Explanation: VSAM has detected an error during OPEN processing for the auxiliary temporary storage data set. The inserts identify the return code and the error code.

System action: The temporary storage initialization task is abnormally terminated.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Check the return code and error code in the appropriate VSAM publication.

Module: DFHTSDM

XMEOUT Parameters: *applid, X'retcode', X'errorcode'*

Destination: Console

DFHTS1373 *applid* VSAM error processing CLOSE for temporary storage data set, R15=*X'retcode'*, RC=*X'errorcode'*

Explanation: VSAM has detected an error during CLOSE processing for the auxiliary temporary storage data set. The inserts identify the return code and the error code.

System action: The temporary storage initialization task is abnormally terminated.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Check the return code and error code in the appropriate VSAM publication.

Module: DFHTSDM

XMEOUT Parameters: *applid, X'retcode', X'errorcode'*

Destination: Console

DFHTS1374 *applid* VSAM error processing PUT for temporary storage data set, R15=*X'retcode'*, RC=*X'errorcode'*

Explanation: VSAM has detected an error during PUT processing for the auxiliary temporary storage data set. The inserts identify the return code and the error code.

System action: The temporary storage initialization task is abnormally terminated.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Check the return code and error code in the appropriate VSAM publication.

Module: DFHTSDM

XMEOUT Parameters: *applid, X'retcode', X'errorcode'*

Destination: Console

DFHTS1375 *applid* VSAM error processing GET for temporary storage data set, R15=*X'retcode'*, RC=*X'errorcode'*

Explanation: VSAM has detected an error during GET processing for the auxiliary temporary storage data set. The inserts identify the return code and the error code.

System action: The temporary storage initialization task is abnormally terminated.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Check the return code and error code in the appropriate VSAM publication.

Module: DFHTSDM

XMEOUT Parameters: *applid, X'retcode', X'errorcode'*

Destination: Console

DFHTS1376 *applid* VSAM error processing MODCB for temporary storage data set, R15=*X'retcode'*

Explanation: VSAM has detected an error during MODCB processing for the auxiliary temporary storage data set. The insert identifies the return code.

System action: The temporary storage initialization task is abnormally terminated.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Check the return code and error code in the appropriate VSAM publication.

Module: DFHTSDM

XMEOUT Parameters: *applid, X'retcode'*

Destination: Console

DFHTS1390 *date time applid* TSQUEUE *name (X'hexval')* not recovered. Time last referenced *hh:mm:ss mm/dd/yy*. TSAGE: *tsage*

Explanation: During an emergency start, the recoverable temporary storage queue (TSQUEUE) *name* was not recovered. This is because the time elapsed since it was last referenced exceeded the aging limit of temporary storage data as specified in the value of TSAGE *tsage* in the DFHTST macro.

System action: The queue is not recovered and processing continues.

User response: Ensure that the value of TSAGE specified in the DFHTST macro is adequate.

Module: DFHTSRM

XMEOUT Parameters: *date, time, applid, name, X'hexval', hh:mm:ss, mm/dd/yy, tsage*

Destination: CSMT

DFHTS1576 *applid* Temporary storage format error

Explanation: A nonzero return code was received from the VSAM macro GENCB when CICS was attempting to build a VSAM request parameter list (RPL).

System action: CICS terminates abnormally with a system dump. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHTSDM

XMEOUT Parameter: *applid*

Destination: Console

DFHTS1599 *applid* Region/Partition size insufficient to initialize CICS.

Explanation: The temporary storage domain has been unable to GETMAIN sufficient storage for its own control blocks during initialization.

System action: CICS terminates with a system dump.

User response: Increase the region/partition size and retry. You can get information about the size and number of occurrences of relevant control blocks by using the *CICS Data Areas* in conjunction with the system dump.

Module: DFHTSDM

XMEOUT Parameter: *applid*

Destination: Console

DFHUPnnnn messages

DFHUP0201 *applid* ANOTHER PRODUCT HAS ALREADY REGISTERED FOR THIS DOMAIN. IFAUSAGE RC 4 HAS BEEN ISSUED. MODULE *module*

Explanation: A return code of 4 has been issued in response to an IFAUSAGE macro call. Another product has already registered for this domain.

System action: The current request is accepted but there is duplicate recording of data for both products.

User response: Examine the type 89 records to determine which product is causing the duplicate registration to the domain.

See the *MVS/ESA Support for Measured Usage License Charges* manual for an explanation of the return code.

Module: DFHCSDUP, DFHDRPA, DFHDUP, DFHEXP1, DFHJUP, DFHKETCB, DFHMNDUP, DFHMSCAN, DFHSTUP, DFHTUP, DFHWOS

Destination: Console

DFHUP0202 *applid* THE UNAUTHORIZED REQUEST LIMIT HAS BEEN EXCEEDED. IFAUSAGE RC 8 HAS BEEN ISSUED. MODULE *module*

Explanation: A return code of 8 has been issued in response to an IFAUSAGE macro call. This unauthorized request would cause the number of such requests to exceed the unauthorized request limit.

System action: Processing continues.

User response: See the *MVS/ESA Support for Measured Usage License Charges* manual for an explanation of the return code.

You may need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCSDUP, DFHDRPA, DFHDUP, DFHEXP1, DFHJUP, DFHKETCB, DFHMNDUP, DFHMSCAN, DFHSTUP, DFHTUP, DFHWOS

Destination: Console

DFHUP0203 *applid* USAGE DATA COLLECTION FUNCTION IS NOT AVAILABLE ON THIS SYSTEM. IFAUSAGE RC 16 HAS

DFHUSnnnn messages

DFHUS0001 *applid* An abend (code *aaa/bbbb*) has occurred at offset *X'offset'* in module *modname*.

Explanation: An abnormal end (abend) or program

BEEN ISSUED. MODULE *module*

Explanation: A return code of 16 has been issued in response to an IFAUSAGE macro call. The usage data collection function is not available on this system.

System action: Processing continues.

User response: If SMF usage processing is not available on this system (for example, if apar 0W02855 is not installed), you can ignore this message.

See the *MVS/ESA Support for Measured Usage License Charges* manual for an explanation of the return code.

You may need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHTUP, DFHWOS, DFHKETCB, DFHSIP

Destination: Console

DFHUP0204 *applid* AN INVALID REQUEST HAS BEEN MADE. IFAUSAGE RETURN CODE *X'code'*. MODULE *module*

Explanation: The return code *X'code'* has been issued in response to an IFAUSAGE macro call. An invalid request or an internal parameter error has occurred.

System action: Processing continues.

User response: If SMF usage processing is not available on this system (for example, if apar 0W02855 is not installed) you can ignore this message.

See the *MVS/ESA Support for Measured Usage License Charges* manual for an explanation of the return code.

You may need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCSDUP, DFHDRPA, DFHDUP, DFHEXP1, DFHJUP, DFHKETCB, DFHMNDUP, DFHMSCAN, DFHSTUP, DFHTUP, DFHWOS

Destination: Console

check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHUSAD, DFHUSDM, DFHUSFL, DFHUSIS, DFHUSST, DFHUSXM

XMEOUT Parameters: *applid, aaa/bbbb, X'offset', modname*

Destination: Console

DFHUS0002 *applid* **A severe error (code *X'code*) has occurred in module *modname*.**

Explanation: An error has been detected in module *modname*. The code *X'code* is the exception trace point ID which uniquely identifies what the error is and where it was detected.

System action: An exception entry (code *X'code* in the message) is made in the trace table. A system

dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHUSAD, DFHUSDM, DFHUSFL, DFHUSIS, DFHUSST, DFHUSXM

XMEOUT Parameters: *applid, X'code', modname*

Destination: Console

DFHUS0004 *applid* **A possible loop has been detected at offset *X'offset* in module *modname*.**

Explanation: A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset *X'offset*. This is the offset of the instruction which was executing at the time the error was detected.

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Notify the system programmer. If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module *modname* in the message is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname*, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. However you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHUSAD, DFHUSDM, DFHUSFL, DFHUSIS, DFHUSST, DFHUSXM

XMEOUT Parameters: *applid, X'offset', modname*

Destination: Console

DFHUS0006 *applid* **Insufficient storage to satisfy Getmain (code X'code') in module *modname*. MVS code *mvscode*.**

Explanation: An MVS GETMAIN was issued by module *modname*, but there was insufficient storage available to satisfy the request.

The code X'code' is the exception trace point ID which uniquely identifies the place where the error was detected.

The code *mvscode* is the MVS GETMAIN return code.

System action: An exception entry is made in the trace table (code X'code'). A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: If CICS has been terminated by another module, look out for the relevant termination messages (from, for example, the domain manager), and look up the User Response for these messages.

If CICS is still running, the problem may be a temporary one which rights itself if more storage becomes available. If you can manage without module *modname*, you may decide to continue and bring CICS down at a convenient time to resolve the problem. If the message recurs or if you cannot run without the full use of all CICS modules, you should bring CICS down in a controlled shutdown.

You can get diagnostic information about the MVS return code by consulting the relevant MVS codes manual.

Try decreasing the size limits of the DSAs or EDSAs. Or, try increasing the size of the whole region, if it is not already at maximum size. See the *CICS System Definition Guide* or the *CICS Performance Guide* for more information on CICS storage.

Module: DFHUSDM, DFHUSAD

XMEOUT Parameters: *applid, X'code', modname, mvscode*

Destination: Console

DFHUS0050 *applid* **The default userid *userid1* cannot be used by this CICS job with region userid *userid2*.**

Explanation: The default userid specified in the system initialization parameter DFLTUSER cannot be used by this CICS job.

The region userid for this CICS job is not authorized to use the userid specified in the DFLTUSER system initialization parameter.

System action: CICS initialization terminates.

User response: Ensure the default userid and the userid for the CICS region are correct.

If the two userids are correct, obtain the necessary authorization for the default userid to be used by the CICS region userid. This may require the assistance of a security administrator.

Previous messages may have been produced by the job giving additional information.

Module: DFHUSDM

XMEOUT Parameters: *applid, userid1, userid2*

Destination: Console

DFHUS0070 *applid* **Security check for CICS region userid (*userid*) has failed. SAF codes are (X'safresp', X'safreas'). ESM codes are (X'esmresp', X'esmreas'). USAD reason code is (*reason*).**

Explanation: An attempt was made to establish security for the CICS region userid but this was rejected by the external security manager (ESM).

System action: CICS initialization terminates.

User response: The response and reason codes (*safresp* and *safreas*) returned by the system authorization facility (SAF), and the response and reason codes (*esmresp* and *esmreas*) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=VERIFY or RACROUTE REQUEST=EXTRACT macros. For the meaning of the response and reason codes in the message see *z/OS MVS Programming: Authorized Assembler Services Guide* (SA22-7608) and *z/OS Security Server Racroute Macro Reference* (SA22-7692).

There may be further messages produced by CICS or the external security manager (ESM) which provide more information.

If the ESM and SAF codes are not sufficient to explain the problem, then the USAD response code can be analyzed by IBM support. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHUSDM

XMEOUT Parameters: *applid, userid, X'safresp', X'safreas', X'esmresp', X'esmreas', reason*

Destination: Console

DFHUS0120 *applid* **An error occurred when performing SNSCOPE checking for a signon request.**

Explanation: The MVS ENQ issued as part of SNSCOPE checking has failed. The return code indicates that the CICS job has reached the limit of concurrent resource requests.

System action: A system dump is suppressed, unless you have specifically enabled dumps for this dumpcode in the dump table. The request to signon is rejected.

User response: See the OS/390 MVS Programming Authorized Assembler Services Guide for guidance on increasing the MVS ENQ limit. The MVS ENQ is issued by CICS in an unauthorized state.

Module: DFHUSAD, DFHUSFL

XMEOUT Parameter: *applid*

Destination: Console

DFHUS0150 *applid* **An attempt to establish security has failed for userid *userid* in group *groupid*, {no terminal, | netname | console }*portname* *applid* *applid*. Unable to initialize the transaction *tranid*. SAF codes are (*X'safresp', X'safreas'*). ESM codes are (*X'esmresp', X'esmreas'*).**

Explanation: An attempt was made to establish security for userid *userid* in group *groupid* with access to resources allowed for the terminal or console

portname and the application *applid*. The attempt was rejected by the external security manager (ESM).

The transaction *tranid* cannot be initialized.

System action: Security has not been established for the userid. The attempt to initialize the transaction has failed.

User response: The response and reason codes (*safresp* and *safreas*) returned by the system authorization facility (SAF), and the response and reason codes (*esmresp* and *esmreas*) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=VERIFY or RACROUTE REQUEST=EXTRACT macros. These return codes are described in the *OS/390 MVS Programming: Authorized Assembler Services Guide* and in *External Security Interface (RACROUTE) Macro Reference for MVS and VM* (SC28-1366). See these manuals for an explanation of the codes.

There may be further messages produced by CICS or the external security manager (ESM) which provide more information.

Module: DFHUSXM

XMEOUT Parameters: *applid, userid, groupid, {99=no terminal, , 1=netname , 2=console }, portname, applid, tranid, X'safresp', X'safreas', X'esmresp', X'esmreas'*

Destination: Console

DFHUS0200 *date time applid* **User *userid* in group *groupid* { at netname | at console }*portname* has been timed out.**

Explanation: User *userid* in group *groupid* (at terminal *portname* if appropriate) has been removed from this CICS system because the userid has been unused for a period longer than that specified in the USRDELAY system initialization parameter.

System action: Processing continues.

User response: See the *CICS System Definition Guide* for more information about USRDELAY.

Module: DFHUSDM

XMEOUT Parameters: *date, time, applid, userid, groupid, {1= at netname , 2= at console }, portname*

Destination: CSCS

DFHWBnnnn messages

DFHWB0001 *applid* An abend (code *aaa/bbbb*) has occurred at offset *X'offset'* in module *modname*.

Explanation: An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem. If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHWBWB

XMEOUT Parameters: *applid*, *aaa/bbbb*, *X'offset'*, *modname*

Destination: Console

DFHWB0002 *applid* A severe error (code *X'code'*) has occurred in module *modname*.

Explanation: An error has been detected in module *modname*. The code *X'code'* is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

System action: An exception entry (code *X'code'* in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHWBST, DFHWBTC, DFHWBDM, DFHWBQM, DFHWBSR, DFHWBXM

XMEOUT Parameters: *applid*, *X'code'*, *modname*

Destination: Console

DFHWB0004 *applid* A possible loop has been detected at offset *X'offset'* in module *modname*.

Explanation: A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset *X'offset'*. This is the offset of the instruction that was executing at the time the error was detected.

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Either this is a critical error and CICS is terminated,

even if you have specified in the dump table that CICS should not terminate.

Or CICS will continue unless you have specified in the dump table that CICS should terminate. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Notify the system programmer. If CICS has not been terminated, it will be necessary to decide whether the problem is serious enough to bring CICS down.

Because some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS will purge a CICS function that exceeds the runaway task time interval that you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that the module *modname* will be terminated and CICS will continue.

If you have declared ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you will have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname*, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You will have to bring CICS down at a suitable time to do this permanently. However, you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you may need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHWBST, DFHWBTC

XMEOUT Parameters: *applid, X'offset', modname*

Destination: Console

DFHWB0006 *applid* **Insufficient storage to satisfy Getmain (code *X'code*) in module *modname*. MVS code *mvscode*.**

Explanation: An MVS GETMAIN was issued by module *modname* but there was insufficient storage available to satisfy the request.

The code *X'code* is the exception trace point ID which uniquely identifies the place where the error was detected.

The code *mvscode* is the MVS GETMAIN return code.

During initialization, CICS may not have access to the user's *applid* coded in the SIT. If CICS produces this message in these circumstances, it uses the default *applid* value DBDCCICS.

System action: CICS will terminate with a system dump. An exception entry is made in the trace table (code *code* in the message).

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Inform the system programmer.

You can get diagnostic information about the MVS return code by consulting the relevant MVS codes manual which is listed in the book list at the front of this book.

Try decreasing the overall size limit of the DSAs or EDSAs. Or, try increasing the size of the whole region, if it is not already at maximum size. If CICS is not already terminated, you will need to bring CICS down to do this. See the *CICS System Definition Guide* or the *CICS Performance Guide* for further information on CICS storage.

Module: DFHWBST

XMEOUT Parameters: *applid, X'code', modname, mvscode*

Destination: Console

DFHWB0100 *date time applid tranid* **The CICS Web Interface program cannot link to program DFHWBBLI. EIBRESP: *eibresp*. EIBRESP2 *resp2val*. Host IP address: *hostaddr*. Client IP address: *clientaddr*. { / TCPIP SERVICE: } *tcpip service***

Explanation: The alias program used EXEC CICS LINK but was unable to link to program DFHWBBLI.

System action: The link is abandoned. An HTTP response code of 500 (internal server error) is returned to the Web Browser. The alias abends with abend code AWBL.

User response: Use the CEDA transaction to ensure that program DFHWBBLI has been correctly defined and installed.

Module: DFHWBA

XMEOUT Parameters: *date, time, applid, tranid, eibresp, resp2val, hostaddr, clientaddr, {1=, 2= TCPIP SERVICE: }, tcpip service*

Destination: CWBO

DFHWB0101 *date time applid tranid* **The CICS Web Interface alias program DFHWBA detected a failure in program DFHWBBLI. Host IP address *hostaddr*. Client IP address: *clientaddr*. { / TCPIP SERVICE: } *tcpip service***

Explanation: Program DFHWBBLI has returned an error response to the alias.

System action: The request is abandoned. The error response returned by program DFHWBBLI is returned to the Web Browser in an HTTP response

403 The userid associated with the request is not

authorized to invoke the requested converter program, or the requested server program.

- 404** A link to the converter program or to the server program failed because CICS could not locate the requested program.
- 500** A link to the converter program or to the server program failed with an unexpected error.
- 503** A link to the converter program or to the server program failed for one of the following reasons:
- The server program is defined as remote, but the link to this program failed with a SYSID error, so the remote connection is either not defined correctly, or not active.
 - The link to the converter or the server program failed with the ROLLEDBACK response.

The alias abends with abend code AWBM unless suppressed by the URM DFHWBEP.

User response: Check program DFHWBBLI and the programs which it calls.

Module: DFHWBA

XMEOUT Parameters: *date, time, applid, tranid, hostaddr, clientaddr, {1=, 2= TCPIP SERVICE: }, tcpip service*

Destination: CWBO

DFHWB0102 *date time applid tranid* **The CICS Web Interface alias program has received an incorrect response on a call made to CICS during alias initialization.**
EIBRESP: *eibresp* **EIBRESP2:** *resp2val.* {
| TCPIP SERVICE }tcpip service

Explanation: The alias program has received an unexpected response on a call made to CICS during alias initialization.

System action: The alias abends with abend code AWBI.

User response: You may need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHWBA

XMEOUT Parameters: *date, time, applid, tranid, eibresp, resp2val, {1=, 2= TCPIP SERVICE: }, tcpip service*

Destination: CWBO

DFHWB0103 *date time applid tranid* **The CICS Web Interface alias program has received an error response (code X'code') on a call made to CICS during alias initialization.** {
*| TCPIP SERVICE:
}tcpip service*

Explanation: The alias program was unable to locate the START data for this request, or the START data was invalid. The error response code X'code' is the exception trace point id that uniquely identifies which error has occurred. A code of '4565'X means that the START data was missing, and '4566'X means that the START data was invalid.

System action: The alias abends with abend code AWBF and a trace entry is made in the trace table.

User response: The alias program DFHWBA is only to be used for alias transactions started by the CICS Web Interface. User-written applications should not be starting alias transactions, as data passed to the alias will not be in the expected format.

Module: DFHWBA

XMEOUT Parameters: *date, time, applid, tranid, X'code', {1=, 2= TCPIP SERVICE: }, tcpip service*

Destination: CWBO

DFHWB0106 *date time applid tranid* **The CICS Web Interface program DFHWBA has detected an error.** {
*| TCPIP SERVICE:
}tcpip service*

Explanation: The alias had detected an error.

System action: A system dump is taken. The alias abends with abend code AWBH. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Examine the diagnostics to determine the reason for the error.

Module: DFHWBA

XMEOUT Parameters: *date, time, applid, tranid, {1=, 2= TCPIP SERVICE: }, tcpip service*

Destination: CWBO

DFHWB0108 *date time applid tranid* **The CICS Web Interface alias program has detected an abend. Host IP address:** *hostaddr.*
Client IP address: *clientaddr.* {
| TCPIP SERVICE: }tcpip service

Explanation: The alias has detected an abend.

System action: The alias abends with abend code AWBK.

User response: Examine the diagnostics to determine the reason for the error.

Module: DFHWBA

XMEOUT Parameters: *date, time, applid, tranid, hostaddr, clientaddr, {1=, 2= TCPIPSERVICE: }, tcpipservice*

Destination: CWBO

DFHWB0109I *applid* Web domain initialization has started.

Explanation: This is an informational message indicating the start of Web domain initialization.

System action: CICS initialization continues.

User response: None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Module: DFHWBDM

XMEOUT Parameter: *applid*

Destination: Console

DFHWB0110I *applid* Web domain initialization has ended.

Explanation: Web domain initialization has completed successfully.

System action: CICS initialization continues.

User response: None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Module: DFHWBDM

XMEOUT Parameter: *applid*

Destination: Console

DFHWB0111 *applid* WB Domain initialization failed. Reason Code *X'rc'*.

Explanation: The CICS Web domain initialization failed with reason code *rc*.

System action: CICS initialization continues. Subsequent calls to the components of the CICS Web environment may fail.

User response: Use the reason code *rc* to determine why initialization failed. The possible reasons are

- 1 Storage for the Web anchor block could not be obtained.
- 5 Storage for the State Manager anchor block could not be obtained.
- 6 The creation of the State Token Directory failed.
- 7 The subpool required for state management could not be added.

8 The subpool required for HTTP buffers could not be added.

9 The addition of the Web State Manager lock failed.

A The subpool required for 3270 buffers could not be added.

B The initialization of the webrequest class failed.

Module: DFHWBDM

XMEOUT Parameters: *applid, X'rc'*

Destination: Console

DFHWB0114 *date time applid tranid* A non-HTTP request has been received by an HTTP service. The request has been rejected. Host IP address: *hostaddr*. Client IP address: *clientaddr.{ | TCPIPSERVICE: }tcpipservice*

Explanation: CICS Web Support has received a non-HTTP request or a SSL request for a HTTP TCPIPSERVICE.

System action: The request is rejected.

User response: Correct the TCPIPSERVICE definition to suit the type of request being sent.

Module: DFHWBXN

XMEOUT Parameters: *date, time, applid, tranid, hostaddr, clientaddr, {1=, 2= TCPIPSERVICE: }, tcpipservice*

Destination: CWBO

DFHWB0117 *date time applid tranid* The CICS Web Interface program DFHWBBLI has received a corrupt parameter list from the converter program *program_name* during {Decode | Encode} processing. { | TCPIPSERVICE: }*tcpipservice*

Explanation: Program DFHWBBLI received an error response from the converter program *program_name* during either Decode or Encode processing, and the parameter list being passed was corrupt.

System action: An error message is sent to the client and an exception trace entry is made in the trace table.

User response: Ensure that the converter program being used is correct.

Module: DFHWBBLI

XMEOUT Parameters: *date, time, applid, tranid, program_name, {4=Decode, 5=Encode}, {1=, 2= TCPIPSERVICE: }, tcpipservice*

Destination: CWBO

DFHWB0118 *date time applid tranid* The CICS Web Interface program DFHWBBLI has detected an error. { | TCPIP SERVICE: }tcpip service

Explanation: Program DFHWBBLI has detected an error.

System action: A system dump is taken. The transaction abends with abend code AWBR. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Examine the diagnostics to determine the reason for the error.

Module: DFHWBBLI

XMEOUT Parameters: *date, time, applid, tranid, {1=, 2= TCPIP SERVICE: }, tcpip service*

Destination: CWBO

DFHWB0119 *date time applid tranid* The CICS Web Interface program DFHWBBLI has been started incorrectly. { | TCPIP SERVICE: }tcpip service

Explanation: Program DFHWBBLI has detected an error while validating initialization information. This probably means that the program has been started incorrectly.

System action: The transaction abends with abend code AWBQ.

User response: Check that the program was not started by a transient data trigger level or by a CECI user.

Module: DFHWBBLI

XMEOUT Parameters: *date, time, applid, tranid, {1=, 2= TCPIP SERVICE: }, tcpip service*

Destination: CWBO

DFHWB0120 *date time applid tranid* The CICS Web Interface program DFHWBBLI cannot link to program *program_name*.
EIBRESP *eibresp* **EIBRESP2:** *resp2val*. { | TCPIP SERVICE: }tcpip service

Explanation: Program DFHWBBLI used an EXEC CICS LINK but was unable to link to the given program and an EIB response was returned.

System action: The link is abandoned.

User response: Ensure that the program definition is correct.

Module: DFHWBBLI

XMEOUT Parameters: *date, time, applid, tranid, program_name, eibresp, resp2val, {1=, 2= TCPIP SERVICE: }, tcpip service*

Destination: CWBO

DFHWB0121 *date time applid tranid* The CICS Web Interface program DFHWBBLI encountered an error during Decode processing in the converter program.
Response code: *respcode*, **reason code** *reasoncode*. { | TCPIP SERVICE: }tcpip service

Explanation: The Decode function of the converter has returned an error.

System action: An error message is sent to the client.

User response: The response code insert gives the RESPONSE code returned by the converter program. The reason code insert gives the REASON code returned by the converter program.

The values defined by CICS for these fields are defined in copybook DFHWBUCD. The CICS defined values for the RESPONSE code are

0	OK
4	Exception
8	Invalid data supplied
16	Disaster

The CICS defined values for the REASON code are

1	Security failure
2	Corrupt client data

Users can architect their own response and reason code values to be returned by the analyzer, but they should use values other than those defined in the CICS supplied copybook DFHWBUCD.

Examine the response and reason codes returned to determine the cause of the error.

Module: DFHWBBLI

XMEOUT Parameters: *date, time, applid, tranid, program, respcode, reasoncode, {1=, 2=TCPIP SERVICE: }, tcpip service*

Destination: CWBO

DFHWB0122 *date time applid tranid* The CICS Web Interface program DFHWBBLI encountered an error during Encode processing in the converter program.
Response code: *respcode*, **reason code** *reasoncode*. { | TCPIP SERVICE: }tcpip service

Explanation: The Encode function of the converter program has returned an error.

System action: An error message is sent to the client.

User response: The response code insert gives the RESPONSE code returned by the converter program. The reason code insert gives the REASON code returned by the converter program.

The values defined by CICS for these fields are defined in copybook DFHWBUCD. The CICS defined values for the RESPONSE code are

0	OK
4	Exception
8	Invalid data supplied
16	Disaster

The CICS defined values for the REASON code are

1	Security failure
2	Corrupt client data

Users can architect their own response and reason code values to be returned by the analyzer, but they should use values other than those defined in the CICS supplied copybook DFHWBUCD.

Examine the response and reason codes returned to determine the cause of the error.

Module: DFHWBBLI

XMEOUT Parameters: *date, time,applid, tranid, program, respcode, reasoncode, {1= , 2=TCPIPSERVICE: }, tcpipservice*

Destination: CWBO

DFHWB0123 *date time applid tranid* **The CICS Web Interface program DFHWBA1 has detected an error.**{ | *TCPIPSERVICE: }tcpipservice*

Explanation: Program DFHWBA1 has detected an error.

System action: A system dump is taken. The transaction abends with abend code AWBR. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Examine the diagnostics to determine the reason for the error.

Module: DFHWBA1

XMEOUT Parameters: *date, time,applid, tranid, {1= , 2= TCPIPSERVICE: }, tcpipservice*

Destination: CWBO

DFHWB0124 *date time applid tranid* **The CICS Web Interface program DFHWBA1 has been started incorrectly.**{ | *TCPIPSERVICE: }tcpipservice*

Explanation: Program DFHWBA1 has detected an error while validating initialization information. This probably means that the program has been started incorrectly.

System action: The transaction abends with abend code AWBQ.

User response: Check that the program was not started by a transient data trigger level or by a CECI user.

Module: DFHWBA1

XMEOUT Parameters: *date, time,applid, tranid, {1= , 2= TCPIPSERVICE: }, tcpipservice*

Destination: CWBO

DFHWB0125 *date time applid tranid* **The CICS Web Interface program DFHWBBLI has detected an abend issued by the program** *program.*{ | *TCPIPSERVICE: }tcpipservice*

Explanation: Program DFHWBBLI has detected an abend by the program that was servicing the request.

System action: The alias returns control to the caller.

User response: Examine the diagnostics to determine the reason for the error.

Module: DFHWBBLI

XMEOUT Parameters: *date, time,applid, tranid, program, {1= , 2= TCPIPSERVICE: }, tcpipservice*

Destination: CWBO

DFHWB0126 *date time applid tranid* **The CICS Web Interface program DFHWBBLI has detected an abend issued by Encode in converter program** *program.*{ | *TCPIPSERVICE: }tcpipservice*

Explanation: Program DFHWBBLI has detected an abend by the program that was servicing the request during Encode processing.

System action: The alias returns control to the caller.

User response: Examine the diagnostics to determine the reason for the error.

Module: DFHWBBLI

XMEOUT Parameters: *date, time,applid, tranid, program, {1= , 2= TCPIPSERVICE: }, tcpipservice*

Destination: CWBO

DFHWB0127 *date time applid tranid* **The CICS Web Interface program DFHWBBLI has detected an abend issued by Decode in converter** *program.*{ | *TCPIPSERVICE: }tcpipservice*

Explanation: Program DFHWBBLI has detected an abend by the converter that was servicing the request during Decode processing.

System action: The alias returns control to the caller.

User response: Examine the diagnostics to determine the reason for the error.

Module: DFHWBBLI

XMEOUT Parameters: *date, time,applid, tranid, program, {1= , 2= TCPIPSERVICE: }, tcpipservice*

Destination: CWBO

DFHWB0128 *date time applid tranid* **An error has been detected by program *program*.{ | TCPIPSERVICE: }tcpipservice**

Explanation: Program DFHWBBLI has detected an error.

System action: The alias returns control to the caller.

User response: Examine the diagnostics to determine the reason for the error.

Module: DFHWBBLI

XMEOUT Parameters: *date, time,applid, tranid, program, {1= , 2= TCPIPSERVICE: }, tcpipservice*

Destination: CWBO

DFHWB0130 *date time applid tranid* **No state token passed to program DFHWBLT.{ | TCPIPSERVICE: }tcpipservice**

Explanation: Program DFHWBLT was not passed the expected state token.

System action: The transaction abends with code AWC2, and an exception trace entry 410C is written.

User response: You may need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHWBLT

XMEOUT Parameters: *date, time,applid, tranid, {1= , 2= TCPIPSERVICE: }, tcpipservice*

Destination: CWBO

DFHWB0131 *date time applid tranid* **An error code *X'code'* occurred in DFHWBLT while accessing the Web state data for this transaction.{ | TCPIPSERVICE: }tcpipservice**

Explanation: The Web Bridge Exit program, DFHWBLT, has detected an error when attempting to access the Web state data held for this transaction.

System action: An exception trace entry is made in

the trace table using code *X'code'*. The transaction abends with abend code AWC1 if the Bridge Exit was trying to establish a partnership with the CICS Web Interface alias transaction.

User response: Use the error code *code* to determine the reason for the failure

4106 Unable to establish a partnership with the associated CICS Web Interface alias transaction.

4107 A call to terminate the partnership between this instance of DFHWBLT and its associated CICS Web Interface alias transaction failed.

4108 A call to wait for the CICS Web Interface alias transaction associated with this instance of DFHWBLT failed.

4109 A call to reactivate the CICS Web Interface alias transaction associated with this instance of DFHWBLT failed.

4112 A call to update the state data for this transaction failed.

4113 A call to retrieve the state data for this transaction failed.

4114 The alias task associated with this instance of DFHWBLT was not in the required state.

4116 A call to break the partnership between this instance of DFHWBLT and its associated CICS Web Interface alias transaction failed.

411B A call to destroy the state data for this instance of DFHWBLT failed.

The most likely cause of the error is that the timeout interval for the Web state data has been exceeded, and the relevant state data has been deleted. Check that the timeout interval for the state data is set to a suitable value. You may need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHWBLT

XMEOUT Parameters: *date, time,applid, tranid, X'code', {1= , 2= TCPIPSERVICE: }, tcpipservice*

Destination: CWBO

DFHWB0132 *date time applid tranid* **Program DFHWBLT terminated due to storage problems.{ | TCPIPSERVICE: }tcpipservice**

Explanation: A getmain for storage issued by DFHWBLT failed. Without the storage, processing cannot continue.

System action: The transaction abends with code AWC5, and an exception trace entry 410D is written.

User response: If this error occurs repeatedly, you may need to examine the storage setup of your CICS system. Refer to the *CICS Customization Guide* for further information on controlling CICS storage.

Module: DFHWBLT

XMEOUT Parameters: *date, time,applid, tranid, {1= , 2= TCPIPSERVICE: }, tcpipservice*

Destination: CWBO

DFHWB0133 *date time applid tranid* **Error X'code'**
occurred during CICS Web 3270
transaction processing.{ |
TCPIPSERVICE: }tcpipservice

Explanation: Program DFHWBTTA detected an error when attempting to attach the Web bridge transaction or the Web 3270 Bridge exit program DFHWBLT encountered an internal error.

System action: The transaction returns an internal server error (HTTP response 500) to the HTTP client.

User response: The error code *code* identifies the CICS trace entry that corresponds to the failure. You may determine the transaction identifier of the Web bridge transaction from this entry and its significant characteristics.

Collect the CICS trace output. You may need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHWBTTA, DFHWBLT

XMEOUT Parameters: *date, time,applid, tranid, X'code', {1= , 2= TCPIPSERVICE: }, tcpipservice*

Destination: CWBO

DFHWB0134 *date time applid tranid* **Error X'code'**
occurred resolving the AID from HTTP
forms data in the CICS Web terminal
translation application.{ |
TCPIPSERVICE }tcpipservice

Explanation: Program DFHWBTTA is unable to resolve an attention identifier from the HTTP forms data returned from a web browser. DFHWBTTA translates the HTTP forms data into the correct 3270 format required by the CICS terminal-oriented transaction that is the target of this request. The attention identifier or AID is a mandatory part of this format. DFHWBTTA cannot locate a *name=value* pair in the HTTP forms data that adheres to the naming convention defined by the CICS Web Interface to represent an AID, and so cannot return an AID value to the terminal-oriented transaction.

System action: DFHWBTTA returns an internal server error (HTTP response 500) to the HTTP client, and

terminates the exchange with the terminal-oriented transaction.

User response: The error code *code* identifies the CICS trace entry that corresponds to the failure. The HTTP forms data is produced as trace data. Collect the CICS trace output. Examine the HTTP forms data to determine what was returned from the web browser. Identify what HTML input type caused the web browser to submit the HTML form. Corruption of the HTTP forms data may be the cause of the problem. You may need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHWBTTA

XMEOUT Parameters: *date, time,applid, tranid, X'code', {1= , 2= TCPIPSERVICE: }, tcpipservice*

Destination: CWBO

DFHWB0135 *date time applid tranid* **Error X'code'**
occurred resolving the next transaction
identifier from HTTP forms data in the
CICS Web terminal translation
application.{ | *TCPIPSERVICE:*
}tcpipservice

Explanation: Program DFHWBTTA is unable to resolve the next transaction identifier from the HTTP forms data returned from a web browser. DFHWBTTA translates the HTTP forms data and extracts the identifier of the next transaction to be executed. DFHWBTTA cannot locate a *name=value* pair in the HTTP forms data that adheres to the naming convention defined by CICS to represent the next transaction identifier and so it cannot determine which terminal-oriented transaction to start.

System action: DFHWBTTA returns an internal server error (HTTP response 500) to the HTTP client.

User response: The error code *code* identifies the CICS trace entry that corresponds to the failure. The HTTP forms data is produced as trace data. Collect the CICS trace output. Examine the HTTP forms data to determine what was returned from the web browser. Corruption of the HTTP forms data may be the cause of the problem. You may need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHWBTTA

XMEOUT Parameters: *date, time,applid, tranid, X'code', {1= , 2= TCPIPSERVICE: }, tcpipservice*

Destination: CWBO

DFHWB0136 *date time applid tranid* **An error code X'code' has occurred as a result of the Web State Garbage Collection process.**{ | *TCPIPSERVICE: }tcpipservice*

Explanation: Program DFHWBLT detected an error when attempting to access the Web state data held for this transaction. The transaction wait time has exceeded the garbage collection limit and the state block has been deleted by the garbage collection process.

System action: If the error occurs in DFHWBLT, a TERMERR condition is returned to the application and processing continues. If the error occurs in DFHWBTTA, an error response is sent to the browser and processing continues.

User response: Use the error code *code* to determine which module received the error

4108 The error occurred in DFHWBLT.

420B The error occurred in DFHWBTTA.

The cause of the error is that the garbage collection interval for the Web state data has been exceeded, and the relevant state data has been deleted. Check that the garbage collection interval for the state data is set to a suitable value. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHWBLT, DFHWBTTA

XMEOUT Parameters: *date, time, applid, tranid, X'code', {1=, 2= TCPIPSERVICE: }, tcpipservice*

Destination: CWBO

DFHWB0137 *date time applid tranid* **An error code X'code' occurred in DFHWBTTA while accessing the Web state data for this transaction.**{ | *TCPIPSERVICE: }tcpipservice*

Explanation: The Web Terminal Translation Application program, DFHWBTTA, has detected an error when attempting to access the Web state data held for this transaction.

System action: An exception trace entry is made in the trace table using code X'code'.

User response: Use the error code *code* to determine the reason for the failure

4203 Unable to establish a partnership with the associated CICS Web Interface alias transaction.

4204 Unable to initialize a partnership with the associated CICS Web Interface alias transaction.

4205 The alias task associated with this instance of DFHWBTTA was not in the required state.

4206 A call to create the state data for this instance of DFHWBTTA failed.

4207 A call to destroy the state data for this instance of DFHWBTTA failed.

4208 A call to retrieve the state data for this instance of DFHWBTTA failed.

4209 A call to break the established partnership between the associated transaction and DFHWBTTA has failed.

420A A call to reactivate the CICS Web Interface alias transaction associated with this instance of DFHWBTTA failed.

420B A call to wait for the CICS Web Interface alias transaction associated with this instance of DFHWBTTA failed.

420C A call to terminate the partnership between this instance of DFHWBTTA and its associated CICS Web Interface alias transaction failed.

4213 A call to update the state data for this transaction failed.

The most likely cause of the error is that the timeout interval for the Web state data has been exceeded, and the relevant state data has been deleted. Check that the timeout interval for the state data is set to a suitable value. You may need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHWBTTA

XMEOUT Parameters: *date, time, applid, tranid, X'code', {1=, 2= TCPIPSERVICE: }, tcpipservice*

Destination: CWBO

DFHWB0150 *date time applid tranid* **The CICS HTML template manager could not locate template *template_name* in the HTML template data set.**{ | *TCPIPSERVICE: }tcpipservice*

Explanation: The CICS HTML template manager DFHWBTL could not find template name *template_name* in the HTML data set.

