanation: A CICS application has been using APPC synclevel 1 to process remote function shipped resources. The application took a syncpoint, either implicitly or explicitly, and this has caused all local resources and synclevel 2 partners to be committed. However, a session failure occurred at a critical time during the synclevel 1 commit processing, and the synclevel 1 function shipped resources may have committed successfully or may have backed out.

System action: CICS synclevel 1 commit processing continues, with the intention of committing as many synclevel 1 resources as possible. For APPC synclevel 1, CICS does not attempt to resolve the situation any further.

On completion of the syncpoint, CICS abends the user task.

User response: Determine whether the remote function shipped resources are out of synchronization. The action to take depends on local procedures and the design of the application program. For example, it may be possible to rerun the application but only making updates to remote resources. Refer to the *CICS Intercommunication Guide* for information on design considerations in a distributed environment.

Destination: CSMT

Modules: DFHCR2U

XMEOUT Parameters: *date, time,applid, mm/dd/yy, hh:mm:ss, netname, tranid,trannum, termid, userid, netuowid, X'localuowid'*

DFHZN2132 *date time applid* **Rollback received in response to CICS synclevel one commit. Local resources are out of sync with those on the remote system. Failure date *mm/dd/yy* failure time *hh:mm:ss* remote system *netname* transaction *tranid* task number *trannum* operator terminal *termid* user *userid* network UOW *netuowid* local UOW *X'localuowid'*.**

Explanation: A CICS application has been using APPC synclevel 1 to process remote function shipped resources. The application took a syncpoint, either implicitly or explicitly, and this has caused all local resources and synclevel 2 partners to be committed. However, when a commit message was sent to a synclevel 1 function shipped resource, the resource voted to backout.

System action: Synclevel 1 commit processing continues with the intention of committing as many synclevel 1 resources as possible. For APPC synclevel 1, CICS does not attempt to resolve the situation any further.

On completion of the syncpoint, CICS abends the user task.

User response: The action to take depends on local

procedures and the design of the application program. For example, it may be possible to rerun the application but only making updates to remote resources. Refer to the *CICS Intercommunication Guide* for information on design considerations in a distributed environment.

Destination: CSMT

| **Modules:** DFHCR2U

| **XMEOUT Parameters:** *date, time,applid, mm/dd/yy, hh:mm:ss, netname, tranid,trannum, termid, userid, netuowid, X'localuowid'*

DFHZN2133 *date time applid* **Error detected during CICS synclevel one commit. Reason code *rc*. Local resources may be out of sync with those on the remote system. Failure date *mm/dd/yy* failure time *hh:mm:ss* remote system *sysid* transaction *tranid* task number *trannum* operator terminal *termid* user *userid* network UOW *netuowid* local UOW *X'localuowid'*.**

Explanation: A CICS application has been using APPC synclevel 1 to process remote function shipped resources. The application took a syncpoint, either implicitly or explicitly, and this has caused all local resources and synclevel 2 partners to be committed. However, when a commit message was sent to a synclevel 1 function shipped resource, the reply indicated that an error has occurred. The reason code provides details of the error and has the following values:

- 01 Protocol violation by partner system – unexpected FMH data
- 02 Protocol violation by partner system – unexpected syncpoint message data
- 03 Abend received
- 04 Deadlock or read timeout.

System action: CICS synclevel 1 commit processing continues, with the intention of committing as many synclevel 1 resources as possible.

For reason code 01, a transaction dump with dump code ASPI is taken. For reason code 02, a transaction dump with dump code ASPJ is taken. On completion of the syncpoint, CICS abends the user task.

User response: The action to take depends on local procedures.

For reason codes 01 and 02, examine the dump to determine what message data was received from the partner. This information is held in one of the terminal input/output areas. A failure in the communication system might have caused corruption of the data.

Reason code 03 indicates that the partner system has sent an abend. There is an error in the partner system which may need to be investigated.

Reason code 04 indicates that the partner system took

too long to respond to the synclevel 1 commit. There could be a problem with the remote system, or the communication system. It may be necessary to increase the deadlock timeout or read timeout values to prevent this recurring.

Destination: CSMT

| **Modules:** DFHCR2U

| **XMEOUT Parameters:** *date, time,applid, rc, mm/dd/yy, hh:mm:ss, sysid, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHZN2200 *date time applid* **FREE IMPLICIT failed during syncpoint processing for session *session id*, remote system *netname*. Transid *transid*. The original abend code was *abend code*.**

Explanation: A DFHTC FREE IMPLICIT request for a non-principal facility MRO session has failed.

System action: CICS writes an exception trace entry with code '0D86' before issuing a DFHTC FREE DETACH request for the session.

User response: If the task was purged by the operator causing abend AZI9 or a read timeout occurred causing abend AZIG this error may be expected and no further action may be necessary.

Otherwise this failure may represent an error. To investigate further set up a system dump table entry for system dump code ZN2200. You may need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Modules: DFHCRIU

DFHZN2701 *date time applid* **Log data sent on ISC session is xxxxxxxx**

Explanation: This is an informational message. The transaction is communicating with a logical unit type LU6.2. It has sent an FMH (function management header) which carries log data.

System action: The transaction continues processing.

User response: None.

Destination: CSNE

Modules: DFHZERH

XMEOUT Parameters: *date, time,applid, xxxxxxxx*

Chapter 2. AXM server environment messages

The following messages are issued by the authorized cross-memory (AXM) server environment, which is a package of run-time services used by the Named counter sequence number server, CICS coupling facility (CF) data tables and the CICS shared temporary storage (TS) queue pool server. See the *CICS System Definition Guide* for more information about AXM and the CICS TS queue pool server.

Notes:

1. AXM messages are not issued by a CICS region and hence do not use the CICS message domain. They cannot be viewed with the CMAC transaction, suppressed with the XMEOUT user exit, or changed with the message editing utility.
2. These messages are normally displayed in mixed case English. If your terminals cannot display lowercase English characters, see the *CICS Customization Guide* for guidance on converting the messages to uppercase.

REQTEXT

AXM error recovery messages

AXMER0001 ABEND *xxx-rr* occurred at *address*, data *word1 word2 word3*.

Explanation: The AXM error recovery routine has intercepted an abend in a task running under an AXM server region TCB. The abend code is shown as three hexadecimal digits for a system completion code or four decimal digits for a user completion code. The data consists of the twelve bytes around the PSW address as provided by MVS in the SDWA.

System action: The error recovery routine will first call AXMWH which attempts to identify the module and procedure in which the abend occurred and writes out a further message if successful. After this, if recovery is allowed, the error recovery routine terminates the affected AXM internal task and resumes normal processing, otherwise it percolates the error, causing the server region to be abnormally terminated.

The system will normally produce a symptom dump message on the job log, and a full dump may be produced if an appropriate DD statement (SYSUDUMP, SYSMDUMP or SYSABEND) is present in the server region JCL.

User response: Look up the completion code to identify the cause of the abend.

Destination: Console and print file

Module: AXMER

AXMER0002 TRAP occurred at offset *offset* in *procname*.

Explanation: An internal logic error in a server resulted in a TRAP macro being executed at the specified location.

The system will normally produce a symptom dump message on the job log, and a full dump may be produced if an appropriate DD statement (SYSUDUMP, SYSMDUMP or SYSABEND) is present in the server region JCL.

System action: The AXM task is abnormally terminated.

User response: This probably indicates a logic error in server code, or an attempt to use some internal component of the server outside its correct context.

If the procedure name in the message begins with AXM, this probably indicates that the server code which called it has passed inconsistent parameters, such as an invalid address when releasing main storage.

Destination: Console and print file

Module: AXMER

AXM event management messages

AXMEV0001 AXM only supports operating system WAIT on MVS.

Explanation: An attempt has been made to issue an operating system WAIT within an AXM server, but the server is not running on MVS. In this case, the MVS POST exit mechanism used by AXM is unavailable and operating system waits cannot be supported.

System action: The program is abnormally terminated.

User response: None.

Destination: Console

Module: AXMEV

AXMEV0003 The AXM POST exit could not be created because AXM system services are not available.

Explanation: AXM server region initialization needed to define the MVS POST exit used by AXM for operating system waits, but AXM system services were not available within the current MVS image.

System action: The server region is terminated with return code 8.

User response: Start up AXM system services first then restart the server region. AXM system services are normally started at IPL using a subsystem definition in IEASSNxx specifying AXM as the subsystem name and AXMSI as the initialization routine. They can also be started up without an IPL by defining the subsystem dynamically using the SETSSI command.

Destination: Console and print file

Module: AXMEV

AXMEV0004 The AXM POST exit could not be created, return code was rc.

Explanation: The MVS POST exit used by AXM for operating system waits could not be created because the AXM system services routine gave a non-zero return code. The only known reason for this is that

AXM system services have been withdrawn, which should not be possible in a production environment.

System action: The server region is terminated with return code 8.

User response: None.

Destination: Console and print file

Module: AXMEV

AXMEV0005I The AXM POST exit had already been created for this address space.

Explanation: During server initialization, AXM system services found that the MVS POST exit used by AXM for operating system waits had already been created for this address space. AXM therefore bypassed trying to create the same POST exit again as this would have resulted in an abend 702-04.

This can occur when a previous server execution in the same address space was terminated abnormally.

System action: Processing continues

User response: None.

Destination: Console and print file

Module: AXMEV

AXMEV0006I The AXM POST exit could not be deleted, return code was rc.

Explanation: The MVS POST exit used by AXM for operating system waits could not be deleted because the AXM system services routine gave a non-zero return code. The only known reason for this is that AXM system services have been withdrawn, which should not be possible in a production environment.

System action: Processing continues.

User response: None.

Destination: Console.

Module: AXMEV

AXM stack (LIFO) storage messages

AXMLF0001S LIFO storage cannot be set up because the PRV size exceeds 4K.

Explanation: AXM initialization has detected that the total link-edited size of the pseudo-register vector (PRV) for the server application load module exceeds the maximum size of 4096 supported by AXM. The PRV contains task-related variables used by AXM resource management plus any task-related data areas defined by server code using the Assembler DXD operation code or Q-type address constants.

System action: The server is abnormally terminated.

User response: The server programmer needs to decrease the size of task-related variables defined in the PRV. When a large amount of task-related information needs to be stored, it is better to store the information in some separately acquired storage area (such as AXM heap storage) and put only a pointer to it in the PRV.

Destination: Console

Module: AXMLF

AXM lock management messages

AXMLK0001 Lock at *address* is already owned for shared use by this task.

Explanation: An AXM server program attempted to acquire exclusive ownership of an AXM lock which was already in shared ownership for the current task. This is not allowed, as the task cannot wait for itself.

System action: The AXM lock request is rejected.

User response: The server programmer needs to modify the program logic. It could for example use an AXM lock PROMOTE to convert the shared lock to an exclusive lock.

Destination: Console and print file

Module: AXMLK

AXMLK0002 *function* failed because lock at *address* is not owned by this task.

Explanation: An AXM server program tried to release, demote or promote an AXM lock but the lock was not owned by the current AXM task.

System action: The AXM lock request is rejected.

User response: The server program logic is in error.

Destination: Console and print file

Module: AXMLK

AXM operating system interface messages

AXMOS0001I The main procedure entry point is *name* at address *address*.

Explanation: This message is written to the print file during AXM initialization to indicate the name and entry point address of the server main procedure. This is primarily for debugging purposes.

System action: Processing continues.

User response: None.

Destination: Print file

Module: AXMOS

AXMOS0002 The main procedure is missing, or the END statement does not name the entry point.

Explanation: The AXM server load module which is being executed does not contain a procedure which has been identified as the AXM main procedure.

System action: The server region is terminated with return code 16.

User response: Check that the main procedure was correctly included in the link edit. If it was, make sure that its entry point name was correctly specified on the END statement and that it was assembled using AXM macros with the macro AXMSET appearing before the MODULE statement and the option ENVIRON=AXM specified on the MODULE statement.

Destination: Console and SYSPRINT

Module: AXMOS

AXM storage page pool management messages

AXMPG0001I The main free area above 16M was at address *xxxxxx*, size *nnnnK*.

Explanation: This message is written to the print file during AXM initialization to indicate the size of the largest area of 31-bit addressable private region storage available at that time.

System action: Processing continues.

User response: None.

Destination: Print file

Module: AXMPG

AXMPG0002I The main free area below 16M was at address *xxxxxx1*, size *nnnnK*.

Explanation: This message is written to the print file during AXM initialization to indicate the size of the largest area of 24-bit addressable private region storage available at that time.

System action: Processing continues.

User response: None.

Destination: Print file

Module: AXMPG

AXMPG0003I Storage page pool *areaname* created, address *xxxxxx*, size *nnnnK*.

Explanation: This message is written to the print file during AXM initialization to show the size and address of each storage page pool as it is created. Once this has been done, most AXM storage requests are allocated from this page pool rather than with MVS GETMAIN.

System action: Processing continues.

User response: None.

Destination: Print file

Module: AXMPG

AXMPG0004I Usage statistics for storage page pool *areaname*:

Explanation: This message shows statistics for the named storage page pool (since the most recent

statistics reset, if any). It is automatically written to the print file at AXM region termination, and may also be requested at other times by the server.

The detailed message layout is as follows:

Size	In Use	Max Used	Free	Min Free
nK	nK	nK	nK	nK
100%	n%	n%	n%	n%
	Gets	Frees	Retries	Fails
	n	n	n	n

Each of the storage statistics is shown in two forms, as a number of kilobytes and as a percentage of the total size.

The individual fields have the following meanings:

Size Total size of the storage pool.

In Use The amount of storage which is currently in use.

Max Used The highest amount of storage which has been in use.

Free The amount of storage within the pool which is current free.

Min Free The lowest amount of storage which has been free.

Gets The number of requests to obtain storage within the pool.

Frees The number of requests to release storage within the pool.

Retries The number of times that a storage request initially failed and was retried after merging any adjacent small free areas to form larger areas.

Fails The number of times that a storage request was unable to obtain the requested amount of storage even after a retry.

System action: Processing continues.

User response: None.

Destination: Print file

Module: AXMPG

AXM resource tracking messages

AXMRS0001 Tidy-up routine at *address* failed to free resource tracking cell.

Explanation: A server routine established an AXM resource tracking element specifying that a procedure was to be called to release the resource if the task was terminated without releasing the resource. The AXM task is now terminating, and the procedure identified

in the tracking element was called, but the resource tracking element was still in existence when it returned. The entry point address of the relevant procedure is indicated in the message.

System action: The tracking element is released on the assumption that the resource has now been deleted, and AXM task termination continues.

User response: The server programmer needs to ensure that the procedure to release the resource also frees the resource tracking element.

Destination: Console and print file

Module: AXMRS

AXM server connection and system services messages

AXMSC0011I AXM system services initialization is in progress.

Explanation: AXM system services are being started up, normally as a result of being called by the AXM subsystem initialization routine.

System action: Processing continues.

User response: None.

Destination: Console

Module: AXMSC

unpredictable. AXM system services should never be withdrawn in a production environment at any time when it is possible that they could be in use.

Destination: Console

Module: AXMSC

AXMSC0012I AXM system services initialization has completed.

Explanation: AXM system services are now fully available in the current MVS image.

System action: AXM cross-memory server connection requests and requests for the POST exit system services will now be accepted.

User response: None.

Destination: Console

Module: AXMSC

AXMSC0022I AXM system services termination has completed.

Explanation: AXM system services have been closed down for this MVS image.

System action: AXM system services are no longer available.

User response: None.

Destination: Console

Module: AXMSC

AXMSC0013 AXM system services have already been initialized.

Explanation: An attempt was made to set up AXM system services again when they are already active in the current MVS image.

System action: The attempt is ignored.

User response: None.

Destination: Console

Module: AXMSC

AXMSC0031I Connection to server *prefix.name* has been opened.

Explanation: The current region has established an AXM connection to the AXM server *prefix.name*.

System action: Processing continues.

User response: None.

Destination: Console

Module: AXMSC

AXMSC0021I AXM system services termination is in progress.

Explanation: AXM system services are being withdrawn. This is only possible if they were initialized using the AXM system region program AXMSR instead of being set up via subsystem initialization.

System action: The AXM system services program call table is deleted and all entry points in the AXM system services anchor are replaced with dummy routines which return an indication that the service are not available.

User response: Note that the results of attempting to call any AXM system service around this time are

AXMSC0032 Connection to server *prefix.name* failed because the server was not found.

Explanation: The current region tried to establish an AXM connection to the AXM server *prefix.name* but could not do so because there is no active server of that name enabled for AXM connections.

System action: The connection attempt is rejected with return code 8, reason code 32.

User response: Ensure that the server is started and that its name was specified correctly.

Destination: Console

Module: AXMSC

AXMSC0033 Connection to server *prefix.name* was rejected by the security system.

Explanation: The current region tried to establish an AXM connection to the AXM server *prefix.name* but the request was rejected by the security system.

System action: The connection attempt is rejected with return code 8, reason code 33.

User response: See the previous AXM message giving details of the results of the security check.

Destination: Console

Module: AXMSC

AXMSC0034 Connection to server *prefix.name* failed because all AXM connections are in use.

Explanation: The current region tried to establish an AXM connection to the AXM server *prefix.name* but the maximum number of AXM connections supported within an MVS image (currently 4096) has been reached.

System action: The connection is rejected with return code 8, reason code 34.

User response: If you anticipate a need for more than 4096 AXM server connections within a single MVS image, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Module: AXMSC

AXMSC0035 Connection to server *prefix.name* failed because request limit *reqs* exceeds 9999.

Explanation: The current region tried to establish an AXM connection to the AXM server *prefix.name* but the connection parameter specifying the maximum number of concurrent requests to be supported exceeds 9999.

System action: The connection is rejected with return code 8, reason code 35.

User response: Check whether the server interface program is specifying the correct value for the maximum number of concurrent requests.

Destination: Console

Module: AXMSC

AXMSC0036 Connection to server *prefix.name* was rejected by the server.

Explanation: The current region tried to establish an AXM connection to the AXM server *prefix.name* but the server-defined connection exit rejected the request.

System action: The connection is rejected with return code 8, reason code 36.

User response: The reason for the rejection depends on the server code, but this typically occurs if the server is preparing to close down or has insufficient resources to accept another connection.

Destination: Console

Module: AXMSC

AXMSC0037 Connection to server *prefix.name* failed because the server is terminating.

Explanation: The current region tried to establish an AXM connection to the AXM server *prefix.name* but the server entered termination processing while the connection request was in progress.

System action: The connection is rejected with return code 8, reason code 37. The instance of the server that was being terminated will no longer be visible to any new connection attempts.

User response: Retry the connection when the server has been restarted.

Destination: Console

Module: AXMSC

AXMSC0038 Connection to server *prefix.name* failed because this address space is already connected to it.

Explanation: The current region tried to establish an AXM connection to the AXM server *prefix.name* but it already has a connection to the same server region. AXM does not support multiple connections from the same region to the same server region.

System action: The connection is rejected with return code 8, reason code 38.

User response: None.

Destination: Console

Module: AXMSC

AXMSC0041I Connection to server *prefix.name* has been closed.

Explanation: An AXM connection from the current region to the named server has been terminated, either as a result of being explicitly closed by this region or as a result of the termination of the MVS TCB which originally established the connection.

System action: Processing continues.

User response: None.

Destination: Console

Module: AXMSC

AXMSC0042 Connection close failed for token *xxxxxxx*, reason is *n*.

Explanation: An attempt was made to close an AXM connection explicitly but the specified connection token did not refer to an active connection owned by the current region, or the connection could not be closed for some other reason.

The reason code indicates which validity check failed within procedure AXMSCCLS. Reason code 9 indicates that a request issued via the connection has not yet completed. Any other reason code probably indicates an incorrect token.

System action: The attempt is rejected with return code 8, reason code 42.

User response: Check that the connection close request is specifying the correct connection token and that there are no incomplete requests for the connection.

Destination: Console

Module: AXMSC

AXMSC0051I Server *prefix.name* is now enabled for connections.

Explanation: This AXM server has completed initialization and is now available for connections from other address spaces.

System action: Processing continues.

User response: None.

Destination: Console

Module: AXMSC

AXMSC0052 Server *prefix.name* cannot be enabled because it is already active in another address space.

Explanation: Only one instance of a given AXM server name can be active in an MVS image at a time.

System action: The attempt to enable the server interface is rejected with return code 8, reason code 52.

User response: None.

Destination: Console

Module: AXMSC

AXMSC0053 Server *prefix.name* cannot be enabled because caller is not APF authorized.

Explanation: AXM requires that an AXM server region must be running APF authorized in order to be allowed to enable its server interface.

System action: The attempt to enable the server interface is rejected with return code 8, reason code 53.

User response: Ensure that the server program is executed from an APF authorized library and is link-edited with AC(1).

Destination: Console

Module: AXMSC

AXMSC0054 Server *prefix.name* cannot be enabled because the security system rejected the request.

Explanation: The security system detected that the server region userid was not correctly authorized to act as an AXM server with the specified server name.

System action: The attempt to enable the server interface is rejected with return code 8, reason code 54.

User response: See the previous AXM message giving details of the results of the security check.

Destination: Console

Module: AXMSC

AXMSC0061I Server *prefix.name* is now disabled for connections.

Explanation: This AXM server is terminating and is no longer available for connections from other address spaces. This occurs either when the server explicitly disables its interface or when the server job step task terminates.

System action: Processing continues.

User response: None.

Destination: Console

Module: AXMSC

AXMSC0062 Server disable failed for token *xxxxxxx*, reason is *n*.

Explanation: An attempt to disable the server interface failed because the specified server interface token did not correctly identify an active server interface established by the current address space.

The reason code provides an internal indication of which validity check failed within procedure AXMSCDIS. All reason codes probably indicate an incorrect token.

System action: The attempt to disable the server interface is rejected with return code 8, reason code 62. If the server interface is still enabled, it will be disabled automatically when the job step task terminates.

User response: As the server interface token is stored internally by AXM, the only known possible reason for this message is storage overwriting within the server region.

Destination: Console

Module: AXMSC

AXMSC0063 Server *prefix.name* cannot be disabled because caller is not APF authorized.

Explanation: AXM requires that an AXM server region must be running APF authorized in order to be allowed to disable its server interface.

System action: The attempt to disable the server interface is rejected with return code 8, reason code 63.

User response: Ensure that the server program is executed from an APF authorized library and is link-edited with AC(1).

Destination: Console

Module: AXMSC

AXMSC0071 Server name *prefix.name* has incorrect syntax for access checks.

Explanation: The security checking routine has detected that the AXM server name specified on a connection request or on a server enable request is not in the correct form, for example because either the prefix or name is blank. This means that the security check cannot be performed.

System action: A return code is set to indicate that the security check failed.

User response: Check that the server prefix and name are specified correctly. The prefix is normally defined by the server, but the name may be set from a user-specified server parameter.

Destination: Console

Module: AXMSC

AXMSC0072 *level* access authorization was denied for FACILITY *facility*.

Explanation: The external security manager has indicated that the current region is not authorized for the required level of access to the specified facility.

System action: A return code is set to indicate that the security check failed.

User response: Check whether the userid for the region has been authorized to access the specified facility resource name.

Destination: Console

Module: AXMSC

AXMSC0073 *level* access authorization is unavailable for FACILITY *facility*.

Explanation: The external security manager has indicated that it is unable to determine whether the current region is authorized for the required level of access to the specified facility. This message is only issued if it is not possible for the security routine to

determine whether security checking is actually required. In cases where it is obvious that no security check is required (for example because no external security manager is installed), access is granted anyway.

System action: A return code is set to indicate that the security check failed.

User response: Check whether the external security manager is available and whether the security definitions for the specified facility have been provided.

Destination: Console

Module: AXMSC

AXMSC0074 RACROUTE REQUEST=AUTH gave R15=xxxxxxx, SAFPRRET=xxxxxxx, SAFPRREA=xxxxxxx.

Explanation: This message provides additional details about the results of a security check in any case where access is not granted. See the documentation of the RACROUTE macro for further information.

System action: Processing continues.

User response: None.

Destination: Console

Module: AXMSC

AXMSC0075 RACROUTE REQUEST=STAT gave R15=xxxxxxx, SAFPRRET=xxxxxxx, SAFPRREA=xxxxxxx.

Explanation: This message provides additional details about the results of a security check in any case where access is not granted. See the documentation of the RACROUTE macro for further information.

System action: Processing continues.

User response: None.

Destination: Console

Module: AXMSC

AXMSC0991I Creating new AXM system services anchor at *address*.

Explanation: This message is issued during AXM system services initialization to enable the system services anchor to be located if necessary for diagnostic purposes.

System action: AXM system services initialization processing continues.

User response: None.

Destination: Console

Module: AXMSC

AXMSC0992I Deleting old AXM system services anchor at *address*.

Explanation: This message is issued during AXM system services initialization if AXM system services were previously active but had been terminated (which is not possible in normal production environment). The old system services anchor is retained after AXM termination because it contains the system LX to be used if AXM is restarted. This message gives the

address of the old system services anchor for diagnostic purposes.

System action: AXM system services initialization processing continues.

User response: None.

Destination: Console

Module: AXMSC

AXM subsystem initialization messages

AXMSI0001I AXM subsystem initialization is in progress.

Explanation: The AXM subsystem initialization program has been started in order to initialize AXM system services.

System action: AXM system services will be loaded and initialized.

User response: None.

Destination: Console

Module: AXMSI

routine has not completed normally. This message indicates the final return code and reason code. This is normally the return code from AXM system services initialization.

System action: The subsystem initialization routine returns control to MVS.

User response: See the previous AXM message describing the cause of the problem. The reason code will normally be the number of an error message issued by AXMSC.

Destination: Console

Module: AXMSI

AXMSI0002I AXM subsystem initialization has completed.

Explanation: The AXM subsystem initialization program has completed execution.

System action: The program returns control to MVS.

User response: None.

Destination: Console

Module: AXMSI

AXMSI0004 AXM subsystem initialization can only run in Master Scheduler address space.

Explanation: An attempt has been made to invoke the AXM subsystem initialization program AXMSI in some other way than as an MVS subsystem initialization program running in the Master Scheduler region (ASID 0001).

System action: The subsystem initialization program is abnormally terminated.

User response: None.

Destination: Console

Module: AXMSI

AXMSI0003 AXM subsystem initialization return code *retcode*, reason code *rsncode*.

Explanation: The AXM subsystem initialization

AXM system region messages

AXMSR0001I AXM system region initialization is in progress.

Explanation: An AXM system region is being started. This is used to initialize AXM system services in a testing environment for development purposes, and allows AXM system services to be closed down and restarted without an IPL.

System action: Processing continues.

User response: None.

Destination: Console

Module: AXMSR

AXMSR0002I AXM system region initialization has completed.

Explanation: AXM system services have been successfully initialized from the AXM system region.

System action: Processing continues.

User response: The system region may be closed down again using the MVS STOP command but this should only be done when it is certain that no AXM services are being used within the MVS image.

Destination: Console

Module: AXMSR

AXMSR0003I AXM system region termination is in progress.

Explanation: The operator has requested termination of the AXM system region using the MVS STOP command.

System action: AXM system services are terminated.

User response: None.

Destination: Console

Module: AXMSR

AXMSR0004I AXM system region termination has completed.

Explanation: The AXM system region has completed termination.

System action: Control is returned to MVS and the job step ends.

User response: None.

Destination: Console

Module: AXMSR

AXMSR0011 AXM system region can only run under MVS/ESA.

Explanation: An attempt was made to execute the AXM system region program AXMSR in a non-MVS environment.

System action: The system region program terminates.

User response: None.

Destination: Console

Module: AXMSR

AXMSR0012 AXM system region program AXMSR needs to be APF authorized.

Explanation: An attempt was made to execute the AXM system region program AXMSR without APF authorization.

System action: The system region program terminates.

User response: Ensure that the module AXMSR is

stored in an APF-authorized library and is link-edited with AC(1).

Destination: Console

Module: AXMSR

AXMSR0013 AXM system region LOAD for *name* failed with completion code *xxx-nn*.

Explanation: The attempt to LOAD the system services module (AXMSC) failed.

System action: The system region program terminates.

User response: See the description of the system completion code *xxx* in *MVS/ESA System Codes* for the reason that the LOAD failed.

Destination: Console

Module: AXMSR

AXMSR0021 AXM system region does not support this command: *text*

Explanation: An attempt was made to issue a command to the AXM system region using the MVS MODIFY command. The AXM system region only supports the MVS STOP command, and does not support commands entered via MODIFY.

System action: The command is ignored.

User response: If the intention was to close down the system region, use the MVS STOP command instead.

Destination: Console

Module: AXMSR

AXMSR0022I AXM system region STOP command has been accepted.

Explanation: An operator has issued a STOP command to close down the AXM system region.

System action: AXM system services will be terminated.

User response: None.

Destination: Console

Module: AXMSR

AXM trace and print file management messages

AXMTR0001 The *ddname* print file could not be opened.

Explanation: The AXM trace and print file with the specified *ddname* (usually AXMPRINT or SYSPRINT) could not be opened during AXM initialization.

System action: Print file output requests will be ignored.

User response: Ensure that the appropriate DD statement is present. The default *ddname* is AXMPRINT, but this may be overridden to SYSPRINT by an AXMTRDEF definition within the server code if the server does not need to reserve the name SYSPRINT for any other purpose.

Destination: Console

Module: AXMTR

AXM address lookup (WHERE) messages

AXMWH0001I Address *address* is at +*offset* in *modtype* module *modname*.

Explanation: This message may be produced after an abend or TRAP message to identify the module containing the error address, if the module is known to MVS. The information about the module and type is obtained using the MVS macros CSVQUERY or NUCLKUP.

System action: Processing continues.

User response: None.

Destination: Console and print file

Module: AXMWH

AXMWH0002I Address *address* is at +*offset* in procedure *procname*.

Explanation: This message may be produced after an abend or TRAP message to identify the procedure containing the error address, if the storage is within a known module and a standard SAVE sequence including a procedure identifier appears at some point before the error address.

System action: Processing continues.

User response: None.

Destination: Console

Module: AXMWH

AXM cross-memory interface messages

AXMXM0011 Server *prefix.name* cannot be enabled because AXM system services are not available.

Explanation: An attempt has been made to enable a server interface but AXM system services have not been initialized within this MVS image.

System action: The server enable request is rejected.

User response: Ensure that AXM system services are started then start the server again.

Destination: Console and SYSPRINT

Module: AXMXM

System action: The ARR will already have completed processing when this message is issued, as the message is written out by the server region. If recovery is allowed, the ARR terminates the affected AXM internal task, in which case the return code from the cross-memory request will consist of the completion code in the usual MVS format but with the high-order bit set to indicate an abend. If recovery is not allowed, the ARR percolates the error, passing the abend to the requesting region.

The diagnostic routine which writes this message will call AXMWH which attempts to identify the module and procedure in which the abend occurred and writes out a further message if successful. It then releases the MVS SDWA. Server execution is not directly affected by an abend in cross-memory mode.

User response: Look up the completion code to identify the cause of the abend.

Destination: Console and SYSPRINT

Module: AXMXM

AXMXM0012 Enable failed for server *prefix.name*, return code *retcode*, reason *rsncode*.

Explanation: The server interface could not be enabled. The specific reason will have been indicated by an earlier AXMSC message.

System action: The server enable request is rejected.

User response: None.

Destination: Console and SYSPRINT

Module: AXMXM

AXMXM0022 TRAP occurred at offset *offset* in *procname*.

Explanation: An internal logic error in a server module or invalid parameters on a server request resulted in a TRAP macro being executed at the specified location in cross-memory mode.

The system will normally produce a symptom dump message on the job log, and a full dump of the connected region may be produced if an appropriate DD statement (SYSUDUMP, SYSMDUMP or SYSABEND) is present in the JCL for the connected region.

System action: The AXM task is abnormally terminated.

User response: This probably indicates a logic error in

AXMXM0021 ABEND *xxx-rr* occurred at *address*, data *word1 word2 word3*.

Explanation: The ARR routine for an AXM cross-memory program call routine has intercepted an abend in a cross-memory mode AXM task and has passed the associated SDWA to a task in the server address space to issue the appropriate diagnostic messages. The abend code is shown as three hexadecimal digits for a system completion code or four decimal digits for a user completion code. The data consists of the twelve bytes around the PSW address as provided by MVS in the SDWA.

server code, or an attempt to use some internal component of the server outside its correct context.

If the procedure name in the message begins with AXM, this probably indicates that the server code which called it has passed inconsistent parameters, such as an invalid address when releasing main storage.

Destination: Console

Module: AXMXM

Chapter 3. Transaction abend codes

When abnormal conditions occur, CICS can send a message to the CSMT transient data destination containing the transaction ID, the program name and the abend code. Here is an example:

```
DFHAC2236 date time applid Transaction tranid abend
          primary abcode in program program name
          term termid backout successful { batchid =
          }batchid. message
```

Alternatively, the application can intercept abends by including an active EXEC CICS HANDLE ABEND command. The actual abend code can be determined by issuing the EXEC CICS ASSIGN command with the ABCODE option.

The transaction identification code *tranid* usually consists of the 4 characters defined to CICS. However, when a transaction is initiated by using a light pen, an operator identification (OPID) card reader, or 3270 PA or PF keys (specified in the TASKREQ= operand), CICS creates an internal transaction identification in the form of a 1-byte 3270 attention identification (AID) code followed by 3 bytes of X'FF'.

The code that may actually appear in the message in place of the internally-created transaction identification will be **xx**, where *xx* is the character translation of the 3270 AID code. To prevent ambiguity, the user should avoid using these codes as transaction identifiers.

The keys, the light pen (LPA), and OPID, and their corresponding printed AID codes are given in the following list:

PF1	*F1*	PF13	*C1*	LPA	*7E*
PF2	*F2*	PF14	*C2*	OPID	*E6*
PF3	*F3*	PF15	*C3*	PA1	*6C*
PF4	*F4*	PF16	*C4*	PA2	*6E*
PF5	*F5*	PF17	*C5*	PA3	*6B*
PF6	*F6*	PF18	*C6*		
PF7	*F7*	PF19	*C7*		
PF8	*F8*	PF20	*C8*		
PF9	*F9*	PF21	*C9*		
PF10	*7A*	PF22	*4A*		
PF11	*7B*	PF23	*4B*		
PF12	*7C*	PF24	*4C*		

An abend code indicates the cause of an error that may have been originated by CICS or by a user program. For most of the abend codes described, a CICS transaction dump is provided at abnormal termination.

All CICS transaction abend codes *abcode* are 4-character alphanumeric codes of the form **A***xy*, where:

Aack 'M'

is the IBM-assigned designation of a CICS transaction abend.

xx is the 2-character code assigned by CICS to identify the module that detected an error.

y is the 1-character alphanumeric code assigned by CICS.

Format of information

For each transaction abend code, the following information is given:

- An explanation of events leading to or following the message.
- The action that has been or will be taken by CICS (system action).
- The action recommended for the user (console or terminal operator).
- The module or modules that can determine that the message should be sent (not necessarily the module or modules that can issue the macro to write the message.)

Abend codes AAxx

AAAC

Explanation: An invalid error code has been passed to the DFHTFP or DFHACP programs.

System action: CICS terminates the task abnormally with a dump.

User response: Notify the system programmer.

Modules: DFHTFP,DFHACP

AALR

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the Temporary Storage Manager. The domain that detected the original error provides a trace entry and possibly a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Inform the system programmer. Examine the trace and the dump to identify the point of error.

Modules: DFHAMBA

AALS

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the Global Enqueue Manager. The domain that detected the original error provides a trace entry and possibly a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Inform the system programmer. Examine the trace and the dump to identify the point of error.

Modules: DFHAMBA

AALT

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the Internet Inter-Orb Protocol Manager. The domain that detected the original error provides a trace entry and possibly a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Inform the system programmer. Examine the trace and the dump to identify the point of error.

Modules: DFHAMOP

AALU

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the Sockets Domain Manager. The domain that detected the original error provides a trace entry and possibly a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Inform the system programmer. Examine the trace and the dump to identify the point of error.

Modules: DFHAMSO

AALV

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the Enterprise Java Domain. The domain that detected the original error provides a trace entry and possibly a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Inform the system programmer. Examine the trace and the dump to identify the point of error.

Modules: DFHAMEJ

AALW

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the Web Domain. The domain that detected the original error provides a trace entry and possibly a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Inform the system programmer. Examine the trace and the dump to identify the point of error.

Modules: DFHAMWB

AALX

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the Pipeline Manager. The domain that detected the original error provides a trace entry and possibly a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Inform the system programmer. Examine the trace and the dump to identify the point of error.

Modules: DFHAMPI

AAL1

Explanation: DFHALP was processing a request that deadlocked. The most likely reason for the abend is that an ALLOCATE QUEUE request has been suspended because there are no contention-winning links available.

AAL1 is issued for non time-out related deadlocks, for instance the task may have been cancelled.

AAL8 is issued for stall purges and deadlock time-outs.

System action: CICS terminates the task abnormally. A dump is taken.

User response: Ensure that there are enough contention-winning sessions available to satisfy the ALLOCATE QUEUE request.

If you are running with modegroups, ensure that there are contention-winning sessions available to satisfy the ALLOCATE request in that modegroup.

Modules: DFHALP

AAL2

Explanation: Either an incorrect response (other than PURGED) was returned from the suspend of the allocated task, or an incorrect response was returned from the resume.

System action: The transaction is abnormally terminated with a dump.

User response: Check the return code from the resume or the suspend to determine the cause of the error.

Modules: DFHALP

AAL3

Explanation: The task has been purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The task that first detected the purged condition provides an exception trace.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate the reason why the task was purged. It was purged either by the master terminal operator or as a result of a deadlock timeout.

Modules: DFHALP

AAL4

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error provides an exception trace, a console message, and possibly a system dump

(depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related message produced by the domain that detected the original error.

Modules: DFHALP

AAL6

Explanation: An error (INVALID, DISASTER or EXCEPTION response) has occurred on a call to SIGNOFF_TERMINAL_USER by DFHALP during sign-off for a surrogate terminal session running CRTE. The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related message produced by the domain that detected the original error.

Modules: DFHALP

AAL7

Explanation: An error (INVALID, DISASTER or EXCEPTION response) has occurred on a call to schedule a remote terminal delete by DFHALP during sign-off for a surrogate terminal session running CRTE. The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related message produced by the domain that detected the original error.

Modules: DFHALP

AAL8

Explanation: DFHALP was processing a request that deadlocked. The most likely reason for the abend is that an ALLOCATE QUEUE request has been suspended because there are no contention-winning links available.

AAL1 is issued for non time-out related deadlocks.

AAL8 is issued for stall purges and deadlock time-outs.

System action: CICS terminates the task abnormally. A transaction or system dump is not taken unless the transaction dump table has been modified for AAL8.

User response: Ensure that there are enough contention-winning sessions available to satisfy the ALLOCATE QUEUE request.

| If you are running with modegroups, ensure that there are contention-winning sessions available to satisfy the ALLOCATE request in that modegroup.

| It might be necessary to increase the deadlock timeout (DTIMEOUT) value for the transaction to prevent this abend from recurring.

| If you require a transaction or system dump for this abend then add AAL8 to the transaction dump table.

| **Modules:** DFHALP

| **AAMA**

| **Explanation:** There is an internal logic error in DFHAMP.

| **System action:** The task is abnormally terminated with a CICS transaction dump.

| **Modules:** DFHAMP

| **AAMP**

| **Explanation:** An unexpected return code has been received from DFHPUP. This might be due to an internal logic error.

| **System action:** The task is abnormally terminated with a CICS transaction dump.

| **User response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

| **Modules:** DFHAMP

| **AAMQ**

| **Explanation:** An attempt has been made to install a partner using RDO. However, the partner resource manager (PRM) is unavailable having failed to initialize during CICS initialization.

| **System action:** The task is abnormally terminated with a CICS transaction dump.

| **User response:** If you need to use the PRM, correct the problem which prevented the PRM from initializing, and restart CICS.

| **Modules:** DFHAMP

| **AAMS**

| **Explanation:** There has been an unexpected return code following a GETMAIN request to the storage manager. This is due to an internal logic error.

| **System action:** The task is abnormally terminated with a CICS transaction dump.

| **User response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

| **Modules:** DFHAMP

| **AAMT**

| **Explanation:** There is an internal logic error in DFHAMP due to an unexpected return code from DFHTMP.

| **System action:** The task is abnormally terminated with a CICS transaction dump.

| **User response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

| **Modules:** DFHAMP

| **AAMZ**

| **Explanation:** An unexpected return code has been received from DFHZCP. This is due to an internal logic error.

| **System action:** The task is abnormally terminated with a CICS transaction dump.

| **User response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

| **Modules:** DFHAMP

| **AAM1**

| **Explanation:** DFHXMCL has returned an unexpected response during the install of a transaction class. This can be caused by the task being purged during the install.

| **System action:** The transaction is abnormally terminated with a CICS transaction dump.

| If an error has occurred, at the time the error is detected, CICS issues a DFHXMnnnn console message, records an exception trace entry and takes a system dump.

| **User response:** Determine why the task has failed. If there is a system dump, use it together with the trace entry and the console message to resolve the problem. If there is no system dump, the task has been purged either by the master terminal operator or as a result of deadlock timeout.

| **Modules:** DFHAMP

| **AAM2**

| **Explanation:** DFHXMxD has returned an unexpected response during the install of a transaction definition. This can be caused by the task being purged during the install.

| **System action:** The transaction is abnormally terminated with a CICS transaction dump.

| If an error has occurred, at the time the error is detected, CICS issues a DFHXMⁿⁿⁿⁿ console message, records an exception trace entry and takes a system dump.

| **User response:** Determine why the task has failed. If there is a system dump, use it together with the trace entry and the console message to resolve the problem. If there is no system dump, the task has been purged either by the master terminal operator or as a result of deadlock timeout.

| **Modules:** DFHAMP

| **AAOA**

| **Explanation:** An application has issued a CPI verb which CICS does not support. The entry point referenced in the application program was resolved in the link edit stub, but the function requested could not be resolved when control passed to CICS.

| There are two possible reasons for this:

- | • You have linkedited your application program with a CPI stub which supports more function than this release of CICS.
- | • The linkedit stub has been corrupted.

| **System action:** The transaction is abnormally terminated with a CICS transaction dump. An exception trace entry is also written.

| **User response:** At the time of the error, general register 0 points to an 8-byte character string which should match the name of the issued CPI call. Use the trace or the dump to verify that this character string is the name of a CPI function which is supported.

| If the character string is not an intelligible character string, the stub has probably been corrupted.

| **Modules:** DFHCPI

| **AAOB**

| **Explanation:** An application has issued a CPI verb which specifies more than eight parameters.

| **System action:** The transaction is abnormally terminated with a CICS transaction dump and an exception trace entry is also written.

| **User response:** Change your application program so

| that the correct number of parameters is specified on the CPI call.

| **Modules:** DFHCPI

| **AAOC**

| **Explanation:** CPI Communications is invoked with an invalid number of parameters for call

| **System action:** The transaction is abnormally terminated with a CICS transaction dump.

| **User response:** The exception trace point produced with this abend contains the incorrectly issued CPI Communications verb name. Use this to determine where the application program was in error and amend it accordingly.

| The *SAA CPI Communications Reference* manual, SC26-4399, provides a detailed description of all the CPI Communications verbs and how they should be called.

| **Modules:** DFHCPARH

| **AAOD**

| **Explanation:** The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The domain that first detected the purged condition provides an exception trace.

| **System action:** The task is abnormally terminated with a CICS transaction dump.

| **User response:** Investigate the reason the task was purged. It was purged either by the master terminal operator or as a result of deadlock timeout.

| **Modules:** DFHCPCBI

| **AAOE**

| **Explanation:** The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The domain that first detected the purged condition provides an exception trace.

| **System action:** The task is abnormally terminated with a CICS transaction dump.

| **User response:** Investigate the reason the task was purged. It was purged either by the master terminal operator or as a result of deadlock timeout.

| **Modules:** DFHCPCBA

| **AAOF**

| **Explanation:** The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The domain that first detected the purged condition provides an exception trace.

| **System action:** The task is abnormally terminated

| with a CICS transaction dump.
| **User response:** Investigate the reason the task was
| purged. It was purged either by the master terminal
| operator or as a result of deadlock timeout.

| **Modules:** DFHPCBS

| AAOG

| **Explanation:** During the processing of CMACCP
| (accept conversation), CPI Communications detected
| that the application was attached with an unsupported
| sync level.

| **System action:** The transaction is abnormally
| terminated with a CICS transaction dump.

| **User response:** This condition is caused by a back-end
| CPI Communications transaction being attached with a
| sync level that is not CM_NONE (0) or CM_CONFIRM
| (1).

| Change the front-end transaction, (that is, the initiator
| of the conversation in the other system) so that it
| defines the sync level correctly.

| **Modules:** DFHPCBA

| AAOH

| **Explanation:** Journaling of data sent on a CPI
| communications mapped conversation has failed. This
| condition is caused by a nonzero response from the
| CICS log manager.

| **Problem determination:** Register 12 addresses the
| current TCA and field TCAJCAAD and register 4
| address the JCA. The log manager request is contained
| in JCATR2 and the response code is in JCAJCRC.

| Possible request codes are:

| X'8001' - WRITE
| X'8003' - PUT

| Possible response codes are:

| X'01' - IDERROR - Journal identification error
| X'02' - INVREQ - Invalid request
| X'03' - STATERR - Status error
| X'05' - NOTOPEN - Journal not open
| X'06' - LERROR - Journal record length error
| X'07' - IOERROR - I/O error.

| The address of the TIOA is contained in register 8 and
| its data length is in TIOATDL.

| **Analysis:**

| **Register Label Description**

| R4=@JCA TCZARQPJ JCAJCRC is nonzero.

| **System action:** The transaction is abnormally
| terminated with a CICS transaction dump.

| **User response:** Use the dump to ascertain why the

| journal or log record could not be written correctly. If a
| journal record length error is indicated, TIOATDL may
| have been corrupted.

| **Modules:** DFHPCOJ

| AAOI

| **Explanation:** The journaling of data received on a CPI
| Communications mapped conversation has failed.

| **Problem determination:** Register 12 addresses the
| current TCA and field TCAJCAAD and register 4
| address the JCA. The CICS log manager request is
| contained in JCATR2 and the response code is in
| JCAJCRC.

| Possible request codes are:

| X'8001' - WRITE
| X'8003' - PUT

| Possible response codes are:

| X'01' - IDERROR - Journal identification error
| X'02' - INVREQ - Invalid request
| X'03' - STATERR - Status error
| X'05' - NOTOPEN - Journal not open
| X'06' - LERROR - Journal record length error
| X'07' - IOERROR - I/O error

| The address of the TIOA is contained in register 8 and
| its data length is in TIOATDL.

| **Analysis:**

| **Register Label Description**

| R4=@JCA TCZARQPJ JCAJCRC is nonzero.

| **System action:** The transaction is abnormally
| terminated with a CICS transaction dump.

| **User response:** This condition is caused by an invalid
| response from the log manager. Use the dump to
| ascertain why the journal or log record could not be
| written correctly. If a journal record length error is
| indicated, TIOATDL may have been corrupted.

| **Modules:** DFHPCRI, DFHPCRW

| AAOJ

| **Explanation:** CPI Communications has detected an
| unexpected response from one of its internal routines.

| **System action:** The transaction is abnormally
| terminated with a CICS transaction dump.

| **User response:** This is a CICS internal logic error.

| A level 2 trace for 'CP' of the transaction shows the
| course of events prior to this error. For example, the
| modules called and their parameters. The level 2 trace
| also provides details of the error itself.

| You need further assistance from IBM to resolve this
| problem. See Part 4 of the *CICS Problem Determination*

| *Guide* for guidance on how to proceed.

| **Modules:** DFHCPIC

| **AAOK**

| **Explanation:** CPI Communications has detected an unexpected call to one of its internal routines.

| **System action:** The transaction is abnormally terminated with a CICS transaction dump.

| **User response:** This is a CICS internal logic error.

| A level 2 trace for 'CP' of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

| You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

| **Modules:** DFHCPIC

| **AAOL**

| **Explanation:** CPI Communications has made an invalid call to DFHLUC.

| **System action:** The transaction is abnormally terminated with a CICS transaction dump.

| **User response:** This is a CICS internal logic error.

| A level 2 trace for 'CP' of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

| You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

| **Modules:** DFHCPCLR

| **AAOM**

| **Explanation:** The CPI Communications and the DFHZUSR state machines are out of synchronization.

| **System action:** The transaction is abnormally terminated with a CICS transaction dump.

| **User response:** This is a CICS internal logic error.

| A level 2 trace for 'CP' of the transaction shows the course of events prior to this error. For example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

| You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

| **Modules:** DFHCPCLR, DFHCPSRH

| **AAON**

| **Explanation:** CPI Communications has detected an unexpected response from DFHLUC.

| **System action:** The transaction is abnormally terminated with a CICS transaction dump.

| **User response:** This is a CICS internal logic error.

| A level 2 trace for 'CP' of the transaction shows the course of events prior to this error. For example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

| You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

| **Modules:** DFHCPCLR, DFHCPLC

| **AAOO**

| **Explanation:** CPI Communications has been invoked with an invalid first parameter. The first parameter should be the code of the function to be performed. This is a CICS internal logic error.

| **System action:** The transaction is abnormally terminated with a CICS transaction dump.

| **User response:** A level 2 trace for 'CP' of the transaction shows the course of events before this error occurred (such as the modules called and their parameters) plus details of the error itself.

| You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

| **Modules:** DFHCPARH

| **AAOP**

| **Explanation:** The CPI Communications state machine has been requested to perform a state transition request that is considered to be an 'impossible' situation. (The *SAA CPI Communications Reference* manual, (SC26-4399) documents all these situations.)

| There are two possible causes of this error:

- The CPC (conversation control block) has been overwritten in such a way that the conversation state has been altered, or
- There is an error in the CPI Communications state machine.

| **System action:** The transaction is abnormally terminated with a CICS transaction dump.

| **User response:** A level 2 trace for 'CP' of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

| The transaction dump shows the CPC. You may need further assistance from IBM to fully resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

| **Modules:** DFHPCPFS

| **AAOQ**

| **Explanation:** The return code generated by CPI Communications does not have an entry in the state table against the current CPI Communications verb. This error is detected by the CPI Communications state machine.

| **System action:** The transaction is abnormally terminated with a CICS transaction dump.

| **User response:** This is a CICS internal logic error.

| A level 2 trace for 'CP' of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

| You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

| **Modules:** DFHPCPFS

| **AAOR**

| **Explanation:** CPI Communications has detected an invalid value in the CPC (conversation control block).

| There are 2 possible causes of this error:

- | • The CPC (conversation control block) has been overwritten, or
- | • There is an error in CPI Communications which causes it to reject valid values.

| **System action:** The transaction is abnormally terminated with a CICS transaction dump.

| **User response:** A level 2 trace for 'CP' of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

| **Modules:** DFHCPIC

| **AAOS**

| **Explanation:** CPI Communications has detected that the conversation state is RESET for a situation where this should not occur. That is, the conversation control block (CPC) is about to be deleted.

| There are two possible causes of this error:

- | • The CPC has been overwritten, or
- | • There is an error in CPI communications.

| **System action:** The transaction is abnormally terminated with a CICS transaction dump.

| **User response:** A level 2 trace for 'CP' of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself. You may need further assistance from IBM to fully resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

| **Modules:** DFHCPIC

| **AAOT**

| **Explanation:** While chaining through the CPCs (conversation control blocks) for a given conversation, CPI Communications detected that the chain was broken.

| There are two possible causes of this error.

- | 1. The CPC chain has been overwritten, or
- | 2. There is an error in the CPI Communications chaining mechanism.

| **System action:** The transaction is abnormally terminated with a CICS transaction dump.

| **User response:** Determine which of the above caused the error.

| A level 2 trace for 'CP' of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

| You may need further assistance from IBM to fully resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

| **Modules:** DFHPCPBI

| **AAOU**

| **Explanation:** CPI Communications has detected an error in the TP_name or partner_LU_name while processing an initialize conversation request. The TP_name or partner_LU_name is obtained by lookup of the sym_dest_name in the partner resource table (PRT).

| There are two possible causes of this error.

- | 1. The entry in the PRT contains invalid data, or
- | 2. There is an error in the mechanism that returns the data from the PRT and interprets it.

| **System action:** The transaction is abnormally terminated with a CICS transaction dump.

| **User response:** A level 2 trace for 'CP' of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

| You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

| **Modules:** DFHPCBBI

| **AAOV**

| **Explanation:** CPI Communications has detected that its internal state table is corrupted.

| This error is detected by the CPI Communications state machine.

| **System action:** The transaction is abnormally terminated with a CICS transaction dump.

| **User response:** This is a CICS internal logic error.

| A level 2 trace for 'CP' of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

| You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

| **Modules:** DFHPCFCS

| **AAOW**

| **Explanation:** CPI Communications has detected an internal logic error in DFHCPCLC.

| **System action:** The transaction is abnormally terminated with a CICS transaction dump.

| **User response:** This is a CICS internal logic error.

| A level 2 trace for 'CP' of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

| You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

| **Modules:** DFHCPCLC

| **AAOX**

| **Explanation:** CPI Communications has detected a bad syncpoint return code which has been set on a synclevel 0 or 1 conversation. The bad return code is only expected on a synclevel 2 conversation.

| **System action:** The transaction is abnormally terminated with a CICS transaction dump.

| **User response:** This is a CICS internal logic error.

| A level 2 trace for 'CP' of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

| You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

| **Modules:** DFHCPIC

| **AAOY**

| **Explanation:** CPI Communications detected an invalid LL field in the GDS records from which it was receiving on a mapped conversation.

| Although it is possible that the remote system is sending invalid records, it is more likely to be an error in the receive logic because DFHZARRC (a lower level receive module) also checks the LLs before passing them to CPI Communications.

| **System action:** The transaction is abnormally terminated with a CICS transaction dump.

| **User response:** Use CICS traces and, possibly a VTAM trace, to determine the data that was sent between both systems.

| A level 2 CICS trace for 'CP' of the transaction documents the course of events prior to this error (such as the modules called and their parameters). The level 2 trace also provides details of the error itself.

| You may need further assistance from IBM to fully resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

| **Modules:** DFHPCRB

| **AAOZ**

| **Explanation:** CPI Communications has detected an invalid ID field in the GDS records it was receiving on a mapped conversation. The exception trace point that accompanies this abend gives the ID field in data 3. The valid IDs are '12FF'X for application data and '12F1'X for null data.

| **System action:** The transaction is abnormally terminated with a CICS transaction dump.

| **User response:** Use CICS traces and, possibly, a VTAM trace to determine the data that was sent between both systems.

| A level 2 CICS trace for 'CP' of the transaction documents the course of events prior to this error (such as the modules called and their parameters). The level 2 trace also provides details of the error itself.

| You may need further assistance from IBM to fully resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

| **Modules:** DFHPCRB

| **AAO2**

| **Explanation:** CPI Communications has detected an unexpected response from DFHLUC.

| **System action:** The transaction is abnormally terminated with a CICS transaction dump.

| **User response:** This is a CICS internal logic error.

| A level 2 CICS trace for 'CP' of the transaction documents the course of events prior to this error (such as the modules called and their parameters). The level 2 trace also provides details of the error itself.

| You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

| **Modules:** DFHPCBA

AAO3

| **Explanation:** The CPI interface detected that a call was made to a CPI Communications function without CPI Communications being initialized. This implies that CPI Communications initialization failed while CICS was initializing.

| **System action:** The transaction is abnormally terminated with a CICS transaction dump. An exception trace entry is also written when this event occurs.

| **User response:** Check the console listing to determine the reason why CPI Communications failed to initialize during CICS initialization. Correct the problem and restart CICS.

| If the console listing indicates that CPI Communications initialized successfully, you need further assistance to resolve the problem. Collect the console listing, the traces and the transaction dump. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

| **Modules:** DFHCPI

AAO4

| **Explanation:** DFHZARL, or a module called by DFHZARL, has detected a logic error. This error is almost certainly caused by the module receiving invalid data or indicators from VTAM.

| **System action:** Before returning to the CPI Communications layer, DFHZARL calls DFHZNAC to clean up the session and put out messages on the CSNE log. CPI Communications abnormally terminates the transaction with a CICS transaction dump, and produces an exception trace entry.

| **User response:** Check the CSNE log to determine the type of error. You may need further assistance from IBM to fully resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

| **Modules:** DFHCPLR

AAO5

| **Explanation:** The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The domain that first detected the purged condition provides an exception trace.

| **System action:** The task is abnormally terminated with a CICS transaction dump.

| **User response:** Investigate the reason why the task was purged. It was purged either by the master terminal operator or as a result of deadlock timeout.

| **Modules:** DFHPCBA, DFHCPCBI, DFHCPCBS

AAO7

| **Explanation:** The CPI Communications syncpoint request handler has been passed an invalid DFHLUC parameter list. This is a CICS internal logic error.

| **System action:** The transaction is abnormally terminated with a CICS transaction dump.

| **User response:** A level 2 trace for 'CP' of the transaction shows the course of events before this error occurred (such as the modules called and their parameters) plus details of the error itself. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

| **Modules:** DFHCPSRH

AAO8

| **Explanation:** The CPI Communications syncpoint request handler has been passed an invalid conversation control block (CPC). This is a CICS internal logic error.

| **System action:** The transaction is abnormally terminated with a CICS transaction dump.

| **User response:** A level 2 trace for 'CP' of the transaction shows the course of events before this error occurred (such as the modules called and their parameters) plus details of the error itself. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

| **Modules:** DFHCPSRH

AAO9

| **Explanation:** A task has been purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

| **System action:** The task is abnormally terminated with a CICS transaction dump.

| **User response:** Investigate why the task was purged.
| If the task was purged by the master terminal operator, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.
| If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the

| number of tasks in the system. If the amount of main storage cannot be increased, the number of tasks in the system should be reduced to avoid short-on-storage situations. Another possibility would be to increase the value of the DTIMOUT option for the transaction.

| **Modules:** DFHCPCLR

Abend codes ABxx

ABAC

| **Explanation:** An activity issued EXEC CICS RETURN (without the ENDACTIVITY option) but no events were processed during the activation. The activity was executed with a RUN command.

| **System action:** The task is abnormally terminated with a CICS transaction dump. The EXEC CICS HANDLE ABEND command cannot handle this abend.

| **User response:** Investigate why the activity did not process any events.

| **Module(s):** DFHBASP

ABAD

| **Explanation:** An activity issued EXEC CICS RETURN ENDACTIVITY while there were activity completion events pending. The activity was executed with a RUN command.

| **System action:** The task is abnormally terminated with a CICS transaction dump. The EXEC CICS HANDLE ABEND command cannot handle this abend.

| **User response:** Investigate why the activity had pending activity completion events.

| **Module(s):** DFHBASP

ABAE

| **Explanation:** An activity issued EXEC CICS RETURN (without the ENDACTIVITY option) but no events were processed during the activation. The activity was executed with a LINK command.

| **System action:** The task which issued the LINK is abnormally terminated with a CICS transaction dump. The EXEC CICS HANDLE ABEND command cannot handle this abend.

| **User response:** Investigate why the activity did not process any events.

| **Module(s):** DFHEIBAM

ABAF

| **Explanation:** An activity issued EXEC CICS RETURN ENDACTIVITY while there were activity completion

| events pending. The activity was executed with a LINK command.

| **System action:** The task which issued the LINK is abnormally terminated with a CICS transaction dump. The EXEC CICS HANDLE ABEND command cannot handle this abend.

| **User response:** Investigate why the activity had pending activity completion events.

| **Module(s):** DFHEIBAM

ABLA

| **Explanation:** The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The domain that first detected the purged condition provides an exception trace.

| **System action:** The task is abnormally terminated with a CICS transaction dump.

| **User response:** Investigate why the task was purged. It was purged either by the master terminal operator or as a result of deadlock timeout.

| If the task was purged by the master terminal operator, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

| If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, the number of tasks in the system should be reduced to avoid short-on-storage situations. Another possibility would be to increase the value of the DTIMOUT option for the transaction.

| **Module(s):** DFHMCP, DFHMCPE, DFHM32, DFHPBP, DFHRLR

ABLB

| **Explanation:** An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump (depending on the options in the dump table).

| **System action:** The task is abnormally terminated with a CICS transaction dump.

User response: Please see the related message produced by the domain that originally detected the error.

Modules: DFHMCP, DFHMCPE, DFHM32, DFHPBP, DFHRLR

ABMA

Explanation: The user has supplied a terminal I/O area (TIOA) with an invalid data length that was either equal to zero or greater than the storage accounting length minus 12.

Alternatively, the length field of a header or trailer area provided by the application program is invalid (that is, not positive).

Problem determination: The output services work area (OSPWA) is in user storage and will be printed in a transaction dump. It is addressed by register 2 at the time of the abend. Relevant fields are:

- OSPTR7
- OSPHDRA
- OSPTRLA

Register 4 or OSPTIOA points to the TIOA. In the TIOA, the following fields are relevant:

- TIOATDL
- TIOASAL

Analysis:

Register	Label	Description
R4=@TIOA	PBCKTDL	TIOATDL is zero or greater than TIOASAL-12.
R2=@OSPWA R0=length of trailer R8=@trailer	PBD20080	R0 (= first halfword of trailer) is zero. R8=OSPTRLA. OSPTR7 has X'20' bit set.
R2=@OSPWA R8=@header R0=length of header.	PBDTXHDR	R0 (= first halfword of header) is zero. R8=OSPHDRA. OSPTR7 has X'40' bit set.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Correct the program that supplied the erroneous data length.

Check the TIOA. If either of the conditions described is present, check the application program. For programs using command-level interface, the TIOA is obtained by CICS using the length of the data item passed in the FROM option on an EXEC CICS SEND MAP or EXEC CICS SEND TEXT command, or in the TRAILER or HEADER option on an EXEC CICS SEND TEXT or an EXEC CICS SEND PAGE command. Check the data item for zero length.

Header and trailer records have a special format

1200 CICS TS for z/OS: CICS Messages and Codes

described in the *CICS Application Programming Reference*. An ABMA abend occurs if the first halfword (the length) is not positive. Check the remainder of the header/trailer record for validity when the length is checked.

Modules: DFHPBP, DFHMCP

ABMB

Explanation: The user has specified a cursor position in the BMS output request. It is larger than the current screen size for the 3270 for which output is being built.

Problem determination: If the abend occurs in DFHPBP:

At the time of the abend, register 2 points to the OSPWA and register 1 to the TTP. Relevant fields are:

- OSPTR3 has X'10' bit set to indicate a user-specified cursor position
- OSPCP contains a halfword cursor position specified by user
- TTPSCSZ contains the halfword value of the screen size to compare against.

If the abend occurs in DFHMCP or DFHMCX:

- Register 6 points to the OSPWA (in LIFO storage)
- OSPCP contains a halfword cursor position specified by user
- OSPTR3 has X'10' bit set to indicate a user-specified cursor position
- OSPSCSZ contains the halfword value of the screen size to compare against.

Analysis:

Register	Label	Description
In DFHPBP: R2=@OSPWA R1=@TTP	PBDBADC	OSPTR3 X'10' bit set indicates the user-specified cursor position. TTPSCSZ halfword screen size. OSPCP halfword cursor position.
In DFHKCP or DFHMCX: R6=@OSPWA	MCENEAU2	OSPTR3 X'10' bit set indicates the user-specified cursor position. OSPSCSZ halfword screen size. OSPCP halfword cursor position.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Correct the program that specified the incorrect cursor location.

Use trace to identify the statement issuing the request.

Check that the cursor position is being correctly set. The program may have been designed to run in alternate screen size mode but is being run in default screen size mode, or it may have been designed to run on a 3270 model different from the one in use. If the program is routing a message, the route list should be checked. If the program is to run with various 3270 models, the cursor position should be within the size of the smallest screen.

Modules: DFHPBP, DFHMCP (for minimum-function BMS), DFHMCX

ABMC

Explanation: The CMSG transaction is attempting to send a message to a greater number of terminals than is possible. There is no fixed maximum because the value depends on the other operands specified on the routing command.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Redefine the route list.

Modules: DFHMCP

ABMD

Explanation: DFHTPR or DFHTPP has issued a DFHDI TYPE=SEND and has received a return code other than "FUNCERR-REQUEST FOR CHANGE DIRECTION SIALED" or "NORESP"

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Inform your system programmer.

Modules: DFHTPP, DFHTPR

ABME

Explanation: DFHTPR or DFHTPP has detected an invalid datastream or DFHWBMS detected invalid forms data while processing a basic mapping support (BMS) request.

System action: The transaction is abnormally terminated with a CICS transaction dump. If the ABEND was issued from DFHTPR or DFHTPP then register 7 indicates the location at which the ABEND was detected.

User response: If DFHTPR or DFHTPP issued the ABEND then examine the transaction dump for bad data in the TIOA. If the origin of the bad data is an application program, correct the program. If DFHWBMS issued the ABEND then check the validity of the incoming forms data in the CICS trace.

Modules: DFHTPP, DFHTPR, DFHWBMS

ABMF

Explanation: The value specified for the length option of the basic mapping support (BMS) send map is greater than the length of the 'from' area.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Redefine the value for the length option.

Modules: DFHPBP

ABMG

Explanation: The user has requested a basic mapping support (BMS) service that was not specified at system generation, or at initialization.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Correlate services requested against options specified in the system generation of BMS.

Follow this procedure:

1. Scan the trace table for the transaction ID that issued the abend. If this is CSPQ (page cleanup), module DFHTPQ abnormally terminated because a message purge delay of zero has been specified and CSPQ has been entered via a terminal. The message purge delay is specified in the PRGDLY of the DFHSIT macro, and its value can be found in SITPRGD.
2. Scan the trace table for the last BMS request (code 'FA'). Use the option bytes at the start of the failing module to see if the requested functions have been generated. For example, paging may have been requested, but standard or minimum BMS was specified in the SIT.
3. If the BMS request is compatible with the BMS options in the CICS system generation, some incompatible suffixing amongst BMS modules must have occurred. This can happen if the DFHSIT macro specified individual suffixes for the BMS modules.

The following modules differ between standard and full-function BMS:

DFHMCP
DFHRLR
DFHPBP
DFHTPP

Modules: DFHMCP, DFHTPQ

ABMI

Explanation: The map specified for a BMS input mapping request was not an input map.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Either define another input map or redefine the existing map.

Modules: DFHMCP, DFHMCX, DFHMCY

ABML

Explanation: The terminal control locate routine received invalid data from DFHRLR and returns with an error return code. DFHRLR is attempting to scan the TCT for a BMS ROUTE request with LIST=ALL or operator class or operator ID specified in the route list. The terminal control table may have been corrupted.

Problem determination: Register 11 points to the current TCTTE in the search.

The TCT prefix (DFHTCTFX) can be located from CSATCTBA.

The first terminal entry (TCTTE) in the TCT is addressed by TCTVTEBA.

TCTTETEL is the halfword offset from current TCTTE to the next.

Analysis: The current TCTTE address is either not on a full-word boundary or is not within the limits of the TCT, or the address of the next TCTTE, obtained by adding TCTTETEL to the current address, is invalid. This check is made by locate code (DFHZLOC) in DFHZCX.

Register	Label	Description
R11=@TCTTE	RLRLOCN	Issue DFHTC CTYPE=LOCATE

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

The terminal control table has probably been corrupted during execution. Attempt to scan through the TCT in a dump. (Because the system dump uses the same technique for printing all TCTTEs, the system dump fails at the same point.)

Determine which entry is incorrect. It may be that the TCTTE has been overwritten by user data that is recognizable in the dump.

Check the application program for references to the TCTTE pointer. Check for user data that may be addressed from the same pointer.

In an assembler program, there may be multiple equates for the TCTTE base register.

It may be that the TCT is being overwritten by some

earlier transaction. If this is so, it is probably one associated with the terminal whose TCTTE is overwritten.

Modules: DFHRLR for full-function BMS

ABMM

Explanation: An invalid map was specified.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Use the supplied dump to diagnose the problem. Register 6 contains the address of the BMS instruction being executed when the error was recognized.

Modules: DFHPBP

ABMO

Explanation: The map specified for a BMS output mapping request was not an output map.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Either define another output map or redefine the existing map.

Modules: DFHMCP, DFHMCX, DFHMCY

ABMQ

Explanation: The query transaction (CQRY) has been initiated and either the task is not terminal-oriented, or the associated terminal is not defined to CICS as a 3270 or SCSPRINT device. This abend will occur if CQRY is entered at a console, even when the console is a 3270 device, since the console has the appearance to CICS of a keyboard/prINTER device. The CQRY transaction does not have an operator interface, and under normal conditions there is no need for an operator to invoke CQRY or for a user transaction to START the CQRY transaction. CQRY is run automatically by CICS when a 3270 or SCSPRINT device connects. In the transaction dump, register 8 contains the address of the TCTTE for the associated terminal. If register 8 contains zero, this indicates that the task is not terminal-oriented.

System action: The task is abnormally terminated with a CICS dump.

User response: Ensure that the terminal associated with CQRY is of the 3270 or SCSPRINT family of devices.

Modules: DFHQRY

ABMR

Explanation: The Page Retrieval transaction (CSPG) has been initiated but the task is not terminal-oriented.

System action: The task is abnormally terminated with a CICS dump.

User response: Ensure that a terminal is associated with the CSPG transaction.

Modules: DFHTPR

ABMU

Explanation: The application program supplied an address that is not within region boundaries. The low-order 3 bytes of general register 1 in the transaction dump contain the erroneous address. The high-order byte of register 1 indicates the address type as follows:

X'01' - Title address (TCAMSTA)
X'02' - Alternate I/O area address (TCAMSIOA)
X'03' - Map address (TCABMSMA)
X'04' - Header address (TCAMSHDR)
X'05' - Route list address (TCAMSRLA)
X'06' - Trailer address (TCAMSTRL)
X'07' - Map set address (TCAMSMSA)
X'08' - TIOA address (TCTTEDA)

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Correct the application program that is supplying the erroneous address.

Modules: DFHMCP, DFHEMS

ABMV

Explanation: DFHRLR has detected an invalid route list entry.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Check that the route list is correctly built with reserved field in the entry containing blank and a stopper of halfword X'FFFF' to terminate the list.

Modules: DFHRLR

ABMX

Explanation: A text string passed to BMS contained a set attribute order that was invalid for one of the following reasons:

1. The set attribute sequence was less than three characters.
2. The attribute type was invalid.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Correct the application program.

Modules: DFHPBP

ABMY

Explanation: BMS is building a TTP (Terminal Type Parameter) control block but the pagesize selected for a terminal by BMS is zero because either the default or alternate screensize has been defined as zero.

In the transaction dump, significant general purpose register contents are as follows:

1. Register 6 points to the BMS extension of the TCTTE
2. Register 10 points to the TTP (Terminal Type Parameter) control block
3. Register 11 points to the TCTTE

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check the TERMINAL and TERMTYPE definitions which determined the attributes of the offending TCTTE.

Modules: DFHRLR

ABMZ

Explanation: The address of the terminal I/O area (TIOA) in TCTTEDA was found to be zero.

When using BMS fast path as a result of an EXEC CICS RECEIVE MAP, DFHEMS always initializes TCTTEDA with the address of the TIOA. If TCTTEDA is subsequently found to be zero by DFHMCX, an overwrite must have occurred.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Investigate why TCTTEDA is zero.

Scan the trace table for the last BMS request (code FA) for the failing task and try to determine which user programs have been given control since that BMS request.

Modules: DFHMCP, DFHMCX, DFHMCY

ABM0

Explanation: The map specified for a basic mapping support (BMS) request could not be located.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Check if the map has been defined. If it has, check that it has been specified correctly.

Modules: DFHMCP, DFHMCX, DFHMCY

ABM1

Explanation: A basic mapping support (BMS) service is requested by a task associated with a terminal that is not supported by BMS. The request is not a routing request.

Problem determination: At the time of the abend, register 11 addresses the TCTTE, and TCTTETEA and register 6 address the TCTTE extension, TCTTETTE.

Relevant fields are:

TCTTEDDS the device dependent suffix.
TCTTEMSS the map set suffix.

Analysis: DFHRLR tests the device dependent suffix and the map set suffix in the TCTTE extension. If both of these are zero, the terminal is not supported by BMS and DFHRLR abends the task with the abend code ABM1.

Register	Label	Description
R4=	RLRSFXCK	TCTEDDS=X'00' and TCTEMSS=X'00'.
@TCTTETE		The device dependent suffix and the map set suffix have loaded into the lower two bytes of register 3 by the subroutine RLRSUFXS.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Do not use terminals not supported by BMS for applications using BMS services.

Check the terminal type and model number. Confirm that it is a terminal that is not supported by BMS. A list of terminals supported by BMS is given in the *CICS Application Programming Guide*. Check that the TCT macro for the terminal accurately describes the physical terminal.

Modules: DFHRLR

ABM2

Explanation: No user data was supplied for this BMS request. That is, the address of a user data area was not found in either TCTTEDA or TCAMSIOA.

When a BMS macro level output request is issued, the user must have placed the address of the data to be passed to BMS in TCTTEDA or TCAMSIOA before issuing the macro. The choice is made on the following criteria:

- If the data is to be passed in a TIOA by a terminal-oriented task, the address of this TIOA may be placed either at TCTTEDA, or in TCAMSIOA together with the setting of binary zeros into TCTTEDA.
- If the data is being passed by a terminal-oriented task but not in a TIOA, the address of the TIOA-like area of this data must be placed in TCAMSIOA and binary zeros set into TCTTEDA.
- If the data is being passed by a non-terminal-oriented task, the address of the TIOA-like area of this data must be placed in TCAMSIOA. TCTTEDA cannot be referenced, because there is no TCTTE associated with this task.

If a task attempts to pass addresses from both TCTTEDA and TCAMSIOA, the address in TCTTEDA is the one selected.

Problem determination: The output services work area (OSPWA) is addressed by register 9. The TCTTE is addressed by register 11. The TCA is addressed by register 12.

The relevant fields are:

Field	Description
OSPIND01	OSPWA indicator byte 1
OSPIOA	Alternate I/O area address
OSPSIOA	Address of address of data (TCTTEDA/TCAMSIOA)
OSPTIOA	Address of user data found by BMS
OSPTR1-8	BMS request data saved from the TCA
TCTTEDA	Terminal data area address
TCAFCI	Facility control indicator
TCAMSIOA	Alternate I/O area address

Analysis: The ABM2 abend is invoked at one point in DFHMCP, at label MCPABEND. There are five regions in DFHMCP in which the user's data is sought:

	Labels
TYPE=MAP	MCPMAP
TYPE=PAGEBLD,DATA=YES/ONLY	MCPPGBLD MCPGTIOA
TYPE=TEXTBLD,DATA=YES/ONLY	MCPPGBLD MCPGTIOA
Mapping but not PAGEBLD,DATA=YES/ONLY	MCPMAPNG
No (mapping,PAGEBLD,TEXTBLD,PAGEOUT)	MCPDFALT

"Mapping" refers to BMS requests that specify maps, that is OSPTR3 bits 5 or 6 or 7 or OSPTR4 bit 3 set on.

Each of these functional regions does a BAL to subroutine MCPFTIOA to search for a user data area. If a valid area (abend ABMU if not) is found, its address is put into OSPTIOA and the address of the data address (of TCAMSIOA or TCTTEDA) is set into OSPSIOA. If a data area is not found, OSPTIOA is cleared and OSPSIOA is now loaded with the address of OSPTIOA as a null data area.

On the BAL return, OSPTIOA is tested for a nonzero value. If it is zero, a branch to MCPABEND is taken.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: The programmer must place the

address of the data into TCTTEDA or TCAMSIOA, whichever is appropriate.

Firstly, check that the user has loaded TCTTEDA or TCAMSIOA with the address of the user data, by checking the application listing and the contents of TCTTEDA and/or TCAMSIOA.

Next, check that the BMS request has been correctly decoded by CICS by referring to the OSPWA request bytes (OSPTR1-8) or decoding the last BMS entry in the trace table. See OSPIND01 to check correct decoding of PAGEBLD or TEXTBLD, and TCAFCI bit 7 to identify whether the task is terminal-oriented or not.

At the abend point, register 1 contains the user data address last loaded, and register 4 the address of OSPTIOA as an address of null data.

If a CICS error is suspected, concentrate initially on subroutine MCPFTIOA, because this is a simple piece of code that shows the data-fetch logic. ABM2 condition is trapped early in the CICS decoding of the DFHBM request and involves module DFHMCP only.

Case/Register	Label	Description
R9=@OSPWA	MCPMAP	OSPTR4 has OSPTRM (X'04') bit set for TYPE=MAP.
R9=@OSPWA	MCPGBLD	OSPTR5 has OSPTRB (X'80') bit set and BMS sets bit OSPLMPB (X'08') in OSPIND01 for TYPE=PAGEBLD. OSPTR4 has X'40', X'80', or X'C0' set for DATA=NO, ONLY, or YES respectively, so should be X'80' or X'C0'.
R9=@OSPWA	MCPXBLD	OSPTR7 has OSPTRX (X'80') bit set and BMS sets bit OSPLMTB (X'04') in OSPIND01 for TYPE=PAGEBLD. OSPTR4 has X'40', X'80', or X'C0' set for DATA=NO, ONLY, or YES respectively, so should be X'80' or X'C0'.
R9=@OSPWA	MCPMAPNG	OSPTR3 has OSPTS (X'01'), OSPTSA (X'02'), or OSPTMN (X'04') bits set, or OSPTR4 has OSPTMA (X'10') bit set for mapping. OSPTR4 has X'04' or X'80' or X'C0' set for DATA=NO, ONLY, or YES

respectively, so should be X'80' or X'C0'.

All R12=@TCA	MCPFTIOA	TCAFCI has TCAFCITRM (X'01') bit set if the task is terminal-oriented.
All R11=@TCTTE	MCPFTIOA	TCTTEDA could point to a user TIOA but does not, thus causing the abend.
All R12=@TCA	MCPFTIOA	TCAMSIOA could point to a user data area (TIOA or otherwise), but does thus causing the abend.
All R9=@OSPWA	MCPNTOTM	OSPTIOA contains the address of the user area found, so is zero. OSPSIOA points to OSPIOA (which is copied from TCAMSIOA) as being the second-dry data area sought by BMS for data. OSPIA (TCAMSIOA) was also zero so causing the abend.

Modules: DFHMCP

ABM3

Explanation: A BMS input or output request has been issued from a task that is not terminal-oriented.

System action: The task is abnormally terminated with a CICS dump.

User response: The task issuing a BMS input or output request must be attached to a terminal.

Modules: DFHMCP

ABM4

Explanation: An invalid request response has been received to a temporary storage PUT or PUTQ request issued by BMS. The data passed to the temporary storage program has an invalid length.

Problem determination: Abend in DFHMCP (see Analysis)

The OSPWA (output services work area) is in user storage and is printed in a transaction dump. It is addressed by register 9 at the time of the abend. Relevant fields are:

OSPTITLE
 OSPTTCNT
 OSPLTI
 OSPTOTPG

The message control record (MCR) is an area of user storage obtained by BMS. It is addressed by register 8 at the time of the abend. The first 8 bytes contain storage accounting information. MCRLBB contains the length of the MCR (halfword) abend in DFHTPP.

The page buffer is addressed by register 7 at the time of the abend. It contains storage accounting fields in the first 8 bytes and a halfword length at offset 8 (TSIOAVRL).

In both cases, the temporary storage use map (DFHTSMAP) is addressed from CSATSATA. TSMAPCOM contains the number of available bytes in a control interval on the temporary storage data set.

Analysis: If the temporary storage request preceding the abend is a DFHTS PUT, the abend occurred in DFHMCP. If the temporary storage request preceding the abend is a DFHTS PUTQ, the abend occurred in DFHTPP. If the abend occurred in DFHMCP, DFHMCP is attempting to put the message control record to temporary storage. Check the length of the MCR (MCRLBB). It may be negative.

The length of the MCR is calculated by code following label MCPNODDS and is:

$$28 + 21 * OSPTTCNT + (\text{length of title record}) \\ + (\text{space for page/LDC table, if needed})$$

The address of the title record is at OSPTITLE and the length is contained in the first halfword. Space for the page/LDC table is required if OSPPLT1 is nonzero, which should occur only for messages routed to LDC devices (3600, 3650, 3767, 3770, 3790). The number of entries is in OSPTOTPG. 2 bytes are required per entry.

If the abend occurred in DFHTPP, BMS is attempting to add a page to the temporary storage queue, and the page buffer will not fit in the control interval. TSIOAVRL contains the length of the page buffer.

For messages directed to 3270 devices, the page buffer consists of a 3270 data stream with a 4-byte page control area following it (a 3270 data stream may be larger than the number of characters available on the screen, particularly if extended 3270 attributes are used). For messages directed to other devices, the page buffer consists of a message formatted with NL characters, a 4-byte page control area following it. The length in TSIOAVRL should be less than the length in the preceding storage accounting area, otherwise an error has occurred in constructing the page, possibly in prior BMS requests.

In either of the above cases, if the length of the area being output appears valid, it is necessary to increase the control interval size for the temporary storage data set.

Register	Label	Description
DFHMCP R8=@MCR	MCPMCRS	The MCR is too long or has invalid length (\$4).
DFHTPP R7=@pgbuf	TPNOPGL or TPNODDS	The page buffer is too large.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Determine from the trace table whether the abend occurred in DFHMCP or DFHTPP.

Check the length of the appropriate area.

If the MCR length is invalid, possible reasons are:

- The title record specified in the TITLE option on a BMS ROUTE request has an invalid format, that is, it does not begin with a halfword length field or is more than 64 characters.
- The message is being routed to more terminals than intended. OSPTTCNT is very large, for example, if LIST=ALL is specified on a ROUTE request and there are a large number of terminals in the TCT.

If the page buffer length is too large, this may be because more data than intended is being built into the page. If the page buffer length is greater than the length of the storage area indicated in the preceding storage accounting area, an error has occurred in page or text building, and the page buffer extends beyond the area allocated to it (that is, storage violation).

Modules: DFHMCP, DFHTPP

ABM5

Explanation: A DFHTS TYPE=PURGE request has been issued with an invalid REQID. This incorrect request was issued by basic mapping support (BMS).

DFHTPR cannot find the terminal identifier for the current terminal in the terminal list in the message control record (MCR).

Problem determination: The TS identifier is built in TCATSDI before the TS purge is issued, although this has probably been overwritten before the dump is taken. The trace table entry for the DFHTS TYPE=PURGE contains the TS identifier in the last 8 bytes.

The OSPWA is addressed by register 9.

OPSTSID temporary storage identifier (8 bytes).

Register 8 points to the MCR.

Register 5 points to the current entry.

Register 0 points to the end of table.

Register 9 points to the TCTTE.

The terminal list starts at MCRIDLST and the terminal identifier is at the start of the terminal entry. Each terminal entry is X'15' bytes long.

Analysis: DFHMCP uses the temporary storage identifier in OSPTSID.

Cannot find the terminal identifier for this terminal in the terminal list in the MCR.

Register	Label	Description
R9=@(OSPWA)	MCPCKPGS	Code builds the temporary storage code in TCATSDI and issues DFHTS TYPE=PURGE macro, specifying IDERROR exit of MCPTSIDE, where the abend is raised.
R8=@(MCR)	TPRCKID	Code scans terminal list for a terminal entry that has the id of the current terminal, and if it cannot be found, links to TPRSNI to raise the abend.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Check the trace table and find the preceding PUT/PUTQ TS requests. Check whether the identifier for the PUT/PUTQ is the same as that for the PURGE. If it is not, find out how they differ. Check to see if the OSPWA has been corrupted.

This error is very unlikely, as the label indicates (TPRSNI - "Should Not Happen"). DFHTPS has scanned the MCR to identify the terminals to which this message is directed, and has created an AID to initiate CSPG (DFHTPR) at each of them. However, when DFHTPR retrieves the MCR, it cannot find the current terminal identifier in the list of terminals. Presumably the MCR has been corrupted between creation of the AID and dispatching of CSPG at the terminal. Check back through the trace table to find the instance of DFHTPS that built the AID for this terminal (transaction CSPS); it will have issued a TC LOCATE request to verify that the terminal identifier is valid, and this identifier can be seen in the trace entry.

Modules: DFHMCP, DFHTPR

ABM6

Explanation: Transaction CSPS, scheduled internally by BMS, has not been installed.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Install the transaction CSPS (Group DFHBMS).

Modules: DFHMCP

ABM7

Explanation: The trailer specified to be used while building pages of text data is longer than the page.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Correct the application program that issues the request with too long a trailer.

Modules: DFHPBP

ABM8

Explanation: A BMS text request specified a value for the JUSTIFY option which is zero or too large for the page being built.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Correct the application program that specified too large or zero value for the JUSTIFY option.

Modules: DFHPBP

ABM9

Explanation: The text data overflow routines have been reentered while text overflow was in process. This condition occurs when the line requirements for the text header and/or trailer exceed the line capacity of the page for which data is being formatted.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Reduce the number of lines required for the header and/or trailer or increase the page size of the terminal.

Modules: DFHPBP

ABNA

Explanation: No route list was supplied with a route request received from the remote system.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHTPS

ABNB

Explanation: Either the principal facility of the task is not a TCTTE of the correct type, or the task has no principal facility.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Ensure that DFHTPS has not been specified as the initial program of a transaction other than CSPTS. Check that the operator did not enter CSPTS from the terminal.

Modules: DFHTPS

ABNC

Explanation: An attempt to access a temporary storage queue failed.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Ensure that temporary storage is correctly generated.

Modules: DFHTPS

ABNE

Explanation: An error response was received from an invocation of a BMS TYPE=ROUTE or TYPE=STORE request.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check that BMS was correctly generated.

Modules: DFHTPS

ABNF

Explanation: The transaction was not in send mode when it sent data to the remote system.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHTPS

ABNG

Explanation: An attach request was received from the remote system without any data indicating the reason for the request.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM

to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHTPS

ABNH

Explanation: An attempt to ship data to the remote system failed.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHTPS

ABNI

Explanation: CICS could not find a profile for an LU6.2 transaction routing request.

System action: CICS terminates the task abnormally.

User response: Either you have specified an incorrect name in the PROFILE parameter of an EXEC CICS ALLOCATE command, or you have not installed the profile. Correct the error before resubmitting the transaction.

Modules: DFHTPS

ABNJ

Explanation: The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The task that first detected the purged condition provides an exception trace.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate the reason why the task was purged. It was purged either by the master terminal operator or as a result of a deadlock timeout.

Modules: DFHTPS

ABNK

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related message produced by the domain that detected the original error.

Modules: DFHTPS

ABRC

Explanation: The bridge exit is not defined and could not be autoinstalled.

System action: The task is abnormally terminated with a CICS transaction dump. The user transaction will not be started.

User response: Either define the program using RDO or change the program autoinstall exit to allow it to be autoinstalled.

Modules: DFHBRMS, DFHBRTC

ABRD

Explanation: The bridge exit is disabled.

System action: The task is abnormally terminated with a CICS transaction dump. The user transaction will not be started.

User response: Identify why the bridge exit is disabled. Enable the bridge exit and retry the action.

Modules: DFHBRMS, DFHBRTC

ABRE

Explanation: The bridge exit could not be loaded.

System action: The task is abnormally terminated with a CICS transaction dump. The user transaction will not be started.

User response: Investigate why it cannot be loaded. It may not have been defined in the DFHRPL library.

Modules: DFHBRMS, DFHBRTC

ABRF

Explanation: The bridge exit is defined as remote.

System action: The task is abnormally terminated with a CICS transaction dump. The user transaction will not be started.

User response: Define the bridge exit as a local program.

Modules: DFHBRMS, DFHBRTC

ABRG

Explanation: An invalid bridge facility token was specified

System action: The task is abnormally terminated with a CICS transaction dump. The user transaction will not be started.

User response: This error was probably caused by the incorrect data being sent to the bridge exit from the client application.

Check the data set by tracing the data sent from the client application.

Ensure that the bridge facility token in the data transmitted by the application is correct.

Modules: DFHBRXM

ABRH

| **Explanation:** The bridge facility token specified is not known to CICS.

| **System action:** The task is abnormally terminated with a CICS transaction dump. The user transaction will not be started.

| **User response:** The most likely error is that the client application specified too small a keep time for the bridge facility. Before the client reused the bridge facility token, CICS had already discarded it. Check the bridge facility keep time in the outbound messages. CICS will use the keep time value specified in the last message used by a transaction. Alternatively use the trace or CEDX to look at the keep time in the BRXA passed back on the terminate call to the bridge exit.

| Another possible error is that the client application passed a request to a CICS system other than that on which the original request was sent. Bridge facilities are only valid on a single CICS system.

| **Modules:** DFHBRXM

ABRI

Explanation: There are no free bridge facility tokens available. This is probably due to excessive keep time values being specified on the bridge exit termination call.

System action: The task is abnormally terminated with a CICS transaction dump. The user transaction will not be started.

User response: Review the keep time values used by the client applications. If some client applications are returning excessive values, modify the bridge exit to specify a limit to the values.

Modules: DFHBRXM

ABRJ

Explanation: An invalid FACILITYLIKE value was specified.

The FACILITYLIKE value can be specified on the bridge exit initialization call. If the default value (blanks) is returned, the value in the user transaction profile definition is used. If no FACILITYLIKE value is specified in the profile definition, a value of CBRF is used.

The name must be that of an installed VTAM 3270 terminal.

System action: The task is abnormally terminated with a CICS transaction dump. The user transaction will not be started.

User response: Define the terminal specified by FACILITYLIKE, change the value on the profile definition, change the value supplied by the client application, or install a terminal definition for CBRF

Modules: DFHBRXM

ABRK

Explanation: The USERID check failed following the call to the bridge exit.

System action: The task is abnormally terminated with a CICS transaction dump. The user transaction will not be started.

User response: Enter the correct password. If the password is correct or was not supplied, review the RACF definitions.

Modules: DFHBRXM

ABRN

Explanation: The bridge exit returned a value in BRXA_RESP that is not valid for the command for which it was invoked.

System action: The transaction is backed out.

User response: Change the bridge exit to only return valid response settings.

Modules: DFHBRIC, DFHBRMS, DFHBRSP, DFHBRTC

ABRQ

Explanation: The bridge exit issued an abend.

System action: The transaction is backed out.

User response: Identify why the bridge exit abended.

Modules: DFHBRMS, DFHBRTC

ABRR

Explanation: The user transaction's profile could not be found.

System action: The task is abnormally terminated with a CICS transaction dump. The user transaction is not started.

User response: Check that the profile name in the user transaction definition is correct, and that this profile has been defined.

Modules: DFHBRXM

ABRX

Explanation: The bridge facility was invalid when a transaction started. This can occur when MAXTASK is reset to a low value on a busy system. The bridge facility can time out and be deleted before the user transaction is started.

System action: The user transaction will abend during initialisation.

User response: None.

Modules: DFHBRXM

ABRY

Explanation: CICS returned an unexpected error running the bridge exit. This is a CICS internal error.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHBRMS, DFHBRTC

ABRZ

Explanation: The bridge exit returned invalid data in the BRXA.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: If a user supplied bridge exit was used, review the format of the data returned by the exit.

If a CICS supplied exit was used, this is a CICS error. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHBRIC, DFHBRMS, DFHBRSP, DFHBRTC, DFHXMBR

ABR3

Explanation: An unsupported BMS request was received by the bridge exit.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: The bridge only supports minimum function BMS and SEND TEXT. This transaction cannot be used in a bridge environment.

Modules: DFHEMS

ABR4

Explanation: The link DFHL3270 command did not specify a commarea.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: The link DFHL3270 command must specify a commarea to contain the BRIH and any message vectors.

Modules: DFHBRMR

ABR5

Explanation: The commarea specified in the link DFHL3270 command is shorter than the BRIH.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: The link DFHL3270 command must specify a commarea to contain the BRIH and any message vectors.

Modules: DFHBRMR

ABR6

Explanation: The commarea specified in the link DFHL3270 command does not contain a valid BRIH.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: The link DFHL3270 command must specify a commarea which must contain a valid BRIH.

Modules: DFHBRMR

ABSA

Explanation: A message passed to DFHBSMSG is too long. This is a CICS internal error.

System action: CICS terminates the task abnormally with a dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHTBS

ABXA

Explanation: A next BRMQ vector in the input message passed to the formatter is the wrong type of a RECEIVE vector. RECEIVE and RECEIVE MAP have separate vectors.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: This may just indicate that the transaction has gone down an error path which should

result in a transaction backout. If not, the input message should have a BRMQ vector for this command. Change the client application, recompile and retry.

Modules: DFH0CBRF

ABXB

Explanation: The BRIH requested that outbound BMS vector must include the ADS descriptor. The map did not contain an ADS descriptor. This means that the mapset was not assembled with CICS TS 1.2 or later.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Either reassemble the mapset using the current level of BMS macros, or set BRIH-ADSDESCRIPTOR to BRIHADSD-NO (the default value is BRIHADSD-YES). Note that BRIHADSD-YES is required when codepage conversion of the Link3270 message is required (e.g. using ECI). If you need to reassemble the mapset and don't have the mapset source, the utility DFHBMSUP can be used to recreate it.

Modules: DFHBRMF

ABXC

Explanation: An error occurred when a SYNCPOINT request was issued by the bridge exit.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check for other CICS messages and exception trace entries to investigate the cause of the SYNCPOINT error.

Modules: DFH0CBRE

ABXD

Explanation: An error occurred when a SYNCPOINT ROLLBACK request was issued by the bridge exit.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check for other CICS messages and exception trace entries to investigate the cause of the SYNCPOINT ROLLBACK error.

Modules: DFH0CBRE

ABXE

Explanation: The bridge exit was expecting data to be passed on the BRDATA parameter of the START command. No data was found.

System action: The task is abnormally terminated with a CICS transaction dump.

| **User response:** Correct the transaction which issued the START. Recompile, reload and retry.

| **Modules:** DFH0CBAE,DFH0CBRE

| **ABXF**

| **Explanation:** An error was detected by the bridge exit when it tried to input the next message.

| **System action:** An exception trace is made of any error information. The task is abnormally terminated with a CICS transaction dump.

| **User response:** Check for other CICS messages and exception trace entries to investigate the cause of the input error.

| **Modules:** DFH0CBAE,DFH0CBRE,DFH0CBAI

| **ABXG**

| **Explanation:** An error was detected by the bridge exit when it tried to output the next message.

| **System action:** An exception trace is made of any error information. The task is abnormally terminated with a CICS transaction dump.

| **User response:** Check for other CICS messages and exception trace entries to investigate the cause of the output error.

| **Modules:** DFH0CBAE,DFH0CBRE

| **ABXH**

| **Explanation:** The user transaction issued a request which requires more data (such as a RECEIVE request). No data was available in the message, and mqcih-conversationaltask was set to mqcct-no which specifies that the transaction is non conversational.

| **System action:** The task is abnormally terminated with a CICS transaction dump.

| **User response:** This may be correct behaviour as defined by the client application. If it is not, the client application should either supply additional data, or be redesigned to allow the transaction to be conversational.

| **Modules:** DFH0CBRF

| **ABXI**

| **Explanation:** A message received by the bridge exit, exceeded the maximum message size.

| **System action:** An exception trace is made of the first 4K of data in error. The task is abnormally terminated with a CICS transaction dump.

| **User response:** Check that the client application is passing the correct data. If it is, it will be necessary to change the size of the buffer. This is in field

| block-length in the sample exit. Recompile and reload the exit and retry.

| **Modules:** DFH0CBAE,DFH0CBRE

| **ABXJ**

| **Explanation:** The bridge exit detected an error in the MQCIH header passed by the client application.

| **System action:** An exception trace is written containing the MQCIH header. The task is abnormally terminated with a CICS transaction dump.

| **User response:** The client application has either not set the MQCIH header, or is using a version of the header which is incompatible with the bridge exit. Correct the client application. Recompile, reload and retry.

| **Modules:** DFH0CBAE,DFH0CBRE

| **ABXK**

| **Explanation:** The bridge exit detected an error in the data passed on the BRDATA parameter of the START command.

| **System action:** An exception trace is made of the data in error. The task is abnormally terminated with a CICS transaction dump.

| **User response:** Correct the transaction which issued the START. Recompile, reload and retry.

| **Modules:** DFH0CBAE,DFH0CBRE

| **ABXM**

| **Explanation:** The bridge exit or formatter was called with a function or command which it doesn't support. This either indicates a storage overwrite, or that the bridge exit is not designed for this command.

| **System action:** An exception trace is made of the data in error. The task is abnormally terminated with a CICS transaction dump.

| **User response:** Check the BRXA data in the trace to see if there has been a storage overwrite, or whether the exit supports this command.

| **Modules:** DFH0CBAE,DFH0CBRE,DFH0CBRF

| **ABXN**

| **Explanation:** The formatter detected that the input message was truncated.

| **System action:** An exception trace is made of the first 4K of the message. The task is abnormally terminated with a CICS transaction dump.

| **User response:** Check that the transport mechanism allows for messages of this length. If this is correct, it indicates that the client application is issuing an

| incorrect message. Trace the outbound message on the client application. Recompile, reload and retry.

| **Modules:** DFH0CBRF

| **ABXO**

| **Explanation:** The formatter detected an error in a BRMQ vector passed by the client application.

| **System action:** The field MQCIH-ERROROFFSET is set to indicate the position of the error in the message. An exception trace is made of the MQCIH and BRMQ vector. The task is abnormally terminated with a CICS transaction dump.

| **User response:** Correct the client application. Recompile, reload and retry.

| **Modules:** DFH0CBRF

| **ABXP**

| **Explanation:** The formatter detected an error in a BRMQ vector header passed by the client application.

| **System action:** The field MQCIH-ERROROFFSET is set to indicate the position of the error in the message. An exception trace is made of the MQCIH and BRMQ vector. The task is abnormally terminated with a CICS transaction dump.

| **User response:** Correct the client application. Recompile, reload and retry.

| **Modules:** DFH0CBRF

| **ABXQ**

| **Explanation:** The formatter could not find an ADSD vector as part of the BRMQ-RM vector when MQCIH-ADSDESCRIPTOR specified MQCADSD-MSGFORMAT.

| **System action:** An exception trace is made of the request. The task is abnormally terminated with a CICS transaction dump.

| **User response:** Correct the client application. Recompile, reload and retry.

| **Modules:** DFH0CBRF

| **ABXS**

| **Explanation:** An error was detected by the bridge exit when it tried to open the queue for the input or output message.

| **System action:** An exception trace is made of any error information. The task is abnormally terminated with a CICS transaction dump.

| **User response:** Check for other CICS messages and exception trace entries to investigate the cause of the open error.

| **Modules:** DFH0CBRE

| **ABXU**

| **Explanation:** The conversion between client code page and server code page is not supported by CICS/390; for example conversion has been requested between Japanese code page 932 and Latin-1 code page 500.

| **System action:** The transaction is abnormally terminated with a transaction dump.

| **User response:** Ensure that the Client codepage, both default and overrides are in the same group as the Server codepage. for example client code page 852 from Latin-2 group, is only supported to server code page 870.

| **Modules:** DFHBRMF

| **ABXV**

| **Explanation:** The client code page which has been requested by the client is not one which CICS can support.

| **System action:** The transaction is abnormally terminated with a transaction dump.

| **User response:** Ensure that the Client codepage is valid.

| **Modules:** DFHBRMF

| **ABX1**

| **Explanation:** The bridge exit or formatter was called with an invalid BRXA-HEADER. This indicates a storage overwrite.

| **System action:** An exception trace is made of the data in error. The task is abnormally terminated with a CICS transaction dump.

| As CICS also does a check of the BRXA on return from the call to the exit, there will probably be a subsequent ABRZ abend.

| **User response:** Investigate the cause of the storage error, and retry.

| **Modules:** DFH0CBAE,DFH0CBRE,DFH0CBRF

| **ABX2**

| **Explanation:** The bridge exit or formatter was called with an invalid BRXA-TRANSACTION-AREA. This indicates a storage overwrite.

| **System action:** An exception trace is made of the data in error. The task is abnormally terminated with a CICS transaction dump.

| As CICS also does a check of the BRXA on return from the call to the exit, there will probably be a subsequent ABRZ abend.

| **User response:** Investigate the cause of the storage error, and retry.

| **Modules:** DFH0CBAE,DFH0CBRE,DFH0CBRF

| **ABX3**

| **Explanation:** The bridge exit or formatter was called with an invalid BRXA-COMMAND-AREA. This indicates a storage overwrite.

| **System action:** An exception trace is made of the data in error. The task is abnormally terminated with a CICS transaction dump.

| As CICS also does a check of the BRXA on return from the call to the exit, there will probably be a subsequent ABRZ abend.

| **User response:** Investigate the cause of the storage error, and retry.

| **Modules:** DFH0CBAE,DFH0CBRE,DFH0CBRF

| **ABX5**

| **Explanation:** The bridge exit or formatter was called without a user-area. This probably indicates an error in the bridge exit.

| **System action:** An exception trace is made of the data in error. The task is abnormally terminated with a CICS transaction dump.

| **User response:** Investigate the cause of the storage error, and retry.

| **Modules:** DFH0CBAE,DFH0CBRE,DFH0CBRF

| **ABX6**

| **Explanation:** The bridge exit or formatter was called with an invalid user-area. This indicates a storage overwrite or an error in the bridge exit.

| **System action:** An exception trace is made of the data in error. The task is abnormally terminated with a CICS transaction dump.

| **User response:** Investigate the cause of the storage error, and retry.

| **Modules:** DFH0CBAE,DFH0CBRE,DFH0CBRF

Abend codes ACxx

ACAA

Explanation: This explanation applies to the two transaction abend codes, ACAA and ACAD. CICS cannot find a match for a function code in the language definition table because the parameterized resource definition contains an unrecognized resource type code. The abend code issued depends on the DFHCAP operation that was invoked before the error occurred:

ABX7

| **Explanation:** A TC command passed to the formatter, exceeded the maximum message size.

| **System action:** An exception trace is made of the first 4K of data in error. The task is abnormally terminated with a CICS transaction dump.

| **User response:** Check that the user transaction is passing the correct data. If it is, it will be necessary to change the size of the buffer. This is in field block-length in the sample exit. Recompile and reload the exit and retry.

| **Modules:** DFH0CBRF

| **ABX8**

| **Explanation:** A next BMS BRMQ vector in the input message passed to the formatter does not contain the mapset requested to answer a RECEIVE MAP request.

| **System action:** The task is abnormally terminated with a CICS transaction dump.

| **User response:** This may just indicate that the transaction has gone down an error path which should result in a transaction backout. If not, the input message should have a BRMQ vector for this mapset. Change the client application, recompile and retry.

| **Modules:** DFH0CBRF

| **ABX9**

| **Explanation:** A next BMS BRMQ vector in the input message passed to the formatter does not contain the mapname requested to answer a RECEIVE MAP request.

| **System action:** The task is abnormally terminated with a CICS transaction dump.

| **User response:** This may just indicate that the transaction has gone down an error path which should result in a transaction backout. If not, the input message should have a BRMQ vector for this mapname. Change the client application, recompile and retry.

| **Modules:** DFH0CBRF

Abend DFHCAP operation

ACAA ANALYZE

ACAD DEFAULTS

The cause of the abend is either:

- The language definition table, DFHEITCU, in the library is invalid for the release of CICS you are running, **or**
- A CICS logic error has occurred.

System action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User response: Ensure that the DFHEITCU module is in the library and is valid for this release of CICS.

If a valid version of DFHEITCU is already in the library, a CICS logic error has occurred. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCAP

ACAD

Explanation: See ACAA.

Modules: DFHCAP

ACAI

Explanation: An internal error has occurred when module DFHCAP was invoked. There was an invalid function code for a domain call to DFHCAP.

System action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCAP

ACAJ

Explanation: An internal error has occurred when module DFHCAP was invoked while processing an EXEC CICS CREATE command. The preallocated dynamic storage area was too small.

System action: The transaction executing the EXEC CICS CREATE command is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCAP

ACAM

Explanation: An internal error has occurred when module DFHECBAM was invoked while processing a CBAM transaction.

System action: CBAM is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHECBAM

ACCx

Explanation: Abend codes with 'ACC' as the first three characters are issued by the C/370 compiler running under CICS. These are documented in the *C/370 User's Guide*.

ACFA

Explanation: During the loading of a Coupling Facility Data Table by the CFCL transaction, an abend was detected or a domain call returned a response (such as DISASTER) after which normal processing could not continue.

System action: A message is issued (one of DFHFC7100, DFHFC7101, DFHFC7103 or DFHFC7104). Loading of the data table is terminated and CFCL abends.

User response: If this abend is produced as a result of an abend during loading, message DFHFC7103 is issued. If it is a result of a domain call failure, depending on which domain the failure was returned by, one of the messages DFHFC7100, DFHFC7101 or DFHFC7104 is issued. Refer to the description of the message for further information and guidance.

Modules: DFHFCDL

ACFB

Explanation: A transaction has issued a request to a coupling facility data table for which it holds an active lock, but after the lock was acquired, the coupling facility data table server for the pool in which this coupling facility data table resides failed and was restarted. This request is of a type which cannot continue against a new instance of the server, because it is reliant on the lock which was acquired before the server failed.

System action: The requesting transaction abends with a transaction dump.

CICS continues normally.

User response: Retry the failed transaction.

Modules: DFHEIFC

ACFC

Explanation: A transaction has issued a request to a coupling facility data table which was last accessed using a previous instance of the coupling facility data table server (that is, the server for the pool in which this coupling facility data table resides has failed and been restarted one or more times since the last access). We therefore need to reopen the access between this CICS file and the coupling facility data table, but the attempt to reopen access has failed.

System action: The requesting transaction abends with a transaction dump.

CICS continues normally.

User response: Retry the failed transaction. If the error continues to occur, issue an explicit close request for the file, followed by an explicit open request.

Modules: DFHEIFC

ACFD

Explanation: During the loading of a Coupling Facility Data Table by the CFCL transaction, a call to the CICS Transaction Manager has returned a response (such as DISASTER) after which normal processing could not continue.

System action: Message DFHFC7121 is issued. Loading of the data table is terminated and CFCL abends.

User response: Refer to the description of the message for further information and guidance.

Modules: DFHFCDL

ACFE

Explanation: An attempt was made to attach a transaction specifying DFHFCDL as the program to be given control, but the transaction was not internally attached by CICS.

DFHFCDL is for use by CICS system transaction CFCL. This loads a Coupling Facility Data Table.

System action: The transaction is abnormally terminated. CICS processing continues.

User response: Establish why an attempt was made to attach CFCL illegally, or why a transaction definition specified DFHFCDL as the program to be given control.

Modules: DFHFCDL

ACHA

Explanation: The remote server transaction, CEHS, is not at a compatible level to operate with the CICS/CMS system. This usually indicates that the service levels of CICS/CMS and the remote server are different.

Problem determination: To diagnose a problem with the remote server, it is generally helpful to obtain a trace of the remote server's activity up to the point of failure.

A remote server trace is obtained by invoking the remote server with the TRACE option, (type CEHS TRACE). The remote server operates as normal but causes entries to be written to a trace log in temporary storage. Note that main storage, not auxiliary, is used for this queue hence large amounts of memory can be used up if this trace is left on for long.

The trace is found in a queue whose name is 'CEHSxxx', where 'xxx' is the four-character terminal identifier. The queue can be browsed in text form or in hexadecimal form using CEBR. To find the terminal identifier, invoke CEBR on the terminal that has run CEHS, without giving a queue name. The queue name will default to 'CEBRxxx', where 'xxx' is the terminal identifier.

Note: CEBR requires the queue name to be in UPPER CASE.

For a description of the remote server and its trace entries and abend codes, see the *CICS/VS Remote Server Diagnosis Manual* (LC33-0438).

System action: CICS terminates the remote server transaction abnormally with a dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCHS

ACHB

Explanation: The remote server has received a data frame from CICS/CMS that is out of sequence. A frame may have been lost in transmission.

System action: CICS terminates the remote server abnormally with a dump.

User response: Reestablish the connection between CICS/CMS and the remote CICS system and try to use the remote server again. For further information, see the 'Problem Determination' section for abend code ACHA.

If the problem persists, you will need assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCHS

ACHC

Explanation: The remote server did not receive the expected acknowledgement type data frame from CICS/CMS.

System action: CICS terminates the remote server abnormally with a dump.

User response: Reestablish the connection between CICS/CMS and the remote CICS system and try to use the remote server again. For further information, see the 'Problem Determination' section for abend code ACHA.

If the problem persists, you will need assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCHS

ACHD

Explanation: The remote server did not receive the expected response type data frame from CICS/CMS.

System action: CICS terminates the remote server abnormally with a dump.

User response: Reestablish the connection between CICS/CMS and the remote CICS system and try to use the remote server again. For further information, see the 'Problem Determination' section for abend code ACHA.

If the problem persists, you will need assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCHS

ACHE

Explanation: The remote server received an unexpected data frame from CICS/CMS. This indicates a logic error in the remote server.

System action: CICS terminates the remote server abnormally with a dump.

User response: Reestablish the connection between CICS/CMS and the remote CICS system and try to use the remote server again. For further information, see the 'Problem Determination' section for abend code ACHA.

If the problem persists, you will need assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCHS

ACHF

Explanation: The remote server attempted to send one of a series of data frames to CICS/CMS when, at this time, only a single frame is allowed. This indicates a logic error in the remote server.

System action: CICS terminates the remote server abnormally with a dump.

User response: Reestablish the connection between CICS/CMS and the remote CICS system and try to use the remote server again. For further information, see the 'Problem Determination' section for abend code ACHA.

If the problem persists, you will need assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCHS

ACHG

Explanation: The remote server attempted to send data to CICS/CMS. However, it was not set to the correct mode to do so. This indicates a logic error in the remote server.

System action: CICS terminates the remote server abnormally with a dump.

User response: Reestablish the connection between CICS/CMS and the remote CICS system and try to use the remote server again. For further information, see the 'Problem Determination' section for abend code ACHA.

If the problem persists, you will need assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCHS

ACHH

Explanation: A TIOA has not been created from the data received by the remote server from CICS/CMS.

System action: CICS terminates the remote server abnormally with a dump.

User response: Reestablish the connection between CICS/CMS and the remote CICS system and try to use the remote server again. For further information, see the 'Problem Determination' section for abend code ACHA.

If the problem persists, you will need assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCHS

ACHI

Explanation: The remote server has received an unexpected return code from the Transformer 2 program.

System action: CICS terminates the remote server abnormally with a dump.

User response: For further information, see the 'Problem Determination' section for abend code ACHA.

Modules: DFHCHS

ACHJ

Explanation: An error has occurred processing a request from CICS/CMS which had the 'No-Reply' option. The remote server cannot, therefore, return the error condition to CICS/CMS.

System action: CICS terminates the remote server abnormally with a dump.

User response: Reestablish the remote server and diagnose the problem by executing the same command from CECI under CICS/CMS without the NOCHECK option. For further information, see the 'Problem Determination' section for abend code ACHA.

Modules: DFHCHS

ACHK

Explanation: The transformer program has requested neither EIP nor DLI to execute the request received from CICS/CMS. This indicates a logic error because the request has to be destined for either EIP or DLI.

System action: CICS terminates the remote server abnormally with a dump.

User response: For further information, see the 'Problem Determination' section for abend code ACHA.

Modules: DFHCHS

ACHL

Explanation: CICS/CMS has supplied a buffer to the remote server which is not large enough to hold the reply that the remote server has to return.

System action: CICS terminates the remote server abnormally with a dump.

User response: Reestablish the connection between CICS/CMS and the remote CICS system and try to use the remote server again. For further information, see the 'Problem Determination' section for abend code ACHA.

If the problem persists, you will need assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCHS

ACHM

Explanation: The remote server has tried to receive a response from CICS/CMS which failed repeatedly until the retry limit was exceeded.

System action: CICS terminates the remote server abnormally with a dump.

User response: Reestablish the connection between CICS/CMS and the remote CICS system and try to use the remote server again. For further information, see the 'Problem Determination' section for abend code ACHA.

If the problem persists, you will need assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCHS

ACHN

Explanation: The remote server has tried to receive a request from CICS/CMS which failed repeatedly until the retry limit was exceeded.

System action: CICS terminates the remote server abnormally with a dump.

User response: Reestablish the connection between CICS/CMS and the remote CICS system and try to use the remote server again. For further information, see the 'Problem Determination' section for abend code ACHA.

If the problem persists, you will need assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCHS

ACHO

Explanation: The remote server has tried to receive a reply from CICS/CMS which failed repeatedly until the retry limit was exceeded.

System action: CICS terminates the remote server abnormally with a dump.

User response: Reestablish the connection between CICS/CMS and the remote CICS system and try to use the remote server again. For further information, see the 'Problem Determination' section for abend code ACHA.

If the problem persists, you will need assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCHS

ACHP

Explanation: CICS/CMS has made a request to the remote server for which the reply would need more than the maximum storage allowed (32660 bytes). This indicates that a logic error has occurred.

System action: CICS terminates the remote server abnormally with a dump.

User response: For further information, see the 'Problem Determination' section for abend code ACHA.

Modules: DFHCHS

ACHR

Explanation: The CICS/CMS remote server transaction (CEHS) has been initiated and either the task is not terminal-oriented, or the associated terminal is a console.

System action: CICS abnormally terminates the remote server with a dump.

User response: Ensure the transaction is initiated with an associated terminal and that the terminal is not defined as a console. For further information, see the 'Problem Determination' section for abend code ACHA.

Modules: DFHCHS

ACHS

Explanation: The CICS/OS2 remote server transaction (CEHP) has been initiated and either the task is not terminal-oriented, or the associated terminal is a console.

System action: CICS abnormally terminates the remote server with a dump.

User response: Ensure the transaction is initiated with an associated terminal and that the terminal is not defined as a console. For further information, see the 'Problem Determination' section for abend code ACHA.

Modules: DFHCHS

ACL0

Explanation: The new operator failed to allocate storage whilst creating an object. This problem will occur if there is insufficient storage available to the CICS region to satisfy the request.

System action: CICS abnormally terminates the transaction.

User response: This abend may occur if you are in a loop creating objects and not deleting them. Alternatively CICS might be short on storage and you should try resubmitting the transaction.

Modules: ICCGLBIC

ACL1

Explanation: The CICS Foundation Classes have thrown an exception which the application programmer failed to catch.

System action: CICS abnormally terminates the transaction.

User response: Check that you have coded your application to catch exceptions. Interrogate the message object contained within the exception object to establish the cause of the exception being thrown.

Another possible cause of this abend is that you are running a Foundation Classes program on a machine that does not have the C++ runtime installed. Check that your machine has the C++ runtime installed.

Modules: ICCGLBIC

ACL2

Explanation: The CICS Foundation Classes invoked the default handleEvent method (defined in class IccResource) in order to handle a CICS condition because the application programmer did not implement his own handleEvent method.

System action: CICS abnormally terminates the transaction.

User response: Implement your own handleEvent method or customize your resource objects so they do not call the handleEvent method for any of the possible CICS conditions.

Modules: ICCRESEC

ACL3

Explanation: The CICS Foundation Classes responded to an application programmer's request to abend a CICS task.

System action: CICS abnormally terminates the transaction.

User response: The application programmer requested that the CICS Foundation Classes abend the transaction using the appropriate return enumeration from the handleEvent method (see IccResource class).

Modules: ICCRESIC

ACL4

Explanation: The CICS Foundation Classes detected an internal error.

System action: CICS abnormally terminates the transaction.

User response: This abend indicates a CICS Foundation Classes internal problem. Please contact your support organization.

| **Modules:** ICCGLIBC

| **ACL5**

| **Explanation:** The CICS Foundation Classes received an error from a CICS storage request (GETMAIN). In response to a new operator request the CICS Foundation Classes issued a CICS GETMAIN request to allocate storage which CICS was unable to satisfy.

| **System action:** CICS abnormally terminates the transaction.

| **User response:** This abend may occur if you are in a loop creating objects and not deleting them. Alternatively CICS might be short on storage and you should try resubmitting the transaction.

| **Modules:** ICCBASEC

| **ACL6**

| **Explanation:** The CICS Foundation Classes detected an error while processing a storage release request.

| **System action:** CICS abnormally terminates the transaction.

| **User response:** This abend can occur if you try to delete an object that does not exist (that is, it has already been deleted). It may also indicate a CICS memory management problem, or a storage corruption problem. If the error persists, please contact your support organization.

| **Modules:** ICCBASEC

| **ACL7**

| **Explanation:** The CICS Foundation Classes have thrown an exception which the application programmer failed to catch.

| **System action:** CICS abnormally terminates the transaction.

| **User response:** Check that you have coded your application to catch exceptions. Interrogate the message object contained within the exception object to establish the cause of the exception being thrown.

| Another possible cause of this abend is that you are running a Foundation Classes program on a machine that does not have the C++ runtime installed. Check that your machine has the C++ runtime installed.

| **Modules:** ICCGLIBC

| **ACL8**

| **Explanation:** The CICS Foundation Classes have thrown an exception which the application programmer failed to catch.

| **System action:** CICS abnormally terminates the transaction.

| **User response:** Check that you have coded your application to catch exceptions. Interrogate the message object contained within the exception object to establish the cause of the exception being thrown.

| Another possible cause of this abend is that you are running a Foundation Classes program on a machine that does not have the C++ runtime installed. Check that your machine has the C++ runtime installed.

| **Modules:** ICCGLIBC

| **ACL9**

| **Explanation:** The CICS Foundation Classes responded to an application programmer's request to abend a CICS task.

| **System action:** CICS abnormally terminates the transaction.

| **User response:** A resource object was customized to cause a transaction abend if a particular CICS condition was raised, and this condition was subsequently raised by CICS.

| **Modules:** ICCRESIC

| **ACLA**

| **Explanation:** The CICS Foundation Classes detected an internal error.

| **System action:** CICS abnormally terminates the transaction.

| **User response:** This abend indicates a CICS Foundation Classes internal problem. Please contact your support organization.

| **Modules:** ICCGLIBC

| **ACLB**

| **Explanation:** The CICS Foundation Classes detected an internal error.

| **System action:** CICS abnormally terminates the transaction.

| **User response:** This abend indicates a CICS Foundation Classes internal problem. Please contact your support organization.

| **Modules:** ICCGLIBC

| **ACLC**

| **Explanation:** The CICS Foundation Classes detected an internal error.

| **System action:** CICS abnormally terminates the transaction.

| **User response:** This abend indicates a CICS Foundation Classes internal problem. Please contact your support organization.

| **Modules:** ICCGLIBC

| **ACLD**

| **Explanation:** The CICS Foundation Classes detected an internal error.

| **System action:** CICS abnormally terminates the transaction.

| **User response:** This abend indicates a CICS Foundation Classes internal problem. Please contact your support organization.

| **Modules:** ICCGLIBC

| **ACLE**

| **Explanation:** The CICS Foundation Classes detected an internal error.

| **System action:** CICS abnormally terminates the transaction.

| **User response:** This abend indicates a CICS Foundation Classes internal problem. Please contact your support organization.

| **Modules:** ICCGLIBC

| **ACLF**

| **Explanation:** The CICS Foundation Classes detected an internal error.

| **System action:** CICS abnormally terminates the transaction.

| **User response:** This abend indicates a CICS Foundation Classes internal problem. Please contact your support organization.

| **Modules:** ICCGLIBC

| **ACLG**

| **Explanation:** The CICS Foundation Classes detected an internal error.

| **System action:** CICS abnormally terminates the transaction.

| **User response:** This abend indicates a CICS Foundation Classes internal problem. Please contact your support organization.

| **Modules:** ICCGLIBC

| **ACLH**

| **Explanation:** The CICS Foundation Classes detected an error while processing a storage release request.

| **System action:** CICS abnormally terminates the transaction.

| **User response:** This abend can occur if you try to

| delete an object that does not exist (that is, it has already been deleted). It may also indicate a CICS memory management problem, or a storage corruption problem. If the error persists, please contact your support organization.

| **Modules:** ICCBASEC

| **ACNA**

| **Explanation:** The table DFHCNV cannot be loaded. This is a general purpose abend code indicating that the LOAD request for the conversion table, DFHCNV, has failed.

| **System action:** The transaction is abnormally terminated with a transaction dump.

| **User response:** Examine the transaction dump to determine the exact condition returned from LOAD request.

| **Modules:** DFHCCNV

| **ACNB**

| **Explanation:** The program DFHUCNV cannot be linked. This is a general purpose abend code indicating that the LINK request for the conversion program DFHUCNV, has failed.

| **System action:** The transaction is abnormally terminated with a transaction dump.

| **User response:** Examine the transaction dump to determine the exact condition returned from LINK request.

| **Modules:** DFHCCNV

| **ACN1**

| **Explanation:** The table DFHCNV cannot be loaded. This is probably because a table has not been pregenerated. It could also occur if the table DFHCNV has been linked above 16MB but DFHCCNV has been linked below 16MB.

| **System action:** The transaction is abnormally terminated with a transaction dump.

| **User response:** Check that the DFHCNV module is in the library and is valid for this release of CICS. Check the linkage of DFHCNV and relink it with the correct AMODE if necessary.

| **Modules:** DFHCCNV

| **ACN2**

| **Explanation:** The table DFHCNV has been loaded but the first record is in the wrong format. This is probably due to an error during assembly or linkedit, but could also be the result of a storage overwrite.

| **System action:** The transaction is abnormally

terminated with a transaction dump.

User response: The table should be reassembled and linked. Check the assemble and linkedit output. Check for any messages issued from CICS indicating that storage overwrites have occurred.

Modules: DFHCCNV

ACN3

Explanation: The program DFHUCNV cannot be linked. A user conversion program must be available (even if it only returns).

System action: The transaction is abnormally terminated with a transaction dump.

User response: Check that the DFHUCNV module is in the library and is valid for this release of CICS. Check the linkage of DFHUCNV and relink it with the correct AMODE if necessary.

Modules: DFHCCNV

ACN4

Explanation: An unrecognized format of a DFHCNV table has been encountered.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Re-assemble and re-link edit the DFHCNV macro.

Modules: DFHCCNV

ACN5

Explanation: An override for the default client code page has been received; however the value is not recognized.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Check that the client system is using one of the client code pages supported by CICS/390.

Modules: DFHCCNV

ACN6

Explanation: The client sent data in unicode but the client and server code pages are not the same. Unicode data is only tolerated provided that conversion is not required.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Ensure that the Client codepage and the Server codepage are the same.

Modules: DFHCCNV

ACNC

Explanation: The client code page which has been requested by the client is not one which CICS can support.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Ensure that the Client codepage is valid.

Modules: DFHCCNV

ACND

Explanation: The conversion between client code page and server code page is not supported by CICS/390; for example conversion has been requested between Japanese code page 932 and Latin-1 code page 500.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Ensure that the Client codepage, both default and overrides are in the same group as the Server codepage. for example client code page 852 from Latin-2 group, is only supported to server code page 870.

Modules: DFHCCNV

ACNE

Explanation: The conversion between client code page and server code page is not supported by CICS/390. Although the code pages are in the same group, CICS does not have a conversion table to match the requested server code page for the client code page specified.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Ensure that the Client codepage and the server codepage are correct. If they are as intended, then CICS can not support the requested conversion.

Modules: DFHCCNV

ACN7

Explanation: An override for the default binary format has been received; however the value is not recognized.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Data formats should be either S/370 or INTEL, anything else is unsupported by CICS/390.

Modules: DFHCCNV

ACN8

Explanation: CICS data conversion is processing a FIELD defined as containing GRAPHIC characters (which are only DBCS): that is DFHCNV TYPE=FIELD,DATATYP=GRAPHIC,... However the client code page (defined in the CLINTCP operand), and the server code page (defined in the SRVERCP operand) imply that the FIELD contains only SBCS characters, for example DFHCNV TYPE=ENTRY,CLINTCP=437,SRVERCP=037

System action: The transaction is abnormally terminated with a transaction dump.

User response: Correct the FIELD definition.

Modules: DFHCCNV

ACN9

Explanation: The table DFHCNV cannot be loaded. This abend code is issued following a NOTAUTH condition being raised during loading of the DFHCNV table.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Ensure the resource security definitions are correct.

Modules: DFHCCNV

ACP1

Explanation: DFHIC TYPE=GET response code is other than the normal response during print key processing.

System action: The transaction is abnormally terminated with a CICS transaction dump. The keyboard of the terminal on which the print key was depressed remains locked to indicate the failure of the operation.

User response: Analyze the dump. The response code is in the low order byte of register 0.

Modules: DFHCPY

ACP2

Explanation: DFHIC TYPE=INITIATE response code is other than the normal response during print key processing.

System action: The transaction is abnormally terminated with a CICS transaction dump. The keyboard of the terminal on which the print key was depressed remains locked to indicate the failure of the operation.

User response: Analyze the dump. The response code is in low-order byte of register 0.

Modules: DFHCPY

ACQA

Explanation: The Connection Quiesce Protocol transaction has been initiated by user action, such as a START command or by typing the transaction identifier at a terminal. The transaction is not intended to be initiated in this way.

System action:

1. If the transaction was not initiated by terminal input, message DFHZC4951 is written to destination CSNE.
2. An exception trace record is written to all active trace destinations.
3. The transaction is abnormally terminated with a CICS transaction dump.

User response: Determine what caused the transaction to be initiated. The exception trace record contains information which will help you.

Modules: DFHCLS5

ACQB

Explanation: The Connection Quiesce Protocol transaction has encountered an error when communicating with another system on an APPC session.

System action:

1. Message DFHZC4951 is written to destination CSNE.
2. An exception trace record is written to all active trace destinations.
3. The transaction is abnormally terminated with a CICS transaction dump.

User response: Determine what caused the failure. A likely cause is a failure of the session with the partner system.

Modules: DFHCLS5

ACQC

Explanation: The Connection Quiesce Protocol transaction has encountered an unexpected error.

System action:

1. Message DFHZC4951 is written to destination CSNE.
2. An exception trace record is written to all active trace destinations.
3. The transaction is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

| **Modules:** DFHCLS5

ACRA

Explanation: The relay program has been invoked without a terminal as its principal facility.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Ensure that DFHAPRT has not been specified as the initial program of a task that is not terminal-related.

Modules: DFHAPRT

ACRB

Explanation: The relay program has been invoked by a transaction that is not defined as remote.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check that the relay program is defined correctly. Determine why DFHAPRT was invoked if the transaction is not a remote transaction.

Modules: DFHAPRT

ACRC

Explanation: The relay program received an invalid response from DFHZCX.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHAPRT

ACRD

Explanation: The system entry for the system to which routing is to be performed could not be found.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check the installed transaction definition to confirm that the system was correctly specified. Check that the system entry is defined in the TCT.

Modules: DFHAPRT

ACRE

Explanation: A transaction invoked from an APPC terminal and specified in the installed transaction definition as remote has abnormally terminated because the link is out of service.

System action: The task is abnormally terminated.

User response: Wait until the link is available. The CICS supplied transaction CEMT INQUIRE CONNECTION can be used to check the states of the links.

Modules: DFHAPRT

ACRF

Explanation: The relay program received a nonzero return code from the dynamic router following its first invocation.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Use the dump to determine why the dynamic routing program has failed by checking the contents of the passed COMMAREA DFHDYE for correctness. The COMMAREA address can be found from field TCACOMM in the system TCA for the task. The COMMAREA fields are mapped via the DFHDYPDS DSECT.

Modules: DFHAPRT

ACRG

Explanation: An ATI initiated remote transaction defined with DYNAMIC(YES) has failed because there is no matching entry in the AID chain.

Each AID in the chain has been checked and none has been found where

- The AID terminal ID matches that of the TCTTE
- The installed transaction definition and the AID transaction IDs match
- The AID is for a remote transaction
- The AID has not been canceled.

System action: The task is abnormally terminated with a CICS system dump.

User response: The dump can be used to help ascertain the mismatch. Check the transactions listed in the TCTTE and PCT fields of the system dump against the AID chain.

Modules: DFHAPRT

ACRH

Explanation: The profile for the session that will carry intersystem flows during transaction routing could not be found.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check the installed transaction definition to confirm that TRPROF is correctly specified.