System action: Because 3270 / HTML conversion cannot be performed without the template, CICS returns a TERMERR condition to the application. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Make sure that the template exists in the template library. See the *CICS External Interfaces Guide* for guidance on how to create HTML templates. Report the details of the symptom string given in message DFHME0116. It will aid problem determination.

Module: DFHWBTC

XMEOUT Parameters: *date, time, applid, tranid, template_name, {1= , 2= TCPIP SERVICE: }, tcpip service*

Destination: CWBO

DFHWB0151 *date time applid tranid* **The CICS Web Interface 3270 emulation code was unable to process the data it was passed.** { | *TCPIP SERVICE: } tcpip service*

Explanation: The CICS Web Interface routine that converts 3270 data streams to HTML, and vice versa, has detected an error. This is probably because it has been passed an invalid 3270 data stream on an EXEC CICS SEND command, or because the browser has returned some data that it is incapable of handling in response to an EXEC CICS RECEIVE command.

System action: The transaction is abended with code AEIP (INVREQ). There will be subsequent messages from the web state management code as it tidies up for the abending task. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Use CEDX or trace to look at the data that was in error and then correct the sending application. Report the details of the symptom string given in message DFHME0116. It will aid problem determination.

Module: DFHWBWC

XMEOUT Parameters: *date, time, applid, tranid, {1= , 2= TCPIP SERVICE: }, tcpip service*

Destination: CWBO

DFHWB0152E *date time applid client_ip_addr tcpip service* **The request receiver SOCB notify gate is unable to attach transaction** *transaction.*

Explanation: The socket domain received a request for a TCPIP service which specified PROTOCOL HTTP, USER or ISC. However, the socket notify gate in module DFHWBSO was unable to attach the transaction specified in the TCPIP service definition.

System action: Exception trace point 0B07 is issued.

User response: Check the definitions in the TCPIP service and the specified transaction.

Module: DFHWBSO

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpip service, transaction*

Destination: CWBO

DFHWB0153E *date time applid client_ip_addr tcpip service* **The web asynchronous socket receive failed with an IO error.**

Explanation: The Web socket notify gate was driven with an action code of ERROR because an outstanding asynchronous socket receive request ended with an IO error.

System action: Exception trace point 0B05 is issued. The socket is closed and the request is terminated.

User response: Determine why an IO error occurred on this port.

Module: DFHWBSO

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpip service*

Destination: CWBO

DFHWB0154E *date time applid client_ip_addr tcpip service* **The request receiver SOCB notify gate is unable to obtain storage.**

Explanation: The socket domain received a request for a TCPIP service which specified PROTOCOL(ISC). However, the socket notify gate in module DFHWBSO was unable to obtain storage. This is because a short-on-storage (SOS) condition has caused the failure of a GETMAIN.

System action: Exception trace point 0B09 is issued.

User response: Investigate the reason for the SOS condition. See the *CICS Problem Determination Guide* for guidance on dealing with the SOS condition.

Retry the request later.

Module: DFHWBSO

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpip service*

Destination: CWBO

DFHWB0360 *date time applid* **An attempt to establish security for userid** *userid* **has failed. Transaction** *tranid* **cannot be started. SAF codes are** (*X'safresp', X'safreas*). **ESM codes are** (*X'esmresp', X'esmreas*). **Host IP address** *hostaddr*. **Client IP address:** *clientaddr*. **TCPIP SERVICE** *tcpip service.*

Explanation: An attempt was made to establish security for userid *userid* but it was rejected by the external security manager (ESM).

In order to start transaction *tranid* CICS Web attach processing requires security to be established for userid *userid*, as selected for this transaction by the Analyzer URM specified for TCPIP SERVICE *tcpip service*

System action: Security has not been established for

DFHWB0361 • DFHWB0364

the userid. The attempt to start the transaction has failed.

User response: The response and reason codes (*safresp* and *safreas*) returned by the system authorization facility (SAF), and the response and reason codes (*esmresp* and *esmreas*) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=VERIFY or RACROUTE REQUEST=EXTRACT macros. These return codes are described in the *OS/390 MVS Programming: Authorized Assembler Services Guide*, and in *External Security Interface (RACROUTE) Macro Reference for MVS and VM (SC28-1366)*. See these manuals for an explanation of the codes.

There may be further messages produced by CICS or the external security manager (ESM) which provide more information.

Module: DFHWBXM

XMEOUT Parameters: *date, time,applid, userid, tranid, X'safresp', X'safreas', X'esmresp', X'esmreas', hostaddr, clientaddr, tcpipSERVICE*

Destination: CWBO

DFHWB0361 *date time applid* **An attempt to attach a CICS Web alias transaction for userid *userid* has failed because the user is not authorized to execute transaction *tranid*. Host IP address *hostaddr*. Client IP address: *clientaddr*. TCPIP SERVICE *tcpipSERVICE*.**

Explanation: An attempt was made to start transaction *tranid* by userid *userid* but it was rejected.

CICS Web attach processing could not start transid *tranid* processing because userid *userid* is not authorized to execute transaction *tranid*, which was selected for this HTTP Request by the Analyzer URM specified for TCPIP SERVICE *tcpipSERVICE*

System action: The attach for transaction *tranid* fails, then processing continues.

User response: Either determine why the Analyzer URM selected transaction *tranid*, or modify the Analyzer URM to select an authorized transaction identifier.

Module: DFHWBXM

XMEOUT Parameters: *date, time,applid, userid, tranid, hostaddr, clientaddr, tcpipSERVICE*

Destination: CWBO

DFHWB0362 *date time applid* **CICS Web alias transaction *tranid* could not be started due to an unexpected error. Host IP address: *hostaddr*. Client IP address: *clientaddr*. TCPIP SERVICE: *tcpipSERVICE*.**

Explanation: An attempt was made to start

transaction *tranid* but the attach failed due to an unexpected error.

CICS Web attach processing could not start transid *tranid* processing due to an unexpected error.

System action: The attach for transaction *tranid* fails, then processing continues.

User response: you may need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHWBXM

XMEOUT Parameters: *date, time,applid, tranid, hostaddr, clientaddr, tcpipSERVICE*

Destination: CWBO

DFHWB0363 *date time applid tranid* **A client certificate that maps to a valid userid is required. Host IP address: *hostaddr*. Client IP address: *clientaddr*. TCPIP SERVICE: *tcpipSERVICE*.**

Explanation: The client at IP address *clientaddr* has tried to connect to CICS on a TCPIP SERVICE that has the option AUTHENTICATE(CERTIFICATE), but the client has not provided a client certificate that maps to a valid userid in the external security manager. This may be for one of the following reasons

- The client has not provided any certificate
- The client's certificate is not installed in the external security manager's database
- The client's certificate is not marked as TRUSTED in the external security manager's database

System action: The connection is rejected with an HTTP 403 (forbidden) response.

User response: Ensure that the client has a valid certificate. Install the certificate in the external security manager with the TRUSTED attribute and mapping to a valid userid. If the security manager is the IBM Security Server for OS/390 (RACF), this can be done with the RACDCERT command, or by using a TCPIP SERVICE defined with AUTHENTICATE(AUTOMATIC).

Module: DFHWBXM

XMEOUT Parameters: *date, time,applid, tranid, hostaddr, clientaddr, tcpipSERVICE*

Destination: CWBO

DFHWB0364 *date time applid* **An attempt to establish security for userid *userid* has failed. The requested static response cannot be returned. SAF codes are (*X'SAFRESP',X'SAFREAS'*). ESM codes are (*X'ESMRESP',X'ESMREAS'*). Host IP address: *hostaddr*. Client IP address: *clientaddr*. TCPIP SERVICE: *tcpipSERVICE***

Explanation: An attempt was made to establish security for userid *userid* but it was rejected by the external security manager (ESM).

In order to return the requested static response CICS Web processing requires security to be established for userid *userid*.

System action: Security has not been established for the userid. The requested static response cannot be returned.

User response: The response and reason codes (*safresp* and *safreas*) returned by the system authorization facility (SAF), and the response and reason codes (*esmresp* and *esmreas*) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=VERIFY or RACROUTE REQUEST=EXTRACT macros. These return codes are described in the *z/OS MVS Programming: Authorized Assembler Services Guide*, and in *External Security Interface (RACROUTE) Macro Reference for MVS*.

There might be further messages produced by CICS or the external security manager (ESM) which provide more information.

Module: DFHWBSR

XMEOUT Parameters: *date, time, applid, userid, X'safresp, X'safreas, X'esmresp, X'esmreashostaddr, clientaddr, tcpipSERVICE*

Destination: CWBO

DFHWB0500I *date time applid tranid* **CICS Web Interface enable processing is complete. Host IP address:** *hostaddr*.

Explanation: The enable process has completed successfully.

System action: Processing continues.

User response: None.

Module: DFHWBWM

XMEOUT Parameters: *date, time, applid, tranid, hostaddr*

Destination: Console and Transient Data Queue
CWBO

DFHWB0551 *date time applid tranid* **The CICS Web Interface server controller detected an abend ACN1 processing a request from client *clientaddr*. Host IP address:** *hostaddr*.

Explanation: The HTTP caller detected an error after invoking program DFHCCNV to perform data conversion on incoming data.

System action: If there is no DFHCNV table defined, the CICS Web Interface cannot perform data conversion on incoming data. An exception disable of the CICS

Web Interface is initiated. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Ensure that there is a valid DFHCNV table link-edited into one of the libraries in the DFHRPL library concatenation.

Module: DFHWBWM

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr*

Destination: CWBO

DFHWB0723 *date time applid tranid* **The CICS Web analyzer program returned an error response. Program name:** *progname*. **RESPONSE** *response*. **REASON:** *reason*. **Host IP address:** *hostaddr*. **Client IP address:** *clientaddr*.{ | *TCPIPSERVICE:* }*tcpipSERVICE*

Explanation: As part of its normal processing of a request, CICS Web attach processing invokes the user replaceable analyzer to tailor the required actions. This program returns RESPONSE and REASON values. If a CICS supplied sample analyzer is being used, possible RESPONSE code values are

0	OK
4	Exception
8	Invalid
12.	Disaster

possible REASON code values are

1	URL of incoming HTTP request is too short
2	No "/" character in the URI of the HTTP request
3.	There is more data to be received for this request
4	Converter program name is less than 1 or greater than 8 bytes long
5	Alias transaction ID is less than 1 or greater than 4 bytes long
6	Server program name is less than 1 or greater than 8 bytes long
7	User token passed as query string data on this request is not valid
8	URL passed on this request is not valid

Users can also architect their own response and reason code values to be returned by the analyzer, but they should use values other than those defined in the CICS supplied copybook DFHWBUCD.

DFHWB0724 • DFHWB0727

If the host IP address and the client IP address are not available when this error occurred, these addresses will be displayed as "UNKNOWN" in the message.

System action: An error response is sent to the client and processing of the request is terminated.

User response: Examine the RESPONSE and REASON code values in the message to determine the cause of the error.

Module: DFHWBXN

XMEOUT Parameters: *date, time,applid, tranid, progname, response, reason, hostaddr, clientaddr, {1= , 2= TCPIPSERVICE: }, tcpipSERVICE*

Destination: CWBO

DFHWB0724 *date time applid tranid* **CICS Web attach processing detected an error linking to the codepage conversion module DFHCCNV. Host IP address: *hostaddr*. Client IP address: *clientaddr*. TCPIPSERVICE: *tcipSERVICE***

Explanation: An error linking to program DFHCCNV has forced CICS Web attach processing to abandon a client request. If the host IP address and the client IP address are not available when this error occurred, these addresses will be displayed as "UNKNOWN".

System action: A system dump is taken. An error response is sent to the client and the request is terminated. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You may need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116. It will aid problem determination.

Module: DFHWBXN

XMEOUT Parameters: *date, time,applid, tranid, hostaddr, clientaddr, {1= , 2= TCPIPSERVICE: }, tcpipSERVICE*

Destination: CWBO

DFHWB0725 *date time applid tranid* **CICS Web attach processing detected an error linking to the analyzer user replaceable module *progname*. Host IP address: *hostaddr*. Client IP address: *clientaddr*. TCPIPSERVICE: *tcipSERVICE***

Explanation: An error linking to the analyzer user replaceable module forced CICS Web attach processing to abandon a client request. If the host IP address and the client IP address are not available when this error occurred, these addresses will be displayed as "UNKNOWN".

System action: An error response is sent to the client and the request is terminated. The tcpipSERVICE remains open but unusable.

User response: Ensure that the program specified has been correctly installed and defined to CICS. If the user replaceable module (URM) has been set dynamically using CEMT or the SPI command, then ensure that the module is defined to CICS and enabled, or available in the library if autoinstall is active.

Module: DFHWBXN

XMEOUT Parameters: *date, time,applid, tranid, progname, hostaddr, clientaddr, {1= , 2=TCPIPSERVICE: }, tcpipSERVICE*

Destination: CWBO

DFHWB0726 *date time applid tranid* **CICS Web attach processing cannot link to the analyzer user replaceable program. No analyzer specified. Host IP address: *hostaddr*. Client IP address: *clientaddr*. TCPIPSERVICE: *tcipSERVICE***

Explanation: CICS Web attach processing cannot invoke the analyzer user replaceable module because none was specified for the TCPIPSERVICE associated with the request being processed. If the host IP address and the client IP address are not available when this error occurred, these addresses will be displayed as "UNKNOWN".

System action: An error response is sent to the client and the request is terminated. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Use CEMT SET TCPIPSERVICE to specify an analyzer name on the URM parameter. CEDA can be used to alter the stored definitions. The URM name for CICS Web TCPIPSEVICES (those TCPIPSEVICES which have CWXN specified as the transaction ID) MUST specify a valid analyzer program name for the URM keyword.

Module: DFHWBXN

XMEOUT Parameters: *date, time,applid, tranid, hostaddr, clientaddr, {1= , 2= TCPIPSERVICE: }, tcpipSERVICE*

Destination: CWBO

DFHWB0727 *date time applid tranid* **CICS Web Interface attach processing could not attach the requested alias transaction *tranid*. Userid: *userid*. Host IP address: *hostaddr*. Client IP address: *clientaddr*. TCPIPSERVICE: *tcipSERVICE***

Explanation: Web attach processing could not attach a new task with the requested alias transaction ID *tranid*. An error response is sent to the client and

processing of the request is terminated with abend code AWB2. If the host IP address and the client IP address are not available when this error occurred, these addresses will be displayed as "UNKNOWN".

User response: Ensure that the alias transaction ID supplied by the analyzer user replaceable program has been defined to CICS.

Module: DFHWBXN

XMEOUT Parameters: *date, time, applid, tranid, tranid, userid, hostaddr, clientaddr, {1=, 2= TCPIP SERVICE: }, tcpip service*

Destination: CWBO

DFHWB0728 *date time applid tranid CICS Web attach processing detected a storage error within the Web receive module DFHWBSR. Host IP address: hostaddr. Client IP address: clientaddr. { | TCPIP SERVICE: } tcpip service*

Explanation: A storage error in program DFHWBSR has forced CICS Web attach processing to abandon a client request. If the host IP address and the client IP address are not available when this error occurred, these addresses will be displayed as "UNKNOWN."

System action: An error response is sent to the client and the request is terminated.

User response: The most probable cause of this error is there being insufficient storage to process the client request. This failure may indicate that you need to increase the size limits of the EDSAs. EDSA storage limits are specified by the EDSALIM system initialization parameter. See the *CICS System Definition Guide* for more guidance on EDSALIM.

Module: DFHWBXN

XMEOUT Parameters: *date, time, applid, tranid, hostaddr, clientaddr, {1=, 2= TCPIP SERVICE: }, tcpip service*

Destination: CWBO

DFHWB0729 *date time applid tranid CICS Web attach processing detected an abend in the analyzer user replaceable module progname. Host IP address: hostaddr. Client IP address clientaddr. { | TCPIP SERVICE: } tcpip service*

Explanation: An abend in the analyzer user replaceable module forced CICS Web attach processing to abandon a client request. If the host IP address and the client IP address are not available when this error occurred, these addresses will be displayed as "UNKNOWN".

System action: An error response is sent to the client and the request is terminated.

User response: Ensure that the program specified is correct.

Module: DFHWBXN

XMEOUT Parameters: *date, time, applid, tranid, progname, hostaddr, clientaddr, {1=, 2=TCPIP SERVICE: }, tcpip service*

Destination: CWBO

DFHWB0730 *date time applid tranid CICS Web attach processing encountered an internal error while processing a client request. Host IP address: hostaddr Client IP address: clientaddr. { | TCPIP SERVICE: } tcpip service*

Explanation: An internal error has forced CICS Web processing to abandon a client request. If the host IP address and the client IP address are not available when this error occurred, these addresses will be displayed as "UNKNOWN."

System action: A system dump is taken. An error response is sent to the client and the request is terminated. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You may need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116. It will aid problem determination.

Module: DFHWBXN

XMEOUT Parameters: *date, time, applid, tranid, hostaddr, clientaddr, {1=, 2= TCPIP SERVICE: }, tcpip service*

Destination: CWBO

DFHWB0731 *date time applid tranid CICS Web attach processing detected an HTTP header longer than 32767 bytes. Host IP address hostaddr. Client IP address: clientaddr. { | TCPIP SERVICE: } tcpip service*

Explanation: An HTTP request was being received by DFHWBSR when it detected that the header data of the request exceeded the currently supported maximum of 32767 bytes. If the host IP address and the client IP address are not available when this error occurred, these addresses will be displayed as "UNKNOWN".

System action: Trace entry 0418 is issued containing the web request block. The length of the HTTP header data can be inferred from the user_data_offset field.

User response: Examine the input HTTP request and reduce the length of the header information to be within the allowed limit. See the *CICS External Interfaces*

Guide and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHWBXN

XMEOUT Parameters: *date, time,applid, tranid, hostaddr, clientaddr, {1= , 2= TCIPSERVICE: }, tcpipservice*

Destination: CWBO

DFHWB0732 *date time applid tranid* **CICS Web attach processing encountered a sockets I/O error while receiving a client request. Host IP address: *hostaddr*. Client IP address: *clientaddr*.{ | TCIPSERVICE: }
*}tcpipservice***

Explanation: A sockets I/O error has forced CICS Web processing to abandon a client request. If the host IP address and the client IP address are not available when this error occurred, these addresses will be displayed as "UNKNOWN".

System action: The Web error program DFHWBEP is driven, but no error response can be sent to the client. The request is terminated.

User response: Check for any associated sockets domain error messages, which may give more details on the error which has occurred. The error may have been caused by a user terminating their Web Browser before CICS has been able to process the request. If the problem persists, there may be a problem with the TCP/IP network. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHWBXN

XMEOUT Parameters: *date, time,applid, tranid, hostaddr, clientaddr, {1= , 2= TCIPSERVICE: }, tcpipservice*

Destination: CWBO

DFHWB0733 *date time applid tranid* **CICS Web attach processing failed because there were no available SSL TCBS. Host IP address: *hostaddr*. Client IP address: *clientaddr*.{ | TCIPSERVICE: }
*}tcpipservice***

Explanation: A Secure Sockets Layer connection from a client with address *ipaddr* was received on TCIPSERVICE(*service*), but there were no available TCBS to process the request.

System action: The socket for the connection is closed. No message is sent to the client because the client expects the response to be encrypted by SSL, but SSL services cannot be provided.

User response: If this message occurs frequently, consider raising the value of the MAXSSLTCBS system

initialization parameter. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHWBXN

XMEOUT Parameters: *date, time,applid, tranid, hostaddr, clientaddr, {1= , 2= TCIPSERVICE: }, tcpipservice*

Destination: CWBO

DFHWB0734 *date time applid tranid* **CICS Web attach processing failed because the SSL handshake with the client has failed. Host IP address *hostaddr*. Client IP address: *clientaddr*.{ | TCIPSERVICE: }
*}tcpipservice***

Explanation: A Secure Sockets Layer connection from a client with address *ipaddr* was received on TCIPSERVICE(*service*), but the SSL handshake failed.

System action: The socket for the connection is closed. No message is sent to the client because the client expects the response to be encrypted by SSL, but SSL services cannot be provided. The reason for the handshake failure may be displayed in an earlier DFHSO0123 message.

User response: If the DFHSO0123 message indicates a CICS configuration error, correct it. Otherwise, the problem is likely to be a client error, and can be ignored. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHWBXN

XMEOUT Parameters: *date, time,applid, tranid, hostaddr, clientaddr, {1= , 2= TCIPSERVICE: }, tcpipservice*

Destination: CWBO

DFHWB0736 *date time applid tranid* **The method in the received HTTP request is not implemented by the server. Host IP address: *hostaddr*. Client IP address: *clientaddr*. TCIPSERVICE *tcpipservice*.**

Explanation: As part of its normal processing of a request, CICS Web Support checks the supplied method with the HTTP version of the request and the version of HTTP supported by the server. The HTTP version supported by CICS depends on the version that the server application is running at. CICS may also report this error if the method is valid but any of the supplied headers are incorrect, as this means that CICS cannot implement the method.

System action: An error response is sent to the client and processing of the request is terminated.

User response: Correct the method in the request to

one supported by the version of HTTP being used and the version that the server application is capable of running at. The version of the server is that supplied on the HTTP response. If the method is correct, check that all the headers supplied in the request are correct.

Module: DFHWBXN

XMEOUT Parameters: *date, time, applid, tranid, hostaddr, clientaddr, tcpipSERVICE*

Destination: CWBO

DFHWB0737 *date time applid tranid* **CICS Web support has detected that the version of the incoming HTTP request is higher than the version that CICS supports. Host IP address: *hostaddr*. Client IP address *clientaddr*. TCPIP SERVICE: *tcpipSERVICE*.**

Explanation: As part of its normal processing of a request, CICS Web Support checks the version of the incoming HTTP request. If it is higher than the version CICS supports and the method is not recognised the request is rejected.

System action: An error response is sent to the client and processing of the request is terminated.

User response: Examine the version in the HTTP response to determine the HTTP version that is supported.

Module: DFHWBXN

XMEOUT Parameters: *date, time, applid, tranid, hostaddr, clientaddr, tcpipSERVICE*

Destination: CWBO

DFHWB0738 *date time applid tranid* **CICS Web Support has detected that the incoming HTTP request has a version that is at least HTTP/1.1 but has no host header. Host IP address: *hostaddr*. Client IP address: *clientaddr*. TCPIP SERVICE: *tcpipSERVICE*.**

Explanation: As part of its normal processing of a request, CICS Web Support checks the version of the incoming HTTP request. If it is at least HTTP/1.1 and there is no host header, the request is rejected as it is not compliant.

System action: An error response is sent to the client and processing of the request is terminated.

User response: Issue the request again after adding a host header.

Module: DFHWBXN

XMEOUT Parameters: *date, time, applid, tranid, hostaddr, clientaddr, tcpipSERVICE*

Destination: CWBO

DFHWB0739 *date time applid tranid* **An invalid EXPECT header has been received. Client IP address: *clientaddr*. TCPIP SERVICE *tcpipSERVICE***

Explanation: While processing an EXPECT header CICS has detected that the value is not 100-continue.

System action: The request is rejected with a HTTP/1.1 status of 417 Expectation Failed.

User response: Correct the HTTP/1.1 Client.

Module: DFHWBXN

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, tcpipSERVICE*

Destination: CWBO

DFHWB0740 *date time applid tranid* **An HTTP/1.0 client has sent an EXPECT header which is not supported. Client IP address: *clientaddr*. TCPIP SERVICE: *tcpipSERVICE***

Explanation: While processing an EXPECT header CICS has detected that the client is not using HTTP version 1.1.

System action: The request is rejected with an HTTP/1.0 status code of 400 Bad Request.

User response: Correct the HTTP Client.

Module: DFHWBXN

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, tcpipSERVICE*

Destination: CWBO

DFHWB0741 *date time applid tranid* **An HTTP socket receive request has timed out. Client IP address: *clientaddr*. TCPIP SERVICE *tcpipSERVICE***

Explanation: There are two possible reasons for this message

- CICS has timed out while receiving data from the client.
- CICS has sent a 100 Continue header in response to an EXPECT: header however the request has timed out before the client has sent the message body.

System action: The possible causes are

- The value of the SOCKETCLOSE parameter on the TCPIP SERVICE is too low
- The client has sent an incorrect Content-Length header
- The client has not sent the body of the request

User response: Possible solutions are

- Increase the value of the SOCKETCLOSE parameter on the TCPIP SERVICE.

- Correct the HTTP Client.

Module: DFHWBXN

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, tcpipSERVICE*

Destination: CWBO

DFHWB0742 *date time applid tranid* **Conversion of HTTP header failed. Host IP address:** *hostaddr. Client IP address: clientaddr. { | TCPIP SERVICE: } tcpipSERVICE*

Explanation: The conversion of the inbound HTTP header has failed and this has caused CICS Web processing to abandon the request. If the host IP address and the client IP address are not available when this error occurred, these addresses will be displayed as "UNKNOWN".

System action: An exception entry is made in the trace table. An error response is sent to the client and the request is terminated. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: The exception trace entry may help you to determine the cause of the error. If not you may need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116. It will aid problem determination.

Module: DFHWBXN

XMEOUT Parameters: *date, time, applid, tranid, hostaddr, clientaddr, {1=, 2= TCPIP SERVICE: }, tcpipSERVICE*

Destination: CWBO

DFHWB0743 *date time applid tranid* **The CICS Web character set codepage is invalid. Host IP address:** *hostaddr. Client IP address: clientaddr. { | TCPIP SERVICE: } tcpipSERVICE*

Explanation: The CICS Web character set codepage is invalid and this has caused CICS Web processing to abandon the request. If the host IP address and the client IP address are not available when this error occurred, these addresses will be displayed as "UNKNOWN".

System action: An exception entry is made in the trace table. An error response is sent to the client and the request is terminated. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: The exception trace may help you to determine the cause of the error. If not you may need

further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116. It will aid problem determination.

Module: DFHWBXN

XMEOUT Parameters: *date, time, applid, tranid, hostaddr, clientaddr, {1=, 2= TCPIP SERVICE: }, tcpipSERVICE*

Destination: CWBO

DFHWB0744 *date time applid tranid* **The CICS Web host codepage is invalid. Host IP address:** *hostaddr. Client IP address: clientaddr. { | TCPIP SERVICE: } tcpipSERVICE*

Explanation: The CICS Web host codepage is invalid and this has caused CICS Web processing to abandon the request. If the host IP address and the client IP address are not available when this error occurred, these addresses will be displayed as "UNKNOWN".

System action: An exception entry is made in the trace table. An error response is sent to the client and the request is terminated. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: The exception trace may help you to determine the cause of the error. If not you may need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116. It will aid problem determination.

Module: DFHWBXN

XMEOUT Parameters: *date, time, applid, tranid, hostaddr, clientaddr, {1=, 2= TCPIP SERVICE: }, tcpipSERVICE*

Destination: CWBO

DFHWB0745 *date time applid tranid* **Conversion of user data failed. Host IP address:** *hostaddr. Client IP address: clientaddr. { | TCPIP SERVICE: } tcpipSERVICE*

Explanation: The conversion of the inbound user data has failed and this has caused CICS Web processing to abandon the request. If the host IP address and the client IP address are not available when this error occurred, these addresses will be displayed as "UNKNOWN".

System action: An exception entry is made in the trace table. An error response is sent to the client and the request is terminated. Message DFHME0116 should

be produced containing the symptom string for this problem.

User response: The exception trace entry may help you to determine the cause of the error. If not you may need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116. It will aid problem determination.

Module: DFHWBXN

XMEOUT Parameters: *date, time, applid, tranid, hostaddr, clientaddr, {1= , 2= TCPIPSERVICE: }, tcpipservice*

Destination: CWBO

DFHWB0746 *date time applid tranid* **The maximum length of data that can be received has been exceeded. Client IP address: clientaddr. TCPIPSERVICE: tcpipservice**

Explanation: The amount of data transmitted by a client has exceeded the limit defined on the tcpipservice.

System action: The request is rejected

User response: There are two possible causes

- The value of the MAXDATALEN parameter on the TCPIPSERVICE is too low
- There is an error in the client

There are two possible solutions

- Increase the value of the MAXDATALEN parameter on the TCPIPSERVICE.
- Correct the HTTP Client.

Module: DFHWBXN

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, tcpipservice*

Destination: CWBO

DFHWB0747 *date time applid tranid* **A Content-Length and Transfer-Encoding conflict has been detected. Client IP address clientaddr. TCPIPSERVICE: tcpipservice**

Explanation: The Client has sent a request that contains a Content-Length header as well as a Transfer-Encoding header.

System action: The request is rejected.

User response: Correct the client

Module: DFHWBXN

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, tcpipservice*

Destination: CWBO

DFHWB0748 *date time applid tranid* **An invalid Chunk Size header has been received. Client IP address: clientaddr. TCPIPSERVICE tcpipservice**

Explanation: The Client has sent a request that contains a an invalid chunk size header. Valid values are 0 - 9, A - F with a maximum of 8 characters.

System action: The request is rejected.

User response: Correct the client

Module: DFHWBXN

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, tcpipservice*

Destination: CWBO

DFHWB0749 *date time applid tranid* **An invalid Trailer has been received. Client IP address: clientaddr. TCPIPSERVICE tcpipservice**

Explanation: The request contains a Trailer that exceeds 32767 bytes in length.

System action: The request is rejected.

User response: Correct the client

Module: DFHWBXN

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, tcpipservice*

Destination: CWBO

DFHWB0750 *date time applid tranid* **HTTP warning request header received. Warning: warnvalue Host IP address: hostaddr Client IP address: clientaddr**

Explanation: A warning header has been received on an incoming HTTP request, by CICS Web support. The contents are written in this message for audit purposes.

System action: Processing for the request continues normally.

User response: Examine the warning to determine if action is required.

Module: DFHWBXN

XMEOUT Parameters: *date, time, applid, tranid, warnvalue, hostaddr, clientaddr*

Destination: CWBW

DFHWB0751 *date time applid tranid* **A precondition specified by an If-Unmodified-Since header has failed. Client IP address: clientaddr. TCPIPSERVICE: tcpipservice.**

Explanation: The request contains an

DFHWB0752 • DFHWB0758

If-Unmodified-Since header and the precondition has failed. If CICS is returning dynamic content, or is returning static content which is a document template, it is assumed that any If-Unmodified-Since precondition can never be met.

System action: The request is rejected with a HTTP/1.1 412 response.

User response: None

Module: DFHWBXN

XMEOUT Parameters: *date, time,applid, tranid, clientaddr, tcpipservice*

Destination: CWBO

DFHWB0752 *date time applid tranid* **HTTP Warning response header received. Warning:** *warnvalue* **Client IP address:** *clientaddr* **Server IP address:** *serveraddr*.

Explanation: A warning header has been received in response to an HTTP request sent by CICS as a client. The contents are written in this message for audit purposes.

System action: Processing for the request continues normally.

User response: Examine the warning to determine if any action is required.

Module: DFHWBCL

XMEOUT Parameters: *date, time,applid, tranid, warnvalue, clientaddr, serveraddr*

Destination: CWBW

DFHWB0753 *date time applid tranid* **Transaction chunked request incomplete. Session token:** *X'sesstoken*'.

Explanation: The transaction has terminated with an incomplete chunked request sent by CICS as a client.

System action: End of transaction processing continues normally.

User response: Examine the warning to determine if any action is required.

Module: DFHWBCL

XMEOUT Parameters: *date, time,applid, tranid, X'sesstoken*'

Destination: CWBO

DFHWB0754 *date time applid tranid* **An invalid Chunk has been received. Client IP address:** *clientaddr*. **TCPIP SERVICE:** *tcpipservice*

Explanation: The client has sent a chunk request but the chunk has not been terminated with the expected CRLF characters.

System action: The request is rejected.

User response: Correct the client.

Module: DFHWBXN

XMEOUT Parameters: *date, time,applid, tranid, clientaddr, tcpipservice*

Destination: CWBO

DFHWB0756 *date time applid tranid* **The host on the received HTTP request is invalid. Client IP address:** *clientaddr*. **TCPIP SERVICE:** *tcpipservice*

Explanation: The host on the HTTP request received by CICS is invalid.

System action: The request is rejected.

User response: Correct the client.

Module: DFHWBXN

XMEOUT Parameters: *date, time,applid, tranid, clientaddr, tcpipservice*

Destination: CWBO

DFHWB0757 *date time applid tranid* **A precondition specified by an If-Modified-Since header has failed. Client IP address:** *clientaddr*. **TCPIP SERVICE:** *tcpipservice*.

Explanation: The request contains an If-Modified-Since header and the precondition has failed. CICS only checks the precondition specified by an If-Modified-Since header when delivering a static response. For a dynamic response it is assumed that the precondition is satisfied.

System action: The request is rejected with a HTTP/1.1 304 response.

User response: None required.

XMEOUT Parameters: *date, time,applid, tranid, clientaddr, tcpipservice*

DFHWB0758 *date time applid tranid* **An attempt to access static data *data* has failed because the transaction user does not have READ access to the resource. Client IP address:** *clientaddr* **TCPIP SERVICE:** *tcpipservice*.

Explanation: The transaction user does not have READ access to the CICS document template or HFS file identified by *data*.

System action: The request is rejected with a HTTP/1.1 403 response.

User response: Contact your security administrator to obtain authorization for the required resource for your user ID.

Module: DFHWBXN

XMEOUT Parameters: *date, time,applid, tranid, data, clientaddr, tcpipSERVICE*

Destination: CWBO

DFHWB0759 *date time applid tranid* **An attempt to access static data data has failed because the resource is not found. Client IP address: *clientaddr* TCPIP SERVICE: *tcpipSERVICE*.**

Explanation: The CICS document template or HFS file identified by *data* cannot be found.

System action: The request is rejected with a HTTP/1.1 404 response.

User response: Ensure that the required resources are defined and installed.

Module: DFHWBXN

XMEOUT Parameters: *date, time,applid, tranid, data, clientaddr, tcpipSERVICE*

Destination: CWBO

DFHWB0760 *date time applid tranid* **An attempt to read HFS file *filename* has failed. Client IP address: *clientaddr*. TCPIP SERVICE: *tcpipSERVICE*.**

Explanation: An authorized user has failed to read HFS file *filename*.

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

The request is rejected with a HTTP/1.1 500 response.

User response: Collect the trace records and possible dumps and contact your IBM support center.

Module: DFHWBXN

XMEOUT Parameters: *date, time,applid, tranid, filename, clientaddr, tcpipSERVICE*

Destination: CWBO

DFHWB0761 *date time applid tranid* **An attempt to send a static response has failed due to an internal error. Client IP address *clientaddr* TCPIP SERVICE: *tcpipSERVICE*.**

Explanation: The user has failed to send a static response due to an internal error.

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

The request is rejected with a HTTP/1.1 500 response.

User response: Collect the trace records and possible

dumps and contact your IBM support center.

Module: DFHWBXN

XMEOUT Parameters: *date, time,applid, tranid, clientaddr, tcpipSERVICE*

Destination: CWBO

DFHWB0762 *date time applid tranid* **The received HTTP request specifies the OPTIONS method but cannot be handled by CICS. Status code *statuscode*. Host IP address: *hostaddr*. Client IP address: *clientaddr*. TCPIP SERVICE: *tcpipSERVICE*.**

Explanation: As part of its normal processing of a request, CICS Web Support checks the validity of the request for the specified method. In this case the method is OPTIONS but CICS cannot process the request. The status code *statuscode* indicates the reason for this as follows

- 400 : the request is not valid HTTP/1.1
- 405 : the request is valid in HTTP/1.1 terms but is not allowed by CICS for the OPTIONS method. For example CICS does not support OPTIONS for a path. CICS returns a HTTP response containing an ALLOW header stating which methods CICS supports when a path is specified.

System action: An error response with status code *statuscode* is sent to the client and processing of the request is terminated.

User response: The HTTP request should be corrected.

Module: DFHWBXN

XMEOUT Parameters: *date, time,applid, tranid, statuscode, hostaddr, clientaddr, tcpipSERVICE*

Destination: CWBO

DFHWB1007 *applid* **Initializing CICS Web environment.**

Explanation: Module DFHWBIP has been invoked to initialize the CICS Web 3270 environment.

System action: Processing continues.

User response: None.

Module: DFHWBIP

XMEOUT Parameter: *applid*

Destination: Console

DFHWB1008 *applid* **CICS Web environment initialization is complete.**

Explanation: The CICS Web 3270 environment has been initialized, and it is now ready to process Web-related work.

System action: Processing continues.

User response: None.

Module: DFHWBIP

XMEOUT Parameter: *applid*

Destination: Console

DFHWB1009 *applid* CICS Web environment initialization failed. Reason Code: *X'rc'*.

Explanation: The CICS Web 3270 environment initialization failed with reason code *rc*.

System action: CICS initialization continues. Subsequent calls to the components of the CICS Web environment may fail.

User response: Use the reason code *rc* to determine why initialization failed. The possible reasons are

- 1 Storage for the Web anchor block could not be obtained.
- 3 Load for module DFHWPBST failed.
- 4 Load for module DFHWPBTC failed.
- 5 Storage for the State Manager anchor block could not be obtained.
- 6 The creation of the State Token Directory failed.
- 7 The subpool required for state management could not be added.
- 8 The subpool required for HTTP buffers could not be added.
- 9 The addition of the WPBST lock failed.
- A Load for module DFHWPBIP failed.

Reason codes 1 to 9 originate in DFHWPBIP. Reason code A originates from DFHSIJ1.

Module: DFHWPBIP, DFHSIJ1

XMEOUT Parameters: *applid, X'rc'*

Destination: Console

DFHWB1020 *date time applid* CICS Web State Manager could not find state data for state token *stoken* for a {*destroy* | *retrieve* | *store*} request. { | *TCPIPSERVICE: }tcpipservice*

Explanation: The CICS Web State Manager could not find the state data for the state token *stoken* or the supplied state token *stoken* does not exist.

System action: The requested state data cannot be destroyed, updated or retrieved by the Web State Manager. An exception trace entry is made in the trace table.

User response: Ensure that the supplied state token *stoken* is correct. On a busy CICS region, the most likely cause of this error is that the state data has been discarded by the Web garbage collection process before the Web state manager could access it. Check that the system initialization *WEBDELAY* parameters are appropriate values. See the *CICS System Definition Guide* for guidance on setting the values of the Web garbage collection interval and the Web terminal timeout interval.

Module: DFHWPBST

XMEOUT Parameters: *date, time, applid, stoken, {1=destroy, 2=retrieve, 3=store}, {1= , 2= TCPIPSERVICE: }, tcpipservice*

Destination: CWBO

DFHWB1021 *date time applid* CICS Web State Manager could not find state data for state token *stoken* in order to perform the {*initialize partnership* | *make partnership* | *break partnership* | *trigger partner* | *wait for partner* | *query partner* | *terminate partnership*} request for task number *taskid*, CICS unit of work id *X'cuowid'*. { | *TCPIPSERVICE: }tcpipservice*

Explanation: The CICS Web State Manager could not find the state data for the state token *stoken* because the supplied state token *stoken* does not exist. The running task is task number *taskid* and the associated CICS unit of work id is *cuowid*.

System action: The Web State Manager cannot therefore perform the requested partnership function for the running task. An exception trace entry is made in the trace table.

User response: Ensure that the supplied state token *stoken* is correct. On a busy CICS region, the most likely cause of this error is that the state data has been discarded by the Web garbage collection process before the Web State Manager could access it for the running task. Check that the system initialization *WEBDELAY* parameters are appropriate values. See the *CICS System Definition Guide* for guidance on setting the values of the Web garbage collection interval and the Web terminal timeout interval.

Module: DFHWPBST

XMEOUT Parameters: *date, time, applid, stoken, {1=initialize partnership, 2=make partnership, 3=break partnership, 4=trigger partner, 5=wait for partner, 6=query partner, 7=terminate partnership}, taskid, X'cuowid', {1= , 2= TCPIPSERVICE: }, tcpipservice*

Destination: CWBO

DFHWB1100E *date time applid* The CICS Web Interface received data from the user application that is longer than expected.

Explanation: The environment variables program has received data from a user application. However, the data received was longer than expected.

System action: Exception trace point 4623 is written. The environment variables program abnormally terminates with abend code AWB7.

User response: Examine the data sent to CICS from the application program.

Module: DFHWBENV

XMEOUT Parameters: *date, time, applid*

Destination: Console Routecodes 2 and 12 and Transient Data Queue CWBO

DFHWB1200 *date time applid tranid* The CICS Web Interface analyzer program set parameter **WBRA_USER_DATA_LENGTH** to more than the maximum. Program name: *progname*. **RESPONSE:** *response*. **REASON** *reason*. **Host IP address:** *hostaddr*. **Client IP address** *clientaddr*. **Data offset:** *X'dataoffset'*. **Data length** *X'datalength'*. **Buffer length** *X'bufferlength',{ | TCPIPSERVICE }tcpipservice*

Explanation: As part of its normal processing of a request, Web attach processing invokes the user replaceable analyzer to tailor the required actions. This program is passed the length of the user data part of the HTTP request in parameter **WBRA_USER_DATA_LENGTH**, which it can modify. However, the modified value is greater than the maximum allowable value which represents the available space in the data buffer.

System action: An error response is sent to the client and processing of the request is terminated.

User response: Modify the analyzer program so that it does not set the parameter **WBRA_USER_DATA_LENGTH** to be greater than the maximum. The sum of the data offset and the data length should not exceed the buffer length.

Module: DFHWBXN

XMEOUT Parameters: *date, time, applid, tranid, progname, response, reason, hostaddr, clientaddr, X'dataoffset', X'datalength', X'bufferlength', {1=, 2=TCPIPSERVICE: }, tcpipservice*

Destination: CWBO

DFHWB1525 *date time applid tranid* The CICS Web Interface connection manager received an unexpected response from CICS.

Explanation: The connection manager received an unexpected response to a CICS command. This is a logic error.

System action: A system dump is taken. Processing continues. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You may need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116. It will aid problem determination.

Module: DFHWBC01

XMEOUT Parameters: *date, time, applid, tranid*

Destination: CWBO and Terminal End User

DFHWB1551 *date time applid* The CWBC Transaction is no longer used to manage CICS Web resources.

Explanation: An attempt has been made to run the CICS-supplied transaction CWBC. This transaction is no longer used to manage CICS Web resources.

System action: None. Processing continues.

User response: Refer to the CICS Internet and External Interfaces Guide, and the Resource Definition Guide for details of how to manage CICS Web resources. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHWBC01

XMEOUT Parameters: *date, time, applid*

Destination: CWBO and Terminal End User

DFHWB1560 *date time applid userid* **URIMAP** *urimap* has been created.

Explanation: This is an audit log message indicating that **URIMAP** *urimap* has been added to the system using the **INSTALL** command.

System action: The system continues normally.

User response: None.

Module: DFHWPBUR

XMEOUT Parameters: *date, time, applid, userid, urimap*

Destination: CWBO

DFHWB1570 *date time applid userid URIMAP urimap*
was successfully discarded.

Explanation: This is an audit log message indicating that URIMAP *urimap* has been removed from the system using the DISCARD command.

System action: The system continues normally.

User response: None.

Module: DFHWBUR

XMEOUT Parameters: *date, time, applid, userid, urimap*

Destination: CWBO

DFHWB7001 HTTPD_extract for *envvar* failed.
Processing of this request terminated
rc=retcode.

Explanation: The CICS GWAPI program received an error response *retcode* when it executed the HTTPD_extract function to retrieve the specified environment variable *envvar*.

System action: The CICS GWAPI program terminates and returns an HTTP server error response (code 500) to the Web browser.

User response: Investigate whether the ICSS/390 server has been correctly configured to use the CICS GWAPI DLL. Refer to the *CICS External Interfaces Guide* for further information.

Module: DFHWBAPI

Destination: SYSPRINT

DFHWB7002 HTTPD_read for HTTP user data failed.
Processing of this request terminated
rc=retcode.

Explanation: The CICS GWAPI program received an error response *retcode* when it executed the HTTPD_read function to retrieve the user data sent with an HTTP request.

System action: The CICS GWAPI program terminates and returns an HTTP server error response (code 500) to the Web browser.

User response: Investigate whether the ICSS/390 server has been correctly configured to use the CICS GWAPI DLL. Refer to the *CICS External Interfaces Guide* for further information.

Module: DFHWBAPI

Destination: SYSPRINT

DFHWB7003 Invalid URL passed to DFHWBAPI: *url*.
Processing of this request terminated
rc=retcode.

Explanation: The CICS GWAPI program has attempted to analyze the path name section of the

Uniform Resource Locator *url* that it received from the Web browser, but has determined that its syntax is not in the standard format expected to decide which CICS region, transaction, and program should process the request.

The reason for the failure is given by one of the following values for the return code *retcode*.

- 1 The path name contains fewer than eight characters.
- 2 The path name does not begin with a leading slash (/) character.
- 3 The CICS applid is invalid.
- 4 The converter name is invalid.
- 5 The transaction name is invalid.
- 6 The server program name is invalid.

System action: The CICS GWAPI program terminates and returns an HTTP server error response (code 500) to the Web browser.

User response: Investigate whether the ICSS/390 server has been correctly configured to use the CICS GWAPI DLL. Refer to the *CICS External Interfaces Guide* for further information.

Module: DFHWBAPI

Destination: SYSPRINT

DFHWB7006 Link to program *program_name* at
applid *applid* failed for URL *url*.
Processing of this request terminated
RESP=resp RESP2=resp2.

Explanation: The CICS GWAPI program has attempted to use the CICS External Call Interface (EXCI) to link to the Business Logic Interface program *program_name* in the CICS region with applid *applid*, but the link was unsuccessful. The EIBRESP and EIBRESP2 values from the EXEC CICS LINK command are *resp* and *resp2*.

System action: The CICS GWAPI program terminates and returns an HTTP error response to the Web browser. If *resp* and *resp2* indicate that there is a temporary problem establishing an Inter-Region Communication connection, the HTTP error response is 503 (system not available), otherwise it is 500 (server error).

User response: Investigate whether the target CICS region has been correctly configured to receive EXCI requests from this ICSS/390 server address space.

The following must be set up

- The target CICS region must be active.
- There must be a generic EXCI pipe, or a specific EXCI pipe for *applid*, installed in the target CICS region.
- Inter-Region Communication must be active in the target CICS region.

Refer to the *CICS External Interfaces Guide* for further information.

Module: DFHQBAPI

Destination: SYSPRINT

DFHQB7007 Error detected by program
program_name. Processing of this request terminated rc=*retcode*.

Explanation: The CICS GWAPI program has attempted to use the CICS External Call Interface (EXCI) to link to the Business Logic Interface program *program_name* in a CICS region, but an error response was returned by the program. The return code *retcode* is the Business Logic Interface response that was returned in *wbb1_response*.

System action: The CICS GWAPI program terminates and returns *retcode* as the HTTP server response to the Web browser.

User response: Investigate the reason for the error response. The values that can be returned in *wbb1_response* are documented in the *CICS External Interfaces Guide*, and are generally caused by a programming error in either the converter program or the server application program.

Module: DFHQBAPI

Destination: SYSPRINT

DFHQB7008 HTTPD_set for variable failed for URL
url. Processing of this request terminated rc=*retcode*.

Explanation: The CICS GWAPI program received an

error response *retcode* when it executed the HTTPD_set function to set a value for the specified variable *variable* while processing URL *url*.

System action: The CICS GWAPI program terminates and returns an HTTP server error response (code 500) to the Web browser.

User response: Investigate whether the ICSS/390 server has been correctly configured to use the CICS GWAPI DLL. Refer to the *CICS External Interfaces Guide* for further information.

Module: DFHQBAPI

Destination: SYSPRINT

DFHQB7009 HTTP_write failed for URL url.
Processing of this request terminated rc=*retcode*.

Explanation: The CICS GWAPI program received an error response *retcode* when it executed the HTTPD_write function to write the user data to be sent with an HTTP response for URL *url*.

System action: The CICS GWAPI program terminates and returns an HTTP server error response (code 500) to the Web browser.

User response: Investigate whether the ICSS/390 server has been correctly configured to use the CICS GWAPI DLL. Refer to the *CICS External Interfaces Guide* for further information.

Module: DFHQBAPI

Destination: SYSPRINT

DFHQAAnnnn messages

DFHQA6521I applid CICS shutdown initiated by
CEBT event

Explanation: This is an informational message issued from the CICS TCB.

System action: CICS terminates normally.

User response: None.

Module: DFHXRCP

XMEOUT Parameter: *applid*

Destination: Console

DFHQA6526I applid MESSAGE RECEIVED FOR
UNSUPPORTED QUEUE X'queue'.

Explanation: This message is issued from the CAVM TCB. A tracking message has been received for a queue with hexadecimal name X'queue'. However this queue is not recognized by CICS.

System action: CICS processing continues, but tracking messages for queue X'queue' are ignored.

User response: Check that the active CICS system and the alternate CICS system are at the same functional level with respect to XRF.

If both CICS systems are at the same level, check why the active CICS system has written data to the alternate system.

Ensure that the queue name has not been corrupted.

Module: DFHXRFB

Destination: Console

DFHQA6528I applid Unable to link to program
progrname

Explanation: This message is issued from the CICS TCB. CICS is unable to link to program *progrname*.

System action: CICS terminates abnormally with a

DFHXA6530 • DFHXA6560I

system dump and abend code 0210.

User response: Examine the dump to determine why CICS was unable to link to program *progname*.

Ensure that the named program is not missing from the data sets concatenated in the DFHRPL DD statement. If *progname* is missing, obtain a copy of the program and include it in the library. In addition, ensure that enough storage is available for the dynamic storage areas.

Module: DFHXRE

XMEOUT Parameters: *applid, progname*

Destination: Console

DFHXA6530 *applid* **START=STANDBY specified.
CICS start-up is terminated because
XRF=NO is specified**

Explanation: START=STANDBY and XRF=NO cannot be specified together.

System action: CICS terminates abnormally with a dump.

User response: Correct the conflicting values of the operands START and XRF.

Module: DFHSIC1

XMEOUT Parameter: *applid*

Destination: Console

DFHXA6540I **XRF HAS FAILED. ERROR NUMBER *nn*
ON XRF MESSAGE DATA SET IN
CONTROL INTERVAL WITH RBA
HEX'*xx*'.**

Explanation: The XRF message manager has encountered a problem with the contents of the given control interval in the message data set. The message includes an error number *nn* which can take one of the following values

- 01** The CI does not contain an XRF message manager control record.
- 02** The XRF message control record contains a cycle number less than that of the current read cycle.
- 03** The XRF message manager did not find a message record boundary where it expected one.
- 04** There is an XRF message sequence number error.
- 05** The CIDF is invalid (for example, the free area length is negative).
- 06** The length in the RDF is less than the length of a message record header, or is inconsistent with the data length in the message record header.

- 07** The end of the record lies outside the data area defined by the data length field of the CIDF.

System action: Surveillance by the alternate system ceases.

User response: Check that the active and alternate systems are using the same pair of data sets for XRF surveillance. If they are, this is almost certainly a CICS error affecting either the alternate system, the active system, or both.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHWMRD

Destination: Console

DFHXA6541I **XRF HAS FAILED. THE XRF MESSAGE
READER IN THE ALTERNATE SYSTEM
HAS FALLEN TOO FAR BEHIND.**

Explanation: The alternate system has been unable to keep up with the messages generated by the active CICS system. Its read position in the wrap-round message data set has been 'lapped' by the active system.

System action: Surveillance by the alternate system ceases.

User response: Try to determine and correct the reason for the delay to the alternate system. It may be that the message data set is too small to allow adequate buffering, or the message data set has been reserved by the active CEC – not necessarily by the active CICS.

Module: DFHWMRD

Destination: Console

DFHXA6560I *applid* **TERMINATION COMMAND
FAILED: *command*.**

Explanation: The command issued by the alternate CICS during takeover to terminate the active CICS failed. MVS rejected the system operator command *command* issued under program control as being invalid.

System action: Message DFHXA6581 or DFHXA6582 is also displayed. The alternate CICS continues with its processing to detect termination of the active CICS job.

User response: Ensure that the active CICS job terminates. See messages DFHXA6581 and DFHXA6582. For problem determination, hard copy of the console log may be required.

Module: DFHWTI

Destination: Console

DFHXA6561D *applid* WHEN *jesno jobname* ENDS
REPLY 'JOB' OR WHEN CEC *sid* HAS
FAILED REPLY 'CEC'.

Explanation: During a takeover attempt, the issuing CICS system was unable to determine whether job *jobname*, running on a different CEC, has terminated. This is for one of the following reasons

- CICS was unable to issue a system operator command under program control to cancel the named job. In this case, message DFHXA6560, DFHXA6569 or DFHXA6570 has been produced.
- CICS has either successfully issued a cancel command, or job *jobname* is a failing DBCTL subsystem, but the job still appears to be running after the time period specified by the initialization parameter JESDI.

If *jobname* is the active CICS. Takeover cannot continue until *jobname* has ended. If *jobname* is a DBCTL subsystem, an alternate DBCTL cannot be started until *jobname* has ended.

System action: The system waits for a reply. In the meanwhile, the issuing CICS system continues processing to detect termination of the job.

If termination is detected while the reply is still outstanding, this message is deleted and message DFHXA6564 is displayed. In this case, a reply is no longer required.

If the reply is 'JOB', then processing continues as if CICS had detected the termination itself.

This also happens if the reply is 'CEC', but in addition an internal record is created indicating that the CEC is inoperative at this time. Other alternate CICS which have issued this message for jobs executing on the CEC specified, and which are still waiting for a reply, will detect the internal record of the failed CEC. Having done so they delete their outstanding replies and issue message DFHXA6563.

User response: The operator should either:-

- Ensure that job *jobname* with JES number *jesno* terminates, and then reply 'JOB', or
- Ensure that the CEC with MVS system identifier *sid* is inoperative at this time, for example by selecting SYSTEM RESET on that CEC, and then reply 'CEC'.

No action is necessary if at any time CICS deletes this message, as described above.

Module: DFHWTI

Destination: Console

DFHXA6563I *applid jesno jobname* ENDED DUE TO
FAILURE OF CEC *sid*.

Explanation: During takeover, the alternate CICS has detected that the CEC with MVS system identifier *sid* has failed and therefore that the active CICS job with job name *jobname* and JES job number *jesno* is regarded to have ended.

System action: The alternate CICS continues with its takeover processing.

User response: None.

Module: DFHWTI

Destination: Console

DFHXA6564I *applid* TERMINATION OF *jesno jobname*
DETECTED.

Explanation: During takeover, the alternate CICS has detected that the active CICS job with specified job name and JES job number has ended.

System action: The alternate CICS continues with its takeover processing.

User response: None.

Module: DFHWTI

Destination: Console

DFHXA6566I *applid modname* NOT LINK-EDITED
REENTERABLE.

Explanation: Module *modname*, the CLT or RST currently in use, was found not to have been link-edited with the reenterable module attribute.

The initialization option CLT=*xx* or RST=*xx* specifies the suffix of the CLT or RST currently in use by this alternate CICS.

System action: Further messages are issued which describe the action taken by CICS.

User response: The appropriate response is indicated by subsequent messages.

Module: DFHWTI

Destination: Console

DFHXA6567I *applid* APPLID *applid2* NOT FOUND IN
modname.

Explanation: Module *modname*, the CLT or RST currently in use by this alternate CICS, was found not to contain the APPLID *applid2*.

System action: Further messages are issued which describe the action taken by CICS.

User response: The appropriate response is indicated by subsequent messages.

Module: DFHWTI**Destination:** Console**DFHXA6568I** *applid* **JOBNAME** *jobname* **NOT FOUND IN** *modname*.**Explanation:** Module *modname* is either a CLT or an RST.

If the module is a CLT, it was found not to contain the job name *jobname* associated with the APPLID of this alternate CICS.

If the module is an RST, it was found not to contain the job name *jobname* associated with the DBCTL subsystem identified in the message.

jobname is the job name which the alternate CICS would have used to cancel the active CICS job or DBCTL job during a takeover

System action: Further messages are issued which describe the action taken by CICS.**User response:** The appropriate response is indicated by subsequent messages.**Module:** DFHWTI**Destination:** Console**DFHXA6569I** *applid* **MVS SYSTEM IDENTIFIER** *sid* **NOT FOUND IN** *DFHCLTxx*.**Explanation:** The CLT currently in use was found not to contain the specified MVS system identifier *sid*, which identifies the CEC on which the active CICS was executing.

The initialization option CLT=*xx* specifies the suffix of the CLT currently in use by this alternate CICS.

System action: Further messages are issued by the alternate CICS to describe the action taken.**User response:** The appropriate response is indicated by subsequent messages.**Module:** DFHWTI**Destination:** Console**DFHXA6570I** *applid* **JES SUBSYSTEM NAME** *jesname* **NOT FOUND IN** *DFHCLTxx* **FOR MVS SYSTEM** *sid*.**Explanation:** The CLT currently in use does not contain the JES subsystem name *jesname* associated with the MVS system *sid* of the CEC on which the active CICS was executing.

The initialization option CLT=*xx* specifies the suffix of the CLT currently in use by this alternate CICS.

System action: Further messages are issued by the alternate CICS to describe the action taken.**User response:** The appropriate response is indicated by subsequent messages.**Module:** DFHWTI**Destination:** Console**DFHXA6571I** *applid* **CICS IS NOT DEFINED AS AN MVS SUBSYSTEM.****Explanation:** The alternate CICS attempted to access an internal record of CEC failures to determine whether the CEC on which the active CICS job was executing had failed. To access this information CICS has to be defined as an MVS subsystem. Because it is not, the attempt failed.**System action:** Processing continues.**User response:** None. For further information about defining CICS as an MVS subsystem, see the *CICS Transaction Server for z/OS Installation Guide*.**Module:** DFHWTI**Destination:** Console**DFHXA6572I** *applid* **UNABLE TO LOAD** *modname*.**Explanation:** The module *modname*, defined by the CLT or RST for use by the alternate CICS that issued this message, cannot be loaded.**System action:** Further messages are issued by the alternate CICS to describe the action taken.**User response:** The appropriate response is indicated by subsequent messages.**Module:** DFHWTI**Destination:** Console**DFHXA6573I** *applid* **LOAD MODULE** *modname* **IS NOT VALID.****Explanation:** Module *modname*, the CLT or RST defined for use by this CICS system, is not valid.**System action:** Further messages are issued by the alternate CICS to describe the action taken.**User response:** The appropriate response is indicated by subsequent messages.**Module:** DFHWTI**Destination:** Console**DFHXA6574I** *applid* **ERROR FOUND WITH** *DFHCLTxx*.**Explanation:** The alternate CICS that issued this message is unable to load a CLT, or has performed a check on the CLT contents and has found an error. If the specified CLT is used during a future takeover, the takeover might not be successful. A new or corrected CLT can be made available and loaded at takeover.

System action: Processing continues.

User response: Verify that the alternate CICS job is authorized to perform a takeover of the active CICS. Take appropriate action if not.

Locate the previous message issued by this alternate CICS, which provides details of the CLT error.

Perform the appropriate source edit, assembly and link-edit tasks necessary to make a correct CLT available for this alternate CICS.

Module: DFHWTI

Destination: Console

DFHXA6575I *applid* **SUBSYSTEM NAME** *subsysid*
NOT FOUND IN *rstname* **FOR THIS**
APPLID.

Explanation: This is an informational message indicating that RST *rstname*, which was selected via the SIT, does not include an entry for DBCTL subsystem *subsysid* in any RSE containing the specific APPLID *applid* of this CICS.

System action: No action results directly when this message is issued. Other messages may be issued following this verification failure.

User response: Check the RST suffix specified in the SIT, the RST, and the DBCTL subsystem to which CICS is connected.

Check any other messages that may also have been issued.

Module: DFHWTI

Destination: Console

DFHXA6576I *applid* **CLT PROCESSING NOT**
POSSIBLE OWING TO ERROR IN
DFHCLTxx.

Explanation: During takeover, the alternate CICS that issued this message performed a check on the CLT contents and found an error.

A previous message specifies the error.

System action: Commands in the CLT are not issued by this alternate CICS. Other takeover processing continues.

User response: Verify that the alternate CICS job is authorized to perform a takeover of the active CICS and take appropriate action if it is not.

If the takeover is to be successful, the system operator should monitor and coordinate execution of the active CICS and alternate CICS jobs in the XRF complex.

Perform the source edit, assembly and link-edit tasks necessary to correct the CLT.

Module: DFHWTI

Destination: Console

DFHXA6577I *applid* **NOT AUTHORIZED TO CANCEL**
jesno jobname **ON CEC** *sid*.

Explanation: The issuing alternate CICS is attempting a takeover of the specified active CICS job. It has been unable to find the data that is needed to fully authorize takeover in the CLT or RST. This may be because the alternate cannot load the table, or because job *jobname* cannot be found

- In the CLT, for an active CICS, or
- In the RST, for a DBCTL subsystem, or
- Because the CLT or RST is invalid.

Further messages specify the error with the CLT or RST, or define why the CLT or RST is invalid.

System action: The issuing CICS system cannot issue a CANCEL, but attempts to alert the active CICS system to the takeover request via the XRF control data set. In most cases this causes the active system to initiate termination. The alternate continues processing to detect termination of the job.

When termination is detected, message DFHXA6563 or DFHXA6564 is displayed.

User response: Verify that the alternate CICS job is authorized to perform a takeover of the active CICS. Take appropriate action if the alternate CICS job is not authorized.

Your CLT and/or RST may require some maintenance action.

Module: DFHWTI

Destination: Console

DFHXA6578I *applid* **NOT AUTHORIZED TO CANCEL**
jesno jobname.

Explanation: The issuing alternate CICS is attempting a cancel of the specified active CICS job. It has been unable to find the data that is needed to fully authorize the cancellation in the CLT or RST. This may be because the alternate cannot load the table, or because job *jobname* cannot be found

- In the CLT, for an active CICS, or
- In the RST, for a DBCTL subsystem. or
- Because the CLT or RST is invalid.

Further messages specify the error with the CLT or RST, or define why the CLT or RST is invalid.

System action: The issuing CICS system cannot issue a CANCEL, but attempts to alert the active CICS system to the takeover request via the XRF control data set. In most cases this causes the active system to initiate termination. The alternate continues processing to detect termination of the job.

DFHXA6580I

When termination is detected, message DFHXA6564 is displayed.

User response: Verify that the alternate CICS job is authorized to perform a takeover of the active CICS. Take appropriate action if the alternate CICS job is not authorized.

Your CLT and/or RST may require maintenance action.

Module: DFHWTI

Destination: Console

DFHXA6580I PROGRAM LOGIC ERROR DETECTED.

Explanation: An internal error has been detected that prevents the CICS XRF CAVM supervisor state processing from continuing.

Depending on the CAVM supervisor state service being processed at the time, CICS may or may not abnormally terminate.

The CAVM TCB for processing the service has abnormally terminated.

Job output should include a dump of MVS LSQA associated with the SYSABEND DD statement.

Diagnostics: Register 2 is the base register for DFHWTI global storage. This storage begins with the eye catcher WTISTOR. The format of this storage is defined in DSECT WSTORAGE in source member DFHWTI.

DFHWTI request arguments copied to global storage begin at field WGLODATA.

Source member DFHWTADS defines the format of global storage arguments.

Field WGLOLOCA contains the address of the first register save area for a routine in DFHWTI.

In the SVRB for the CICS SVC call that invoked DFHWTI, the first *fullword* in the FEPARM field contains the address of DFHWTI global storage.

Register 4 is the base register for local storage for each routine in DFHWTI. Its format is defined in a DSECT whose name is of the form WLOCxxx where xxx is the short name of the routine (see below for a list of routine names).

These DSECTs are in source member DFHWTI. The first *halfword* is the internal return code for the routine. The values used for internal return codes are the same as the DFHWTI request reason codes as defined in source member DFHWTADS field name WTARRC.

In addition, internal return codes of the format X'40nn are used. X'40F0 is 'Internal Logic Error' variable name, RCLOGERR.

Other internal return codes of this format are defined in the local storage DSECTs.

The DFHWTI request type for the CAVM supervisor

state service is copied into local storage associated with the DFHWTI initialization and termination routine, field name WWTIREQ, DSECT WLOCWTI in source member DFHWTI.

Register 6 is the base register for each routine in DFHWTI. When set, it points at a location immediately following an eye catcher of the routine's long name (see list of routine names).

Register 13 is the base register for a register save area local to a routine in DFHWTI. These save areas are standard MVS format except the first *fullword* contains the routine's short name (see list of names). They are chained in the standard way with backward and forward pointers set on entry to a routine and zeroed on return.

Register save areas physically precede the storage local to a routine.

If a routine has to access the CLT, its address is in local storage for the routine. The field name for the CLT address is of the form WxxxCLTA, where xxx is the short name of the routine.

System action: In general, the CAVM request issued by this CICS job will fail. For the effect this has on processing by this CICS job, refer to messages issued after this one.

CAVM XRF supervisor state processing issues an MVS abend with system abend code 0214 and an MVS SYSABEND dump is produced.

User response: Keep the job output and console log for problem determination.

Using the SYSABEND dump of the MVS LSQA, and if available, the MVS symptom dump output, find the DFHWTI routine that detected the error from the value of register 6 or register save area chain fields.

Find the internal return code currently set in local storage for the routine.

Using the reason code value, remaining content of local storage and global storage, try to determine the cause of the action by the routine.

An assembly listing of the CLT assembled with the PRINT NOGEN option may be required.

Routine names Long names are used for

- The routine entry point name, and
- The routine entry eye catcher.

Short names are used for

- The routine register save area eye catcher,
- Characters 2 to 4 of routine local storage field names,
- Characters 5 to 7 of routine local storage DSECT names, and
- Characters 1 to 3 of routine labels.

Routines are as follows

Module: DFHWTI

Destination: Console

DFHXA6581I *applid* **UNABLE TO DETERMINE STATUS OF JOB** *jesno jobname*.

Explanation: The issuing CICS system was unable to determine whether job *jobname*, running on the same CEC, has terminated. This is for one of the following reasons

1. CICS was unable to issue a system operator command under program control to cancel the named job. In this case, message DFHXA6560 has been produced.
2. CICS has successfully issued a cancel command, but the job still appears to be running after the time period specified by the initialization parameter JESDI.
3. Job *jobname* is a failing DBCTL subsystem, but the job still appears to be running after the time period specified by the initialization parameter JESDI.

If *jobname* is the active CICS, takeover cannot continue until *jobname* has ended.

If *jobname* is a DBCTL subsystem, an alternate DBCTL cannot be started until *jobname* has ended.

System action: Takeover is suspended until the issuing CICS system detects the termination of the named job.

When termination is detected the message DFHXA6564 is displayed.

User response: Ensure that the active CICS job terminates.

Module: DFHWTI

Destination: Console

DFHXA6582I *applid* **UNABLE TO DETERMINE STATUS OF JOB** *jesno jobname* **ON MVS SYSTEM** *mvsname(sid)*.

Explanation: The issuing CICS system was unable to determine whether job *jobname*, running on MVS image *mvsname*, has terminated. This is for one of the following reasons

- CICS was unable to issue a system operator command under program control to cancel the named job. In this case, message DFHXA6560, DFHXA6569, or DFHXA6570 has been produced.
- CICS has successfully issued a cancel command, but the job still appears to be running after the time period specified by the initialization parameter JESDI.
- Job *jobname* is a failing DBCTL subsystem, but the job still appears to be running after the time period specified by the initialization parameter JESDI.

If *jobname* is the active CICS, takeover cannot continue until *jobname* has ended.

If *jobname* is a DBCTL subsystem, an alternate DBCTL cannot be started until *jobname* has ended.

System action: Takeover is suspended until the issuing CICS system detects the termination of the named job.

DFHXA6583I • DFHXC6604I

When termination is detected the message DFHXA6583I is displayed.

User response: Ensure that the active CICS job terminates.

jobname **ON MVS SYSTEM**
mvsname(sid) **HAS BEEN DETECTED.**

DFHXCnnnn messages

DFHXC6600I *applid* **CAVM DATA SET INITIALIZATION FAILED.**

Explanation: The CICS job which displayed this message attempted to sign on to the CAVM but the signon request failed because the CAVM data sets could not be initialized properly. This is due to one of the following

- The data set formatting subtask had not completed its processing in 2 minutes. This might occur if reserves issued by jobs (not necessarily CICS) running in other CECs cause a CAVM data set's DASD volume or a VSAM catalogue to remain inaccessible for a protracted period.
- SIGNON found that one of the CAVM data sets had already been formatted by a different CICS job but that the other was either empty or could not be opened because of conflict with another user of the data set. SIGNON waited for the other CICS job to finish the data set formatting, but 5 minutes later, this still had not been done. This might occur if a CICS job failed during data set formatting. A specific error reported in a previous message prevented successful completion of data set initialization.

System action: See following message issued by this CICS job.

User response: Correct the JCL or redefine the CAVM data sets if necessary and resubmit the CICS job. See the *CICS System Definition Guide* for information on CAVM data sets.

Module: DFHWSSN3

Destination: Console

DFHXC6601I *applid* **DD STATEMENT MISSING FOR CAVM DATA SET** *dsname*

Explanation: The CICS job which displayed this message issued a SIGNON to the CAVM. The CAVM is attempting to open the CAVM data sets, but the error condition described in the message text has been detected.

System action: See following message issued by this CICS job.

Explanation: During takeover, the alternate CICS has detected that the active CICS job *jobname* with JES job number *jesno* running on MVS image *mvsname* has ended.

System action: The CICS alternate continues takeover processing.

User response: None.

Module: DFHWTI

System action: See following message issued by this CICS job.

User response: See message DFHXC6600

Module: DFHWSSN3

Destination: Console

DFHXC6603I *applid* **CAVM DATA SET** *dsname* **IS INVALID.**

Explanation: The CICS job which displayed this message issued a SIGNON to the CAVM. The CAVM is attempting to open the CAVM data sets, but the error condition described in the message text has been detected.

System action: See following message issued by this CICS job.

User response: See message DFHXC6600

Module: DFHWSSN3

Destination: Console

DFHXC6604I *applid* **CAVM DATA SET** *dsname* **MUST BE A VSAM ESDS.**

Explanation: The CICS job which displayed this message issued a SIGNON to the CAVM. The CAVM is attempting to open the CAVM data sets, but the error condition described in the message text has been detected.

System action: See following message issued by this CICS job.

User response: See message DFHXC6600

Module: DFHWSSN3

Destination: Console

DFHXC6605I *applid* **CI SIZE OF PAIRED CAVM DATA SETS MUST BE EQUAL.**

Explanation: The CICS job which displayed this message issued a SIGNON to the CAVM. The CAVM is attempting to open the CAVM data sets, but the error condition described in the message text has been detected.

System action: See following message issued by this CICS job.

User response: See message DFHXC6600

Module: DFHWSSN3

Destination: Console

DFHXC6606I *applid* **CI SIZE OF CAVM DATA SET *dsname* MUST BE AT LEAST 4K.**

Explanation: The CICS job which displayed this message issued a SIGNON to the CAVM. The CAVM is attempting to open the CAVM data sets, but the error condition described in the message text has been detected.

System action: See following message issued by this CICS job.

User response: See message DFHXC6600

Module: DFHWSSN3

Destination: Console

DFHXC6607I *applid* **SIGNON IS WAITING TO RESERVE OR ACCESS CAVM DATA SET *dsname***

Explanation: The CICS job which displayed this message issued a sign on to the CAVM. CAVM is attempting to reserve or access the CAVM data set indicated in the message text, but for some considerable time, either the required resource has remained unavailable or an outstanding I/O request has not completed. The reason for issuing this particular message cannot be failure of a conditional reserve request unless new empty CAVM data sets are being used for the first time. The reserve attempt should not fail anyway unless another CICS job using the same CAVM data set and executing a sign on, sign-off or takeover request has been held up, possibly by I/O delays, after issuing a successful reserve. I/O delay might be caused by reserves issued by jobs (not necessarily CICS) running in other CECs that have

made the CAVM data set's DASD volume temporarily inaccessible.

System action: After a short delay, the CICS job that displayed this message either reissues the conditional reserve macro or checks for completion of the outstanding I/O. If the required resource is now available or the I/O request has completed, normal processing continues. Otherwise, this message is reissued.

User response: None, unless the condition persists. If so, another CEC might have failed after reserving the DASD volume containing a CAVM data set. In this case, follow your installation's operations procedure for removing an outstanding reserve for a shared DASD. (For example, issue system reset on the failed CEC.)

Module: DFHWSSN3

Destination: Console

DFHXC6608I *applid* **I/O ERROR ACCESSING CAVM DATA SET *dsname* DURING SIGNON.**

Explanation: The CICS job which displayed this message issued a SIGNON to the CAVM. The CAVM is attempting to access the CAVM data sets, but the error condition described in the message text has been detected.

System action: See following message issued by this CICS job.

User response: See message DFHXC6600

Module: DFHWSSN3

Destination: Console

DFHXC6609I *applid* **CAVM DATA SET *dsname* IS OF THE WRONG TYPE OR ITS FORMAT IS INCOMPATIBLE WITH THIS CODE LEVEL.**

Explanation: The CICS job that displayed this message issued a SIGNON to the CAVM. However, the CAVM found that the information in the data set's control record either did not agree with its intended use or had been placed there by an incompatible level of CAVM code. This will occur if

- The data set with ddname DFHXRCTL is not empty and has already been used for something other than a CAVM control data set or by an incompatible level of CAVM code.
- The data set with ddname DFHXRMSG is not empty and has already been used for something other than a CAVM message data set or by an incompatible level of CAVM code.

System action: See following message issued by this CICS job.

User response: See message DFHXC6600

Module: DFHWSSN3

Destination: Console

DFHXC6610I *applid* **CAVM DATA SET *dsname* DOES NOT BELONG TO THE GENERIC APPLID SPECIFIED AT SIGNON.**

Explanation: The CICS job which displayed this message issued a SIGNON to the CAVM. However, the CAVM found that the generic APPLID specified in the sign on request did not match that saved in the CAVM data set's control record when the data set was first formatted.

System action: See following message issued by this CICS job.

User response: See message DFHXC6600

Module: DFHWSSN3

Destination: Console

DFHXC6611I *applid* **CAVM DATA SETS DO NOT FORM A VALID PAIR.**

Explanation: The CICS job that displayed this message issued a SIGNON to the CAVM. However, the CAVM found that the time stamps that were placed in the control records of the two data sets when they were first formatted do not match. This will occur unless the two CAVM data sets were used for the first time as a pair by a single CICS job.

System action: See following message issued by this CICS job.

User response: See message DFHXC6600

Module: DFHWSSN3

Destination: Console

DFHXC6612I *applid* **MULTIPLE VOLUMES ARE NOT SUPPORTED FOR CAVM DATA SET *dsname***

Explanation: The CICS job that displayed this message issued a SIGNON to the CAVM. The CAVM is attempting to OPEN the CAVM data sets but the error condition described in the message text has been detected.

System action: See following message issued by this CICS job.

User response: See message DFHXC6600

Module: DFHWSSN3

Destination: Console

DFHXC6613I *applid* **MULTIPLE UNITS ARE NOT SUPPORTED FOR CAVM DATA SET *dsname***

Explanation: The CICS job which displayed this message issued a SIGNON to the CAVM. The CAVM is attempting to open the CAVM data sets but the error condition described in the message text has been detected.

User response: See message DFHXC6600

Module: DFHWSSN3

Destination: Console

DFHXC6614I *applid* **CONCATENATION IS NOT SUPPORTED FOR CAVM DATA SET *dsname***

Explanation: The CICS job which displayed this message issued a SIGNON to the CAVM. The CAVM is attempting to open the CAVM data sets, but the error condition described in the message text has been detected.

System action: See following message issued by this CICS job.

User response: See message DFHXC6600

Module: DFHWSSN3

Destination: Console

DFHXC6615I *applid* **ALLOCATION CHANGE DURING SIGNON IS NOT SUPPORTED FOR CAVM DATA SET *dsname***

Explanation: The CICS job which displayed this message issued a SIGNON to the CAVM. The CAVM is attempting to OPEN the CAVM data sets, but the error condition described in the message text has been detected.

System action: See following message issued by this CICS job.

User response: See message DFHXC6600

Module: DFHWSSN3

Destination: Console

DFHXC6616I *applid* **CAVM CONTROL AND MESSAGE DATA SETS MUST BE DISTINCT.**

Explanation: The CICS job which displayed this message issued a SIGNON to the CAVM. The CAVM is attempting to format the CAVM data sets, but the ddnames DFHXRMMSG and DFHXRCTL refer to the same data set.

System action: See following message issued by this CICS job.

User response: See message DFHXC6600

Module: DFHWSSN3

Destination: Console

DFHXC66171 *applid* **OBTAIN ERROR WHILE FORMATTING CAVM DATA SET** *dsname*

Explanation: The CICS job which displayed this message issued a SIGNON to the CAVM. The CAVM is attempting to gain exclusive access to a CAVM data set to format it. The CAVM issued a reserve macro specifying the DASD device allocated for the data set and then issued an OBTAIN macro for the volume's Format-4 DSCB to cause a hardware reserve command to be executed if necessary. Possible causes of the OBTAIN failure are

- Specified volume not mounted
- I/O error
- VTOC is invalid.

System action: See following message issued by this CICS job.

User response: See message DFHXC6600

Module: DFHWSSN3

Destination: Console

DFHXC66181 *applid* **SPACE ALLOCATED TO CAVM DATA SET** *dsname* **IS INADEQUATE.**

Explanation: The CICS job which issued this message issued a SIGNON to the CAVM. The CAVM is attempting to format the CAVM data sets, but the error condition described in the message text has been detected.

System action: See following message issued by this CICS job.

User response: See message DFHXC6600

Module: DFHWSSN3

Destination: Console

DFHXC66201 *applid* **SIGNON IS WAITING TO RESERVE OR ACCESS A CAVM DATA SET.**

Explanation: The CICS job that displayed this message issued a sign on to the CAVM. CAVM is attempting to reserve the CAVM control data set or access either the control or the message data set, but for some considerable time either the required resource has remained unavailable or an outstanding I/O request has not completed. The reserve attempt should not fail unless another CICS job using the same CAVM data set and executing a sign on, sign-off or takeover request

has been held up, possibly by I/O delays, after issuing a successful reserve. I/O delay might be caused by reserves issued by jobs (not necessarily CICS) running in other CECs that have made the CAVM data set's DASD volume temporarily inaccessible.