Modules: DFHAPRT

ACRI

| **Explanation:** An error occurred when attempting to link to the dynamic routing program.

System action: The transaction is abnormally terminated with a CICS transaction dump.

A message in the range DFHRT4417 to DFHRT4420 is written to the CSMT log.

User response: Refer to the message sent to the CSMT log. It identifies the cause of the link failure and provides further user guidance.

| **Modules:** DFHAPRT, DFHEPC

ACRJ

| **Explanation:** An abend has occurred in the dynamic routing program after a link has been executed from DFHAPRT or DFHEPC.

System action: The transaction is abnormally terminated with a CICS transaction dump. Message DFHRT4416 is written to the CSMT log.

| **User response:** Refer to message DFHRT4416. It identifies the abend in the dynamic routing program and provides further user guidance.

| **Modules:** DFHAPRT, DFHEPC

ACRK

Explanation: The relay program has been invoked with no address for the principal facility.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHAPRT

ACRL

Explanation: The task does not own the facility.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHAPRT

ACRM

Explanation: In response to a request from the dynamic routing program, DFHAPRT has attempted an INITIAL_LINK to a program that is not the initial program of the transaction for which the dynamic router has been invoked. The attempt has failed.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Examine the following possibilities:

- The autoinstall user-replaceable module (URM) was called but is unable to do the autoinstall.
- The autoinstall URM was called but data supplied by the autoinstall URM is invalid.
- The autoinstall URM was called, but there is no processing program table (PPT) entry for the autoinstall model.
- There is a problem with the autoinstall URM.
- There is no PPT entry for the program, and either autoinstall is not active or the autoinstall URM indicated that the program should not be autoinstalled.
- The program is disabled.
- The program cannot be loaded.
- The program is defined as remote.

Modules: DFHAPRT

ACRN

| **Explanation:** The dynamic routing program has indicated that the transaction should not be routed, but execute in the local system. Prior to invoking the application program, a security check is performed. This check has failed.

| **System action:** The transaction is abnormally terminated with a CICS transaction dump.

| **User response:** Ensure that the transaction security definition is correct.

| **Modules:** DFHAPRT

ACRO

Explanation: An attempt has been made to invoke the CRSQ transaction from a terminal. CRSQ is an internal CICS transaction and cannot be invoked in this way.

System action: The task is abnormally terminated.

User response: None. You can use CEMT and EXEC CICS commands to cancel AIDs.

Modules: DFHCRQ

ACRP

| **Explanation:** The dynamic router has supplied a sysid whose supported functions are unknown. This may be due to either a backlevel release, or APPC is used for communication and no work has flowed across this connection.

| **System action:** The task is abnormally terminated with a CICS transaction dump.

| **User response:** Give an alternative sysid, or revert to

| the old style START, or flow some routed work across
| the connection.

| **Modules:** DFHAPRT

ACSA

Explanation: The remote scheduler task (CRSR) does not own an intersystem link TCTTE as its principal facility.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Ensure that DFHCRS is not specified as the initial program of a task other than CRSR. Check that the terminal operator did not enter CRSR.

Modules: DFHCRS

ACSB

Explanation: An unexpected reply was received from a remote system in response to a request to schedule a task on that system.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCRS

ACSC

Explanation: An unexpected request was received from a remote system when expecting a request to schedule a task.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCRS

ACSD

Explanation: An internal logic error has been detected.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCRS

ACSE

Explanation: Module DFHCRS has been attached in an unsupported manner.

System action: CICS abnormally terminates the transaction with a transaction dump.

User response: Module DFHCRS should be executed only by transaction CRSR, which executes with an MRO session, an LU6.1 session or an LU type 6.2 conversation as its principal facility. Ensure that the transaction is being attached by a CRSR transaction in the connected system, and not by a user transaction.

If the transaction is being attached by a CRSR transaction, you will need assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCRS

ACSF

Explanation: The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The task that first detects the purged condition provides an exception trace.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate the reason why the task was purged. It was purged either by the master terminal operator or as a result of a deadlock timeout.

Modules: DFHCRS

ACSG

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error will have provided an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Please see the related error message produced by the domain that detected the original error.

Modules: DFHCRS

ACSH

Explanation: The processing of APPC mapped data requires the generation of an LU6.2 attach FMH with default values. In particular, the sync level requested is defaulted to 2. However, the session that is to be used has been bound with a sync level of 1.

System action: The task is abnormally terminated

with a CICS transaction dump.

User response: Check that:

- The entry in the TCT for the remote system has been defined with parallel sessions
- The remote system can support a sync level of 2
- The correct sync level has been requested.

Modules: DFHCRS

ACSI

Explanation: An APPC conversation failure occurred when an attach between CICS systems was issued.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check the connection to the remote CICS system and try to reestablish it.

Modules: DFHCRS

ACSJ

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the recovery manager (RM) domain. The domain provides an exit trace, and possibly a console message and a system dump (depending on the options specified in the dump table). This failure is either the result of a task purge, or a CICS logic error.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related diagnostic material produced by the recovery manager domain and determine the reason for the failure.

In the case of a CICS logic error, you need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCRS

ACSK

Explanation: The transaction wait was purged while waiting for a VTAM INQUIRE macro to complete.

CICS issued a VTAM INQUIRE OPTCD=NQN or INQUIRE OPTCD=SESSNAME request then waited for VTAM to post the ECB, but the wait was terminated either as a result of an explicit FORCEPURGE request, or due to a 3 minute time out.

System action: A transaction dump is taken together with CICS issuing message DFHZC0001.

User response: Investigate the reason why the wait was terminated.

In the case of a time out, you may need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZGIN

ACSL

Explanation: CICS has been unable to attach a transaction to perform a mass flag (CFTS) or mass remote delete (CDTS) request.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCRS

ACSM

Explanation: Transaction CFTS has abended. The mass flagging of terminals for deletion has failed.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCRS

ACSN

Explanation: Transaction CFTS has stalled. The mass flagging of terminals for deletion has exceeded the expected time and is therefore assumed to have failed.

System action: The task is abnormally terminated with a CICS transaction dump. A flag is set in the remote work element (RWE) to indicate that the mainline transaction has assumed that CFTS has failed.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCRS

ACTA

Explanation: The relay program running in the terminal-owning region has received an unexpected request from the application owning region. The request received is in violation of CICS transaction routing protocols.

The request will be in the DFHLUCDS DSECT in DFHZTSP's LIFO – field LUCOPN0

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZTSP

ACTB

Explanation: The relay program running in the terminal-owning region issued a terminal control WRITE, LAST request to the application-owning system, and received a nonzero return code from terminal control.

This is the usual return code from terminal control in TCATPAPR.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Use the transaction dump to determine why terminal control was unable to process the request.

Modules: DFHZTSP

ACTC

Explanation: The relay program running in the terminal-owning region issued a terminal control request to free its session to the application-owning system, and received a nonzero return code from terminal control.

This is the usual return code from terminal control in TCATPAPR.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Use the transaction dump to determine why terminal control was unable to process the request.

Modules: DFHZTSP

ACTD

Explanation: The relay program running in the terminal-owning region issued a terminal control WRITE, WAIT, READ request to the application-owning system, and received a nonzero return code from terminal control.

This is the usual return code from terminal control in TCATPAPR.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Use the transaction dump to determine why terminal control was unable to process the request.

Modules: DFHZTSP

ACTE

Explanation: The relay program running in the terminal-owning region attempted to free its session with the APPC terminal, and received a nonzero return code from terminal control.

The return code will be in the DFHLUCDS DSECT in DFHZTSP's LIFO field, LUCR CODE.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Use the transaction dump to determine why terminal control was unable to process the request. The terminal session may have failed.

Modules: DFHZTSP

ACTF

Explanation: The relay program running in the terminal-owning region issued a terminal control request to free its session to the application-owning system, and received a nonzero return code from terminal control.

This return code can be found in the TCA field, TCATPAPR.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Use the transaction dump to determine why terminal control was unable to process the request. The transaction on the application-owning region may have abnormally terminated or the session may have failed.

Modules: DFHZTSP

ACTG

Explanation: The relay program running in the terminal-owning region issued a request to attach a transaction in the application-owning region, but the response received from that region was invalid.

The return code in the TCA (field TCATPAPR) will be nonzero, and either there will be no TIOA (field TCTTEDA in the TCTTE is zero) or there will be no FMH7 at the start of the TIOA.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Use the transaction dump to determine why terminal control was unable to process the request. The transaction on the application-owning region may have abnormally terminated or the session may have failed.

Modules: DFHZTSP

ACTH

Explanation: A privileged allocate was issued against a remote LU 6.2 system.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZISP

ACTI

Explanation: The relay transaction has an ISC or MRO session as its principal facility. However the TCTTE for that session is not owned by the task.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCRT

ACTJ

Explanation: The principal facility of the relay transaction is not a TCTTE.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Task CXRT should only be started in a terminal-owning region by an ALLOCATE request issued in an application-owning region against a remote APPC device. The principal facility of the task should be an ISC or MRO link. Check that your CICS system is defined in such a way that this will always be the case. Also ensure that program DFHCRT is started only by task CXRT.

Modules: DFHCRT

ACTK

Explanation: The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The task that first detected the purged condition will have provided an exception trace.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate the reason why the task was purged. It was either purged by the master terminal operator or as a result of a deadlock timeout.

Modules: DFHZISP

ACTL

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error will have provided an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related message produced by the domain that detected the original error.

Modules: DFHZISP

ACUA

Explanation: DFHZXRL was called with a request which is not supported for transaction routing.

The request is located in the DFHLUC parameter list which is printed in the exception trace. DFHZXRL is called from DFHZARL, which will put details of the request in its trace entry.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZXRL

ACUB

Explanation: The parameter list passed to DFHZXRL for an ALLOCATE request does not contain the TCTSE address of a remote APPC terminal.

The TCTSE address is located in the DFHLUC parameter list which is printed in the exception trace. DFHZXRL is called from DFHZARL, which will put details of the request in its trace entry.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZXRL

ACUC

Explanation: The TCTSE address passed to DFHZXRL is not that of a remote LU 6.2 terminal.

The TCTSE address is located in the DFHLUC parameter list which is printed in the exception trace. DFHZXRL is called from DFHZARL, which will put details of the request in its trace entry.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZXRL

ACUD

Explanation: The profile DFHCICSR could not be located as an installed profile definition.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Check that the IBM-supplied profile DFHCICSR is correctly defined and installed to CICS.

Modules: DFHZXRLL

ACUE

Explanation: A request to DFHZTSP to build a surrogate TCTTE was not satisfied.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZXRLL

ACUF

Explanation: A session between the application-owning region and the terminal-owning region was not allocated because the request was incorrectly specified.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZXRLL

ACUG

Explanation: A request to allocate a session between the application-owning region and the terminal-owning region failed. The return code from the ALLOCATE request indicated that the profile could not be located as an installed transaction definition, although an earlier attempt to locate it was successful.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZARQ.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZXRLL

ACUH

Explanation: A request to allocate a session between the application-owning region and the terminal-owning region failed. The return code from the ALLOCATE request indicated that the requested session is already owned by the TCA.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZARQ.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZXRLL

ACUI

Explanation: An ISC session between the application-owning region and the terminal-owning region was not allocated because the MODENAME named in the profile could not be found. The profile DFHCICSR as supplied by IBM does not specify a MODENAME. Therefore, this error will occur when a MODENAME has been added to the IBM-supplied profile, but that MODENAME is not defined in the SESSIONS definition for the terminal-owning region.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Ensure that the MODENAME specified in profile DFHCICSR was also specified when defining the SESSIONS to the terminal-owning region.

Modules: DFHZXRLL

ACUJ

Explanation: A session between the application-owning region and the terminal-owning region was not allocated because the maximum session count for the mode group specified in profile DFHCICSR is zero.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Use the CEMT transaction to set sessions in the required mode group available for use.

Modules: DFHZXRLL

ACUK

Explanation: No TCT entry was found for the terminal-owning region specified in the TCTSE for the remote terminal.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Ensure that the terminal-owning region defined in the remote system entry is also defined with a system entry in the TCT.

Modules: DFHZXRLL

ACUL

Note: The description of this abend also applies to ACUX and ACUZ.

Explanation: The transaction routing program in the application-owning region issued a terminal control WRITE, WAIT, READ request to the terminal-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZARQ.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:

- The relay program in the terminal-owning region terminates abnormally. In this case, determine the reason why the relay program has abnormally terminated.
- The session has failed.

Modules: DFHZXRL

ACUM

Explanation: A request to DFHZTSP to free a surrogate TCTTE was not satisfied.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZXRL

ACUO

Note: The description of this abend also applies to ACUQ, ACUS and ACU1.

Explanation: A terminal control READ request has failed. The transaction routing program in the application-owning region attempted to receive data from the terminal-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZARQ.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:

- The relay program in the terminal-owning region terminates abnormally. In this case, determine the reason why the relay program has abnormally terminated.

- The session has failed.

Modules: DFHZXRL

ACUP

Note: The description of this abend also applies to ACUR.

Explanation: The transaction routing program in the application-owning region did not receive a rollback from the terminal-owning region. This violates CICS transaction routing protocols.

The trace from the terminal-owning region will show its response to the application-owning region.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZXRL

ACUQ

Explanation: Refer to the description of abend ACUO.

Modules: DFHZXRL

ACUR

Explanation: Refer to the description of abend ACUP.

Modules: DFHZXRL

ACUS

Explanation: Refer to the description of abend ACUO.

Modules: DFHZXRL

ACUT

Explanation: The transaction routing program in the application-owning region did not receive either a syncpoint or a rollback from the terminal-owning region. This violates CICS transaction routing protocols.

The trace from the terminal-owning region will show its response to the application-owning region.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZXRL

ACUV

Explanation: The transaction routing program in the application-owning region issued a terminal control ISSUE ABEND request on an MRO link to the terminal-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZIS1.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:

- The relay program in the terminal-owning region terminates abnormally. In this case, determine the reason why the relay program has abnormally terminated.
- The session has failed.

Modules: DFHZXRL

ACUW

Explanation: The transaction routing program in the application-owning region issued a terminal control ISSUE ERROR request on an MRO link to the terminal-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZIS1.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:

- The relay program in the terminal-owning region terminates abnormally. In this case, determine the reason why the relay program has abnormally terminated.
- The session has failed.

Modules: DFHZXRL

ACUX

Explanation: Refer to the description of abend ACUL.

Modules: DFHZXRL

ACUY

Explanation: The transaction routing program in the application-owning region issued a terminal control WRITE, WAIT request to the terminal-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in

the trace entry on return from DFHZARQ.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:

- The relay program in the terminal-owning region terminates abnormally. In this case, determine the reason why the relay program has abnormally terminated.
- The session has failed.

Modules: DFHZXRL

ACUZ

Explanation: Refer to the description of abend ACUL.

Modules: DFHZXRL

ACU0

Explanation: The transaction routing program in the application-owning region issued a terminal control WRITE, LAST, WAIT request to the terminal-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZARQ.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:

- The relay program in the terminal-owning region terminates abnormally. In this case, determine the reason why the relay program has abnormally terminated.
- The session has failed.

Modules: DFHZXRL

ACU1

Explanation: Refer to the description of abend ACUO.

Modules: DFHZXRL

ACU2

Explanation: The transaction routing program in the application-owning region received a response from the terminal-owning region which violates CICS transaction routing protocols.

The trace from the terminal-owning region will show its response to the application-owning region.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZXRL

ACU3

Explanation: The transaction routing program in the application-owning region attempted to set the conversation state machine to a state which violates CICS transaction routing protocols.

The register containing the state can be determined from the assembler listing.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZXRL

ACU4

Explanation: The transaction routing program in the application-owning region issued a SET request to the conversation state machine and received a nonzero return code. This violates CICS transaction routing protocols.

The trace entry on return from DFHZUSR will show the request type and current state.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZXRL

ACU5

Explanation: An program running in an application-owning region has issued an ALLOCATE against an APPC device attached to a terminal owning region, but the connection between the two systems is not installed.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Install the connection between the two regions.

Modules: DFHZXRL

ACU6

Explanation: A request to DFHRTSU to prepare the surrogate TCTTE for syncpoint gave an unexpected response and reason code. The response and reason code are included in DFHRTSU's parameter list which is printed in the exception trace.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZXRL

ACU7

Explanation: A request to allocate a session between the application-owning region and the terminal-owning region was issued, but the connection with the remote system is not an APPC or MRO connection.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Redefine the connection as APPC or MRO, or avoid using transaction routing on this connection.

Modules: DFHZXRL

ACU8

Explanation: A request to DFHRTSU to get the recovery status of a surrogate TCTTE gave an unexpected response and reason code. The response and reason code are included in DFHRTSU's parameter list which is printed in the exception trace.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZXRL

ACU9

Explanation: A request to recovery manager to set the recovery status of a link gave an unexpected response and reason code. The response and reason code are included in DFHRMLN's parameter list which is printed in the exception trace.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZXRL

ACVA

Explanation: The transaction routing program in the terminal-owning region issued a terminal control WRITE,WAIT,READ request to the application-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZARQ.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:

- The program in the application-owning region terminates abnormally. In this case, determine the reason why the program has abnormally terminated.
- The session has failed.

Modules: DFHZXRT

ACVB

Explanation: The transaction routing program in the terminal-owning region attempted to issue an ISSUE SIGNAL request on an MRO link to the application-owning region. This violates CICS transaction routing protocols.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZXRT

ACVC

Explanation: The transaction routing program in the terminal-owning region issued an ISSUE SIGNAL request on an LU 6.2 link to the application-owning region, and received a nonzero return code from terminal control.

The return code is located in the DFHLUC parameter list which is printed in the exception trace.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:

- The program in the application-owning region terminates abnormally. In this case, determine the reason why the program has abnormally terminated.
- The session has failed.

Modules: DFHZXRT

ACVD

Explanation: The transaction routing program in the terminal-owning region issued a READ,WAIT request to the application-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZARQ.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:

- The program in the application-owning region terminates abnormally. In this case, determine the reason why the program has abnormally terminated.
- The session has failed.

Modules: DFHZXRT

ACVE

Explanation: The transaction routing program in the terminal-owning region issued a WRITE request to the application-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZARQ.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:

- the program in the application-owning region terminates abnormally. In this case, determine the reason why the program has abnormally terminated.
- the session has failed.

Modules: DFHZXRT

ACVF

Explanation: The transaction routing program in the terminal-owning region issued a WRITE,LAST,WAIT request to the application-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZARQ.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:

- The program in the application-owning region terminates abnormally. In this case, determine the reason why the program has abnormally terminated.

- The session has failed.

Modules: DFHZXRT

ACVG

Explanation: The transaction routing program in the terminal-owning region issued a FREE request to free the session with the LU 6.2 terminal, and received a nonzero return code from terminal control.

The return code is located in the DFHLUC parameter list which is printed in the exception trace.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Use the transaction dump to determine why terminal control was unable to process the request. The terminal session may have failed.

Modules: DFHZXRT

ACVH

Explanation: The transaction routing program in the terminal-owning region issued a FREE request to free the session with the application-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZARQ.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:

- The program in the application-owning region terminates abnormally. In this case, determine the reason why the program has abnormally terminated.
- The session has failed.

Modules: DFHZXRT

ACVK

Explanation: The transaction routing program in the terminal-owning region issued an ISSUE ABEND request on an LU 6.2 link, and received a nonzero return code from terminal control.

The return code is located in the DFHLUC parameter list which is printed in the exception trace.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:

- The program in the connected region terminates abnormally. In this case, determine the reason why the program has abnormally terminated.
- The session has failed.

Modules: DFHZXRT

ACVL

Explanation: The transaction routing program in the terminal-owning region issued an ISSUE ABEND request on an MRO link to the application-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZIS1.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:

- The program in the application-owning region terminates abnormally. In this case, determine the reason why the program has abnormally terminated.
- The session has failed.

Modules: DFHZXRT

ACVM

Explanation: The transaction routing program in the terminal-owning region issued an ISSUE ERROR request on an LU 6.2 link, and received a nonzero return code from terminal control.

The return code is located in the DFHLUC parameter list which is printed in the exception trace.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:

- The program in the connected region terminates abnormally. In this case, determine the reason why the program has abnormally terminated.
- The session has failed.

Modules: DFHZXRT

ACVN

Explanation: The transaction routing program in the terminal-owning region issued an ISSUE ERROR request on an MRO link to the application-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZIS1.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:

- The program in the application-owning region terminates abnormally. In this case, determine the reason why the program has abnormally terminated.
- The session has failed.

Modules: DFHZXRT

ACVO

Explanation: The transaction routing program in the terminal-owning region issued an ISSUE PREPARE request and received either a nonzero return code or a response which violates CICS transaction routing protocols.

The return code is located in TCASPRC and the response is located in TCASPSN1.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Use the transaction dump to determine whether the problem is caused by the return code or the response. If terminal control was unable to process the request, the abend may occur when:

- The program in the connected region terminates abnormally. In this case, determine the reason why the program has abnormally terminated.
- The session has failed.

Otherwise the distributed application programs may have violated APPC conversation protocols.

Modules: DFHZXRT

ACVP

Explanation: The transaction routing program in the terminal-owning region did not receive an FMH43 from the application-owning region. This violates CICS transaction routing protocols.

The trace from the application-owning region will show its response to the terminal-owning region.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZXRT

ACVQ

Explanation: The transaction routing program in the terminal-owning region issued a request to the APPC terminal, and received a nonzero return code from terminal control.

Both the request and the return code are located in the DFHLUC parameter list which is printed in the exception trace.

System action: The task is abnormally terminated

with a transaction dump and an exception trace entry.

User response: Use the transaction dump to determine why terminal control was unable to process the request. The terminal session may have failed or be in the wrong state, for example, as the result of both the terminal and application issuing SYNCPOINT ROLLBACK at the same time.

Modules: DFHZXRT

ACVR

Explanation: The transaction routing program in the terminal-owning region issued a SEND, LAST, WAIT request to the LU 6.2 terminal, and received a nonzero return code from terminal control.

The return code is located in the DFHLUC parameter list which is printed in the exception trace.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Use the transaction dump to determine why terminal control was unable to process the request. The terminal session may have failed.

Modules: DFHZXRT

ACWA

Explanation: CICS CWTO transaction has failed because the task does not own a terminal (TCTTE) as its principal facility. This has probably happened because CWTO has been started as an EXEC CICS START transid without a terminal ID.

System action: The transaction is abnormally terminated without a transaction dump.

User response: Retry with a terminal ID value or enter CWTO from a terminal.

Modules: DFHCWTO

ACXA

Explanation: The catch-up transaction, CXCU, has failed. CXCU runs either in response to a transaction request from an end-user, or is run automatically by an active CICS system in response to the appearance of an alternative CICS system. Its purpose is to inform the alternate system of the active system's state regarding terminals and DBCTL connection.

System action: The catch-up transaction, CXCU, is abnormally terminated with a CICS transaction dump. Both active and alternate CICS systems continue, but the alternate CICS system is less effective in the event of a takeover. For example, terminal back-up sessions may not be established. This abend is accompanied by DFHDX8313.

User response: Retry by entering 'CXCU' from a

terminal. If the error persists, diagnose the problem from the dump.

Modules: DFHCXCU

Abend codes ADxx

ADCA

Explanation: This abend is issued if DBCTL returns a non-zero response code when a DL/I request has been issued from an application program.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Look up accompanying message DFHDB8109 that appears on the CDBC transient data destination.

Modules: DFHDLIDP

ADCB

Explanation: This abend occurs when DBCTL has notified CICS that a task has issued a DL/I request, but it did not have a PSB scheduled. If your application does have a PSB scheduled then a possible cause for this abend is that the DBCTL STOP THREAD command may have been used to terminate the DBCTL thread that corresponds to this task.

System action: CICS abnormally terminates the transaction with a transaction dump. CICS processing continues.

User response: Check if the DBCTL operator has issued a STOP THREAD command for the task that has abnormally terminated. Look up DBCTL response code 28 in the DBCTL return code section of the *IMS Messages and Codes* manual.

Modules: DFHDLIDP

ADCC

Explanation: This abend occurs when DBCTL has notified CICS that a task has issued program specification block (PSB) request, but it has a PSB already scheduled. CICS prevents a task from issuing a PSB schedule request to DBCTL when it has already issued a PSB schedule request by returning a PSBSCH response in UIBDLTR. However, in this case it is DBCTL that has rejected the subsequent PSB schedule request. A possible cause for this abend is a storage over-write.

System action: CICS abnormally terminates the transaction with a transaction dump. CICS processing continues.

User response: Check for any messages issued from your CICS system indicating that storage over-writes have taken place. Look up DBCTL response code 32 in the DBCTL return code section of the *IMS Messages and Codes* manual.

Modules: DFHDLIDP

ADCD

Explanation: This abend is issued when a deadlock has been detected by IMS and this transaction has been selected for abnormal termination.

This abend can occur when a transaction is accessing IMS resources via DBCTL or via a remote DLI request to a remote CICS region. The remote CICS region can be accessing IMS via DBCTL, or if it is a CICS 4.1 region or earlier, accessing IMS via local DLI.

System action: Access to IMS resources via DBCTL is withdrawn for this transaction. Further attempts to access IMS will result in an AEY9 abend.

CICS abnormally terminates the transaction with a transaction dump. CICS processing continues.

User response: If ADCD abends occur infrequently in your system, no action is required although you may like to consider setting your system up in such a way that, after an ADCD abend is issued, the transaction is automatically restarted. See the *CICS Recovery and Restart Guide* for further information.

If ADCD abends are occurring frequently in your system, you may need to review the design of your applications. Some general techniques for deadlock avoidance are described in the *CICS Recovery and Restart Guide*.

Modules: DFHDLIDP

ADCE

Explanation: This abend is issued when the module DFHDBAT returns a nonzero return code in reply to a DL/I request issued from an application program to DBCTL. DFHDBAT is a task related user exit and forms part of the CICS-DBCTL interface. This abend is accompanied by message DFHDB8110.

System action: CICS abnormally terminates the transaction with a transaction dump. CICS processing continues.

User response: Look up the accompanying message DFHDB8110 that appears on the CDBC transient data destination.

Modules: DFHDLIDP

ADCI

Explanation: This abend is issued when IMS returns a user abend 3303 response for a DL/I request issued from an application program.

- | **System action:** Access to IMS resources via DBCTL is withdrawn for this transaction. Further attempts to access IMS will result in an AEY9 abend.
- | CICS abnormally terminates the transaction with a transaction dump. CICS processing continues.
- | **User response:** Check the description in the *IMS Messages and Codes* manual for the meaning of IMS user abend 3303.
- | **Modules:** DFHDLIDP

ADCJ

Explanation: This abend is issued when an application has been using DBCTL, and while the application was still scheduled to DBCTL, the CICS-DBCTL interface was terminated.

System action: CICS abnormally terminates the transaction with a transaction dump. CICS processing continues.

User response: Check the CDBC transient data destination for messages indicating the reason for termination of the CICS-DBCTL interface. If you do not know where the CDBC transient is, then please check with your system programmer. Check for messages issued from the DBCTL system.

Modules: DFHDLIDP

ADCP

Explanation: When checking the DBCTL program specification block (PSB), the external security manager checked the usage of the PSB, and found that:

- The user was unauthorized to access the PSB, or
- The PSB was unknown to the external security manager, or
- The user was set to the capability of the default user.

The meaning of the term “user” in the above context depends on the way the transaction was invoked.

- If the transaction is being run from a local terminal, or has been routed from a remote terminal, the user is the terminal user. (For a routed transaction, if PSBCHK=NO is specified in the SIT, or RESSEC=NO is specified in the transaction definition (CEDA DEFINE TRANSACTION command), the security manager does *not* check the terminal user.)
- If the transaction is being run as a result of a request from another CICS MRO region, the user is the owner of the other CICS system (as defined to the external security manager in the JOB statement of the initializing JCL).
- If the transaction is being run as a result of a request from a connected ISC system, the user is defined in the SECURITYNAME operand of the installed CONNECTION definition that defines the link between the remote system and the local system. Ensure that the name in the SECURITYNAME

operand is the same as that supplied by the connected CICS system. This will depend upon the type of CONNECTION between the two systems. For further information about this, refer to the *CICS Intercommunication Guide*.

Notes.

By the above definitions, a PSB used by a routed transaction has two users, the terminal user and the communicating region. Therefore, for routed transactions, the external security manager makes two checks, on the terminal user (as qualified in 1 above), and on the communicating region (2 or 3 above).

System action: CICS abnormally terminates the task attempting to schedule the PSB. CICS processing continues.

User response: Ensure that the PSB is defined to the external security manager, and that all users have the correct level of authorization. If the system setup is correct, note the security violation.

Modules: DFHDLIDP

ADCQ

Explanation: This abend occurs when an application has issued an EXEC DLI SCHED request for a PSB that contains no DBPCBs, and the SYSSERVE keyword was not specified. This abend also occurs when an application has issued a PCB request for a PSB that contains no DBPCBs, and the IOPCB option was not specified.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Check that the application program has scheduled the appropriate PSB.

Modules: DFHDLIDP

ADCR

Explanation: This abend occurs when an application has issued a DL/I request other than a schedule request, and the DBCTL DRA return code of 40 indicates that there was no active communication with DBCTL.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Check the CDBC transient data destination for messages indicating the reason for termination of the CICS-DBCTL interface. If you do not know where the CDBC transient data destination is, check with your system programmer. Check for messages issued from the DBCTL system.

Modules: DFHDLIDP

ADCS

Explanation: CICS issued a single-phase commit request to DBCTL and an unexpected response was returned from DBCTL.

System action: CICS issues message DFHDB8119 to transient data queue CDBC, then terminates the task abnormally with a CICS transaction dump.

User response: Message DFHDB8119 shows the unexpected response from DBCTL, along with the recovery token of the LUW involved. The explanation of message DFHDB8119 indicates how the outcome of the LUW can be determined.

Modules: DFHDBAT

ADCT

Explanation: A user has attempted to invoke the CICS-DBCTL control transaction from a terminal.

System action: CICS rejects the request.

User response: Do not try to invoke CICS internal transactions directly.

Modules: DFHDBCT

ADCV

Explanation: The connection to DBCTL was terminated and then re-established. The failing task had issued a schedule request against an earlier run of DBCTL and is therefore no longer scheduled.

System action: CICS abnormally terminates the transaction with a transaction dump. CICS processing continues.

User response: No action is required, although you may like to consider setting your system up in such a way that, after an abend ADCV is issued, the transaction is automatically restarted.

Modules: DFHDLIDP

ADDA

Explanation: An error (INVALID or DISASTER response) has occurred on a call to the storage manager domain. The domain that detected the original error provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump (depending on the options in the dump table).

User response: See related message from the domain that detected the original error.

Modules: DFHDBME, DFHDLI, DFHDLIDP

ADDB

Explanation: An error (INVALID or DISASTER response) has occurred on a call to the catalog (CC) domain. The domain that detected the original error provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump (depending on the options in the dump table).

User response: See related message from the domain that detected the original error.

Modules: DFHDBCON, DFHDBDSC

ADDC

Explanation: An error (INVALID or DISASTER response) has occurred on a call to the loader (LD) domain. The domain that detected the original error will have provided an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump (depending on the options in the dump table).

User response: See related message from the domain that detected the original error.

Modules: DFHDBCON, DFHDBDI

ADDI

Explanation: CICS has been notified of a DBCTL failure. However, it has been unable to complete the search for a DBCTL alternate. This is possibly due to an unexpected return code from an IEFSSREQ request.

System action: A CICS transaction dump is produced. CICS continues as if no XRF DBCTL alternate has been found. This abend is accompanied by message DFHDX8323.

User response: Refer to message DFHDX8323 for further information. It may be necessary to restart DBCTL manually.

Modules: DFHDBCT

ADDJ

Explanation: CICS has failed to connect to DBCTL because program DFHDBAT could not be ENABLED.

System action: A CICS transaction dump is produced. The state of the CICS/DBCTL interface remains not connected.

User response: Refer to the transaction dump to determine why the ENABLE failed.

Modules: DFHDBCON

ADEF

Explanation: A severe error has been encountered when executing transaction CLS3.

System action: CLS3 is abnormally terminated with a transaction dump. CICS issues message DFHZC4948.

User response: See message DFHZC4948 for further guidance.

Modules: DFHCLS3

ADIR

Explanation: The abend code is issued for either of the following reasons:

- A DFHDI or DFHBMS request was issued when the DFHDIP program was generated as a dummy.
- A DFHDI TYPE=RECEIVE or TYPE=NOTE was attempted but the transaction identification did not specify either INBFMH=DIP or INBFMH=ALL.

System action: A CICS transaction dump is provided to assist in problem determination.

User response: Either generate a DFHDIP program into the system or specify INBFMH correctly on the profile definition.

Modules: DFHDIP

ADLE

Explanation: A DL/I request was made for a remote database, but the system named in the remote PDIR entry was unknown to CICS, that is, not specified in a DFHTCT TYPE=SYSTEM macro or CEDA DEFINE CONNECTION command.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Either correct the SYSIDNT parameter in the relevant DFHDLPSB entry, or define the remote system to CICS with a DFHTCT TYPE=SYSTEM macro or a CEDA DEFINE CONNECTION command.

Modules: DFHDLIRP

ADLF

Explanation: A DL/I request was made for a remote database, but the link to the system on which the database resides was down.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Notify the system programmer. Once the link to the remote system has been reestablished, resubmit the transaction.

Modules: DFHDLIRP

ADLG

Explanation: A DL/I request was made for a remote database, but there were errors in the DL/I argument list that was provided by the user.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Ensure that any errors in the DL/I argument are corrected.

Modules: DFHDLIRP

ADLP

Explanation: When checking the DLI program specification block (PSB), the external security manager checked the usage of the PSB, and found that:

- The user was unauthorized to access the PSB, or
- The PSB was unknown to the external security manager, or
- The user was set to the capability of the default user.

The meaning of the term "user" in the above context depends on the way the transaction was invoked.

- If the transaction is being run from a local terminal, or has been routed from a remote terminal, the user is the terminal user. (For a routed transaction, if PSBCHK=NO is specified in the SIT, or RESSEC=NO is specified in the transaction definition (CEDA DEFINE TRANSACTION command), the security manager does *not* check the terminal user.)
- If the transaction is being run as a result of a request from another CICS MRO region, the user is the owner of the other CICS system (as defined to the external security manager in the JOB statement of the initializing JCL).
- If the transaction is being run as a result of a request from a connected ISC system, the user is defined in the SECURITYNAME operand of the installed CONNECTION definition that defines the link between the remote system and the local system. Ensure that the name in the SECURITYNAME operand is the same as that supplied by the connected CICS system. This will depend upon the type of CONNECTION between the two systems. For further information about this, refer to the *CICS Intercommunication Guide*.

Note: By the above definitions, a PSB used by a routed transaction has two users, the terminal user and the communicating region. Therefore, for routed transactions, the external security manager makes two checks, on the terminal user (as qualified in 1 above), and on the communicating region (2 or 3 above).

System action: The task attempting to schedule the PSB abnormally terminates.

User response: Ensure that the PSB is defined to the

external security manager, and that all users have the correct level of authorization. If the system setup is correct, note the security violation.

Modules: DFHDLIRP

ADMA

Explanation: The alternate CICS task responsible for tracking the DBCTL connection status of the active CICS has received an error from the CICS Availability Manager (CAVM) message input service.

System action: The tracking transaction terminates with a CICS transaction dump. No further action is taken in response to DBCTL status changes. The global exits, XXDFB and XXDTO, are never invoked and no attempt at a DBCTL restart is made in the event of a takeover. This abend is accompanied by DFHDX8331.

User response: Check for any other messages relating the CAVM dataset problems. In the event of a takeover, it may be necessary to restart DBCTL manually.

Modules: DFHDBCR

ADMB

Explanation: The CICS/XRF DBCTL tracking task has received an unrecognizable message from the CICS/XRF message manager. This abend is preceded by message DFHDX8333.

System action: The CICS/XRF DBCTL tracking task abends.

User response: Refer to the instructions for message DFHDX8333.

Modules: DFHDBCR.

ADMD

Explanation: The alternate CICS system task responsible for tracking the DBCTL connection status of the active CICS has been unable to complete its search for a DBCTL alternate, possibly due to an unexpected return code from an IEFSSREQ request.

System action: A CICS transaction dump is produced. The tracking transaction continues as if no DBCTL alternate had been found. This abend is accompanied by message DFHDX8335.

User response: Refer to message DFHDX8335 for further information. It may be necessary to restart DBCTL manually.

Modules: DFHDBCR.

ADPA

Explanation: The CICS supplied transaction for managing debugging profiles, CADP, has received an exception response from the file manager, with reason file error. The file manager will have issued a message to the CICS joblog containing a code which indicates the precise nature of the error. For example this abend will be issued if the underlying file DFHDPFMB used by CADP is disabled or doesn't exist.

System action: CICS abends the transaction with a transaction dump.

User response: Examine the CICS joblog for associated messages, correct the problem and retry the CADP transaction.

Modules: DFHDPLU

ADPB

Explanation: The CICS supplied transaction for managing debugging profiles, CADP, has received a disaster response from the file manager, with reason internal error. There is an error in the file manager program.

System action: CICS abends the transaction with a transaction dump.

User response: Examine the CICS joblog for associated messages. Contact IBM for assistance with this type of error.

Modules: DFHDPLU

ADPC

Explanation: The CICS supplied transaction for managing debugging profiles, CADP, has received a disaster response from the file manager, with reason disaster percolation. There is an error in one of the CICS domains called by the file manager.

System action: CICS abends the transaction with a transaction dump.

User response: Examine the CICS joblog for associated messages. Contact IBM for assistance with this type of error.

Modules: DFHDPLU

ADPD

Explanation: The CICS supplied transaction for managing debugging profiles, CADP, has received a purged response from the file manager. reason disaster percolation. It is likely that an underlying request to CICS File Control has timed out because the record that CADP is trying to access, is held up by another transaction. For example this would occur if CECI was being used to access the underlying file, DFHDPFMB, at the same time as using CADP.

System action: CICS abends the transaction with a transaction dump.

User response: Investigate if there are other tasks running against the file used by CADP.

Modules: DFHDPLU

ADPI

Explanation: The CICS supplied program for inactivating all debugging profiles, DFHDPIN, has received an exception response from the file manager, with reason file error. The file manager will have issued a message to the CICS joblog containing a code which indicates the precise nature of the error. For example this abend will be issued if the underlying file DFHDPFMB used by CADP was disabled or deleted whilst DFHDPIN was running.

System action: CICS abends the transaction with a transaction dump.

User response: Examine the CICS joblog for associated messages, correct the problem and retry the CADP transaction.

Modules: DFHDPIN

ADPL

Explanation: A server program has issued a command which is restricted in the distributed program link (DPL) environment. Certain API and CPI-RR requests, and the DL/I terminate request are not allowed in the DPL environment. See the *CICS Application Programming Guide* for a list of these restricted commands.

A server program is a program which has been remotely linked, or a program defined to run with the DPL subset.

System action: CICS abends the transaction with a transaction dump.

User response: Remove the restricted commands from the server program, or run the server program locally.

Modules: DFHEIP, DFHCPIR, DFHDLI

ADXA

Explanation: The XRF DBCTL state catch-up transaction, DXCU, has failed.

System action: DXCU is abnormally terminated with a CICS transaction dump. This abend is accompanied by DFHDX8319.

User response: Diagnose the error from the CICS transaction dump. Refer to DFHDX8319 for further information.

Modules: DFHDXCU

ADXB

Explanation: The XRF DBCTL state catch-up transaction, DXCU, has failed.

System action: DXCU is abnormally terminated with a CICS transaction dump. This abend is accompanied by DFHDX8318.

User response: Use the dump to help diagnose the problem. Refer to DFHDX8318 for further information. Check for any other messages relating to CICS availability manager (CAVM) data set problems.

Modules: DFHDXCU

AD2A

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a LOCK call to the lock manager (LM) domain. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHD2EX1

AD2B

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on an UNLOCK call to the lock manager (LM) domain. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHD2EX1

AD2C

Explanation: An unexpected EXCEPTION response has occurred on a locate call to directory manager (DD) domain to locate a DB2TRAN control block. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem*

Determination Guide for guidance on how to proceed.

Modules: DFHD2EX1

AD2D

Explanation: An error (INVALID or DISASTER response) has occurred on a locate call to directory manager (DD) domain to locate a DB2TRAN control block. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHD2EX1

AD2E

Explanation: An unexpected EXCEPTION response has occurred on a locate call to directory manager (DD) domain to locate a DB2ENTRY control block. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHD2EX1

AD2F

Explanation: An error (INVALID or DISASTER response) has occurred on a locate call to directory manager (DD) domain to locate a DB2ENTRY control block. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHD2EX1

AD2G

Explanation: A transaction attempted to use a DB2ENTRY that is DISABLED or is DISABLING. The DISABLEDACT attribute of the DB2ENTRY specified ABEND meaning that new transactions that attempt to use the DB2ENTRY should be abended.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Use CEMT INQ DB2TRAN TRANSID(tttt) where tttt is the transid, to determine the name of the DB2ENTRY involved. Re-enable the DB2ENTRY or discard the DB2ENTRY so that the transid will use a pool thread.

Modules: DFHD2EX1

AD2H

Explanation: The CICS-DB2 attachment facility detected that a dynamic plan exit program abended.

System action: CICS trapped the abend from the dynamic plan exit, issued message DFHDB2050, and then abnormally terminated the task with a CICS transaction dump.

User response: See the associated DFHDB2050 transient data message to determine the abend code with which the dynamic plan exit program abended. Determine why the exit program abended.

Modules: DFHD2EX1

AD2I

Explanation: The CICS-DB2 attachment facility failed to link to a dynamic plan exit program because it was not link edited AMODE 31.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the associated DFHDB2051 transient data message to determine the name of the dynamic plan exit program involved. Re-linkedit the dynamic plan exit program AMODE 31.

Modules: DFHD2EX1

AD2J

Explanation: The CICS-DB2 attachment facility failed to link to a dynamic plan exit program because it is disabled.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the associated DFHDB2053 transient data message to determine the name of the dynamic plan exit program involved. Enable the dynamic plan exit program.

Modules: DFHD2EX1

AD2K

Explanation: The CICS-DB2 attachment facility failed to link to a dynamic plan exit program because no program definition was found.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the associated DFHDB2057 transient data message to determine the name of the dynamic plan exit program involved. Ensure that the dynamic plan exit program has been correctly defined to CICS.

Modules: DFHD2EX1

AD2L

Explanation: The CICS-DB2 attachment facility failed to link to a dynamic plan exit program because the program could not be loaded.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the associated DFHDB2058 transient data message to determine the name of the dynamic plan exit program involved. Ensure that the dynamic plan exit program has been correctly defined and is in a load library accessible to CICS.

Modules: DFHD2EX1

AD2M

Explanation: The CICS-DB2 attachment facility failed to link to a dynamic plan exit program because the program is defined as remote.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the associated DFHDB2066 transient data message to determine the name of the dynamic plan exit program involved. Correct the program definition for the dynamic plan exit program so that it is defined as local.

Modules: DFHD2EX1

AD2N

Explanation: The CICS-DB2 attachment facility failed to link to a dynamic plan exit program.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the associated DFHDB2054 transient data message to determine the name of the dynamic plan exit program involved. Examine the transaction dump to determine why the link failed.

Modules: DFHD2EX1

AD2O

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on an WAIT_MVS call to the dispatcher (DS) domain. A console message is output, an exception trace written

and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHD2EX1

AD2P

Explanation: The transaction was unable to obtain a DB2 thread from a DB2ENTRY or the pool. See the associated transient data message DFHDB2011 to determine which DB2ENTRY was involved or whether it was the pool. The transaction was abended because the DB2ENTRY or the pool specified threadwait(no) meaning do not wait for a thread if all threads are currently in use. Note if message DFHDB2011 indicates that the pool was being used, it means the transaction was using the pool directly rather than overflowing to the pool. (An abend AD3T is produced when a transaction overflows to the pool and no pool threads are available.)

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Determine whether more threads should be allocated to the DB2ENTRY or the pool, or whether the number of instances of this transaction should be limited using TRANCLASS.

Modules: DFHD2EX1

AD2Q

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on an getmain call to the storage manager (SM) domain. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHD2EX1

AD2R

Explanation: The CICS-DB2 thread TCB processing the DB2 request for this transaction has abended. An exception trace (AP 319D) is written containing the MVS abend code and reason code as well as the relevant CICS-DB2 control blocks used by the CICS task and the CICS-DB2 thread TCB. In particular the CSUB control block contains data from the MVS SDWA

| at the time of the abend, for example fields
| CSB_SDWA_REGS (regs 0 -15) and CSB_SDWA_PSW.

| **System action:** The task is abnormally terminated
| with a CICS transaction dump.

| **User response:** Examine the trace in the CICS
| transaction dump to determine why the CICS-DB2
| thread TCB abended.

| **Modules:** DFHD2EX1

| AD2S

| **Explanation:** The thread TCB servicing the DB2
| request for the transaction issued a sign-on request to
| DB2 which failed. The installed DB2CONN specifies
| THREADERROR(N906D) or THREADERROR(ABEND).

| **System action:**

| If THREADERROR(N906D) is specified in the
| DB2CONN, processing continues. A -906 sqlcode is
| returned to the application, and a transaction dump is
| taken with abend code AD2S.

| If THREADERROR(ABEND) is specified in the
| DB2CONN, the task is abnormally terminated with a
| CICS transaction dump.

| **User response:** Examine the AUTHID or AUTHTYPE
| parameter of the DB2ENTRY or pool used for the
| transaction. Ensure the id is authorised to access the
| plan in DB2.

| **Modules:** DFHD2EX1

| AD2T

| **Explanation:** An attempt to create a DB2 thread by the
| TCB servicing the DB2 request for the transaction failed
| with DB2 reason code 00F30040. The installed
| DB2CONN specifies THREADERROR(N906D) or
| THREADERROR(ABEND).

| **System action:**

| If THREADERROR(N906D) is specified in the
| DB2CONN, processing continues. A -906 sqlcode is
| returned to the application and a transaction dump is
| taken with abend code AD2T.

| If THREADERROR(ABEND) is specified in the
| DB2CONN, the task is abnormally terminated with a
| CICS transaction dump.

| **User response:** Either the plan is unavailable or is not
| known to DB2.

| **Modules:** DFHD2EX1

| AD2U

| **Explanation:** An attempt to create a DB2 thread by the
| TCB servicing the DB2 request failed. The installed
| DB2CONN specifies THREADERROR(N906D) or
| THREADERROR(ABEND).

| **System action:**

| If THREADERROR(N906D) is specified in the
| DB2CONN, processing continues. A -906 sqlcode is
| returned to the application and a transaction dump is
| taken with abend code AD2U.

| If THREADERROR(ABEND) is specified in the
| DB2CONN, the task is abnormally terminated with a
| CICS transaction dump.

| **User response:** Examine the dump to determine why
| the create thread failed.

| **Modules:** DFHD2EX1

| AD2V

| **Explanation:** The CICS-DB2 attachment facility issued
| a commit or abort request to DB2 but received a reason
| code 00F30805 indicating that connection to DB2 has
| been lost. This is due to DB2 terminating abnormally or
| being in the process of terminating abnormally. If the
| commit or abort request was preceded by a prepare
| request, DB2 may well still be indoubt. In this case, the
| CICS-DB2 attachment facility instructs CICS to
| remember the outcome of the UOW pending
| resynchronisation, which will happen when CICS and
| DB2 are reconnected. For an abort request not preceded
| by a prepare, i.e. a transaction abend or syncpoint
| rollback, DB2 will not be indoubt as the UOW was still
| in flight. DB2 will backout updates made by the UOW
| when restarted so there is no need for CICS to
| remember the outcome of the UOW.

| **System action:** The transaction completes normally
| but a transaction dump is taken with abend code
| AD2V. If DB2 is indoubt about the outcome of the
| UOW it will be resolved when CICS and DB2 are
| reconnected.

| **User response:** Contact your system programmer to
| restart the DB2 subsystem.

| **Modules:** DFHD2EX1

| AD2W

| **Explanation:** The CICS-DB2 attachment facility issued
| a single-phase commit call to DB2 but received an
| unexpected response. Transient data message
| DFHDB2055 details the DB2 reason code received. The
| commit request may have been processed or it may
| have been ended. There is no resynchronisation needed,
| as no CICS recoverable resources were updated.

| **System action:** The CICS-DB2 attachment facility
| abnormally terminates the transaction with abend code
| AD2W. The CICS recovery manager will supersede the
| AD2W abend code with abend code ASPR. A
| transaction dump is taken.

| **User response:** You need further assistance from IBM
| to resolve this problem. See Part 4 of the *CICS Problem
| Determination Guide* for guidance on how to proceed.

Modules: DFHD2EX1

AD2X

Explanation: The CICS-DB2 attachment facility detected that the CICS task and the thread TCB were in an invalid state. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHD2EX1

AD2Y

Explanation: The transaction was unable to obtain a DB2 thread from a DB2ENTRY or the pool because there were no TCBs available on which to create the thread. The number of thread TCBs currently running is at the TCBLIMIT defined in the DB2CONN. Message DFHDB2010 is output to transient data. The transaction was abended because either:

- The DB2ENTRY specifies threadwait(no), meaning do not wait for a thread, including having to wait to create a thread because a TCB is not available - that is, do not wait for a TCB either.
- The DB2ENTRY specified threadwait(pool), but the pool definition within the DB2CONN specifies threadwait(no), and again there were no TCBs available.
- The transaction was using the pool directly, the pool specifies threadwait(no) and no TCB was available.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Determine whether TCBLIMIT should be increased or whether the number of transactions using DB2 at any one instance should be limited using transaction classes.

Modules: DFHD2EX1

AD2Z

Explanation: DB2 detected a deadlock and the CICS-DB2 attachment facility attempted a syncpoint rollback command for the transaction as DROLLBACK(YES) was specified for the DB2ENTRY or POOL. The syncpoint rollback command failed. Message DFHDB2070 is output to transient data detailing the transid involved and the EIBRESP2 from the failed syncpoint rollback command.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Examine the eibresp2 value to determine why the syncpoint rollback request failed. One possible reason could be that the transaction running is a DPL server transaction which was DPLed to by a client transaction without specifying the SYNCONRETURN parameter. In this case syncpoints, or syncpoint rollbacks, cannot be taken by the server transaction, so DROLLBACK(YES) is invalid in this case.

Modules: DFHD2EX1

AD21

Explanation: The CICS-DB2 attachment facility received a request for a resource manager with the incorrect name. Message DFHDB2045 is output to transient data detailing the invalid name.

System action: The transaction is abnormally terminated with a transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHD2EX1

AD22

Explanation: The CICS-DB2 attachment facility EDF processor was unable to interpret the SQL request.

System action: The command is not interpreted by EDF. A CICS transaction dump is taken with abend code AD22.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHD2EDF

AD23

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a LOCK call to the lock manager (LM) domain made by the CICS-DB2 attachment facility service transaction CEX2. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The CICS-DB2 service task initiates a force shutdown of the CICS-DB2 interface.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHD2EX2

AD24

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on an UNLOCK call to the lock manager (LM) domain made by the CICS-DB2 attachment facility service transaction CEX2. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The CICS-DB2 Service task initiates a force shutdown of the CICS-DB2 interface.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHD2EX2

AD25

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a LOCK call to the lock manager (LM) domain made by the CICS-DB2 attachment facility while processing a DSNB command. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The DSNB command fails and the transaction is abnormally terminated with a transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHD2CC

AD26

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on an UNLOCK call to the lock manager (LM) domain made by the CICS-DB2 attachment facility while processing a DSNB command. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The DSNB command fails and the transaction is abnormally terminated with a transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHD2CC

AD27

Explanation: The CICS-DB2 attachment facility attempted to attach a TCB on which a DB2 thread was to be created to service the SQL request from the application. The attach of the TCB failed due to lack of storage.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Increase the size of the CICS region or lower the TCBLIMIT value specified in the DB2CONN.

Modules: DFHD2EX1

AD28

Explanation: The CICS-DB2 attachment facility attempted to attach a TCB on which a DB2 thread was to be created to service the SQL request from the application. The attach of the TCB failed.

System action: The transaction is abnormally terminated with a transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHD2EX1

AD29

Explanation: The CICS-DB2 attachment facility was unable to link to its EDF processor DFHD2EDF.

System action: The command is not interpreted by EDF. Message DFHDB2048 is output to transient data and a transaction dump is taken with abend code AD29.

User response: Examine the trace in the CICS transaction dump to determine why the link to module DFHD2EDF failed.

Modules: DFHD2EDF

AD3A

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a LOCK call to the lock manager (LM) domain made by the CICS-DB2 attachment facility startup program. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: Startup of the CICS-DB2 interface is terminated, and the interface is closed. The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHD2STR

AD3B

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on an UNLOCK call to the lock manager (LM) domain made by the CICS-DB2 Attachment facility startup program. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: Startup of the CICS-DB2 interface is terminated, and the interface is closed. The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHD2STR

AD3C

Explanation: An error (INVALID, DISASTER response) has occurred on a CONNECT_TO_DB2 function call to the CICS-DB2 Coordinator program DFHD2CO made by the CICS-DB2 Attachment facility startup program. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: Startup of the CICS-DB2 interface is terminated, and the interface is closed. The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHD2STR

AD3D

Explanation: An unexpected response was received while attempting to delete a record from a temporary storage queue during processing of a DSNCR STRT command. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The DSNCR STRT command fails. The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHD2CM1

AD3E

Explanation: During processing of a DB2 request for the transaction, an identify request was made to identify the calling TCB to DB2. The identify request failed. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The DB2 request fails. The task is abnormally terminated with a CICS transaction dump.

User response: Examine the exception trace in the dump to determine why the identify request failed. The CSUB control block is output as part of the exception trace entry, and it contains a record of all calls to DB2 starting at field CSB_TRACE_ENTRIES_START. The identify request contains eyecatcher "IDEN" and is followed by the DB2 FRB response and reason codes.

Modules: DFHD2D2

AD3F

Explanation: During processing of a DB2 request for the transaction, a terminate thread request was made to DB2 which failed. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The DB2 request fails. The task is abnormally terminated with a CICS transaction dump.

User response: Examine the exception trace in the dump to determine why the terminate thread request failed. The CSUB control block is output as part of the exception trace entry, and it contains a record of all calls to DB2 starting at field CSB_TRACE_ENTRIES_START. The terminate thread request contains eyecatcher "TERM" and is followed by the DB2 FRB response and reason codes.

Modules: DFHD2D2

AD3G

Explanation: An unexpected response was received from an EXEC CICS GETMAIN issued during processing of a CICS-DB2 DSNCR command. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The DSNCR command fails. The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHD2CM1

AD3H call.

Explanation: The issuing of an EXEC SQL command or IFI call from a Dynamic Plan Exit is not allowed.

System action: The task is abnormally terminated.

User response: Remove any EXEC SQL commands or IFI calls from the Dynamic Plan Exit.

Modules: DFHD2EX1

AD3I

Explanation: An unexpected response was received from an EXEC CICS INQUIRE DB2CONN command issued during startup of the CICS-DB2 interface. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: Startup of the CICS-DB2 interface is terminated, and the interface is closed. The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHD2CM1

AD3J

Explanation: A commit request to DB2, issued during the second phase of syncpoint, failed. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump. CICS maintains a record that the UOW committed pending a future resynchronization request with DB2.

User response: Examine the exception trace in the dump to determine why the commit request failed. The CSUB control block is output as part of the exception trace entry, and it contains a record of all calls to DB2 starting at field CSB_TRACE_ENTRIES_START. The commit request contains eyecatcher "COMM" and is followed by the DB2 FRB response and reason codes.

Modules: DFHD2D2

AD3K

Explanation: An abort request to DB2, issued during the second phase of syncpoint, failed. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump. CICS maintains a record that the UOW backed out pending a future

resynchronization request with DB2.

User response: Examine the exception trace in the dump to determine why the abort request failed. The CSUB control block is output as part of the exception trace entry, and it contains a record of all calls to DB2 starting at field CSB_TRACE_ENTRIES_START. The abort request contains eyecatcher "ABRT" and is followed by the DB2 FRB response and reason codes.

Modules: DFHD2D2

AD3L

Explanation: During processing of a DB2 request for the transaction, an associate request was made to associate the DB2 connection with the calling TCB. The associate request failed. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The DB2 request fails. The task is abnormally terminated with a CICS transaction dump.

User response: Examine the exception trace in the dump to determine why the associate request failed. The CSUB control block is output as part of the exception trace entry, and it contains a record of all calls to DB2 starting at field CSB_TRACE_ENTRIES_START. The associate request contains eyecatcher "ASSO" and is followed by the DB2 FRB response and reason codes.

Modules: DFHD2D2

AD3M

Explanation: An unexpected error occurred during processing of a DSNB MODIFY command. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The DSNB MODIFY command fails. The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHD2CM1

AD3P

Explanation: An unexpected error occurred during processing of a DSNB STOP command. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The DSNB STOP command fails. The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHD2CM1

AD3Q

Explanation: An unexpected response was received while attempting to read a record from a temporary storage queue during processing of a DSNCR STRT command. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The DSNCR STRT command fails. The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHD2CM1

AD3R

Explanation: An unexpected response was received while attempting to read a record from a temporary storage queue during startup of the CICS-DB2 interface. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: Startup of the CICS-DB2 interface is terminated, the interface is closed. The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHD2STR

AD3S

Explanation: An unexpected response was received from an EXEC CICS SET DB2CONN command issued during startup of the CICS-DB2 interface. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: Startup of the CICS-DB2 interface is terminated, and the interface is closed. The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHD2CM1

AD3T

Explanation: The transaction was unable to obtain a DB2 thread from the pool. Message DFHDB2011 is output to transient data. The transaction was abended because the transaction tried using a DB2ENTRY but all threads were in use on the DB2ENTRY, and despite threadwait(pool) being specified, all threads in the pool were also in use. The pool definition within the DB2CONN specifies threadwait(no).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Determine whether more threads should be allocated to the DB2ENTRY or the pool, or whether the number of instances of this transaction should be limited using TRANCLASS.

Modules: DFHD2EX1

AD3U

| **Explanation:** An error (INVALID or DISASTER
| response) has occurred on a locate call to transaction
| manager (XM) domain to locate a transaction
| definition. A console message is output, an exception
| trace written and, possibly, a system dump taken
| (depending on the options specified in the dump table).

| **System action:** The task is abnormally terminated
| with a CICS transaction dump.

| **User response:** You need further assistance from IBM
| to resolve this problem. See Part 4 of the *CICS Problem
| Determination Guide* for guidance on how to proceed.

| **Modules:** DFHD2EX1

AD3W

Explanation: An unexpected response was received while attempting to write a record to a temporary storage queue during startup of the CICS-DB2 interface. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: Startup of the CICS-DB2 interface is terminated, and the interface is closed. The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHD2STR

AD3X

Explanation: An unexpected response was received while attempting to write a record to a temporary storage queue during processing of a DSNCR STRT command. A console message is output, an exception trace written and, possibly, a system dump taken

(depending on the options specified in the dump table).

System action: The DSNB STRT command fails. The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHD2CM1

AD3Z

Abend codes AExx

AEC1

Explanation: An attempt has been made to use the Command Level Interpreter (CECI) or the Enhanced Master Terminal (CEMT) or an RDO (CEDA, CEDB, CEDC) transaction on a terminal that is not supported.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Use a terminal that is supported by the Command Level Interpreter, Enhanced Master Terminal, or RDO transaction.

Module(s): DFHECIP, DFHECSP, DFHEMTP, DFHESTP, DFHEOTP, DFHEDAP

AEC2

Explanation: An attempt has been made to use the Command Level Interpreter (CECI) or the Enhanced Master Terminal (CEMT) or an RDO (CEDA, CEDB, CEDC) transaction on a display terminal of size less than 24 X 80.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Use a display terminal that is supported by the Command Level Interpreter or Enhanced Master Terminal or RDO transaction.

Modules: DFHECIP, DFHECSP, DFHEMTP, DFHESTP, DFHEOTP, DFHEDAP

AEC7

Explanation: Language Environment has encountered an unexpected error during the THREAD INITIALIZATION phase while attempting to execute a Language Environment enabled program. The return code received from Language Environment is placed into the field EIBRESP2.

System action: Message DFHAP1200 is issued and the transaction is abnormally terminated. The program is disabled.

User response: Refer to the error message or messages

| **Explanation:** The CICS-DB2 thread TCB processing the DB2 request for this transaction has abended because the DB2 adapter is being shutdown.

| **System action:** The task is abnormally terminated.

| **User response:** If this abend should occur at CICS or DB2 shutdown then it can be ignored, because the DB2 adapter is abending the task as part of shutdown processing, otherwise you will need assistance from IBM.

| **Modules:** DFHD2EX1

issued by Language Environment to determine the cause of the problem.

Modules: DFHAPLI

AEC8

Explanation: Language Environment has encountered an unexpected error during the RUNUNIT INITIALIZATION phase while attempting to execute a Language Environment enabled program.

System action: The return code received from Language Environment is placed into the field EIBRESP2. Message DFHAP1200 is issued and the transaction is abnormally terminated. The program is disabled.

User response: Refer to the error message or messages issued by Language Environment to determine the cause of the problem.

Modules: DFHAPLI

AEC9

Explanation: Language Environment has encountered an unexpected error during the RUNUNIT BEGIN INVOCATION phase while attempting to execute a Language Environment enabled program.

System action: The return code received from Language Environment is placed into the field EIBRESP2. Message DFHAP1200 is issued and the transaction is abnormally terminated. The program is disabled.

User response: Refer to the error message or messages issued by Language Environment to determine the cause of the problem.

Modules: DFHAPLI

AEDA

Explanation: The CEDF transaction has been started with an invalid start code. This could be the result of attempting to start the execution diagnostic facility (EDF) with EXEC CICS START(CEDF).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Use the transaction dump to determine why the start has failed.

Modules: DFHEDFX

AEDB

Explanation: DFHEDFP has been passed an invalid EDFXA. This is an internal CICS error.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHEDFX

AEDC

Explanation: The program EDF has terminated because a GETMAIN request to the storage manager failed.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Use the transaction dump to determine why the request has failed.

Modules: DFHEDFX

AEDD

Explanation: CICS has attempted to attach the EDF task to display the user request but the attach has failed.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Use the transaction dump to determine why the attach has failed.

Modules: DFHEDFX

AEDE

Explanation: CICS has suspended the user task to allow the EDF task to complete but an error has occurred while performing the suspend.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Use the transaction dump to determine why the suspend has failed.

Modules: DFHEDFX

AEDF

Explanation: CICS has suspended the user task to allow the EDF task to complete. The user task has been purged while suspended, before control was returned from EDF.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: The task was probably purged by the master terminal operator.

Investigate the reason why the task was purged. This may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

Modules: DFHEDFX

AEDG

| **Explanation:** CICS has suspended the user task to
| allow the EDF task to complete. The user task has gone
| away while suspended, before control was returned
| from EDF.

| **System action:** The task is abnormally terminated
| with a CICS transaction dump.

| **User response:** Use the transaction dump to determine
| the reason why the task finished before being resumed.

| **Modules:** DFHEDFX

AEDH

Explanation: An error occurred when CICS called the Program Manager in order to discover details of the user program that has invoked EDF.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Use the transaction dump to determine why the call has failed.

Modules: DFHEDFX

AED1

Explanation: This abend is produced as a result of either:

- An attempt to use the execution diagnostic facility (EDF) on an unsupported terminal,
- Using the temporary storage browse transaction (CEBR) on an unsupported device, or
- An attempt to initiate the temporary storage browse transaction (CEBR) with a non-terminal principal facility.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Use a terminal or device that is properly supported.

Modules: DFHEDFP, DFHEDFBR

AED2

Explanation: The program EDF has terminated a task and placed this abend code in the terminated task's TCA. This occurs because execution of EDF is about to be abnormally terminated. A probable reason for EDF being terminated is that a line, control unit, or a terminal has been put out of service.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Use a terminal that is supported as a display terminal by EDF. A CICS transaction dump of the task terminated with this abend code is available for review.

Modules: DFHEDFX

AED3

Explanation: The program EDF has terminated a task and placed this abend code in the terminated task's TCA. The termination occurs because execution of EDF is about to be abnormally terminated.

One possible cause of an abend in EDF is incorrect data being sent to the terminal by the user task.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: A CICS transaction dump of the terminated task and also a similar dump for EDF, when its termination was abnormally terminated, are available for review.

Modules: DFHEDFX

AED4

Explanation: An internal logic error has been detected in EDF module DFHEDFP.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: This indicates a CICS logic error. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHEDFP

AED5

Explanation: An internal logic error was been detected in EDF. Insufficient dynamic storage was pre-allocated.

System action: EDF is terminated abnormally with dumps having dump codes CXSP, RMIN, PAGE, LDIN. The user task continues.

User response: The problem may be avoided by less

complex user interactions with EDF. If the problem persists, you may need further assistance. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHEDFD

AED6

Explanation: An internal logic error was detected in EDF.

System action: EDF is terminated abnormally with dumps having dump codes CXSP, RMIN, PAGE, LDIN. The user task continues.

User response: The problem may be avoided by less complex user interactions with EDF. If the problem persists, you may need further assistance. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHEDFU

AED7

Explanation: The installed definition of the transaction CEDF has a TWA size which is too small.

System action: CICS abnormally terminates the transaction with a CICS transaction dump.

User response: If you have an updated copy of the CEDF transaction installed, ensure that you have a TWA size at least as big as the one defined by the IBM supplied definition. If you do not have an updated CEDF you may need further assistance to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHEDFP

AED8

Explanation: A terminal control error has occurred in DFHEDFX.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHEDFX

AED9

Explanation: A temporary storage error has occurred in EDF. This could be caused by an input/output error on temporary storage or because temporary storage data is full.

System action: EDF is abnormally terminated with a CICS transaction dump.

User response: Investigate the reason for the temporary storage request failure. Ensure that the definition of the temporary storage data set is correct.

See the *CICS Problem Determination Guide* for further guidance in dealing with temporary storage problems.

Modules: DFHEDFD

AEIA

Note: The description of this abend also applies to AEID to AEI9, AEXC, AEXF, AEXG, AEXI to AEXL, AEXV to AEXX, AEX0 to AEX9, AEYA to AEYC, AEYE to AEY3, AEY7, and AEZE to AEZX.

Explanation: The EXEC interface program issues an abend when an exceptional condition has occurred but the command does not have the RESP option (or NOHANDLE option), or the application program has not executed an EXEC CICS HANDLE CONDITION command for that condition. This will cause DFHEIP to take the system action for the condition in question. In most cases, the system action will be to abend the transaction.

Because of their similar characteristics, the above-named abend codes for the EXEC interface program are described as a group. The codes and their corresponding exceptional conditions are as follows:

Code	Condition
AEIA	ERROR
AEID	EOF
AEIE	EODS
AEIG	INBFMH
AEIH	ENDINPT
AEII	NONVAL
AEIJ	NOSTART

AEZW	CCSIDERR
AEZX	TIMEDOUT

Problem determination: The function code of the command that produced the exceptional response and the response code can be found in the EXEC interface block (EIB). The EIB is part of a larger control block, used by DFHEIP, known as the EXEC interface storage block (EIS). The EIS is addressed by the TCAEISA, which is the system part of the TCA + X'90'. The EIB is pointed to from the EIS + X'8'.

The function code may be located at offset X'1B' in the EIB while the response codes may be one of the following at the given offsets:

EIBRCODE	X'1D'
EIBRESP	X'4C'
EIBRESP2	X'50'

The *CICS Application Programming Reference* gives translations of the encoded functions and their responses.

Analysis: Because these abend codes are directly related to exceptional conditions that can be specified in HANDLE CONDITION commands, the application programmer should decide whether the condition is one that should be handled by the application (for example ENDFILE), or one that requires modifications to the application or CICS tables.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Change the application program either to prevent the condition recurring, to check it by using the RESP option, or to handle the condition when it does occur (by using the EXEC CICS HANDLE CONDITION command). If necessary, use the contents of the EIBRESP2 field or the EIBRCODE in the EIB to assist in determining the cause of the exceptional condition.

Modules: DFHEIP

AELA

Explanation: The executing function has been purged before control could be returned.

System action: The transaction is marked to be abnormally terminated with abend code AELA.

User response: Investigate the reason the task was purged. It was purged either by the master terminal operator, or as a result of a deadlock timeout.

If the task was purged by the master terminal operator, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased then the number of tasks in the system should be reduced to avoid short-on-storage situations. Another possibility would be to increase the value of the DTIMOUT option for the transaction.

Modules: DFHETL

AELB

Explanation: The executing function has been purged before control could be returned.

System action: The transaction is marked to be abnormally terminated with abend code AELB.

User response: Investigate the reason the task was purged. It was purged either by the master terminal operator, or as a result of a deadlock timeout.

If the task was purged by the master terminal operator, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased then the number of tasks in the system should be reduced to avoid short-on-storage situations. Another possibility would be to increase the value of the DTIMOUT option for the transaction.

Modules: DFHEGL

AEMA

Explanation: An error (INVALID or DISASTER response) has occurred on a call to the application (AP) domain when a request for set user exit active could not be serviced.

System action: The task is abnormally terminated. The domain that detected the original error issues a console message and might provide an exception trace, and depending on the options specified in the dump table, a system dump.

User response: See the associated console message for further guidance.

Modules: DFHUEM

AEMB

Explanation: An error (INVALID or DISASTER response) has occurred on a call to the loader (LD) domain. The domain that detected the original error will have provided an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump (depending on the options in the dump table).

User response: See the related message from the domain that detected the original error.

Modules: DFHUEM

AEMP

Explanation: The task was purged before a set active request to the application (AP) domain was able to complete successfully. The domain that first detected the purged condition may provide an exception trace.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate why the task was purged. This is either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Modules: DFHUEM

AEMQ

Explanation: The task was purged before an IDENTIFY_PROGRAM request to the loader (LD) domain was able to complete successfully. The domain that first detected the purged condition provides an exception trace.

System action: The task is abnormally terminated

with a CICS transaction dump (depending on the options in the dump table).

User response: Investigate why the task was purged. This is either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Modules: DFHUEM

AETA

Explanation: A CICS transaction has issued a non-CICS command via an application "stub" (an expansion of a DFHRMCAL macro). Program DFHERM has determined that the exit has been disabled since the previous DFHRMCAL request was issued from the transaction.

System action: The task is abnormally terminated with a transaction dump

User response: Notify your system programmer.

Modules: DFHERM

AETC

Explanation: A CICS transaction has issued a non-CICS command via an application "stub" (an expansion of a DFHRMCAL macro). However, the task-related user exit (TRUE) is not known to program manager.

System action: The task is abnormally terminated with a transaction dump

User response: Ensure that the TRUE as identified to the DFHRMCAL macro has been correctly defined to CICS.

Modules: DFHERM

AETF

Explanation: The task was purged before a request to the storage manager (SM) domain was able to complete successfully. The domain that first detected the purged condition will have provided an exception trace.

System action: The task is abnormally terminated

with a CICS transaction dump.

User response: Investigate why the task was purged. This is either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Modules: DFHERM

AETG

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error will have provided an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related message produced by the domain that detected the original error.

Modules: DFHERM

AETH

Explanation: The task was purged before a request to the storage manager (SM) domain was able to complete successfully. The domain that first detected the purged condition will have provided an exception trace.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate why the task was purged. This is either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the

number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Modules: DFHERM

AETI

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error will have provided an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related message produced by the domain that detected the original error.

Modules: DFHERM

AETJ

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR or PURGED) has occurred on an ADD_LINK call to the recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHERM provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHERM

AETK

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR or PURGED) has occurred on an SET_LINK call to the recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHERM provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHERM

AETL

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR or PURGED) has occurred on an SET_UOW call to the recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHERM provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHERM

AETM

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR, or PURGED) has occurred on an INQUIRE_TRANSACTION call to the transaction manager (XM) domain. For errors other than EXCEPTION, the XM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHRMSY provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHRMSY

AETN

Explanation: An EXCEPTION response with an unexpected reason occurred on an INITIATE_RECOVERY call to recovery manager (RM) domain. DFHRMSY provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem*

Determination Guide for guidance on how to proceed.

Modules: DFHRMSY

AETO

Explanation: An error (DISASTER, INVALID, KERNERROR, or PURGED) has occurred on an INITIATE_RECOVERY call to the recovery manager (RM) domain. The RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

DFHRMSY also provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHRMSY

AETP

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR, or PURGED) has occurred on an TERMINATE_RECOVERY call to recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHRMSY provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHRMSY

AETQ

Explanation: An EXCEPTION response with an unexpected reason occurred on an INQUIRE_UOW call to the recovery manager (RM) domain. DFHRMSY provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHRMSY

AETR

Explanation: An error (DISASTER, INVALID, KERNERROR, or PURGED) has occurred on an INQUIRE_UOW call to the recovery manager (RM) domain. The RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

DFHRMSY also provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHRMSY

AETS

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR, or PURGED) has occurred on an INQUIRE_STARTUP call to recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHRMSY provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHRMSY

AEXU

Explanation: During execution of an EXEC CICS command, a NOTPOSS condition has been raised on encountering an invalid parameter. This is probably caused by a previous storage overlay.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Refer to abend AEIA for an explanation of how to determine the function code of the CICS command that caused the abend.

It is not possible to set an EXEC CICS HANDLE CONDITION for NOTPOSS.

The system programmer should investigate the cause of the storage overlay.

Modules: DFHEIDTI, DFHEIQDS, DFHEIQSA,

DFHEIQSC, DFHEIQSM, DFHEIQSP, DFHEIQST, DFHEIQSX

AEXY

Explanation: The executing transaction has been purged before control could be returned.

This can arise when the transaction is purged while

- A CICS command was being processed
- The transaction was waiting to be dispatched

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Contact your system programmer to determine why the transaction has been purged.

AEYD

Explanation: A transaction has requested that CICS access a storage area that the transaction itself could not access. This occurred when an invalid storage area was passed to CICS as an output parameter on an EXEC CICS command.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Examine the trace to find the exception trace entry created by DFHEISR and then identify the parameter in error. If the abend is handled, EXEC CICS ASSIGN ASRASTG, ASRAKEY, ASRASPC, and ASRAREGS give additional information about the abend. At the time of the abend, register 2 points to the storage area at fault.

Change one or more of the following:

- Correct the code in error in the transaction issuing the EXEC CICS command in order to supply a valid storage area.
- If storage protection is active, change the EXECCKEY on the CEDA definition for the program that issued the EXEC CICS command from USER to CICS.
- If storage protection is active, change the TASKDATAKEY attributes on the transaction definition from CICS to USER.
- If transaction isolation is active, change the ISOLATE attribute on the transaction definition from YES to NO.

Modules: DFHSRP

AEYF

Explanation: A transaction has requested that CICS access a storage area that the transaction itself could not access. This occurred when an invalid storage area was passed to CICS on a PUT CONTAINER or a GET CONTAINER command. The error can occur when:

- Either the FROM or INTO address is specified incorrectly.
- The FLENGTH value specifies a value large enough to cause the area to include storage which the transaction can not access.

A common cause of this error is specifying the address of a halfword area in the FLENGTH parameter, which expects a fullword area. This error can arise when a program which previously used commareas, which have halfword lengths, has been modified to use containers which have fullword lengths.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Examine the trace to find the entry trace entry created by DFHEISR and then identify the parameter in error. If the abend is handled, EXEC CICS ASSIGN ASRASTG, ASRAKEY, ASRASPC, and ASRAREGS give additional information about the abend. At the time of the abend, register 2 points to the storage area at fault.

You will most likely need to do the following:

- Correct the program in error that issued the EXEC CICS PUT CONTAINER or EXEC CICS GET CONTAINER command. Ensure that it supplies the address of a valid storage area and that it supplies an FLENGTH such that no part of the storage area is inaccessible to the transaction. Ensure that FLENGTH refers to a fullword length.

You may also need to consider changing one or more of the following:

- If storage protection is active, change the EXECCKEY on the CEDA definition for the program that issued the EXEC CICS command from USER to CICS.
- If storage protection is active, change the TASKDATAKEY attributes on the transaction definition from CICS to USER.
- If transaction isolation is active, change the ISOLATE attribute on the transaction definition from YES to NO.

Modules: DFHSRP

AEY6

Explanation: Internal logic error in DFHUEM. This arises when using EXITALL to DISABLE an exit program from all exit points for which it has been enabled. The entire user exit table has been scanned and all associations of the program have been found. But the activation count for the program in its exit program block indicates there should be more associations (for example, the activation count has not been reduced to zero). The user exit table and associated control blocks (EPBs and EPLs) are out of step and have probably been corrupted.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHUEM

AEY8

Explanation: No DSA was found on the chain while trying to free dynamic storage for an assembler language program using an EXEC CICS command.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Ensure that the DFHEIENT, DFHEISTG, and DFHEIEND macro invocations are correctly positioned and retry. If the error persists, you will need further assistance. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHEIP

AEY9

Explanation: One of the following:

- An EXEC CICS command has been issued that is not supported by the EXEC interface program DFHEIP.
- A transaction has issued an EXEC CICS command which is supported in principle by the EXEC interface program DFHEIP, but for which the prerequisite function has not been included in the current CICS start-up.
- A non-CICS command has been issued via an application “stub” (expansion of a DFHRMCAL macro), and the program DFHERM has detected that the necessary non-CICS support is not available.

Note: It is possible that, although DFHERM has
detected that the necessary non-CICS support
is no longer available for a particular
transaction, it may be available to the rest of
CICS.

- An attempt has been made to use remote resources, but the local SYSID has been specified in an EXEC CICS command, or vice versa.
- An attempt has been made to use remote resources, but ISC is not supported.
- An EXEC CICS command contains an invalid AID or CONDITION identifier. This indicates that the EXEC CICS command has become corrupted.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Check that the sysid specified and the resource names were correct. If not, notify the system programmer. Either the command (or an application stub) has become corrupted, or the unavailable function needs to be generated (CICS command), ENABLED (non-CICS command), or exceptionally the non-CICS support has suffered damage and is attempting to withdraw itself from the CICS system.

Modules: DFHEIP, DFHEEI

AEZA

Explanation: A transaction has been defined with a TASKDATALOC(ANY), but the programs within the transaction are running amode 24. The exec interface program is therefore unable to access the TCA for the application. Furthermore, any reference to the EIB would cause the transaction to fail with an OC4 protection exception.

System action: The transaction is abnormally terminated.

User response: Either redefine and install a new definition for the transaction with TASKDATALOC(BELOW), or relink the programs as amode 31.

Modules: DFHEIP

AEZB

Explanation: A transaction has been defined with a TASKDATALOC(ANY), and the application is attempting to call a task related user exit. However the task related user exit has been linkedited AMODE 24 and enabled with the LINKEDITMODE option, thereby directing CICS to invoke it in AMODE 24. An AMODE 24 task related user exit cannot run when the calling application is running with TASKDATALOC(ANY), as this would cause a protection exception, or a storage overwrite.

System action: The transaction is abnormally terminated.

User response: Either redefine and install a new definition for the transaction with TASKDATALOC(BELOW), or modify the task related user exit so that it is invoked in AMODE 31.

Modules: DFHERM

AEZC

Explanation: A transaction has been defined with a TASKDATALOC(ANY), but a program within the transaction is defined to run AMODE 24. CICS cannot invoke the AMODE 24 program when the transaction is running with TASKDATALOC(ANY), as this would cause a protection exception, or a storage overwrite.

System action: The transaction is abnormally terminated.

User response: Either redefine and install a new definition for the transaction with TASKDATALOC(BELOW), or relink the program as AMODE 31.

Modules: DFHAPLI

AEZD

Explanation: An attempt has been made to run a program defined as EXECKEY(USER) as part of a transaction defined as TASKDATAKEY(CICS). These attributes are incompatible and the transaction is abended. This incompatibility could occur as a result of the program definition being autoinstalled. See the CICS Customization Guide and the CICS Resource Definition Guide for more information about program autoinstall.

System action: The transaction is abnormally terminated. Message DFHAP1226 will show the incompatible program and transaction.

User response: Redefine and install a new definition either for the transaction with TASKDATAKEY(USER), or for the program with EXECKEY(CICS).

If this abend occurs when running a CICS transaction, a possible cause is that you are not using the CICS-supplied definition for the program. If you are using your own copies of CICS-supplied program definitions, they must be defined as EXECKEY(CICS).

Modules: DFHAPLI

AEZE

Explanation: CHANGED condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

Abend codes AFxx

AFCB

Explanation: Module DFHEIFC issued a resource level security check (RSLC) request to module DFHXSRC and received a response other than OK or EXCEPTION.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Examine the trace to find the exception trace entry created by DFHXSRC at the time of the error. Use this trace entry to determine the cause of the return code from DFHXSRC.

Module(s): DFHEIFC

AFCC

Explanation: An internal logic error was detected when calling the file control request processing module DFHF CFR. Either DFHF CFR returned an INVALID response to its caller indicating an error in the caller's parameter list, or DFHF CFR passed back a return code that was not recognized by its caller.

System action: The transaction is abnormally terminated with a transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module(s): DFHEIFC, DFHDMPCA

AFCE

Explanation: A GETMAIN for FFLE storage has failed.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Retry the failed transaction.

Module(s): DFHEIFC

AFCF

Explanation: A deadlock has been detected between two or more tasks issuing file control requests.

System action: The task that would have entered deadlock is abended with a CICS transaction dump.

User response: Examine this transaction and other transactions in the system that update the same files to find the cause of the deadlock, then correct the error.

When transactions update several files within the same unit of work, all transactions should update these files in the same order. A transaction that abends AFCF may be retried by specifying RESTART(YES) in the

transaction definition and by coding a suitable DFHREST program.

Modules: DFHEIFC, DFHDMPCA

AFCG

Explanation: A transaction has issued a sequence of file control requests that would cause the file to deadlock itself. This response arises for different reasons depending upon the file type.

If the file is being accessed in non-RLS mode, the response is caused by the transaction making conflicting requests against the same CI. For example, if the file is being accessed using LSR, a self deadlock will arise when an attempt is made to read a record that is in the same CI as a record that is the subject of a READ UPDATE or WRITE MASSINSERT request issued by the same transaction.

If the file is accessed in RLS mode there is no CI locking, but self deadlock responses can still arise. They are caused by sequences of requests that are either logically meaningless or which cannot be performed by VSAM RLS.

With VSAM RLS the most likely causes of this abend are as follows:

- Two successive READ UPDATE requests against the same record by the same transaction without an intervening REWRITE, DELETE or UNLOCK command.

This is an incorrect use of file control requests.

- A transaction has created a record by WRITE MASSINSERT and then, without terminating the WRITE MASSINSERT sequence by issuing an UNLOCK request, the same transaction has attempted to modify the same record by issuing a READ UPDATE or DELETE request.

This sequence of requests fails if VSAM has not written the record out to disk. The only way to guarantee that the record has been written to disk is to issue the UNLOCK request.

- A transaction has updated or deleted a record using a browse for update sequence and then, without terminating the browse for update sequence by issuing an ENDBR request, the same transaction has attempted to modify the same record by issuing a separate READ UPDATE or DELETE or WRITE request.

This sequence of requests fails if VSAM has not written the record out to disk. The only way to guarantee that the record has been written to disk is to issue the ENDBR request.

If the file is used to access a coupling facility data table, then self deadlock responses are caused by sequences of requests that are either logically meaningless or which cannot be performed by coupling facility data tables support.

For coupling facility data tables, the most likely cause of this abend is as follows:

- Two successive READ UPDATE requests have been issued against the same record by the same transaction without an intervening REWRITE, DELETE or UNLOCK command.

This is an incorrect use of file control requests.

System action: The task that would have entered deadlock is abended with a CICS transaction dump.

User response: Examine the previous requests made by this transaction against this file to identify the cause of the deadlock, then correct the error. In some cases (particularly when the file is being accessed in RLS mode or is using a coupling facility data table) this abend may indicate a programming error in the program that issued the file control requests.

Modules: DFHEIFC, DFHDMPCA

AFCH

Explanation: The transaction has issued a request for a remote shared data table for which it has an active browse, but in the meantime the table has been disabled or closed by the owning CICS system, or the owning CICS system has failed.

System action: The requesting transaction abends with a transaction dump.

CICS continues normally.

User response: In the application owning region, take whatever action normally follows the issue of a FORCE request in, or the failure of, the file owning CICS system.

See the *CICS Shared Data Tables Guide* for further guidance.

Modules: DFHEIFC

AFCL

Explanation: The transaction issued a file request
resulting in a call to the main file control program
(DFHFCFR). During the processing of the request the
transaction was purged. That is, the transaction was the
subject of an explicit PURGE or FORCEPURGE request,
was timed out, or was selected by CICS for termination
in an attempt to alleviate an SOS condition.

System action: A CICS transaction dump is issued
with abend code AFCL. A purged response is returned
from DFHFCFR to its caller. The transaction issuing the
file control request will eventually issue an AFCY

abend with a further transaction dump.

User response: In some instances, for example if the
transaction was explicitly purged, no further action is
necessary. Otherwise, examine the exception trace and
the transaction dump to identify the point at which the
purge occurred.

Module: DFHFCFR

AFCJ

Explanation: DFHFCU issued a call to DFHFCFS to open a file. A purged error was returned from DFHFCFS because the task has been waiting for a resource longer than the DTIMEOUT interval specified for the CSFU transaction.

System action: The task is abnormally terminated with a CICS transaction dump. CICS processing continues.

User response: Examine the dump to determine the cause of the error. A system dump can be produced by adding the appropriate dump table entry using the CEMT SET TRDUMPCODE command.

Modules: DFHFCU

AFCK

Explanation: The transaction issued a file update request (READ UPDATE, WRITE or DELETE) against an RLS mode data set for which a DFSMSdss non-BWO backup was in progress.

System action: The transaction is abnormally terminated with a CICS transaction dump. CICS processing continues.

User response: All new file update requests are prohibited when a non-BWO backup is in progress for an RLS mode data set. This restriction is automatically lifted when the backup completes. (A non-BWO backup is any type of backup operation other than a Backup While Open backup.) When the backup has completed, retry the transaction.

Modules: DFHDMPCA, DFHEIFC

| AFCL

| **Explanation:** During the loading of a Shared Data
| Table by the CFTL transaction, a call to the CICS
| Transaction Manager has returned a response (such as
| DISASTER) after which normal processing could not
| continue.

| **System action:** Message DFHFC0949 is issued.
| Loading of the data table is terminated and CFTL
| abends.

| **User response:** Refer to the description of the message
| for further information and guidance.

| **Modules:** DFHDTLX

AFCM

Explanation: During the loading of a data table by the CFTL transaction, an abend was detected, or a domain call returned a response (such as DISASTER) after which normal processing could not continue.

System action: A message is issued (one of DFHFC0945, DFHFC0946, or DFHFC0947). Loading of the data table is terminated and CFTL abends.

User response: If this abend is produced as a result of an abend during loading, message DFHFC0945 is issued. If it is a result of a domain call failure, depending on which domain the failure was returned by, one of the messages DFHFC0946 or DFHFC0947 is issued. Refer to the description of the message for further information and guidance.

Modules: DFHDTLX

AFCN

Explanation: The transaction issued a file request that caused file control to attempt to create a journal record but the record was too large for the journal buffer to accommodate. This indicates that a journal referenced in the file definition is using an MVS logstream, which in turn, is using a coupling facility structure which has been defined with a MAXBUFSIZE parameter less than the recommended 64000.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Redefine the coupling facility structure that the logstream is using with a MAXBUFSIZE parameter of 64000. The journal in error can be the forward recovery log or the journal used for auto-archiving. If the module that detected the error is DFHDMPCA, the error is associated with a journal referenced in the definition of the CSD (DFHCSD).

Modules: DFHDMPCA, DFHEIFC

AFCO

Explanation: An attempt was made to attach a transaction specifying DFHDTLX as the program to be given control, but the transaction was not internally attached by CICS.

DFHDTLX is for use by CICS system transaction CFTL. This loads a Shared Data Table.

System action: The transaction is abnormally terminated. CICS processing continues.

User response: Establish why an attempt was made to attach CFTL illegally, or why a transaction definition specified DFHDTLX as the program to be given control.

Modules: DFHDTLX

AFCR

Explanation: The program issued a file control request against a file opened in RLS mode. While executing this request, CICS detected that the SMSVSAM server address space had failed.

System action: The task is abnormally terminated with a CICS transaction dump.

CICS disables all further RLS accesses and initiates error recovery.

User response: Retry the transaction when the server is available again

If the SMSVSAM server fails, it should normally automatically restart itself as quickly as possible. If this does not happen, consult the VSAM documentation which provides further guidance on debugging problems in the SMSVSAM server.

Modules: DFHEIFC, DFHDMPCA

AFCS

Explanation: The program issued a file control request against a file opened in RLS mode. VSAM was unable to perform this request because the SMSVSAM server address space was inactive.

However, if an offsite restart is being performed (that is, OFFSITE=YES was specified as a system initialization override), this transaction abend is also issued even if the SMSVSAM server address space is active. This is because RLS access is not allowed during an offsite restart for any RLS file control requests other than those issued by transactions which have been attached by CICS to perform RLS recovery work.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Retry the transaction when the server is available again.

If the SMSVSAM server fails, it should normally automatically restart itself as quickly as possible. If this does not happen, consult the VSAM documentation which provides further guidance on debugging problems in the SMSVSAM server.

If an offsite restart is being performed, retry the transaction after RLS recovery has been completed when RLS access by user transactions is allowed again.

Modules: DFHEIFC, DFHDMPCA

AFCT

Explanation: The program has made a file control request against a file opened in RLS mode. The SMSVSAM server has been recycled since an earlier RLS request from the same unit of work. The same unit of work cannot issue requests against two different instances of the SMSVSAM server. Note that this abend

will occur even if the earlier request was not successful.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Resubmit the transaction.

Modules: DFHEIFC, DFHDMPCA

AFCU

Explanation: A program made a file control request against a file that is being accessed in VSAM RLS mode. The underlying data set is in lost locks state. File control requests are not allowed against a data set that is in lost locks state.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Recovery from lost locks is normally automatic. See the *CICS Recovery and Restart Guide* for a full explanation of lost locks recovery. You will not be able to issue any file control requests against this data set until all systems that owned locks at the time of the lock structure failure have completed their lost locks recovery.

See the *CICS Recovery and Restart Guide* for guidance on how to determine which CICS systems still have lost locks recovery pending, for information on commands that allow you to find the work that these systems have outstanding, and on commands that allow you to force a system to immediately complete lost locks recovery. The commands that force immediate completion of lost locks recovery should only be used as a last resort as they may cause loss of data integrity. It is better to allow the automatic recovery procedures to complete normally.

Modules: DFHEIFC, DFHDMPCA

AFCV

Explanation: A request made against a file opened in RLS mode was unable to acquire a record lock. It waited for the lock, but the wait time exceeded the maximum wait time applicable to that request.

System action: The task is abnormally terminated with a CICS transaction dump.

CICS prints message DFHFC0164 and message(s) DFHFC0165 or DFHFC0175 which identify the transaction(s) or Transactional VSAM unit(s) of recovery that were immediately in front of this transaction in the queue for the lock. Normally these transaction(s) or Transactional VSAM unit(s) of recovery are the owners of the lock, although this is not the case if a chain of requests for the record has built up.

User response: Retry the transaction.

If the problem recurs, see messages DFHFC0164 and DFHFC0165 or DFHFC0175 to determine the

transaction or Transactional VSAM unit of recovery that is holding the lock. In most cases the problem lies with the lock owner rather than the transaction that has failed.

Examples of reasons why CICS transactions may cause a timeout:

- The transaction that holds the lock has a design error. For example:
 - A conversational transaction updates a recoverable record and then issues a terminal control read. It does not issue syncpoint (and therefore does not release the lock) until the end user has responded to the terminal control read. It may therefore hold the lock for a considerable period.
 - A transaction updates very many records in recoverable files before issuing syncpoint. You are recommended to keep the number of updates made within a unit of work small and to issue frequent syncpoints to ensure that locks are released regularly.
- The system in which the lock holder is running is experiencing severe performance degradation. Investigate the reason for the performance degradation.
- There is a deadlock between RLS and another resource manager. For example one transaction may be holding an RLS lock and waiting for a lock on a transient data queue. The transaction that times out may hold the lock on the transient data queue and be waiting for the RLS lock. RLS can detect deadlocks only when all the locks involved in the deadlock are RLS locks. A deadlock such as this can appear to RLS to be a long wait for a lock and is reported as a time out. Examine the design of the transactions to determine whether resource manager deadlocks can occur.
- It may be possible for RLS deadlocks to be reported as RLS timeouts if VSAM does not perform deadlock detection until after the time out value for the request occurred. For example, assume that DEADLOCK_TIMEOUT is specified as (15,4) in SYS1.PARMLIB. This means that VSAM does not attempt to detect cross-MVS deadlocks until 4 periods of 15 (that is, 60) seconds have elapsed. If DTIMOUT was not active for the transaction and the SIT specified FTIMEOUT=30, the RLS request times out after 30 seconds, before VSAM has attempted to detect cross-MVS deadlocks. Adjust FTIMEOUT, DTIMOUT, and DEADLOCK_DETECTION to avoid such effects.

DFHFC0175 messages identify Transactional VSAM units of recovery owning an RLS lock. If a Transactional VSAM application is the lock owner it should be investigated to determine why it is holding the lock. Some of the above considerations will be similar for Transactional VSAM applications.

Modules: DFHEIFC, DFHDMPCA

AFCW

Explanation: The program issued a file control request against a file opened in RLS mode. VSAM RLS detected that this request would cause a deadlock. This transaction is abended in order to break the deadlock chain.

System action: The task is abnormally terminated with a CICS transaction dump.

CICS prints message DFHFC0166 and message(s) DFHFC0167 or DFHFC0177 which identify the other transactions or Transactional VSAM units of recovery in the deadlock chain.

User response: Retry the transaction.

Examine the logic of all the programs involved in the deadlock chain to determine whether they could be improved to avoid possible sources of deadlock. See the *CICS Application Programming Guide* for guidance on how to write programs that avoid deadlocks.

Modules: DFHEIFC, DFHDMPCA

AFCY

Explanation: The transaction issued a file request resulting in a call to the main file control program (DFHFCFR). During the processing of the request the transaction was purged (that is, was the subject of an explicit PURGE or FORCEPURGE request, was timed out, or was selected by CICS for termination in an attempt to alleviate an SOS condition). A purged response was returned from DFHFCFR to its caller.

System action: The task is abnormally terminated with a CICS transaction dump.

Exception trace entries are made between the point at which the purge is detected and the issuing of the abend.

- # A transaction dump with abend code AFCI is taken
- # when the purged response is detected by DFHFCFR.

User response: In some instances, for example if the transaction was explicitly purged, no further action is necessary.

- # Otherwise examine the exception trace and the AFCI or
- # AFCY transaction dumps to identify the point at which
- # the purge occurred.

Modules: DFHDMPCA, DFHEIFC

AFCZ

Explanation: The transaction issued a file request resulting in a call to the main file control program (DFHFCFR). A "disastrous error" response was returned from DFHFCFR to its caller.

System action: At the time the error is detected, CICS writes a message to the console, records an exception

trace entry, and takes a system dump. The trace and dump identify the point of error.

Subsequently, the task is abnormally terminated with a CICS transaction dump.

User response: The system programmer should use the trace and dumps to determine what the error is, and why it has occurred.

Modules: DFHDMPCA, DFHEIFC

AFC0

Explanation: An attempt has been made to update a file after file control restart failed.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Determine the cause of the failure in file control restart. Restart CICS.

Modules: DFHEIFC, DFHDMPCA

AFC2

Explanation: DFHFCU issued a call to DFHFCFS to open a file. A disastrous error was returned from DFHFCFS.

System action: The task is abnormally terminated with a CICS transaction dump.

At the time the disastrous error is detected, CICS writes a message to the console, records an exception trace entry and takes a system dump.

CICS processing continues.

User response: The system programmer should examine the trace, the system dump and any related CICS messages to identify the cause of the error.

Modules: DFHFCU

AFC7

Explanation: The CICS definition file (CSD) manager (DFHDMPCA) issued a request to DFHFCFS to enable, open or close the DFHCSD file. A "disastrous error" response was returned from DFHFCFS to DFHDMPCA.

System action: The task is abnormally terminated with a CICS transaction dump.

At the time the disastrous error is detected, CICS writes a message to the console, records an exception trace entry and takes a system dump.

CICS processing continues.

User response: The system programmer should examine the trace, the system dump and any related CICS messages to identify the cause of the error.

Modules: DFHDMPCA

AFDA

Explanation: An attempt was made to attach a transaction specifying DFHFCQT as the program to be given control, but the transaction was not internally attached by CICS.

DFHFCQT is for use by CICS system transactions CFQS and CFQR. These provide support for VSAM RLS data set quiesce and unquiesce operations, DFSMSdss BWO and non-BWO backups, and certain other data set related operations.

System action: The transaction is abnormally terminated. CICS processing continues.

User response: Establish why an attempt was made to illegally attach CFQS or CFQR, or why a transaction definition specified DFHFCQT as the program to be given control.

Modules: DFHFCQT

AFDB

Explanation: An attempt was made by CICS to internally attach a transaction specifying DFHFCQT as the program to be given control, and the transaction id was other than CFQS or CFQR.

DFHFCQT is for use by CICS system transactions CFQS and CFQR. These provide support for VSAM RLS data set quiesce and unquiesce operations, DFSMSdss BWO and non-BWO backups, and certain other data set related operations.

System action: The transaction is abnormally terminated with a CICS transaction dump. CICS processing continues but it is probable that VSAM RLS data set quiesce support has been lost.

User response: Restart CICS. If the problem reoccurs, a more severe error is indicated. In this case, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHFCQT

AFDC

Explanation: CICS system transaction CFQS has failed due to a serious error. An attempt will be made to reattach the transaction. CICS messages should indicate the cause of the error.

CFQS provides support for the initiation of VSAM RLS data set quiesce and unquiesce operations.

System action: CFQS is abnormally terminated with a CICS transaction dump. CFQS is reattached and CICS processing continues.

User response: Check Transient Data Queue CSFL for message DFHFC6028, indicating that the reattach of CFQS was successful. If the reattach fails, VSAM RLS

data set quiesce initiation support is lost. If this support is required, CICS must be restarted.

If it is not possible to restore VSAM RLS quiesce initiation support, a more severe error is indicated. In this case, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHFCQT

AFDD

Explanation: CICS system transaction CFQR has failed due to a serious error. An attempt will be made to reattach the transaction. CICS messages should indicate the cause of the error.

CFQR provides support for VSAM RLS data set quiesce and unquiesce operations, DFSMSdss BWO and non-BWO backups, and certain other data set related operations.

System action: CFQR is abnormally terminated with a CICS transaction dump. CFQR is reattached and CICS processing continues.

User response: Check Transient Data Queue CSFL for message DFHFC6028, indicating that the reattach of CFQR was successful. If the reattach fails, VSAM RLS data set quiesce support is lost. If this happens, CICS must be restarted.

If it is not possible to restore VSAM RLS quiesce support, a more severe error is indicated. In this case, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHFCQT

AFDE

Explanation: An attempt was made to attach a transaction specifying DFHFCRD as the program to be given control, but the transaction was not internally attached by CICS.

DFHFCRD is for use by CICS system transaction CSFR. This provides support for error recovery after a failure of the SMSVSAM server.

System action: The transaction is abnormally terminated. CICS processing continues.

User response: Establish why an attempt was made to illegally attach CSFR, or why a transaction definition specified DFHFCRD as the program to be given control.

Modules: DFHFCRD

AFDF

Explanation: An attempt was made to attach a transaction specifying DFHFCOR as the program to be given control, but the transaction was not internally attached by CICS.

DFHFCOR is for use by CICS system transaction CFOR. This provides part of the RLS offsite recovery support.

System action: The transaction is abnormally terminated. CICS processing continues.

User response: Establish why an attempt was made to illegally attach CFOR, or why a transaction definition specified DFHFCOR as the program to be given control.

Modules: DFHFCOR

AFDG

Explanation: CICS system transaction CFOR has failed due to a serious error. CICS messages should indicate the cause of the error.

DFHFCOR provides part of the RLS offsite recovery support.

This abend indicates that this CICS system has completed its RLS offsite recovery, but an error occurred either in attempting to issue message DFHFC0575D which reports this fact, or in attempting to process the reply to message DFHFC0575D.

System action: CFOR is abnormally terminated with a CICS transaction dump. CICS processing continues.

User response: If you are using an automated

Abend codes AGxx

AGMA

Explanation: An attempt to initiate the good morning message transaction was made without specifying a termid for it to be displayed.

System action: The transaction is abnormally terminated with a CICS transaction dump.

Abend codes Alxx

AICA

Explanation: A task has been executing for longer than the runaway time interval (defined by the ICVR operand on the system initialization table macro, DFHSIT) without giving up control. The runaway task condition indicates a possible loop in the application.

System action: The task is terminated with an AICA transaction dump.

User response: See the *CICS Problem Determination*

procedure to check for and reply to message DFHFC0575D, then you should shut this CICS down and restart it specifying OFFSITE=YES again. If you are using manual procedures to check for completion of all RLS offsite recovery and to reply to message DFHFC0575D then you can "tick" this CICS off the list of systems which have completed their recovery, but you must ensure that it is not restarted with OFFSITE=NO until all other CICS systems have completed their RLS offsite recovery. Also note that until the system is restarted, RLS access will not be allowed by this system.

Modules: DFHFCOR

AFDH

Explanation: VSAM has returned a response indicating that the RLS lock structure in the coupling facility is full. VSAM RLS is unable to create any new locks.

This abend code is usually issued from various CICS systems residing within the same sysplex.

System action: The transaction which issued the VSAM RLS request is abnormally terminated with a CICS transaction dump. CICS processing continues.

User response: Allocate a larger VSAM RLS lock structure and rebuild the RLS structure into the new larger structure. See *OS/390 MVS Setting up a Sysplex*, (GC28-1779) and *DFSMS/MVS DFSMSdfp Storage Administration Reference*, (SC26-4920) for further details on creating RLS lock structures and rebuilding lock structures.

Modules: DFHEIFC, DFHDMPCA

User response: Use the dump to determine how the attempt to start the transaction was made. Ensure that no EXEC CICS STARTs are made for the good morning message transaction where no termid is specified.

Module(s): DFHGMM

Guide for guidance on dealing with loops.

Modules: DFHSRP

AICB

Explanation: A RETRIEVE WAIT request has been reissued in system shutdown.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: None

Modules: DFHICP

AICC

Explanation: An incorrect response was returned from a timer (TI) domain request.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHTAJP, DFHICP

AICD

Explanation: A incorrect response was returned from a kernel (KE) domain request.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHICP

AICE

Explanation: An incorrect response was returned from a dispatcher (DS) domain request (other than AICG).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHICP

AICF

Explanation: An incorrect response was returned from a transaction manager (TM) domain request.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHICP

AICG

Explanation: A PURGED response was returned from a dispatcher domain (DS) request, with a reason code of TASK_CANCEL. TASK_CANCEL was returned as the transaction had been explicitly cancelled.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Notify your system programmer to determine why the task has been purged.

Modules: DFHICP

AICH

Explanation: The task was purged before a request to the storage manager (SM) domain was able to complete successfully. The domain that first detected the purged condition will have provided an exception trace.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate why the task was purged. This is either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Modules: DFHICP, DFHEIIC

AICJ

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error will have provided an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related message produced by the domain that detected the original error.

Modules: DFHICP

AICK

Explanation: Module DFHEIIC has issued a resource level security check (RSLC) request to module DFHXSRC and received a response other than OK or EXCEPTION.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Examine the trace to find the exception

trace entry created by DFHXSRC at the time of the error. Use this trace entry to determine the cause of the return code from DFHXSRC.

Modules: DFHEIIC

AICL

Explanation: DFHEIIC detected an invalid function code in the command level parameter list. This is caused either by a storage overwrite or a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, a level 1 trace of the IC and EI components would aid problem determination. Look in the program storage section of the transaction dump and compare argument 0, the exec interface descriptor (EID), for the command being processed with the argument 0 produced by the translator for the same command. Any differences mean that an overwrite of the application program may have occurred. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHEIIC

AICN

Explanation: An incorrect response has been returned from a user domain (US) request.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHICP

AICO

Explanation: An unexpected EXCEPTION response was received from a call to the user (US) domain.

The call was issued during initialization of a transaction that was started without a terminal. The call was made as part of processing to associate the transaction with its intended user. The attempt to associate the intended user with the transaction has failed.

The userid for the intended user of the transaction may not be correctly defined.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Determine why the intended user of the transaction is not correctly defined.

Examine messages produced for the CICS job by the

external security manager (ESM). This may require the assistance of a security administrator.

It may be necessary to examine the transaction dump to determine why the external security manager has informed CICS that the user is not correctly defined.

When the user has been correctly defined, consider rerunning the transaction.

Modules: DFHICXM

AICQ

| **Explanation:** Module DFHDFST is executing at a terminal which is not permitted.

| **System action:** The transaction is abnormally terminated with a transaction dump.

| **User response:** Determine why this transaction is executing at a terminal.

| **Modules:** DFHDFST

AICR

Explanation: A DFHTC write request has failed for IRC. The return codes within TCATPAPR and TCTEIRET should be examined to determine the cause of failure.

System action: The CSNC transaction is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCRR

AICS

| **Explanation:** Module DFHDFST has encountered an error during Retrieve processing.

| **System action:** The transaction is abnormally terminated with a transaction dump.

| **User response:** Use level 1 trace entries to determine the cause of the failure.

| **Modules:** DFHDFST

AICT

| **Explanation:** Module DFHDFST has encountered an error during START processing.

| **System action:** The transaction is abnormally terminated with a transaction dump.

| **User response:** Use level 1 trace entries to determine the cause of the error.

| **Modules:** DFHDFST

AIEA

Explanation: An unexpected EXCEPTION response was received from a call to the user (US) domain.

The call was issued during initialization of a transaction that was started without a terminal. The call was made as part of processing to associate the transaction with its intended user. The attempt to associate the intended user with the transaction has failed.

The userid for the intended user of the transaction may not be correctly defined.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Determine why the intended user of the transaction is not correctly defined.

Examine messages produced for the CICS job by the external security manager (ESM). This may require the assistance of a security administrator.

It may be necessary to examine the transaction dump to determine why the external security manager has informed CICS that the user is not correctly defined.

When the user has been correctly defined, consider rerunning the transaction.

Modules: DFHIEXM

AIEB

Explanation: The transaction id (CIEP) of the ECI for TCP/IP listener task has been initiated invalidly, probably by entering the id at a terminal. This transaction must only be initiated by CICS internal processes.

System action: The transaction is abnormally terminated.

User response: Do not initiate CIEP directly.

Modules: DFHIIEP

AIIA

Explanation: An error occurred in the IIOB Request Processor which prevented it from sending a reply to the Request Receiver.

System action: The transaction is abnormally terminated.

User response: The Request Processor will have issued an exception trace and a message.

Examine this information to determine why the Request Processor failed.

Modules: com.ibm.cics.iioB.RequestProcessor

AIID

Explanation: The IIOB Request Processor attempted to use a CorbaServer that has been disabled or failed to initialize.

System action: The transaction is abnormally terminated.

User response: Determine why the CorbaServer has been disabled or failed to initialize.

Modules: com.ibm.cics.iioB.RequestProcessor

AIIP

Explanation: An EJB was running in an OTS transaction and the timeout for this transaction was exceeded.

System action: The transaction is abnormally terminated.

User response: Check that an appropriate value has been set for the OTS timeout.

Modules: com.ibm.cics.iioB.RequestProcessor

AIIT

Explanation: The IIOB Request Processor timed out waiting for a request from a Request Receiver. It received a timed out notification from the RZ domain in response to a listen on the RequestStream of which it is the target.

Reasons for this problem include:-

- the RTIMOUT value for this RequestProcessor transaction is too low.
- the client program has failed to send a further method request when one is expected by a transactional object.
- a CICS failure or logic error may have occurred.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See any related diagnostic material and determine the reason for the failure. In the case of a CICS logic error, you need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: com.ibm.cics.iioB.RequestProcessor

AIII

Explanation: An IIOB Request Receiver transaction (default CIRR) was started invalidly. This transaction can only be initiated internally by CICS.

System action: The transaction is abnormally terminated.

User response: Do not issue this transaction.

Modules: DFHIIRRS

AII2

Explanation: The IIOF Request Receiver program DFHIIRR returned an exception which may have been caused by data received from the client.

System action: The transaction is abnormally terminated.

User response: DFHIIRR will have issued an exception trace point and a message and attempted to send a messageError or systemException to the client.

Examine this information to determine why the request receiver rejected the request.

Modules: DFHIIRRS

AII3

Explanation: An IIOF Request Receiver task has been purged.

System action: The transaction is abnormally terminated.

User response: None.

Modules: DFHIIRRS

AII4

Explanation: The IIOF Request Receiver program DFHIIRR has returned a disaster response due to a call to another CICS program failing.

System action: The transaction is abnormally terminated.

User response: DFHIIRR, or the program it called, will have issued an exception trace point and a message.

Examine this information to determine why the request receiver failed.

Modules: DFHIIRRS

AII5

Explanation: The IIOF Request Receiver stub program was invoked from the sockets domain. However the TCPIPSERVICE defined in RDO did not specify a PROTOCOL of IIOF.

System action: The transaction is abnormally terminated.

User response: Change the TCPIPSERVICE definition to specify PROTOCOL(IIOF).

Modules: DFHIIRRS

AINA

Explanation: An application program has issued an EXEC CICS LINK command to the indoubt testing tool program DFHINDT but has failed to pass a commarea containing the request to be executed. Valid requests are: ON, OFF, RESYNC COMMIT or RESYNC BACKOUT.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Correct the application program so that it passes a commarea to DFHINDT containing a valid request for DFHINDT.

Modules: DFHINDT

AINB

Explanation: An application program has issued an EXEC CICS LINK command to the indoubt testing tool program DFHINDT passing a commarea that did not contain a valid request to be executed, Valid requests are: ON, OFF, RESYNC COMMIT or RESYNC BACKOUT

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Correct the application program so that it passes a commarea to DFHINDT containing a valid request for DFHINDT.

Modules: DFHINDT

AINC

Explanation: The indoubt testing tool issued a EXEC CICS INQUIRE EXITPROGRAM command to inquire on the status of the indoubt testing tool task related user exit program DFHINTRU, and the command failed with a NOTAUTH response.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: The indoubt testing tool can be run under transaction CIND , under a user transaction where the program EXEC CICS LINKs to DFHINDT. or under a transaction where the program EXEC CICS LINKs to DFHINDAP. If command security checking is active for the transaction (CMDSEC=YES), check that the user has read access to resource EXITPROGRAM. If resource security checking is active for the transaction (RESSEC=YES), check that the user has read access to resource DFHINTRU.

Modules: DFHINDT, DFHINDAP

AIND

Explanation: The indoubt testing tool issued a EXEC CICS INQUIRE EXITPROGRAM command to inquire on the status of the indoubt testing tool task related user exit program DFHINTRU, and the command failed with an unexpected response.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHINDT, DFHINDAP

AINE

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR or PURGED) has occurred on an START_LINK_BROWSE command issued by the indoubt tool to recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHINDT provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHINDT

AINF

Explanation: An EXCEPTION response with an unexpected reason occurred on an GET_NEXT_LINK call issued by the indoubt testing tool to recovery manager (RM) domain. DFHINDT provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHINDT

AING

Explanation: An error (DISASTER, INVALID, KERNERROR, or PURGED) has occurred on an GET_NEXT_LINK call issued by the indoubt testing tool to recovery manager (RM) domain. The RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

DFHINDT also provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHINDT

AINH

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR or PURGED) has occurred on an END_LINK_BROWSE command issued by the indoubt tool to recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHINDT provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHINDT

AINI

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR or PURGED) has occurred on an INQUIRE_UOW command issued by the indoubt testing tool to recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHINDT provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM

to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHINDT

AINJ

Explanation: An EXCEPTION response with an unexpected reason occurred on an INITIATE_RECOVERY call issued by the indoubt testing tool to recovery manager (RM) domain. DFHINDT provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHINDT

AINK

Explanation: An error (DISASTER, INVALID, KERNERROR, or PURGED) has occurred on an INITIATE_RECOVERY call issued by the indoubt testing tool to recovery manager (RM) domain. The RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

DFHINDT also provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHINDT

AINL

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR or PURGED) has occurred on an SET_RECOVERY_STATUS command issued by the indoubt testing tool to recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHINDT provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM

to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHINDT

AINM

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR or PURGED) has occurred on an TERMINATE_RECOVERY command issued by the indoubt testing tool to recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHINDT provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHINDT

AINN

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR or PURGED) has occurred on an ADD_LINK command issued by the indoubt testing tool to recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHINTRU provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHINTRU

AINO

Explanation: The indoubt testing tool task related user exit DFHINTRU issued an EXEC CICS INQUIRE TRANSACTION command to inquire whether the current transaction was in the indoubt transaction class DFHTCIND. The command failed with a NOTAUTH response.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: When the indoubt testing tool is

active, the task related user exit DFHINTRU is invoked whenever a CICS transaction is started. For all transactions for which command security checking is active, ensure that the user has read access to resource TRANSACTION. If started transaction resource security checking is specified, for all transactions for which resource security checking is active, ensure that the user has read access to the transaction name in the specified RACF resource class.

For more information on command security and resource security see the *CICS RACF Security Guide*.

Modules: DFHINTRU

AINP

Explanation: The indoubt testing tool task related user exit DFHINTRU issued an EXEC CICS INQUIRE TRANSACTION command to inquire whether the current transaction was in the indoubt transaction class DFHTCIND. The command failed with an unexpected response.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHINTRU

AINQ

Explanation: The indoubt testing tool task related user exit DFHINTRU issued an EXEC CICS INQUIRE TASK command to inquire on the current task to obtain the unit of work ID to include in message DFHIN1009. The command failed with a TASKIDERR response.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHINTRU

AINR

Explanation: The indoubt testing tool task related user exit DFHINTRU issued an EXEC CICS INQUIRE TASK command to inquire on the current task to obtain the unit of work ID to include in message DFHIN1009. The command failed with a NOTAUTH response.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: When the indoubt testing tool is active, the task related user exit DFHINTRU is invoked whenever a CICS transaction is started. For all transactions for which command security checking is

active (CMDSEC=YES), ensure that the user has read access to resource TASK.

Modules: DFHINTRU

AINS

Explanation: The indoubt testing tool task related user exit DFHINTRU issued an EXEC CICS INQUIRE TASK command to inquire on the current task to obtain the unit of work ID to include in message DFHIN1009. The command failed with an unexpected response.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHINTRU

AISA

Explanation: The mirror transaction (CSMI) has been attached from some facility other than a terminal. This is not permitted.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Using the dump, check the field TCAFCAAA to identify the invalid attach.

Modules: DFHMIRS

AISB

Explanation: The mirror transaction (CSMI) has detected errors in the data passed to it from the attaching transaction.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: The invalid input will be visible in the transaction dump. This error is likely to be caused by some mismatch between the two systems. A typical example might be a DL/I request received on a system generated without DL/I.

Modules: DFHMIRS

AISC

Explanation: The mirror transaction (CSMI) has not received a TIOA from the terminal.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Use the trace in the dump and the dumped TCTTE to analyze the problem further.

Modules: DFHMIRS

AISD

Explanation: The mirror program executed the request and received a nonzero return code as a result. The data flow control state of the intersystem link being used was such that this information could not be returned normally.

System action: The mirror task is abnormally terminated with a CICS transaction dump.

User response: The transaction dump provided will provide information required to analyze the source of the nonzero return code at its point of origin.

Modules: DFHMIRS

AISF

Explanation: The CICS mirror program DFHMIRS has been attached in an unsupported manner. The principal facility for the mirror transaction is defined as APPC, however the conversation is unmapped.

System action: CICS abnormally terminates the transaction with a transaction dump.

User response: There is a problem with the system that caused the mirror transaction to be attached. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHMIRS

AISG

Explanation: The mirror program executed the request and produced the reply. This would not be sent because the data flow control state of the intersystem link was such that this could not be done.

System action: The task (CSMI) is abnormally terminated with a CICS transaction dump.

User response: Use the transaction dump provided to analyze the problem.

Modules: DFHMIRS

AISH

Explanation: The new connection task, CSNC, has been invoked in an incorrect manner (for example, from a terminal or via an EXEC CICS START request).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: None.

Modules: DFHCRNP

AISI

Explanation: A function shipping request was passed by DFHEIP to DFHISP. This was found to be invalid by the transformer, DFHXFP.

System action: The transaction issuing the function shipping request is abnormally terminated with a CICS transaction dump.

User response: The transaction dump will provide information to further analyze the problem.

Modules: DFHISP

AISJ

Explanation: The IRC control task CSNC has abended because the attempt to LINK to DFHCRR failed.

System action: CSNC is abnormally terminated with a system dump. All tasks using MRO links to other systems are abnormally terminated. All tasks in other CICS regions (including shared database batch regions) that are currently communicating with this system are also abnormally terminated.

User response: Ensure that program DFHCRR is available.

Modules: DFHCRNP

AISK

Explanation: The user transaction has been abnormally terminated during the execution of a function shipping request on an APPC session. This has happened because the mirror transaction on the remote system has abnormally terminated, and caused a request for syncpoint rollback to be sent across the session. CICS abends the user transaction in these circumstances so that function shipping remains transparent to the transaction.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check the log on the mirror system to determine the reason for the original abend of the mirror task.

Modules: DFHISP

AISL

Explanation: The LU services manager transaction has been started directly from a user terminal. This is not permitted.

System action: The task is abnormally terminated with a transaction dump.

User response: None. The LU services manager transaction must be started internally by CICS.

Modules: DFHLUP, DFHCLS3, DFHCLS4, DFHZLS1

AISN

Explanation: Task CSNC attempted to acquire a SUSPEND TOKEN to enable it to suspend itself until further work arrives. The attempt failed.

System action: CSNC is abnormally terminated with a dump. The IRC facility is disabled.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCRNP

AISO

Explanation: Task CSNC attempted to suspend itself, awaiting further work. The attempt failed.

System action: CSNC is abnormally terminated with a dump. The IRC facility is disabled.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCRNP

AISP

| **Explanation:** A mirror transaction (transaction
| identifiers CSHR, CSM1, CSM2, CSM3, CSM5, or CSMI)
| has been invoked with an invalid principal facility. The
| mirror transaction executes with an MRO session, an
| LU6.1 session or an APPC session as its principal
| facility.

| **System action:** The transaction is abnormally
| terminated with a CICS transaction dump.

| **User response:** Do not attempt to invoke the mirror
| transaction by entering the transaction identifier at a
| terminal.

| **Modules:** DFHMIRS

AISQ

Explanation: An EXEC CICS command has been issued against a CPI Communications session. A CPI Communications session is one that has a CPI-Communications Control Block (CPC) associated with it.

System action: The mirror task is abnormally terminated with a CICS transaction dump.

User response: Do not mix EXEC commands with CPI Communications calls on the same end of a conversation.

Modules: DFHMIRS

AISR

| **Explanation:** The CICS Inter-Region Session Recovery
| Program (DFHCRR) has been invoked in an incorrect
| manner, for example, from a terminal.

| **System action:** The program DFHCRR is abnormally
| terminated with a CICS transaction dump.

| **User response:** None.

| **Modules:** DFHCRR

AISS

Explanation: A security violation has occurred while CICS was attempting to start a conversation with a remote APPC system. The security access level of the requestor was insufficient to access the transaction on the connected APPC system. Depending on the nature of the request and the way security has been set up, the requestor with an insufficient access level can be the local CICS system, the requesting transaction, or the terminal user.

Note: DTP programs do not abend with code AISS after a security failure in the remote region.

System action: The transaction is abnormally terminated with a transaction dump.

User response: First, verify that the access was correctly denied. Then, if required, change the access level.

Modules: DFHZARM

AIST

Explanation: An unexpected return code has been returned after a DFHTC TYPE=LOCATE command.

System action: CSNC is abnormally terminated with a system dump. All tasks using MRO links to other systems are abnormally terminated. All tasks in other CICS regions (including shared database batch regions) that are currently communicating with this system are also abended.

User response: The trace in the system dump should be used to analyze the problem further.

Modules: DFHCRNP

AISU

Explanation: An INVALID, DISASTER, or EXCEPTION condition has occurred on a call to the storage manager domain (SM) to FREEMAIN a FCENT control block.

The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump.

System action: The task is abnormally terminated with a transaction dump.

User response: See the related message from the domain that detected the original error.

Modules: DFHMIRS

AISV

Explanation: A PURGED condition has occurred on a call to the storage manager domain (SM) to FREEMAIN a FCENT control block.

The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump.

System action: The task is abnormally terminated with a transaction dump.

User response: Investigate why the task was purged. This is either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Modules: DFHMIRS

AISW

Explanation: An INVALID, DISASTER, or EXCEPTION condition has occurred on a call to the storage manager domain (SM) to GETMAIN or FREEMAIN a CRB control block.

The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump.

System action: The task is abnormally terminated with a transaction dump.

User response: See the related message from the domain that detected the original error.

Modules: DFHCRSP

AISX

Explanation: A PURGED condition has occurred on a call to the storage manager domain (SM) to GETMAIN or FREEMAIN a CRB control block.

The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump.

System action: The task is abnormally terminated with a transaction dump.

User response: Investigate why the task was purged. It was purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Modules: DFHCRSP

AISY

Explanation: The LU services manager transaction has been started, but invalid parameters have been detected.

System action: The task is abnormally terminated with a transaction dump.

User response: See message DFHZC4921 for further guidance.

Modules: DFHLUP

AISZ

| **Explanation:** DFHMXP has received an unexpected
| reply when committing START PROTECT NOCHECK
| requests sent on a LUTYPE6.2 synclevel 1 conversation.

| **System action:** The task is abnormally terminated.

| **User response:** Determine what happened to
| transaction CVMI in the partner system. If the START
| PROTECT NOCHECK requests had been committed,
| no further action is necessary. If they had not been
| committed, user-defined action is required to recover
| from the error.

| **Modules:** DFHMXP

AIS1

Explanation: An unexpected return code has been returned after a DFHMROQM FUNC=ENQ command was issued.

This command was issued when enqueueing work for the IRC control task (CSNC) during IRC initialization.

System action: If IRC is being initialized during CICS initialization (as a result of IRCSTRT being specified in the DFHSIT or override parameters), then CICS is abnormally terminated.

If IRC is being initialized during the execution of a CEMT SET IRC OPEN command, then the CEMT transaction is abnormally terminated.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCRSP

AIS2

Explanation: An unexpected return code has been returned after a DFHMROQM FUNC=WAIT_Q command was issued.

This command was issued when waiting for more IRC work to process.

System action: CSNC is abnormally terminated with a system dump. All tasks using MRO links to other systems are abnormally terminated.

All tasks in other CICS regions (including shared database batch regions) that are currently communicating with this system are also abended.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCRNP

AIS3

Explanation: An attempt to issue a STCK (Store Clock) instruction failed.

System action: CSNC is abnormally terminated with a system dump.

All tasks using MRO links to other systems are abnormally terminated.

All tasks in other CICS regions (including shared database batch regions) that are currently communicating with this system are also abended.

User response: Repair or enable the system clock.

Modules: DFHCRNP

AIS4

Explanation: An unexpected return code has been returned after a DFHMROQM FUNC=ENQUEUE command. This command was issued when enqueueing work to the IRC 'delayed work' queue.

System action: CSNC is abnormally terminated with a system dump. All tasks using MRO links to other systems are abnormally terminated.

All tasks in other CICS regions (including shared database batch regions) that are currently communicating with this system are also abended.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCRNP

AIS5

Explanation: An unexpected return code has been returned after a DFHMROQM FUNC=ENQUEUE command was issued.

This command was issued when enqueueing work to the IRC 'immediate work' queue.

System action: CSNC is abnormally terminated with a system dump. All tasks using MRO links to other systems are abnormally terminated.

All tasks in other CICS regions (including shared database batch regions) that are currently communicating with this system are also abended.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCRNP

AIS6

Explanation: An INVALID, DISASTER or EXCEPTION condition has occurred on a call to the storage manager domain (SM) to GETMAIN or FREEMAIN a file control read set buffer.

The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump.

System action: The task is abnormally terminated with a transaction dump.

User response: See the related message from the domain that detected the original error.

Modules: DFHMIRS

AIS7

Explanation: A PURGED condition has occurred on a call to the storage manager domain (SM) to FREEMAIN a file control read set buffer.

The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump.

System action: The task is abnormally terminated with a transaction dump.

User response: Investigate the reason why the task was purged. It was purged either by the master terminal operator , or as a result of a deadlock timeout.

Modules: DFHMIRS

AIS8

Explanation: An internal logic error has been detected in module DFHMIRS.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHMIRS

AIS9

Explanation: The mirror program has detected that a DPL server program has returned in an invalid state following the completion of the LINK command. The server program or a program it linked to has initiated a synclevel 2 conversation with another program which in turn has issued a syncpoint. The server program has not responded to the syncpoint request which is still outstanding when control returns to the mirror program.

The mirror program only issues this abend code if the LINK request did not specify SYNCONRETURN.

System action: The task is abnormally terminated with a transaction dump.

User response: Correct the design of the DTP application or applications initiated by the server program. If the SYNCONRETURN option is not specified on the LINK request, only the client program should initiate the syncpoint. If it is necessary to issue syncpoint requests from the DTP applications, consider using the SYNCONRETURN option on the LINK request. See the *CICS Intercommunication Guide* for further details of the LINK command and its options.

Modules: DFHMIRS

AITA

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the recovery manager (RM) domain to initialize the recovery status of an IRC session. The domain provides an exit trace, and possibly a console message and a system dump (depending on the options specified in the dump table).

This failure is either the result of a task purge, or a CICS logic error,

System action: The CSNC task is abnormally terminated with a CICS transaction dump.

User response: See the related diagnostic material produced by the recovery manager domain and determine the reason for the failure. In the case of a CICS logic error, you need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCRNP

AITB

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the recovery manager (RM) domain. The domain provides an exit trace, and possibly a console message and a system dump (depending on the options specified in the dump table).

This failure is either the result of a task purge, or a CICS logic error,

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related diagnostic material produced by the recovery manager domain and determine the reason for the failure. In the case of a CICS logic error, you need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHISP DFHMXP

AITC

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the recovery manager (RM) domain. The domain provides an exit trace, and possibly a console message and a system dump (depending on the options specified in the dump table).

This failure is either the result of a task purge, or a CICS logic error,

System action: The mirror task is abnormally terminated with a CICS transaction dump.

User response: See the related diagnostic material produced by the recovery manager domain and

determine the reason for the failure. In the case of a CICS logic error, you need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHMIRS

AITD

Explanation: The mirror program has received an unexpected response from the RX domain.

There are several reasons why this error may occur:

- A request received from an EXCI client is inconsistent with an earlier request in the same Unit of Work
- CICS has received an unexpected response from the Recoverable Resource Management Services component of MVS.
- There has been an internal error in the RX domain.

System action: The mirror task is abnormally terminated with a CICS transaction dump.

User response: Use the exception trace provided by the RX domain to determine the reason for the failure. If the error is caused by an inconsistent request from an EXCI client, there may be an error in the client program.

In the other cases, you might need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHMIRS

AITE

Explanation: A transaction has executed a transactional EXCI request from a batch region, and has been waiting for one of the following events for longer than the interval specified in the RTIMOUT value for the transaction.

- A further transactional EXCI request from the batch region
- A syncpoint initiated by Resource Recovery Management Services (RRMS).

System action: The mirror task is abnormally terminated with a CICS transaction dump.