System action: See message DFHXC6607.

User response: See message DFHXC6607.

Module: DFHWSSN2

Destination: Console

DFHXC66211 *applid* **CAVM SIGNON CANNOT PROCEED BECAUSE JES IS EITHER NOT RUNNING OR NOT RESPONDING TO JOB STATUS ENQUIRIES.**

Explanation: The CICS job that displayed this message issued a sign on to the CAVM. To process the request, CAVM needs to know the status of a job identified by an entry in the control data set, but cannot obtain this information for the reason given in the message text.

System action: After a one minute delay, the CICS job that displayed this message reissues the failing job status enquiry. If the request is completed successfully this time, normal processing continues. Otherwise, this message is reissued.

User response: If JES is not running, restart it if possible. Otherwise, if the condition persists, try to correct the problem that is preventing job status enquiries from being answered. In some cases, just stopping JES and restarting it again may achieve the desired effect. In a JES2 environment, a possible cause of this trouble is that another CEC has failed after reserving the DASD volume containing the check-point data set. See message DFHXC6607. In a JES3 environment, job status enquiries cannot be answered if the global processor has failed.

Module: DFHWSSN2

Destination: Console

DFHXC66221 *applid* **ERROR IN INQUIRE HEALTH EXIT DURING SIGNON.**

Explanation: The CICS job that displayed this message issued a SIGNON to the CAVM, but the return code passed back to CAVM by the INQUIRE HEALTH exit (DFHXRC) when it was called during sign on processing was nonzero. This message always indicates an internal error in CAVM or CICS.

System action: CAVM SIGNON continues but XRF function is probably degraded.

User response: Inform your installation's system programmer.

Module: DFHWSSN2

Destination: Console

DFHXC6623I *applid* **CAVM SIGNON IMPOSSIBLE AT PRESENT BECAUSE ANOTHER JOB HAS SIGNED ON WITH THE SAME SPECIFIC APPLID.**

Explanation: The CICS job which issued this message issued a SIGNON to the CAVM, but the request cannot be accepted because the error condition described in the message text has been detected.

System action: See following message issued by this CICS job.

User response: None unless the wrong specific applid has been requested for the new job or the conflicting job was started by mistake. If so, resubmit the failing CICS job with appropriate corrections or after canceling the conflicting job.

Module: DFHWSSN2

Destination: Console

DFHXC6624I *applid* **CAVM SIGNON IMPOSSIBLE BECAUSE SMF IS NOT ACTIVE FOR THE REQUESTING JOB.**

Explanation: The CICS job which issued this message issued a SIGNON to the CAVM, but the request cannot be accepted because the error condition described in the message text has been detected.

System action: See following message issued by this CICS job.

User response: Re-IPL the MVS system, ensuring that the system parameters chosen include SMF.

Module: DFHWSSN2

Destination: Console

DFHXC6625I *applid* **CAVM SIGNON IMPOSSIBLE BECAUSE CAVM DATA SETS ARE UNUSABLE.**

Explanation: The CICS job which issued this message issued a SIGNON to the CAVM, but the request cannot be accepted because the error condition described in the message text has been detected.

System action: See following message issued by this CICS job.

User response: See message DFHXC6600

Module: DFHWSSN2

Destination: Console

DFHXC6626D *applid* **POSSIBLE CAVM SIGNON CONFLICT. IS JOB *jobname,jesno* RUNNING ON SYSTEM *sid?* REPLY 'YES' OR 'NO'.**

Explanation: The CICS job which issued this message issued a SIGNON to the CAVM but the CAVM needs the operator's help in order to decide whether it is safe to accept the request. The CAVM has found that the control data set refers to a job satisfying all the following conditions

- JES believes that this job is still executing.
- If JES is right, the current sign on request must be rejected because the presence of this job would conflict with it.
- This job is not running in the same CEC as the CICS job which is attempting to sign on.
- This job's surveillance signals appear to be absent.

Such a situation might have arisen as a result of a failure of the CEC in which the conflicting job was running and if so, the CAVM should not reject the sign on request unless it finds another reason for doing so. If the job which displayed this message is a CICS active, the conflicting job is another active or an alternate which has started a takeover. If the job which displayed this message is a CICS alternate, the conflicting job is another alternate. The jobname, JES job identifier and CEC SMF identifier of the conflicting job are specified in the message text.

System action: The CICS job waits for a reply.

User response: If the job which displayed this message is a CICS active job, reply NO only if

1. You are certain that the job referred to in the message text is not executing. It might be necessary to perform a System Reset of the CEC where it was running to guarantee this.
AND
2. The job which issued this message ought to continue with its CAVM sign on request and become the CICS active job.

Otherwise reply YES.

If the job which displayed this message is a CICS alternate job, reply NO only if

1. You are certain that the job referred to in the message text is not executing. It might be necessary to perform a System Reset of the CEC where it was running to guarantee this.
AND
2. The job which issued this message ought to continue with its CAVM sign on request and become the CICS alternate job.

Otherwise reply YES.

Module: DFHWSSN2

Destination: Console

DFHXC6627I *applid* **CAVM SIGNON IMPOSSIBLE BECAUSE THIS JOB IS CURRENTLY SIGNED ON OR WAS ONCE AN ACTIVE SYSTEM.**

Explanation: The CICS job which issued this message issued a SIGNON to the CAVM, but the request cannot be accepted because the error condition described in the message text has been detected.

System action: See following message issued by this CICS job.

User response: This message indicates an internal error has occurred.

Module: DFHWSSN2

Destination: Console

DFHXC6628I *applid* **CAVM SIGNON IMPOSSIBLE AT PRESENT BECAUSE CONFLICTING JOB(S) HAVE NOT YET SIGNED OFF OR TERMINATED.**

Explanation: The CICS job which issued this message issued a SIGNON to the CAVM, but the request cannot be accepted because the error condition described in the message text has been detected.

System action: See following message issued by this CICS job.

User response: None unless the wrong START option has been requested for the new job or the conflicting job(s) were started by mistake. If so, resubmit the failing CICS job with appropriate corrections or after canceling the conflicting job(s).

Module: DFHWSSN2

Destination: Console

DFHXC6629I *applid* **CAVM SIGNON IMPOSSIBLE BECAUSE REQUESTING JOB AND SIGNED-ON JOB(S) DO NOT SHARE A COMMON JES JOB QUEUE.**

Explanation: The CICS job which issued this message issued a sign on to the CAVM, but the request cannot be accepted because the error condition described in the message text has been detected.

System action: See following message issued by this CICS job.

User response: If any of the signed on jobs are running under the control of the wrong JES, cancel them. Resubmit the failing job and any that had to be canceled, ensuring that all are running under the control of either a single JES or multiple JESs that share a common job queue.

Module: DFHWSSN2

Destination: Console

DFHXC6630I *applid* **TAKEOVER REJECTED BECAUSE LAST ACTIVE SIGNED OFF NORMALLY.**

Explanation: The CICS job that issued this message issued a takeover request to the CAVM but the request has been rejected due to the error condition described in the message text.

System action: See following message issued by this CICS job.

User response: None

Module: DFHWSTKV

Destination: Console

DFHXC6631I *applid* **TAKEOVER REJECTED BECAUSE LAST ACTIVE INSTANCE NUMBER DOES NOT MATCH THAT SPECIFIED.**

Explanation: The CICS job which issued this message issued a takeover request to the CAVM but the request has been rejected due to the error condition described in the message text. This error would occur if a new CICS active job signed on to the CAVM after this CICS alternate job had already made the decision to attempt to take over from the previous CICS active job.

System action: See following message issued by this CICS job.

User response: None

Module: DFHWSTKV

Destination: Console

DFHXC6632I *applid* **NON PRE-EMPTIVE TAKEOVER REJECTED BECAUSE LATEST ACTIVE VERSION NUMBER DOES NOT MATCH THAT SPECIFIED.**

Explanation: The CICS job which issued this message issued a takeover request to the CAVM but the request has been rejected due to the error condition described in the message text.

System action: See following message issued by this CICS job.

User response: None

Module: DFHWSTKV

Destination: Console

DFHXC6633I *applid* **NON PRE-EMPTIVE TAKEOVER REJECTED BECAUSE A TAKEOVER IS ALREADY IN PROGRESS.**

Explanation: The CICS job which issued this message issued a takeover request to the CAVM but the request has been rejected due to the error condition described in the message text.

System action: See following message issued by this CICS job.

User response: None

Module: DFHWSTKV

Destination: Console

DFHXC6634I *applid* **TAKEOVER REJECTED BECAUSE NECESSARY TOD CLOCK DIFFERENCE INFORMATION IS NOT AVAILABLE.**

Explanation: The CICS job which issued this message issued a takeover request to the CAVM but the request has been rejected due to the error condition described in the message text. This error cannot occur unless both the following conditions are satisfied

- The CICS active and alternate jobs are running in different CECs.
- A TAKEOVER has been attempted before the alternate job has had the chance to observe the active job's surveillance signals for the short time (less than 1 minute) needed to deduce the maximum possible difference between the respective TOD clocks.

The takeover cannot be performed unless the difference between the CECs' TOD clocks is known because normal CICS processing must not be resumed until the current TOD clock reading is later than the TOD clock reading when the old CICS active job terminated as observed in the CEC where it had been running.

System action: See following message issued by this CICS job.

User response: None

Module: DFHWSTKV

Destination: Console

DFHXC6635I *applid* **TAKEOVER PROCESSING TERMINATED BECAUSE ANOTHER BACKUP HAS STARTED A PRE-EMPTIVE TAKEOVER.**

Explanation: The CICS job which issued this message issued a takeover request to the CAVM and the request was accepted, but the error condition described in the message text was encountered before the completion of TAKEOVER.

System action: See following message issued by this CICS job.

User response: None

Module: DFHWSTKV

Destination: Console

DFHXC6636I *applid* **TAKEOVER PROCESSING TERMINATED BECAUSE STATUS OF ACTIVE JOB CANNOT BE DETERMINED.**

Explanation: The CICS job which issued this message issued a takeover request to the CAVM and the request was accepted, but takeover processing could not be completed because of an error encountered in using the CAVM services provided by the CICS SVC.

System action: See following message issued by this CICS job.

User response: For problem determination, consult the *CICS Problem Determination Guide*. The console log and job output may be required.

Module: DFHWSTKV

Destination: Console

DFHXC6637I *applid* **TAKEOVER IS WAITING TO RESERVE OR ACCESS THE CAVM CONTROL DATA SET.**

Explanation: The CICS job that issued this message issued a TAKEOVER request to the CAVM. CAVM is attempting to reserve or access the CAVM control data set in order to process the request, but for some considerable time, either the required resource has remained unavailable or an outstanding I/O request has not completed. The reserve attempt should not fail unless another CICS job using the same CAVM data set and executing a SIGNON, SIGNOFF or TAKEOVER request has been held up, possibly by I/O delays, after issuing a successful reserve.

System action: See message DFHXC6607.

User response: See message DFHXC6607.

Module: DFHWSTKV

Destination: Console

DFHXC6638I *applid* **NOTIFY RC=** *retcode - text*

Explanation: The CICS job that displayed this message has found that the return code passed back to CAVM by the NOTIFY exit (DFHXRB) was non-zero. The message includes the actual return code value *retcode* (or greater than 99) and some text identifying the type of event which was being processed when the error occurred. This message always indicates either an

internal error in CAVM or CICS or that code or data has become corrupted.

System action: Processing continues but XRF function is probably degraded.

User response: Inform your installation's system programmer.

Module: DFHWSTKV

Destination: Console

DFHXC6640I *applid* **ALL STATUS WRITERS ARE IN I/O WAIT.**

Explanation: The CICS job which displayed this message has found that the writes of its latest status issued to the control data set and the message data set are both taking a long time to complete. This might occur if reserves issued by jobs (not necessarily CICS) running in other CECs have made the DASD volumes of both CAVM data sets temporarily inaccessible.

System action: The CICS job re-issues this warning message at intervals until one of its status writes completes. Meanwhile, it continues to perform any processing which is not dependent on status write completion. If the job which displayed this message is a CICS active and the condition persists for long enough, it is possible that an unwanted takeover will be initiated when the alternate (assuming that it is able to read the CAVM data sets because it is running in a different CEC) notices that the active system's surveillance signals have ceased.

User response: If this message is issued by an CICS active job which does not seem to be experiencing other problems, it might be advisable to issue a suitable command to the corresponding alternate job to prevent it from initiating an unnecessary takeover. See also message DFHXC6607.

Module: DFHWSSW

Destination: Console

DFHXC6641I *applid* **STATUS WRITE I/O ERROR ON dsname**

Explanation: The CICS job which displayed this message has encountered an I/O error in writing its latest status to either the control data set or the message data set.

System action: If the CICS job is able to write its status successfully to either the control data set or the message data set, processing continues. Further writes to the failing data set might be attempted later on because it is possible that the error condition was transient. If both data sets become unusable simultaneously, the CAVM TCB ABENDs.

User response: Inform your installation's system programmer.

Module: DFHWSSW

Destination: Console

DFHXC6642I *applid* **ALL STATUS READERS ARE IN I/O WAIT.**

Explanation: The CICS job which displayed this message has found that the reads it has issued to the control data set and the message data set to obtain the latest available status of its partner system are both taking a long time to complete. This might occur if reserves issued by jobs (not necessarily CICS) running in other CECs have made the DASD volumes of both CAVM data sets temporarily inaccessible.

System action: The CICS job reissues this warning message at intervals until one of the status reads completes. Meanwhile, it continues to perform any processing which is not dependent on status read completion. If the job which displayed this message is a CICS alternate, it is possible that a takeover will not be initiated if the active fails, since the alternate cannot detect that the active's surveillance signals have ceased.

User response: See message DFHXC6607.

Module: DFHWSSR

Destination: Console

DFHXC6643I *applid* **STATUS READ I/O ERROR ON dsname**

Explanation: The CICS job which displayed this message has encountered an I/O error in reading the latest available status of its partner system from either the control data set or the message data set. *dsname* is the name of the data set.

System action: Processing continues but XRF function will be degraded because the affected system might not be able to detect changes in its partner's status. Further reads from the failing data set might be attempted later on because it is possible that the error condition was transient. If this error is encountered in an alternate system while it is processing a takeover request, the takeover will fail.

User response: Inform your installation's system programmer.

Module: DFHWSSR

Destination: Console

DFHXC6644I *applid* **NOTIFY RC= retcode - text**

Explanation: The CICS job which displayed this message has found that the return code passed back to CAVM by the NOTIFY exit (DFHXRB) was non-zero. The message includes the actual return code value *retcode* (or a value greater than 99) and some text identifying the type of event that was being processed

DFHXC6645I • DFHXC6650I

when the error occurred. This message always indicates either an internal error in CAVM or CICS or that code or data has become corrupted.

System action: Processing continues but XRF function is probably degraded.

User response: Inform your installation's system programmer.

Module: DFHWSSR

Destination: Console

DFHXC6645I *applid* ERROR IN INQUIRE HEALTH EXIT.

Explanation: The CICS job which displayed this message has found that the return code passed back to CAVM by the INQUIRE HEALTH exit (DFHXRC) was nonzero. This message indicates either an internal error in CAVM or in CICS, or that code or data has become corrupted.

System action: Processing continues but XRF function is probably degraded.

User response: Inform your installation's system programmer.

Module: DFHWSTI

Destination: Console

DFHXC6646I *applid* ERROR CALLING CICS SVC - xxxxxxxxxxxx

Explanation: The CICS job which displayed this message has encountered an error calling the CICS supervisor code (SVC) to determine the status of another MVS image in the same XCF sysplex as the calling CICS MVS image.

System action: Processing continues but XRF function is probably degraded.

User response: Ensure that the correct level of CICS SVC has been specified. Also ensure that MVS has issued an acceptable return code as this error can be caused by a change in MVS response codes. If the error is caused by neither of these, it could be the result of an internal error in CAVM. If this is the case, you need further guidance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHWSSR

Destination: Console

DFHXC6649I *applid* SIGNOFF IS UNABLE TO RESERVE THE CAVM CONTROL DATA SET.

Explanation: The CICS job which issued this message issued a SIGNOFF request to the CAVM or

SIGNOFF processing was invoked implicitly by abnormal termination of the CAVM TCB. CAVM attempted to reserve the CAVM control data set in order to process the request, but for some considerable time, the required resource remained unavailable. The reserve attempt should not fail unless another CICS job using the same CAVM data set and executing a SIGNON, SIGNOFF or TAKEOVER request has been held up, possibly by I/O delays, after issuing a successful reserve.

System action: The CAVM TCB terminates without updating the CAVM data sets to indicate that this CICS job has signed off. See also any following message issued by this CICS job.

User response: None.

Module: DFHWSSOF

Destination: Console

DFHXC6650I *applid* CAVM HAS FAILED, CODE = *code*

Explanation: The CICS XRF job that issued this message has encountered an unexpected severe error during CAVM processing. The code *code* in the message identifies both the error, and the CAVM module that detected it, as follows

Errors detected by DFHWSRTR (00xx)

0002 CAVM dispatcher has no ready processes to dispatch and no external event to wait for.

Errors detected by DFHWSSN1 (10xx)

1001 Nonzero return code from ATTACH for CAVM TCB.

Errors detected by DFHWSSN2 (20xx)

2001 Function code in SIGNON parameter block is invalid.

2002 Function modifier in SIGNON parameter block is invalid.

2003 Length of SIGNON parameter block extension is incorrect.

2004 Requested surveillance interval is not positive.

2005 Nonzero return code from ESTAE to establish recovery for CAVM TCB.

2006 Nonzero return code from asynchronous VSAM GET or CHECK while reading the state management record. (This could be caused by an I/O error.)

2007 Nonzero return code from asynchronous VSAM PUT or CHECK while updating the state management record. (This could be caused by an I/O error.)

- 2008** Nonzero return code from a request to start a check for the presence of surveillance signals.
- 2009** Unexpected return code from a request to complete a check for the presence of surveillance signals.
- 200A** Nonzero return code from asynchronous VSAM GET or CHECK while reading a status CI to check for the presence of surveillance signals. (This could be caused by an I/O error.)
- 200B** Routine to check for the presence of surveillance signals found that the sequence number in a status CI has decreased.
- 200C** Nonzero return code from asynchronous VSAM GET or CHECK while reading a status CI in order to update it. (This could be caused by an I/O error.)
- 200D** Content of the state management record has changed but its security count is unaltered.
- 200E** Nonzero return code from asynchronous VSAM PUT or CHECK while updating a status CI in the control data set. (This could be caused by an I/O error.)
- 200F** Unexpected return code from the conditional RESERVE macro.
- 2010** Nonzero return code from VSAM MODCB macro to change OPTCD in RPL to UPD.
- 2011** Nonzero return code from VSAM MODCB macro to change ACB address in RPL.
- 2012** Nonzero return code from ATTACH for TCB to issue a job STATUS enquiry request to the CICS SVC.
- 2013** Unexpected return code from CICS SVC (A version of DFHCSVC which includes XRF support might not have been installed on the MVS/ESA system, or the wrong SVC number might have been specified on the SIT or as an override.)
- 2014** Unexpected return code from a requested JES job STATUS enquiry function. (This error could also be caused by using a wrong SVC number which does not correspond to any version of the CICS SVC.)
- 2015** Unexpected return code from a XCF IXCQUERY function.
- 2016** Unexpected response code from CICS SVC when attempting to determine details of a job that is running under a release of MVS which supports XCF.
- 2017** Unexpected reason code from CICS SVC when attempting to determine details of a job that is running under a release of MVS which supports XCF.
- Errors detected by DFHWSSN3 (30xx)
- 3001** Nonzero return code from VSAM GENCB macro to build an RPL.
- 3002** Nonzero return code from VSAM SHOWCB macro to obtain the length of an ACB.
- 3003** Nonzero return code from VSAM SHOWCB macro to obtain the length of an RPL.
- 3004** Nonzero return code from VSAM SHOWCB macro to obtain ACB OPEN error code.
- 3005** Nonzero return code from VSAM SHOWCB macro to obtain ACB CI size and RBA data.
- 3006** The high-used RBA of a CAVM data set is zero when it should not be empty.
- 3007** Nonzero return code from asynchronous VSAM GET while reading the Control CI from a CAVM data set.
- 3008** Nonzero return code from VSAM MODCB macro to change STRNO in an ACB.
- 3009** Unexpected return code from the conditional RESERVE macro.
- 300A** Nonzero return code from ATTACH for TCB to format a new pair of CAVM data sets.
- 300B** Internal logic error while processing a new pair of CAVM data sets.
- 300C** Nonzero return code from VSAM TESTCB macro to test whether the data set associated with an open ACB is an ESDS.
- 300D** Nonzero return code from VSAM SHOWCB macro to obtain ACB CI size and RBA data during the data set formatting.
- 300E** Nonzero return code from synchronous VSAM PUT while formatting a new pair of CAVM data sets. (This could be caused by an I/O error.)
- 300F** Nonzero return code from VSAM GENCB macro to build an ACB.
- 3010** Nonzero return code from VSAM SHOWCB macro to obtain ACB CI size and RBA data.
- 3011** Nonzero return code from VSAM MODCB macro to change the ACB address in RPL.
- Errors detected by DFHWSSOF (40xx)
- 4001** Nonzero return code from VSAM GENCB macro to build RPLs.
- 4002** Error return code from PURGE macro (SVC 16).
- 4003** Nonzero return code from VSAM MODCB macro or synchronous GET, or I/O request was purged by the timer exit, when trying to read the state management record. (This could be caused by an I/O error.)

DFHXC6650I

- 4004** The MVS/ESA system no longer has an SMF SMCA although it existed when this CICS XRF job signed on to the CAVM.
- 4005** This CICS XRF job no longer has an SMF TCT although it existed at SIGNON.
- 4006** This CICS XRF job no longer has an SMF JMR although it existed at SIGNON.
- 4007** State management record contains invalid duplicate entries for this CICS XRF job.
- 4008** The location of this CICS XRF job's description in the state management record is inconsistent with the current value of SMDR1NDX.
- 4009** The sequence numbers in this CICS XRF job's pair of status CIs in the control and message data sets are equal but nonzero.
- 400A** Unexpected return code from the conditional RESERVE macro.
- 400B** Unable to RESERVE control data set after repeated attempts.
- 400C** Nonzero return code from VSAM MODCB macro or return code 4 from synchronous PUT when trying to update status CI.
- 400D** Nonzero return code from VSAM MODCB macro or synchronous GET, or I/O request was purged by the timer exit, when trying to update the state management record. (This could be caused by an I/O error.)
- Errors detected by DFHWSSR (50xx)
- 5001** Nonzero return code from VSAM GENCB macro to build an RPL.
- 5002** The alternate has detected that the active's status CI was still being updated after the active job had signed off or terminated. (This error could be caused by an invalid XRF configuration in which the active and alternate do not share a common JES job queue. The problem was not discovered when the second job signed on to the CAVM because at that time it was unable to detect the first job's surveillance signals.)
- 5003** The sequence number in a status CI of an XRF partner job has decreased.
- 5004** The alternate has detected that the sequence numbers in the active's pair of status CIs in the control and message data sets are equal but nonzero.
- 5005** The estimate of the lower bound of the difference between the active's and alternate's TOD clocks derived from the time-stamp in the status CI which has just been read is greater than the existing estimate of the upper bound of this difference.
- 5006** The estimate of the upper bound of the difference between the active's and alternate's TOD clocks derived from the time-stamp in the status CI which has just been read is less than the existing estimate of the lower bound of this difference.
- 5007** The sequence numbers in an XRF partner job's pair of status CIs in the control and message data sets are equal but nonzero.
- 5008** The sequence number in a status CI of an XRF partner job is now inconsistent with previously observed values.
- 5009** The instance and version numbers in a status CI of an XRF partner job are now less than the corresponding values in the public status area.
- 500A** The instance and version numbers in a status CI of an XRF partner job are unaltered but the job state indicator has changed from 'signed off' to 'signed on'.
- 500B** Public status area seems to contain valid data about an XRF partner job before it should.
- 500C** Attempt to indicate that public status is available for another XRF partner job when it is already available for all partners.
- 500D** The alternate has encountered I/O errors in consecutive attempts to read the active's status CIs from both control and message data sets.
- 500E** The alternate has encountered an I/O error in trying to read one of the active's status CIs during a takeover.
- 500F** Logical error return code from VSAM CHECK of an asynchronous GET.
- 5010** Nonzero return code from asynchronous VSAM GET.
- 5011** This alternate has been invalidated by the active, probably because of message transmission difficulties. This can also be caused by a message data set that is too small. In this case, increase the size of the message data set to allow the alternate CICS to apply its updates before they are overwritten by those of the active CICS.
- Errors detected by DFHWSSW (60xx)
- 6001** Logical error return code from VSAM CHECK of an asynchronous PUT.
- 6002** I/O errors have been encountered in consecutive attempts to write to this job's status CIs in both control and message data sets.
- 6003** Nonzero return code from asynchronous VSAM PUT.

- 6004** The 'status write completed' event masks have been corrupted.
- 6005** WSAGINDEX has been corrupted.
- 6006** Nonzero return code from VSAM GENCB macro to build an RPL.
- 6007** The sequence number in one of this job's status CIs has been corrupted in the control or message data set. (This error could be caused by an invalid XRF configuration in which two actives or two alternates do not share a common JES job queue. The problem was not discovered when the second job signed on to the CAVM because at that time, it was unable to detect the first job's surveillance signals.)

Errors detected by DFHWSTKV (80xx)

- 8001** Nonzero return code from VSAM GENCB macro to build an RPL.
- 8002** State management record indicates that the alternate attempting to take over already holds the takeover lock.
- 8003** State management record indicates that the alternate attempting to take over already holds the resources which are freed by SIGNOFF of the active job.
- 8004** State management record indicates that the alternate attempting to take over already holds the resources which are freed by termination of the active job.
- 8005** DFHWTI encountered an error in trying to confirm termination of the active job after the alternate performing the takeover had already acquired the resources freed by the active SIGNOFF.
- 8006** Another alternate has started a preemptive takeover after this alternate had already acquired the resources freed by the active SIGNOFF.
- 8007** The time-stamp associated with the resources freed by termination of the active job cannot be updated because an unexpected problem has arisen with the TOD clock difference data after this alternate had already acquired the resources freed by the active SIGNOFF.
- 8008** Nonzero return code from asynchronous VSAM GET to read the state management record.
- 8009** Nonzero return code from VSAM CHECK of asynchronous GET for the state management record. (This could be caused by an I/O error.)
- 800A** Nonzero return code from asynchronous VSAM PUT to update the state management record.
- 800B** Nonzero return code from VSAM CHECK of

asynchronous PUT for the state management record. (This could be caused by an I/O error.)

- 800C** Nonzero return code from asynchronous VSAM GET to read the state management record in QUIESCE routine.
- 800D** Nonzero return code from VSAM CHECK of asynchronous GET for the state management record in QUIESCE routine. (This could be caused by an I/O error.)
- 800E** Nonzero return code from VSAM MODCB macro to change OPTCD in RPL to UPD.
- 800F** Nonzero return code from VSAM MODCB macro to change OPTCD in RPL to NUP.
- 8010** Unexpected return code from the conditional RESERVE macro.
- 8011** Invalid request code passed to the routine which attaches subtask TCBs to issue XRF requests to the CICS SVC.
- 8012** Nonzero return code from ATTACH for TCB to issue XRF request to the CICS SVC.
- 8013** Nonzero return code from DETACH for subtask TCB.

The CICS XRF job that issued this message has encountered an unexpected severe error during CAVM processing. The code *code* identifies both the error and the CAVM module that detected it. See message DFHXC6650 in the *CICS Messages and Codes* manual for an explanation of these codes.

System action: An ABEND U0218 is issued with a reason code equal to the code in message DFHXC6650. This results in abnormal termination of the CICS XRF job. See also any following messages issued by this CICS XRF job.

User response: Inform your installation's system programmer.

Module: DFHWSRTR, DFHWSSN1, DFHWSSN2, DFHWSSN3, DFHWSSOF, DFHWSSR, DFHWSSW, DFHWSTKV

Destination: Console

DFHXC6651I applid CAVM HAS DETECTED AN INVALID REQUEST.

Explanation: CAVM has found that the parameter block passed to it is invalid, or that the request is being made at an inappropriate time.

System action: An ABEND U0218 is issued with reason code 1. This results in the abnormal termination of the CICS job. See also any following messages issued by this CICS job.

User response: Restart the failing CICS job and inform your installation's system programmer.

Module: DFHWSRTR

Destination: Console

DFHXGnnnn messages

DFHXG6215 *applid progname operation failure, response code cccc cccc keyrange: rrrr{. | key: }key***Explanation:** Table builder services (DFHTBSS) failed in an operation on the global catalog (DFHCCCC).

The failing operation is shown in the message, and is a DELETE, WRITE_NEXT, START_WRITE or END_WRITE. request.

- *cccc cccc* are the response and reason codes from the catalog domain.
- *rrrr* is the internal RQ token passed to the catalog domain.
- *key* appears in the message only for a WRITE or DELETE operation, and usually includes the name of the resource for which CICS failed to record information on the global catalog.

This is normally an internal CICS error, however, it can occur during shut down if one task initiates a normal shut down, and another initiates an immediate shut down shortly afterwards. This is because the immediate shut down closes resources that are being used by the normal shut down task.

This can also occur if the global catalog is not big enough and a large group is being installed.

System action: CICS terminates.**User response:** Check the size of the global catalog. Redefine a larger one if necessary.

Alternatively this message could be caused by an immediate shutdown of CICS because tasks not yet quiesced may abend trying to access a service removed by the shutdown process.

Module: DFHTBSS**XMEOUT Parameters:** *applid, progname, operation, cccc, cccc, rrrr,{1=., 2= key: }, key***Destination:** Console

DFHXG6400I *applid Signing on to the CAVM as active with generic APPLID genericid***Explanation:** This is an informational message issued from the CICS TCB. It indicates that the system is about to sign on to the CICS availability manager (CAVM) as active. The message insert provides the generic applid.**System action:** CICS initialization is delayed until the signon request has been processed.

In general the delay is insignificant. In those cases where the delay is significant messages are produced by the CAVM to note the reasons.

User response: None.**Module:** DFHXRA**XMEOUT Parameters:** *applid, genericid***Destination:** Console

DFHXG6401I *applid Sign on to the CAVM as active accepted***Explanation:** This is an informational message issued from the CICS TCB. Destination: Console

DFHXG6407I *applid* **Sign off normal from the CAVM detected.**

Explanation: This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that alternate CICS has signed off from the CAVM.

System action: CICS processing continues.

User response: None.

Module: DFHXRSP

XMEOUT Parameter: *applid*

Destination: Console

DFHXG6408I *applid* **SIGNING OFF ABNORMALLY FROM THE CAVM.**

Explanation: This is an informational message issued from the CICS TCB. It indicates that the sign off request has been accepted by the CAVM.

System action: CICS termination continues.

User response: None.

Module: DFHXRF

Destination: Console

DFHXG6409I *applid* **SIGN OFF ABNORMAL FROM THE CAVM ACCEPTED.**

Explanation: This is an informational message issued from the CICS TCB. It indicates that the sign off request has been accepted by the CAVM. (Refer to message DFHXG6408).

System action: CICS termination continues.

User response: None.

Module: DFHXRF

Destination: Console

DFHXG6410I *applid* **SIGN OFF ABNORMAL FROM THE CAVM REJECTED.**

Explanation: This is an informational message issued from the CICS TCB. It indicates that the sign off request has been rejected by the CAVM. (Refer to message DFHXG6408.)

Messages are produced by the CAVM to note the reasons for rejecting the request.

System action: CICS termination continues.

User response: Refer to the messages produced by the CAVM for further information.

Module: DFHXRF

Destination: Console

DFHXG6411I *applid* **Sign off abnormal from the CAVM detected.**

Explanation: This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that the alternate CICS has signed off from the CAVM.

System action: The system continues with normal processing. However, you should be aware that takeover does not occur if the active CICS fails.

User response: Determine the reason for the abnormal sign-off.

Module: DFHXRSP

XMEOUT Parameter: *applid*

DFHXG6415I • DFHXG6429I

Destination: Console

DFHXG6415I *applid* CICS is being taken over.
Execution will be terminated.

Explanation: This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that the CAVM has accepted a takeover request from alternate CICS.

System action: CICS is terminated abnormally with abend code 206.

User response: None.

Module: DFHXRSP

XMEOUT Parameter: *applid*

Destination: Console

DFHXG6416I *applid* APPARENT FAILURE OF
ALTERNATE CICS DETECTED.

Explanation: This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that the alternate CICS appears to have failed.

System action: The system continues with normal processing. However, you should be aware that takeover may not occur should the active CICS fail.

User response: Determine the reason for the apparent failure of the alternate CICS.

Module: DFHXRSP

Destination: Console

DFHXG6417I *applid* Recovery of alternate CICS
detected.

Explanation: This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that alternate CICS has recovered from the apparent failure reported by message DFHXG6416.

System action: The system continues with normal processing.

User response: None.

Module: DFHXRSP

XMEOUT Parameter: *applid*

Destination: Console

DFHXG6422I *applid* Sign off normal from the CAVM
assumed.

Explanation: This is an informational message issued from the CICS TCB. It indicates that CICS has assumed that the alternate CICS has signed off from the CAVM.

This is likely to occur when the active CICS is running on CEC 1 and

1. the CICS alternate is started on CEC 2, or

2. the CEC 2 initial program load is repeated, or
3. CICS alternate is restarted on CEC 2.

System action: CICS processing is continued.

User response: None.

Module: DFHXRSP

XMEOUT Parameter: *applid*

Destination: Console

DFHXG6423I *applid* CAVM failure detected. CICS
cannot continue as active.

Explanation: This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that the CAVM has failed.

Messages are produced by the CAVM to note the reasons for failure.

System action: CICS terminates abnormally with abend code 212.

User response: Correct the error.

Module: DFHXRSP

XMEOUT Parameter: *applid*

Destination: Console

DFHXG6427I *applid* Terminal control restart task
has failed. CICS execution will be
terminated.

Explanation: This is an informational message issued from the CICS TCB. It indicates that the terminal control restart task has failed. It is no longer possible for CICS to continue either as active or as alternate.

Messages are produced by the terminal control restart task to note the reasons for failure.

System action: CICS terminates abnormally with abend code 209.

User response: Correct the error.

Module: DFHXRSP

XMEOUT Parameter: *applid*

Destination: Console

DFHXG6429I *applid* Transaction CXCU cannot be
attached.

Explanation: This is an informational message issued from the CICS TCB. It indicates that CICS is unable to attach transaction CXCU. Therefore, CICS is unable to initiate the transmission of tracking messages. Takeover is adversely affected if CXCU cannot be attached. This can occur if

1. CXCU is not defined to CICS, or
2. CICS is short on storage

System action: CICS attempts to attach CXCU at regular intervals.

User response: Either install CXCU using RDO, or alleviate the storage shortage.

Module: DFHXRSP

XMEOUT Parameter: *applid*

Destination: Console

DFHXG6439I *applid* CICS startup is terminated for reasons given above.

Explanation: This is an informational message indicating that CICS startup is terminated.

System action: CICS is terminated abnormally with a dump.

User response: Refer to previous messages that have been sent to the system console for further guidance.

Module: DFHSIC1

XMEOUT Parameter: *applid*

Destination: Console

DFHXG6440I I/O ERROR ON XRF MESSAGE DATA SET. RPL ADDRESS = HEX'xx'.

Explanation: VSAM reported a physical I/O error on the XRF message data set. The address X'xx' is that of the VSAM RPL which reported the error.

System action: Surveillance by the XRF system ceases.

User response: It is necessary to restart both the active and alternate CICS systems with a fresh pair of surveillance data sets. For diagnostic purposes, the message gives the address of the RPL being used at the time the error was reported. The RPL has an associated VSAM message area.

Module: DFHWMMT

Destination: Console

DFHXG6441I LOGICAL ERROR ON XRF MESSAGE DATA SET. VSAM FEEDBACK DATA = HEX' xx'.

Explanation: VSAM reported a logical error on the XRF message data set.

System action: Surveillance by the XRF system ceases.

User response: This is an error in the CICS system. For diagnostic purposes the message contains the VSAM feedback data for the error.

Module: DFHWMMT

Destination: Console

DFHXG6442I INTERNAL ERROR IN XRF MESSAGE MANAGER.

Explanation: Request chains maintained by the CICS message manager are in an inconsistent state.

System action: Surveillance by the XRF system ceases.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHWMQS

Destination: Console

DFHXG6443I INTERNAL ERROR IN XRF SURVEILLANCE COMPONENT.

Explanation: An invalid internal call has been made to a routine in XRF surveillance component.

System action: Surveillance by the XRF system ceases.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHWCCS

Destination: Console

DFHXG6444I VSAM REQUEST REJECTED FOR XRF MESSAGE DATA SET.

Explanation: A VSAM PUT or GET request directed to the XRF message data set has been rejected.

System action: Surveillance by the XRF system ceases.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHWMMT

Destination: Console

DFHXG6445I XRF MESSAGE DATA SET FORMATTING STARTED.

Explanation: The XRF message data set is new and must be formatted before it can be used to pass messages from the active to the alternate.

System action: Normal service continues.

User response: Depending on the size of the message data set, there will be some delay before the active can send messages to the alternate. It may be advisable to defer starting an alternate system until the corresponding message DFHXG6446 has been received.

Module: DFHWMMT

Destination: Console

**DFHXG6446I XRF MESSAGE DATA SET
FORMATTING COMPLETED.**

Explanation: The XRF message data set has now been formatted. It can be used to pass messages from the active to the alternate.

System action: Normal service continues.

User response: None. See message DFHXG6445.

Module: DFHWMMT

Destination: Console

**DFHXG6447I NON CRUCIAL XRF MESSAGE(S)
DISCARDED.**

Explanation: The XRF message data set is full. Some messages are being discarded in preference to invalidating the alternate system by overwriting messages that it has not yet read.

System action: Normal service continues.

User response: This situation is likely to arise in circumstances similar to those described for message DFHXA6541. The alternate has not yet become invalid but is likely to become so and corrective action is warranted. Refer to message DFHXA6541 for further guidance.

Module: DFHWMWR

Destination: Console

**DFHXG6450I SVC GETMAIN FAILED IN XRF
SURVEILLANCE.**

Explanation: An SVC GETMAIN issued by the CICS surveillance component has failed. The GETMAIN may have been issued under either the CICS TCB or the XRF TCB.

System action: An MVS abend 0190 is issued.

User response: Since the GETMAIN requests storage above the 16MB line, it is extremely unlikely that the request cannot be satisfied.

A system error may have occurred. If this is the case, you will require further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHWCCS

Destination: Console

**DFHXG6451I SVC GETMAIN FAILED IN XRF
SURVEILLANCE.**

Explanation: An SVC GETMAIN issued by the CICS surveillance component has failed. The GETMAIN may

have been issued under either the CICS TCB or the XRF TCB.

System action: An MVS abend 0191 is issued.