User response: Determine why the expected event has not occurred:

If a further transactional EXCI request is expected

- The batch program may be suspended

If a syncpoint is expected

- The batch program may be suspended before reaching syncpoint
- RRMS may have started syncpoint processing but is waiting for another Resource Manager to respond to the syncpoint request.

See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHMIRS

AITF

Explanation: A transaction has executed a transactional EXCI request from a batch region, and has been purged while waiting for one of the following events:

- A further transactional EXCI request from the batch region
- A syncpoint initiated by Resource Recovery Management Services (RRMS).

System action: The mirror task is abnormally terminated with a CICS transaction dump.

User response: Determine why the expected event has not occurred:

If a further transactional EXCI request is expected

- The batch program may be suspended

If a syncpoint is expected

- The batch program may be suspended before reaching syncpoint
- RRMS may have started syncpoint processing but is waiting for another Resource Manager to respond to the syncpoint request.

See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHMIRS

AITG

Explanation: A transaction has executed a transactional EXCI request from a batch region, and both of the following events has occurred:

- A further transactional EXCI request from the batch region
- A syncpoint initiated by Resource Recovery Management Services (RRMS).

Normally, only one event should occur, and not both.

System action: The mirror task is abnormally terminated with a CICS transaction dump.

User response: Determine why both events have occurred. This situation may arise when an EXCI client times out on a DPL request that CICS is not ready to receive and then proceeds to take a syncpoint. If this is not the case, you may need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHMIRS

AITH

Explanation: A mirror transaction processing an ECI request from a TCP/IP connected client has failed while trying to receive data from, or send data to, a client. This could be a read time out, or a more serious error in the flows that prevented CICS from correctly processing the data.

System action: The mirror task is abnormally terminated with a CICS transaction dump.

User response: If the error was a time out, determine why the client has not continued with the extended ECI conversation. Other errors will have associated IE domain messages to aid in problem determination.

Modules: DFHMIRS

AITI

Explanation: A mirror transaction processing a START CHANNEL or LINK CHANNEL request has failed

while trying to receive data from, or send data to, a connected CICS system. Because a channel may include a considerable amount of data, it may require many calls to terminal control to transmit channel data. DFHMIRS calls program DFHAPCR to perform all the inter-system transmission of channel data. Terminal control has detected an error in one of these calls. The error could be a read time out, or a more serious error in the flows that prevented CICS from correctly processing the data.

System action: The mirror task is abnormally terminated with a CICS transaction dump.

User response: If the error was a time out, determine why the other end has not continued with the conversation. Other errors will have associated terminal control messages to aid in problem determination. Examine trace entries from DFHAPCR to determine terminal control error and sense information.

Modules: DFHMIRS

Abend codes AJxx

AJAA

Explanation: The CREA/CREC transaction could not allocate the shared memory it required. The transaction will free all allocated memory and issue this abend.

System action: The transaction is terminated.

User response: Examine the trace to determine why the GETMAIN failed. If the CICS region was short on storage then take the necessary steps to correct this. If your region was not short on storage you may need help from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHADDRM

AJAB

Explanation: The CREA/CREC transaction could not free the shared memory it allocated.

System action: The transaction is terminated.

User response: Examine the trace to determine why the FREEMAIN failed. You may need help from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHADDRM

AJAC

Explanation: The CREA/CREC transaction browses the installed REQUESTMODELS. An attempt to start or continue the browse of the REQUESTMODELS failed with an unexpected return code.

System action: The transaction is terminated.

User response: Examine the trace to determine why the INQUIRE REQUESTMODEL call failed. You may need help from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHADDRM

AJAD

Explanation: The CREA/CREC transaction received an unexpected return code from an EXEC CICS call and could not continue.

System action: The transaction is terminated.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHADDRM

AJAE

Explanation: The CREA/CREC transaction used the EXEC CICS SEND MAP call to display a BMS map. This call returned an expected return code.

System action: The transaction is terminated.

User response: Examine the trace to determine why the SEND MAP call. You may need help from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. failed.

Modules: DFHADDRM

AJAF

Explanation: The CREA/CREC transaction used the EXEC CICS RECEIVE MAP call to receive data from a BMS map. This call returned an expected return code.

System action: The transaction is terminated.

User response: Examine the trace to determine why the RECEIVE MAP call failed. You may need help from IBM to resolve this problem. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHADDRM

AJAG

Explanation: The CREA/CREC transaction must be invoked using the transaction ID of 'CREA' or 'CREC'. You are not able to use another transaction ID to invoke DFHADDRM (the program invoked for the CREA/CREC transaction).

System action: The transaction is terminated.

User response: Use CREA or CREC to invoke the CREA/CREC transaction.

Modules: DFHADDRM

AJA0

Explanation: The native method SetAbendForCondition has been passed an invalid Resp value by the Wrapper class.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFJCICS

AJCD

Explanation: An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related message from the domain that detected the original error.

Modules: DFHJCP

AJCE

Explanation: The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The domain that first detected the purged condition provides an exception trace.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate why the task was purged. It was purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Modules: DFHJCP

AJCS

Explanation: An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to the log manager (LM) domain. The domain that detected the original error provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related message from the domain that detected the original error.

Modules: DFHJCP

AJCT

Explanation: An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to the recovery manager (RM) domain. The domain that detected the original error provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related message from the domain that detected the original error.

Modules: DFHJCP

AJCU

Explanation: A purge response has been received from either the log manager or the recovery manager. The domain that detected the original purge condition provides an exception trace.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate why the task was purged. It was purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Modules: DFHJCP

AJMB

Explanation: The CICS-JVM interface has rejected an attempt to invoke a Java program to run under control of a JVM because a previous JVM for the same CICS task terminated abnormally. The CICS-JVM interface is unable to create a JVM to run the Java program.

This error occurs when the previous JVM was terminated because of a Java program invoking the Java system.exit method and because errors occurred during the subsequent JVM termination. A system.exit invocation causes a forced termination of the JVM and the LE/370 runtime environment.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Examine why the previous JVM termination failed. Wherever possible avoid the use of system.exit to return from Java programs.

Modules: DFHAPLJ

AJ01

Explanation: The main method of the Java environment setup class, Wrapper, has been invoked without an argument. Wrapper main expects the class name of the user's main to be passed as the first argument.

The callUserCode method of Wrapper detects this, sets

return code INVALID_ARGUMENTS and invokes native method SetAbend to abend the task.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFJCICS

AJ02

Explanation: A CICS AbendError has been caught by the Java environment setup class, Wrapper.

The callUserCode method of Wrapper detects this, sets return code ABEND_RECEIVED and invokes native method SetAbend to abend the task.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See related messages to determine the reason for the original abend.

Modules: DFJCICS

AJ03

Explanation: A CicsConditionException has been caught by the Java environment setup class, Wrapper.

The callUserCode method of Wrapper detects this, sets return code CONDITION_RECEIVED and invokes native method SetAbendForCondition to abend the task. The appropriate default abend code for the condition should be issued but, if for some reason this is not possible, an AJ03 abend may be issued.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See related messages to determine the reason for the original CicsConditionException.

Modules: DFJCICS

AJ04

Explanation: An unexpected error has been caught by the Java environment setup class, Wrapper, attempting to invoke the user class.

The callUserCode method of Wrapper detects this, sets return code UNEXPECTED_EXCEPTION and invokes native method SetAbend to abend the task.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFJCICS

AJ05

Explanation: An unhandled exception has been caught by the Java environment setup class, Wrapper, as an InvocationTargetException from the user class.

The callUserClass method of Wrapper detects this, sets return code INVOCATION_TARGET_EXCEPTION and invokes native method setAbend to abend the task.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See related messages to determine the reason for the original Exception.

Modules: DFJICICS

AJ07

Explanation: The Java environment setup class, Wrapper, has been unable to invoke the user's main method. The class whose name was passed as an input parameter to its CallUserClass method was not found.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: If your Java program has been bound using ET/390, check that the -main option correctly specifies, or defaults to, the name of the class containing your main method.

Check that CICS has been granted read permission to the target class and the entire HFS directory structure in which the class or Jar file is located.

Modules: DFJICICS

AJ09

Explanation: The Java environment setup class, Wrapper, has been unable to invoke the user's main method. A public static method, taking either a CommAreaHolder or a String array as input, was not found in the class whose name was passed as an input parameter to the CallUserClass method of Wrapper.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check that you have provided a main method, with an appropriate method signature, in the specified class. Also check that the target class explicitly uses the 'public' class modifier. If your Java program has been bound using ET/390, check that the -main option correctly specifies, or defaults to, the name of the class containing your main method.

Modules: DFJICICS

AJ10

Explanation: The Java environment setup class, Wrapper, has detected that the user's class has used JDBC or SQLJ. It however has been unable to load the DB2 JDBC classes necessary to call back the JDBC/SQL driver for cleanup processing following completion of the user class.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFJICICS

AJ11

Explanation: The Java environment setup class, Wrapper, has detected that the user's class has used JDBC or SQLJ. It however has been unable to find the DB2 JDBC static method to call back the JDBC/SQL driver for cleanup processing following completion of the user class.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFJICICS

AJ12

Explanation: The Java environment setup class, Wrapper, has detected that the user's class has used JDBC or SQLJ. It however has been unable to invoke the DB2 JDBC static method to call back the JDBC/SQL driver for cleanup processing following completion of the user class.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFJICICS

AJ99

Explanation: The Java environment setup class, Wrapper, has detected an AbendException and issued setAbend. The abend code extracted from the AbendException is too long.

System action: Task abnormal termination continues with the abend code set to AJ99

User response: Correct the abend code String used to create the AbendException.

Abend codes AKxx

AKCB

Explanation: The CICS transaction manager restart task could not complete because a necessary step failed. The task has done some essential recovery operations and abnormally terminated itself with code AKCB.

System action: CICS writes a transaction dump for the transaction manager restart task.

CICS sends three messages to the console, one to identify the error detected by the transaction manager restart task, one to say that the task has failed, and one that gives you the option of cancelling CICS or letting it continue. Depending on the nature of the original error, you may see messages from some other system component (for example, an access method).

User response: Use the messages and dumps to find out the cause of the failure.

Modules: DFHKCRP

AKCC

Explanation: The CICS transaction manager has abended the transaction because the purge threshold of its TRANCLASS has been reached. This is specified by the PURGETHRESH parameter on CEDA DEFINE TRANCLASS. See the *CICS Resource Definition Guide* manual for more details of this parameter.

System action: The transaction is abended and messages DFHAC2004 and DFHAC2236 are issued. The transaction dump is suppressed for this abend code.

User response: Resubmit the transaction. The cause of the abend may be a temporary stress condition in the system.

If the problem persists, determine why the TRANCLASS purge threshold has been reached. Ensure that PURGETHRESH has been specified correctly. Also, ensure that the MAXACTIVE value of the TRANCLASS has not been set too low. Transactions attached after the MAXACTIVE limit has been reached are immediately queued subject to the PURGETHRESH limit.

If PURGETHRESH and MAXACTIVE are set correctly, look for a more general problem which has caused a decrease in the capacity of the system to execute transactions in the TRANCLASS. The decrease might, for example, be caused by a connected CICS region which processes requests for transactions in the TRANCLASS, if this connected region has slowed down.

Examine all resources (files, links, storage, and so on) used by the transactions in the TRANCLASS which is reaching the purge threshold and determine why the capacity of the system is reduced.

Modules: DFHXMAT, DFHXMCL

AKCE

Explanation: While CICS transaction manager was recording changes to a transaction or profile definition, a write to the system log failed.

System action: CICS terminates the transaction with a transaction dump.

User response: Use the dumps to find out why the write to the log failed.

Modules: DFHKCQ

AKCF

Explanation: While CICS transaction manager was recording changes to a profile definition, a write to the catalog failed.

System action: CICS terminates the transaction with a transaction dump.

User response: Use the dumps to find out why the write to the catalog failed.

Modules: DFHKCQ

AKCR

Explanation: Transaction manager has received an invalid request code. The last AP F000 trace entry before the program control program (PCP) ABEND TRACE entry (TRACE ID 'F2', request code X'6000') will contain the invalid transaction manager request code in the fifth byte of the first section of the trace.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Determine the cause of the invalid request code and correct the problem.

Modules: DFHXCP

AKCS

Explanation: A deadlock timeout condition has been detected. This condition may occur within a transaction that specifies DTIMOUT to be nonzero on its installed transaction definition. Deadlock timeout occurs when a transaction has been waiting or has been suspended for longer than the time specified in DTIMOUT.

The abend may be driven by a variety of internal CICS events, for example:

- A short on storage condition
- A temporary storage shortage
- ENQUEUE

- An ALLOCATE request
- A RETRIEVE WAIT request.

The abend can also occur if CICS stops running for a time, for example while an sdump is taken. This is because deadlock timeout is based on total elapsed time, and not just the time CICS is executing.

Analysis: The transaction receiving the AKCS abend must have been suspended or must be waiting for a reason such as a short on storage, enqueued on a lock, a short on temporary storage, a suspend after RETRIEVE WAIT, a suspend after ALLOCATE, or an implicit ALLOCATE within function shipping or terminal sharing support. If none of these apply, the trace might reveal some event that has caused CICS to stop running for a time.

System action: The transaction is abnormally terminated. A dump is not provided unless the dump table entry for transaction dump AKCS indicates that one should be taken.

User response: The transaction should be reexecuted, and the situation causing the SUSPEND to occur may clear itself.

The AKCS abend is to be expected occasionally, unless DTIMOUT is set to zero. No special action is necessary.

Modules: DFHXCP

AKCT

Explanation: A terminal read-time-out condition has been detected. The transaction has been waiting for a terminal input message for an interval longer than specified in the RTIMOUT value for that transaction.

If an EXEC CICS HANDLE ABEND has been issued for this task, the read that was timed-out is still outstanding. To cancel this read you should issue an EXEC CICS ABEND at the end of the user exit routine so that CICS can clean up the terminal's TCTTE.

System action: The transaction is abnormally terminated. A transaction dump is not provided.

User response: This abend is a normal one. Coding RTIMOUT in the PROFILE entry asks for the task to be abnormally terminated if the terminal does not send input within the specified time.

Modules: DFHXCP

AKCV

Explanation: A bad return code was passed as a result of the resume of a task suspended by ICP.

System action: The transaction is terminated with a dump.

User response: Check the response from the resume in the trace to determine the cause of the error.

Modules: DFHALP

AKC0

Explanation: An attempt has been made to run the CICS internal task CSSY as a user transaction.

System action: CICS terminates the task with a transaction dump.

User response: Investigate why the attempt was made to run CSSY as a user transaction.

Modules: DFHAPATT

AKC1

Explanation: A DFHKC WAIT request was issued when the ECB was already marked as waiting.

System action: There is a probable user error. The transaction is abnormally terminated.

User response: Correct the program that issued the request.

Modules: DFHXCP

AKC2

Explanation: A bad response has been received from a dispatcher (DS) domain call.

System action: The transaction is abnormally terminated with a transaction dump and a trace entry.

User response: Examine the trace entry for further information.

Modules: DFHXCP

AKC3

Explanation: The task has been purged, probably due to operator action such as a CEMT TASK PURGE command. The task might also have been purged as a result of CICS issuing a purge request.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Use the transaction dump to determine why the task was purged. In particular, if the purge was operator initiated, the dump should be useful in determining why this task needed to be explicitly purged.

Modules: DFHXCP, DFHXMAT, DFHXMCL, DFHXMIQ, DFHXMTA

AKC6

Explanation: DFHKC RESUME should always be preceded by DFHKC SUSPEND. If this protocol is violated then the transaction is abnormally terminated with abend code AKC6.

System action: Transaction is abnormally terminated with abend code AKC6.

User response: Examine the trace entry for further information.

Modules: DFHXCP

AKC8

Explanation: A bad response has been received from a call to the kernel (KE) domain during the processing of a task purge request.

System action: The transaction is abended with a transaction dump.

User response: Examine the dump and any exception trace entries for further information.

Modules: DFHXCP

AKC9

Explanation: An incorrect response has been received from a call to the enqueue (NQ) domain during the processing of a DFHKC TYPE=ENQ or a DFHKC TYPE=DEQ request.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Examine the dump and any exception trace entries for further information. Since the DFHKC service is only used for internal enqueues, this abend indicates an error in CICS. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHXCP

AKEA

Explanation: A program check has been detected by the kernel (KE) domain.

System action: If an application is in control, the ASRA abend is presented to the application. Otherwise, the functional recovery routine of the CICS module in control at the time is given control. This recovery routine produces suitable diagnostics and may terminate CICS.

User response: Look at the kernel domain section of the system dump to determine where the program check has occurred.

Modules: DFHKESTX

AKEB

Explanation: An operating system abend has been detected by the kernel (KE) domain.

System action: If an application is in control, the

ASRB abend is presented to the application. Otherwise, the functional recovery routine of the CICS module in control at the time is given control. This recovery routine produces suitable diagnostics and may terminate CICS.

User response: Check the console for any MVS messages that may have caused this abend.

Look at the kernel domain section of the system dump to determine where the abend has occurred.

Modules: DFHKESTX

AKEC

Explanation: The kernel (KE) domain has detected runaway.

System action: If an application is in control, the AICA abend is presented to the application. Otherwise, the functional recovery routine of the CICS module in control at the time is given control. This recovery routine produces suitable diagnostics and may terminate CICS.

User response: Look at the kernel domain section of the system dump to determine where the runaway has occurred.

Modules: DFHKESTX, DFHKERRU

AKED

Explanation: The kernel (KE) domain has been requested to initiate abend processing as a result of a deferred abend request.

System action: Abend processing starts for the task that is subject to the deferred abend request.

User response: The task is not abended with AKED but by an abend code specified by the requestor of the deferred abend. See the description of this abend for further guidance.

Modules: DFHKEEDA

AKEF

Explanation: The kernel (KE) domain has detected an error while processing a domain call. The error may have been caused by a domain gate that was not yet active during initialization

System action: If an application is in control, the transaction terminates with a system dump. Otherwise, the functional recovery routine of the CICS module in control at the time is given control. This recovery routine produces suitable diagnostics and may terminate CICS.

User response: See any related messages from the kernel domain.

Look at the kernel domain section of the system dump

to determine where the error has occurred. Check that a call has not been made to a domain gate that has not yet been made active. Check that the caller has NOT specified KERNERROR(YES).

If the abend occurs during CICS system initialization,
ensure that the utility (DFHCCUTL) used to initialize
the local catalog (DFHLCD) is at the correct level. A
sample job is provided in SDFHINST(DFHDEFDS).

Modules: DFHKERKE

AKEG

| **Explanation:** The kernel (KE) domain issued an SM
| GETMAIN for kernel stack storage, but the GETMAIN
| request failed.

System action: If an application is in control, the
transaction terminates with a system dump. Otherwise,
the functional recovery routine of the CICS module in
control at the time is given control. This recovery
routine produces suitable diagnostics and may
terminate CICS.

User response: Look at the kernel domain section of
the system dump to determine why sufficient storage
was not available.

| If the short-on-storage condition persists, consider
| increasing the size limit of the CICS DSA. You can vary
| the DSA dynamically using the DSALIM parameter on
| the CEMT master terminal command.

Modules: DFHKESGM

AKEH

| **Explanation:** The transaction was purged while
| running outside the control of CICS.

| **System action:** CICS terminates the transaction
| abnormally.

| The EXEC CICS HANDLE ABEND command can not
| handle this abend.

| **User response:** Investigate the reason why the
| transaction was purged.

| Possible reasons are

- | • An operator purged the transaction
- | • The transaction was purged because DTIMEOUT has
| been exceeded
- | • Another transaction purged the transaction

| **Modules:** DFHKESTX

AKEI

| **Explanation:** The kernel (KE) domain has detected
| runaway while the transaction is running outside the
| control of CICS.

| **System action:** If an application is in control, the

| AICA abend is presented to the application. Otherwise,
| the functional recovery routine of the CICS module
| which was last in control at the time of runaway
| detection is given control. This recovery routine
| produces suitable diagnostics and may terminate CICS.

| The EXEC CICS HANDLE ABEND command can not
| handle this abend.

| **User response:** See the *CICS Problem Determination
| Guide* for guidance on dealing with loops.

| **Modules:** DFHKESTX

AKEZ

Explanation: A user attach has failed because there are
insufficient kernel tasks available. This indicates an
internal logic error.

System action: Message DFHKE0001 is issued and a
system dump is taken. The attach of the user
transaction fails.

User response: You need further assistance from IBM
to resolve this problem. See Part 4 of the *CICS Problem
Determination Guide* for guidance on how to proceed.

Modules: DFHKETA

AKKA

Explanation: A kill request has been actioned when a
transaction was not protected from purge or force
purge. The transaction is either in a dispatcher
suspend, the deferred abend processor is in control, the
application is calling CICS, CICS is returning to the
application, or the application is outside of the control
of CICS.

System action: If an application is in control, the
abend is presented to the application. Otherwise, the
functional recovery module of the CICS module in
control at the time is given control. This recovery
routine produces diagnostics and might terminate
CICS. This abend code cannot be handled by the
application.

User response: Notify the system programmer to
determine why the task has been killed.

Modules: DFHDSSR, DFHKEEDA, DFHEIP,
DFHKEDS

AKKB

Explanation: A kill request has been actioned when a
transaction was not protected from forcepurge but was
protected from purge. The transaction is either in a
dispatcher suspend, the deferred abend processor is in
control, the application is calling CICS, CICS is
returning to the application, or the application is
outside of the control of CICS.

System action: If an application is in control, the

abend is presented to the application. Otherwise, the functional recovery module of the CICS module in control at the time is given control. This recovery routine produces diagnostics and might terminate CICS. This abend code cannot be handled by the application.

User response: Notify the system programmer to determine why the task has been killed.

Modules: DFHDSSR, DFHKEEDA, DFHEIP, DFHKEDS

AKKC

Explanation: A kill request has been actioned when a transaction was protected from force purge. The transaction is either in a dispatcher suspend, the deferred abend processor is in control, the application is calling CICS, CICS is returning to the application, or the application is outside of the control of CICS.

System action: If an application is in control, the abend is presented to the application. Otherwise, the functional recovery module of the CICS module in control at the time is given control. This recovery routine produces diagnostics and might terminate CICS. This abend code cannot be handled by the application.

User response: Notify the system programmer to determine why the task has been killed.

Modules: DFHDSSR, DFHKEEDA, DFHEIP, DFHKEDS

AKKD

Explanation: A CEKL purge has been requested. Abend processing has started for the task that is subject to the deferred abend request.

System action: The task is abended with abend code AKKD.

User response: Notify the system programmer to determine why the task has been purged.

Modules: DFHKEEDA

AKKE

Explanation: A CEKL force purge has been requested. Abend processing has started for the task that is subject to the deferred abend request.

System action: The task is abended with abend code AKKE.

User response: Notify the system programmer to determine why the task has been purged.

Modules: DFHKEEDA

AKKG

Explanation: The kernel (KE) domain has detected a kill request from the runaway exit program. The task was not protected from runaway when the kill request was actioned.

System action: If an application is in control, the abend is presented to the application. Otherwise, the functional recovery module of the CICS module in control at the time is given control. This recovery routine produces diagnostics and might terminate CICS. This abend code cannot be handled by the application.

User response: Notify the system programmer to determine why the task has been killed.

Modules: DFHKESTX, DFHKERRU, DFHKEKIL

AKKH

Explanation: The kernel (KE) domain has detected a kill request from the runaway exit program. The task was protected from runaway when the request was actioned.

System action: If an application is in control, the abend is presented to the application. Otherwise, the functional recovery module of the CICS module in control at the time is given control. This recovery routine produces diagnostics and might terminate CICS. This abend code cannot be handled by the application.

User response: Notify the system programmer to determine why the task has been killed.

Modules: DFHKESTX, DFHKERRU, DFHKEKIL

AKSE

Explanation: A user has generated an addition to the keyword table, but code has not been added to process this keyword.

System action: The transaction is abnormally terminated and a dump is taken.

User response: Add code to process the keyword.

Modules: DFH99KC

Abend codes ALxx

ALGA

Explanation: An error has occurred obtaining a lock within the log manager domain.

System action: The recovery routine of the module in control is invoked which issues message DFHLG0002 with a system dump. DFHLG0002 reports the module in control at the time of the error.

User response: See the description of message DFHLG0002 for further guidance.

Modules: DFHLGGL, DFHLGJN, DFHLGLD, DFHLGST

ALGB

Explanation: An error has occurred releasing a lock within the log manager domain.

System action: The recovery routine of the module in control is invoked which issues message DFHLG0002 with a system dump. DFHLG0002 reports the module in control at the time of the error.

User response: See the description of message DFHLG0002 for further guidance.

Modules: DFHLGGL, DFHLGJN, DFHLGLD, DFHLGST

ALGC

Explanation: A disaster response has been detected when processing the building block code used by the log manager.

System action: The recovery routine of the module in control is invoked which issues message DFHLG0002 with a system dump. DFHLG0002 reports the module in control at the time of the error.

User response: See the description of message DFHLG0002 for further guidance.

Modules: DFHLGGL, DFHLGJN, DFHLGLD, DFHLGST

ALGD

Explanation: A disaster response has been detected when processing the building block storage interface code used by the log manager.

System action: The recovery routine of the module in control is invoked which issues message DFHLG0002 with a system dump. DFHLG0002 reports the module in control at the time of the error.

User response: See the description of message DFHLG0002 for further guidance.

Modules: DFHLGCM, DFHLGGL, DFHLGJN, DFHLGLD, DFHLGST

ALGE

Explanation: An unexpected error has occurred while the log manager was attempting to find a journal model definition.

System action: The recovery routine of the module in control is invoked which issues message DFHLG0002 with a system dump. DFHLG0002 reports the module in control at the time of the error.

User response: See the description of message DFHLG0002 for further guidance.

Modules: DFHLGJN

ALGF

Explanation: An unexpected error occurred when the log manager was attempting an enqueue or dequeue operation.

System action: The recovery routine of the module in control is invoked which issues message DFHLG0002 with a system dump. DFHLG0002 reports the module in control at the time of the error.

User response: See the description of message DFHLG0002 for further guidance.

Modules: DFHLGGL, DFHLGJN, DFHLGST

ALGG

Explanation: Transaction CSQC has been issued from a terminal. This is not permitted. The transaction can only be started internally by CICS.

System action: The transaction is abnormally terminated.

User response: Do not try to invoke CSQC from a terminal.

Modules: DFHLGQC

ALIC

Explanation: CICS has issued a GETMAIN request during the initialization phase for an LE/370 application program in order to obtain run time execution storage above the 31-bit line. However insufficient storage was available to satisfy the request.

System action: CICS abnormally terminates the task. CICS processing continues.

User response: See the related message from the Storage Manager domain where the original error was detected.

Modules: DFHAPLI

ALID

Explanation: CICS has issued a GETMAIN request during the initialization phase for an LE/370 application program in order to obtain run time execution storage below the 31-bit line. However insufficient storage was available to satisfy the request.

System action: CICS abnormally terminates the task. CICS processing continues.

User response: See the related message from the Storage Manager domain where the original error was detected.

Modules: DFHAPLI

ALIF

Explanation: CICS has issued a GETMAIN request during the initialization phase for an LE/370 application program in order to obtain thread storage. However insufficient storage was available to satisfy the request.

System action: CICS abnormally terminates the task. CICS processing continues.

User response: See the related message from the Storage Manager domain where the original error was detected.

Modules: DFHAPLI

ALIG

Explanation: CICS has been unable to determine the language of the user application program about to be executed. Either the program was compiled against an old level of compiler that is no longer supported by CICS, or the language of the program is not supported by CICS.

System action: CICS abnormally terminates the task and disables the program. CICS processing continues.

User response: Ensure that the program to be run is written in one of the languages and compiled against a level of compiler supported by CICS. See the *CICS Application Programming Guide* for details of the languages and compilers currently supported.

Modules: DFHAPLI

ALIH

Explanation: CICS has determined the language of a program to be VS COBOL II, but Language Environment has indicated that it is unable to execute the program. Normally Language Environment is able to execute VS COBOL II programs in compatibility code.

System action: CICS abnormally terminates the task and disables the program. CICS processing continues.

User response: Ensure that the program to be run is written in one of the languages supported by CICS and Language Environment, and compiled against a level of compiler supported by Language Environment. See the Language Environment Migration Guide for details of the languages and compilers currently supported, and any actions which may be necessary by the user such as re-compilation or re-linking.

Modules: DFHAPLI

ALII

Explanation: CICS has determined the language of a program to be OS/PLI, but Language Environment has indicated that it is unable to execute the program. Normally Language Environment is able to execute OS/PLI programs in compatibility code.

System action: CICS abnormally terminates the task and disables the program. CICS processing continues.

User response: Ensure that the program to be run is written in one of the languages supported by CICS and Language Environment, and compiled against a level of compiler supported by Language Environment. See the Language Environment Migration Guide for details of the languages and compilers currently supported, and any actions which may be necessary by the user such as re-compilation or re-linking.

Modules: DFHAPLI

ALIJ

Explanation: CICS has determined that an C or C++ program compiled with the XPLINK option is about to be executed but the program is defined with attribute CONCURRENCY(QUASIRENT). XPLINK programs execute on open TCBS and cannot rely on quasi-reentrancy. They must be coded to threadsafe standards and defined to CICS with CONCURRENCY(THREADSAFE).

System action: CICS abnormally terminates the task and disables the program. CICS processing continues.

User response: Ensure that the program is coded to threadsafe standards and defined as CONCURRENCY(THREADSAFE), or recompile the program without the XPLINK option.

A program can be defined as threadsafe by using standard CICS or CPSM resource definition facilities, via program auotinstall, or by using an LE runtime option. The runtime option can be specified in the source of the program by means of a #pragma runopts(ENVAR(CICSVAR=THREADSAFE)) statement. Alternatively ENVAR=('CICSVAR=THREADSAFE') can be specified in a CEEUOPT CSECT which is then linkedited with the program.

Modules: DFHAPLI

ALIK

Explanation: CICS has determined that an OS/VS COBOL program is about to be executed. However CICS no longer supports such programs.

System action: CICS abnormally terminates the task and disables the program. CICS processing continues.

User response: Ensure that the program is recompiled against a level of COBOL compiler supported by CICS. See the *CICS Application Programming Guide* for details of the languages and compilers currently supported.

Modules: DFHAPLI

ALX1

Explanation: CICS has issued an initialize request to the LE preinitialized services system (CEEPIPI). However, CEEPIPI has returned an error condition. This error strongly indicates an internal LE failure.

System action: CICS abnormally terminates the task. CICS processing continues.

User response: The full trace entry will indicate the return code from LE. Consult the Language Environment Programming Guide manual for an explanation of the return code.

Modules: DFHAPLX

ALX2

Explanation: CICS has issued an add_entry request to the LE preinitialized services system (CEEPIPI). However, CEEPIPI has returned an error condition. This error strongly indicates an internal LE failure.

System action: CICS abnormally terminates the task. CICS processing continues.

User response: The full trace entry will indicate the return code from LE. Consult the Language Environment Programming Guide manual for an explanation of the return code.

Modules: DFHAPLX

Abend codes AMxx

AMI1

Explanation: When the mirror task is resumed, a bad response other than a time out or a cancellation was given by the dispatcher.

System action: The mirror transaction is abnormally terminated with a transaction dump.

User response: Use the dump and the trace to determine the cause of the error.

ALX3

Explanation: CICS has issued a call_main request to the LE preinitialized services system (CEEPIPI). However, CEEPIPI has returned an error condition. This error strongly indicates an internal LE failure.

System action: CICS abnormally terminates the task. CICS processing continues.

User response: The full trace entry will indicate the return code from LE. Consult the Language Environment Programming Guide manual for an explanation of the return code.

Modules: DFHAPLX

ALX4

Explanation: CICS has issued a remove_entry request to the LE preinitialized services system (CEEPIPI). However, CEEPIPI has returned an error condition. This error strongly indicates an internal LE failure.

System action: CICS abnormally terminates the task. CICS processing continues.

User response: The full trace entry will indicate the return code from LE. Consult the Language Environment Programming Guide manual for an explanation of the return code.

Modules: DFHAPLX

ALX5

Explanation: CICS has issued a terminate request to the LE preinitialized services system (CEEPIPI). However, CEEPIPI has returned an error condition. This error strongly indicates an internal LE failure.

System action: CICS abnormally terminates the task. CICS processing continues.

User response: The full trace entry will indicate the return code from LE. Consult the Language Environment Programming Guide manual for an explanation of the return code.

Modules: DFHAPLX

Modules: DFHMIRS

AMNA

Explanation: An exception response has been received from the monitoring (MN) domain while processing a user event monitoring point (EMP) request. The exception response is produced when the 4-byte DATA1 field in the user parameter contains an invalid address.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Use the transaction dump to determine why the DATA1 value passed to the monitoring (MN) domain was invalid.

Modules: DFHCOMP

AMNB

Explanation: An exception response has been received from the monitoring (MN) domain whilst processing a user event monitoring point (EMP) request. The exception response is produced when the 4-byte DATA2 field in the user parameter contains invalid data.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Use the transaction dump to determine why the DATA2 value passed to the monitoring (MN) domain was invalid.

Modules: DFHCOMP

AMNZ

Explanation: An unexpected error response has been received from the monitoring (MN) domain while processing a user event monitoring point (EMP) request.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: This indicates a possible error in CICS code. An earlier CICS message is issued from the monitoring domain. Follow the user response for that message.

Modules: DFHCOMP

AMSA

Explanation: An input data stream received from a 3270 begins with a set buffer address (SBA) order but is not followed by two 1-byte address fields. This is probably due to a hardware error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: It may be possible to bypass the problem by entering two spaces before the data to be entered.

If the problem persists, you need further assistance. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHMSP

AMSB

Explanation: An internal logic error has been detected in module DFHMSP.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Retry the CMSG transaction, specifying operands in a different order. If this fails, keep the dump and contact your IBM Support Center.

Modules: DFHMSP

AMSC

Explanation: The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The task that first detected the purged condition will have provided an exception trace.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate why the task was purged. This is either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Modules: DFHMSP

AMSD

Explanation: An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related error message produced by the domain that detected the original error.

Modules: DFHMSP

Abend codes ANxx

ANQA

Explanation: An error has occurred obtaining a lock within the enqueue domain.

System action: The recovery routine of the module in control is invoked which issues message DFHNQ0002 with a system dump. DFHNQ0002 reports the module in control at the time of the error.

User response: See the description of message DFHNQ0002 for further guidance.

Modules: DFHNQED, DFHNQIB, DFHNQONQ, DFHNQST

ANQB

Explanation: An error has occurred releasing a lock within the enqueue domain.

System action: The recovery routine of the module in control is invoked. This routine issues message DFHNQ0002 with a system dump. DFHNQ0002 reports the module in control at the time of the error.

User response: See the description of message DFHNQ0002 for further guidance.

Modules: DFHNQED, DFHNQIB, DFHNQONQ, DFHNQST

ANQC

Explanation: An error has occurred obtaining a sysplex enqueue. The limit for the number of concurrent sysplex resource ENQ requests has been reached.

System action: Module DFHNQED issues message DFHNQ0103 and the task issuing the EXEC ENQ request is abended.

User response: See the description of message DFHNQ0103 for further guidance.

Modules: DFHNQED

ANQD

Explanation: An error has occurred obtaining a sysplex enqueue. An unexpected environmental error has been detected.

System action: Module DFHNQED issues message DFHNQ0104 and the task issuing the EXEC ENQ request is abended.

User response: See the description of message DFHNQ0104 for further guidance.

Modules: DFHNQED

ANQE

Explanation: An EXEC ENQ has been issued on a resource for which the enqmodel is either disabled or in the waiting state.

System action: Module DFHNQONQ issues message DFHNQ0105 and the task issuing the EXEC ENQ request is abended.

User response: See the description of message DFHNQ0105 for further guidance.

Modules: DFHNQONQ

ANQF

Explanation: An EXEC CICS ENQ request has been issued too early during transaction initialization, before a recoverable transaction environment has been established.

System action: The transaction is abnormally terminated.

User response: This error should only occur when an exit such as the 3270 Bridge Exit is executing. If the exit program is written in a high level language, the ENQ may have been issued by Language Environment.

Modules: DFHEKC

ANSA

Explanation: An error has occurred obtaining the numberspace lock within the AP domain.

System action: The recovery routine of the module in control is invoked which issues message DFHAP0002 with a system dump. DFHAP0002 reports the module in control at the time of the error.

User response: See the description of message DFHAP0002 for further guidance.

Modules: DFHBRNS

ANSB

Explanation: An error has occurred releasing a lock within the AP domain.

System action: The recovery routine of the module in control is invoked which issues message DFHAP0002 with a system dump. DFHAP0002 reports the module in control at the time of the error.

User response: See the description of message DFHAP0002 for further guidance.

Modules: DFHBRNS

Abend codes AOxx

AOTA

Explanation: The OT domain resynchronization transaction CJTR has been started in an incorrect manner (for example, from a user terminal, or by a start request). This is not permitted.

System action: The task is abnormally terminated with a transaction dump.

User response: None. The OT domain resynchronization transaction must be started internally by CICS.

Modules: DFHOTR

AOTB

Abend codes APxx

APCF

Explanation: A CICS task has invoked a program which was defined as PL/I, but the program was not compiled with a supported PL/I compiler, or the program may not be written in the PL/I language.

System action: CICS terminates the task, and disables the program.

User response: Check that the program is PL/I. If the program is PL/I, recompile it with an LE conforming compiler such as VisualAge PL/I for OS/390 in which case you may need to change the source program. If the program is not PL/I, redefine it correctly.

Modules: DFHAPLI

APCG

Explanation: The transaction was purged either by master terminal actions or due to deadlock timeout actions as part of a request to the loader for a usable program copy. Deadlock timeout could be caused by a program whose size exceeds the available space in the DSAs or EDSAs.

System action: CICS terminates the task with a transaction dump.

User response: Use the dump to investigate why the transaction was purged. This may be due to waiting for loader resources or for program storage. Check the program size. It may be necessary to increase the overall size limits of the DSAs or EDSAs.

Modules: DFHACP, DFHCRNP, DFHCRSP, DFHDBCT, DFHDBDSC, DFHEDFP, DFHEIP, DFHEICRE, DFHEIDEL, DFHEIINS, DFHEIPSH, DFHEIQIR, DFHEIQSJ, DFHFICRP, DFHFEP, DFHICP, DFHKCQ, DFHMCP, DFHMCPPE, DFHMCY, DFHMSP, DFHPCPG, DFHPHP, DFHPSIP,

Explanation: An unexpected error was encountered by the OT domain resynchronization transaction CJTR. The domain that detected the original error will have provided an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related message produced by the domain that detected the original error.

Modules: DFHOTR

DFHPUP, DFHRDCAL, DFHRTC, DFHSII1, DFHSIJ1, DFHSPP, DFHSTP, DFHTACP, DFHTBSGB, DFHTCRP, DFHTDX, DFHTFP, DFHTSPA, DFHTSRP, DFHUSBP, DFHXRC, DFHXRE, DFHXRS, DFHZATA, DFHZATD, DFHZCPLN, DFHZGAI, DFHZQ00, DFHZNCA, DFHZOPA, DFHZXCU

APCH

Explanation: A request for a program which CICS has identified as VS COBOL II cannot be executed because either Language Environment is not active in this address space or Language Environment cannot provide support for the COBOL language.

System action: The transaction is abnormally terminated and the program is disabled.

User response: Ensure that the correct Language Environment support is present. Refer to messages issued during CICS initialization to determine why COBOL support is not present.

Modules: DFHAPLI

APCI

Explanation: A request for a program which CICS as identified as an OS/PLI program cannot be executed because either Language Environment is not active in this address space or Language Environment cannot provide support for the PL/I language.

System action: The transaction is abnormally terminated and the program is disabled.

User response: Ensure that the correct Language Environment support is present. Refer to messages issued during CICS initialization to determine why PL/I support is not present.

Modules: DFHAPLI

APCJ

Explanation: A request for a C/370 program could not be executed either because Language Environment was unable to recognize the program as having been compiled under the C/370 Compiler, or because the program was not link-edited with the attribute AMODE(31).

System action: The transaction is abnormally terminated and the program is disabled.

User response: Ensure that the program is link-edited with the attribute AMODE(31). If necessary, recompile the program with a Language Environment conforming compiler such as OS/390 C/C++.

Modules: DFHAPLI

APCK

Explanation: A request for a C program could not be honored either because Language Environment is not active in this address space or because Language Environment cannot provide support for the C language.

System action: The transaction is terminated abnormally and the program is disabled.

User response: Ensure that the correct Language Environment support is present. Refer to messages issued during CICS initialization to determine why C support is not present.

Modules: DFHAPLI

APCL

Explanation: A request for a program which CICS has identified as 'LE-enabled' has failed because Language Environment is unable to execute the program.

System action: The transaction is abnormally terminated and the program is disabled.

User response: Ensure that the program has been compiled either with a Language Environment conforming compiler or with a compiler which is supported by Language Environment in compatibility mode. Refer to the Language Environment Migration Guide to verify this conformance.

If the compiler is supported, and the relevant language migration guides do not indicate any special actions, refer this problem to your installation systems programming facility.

Modules: DFHAPLI

APCN

Explanation: An attempt to release an internal CICS program, a mapset, or a partitionset because the program, mapset or partitionset has not been loaded or has already been deleted. This is probably an internal CICS error.

System action: The transaction is abnormally terminated with a CICS transaction dump. The name of the program for which the RELEASE was attempted can be found in the abend dump at TCAPCPI.

User response: This is either an internal CICS error or is due to the overwriting of CICS internal control blocks. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHAMPEN, DFHFEP, DFHMCP, DFHMCPE, DFHMCY, DFHPHP, DFHTBSSP, DFHZCPLN

APCO

Explanation: A GETMAIN of storage for LEVEL 2 trace failed during transaction initialization.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: See the related message from the domain that detected the original error.

Modules: DFHAPXM

APCS

Explanation: An attempt to run the program failed because CICS was unable to make a successful connection with Language Environment to determine the run-time characteristics of the program. This abend is accompanied by message DFHAP1200 which gives the reason code set by Language Environment indicating the nature of the error.

System action: The transaction is abnormally terminated and the program is disabled.

User response: Refer to the Language Environment *Debugging Guide and Runtime Messages* manual for the meaning of the reason code, and take whatever action is necessary to correct the error.

Modules: DFHAPLI

APCT

Explanation: One of the following has occurred:

1. The program name in the EXEC CICS HANDLE ABEND program is not usable at the time an abend occurs because:
 - The program is not on the relocatable program library (RPL).

- The program is disabled.
 - The program cannot be loaded.
2. An attempt to load a mapset or partitionset failed because although the program is defined to CICS
 - It is not available on the RPL, or
 - It is disabled, or
 - It cannot be autoinstalled.
 3. An attempt to link to, load, or release an internal CICS program failed because:
 - The program is not on the RPL.
 - The program is disabled.
 - The program cannot be loaded.

Problem determination: The trace preceding the abend indicates the program, mapset, or partitionset that could not be loaded, linked to, or released. The name is also in TCAPCEPI.

System action: The transaction requiring the program is abnormally terminated with a CICS transaction dump.

User response: In cases 1 and 2, define the program, mapset partitionset to CICS using CEDA and ensure it is enabled.

In case 3, the definition of a CICS-provided module is incorrect. Check for associated messages issued during CICS start up.

Modules: DFHACP, DFHAMPEN, DFHCRSP, DFHEDFP, DFHEIP, DFHEICRE, DFHEIDEF, DFHEIDEL, DFHEIINS, DFHEIPSH, DFHEIQSJ, DFHFEP, DFHICP, DFHMCP, DFHMCPE, DFHMCY, DFHMELDE, DFHPCPG, DFHPHP, DFHPUP, DFHRDCAL, DFHSII1, DFHTBSGB, DFHTFP, DFHTSRP, DFHZCPLN, DFHZQ00, DFHZXCU

APCW

Explanation: The program language is defined as COBOL but the level of the compiler under which it is compiled cannot be determined. Most probably, the program was compiled under an OS/VS COBOL compiler but the required level of support for that compiler is not present in the system.

System action: The transaction is abnormally terminated and the program is disabled.

User response: Check that the OS/VS COBOL runtime is present in the Language Environment SCEERUN dataset, and that this dataset is referenced via both STEPLIB and the DFHRPL concatenation of datasets in this CICS region. Otherwise, the program source may need to be converted and compiled with an Language Environment conforming COBOL compiler such as COBOL for OS/390 and VM.

Modules: DFHAPLI

APCY

Explanation: In an MVS/ESA environment, a CICS macro request has been issued from a PL/I or COBOL application. Alternatively, it is possible that the application program has been link edited without the EXEC interface module (for example, DFHECI or DFHELII) which is used by the CICS high-level language programming interface. See the *CICS System Definition Guide* for details of what has to be done to include this module.

System action: The transaction is abnormally terminated and the program is disabled.

User response: Remove the macro request from the application program.

Modules: DFHAPLI

APCZ

Explanation: An attempt has been made to run either an 'old-style' application program (that is, a program with a pre-release 1.6 or a DFHE program stub) or an OS/VS COBOL program, either having been link-edited with the RENT or REFR attributes. These types of programs are not reentrant and therefore cannot be loaded into read-only storage.

System action: The transaction is abnormally terminated.

User response: Relink the program without the RENT and REFR attributes.

Modules: DFHAPLI

APC0

Explanation: A serious error occurred in a call to the program manager domain when trying to link a system program.

System action: CICS terminates the task with a transaction dump.

User response: Use the dump to investigate why the error occurred. Look at the trace records prior to the error for abnormal conditions in processing the PGLK domain call. This may be due to a problem with directory manager, loader, or storage manager. Check the program size. It may be necessary to increase the overall size limits of the DSAs or EDSAs.

Modules: DFHEICRE, DFHEIDEF, DFHEIDEL, DFHEIINS, DFHPCP, DFHMCY

APC1

Explanation: A request for a TGT exceeding 64KB has been detected.

System action: CICS abnormally terminates the

transaction and disables the installed program definition.

User response: Change the application program to reduce the working storage requirement. Perform CEMT NEWCOPY and ENABLE for the program when it has been corrected.

Modules: DFHAPLI

APC2

Explanation: An illegal branch has been attempted by a Language Environment user program following an abend condition with an active handle label abend. Usually an Out-Of-Block GOTO will have resulted, implying that the program tried to branch to, for example, an inactive block.

System action: The transaction is abnormally terminated and the program is disabled.

User response: Use the dump and trace to determine the cause of the error and amend the GOTO in error.

Modules: DFHAPLI

APC3

Explanation: An attempt to run the program has failed because CICS has identified the program as 'Language Environment enabled' but Language Environment support is not present in the system.

System action: The transaction is abnormally terminated and the program is disabled.

User response: Refer to messages issued during CICS initialization to determine why Language Environment is not present in the system.

Modules: DFHAPLI

APIA

Explanation: The transaction id (CPIH) of the Pipeline Inbound HTTP router program has been initiated invalidly, probably by entering the id at a terminal. This transaction must only be initiated by CICS internal processes.

System action: The transaction is abnormally terminated.

User response: Do not initiate CPIH directly.

Modules: DFHPIDSH

APIB

Explanation: The Pipeline HTTP outbound router program received an error response from the Pipeline Manager when it started the pipeline.

System action: The outbound router program is abnormally terminated.

User response: Examine the trace and associated messages to determine why the Pipeline Manager failed to start successfully.

Modules: DFHPIRT

APIC

Explanation: The Pipeline HTTP outbound router program received an error response from its attempt to do an EXEC CICS GET CONTAINER call to obtain the pipeline name from the DFHWS-PIPELINE container. Both a trace and message DFHPI0998 are issued and these will be an indication of what the error was. If the trace point id is '09DD'x then a CONTAINERERR was returned to DFHPIRT. A point id of '09DE'x indicates that a LENGERR was returned.

System action: The outbound router program is abnormally terminated.

User response: Examine the trace and associated messages to determine why the Pipeline failed to start successfully.

Modules: DFHPIRT

APID

Explanation: The CICS supplied program for handling webservices has tried to getmain storage into which to copy containers which have been passed into it. The getmain call has failed.

System action: CICS abends the transaction with a transaction dump.

User response: Examine the CICS joblog for associated messages, correct the problem and retry the transaction.

Modules: DFHPITL

APIE

Explanation: The CICS supplied program for handling webservices has tried to determine the operation which has been called for a webservice. The signature supplied did not match any of the operations on the webservice.

System action: CICS abends the transaction with a transaction dump.

User response: Examine the CICS joblog for associated messages, correct the problem and retry the transaction.

Modules: DFHPITL

APIF

Explanation: An attempt has been made to invoke a webservice in CICS but the status of the webservice is not inservice. The webservice cannot be used.

System action: CICS abends the transaction with a transaction dump.

User response: Examine the CICS joblog for associated messages, correct the problem and retry the transaction.

Modules: DFHPITL

APIG

Explanation: An attempt has been made to invoke a CICS application program but the conversion of the SOAP message or the commarea has failed.

System action: CICS abends the transaction with a transaction dump.

User response: Examine the CICS trace for exception traces issued from DFHPITL. These will identify the source of the failure. If validation is currently disabled for the failing WEBSERVICE then consider enabling it and reproduce the problem. This causes CICS to call a Java based program to validate the SOAP message against the WSDL for the WEBSERVICE. If the SOAP message is malformed then a message will be issued to describe the problem in more detail.

Modules: DFHPITP

APIH

Explanation: The transaction id (CPIL) of the Pipeline MQ Listener program has been initiated invalidly, probably by entering the id at a terminal. This transaction must only be initiated by being triggered by an inbound Websphere MQ message.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Do not initiate CPIL directly.

Modules: DFHPILSQ

APII

Explanation: An attempt has been made to use Websphere MQ as the transport for CICS Web Services, but the Websphere MQ stub CSQCSTUB could not be loaded during CICS Initialisation. The Websphere MQ library SCSQLOAD needs to be included in the DFHRPL concatenation to permit use of Websphere MQ as a transport for CICS Web Services

System action: The attempt to use Websphere MQ as a transport for CICS Web Services has been rejected. Any further such attempts will also be rejected.

Message DFHAP0900 is produced.

The task is abnormally terminated with a CICS transaction dump.

User response: The Websphere MQ library SCSQLOAD must be included in the DFHRPL concatenation to allow use of Websphere MQ as a transport for CICS Web Services. This is in addition to the other Websphere MQ libraries needed for MQ support in CICS.

Modules: DFHPILSQ

APIJ

Explanation: A Websphere MQ function call issued by transaction CPIL was unsuccessful and has set a non-zero reason code. The transaction CPIL is used to start a PIPELINE for a message received from Websphere MQ.

System action: Message DFHPI0111 is produced, which includes the Websphere MQ reason code. The task is abnormally terminated with a CICS transaction dump.

User response: Check the Websphere MQ reason code in the MQ Messages and Codes manual, and examine the trace to determine why the MQ function call failed. You may need help from IBM to resolve this problem.

Modules: DFHPILSQ

APIK

Explanation: The CICS supplied SOAP Handler received an unexpected response from another module.

System action: CICS attempts to run the pipeline in an error mode. No dump is taken.

User response: Examine the CICS joblog for associated messages.

Modules: DFHPISN

APIL

Explanation: The CICS supplied SOAP Handler has failed with a disaster response.

System action: CICS attempts to run the pipeline in an error mode. A dump is taken.

User response: Keep the dump and contact your IBM Support Center.

Modules: DFHPISN

APIM

Explanation: The transaction id (CPIQ) of the Pipeline Inbound MQ router program has been initiated invalidly, probably by entering the id at a terminal. This transaction must only be initiated by CICS internal processes.

System action: The transaction is abnormally terminated.

User response: Do not initiate CPIQ directly.

Modules: DFHPIDSQ

APIN

Explanation: The transaction id (CPIS) of the Pipeline WSAT resync program has been initiated invalidly, probably by entering the id at a terminal. This transaction must only be initiated by CICS internal processes.

System action: The transaction is abnormally terminated.

User response: Do not initiate CPIS directly.

Modules: DFHPIR

APIO

Explanation: The WSAT Registration Services program has encountered an error, which has prevented it from completing the processing of a registration or 2PC protocol request. The program is abnormally terminated.

User response: Examine the trace and associated messages to determine why the Registration Services program has failed.

Modules: DFHPIRS

APIP

Explanation: The WSAT Coordination Context header handler program has encountered an unrecoverable error, which has prevented it from successfully creating or processing a coordination context. The program is abnormally terminated.

User response: Examine the trace and associated messages to determine why the Registration Services program has failed.

Modules: DFHWSATH

APIQ

Explanation: The WSAT application handler programs has encountered an unrecoverable error, which has prevented it from creating or processing a registration message or a protocol message. The program is abnormally terminated.

User response: Examine the trace and associated messages to determine why the Registration/Protocol Services program has failed.

Modules: DFHWSATX.

APLx

Explanation: Abend codes with 'PL' as the middle two characters are issued by PL/I, and are described in further detail in the *OS PL/I Optimizing Compiler Programmer's Guide*.

APP1

Explanation: The DFHIC TYPE=GET response code was not a normal response.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Analyze the dump. The response code is in the low-order byte of register 0.

Modules: DFHP3270

APP2

Explanation: The length of data that has been passed to DFHP3270 via temporary storage is less than or equal to 5.

Problem determination: Register 6 points to the data retrieved from temporary storage via a DFHIC TYPE=GET macro invocation. The layout of this data is:

- Terminal data area length (2 bytes)
- Write control indicator (1 byte)
- Write control or carriage control character (1 byte)
- Data (variable length)

Analysis: DFHP3270 has been called to handle a print request from a 3270 Information Display System terminal. It obtains from temporary storage the data to be printed, via a DFHIC TYPE=GET invocation. It ensures that some data to be printed is present. The area returned from temporary storage contains the data to be printed preceded by 4 bytes as described above. DFHP3270 has found that, because the length of data passed to it is less than or equal to 5, there is no data to be printed.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Check the user DFHTEP. If it is not at fault, submit an APAR.

If this abend has occurred, the data that DFHP3270 obtained from temporary storage was probably put there with an incorrect length. The user may have requested indirectly that this data be placed in temporary storage either by an application request for printing (for example ISSUE PRINT) or by pressing the Print Request key. However, CICS should control the data length for this request. Under normal circumstances, the only way the user could have requested directly that data is to be placed in temporary storage is in the user's TEP. The user should check any invocations of DFHIC TYPE=PUT in handling print requests, particularly when dealing with the "printer unavailable or busy" condition, and ensure that the length field is set correctly.

Modules: DFHP3270

APP3

Explanation: An attempt to request data has been sent to a nonprinter or unsupported device type by either:

- A terminal operator entering CSPP as a transaction code, or
- A transaction issuing a DFHTEP request.

System action: The transaction is abnormally terminated. A CICS transaction dump **is not** provided.

User response:

1. Ensure that the terminal operator ceases to use CSPP as a transaction code, or
2. Correct the user DFHTEP program.

Modules: DFHP3270

APR1

Explanation: An abnormal DFHIC TYPE=PUT response code was received during print key processing.

System action: The transaction is abnormally terminated with a CICS transaction dump. The keyboard of the terminal on which the print key was depressed remains locked to indicate the failure of the operation.

User response: Analyze the dump. The response code is in low-order byte of register 0.

Modules: DFHPRK

APSJ

Explanation: The abending transaction invoked the system spooler initialization program (DFHPSIP) illegally, that is from a program other than the CICS module, DFHSIJ1.

System action: CICS terminates the transaction abnormally. The EXEC CICS HANDLE ABEND command can not handle this abend.

User response: Remove any calls or links to DFHPSIP from your application programs. If you can find no invocation of DFHPSIP in your application, you need further assistance to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHPSIP

APST

Explanation: A task issued a SPOOL command without the mandatory NOHANDLE operand.

System action: CICS terminates the task abnormally with a dump.

User response: Correct the syntax of the command, specifying NOHANDLE.

Modules: DFHEPS

APSU

Explanation: The CICS SVC passed an invalid JES interface return code to the CICS system spooler (an MVS subtask).

System action: CICS terminates the task abnormally.

User response: This is an internal error – check any JES failures that occurred at the same time.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHPSPST

APSV

Explanation: A storage area for VSAM macro return codes contained an invalid value.

System action: CICS terminates the task abnormally with a dump.

User response: Check the syntax and input data of the spool commands issued by the failing transaction. Check any JES failures that occurred at the same time.

Modules: DFHPSPST

APSW

Explanation: An abend occurred within a CICS system spooler subtask.

System action: CICS terminates the task abnormally with a dump.

User response: This is an internal CICS error. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHPSPST

APSX

Explanation: A CICS storage area used for notification of invalid parameters contained an invalid value.

System action: CICS terminates the task abnormally with a dump.

User response: Check the syntax and input data of the spool commands issued by the failing transaction. Check any JES failures that occurred at the same time.

Modules: DFHPSPST

APSY

Explanation: A CICS storage area for MVS macro return codes contained an invalid value.

System action: CICS terminates the task abnormally with a dump.

User response: Check the syntax and input data of the spool commands issued by the failing transaction. Check any JES failures that occurred at the same time.

Modules: DFHPSPST

APSZ

Explanation: A CICS area, used to store a JES interface return code, contained an invalid value.

System action: CICS terminates the task abnormally with a dump.

User response: Check the syntax and input data of the spool commands issued by the failing transaction. Check any JES failures that occurred at the same time.

This is an internal CICS error. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHPSPST

APTI

Explanation: The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The domain that first detected the purged condition will have provided an exception trace.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate why the task was purged. It was purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Modules: DFHPSPST

APTJ

Explanation: An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error will have provided an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related message from the domain that detected the original error.

Modules: DFHPSPST

APUA

Explanation: An internal error was detected when module DFHPUP was invoked. The GETSTG parameter is missing on a call to DFHPUP (PUPF).

System action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHPUP

APUB

Explanation: An internal error was detected when module DFHPUP was invoked. The GETSTG parameter is missing on a call to DFHPUP (PUPU).

System action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHPUP

APUC

Explanation: An internal error was detected when module DFHPUP was invoked. An invalid function code was supplied for a domain call to DFHPUP.

System action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHPUP

APUD

Explanation: The RDO language definition table (DFHEITSP) could not be located in the library.

System action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User response: Ensure that module DFHEITSP is in the library and is valid for this release of CICS.

Modules: DFHPUP

APUE

Explanation: The RDO language definition table (DFHEITSP) could not be loaded because of a lack of available storage.

System action: Processing is abnormally terminated with an operating system dump.

User response: Allocate more storage and resubmit the offline COPY or APPEND command(s) that failed.

Modules: DFHPUP (Batch environment)

APUF

Explanation: Either the RDO language definition table is invalid or it is missing from the library.

System action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User response: Ensure that module DFHEITSP is in the library and is valid for this release of CICS.

Modules: DFHPUP

APUG

Explanation: An internal error was detected in module DFHPUP. Storage could not be obtained for the CSD record buffer.

System action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHPUP

APUH

Explanation: An internal error was detected in module DFHPUP. Storage could not be obtained for the argument list.

System action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHPUP

APUI

Explanation: An internal error was detected in module DFHPUP. Storage cannot be freed for the argument list.

System action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHPUP

APUJ

Explanation: An internal error was detected in module DFHPUP. Storage cannot be freed for the CSD record buffer.

System action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User response: You need further assistance from IBM

to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHPUP

APUK

Explanation:

- In a CICS environment, storage could not be acquired for a buffer to contain logged RDO commands in the CEDA transaction.
- In a batch environment, storage could not be acquired for a buffer to contain back-translated resource definitions from the CSD.

System action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHPUP

APUL

Explanation:

Note: The description of this abend also applies to APUM, APUN and APUO.

CICS cannot find a match for a function code in the language definition table, because the parameterized resource definition contains an unrecognized resource type code.

The abend code issued depends on the DFHPUP operation that was invoked before the error occurred:

Abend DFHPUP operation

APUL FLATTEN
APUM TRANCASE
APUN COMPARE
APUO BACKTRANS

The cause of the abend is either:

1. A language definition table (DFHEITSP or DFHEITCU) in the library is invalid for the CICS release you are running, **or**
2. A CICS logic error has occurred.

System action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User response: Your response depends on which of the two possible reasons apply:

1. Ensure that the DFHEITSP and DFHEITCU modules in the library are valid for this release of CICS.
2. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHPUP

APUM

Explanation: Refer to the description of abend APUL.

Modules: DFHPUP

APUN

Explanation: Refer to the description of abend APUL.

Modules: DFHPUP

APUO

Explanation: Refer to the description of abend APUL.

Modules: DFHPUP

APUP

Explanation: An internal error occurred in DFHPUP processing of the language definition table for RDO. There was a stack error building a keyword list for the syntax tree.

System action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHPUP

APUQ

Explanation: An internal error occurred in DFHPUP processing of the language definition table for RDO. Too many keywords found in syntax expansion.

System action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHPUP

APUR

Explanation: An internal error occurred in DFHPUP processing of an argument list or a CSD record buffer. The data type for a keyword field conflicts with the data type specified in the language definition table.

System action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User response: Ensure that the module DFHEITSP is in the library and is valid for this release of CICS.

Modules: DFHPUP

APUS

Explanation: An internal error occurred in DFHPUP processing of a CSD record buffer. The integer data length for a keyword field is invalid.

System action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User response: Ensure that the module DFHEITSP is in the library and is valid for this release of CICS.

Modules: DFHPUP

APUT

Explanation: An internal error occurred in DFHPUP processing of an argument list or a CSD record buffer. The keyword existence bit number, which is the KEP(1) value in language definition table DFHEITSP, is not valid.

System action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User response: Ensure that the module DFHEITSP is in the library and is valid for this release of CICS.

Modules: DFHPUP

*-----

APUZ

Explanation: CICS has found an unrecognized resource type code in a CSD record. The unrecognized code does not match any of the function codes in the language definition table. This abend can occur for one of the following reasons:

1. You are using a CICS release that does not support a type of definition that was created on the CSD file by a later CICS release.
2. The language definition table (DFHEITSP or DFHEITCU) is invalid for this CICS release.
3. The CSD manager (DFHDMP) has passed an invalid CSD record buffer to DFHPUP. This is a CICS internal logic error.

System action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump
- In a batch environment, processing is abnormally terminated with an operating system dump.

User response: Determine which of the possible reasons caused the error. If you can eliminate reasons 1 and 2, you can assume that reason 3 applies.

Take action corresponding to the reason you have established as follows:

1. Avoid operations on groups containing definition-types that are unsupported by the CICS release you are running.
2. Ensure that the library contains versions of DFHEITSP and DFHEITCU that are valid for the CICS release you are running.
3. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHPUP

APXA

| **Explanation:** The user transaction's profile could not be found.

| **System action:** The task is abnormally terminated with a CICS transaction dump. The user transaction is not started.

| **User response:** Check that the profile name in the user transaction definition is correct, and that this profile has been defined.

| **Modules:** DFHAPXM

Abend codes ARxx

ARCB

Explanation: CICS has attempted to enable a task-related user exit, or a global user exit during initialization, but failed because the exit program could not be found.

On all types of start, CICS attempts to enable DFHEDP, the EXEC DLI task-related user exit. On an emergency restart, CICS enables transaction backout exit programs as specified by the first two TBEXITS system initialization parameters.

On all types of start, CICS attempts to enable file control backout programs as specified by the third, fourth, fifth and sixth TBEXITS system initialization parameters.

System action: CICS issues a message to the console indicating which exit program is involved. CICS initialization then terminates abnormally with a system dump.

User response: If the associated message indicates that program DFHEDP could not be found, check that IBM-supplied group DFHEDP is included in the group list used at CICS cold or initial start time.

For transaction backout exit programs, including the file control backout programs, ensure the program has been defined and is in a library available to CICS.

If necessary, use the dump to find out why the exit program could not be enabled.

Modules: DFHRCEX

ARHA

Explanation: The SAA resource recovery interface has been invoked with an invalid first parameter. The first parameter should be the code of the function to be performed. This is a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: A level 2 trace for 'CP' of the transaction shows the course of events before this error occurred (such as the modules called and their parameters) plus details of the error itself. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCPIR

ARHB

Explanation: The SAA resource recovery interface has been invoked with an invalid number of parameters for the call.

System action: the transaction is abnormally terminated with a CICS transaction dump.

User response: The exception trace point produced with this abend contains the SAA resource recovery verb name that was issued incorrectly. Use this to determine where the application program was in error and amend application program accordingly. The *SAA Resource Recovery Reference Manual*, SC31-6821, provides a detailed description of the SAA resource recovery verbs and how they should be called.

Modules: DFHCPIR

ARHC

Explanation: The SAA resource recovery interface has detected an unexpected return code from the syncpoint program. This is a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: A level 2 trace for 'CP' of the transaction shows the course of events before this error occurred (such as the modules called and their parameters) plus details of the error itself. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCPIR

ARM0

Explanation: An attempt was made to attach a transaction specifying DFHRMXN3 as the program to be given control, but the transaction was not internally attached by CICS.

DFHRMXN3 is for use by CICS system transaction CSKP. This provides support for activity keypoints,

System action: The transaction is abnormally terminated. CICS processing continues.

User response: Establish why an attempt was made to attach CSKP incorrectly, or why a transaction definition specified DFHRMXN3 as the program to be given control.

Modules: DFHRMXN3

ARPA

Explanation: An unexpected response from DFHSUSN has occurred when trying to sign off a user of the CRTE transaction in the target system when processing a CANCEL request.

This abend can be caused by incorrect use of the VTAM VARY INACT command. Otherwise it indicates that there may be an error in CICS.

System action: The CSSF transaction (CRTE cancel processor transaction) is terminated with an ARPA abend.

User response: Ensure that the VTAM VARY inact

command is used correctly. If this is not the cause of the abend, you need further assistance from IBM to correct this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHRTC

ARPF

Explanation: The alias could not be initialized.

System action: One of the following messages is issued: DFHRP0103, DFHRP0104, DFHRP0106, DFHRP0108, DFHRP0109.

User response: See the user response for the message.

Modules: DFHRPAS

ARPG

Explanation: The alias was not able to link to the CICS program or the **Encode** function of the converter one of the following reasons:

- The userid supplied for the alias was not valid.
- The CICS program is not defined as a resource to the external security manager.
- The CICS program name is not valid.
- The CICS program was on a different system from CICS ONC RPC, and the specified system name was not valid.
- The converter program name was not valid.
- The converter program is defined as remote.
- The alias is not authorized to use the converter

System action: One of the following messages is issued: DFHRP0121, DFHRP0131, DFHRP0138, DFHRP0139, DFHRP0141, DFHRP0156, DFHRP0157, DFHRP0159.

User response: See the user response for the message.

Modules: DFHRPAS

ARPH

Explanation: The alias detected a global work area error.

System action: The following message is issued: DFHRP0118.

User response: See the user response for the message.

Modules: DFHRPAS

ARPI

Explanation: The alias detected a logic error.

System action: One of the following messages is issued: DFHRP0107, DFHRP0133, DFHRP0135, DFHRP0137, DFHRP0143, DFHRP0144, DFHRP0148,

DFHRP0149, DFHRP0155, DFHRP0164, DFHRP0168, DFHRP0170.

User response: See the user response for the message.

Modules: DFHRPAS

ARPJ

Explanation: The alias ends for one of the following reasons:

- An unexpected response was received from CICS during transaction initialization.
- The external security manager is no longer available.
- The remote CICS region in which the CICS program was running abended.
- The CICS program, which was running in a remote CICS region, abended.
- The reply could not be sent to the client.

System action: One of the following messages is issued: DFHRP0105, DFHRP0132, DFHRP0136, DFHRP0140, DFHRP0145, DFHRP0146, DFHRP0147, DFHRP0150, DFHRP0165, DFHRP0166, DFHRP0167.

User response: See the user response for the message.

Modules: DFHRPAS

ARPK

Explanation: The alias detected a CICS logic error.

System action: One of the following messages is issued: DFHRP0102, DFHRP0122, DFHRP0142, DFHRP0160.

User response: See the user response for the message.

Modules: DFHRPAS

ARPL

Explanation: The alias detected an authorization error.

System action: One of the following messages is issued: DFHRP0119, DFHRP0120, DFHRP0132, DFHRP0134.

User response: See the user response for the message.

Modules: DFHRPAS

ARPM

Explanation: The alias detected an error in user code.

System action: One of the following messages is issued: DFHRP0161, DFHRP0162, DFHRP0163, DFHRP0169.

User response: See the user response for the message.

Modules: DFHRPAS

ARNP

Explanation: The alias detected an error while trying to switch TCBS.

System action: The following message is issued: DFHRP0151.

User response: See the user response for the message.

Modules: DFHRPAS

ARPO

Explanation: The alias program detected an abend.

System action: One of the following messages is issued: DFHRP0181, DFHRP0182, DFHRP0183.

User response: See the user response for the message.

Modules: DFHRPAS

ARPU

Explanation: The connection manager could not access the CICS ONC RPC data set, and received an error response when it tried to send message DFHRP1512.

System action: None.

User response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHRPC01

ARPV

Explanation: The connection manager received an unexpected response from CICS following an EXEC CICS command.

System action: One of the following messages is issued: DFHRP1540, DFHRP1651, DFHRP1954.

User response: See the user response for the message.

Modules: DFHRPC0E

ARPW

Explanation: The connection manager received an unexpected response from CICS following an EXEC CICS command.

System action: The following message is issued: DFHRP1969.

User response: See the user response for the message.

Modules: DFHRPC0E

ARPX

Explanation: The connection manager was started against an invalid terminal.

System action: The following message is issued: DFHRP1522.

User response: See the user response for the message.

Modules: DFHRPC01

ARPZ

Explanation: The connection manager has insufficient authority.

System action: The following message is issued: DFHRP1902.

User response: See the user response for the message.

Modules: DFHRPC0B

ARP2

Explanation: The server controller detected an internal error during CICS ONC RPC enable processing.

System action: One of the following messages is issued: DFHRP0508, DFHRP0509, DFHRP0528, DFHRP0529, DFHRP0590, DFHRP0591.

User response: See the user response for the message.

Modules: DFHRPMS

ARP4

Explanation: The server controller has performed an exception disable because of an internal error.

System action: One of the following messages is issued: DFHRP0503, DFHRP0559, DFHRP0697, DFHRP0726, DFHRP0728, DFHRP0730, DFHRP0741.

User response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHRPMS

ARP5

Explanation: An invalid attempt was made to start the server controller.

System action: The following message is issued: DFHRP0640.

User response: See the user response for the message.

Modules: DFHRPMS

ARP9

Explanation: There was not enough storage for the connection manager.

System action: None.

User response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHRPC01

ARTA

Explanation: The task does not own a terminal as its principal facility.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Ensure that DFHRTE has not been specified as the program for a task other than CRTE. Ensure that CRTE has not been initiated by means other than terminal input.

Modules: DFHRTE

ARTB

Explanation: There is no input TIOA or the data length is zero.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Ensure that DFHRTE has not been specified as the program for a task other than CRTE. Ensure that CRTE has not been initiated by means other than terminal input.

Modules: DFHRTE

ARTC

Explanation: The link to the required system is not usable for an unknown reason.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHRTE

ARTD

Explanation: An internal logic error has been detected.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem*

Determination Guide for guidance on how to proceed.

Modules: DFHRTE

ARTE

Explanation: An error was encountered when attempting to read from or write to temporary storage.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Determine the cause of the temporary storage problem and correct it.

Modules: DFHRTE

ARTF

Explanation: An attempt has been made to use the routing transaction (CRTE) from a terminal that has a permanent transaction code set.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Inform the system programmer.

Modules: DFHRTE

ARTG

Explanation: CICS could not find the profile specified for a transaction being routed.

System action: CICS terminates the task abnormally with a dump.

User response: Check your transaction and profile definitions.

Modules: DFHRTE

ARTH

Explanation: An error (INVALID, DISASTER or EXCEPTION response) has occurred on a call to schedule a remote terminal delete by DFHRTE during sign-off for a surrogate terminal session running CRTE. The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System action: CICS terminates the task abnormally with a dump.

User response: See the related message produced by the domain that detected the original error.

Modules: DFHRTE

ARUA

Explanation: An exception condition was returned on the ADD_LINK during the BIND phase of ATTACH for the transaction invoked by the RUN command.

System action: CICS terminates the invoked transaction abnormally with a dump. The RUN SYNCHRONOUS command that was issued by the application returns with an error response of INVREQ (RESP2 28).

User response: More details can be found in the trace.

Modules: DFHXMURU

ARUB

Explanation: A RUN SYNCHRONOUS command caused an attempt to attach a transaction defined as remote. Only transactions defined as local may be run synchronously.

System action: CICS terminates the invoked transaction abnormally with a dump. The RUN SYNCHRONOUS command that was issued by the application returns with an error response of ACTIVITYERR or PROCESSERR (RESP2 27).

User response: More details can be found in the trace.

Modules: DFHXMXXM

ARUC

Explanation: A RUN SYNCHRONOUS command caused an attempt to attach a transaction with an invalid USERID.

System action: CICS terminates the invoked transaction abnormally with a dump. The RUN SYNCHRONOUS command that was issued by the application returns with a resp2 value of 27.

User response: More details can be found in the trace.

Modules: DFHXMURU

ARXA

Explanation: A transactional EXCI request has been received from a batch region. CICS has encountered an error when attempting to express interest in an RRMS Unit of Recovery.

DFHRXUW provides an exception trace, console message DFHRX0002, and possibly a system dump (depending on the options in the dump table).

System action: The transaction is terminated with a CICS transaction dump.

User response: Resource Recovery Services (RRS) may have been shut down after the request was received by CICS. If this is the case, retry the EXCI request once RRS has been restarted.

If this is not the case, use the exception trace provided by the RX domain to determine the reason for the failure. You might need further assistance from IBM in this situation. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHRXUW

ARXB

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR or PURGED) has occurred on an ADD_LINK call to the recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHRXUW provides an exception trace, console message DFHRX0002, and possibly a system dump (depending on the options in the dump table).

System action: The transaction is terminated with a CICS transaction dump.

User response: See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHRXUW

ARXC

Explanation: A transactional EXCI request has been received from a batch region when either:

- CICS did not register as a resource manager with Recoverable Resource Management Services (RRMS) because system initialization parameter RRMS=NO was specified.
- the RX domain did not successfully complete its initialization.

System action: The transaction is terminated with a CICS transaction dump.

User response: If CICS was started with system initialization parameter RRMS=NO, restart CICS specifying RRMS=YES (or route transactional EXCI requests to another CICS system).

Otherwise, investigate why the RX domain did not initialize successfully. A failure during initialization of the domain is accompanied by a console message and a system dump. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHRXUW

ARZE

Explanation: A command has failed due to a serious failure in a CICS component (resource manager).

System action: The transaction is abnormally terminated with abend code ARZE. CICS takes a

| transaction dump, unless module DFHDUIO is not
| loaded.
| **User response:** Use the transaction dump to determine
| the cause of the failure. For further assistance, or if
| module DFHDUIO is not loaded and no transaction
| dump is available, contact your system programmer.
| **Modules:** DFHRZLN, DFHRZRM, DFHRZSO,
| DFHRZSO1, DFHRZTA, DFHRZXM

| ARZF

| **Explanation:** A command has failed due to a serious
| failure in a CICS component (resource manager).
| **System action:** The transaction is abnormally
| terminated with abend code ARZF. CICS takes a
| transaction dump, unless module DFHDUIO is not
| loaded.
| **User response:** Use the transaction dump to determine
| the cause of the failure. For further assistance, or if
| module DFHDUIO is not loaded and no transaction
| dump is available, contact your system programmer.
| **Modules:** DFHRZLN, DFHRZRM, DFHRZSO,
| DFHRZSO1, DFHRZTA, DFHRZXM

| ARZI

| **Explanation:** A command has failed due to a serious
| failure in a CICS component (resource manager).
| **System action:** The transaction is abnormally
| terminated with abend code ARZI. CICS takes a
| transaction dump, unless module DFHDUIO is not
| loaded.
| **User response:** Use the transaction dump to determine
| the cause of the failure. For further assistance, or if
| module DFHDUIO is not loaded and no transaction
| dump is available, contact your system programmer.
| **Modules:** DFHRZLN, DFHRZRM, DFHRZSO,
| DFHRZSO1, DFHRZTA, DFHRZXM

| ARZJ

| **Explanation:** A command has failed due to a serious
| failure in a CICS component (resource manager).
| **System action:** The transaction is abnormally
| terminated with abend code ARZJ. CICS takes a
| transaction dump, unless module DFHDUIO is not
| loaded.
| **User response:** Use the transaction dump to determine
| the cause of the failure. For further assistance, or if
| module DFHDUIO is not loaded and no transaction
| dump is available, contact your system programmer.
| **Modules:** DFHRZLN, DFHRZRM, DFHRZSO,
| DFHRZSO1, DFHRZTA, DFHRZXM

| ARZ2

| **Explanation:** An attempt to service a GIOP request
| failed during task attach due to required resources
| being unobtainable, or missing information from
| request data.
| **System action:** The request fails and the task is
| abnormally terminated with abend code ARZ2. CICS
| takes a transaction dump, unless module DFHDUIO is
| not loaded.
| **User response:** Use the transaction dump to determine
| the cause of the failure. For further assistance, or if
| module DFHDUIO is not loaded and no transaction
| dump is available, contact your system programmer.
| **Modules:** DFHRZXM

| ARZ3

| **Explanation:** An attempt to service a GIOP request
| failed during task attach due to required resources
| being unobtainable, or missing information from
| request data.
| **System action:** The request fails and the task is
| abnormally terminated with abend code ARZ3. CICS
| takes a transaction dump, unless module DFHDUIO is
| not loaded.
| **User response:** Use the transaction dump to determine
| the cause of the failure. For further assistance, or if
| module DFHDUIO is not loaded and no transaction
| dump is available, contact your system programmer.
| **Modules:** DFHRZIX, DFHRZTCX

| ARZ4

| **Explanation:** An attempt to service a GIOP request
| failed during task attach due to required resources
| being unobtainable, or missing information from
| request data.
| **System action:** The request fails and the task is
| abnormally terminated with abend code ARZ4. CICS
| takes a transaction dump, unless module DFHDUIO is
| not loaded.
| **User response:** Use the transaction dump to determine
| the cause of the failure. For further assistance, or if
| module DFHDUIO is not loaded and no transaction
| dump is available, contact your system programmer.
| **Modules:** DFHRZRM, DFHRZSO1

Abend codes ASxx

ASCA

Explanation: A DFHSC TYPE=GETMAIN request has resulted in a call to the storage manager (SM) domain which has returned an INVALID or DISASTER response.

System action: The transaction is terminated with a CICS transaction dump.

User response: There has been an earlier failure which led to the response from the storage manager domain. Investigate the earlier failure (which is accompanied by a console message and a system dump).

Module(s): DFHSMSCP

ASCB

Explanation: A DFHSC TYPE=FREEMAIN request has resulted in a call to the storage manager (SM) domain which has returned an INVALID or DISASTER response.

System action: The transaction is terminated with a CICS transaction dump.

User response: There has been an earlier failure which led to the response from the storage manager domain. Investigate the earlier failure (which is accompanied by a console message and a system dump).

Modules: DFHSMSCP

ASCP

Explanation: A task which has issued an unconditional DFHSC TYPE=GETMAIN request has been purged while waiting for sufficient contiguous main storage to become free.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate why the task was purged. This will either have been as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the task was purged by the master terminal operator then this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded then this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased then the number of tasks in the system should be reduced to avoid short-on-storage situations. Another possibility would be to increase the

value of the DTIMOUT option for the transaction.

Modules: DFHSMSCP

ASCR

Explanation: A DFHSC macro request has been issued with an invalid request type.

System action: The transaction is terminated with a CICS transaction dump.

Detection of the invalid request by DFHSMSCP causes a console message and a system dump to be produced.

User response: Use the associated console message and system dump to investigate the problem.

Modules: DFHSMSCP

ASDA

Explanation: The default shutdown transaction (CESD) has been started directly from a terminal. This is not permitted. This transaction can only be started internally by CICS.

System action: The transaction is abnormally terminated with a transaction dump.

User response: None.

Modules: DFHCESD

ASFA

Explanation: An internal logic error occurred in DFHSFP because of an unexpected response from EXEC CICS. Thisabend code is usually accompanied by message DFHCE3598 which contains the associated return codes.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHSFP

ASFB

Explanation: An attempt was made to execute the CICS signoff program without an associated terminal.

System action: CICS terminates the transaction with a dump. Thisabend code is usually accompanied by message DFHCE3598.

User response: Only use the signoff program when there is a related terminal.

Modules: DFHSFP

ASFC

Explanation: An attempt was made to execute the CICS signoff program against an APPC session.

System action: CICS terminates the transaction with a dump. This abend code is usually accompanied by message DFHCE3598.

User response: Only use the signoff program when there is a related terminal.

Modules: DFHSFP

ASHA

Explanation: A command has failed due to a serious failure in a CICS component (resource manager).

System action: The transaction is abnormally terminated with abend code ASHA. CICS takes a transaction dump, unless module DFHDUIO is not loaded.

User response: Use the transaction dump to determine the cause of the failure. For further assistance, or if module DFHDUIO is not loaded and no transaction dump is available, contact your system programmer.

Modules: DFHSHDM

ASHB

Explanation: A command has failed due to a serious failure in a CICS component (resource manager).

System action: The transaction is abnormally terminated with abend code ASHB. CICS takes a transaction dump, unless module DFHDUIO is not loaded.

User response: Use the transaction dump to determine the cause of the failure. For further assistance, or if module DFHDUIO is not loaded and no transaction dump is available, contact your system programmer.

Modules: DFHSHDM

ASHR

Explanation: A command has failed due to a serious failure in a CICS component (resource manager).

System action: The transaction is abnormally terminated with abend code ASHR. CICS takes a transaction dump, unless module DFHDUIO is not loaded.

User response: Use the transaction dump to determine the cause of the failure. For further assistance, or if module DFHDUIO is not loaded and no transaction dump is available, contact your system programmer.

Modules: DFHSHRSP

ASHU

Explanation: In the process of transferring the request from one region to another an abend occurred due to a routing failure. The Request cannot be routed to a suitable region. The request is unserviceable.

System action: The transaction is abnormally terminated with abend code ASHU. CICS takes a transaction dump, unless module DFHDUIO is not loaded.

User response: Check the links between regions are available. Check the Distributed Routing Program name is correct and the program is usable. Use the transaction dump to determine the cause of the failure. For further assistance, or if module DFHDUIO is not loaded and no transaction dump is available, contact your system programmer.

Modules: DFHSHRSP

ASH2

Explanation: An attempt to service a Scheduler Services request failed due to required resources being unobtainable. This may result in a request being unserviceable or an Activity being marked abended depending on the nature of the failure.

System action: The transaction is abnormally terminated with abend code ASH2. CICS takes a transaction dump, unless module DFHDUIO is not loaded.

User response: Check that any required links between regions are available. Check the Distributed Routing Program name is correct and the program is usable. Use the transaction dump to determine the cause of the failure. For further assistance, or if module DFHDUIO is not loaded and no transaction dump is available, contact your system programmer.

Modules: DFHSHXM

ASH3

Explanation: A transaction bound to a Scheduler Services request has backed out. No other abend code has been set. The SH abend request uses this abend code by default.

System action: The transaction continues backing out. A subsequent task will process the SH abend request.

User response: None.

Modules: DFHSHRM

ASH4

Explanation: A Scheduler Services request attempted to attach a transaction that is currently disabled.

System action: The transaction is abnormally

| terminated with abend code ASH4. CICS takes a
| transaction dump, unless module DFHDUIO is not
| loaded.

| **User response:** Check the status of the transaction. For
| further assistance, or if module DFHDUIO is not
| loaded and no transaction dump is available, contact
| your system programmer.

| **Modules:** DFHSHXM

ASIA

Explanation: An error has occurred on a call to the
storage manager (SM) domain. The domain that
detected the original error will have provided an
exception trace, a console message and, possibly, a
system dump (depending on the options specified in
the dump table).

System action: The task is abnormally terminated
with a CICS transaction dump. CICS then terminates
abnormally.

User response: See the related message from the
domain that detected the original error.

Modules: DFHSI1

ASIB

Explanation: An attempt has been made to run the
CICS internal task CPLT as a user transaction.

System action: CICS terminates the task with a
transaction dump.

User response: Investigate why the attempt was made
to run CPLT as a user transaction.

Modules: DFHSIPLT

ASJD

| **Explanation:** An attempt to load a DLL by SJ Domain
| has failed.

| **System action:** CICS terminates the task with a
| transaction dump.

| **User response:** See message DFHSJ0503 to determine
| the DLL name and the reason why the load failed.

| **Modules:** DFHSJCS

ASJE

| **Explanation:** An attempt to locate the Wrapper class
| has failed.

| **System action:** CICS terminates the task with a
| transaction dump.

| **User response:** Verify the location and attributes of the
| CICS Wrapper class particularly the HFS permissions.
| If Java 2 security is active ensure the necessary
| permissions have been granted in the policy file. See

| message DFHSJ0501 for further information.

| **Modules:** DFHSJCS

ASJF

| **Explanation:** An attempt to change the HFS working
| directory has failed.

| **System action:** CICS terminates the task with a
| transaction dump.

| **User response:** See message DFHSJ0502 to determine
| the directory name and the reason why the attempt
| failed.

| **Modules:** DFHSJCS

ASJG

| **Explanation:** An attempt by SJ domain to fetch the
| user-replaceable module DFHJVMAT has failed.

| **System action:** CICS terminates the task with a
| transaction dump.

| **User response:** Verify that module DFHJVMAT is
| contained in a dataset referenced by ddname
| SDFHAUTH and that it is executable.

| **Modules:** DFHSJIN

ASJJ

| **Explanation:** A JVM was started which does not meet
| the minimum version requirements for this release of
| CICS.

| **System action:** CICS terminates the task with a
| transaction dump.

| **User response:** Update the version of Java specified in
| the JVM profile.

| **Modules:** DFHSJIN

ASJ1

| **Explanation:** CICS attempted to initialize the Java
| environment for a task by issuing a JNI_CreateJavaVM
| call to the Java Native Interface. The call was not
| successful.

| **System action:** Exception trace SJ 050C is created. The
| task is abnormally terminated with a CICS transaction
| dump.

| **User response:** This abend usually implies that there
| is an error in the JVM Profile. Check that the LIBPATH
| and JAVA_HOME entries in the JVM Profile are correct.
| Also check that the CICS_DIRECTORY has been set
| correctly.

| Ensure that CICS is using the correct JVM Profile and
| that the correct version of Java is being used. Check
| that the CICS region id has read permission to the Java

| HFS files and that you have the latest Java maintenance applied.

| Examine the HFS files used for stdout and stderr (as named by the environment variables STDOUT and STDERR, whose default names are dfhjvmout and dfhjvmerr) for error messages output by the JVM. Also examine destination CEEMSG for error messages output by Language Environment and the Java Native Interface (JNI). The trace table from the transaction dump contains the exception trace mentioned above.

| If the suggestions above do not help you should ensure that the JVM has not abended. To do this look in the WORK_DIR directory specified in the JVM Profile for any JAVADUMP files.

| **Modules:** DFHSJCS

| ASJ3

| **Explanation:** The CICS JVM interface invoked the JVM to find the main method of the CICS Wrapper class used to set up the operating environment before executing the user Java class. The JVM failed to find the main method of the CICS Wrapper class.

| **System action:** DFHSJCS provides an exception trace, console message DFHSJ0002, and possibly a system dump (depending on the options in the dump table). The task is abnormally terminated with a CICS transaction dump.

| **User response:** Examine the HFS files used for stdout and stderr (as named by the environment variables STDOUT and STDERR, whose default names are dfhjvmout and dfhjvmerr) for error messages output by the JVM. Also examine destination CEEMSG for error messages output by Language Environment and the Java Native Interface (JNI).

| Ensure that the CICS_DIRECTORY entry in the JVM Profile is correct and that the CICS region id has permission to read the CICS_DIRECTORY HFS structure.

| **Modules:** DFHSJCS

| ASJ4

| **Explanation:** The SJ domain failed to build the argument list required to invoke the CICS Wrapper class used to set up the operating environment before executing the user Java class. This is possibly due to lack of free storage.

| **System action:** DFHSJCS provides an exception trace, console message DFHSJ0002, and possibly a system dump (depending on the options in the dump table). The task is abnormally terminated with a CICS transaction dump.

| **User response:** Examine the HFS files used for stdout and stderr (as named by the environment variables STDOUT and STDERR, whose default names are

| dfhjvmout and dfhjvmerr) for error messages output by the JVM. Also examine destination CEEMSG for error messages output by Language Environment and the Java Native Interface (JNI).

| **Modules:** DFHSJCS

| ASJ5

| **Explanation:** The CICS JVM interface invoked the CICS Wrapper class used to set up the operating environment before executing the user Java class. The Wrapper returned an exception.

| **System action:** The task is abnormally terminated with a CICS transaction dump.

| **User response:** Examine the HFS files used for stdout and stderr (as named by the environment variables STDOUT and STDERR, whose default names are dfhjvmout and dfhjvmerr) for error messages output by the JVM. Also examine destination CEEMSG for error messages output by Language Environment and the Java Native Interface (JNI).

| **Modules:** DFHSJCS

| ASJ6

| **Explanation:** The SJ domain issued a call to the kernel to ensure that CICS's ESTAE is the current ESTAE. This is required before calling CICS services from a native C environment which is running with Language Environment's ESTAE in effect. The call failed.

| **System action:** The task is abnormally terminated with a CICS transaction dump.

| **User response:** Examine the CICS Kernel or MVS messages and diagnostics that should be present as a result of the failure.

| **Modules:** DFHSJCS

ASNA

Explanation: An internal logic error occurred in DFHSNP because of an unexpected response from EXEC CICS.

System action: CICS terminates the transaction with a dump. This abend code is usually accompanied by message DFHCE3548.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHSNP

ASNB

Explanation: An attempt was made execute the CICS sign on program without an associated terminal. This abend code is usually accompanied by message DFHCE3548.

System action: CICS terminates the transaction with a dump.

User response: Only use the sign on program when there is a related terminal.

Modules: DFHSNP

ASNC

Explanation: The signon program attempted to send a request to the user but failed to do so.

System action: CICS terminates the transaction with a dump. This abend code is usually accompanied by message DFHCE3548.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHSNP

ASND

Explanation: A request from DFHSNTU to ENQ on the address of the SNEEX has failed during signoff terminal user.

System action: A transaction dump is taken and the task which issued the signoff is abended.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHSNTU

ASOA

Explanation: The TCP/IP listener task CSOL has been incorrectly started from a terminal. It can only be enabled by the Sockets Domain at CICS system initialization or by using CEMT SET TCPIP OPEN or the equivalent SPI function.

System action: The transaction is abnormally terminated with a transaction dump.

User response: None.

Modules: DFHSOL

ASOB

Explanation: The TCP/IP listener task CSOL has encountered a locking error while attempting to issue a lock.

System action: The transaction is abnormally

terminated with a transaction dump.

User response: The exception trace prior to this abend gives more information as to why this abend was issued.

Modules: DFHSOL

ASOC

Explanation: The TCP/IP listener task CSOL has encountered an unlocking error while attempting to issue an unlock.

System action: The transaction is abnormally terminated with a transaction dump.

User response: The exception trace prior to this abend gives more information as to why this abend was issued.

Modules: DFHSOL

ASOD

Explanation: The TCP/IP transaction attach module DFHSOXM encountered an error during the bind stage of transaction attach processing for a new task.

System action: The transaction is abnormally terminated with a transaction dump.

User response: The exception trace prior to this abend gives more information as to why this abend was issued.

Modules: DFHSOXM

ASOL

Explanation: The TCP/IP listener task CSOL has abended.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Investigate why the transaction was abended. The exception trace prior to this abend gives more information as to why this abend was issued.

Modules: DFHSOL

ASPA

Explanation: The task was purged before a request to recovery manager (RM) domain was able to complete successfully. The domain that first detected the purged condition provides an exception trace.

System action: The task is abnormally terminated with a CICS transaction dump. If processing is at a point where data integrity might not be maintained, CICS is abnormally terminated.

User response: Investigate why the task was purged. This is either as a result of a purge from the master terminal operator via the CEMT transaction, or by the

task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

If CICS is abnormally terminated, it should be emergency restarted to ensure that data integrity is maintained.

Modules: DFHAPAC

ASPB

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the recovery manager (RM) domain. The domain that detected the original error will have provided an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump. If processing is at a point where data integrity might not be maintained, CICS is abnormally terminated.

User response: See the related message from the domain that detected the original error. If CICS was abnormally terminated, it should be emergency restarted to ensure that data integrity is maintained.

Modules: DFHAPAC

ASPC

Explanation: An error (INVALID or DISASTER) has occurred on a call to the bridge syncpoint routine (DFHBRSP). The domain that detected the original error will have provided an exception trace, and, possibly, a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related message from the domain that detected the original error.

Modules: DFHSPP

ASPD

Explanation: The transaction requested syncpoint via EXEC CICS SYNCPOINT, or rollback via EXEC CICS SYNCPOINT ROLLBACK, but this is not allowed in a transaction that is associated with an OTS transaction.

System action: CICS terminates the transaction abnormally. EXEC CICS HANDLE ABEND command cannot handle this abend.

User response: The error indicates an invalid attempt to syncpoint the transaction.

If DB2 is being accessed in the transaction, check that the DB2ENTRY or DB2CONN pool definition used by the transaction does not specify DROLLBACK(YES).

Modules: DFHEISP

ASPF

Explanation: CICS issued an internal syncpoint request resulting in a syncpoint with an intersystem session which has returned ROLLEDBACK to recovery manager (RM) domain. As a result, the transaction is abnormally terminated because the unit of work which was being syncpointed has been backed out.

This could result from shutting down IRC or from the failure of a connected CICS region.

System action: The transaction is abnormally terminated. Recoverable resources updated by the unit of work are backed out and locks released. The EXEC CICS HANDLE ABEND command cannot handle this abend.

Message DFHAC2215 is sent to the terminal end user if possible, and message DFHAC2245 is sent to transient data destination CSMT.

User response: Determine why the remote intersystem session returned a ROLLEDBACK response to the syncpoint request. Once this has been corrected retry the transaction.

To avoid ASPF abends in future, ensure that no in-flight units of work exist before shutting down IRC.

Modules: DFHAPAC

ASPI

Explanation: During CICS synchronization level 1 (synclevel 1) commit, an unexpected FMH or no data has been received from the partner system. Local resources and synclevel 2 partners have been committed, but synclevel 1 function-shipped resource updates may have been backed out.

System action: The transaction does not abend. CICS synclevel 1 commit processing continues, with the aim of committing as many synclevel 1 resources as possible.

User response: Examine the transaction dump to determine why the FMH was invalid or missing. It is likely that the error is in the remote system.

See the *CICS Family: Communicating from CICS on System/390* for more information about syncpointing.

Modules: DFHCR2U

ASPJ

Explanation: During CICS synchronization level 1 (synclevel 1) commit, unexpected syncpoint message data has been received from the partner system. Local resources and synclevel 2 partners have been committed, but synclevel 1 function-shipped resource updates may have been backed out.

System action: The transaction does not abend. CICS synclevel 1 commit processing continues, with the aim of committing as many synclevel 1 resources as possible.

User response: Examine the transaction dump to determine why the message data was invalid. It is likely that the error is in the remote system.

See the *CICS Family: Communicating from CICS on System/390* for more information about syncpointing.

Modules: DFHCR2U

ASPN

Explanation: A transaction has issued an EXEC CICS RETURN in backout required program state. The backout required program state is set when an application receives or issues an abend, or receives a backout request on a protected conversation.

System action: The transaction is abnormally terminated. Recoverable resources updated by the unit of work are backed out and locks released. The EXEC CICS HANDLE ABEND command cannot handle this abend.

Message DFHAC2216 is sent to the terminal end user if possible, and message DFHAC2246 is sent to transient data destination CSMT.

User response: To avoid the transaction abend, the application should code an EXEC CICS SYNCPOINT command before the EXEC CICS RETURN. A syncpoint issued in 'backout required' program state results in a backout being performed, and the ROLLEDBACK condition returned on the EXEC CICS SYNCPOINT command. If this condition is then handled, a subsequent EXEC CICS RETURN will complete successfully. For LU61 conversations the application should issue an EXEC CICS FREE followed by an EXEC CICS SYNCPOINT ROLLBACK, in order to avoid a subsequent ASP8 abend.

Modules: DFHAPAC

ASPO

Explanation: An intersystem session failed while a syncpoint was being taken. The intersystem session that failed was the link to the coordinator system. The failure occurred during the indoubt period of syncpoint processing. As a result this CICS system is in doubt as to the outcome of the unit of work for the transaction.

The unit of work is not shunted to await the return of the coordinator system, but is instead unilaterally committed. The unit of work is not shunted for one of the following reasons:

- The transaction definition specifies WAIT(NO).
- The unit of work includes an MRO session to a back-level CICS system which does not support the WAIT(YES) option, and the role of the session in the unit of work is such that it cannot await the return of the coordinator system.
- The unit of work includes an LU6.1 session, and the role of the session in the unit of work is such that it cannot await the return of the coordinator system.
- The unit of work involves a task related user exit which is not enabled with the INDOUBTWAIT option.
- The unit of work has updated a recoverable transient data destination, which is defined with WAIT(NO).
- The unit of work involves the installation of CICS resource definitions from the CSD (CICS system definition) file.

The unit of work is committed, rather than backed out, because the transaction definition specifies ACTION(COMMIT).

The fact that the unit of work is committed is remembered by the recovery manager (RM) domain until the unit of work is resynchronized with the coordinator system. At this time, according to whether the coordinator system committed or backed out, the recovery manager domain issues resynchronization messages reporting whether or not the resolution of the unit of work in the subordinate system was consistent with the coordinator system.

System action: The transaction is abnormally terminated. Recoverable resources updated by the unit of work are committed and locks released. The EXEC CICS HANDLE ABEND command cannot handle this abend.

Message DFHAC2202 is sent to the terminal end user if possible, and message DFHAC2232 is sent to transient data destination CSMT.

User response: Any updates performed by the unit of work are committed. There is a danger that recoverable resources will be inconsistent with the coordinator system if the coordinator system has backed out. If the reason for the failure is the first of those listed above and if you wish CICS to ensure that data integrity is maintained, change the indoubt transaction definition

to specify WAIT(YES) so that CICS automatically handles indoubt failures and resynchronizes the unit of work when the link to the coordinator system is reestablished.

Modules: DFHAPAC

ASPP

Explanation: An intersystem session failed while a syncpoint was being taken. The intersystem session that failed was the link to the coordinator system, and the failure occurred during the critical indoubt period of syncpoint processing. As a result this CICS system is in doubt as to the outcome of the unit of work for the transaction.

The unit of work is not shunted to await the return of the coordinator system. Instead it is unilaterally backed out. The unit of work is not shunted for one of the following reasons:

- The transaction definition specifies WAIT(NO).
- The unit of work includes an MRO session to a back-level CICS system which does not support the WAIT(YES) option, and the role of the session in the unit of work is such that it cannot await the return of the coordinator system.
- The unit of work includes an LU6.1 session, and the role of the session in the unit of work is such that it cannot await the return of the coordinator system.
- The unit of work involves a task related user exit which is not enabled with the INDOUBTWAIT option.
- The unit of work has updated a recoverable transient data destination, which is defined with WAIT(NO).
- The unit of work involves the installation of CICS resource definitions from the CSD (CICS system definition) file.

The unit of work is backed out, rather than committed, because the transaction definition specifies ACTION(BACKOUT).

The fact that the unit of work is backed out is remembered by recovery manager (RM) domain until the unit of work is resynchronized with the coordinator system. At this time, according to whether the coordinator system backed out or committed, the recovery manager domain issues resynchronization messages reporting whether or not the resolution of the unit of work in the subordinate system was consistent with the coordinator system.

System action: The transaction is abnormally terminated. Recoverable resources updated by the unit of work are backed out and locks released. The EXEC CICS HANDLE ABEND command cannot handle this abend.

Message DFHAC2203 is sent to the terminal end user if possible, and message DFHAC2233 is sent to transient data destination CSMT.

User response: Any updates performed by the unit of work are backed out. There is a danger that recoverable resources will be inconsistent with the coordinator system if the coordinator system has committed. If the reason for the failure is the first of those listed above and if you wish CICS to ensure that data integrity is maintained, change the indoubt transaction definition to specify WAIT(YES) so that CICS automatically handles indoubt failures and resynchronizes the unit of work when the link to the coordinator system is reestablished.

Modules: DFHAPAC

ASPQ

Explanation: During phase 2 of the two phase syncpoint protocol an error occurred while communicating with a remote system. The error occurred after the recoverable resources were committed or backed out, so data integrity is not in danger.

System action: The transaction is abnormally terminated. Recoverable resources updated by the unit of work will have backed out or committed depending on the decision taken by the recovery manager (RM) domain, which was not influenced by this later problem. The EXEC CICS HANDLE ABEND command cannot handle this abend.

Message DFHAC2221 is sent to the terminal end user if possible, and message DFHAC2251 is sent to transient data destination CSMT.

User response: Refer to earlier messages issued by the communication or remote resource management components of CICS to determine the cause of the intersystem communication problem.

Modules: DFHAPAC

ASPR

Explanation: Intersystem communication failed while a syncpoint was being taken. Communication with the coordinator system has been interrupted, and the failure occurred during the critical indoubt period of syncpoint processing. As a result this CICS system is in doubt as to the outcome of the unit of work for the transaction.

However, this CICS system has not updated any recoverable resources in the unit of work and hence does not require the unit of work to be shunted to await resynchronization of its resources later. The coordinator system commits or backs out its resources. No resources on this system need to be kept in step.

This error can occur with external resource managers connected to CICS via the resource manager interface (RMI) as well as CICS systems connected via LU 6.2, and MRO. If an external resource manager such as DB2 is the only recoverable resource updated in the

transaction, the recovery manager (RM) domain can optimize the syncpoint protocol. In this instance, the external resource manager becomes the syncpoint coordinator. If the link to the external resource manager is lost during this time, CICS will be in doubt as to whether the external resource manager updates were committed or backed out.

System action: The transaction is abnormally terminated. There are no recoverable resources affected in this CICS system. The EXEC CICS HANDLE ABEND command cannot handle this abend.

Message DFHAC2222 is sent to the terminal end user if possible, and message DFHAC2252 is sent to transient data destination CSMT.

User response: Refer to messages on the remote system to determine if the remote resources were backed out or committed.

Modules: DFHAPAC

ASP1

Explanation: Intersystem communication failed while a syncpoint was being taken. Communication with the coordinator system has been interrupted, and the failure occurred during the critical indoubt period of syncpoint processing. As a result this CICS system is in doubt about the outcome of the unit of work for the transaction.

| Alternatively, a transaction may have timed out while
| waiting for Recoverable Resource Management Services
| (RRMS) to provide the outcome of the unit of work, or
| RRMS may have failed during the critical indoubt
| period.

The transaction definition specifies WAIT(YES) as an indoubt attribute. Therefore the unit of work is not completed but is shunted and allowed to wait for resynchronization with the coordinator system. If the WAITTIME attribute is specified on the transaction definition, the unit of work waits for the specified time. If after that time the coordinator system has not resynchronized, a unilateral decision is made about the unit of work as specified by the ACTION keyword on the transaction definition. A WAITTIME of zero, the default, means an indefinite wait. The unit of work can also be forced to take a unilateral decision by means of a CEMT SET UOW command.

System action: The transaction is abnormally terminated. The EXEC CICS HANDLE ABEND command cannot handle this abend.

The associated unit of work is shunted awaiting the return of the coordinator system. Recoverable resources updated by the unit of work remain locked. The locks are released when the unit of work is backed out or committed at resynchronization time, or when a unilateral decision is made by this system.

Message DFHAC2201 is sent to the terminal end user if

possible, and message DFHAC2231 is sent to transient data destination CSMT.

User response: None. Any updates performed by the unit of work are resolved automatically when resynchronization with the coordinator system takes place.

Alternatively, the user can force resolution of the updates independently of the coordinator system by making a CEMT request to commit or back out the unit of work.

Modules: DFHAPAC o*----- ABCODE ASP2
ALTERED BY APAR PQ47569 -----

ASP2

Explanation: A syncpoint has been attempted when an intersystem conversation is in a state in which the EXEC CICS SYNCPOINT command is not allowed. If CICS is connected to a system which must act as LAST AGENT, such as IMS, then this ABEND will be issued from SYNCPOINT processing if a PREPARE has been received on a link to another system. In order to support syncpointing CICS must act as COORDINATOR when it is directly connected to the LAST AGENT, the COORDINATOR system may send PREPARE syncpoint commands but never receives them.

System action: The task is abnormally terminated with a CICS transaction dump which includes terminal control information. In particular, the dump contains state information for the links used by this transaction. The EXEC CICS HANDLE ABEND command cannot handle this abend.

User response: Ensure that the application issues an EXEC CICS SYNCPOINT command only when its sync level 2 conversations are in the correct state. The EXEC CICS SYNCPOINT command may be issued only when each conversation is in one of the following states:

SEND
PEND-RECEIVE (Not for MRO)
PEND-FREE
SYNC-RECEIVE
SYNC-SEND (Not for MRO)
SYNC-FREE

Modules: DFHAPAC

ASP3

Explanation: An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. The coordinator of the syncpoint is not this CICS system but is remote. During the syncpoint protocol the remote coordinator has decided that the unit of work cannot be committed and must be backed out.

This error can occur with external resource managers connected to CICS via the resource manager interface

(RMI) as well as CICS systems connected via LU 6.2, and MRO. If an external resource manager such as DB2 is the only recoverable resource updated in the transaction, the recovery manager (RM) domain can optimize the syncpoint protocol. In this instance, the external resource manager becomes the syncpoint coordinator. In this instance if the external resource manager returns with a backed out response, an ASP3 abend results.

System action: The transaction is abnormally terminated and recoverable resources updated by the unit of work are backed out. The EXEC CICS HANDLE ABEND command cannot handle this abend.

Message DFHAC2220 is sent to the terminal end user if possible, and message DFHAC2250 is sent to transient data destination CSMT.

User response: Refer to the remote coordinator system to determine why the unit of work was backed out.

Modules: DFHAPAC

ASP7

Explanation: A resource manager involved in syncpoint protocols has replied 'No' to a request to 'Prepare'. The resource manager may be local to this CICS system, or may be a remote resource manager on another CICS system, or an external resource manager communicating through the resource manager interface (RMI).

System action: CICS terminates the transaction abnormally. Recoverable resources updated by the unit of work are backed out. The EXEC CICS HANDLE ABEND command cannot handle this abend.

If it is a local resource manager that has voted no, message DFHAC2218 is sent to the terminal end user if possible, and message DFHAC2248 is sent to transient data destination CSMT.

If it is a remote resource manager that has voted no, message DFHAC2219 is sent to the terminal end user if possible, and message DFHAC2249 is sent to transient data destination CSMT.

User response: This abend is caused by a prior problem. For example, the resource manager cannot flush its buffers because of an I/O error, or it cannot communicate with CICS because of a TP failure. Correct the earlier problem. An ASP7 can also occur during terminal or connection install if CICS is short on storage. For instance if message DFHAC2248 shows the transaction as CATA then look for earlier short on storage messages.

Modules: DFHAPAC

ASP8

Explanation: The transaction requested syncpoint rollback, but was using a type of processing for which syncpoint rollback is not supported.

System action: CICS terminates the transaction abnormally. The EXEC CICS HANDLE ABEND command cannot handle this abend.

Message DFHAC2217 is sent to the terminal end user if possible, and message DFHAC2247 is sent to transient data destination CSMT.

User response: This error may be an application error or a configuration error. Some communication sessions, (for example, LU6.1) do not support syncpoint rollback, and if CICS detects such a session during rollback processing, the task is abended. This restriction is described in the *CICS Intercommunication Guide*. To resolve the problem, either:

- Change the application so that it does not issue syncpoint rollback commands while the non-supporting sessions are allocated (e.g. issue an EXEC CICS FREE first), or
- Change the configuration so that either APPC or MRO sessions are used for communication. These are the only two session types which support syncpoint rollback.

Alternatively, following a session failure during a previous syncpoint, CICS may have decided to rollback this unit-of-work in order to preserve data integrity. Since the unit-of-work contains a session which does not support syncpoint rollback, this abend ensues. In this case, no action is required in response to this abend, although action may be required to deal with the original failure.

Modules: DFHAPAC

ASP9

Explanation: The transaction requested syncpoint via EXEC CICS SYNCPOINT, but this is not allowed in a transaction that is acting on behalf of an Activity.

System action: CICS terminates the transaction abnormally. EXEC CICS HANDLE ABEND command cannot handle this abend.

User response: The error indicates an invalid attempt to syncpoint the transaction.

Modules: DFHEISP

ASQA

Explanation: The CLS2 transaction was processing resynchronization work but the communications session which it was using has failed.

System action: The work is reexecuted on a new

session. If reexecution has already been attempted, the transaction terminates.

User response: The error may be caused by the failure of several sessions between communicating systems during the resynchronization process. To confirm this, examine the CSMT transient data queue for the relevant period.

Another cause could be logic errors within the resynchronization program, either on this system or on the partner system, which caused the session to be terminated. In this case, CSMT transient data messages indicate the nature of the error.

Modules: DFHCRRSY

ASQB

Explanation: The CLS2 transaction was executing exchange log names or resynchronization with a remote system when a logic error occurred.

System action: The transaction is abnormally terminated with a transaction dump.

Message DFHRS2158 may also be issued.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCRRSY

ASQC

Explanation: The CLS2 transaction was attached with an unexpected start code. The transaction can be attached due to terminal input (on a communications session), or via a system attach. Neither of these methods was used.

System action: The transaction is abnormally terminated.

User response: The error indicates an invalid attempt to start the transaction.

Modules: DFHCRRSY

ASQD

Explanation: The CLS2 transaction was attached but could not use the transaction manager interface to obtain input parameters.

System action: The transaction is abnormally terminated.

User response: The error indicates a failure in the transaction manager. See the exception trace entries produced by the transaction manager to determine the reason for the error.

Modules: DFHCRRSY

ASQE

Explanation: The CLS2 transaction was executing exchange log names with a remote system and 3 retry attempts have failed to solicit a warm exchange log names reply, in response to a warm exchange log names request sent by CICS.

System action: The transaction is abnormally terminated with a transaction dump.

User response: This abend indicates an error in the remote system. It should have saved the log name sent by CICS and, on receiving a later exchange lognames request, should then respond with a warm reply.

Modules: DFHCRRSY

ASQG

Explanation: The CLS2 transaction was executing resynchronization work and has failed during the receipt of data from remote system via an MRO session. The data was longer than expected.

System action: The transaction is abnormally terminated with a transaction dump.

User response: The abend indicates a CICS logic error, possibly in the remote system. The transaction storage in the dump shows the data received. The transaction trace shows the preceding flows between the systems, which should match those documented in the *SNA LU6.2 Reference: Peer Protocols* manual, SC30-6808.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCRRSY

ASQH

Explanation: The CLS2 transaction was executing resynchronization work and has failed during the receipt of data from remote system via an MRO session. The data was shorter than the minimum length expected.

System action: The transaction is anomalously terminated with a transaction dump.

User response: This indicates a CICS logic error, possibly in the remote system. The transaction storage in the dump shows the data received. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCRRSY

ASQI

Explanation: The CLS2 transaction was executing the exchange lognames process as part of the initialization sequence for an APPC connection. An attempt to invoke the CICS recovery manager to save a logname failed.

System action: The transaction is abnormally terminated with a transaction dump.

Message DFHRS2157 may also be issued.

User response: This indicates an error in the CICS recovery manager which has produced its own exception trace records. Look at the trace records and the CSMT message log for further information about the error.

Modules: DFHCRRSY

ASQK

Explanation: The CLS2 transaction was processing exchange lognames or resynchronization for a connected partner identified by a netname. The connection entry associated with the netname was located and locked, but could not be unlocked in subsequent processing. This indicates a CICS internal logic error.

System action: The transaction is abnormally terminated with a transaction dump.

Message DFHRS2156 may also be issued.

User response: This indicates an error either in the CICS table manager, (which may have produced its own exception trace records) or in the resynchronization program itself. Look at the trace records and the CSMT message log for further information which might have indicated an error in the table manager program or in the table entry for the connection. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCRRSY

ASQL

Explanation: The CLS2 transaction was executing the resynchronization of a unit of work with a connected partner, and has locked the associated data managed by the CICS recovery manager. The invocation of the TERMINATE_RECOVERY command to unlock the data failed.

System action: The transaction is abnormally terminated with a transaction dump.

Message DFHRS2154 is also issued.

User response: This indicates an error either in the CICS recovery manager (which may have produced its own exception trace records) or in the

resynchronization program itself. Look at the trace records and the CSMT message log for further information. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCRRSY

ASQM

Explanation: A CICS internal logic error has occurred in the management of dynamic storage for the resynchronization program.

System action: The transaction is abnormally terminated with a transaction dump.

User response: This indicates that the resynchronization program has exhausted the available space for recording storage areas. The symptoms may indicate that the program was looping without executing the error recovery process. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCRRSY

ASRA

Explanation: The task has terminated abnormally because of a program check.

System action: The task is abnormally terminated and CICS issues either message DFHAP0001 or DFHSR0001. Message DFHSR0622 may also be issued.

User response: Refer to the description of the associated message or messages to determine and correct the cause of the program check.

Modules: DFHSRP

ASRB

Explanation: An operating system abend has occurred and CICS has been able to abend the current transaction.

System action: The task is abnormally terminated and CICS issues either message DFHAP0001 or DFHSR0001

User response: Refer to the description of the associated message to determine the cause of the original operating system abend, and take the necessary corrective action.

Modules: DFHSRP

ASRD

Explanation: The task has been abnormally terminated for one of these reasons:

- A program contains an assembler macro call which is no longer supported by CICS.

- An invalid attempt has been made to access the CSA or TCA.
- A non-assembler program has been wrongly defined to CICS as an assembler program.

This error appears as a program check.

System action: The task is abnormally terminated and CICS issues message DFHSR0618, followed by either DFHAP0001 or DFHSR0001.

User response: Refer to the description of the associated messages to determine and correct the error.

It is likely that either R12 which usually addresses the TCA or R13 which usually addresses the CSA is pointing to an area of storage that you are not allowed to access.

Modules: DFHSRP

ASRE

Explanation: The task has been abnormally terminated because an attempt has been made to access a CICS-DB2 RCT load module.

| The RCT no longer exists as a load module and cannot
| be accessed directly.

To access information held in the RCT use the CICS SPI commands EXEC CICS INQUIRE/SET DB2CONN, EXEC CICS INQUIRE/SET DB2ENTRY and EXEC

Abend codes ATxx

ATCA

Explanation: The system was in a final quiesce mode when the CICS application program issued a DFHTC macro.

System action: The task requesting the I/O is abnormally terminated with a CICS transaction dump.

User response: None.

Modules: DFHZARQ

ATCB

Explanation: The CICS application program issued two consecutive DFHTC writes or two consecutive DFHTC reads, but in either case did not issue an intervening wait.

Problem determination: A transaction dump is provided with this abend. In the dump, register 12 addresses the current TCA, and register 10 and the field TCAFCAAA address the TCTTE associated with this task. In TCATPOS2, bit TCATPOWR (X'01') indicates that a write is requested by the DFHTC macro, and bit TCATPORR (X'10') indicates that a read is requested. In TCTTEOS, bit TCTTEOWR (X'01') indicates that a write is in progress, and bit TCTTEORR (X'10') indicates that a read is in progress.

CICS INQUIRE/SET DB2TRAN.

This error appears as a program check.

System action: The task is abnormally terminated and CICS issues message DFHSR0619, followed by either DFHAP0001 or DFHSR0001.

User response: Change the application to use the CICS SPI commands to retrieve data from, or set fields in, the RCT.

Modules: DFHSRP

ASRK

Explanation: The AP domain recovery stub, DFHSR1, has been invoked to deal with a program check, operating system abend, or another error within a transaction environment. However, DFHSR1 has been unable to call the system recovery program, DFHSRP, because register 12, which should be pointing to the task control area (TCA), is null. This indicates that the caller of DFHSR1, has not set the address of the TCA..

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHSR1

Analysis:

Register	Label	Description
R10=@TCTTE R12=@TCA	TCZARQ05 (TCZAQ1W)	Bit TCATPOWR is on in byte TCATPOS2, and bit TCTTEOWR is on in byte TCTTEOS.
R10=@TCTTE R12=@TCA	TCZARQ05 (TCZAQ2W)	Bit TCATPOWR is on in byte TCATPOS2, and bit TCTTEORR is on in byte TCTTEOS.
R10=@TCTTE R12=@TCA	TCZARQ12	Bit TCATPORR is on in byte TCATPOS2, and bit TCTTEORR is on in byte TCTTEOS.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Take corrective action within the program being executed.

This is almost certainly an application program error. Determine the flow of control through the application and determine why an intervening wait is not issued. The trace table may be useful to discover where the application is issuing the read and write requests. If necessary, start trace or auxiliary trace using the master terminal command and rerun the transaction to obtain a trace. The output of the auxiliary trace can be printed using the trace utility program, DFHTU640.

Modules: DFHZARQ

ATCC

Explanation: An application program, using a pipeline session, has either issued more than one write request or issued a read request.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Correct the application program so that it will not issue more than one consecutive WRITE to a pipeline session terminal.

Modules: DFHZARQ

ATCD

Explanation: This abend code is used whenever a CTYPE request or a QUEUE request is issued and VTAM or a ZCP function has not been included in the system.

It is also used to abend a task that issues an APPC command when the CICS system is not at a level to support APPC.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Correct the transaction so that it does not issue a CTYPE macro instruction if VTAM is not generated into the system, or include the ZCP function for which the CTYPE or QUEUE request was issued.

Modules: DFHZDSP, DFHZERH

ATCE

Explanation: A CICS application program has issued a DFHTC request without specifying the address of a TIOA, but the request is not an ERASE ALL UNPROTECTED or a READBUF request for a 3270 data stream terminal.

Problem determination: A transaction dump is provided with this abend. In the dump, register 12 addresses the current TCA, and register 10 and the field TCAFCAAA addresses the TCTTE associated with this task. Register 8 and TCTTEDA should contain the address of the TIOA to be used in the I/O request, but actually they contain zero. For a 3270 data stream terminal, byte TCTETDST has bit TCTETTSI (X'01') set. An erase-all-unprotected request is indicated by the setting of bit TCTTEEUI (X'40') in byte TCTTEEUB, and a read buffer request is indicated by the setting of bit TCTTERBI (X'80') in byte TCTTERBB. **Analysis:**

Register	Label	Description
R10=@TCTTE	TCZARQ41	NIOABAR (register 8) contains zero.
R8=0		Register 8 has been loaded field TCTTEDA of the TCTTE associated with this task.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Correct the error in the user program by ensuring that a terminal input/output area (TIOA) is provided at write time.

This is almost certainly an application program error. Determine the flow of control through the application and determine why a TIOA has not been specified.

Modules: DFHZARQ

ATCF

Explanation: A DFHTC CTYPE macro was issued to a non-VTAM terminal control table terminal entry (TCTTE), or a DFHTC CTYPE=COMMAND or RESPONSE macro was issued to a VTAM 3270 TCTTE.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Ensure that the program issues CTYPE macros to VTAM terminals only, and does not issue CTYPE=COMMAND or RESPONSE to a VTAM 3270.

Modules: DFHZCRQ

ATCG

Explanation: A CICS application program has issued a DFHTC request for a terminal that it does not own. The problem of ownership may be because the task previously issued a WRITE, LAST request (which would have detached the terminal from that task) or because the task incorrectly specified the terminal to which the request is directed.

Problem determination: Register 12 addresses the current TCA and register 10 contains the address of the TCTTE. The address of the TCTTE was obtained either from TCAFCAAA in the case of a non-ISC transaction, or from TCATPTA if bit TCATPTTA (X'40') is on in byte TCATPOC3 (this indicates that TERM=YES was specified on the DFHTC request and that this is an ISC transaction). In the TCTTE thus located, the field TCTTECA does not contain the address of the TCA, indicating that this TCA is not owned by this task.

Analysis: A DFHTC request has been issued specifying a TCTTE in which the field TCTTECA does not contain the address of the TCA.

Register	Label	Description
R10=@TCTTE	TCZARQ05	TCTTECA is not equal to register 12.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: This is most probably an application error (unless storage has been completely overwritten). Determine the flow from the trace table and when a request to the DFHZZCP detach routine, DFHZZDET, or a

DFHTC WRITE, LAST was issued.

Modules: DFHZARQ

ATCH

Explanation: The task was purged before a domain call was able to complete successfully. The task that first detected the purged condition provides an exception trace.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate why the task was purged. It was purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction, or by CICS issuing a purge request.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

When CICS purges a task, it does so to allow an operation to complete which would be held up by the presence of active tasks, or to ensure data integrity. For example, CICS will purge a task which has made recoverable updates to a coupling facility data table if it determines that the coupling facility data table server for the pool in which that table resides has recycled, to ensure that all updates in the unit of work will be backed out.

Modules: DFHBSM62 DFHBSS DFHBSSZ DFHBSTZ DFHBSTZV DFHBSTZ1 DFHBSTZ2 DFHTBSB DFHTBSBP DFHTBSD DFHTBDP DFHTBSL DFHTBSLP DFHTBSQ DFHTBSR DFHTBSRP DFHTBSSP DFHTCRP DFHTOASE DFHTOATM DFHTOLCR DFHTOLUI DFHTRZCP DFHTRZIP DFHTRZPP DFHTRZXP DFHTRZYP DFHTRZZP DFHZCQCH DFHZCQDL DFHZCQIQ DFHZCQIS DFHZCQRS DFHZCQ00 DFHMRXM DFH62XM

ATCI

Explanation: An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to module DFHRTSU. The module that detected the original error provides an exception trace, a console message and, possibly a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related message produced by the module that detected the original error.

Modules: DFHZSUP DFHMRXM DFH62XM

ATCJ

Explanation: This abend is issued by DFHZATA in the following circumstances:

- Transaction CATA is issued from a terminal
- The address of the AWE (TCAFCAAA) is 0
- The AWE is invalid (TCTWETYP should be TCTTEAWE)
- An abend is issued early in DFHZATA.

This abend is issued by DFHZATD in the following circumstances:

- Transaction CATD is issued from a terminal
- The address of the AWE (TCAFCAAA) is 0
- TCAFCAAA is an AWE and not a terminal
- An abend is issued early in DFHZATD.

This abend is issued by DFHZATR in the following circumstances:

- Transaction CATR is issued from a terminal
- An abend is issued early in DFHZATD.

System action: CICS rejects the request.

User response: Determine the issuing program and the reason for the abend and take the appropriate action as follows:

Do not try to invoke CATA, CATD or CATR from a terminal.

If the address in TCAFCAAA is incorrect, the calling mechanism has failed. This is a CICS logic error.

If an abend has been issued, use the transaction dump to determine where the abend occurred. This is a CICS logic error.

Modules: DFHZATA DFHZATD DFHZATR

ATCK

Explanation: An application program has issued a WRITE to a VTAM terminal specifying CCOMPL=NO without being authorized to do so.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Specify CHAINCONTROL in the transaction profile.

Modules: DFHZARQ

ATCL

Explanation: An error has occurred either during automatic journaling or automatic logging of terminal messages to or from this transaction. The message being logged will be one associated with an explicit READ or WRITE in the application program.

Problem determination: Register 12 addresses the current TCA and field TCAJCAAD and register 4 address the JCA. The log manager request is contained in JCATR2 and the response code is in JCAJCRC.

Possible request codes are:

X'8001' - WRITE
X'8003' - PUT

Possible response codes are:

X'01' - IDERROR - Journal identification error
X'02' - INVREQ - Invalid request
X'03' - STATERR - Status error
X'05' - NOTOPEN - Journal not open
X'06' - LERROR - Journal record length error
X'07' - IOERROR - I/O error.

The address of the TIOA is contained in register 8 and its data length is in TIOATDL.

Analysis:

Register	Label	Description
----------	-------	-------------

R4=@JCA	TCZARQPJ	JCAJCRC is nonzero.
---------	----------	---------------------

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Use the dump to ascertain why the journal or log record could not be written correctly. If a journal record length error is indicated, TIOATDL may have been corrupted.

Modules: DFHETL, DFHTPCM, DFHZARQ

ATCN

Explanation: An error has occurred during the automatic journaling or automatic logging of the initial input message of this transaction. This input message is the message that actually caused the transaction to be invoked.

Problem determination: Register 12 addresses the current TCA and field TCAJCAAD and register 4 address the JCA. The log manager request is contained in JCATR2 and the response code is in JCAJCRC.

Possible request codes are:

X'8001' - WRITE
X'8003' - PUT

Possible response codes are:

X'01' - IDERROR - Journal identification error
X'02' - INVREQ - Invalid request
X'03' - STATERR - Status error
X'05' - NOTOPEN - Journal not open
X'06' - LERROR - Journal record length error
X'07' - IOERROR - I/O error.

Analysis:

Register	Label	Description
----------	-------	-------------

R4=@JCA	TCZARQJP TCZSUPJW	JCAJCRC is nonzero. Journal error.
---------	----------------------	---------------------------------------

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Use the dump to ascertain why the log record could not be written correctly.

If a journal record length error is indicated, TIOATDL (X'08') may have been corrupted.

Modules: DFHZSUP DFH62XM DFHTFXM

ATCO

Explanation: An application program has attempted to perform a function not supported by a terminal or system.

Possible errors are:

1. SIGNAL not supported.

A DFHTC TYPE=SIGNAL request with the WAIT=YES option was issued to a VTAM logical unit that CICS does not support for the receipt of the SIGNAL indicator.

2. WRITE STRUCTURED FIELD not supported.

This write may have been attempted as a result of a SEND command with the STRFIELD keyword to a device that does not support this function.

3. APPC mapped conversation not supported.

The application has attempted to perform a normal terminal control command on a session that is in use for an APPC unmapped conversation. (Only EXEC CICS GDS commands are permitted.)

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Correct the application program.

Modules: DFHZARQ

ATCQ

Explanation: The application program issued a write operation to a terminal that was in send status. In order to allow this write to proceed, a signal command was sent, and DFHZCP started to read data from the terminal waiting for the change direction indication. As each data record is received, it is placed on temporary storage and, for one of these operations, a temporary storage error has occurred.

Problem determination: Register 12 addresses the current TCA. TCACCSV1 contains a saved copy of TCATSTR containing the temporary storage response code. The temporary storage response code may be one of:

X'04' - IOERROR - I/O error
X'08' - NOSPAC - No temporary storage space
X'20' - INVREQ - Invalid request.

The temporary storage identification is constructed by concatenating the character string "DFHQ" with the terminal identification from TCTTETI. The temporary storage identification is placed in TCATSDI.

Register 8 and field TCTTEDA address the TIOA that is being written to temporary storage. The address passed to temporary storage is that of TIOATDL.

Analysis: After the DFHTS TYPE=PUTQ, the temporary storage response code was not zero.

Register	Label	Description
----------	-------	-------------

R12=@TCA	ZRAQ60	TCATSTR is nonzero.
----------	--------	---------------------

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Check that temporary storage has been included in the system and that it has sufficient space.

If an invalid request is indicated, check that the length of the data being written to temporary storage is not greater than the VSAM control interval size minus 84. The length of the data is in TIOATDL (which is 8 greater than the length of the data that is read in by DFHZCP).

Modules: DFHZRAQ

ATCR

Explanation: An application program has issued a read operation, after a previous write operation has caused DFHZCP to read-ahead data from the terminal in order to avoid a lock-out. DFHZCP has now issued a DFHTS GETQ to retrieve the saved data from temporary storage, and an error has occurred.

Problem determination: Register 12 addresses the current TCA. TCACCSV1 contains a saved copy of TCATSTR that contains the temporary storage response code. The temporary storage response code may be one of:

X'01' - ENERROR - Entry error
X'02' - IDERROR - Identification error
X'04' - IOERROR - I/O error
X'20' - INVREQ - Invalid request

The temporary storage identification is constructed by concatenating the character string "DFHQ" with the terminal identification from TCTTETI. The temporary storage identification is placed in TCATSDI.