User response: Since the GETMAIN requests storage above the 16MB line it is extremely unlikely that the request cannot be satisfied.

A system error may have occurred. If this is the case, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHWLGET

Destination: Console

**DFHXG6452I INTERNAL ERROR IN XRF
SURVEILLANCE.**

Explanation: A consistency check made by the XRF LIFO storage manager has failed. The failure may have occurred while running under either the CICS TCB or the XRF TCB.

System action: An MVS abend 0192 is issued.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHWLFRE

Destination: Console

**DFHXG6453I INTERNAL ERROR IN XRF
SURVEILLANCE.**

Explanation: A consistency check made by the XRF process manager has failed. A process has made an invalid internal lock request.

System action: An MVS abend 0193 is issued.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHWDWAT

Destination: Console

**DFHXG6454I PROGRAM CHECK IN XRF
SURVEILLANCE. PSW = HEX'xx' 'xx'.
ADDRESS OF EPIE COPY = HEX'xx'.**

Explanation: A program check occurred from which the XRF process was unable to recover.

System action: An MVS abend 0194 is issued and a dump is produced.

User response: This is an error in the CICS system. The message gives the PSW at which the check occurred. Further information is preserved in the dump.

You need further assistance from IBM to resolve this

problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHWDSRP

Destination: Console

DFHXG6475 *applid iiiii* **Backup simlogon(s) abandoned**

Explanation: An XRF alternate is taking over, and is processing the last few session tracking requests.

CICS has issued a SIMLOGON for a standby session, but VTAM has not yet returned the logon request to CICS's VTAM logon exit.

Message DFHXG6480 has been issued twice, and CICS has now assumed that the logons will not appear.

Normal processing continues, though the state of the sessions currently pending backup SIMLOGON is unpredictable at the end of CICS initialization.

The reconnection process attempts to BIND these sessions normally.

System action: Normal takeover processing continues.

User response: The CSTL log and CICS trace should be collected.

Module: DFHZXST

XMEOUT Parameters: *applid, iiiii*

Destination: Console

DFHXG6476I *applid* **XRF catch-up abandoned - all XRF alternates signed off**

Explanation: A run of the XRF catch-up transaction has been abandoned because there are no XRF alternates. A failing alternate may have issued some messages.

System action: Normal processing continues.

User response: None.

Module: DFHZXCU

XMEOUT Parameter: *applid*

Destination: Console

DFHXG6477I *applid* **Generic and Specific Ids have same value**

Explanation: A CICS system has issued the command to re-assign the VTAM USERVAR representing the XRF complex so that from now on logon requests to the XRF complex are directed to this CICS. However, this system is an XRF primary, and the value of the specific ID is the same as the generic ID for the XRF complex.

System action: Normal processing continues.

User response: None. However special care must be taken when using the application ID. You must make it clear whether reference is being made to the CICS system or to the XRF complex.

Module: DFHZXSTS

XMEOUT Parameter: *applid*

Destination: Console

DFHXG6479 *applid* **Modify USERVAR issued unsuccessfully. Return code nn**

Explanation: A CICS system has unsuccessfully issued a command to re-assign the VTAM USERVAR representing the XRF complex.

System action: Normal processing continues.

User response: The system operator can issue the command on CICS's behalf. The format is as follows

F procname,USERVAR,ID=generic-id,VALUE=specific-id

Where

- 'procname' is the procedure name for VTAM,
- 'generic-ID' is the VTAM application ID for the whole complex, and
- 'specific-ID' is the VTAM application ID for the new CICS

If it is not possible to change the USERVAR, end-user logons which name the generic-ID value continue to be directed to the old specific-applid, with unpredictable results.

(However, logons quoting the specific-ID of the new system are routed to that system.)

Module: DFHZXSTS

XMEOUT Parameters: *applid, nn*

Destination: Console

DFHXG6480I *applid* **Waiting for backup simlogon processing to drain**

Explanation: An XRF alternate is taking over, and is processing the last few session tracking requests.

CICS has issued SIMLOGON for a standby session, but VTAM has not yet returned the logon request to the CICS VTAM logon exit.

This message is issued every 5 seconds for 20 seconds while the takeover is being held up.

This indicates either a VTAM error or a CICS logic error.

System action: This message is issued twice and then message DFHXG6475 is issued.

User response: If this message is repeated look for other evidence of failure in CICS or VTAM.

Module: DFHZXQO

XMEOUT Parameter: *applid*

Destination: Console

DFHXG6481I *applid* **Autoconnect delayed for *hh* hours, *mm* minutes, *ss* seconds.**

Explanation: CICS has delayed running the reconnection transaction CXRE for an interval of *hh* hours, *mm* minutes, *ss* seconds, to either

- acquire AUTOCONNECT terminals after a CICS startup, or
- reacquire terminal sessions after an XRF takeover.

The delay value, *hh* hours, *mm* minutes, *ss* seconds, is taken from the AUTCONN system initialization parameter. In the case of XRF takeover, a value calculated from the number of standby BINDs held at the time of takeover. This extra interval allows the switching of XRF-capable terminals before non-XRF sessions are reconnected by CXRE.

System action: Normal processing continues.

User response: None.

Module: DFHSIJ1

XMEOUT Parameters: *applid, hh,mm, ss*

Destination: Console

DFHXG6482 *applid* **Unable to issue SETLOGON HOLD (*reqcode,reg15,reg0*)**

Explanation: This message is issued if VTAM SETLOGON START fails during initialization or if in preparation for changing the routing of VTAM logons, this system (which is currently doing an XRF takeover) has attempted to request VTAM to stop passing any more logon requests to it. The attempt failed, and the details of the failure are given in the message, as follows. The first insert is one of the following.

- 'S'—The SETLOGON START request failed.
- 'H'—The SETLOGON HOLD request failed.

The second and third inserts are the values of registers 15 and 0, respectively, at the time of the failure.

See the *VTAM Programming* manual for your release of VTAM for the interpretation of these values.

Valid logons reaching CICS before message DFHSI1517 is issued may be rejected.

System action: Normal processing continues.

User response: Note the message.

Module: DFHZXSTS

XMEOUT Parameters: *applid, reqcode,reg15, reg0*

Destination: Console

DFHXG6483I *applid* **This will be the last pass.**

Explanation: The reconnection transaction CXRE is about to scan the VTAM terminals and sessions that were to be (re)connected for the last time. All those found are listed in message DFHXG6486.

System action: Processing continues

User response: If any of the VTAM terminals or sessions listed in message DFHXG6486 are crucial, then check whether they are successfully connected as a result of this pass.

Module: DFHZXRE

XMEOUT Parameter: *applid*

Destination: Console

DFHXG6484I *applid* **Autoconnect processing now complete.**

Explanation: The reconnection transaction CXRE has just scanned all the VTAM terminals and sessions, and all those that were to be (re)connected are now connected.

System action: Processing continues

User response: None.

Module: DFHZXRE

XMEOUT Parameter: *applid*

Destination: Console

DFHXG6485 *applid* **Unable to schedule Autoconnection / Reconnection process.**

Explanation: CICS initialization attempted to schedule the reconnection process, but was unable to do this as CICS rejected the DFHPC TYPE=LINK call.

See following message DFHXG6487 or DFHXG6488 for the reason.

System action: The reconnection process is not run.

User response: CEMT must be used to restore individual terminals to the desired state.

Module: DFHZOPA

XMEOUT Parameter: *applid*

Destination: Console

DFHXG6486I *applid termid* **may not be acquired after takeover**

Explanation: The reconnection transaction, CXRE, is making its last run, but has discovered that terminal or session *termid* is still not bound in the same status that it was in during the previous failed run of CICS.

System action: Normal processing continues.

User response: Note the terminal identification *termid* in the message, and try to discover why previous reconnection attempts failed. The terminal may not have been physically switched, for example, CEMT may be used to acquire individual terminals after such problems have been cleared.

Module: DFHZXRE0

XMEOUT Parameters: *applid, termid*

Destination: Console

DFHXG6487 *applid* **Unexpected IC/PC error code**
X'code'. **Module** *modname*

Explanation: The reconnection transaction CXRE could not be scheduled or rescheduled., as the DFHIC TYPE=INITIATE or DFHPC TYPE=LINK was rejected with code *X'code'*. This is caused by a CICS logic error.

This message follows either

- DFHXG6485 if CICS was unable to schedule CXRE, or
- DFHXG6489 if CICS was unable to reschedule CXRE.

System action: The action taken by CICS depends upon whether the error occurred during scheduling or rescheduling of CXRE.

Refer to the system action for either DFHXG6485 or DFHXG6489 for further details about the action taken by CICS.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHSIJ1, DFHZOPA

XMEOUT Parameters: *applid, X'code', modname*

Destination: Console

DFHXG6488 *applid* **Required transaction CXRE is not defined to CICS.** **Module** *modname*

Explanation: The reconnection transaction, CXRE, could not be rescheduled. This was because either the transaction code required no longer has an installed transaction definition, or the program required does not have an installed program definition.

This message follows DFHXG6489 or DFHXG6485

System action: The current run of the reconnection transaction is the last one. Message DFHXG6486 is issued for all terminals and sessions found.

User response: If non-XRF terminals are to be reconnected, correct the problem.

Module: DFHSIJ1, DFHZOPA

XMEOUT Parameters: *applid, modname*

Destination: Console

DFHXG6489 *applid* **Unable to schedule Autoconnection / Reconnection transaction CXRE.** **Module** *modname*.

Explanation: The reconnection transaction, CXRE, attempted to reschedule itself, but was unable to as CICS interval control rejected the DFHIC TYPE=INITIATE call.

This message is followed either by DFHXG6487 or DFHXG6488, which provides further information about the cause of the error.

System action: The current run of the reconnection transaction is the last one. Message DFHXG6486 is issued for all terminals and sessions found.

User response: See the following message. CEMT may be used to acquire individual terminals.

Module: DFHSIJ1

XMEOUT Parameters: *applid, modname*

Destination: Console

DFHXG6490I *applid* **Reconnecting VTAM session - pass number xxxx**

Explanation: Control has recently been given to CICS after an XRF takeover. The reconnection transaction, CXRE, which attempts to start acquire processing for logical units that were in session in the failed active, has just started for the pass number xxxx.

System action: Normal processing continues.

User response: Note any error messages arising as CICS attempts to reconnect terminals and sessions.

Module: DFHZXRE0

XMEOUT Parameters: *applid, xxxx*

Destination: Console

DFHXG6491 *applid* **Logic error during session tracking.** **REASON** *rcode*
terminal/session event

Explanation: XRF session tracking encountered an unexpected circumstance probably due to a design error. The reason code (*rcode*) is one of the following.

- 1 POST called but no pending action for terminal or session.
Inserts
 - name of terminal or session.
- 2 DFHZXST called with bad request value.
- 3 XRF-capable session lacks a correlation id.
Inserts

- name of terminal or session,
- code for event being tracked.

The following are valid for DFHSUSX only.

- X'01—Send sign on data
- X'02—Send sign on data (catchup)
- X'03—Receive sign on data

The following are valid for DFHZXST only.

- X'F1—BIND
- X'F2—Free LOGON data
- X'F3—UNBIND

- 4** Could not get key to build tracking message.
- Inserts
- name of terminal or session
 - code for event being tracked (see 3 above)
- 5** Could not get send tracking message.
- Inserts
- name of terminal or session
 - code for event being tracked (see 3 above)
- 6** Could not find session named in tracking message.
- Inserts
- name of terminal or session
 - code for event being tracked (see 3 above)
- 7** Illegal entry named in tracking message.
- Inserts
- name of terminal or session
 - code for event being tracked (see 3 above)
- 8** Bad request code in tracking message.
- Inserts
- name of terminal or session
 - bad request code (see 3 above for valid DFHZXST codes)
- 9** Correlator in tracking message is longer than 8.
- Insert
- name of terminal or session
- 10** Unable to schedule standby BIND.
- Insert
- name of terminal or session.

System action: Normal processing continues.

User response: Note the message. Resources and states may be incorrect should the backup take over. If many of these messages are issued, then it is likely that there is a more general problem.

Module: DFHSUSX, DFHZXST

XMEOUT Parameters: *applid, rcode, terminal/session, event*

Destination: Console

DFHXG6492I *applid* XRF catch-up logic error *reason*
length

Explanation: The XRF catch-up program encountered an unexpected circumstance probably due to a CICS design error. The reason, indicated by the first insert, is one of the following

- 1 Catalog record internal length value not correct.
- 2 Catalog record format error. There is no room for a key.
- 3 Catalog record format error. The key is longer than 16.
- 4 Catalog record too long for buffer (variable CUBUFFER). The second insert gives the required length.
- 5 Unexpected ABEND or response from EXEC CICS command.
- 6 Catalog record format error. There is no resource manager prefix.

System action: In cases 1, 2, 3, and 6 above, normal processing continues.

In case 4, DFHZXCU abends with abend code AZXB. In case 5, DFHZXCU abends with abend code AZXA.

User response: Note the message. Resources and states may be incorrect should the alternate take over. If many of these messages are issued, it is likely that there is a more general problem.

Module: DFHZXCU

XMEOUT Parameters: *applid, reason, length*

Destination: Console

DFHXG6493 *date time applid* XRF tracking record
could not be sent *xxxx xxxx xxxx xxxx*
xxxx (Module: modname)

Explanation: The XRF catch-up program obtained a bad return code from the XRF message manager and was unable to send a record that the alternate would require to obtain a correct copy of the active. The inserts (internal diagnostic information) are

1. WMSRETC
DFHWMS return code. (For values and meanings of the return codes, refer to the XRF CICS manager request interface block (WMSPS) listing in the *CICS Data Areas*.)
2. WMSREASN
DFHWMS reason code. (For values and meanings of the reason codes, please refer to the XRF CICS manager request interface block (WMSPS) listing in the *CICS Data Areas*.)
3. XTR-KEY-VALUE is the key of the tracking record.
4. XTR-ID is the record ID, where
 - zero = tracking, and
 - non-zero = catch-up.
5. XTR-TYPE is the record type (see DFHZXTR), where

- X = tracking control,
- C = TCT contents,
- S = ZCP session tracking, and
- U = sign on data

The message is issued from module *modname*.

System action: Normal processing continues.

User response: Note the message. Resources and states may be incorrect should the alternate take over. If many of these messages are issued, then it is likely that there is a more general problem.

Module: DFHZXCU, DFHZXST, DFHTCRP, DFHTBSSP, DFHSUSX

DFHXG6500I *applid* **Signing on to the CAVM as alternate with generic APPLID genericid**

Explanation: This is an informational message issued from the CICS TCB. It indicates that the system is about to sign on to the CICS availability manager (CAVM) as alternate. The message insert provides the generic applid.

System action: CICS initialization is delayed until the sign on request has been processed. In general the

DFHXG6501I • DFHXG6513I

delay is insignificant. In those cases where the delay is significant messages are produced by the CAVM to note the reasons.

User response: None.

Module: DFHXRA

XMEOUT Parameters: *applid, genericid*

Destination: Console

DFHXG6501I *applid* Sign on to the CAVM as alternate accepted

Explanation: This is an informational message issued from the CICS TCB. It indicates that the sign on request has been accepted by the CAVM. (Refer to message DFHXG6500.)

System action: CICS initialization is resumed.

User response: None.

Module: DFHXRA

XMEOUT Parameter: *applid*

Destination: Console

DFHXG6502I *applid* Sign on to the CAVM as alternate rejected

Explanation: This is an informational message issued from the CICS TCB. It indicates that the sign on request has been rejected by the CAVM. (Refer to message DFHXG6500.) Messages are produced by the CAVM to note the reasons for rejecting the request.

System action: CICS initialization is terminated.

User response: None.

Module: DFHXRA

XMEOUT Parameter: *applid*

Destination: Console

DFHXG6503I *applid* Sign on of *specificid* to the CAVM as active detected.

Explanation: This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that the named active CICS has signed on to the CAVM.

System action: CICS initialization continues.

User response: None.

Module: DFHXRSP

XMEOUT Parameters: *applid, specificid*

Destination: Console

DFHXG6507I *applid* Sign off normal from the CAVM detected.

Explanation: This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that active CICS has signed off from the CAVM.

System action: CICS processing is terminated.

User response: None.

Module: DFHXRSP

XMEOUT Parameter: *applid*

Destination: Console

DFHXG6511I *applid* Sign off abnormal from the CAVM detected.

Explanation: This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that active CICS has signed off from the CAVM.

System action: The action taken depends on the current value of the takeover option. This is specified in the system initialization table. The CEBT SET TAKEOVER command is used to change the value. A takeover request is passed to the CAVM if the current value of the takeover option is either AUTOMATIC or MANUAL.

User response: The user response, if any, is installation dependent.

Module: DFHXRSP

XMEOUT Parameter: *applid*

Destination: Console

DFHXG6512I *applid* Takeover request passed to the CAVM

Explanation: This is an informational message issued from the CICS TCB. It indicates that the system is about to request the CAVM to initiate takeover.

System action: CICS initialization continues.

User response: None.

Module: DFHXRA

XMEOUT Parameter: *applid*

Destination: Console

DFHXG6513I *applid* Takeover request accepted by the CAVM

Explanation: This is an informational message issued from the CICS TCB. It indicates that the takeover request (refer to message DFHXG6512) has been accepted by the CAVM.

System action: CICS initialization continues.

User response: None.

Module: DFHXRA

XMEOUT Parameter: *applid*

Destination: Console

DFHXG6514I *applid* **Takeover request rejected by the CAVM**

Explanation: This is an informational message issued from the CICS TCB. It indicates that the takeover request (refer to message DFHXG6512) has been rejected by the CAVM. Messages are produced by the CAVM to note the reasons for rejecting the request.

System action: CICS initialization continues.

User response: None.

Module: DFHXRA

XMEOUT Parameter: *applid*

Destination: Console

DFHXG6516I *applid* **Apparent failure of active CICS detected.**

Explanation: This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that active CICS appears to have failed.

System action: The action taken depends on the current value of the takeover option. This is specified in the system initialization table. The CEBT SET TAKEOVER command is used to change the value. A takeover request will be passed to the CAVM if the current value of the takeover option is AUTOMATIC. Message DFHXG6518 will be sent to the console if the current value is MANUAL.

User response: Determine the reason for the apparent failure of active CICS.

Module: DFHXRSP

XMEOUT Parameter: *applid*

Destination: Console

DFHXG6517I *applid* **Recovery of active CICS detected.**

Explanation: This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that active CICS has recovered from the apparent failure reported by message DFHXG6516.

System action: CICS initialization continues.

User response: None.

Module: DFHXRSP

XMEOUT Parameter: *applid*

Destination: Console

DFHXG6518A *applid* **APPARENT FAILURE OF ACTIVE CICS DETECTED. REPLY 'TAKEOVER' OR 'IGNORE'**

Explanation: This is an action message issued from the CICS TCB. It is issued when the current value of the active CICS appears to have failed.

System action: If the reply is 'TAKEOVER', CICS requests the CAVM to initiate takeover.

If the reply is 'IGNORE', CICS assumes one of the following:

- The active CICS system recovers from the apparent failure.
- The active CICS system is restarted.
- The CEBT PERFORM TAKEOVER command is used to initiate takeover.

Subsequent events may mean that the user need not reply to message DFHXG6518A. Examples of this are :

- If CICS is notified that the active CICS system has recovered from the apparent failure reported by message DFHXG6516, messages DFHXG6517 and DFHXG6519 are sent to the console.
- If CICS is notified that the active CICS system has signed off abnormally from the CAVM, messages DFHXG6511 and DFHXG6519 are sent to the console.
- If takeover is initiated (from the alternate CICS system) at the same time as the active CICS recovers from the apparent failure reported by message DFHXG6516, messages DFHXG6513 and DFHXG6539 are sent to the console.

User response: Determine the reason for the apparent failure of the active CICS. If possible, resolve the failure and make the appropriate reply.

Module: DFHXRSP

Destination: Console

DFHXG6519I *applid* **The reply to message DFHXG6518 is assumed to be IGNORE.**

Explanation: This is an informational message issued from the CICS TCB. It indicates that CICS no longer requires the user to respond to message DFHXG6518.

System action: CICS initialization continues.

User response: None.

Module: DFHXRSP

XMEOUT Parameter: *applid*

Destination: Console

DFHXG6520I *applid* CICS shutdown initiated by CAVM event.

Explanation: This is an informational message issued from the CICS TCB. CICS initiated shutdown occurs in the following situations

1. CICS is notified that active CICS has signed off normally from the CAVM. Message DFHXG6507 is sent to the console.
2. CICS is notified that active CICS has been restarted "in place". Message DFHXG6511 is sent to the console.
3. CICS assumes that the active CICS has signed off normally from the CAVM. Message DFHXG6522 is sent to the console.

System action: CICS terminates normally, but note that takeover does not occur if (active) CICS fails.

User response: Consider restarting (alternate) CICS.

Module: DFHXRSP

XMEOUT Parameter: *applid*

Destination: Console

DFHXG6522I *applid* Sign off normal from the CAVM assumed.

Explanation: This is an informational message issued from the CICS TCB. It indicates that CICS has assumed that the active CICS has signed off from the CAVM. This is likely to occur when the alternate CICS is running on CEC 1 and

1. Active CICS is started on CEC 2.
2. CEC 2 is reinitialized.
3. Active CICS is restarted on CEC 2.

System action: CICS processing is terminated.

User response: None.

Module: DFHXRSP

XMEOUT Parameter: *applid*

Destination: Console

DFHXG6523I *applid* CAVM failure detected. CICS cannot continue as Alternate.

Explanation: This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that the CAVM has failed. Messages are produced by the CAVM to note the reasons for failure.

System action: CICS terminates abnormally. The abend code is 207.

User response: Correct the error.

Module: DFHXRSP

XMEOUT Parameter: *applid*

Destination: Console

DFHXG6524I *applid* CAVM error detected. CICS cannot continue as Alternate.

Explanation: This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that the CAVM has detected an error that prevents CICS from continuing as an alternate.

This would be the case, for example, where the alternate CICS has been unable to keep up with the messages generated by the active CICS.

Messages are produced by the CAVM to note the reasons for failure.

System action: CICS terminates abnormally. The abend code is 213.

User response: Correct the error.

Module: DFHXRSP

XMEOUT Parameter: *applid*

Destination: Console

DFHXG6539I *applid* The reply to message DFHXG6518 is assumed to be TAKEOVER.

Explanation: This is an informational message issued from the CICS TCB. It indicates that CICS no longer requires the user to respond to message DFHXG6518.

System action: CICS initialization continues.

User response: None.

Module: DFHXRSP

XMEOUT Parameter: *applid*

Destination: Console

DFHXG6680I *applid* TIME-OF-DAY CLOCK DIFFERENCE IS AT LEAST *sss* SECONDS.

Explanation: This is an informational message issued from the CICS TCB. Active CICS and alternate CICS systems are executing on different CECs, and the time-of-day clock on the alternate CEC is earlier than that on the active CEC. If takeover occurs then some CICS processing will have to be delayed until the time-of-day clock on the alternate CEC is later than that on the active CEC. The CAVM has estimated the lower bound to the clock difference and this is at least 15 seconds; the message contains the estimated difference. Note that the lower bound may change as more surveillance signals are processed by the CAVM. This may be the case within the first 3 to 5 surveillance signals of the active CICS starting. An elapsed time of some 10 seconds. This message is repeated as necessary.

System action: CICS processing continues.

User response: Ensure that the time-of day clocks are synchronized as closely as possible. Note that takeover times may be increased if the difference in values is significant.

Module: DFHXRSP

Destination: Console

DFHXG6681I *applid* **TIME-OF-DAY CLOCK
DIFFERENCE IS AT MOST *sss*
SECONDS.**

Explanation: This is an informational message issued from the CICS TCB. Active CICS and alternate CICS systems are executing on different CECS, and the time-of-day clock on the alternate CEC is earlier than that on the active CEC. If takeover occurs then some CICS processing will have to be delayed until the time-of-day clock on the alternate CEC is later than that on the active CEC. The CAVM has estimated the upper bound to the clock difference and this is at least 15 seconds; the message contains the estimated difference. Note that the upper bound may change as more surveillance signals are processed by the CAVM; message DFHXG6681 will be repeated as necessary.

System action: CICS processing continues.

User response: Ensure that the time-of day clocks are synchronized as closely as possible. Note that takeover times may be increased if the difference in values is significant.

Module: DFHXRSP

Destination: Console

DFHXG6682I *applid* **XRF clock synchronization
started**

Explanation: This is an informational message issued from the CICS TCB. The time-of-day clock on the alternate CEC is earlier than that on the active CEC; time dependent processing must be suspended. Such processing is delayed until the time-of-day clock value on the alternate is later than that on the active CEC when the active job terminated.

System action: Some CICS initialization continues.

User response: Ensure that the time-of-day clocks are synchronized as closely as is possible. Note that takeover times may be increased if the difference in values is significant.

Module: DFHXRA

XMEOUT Parameter: *applid*

Destination: Console

DFHXG6683I *applid* **XRF clock synchronization
ended**

Explanation: This is an informational message issued from the CICS TCB. The time-of-day clock on the alternate CEC is now later than that on the active CEC; time dependent processing can be resumed.

System action: CICS initialization continues.

User response: None.

Module: DFHXRA

XMEOUT Parameter: *applid*

Destination: Console

DFHXMnnnn messages

DFHXM0001 *applid* An abend (code *aaa/bbbb*) has occurred at offset *X'offset'* in module *modname*.

Explanation: An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. In some circumstances CICS is terminated directly if the error occurred in a crucial XM domain module.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

Next, look up the CICS alphanumeric code in this manual. for further guidance.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXMAT, DFHXMBD, DFHXMCL, DFHXMDD, DFHXMMD, DFHXMER, DFHXMFD, DFHXMIIQ, DFHXMLD, DFHXMQD, DFHXMQC, DFHXMRRP, DFHXMRSR, DFHXMRTA, DFHXMXXD, DFHXMXXE

XMEOUT Parameters: *applid*, *aaa/bbbb*, *X'offset'*, *modname*

Destination: Console

DFHXM0002 *applid* A severe error (code *X'code'*) has occurred in module *modname*.

Explanation: An error has been detected in module *modname*. The code *X'code'* is the exception trace point id which uniquely identifies what the error is and where the error was detected.

System action: An exception entry (code *X'code'* in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. In some circumstances CICS is terminated directly if the error is critical.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname*, perform a controlled shutdown of CICS.

If the severe error code is *X'1112'*, there are no free transaction numbers to allocate to new transactions as all available transaction numbers are in use. If you are using transaction classes to limit the number of CICS tasks in your system, specify a transaction class purge threshold (PURGETHRESH) for any transaction class that has a heavy transaction load. See the *CICS Resource Definition Guide* and *CICS Performance Guide* for more information.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXMAT, DFHXMBD, DFHXMCL, DFHXMDD, DFHXMMD, DFHXMER, DFHXMFD, DFHXMIIQ, DFHXMLD, DFHXMQD, DFHXMQC, DFHXMRRP, DFHXMRSR, DFHXMRTA, DFHXMXXD, DFHXMXXE

XMEOUT Parameters: *applid*, *X'code'*, *modname*

Destination: Console

DFHXM0004 *applid* A possible loop has been detected at offset *X'offset'* in module *modname*.

Explanation: A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset *X'offset*. This is the offset of the instruction which happened to be executing at the time when the error was detected.

System action: An exception entry is made in the trace table.

A system dump is taken unless you have specifically suppressed the dump (by a user exit program at the XDUREQ exit, in the dump table or by global system dump suppression). CICS processing continues unless you have specified in the dump table that CICS should terminate.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of CPU time, this message may have been caused by a long-running function. So there may not be an error. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that execution of module *modname* is terminated and CICS continues.

If you have specified ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname*, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online using the CEMT transaction.

If raising the ICVR time does not solve the problem, you may need further assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXMAT, DFHXMBD, DFHXMCL, DFHXMDD, DFHXMMD, DFHXMER, DFHXMFD, DFHXMIQ, DFHXMLD, DFHXMQD, DFHXMQC, DFHXMRR, DFHXMSS, DFHXMVA, DFHXMVD, DFHXMVE

XMEOUT Parameters: *applid, X'offset', modname*

Destination: Console

DFHXM0101 *date time applid terminal userid tranid*
TRANSACTION definition entry for
transname has been added.

Explanation: This is an audit log message indicating that transaction definition entry *transname* has been added to the system using the INSTALL command.

- *terminal* is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- *userid* is the user identifier of the user associated with the transaction issuing the message.
- *tranid* is the transaction issuing the message.

System action: The system continues normally.

User response: None.

Module: DFHXMMD

XMEOUT Parameters: *date, time, applid, terminal, userid, tranid, transname*

Destination: CSKL

DFHXM0103 *date time applid terminal userid tranid*
TRANSACTION definition entry for
transname has been deleted.

Explanation: This is an audit log message indicating that transaction definition entry *transname* has been deleted from the system using the DISCARD command.

- *terminal* is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- *userid* is the user identifier of the user associated with the transaction issuing the message.
- *tranid* is the transaction issuing the message.

System action: The system continues normally.

User response: None.

Module: DFHXMDD

XMEOUT Parameters: *date, time, applid, terminal, userid, tranid, transname*

Destination: CSKL

DFHXM0105 *date time applid terminal userid tranid*
TRANSACTION definition entry for
transname has been replaced.

Explanation: This is an audit log message indicating that transaction definition entry *transname* has been replaced in the system using the INSTALL command.

- *terminal* is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- *userid* is the user identifier of the user associated with the transaction issuing the message.
- *tranid* is the transaction issuing the message.

System action: The system continues normally.

User response: None.

Module: DFHXMMD

DFHXM0110 • DFHXM0111

XMEOUT Parameters: *date, time,applid, terminal, userid, tranid, transname*

Destination: CSKL

DFHXM0110 *date time applid* **Transaction definition *transid1* has been installed with the same REMOTENAME and REMOTESYSTEM as existing definition *transid2*.**

Explanation: Transaction definition *transid1* has been installed with the same REMOTENAME and REMOTESYSTEM as transaction definition *transid2*.

If this CICS system routes a transaction to the CICS system named as the REMOTESYSTEM of both the definitions and that transaction issues an EXEC CICS START request for the transaction-id named as the REMOTENAME of *transid1* and *transid2*, CICS can either attach *transid1* or *transid2* on the local system to satisfy the START request.

System action: The install of transaction definition *transid1* continues normally.

If an EXEC CICS START request is issued on a remote system as described in the message explanation, CICS attaches *transid1* and not *transid2* on the local system.

CICS does not always resolve this ambiguity in the same way after a warm or emergency restart, however.

User response: This situation usually causes no problems because the correct transaction is attached in the remote system. However, the correct transaction in the local system may not have been attached and this can manifest itself in the following ways

- Inconsistent statistics being accumulated in the local system.
- The incorrect TRPROF being used when routing the START request back over to the remote system.
- CEMT INQUIRE TASK showing the wrong set of transactions running in the local system.

Although these are not necessarily problems, you may want to check the definitions of the remote transactions in this system in case they have been defined incorrectly.

If remote START requests are issued as described, and it does matter which transaction CICS attaches in the local system, you should modify and reinstall the transaction definition that should not be attached. This removes any ambiguity.

Module: DFHXMxD

XMEOUT Parameters: *date, time,applid, transid1, transid2*

Destination: CSMT

DFHXM0111 *date time applid* **Catalog failure while processing {INSTALL | SET | DISCARD} request for transaction definition *transid*.**

Explanation: An error has occurred while altering the catalog during the processing of an install, set, or discard request for transaction definition *transid*.

System action: The request continues as normal.

Depending upon the error that has occurred with the catalog, there may be severe problems if a warm or emergency restart of CICS is attempted. The catalog domain will have issued a message outlining the problem in this case.

Alternatively the problem may only be local to the catalog record containing the image of transaction definition *transid* and the following problems may occur only on a warm or emergency restart.

INSTALL

If it is a reinstall, the old version of the transaction definition is recovered. If it is an install, the transaction definition is not recovered.

SET The change requested by the SET is not recovered. Instead the transaction definition is recovered to the state prior to the SET request being issued.

DISCARD

The transaction definition is recovered on the restart even though it is currently discarded.

User response: No immediate action is required. Consider performing a cold or initial start the next time CICS is restarted to remedy the problem. If a cold or initial start is not appropriate and the problem is only localized to transaction definition *transid*, remedy the effects outlined for each case previously.

For example,

INSTALL

Reinstall the tranclass definition after the restart.

SET Reissue the SET command after CICS has been restarted.

DISCARD

Reissue the DISCARD command after CICS has been restarted.

If the catalog problem persists after the restart, you need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXMDD, DFHXMxD

XMEOUT Parameters: *date, time,applid, {1=INSTALL, 2=SET,3=DISCARD}, transid*

Destination: Console and Transient Data Queue
CSMT

DFHXM0112 *date time applid* **The install of transaction definition *transid1* has removed ALIAS *alias* of *transid2*.**

Explanation: Transaction definition *transid1* has been installed with an ALIAS of *alias*. However, ALIAS *alias* currently invokes transaction definition *transid2*.

System action: The install of *transid1* continues as normal.

The ALIAS *alias* now invokes transaction definition *transid1* and not *transid2* as previously.

User response: If removal of transaction definition *transid2*'s ALIAS was expected, no action is required. However, transaction definition *transid2* should be modified on the CSD so that it no longer specifies the ALIAS.

If the ALIAS has been removed in error, reinstall transaction definition *transid2* to reinstate its ALIAS. Transaction definition *transid1* should be modified on the CSD so that it no longer specifies the ALIAS.

Module: DFHXMxD

XMEOUT Parameters: *date, time, applid, transid1, alias, transid2*

Destination: CSMT

DFHXM0113 *date time applid* **The install of transaction definition *transid1* has removed TASKREQ *taskreq* of *transid2*.**

Explanation: Transaction definition *transid1* has been installed with a TASKREQ of *taskreq*. However, TASKREQ *taskreq* currently invokes transaction definition *transid2*.

System action: The install of *transid1* continues as normal.

The TASKREQ *taskreq* now invokes transaction definition *transid1* and not *transid2* as previously.

User response: If removal of transaction definition *transid2*'s TASKREQ was expected, no action is required. However, transaction definition *transid2* should be modified on the CSD so that it no longer specifies the TASKREQ.

If the TASKREQ has been removed in error, reinstall transaction definition *transid2* to reinstate its TASKREQ. Transaction definition *transid1* should be modified on the CSD so that it no longer specifies the TASKREQ.

Module: DFHXMxD

XMEOUT Parameters: *date, time, applid, transid1, taskreq, transid2*

Destination: CSMT

DFHXM0114 *date time applid* **The install of transaction definition *transid1* has removed XTRANID *X'xtranid'* of *transid2*.**

Explanation: Transaction definition *transid1* has been installed with a XTRANID of *xtranid*. However, XTRANID *xtranid* currently invokes transaction definition *transid2*.

System action: The install of *transid1* continues as normal.

The XTRANID *xtranid* now invokes transaction definition *transid1* and not *transid2* as previously.

User response: If removal of transaction definition *transid2*'s XTRANID was expected, no action is required. However, transaction definition *transid2* should be modified on the CSD so that it no longer specifies the XTRANID.

If the XTRANID has been removed in error, reinstall transaction definition *transid2* to reinstate its XTRANID. Transaction definition *transid1* should be modified on the CSD so that it no longer specifies the XTRANID.

Module: DFHXMxD

XMEOUT Parameters: *date, time, applid, transid1, X'xtranid', transid2*

Destination: CSMT

DFHXM0115 *date time applid* **The install of transaction definition *transid1* has removed TPNAME *tpname* of *transid2*.**

Explanation: Transaction definition *transid1* has been installed with a TPNAME of *tpname*. However, TPNAME *tpname* currently invokes transaction definition *transid2*.

System action: The install of *transid1* continues as normal.

The TPNAME *tpname* now invokes transaction definition *transid1* and not *transid2* as previously.

User response: If removal of transaction definition *transid2*'s TPNAME was expected, no action is required. However, transaction definition *transid2* should be modified on the CSD so that it no longer specifies the TPNAME.

If the TPNAME has been removed in error, reinstall transaction definition *transid2* to reinstate its TPNAME. Transaction definition *transid1* should be modified on the CSD so that it no longer specifies the TPNAME.

Module: DFHXMxD

XMEOUT Parameters: *date, time, applid, transid1, tpname, transid2*

Destination: CSMT

DFHXM0116 *date time applid* **PROGRAM** parameter missing from transaction definition *transid*. **PROGRAM is required because REMOTESYSTEM is the same as the local system.**

Explanation: Transaction definition *transid* has been installed without a PROGRAM parameter. Since it has been defined with a REMOTESYSTEM equal to the local system, a program is required if the transaction is executed on this system.

System action: The install of *transid* continues as normal. Any attempt to run the transaction *transid* will fail because there is no program to link to.

User response: This message is issued for information only. There is no problem if transaction *transid* is not executed on this system. If it is to be executed, the definition of *transid* needs to be modified and then reinstalled.

If the transaction is not executed, you may wish to investigate why the transaction definition has been installed. It could be that the transaction is defined in an RDO group that is shared between a number of different CICS systems. For example *transid* may be TTT1 in the following pair of definitions used to implement transaction routing to this local system CICB.

Transaction	Remotesystem	Remotename	Program
TTT1	CICB	TTT2	-
TTT2	-	-	PROGA

In this example, a single definition would suffice if the transaction was made to have the same name on this system.

Transaction	Remotesystem	Remotename	Program
TTT1	CICB	TTT1	PROGA

Module: DFHXMxD

XMEOUT Parameters: *date, time, applid, transid*

Destination: CSMT

DFHXM0201 *date time applid terminal userid tranid* **TRANCLASS** definition entry for *tranclassname* has been added.

Explanation: This is an audit log message indicating that tranclass definition entry *tranclassname* has been added to the system using the INSTALL command.

- *terminal* is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- *userid* is the user identifier of the user associated with the transaction issuing the message.
- *tranid* is the transaction issuing the message.

System action: The system continues normally.

User response: None.

Module: DFHXMCL

XMEOUT Parameters: *date, time, applid, terminal, userid, tranid, tranclassname*

Destination: CSKL

DFHXM0203 *date time applid terminal userid tranid* **TRANCLASS** definition entry for *tranclassname* has been deleted.

Explanation: This is an audit log message indicating that tranclass definition entry *tranclasssname* has been deleted from the system using the DISCARD command.

- *terminal* is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- *userid* is the user identifier of the user associated with the transaction issuing the message.
- *tranid* is the transaction issuing the message.

System action: The system continues normally.

User response: None.

Module: DFHXMCL

XMEOUT Parameters: *date, time, applid, terminal, userid, tranid, tranclassname*

Destination: CSKL

DFHXM0205 *date time applid terminal userid tranid* **TRANCLASS** definition entry for *tranclassname* has been replaced.

Explanation: This is an audit log message indicating that tranclass definition entry *transname* has been replaced in the system using the INSTALL command.

- *terminal* is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- *userid* is the user identifier of the user associated with the transaction issuing the message.
- *tranid* is the transaction issuing the message.

System action: The system continues normally.

User response: None.

Module: DFHXMCL

XMEOUT Parameters: *date, time, applid, terminal, userid, tranid, tranclassname*

Destination: CSKL

DFHXM0211 *date time applid* **Catalog failure while processing {INSTALL | SET | DISCARD} request for tranclass definition *tranclassname*.**

Explanation: An error has occurred while altering the

catalog during the processing of an install, set, or discard request for tranclass definition *tranclassname*.

System action: The request continues normally.

Depending upon the error that has occurred with the catalog, there may be severe problems if a warm or emergency restart of CICS is attempted. The catalog domain will have issued a message outlining the problem in this case.

Alternatively the problem may only be local to the catalog record containing the image of tranclass definition *tranclassname* and the following problems may occur only on a warm or emergency restart.

INSTALL

If it is a reinstall, the old version of the tranclass definition is recovered. If it is an install, the tranclass definition was not recovered.

SET The change requested by the SET is not recovered. Instead the tranclass definition is recovered to the state it was in before the SET request was issued.

DISCARD

The tranclass definition is recovered on the restart even though it is currently discarded.

User response: No immediate action is required. To fully resolve the problem, consider performing a cold or initial start the next time CICS is restarted. If a cold or initial start is not appropriate and the problem is only localized, to tranclass definition *tranclassname*, you can resolve each of the symptoms separately.

For example

INSTALL

Reinstall the tranclass definition after CICS has been restarted.

SET Reissue the SET command after CICS has been restarted.

DISCARD

Reissue the DISCARD command after CICS has been restarted.

If the catalog problem persists after the restart, you may need further assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXMCL

XMEOUT Parameters: *date, time, applid, {1=INSTALL, 2=SET, 3=DISCARD}, tranclassname*

Destination: Console and Transient Data Queue
CSMT

DFHXM0212 *applid* Transaction *transid* has been attached with unknown tranclass *tranclassname*.

Explanation: Transaction *transid* has just been attached. It is defined as belonging to tranclass *tranclassname* but *tranclassname* does not exist.

This message is only issued the first time transaction *transid* is attached with the unknown tranclass.

System action: The attach of transaction *transid* proceeds as normal but without being subject to any tranclass scheduling constraints.

User response: If transaction *transid* should belong to tranclass *tranclassname*, install that tranclass. If not, modify the transaction definition for *transid* as appropriate, and reinstall.

The CEDA CHECK command can be used to ensure that each of the tranclasses referenced by transaction definitions are defined within the same startup GRPLIST.

Module: DFHXMQC

XMEOUT Parameters: *applid, transid, tranclassname*

Destination: Console

DFHXM0213 *applid* Insufficient storage for system attach of transaction *transid*.

Explanation: There is insufficient storage for a new task to be created for the attach of transaction *transid*.

Since the majority of the storage required for the new task is obtained from DSA storage, CICS is probably short on storage in one of the DSAs.

System action: The attach request is queued. It is retried later when more storage should have become available. If the retried attach fails, it is queued and retried repeatedly until it succeeds.

User response: If CICS is short on storage, message DFHSM0133 is also issued. Refer to that message for advice on how to resolve the condition.

If message DFHSM0133 has not been issued, the problem has been caused by insufficient MVS storage. In this case consider lowering the EDSALIM of the system to increase the amount of available MVS storage.

Module: DFHXMAT

XMEOUT Parameters: *applid, transid*

Destination: Console

DFHXM0301 *date time applid* **An attempt to link to the user-replaceable transaction restart program (DFHREST) has failed for task number *tasknum*. Transaction restart is not performed for transaction *tranid*.**

Explanation: A restartable transaction abended and the transaction manager attempted to link to the user-replaceable transaction restart program (DFHREST) but the link has failed. Likely reasons are

- DFHREST is not defined (and not autoinstalled)
- DFHREST is not present in any library specified in the DFHRPL concatenation.
- DFHREST has been linked with AMODE(24).

System action: The transaction is not restarted.

User response: If the problem is not rectified, a message is issued each time the link to DFHREST fails. To avoid this, ensure that DFHREST is properly defined and present in a library specified in the DFHRPL concatenation.

See the *CICS Customization Guide* for more information about user-replaceable programs.

Module: DFHXMTA.

XMEOUT Parameters: *date, time, applid, tasknum, tranid*

Destination: Console and Transient Data Queue CSMT

DFHXM0302 *applid* **An abend *abcode* occurred in the user-replaceable transaction restart program (DFHREST) under task number *tasknum*. Transaction restart is not performed for transaction *tranid*.**

Explanation: A restartable transaction abended and the transaction manager linked to the user-replaceable transaction restart program (DFHREST). DFHREST abended.

System action: The transaction is not restarted.

User response: If the problem is not rectified, a message is issued each time DFHREST abends. To avoid this, fix the problem in DFHREST and ensure that it is properly defined and present in a library specified in the DFHRPL concatenation.

See the *CICS Customization Guide* for more information about user-replaceable programs.

Module: DFHXMTA.

XMEOUT Parameters: *applid, abcode, tasknum, tranid*

Destination: Console

DFHXM0303 *applid* **A severe error (code *X'code*) has occurred while initializing task number *tasknum* with transaction identifier *tranid*. Terminal *termid* has not been released. The task is suspended indefinitely.**

Explanation: An internal error has prevented the initialization of task number *tasknum* with identifier *tranid*.

The task cannot run and cannot be abended. The principal facility of the task is a terminal. No message may be sent to the terminal and it is unusable by CICS. Rather than terminate CICS, the transaction manager keeps CICS running and preserves its integrity by suspending the task.

The suspended task will hold its MXT slot until CICS is terminated.

Note that the task may hold resources (for example, locks and enqueues) so you should cancel CICS at your earliest convenience. Otherwise you may risk other tasks being prevented from running because they also need access to the same resources. You may wish to add a dump table entry to always terminate CICS on this message.

System action: The task is suspended indefinitely. First failure diagnostics should be produced by the component which first detects the error. The transaction manager also takes a dump. Message DFHME0116 should be produced containing the symptom string for this problem.

The terminal principal facility of the task is unusable by CICS until CICS is canceled.

The task is suspended with a resource type of FOREVER and a resource name of DFHXMTA.

User response: You must cancel CICS if you need to release the terminal associated with the task. You cannot quiesce CICS since this task will not terminate. You cannot purge or force-purge the task.

Note the error code *X'code*. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXMTA.

XMEOUT Parameters: *applid, X'code', tasknum, tranid, termid*

Destination: Console

DFHXM0304 *applid* **A severe error (code *X'code*) has occurred while initializing task number *tasknum* with transaction identifier *tranid*. Transient data queue *tdqueue* has not been released. The task is suspended indefinitely.**

Explanation: An internal error has prevented the initialization of task number *tasknum* with identifier *tranid*.

The task cannot run and cannot be abended. The principal facility of the task is a transient data queue. The TD queue will not trigger another task until CICS is terminated. Rather than terminate CICS, the transaction manager keeps CICS running and preserves its integrity by suspending the task.

The suspended task will hold its MXT slot until CICS is terminated.

Note that the task may hold resources (for example, locks and enqueues) so you should cancel CICS at your earliest convenience. Otherwise you risk other tasks being prevented from running because they also need access to the same resources. You may wish to add a dump table entry always to terminate CICS on this message.

System action: The task is suspended indefinitely. First failure diagnostics should be produced by the component which first detects the error. The transaction manager also takes a dump. Message DFHME0116 should be produced containing the symptom string for this problem.

The task is suspended with a resource type of FOREVER and a resource name of DFHXMATA.

User response: You must cancel CICS if you need to release the TD queue associated with the task. You cannot quiesce CICS since this task will not terminate. You cannot purge or force-purge the task.

Note the error code *X'code*. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXMATA.

XMEOUT Parameters: *applid, X'code', tasknum, tranid, tdqueue*

Destination: Console

DFHXM0305 *applid* **A severe error (code *X'code*) has occurred while initializing task number *tasknum* with transaction identifier *tranid*. The interval control element has not been released. The task is suspended indefinitely.**

Explanation: An internal error has prevented the initialization of task number *tasknum* with identifier *tranid*.

The task cannot run and cannot be abended. The principal facility of the task is an interval control element. Any start data associated with the ICE will not be retrieved. Rather than terminate CICS, the transaction manager keeps CICS running and preserves its integrity by suspending the task.

The suspended task will hold its MXT slot until CICS is terminated.

Note that the task may hold resources (for example, locks and enqueues) so you should cancel CICS at your earliest convenience. Otherwise you may risk other tasks being prevented from running because they also need access to the same resources. You may wish to add a dump table entry always to terminate CICS on this message.

System action: The task is suspended indefinitely. First failure diagnostics should be produced by the component which first detects the error. The transaction manager also takes a dump. Message DFHME0116 should be produced containing the symptom string for this problem.

The task is suspended with a resource type of FOREVER and a resource name of DFHXMATA.

User response: You must cancel CICS if you need to destroy the ICE. Any start data will remain in temporary storage until it is deleted unless it is nonrecoverable in which case it will disappear on the next cold, initial or emergency restart of CICS. You cannot quiesce CICS since this task will not terminate. You cannot purge or force-purge the task.

Note the error code *X'code*. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXMATA.

XMEOUT Parameters: *applid, X'code', tasknum, tranid*

Destination: Console

DFHXM0306 *applid* **A severe error (code *X'code*) has occurred while initializing task number *tasknum* with transaction identifier *tranid*. The task is suspended indefinitely.**

Explanation: An internal error has prevented the initialization of task number *tasknum* with identifier *tranid*.

The task cannot run and cannot be abended. The task has no principal facility bound to it. Rather than terminate CICS, the transaction manager keeps CICS running and preserves its integrity by suspending the task.

The suspended task will hold its MXT slot until CICS is terminated.

Note that the task may hold resources (for example, locks and enqueues) so you should cancel CICS at your earliest convenience. Otherwise you may risk other tasks being prevented from running because they also need access to the same resources. You may wish to add a dump table entry to always terminate CICS on this message.

DFHXM0307 • DFHXM0308

System action: The task is suspended indefinitely. First failure diagnostics should be produced by the component which first detects the error. The transaction manager also takes a dump. Message DFHME0116 should be produced containing the symptom string for this problem.

The task is suspended with a resource type of FOREVER and a resource name of DFHXMTA.

User response: You must cancel CICS if you need to destroy the task. You cannot quiesce CICS since this task will not terminate. You cannot purge or force purge the task.

Note the error code *X'code*. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXMTA.

XMEOUT Parameters: *applid, X'code', tasknum, tranid*

Destination: Console

DFHXM0307 *applid* **A severe error (code *X'code*) has occurred while terminating task number *tasknum* with transaction identifier *tranid*. The terminal *termid* has not been released. The task is suspended indefinitely.**

Explanation: An internal error has prevented the termination of task number *tasknum* with identifier *tranid*. It is not possible to abend the task or send a message to its terminal principal facility. Rather than terminate CICS, the transaction manager keeps CICS running and preserves its integrity by suspending the task.

The suspended task will hold its MXT slot until CICS is terminated.

Note that the task may hold resources (for example, locks and enqueues) so you should cancel CICS at your earliest convenience. Otherwise you may risk other tasks being prevented from running because they also need access to the same resources. You may wish to add a dump table entry to always terminate CICS on this message.

System action: The task is suspended indefinitely. First failure diagnostics should be produced by the component which detected the error. The transaction manager also takes a dump. Message DFHME0116 should be produced containing the symptom string for this problem.

The terminal principal facility of the task is unusable until CICS is canceled.

The task is suspended with a resource type of FOREVER and a resource name of DFHXMTA.

User response: You must cancel CICS if you need to

free up the terminal associated with the task. You cannot quiesce CICS since this task will not terminate. You cannot purge or force purge the task.

Note the error code *X'code*. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXMTA.

XMEOUT Parameters: *applid, X'code', tasknum, tranid, termid*

Destination: Console

DFHXM0308 *applid* **A severe error (code *X'code*) has occurred while terminating task number *tasknum* with transaction identifier *tranid*. The transient data queue *tdqueue* has not been released. The task is suspended indefinitely.**

Explanation: An internal error has prevented the termination of task number *tasknum* with identifier *tranid*. It is not possible to abend the task. The principal facility of the task is a transient data queue. The TD queue will not trigger another task until CICS is terminated. Rather than terminate CICS, the transaction manager keeps CICS running and preserves its integrity by suspending the task.

The suspended task will hold its MXT slot until CICS is terminated.

Note that the task may hold resources (for example, locks and enqueues) so you should cancel CICS at your earliest convenience. Otherwise you may risk other tasks being prevented from running because they also need access to the same resources. You may wish to add a dump table entry always to terminate CICS on this message.

System action: The task is suspended indefinitely. First failure diagnostics should be produced by the component which detected the error. The transaction manager also takes a dump. Message DFHME0116 should be produced containing the symptom string for this problem.

The task is suspended with a resource type of FOREVER and a resource name of DFHXMTA.

User response: You must cancel CICS if you need to free up the transient data queue associated with the task. You cannot quiesce CICS since this task will not terminate. You cannot purge or force purge the task.

Note the error code *X'code*. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXMTA.

XMEOUT Parameters: *applid, X'code', tasknum, tranid, tdqueue*

Destination: Console

DFHXM0309 *applid* **A severe error (code *X'code'*) has occurred while terminating task number *tasknum* with transaction identifier *tranid*. The interval control element has not been released. The task is suspended indefinitely.**

Explanation: An internal error has prevented the termination of task number *tasknum* with identifier *tranid*. It is not possible to abend the task. The principal facility of the task is an interval control element. Rather than terminate CICS, the transaction manager keeps CICS running and preserves its integrity by suspending the task.

The suspended task will hold its MXT slot until CICS is terminated.

Note that the task may hold resources (for example, locks and enqueues) so you should cancel CICS at your earliest convenience. Otherwise you may risk other tasks being prevented from running because they also need access to the same resources. You may wish to add a dump table entry to always terminate CICS on this message.

System action: The task is suspended indefinitely. First failure diagnostics should be produced by the component which detected the error. The transaction manager also takes a dump. Message DFHME0116 should be produced containing the symptom string for this problem.

The task is suspended with a resource type of FOREVER and a resource name of DFHXMTA.

User response: You must cancel CICS if you need to destroy the ICE associated with the task. Any start data remains in temporary storage until it is deleted unless it is nonrecoverable, in which case it disappears on the next cold, initial or emergency restart of CICS. You cannot quiesce CICS since this task does not terminate. You cannot purge or force purge the task.

Note the error code *X'code'*. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXMTA.

XMEOUT Parameters: *applid, X'code', tasknum, tranid*

Destination: Console

DFHXM0310 *applid* **A severe error (code *X'code'*) has occurred while terminating task number *tasknum* with transaction identifier *tranid*. If the task had a principal facility, it has been released.**

The task is suspended indefinitely.

Explanation: An internal error has prevented the termination of task number *tasknum* with identifier *tranid*. It is not possible to abend the task. Rather than terminate CICS, the transaction manager keeps CICS running and preserves its integrity by suspending the task.

The suspended task will hold its MXT slot until CICS is terminated.

Note that the task may hold resources (for example, locks and enqueues) so you should cancel CICS at your earliest convenience. Otherwise you risk other tasks being prevented from running because they also need access to the same resources. You may wish to add a dump table entry always to terminate CICS on this message.

System action: If the task had a principal facility, it has been released. If this was a terminal, the terminal should be usable by CICS.

The task is suspended indefinitely. First failure diagnostics should be produced by the component which detects the error. The transaction manager also takes a dump. Message DFHME0116 should be produced containing the symptom string for this problem.

The task is suspended with a resource type of FOREVER and a resource name of DFHXMTA.

User response: You cannot quiesce CICS since this task will not terminate. You cannot purge or force-purge the task.

Note the error code *X'code'*.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXMTA.

XMEOUT Parameters: *applid, X'code', tasknum, tranid*

Destination: Console

DFHXM0311 *applid* **A severe error (code *X'code'*) has occurred while initializing task number *tasknum* with transaction identifier *tranid*. Scheduler resources associated with the task have not been released. The task is suspended indefinitely.**

Explanation: An internal error has prevented the initialization of task number *tasknum* with identifier *tranid*.

The task cannot run and cannot be abended. The principal facility of the task is the scheduler. The scheduler will not initiate another task until CICS is terminated. Rather than terminate CICS, the transaction manager keeps CICS running and preserves its integrity by suspending the task.

DFHXM0501 • DFHXM0503

The suspended task will hold its MXT slot until CICS is terminated.

Note that the task may hold resources (for example, locks and enqueues), so you should cancel CICS at your earliest convenience. Otherwise, you risk other tasks being prevented from running because they also need access to the same resources. You may wish to add a dump table entry to always terminate CICS on production of this message.

System action: The task is suspended indefinitely. First failure diagnostics should be produced by the component which first detects the error. The transaction manager also takes a dump. Message DFHME0116 should be produced containing the symptom string for this problem.

The task is suspended with a resource type of FOREVER and a resource name of DFHXMTA.

User response: You must cancel CICS if you need to release the resources associated with the task. You cannot quiesce CICS since this task will not terminate. You cannot purge or force-purge the task.

Note the error code *X'code*. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXMTA.

XMEOUT Parameters: *applid, X'code', tasknum, tranid*

Destination: Console

DFHXM0501 *applid* CICS cannot satisfy request for MXT. Value *mxtvalue* has been used instead.

Explanation: The value entered for MXT cannot be handled by the system. *mxtvalue* is the largest value for which CICS has been able to acquire task storage.

The majority of the task storage required is now acquired from CICS DSAs.

System action: The system continues to run with a MXT value of *mxtvalue*.

User response: Check that the original value entered for MXT was correctly typed. If the value is mistyped, use CEMT to amend the MXT value (you are unlikely to be able to force the value higher). Remember that MXT now only includes user tasks and so it should not need to be set to a value as high as in previous releases.

If the value *mxtvalue* is acceptable, no action is necessary.

If the value *mxtvalue* is too small, check to see which programs, apart from CICS, are running in this region. To relieve the storage constraint, either increase the DSALIM or EDSALIM of the system to give CICS more storage for its own use. For further details about storage allocation at initialization, see the *CICS Transaction*

Server for z/OS Installation Guide.

Module: DFHXMMSR

XMEOUT Parameters: *applid, mxtvalue*

Destination: Console

DFHXM0502 *applid* A catalog failure has occurred while saving the MXT setting.

Explanation: An error has occurred while saving the requested MXT setting on the catalog.

System action: The requested MXT change request continues as normal.

Depending upon the error that has occurred with the catalog, there may be severe problems if a warm or emergency restart of CICS is attempted. The catalog domain will have issued a message outlining the problem in this case.

Alternatively the problem may only be local to the catalog record containing the MXT value and only it may not be recovered on a warm or emergency restart.

User response: No immediate action is required. Consider performing a cold or initial start, with the required MXT value specified in the SIT the next time CICS is restarted. If a cold start is not appropriate, add MXT as a SIT override specifying the required MXT value.

Module: DFHXMMSR

XMEOUT Parameter: *applid*

Destination: Console

DFHXM0503 *applid* CICS cannot support minimum MXT value of *minmxt*. CICS is terminated.

Explanation: A severe lack of storage has resulted in CICS not being able to acquire enough task storage to satisfy even the minimum MXT value of *minmxt*.

CICS cannot perform any useful work without *minmxt* number of user tasks.

System action: CICS is terminated.

User response: Investigate why there is insufficient storage for CICS to support such a low number of user tasks.

To relieve the storage constraint, either increase the DSALIM or EDSALIM of the system to give CICS more storage for its own use. For further details about storage allocation at initialization, see the *CICS Transaction Server for z/OS Installation Guide*.

Module: DFHXMMSR

XMEOUT Parameters: *applid, minmxt*

Destination: Console

DFHXOnnnn messages

DFHXO6700 OPTION STARTING xxx HAS ILLEGAL SYNTAX.

Explanation: The option xxx has illegal syntax.

System action: The overseer program is abnormally terminated after completion of parameter analysis.

User response: Correct the error and resubmit the overseer program.

Module: DFHWOSA

Destination: Console

DFHXO6702 JOB STEP IS NOT APF-AUTHORIZED.

Explanation: Part of CICS initialization must be done in an APF-authorized state. The kernel has detected that DFHSIP is not APF-authorized.

System action: The overseer program is abnormally terminated.

User response: Ensure that the job step is APF-authorized. All libraries concatenated in the STEPLIB concatenation should be APF-authorized, and DFHSIP should be link-edited with an authorization code of 1.

Module: DFHWOSA

Destination: Console

DFHXO6703 UNABLE TO SET UP AUTHORIZED FACILITY.

Explanation: Insufficient storage is available to initialize the authorized facility required by the overseer.

System action: The overseer program is abnormally terminated.

User response: Ensure that the REGION parameter is sufficiently large.

Module: DFHWOSA

Destination: Console

DFHXO6704 UNABLE TO OPEN DFHLIB.

Explanation: A DD statement for (ddname) DFHLIB was missing from the batch job stream.

System action: The overseer program is abnormally terminated.

User response: Correct the JCL.

Module: DFHWOSA

Destination: Console

DFHXO6705 xxx OPTION IS MISSING.

Explanation: The option xxx may not be omitted.

System action: The overseer program is abnormally terminated after completion of parameter analysis.

User response: Correct the error and resubmit the overseer program.

Module: DFHWOSA

Destination: Console

DFHXO6706 CYTIM OPTION MUST BE IN RANGE 20 TO 32767.

Explanation: The CYTIM option must fall within the range 20 through 32767.

System action: The overseer program is abnormally terminated after completion of parameter analysis.

User response: Correct the error and resubmit the overseer program.

Module: DFHWOSA

Destination: Console

DFHXO6707 VALUE OF xxx OPTION IS LONGER THAN 5 DIGITS.

Explanation: The value of the given numeric option must occupy no more than five digits.

System action: The overseer program is abnormally terminated after completion of parameter analysis.

User response: Correct the error and resubmit the overseer program.

Module: DFHWOSA

Destination: Console

DFHXO6708 VALUE OF xxx OPTION IS NON-NUMERIC.

Explanation: The value of the option xxx must be numeric.

System action: The overseer program is abnormally terminated after completion of parameter analysis.

User response: Correct the error and resubmit the overseer program.

Module: DFHWOSA

Destination: Console

DFHXO6709 VALUE OF xxx OPTION IS LONGER THAN 8 CHARACTERS.

DFHXO6712 • DFHXQ0104

Explanation: The value of option xxx must occupy no more than eight characters.

System action: The overseer program is abnormally terminated after completion of parameter analysis.

User response: Correct the error and resubmit the overseer program.

Module: DFHWOSA

Destination: Console

DFHXO6712 xxx IS AN INVALID OPTION KEYWORD.

Explanation: The specified keyword xxx is an invalid option.

System action: Option xxx is ignored.

User response: Correct the error.

Module: DFHWOSA

Destination: Console

DFHXO6720 THE CICS XRF OVERSEER HAS RECEIVED AN INVALID RESPONSE TO A SUBSYSTEM INTERFACE REQUEST.

Explanation: Overseer services has received an inconsistent response to an MVS subsystem interface request for job status. The response indicates insufficient storage although more than the indicated necessary amount is provided.

System action: A dump is taken and the overseer job abnormally terminates with MVS user abend code 224.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHWOSB

Destination: Console

DFHXO6721 THE CICS XRF OVERSEER HAS BEEN UNABLE TO GET STORAGE FOR A SUBSYSTEM INTERFACE REQUEST.

Explanation: The XRF overseer application program has issued a DFHWOSM FUNC=JJC, JJS or QJJS macro. The MVS subsystem interface request issued by the overseer services program while processing this request has failed. The response indicates that the reply area is too small. The MVS GETMAIN request to obtain a larger area is not satisfied.

System action: The subsystem options block (SSOB), indicating 'status array too small' (SSOBRETN=SSCSMALL), is returned to the caller in the 256 byte SSOB return area specified in the DFHWOSM macro.

User response: Since the areas involved are small, the condition should not normally occur. If it persists, or disrupts the effectiveness of your overseer application, you may need to cancel the overseer job with a dump to investigate the reason for the shortage of storage.

Module: DFHWOSB

DFHXQnnnn messages

DFHXQ0101 Shared TS queue server initialization is in progress.

Explanation: The queue server program has started execution.

System action: Initialization continues.

User response: None.

Module: DFHXQMN

Destination: Console and SYSPRINT

DFHXQ0102I Shared TS queue server for pool *poolname* is now active.

Explanation: The queue server for the named pool has completed initialization and is now ready to accept connections.

System action: The server waits for connection requests or operator commands.

User response: None.

Module: DFHXQMN

Destination: Console and SYSPRINT

DFHXQ0103 The pool name parameter is missing.

Explanation: The shared TS queue server program needs to know the name of the queue pool in order to complete initialization but no pool name was specified in the SYSIN or PARM field parameters.

System action: The queue server is terminated.

User response: Ensure that the parameter POOLNAME=name is specified either in the SYSIN parameters or in the PARM field of the JCL for the queue server.

Module: DFHXQMN

Destination: Console and SYSPRINT

DFHXQ0104 Shared TS queue server initialization failed because program DFHXQMN is not APF authorized.

Explanation: The queue server main program DFHXQMN cannot complete initialization because it is

not running with APF authorization.

System action: The queue server is terminated.

User response: Ensure that the queue server program DFHXQMN is loaded from an APF authorized library and has been linkedited with the option AC(1).

Module: DFHXQMN

Destination: Console and SYSPRINT

DFHXQ0111I Shared TS queue server for pool *poolname* is terminating.

Explanation: The queue server has started termination processing, so no further requests will be processed.

System action: Termination continues.

User response: None.

Module: DFHXQMN

Destination: Console and SYSPRINT

DFHXQ0112I Shared TS queue server has terminated, return code *retcode*, reason code *rsncode*.

Explanation: The queue server has completed termination processing. If the termination was caused by an error, the return code will be non-zero and the reason code will normally be the number of a previous DFHXQnnnn message giving the reason for termination.

System action: The queue server program returns control (via the AXM termination routines) to MVS for job step termination.

User response: None.

Module: DFHXQMN

Destination: Console and SYSPRINT

DFHXQ0113 Shared TS queue server completion code is *cmpcode*, reason code *rsncode*.

Explanation: The queue server has terminated after intercepting an abnormal termination (ABEND) request. If the completion code is a system completion code, it is shown as three hexadecimal digits, otherwise it is shown as four decimal digits for a user completion code.

System action: The queue server program returns control (via the AXM termination routines) to MVS for job step termination.

User response: None.

Module: DFHXQMN

Destination: Console and SYSPRINT

DFHXQ0121I Automatic restart support is not available because &SYSCClone may not be unique within the sysplex.

Explanation: The server attempted to generate a default ARM element identifier to use for automatic restart registration, using the one or two character &SYSCClone value to identify the MVS system. Normally, MVS verifies during start-up that &SYSCClone is unique within the sysplex. However, the server is running on a level of MVS where this check is optional and has not been performed, so the server is unable to generate a unique element identifier.

System action: The server is terminated.

User response: Servers should not normally be run on a level of MVS which does not enforce unique &SYSCClone values. However, the problem can be bypassed by specifying an ARM element name explicitly on the server ARMELEMENT parameter.

Module: DFHXQRS

Destination: Console and SYSPRINT

DFHXQ0122 IXCARM REQUEST=*reqtype* failed, return code *retcode*, reason code *rsncode*.

Explanation: A request to the MVS automatic restart manager (ARM) gave an unexpected return code. The return code and reason code are shown in hexadecimal notation.

System action: The server is terminated.

User response: See the IXCARM macro in *OS/390 MVS Programming Sysplex Services Reference* (GC28-1772) for the explanation of the return and reason code.

Module: DFHXQRS

Destination: Console and SYSPRINT

DFHXQ0123 IXCARM REQUEST=*reqtype* failed, return code *retcode*, reason code *rsncode*.

Explanation: Automatic restart support is not available. The MVS automatic restart manager (ARM) gave a return code and reason code which indicates that ARM services are not available, but the reason could possibly be intentional or unavoidable, so the server is being allowed to continue execution without automatic restart support. The return code and reason code are shown in hexadecimal notation.

System action: The server continues initialisation without automatic restart support.

User response: See the IXCARM macro in *OS/390 MVS Programming Sysplex Services Reference*

(GC28-1772) for the explanation of the return and reason code.

Module: DFHXQRS

Destination: Console and SYSPRINT

DFHXQ0201I Processing type parameters

Explanation: The queue server parameter processing routine is interpreting the specified parameter string. The first word gives the type of parameter (SYSIN/PARM/SET/DISPLAY/PRINT) and the rest is the specified parameters optionally followed by descriptive comment text after one or more spaces. If the parameters start with an asterisk or a space, the whole line is taken as descriptive comments.

System action: Any specified parameters will be processed.

User response: None.

Module: DFHXQPR

Destination: SYSPRINT

DFHXQ0202I Unknown parameter keyword: *keyword*

Explanation: This parameter keyword did not match any of the defined parameter keywords for the queue server.

System action: Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response: Correct the parameter keyword (or remove the incorrect parameter) and reenter the command or restart the server.

Module: DFHXQPR

Destination: Console and SYSPRINT

DFHXQ0203I Value *value* for parameter *keyword* is incorrect. It must be a name of up to *maxlength* characters.

Explanation: The value of this parameter should have been specified as a name containing not more than the indicated number of characters.

System action: Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response: Correct the parameter keyword (or remove the incorrect parameter) and reenter the command or restart the server.

Module: DFHXQPR

Destination: Console and SYSPRINT

DFHXQ0204I Value *value* for parameter *keyword* is incorrect. It must be a decimal number.

Explanation: The value of this queue server parameter should have been specified as a decimal number but was not in a valid format. (Numeric parameters can optionally be followed by the letter K, M, G or T to denote the appropriate powers of 1024).

System action: Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response: Correct the parameter value (or remove the incorrect parameter) and reenter the command or restart the server.

Module: DFHXQPR

Destination: Console and SYSPRINT

DFHXQ0205I Value *value* for parameter *keyword* is greater than the maximum allowed value *maximum*.

Explanation: The value of this queue server parameter exceeded the maximum allowed value *maximum*. This message also occurs if the numeric part of a decimal value exceeds the maximum unsigned 32-bit integer (4294967295) even if a larger value is allowed to be specified by using a suffix "K", "M", "G" or "T".

System action: Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response: Correct the parameter value (or remove the incorrect parameter) and reenter the command or restart the server.

Module: DFHXQPR

Destination: Console and SYSPRINT

DFHXQ0206I Value *value* for parameter *keyword* is less than the minimum allowed value *minimum*.

Explanation: The value of this queue server parameter was less than the minimum allowed value *minimum*.

System action: Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response: Correct the parameter value (or remove the incorrect parameter) and reenter the command or restart the server.

Module: DFHXQPR

Destination: Console and SYSPRINT

DFHXQ0207 Value *value* for parameter *keyword* is incorrect. It should be a time hh:mm:ss or hh:mm or a number of seconds.

Explanation: The value of this queue server parameter did not conform to the correct syntax for a time interval.

System action: Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response: Correct the parameter value (or remove the incorrect parameter) and reenter the command or restart the server.

Module: DFHXQPR

Destination: Console and SYSPRINT

DFHXQ0208 Parameter keyword *keyword* is not supported for *command*.

Explanation: A queue server parameter keyword was specified in a context where it is not valid, usually indicating an attempt to SET dynamically a parameter which can only be specified at initialization time.

System action: Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response: Correct the parameter value (or remove the incorrect parameter) and reenter the command or restart the server.

Module: DFHXQPR

Destination: Console and SYSPRINT

DFHXQ0209 Parameter text contains invalid character: *text*

Explanation: The queue server parameter processing routine found some unexpected text when attempting to process parameters.

System action: Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response: Correct the parameters (or remove

the incorrect parameter) and reenter the command or restart the server.

Module: DFHXQPR

Destination: Console and SYSPRINT

DFHXQ0210 Parameter keyword *keyword* should not have a value for *command*.

Explanation: A queue server parameter keyword was specified in the form keyword=value in a context where it was not expected, for example on a DISPLAY command.

System action: Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response: Reenter the command without specifying a value for the parameter to be displayed.

Module: DFHXQPR

Destination: Console and SYSPRINT

DFHXQ0211 Parameter value: *keyword=value*

Explanation: This message is issued to show the current value of a queue server parameter setting in response to a DISPLAY or PRINT command.

System action: Processing continues normally.

User response: None.

Module: DFHXQPR

Destination: Console and SYSPRINT

DFHXQ0212 Value *value* for parameter *keyword* is incorrect. It must be one of *validlist*.

Explanation: The value of this queue server parameter was not recognized. It should have been specified as one of the indicated list of values.

System action: Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response: Correct the parameter value (or remove the incorrect parameter) and reenter the command or restart the server.

Module: DFHXQPR

Destination: Console and SYSPRINT

DFHXQ0213 Value for parameter *keyword* is missing. The correct form is *keyword=value*.

Explanation: A parameter keyword was specified without an associated parameter value on a queue server SET command or in a SYSIN or PARM parameter string. Note that the only character which should appear between the parameter keyword and its intended value is the equals sign, without any extra spaces.

System action: Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response: Reenter the parameter specification in the correct form *keyword=value*.

Module: DFHXQPR

Destination: Console and SYSPRINT

DFHXQ0301I Console operator *consname* issued command: *command*

Explanation: A queue server operator command has been issued via the MVS MODIFY or STOP command. This message identifies the console name (or TSO userid) from which the command was issued and the text of the command.

System action: Processing continues.

User response: None.

Module: DFHXQOP

Destination: SYSPRINT

DFHXQ0302I *command* command ignored because no valid parameters were given.

Explanation: A queue server command was issued which had no valid parameters on it but was otherwise syntactically valid. The command has had no effect.

System action: Processing continues normally.

User response: Ensure that the command was entered correctly.

Module: DFHXQOP

Destination: Console and SYSPRINT

DFHXQ0303I *command* command has been processed.

Explanation: A queue server command has been processed successfully.

System action: Processing continues.

User response: None.

Module: DFHXQOP

Destination: Console and SYSPRINT

DFHXQ0304I STOP command is waiting for connections to be closed. Number of active connections = *connections*.

Explanation: A queue server STOP command has been issued (either via an MVS STOP command or via an MVS MODIFY command with the text STOP) but there are still active connections to the server, so the STOP command has not yet taken effect.

System action: The server rejects any further attempts to establish new connections, but continues processing requests for existing connections. Each time a connection is terminated, this message is repeated for as long as there are more active connections.

User response: Further information about the connections which are still active can be obtained using the command DISPLAY CONNECTIONS.

If the server needs to be shut down without waiting for connections to be closed, issue the queue server CANCEL command. Note that this immediately terminates any active connections, causing any further requests for that server to be given a SYSIDERR indication. (The MVS CANCEL command can also be used, but should preferably be avoided because it prevents the server from producing its normal closedown statistics and reports).

Note that if a CICS region is abnormally terminated while server connect or disconnect processing is in progress, or is terminated without going through end of task processing (for example using the FORCE command) there is a slight chance that the server will not be notified that the connection has been terminated. In this case the server is not able to be closed down with the server STOP command, but only with the server CANCEL command.

Module: DFHXQOP

Destination: Console and SYSPRINT

DFHXQ0305I STOP command has been processed.

Explanation: Processing of a queue server STOP command has now been successfully completed. This means that there are no longer any active connections and the server is ready to close down.

System action: The queue server starts termination processing.

User response: None.

Module: DFHXQOP

Destination: Console and SYSPRINT

DFHXQ0306 Shared TS queue server does not support this command: *command*

Explanation: An operator command was addressed to the queue server using the MVS MODIFY command, but the first word of the MODIFY text is not a recognized queue server command (SET, DISPLAY, PRINT, STOP or CANCEL).

System action: The command is ignored.

User response: Correct and reenter the command.

Module: DFHXQOP

Destination: Console and SYSPRINT

DFHXQ0307I CANCEL *parm* command has been processed. Number of active connections = *connections*.

Explanation: A queue server CANCEL command has been issued, either from an operator console or internally by the queue server in response to a severe error. This message includes any restart parameter specified on the command and the number of active connections which may be affected by this command.

System action: The queue server terminates immediately, without waiting to close connections.

User response: None.

Module: DFHXQOP

Destination: Console and SYSPRINT

DFHXQ0309 Parameter *parm* on CANCEL command is incorrect. The only valid parameters are RESTART=YES or RESTART=NO.

Explanation: A queue server CANCEL command was issued with a parameter which did not match the valid parameter keywords.

System action: The command is ignored.

User response: Correct and reenter the command.

Module: DFHXQOP

Destination: Console and SYSPRINT

DFHXQ0310 Parameter *parm* on STOP command is incorrect. No parameters should be specified.

Explanation: A queue server STOP command was issued with parameters, but the STOP command does not support any parameters.

System action: The command is ignored.

User response: Correct and reenter the command.

Module: DFHXQOP

Destination: Console and SYSPRINT

DFHXQ0351I Connection: Job *jobname* Appl *applid* Idle *idletime*

Explanation: This describes a single connection in response to the command DISPLAY CONNECTIONS or PRINT CONNECTIONS. The information shows the job name, the specific APPLID and the time in hours, minutes and seconds since the most recent queue request or inquire call was issued using the connection.

System action: This message is issued for each active connection then message DFHXQ0352I is issued to show the total number of active connections.

User response: None.

Module: DFHXQCN

Destination: Console and SYSPRINT

DFHXQ0352I Queue pool *poolname* total active connections: *connections*.

Explanation: This describes the total number of active connections to the queue pool server, in response to the server command DISPLAY CONNECTIONS or PRINT CONNECTIONS.

System action: Processing continues.

User response: None.

Module: DFHXQCN

Destination: Console and SYSPRINT

DFHXQ0401I Connected to CF structure *strname*.

Explanation: The queue server has successfully established a connection to the coupling facility list structure for the queue pool, using the IXLCONN macro.

System action: Processing continues.

User response: None.

Module: DFHXQCF

Destination: Console and SYSPRINT

DFHXQ0402I CF structure *strname* was allocated by this connection.

Explanation: The list structure did not previously exist and was allocated as part of the connection process.

System action: List structure initialization will be performed if necessary.

User response: None.

Module: DFHXQCF

Destination: Console and SYSPRINT

DFHXQ0403 Connection to CF structure *strname* failed, IXLCONN return code *retcode*, reason code *rsncode*.

Explanation: The IXLCONN macro to connect the queue server to its coupling facility list structure failed.

System action: The queue server is terminated.

User response: See the IXLCONN macro in *OS/390 MVS Programming Sysplex Services Reference* (GC28-1772) for the explanation of the return and reason code. If the reason code is of the form xxxx0C08, indicating structure allocation failure, this message is followed by message DFHXQ0409 giving the facility reason code for each CF in which allocation was attempted.

Module: DFHXQCF

Destination: Console and SYSPRINT

DFHXQ0404 CF structure *strname* cannot be used because it has been allocated with attribute *attribute*.

Explanation: The queue server has successfully connected to its list structure but has found that the structure has been allocated using an IXLCONN structure attribute keyword which is not supported by the queue server.

System action: The queue server is terminated.

User response: This probably indicates that the structure has been allocated or modified by some program other than the queue server. In this case, the incorrect structure should be deleted (for example using the SETXCF FORCE command) so that it will be reallocated correctly when the queue server is restarted.