Analysis: After the DFHTS TYPE=GETQ, the temporary storage response code was not zero.

Register	Label	Description
----------	-------	-------------

R12=@TCA	ZRAR90	TCATSTR is not zero.
----------	--------	----------------------

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Determine the cause of the temporary storage error and correct it.

If a temporary storage identification error is indicated, examine TCTTETI for a valid terminal identification.

Modules: DFHZRAR

ATCS

Explanation: An application program attempted to send data to a logical unit after a SIGNAL data flow command with an RCD (request change direction) has been received. This condition arises when the application handles the IGREQCD exceptional condition incorrectly.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Handle the IGREQCD exceptional condition correctly.

Modules: DFHZARQ

ATCT

Explanation: An attempt to build a surrogate TCTTE to represent a remotely-owned terminal failed.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZSUP DFHMRXM DFH62XM

ATCU

Explanation: An application program attempted to send data to a logical unit, but was in receive mode (EIBRECV is set), and read-ahead queuing was not specified in installed profile definition (RAQ=NO).

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Either change the application program to issue receives until EIBRECV is not set, or specify RAQ=YES in the installed profile definition (If RAQ=YES is specified, ensure that all input messages are read before the transaction is terminated.)

Modules: DFHZARQ

ATCV

Explanation: An application attempted an operation on a logical unit, but was not in the correct mode for one of the following reasons:

1. When issued by DFHZARQ, CICS cannot perform the current request because another request is outstanding (EIBSYNC is set). This holds for APPC or non-APPC systems
2. When issued by DFHETL, the application is communicating with an APPC system, and is not in the correct state to perform the attempted operation. This holds for APPC systems only
3. When issued by DFHZISP, a TCTTE free was requested, and there is an outstanding sync point request. This holds for non-APPC systems only
4. When issued by DFHZISP, a TCTTE free was requested, the TCTTE is in receive mode, and RAQ=NO was specified in the installed profile definition. This holds for non-APPC systems only.

Problem determination: Register 12 addresses the current TCA. Register 10 and field TCAFCAAA address TCTTE. The terminal byte TCTTECRE has bit TCTEUCOM (X'02') set if sync point is required, and TCTEUFRT (X'04') set if Free Session is required; TCTESMDI has TCTEUSMD (X'02') set if the application is in SEND mode. TCTERCVI has TCTEURCV (X'01') set if the application is in RECEIVE mode. Bit TCTESRAQ (X'80') in byte TCTEIRAQ indicates that read-ahead queuing is coded on the installed profile definition for this transaction.

The type-of-request bits in the TCA are set as follows:

- TCATPOS1 TCATPIS (X'01') Signal requested.
 - TCATPFRE (X'03') Free TCTTE.
- TCATPOS2 TCATPORR (X'10') Receive requested.
 - TCATPOWR (X'01') Send requested.

Analysis:

Number	Label	Description
DFHZARQ		
1.	TCZAQW8	Attempting to receive when sync point or Free Session outstanding.
2.	TCZAQ2W	Attempting to send while in receive mode.
3.	ZARQNOPG	Issuing SIGNAL while in send mode.
DFHZISP		
4.	ZISPVTCK	Attempting to free session while sync point request is outstanding.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: The response depends on the reason for the error as follows:

1. Issue a sync point and then issue the request.

2. Issue the free request and reallocate the session.
3. Either change the application to issue receives until EIBRECV is not set, or specify RAQ=YES in the installed profile definition. (If you specify RAQ=YES in the installed profile definition, ensure that all input messages are read before the transaction is terminated.)
4. See the *CICS Distributed Transaction Programming Guide* where rules for the correct use of commands are given. Then correct the application.

The application program has attempted an operation on a logical unit that is invalid, because the program's current status on the session with that logical unit does not permit it. An investigation of the TCTTE (that is, Session), status bytes, and TCA type of request bytes will reveal which of the above problems are relevant.

When the cause of the problem has been ascertained, the application program should be changed to ensure that the session-oriented information is acted upon before any further requests are sent across that session. The session status information is made available to the application program in the exec interface block (EIB) immediately following the execution of RECEIVE, CONVERSE, or RETRIEVE requests across the session. The relevant bytes must be tested, strictly in the order shown, and acted upon, before any further operations are attempted on the session. In addition, the status information bytes themselves are necessarily volatile in that they are reset before the execution of every EXEC CICS... statement. Thus it is good programming practice to save them into application user storage after a RECEIVE, CONVERSE, or RETRIEVE for later testing. The states are:

1. **EIBSYNC**
the application must take a syncpoint
2. **EIBFREE**
the application must free the session (or terminate when the session will be freed automatically)
3. **EIBRECV**
the application must continue receiving data by issuing further RECEIVE commands; by definition, data cannot be sent while in this state.

Some of these status tests can sometimes be omitted (for example, testing of the EIBSYNC status is not essential if it is known that the application program on the remote system never issues sync point requests itself). However, the tests should always be carried out, particularly if the remote application might be amended at a future date, in which event the session handling logic may well be altered. Also, it may be that the remote transaction itself causes an unsuspected flow on the session. For example, if the remote program issues EXEC CICS SEND..... LAST across the session, followed by RETURN, a syncpoint request

(RQD2) will be added onto the transmitted data. (The application programmer is referred to the *CICS Distributed Transaction Programming Guide* for a discussion of this topic). As a result of this addition, an unsuspected syncpoint request is received by the local application, which abend if the session is freed without the sync point request being honored.

Note: An ATCV abend is also raised by module DFHETL if a state error occurs during processing of an APPC mapped application (that is, the program attempts to perform an operation while in the wrong state). The handling of APPC mapped applications is described in the *CICS Diagnosis Reference*. Some commands are processed by DFHZARQ, as above, and others by various other modules invoked by DFHETL. Rules for using commands for APPC are given in the *CICS Distributed Transaction Programming Guide*. Reference to this guide should reveal the programming error.

Modules: DFHETL, DFHZARQ, DFHZISP

ATCW

Explanation: The system has been generated without an installed profile definition for an LU6.1 or APPC session.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Notify the system programmer of the error.

Modules: DFHZSUP DFHMRXM DFH62XM

ATCX

Explanation: An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

An application program that issues terminal control requests after an ATCX abend may cause further problems.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related message produced by the domain that detected the original error.

Modules: DFHBSMIR, DFHBSMPP, DFHBSM62, DFHBSS, DFHBSTB, DFHBSTB3, DFHBSTC, DFHBSTZ, DFHBSTZB, DFHBSTZO, DFHBSTZR, DFHBSTZV, DFHBSTZ1, DFHBSTZ2, DFHBSZZS, DFHAPRT, DFHCRP, DFHQRY, DFHZARL, DFHZARQ, DFHZERH, DFHZGET, DFHZFRE, DFHZNAC,

DFHZRVS, DFHZSUP, DFHMRXM, DFH62XM
DFHZTSP, DFHZXST

ATCY

Explanation: An error has occurred during the processing of an inbound function management header (FMH). Either a length error has been detected, for example, incomplete FMH received, or an invalid field has been detected within the FMH.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Notify the system programmer of the error. The problem is probably in the remote system that has sent the invalid FMH.

If the inbound FMH is from a system with an earlier release of CICS then you may need to set USEDFTUSER. See 'Attach Time Security and the USEDFTUSER option' in chapter 12 of the *CICS RACF Security Guide*.

Modules: DFHZARQ, DFHZSUP DFHMRXM
DFH62XM

ATCZ

Explanation: An error (INVALID, DISASTER or EXCEPTION response) has occurred on the SET_NETWORK_IDENTIFIER call to the security domain as part of opening the CICS VTAM ACB (for example, EXEC CICS SET VTAM OPEN or CEMT SET VTAM OPEN). The domain that detected the original error provides an exception trace, a console message, and depending on the options specified in the dump table, a system dump.

System action: The task is abnormally terminated with a CICS transaction dump. The VTAM ACB is closed.

User response: Use the dump, the trace and the console message to diagnose and correct the original error. Retry the command when the earlier error is resolved.

Modules: DFHZSLS

ATC1

Explanation: The CICS terminal control restart task could not complete because a necessary step failed. The task has done some essential recovery operations and abnormally terminated itself with code ATC1.

System action: CICS writes a transaction dump for the terminal control restart task.

CICS sends two messages to the console, one to identify the error detected by the terminal control restart task, and DFHTC1001 to report that the task has failed. A third message follows either to say that CICS has terminated abnormally with a dump, or to ask you

to reply GO or CANCEL. Depending on the nature of the original error, you may see messages from some other system component (for example, an access method).

User response: First, if CICS has requested a response, you must reply. If you reply 'GO', CICS continues processing, but without terminal control. If you reply 'CANCEL', CICS terminates abnormally with a dump.

Use the messages and dumps to find out the cause of the failure.

Modules: DFHTCRP

ATC2

Explanation: A CICS SET VTAM OPEN command has failed due to VTAM rejecting a CICS request.

System action: Message DFHZA2302, DFHZA2304 or DFHZA2307 is sent to the console, and CICS terminates the transaction abnormally with a transaction dump.

User response: The RPL with the VTAM request code and return code can be found in the RA pool addressed from TCTVRVRA. Use the *VTAM Programming* manual, to determine the cause of the error and the actions necessary to correct it. After correcting the error, either retry the request or terminate CICS and restart the network in your own time.

Modules: DFHZSL

ATC3

Explanation: A write to a TLX device was issued with a data length of 0 causing TIOA data length (TIOATDL) to be zero.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response:

For an error writing to a TLX device correct the error in the user program by ensuring that a data length for data to be placed in the terminal input/output area (TIOA) is provided at write time.

Modules: DFHZARL DFHZARQ

ATC4

Explanation: A serious CAVM error has occurred. The XRF TCB has abended.

System action: CICS abnormally terminates with a system dump.

User response: Use the dump and the guidance in any messages issued by other system components to diagnose and correct the original error.

See the *CICS Problem Determination Guide* for further guidance on using system dumps.

Modules: DFHTCRP

ATC5

Explanation: An internal logic error has been detected during APPC mapped processing. The conversation state maintained by DFHZARL does not match the state which is jointly maintained by DFHETL and DFHZARM.

This problem could also arise when CICS is receiving application data. CICS may receive an end of chain notification before receiving all the data expected.

System action: The task is abnormally terminated with a CICS transaction dump. CICS processing continues.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHETL

ATC6

Explanation: DFHETL has a SEND DATA request with a data length greater than 65 528 bytes which is the maximum that it can process.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: This is a CICS internal logic error. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHETL

ATC7

Explanation: DFHZSUP has detected a bad response from an INITIAL-CALL request to DFHZARL. This response is returned to DFHZSUP in the DFHLUC parameter list.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Examine field LUCCDRCD in the DFHLUC parameter list. This appears in the ENTRY/EXIT trace points for DFHZARL. If trace is switched off, then it can be found in DFHZSUP's LIFO entry in the transaction dump.

- LUCCDRCD = 'A0000100' - session failure
- LUCCDRCD = 'A0010100' - read timeout
- LUCCDRCD = 'A0010000' - deadlock timeout.

(The offset for LUCCDRCD can be found in *CICS Data Areas*).

If LUCCDRCD is X'00000000', the error is the result of a connection failure. In this case examine the CSMT log for further diagnostic information.

Modules: DFHZSUP

ATC8

Explanation: An error has occurred during the processing of an inbound function management header (FMH). Either a length error has been detected, for example, incomplete FMH received, or an invalid field has been detected within the FMH.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Notify the system programmer of the error. The problem is probably in the remote system that has sent the invalid FMH.

Modules: DFHETL

ATC9

Explanation: A DFHKC RESUME macro call has been issued for a task without first issuing DFHKC SUSPEND. DFHKC RESUME must be preceded by DFHKC SUSPEND.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Examine the trace entry to locate the error.

Modules: DFHZNCE

ATDC

Explanation: A transaction has issued an EXEC CICS READQ, WRITEQ or DELETEQ command against a logically recoverable transient data queue. The task was enqueued because another task currently owns the enqueue. While waiting to obtain the enqueue, the task was purged.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Investigate why the transaction was purged. It may have been purged via CEMT or automatically, by DTIMEOUT for example.

Modules: DFHETD

ATDS

Explanation: A deadlock timeout condition has been detected. This condition may occur within a transaction that specifies DTIMEOUT to be nonzero on its installed transaction definition. Deadlock timeout occurs when a transaction has been waiting or has been suspended for longer than the time specified in DTIMEOUT.

The abend is driven by the internal CICS event, ENQUEUE.

Analysis: The transaction receiving the ATDS abend must have been suspended after issuing an ENQUEUE request.

System action: The transaction is abnormally terminated. A dump is not provided (even if a dump table entry has been set up).

User response: The transaction should be reexecuted, and the situation causing the SUSPEND to occur may clear itself.

The ATDS abend is to be expected occasionally, unless DTIMEOUT is set to zero. No special action is necessary.

Modules: DFHTDB

ATDY

Explanation: Transient data initialization has failed. A console message, DFH12xx, gives the reason for the failure.

System action: Transient data initialization terminates abnormally. This abend is always followed by an ATDZ abend for the failing function, and by message DFHSI1521 (if CICS abends unconditionally), or message DFHSI1522, which prompts you to reply GO or CANCEL.

User response: See the associated console message for information regarding the cause of the failure. Then respond to message DFHSI1522, if it has been issued.

Modules: DFHTDRP

ATDZ

Explanation: A CICS function invoked by transient data initialization has failed. If the failing function is a transient data routine, this abend is preceded by a console message and an ATDY abend.

System action: Transient data initialization terminates abnormally. This abend is always followed by message DFHSI1521 (if CICS abends unconditionally), or message DFHSI1522, which asks you to reply GO or CANCEL.

User response: Refer to the associated console message for further information regarding the cause of the failure. Then respond to message DFHSI1522, if it has been issued.

Modules: DFHTDRP DFHTDB

ATD3

Explanation: The task has been purged, probably due to operator action such as a CEMT TASK PURGE command. The task might also have been purged as a result of CICS issuing a purge request.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Use the transaction dump to determine why the task was purged. In particular, if the purge was operator initiated, the dump should be useful in determining why this task needed to be explicitly purged.

Modules: DFHTDB

ATD9

Explanation: An incorrect response has been received from a call to the enqueue (NQ) domain during the processing of an ENQUEUE or a DEQUEUE request.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Examine the dump and any exception trace entries for further information. Since this is only used for internal enqueues, this abend indicates an error in CICS. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHTDB

ATFE

Explanation: A FREEMAIN request to the storage manager has failed while CICS was executing a CEDA CHECK or CEDA INSTALL command.

System action: CICS abnormally terminates the task with a transaction dump.

User response: Use the dump and any associated messages issued by the storage manager to investigate the FREEMAIN failure.

Modules: DFHTOUT1

ATGE

Explanation: A GETMAIN request to the storage manager has failed while CICS was executing a CEDA CHECK or CEDA INSTALL command.

System action: CICS abnormally terminates the task with a transaction dump.

User response: Use the dump and any associated messages issued by the storage manager to investigate the GETMAIN failure.

Modules: DFHTOUT1

ATMA

Explanation: The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The domain that first detected the purged condition will have provided an exception trace.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate why the task was purged. It was purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction, or by CICS issuing a purge request.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

When CICS purges a task, it does so to allow an operation to complete which would be held up by the presence of active tasks.

Modules: DFHTMP

ATMB

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error will have provided an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related message from the domain that detected the original error.

Modules: DFHTMP

ATNA

Explanation: A terminal operator entered the transaction identification for NACP.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Do not reenter the NACP transaction identification (CSNE).

Modules: DFHZNAC

ATNB

Explanation: The application program has issued a terminal control request for a terminal for which a previous request was terminated with an abend AZCT, because of a read timeout condition. The terminal

control blocks are not in a fit state to allow a new request to be processed.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Change the application program to issue an abend when handling an abend AZCT.

Modules: DFHZARQ

ATNC

Explanation: The application program has issued a terminal control request for a terminal for which a previous terminal control request was terminated with an abend ATCH, because the task was purged. The terminal control blocks are not in a fit state to allow a new request to be processed.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Change the application program to issue an abend when handling an abend ATCH.

Modules: DFHZARQ

ATND

Explanation: The node error program (NEP) or NACP decides that a task should abnormally terminate, but the task is at a critical point of processing and immediate termination would put the integrity of the system at risk.

System action: The task is abnormally terminated with a CICS transaction dump when the task next requests any action against the terminal, or issues a sync point request involving the terminal.

User response: Check destination CSMT for possible further information. Use the dump to determine why the task was abnormally terminated by NEP.

Modules: DFHZARQ, DFHZARL, DFHZSUP

ATNI

Explanation: There are two forms of this abend:
VTAM form

The node error program (NEP) or NACP decides the task should be abnormally terminated. DFHZNAC informs the request module to abend the transaction after the TC unit has completed.

Non-VTAM form

The terminal error program (TEP) or terminal abnormal condition program (TACP) decides the task should be abnormally terminated. DFHTACP informs DFHZARQ to abend the transaction after the TC unit has completed.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: This usually occurs when, due to a hardware failure, a network device rejects the data stream sent to it. The device itself may indicate an error code that will give a specific reason for the rejection. Check the CSMT log for further information.

This abend can also result from an error in a connected system such as a mirror transaction abend.

Abend ATNI can occur if a user application does not correctly handle an error return code from an external resource manager, such as DB2.

For the NEP (VTAM) form, run a VTAM trace type=BUF for the logical unit and repeat the error.

For the TEP (non-VTAM) form, run a link trace for the line or local channel address for the device.

Examine the data stream and error response to determine the cause of the error.

This type of error occurs if the definitions in the TCT do not match the attributes of the actual device.

Modules: DFHZARL, DFHZARM, DFHZARQ, DFHZRAQ, DFHZSUP

ATOA

Explanation: You have attempted to invoke the CESC transaction with a terminal as principal facility. This is not allowed.

System action: CICS terminates the CESC transaction. No dump is produced.

User response: Ensure that the CESC transaction is not run against a terminal.

Modules: DFHCESC

ATOB

Explanation: CICS has received an abnormal response from an EXEC CICS START TRANSACTION(CESC) request. This is caused by an internal error.

System action: CICS terminates the CESC transaction with a dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCESC

ATOC

Explanation: CICS has received an abnormal response from a request to DFHZCUT to timeout a local userid table (LUIT). This is caused by an internal error in DFHZCUT.

System action: CICS terminates the CESC transaction with a dump.

User response: You need further assistance from IBM

to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCEC

ATOD

Explanation: CICS has received an abnormal response from an EXEC CICS CANCEL TRANSACTION(CEC) request.

System action: CICS terminates the CEC transaction with a dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCEC

ATOE

Explanation: CICS cannot determine the time at which an XRF takeover began.

System action: CICS terminates the CEC transaction with a dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCEC

ATOF

Explanation: CICS has received an abnormal response from an EXEC CICS DELAY TRANSACTION(CEC) request.

System action: CICS terminates the CEC transaction with a dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCEC

ATOG

Explanation: CICS has received an abnormal response from an EXEC CICS START TRANSACTION(CEGN) request. This is caused by an internal error.

System action: CICS terminates the CEGN transaction with a dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCEC

ATOH

Explanation: An attempt has been made to invoke the CEC transaction with an invalid function code. The CEC transaction should only be invoked by CICS. Valid codes are TERM_TIMEOUT, XRF_TIMEOUT, and ENABLE_TIMEOUT.

The most likely cause of this error is an invalid attempt by a user to invoke CEC.

System action: CICS terminates the CEC transaction with a transaction dump.

User response: Determine how CEC was invoked. If it was invoked by CICS, you will need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCEC

ATOT

Explanation: An error has occurred in the invocation of the CEGN transaction. CEGN has issued an EXEC CICS RETRIEVE command to retrieve the CEGN parameter list. Either the EXEC CICS RETRIEVE command has failed or it has succeeded but the retrieved data is invalid.

The most likely cause of this error is an invalid attempt by a user to invoke CEGN (for example, from a terminal or via an EXEC CICS START request).

System action: CICS terminates the CEGN transaction with a transaction dump.

User response: Determine how CEGN was invoked. If it was invoked by CICS, you will need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCEGN

ATOU

Explanation: The CEGN transaction has attempted to issue an EXEC CICS RETURN but the command has failed.

System action: CICS terminates the transaction with a dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCEGN

ATOV

Explanation: The CEGN transaction has attempted to issue an EXEC CICS GETMAIN, ASSIGN, or SEND but the command has failed.

System action: CICS terminates the transaction with a dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCEGN

ATPA

Explanation: An error occurred when trying to estimate the length of a CICS message owned by the message domain.

System action: CICS terminates the transaction with a dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHTPR.

ATPB

Explanation: An error occurred when trying to retrieve a CICS message from the message domain.

System action: CICS terminates the transaction with a dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHTPR.

ATPC

Explanation: An error occurred when trying to estimate the length of a CICS message owned by the message domain.

System action: CICS terminates the transaction with a dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHTPQ.

ATPD

Explanation: An error occurred when trying to retrieve a CICS message from the message domain.

System action: CICS terminates the transaction with a dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHTPQ.

ATPE

Explanation: The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The task that first detected the purged condition will have provided an exception trace.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate why the task was purged. It was purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction, or by CICS issuing a purge request.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

When CICS purges a task, it does so to allow an operation to complete which would be held up by the presence of active tasks.

Modules: DFHTPQ, DFHTPR.

ATPF

Explanation: An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error will have provided an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related message produced by the domain that detected the original error.

Modules: DFHTPQ, DFHTPR.

ATRA

Explanation: The field engineering global trap exit program, DFHTRAP, requested task abnormal termination. However, the currently active task was **not** a system task (for example, task dispatcher) and it was not about to abend.

System action: CICS disables the trap exit so that it will not be reentered, and terminates the currently active task abnormally.

User response: This is a user-requested task abend.

If you want to use the trap again, you must reactivate it as follows:

```
CSFE DEBUG,TRAP=ON
```

You should use the global trap exit only in consultation with an IBM support representative.

Modules: DFHTRP

ATSA

Explanation: The transaction CTSD was attached other than by an internal request from the TS domain.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Investigate why the CTSD transaction was started. This transaction is intended for CICS internal use only and should not be started by a user or from a terminal.

Modules: DFHTSDQ

ATSB

Explanation: The transaction CTSD was attached with invalid parameters.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHTSDQ

ATSC

Explanation: The task was canceled during execution of a temporary storage command.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Investigate the reason the task was canceled. The task has been canceled by the master terminal operator or automatically by either the deadlock timeout (DTIMEOUT) mechanism or the read timeout (RTIMOUT) mechanism.

Modules: DFHEITS, DFHICP, DFHTSP

ATSD

Explanation: An INVALID or DISASTER response was received from a request to the Temporary Storage (TS) Domain.

System action: The transaction is terminated with a CICS transaction dump.

User response: There has been an earlier failure which lead to the response from TS. Investigate the earlier failure (which is accompanied by a console message and a system dump).

Modules: DFHEITS, DFHICP, DFHTSP

ATSP

Explanation: A task has attempted to issue a WRITEQ TS request for a recoverable TS queue that has already been deleted in the same unit of work.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Correct the application to avoid issuing a WRITEQ TS request to a recoverable queue in a unit of work in which the queue has already been deleted.

Modules: DFHEITS, DFHTSP

ATSQ

Explanation: A move of data to or from temporary storage has failed. The probable reason is that the size of the area being passed to CICS is inconsistent with the data length being used.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Identify the failing temporary storage request in the application and verify whether the length supplied on the request agrees with the data area size. Correct the application as appropriate.

Note: If the error occurs in DFHTSP and not in DFHEITS, there is probably an internal logic error in temporary storage. In this case you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHEITS

ATSU

Explanation: A DISASTER response caused by an # IOERR was received from a request to the temporary # storage (TS) domain.

System action: The transaction is terminated with a # CICS transaction dump.

User response: There has been a failure during the

creation of a temporary storage record. The likelihood
is that an IOERR occurred during the buffer
preparation prior to the new record being added to it.
It is recommended that the queue be deleted to avoid
future references to the failed record.
Module: DFHEITS, DFHTSP, DFHICP

ATUF

Explanation: Insufficient space exists to build the

Abend codes AUxx

AUEL

| **Explanation:** Internal logic error in CICS user exit
| management. This arises when an attempt to obtain or
| release the lock on the chain of EPB's fails
| unexpectedly.
| **System action:** The task is abnormally terminated
| with a CICS transaction dump.
| **User response:** You need further assistance from IBM
| to resolve this problem. See Part 4 of the *CICS Problem*
| *Determination Guide* for guidance on how to proceed.
| **Module(s):** DFHUEM, DFHERM.

AUEP

Explanation: The task has been abnormally terminated
because a return code of UERCPURG has been sent to

Abend codes AWxx

AWBB

| **Explanation:** The incoming parameter list to the CICS
| Web Business Logic Interface program is not in the
| expected format. At present, the structure is assumed to
| be fixed and only a single version level is recognized.
| **System action:** The CICS Web Business Logic Interface
| program is not executed.
| **User response:** Ensure that the program receives a
| parameter list in the correct format.
| **Module(s):** DFHWBBLI

AWBC

Explanation: No commarea was passed to a CICS Web
Interface utility program. One of the utility programs
supplied with the CICS Web Interface was executed,
but the commarea that was passed was absent or was
too short to contain valid information.

System action: The CICS Web Interface utility is not
executed.

User response: Ensure that the program passes a
commarea that is long enough to contain the expected

parameter list for the DYNALLOC SVC.

System action: The task is abnormally terminated and
a dump is taken.

User response: You need further assistance from IBM
to resolve this problem. See Part 4 of the *CICS Problem*
Determination Guide for guidance on how to proceed.

Modules: DFH99KO

the User Exit Handler by a User Exit Program. The
value of UERCPURG is defined by the macro
DFHUEXIT TYPE=EP, ID=xxxxxxx, where xxxxxxx is
the exit point by which the exit program is enabled.
This code does not apply to exit points in domains. The
exit program returns this value when it has made a
request for CICS services using the exit programming
Interface (XPI) and when the XPI call has had a
RESPONSE code of PURGED. Exit programs must not
set UERCPURG return code under any other
circumstance.

System action: The task is abnormally terminated
with a CICS transaction dump.

User response: Refer to the *CICS Customization Guide*
for the use of this return code.

Module(s): DFHUEH

parameters for the utility you are invoking.

Module(s): DFHWBENV, DFHWBTL

AWBE

| **Explanation:** The CICS Web Interface detected that a
| Converter program attempted to change the address of
| the response buffer when it was not allowed to do so.
| **System action:** The data in the new response buffer is
| not returned to the Web browser. A CICS transaction
| dump is taken.
| **User response:** The Converter program is only
| allowed to replace the response buffer if the
| converter_volatile flag in the Converter parameter list
| is set to '1'. Check that your Converter program is not
| trying to return a new response buffer when this flag is
| set to '0'.
| **Module(s):** DFHWBBLI

AWBF

Explanation: The CICS Web Interface alias detected an
error in its initialization. The alias was not started by
EXEC CICS START, or there was an error in the EXEC

CICS RETRIEVE command for the start data.

System action: If there is an error in EXEC CICS RETRIEVE, message DFHWB0103 is written to the CWBO destination. A CICS transaction dump is taken.

User response: If the alias was not started by EXEC CICS START, check if it is being started from a terminal. This is not allowed. Otherwise, see the associated message for guidance.

Module(s): DFHWBA

AWBH

Explanation: The CICS Web Interface alias detected a logic error.

System action: An exception trace entry 454F is written. Message DFHWB0106 is written to the CWBO destination. A CICS transaction dump is taken.

User response: Use related diagnostics to determine the user response.

Module(s): DFHWBA

AWBI

Explanation: The CICS Web Interface alias received an unexpected response from EXEC CICS ASSIGN STARTCODE

System action: An exception trace entry 4544 is written. Message DFHWB0102 is written to the CWBO destination.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module(s): DFHWBA

AWBJ

Explanation: The CICS Web Interface alias received an unexpected response when it switched to the RP TCB.

System action: An exception trace entry 454E is written. Message DFHWB0105 is written to the CWBO destination. A transaction dump is taken.

User response: See the associated message for guidance.

Module(s): DFHWBA

AWBK

Explanation: The CICS Web Interface alias detected an abend in the converter or the CICS program servicing the request.

System action: An exception trace entry 4550 is written. Message DFHWB0108 is written to the CWBO destination.

User response: Use related diagnostics to determine the user response.

Module(s): DFHWBA

AWBL

Explanation: The CICS Web Interface alias detected an error in an EXEC CICS LINK command for program DFHWBBLI.

System action: An exception trace entry 4543 is written. Message DFHWB0101 is written to the CWBO destination. A transaction dump is taken.

User response: See the associated message for guidance.

Module(s): DFHWBA

AWBM

Explanation: The CICS Web Interface alias detected error response from the Business Logic Interface program DFHWBBLI.

System action: Message DFHWB0101 is written to the CWBO destination. A transaction dump is taken.

User response: See the associated message for guidance.

Module(s): DFHWBA

AWBN

Explanation: The CICS Web Interface alias detected an error in an EXEC CICS LINK command for program DFHWBEP.

System action: Message DFHWB0101 is written to the CWBO destination. A transaction dump is taken.

User response: See the associated message for guidance.

Module(s): DFHWBA

AWBO

Explanation: The CICS Web Interface alias program has received a non-HTTP request for an HTTP service or a SSL request has been sent to a non-SSL TCPIP SERVICE.

System action: Message DFHWB0114 is written to the CWBO transient data destination and a transaction dump is taken. An exception trace entry, 4567, is also written.

User response: See the associated message for guidance.

Module(s): DFHWBA

AWBP

- | **Explanation:** The CICS Web Interface alias has detected that the application has started sending a chunked response over the socket but has not terminated the sequence of web send chunk commands with a zero length chunk.
- | **System action:** A transaction dump is taken.
- | **User response:** Check the application to see why the terminating chunk was not sent.
- | **Module(s):** DFHWBA

AWBQ

- | **Explanation:** The CICS Web Business Logic Interface program detected an error in its parameter list.
- | **System action:** If the abend was issued from the Business Logic Interface program, DFHWBBLI, an exception trace entry '4581' is made and message DFHWB0119 is written to the CWBO transient data destination. If the abend was issued from the Web Interface program, DFHWBA1, an exception trace entry '4560' is written and message DFHWB0124 is sent to the CWBO destination. A transaction dump is taken.
- | **User response:** See the associated message for guidance.
- | **Modules:** DFHWBA1, DFHWBBLI

AWBR

- | **Explanation:** The CICS Web Business Logic Interface program detected a logic error.
- | **System action:** If the abend was issued from the Business Logic Interface program, DFHWBBLI, an exception trace entry '4583' is made and message DFHWB0118 is written to the CWBO transient data destination. If the abend was issued from the Web Interface program, DFHWBA1, an exception trace entry '4558' is written and message DFHWB0123 is sent to the CWBO destination.
- | **User response:** Use related diagnostics to determine the user response.
- | **Modules:** DFHWBA1, DFHWBBLI

AWBU

Explanation: The CICS Web Interface connection manager could not get storage to send a message to the terminal.

System action: Processing continues.

User response: Use related diagnostics to determine the user response.

Modules: DFHWBC01

AWBV

Explanation: The CICS Web Interface connection manager detected an error response on EXEC CICS DEQ.

System action: An exception trace entry 4345 is written. Message DFHWB1651 is written to the CWBO destination.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

| **Modules:** DFHWBC04

AWBX

Explanation: The CICS Web Interface connection manager was started against an invalid terminal type.

System action: An exception trace entry 4308 is written. Message DFHWB1522 is written to the CWBO destination.

User response: See the associated message for guidance.

| **Modules:** DFHWBC01

AWBZ

Explanation: The CICS Web Interface connection manager detected a NOTAUTH response to EXEC CICS EXTRACT EXIT.

System action: Message DFHWB1902 is written to the CWBO destination.

User response: See the associated message for guidance.

| **Modules:** DFHWBC0B

AWB2

| **Explanation:** The CICS Web Interface has encountered an error while performing a transaction attach call for the alias task.

| **System action:** Message DFHWB0727 describing the error is written to the CWBO transient data destination and a trace entry is made.

| **User response:** See the associated message for guidance.

| **Modules:** DFHWBXN

AWB3

| **Explanation:** CICS Web transaction, CWXN, has been illegally started either with data, or by a user at a terminal, with the wrong start code.

| **System action:** The CICS Web Interface is not started.

| **User response:** CICS Web Transaction Execution should only ever be started by Sockets Domain using DFHXMAT ATTACH, not by a user at a terminal or with data.

| **Modules:** DFHWBXN

AWB4

| **Explanation:** The CICS Web Transaction Execution has received a bad response from an INQUIRE_TRANSACTION call to determine the start code for the CWXN transaction.

| **System action:** The CICS Web Interface is not started.

| **User response:** CICS Web Transaction Execution should only ever be started by Sockets Domain using DFHXMAT ATTACH, not by a user at a terminal or with data.

| **Modules:** DFHWBXN

AWB5

Explanation: The CICS Web Interface Server Controller could not continue with enable processing because the requested port is not available.

System action: An exception trace entry 4106 is written, and message DFHWP0131 is issued.

User response: Terminate the TCP/IP application which is using the requested port, and use CBWB to enable the feature again, or use CWBC to enable the CICS web Interface using a different port number.

Modules: DFHWBWM

AWB7

Explanation: The CICS Web Interface environment variables program was invoked, but the invoking transaction does not appear to be executing in a valid Web environment.

System action: The program writes an exception trace point 4623.

User response: Determine how the environment variables program was invoked. It is only meaningful to execute the program from a transaction that has been initiated from the Web, either through the CICS Web Interface or through the Business Logic Interface.

Modules: DFHWBENV

AWB8

| **Explanation:** The CICS Web Interface environment garbage collection task CWBG has been started directly from a terminal. This is not permitted.

| **System action:** The transaction is abnormally terminated with a transaction dump.

| **User response:** None.

| **Modules:** DFHWBGB

AWB9

Explanation: The CICS Web Interface connection manager failed due to lack of storage.

System action: A transaction dump is taken.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHWBC01

AWC1

| **Explanation:** The CICS Web Interface 3270 bridge exit DFHWBLT could not establish a partnership with the Web terminal translation task which started the abended transaction.

| **System action:** An exception trace entry 4106 is written, and message DFHWP0131 is issued.

| **User response:** Use related diagnostics to determine the user response.

| **Modules:** DFHWBLT

AWC2

| **Explanation:** The CICS Web Interface 3270 bridge exit DFHWBLT was passed an invalid state token by attach processing.

| **System action:** An exception trace entry 410C is written, and message DFHWP0130 is issued.

| **User response:** Use related diagnostics to determine the user response. On a busy CICS region, the most likely cause is that the bridged transaction started after the state data had been discarded by Web 3270 garbage collection process.

| **Modules:** DFHWBLT

AWC3

| **Explanation:** An application using the CICS Web 3270 function issued an unsupported combination of BMS and Terminal Control commands.

| **System action:** An exception trace entry is written.

| **User response:** Use related diagnostics to determine the user response.

| **Modules:** DFHWBLT

AWC4

Explanation: The CICS Web Interface 3270 bridge exit DFHWBLT has been reinvoked after returning an earlier error.

System action: An exception trace entry is written.

User response: Use related diagnostics to determine the user response.

Modules: DFHWBLT

AWC5

Explanation: The CICS Web Interface 3270 bridge exit DFHWBLT abended during attach processing because it could not getmain a brxa user area.

System action: Message DFHWB0132 is issued, and an exception trace entry 410D is written.

User response: Use related diagnostics to determine the user response. The most likely cause of this abend is that CICS is having storage problems.

Modules: DFHWBLT

AWC6

Explanation: The CICS Web Interface 3270 bridge exit DFHWBLT has detected an inconsistency in its request parameters or state data.

System action: Message DFHWB0133 is issued, and an exception trace entry is written.

User response: Use related diagnostics to determine the user response. The most likely cause of this abend is a storage overwrite.

Modules: DFHWBLT

AWC7

Explanation: CICS detected an error during transaction initialization for a CICS Web alias transaction.

System action: Message DFHWB0360 is issued. No transaction dump is taken for this abend.

User response: Use related diagnostics to determine the user response. The most likely cause of this abend is an invalid userid being passed to CICS by the CICS Web Interface Analyzer user replaceable module. The userid is invalid if:

- It is not defined in the external security manager
- It is revoked
- It is not authorized to access this CICS region

Modules: DFHWBXM

AWC8

Explanation: CICS detected an error during transaction initialization for a CICS Web alias transaction.

System action: A transaction dump is taken for this abend.

User response: Use related diagnostics to determine the user response.

Modules: DFHWBXM

AWKY

Explanation: A request to PURGE or WRITE a record using the global catalog during warm keypointing has failed.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check for problems with the global or local catalog. See any DFHCC $nnnn$ messages issued by the CICS catalog domain for further guidance.

Modules: DFHWKP

AWSC

Explanation: A container which is required by a SOAP Feature pipeline stage was not found.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check that user-written programs in earlier pipeline stages use the correct containers.

Modules: DFHWSPMI,DFHWSPMO

AWSH

Explanation: A BTS activity that represents a stage in the SOAP Feature pipeline was found by the pipeline manager to be in an incorrect state.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check that user-written programs in earlier pipeline stages use the correct BTS protocols.

Modules: DFHWSPMI,DFHWSPMO

AWSL

Explanation: The SOAP Feature inbound pipeline manager could not link to the message adapter.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check previous CICS messages to determine why the message adapter could not be linked to.

Modules: DFHWSPMI

AWSN

Explanation: An EXEC CICS DEFINE COUNTER or EXEC CICS GET COUNTER command has returned a bad response.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check the options table DFHNCOPT for possible errors. Look in the CICS job log for any AXMSCnnnn messages.

Modules: DFHWSDSH

AWSP

Explanation: An application making a Web Service request passed a SOAPAction HTTP request header exceeding 256 bytes in length to the SOAP Feature pipeline.

System action: The task is abnormally terminated.

User response: Check that SOAPAction headers exceeding 256 bytes in length are not constructed by applications invoking Web Services.

Modules: DFHWSRT

AWSQ

Explanation: This is normal behavior when a user stage of the pipeline abends.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Correct the user abend.

Modules: DFHWSPMI

AWSR

Explanation: Either the TARGET-URI or the REQUEST-BODY container was not found when an application invoked the SOAP Feature pipeline to make a Web Service request.

System action: The task is abnormally terminated

Abend codes AXxx

AXFA

Explanation: The key length for a file control request that is to be sent to a remote system has to be obtained from the file control table, and has proved to be zero.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Ensure that the key length has been defined either in the remote file definition that is being

with a CICS transaction dump.

User response: Check that the application making the Web Service request supplies the required containers.

Modules: DFHWSRT

AWSS

Explanation: The SOAP Feature service provider pipeline was requested to invoke the message adapter under a different transaction ID or user ID to the pipeline, but was unable to satisfy the request.

System action: The task is abnormally terminated.

User response: Check that transaction ID and user ID requested are valid, and that the user ID with which the pipeline is running is a surrogate of the requested user ID.

Modules: DFHWSPMI

AWST

Explanation: The HTTP or WebSphere MQ transport stage of the SOAP Feature pipeline has encountered an input or output error.

System action: The task is abnormally terminated.

User response: Use CICS or WebSphere MQ messages to help you determine the cause of the problem. The error may be transient, in which case you can retry.

Modules: DFHWSTOH

AWSU

Explanation: An invalid URI was passed to the SOAP Feature requester pipeline as the location of a Web Service provider.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check that applications making Web Service requesting specify valid URIs for locations of Web Service providers.

Modules: DFHWSRT

used, or as a length option from the application program that is using it.

Modules: DFHXFP

AXFB

Explanation: An unacceptable function management header (FMH) type has been found. It must be type 05, type 06, or type 43.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHXFP

AXFC

Explanation: The request passed to the data transformation program is unknown to CICS. This abend can also occur in an MRO/IRC system as a result of an invalid EXEC CICS START request issued from the user's node error program (DFHZNEP).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the *CICS Customization Guide* for restrictions on the use of EXEC CICS commands from within an NEP. If this is not the cause of the abend, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHXFP

AXFD

Explanation: The request that is passed to the data transformation program cannot be sent to a remote system; for example, a storage control request.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHXFP

AXFE

Explanation: The transformation requested does not exist; for example, a DL/I schedule reply is not recognized by the outbound request processor in the data transformation program.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHXFP

AXFF

Explanation: An unacceptable queue organization has been found in a queue model function management header (FMH).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHXFP

AXFG

Explanation: An unacceptable argument number has been found in the data following a function management header (FMH) of type 43.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHXFP

AXFH

Explanation: The argument number in the data following a function management header (FMH) of type 43 is acceptable, however, the argument itself is not expected.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHXFP

AXFI

Explanation: The data length for a WRITEQ TD or READQ TD, which is determined from the destination control table, is zero. The abend can also occur when determining the length for file control requests from the file control table.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Notify the system programmer.

Modules: DFHXFP

AXFJ

Explanation: The error code held in UIBFCTR and UIBDLTR cannot be converted to an equivalent SNA error code.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHXFP

AXFL

Explanation: Transformers 2 and 4 expect to receive a function management header (FMH), possibly followed by user data. A null chain of data has been received.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHXFP

AXFM

Explanation: The ISCINVREQ condition has been raised. This can happen when the resource proves to be on yet another remote system, that is, when daisy-chaining is active.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check that daisy-chaining of requests is intended and that all relevant intersystem links are in service.

Modules: DFHXFP

AXFO

Explanation: The check on the DS and DBA parameters in an attach function management header (FMH) has failed. This abend represents a user error resulting from a mismatch in the system definitions for both ends of an intersystem link.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Notify the system programmer.

Modules: DFHXFP

AXFP

Explanation: CICS requires a second function management header (FMH) to follow an attach FMH. No second FMH was received.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Notify the system programmer.

Modules: DFHXFP

AXFQ

Explanation: Either the function management header (FMH) just received is too short or too long to be a valid FMH, or an expected FMH is not present.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check that the transaction profile parameter, INBFMH, is set to ALL. If communicating across a distributed program link, ensure that the requested function is supported on the partner system.

Modules: DFHXFP

AXFR

Explanation: The CICS command level interface imposes a maximum length of 32 767 for data. The length of the data just received exceeds this limit.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Notify the system programmer.

Modules: DFHXFP

AXFS

Explanation: A PSB has been scheduled successfully. However, the maximum possible length of an I/O area exceeded 65 535. This abend is likely to occur if path calls are used to retrieve large segments, and/or if FLS causes excessive expansion of segments.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Notify the system programmer.

Modules: DFHXFP

AXFT

Explanation: An estimate of the size of the output I/O area has been made, and it exceeds the maximum possible size of 65 535.

Note: While the estimated size may exceed the actual size, the difference will only be a few bytes.

This abend is likely to occur if a database calls, inserts, or replaces multiple segments, and many qualified segment search arguments are specified.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Notify the system programmer.

Modules: DFHXFP

AXFU

Explanation: A two-level cursor is present in a function management header (FMH) relating to a linear (temporary storage) queue. However, these cursors are valid only for hierarchical queues that are not supported by CICS.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHXFP

AXFW

Explanation: An invalid length specification has been given in a CICS command-level request corresponding to one of the data variables.

The CICS-architected FMH is followed by zero or more self-describing data variables for each parameter specified.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check for an invalid or zero length specified in a CICS command-level request, or for data truncation in a user-written node error program (NEP).

Modules: DFHXFP

AXFX

Explanation: A function shipping request by an APPC link failed because

- the remote system does not support full syncpoint protocols, or
- the exchange log name sequence could have failed, resulting in a mismatch, or
- the request has not completed within the allocated time (10 seconds).

System action: CICS terminates the task abnormally.

User response: Check that the request was directed to the correct remote system, and that the remote system is set up to support full syncpoint protocols (synclevel 2).

Modules: DFHXFP

AXFY

Explanation: An APPC conversation failure has occurred when an attach between CICS systems was issued.

System action: The task is abnormally terminated with a transaction dump.

User response: Check the connection to the remote CICS system and try to reestablish it.

Modules: DFHXFP

AXF0

Explanation: A task has been purged due to lack of storage in a dynamic storage area (DSA).

System action: The task is abnormally terminated with a transaction dump.

User response: Try the transaction again later.

If the short-on-storage condition persists, consider increasing the size limit of the CICS DSAs. You can vary the DSAs dynamically using the DSALIM and EDSALIM parameters on the CEMT master terminal command.

Modules: DFHXFP

AXF1

Explanation: The storage manager module, DFHSMGE, has returned a condition not expected by DFHXFP.

System action: The task is abnormally terminated with a transaction dump.

User response: Look for any related CICS messages and abends to determine if there has been a prior failure in CICS storage.

Modules: DFHXFP

AXF2

Explanation: A task has been purged due to lack of storage in the DSA.

System action: The task is abnormally terminated with a transaction dump.

User response: Try the transaction again later.

If the short-on-storage condition persists, increase the size of the dynamic storage area using the DFHSIT DSA parameter.

Modules: DFHXFP

AXF3

Explanation: The storage manager module DFHSMMC has returned a condition not expected by DFHXFP.

System action: The task is abnormally terminated with a transaction dump.

User response: Look for any related CICS messages and abends to determine if there has been a prior failure in CICS storage.

Modules: DFHXFP

AXF4

Explanation: The task was purged before a GET_BUFFER request to the EXEC interface service routines module (DFHEISR), was able to complete successfully. The domain that first detected the purged condition provides an exception trace.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate why the task was purged. It was purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Modules: DFHXFX

AXF5

Explanation: An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to the EXEC interface service routines module (DFHEISR). The domain that detected the original error provides an exception trace, a console message, and possibly, a system dump (depending on the options specified the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related message from the domain that detected the original error.

Modules: DFHXFX

AXF8

Explanation: A keyword such as TOKEN, CONSISTENT, REPEATABLE, UNCOMMITTED, or NOSUSPEND has been specified on a file control command for shipping to a system which does not support these functions.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Ensure that CICS in the file-owning region is at the correct level.

Modules: DFHXFX

AXGA

Explanation: Program DFHAPCR has returned an unexpected response. DFHAPCR performs the following functions:-

- Extracts the contents of all containers making up a channel and transmits them to a remote system.
- Recreates the channel and containers from inbound data received from a remote system.

DFHAPCR has either detected an error in inbound data or has received an unexpected response whilst extracting or recreating channel data.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Look for any related CICS messages and abends to determine if there has been a prior failure in Program Manager, which manages containers. Look for exception trace entries from Program Manager or DFHAPCR to determine the cause of the error.

Modules: DFHXFX,DFHXFP

AXMA

Explanation: An error has occurred obtaining a lock within the transaction manager domain.

System action: The recovery routine of the module in control is invoked which issues message DFHXM0002 with a system dump. DFHXM0002 reports the module in control at the time of the error.

User response: See the description of message DFHXM0002 for further guidance.

Modules: DFHXMAT, DFHXMBD, DFHXMCL, DFHXMDD, DFHXMFD, DFHXMLD, DFHXMQD, DFHXMST, DFHXMTA, DFHXMxD, DFHXMxE

AXMB

Explanation: An error has occurred releasing a lock within the transaction manager domain.

System action: The recovery routine of the module in control is invoked. This routine issues message DFHXM0002 with a system dump. DFHXM0002 reports the module in control at the time of the error.

User response: See the description of message DFHXM0002 for further guidance.

Modules: DFHXMAT, DFHXMBD, DFHXMCL, DFHXMDD, DFHXMFD, DFHXMLD, DFHXMQD, DFHXMST, DFHXMTA, DFHXMxD, DFHXMxE

AXMC

Explanation: An severe error has occurred allocating a unique transaction number to a new transaction.

System action: The recovery routine of the module in

control is invoked. This routine issues message DFHXM0002 with a system dump. DFHXM0002 reports the module in control at the time of the error.

User response: See the description of message DFHXM0002 for further guidance.

Modules: DFHXMAT, DFHXMXE

AXMD

Explanation: An attempt has been made to run the CICS internal task CSXM as a user transaction.

System action: CICS terminates the task with a transaction dump.

User response: Investigate why the attempt was made to run CSXM as a user transaction.

Modules: DFHXMAB

AXMU

Explanation: During transaction attach the userid that had been assigned to the transaction was found to be invalid.

System action: CICS terminates the task with a transaction dump.

User response: Determine how the invalid userid had been assigned to the transaction. It might have been output by a user-replaceable module.

Modules: DFHXMAT

AXMY

Explanation: During transaction attach an unexpected error occurred obtaining transaction class membership.

System action: The transaction is no longer considered for class membership. It is then abnormally terminated with a CICS transaction dump.

User response: Use the dump to determine why the transaction failed to obtain membership of its transaction class.

Modules: DFHXMAT

AXMZ

Explanation: A serious failure in another component has been detected by the transaction manager domain.

System action: The task in control is abnormally terminated with a transaction dump. Further diagnostics should have been taken by the failing component.

User response: Look for earlier messages identifying the source of the problem. Refer to the descriptions of these messages for further guidance.

Modules: DFHXMAT

AXSA

Explanation: The CICS security control task could not complete because a necessary step failed. The task has done some essential recovery operations and abnormally terminated itself with code AXSA.

System action: CICS writes a transaction dump for the security control restart task.

CICS sends messages to the console, one to identify the error detected by the security control task, and, if the error occurred during initialization, one to say that security initialization or CEMT PERFORM SECURITY REBUILD has failed. A third message follows either to say that CICS has terminated abnormally with a dump, or to ask you to reply GO or CANCEL. Depending on the nature of the original error, you may see messages from some other system component (for example, an access method).

User response: First, if CICS has requested a response, you must reply. If you reply 'GO', CICS continues processing, but without support for the external security manager. CICS security still operates. If you reply 'CANCEL', CICS terminates abnormally with a dump.

Use the messages and dumps to find out the cause of the failure.

Modules: DFHXS MN

AXSC

Explanation: The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The task that first detected the purged condition will have provided an exception trace.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate why the task was purged. It was purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Modules: DFHXS MN

AXSD

Explanation: An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related message produced by the domain that detected the original error.

Modules: DFHTCRP

AXTA

Explanation: The calculation of the length of data to be shipped has failed.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHXTTP

AXTB

Explanation: An attempt to obtain a TIOA to ship data has failed.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHXTTP

AXTC

Explanation: An attempt to transform data ready for shipment has failed.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHXTTP

AXTD

Explanation: No TIOA received message was received from a remote system.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHXTTP

AXTE

Explanation: Incorrect data was received from a remote system. The data was not long enough.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHXTTP

AXTF

Explanation: No relay process function management header (FMH) was received from the remote system.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHXTTP

AXTG

Explanation: Transformation of data received from remote system failed.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check that the reason for failure of the transformation process was not incorrect definition of the remote terminal. In particular check that the user area length specified for the terminal is the same in both local and remote systems. If the terminal definitions are correct, you need further assistance to resolve this problem. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHXTTP

AXTH

Explanation: An attempt to locate terminal identifier failed.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHXTP

AXTI

Explanation: The major request byte LUCOPN0 of the DFHLUC parameter list specified to the transaction-routing transformer is invalid, or corresponds to a request that is not shipped to a remote system. The parameter list will be found in the dynamic storage of XTP's caller and may be located using the output from auxiliary trace.

System action: The task is abnormally terminated with a transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHXTP

AXTJ

Explanation: An unexpected combination of bit settings in the fields XTSSTAT and XTSTCOPC in the parameter list of the transaction-routing transformer was made.

System action: The task is abnormally terminated with a transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHXTP

AXTK

Explanation: An APPC conversation failure occurred when an attach between CICS systems was issued.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check the connection to the remote CICS system and try to reestablish it.

Modules: DFHXTP

AXTL

Explanation: The processing of APPC mapped data requires the generation of an APPC attach FMH with default values. In particular, the sync level requested is defaulted to 2. However, the session that is to be used has been bound with a sync level of 1.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check that:

- The entry in the TCT for the remote system has been defined with parallel sessions
- The remote system is capable of supporting a sync level of 2.

- Exchange lognames has completed for the connection. You can use the command CEMT INQUIRE CONNECTION to do this. See the *CICS Intercommunication Guide* for more details of the exchange lognames process.
- The correct sync level has been requested.

Modules: DFHXTP

AXTM

Explanation: An attempt has been made to route a message-protected transaction over an APPC link bound at sync level 1. The attempt has failed because such transactions can be routed only over an APPC link that has been bound at sync level 2.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: If the transaction is to be routed to CICS OS/2 (which is bound at synclevel 1), remove the message protection option. If the transaction is to be routed to another host system and message protection is required, the link must be redefined so that it can be bound at synclevel 2.

Modules: DFHXTP

AXTN

Explanation: Module DFHXTP detected that the application buffer chained off a TCTTE at offset TCTERCSA has a corrupted header. This is caused either by a CICS logic error or by a storage overwrite.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: This is a CICS internal logic error. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHETL

AXTO

Explanation: An exception response has been returned to the DFHXTP module from the CICS security manager. Prior to the call to the CICS security manager, the DFHXTP module detected that a shipped terminal definition had preset security. DFHXTP then invoked the CICS security manager in order to perform a preset security signon for the userid sent with the shipped terminal information. It is this preset security signon attempt which failed.

System action: The transaction routing request is terminated and a message is sent to the terminal owning region (TOR) to indicate that the transaction routing request has failed. The CICS security manager issues a DFHSNxxxx message to the transient data queue, CSCS.

User response: The most likely cause of this abend is that the terminal being shipped to the application owning region (AOR) has preset security with a userid which is not valid in the AOR. To confirm this, check the associated DFHSNxxxx message on the CSCS transient data queue in the AOR which gives the precise reason for the failure of the preset security signon request. This could be the result of an unauthorized transaction routing request.

Modules: DFHXTTP

AXTP

Explanation: An exception response has been returned to the DFHXTTP module from DFHCCNV FUNCTION(CONVERT_DS3270_FOR_SBCS). The module was called for a CICS client virtual terminal which requested conversion from ASCII to EBCDIC for data coming from the client. However, the conversion failed.

System action: The transaction routing request is terminated and a message is sent to the terminal owning region (TOR) to indicate that the transaction routing request has failed. The CICS security manager issues a DFHSNnnnnn message to the transient data queue, CSCS.

User response: Examine the response and reason returned in the DFHCCNV commarea DFHC32. The client and server codepages will have already been validated so this may be a CICS error. You may need to contact IBM for further assistance. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHXTTP

AXTQ

Explanation: An exception response has been returned to the DFHXTTP module from DFHCCNV FUNCTION(CONVERT_DS3270_FOR_SBCS). The module was called for a CICS client virtual terminal which requested conversion from EBCDIC to ASCII for data to be sent to the client. However the conversion failed.

System action: The transaction routing request is terminated and a message is sent to the terminal owning region (TOR) to indicate that the transaction routing request has failed. The CICS security manager issues a DFHSNnnnnn message to the transient data queue, CSCS.

User response: Examine the response and reason returned in the DFHCCNV commarea DFHC32. The client and server codepages will have already been validated so this may be a CICS error. You may need to contact IBM for further assistance. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHXTTP

AXTR

Explanation: An exception response has been returned to the DFHXTTP module from DFHPGLE FUNCTION(LOAD_EXEC) whilst trying to load EXEC program DFHCCNV.

System action: The transaction routing request is terminated and a message is sent to the terminal owning region (TOR) to indicate that the transaction routing request has failed. The CICS security manager issues a DFHSNnnnnn message to the transient data queue, CSCS.

User response: Examine the response and reason returned from DFHPGLE to determine why CICS was unable to call DFHCCNV.

Modules: DFHXTTP

AXTS

Explanation: One of the following conditions has occurred.

- A transaction running in an AOR has created a channel. The transaction has terminated by issuing EXEC CICS RETURN TRANSID CHANNEL to name the next transaction in the pseudo-conversation and pass the channel to it. However the TOR is not at a high enough CICS level to support channels.
- A transaction running in an AOR has created a channel. The transaction has terminated by issuing EXEC CICS RETURN TRANSID CHANNEL to name the next transaction in the pseudo-conversation and pass the channel to it. The channel is transmitted to the TOR and is held there until the next transaction in the pseudo-conversation starts. However, when the next transaction is initiated, it is found to reside in an AOR that is not at a high enough CICS level to support channels.

System action: The transaction routing request is terminated and a message is sent to the terminal owning region (TOR) to indicate that the transaction routing request has failed.

User response: If channels are passed between transactions in a pseudo-conversation, you must ensure that all TOR and AOR systems involved in passing the channel are at a high enough CICS level to support channels.

Modules: DFHXTTP

AXTU

Explanation: Program DFHAPCR has returned an unexpected response. DFHAPCR performs the following functions:-

- Extracts the contents of all containers making up a channel and transmits them to a remote system.

- Recreates the channel and containers from inbound data received from a remote system.

DFHAPCR has either detected an error in inbound data or has received an unexpected response whilst extracting or recreating channel data.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Look for any related CICS messages and abends to determine if there has been a prior failure in Program Manager, which manages containers. Look for exception trace entries from Program Manager or DFHAPCR to determine the cause of the error.

Modules: DFHXTTP

Abend codes AZxx

AZAB

Explanation: DFHZARM has a SEND DATA request with a data length greater than 65 528 bytes which is the maximum that it can process.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: This is a CICS internal logic error. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module(s): DFHZARM

AZAD

Explanation: DFHZCN1 has been started from an unexpected system. The CCIN transaction can only be issued by a client.

System action: The transaction is abnormally terminated. Exception trace point AP3008 is written. Data1 holds the XMIQ start type.

User response: Issue the CCIN transaction only from a client.

Module(s): DFHZCN1

AZAE

Explanation: DFHZCN1 was started from a terminal facility, but not an LU6.2 session. The CCIN transaction may only be issued by a client.

System action: The transaction is abnormally terminated.

User response: Issue the CCIN transaction only from a client.

Module(s): DFHZCN1

AZAF

Explanation: DFHZCN1 was started for transaction CCIN. However either the environment is wrong or the client architecture has been violated. This abend is always issued in conjunction with a DFHZC32nn message which explains the problem in more detail.

System action: Exception trace point AP30xx is

written. The transaction is abnormally terminated.

User response: Look for a DFHZC32nn message on the console or CSNE and look for exception trace points AP30xx. Use these to diagnose the problem.

Module(s): DFHZCN1

AZAG

Explanation: DFHZCT1 has been started from an unexpected system. The CTIN transaction can only be issued by a client.

System action: The transaction is abnormally terminated with a CICS transaction dump. Exception trace point AP302A is written. Data1 holds the XMIQ start type.

User response: Issue the CTIN transaction only from a client.

Module(s): DFHZCT1

AZAH

Explanation: DFHZCT1 was started from a terminal facility, but not an LU62 session. The CTIN transaction can only be issued by a client.

System action: The transaction is abnormally terminated with a CICS transaction dump. Exception trace point AP3032 is written. Data1 holds the principal facility address.

User response: Issue the CTIN transaction only from a client.

Module(s): DFHZCT1

AZAI

Explanation: DFHZCT1 was started for transaction CTIN. However either the environment is wrong or the client architecture has been violated. This abend is always issued in conjunction with a DFHZC32nn message which explains the problem in more detail.

System action: Exception trace point AP30xx is written. The transaction is abnormally terminated.

User response: Look for a DFHZC32nn message on the console or CSNE and look for exception trace points AP30xx. Use these to diagnose the problem.

Module(s): DFHZCT1

AZAJ

Explanation: DFHZCN1 was started for transaction CCIN. However, the CCIN transaction is being started on a surrogate, which means that it has been defined as a remote transaction. CCIN must be a local transaction and be run on a CICS region which is directly connected to a client.

System action: Exception trace point AP3041 is written. The transaction is abnormally terminated.

User response: Either use the default definitions for CCIN or ensure that it is defined as a local transaction.

Module(s): DFHZCN1

AZAK

Explanation: DFHZCT1 was started for transaction CTIN. However, the CTIN transaction is being started on a surrogate, which means that it has been defined as a remote transaction. CTIN must be a local transaction and be run on a CICS region which is directly connected to a client.

System action: Exception trace point AP3039 is written. The transaction is abnormally terminated.

User response: Either use the default definitions for CTIN or ensure that it is defined as a local transaction.

Module(s): DFHZCT1

AZCA

Explanation: An internal logic error has been detected during APPC mapped processing. The conversation state maintained by DFHZARL does not match that maintained jointly by DFHETL and DFHZARM.

The problem may also arise when CICS is assembling application data and receives end of chain before receiving all of the data that is expected.

System action: The task is abnormally terminated with a CICS transaction dump. CICS processing continues.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module(s): DFHZARM

AZCB

Explanation: CICS has received sense code X'088901.xx' during APPC mapped processing. This should be followed by an error data GDS (generalized data stream) variable.

CICS has attempted to receive the error data. However this attempt has failed because no data has been

received or because the data received is not for an CICS ISSUE ERROR of the correct length.

CICS expects the error data to indicate that the other system does not recognize GDS ID X'12F2' (function management data).

System action: The task is abnormally terminated with a CICS transaction dump.

The erroneous GDS ID is returned to the remote system for further analysis there.

User response: Check for session failure and for abend by the transaction in the other system.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module(s): DFHZARM

AZCC

Explanation: The failing transaction has sent function management data to a transaction running in a system that does not provide support for application function management data.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check that the remote system can support application function management data.

Module(s): DFHZARM

AZCD

Explanation: A possible intersystem logic error has been detected during APPC mapped processing. The length of application data that is to be received (as determined from the LL fields and concatenation flags) does not match the length actually received. CICS determines the length of application data that is to be received from the LL fields and concatenation flags. However, CICS has not received all of the data that is expected.

This abend can be caused by a loss of data following the failure of a persistent sessions restart in a partner system. In this case, no logic error has occurred because any updates are backed out.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: If this abend is not caused by the failure of a persistent sessions restart in a partner system, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module(s): DFHETL, DFHZARM

AZCE

Explanation: An intersystem error has been detected during APPC mapped processing. The length of application data that is to be received (as determined from the LL fields and concatenation flags) exceeds the CICS implementation limit of 32 767, for receive and converse commands, or 65 000 for CICS transaction routing or function shipping requests.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Reduce the amount of data that the transaction in the remote system is transmitting to CICS.

Modules: DFHETL, DFHZARM

AZCF

Explanation: An internal logic error has been detected during APPC mapped processing. An invalid request has been passed to DFHZARL.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZARM

AZCG

Explanation: An internal logic error has been detected during APPC mapped processing. DFHZARM expects the TCITE passed to have been defined as APPC, TCTEILUC (TCTELUC) set on, and TCTECVT set to TCTEMAPD (to indicate a mapped conversation).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZARM

AZCH

Explanation: Sense code X'0889xxxx' has been received unexpectedly during the processing of APPC mapped data.

This represents a violation of the APPC architecture by the remote system.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHETL, DFHZARM

AZCI

Explanation: The processing of APPC mapped data requires generation of an APPC attach function management header (FMH) with default values. In particular, the sync level requested is defaulted to 2. However, the session that is to be used has been bound with a sync level of 1.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check that:

- The entry in the TCT for the remote system has been defined with parallel sessions.
- The remote system is capable of supporting a sync level of 2.
- Exchange lognames has completed for the connection. You can use the CEMT INQUIRE CONNECTION to do this. See the *CICS Intercommunication Guide* for details of the exchange lognames process.

Modules: DFHETL, DFHZARM, DFHZARQ

AZCJ

Explanation: An APPC structured field with GDS ID X'12F1' (null data) has been sent to a remote system that does not support the receipt of these fields. The remote system has responded negatively and has terminated the conversation.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: The problem is in the remote system. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZARM

AZCK

Explanation: An internal logic error has been detected during error recovery for APPC mapped processing. The conversation was being switched to RECEIVE state by an internal CICS SEND INVITE, but the conversation had already been FREED by the partner.