Module: DFHXQCF

Destination: Console and SYSPRINT

DFHXQ0405 CF structure *strname* element size *elemsize* is incorrect. It should be a power of 2 in the range 256 to 4096.

Explanation: The queue server list structure element size (specified via the ELEMSIZE initialization parameter) is not a power of two, or is outside the range supported by the list structure hardware.

System action: The queue server is terminated (without attempting to connect to the list structure).

User response: Correct the ELEMSIZE parameter and restart the queue server.

Module: DFHXQCF

Destination: Console and SYSPRINT

DFHXQ0406 Initialization failed for CF structure *strname* with response *response*.

Explanation: Queue server processing to initialize the list structure failed with an abnormal internal response code.

System action: The server is terminated.

User response: If the response code is 8 (I/O error), it indicates that an IXLLIST macro gave an abnormal return code, in which case a previous DFHXQ0441 message will have been issued giving the IXLLIST return code and reason code. If this response code is any other value, this indicates that the list structure is in a state which should not occur, probably indicating that it was allocated or modified by a program other than the queue server. In this case the structure may need to be deleted (using SETXCF FORCE) so that it will be reallocated when the server is restarted.

Module: DFHXQCF

Destination: Console and SYSPRINT

DFHXQ0407 CF structure *strname* is not available for shared use.

Explanation: The queue pool is currently locked for exclusive use by some other job such as a queue pool unload or reload job. (This serialization uses an MVS ENQ with scope SYSTEMS for major name SYSZDFH minor name DFHXQLS_poolname).

System action: The server is terminated.

User response: Check whether a queue pool maintenance job is currently running. If it is, wait until it has finished before trying to start the server again.

Module: DFHXQCF

Destination: Console and SYSPRINT

DFHXQ0408 CF structure *strname* is not available for exclusive use.

Explanation: The current job (an unload or reload) requires exclusive use of the queue pool, but some other job is running which already has shared or exclusive use of the pool. (This serialization uses an MVS ENQ with scope SYSTEMS for major name SYSZDFH minor name DFHXQLS_poolname).

System action: The server is terminated.

User response: Check whether a queue pool server or maintenance job is currently running. If it is, wait until it has finished before trying to run the current job again.

Module: DFHXQCF

Destination: Console and SYSPRINT

DFHXQ0409 CF structure *strname* could not be allocated in facility *cfname*, reason code *rsncode*.

Explanation: If a previous message DFHXQ0403 indicated an IXLCONN failure because the structure could not be allocated, this message is issued for each CF in which allocation was attempted to show the facility reason code indicating why structure allocation failed. If the reason code is known to the server, the name of the reason code is given (without the ConaRsn prefix), otherwise its decimal value is shown.

If the response indicates InvalidStructureSize, this means that the initial list structure size (specified on the server POOLSIZE parameter or in the CFRM policy INITSIZE parameter) is not large enough to contain the required structure control information. The size of the control information is affected by the number of list headers (determined by the server MAXQUEUEES parameter) and by the maximum structure size specified in the CFRM policy.

System action: The queue server is terminated.

User response: See the descriptions of the reason codes in the MVS macro IXLYCONA which maps the connect answer area.

If the response was InvalidStructureSize, increase the initial structure size specification in the server POOLSIZE parameter or the CFRM policy INITSIZE parameter to ensure that there is enough space for data in addition to the structure control information. Also, check that the server MAXQUEUEES parameter and the maximum structure size specified in the CFRM policy are not unnecessarily large. See the *System Definition Guide* for more information on how to estimate temporary storage queue pool sizes.

Module: DFHXQCF

Destination: Console and SYSPRINT

DFHXQ0410 CF structure *strname* cannot be used, coupling facility maintenance level is too low.

Explanation: Initialization test routines executed against the allocated list structure gave incorrect results, indicating that the coupling facility control code does not include all maintenance necessary to support shared temporary storage.

System action: The queue server is terminated.

User response: Ensure that the required level of coupling facility maintenance is applied.

Module: DFHXQCF

Destination: Console and SYSPRINT

DFHXQ0411I CF structure *strname* now has *percentage%* of entries in use.

Explanation: This message is issued by the queue server when the percentage of list entries in use within the list structure increases past certain set threshold levels, or when it decreases past a threshold level after previously being at a higher level. This message is also issued immediately after an ALTER request has completed in order to show how the percentage has been affected by changes in the structure size or entry to element ratio.

System action: The warning threshold is increased to the next higher level (normally 5% higher if less than 95%, otherwise 1% higher), or decreased to the previous lower level depending on whether the usage is increasing or decreasing. If the structure usage is increasing and the structure element to entry ratio is not making full use of the available space, the server may issue an automatic IXLALTER request to adjust the ratio.

User response: Note that the structure may soon become full, preventing queues from being created. If the structure was allocated at less than its maximum size and the coupling facility has enough free space, the size of the structure can be altered dynamically using the MVS SETXCF command with the START,ALTER options.

Module: DFHXQCF

Destination: Console and SYSPRINT

DFHXQ0412I CF structure *strname* now has *percentage%* of elements in use.

Explanation: This message is issued by the queue server when the percentage of list data elements in use within the list structure increases past certain set threshold levels, or when it decreases past a threshold level after previously being at a higher level. This message is also issued immediately after an ALTER request has completed in order to show how the percentage has been affected by changes in the structure size or entry to element ratio.

System action: The warning threshold is increased to the next higher level (normally 5% higher if less than 95%, otherwise 1% higher), or decreased to the previous lower level depending on whether the usage is increasing or decreasing. If the structure usage is increasing and the structure element to entry ratio is not making full use of the available space, the server may issue an automatic IXLALTER request to adjust the ratio.

User response: Note that the structure may soon become full, preventing queues from being created. If the structure was allocated at less than its maximum size and the coupling facility has enough free space, the size of the structure can be altered dynamically

DFHXQ0413I • DFHXQ0419I

using the MVS SETXCF command with the START,ALTER options.

Module: DFHXQCF

Destination: Console and SYSPRINT

DFHXQ0413I Starting ALTER to adjust CF structure *strname* entry/element ratio to *entries/elements*.

Explanation: The queue server has determined that the ratio of free entries to free elements is significantly different from the ratio of entries to elements actually in use. It is issuing an IXLALTER macro to request the coupling facility to adjust the ratio to make better use of the coupling facility storage.

System action: The server continues by issuing the IXLALTER macro. A further message will be issued when the ALTER request is accepted or rejected by MVS.

User response: None.

Module: DFHXQCF

Destination: Console and SYSPRINT

DFHXQ0414I ALTER started for CF structure *strname*.

Explanation: The queue server has successfully started an ALTER request to change the entry to element ratio for the list structure.

System action: The queue server event exit will be notified by MVS when the ALTER request completes and a further message will then be issued.

User response: None.

Module: DFHXQCF

Destination: Console and SYSPRINT

DFHXQ0415I ALTER rejected for CF structure *strname*, ALTER already active.

Explanation: The queue server attempted to start an ALTER to change the entry to element ratio for the list structure, but this was rejected by the system because another ALTER was already active.

System action: The queue server event exit will be notified by MVS when the ALTER request completes and a further message will then be issued.

User response: None.

Module: DFHXQCF

Destination: Console and SYSPRINT

DFHXQ0416 ALTER request failed for CF structure *strname*, IXLALTER return code *retcode*, reason code *rsncode*.

Explanation: The queue server attempted to start an ALTER to change the entry to element ratio for the list structure, but this was rejected by the system with an unexpected return code.

System action: The current ALTER attempt is abandoned. Another attempt may be made when the minimum alter interval has expired.

User response: See the IXLALTER macro in *OS/390 MVS Programming Sysplex Services Reference* (GC28-1772) for the explanation of the return and reason code.

Module: DFHXQCF

Destination: Console and SYSPRINT

DFHXQ0417I ALTER completed normally for CF structure *strname*.

Explanation: The queue server has been notified by the system that an ALTER request has completed normally.

System action: New values for the structure size and numbers of elements and entries are stored. This message is followed by messages DFHXQ0411 and DFHXQ0412 to indicate the new usage percentages.

User response: None.

Module: DFHXQCF

Destination: Console and SYSPRINT

DFHXQ0418I ALTER ended abnormally for CF structure *strname* with status *status*.

Explanation: The queue server has been notified by the system that an ALTER request has ended abnormally. The two bytes of status information in this message are taken from EEPLALTERENDSTATEFLAGS in the event exit parameter list (defined in the IXLYEPL macro).

System action: No action is taken as a result of this notification, but the problem which caused the ALTER to fail will probably result in other related problems.

User response: None.

Module: DFHXQCF

Destination: Console and SYSPRINT

DFHXQ0419I ALTER ended normally for CF structure *strname* but target was not attained.

Explanation: The queue server has been notified by the system that an ALTER request has ended normally

but that the target ratio or target size was not attained.

System action: New values for the structure size and numbers of elements and entries are stored. This message is followed by messages DFHXQ0411 and DFHXQ0412 to indicate the new usage percentages.

User response: None.

Module: DFHXQCF

Destination: Console and SYSPRINT

DFHXQ0424 Connectivity has been lost to CF structure *strname*. The shared TS queue server cannot continue.

Explanation: The queue server has been notified by the system that connectivity has been lost to its list structure.

System action: The server issues an internal CANCEL command to terminate itself immediately.

User response: Restart the server when connectivity to the server from the current system has been reestablished. If connectivity is still available from other systems, CICS transactions which require access to the affected queue pool should be diverted to those systems if possible.

Module: DFHXQCF

Destination: Console and SYSPRINT

DFHXQ0425 CF structure *strname* has failed. The shared TS queue server cannot continue.

Explanation: The queue server has been notified by the system that its list structure has been lost due to coupling facility failure. All data in the queue pool has been lost.

System action: Each queue server for the affected pool issues an internal CANCEL command to terminate itself immediately.

User response: If another coupling facility is available and is included in the CFRM preference list for the failed structure, delete the failed structure and restart the servers to cause a fresh copy of the list structure to be allocated on the alternate coupling facility. If no other coupling facility is available, wait until the original coupling facility has been made available again before restarting the servers.

Module: DFHXQCF

Destination: Console and SYSPRINT

DFHXQ0431I Access statistics for CF structure *strname*

Explanation: This message gives a summary of coupling facility access statistics. It is issued in response to a DISPLAY or PRINT command which includes the CFSTATS parameter, and may also be produced on the SYSPRINT file during interval statistics if the statistics options include print file output.

The detailed message layout is as follows

```

9'.
Index: Wrt Adjs Writes Reads Deletes Rereads
        n      n      n      n      n
      Read Adjs
        n
Data: Creates Writes Reads Deletes Rereads
      n      n      n      n      n
      Rewrites
        n
Responses: Asynch Unavail Normal Len err
           n      n      n      n      n
           Not fnd Vers chk List chk
           n      n      n
           List full Str full I/O err
           n      n      n
  
```

System action: Processing continues.

User response: The statistics are described in detail in the DFHXQS1D data area. For queues which do not exceed 32K bytes, the data is included in the queue index, otherwise it is stored as a separate list. The individual fields have the following meanings

- Index access counts

Wrt Adjs

Number of index writes to update adjunct area only. (This area contains the read cursor for small queues and the queue status including last used data).

Writes Number of queue writes (new or update) including data.

Reads Number of queue index reads.

Delete Number of queue deletes.

Rereads

Number of reads which had to be repeated because the data was larger than the default data transfer size.

Read Adjs

Number of index reads for the status area only. This is used for inquire processing, and also to read the queue details if necessary during delete processing.

- Data access counts

Creates

Number of times a separate data list was created.

Writes Number of writes to add items to separate data lists.

Reads Number of reads from separate data lists.

Delete Number of times a separate data list was deleted.

Rereads
Number of reads which had to be repeated because the data was larger than the default data transfer size.

Rewrites
Number of writes to replace items in separate data lists.

- Response counts

Asynch
Number of requests for which completion was asynchronous.

Unavail
Number of times requests were deferred because the structure was temporarily unavailable, for example because system-managed rebuild was in progress.

Normal
Number of normal responses.

Len err
The input buffer was too small to contain the data. The server often tries a buffer size of only 4K in order to use a synchronous read if possible. If this response occurs, the server sets up the maximum sized buffer and reissues the read.

Not fnd
The specified entry (queue or item) was not found.

Vers chk
A version check failed for an entry being updated or created, indicating that another task had updated it first.

List chk
A list authority comparison failed, usually meaning that the queue is in the process of being deleted.

List full
A queue reached the maximum number of items, causing the relevant list to be marked as full.

Str full The list structure became full.

I/O err Some other error code was returned by IXLLIST.

Module: DFHXQCF

Destination: Console and SYSPRINT

DFHXQ0432I Queue pool statistics for CF structure

strname

Explanation: This message gives a summary of the usage statistics for the queue pool list structure. It is issued in response to a DISPLAY or PRINT command which includes the POOLSTATS parameter, and may also be produced on the SYSPRINT file during interval statistics if the statistics options include print file output.

The detailed message layout is as follows

g'.

Structure: Size Max size Elem size
 nK nK n

Queues: Current Highest
 n n

Lists: Total In use Max used Control Data
 n n n n n
 100% n% n% n% n%

Entries: Total In use Max used Free Min free
 n n n n n
 100% n% n% n% n%

Elements: Total In use Max used Free Min free
 n n n n n
 100% n% n% n% n%

System action: Processing continues.

User response: The statistics are described in detail in the DFHXQS1D data area. Pool usage statistics are calculated from information returned by coupling facility requests, and are not always very accurate, especially if the relevant information has not been accessed recently by the current server. The individual fields have the following meanings

- Structure

Size Current allocated size of the list structure.

Max size
Maximum size to which this structure could be altered.

Elem size
Data element size used for the structure.

- Queues

Current
Number of queues currently in existence.

Highest
Highest number of queues at any time (since last reset).

- Lists

Total Maximum number of list headers in the structure.

In Use Number currently in use.

Max Used
Maximum number in use (since last reset).

Control
Number of lists in use for control information.

- Data** Number of lists in use for queue data.
- Entries
 - Total** Total entries in the currently allocated structure. (Obtained at connection time, may be updated by ALTER).
 - In Use** Number of entries currently in use.
 - Max Used**
 - Maximum number in use (since last reset).
 - Free** Number of entries currently free (total minus used).
 - Min Free**
 - Minimum number of free entries (since last reset).
- Elements
 - Total** Total data elements in the currently allocated structure. (Obtained at connection time, may be updated by ALTER).
 - In Use** Number of elements currently in use.
 - Max Used**
 - Maximum number in use (since last reset).
 - Free** Number of elements currently free (total minus used).
 - Min Free**
 - Minimum number of free elements (since last reset).

Module: DFHXQCF

Destination: Console and SYSPRINT

DFHXQ0441 CF structure *strname* request failed, IXLLIST return code *retcode*, reason code *rsncode*.

Explanation: A coupling facility access request issued via the IXLLIST macro gave an abnormal return code.

System action: The failing request is given an I/O error indication, giving an IOERROR condition if it originated from a CICS API request.

User response: See the IXLLIST macro in *OS/390 MVS Programming Sysplex Services Reference* (GC28-1772) for the explanation of the return and reason code.

Module: DFHXQCF

Destination: Console and SYSPRINT

DFHXQ0442 CF structure *strname* request failed, structure is full.

Explanation: A coupling facility access request issued via the IXLLIST macro failed because there are insufficient free entries or elements to store the new data in the structure.

System action: The failing request is given a NOSPACE indication if it originated from a CICS API request. For reload processing, if an automatic ALTER is in progress, the request may be suspended until the outcome of the ALTER is known, then retried. This message will not be issued again for further failures until the used numbers of elements and entries fall well below the warning threshold.

User response: Any queues which are no longer in use should be deleted so that the space can be reused. If the structure is not at its maximum size, it may be possible to start an ALTER request to increase the size using the MVS SETXCF command.

Module: DFHXQCF

Destination: Console and SYSPRINT

DFHXQ0443 CF structure *strname* request failed, all lists are in use.

Explanation: A coupling facility access request issued via the IXLLIST macro failed because all list headers defined in the structure are now in use. The number of list headers is determined by the MAXQUEUES server initialization parameter when the structure was allocated.

System action: The failing request is given a NOSPACE indication if it originated from a CICS API request. This message will not be issued again for further failures while the shortage of list entries remains.

User response: Any queues of total size greater than 32K bytes which are no longer in use should be deleted to free up data lists. As the number of lists is fixed when the structure is allocated, the only way to increase the number of lists is to unload the structure, use SETXCF FORCE to delete it then reload it with a larger MAXQUEUES parameter.

Module: DFHXQCF

Destination: Console and SYSPRINT

DFHXQ0444I CF request has been suspended to await ALTER completion.

Explanation: A coupling facility access request issued from the server address space (during reload processing) ran out of space in the list structure, but an automatic ALTER attempt to free up more space is either already active or is being started at this point. The request is therefore being suspended to await the outcome of the ALTER attempt.

System action: The request is suspended until either the ALTER request completes (normally or abnormally), then the request is retried.

User response: None.

Module: DFHXQCF

Destination: Console and SYSPRINT

DFHXQ0445I CF request is being retried after ALTER completion.

Explanation: A request which was suspended to await the completion of an ALTER request is now being retried because the ALTER has either completed or failed.

System action: The suspended request will be restarted.

User response: None.

Module: DFHXQCF

Destination: Console and SYSPRINT

DFHXQ045I Purge for CF structure *strname* failed, IXPURGE return code *retcode*, reason code *rsncode*.

Explanation: A queue access request was terminated abnormally and the queue server issued an IXPURGE macro to ensure any active IXLLIST request was purged before releasing the I/O buffer, but the IXPURGE macro gave a non-zero return code.

System action: The error is ignored because this only occurs when a request is already being terminated abnormally.

User response: See the IXPURGE macro in *OS/390 MVS Programming Sysplex Services Reference* (GC28-1772) for the explanation of the return and reason code.

Module: DFHXQCF

Destination: Console and SYSPRINT

DFHXQ0461I Disconnected from CF structure *strname*.

Explanation: The server has successfully disconnected from the CF structure (using the IXLDISC macro).

System action: Processing continues.

User response: None.

Module: DFHXQCF

Destination: Console and SYSPRINT

DFHXQ0462 Disconnect from CF structure *strname* failed, IXLDISC return code *retcode*, reason code *rsncode*.

Explanation: The IXLDISC macro to disconnect the queue server from its coupling facility list structure failed.

System action: The error is ignored, as disconnection only occurs when the server is already terminating.

User response: See the IXLDISC macro in *OS/390*

MVS Programming Sysplex Services Reference (GC28-1772) for the explanation of the return and reason code.

Module: DFHXQCF

Destination: Console and SYSPRINT

DFHXQ0481I Waiting for structure *strname* to become available.

Explanation: The queue server was unable to connect to its coupling facility structure because of an environmental error, such as the structure being unavailable, as described in a previous DFHXQ0403 message. The server is now waiting for this problem to be fixed, and will retry the connection request when it is notified via the ENF facility that the specific structure may now be available or that some change has occurred in the status of general coupling facility resources.

System action: The server waits to be notified of a relevant event.

User response: No action is required, but the waiting server can optionally be terminated using the MVS **CANCEL** command if it is no longer required.

Module: DFHXQEN

Destination: Console and SYSPRINT

DFHXQ0482I Retrying connection to structure *strname*.

Explanation: The queue server has been notified via ENF that its list structure may now be available or that a change has occurred in the status of some general coupling facility resources, so it is about to make another attempt to connect to the structure.

System action: The original IXLCONN request is retried.

User response: None.

Module: DFHXQEN

Destination: Console and SYSPRINT

DFHXQ049I ENFREQ ACTION=*action* failed, return code *retcode*.

Explanation: An ENF request issued by the queue server gave an unexpected return code.

System action: If this occurs on the ENFREQ ACTION=LISTEN request and the server is subsequently unable to connect to the list structure, the server will be terminated instead of waiting for the structure to become available.

User response: See the documentation of the ENFREQ macro in *OS/390 MVS Programming: Authorized Assembler Services Reference, Volume 2*

(ENFREQ-ITTFMTB) (GC28-1765) for the explanation of the return and reason code.

Module: DFHXQEN

Destination: Console and SYSPRINT

DFHXQ0501 Insufficient storage, only actual of requested data buffers allocated.

Explanation: The queue server was unable to allocate the specified number of data buffers (of 32K bytes) during initialization because the relevant storage pool (AXMPGANY) was exhausted.

System action: The server is terminated.

User response: Decrease the BUFFERS initialization parameter to a value less than the number which were successfully allocated (to leave plenty of storage for request processing) and restart the server. Alternatively, increase the region size for the queue server to allow more buffers to be allocated.

Module: DFHXQBF

Destination: Console and SYSPRINT

DFHXQ05111 Queue index buffer pool statistics

Explanation: This message gives a summary of the usage statistics for the queue index buffer pool, which is used to read and write queue index entries and their associated data, and to save recently accessed index entries in storage to reduce coupling facility I/O. It is issued in response to a DISPLAY or PRINT command which includes the BUFSTATS parameter, and may also be produced on the SYSPRINT file during interval statistics if the statistics options include print file output.

The detailed message layout is as follows

9'.

```

Buffers: Total  Max used  Active  On LRU  Empty
           n           n           n           n           n
Requests: Gets  Puts    Keeps  Frees  Purges
           n           n           n           n           n
Results: Got hit Got free Got new Got LRU No buff
(Get)      n           n           n           n           n
Errors: Not freed  No purge Not owned
           n           n           n
Waits: Pool lock  Buf lock
           n           n

```

System action: Processing continues.

User response: The statistics are described in detail in the DFHXQS2D data area. The individual fields have the following meanings

- Buffers

Total Number of buffers in the pool.

Max used

Highest number ever used (not affected by reset).

Active Buffers currently in use.

On LRU

Buffers with valid contents on LRU chain to allow reuse.

Empty Buffers previously used but now empty.

- Requests

Gets Requests to get a buffer.

Puts Requests to put back a buffer with valid contents.

Keeps Requests to put back a buffer with modified contents. (This function is not currently used by the queue server).

Frees Requests to put back a buffer as empty.

Purges

Requests to discard contents of a previously valid buffer.

- Results (Get)

Got hit Request found a valid match on the LRU chain.

Got free Request obtained an empty buffer.

Got new Request obtained a buffer not previously used.

Got LRU Request discarded and reused the oldest valid buffer.

No buff Request failed to obtain a buffer.

- Errors

Not freed Request tried to free a buffer which it did not own. (This can occur during error recovery).

No purge A purge request did not find any matching buffer.

Not owned A purge request hit a buffer owned by another task.

- Waits

Pool lock Number of waits for the buffer pool header lock.

Buf lock Number of waits because another request owned the buffer.

Module: DFHXQBF

Destination: Console and SYSPRINT

DFHXQ0601I Starting statistics collection for interval since *lasttime*.

Explanation: The queue server is about to collect interval, end of day or closedown statistics. This message identifies the start of the time interval to which the statistics apply, which is either the time that the server was started up or the time of the last reset, which occurs whenever interval or end of day statistics are produced. The format of the timestamp is yyyy-mm-dd hh:mm:ss.

System action: The queue server proceeds with statistics collection.

User response: None.

Module: DFHXQST

Destination: SYSPRINT

DFHXQ0602I Statistics collection completed, reset performed.

Explanation: Queue server statistics have been collected and counters have been reset. This occurs for interval or end of day statistics.

System action: Processing continues.

User response: None.

Module: DFHXQST

Destination: SYSPRINT

DFHXQ0603I Statistics collection completed.

Explanation: Queue server statistics have been collected but counters have not been reset. This normally occurs at server closedown.

System action: Processing continues.

User response: None.

Module: DFHXQST

Destination: SYSPRINT

DFHXQ0604 Timer SET failed, return code *retcode*, reason code *rsncode*.

Explanation: An attempt by the queue server statistics subtask to set up a timer wait interval failed.

System action: The interval statistics function is terminated with message DFHXQ0606.

User response: Check the return code and reason code. A return code of 4 indicates an attempt to set up more than one concurrent timer interval, which indicates a logic error in the server. A return code of 8 indicates that the MVS STIMERM macro failed, in which case the reason code indicates the return code received from STIMERM SET.

Module: DFHXQST

Destination: Console and SYSPRINT

DFHXQ0605 Timer CANCEL failed, return code *retcode*, reason code *rsncode*.

Explanation: An attempt by the queue server statistics subtask to cancel a timer wait interval failed.

System action: The interval statistics function is terminated with message DFHXQ0606.

User response: Check the return code and reason code. A return code of 4 indicates an attempt to cancel a nonexistent timer interval, which indicates a logic error in the server. A return code of 8 indicates that the MVS STIMERM macro failed, in which case the reason code indicates the return code received from STIMERM CANCEL.

Module: DFHXQST

Destination: Console and SYSPRINT

DFHXQ0606 Statistics collection function is no longer available.

Explanation: The queue server statistics collection subtask was unable to continue processing and has terminated. The reason will have been indicated by an earlier message.

System action: The interval statistics subtask terminates and no further interval statistics or end of day statistics will be produced for this run of the server.

User response: See the earlier message indicating the reason for the termination of the subtask.

Module: DFHXQST

Destination: Console and SYSPRINT

DFHXQ0610I Statistics written to SMF, return code was *retcode*.

Explanation: Queue server statistics have been sent to SMF. The return code from the SMFEWMT macro is indicated in this message. A non-zero return code usually indicates that SMF recording was suppressed because of current SMF options or an installation exit.

System action: Processing continues.

User response: If the return code is non-zero but SMF statistics were expected to be successfully written, see the SMFEWMT macro in *MVS/ESA System Management Facilities (SMF) (GC28-1457)* for more information about return codes.

Module: DFHXQST

Destination: SYSPRINT

DFHXQ0701I Shared TS queue pool *poolname* is to be unloaded.

Explanation: The server program has been started with the UNLOAD option requesting that the queue pool is unloaded to a sequential data set.

System action: The server starts to process the unload request. In this case, the rest of cross-memory server initialization is bypassed as it will not be needed.

User response: None.

Module: DFHXQUL

Destination: Console and SYSPRINT

DFHXQ0702I Shared TS queue pool *poolname* has been successfully unloaded.

Explanation: The queue pool has been unloaded successfully.

System action: The server closes down normally.

User response: None.

Module: DFHXQUL

Destination: Console and SYSPRINT

DFHXQ0703I Number of unloaded queues: *queues*. Blocks written *blocks*.

Explanation: This message provides additional information about the results of the unload process, giving the number of queues which were unloaded and the number of 4K data blocks written to the unloaded queue pool data set.

System action: Server termination continues.

User response: None.

Module: DFHXQUL

Destination: Console and SYSPRINT

DFHXQ0704 DFHXQUL data set for unload could not be opened.

Explanation: The data set to contain the unloaded queue pool could not be opened.

System action: Unload processing is terminated and the server is closed down with message DFHXQ0706.

User response: Check that the DFHXQUL DD statement is present in the JCL for the unload job.

Module: DFHXQUL

Destination: Console and SYSPRINT

DFHXQ0705 Unload access to CF structure *strname* failed with response *response*.

Explanation: The unload process failed because of a problem with coupling facility access.

System action: Unload processing is terminated and the server is closed down with message DFHXQ0706.

User response: If the response code is 8, this indicates that an unexpected IXLLIST error occurred, for which a previous error message will have been issued. Any other response code indicates an internal logic error.

Module: DFHXQUL

Destination: Console and SYSPRINT

DFHXQ0706 Unload for shared TS queue pool *poolname* was unsuccessful.

Explanation: The queue pool unload process failed. The reason will have been described in a previous message.

System action: The server is terminated.

User response: See the previous message giving the reason for the unload failure. Note that any unload data set produced in this case will be incomplete and will not be valid for reload purposes.

Module: DFHXQUL

Destination: Console and SYSPRINT

DFHXQ0801I Shared TS queue pool *poolname* is to be reloaded.

Explanation: The server program has been started with the RELOAD option requesting that the queue pool is to be reloaded from a sequential data set produced using the UNLOAD option.

System action: The server starts to process the reload request. In this case, the rest of cross-memory server initialization is bypassed as it will not be needed.

User response: None.

Module: DFHXQRL

Destination: Console and SYSPRINT

DFHXQ0802I Shared TS queue pool *poolname* has been successfully reloaded.

Explanation: The queue pool has been reloaded successfully.

System action: The server closes down normally.

User response: None.

Module: DFHXQRL

Destination: Console and SYSPRINT

DFHXQ0803I Queues reloaded: *queues*. **Queues bypassed:** *duplicates*. **Blocks read:** *blocks*.

Explanation: This message provides additional information about the results of the reload process. Queues on the unloaded data set are bypassed during reload processing if they already exist in the pool (for example as a result of a previous reload which could not be completed due to lack of space).

System action: Server termination processing continues.

User response: None.

Module: DFHXQRL

Destination: Console and SYSPRINT

DFHXQ0804 DFHXQRL data set for reload could not be opened.

Explanation: The data set containing the queue pool to be reloaded could not be opened.

System action: Reload processing is terminated and the server is closed down with message DFHXQ0808.

User response: Check that the DFHXQRL DD statement is present in the JCL for the reload job.

Module: DFHXQRL

Destination: Console and SYSPRINT

DFHXQ0805 Reload access to CF structure *strname* failed with response *response*.

Explanation: The reload process failed because of a problem with coupling facility access.

System action: Reload processing is terminated and the server is closed down with message DFHXQ0808.

User response: If the response code is 8, this indicates that an unexpected IXLLIST error occurred, for which a previous message DFHXQ0441 will have been issued. Any other response code indicates an internal logic error.

Module: DFHXQRL

Destination: Console and SYSPRINT

DFHXQ0806 Unexpected end of file encountered on reload data set.

Explanation: End of file was encountered on the unloaded data set before the logical end of the unloaded data was encountered.

System action: Reload processing is terminated and the server is closed down with message DFHXQ0808.

User response: This indicates that the unloaded data

set is incomplete, perhaps because the unload process was abnormally terminated.

Module: DFHXQRL

Destination: Console and SYSPRINT

DFHXQ0807 Reload data set contains incorrect data near block *block*, offset *offset*.

Explanation: The reload process failed because the unloaded queue pool data set is not in the correct format.

System action: Reload processing is terminated and the server is closed down with message DFHXQ0808.

User response: Check that the correct data set is being used and that the unload process completed normally.

Module: DFHXQRL

Destination: Console and SYSPRINT

DFHXQ0808 Reload for shared TS queue pool *poolname* was unsuccessful.

Explanation: The queue pool reload process could not be completed. The reason will have been described in a previous message.

System action: The program is terminated.

User response: See the previous message giving the reason for the reload failure.

Module: DFHXQRL

Destination: Console and SYSPRINT

DFHXQ0809 Reload for CF structure *strname* failed, structure is full.

Explanation: Reload processing failed because there are insufficient free entries or elements to store the new data in the structure.

System action: Reload processing is terminated and the server is closed down with message DFHXQ0808.

User response: If the structure is not at its maximum size, use the MVS SETXCF FORCE to delete the structure, then change the reload parameters to specify a larger POOLSIZE parameter and rerun the reload job. The approximate amount of information which could not be reloaded can be estimated by comparing the numbers of blocks read and queues reloaded, as described by following message DFHXQ0803, with the corresponding numbers from message DFHXQ0703 in the unload job.

Module: DFHXQRL

Destination: Console and SYSPRINT

DFHXQ0810 Reload for CF structure *strname* failed, all lists are in use.

Explanation: Reload processing failed because all list headers defined in the structure are now in use.

System action: Reload processing is terminated and the server is closed down with message DFHXQ0808.

User response: Use the MVS SETXCF FORCE to delete the structure, then change the reload MAXQUEUEES parameter to a large value and rerun the reload job.

Module: DFHXQRL

DFHXSnnnn messages

DFHXS0001 applid An abend (code aaa/bbbb) has occurred at offset X'offset' in module modname.

Explanation: An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant

MVS codes manual which is detailed in the book list in the front of this manual.

Next, look up the CICS alphanumeric code in this manual. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXSAD, DFHXSCL, DFHXSDM, DFHXSFL, DFHXSIS, DFHXSLU, DFHXSPW, DFHXSRC, DFHXSST, DFHXSXM

XMEOUT Parameters: *applid, aaa/bbbb, X'offset', modname*

Destination: Console

DFHXS0002 applid A severe error (code X'code') has occurred in module modname.

Explanation: An error has been detected in module *modname*. The code *X'code'* is the exception trace point id which uniquely identifies what the error is and where the error was detected.

System action: An exception entry (code *X'code'* in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXSAD, DFHXSCL, DFHXSDM, DFHXSFL, DFHXSIS, DFHXSLU, DFHXSPW, DFHXSRC, DFHXSST, DFHXSXM

XMEOUT Parameters: *applid, X'code',modname*

Destination: Console

DFHXS0004 *applid* **A possible loop has been detected at offset *X'offset'* in module *modname*.**

Explanation: A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset *X'offset'*. This is the offset of the instruction which was executing at the time the error was detected.

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Notify the system programmer. If

CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module *modname* in the message is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname*, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXSAD, DFHXSCL, DFHXSDM, DFHXSFL, DFHXSIS, DFHXSLU, DFHXSPW, DFHXSRC, DFHXSST, DFHXSXM

XMEOUT Parameters: *applid, X'offset', modname*

Destination: Console

DFHXS0006 *applid* **Insufficient storage to satisfy Getmain (code *X'code'*) in module *modname*. MVS code *mvscode*.**

Explanation: An MVS GETMAIN was issued by module *modname*, but there was insufficient storage available to satisfy the request.

The code *X'code'* is the exception trace point ID which uniquely identifies the place where the error was detected.

The code *mvscode* is the MVS GETMAIN return code.

System action: An exception entry is made in the trace table (code *X'code'*). A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: If CICS has been terminated by another module, look out for the relevant termination messages (from, for example, the domain manager), and look up the user response suggested for these messages.

If CICS is still running, the problem may be a temporary one which rights itself if more storage becomes available. If you can manage without module *modname*, you may decide to continue and bring CICS down at a convenient time to resolve the problem. If the message recurs or if you cannot run without the full use of all CICS modules, you should bring CICS down in a controlled shutdown.

You can get diagnostic information about the MVS return code by consulting the relevant MVS codes manual which is listed in the book list at the front of this book.

Try decreasing the size limits of the DSAs or EDSAs. Or, try increasing the size of the whole region, if it is not already at maximum size. See the *CICS System Definition Guide* or the *CICS Performance Guide* for further information on CICS storage.

Module: DFHXSAD, DFHXSCL, DFHXSDM, DFHXSFL, DFHXSIS, DFHXS LU, DFHXSPW, DFHXSRC, DFHXSST, DFHXSXM

XMEOUT Parameters: *applid, X'code', modname, mvscode*

Destination: Console

DFHXS0200I *date time applid* **External security initialization has been successfully tracked.**

Explanation: An external security initialization performed on an active CICS system (via CEMT PERFORM SECURITY, or EXEC CICS SECURITY REBUILD) has been tracked to the XRF alternate system, and has completed successfully.

System action: None.

User response: None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Module: DFHXSWM

XMEOUT Parameters: *date, time, applid*

Destination: Console

DFHXS0201I *date time applid* **External security initialization has been tracked, and has failed with return code X'xx' and reason code X'yy'.**

Explanation: An external security initialization was performed on an active CICS system by use of a CEMT PERFORM SECURITY, or EXEC CICS SECURITY REBUILD.

The external security initialization has been tracked to the XRF alternate system, but has failed with return code *xx* and reason code *yy*.

xx and *yy* are the values placed in registers 15 and 0 by the external security manager.

System action: CICS provides a system dump of the XRF alternate system, and continues tracking security initializations.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: The security characteristics of the alternate system no longer match those of the active system. Either shut down the alternate system, perform a security rebuild at takeover, or accept the difference.

Use the return codes in the message, to determine why the security initialization failed.

If the codes are invalid, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXSWM

XMEOUT Parameters: *date, time, applid, X'xx', X'yy'*

Destination: Console

DFHXS0202 *date time applid* **An attempt to track external security initialization has failed, tracking data could not be sent.**

Explanation: An external security initialization was performed on an active CICS system (via CEMT PERFORM SECURITY, or EXEC CICS SECURITY REBUILD).

It has not been tracked to an alternate system because the tracking data could not be sent.

System action: CICS provides a system dump of the active, and continues tracking security initializations.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: The security characteristics of the alternate will no longer match those of the active. Either shut down the alternate, perform a security rebuild at takeover, or accept the difference.

Module: DFHXSWM

XMEOUT Parameters: *date, time, applid*

Destination: CSCS

DFHXS0203 *date time applid* **An attempt to track external security initialization has failed, tracking data could not be received.**

Explanation: An external security initialization was performed on an active CICS system (via CEMT

PERFORM SECURITY, or EXEC CICS SECURITY REBUILD).

The external security initialization has not been tracked to an alternate system because the tracking data could not be received.

Message DFHME0116 should be produced containing the symptom string for this problem.

System action: CICS provides a system dump of the alternate system, and ceases to track the security initializations.

User response: The security characteristics of the alternate system no longer match those of the active system. Either shut down the alternate system, perform a security rebuild at takeover, or accept the difference.

Module: DFHXSWM

XMEOUT Parameters: *date, time, applid*

Destination: CSCS

DFHXS0204 *date time applid* **An attempt to track external security initialization has failed, tracking data was corrupted.**

Explanation: An external security initialization was performed on an active CICS system (via CEMT PERFORM SECURITY, or EXEC CICS SECURITY REBUILD).

It has been tracked to an alternate system but the tracking data was corrupted in transit.

System action: CICS provides a system dump of the alternate systems, and ceases to track the security initializations.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: The security characteristics of the alternate system no longer match those of the active system. Either shut down the alternate system, perform a security rebuild at takeover, or accept the difference.

Module: DFHXSWM

XMEOUT Parameters: *date, time, applid*

Destination: CSCS

DFHXS1100I *applid* **Security initialization has started.**

Explanation: This is an informational message indicating that security domain initialization has started.

System action: System initialization continues.

User response: None.

This message can be suppressed with the system initialization parameter MSGLVL=0.

Module: DFHXSDM

XMEOUT Parameter: *applid*

Destination: Console

DFHXS1101I *applid* **Security initialization has ended.**

Explanation: This is an informational message indicating that security domain initialization has completed successfully.

System action: System initialization continues.

User response: None.

This message can be suppressed with the system initialization parameter MSGLVL=0.

Module: DFHXSWM

XMEOUT Parameter: *applid*

Destination: Console

DFHXS1102I *applid* **Security is inactive.**

Explanation: This is an informational message indicating that security is not active.

System action: System initialization continues.

User response: None.

This message can be suppressed with the system initialization parameter MSGLVL=0.

Module: DFHXSWM

XMEOUT Parameter: *applid*

Destination: Console

DFHXS1103I *applid* **Default security for userid *dftuser* has been established.**

Explanation: CICS has established a security environment for the default userid *dftuser*.

System action: The authorities that are assigned to this userid by the external security manager will be used in CICS resource checks whenever no other userid has been established.

User response: None.