System action: The task is abnormally terminated with a CICS transaction dump. CICS processing continues.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZARM

AZCL

Explanation: CICS has received sense code X'088901xx' during APPC mapped processing. The generalized data stream (GDS) should contain a valid GDS identity in the error data but CICS does not recognize the value. The values recognized by CICS are:

X'12F1'null data
X'12F2'function management data
X'12FF'application data.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check for session failure and for an abend by the transaction in the other system.

Modules: DFHZARM

AZCM

Explanation: An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related message produced by the domain that detected the original error.

Modules: DFHZARM

AZCN

Explanation: The task has been purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The task that first detected the purged condition provides an exception trace.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate why the task was purged. It was purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the

DTIMOUT option for the transaction.

Modules: DFHZARM

AZCO

| **Explanation:** The VTAM persistent sessions
| initialization transaction CGRP has been started directly
| from a terminal. This is not permitted. This transaction
| can only be started internally by CICS.

| **System action:** The transaction is abnormally
| terminated with a transaction dump.

| **User response:** None.

| **Modules:** DFHZCGRP

AZCP

Explanation: A logic error has been detected in ZCP. An allocation request for a starting task cannot be satisfied.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZSUP DFH62XM

AZCQ

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the recovery manager (RM) domain to change the recovery status of an intercommunication session. The domain provides an exit trace, and possibly a console message and a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: This failure is either the result of a task purge, or it represents a CICS logic error and you will need assistance from IBM.

See the related diagnostic material produced by the recovery manager domain.

Modules: DFHZSUP DFHMRXM DFH62XM

AZCR

Explanation: A logic or protocol error has been detected during processing of an APPC SYNCPOINT ROLLBACK request. An attempt has been made to restore the conversation state to what it was after completion of the last successful unit of work. This saved state does not match flows received from the partner.

The problem arises during rollback in one of the following situations:

- The saved state is receive, and the partner sent change direction on the last flow, indicating that the partner expects CICS to be in send state
- The saved state is send, and the partner did not send the change-direction indicator on the last flow, indicating that the partner expects CICS to be in receive state.

System action: The task is abnormally terminated with a CICS transaction dump. Other processing continues.

User response: The problem can arise because of a failure in CICS, or a failure in the partner. To determine which is failing, analyze the flows at the last successful syncpoint. Try to determine the states the two LUs were in at this point. Look at the last syncpoint flow into CICS from the partner, before the abend. From this flow, calculate whether the change-direction indicator on the SPCMOD modifier byte is on. (See the *SNA Formats* manual for further information on the SPCMOD modifier byte.) The indicator must only be set when the saved CICS conversation state is send. If the last CICS state was send, and the indicator is on, CICS is at fault. Similarly, if the last CICS state was receive, and the indicator is off, CICS is at fault.

If the last CICS state was send and the indicator is off, or the last CICS state was receive, and the indicator is on, CICS has received a change-direction indicator when it was not expecting one. In this case, examine the partner for a logic error.

Modules: DFHZARL

AZCT

Explanation: A terminal read-time-out condition has been detected. The transaction has been waiting for a terminal input message for an interval longer than specified in the RTIMOUT value for that transaction.

Coding RTIMOUT in the PROFILE entry causes the task to be abnormally terminated if the terminal does not send input within the specified time.

System action: The transaction is abnormally terminated. A dump is not provided unless the dump table entry for transaction dump code AZCT indicates that one should be taken.

User response: If a HANDLE ABEND command has been issued for this task, the read that was timed-out is still outstanding. In order to cancel this read, issue an ABEND command at the end of the user exit routine so that CICS can clean up the terminal's TCTTE. No further terminal control commands should be issued.

Modules: DFHZARQ

AZCU

Explanation: The COVR transaction has been started directly from a terminal, or by a START command. This is not permitted. This transaction can only be started internally by CICS.

System action: The transaction is abnormally terminated. No transaction dump is taken.

User response: None.

Modules: DFHZCOVR

AZCV

Explanation: A logic error has been detected in the COVR transaction while trying to connect to VTAM.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZCOVR

AZCW

Explanation: An attempt has been made to run the CICS internal task CSTP as a user transaction.

System action: CICS terminates the task with a transaction dump.

User response: Investigate why the attempt was made to run CSTP as a user transaction.

Modules: DFHZCSTP

AZIA

Explanation: The transaction attempted to acquire or free storage during MRO processing. The response from the CICS storage manager (SM) domain indicated that the request was invalid.

System action: The task is abnormally terminated with a dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZIS2

AZIB

Explanation: The transaction was purged whilst waiting for storage to receive MRO data from a connected subsystem. The purge may have been the result of operator action, such as CEMT SET TASK PURGE, or as the result of the waiting time exceeding the DTIMOUT value for the transaction.

System action: The task is abnormally terminated with a dump.

User response: If the condition is caused by time-out, examine the DTIMOUT value for the failing transaction and increase it if it is too low.

Modules: DFHZIS2

AZIC

Explanation: An INVALID, DISASTER, or EXCEPTION condition has occurred on a call to the storage manager domain (DFHSMGFM) to FREEMAIN a CRB control block.

The domain that detected the original error provides an exception trace, a console message, and possibly a system dump.

System action: The task is abnormally terminated with a transaction dump.

User response: Please see the related message from the domain that detected the original error.

Modules: DFHZIS2

AZID

Explanation: A PURGED condition has occurred on a call to the storage manager domain (DFHSMGFM) to FREEMAIN a CRB control block.

The domain that detected the original error provides an exception trace.

System action: The task is abnormally terminated with a transaction dump.

User response: Investigate why the task was purged. It was purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Modules: DFHZIS2

AZIE

Explanation: An interregion communication (IRC) ISSUE-ERROR or ISSUE-ABEND flow has been received in violation of IRC protocols. This can be caused by:

- A CICS logic error. IRC protocols are not available to MRO distributed transaction processing applications. They are for CICS internal use only.
- A transaction abend on a connected system. This results in an FMH 7 flow over an LU6.2 connection and causes this abend to be issued.

System action: The task is abnormally terminated with a transaction dump.

User response: Check whether a mixture of mapped and unmapped conversations are being used as this can cause this abend. Check for any other reasons for transactions to be abending on the attached system.

If a CICS logic error is involved, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZARQ

AZIF

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the recovery manager (RM) domain to change the recovery status of an intercommunication session. The domain provides an exit trace, and possibly a console message and a system dump (depending on the options specified in the dump table).

| This is either the result of a task purge, a CICS logic
| error, or of the inappropriate use of the indoubt test
| transaction, CIND. CIND should be activated only on
| the CICS system where the syncpoint processing was
| initiated. In particular, CIND should not be used on
| any of the CICS mirror transactions.

System action: The task is abnormally terminated with a CICS transaction dump.

| **User response:** Determine whether CIND has been
| activated for a transaction that did not initiate the
| syncpoint processing. If CIND is not being used see the
| related diagnostic material produced by the recovery
| manager domain and determine the reason for the
| failure.

In the case of a CICS logic error, you need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZARQ

AZIG

Explanation: An MRO session read-time-out condition has been detected. The transaction has been waiting for an MRO session for an interval longer than specified in the RTIMOUT value for that transaction.

Coding RTIMOUT in the PROFILE entry causes the task to be abnormally terminated if the session does not respond within the specified time.

System action: The transaction is abnormally terminated. A dump is not provided unless the dump table entry for transaction dump code AZIG indicates that one should be taken.

User response: If a HANDLE ABEND command has been issued for this task, the read that was timed-out is still outstanding. In order to cancel this read, issue an ABEND command at the end of the user exit routine so that CICS can clean up the terminal's TCTTE. No further terminal control commands should be issued.

Modules: DFHZIS2

AZI1

Explanation: An IRC data transmission request has been issued, but cannot be completed because the transmission protocol has been violated.

If the session is not used for distributed transaction processing, that is if it is used for function shipping or transaction routing, then the problem is caused by a CICS logic error.

If the session is used for distributed transaction processing, then the following are possible causes of the abend:

- An invalid terminal control command, such as ISSUE SIGNAL, was issued
- A send request was issued but the session was not in send state, or a read request was issued but the session was not in receive state.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Determine the cause of the abend and if appropriate, correct the application. For further guidance, refer to the section on the EXEC Interface block (EIB) in the *CICS Intercommunication Guide*. The EIB describes the state of the session after a request has been issued.

Modules: DFHZARQ

AZI2

Explanation: An IRC data transmission request has been issued but cannot be completed. Possible causes of the problem include:

- The transaction running in the connected system has been purged, or

- The transaction running in the connected system has been timed out, or
- The abending transaction has attempted to SEND while in RECEIVE state, or
- The abending transaction has attempted to RECEIVE while in SEND state.

If the abend was caused by DFHIRP rejecting the transmission request, the dump will contain DFHIRP's return code in the field TCTEIRET for the TCTTE representing the failed IRC session. The address of this TCTTE is in field B of the trace entry representing the DFHTC data transmission request.

The meanings of the DFHIRP return codes are given in the copybook, DFHIRSDS.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: If the cause of the error was a purge or a time-out, no further action is required.

If the error was caused by a condition such as an attempted SEND while in RECEIVE state or vice versa, analyze the dump and correct the protocol violation.

Modules: DFHZARQ

AZI3

Explanation: A terminal control request issued by an application to a remotely-owned terminal failed because the conversation with the other system failed.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZARQ

AZI4

Explanation: An IRC data transmission request has been issued, but cannot be completed because the other system has become unavailable for interregion communication.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Rerun the transaction when IRC is available.

Modules: DFHZARQ

AZI5

Explanation: An IRC data transmission request has been issued, but the data sent by the connected system in response to the request violated IRC protocols.

System action: The task is abnormally terminated

with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZARQ

AZI6

Explanation: The transaction was connected to another transaction in another CICS system via an IRC link. This other transaction has abnormally terminated.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Correct the cause of the abend in the connected transaction.

Modules: DFHZARQ

AZI7

Explanation: The transaction was processing an MRO request which involved waiting for a response from a connected subsystem. The 'wait' request was rejected by the CICS dispatcher.

System action: The transaction is abnormally terminated with a dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZIS2

AZI8

Explanation: The error log data received with an ISSUE-ABEND flow on an IRC connection was not in the correct format.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZIS1

AZI9

Explanation: The transaction was processing an MRO request which involved waiting for a response from a connected subsystem. During the wait, the failing transaction was purged. The purge can only have been the result of operator action, such as a CEMT SET TASK PURGE.

System action: The task is abnormally terminated with a dump.

User response: Investigate the reason the transaction was purged.

Modules: DFHZIS2

AZRA

Explanation: DFHZARRC detected that the address of an FMH in the APPC was not in the receive buffer. The cause could either be a storage overwrite or a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. Check the TCTTE in the transaction dump for printable characters or other signs of a storage violation error.

Modules: DFHZARRC

AZRB

Explanation: Module DFHZARR0 was called with an invalid first parameter. The first parameter should be the code of the function to be performed. This is a CICS logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, then a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZARR0

AZRD

Explanation: The logical and physical APPC receive buffers have become out of step. This problem is caused either by a storage overwrite or by a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, then a level 1 and 2 trace of the TC component would aid problem determination. Check the TCTTE in the transaction dump for printable characters or other signs of a storage violation error.

Modules: DFHZARR0

AZRE

Explanation: The logical APPC receive buffer (addressed by TCTERBLA) starts before or after the physical receive buffer (addressed by TCTERBLA). This is not valid as the logical receive buffer is the part of the physical receive buffer that is yet to be processed. This problem could be caused either by a storage

overwrite or by a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible then a level 1 and 2 trace of the TC component would aid problem determination. Check the TCTTE in the transaction dump for printable characters or other signs of a storage violation error.

Modules: DFHZARR0

AZRF

Explanation: The DFHZUSR state machine has returned an invalid state error at a point where it should not be possible. This is a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, then a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZARRF

AZRG

Explanation: The DFHZUSR state machine has returned an invalid state error at a point where it should not be possible. This is a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, then a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZARR

AZRH

Explanation: The DFHZARR state variable RECEIVE_TYPE, used to control receive processing, has been set to an invalid value. The only other module that has access to this variable is DFHZARRF. This is a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, then a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the

CICS Problem Determination Guide for guidance on how to proceed.

Modules: DFHZARR

AZRI

Explanation: One of the parameters passed to DFHZARR1. was invalid. This is a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, then a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZARR1

AZRJ

Explanation: The length of a record that DFHZARR0 has been requested to remove from the APPC receive buffer, is longer than the buffer itself. This problem could be caused either by a storage overwrite or by a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. Check the TCTTE in the transaction dump for printable characters or other signs of a storage violation error.

Modules: DFHZARR0

AZRK

Explanation: The DFHLUC parameter list passed back from DFHZERH to DFHZARRF contained an invalid combination of LUCCIERR, LUCCIFRE, and LUCCIRBK fields. This is a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZARRF

AZRL

Explanation: Module DFHZARRF was called with an invalid first parameter. The first parameter should be the code of the function to be performed. This is a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZARRF

AZRM

Explanation: Module DFHZARR called one of its own internal routines at the wrong time. This is a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZARR

AZRN

Explanation: The DFHLUC parameter list passed back from DFHZERH to DFHZARRF did not have LUCCIERR set on. This is a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZARRF

AZRO

Explanation: Module DFHZARER was called with an invalid first parameter. The first parameter should be the code of the function to be performed. This is a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem*

Determination Guide for guidance on how to proceed.

Modules: DFHZARER

AZRP

Explanation: Module DFHZARER detected an invalid response from DFHZNAC. This is a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZARER

AZRQ

Explanation: Module DFHZARRA was called with an invalid parameter. This is a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZARRA

AZRR

Explanation: Module DFHZARRA detected that the application buffer chained off of a TCTTE at offset TCTERCSA had a corrupted header. This is caused either by a CICS logic error or by a storage overwrite. The exception trace point that accompanies this abend code gives the TCTTE address.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. Check the TCTTE in the transaction dump for printable characters or other signs of a storage violation error.

Modules: DFHZARRA

AZRS

Explanation: Module DFHZARRA is unable to acquire main memory for a new application buffer into which it is supposed to copy some data. This is because the DFHLUC receive request is SUBTYPE=LLID, SET=YES and DFHZARRA does not know the length to acquire on the GETMAIN. DFHZARRA requires the length of

the record currently being received, but it has been set to 0 in error. This is a CICS logic error. The exception trace point that accompanies this abend code gives the TCTTE address.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZARRA

AZRT

Explanation: Module DFHZARRA has detected that the application buffer, into which it is supposed to copy some data, is invalid. This is either because the address of the buffer is zero or because its length is less than that of the data to be copied into it. This is a CICS logic error. The exception trace point that accompanies this abend code gives the buffer address and length plus the data address and length.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZARRA

AZRU

Explanation: Module DFHZARRF detected an unexpected response from DFHZARR0. This is a CICS logic error. The exception trace point that accompanies this abend code gives the invalid response code.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, then a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZARRF

AZRV

Explanation: Module DFHZARR1 detected an unexpected response from DFHZARR0. This is a CICS logic error. The exception trace point that accompanies this abend code gives the invalid response code.

System action: The transaction is abnormally

terminated with a CICS transaction dump.

User response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: One of the parameters passed to DFHZARR1

AZRW

Explanation: Module DFHZARRA detected a negative record length in the TCTTE (field TCTELLC). This is caused either by a CICS logic error or by a storage overwrite. The exception trace point that accompanies this abend code gives the TCTTE address and the value of TCTELLC.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. Check the TCTTE in the transaction dump for printable characters or other signs of a storage violation error.

Modules: DFHZARRA

AZRY

Explanation: Module DFHZARR detected an unexpected response from DFHZARRC. This is a CICS logic error. The exception trace point that accompanies this abend code gives the invalid response code.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZARR

AZRZ

Explanation: Module DFHZARR detected an unexpected response from an internal subroutine. This is a CICS logic error. The exception trace point that accompanies this abend code gives the invalid response code.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZARR

AZR2

Explanation: Module DFHZARRA is unable to acquire main memory for a new application buffer because the storage manager GETMAIN failed.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Use the trace to identify the failing return from the storage manager and analyze the reason for failure.

Modules: DFHZARRA

AZR3

Explanation: During a GETMAIN request, the storage domain detected that the task has been purged.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Use the trace to investigate why the task was purged. Check if the master terminal operator was responsible.

Modules: DFHZARRA

AZR4

Explanation: An unexpected response has been received from a dispatcher domain call.

System action: The transaction is abnormally terminated with a transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZARER

AZR5

Explanation: An unexpected response has been received from a dispatcher domain call.

System action: The transaction is abnormally terminated with a transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZARR1

AZR6

Explanation: An exception condition was raised as the result of a request from the APPC communications routine DFHZARL to the CICS recovery manager domain. This is either caused by a CICS logic error or by the inappropriate use of the indoubt test transaction,

CIND. CIND should be activated only on the CICS system where the syncpoint processing was initiated. In particular, CIND should not be used on any of the CICS mirror transactions.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Determine whether CIND has been activated for a transaction that did not initiate the syncpoint processing. If CIND is not being used, you will need further assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZARER

AZS0

Explanation: An invalid request was passed via the DFHZSTAM macro to the processing DFHZSTAP program. This is a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZSTAP

AZS1

Explanation: No TCTTE pointer was passed via the DFHZSTAM macro to the processing DFHZ program. This is a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZSTAP

AZS2

Explanation: The TCTTE passed via the DFHZSTAM macro to the processing DFHZSTAP program does not relate to an MRO or an APPC Conversation. This is a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZSTAP

AZS3

Explanation: The TCTTE passed via the DFHZSTAM macro to the processing DFHZSTAP program for an APPC Conversation, but the LUC Extension Control Block was not located. This is a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZSTAP

AZS4

Explanation: While processing a DFHZSTAM request in DFHZSTAP, the DFHZUSRM LUC State Machine was found to have an invalid setting. This is a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZSTAP

AZS5

Explanation: Whilst processing a DFHZSTAM request in DFHZSTAP, the Internal State number was found to have an invalid setting. This is a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZSTAP

AZS6

Explanation: Whilst processing a DFHZSTAM request in DFHZSTAP, the Internal State number was found to have an invalid setting. This is a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZSTAP

AZTA

Explanation: The task does not own a terminal as its principal facility.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZTSP

AZTB

Explanation: An attempt to install or delete a remote terminal in this CICS system has failed. This may be because CATA was trying to install a local terminal at the same time as CITS was installing a remote terminal with the same termid. In this situation CICS gives priority to the locally installed terminal (CATA). This abend can also occur if the CITS/CDTS/CMTS/CFTS transactions are not available (that is , if the transactions have not been installed).

System action: DFHZTSP is abnormally terminated with a CICS transaction dump.

User response: If there was an abend AZI6/AZTS abend in the TOR then retry the request after the locally installed terminal with the same TERMID has logged off. Otherwise, verify that the listed transactions exist and have been installed. If the failure persists then you need further assistance to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZTSP

AZTC

Explanation: An attempt to install or delete a remote terminal in this system has failed. This is because a short-on-storage (SOS) condition has caused the failure of a GETMAIN for the attach of CITS, CDTS, or CFTS.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Investigate the reason for the SOS condition. See the *CICS Problem Determination Guide* for guidance on dealing with the SOS condition.

Retry the transaction later.

Modules: DFHZTSP

AZTF

Explanation: DFHZTSP tried to GETMAIN or FREEMAIN a TCTTE whose length (TCTTETEL) is longer than the largest TCTTE SUBPOOL and is therefore invalid. This implies a storage violation or a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Use the transaction dump to identify the TCTTE in error. First, check whether this is a storage overwrite. If so, check in your statistics to see if you are getting a number of storage violations caused by the same transaction. If this is the case, then a user-supplied application is probably causing the problem.

If it is not a storage violation problem, or if there is a random storage violation, there might be an error in CICS. In this case, you need further assistance to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZTSP

AZTG

Explanation: An attempt has been made to attach a task on a remotely-owned terminal without an intersystem TCTTE as its principal facility.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZTSP

AZTH

Explanation: An error response was received from the remote terminal control macro.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZTSP

AZTI

Explanation: An attempt has been made to attach a task on a remotely-owned terminal, but the terminal is not defined in this system as a remotely-owned terminal.

This may occur after an AZVK abend when CICS attempts to delete the surrogate TCTTE, but there is still a transaction running against it.

Alternatively, another task holds a lock on this terminal.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check the terminal control table definitions in the systems involved. If the definitions

are correct, check that no other tasks have locks held on the terminal (CECI, for example).

Check to see if an AZVK abend occurred earlier for this terminal and determine if the link session timing out was the original cause. All should be well once the long running transaction finishes.

Modules: DFHZTSP

AZTL

Explanation: An attempt has been made to attach a task to a remotely-owned terminal that cannot be used to run this transaction.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Inform the system programmer. Check the terminal control table definitions in the systems involved.

Modules: DFHZTSP

AZTM

Explanation: The data received from the remote system does not contain an FMH (function management header).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZTSP

AZTN

Explanation: Conversation with a remote system has been unexpectedly terminated.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZTSP

AZTO

Explanation: The TCTTE ownership chain is in error.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZTSP

AZTP

Explanation: A BMS TYPE=STORE request issued on behalf of a remote transaction failed.

System action: The task abnormally terminates with a CICS transaction dump.

User response: Inform the system programmer. Check that the required BMS support has been generated.

Modules: DFHZTSP

AZTQ

Explanation: Invalid BMS data received from remote system.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZTSP

AZTR

Explanation: A BMS TYPE=PAGEOUT request issued on behalf of a remote system failed.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Ensure that the required BMS support has been generated.

Modules: DFHZTSP

AZTS

Explanation: An attempt to send data to a remote system failed.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate why the conversations with the remote system failed. The transaction on the remote system has probably been abnormally terminated or the session has failed.

If message 'DFHZC4930 Session unbound following read timeout.' occurred just before the AZTS then the AZTS is caused by a timeout occurring on an APPC session when CICS attempted to converse with the remote system.

Modules: DFHZTSP

AZTT

Explanation: An attempt was made to attach a task on a remote system, but the connection with the remote system is not an APPC or MRO connection.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Redefine the connection as APPC or MRO, or avoid using transaction routing on this connection.

Modules: DFHZTSP

AZTU

Explanation: The task does not own the link TCTTE after a sync point has been taken.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZTSP

AZTV

Explanation: An invalid function management header (FMH) has been received from the remote system.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZTSP

AZTW

Explanation: An attempt was made to attach a task on a remotely-owned terminal that was already running a task.

This may be caused by a read time out occurring in the terminal owning region for the link session being used by this transaction. The read timeout is specified in profile DFHCICSS. Although the session has timed out the transaction may still be running and the surrogate TCTTE is unable to accept any more transactions until the first one has finished.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check the terminal control table definitions in the systems involved.

Check to see if a read timeout abend occurred on the TOR for the same terminal to determine if this is the cause. Wait until the transaction terminates before retrying any further transactions on this terminal.

Modules: DFHZTSP

AZTY

Explanation: A session TCT entry for a remotely owned APPC terminal or connection could not be created because to do so would exceed the maximum number of APPC sessions permitted.

| The maximum number of sessions depends on whether
| the PTF shipped for APAR PQ27823 is installed. The
| basic limit is 46656 and the names are in the range
| -AAA to -999. The APAR doubles this limit to 93312
| giving an additional range of AAA- to 999-.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Inform the system programmer. Either wait for the system to become less busy, or delete some APPC sessions.

| The system programmer should consider increasing the
| number of CICS TORs.

Modules: DFHZTSP

AZTZ

Explanation: The CICS relay program DFHCRT has been attached in an unsupported manner.

System action: CICS abnormally terminates the transaction with a transaction dump.

User response: The relay transaction executes with an MRO session or an LU type 6.2 conversation as its principal facility. Ensure that the transaction is being attached by APPC terminal sharing logic and not directly by a user transaction.

If the transaction is being attached by APPC terminal sharing logic, you need further assistance to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZTSP

AZT1

Explanation: The task has been attached improperly in the application-owning region when transaction routing.

System action: CICS abnormally terminates the transaction with a transaction dump.

User response: The conversation with the routing system should be an MRO session or an LU type 6.2 conversation. Ensure that the transaction is being attached by the CICS relay program in the connected system and not by a user program.

If the transaction is being attached by the CICS relay program in the connected system, you need further assistance to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZTSP

AZT3

Explanation: The task is being routed back to the region from where it came.

System action: CICS abnormally terminates the transaction with a transaction dump.

User response: Correct the transaction definition.

Modules: DFHZTSP

AZT6

Explanation: The task in the application-owning region has received a ROLLBACK request from the terminal-owning region, but the conversation is continuing. The terminal-owning region has violated the transaction routing protocol.

System action: CICS abnormally terminates the transaction with a transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZTSP

AZT7

Explanation: A session terminal control table (TCT) entry for a remotely owned APPC terminal or connection could not be added to the TCT.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZTSP

AZT8

Explanation: A session terminal control table (TCT) entry for a remotely owned APPC terminal or connection could not be deleted from the TCT.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZTSP

AZT9

Explanation: A session terminal control table (TCT) entry for a remotely owned APPC terminal or connection could not be deleted from the TCT because it is locked by another task.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: The other task may be transitory in nature, and if so, another attempt will succeed.

Modules: DFHZTSP

AZVA

Explanation: DFHZTSP has timed out waiting for service transaction CITS to complete during the creation of a remote terminal while attaching a task in the application-owning region.

The probable cause of this is that the application-owning region is very busy, so the CITS transaction has been waiting to be dispatched for longer than the timeout value allowed by DFHZTSP. Lack of storage on the target system is one possible reason why CITS has not been dispatched, or has been dispatched but has not completed.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Retry the transaction when the system becomes less busy. For more information on improving transaction throughput on the target system, see the *CICS Performance Guide*.

Modules: DFHZATS

AZVB

Explanation: DFHZCQ has failed to create the remote terminal definition. A previous message or messages should indicate the reason for the failure.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the previous message or messages for further guidance.

Modules: DFHZATS

AZVC

Explanation: An unexpected error has occurred in DFHZATS. This is probably caused by DFHZATS being unable to address the CSA, EIB or the TCA. It can also occur if DFHZATS is called with an EXEC CICS START command for transactions CITS, CFTS, CMTS or CDTS. These are internal CICS transactions and should not be called in this way.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZATS

AZVD

Explanation: An unexpected error has occurred in the install procedure of DFHZATS.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: This is a CICS logic error. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZATS

AZVE

Explanation: DFHZATS is trying to install a remote terminal with the same terminal id as an existing TCT entry.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Change the terminal names to ensure that a duplicate does not occur in the same system.

Modules: DFHZATS

AZVF

Explanation: One of the remote install or delete transactions of DFHZATS (CITS, CFTS, CMTS or CDTS) has been started directly from a terminal. This is not permitted. These transactions can only be started internally by CICS.

System action: The transaction is abnormally terminated with a transaction dump.

User response: None.

Modules: DFHZATS

AZVG

Explanation: An error has occurred in the remote delete routines.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZATS

AZVH

Explanation: An error has occurred in the remote delete routine during the mass deletion of remote terminals.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZATS

AZVI

Explanation: An error has occurred in the remote delete routine while an attempt was being made to delete a single remote terminal.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check the CADL transient data queue for any associated messages indicating the reason for the error. If you cannot resolve the problem, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZATS

AZVJ

Explanation: An error has occurred during the mass deletion of remote terminals. This is caused by a CICS logic error.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZATS

AZVK

Explanation: An unexpected return code has been received from the remote delete routine during the deletion of a single remote terminal.

This may occur after an AZTW abend when CICS attempts to delete the surrogate TCTTE, but there is still a transaction running against it. It may also occur without an AZTW if the link session timed out leaving the transaction in the AOR still running but followed by a logoff from the terminal which initiated the long running transaction.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Look for an accompanying

DFHZC6911 message indicating the reason for the delete failure, and take appropriate action.

Check to see if the link session for this terminal timed out and whether the terminal then issued another transaction or logged off. All should be well once the long running transaction finishes.

Modules: DFHZATS

AZVL

Explanation: An error has occurred during the mass flagging of remote terminals for deletion.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZATS

AZVM

Explanation: An error has occurred in DFHZATMF. This is probably caused by DFHZATMF being unable to address the CSA, EIB, or the TCA.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZATMF

AZVN

Explanation: The remote delete flag transaction of DFHZATMF (CRMF) has been started directly from a terminal. This is not permitted. This transaction can only be started internally by CICS.

System action: The transaction is abnormally terminated with a transaction dump.

User response: None.

Modules: DFHZATMF

AZVO

Explanation: The remote delete transaction of DFHZATMD (CRMD) has been started directly from a terminal. This is not permitted. This transaction can only be started internally by CICS.

System action: The transaction is abnormally terminated with a transaction dump.

User response: None.

Modules: DFHZATMD

AZVP

Explanation: An error has occurred in DFHZATMD. This is probably caused by DFHZATMD being unable to address the CSA, EIB, or the TCA.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZATMD

AZVQ

Explanation: A request to install a shipped terminal definition has been rejected by the autoinstall user program.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Retry the transaction when the system is less busy.

Modules: DFHZATS

AZVR

Explanation: An attempt to install a shipped terminal definition has failed because the autoinstall user program has issued an unexpected return code.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Examine the autoinstall user program to determine why this return code was issued.

Modules: DFHZATS

AZVS

Explanation: An attempt to install a shipped terminal definition has failed because an error has occurred in the autoinstall user program.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Examine the autoinstall user program to determine the reason for the failure.

Modules: DFHZATS

AZVU

Explanation: DFHZATS was attempting to autoinstall a shipped terminal, a virtual terminal or a shipped connection and the autoinstall URM was called. However the autoinstall failed for one of the following reasons:

- The name returned by the URM in SELECTED_SHIPPED_TERMID started with one of these characters:

<
>
-

- The value in the SIT VTPREFIX parameter contained imbedded blanks or a character that is not allowed for terminal names.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZATS

AZXA

Explanation: An unexpected error, with reason code 5, has been detected in the catchup program, DFHZXCU. See the description of message DFHXG6492 for further details.

System action: Console message DFHXG6492 is issued, and CICS continues after abending the transaction.

User response: Refer to message DFHXG6492.

Modules: DFHZXCU

AZXB

Explanation: An unexpected error, with reason code 4, has been detected in the catchup program, DFHZXCU. See the description of message DFHXG6492 for further details.

System action: Console message DFHXG6492 is issued, and CICS continues after abending the transaction.

User response: Refer to message DFHXG6492.

Modules: DFHZXCU

Chapter 4. System abend and dump codes

This chapter describes the abend and dump codes that are used by

- The CICS system
- IMS/ESA
- The CICS translator
- The CICS system dump program
- The CICS utility program, DFHCSDUP
- The external CICS interface
- The CICS JVM interface
- COBOL II
- Language Environment

CICS system dump codes

Whenever a CICS system dump is requested, CICS references a system dump code that corresponds to the event that caused the dump request to be made. This is done in order to see what further action should be taken. More information about this can be found in the *CICS Problem Determination Guide*.

In most cases, system dump codes correspond to a DFH message with the DFH tag stripped off. For example, system dump code DM0001 corresponds to message DFHDM0001 with the DFH tag removed. For further information, look up the relevant message where appropriate.

However, there are some exceptions to this format, as shown in the following list.

System dump code

Corresponding message or exception condition

ABNDU603

This system dump code refers to a USER abend code and is associated with message DFHSR0603.

ABNDU605

This system dump code refers to a USER abend code and is associated with message DFHSR0605.

APTRAPPC

This system dump code is associated with message DFHTR1001.

APTRAPUS

This system dump code is associated with message DFHTR1000.

APUSER

This system dump code is issued through the use of the CEBT transaction when performing a PERFORM SNAP command.

APXRFTO

This system dump code has no DFH message associated with it. An error in the currently active CICS system has occurred. An alternate CICS system is now taking control and is requesting that the active CICS system produces a dump of itself.

MT0001

This system dump code has no DFH message associated with it. It indicates that a dump was requested by a user of CEMT, issuing either a PERFORM SNAP or a PERFORM DUMP.

DHxx (IMS/ESA) abend codes

If the IMS high-level programming interface (HLPI) has found a condition caused by a programming error, or if DL/I has returned a status code to HLPI which indicates an error, IMS/ESA returns a status code *xx* to CICS Transaction Server for z/OS. A few of the more common abend codes are listed below. For a full list of *xx* status codes that can make up a DHxx abend, refer to the *IMS/ESA Application Programming: EXEC DLI Commands* manual.

DHTA

Explanation: A task has issued a program specification block (PSB) schedule request but the PSB could not be found.

See the description of the DL/I status code TA in the *IMS/ESA Application Programming: EXEC DLI Commands* manual for guidance.

DHTC

Explanation: A task has issued a program specification block (PSB) schedule request but the PSB has already been scheduled.

See the description of the DL/I status code TC in the *IMS/ESA Application Programming: EXEC DLI Commands* manual for guidance.

DHTE

Explanation: A task has issued a program specification block (PSB) schedule request but a PSB initialization error occurred.

See the description of the DL/I status code TE in the *IMS/ESA Application Programming: EXEC DLI Commands* manual for guidance.

DHTG

Explanation: A task has issued a terminate request but the request failed because the program specification block (PSB) is not scheduled.

See the description of the DL/I status code TG in the *IMS/ESA Application Programming: EXEC DLI Commands* manual for guidance.

DHTH

Explanation: A task has issued a DL/I request but the request failed because the program specification block (PSB) is not scheduled.

See the description of the DL/I status code TH in the *IMS/ESA Application Programming: EXEC DLI Commands* manual for guidance.

DHTJ

Explanation: A task has issued a program specification block (PSB) schedule request but the request failed because CICS is not connected to DBCTL.

See the description of the DL/I status code TJ in the *IMS/ESA Application Programming: EXEC DLI Commands* manual for guidance.

DHTQ

Explanation: A task has issued a program specification block (PSB) schedule request but the request failed.

See the description of the DL/I status code TQ in the *IMS/ESA Application Programming: EXEC DLI Commands* manual for guidance.

01xx (translator) abend codes

0100 LISTING FILE CANNOT BE OPENED

Explanation: The listing data set has not opened successfully.

System action: The CICS command level translator terminates abnormally. A system dump is produced if a SYSABEND or SYSUDUMP DD statement is provided.

User response: Ensure correct JCL or determine what is causing the open error.

Modules: DFHEAP (for assembler language), DFHECP (for COBOL), DFHEDP (for C), DFHEPP (for PL/I)

0101 UNRECOVERABLE TRANSLATOR ERROR

Explanation: The translator encountered a program check from which it could not recover.

System action: The CICS command-level translator terminates abnormally. A system dump is produced if a SYSABEND or SYSUDUMP DD statement is provided.

User response: You need further assistance from IBM

to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHEAP (for assembler language), DFHECP (for COBOL), DFHEDP (for C), DFHEPP (for PL/I)

02xx (DFHPD640) abend codes

0211 RECURSIVE PROGRAM CHECK

Explanation: A program check has occurred while the system dump formatting program was handling an earlier program check.

System action: The system dump formatting program terminates abnormally. A system dump is produced if a SYSABEND or SYSUDUMP DD statement is provided.

User response: The program check preceding the abend is accompanied by message DFHPD0123. See the description of this message for more guidance.

Modules: DFHPD640

Explanation: A sixth program check has occurred during execution of the system dump formatting program.

System action: The system dump formatting program terminates abnormally. A system dump is produced if a SYSABEND or SYSUDUMP DD statement is provided.

User response: This abend is preceded by five DFHPD0123 messages, one for each of the five earlier program checks. See the description of this message for more guidance.

Modules: DFHPD640

0212 TOO MANY PROGRAM CHECKS

03xx (DFHCSDUP) abend codes

0300

Explanation: The SYSIN data set has not opened successfully.

System action: The CSD batch update utility terminates abnormally. If a SYSABEND or SYSDUMP DD statement is provided, a system dump is produced.

User response: Ensure that the JCL is correct and that the SYSIN data set exists in sequential form. If necessary, examine the SYSIN DD statement to determine the cause of the error.

Modules: DFHCSDUP

System action: The CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

User response: Ensure that the record length specified in the SYSIN data set is no greater than 80.

Modules: DFHCSDUP

0301

Explanation: The RECFM parameter specified in the SYSIN data set is invalid.

System action: The CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

User response: Ensure that the RECFM parameter in the SYSIN data set is either F or V.

Modules: DFHCSDUP

0303

Explanation: The SYSPRINT data set did not open successfully.

System action: The CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

User response: Ensure that the SYSPRINT data set exists. If necessary, examine the SYSPRINT DD statement to determine the cause of the error.

Modules: DFHCSDUP

0302

Explanation: The record length specified in the SYSIN data set is invalid.

| 0304

| **Explanation:** DFHCSDUP has found an unrecognized
| resource type code in a CSD record. The unrecognized
| code does not match any of the function codes in the
| language definition table. This can occur for one of the
| following reasons:

- | 1. You are using a CICS release that does not support
| a type of definition that was created on the CSD file
| by a later CICS release.

| 2. The language definition table (DFHEITSP or
| DFHEITCU) is invalid for this CICS release.

| 3. The CSD manager (DFHDMP) has passed an
| invalid CSD record buffer to DFHPUP. This is a
| CICS internal logic error.

| **System action:** The CSD batch update utility
| terminates abnormally. If a SYSABEND or SYSUDUMP
| DD statement is provided, a system dump is produced.

| **User response:** Determine which of the possible
| reasons caused the error. If you can eliminate reasons 1
| and 2, you can assume that reason 3 applies.

| Take action corresponding to the reason you have
| established as follows:

| 1. Ignore the message.

| 2. Ensure that the library contains versions of
| DFHEITSP and DFHEITCU that are valid for the
| CICS release you are running.

| 3. You need further assistance from IBM to resolve this
| problem. See Part 4 of the *CICS Problem*
| *Determination Guide* for guidance on how to
| proceed.

| **Modules:** DFHCSDUP

| **0305**

| **Explanation:** An unexpected return code was received
| either while trying to close the alternate SYSIN and
| SYSPRINT DCBs (CLOSEDCB) or while trying to free
| the task local storage (FREETLS).

| **System action:** The CSD batch update utility
| terminates abnormally. If a SYSABEND or SYSUDUMP
| DD statement is provided, a system dump is produced.

| **User response:** You need further assistance from IBM
| to resolve this problem. See Part 4 of the *CICS Problem*
| *Determination Guide* for guidance on how to proceed.

| **Modules:** DFHCSDUP

| **0307**

| **Explanation:** An attempt to print the input command
| failed. Since messages cannot be issued, the utility must
| terminate.

| **System action:** The CSD batch update utility
| terminates abnormally. If a SYSABEND or SYSUDUMP
| DD statement is provided, a system dump is produced.

| **User response:** You need further assistance from IBM
| to resolve this problem. See Part 4 of the *CICS Problem*
| *Determination Guide* for guidance on how to proceed.

| **Modules:** DFHCSDUP

| **0308**

| **Explanation:** During the migration of a TCT table, a
| bad command sequence was found. This can occur for
| one of the following reasons:

- | • TYPETERM was not preceded by TERMINAL
- | • TERMINAL was not followed by TYPETERM

| **System action:** The CSD batch update utility
| terminates abnormally. If a SYSABEND or SYSUDUMP
| DD statement is provided, a system dump is produced.

| **User response:** Correct the TCT table to be migrated
| and rerun the job.

| **Modules:** DFHCSDUP

| **0309**

| **Explanation:** DFHCSDUP has found an unrecognized
| function code in a command. This is a CICS internal
| logic error.

| **System action:** The CSD batch update utility
| terminates abnormally. If a SYSABEND or SYSUDUMP
| DD statement is provided, a system dump is produced.

| **User response:** You need further assistance from IBM
| to resolve this problem. See Part 4 of the *CICS Problem*
| *Determination Guide* for guidance on how to proceed.

| **Modules:** DFHCSDUP

| **0321**

| **Explanation:** An internal error has occurred in module
| DFHCSDUP when invoked by a CSD utility command.

| **System action:** Message DFH5100 is issued and the
| CSD batch update utility terminates abnormally. If a
| SYSABEND or SYSUDUMP DD statement is provided,
| a system dump is produced.

| **User response:** You need further assistance from IBM
| to resolve this problem. See Part 4 of the *CICS Problem*
| *Determination Guide* for guidance on how to proceed.

| **Modules:** DFHCSDUP

| **0322**

| **Explanation:** While processing a MIGRATE command,
| the specified table to be migrated could not be loaded.

| **System action:** Message DFH5601 is issued and the
| CSD batch update utility terminates abnormally. If a
| SYSABEND or SYSUDUMP DD statement is provided,
| a system dump is produced.

| **User response:** You need further assistance from IBM
| to resolve this problem. See Part 4 of the *CICS Problem*
| *Determination Guide* for guidance on how to proceed.

| **Modules:** DFHCSDUP

| 0323

| **Explanation:** While processing a command, VSAM detected an error.

| **System action:** Message DFH5179 is issued preceded by either DFH5177 or DFH5178 depending on the error and the CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

| **User response:** See the description of the issued messages to determine the cause of the error.

| **Modules:** DFHCSDUP

| 0325

| **Explanation:** When the LIST command invoked DFHDMP to scan the objects on the CSD file, an error occurred during execution of the DFHDMP function.

| **System action:** Message DFH5180 is issued and the CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

| **User response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

| **Modules:** DFHCSDUP

| 0326

| **Explanation:** There has been an internal logic error in the DFHCSDUP utility program. The data in the back-translated output buffer is invalid. The length code may be out of range or the data fields in the wrong sequence. One or more of the data fields may be invalid.

| **System action:** Message DFH5184 is issued and the CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

| **User response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

| **Modules:** DFHCSDUP

| 0327

| **Explanation:** The language table DFHEITCU could not be loaded.

| **System action:** The CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

| **User response:** Refer to the preceding message which should specify the reason for the failure. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for

| guidance on how to proceed.

| **Modules:** DFHCSDUP

| 0328

| **Explanation:** The language table DFHEITCU could not be unloaded.

| **System action:** The CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

| **User response:** Refer to the preceding message which should specify the reason for the failure. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

| **Modules:** DFHCSDUP

| 0330

| **Explanation:** The cross reference table size for the table being migrated is too small.

| **System action:** The CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP statement is provided, a system dump is produced.

| **User response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

| **Modules:** DFHCSDUP

| 0331

| **Explanation:** DFHCSDUP was invoked to perform an EXTRACT command using a Language Environment-conforming HLL user exit, but the utility failed to initialize the CEE environment successfully.

| **System action:** The CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP statement is provided, a system dump is produced. Register 15 contains the initialization return code.

| **User response:** You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

| **Modules:** DFHCSDUP

| 0332

| **Explanation:** DFHCSDUP was invoked to perform an EXTRACT command using a Language Environment-conforming HLL user exit, but during execution the utility received a bad return code from the Language Environment.

| **System action:** The CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP statement is provided, a system dump is produced.

| Register 15 contains the Language Environment return code. code.

| **User response:** You need further assistance from IBM

| to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

| **Modules:** DFHCSDUP

| 04xx (external CICS interface) abend codes

| 0401

| **Explanation:** An external CICS interface (EXCI) request was issued using the CALL API or the EXEC API, and the EXCI stub DFHXCSTB link-edited with the application detected that it was running in AMODE 24. The external CICS interface only supports calls made in AMODE 31.

| **System action:** The application terminates abnormally.

| **User response:** Change the application so that EXCI calls are made in AMODE 31, or relink-edit the application AMODE 31.

| **Modules:** DFHXCSTB.

| 0402

| **Explanation:** The external CICS interface module DFHXCPRH issued an MVS ESTAE macro to establish a recovery environment, but a nonzero return code was returned from MVS.

| **System action:** The application terminates abnormally with a dump.

| **User response:** Examine the dump and any associated MVS messages produced to determine why the MVS ESTAE request failed.

| If the error occurred while processing an INITIALIZE_USER request on behalf of the application, an attempt to format the dump using the CICS IPCS dump formatter does not produce any formatted output. This is because the error occurred too early in EXCI initialization for there to be any control blocks.

| **Modules:** DFHXCPRH

| 0403

| **Explanation:** The external CICS interface module DFHXCPRH issued an MVS GETMAIN request to obtain storage for its XCGLOBAL block, but a nonzero return code was returned from MVS.

| **System action:** Module DFHXCPRH issues an MVS abend with abend code 0403 which invokes its ESTAE routine to clear up its environment. A SYSMDUMP is taken before returning control to the application. An application using the EXCI CALL API receives RESPONSE(SYSTEM_ERROR) REASON(XCGLOBAL_GETMAIN_ERROR) in its return area. The subreason1 field of the return area contains the R15 return code from MVS indicating why the GETMAIN failed. An application using the EXCI EXEC API receives RESP(LINKERR) RESP2(602).

| **User response:** Use the MVS R15 return code obtained from the application or from the dump to determine why the MVS GETMAIN request failed. If the reason is insufficient storage, increase the region size of the batch application.

| An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter does not produce any formatted output for the job because the error occurred too early in EXCI initialization for there to be any control blocks.

| **Modules:** DFHXCPRH

| 0404

| **Explanation:** The external CICS interface module DFHXCPRH needed to take an MVS SDUMP for an earlier reported problem. However the error has occurred too early in EXCI initialization for EXCI dump services to be available.

| **System action:** Module DFHXCPRH issues an MVS abend with abend code 0404 which invokes its ESTAE routine from which a SYSMDUMP is taken instead of an SDUMP to capture the earlier reported problem.

| **User response:** Examine the SYSMDUMP to determine the cause of the earlier reported problem.

| An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter does not produce any formatted output for the job because the error occurred too early in EXCI initialization for there to be any control blocks.

| **Modules:** DFHXCPRH

| 0405

| **Explanation:** The external CICS interface module DFHXCPRH issued an IEFSSREQ SSI verify request to MVS to determine the number of the CICS SVC type 3 SVC to use. The SSI VERIFY request failed.

| **System action:** Module DFHXCPRH issues an MVS abend with abend code 0405 which invokes its ESTAE routine to clear up its environment. A SYSMDUMP is taken before returning control to the application. An application using the EXCI CALL API receives RESPONSE(SYSTEM_ERROR) REASON(SS1_VERIFY_FAILED) in its return area. The subreason1 field of the return area contains the R15 return code from MVS indicating why the SSI verify failed. An application using the EXCI EXEC API receives RESP(LINKERR) RESP2(606).

| **User response:** Use the MVS R15 return code obtained

| from the application or from the dump to determine
| why the SSI VERIFY request failed.

| An attempt to format the SYSMDUMP produced with
| the CICS IPCS dump formatter does not produce any
| formatted output for the job because the error occurred
| too early in EXCI initialization for there to be any
| control blocks.

| **Modules:** DFHXCPRH

| **0406**

| **Explanation:** The external CICS interface module
| DFHXCPRH called the CICS SVC to initialize the EXCI
| environment. The CICS SVC call failed.

| **System action:** Module DFHXCPRH issues an MVS
| abend with abend code 0406 which invokes its ESTAE
| routine to clear up its environment. A SYSMDUMP is
| taken before returning control to the application. An
| application using the EXCI CALL API receives
| RESPONSE(SYSTEM_ERROR)
| REASON(CICS_SVC_CALL_FAILURE) in its return
| area. The subreason1 field of the return area contains
| the R15 return code from the CICS SVC indicating why
| it failed. An application using the EXCI EXEC API
| receives RESP(LINKERR) RESP2(607).

| **User response:** Use the MVS R15 return code obtained
| from the application or from the dump to determine
| why the CICS SVC call failed.

| An attempt to format the SYSMDUMP produced with
| the CICS IPCS dump formatter does not produce any
| formatted output for the job because the error occurred
| too early in EXCI initialization for there to be any
| control blocks.

| **Modules:** DFHXCPRH

| **0407**

| **Explanation:** The external CICS interface module
| DFHXCPRH issued a call to the CICS SVC to check
| whether the SVC in use is at the correct level to be
| used with the external CICS interface. The check failed
| indicating that the CICS SVC is not at the correct level.

| **System action:** Message DFHEX0100 is output, and
| module DFHXCPRH issues an MVS abend with abend
| code 0407 which invokes its ESTAE routine to clear up
| its environment. A SYSMDUMP is taken before
| returning control to the application. An application
| using the EXCI CALL API receives
| RESPONSE(SYSTEM_ERROR)
| REASON(INCORRECT_SVC_LEVEL) in its return area.
| An application using the EXCI EXEC API receives
| RESP(LINKERR) RESP2(627).

| **User response:** See the explanation of message
| DFHEX0100 for guidance.

| An attempt to format the SYSMDUMP produced with
| the CICS IPCS dump formatter does not produce any

| formatted output for the job because the error occurred
| too early in EXCI initialization for there to be any
| control blocks.

| **Modules:** DFHXCPRH

| **0408**

| **Explanation:** The external CICS interface module
| DFHXCPRH issued an MVS GETMAIN request for its
| working storage but a nonzero return code was
| returned from MVS.

| **System action:** Module DFHXCPRH issues an MVS
| abend with abend code 0408 which invokes its ESTAE
| routine to clear up its environment. A SYSMDUMP is
| taken before returning control to the application. An
| application using the EXCI CALL API receives
| RESPONSE(SYSTEM_ERROR)
| REASON(WS_GETMAIN_ERROR) in its return area.
| The subreason1 field of the return area contains the R15
| return code from MVS indicating why the GETMAIN
| failed. An application using the EXCI EXEC API
| receives RESP(LINKERR) RESP2(601).

| **User response:** Use the MVS R15 return code obtained
| from the application or from the dump to determine
| why the MVS GETMAIN request failed. If the reason is
| insufficient storage, increase the region size of the batch
| application.

| An attempt to format the SYSMDUMP produced with
| the CICS IPCS dump formatter does not produce any
| formatted output for the job because the error occurred
| too early in EXCI initialization for there to be any
| control blocks.

| **Modules:** DFHXCPRH

| **0409**

| **Explanation:** The external CICS interface module
| DFHXCPRH issued an MVS GETMAIN request for
| storage required for its SSI VERIFY request, but a
| nonzero return code was returned from MVS.

| **System action:** Module DFHXCPRH issues an MVS
| abend with abend code 0409 which invokes its ESTAE
| routine to clear up its environment. A SYSMDUMP is
| taken before returning control to the application. An
| application using the EXCI CALL API receives
| RESPONSE(SYSTEM_ERROR)
| REASON(VERIFY_BLOCK_GM_ERROR) in its return
| area. The subreason1 field of the return area contains
| the R15 return code from MVS indicating why the
| GETMAIN failed. An application using the EXCI EXEC
| API receives RESP(LINKERR) RESP2(605).

| **User response:** Use the MVS R15 return code obtained
| from the application or from the dump to determine
| why the MVS GETMAIN request failed. If the reason is
| insufficient storage, increase the region size of the batch
| application.

| An attempt to format the SYSMDUMP produced with

| the CICS IPCS dump formatter does not produce any
| formatted output for the job because the error occurred
| too early in EXCI initialization for there to be any
| control blocks.

| **Modules:** DFHXCPRH

| **0410**

| **Explanation:** The external CICS interface module
| DFHXCPRH issued an MVS GETMAIN request for an
| XCUSER block but a nonzero return code was returned
| from MVS.

| **System action:** Module DFHXCPRH issues an MVS
| abend with abend code 0410 which invokes its ESTAE
| routine to clear up its environment. A SYSMDUMP is
| taken before returning control to the application. An
| application using the EXCI CALL API receives
| RESPONSE(SYSTEM_ERROR)
| REASON(XCUSER_GETMAIN_ERROR) in its return
| area. The subreason1 field of the return area contains
| the R15 return code from MVS indicating why the
| GETMAIN failed. An application using the EXCI EXEC
| API receives RESP(LINKERR) RESP2(603).

| **User response:** Use the MVS R15 return code obtained
| from the application or from the dump to determine
| why the MVS GETMAIN request failed. If the reason is
| insufficient storage, increase the region size of the batch
| application.

| **Modules:** DFHXCPRH

| **0411**

| **Explanation:** The external CICS interface dump
| module DFHXCDMP was attempting to call the CICS
| SVC in order for an MVS SDUMP to be taken to
| capture an earlier problem. DFHXCDMP was unable to
| call the SVC as no SVC number was available.
| DFHXCDMP issued an 0411 abend in order that the
| callers ESTAE routine is invoked which takes a
| SYSMDUMP instead.

| **System action:** A SYSMDUMP is taken instead of an
| SDUMP for an earlier reported problem.

| **User response:** Use the SYSMDUMP produced to
| diagnose the earlier reported problem.

| An attempt to format the SYSMDUMP produced with
| the CICS IPCS dump formatter does not produce any
| formatted output for the job because the error occurred
| too early in EXCI initialization for there to be any
| control blocks.

| **Modules:** DFHXCDMP

| **0412**

| **Explanation:** The external CICS interface dump
| module DFHXCEIP was processing an EXCI EXEC API
| request and detected that the EXEC parameter list

| passed to it contained a function that is not supported
| by the external CICS interface.

| **System action:** The application is abnormally
| terminated with a dump.

| **User response:** This error indicates the parameter list
| being passed to the EXCI has not been generated by
| the CICS translator. The translator should always be
| used. Correct the application to specify the correct
| EXCI EXEC API command.

| An attempt to format the SYSMDUMP produced with
| the CICS IPCS dump formatter may not produce any
| formatted output for the job if this was the first EXCI
| request for this TCB.

| **Modules:** DFHXCEIP

| **0413**

| **Explanation:** The external CICS interface dump
| module DFHXCEIP was processing an EXCI EXEC API
| request and detected that the EXEC parameter list
| passed to it did not require the mandatory RETCODE
| parameter in which return codes are returned to the
| application.

| An attempt to format the SYSMDUMP produced with
| the CICS IPCS dump formatter may not produce any
| formatted output for the job if this was the first EXCI
| request for this TCB.

| **System action:** The application is abnormally
| terminated with a dump.

| **User response:** This error indicates the parameter list
| being passed to the EXCI has not been generated by
| the CICS translator. The translator should always be
| used. Correct the application to specify RETCODE.

| **Modules:** DFHXCEIP

| **0414**

| **Explanation:** The external CICS interface module
| DFHXCEIP issued an MVS ESTAE macro to establish a
| recovery environment but a nonzero return code was
| returned from MVS.

| **System action:** The application terminates abnormally
| with a dump.

| **User response:** Examine the dump and any associated
| MVS messages to determine why the MVS ESTAE
| request failed.

| An attempt to format the SYSMDUMP produced with
| the CICS IPCS dump formatter may not produce any
| formatted output for the job if this was the first EXCI
| request for this TCB.

| **Modules:** DFHXCEIP

0415

Explanation: The external CICS interface module DFHXCEIP detected an error early in EXCI initialization before EXCI dump services were available. DFHXCEIP issues abend 0415 so that its ESTAE routine is invoked from where an SYSMDUMP is taken instead to capture the error.

System action: The application terminates abnormally with a dump.

User response: Examine the SYSMDUMP to determine the cause of the earlier reported error.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter does not produce any formatted output for the job because the error occurred too early in EXCI initialization for there to be any control blocks.

Modules: DFHXCEIP

05xx CICS JVM Interface abend codes

0501

Explanation: Either a JCICS Java Class method or a CICS Domain call was invoked from a Java application running under control of a JVM and executing on a thread other than the initial process thread (IPT). CICS requests can only be issued when executing under the initial process thread.

System action: The thread is abended with a MVS 0501 user abend code causing the initial process thread to be abnormally terminated. Language environment recovery processing is driven causing a 4xxx abend to be issued under the J8 TCB on which the JVM is running. CICS recovery processing terminates the JVM and abnormally terminates the transaction with an ASRB abend code.

User response: If issued from a JCICS call, change the application so that these requests are issued when running under the initial process thread. Otherwise contact your local IBM support centre for assistance.

Modules: DFHCALLA, DFHCDKRN, DFHMSGIF, DFHTRCIF

thread waits for a time longer than the global timeout value, then CICS abends the thread with MVS abend code 0505, so forcing the requesting transaction to terminate, and release its resources.

System action: CICS will abend the requesting transaction which might help to relieve the shortage of MVS storage.

User response: You should decrease the MAXJVMTCBS parameter, to reduce the number of concurrent JVMs which may be requesting storage. For more information about how to do this, see the *CICS Performance Guide*.

Modules: DFHSMVP

0555

Explanation: A program check occurred, or an operating system or CICS abend was issued within the CICS JVM interface. CICS recovery processing issues an MVS 555 user abend in order to drive the language environment ESTAE routine, which is still active, as part of its cleanup and termination of the CICS task.

System action: The 555 abend code drives language environment recovery processing. The JVM is terminated and the CICS task is abnormally terminated with the abend code that first initiated CICS recovery processing.

User response: None. The 555 abend is an internal mechanism to ensure that CICS and Language environment recovery facilities correctly terminate the CICS task and the JVM environment.

Modules: DFHAPLJ

0505

Explanation: This abend occurs when a request for MVS storage waits for storage for a time longer than the global timeout value specified in SMVPA (storage management anchor).

CICS has determined that there is a shortage of MVS storage available for supporting JVMs, and has previously issued message DFHSM0139. Threads requiring MVS storage which cannot be satisfied are queued until MVS storage becomes available. If such a

1xxx - 9xxx (COBOL II) abend codes

Abend codes with 1 through 9 as the first character are issued by COBOL II applications running on CICS. The last three digits of the abend code, *xxx*, correspond to the digits *xxx* in the associated COBOL II run-time message, IGZ*xxx*I. For example, if you receive an abend code of 1001, the associated run-time message is IGZ001I.

COBOL II run-time messages are described in *VS COBOL II Application Programming Debugging*.

4xxx Language Environment abend codes

Abend codes in the range 4000 to 4095 are issued by Language Environment runtime library modules for LE enabled applications running on CICS.

When Language Environment detects an unrecoverable error, Language Environment terminates the transaction with an EXEC CICS abend with an abend code numbered from 4000-4095. A write-to-operator (WTO) is performed to write a CEE1000S message to the system console. This message contains the abend code and the reason code associated with the abend.

Some of these abends can occur when the system is under stress and is unable to acquire the resources required to report a previous abend or failure. In this case there will usually be other symptoms that the system is under stress (for example short on storage messages or other transactions being purged with AEXY or AKC3 abends), and inspection of the transaction dump should allow identification of the original abend.

Language Environment abend codes and run-time messages are described in *IBM Language Environment for MVS and VM Debugging Guide and Run-Time Messages*.

Bibliography

The CICS Transaction Server for z/OS library

The published information for CICS Transaction Server for z/OS is delivered in the following forms:

The CICS Transaction Server for z/OS Information Center

The CICS Transaction Server for z/OS Information Center is the primary source of user information for CICS Transaction Server. The Information Center contains:

- Information for CICS Transaction Server in HTML format.
- Licensed and unlicensed CICS Transaction Server books provided as Adobe Portable Document Format (PDF) files. You can use these files to print hardcopy of the books. For more information, see “PDF-only books.”
- Information for related products in HTML format and PDF files.

One copy of the CICS Information Center, on a CD-ROM, is provided automatically with the product. Further copies can be ordered, at no additional charge, by specifying the Information Center feature number, 7014.

Licensed documentation is available only to licensees of the product. A version of the Information Center that contains only unlicensed information is available through the publications ordering system, order number SK3T-6945.

Entitlement hardcopy books

The following essential publications, in hardcopy form, are provided automatically with the product. For more information, see “The entitlement set.”

The entitlement set

The entitlement set comprises the following hardcopy books, which are provided automatically when you order CICS Transaction Server for z/OS, Version 3 Release 1:

Memo to Licensees, GI10-2559
CICS Transaction Server for z/OS Program Directory, GI10-2586
CICS Transaction Server for z/OS Release Guide, GC34-6421
CICS Transaction Server for z/OS Installation Guide, GC34-6426
CICS Transaction Server for z/OS Licensed Program Specification, GC34-6608

You can order further copies of the following books in the entitlement set, using the order number quoted above:

CICS Transaction Server for z/OS Release Guide
CICS Transaction Server for z/OS Installation Guide
CICS Transaction Server for z/OS Licensed Program Specification

PDF-only books

The following books are available in the CICS Information Center as Adobe Portable Document Format (PDF) files:

CICS books for CICS Transaction Server for z/OS General

CICS Transaction Server for z/OS Program Directory, GI10-2586
CICS Transaction Server for z/OS Release Guide, GC34-6421

CICS Transaction Server for z/OS Migration from CICS TS Version 2.3, GC34-6425

CICS Transaction Server for z/OS Migration from CICS TS Version 1.3, GC34-6423

CICS Transaction Server for z/OS Migration from CICS TS Version 2.2, GC34-6424

CICS Transaction Server for z/OS Installation Guide, GC34-6426

CICS Diagnosis Reference, LY33-6110
CICS Data Areas, LY33-6107
CICS Supplementary Data Areas, LY33-6108
CICS Debugging Tools Interfaces Reference, LY33-6109

Other CICS books

The following publications contain further information about CICS, but are not provided as part of CICS Transaction Server for z/OS, Version 3 Release 1.

<i>Designing and Programming CICS Applications</i>	SR23-9692
<i>CICS Application Migration Aid Guide</i>	SC33-0768
<i>CICS Family: API Structure</i>	SC33-1007
<i>CICS Family: Client/Server Programming</i>	SC33-1435
<i>CICS Transaction Gateway for z/OS Administration</i>	SC34-5528
<i>CICS Family: General Information</i>	GC33-0155
<i>CICS 4.1 Sample Applications Guide</i>	SC33-1173
<i>CICS/ESA 3.3 XRF Guide</i>	SC33-0661

Determining if a publication is current

IBM regularly updates its publications with new and changed information. When first published, both hardcopy and BookManager® softcopy versions of a publication are usually in step. However, due to the time required to print and distribute hardcopy books, the BookManager version is more likely to have had last-minute changes made to it before publication.

Subsequent updates will probably be available in softcopy before they are available in hardcopy. This means that at any time from the availability of a release, softcopy versions should be regarded as the most up-to-date.

For CICS Transaction Server books, these softcopy updates appear regularly on the *Transaction Processing and Data Collection Kit* CD-ROM, SK2T-0730-xx. Each reissue of the collection kit is indicated by an updated order number suffix (the -xx part). For example, collection kit SK2T-0730-06 is more up-to-date than SK2T-0730-05. The collection kit is also clearly dated on the cover.

Updates to the softcopy are clearly marked by revision codes (usually a # character) to the left of the changes.

Accessibility

Accessibility features help a user who has a physical disability, such as restricted mobility or limited vision, to use software products successfully.

You can perform most tasks required to set up, run, and maintain your CICS system in one of these ways:

- using a 3270 emulator logged on to CICS
- using a 3270 emulator logged on to TSO
- using a 3270 emulator as an MVS system console

IBM Personal Communications provides 3270 emulation with accessibility features for people with disabilities. You can use this product to provide the accessibility features you need in your CICS system.

Sending your comments to IBM

If you especially like or dislike anything about this book, please use one of the methods listed below to send your comments to IBM.

Feel free to comment on what you regard as specific errors or omissions, and on the accuracy, organization, subject matter, or completeness of this book.

Please limit your comments to the information in this book and the way in which the information is presented.

To ask questions, make comments about the functions of IBM products or systems, or to request additional publications, contact your IBM representative or your IBM authorized remarketer.

When you send comments to IBM, you grant IBM a nonexclusive right to use or distribute your comments in any way it believes appropriate, without incurring any obligation to you.

You can send your comments to IBM in any of the following ways:

- By mail, to this address:

IBM United Kingdom Limited
User Technologies Department (MP095)
Hursley Park
Winchester
Hampshire
SO21 2JN
United Kingdom

- By fax:
 - From outside the U.K., after your international access code use 44-1962-816151
 - From within the U.K., use 01962-816151
- Electronically, use the appropriate network ID:
 - IBMLink™: HURSLEY(IDRCF)
 - Internet: idrcf@hursley.ibm.com

Whichever you use, ensure that you include:

- The publication title and order number
- The topic to which your comment applies
- Your name and address/telephone number/fax number/network ID.