Module: DFHXSWM

XMEOUT Parameters: *applid, dftuser*

Destination: Console Routecodes 2, 9 and 11

DFHXS1104 *applid* **Default security could not be established for userid *dftuser*. The security domain cannot continue, so CICS is terminated. SAF codes are (*X'safresp',X'safreas*). ESM codes are (*X'esmresp',X'esmreas*).**

Explanation: CICS could not establish a security environment for the default userid *dftuser*. The security

DFHXS1105 • DFHXS1108

domain cannot continue without a default user. The response and reason codes (*safresp* and *safreas*) returned by the system authorization facility (SAF), and the response and reason codes (*esmresp* and *esmreas*) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=VERIFY macro.

System action: CICS terminates.

User response: Use the external security manager codes to determine why the RACROUTE REQUEST=VERIFY operation failed. Then, either correct the errors for the failing default user and restart CICS, or restart CICS with a different default userid.

Module: DFHXSDM

XMEOUT Parameters: *applid*, *dftuser*, *X'safresp*, *X'safreas*, *X'esmresp*, *X'esmreas*

Destination: Console Routecodes 2, 9, 10 and 11

DFHXS1105 *applid* **Resource profiles for class *classname* have been built.**

Explanation: The security resource profiles for the class *classname* have been successfully loaded into storage by the external security manager.

System action: The profiles are used in subsequent resource checks to determine users' authorizations to access resources in the named class.

User response: None.

Module: DFHXSRC

XMEOUT Parameters: *applid*, *classname*

Destination: Console Routecodes 2, 9, 10 and 11

DFHXS1106 *applid* **Resource profiles could not be built for class *classname*. CICS is terminated. SAF codes are (*X'safresp*,*X'safreas*). ESM codes are (*X'esmresp*,*X'esmreas*).**

Explanation: The security resource profiles for the class *classname* could not be loaded into storage by the external security manager. The response and reason codes (*safresp* and *safreas*) returned by the system authorization facility (SAF), and the response and reason codes (*esmresp* and *esmreas*) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=LIST macro.

The build of the profiles was requested by one of the following

- The initialization of the security domain
- The CEMT command PERFORM SECURITY REBUILD
- A user-supplied transaction invoking the EXEC CICS PERFORM SECURITY REBUILD command.

System action: CICS is unable to provide reliable

resource security, so it terminates.

User response: Use the external security manager codes to determine why the RACROUTE REQUEST=LIST operation failed. Rectify the problem in the external security manager, then restart CICS.

Module: DFHXSRC

XMEOUT Parameters: *applid*, *classname*, *X'safresp*, *X'safreas*, *X'esmresp*, *X'esmreas*

Destination: Console Routecodes 2, 9, 10 and 11

DFHXS1107 *applid* **Partner-LU profiles for class APPCLU have been built.**

Explanation: The partner-LU profiles for the class APPCLU have been successfully loaded into storage by the external security manager.

System action: The profiles are used in subsequent bind authorization checks for LU6.2 sessions whose CONNECTION definition specifies BINDSECURITY(YES).

User response: None.

Module: DFHXSRC

XMEOUT Parameter: *applid*

Destination: Console Routecodes 2, 9, 10 and 11

DFHXS1108 *applid* **Partner-LU profiles could not be built for class APPCLU. SAF codes are (*X'safresp*,*X'safreas*). ESM codes are (*X'esmresp*,*X'esmreas*).**

Explanation: The partner-LU profiles for the class APPCLU could not be loaded into storage by the external security manager. CICS therefore has no APPCLU security profiles. The response and reason codes (*safresp* and *safreas*) returned by the system authorization facility (SAF), and the response and reason codes (*esmresp* and *esmreas*) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=LIST macro.

The build of the profiles was requested by one of the following

- The initialization of VTAM support in terminal control
- The CEMT command SET VTAM OPEN
- The CEMT command PERFORM SECURITY REBUILD
- A user-supplied transaction invoking the EXEC CICS SET VTAM OPEN command.
- A user-supplied transaction invoking the EXEC CICS PERFORM SECURITY REBUILD command.

System action: If the failure occurs during CICS initialization or PERFORM SECURITY REBUILD, CICS terminates. If the failure occurs during SET VTAM OPEN, the VTAM ACB is closed and CICS continues.

User response: Use the external security manager codes to determine why the RACROUTE REQUEST=LIST operation failed. Rectify the problem in the external security manager, then restart CICS.

Module: DFHXSIS, DFHXSRC

XMEOUT Parameters: *applid, X'safresp', X'safreas', X'esmresp', X'esmreas'*

Destination: Console Routecodes 2, 9, 10 and 11

DFHXS1109 *applid* **APPC PROFILE** *profile* **COULD NOT BE AUDITED. SAF CODES ARE** (*X'safresp',X'safreas'*). **ESM CODES ARE** (*X'esmresp',X'esmreas'*).

Explanation: An audit request for a partner-LU verification check has failed for profile *profile*.

During the start-up of an APPC session, each partner can validate the other. During this validation process, the system

- Retrieves the relevant APPCLU profile from the external security manager
- Checks that the session key is still usable
- Requests the external security manager to write audit records concerning this profile and the validation to the system management facility (SMF).

The following events are audited

- Whether the session partner was correctly validated
- Whether the session partner failed validation
- Whether the session key will expire in less than six days
- Whether the retrieved profile is "locked"
- Whether the session key is null, or all zero
- Whether the session key has expired.

The response and reason codes (*safresp* and *safreas*) returned by the system authorization facility (SAF), and the response and reason codes (*esmresp* and *esmreas*) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=AUDIT macro.

System action: The CICS system is not affected by this event, and CICS continues.

User response: Use the external security manager codes to determine why the RACROUTE REQUEST=AUDIT operation failed. Correct the problem in the external security manager, then perform a security rebuild, if appropriate.

Module: DFHXSBB

Destination: Console Routecode 9

DFHXS1110 *applid* **Security is requested, but the external security manager is inactive.**

Explanation: Security was requested for this region, but the external security manager (ESM) was found to be inactive. The SEC system initialization parameter

was specified as YES or left as its default value. CICS cannot initialize its security manager unless the ESM is active.

System action: CICS terminates.

User response: If you have an ESM installed on your system, ensure that it is active before attempting to start CICS. Otherwise, restart CICS without security by specifying SEC=NO as a system initialization parameter. Note that the SEC parameter cannot be entered as a console override.

Module: DFHXSIS

XMEOUT Parameter: *applid*

Destination: Console Routecodes 1, 9, 10 and 11

DFHXS1111 *date time applid tranid* **Security violation by user** *userid* { *at netname* | *at console* } *portname* **for resource** *resource* **in class** *classname*. **SAF codes are** (*X'safresp',X'safreas'*). **ESM codes are** (*X'esmresp',X'esmreas'*).

Explanation: CICS has detected a security violation by user *userid* while performing an authority check for resource *resource* in resource class *classname*.

If the *userid* causing the violation is signed on at a VTAM terminal, the phrase "at netname *portname*" reports the netname at which the violation occurred. If the *userid* causing the violation is signed on at a console, the phrase "at console *portname*" reports the console name at which the violation occurred. If the *userid* causing the violation is not signed on or this is a non terminal task, the entry port does not appear in this message as it is not available.

The response and reason codes (*safresp* and *safreas*) returned by the system authorization facility (SAF), and the response and reason codes (*esmresp* and *esmreas*) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=FASTAUTH or RACROUTE REQUEST=AUTH macros. These return codes are described in the *OS/390 MVS Programming: Authorized Assembler Services Guide* and in *External Security Interface (RACROUTE) Macro Reference for MVS and VM*

CICS can also issue this message when you use the EXEC CICS QUERY SECURITY command with the LOGMESSAGE(LOG) option.

System action: CICS abnormally terminates the task requesting the invalid access except under one of the following conditions

- The command is issued within the scope of an EXEC CICS HANDLE NOTAUTH command.
- The command is issued as a result of an EXEC CICS QUERY SECURITY command.

User response: Note the security violation.

Module: DFHXSRC

XMEOUT Parameters: *date, time, applid, tranid, userid, {1= at netname , 2= at console }, portname, resource, classname, X'safresp', X'safreas', X'esmresp', X'esmreas'*

Destination: CSCS

DFHXS1112 *applid* **The CICS region userid and groupid could not be determined. SAF codes are (X'safresp',X'safreas'). ESM codes are (X'esmresp',X'esmreas').**

Explanation: CICS could not determine the userid and groupid for this CICS region.

The response and reason codes (*safresp* and *safreas*) returned by the system authorization facility (SAF), and the response and reason codes (*esmresp* and *esmreas*) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=EXTRACT macro.

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

User response: Use the external security manager codes to determine why the RACROUTE REQUEST=EXTRACT operation failed. Then, either correct the errors for the failing region userid and groupid, and restart CICS, or restart CICS with a different userid and groupid.

Module: DFHXSIS

XMEOUT Parameters: *applid, X'safresp', X'safreas', X'esmresp', X'esmreas'*

Destination: Console Routecodes 2, 9, 10 and 11

DFHXS1113 *applid* **The region userid cannot access system transaction *tranid*. CICS will terminate. SAF codes are (X'safresp',X'safreas'). ESM codes are (X'esmresp',X'esmreas').**

Explanation: The region userid for this CICS system is not authorized to attach the system transaction *tranid*. It is a CICS requirement that the region userid must be able to access this transaction.

The response and reason codes (*safresp* and *safreas*) returned by the system authorization facility (SAF), and the response and reason codes (*esmresp* and *esmreas*) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=FASTAUTH or AUTH macro.

System action: CICS terminates.

User response: Authorize the CICS region userid to access all the required CICS system transactions, or specify a different region userid that does have the required authority. (The required transactions are

documented as the 'Category 1' transactions in the *CICS RACF Security Guide*. To authorize the region userid to use these transactions, you should execute the sample clist DFH\$CAT1, as described in the *CICS Transaction Server for z/OS Installation Guide*.)

Then restart CICS.

Module: DFHXSRC

XMEOUT Parameters: *applid, tranid,X'safresp', X'safreas', X'esmresp',X'esmreas'*

Destination: Console Routecodes 2, 9, 10 and 11

DFHXS1115 *applid* **USER *userid* IS NOT AUTHORIZED TO INVOKE {HOME | REMOTE} METHOD *method-name* FROM BEAN *bean-name* {FOR APPLICATION *application-name*} IN CORBASERVER *cs-name*. USER HAS NO ACCESS TO ANY OF THESE ROLES {FOR METHOD(*)}: *role-name-list***

Explanation: The user *userid* is not authorized to invoke the method named *method-name* within the Enterprise Java Bean named *bean_name*, which is deployed in the Corbaserver named *cs-name*. If the optional text "FOR APPLICATION *application-name*" appears in the message, the JAR containing the bean is identified in the deployment descriptor by a <display-name> tag containing *application-name*.

The user is not authorized to invoke the method because *userid* does not have READ access to at least one of the roles specified in the <method-permission> section of the deployment descriptor. These roles are listed in *role-name-list* (which may be empty).

If the optional text "FOR METHOD(*)" appears in the message, the roles in *role-name-list* apply to the generic method (*), because there are no specific role definitions for *method-name* in the deployment descriptor.

System action: CICS does not execute the specified method, and writes a type 80 SMF record to record the violation.

User response: Determine whether the user *userid* should be authorized to execute the specified method, and if so, grant the userid READ access to one of the roles named in *role-name-list*, or add new roles to the deployment descriptor and re-install the DJAR.

Module: DFHXSFF

Destination: Console Routecode 9

DFHXS1116 *date time applid tranid* **Security violation by user *userid*{ at IP address }location for HFS file *hfsfile*. USS codes are (X'ussvalue',X'ussreturn',X'ussreason').**

Explanation: CICS has detected a security violation by user *userid* while performing an authority check for the UNIX System Services HFS file *filename*.

If the userid causing the violation is using CICS Web support, the phrase “at IP address *location*” may be present. Otherwise, the location does not appear in this message as it is not available.

The response codes *ussvalue*, *ussreturn*, and *ussreason* are those returned by the UNIX System Services **access** function (BPX1ACC), and are described in *z/OS UNIX System Services Messages and Codes* (SA22-7807).

System action: If the HFS file is being accessed to deliver static web content for the CICS Web support, CICS returns an HTTP 403 (Not Authorized) response to the web client. Otherwise, CICS abnormally terminates the task requesting the invalid access unless it is protected by an EXEC CICS HANDLE NOTAUTH command.

User response: Note the security violation.

Module: XMEOUT **Parameters:** *date, time, applid, tranid, userid, {3= at IP address }, location, hfsfile, X'ussvalue', X'ussreturn', X'ussreason'*

Destination: CSCS

DFHXS111I *date time applid* **User *userid* is not authorized to invoke method *methodName(signature)* from bean *beanName* in CORBAServer *corbaServer*.**

Explanation: The user is not authorized to invoke the named method. The *userid* is not authorized to use any of the roles specified in the <method-permission> section of the deployment descriptor for this method.

System action: CICS does not execute the specified method. CICS also issues message DFHXS1115 to the system console, which contains further information about the roles to which access is required.

User response: Determine whether the user *userid* should be authorized to execute the specified method, and if so, grant the user appropriate permission.

Module: DFHXSEJ

XMEOUT Parameters: *date, time, applid, userid, methodName(signature), beanName, corbaServer*

DFHXS1201 *date time applid* **The password supplied in the verification request for userid *userid* was invalid. This occurred in transaction *tranid* when userid *userid* was signed on at netname *netname*.**

Explanation: An invalid password was supplied for user verification.

System action: The external security manager also

issues a message on the MVS/ESA security console.

CICS continues. No dump is taken.

User response: Supply the correct password, or contact your security administrator for assistance. If you continue to supply incorrect passwords, the userid may be revoked by the external security manager. A revoked userid can only be reinstated by a security administrator.

Module: DFHXSPW

XMEOUT Parameters: *date, time, applid, userid, tranid, userid, netname*

Destination: CSCS

DFHXS1202 *date time applid* **The password supplied in the verification request for userid *userid* has expired. This occurred in transaction *tranid* when userid *userid* was signed on at netname *netname*.**

Explanation: An expired password was supplied for user verification.

System action: CICS continues. No dump is taken.

User response: Change the password using the CICS signon process, the EXEC CICS CHANGE PASSWORD API, or any other method available to you. Alternatively, contact your security administrator for assistance.

Module: DFHXSPW

XMEOUT Parameters: *date, time, applid, userid, tranid, userid, netname*

Destination: CSCS

DFHXS1203 *date time applid* **The userid supplied in the verification request for userid *userid* is revoked. This occurred in transaction *tranid* when userid *userid* was signed on at netname *netname*.**

Explanation: A revoked userid was supplied for user verification.

System action: CICS continues. No dump is taken.

User response: Contact your security administrator for assistance.

Module: DFHXSPW

XMEOUT Parameters: *date, time, applid, userid, tranid, userid, netname*

Destination: CSCS

DFHXS1205 *date time applid* **The userid *userid* supplied in a verification request is not defined in the ESM. This occurred in transaction *tranid* at netname *netname*.**

Explanation: An undefined userid was supplied for user verification.

System action: CICS continues. No dump is taken.

User response: Contact your security administrator for assistance.

Module: DFHXSPW

XMEOUT Parameters: *date, time, applid, userid, tranid, netname*

Destination: CSCS

DFHXS1211 *date time applid* **The password supplied in a change password request for userid *userid* was invalid. This occurred in transaction *tranid* when userid *userid* was signed on at netname *netname*.**

Explanation: An invalid password was supplied for change password processing.

System action: The external security manager also issues a message on the MVS security console.

CICS continues. No dump is taken.

User response: Supply the correct password or contact your security administrator for assistance. If you continue to supply incorrect passwords, the userid may be revoked by the external security manager. A revoked userid can only be reinstated by a security administrator.

Module: DFHXSPW

XMEOUT Parameters: *date, time, applid, userid, tranid, userid, netname*

Destination: CSCS

DFHXS1213 *date time applid* **The userid supplied in a change password request for userid *userid* is revoked. This occurred in transaction *tranid* when userid *userid* was signed on at netname *netname*.**

Explanation: A revoked userid was supplied on a password change request

System action: CICS continues. No dump is taken.

User response: You should have the userid reinstated before it can be used. Contact your security administrator for assistance.

Module: DFHXSPW

XMEOUT Parameters: *date, time, applid, userid, tranid, userid, netname*

Destination: CSCS

DFHXS1214 *date time applid* **The new password supplied in a change password request for userid *userid* was not accepted. This occurred in transaction *tranid* when userid *userid* was signed on at netname *netname*.**

Explanation: An invalid new password was supplied on a password change request.

System action: CICS continues. No dump is taken.

User response: Select a suitable new password and try again. If necessary, contact your security administrator for assistance.

Module: DFHXSPW

XMEOUT Parameters: *date, time, applid, userid, tranid, userid, netname*

Destination: CSCS

DFHXS1215 *date time applid* **The userid *userid* supplied in a change password request is not defined in the ESM. This occurred in transaction *tranid* at netname *netname*.**

Explanation: An undefined userid was supplied on a password change request

System action: CICS continues. No dump is taken.

User response: Contact your security administrator for assistance.

Module: DFHXSPW

XMEOUT Parameters: *date, time, applid, userid, tranid, netname*

Destination: CSCS

DFHXS1216 *date time applid* **The userid *userid* supplied in a change password request has a revoked connection to the default group in the ESM. This occurred in transaction *tranid* at netname *netname*.**

Explanation: The userid supplied on a password change request is revoked in the ESM connection to the default group.

System action: CICS continues. No dump is taken.

User response: Contact your security administrator for assistance.

Module: DFHXSPW

XMEOUT Parameters: *date, time, applid, userid, tranid, netname*

Destination: CSCS

DFHXS1217 *date time applid* **A client certificate has been successfully registered for user *userid*.**

Explanation: A client using the client authentication protocol of Secure Sockets Layer has presented a valid X.509 client certificate and a valid *userid* and password. CICS has successfully registered the certificate with the specified *userid* *userid*.

System action: The certificate is permanently associated with *userid* *userid* in the external security manager's database.

User response: Whenever the client certificate is used again, *userid* *userid* will be assigned to it without further prompting for a *userid* and password.

Module: DFHXSPW

XMEOUT Parameters: *date, time, applid, userid*

Destination: CSCS

DFHXS1218 *applid* **The CICS region *userid* *userid* is not authorized to access key ring *keyring*.**

Explanation: The KEYRING system initialization parameter has been used to specify a key ring named *keyring*, but the CICS region *userid* (*userid*) does not

have sufficient authority to access it.

System action: If the PARMERR=ABEND system initialization parameter is specified, CICS initialization terminates.

If the PARMERR=IGNORE system initialization parameter is specified, CICS initialization continues without a key ring. CICS does not initialize support for secure sockets layer, is not able to install TCPIP SERVICES that specify SSL(YES) or SSL(CLIENTAUTH), or CORBASERVERs that specify CERTIFICATE.

If the PARMERR=INTERACT system initialization parameter is specified, you are prompted to enter a new key ring name, but you can only reply with a blank name, which causes CICS to continue initialization without a key ring.

User response: If CICS is to use the secure sockets layer, the CICS region *userid* must be given READ access to the IRR.DIGTCERT.LIST and IRR.DIGTCERT.LISTRING resources in the FACILITY class. For further information, see the *CICS RACF Security Guide*.

Module: DFHXSIS

XMEOUT Parameters: *applid, userid, keyring*

Destination: Console Routecodes 2, 9, 10 and 11

DFHZCnnnn messages

DFHZC0001 *applid* **An abend (code *aaa/bbbb*) has occurred at offset *X'offset'* in module *modname*.**

Explanation: An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 should be produced containing

the symptom string for this problem.

User response: Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the *OS/390 MVS System Codes* manual.

Next, look up the CICS abend code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

For further information about *code*, see the *CICS Problem Determination Guide*.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZGBM, DFHZGCA, DFHZGCC, DFHZGCN, DFHZGDA, DFHZGPC, DFHZGRP, DFHZGSL, DFHZGUB

DFHZC0002 • DFHZC0004

XMEOUT Parameters: *applid, aaa/bbbb, X'offset', modname*

Destination: Console

DFHZC0002 *applid* **A severe error (code X'code') has occurred in module *modname*.**

Explanation: An error has been detected in module *modname*. The code X'code' is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

System action: An exception entry (code X'code' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZGCA, DFHZGCC, DFHZGCN, DFHZGDA, DFHZGPC, DFHZGRP, DFHZGSL, DFHZGUB

XMEOUT Parameters: *applid, X'code', modname*

Destination: Console

DFHZC0003 *applid* **Insufficient storage (code X'code') in module *modname*.**

Explanation: A CICS GETMAIN was issued by module *modname*, but there was insufficient storage available to satisfy the request.

The code X'code' is the exception trace point ID which uniquely identifies the place where the error was detected.

System action: An exception entry is made in the

trace table (code X'code' in the message). A system dump is taken, unless you have specifically suppressed dumps in the dump table. CICS will continue unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller. A message will be issued to this effect. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Inform the system programmer.

Try increasing the size of the DSA or EDSA. See the *CICS System Definition Guide* or the *CICS Performance Guide* for more information on CICS storage.

Module: DFHTCRP, DFHZGRP

XMEOUT Parameters: *applid, X'code', modname*

Destination: Console

DFHZC0004 *applid* **A possible loop has been detected at offset X'offset' in module *modname*.**

Explanation: A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset X'offset'. This is the offset of the instruction which was executing at the time the error was detected.

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Notify the system programmer. If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module *modname* in the message is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname*, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: XMEOUT **Parameters:** *applid, X'offset', modname*

Destination: Console

DFHZC01011 *date time applid* **A predatory takeover has forced VTAM to allow another application to open the ACB which CICS was using.**

Explanation: A predatory takeover is occurring. This means that a job is initializing which has the same applid as the CICS system. This initiates a takeover of the network. As a normal part of this process, VTAM drives the TPEND exit.

System action: All requests on VTAM sessions are abnormally terminated and the sessions closed. The VTAM ACB is then opened by the application which is using the same APPLID as the CICS region. The new system recovers any persisting sessions.

User response: If this takeover of the network was unintentional, you can prevent it happening in future by using RACF to protect the APPLID. Refer to the VTAM application security section in the *VTAM Network Implementation Guide*, SC31-6434 for details of how to do this.

Module: DFHZNCA

XMEOUT Parameters: *date, time, applid*

Destination: Console and Transient Data Queue
CSNE

DFHZC0110 *date time applid* **The LU6.2 NIB and the TCTTE/BIND data for session *sessid* did not match during a persistent sessions restart. Reason code *X'n'*.**

Explanation: A node initialization block (NIB) has been passed to CICS by VTAM during a persistent sessions restart. An attempt was made by CICS to match the NIB to a session TCTTE. The reason code explains the cause of the mismatch.

Reason Explanation

- 1 Single/parallel session indication did not match.
- 2 LU type did not match.

- 3 LU type and single/parallel session did not match.

System action: The attempt to match a persisting session with a TCTTE has failed. The session is unbound. CICS ignores this session and continues with the next session if there is one.

User response: The production of this message means that there is no suitable global catalog record to match the NIB which VTAM has passed in. This implies that the wrong global catalog is being used for this initialization of CICS, or that the catalog records are corrupted. Ensure that the global catalog being used is correct.

Module: DFHZGPC

XMEOUT Parameters: *date, time, applid, sessid, X'n'*

Destination: CSNE

DFHZC0111 *date time applid* **No session TCTTE is available to match sysid *sysid* for modename *modename* because VTAM has returned more NIBs than the CNOS session limit values require.**

Explanation: During persistent sessions restart VTAM has returned more node initialization blocks (NIBs) than the current CNOS session limit values require. This is probably because a CNOS from a high session limit to a lower session limit was in progress when CICS failed.

System action: The process NIB function is terminated. The session is unbound. CICS ignores this session and continues with the next session if there is one.

This situation has no effect on the restored CICS. The last catalogued CNOS values are restored.

User response: None.

Module: DFHZGPC

XMEOUT Parameters: *date, time, applid, sysid, modename*

Destination: CSNE

DFHZC0112 *date time applid* **No TCTME was found for sysid *sysid* modename *modename* during a persistent sessions restart.**

Explanation: An error has occurred during persistent sessions restart. VTAM passed a NIB to CICS containing the named modename, but CICS was unable to locate the corresponding TCTME.

System action: The attempt to match the NIB to a TCTTE is terminated. The session is unbound.

A system dump is produced.

The CNOS values not related to this modegroup are

DFHZC0120I • DFHZC0122I

restored, but the named modegroup cannot be recovered.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZGPC

XMEOUT Parameters: *date, time,applid, sysid, modename*

Destination: CSNE

DFHZC0120I *applid* VTAM sessions persisted for a cold or initial start. Sessions terminated. Inquire issued *icount*, sessions persisting *spcount*, sessions terminated *stcount*.

Explanation: CICS is initializing with a cold or initial start, but some VTAM sessions have persisted from a previous CICS with a nonzero PSDI value.

CICS has attempted to terminate all persisting sessions. The message inserts are as follows

- *icount* is the number of VTAM INQUIRE OPTCD=PERSESS commands issued.
- *spcount* is the number of VTAM sessions that persisted.
- *stcount* is the number of sessions that CICS has terminated with a CLSDST or TERMSESS macro. This should be equal to *spcount*. If it is not, persistent session recovery probably failed. Earlier messages explain why.

If there are no earlier messages, it is possible that the count obtained from the VTAM INQUIRE counts macro, indicating the number of active sessions, was not equal to the number of sessions that VTAM held persisting. This is not a problem.

System action: CICS continues.

User response: None.

Module: DFHZGRP

XMEOUT Parameters: *applid, icount,spcount, stcount*

Destination: Console

DFHZC0121I *applid* VTAM sessions persisted for a WARM start. Sessions terminated. Inquires issued *icount*, sessions persisting *spcount*, sessions terminated *stcount*.

Explanation: CICS is initializing with a WARM start, but some VTAM sessions unexpectedly persisted from a previous CICS with a nonzero PSDI value.

CICS has attempted to terminate all persisting sessions. The message inserts are as follows

- *icount* is the number of VTAM INQUIRE OPTCD=PERSESS commands issued.

- *spcount* is the number of VTAM sessions that persisted.
- *stcount* is the number of sessions that CICS has terminated with a CLSDST or TERMSESS macro. This should be equal to *spcount*. If it is not, persistent session recovery probably failed. Earlier messages explain why.

If there are no earlier messages, it is possible that the count obtained from the VTAM INQUIRE counts macro, indicating the number of active sessions, was not equal to the number of sessions that VTAM held persisting. This is not a problem.

System action: CICS continues.

User response: Examine the JOBLOG from the previous run to determine why sessions persisted despite a WARM shut down.

Module: DFHZGRP

XMEOUT Parameters: *applid, icount,spcount, stcount*

Destination: Console

DFHZC0122I *applid* VTAM sessions persisted for an EMERGENCY, XRF=YES start. Sessions terminated. Inquires issued *icount*, sessions persisting *spcount*, sessions terminated *stcount*.

Explanation: CICS is initializing with an EMERGENCY start, but XRF = YES has been specified and some VTAM sessions persisted unexpectedly from a previous CICS with a nonzero PSDI value.

CICS has attempted to close all persisting sessions. The message inserts are as follows

- *icount* is the number of VTAM INQUIRE OPTCD=PERSESS commands issued.
- *spcount* is the number of VTAM sessions that persisted.
- *stcount* is the number of sessions that CICS has terminated with a CLSDST or TERMSESS macro. This should be equal to *spcount*. If it is not, persistent session recovery probably failed. Earlier messages explain why.

If there are no earlier messages, it is possible that the count obtained from the VTAM INQUIRE counts macro, indicating the number of active sessions, was not equal to the number of sessions that VTAM held persisting. This is not a problem.

System action: CICS continues.

User response: You should not mix XRF and persistent sessions. If you wish to use XRF, do a cold or initial start.

Module: DFHZGRP

XMEOUT Parameters: *applid, icount,spcount, stcount*

Destination: Console

DFHZC0123I *applid* VTAM sessions persisted when OPEN VTAM ACB issued. Sessions terminated. Inquires issued *icount*, sessions persisting *spcount*, sessions terminated *stcount*.

Explanation: The VTAM ACB has been opened while CICS is running, however some VTAM sessions persisted either from a previous CICS with a nonzero PSDI value, or when the VTAM ACB was closed.

Persisting sessions have been terminated. The message inserts are as follows

- *icount* is the number of VTAM INQUIRE OPTCD=PERSESS commands issued.
- *spcount* is the number of VTAM sessions that persisted.
- *stcount* is the number of sessions that CICS terminated with a CLSDST or TERMSESS macro. This should be equal to *spcount*. If it is not, persistent session recovery probably failed. Earlier messages explain the reason.

If there are no earlier messages, it is possible that the count obtained from the VTAM INQUIRE counts macro, indicating the number of active sessions, was not equal to the number of sessions that VTAM held persisting. This is not a problem.

System action: CICS continues.

User response: None.

Module: DFHZGRP

XMEOUT Parameters: *applid, icount, spcount, stcount*

Destination: Console

DFHZC0124I *applid* VTAM sessions persisted for an EMERGENCY start. Inquires issued *icount*, sessions persisting *spcount*, sessions terminated *stcount*, sessions OPNDSTed *socount*, sessions in error *secount*.

Explanation: CICS was initializing with an EMERGENCY start and some VTAM sessions persisted from a previous CICS with a nonzero PSDI value.

Each of the persisting sessions has been restored or terminated. The message inserts are as follows

- *icount* is the number of VTAM INQUIRE OPTCD=PERSESS commands issued.
- *spcount* is the number of VTAM sessions that persisted.
- *stcount* is the number of sessions that CICS terminated with a CLSDST or TERMSESS macro. If an OPNDST failure occurred for an entire NIBLIST (see message DFHZC0129), the sessions in the NIBLIST have been terminated and this count includes these sessions.

- *socount* is the number of VTAM sessions that CICS restored successfully with an OPNDST OPTCD=RESTORE macro.
- *secount* is the number of sessions that CICS failed to restore.

System action: CICS continues.

User response: None.

Module: DFHZGRP

XMEOUT Parameters: *applid, icount, spcount, stcount, socount, secount*

Destination: Console

DFHZC0125 *date time applid netname persistent session will be terminated. sense ((instance) Module name {DFHZGRP})*

Explanation: CICS was initializing with an EMERGENCY start and some VTAM sessions persisted from a previous CICS with a nonzero PSDI value.

However, the session with a NETNAME of *netname* is terminated for one of the following reasons as indicated by the *instance* in the message. An AP exception trace entry is made for each *instance* as follows.

Instance

Point ID and Explanation

- | | |
|---|--|
| 1 | X'FB21 There is not enough storage to recover an APPC session. |
| 2 | X'FB22 There is not enough storage to recover a terminal session. |
| 3 | X'FB25 The NIB and the TCTTE with the same NETNAME were not of the same LU TYPE. |

System action: An AP exception trace with a point ID as above is issued. The session is terminated and CICS continues.

User response: The exception trace point identifies where the message was issued and determines the action to take.

Module: DFHZGRP

XMEOUT Parameters: *date, time, applid, netname, sense, instance, {1=DFHZGRP, 2=DFHZGRP, 3=DFHZGRP}*

Destination: CSNE

DFHZC0126I *applid* No VTAM sessions persisted for an EMERGENCY restart.

Explanation: CICS was initializing with an EMERGENCY start but no VTAM sessions persisted from a previous CICS run. Possible reasons are

- No persistence was specified in the previous run.
- CICS crashed with the ACB open but no sessions were in use.

DFHZC0127 • DFHZC0130

- The PSDI value expired.
- An error occurred before DFHZGRP could determine if any sessions persist.

System action: CICS continues.

User response: None.

Module: DFHZGRP

XMEOUT Parameter: *applid*

Destination: Console

DFHZC0127 *applid* **Cannot reestablish persisting sessions - VTAM ACB is closed. Code: X'code'. Module name: module**

Explanation: The VTAM ACB has been opened and CICS is processing VTAM persisting sessions, however the ACB was closed, or is being closed by operator action before all the sessions could be restored or terminated.

System action: CICS continues to close the VTAM ACB and then runs without VTAM support.

User response: Determine why the operator closed the ACB and either continue without VTAM, dynamically open the ACB, or shut CICS down normally and restart it.

X'code is the AP exception trace entry that determines which VTAM macro diagnosed the ACB as being closed and where it was issued.

Module: DFHZGRP DFHZGUB

XMEOUT Parameters: *applid, X'code', module*

Destination: Console

DFHZC0128 *applid* **Cannot reestablish persisting sessions - VTAM not responding. Module name: module**

Explanation: CICS is processing VTAM persisting sessions. However it has issued a VTAM macro and has waited for 8 minutes for the response.

System action: If this occurs during start up, CICS terminates. If this occurs during dynamic open, the VTAM ACB is closed and CICS continues without VTAM.

A dump is taken for this message in both cases.

User response: You can restart CICS again immediately, or wait for the persistent sessions to time out and then restart CICS.

If this problem recurs you need to find out why VTAM is not responding to the INQUIRE or OPNDST macro (if the message is issued by DFHZGRP), or the CLSDST or TERMSESS macro (if the message is issued by DFHZGUB).

You can determine which macro is not responding by

examining the TCP section of the dump and looking at the RPLs in the PS POOL labeled PS_RPL. The first RPL is for use by INQUIRE or OPNDST, the next 10 by CLSDST or TERMSESS.

Module: DFHZGRP, DFHZGUB

XMEOUT Parameters: *applid, module*

Destination: Console

DFHZC0129 *applid* **VTAM OPNDST RESTORE failed. All sessions in the NIBLIST will be terminated instead. RTNCD,FDB2 X'rc',X'fd'. Code: X'code'**

Explanation: CICS is processing VTAM persistent sessions during an EMERGENCY restart but VTAM returned a RTNCD,FDB2 of *rc,fd* in response to the OPNDST OPTCD=RESTORE macro.

System action: An AP exception trace entry, *X'code*, is made.

A system dump is taken on the first occurrence of this problem unless dumps have been specifically suppressed in the dump table.

CICS attempts to terminate all the sessions in the NIBLIST instead of restoring them.

User response: Use the dump taken on the first occurrence of this problem or the exception trace entry and the *VTAM programming manual* to determine the meaning of the RTNCD,FDB2 and the actions necessary to correct it.

Module: DFHZGRP

XMEOUT Parameters: *applid, X'rc',X'fd', X'code'*

Destination: Console

DFHZC0130 *applid* **VTAM INQUIRE PERSESS failed. Cannot restore any persisting sessions. RTNCD,FDB2: X'rc',X'fd'. Code X'code'**

Explanation: CICS is processing VTAM persistent sessions but VTAM returned a RTNCD,FDB2 of *rc,fd* in response to the INQUIRE OPTCD=PERSESS macro.

System action: An AP exception trace entry, *X'code*, is made.

A system dump is taken unless dumps have been specifically suppressed in the dump table.

If this occurs during initialization, CICS terminates.

If this occurs during a dynamic open of the ACB, CICS closes the ACB and continues to run without VTAM.

The sessions persist until the PSDI value times out or until VTAM operator commands are issued to terminate the sessions.

User response: Use the dump or the exception trace

entry and the *VTAM programming manual* to determine the meaning of the RTNCD,FDB2 and the actions necessary to correct it.

If the problem occurs during initialization, try to correct the error and then retry the start up, or wait until the PSDI value time expires and restart CICS.

If the problem occurs when the ACB was opened dynamically, you can repeat the command to open the VTAM ACB, or wait until the PSDI time expires and then repeat it.

Module: DFHZGRP

XMEOUT Parameters: *applid, X'rc',X'fd', X'code'*

Destination: Console

DFHZC0131 *date time applid netname termid* **VTAM OPNDST RESTORE failed.**

Explanation: CICS is processing VTAM persistent sessions and has issued an OPNDST OPTCD=RESTORE against a NIBLIST. However, the NIB identified by *netname* and a session or termid of *termid* failed to open successfully. This is probably because the session was terminated by the VTAM operator after INQUIRE OPTCD=PERSESS was issued.

System action: CICS continues.

User response: Reopen the session in the normal way.

Module: DFHZGRP

XMEOUT Parameters: *date, time,applid, netname, termid*

Destination: CSNE

DFHZC0132 *applid* **VTAM INQUIRE PERSESS failed. Cannot restore some persisting sessions. Network only partially restored. RTNCD,FDB2 X'rc',X'fd'. Code: X'code'**

Explanation: CICS is processing VTAM persistent sessions but VTAM returned a RTNCD,FDB2 of *rc,fd* in response to a subsequent INQUIRE OPTCD=PERSESS macro.

System action: An AP exception trace entry, *X'code'*, is made.

A system dump is taken unless you have specifically suppressed dumps in the dump table.

CICS continues with a partial network. Some of the sessions are usable, others are not until the PSDI value times out or the VTAM operator terminates the sessions that failed.

User response: Use the dump or the exception trace entry and the *VTAM programming manual* to determine

the meaning of the RTNCD,FDB2 and the actions necessary to correct it.

If enough of the network is available, wait until the PSDI value expires or use VTAM operator commands to terminate the sessions.

If the network is unusable, either close and reopen the VTAM ACB, or restart CICS.

Module: DFHZGRP

XMEOUT Parameters: *applid, X'rc',X'fd', X'code'*

Destination: Console

DFHZC0133A *applid* **Persistent session recovery failed.**

Explanation: CICS was initializing when an attempt to process VTAM persistent session failed. The reasons are given in earlier messages.

System action: CICS terminates.

User response: Examine earlier messages and exception trace entries to determine the reason for failure.

Module: DFHSII1

XMEOUT Parameter: *applid*

Destination: Console

DFHZC0134I *applid* **VTAM sessions persisted when OPEN ACB issued. Inquires issued icount, sessions persisting spcount, sessions terminated stcount, sessions OPNDSTed socount, sessions in error secount.**

Explanation: The VTAM ACB has been opened while CICS is running, and some VTAM sessions persisted after VTAM abended.

Each of the persisting sessions has been restored or terminated. The message inserts are as follows

- *icount* is the number of VTAM INQUIRE OPTCD=PERSESS commands issued.
- *spcount* is the number of VTAM sessions that persisted.
- *stcount* is the number of sessions that CICS terminated with a CLSDST or TERMSESS macro. If an OPNDST failure occurred for an entire NIBLIST (see message DFHZC0129), the sessions in the NIBLIST have been terminated and this count includes these sessions.
- *socount* is the number of VTAM sessions that CICS restored successfully with an OPNDST OPTCD=RESTORE macro.
- *secount* is the number of sessions that CICS failed to restore.

System action: CICS continues.

User response: None.

Module: DFHZGRP

XMEOUT Parameters: *applid, icount, spcount, stcount, socount, secout*

Destination: Console

DFHZC0136 *applid* **PSDI value indicated persistence but the run time VTAM does not support persistent sessions.**

Explanation: The PSDI value is nonzero. This specifies that VTAM sessions are to persist across CICS failures. However, this release of VTAM does not support persistent sessions.

System action: CICS sets the PSDI value to 0 and continues without persistent session support.

User response: ACF/VTAM Release 3 Version 4 Modification 1 or higher must be used in order to take advantage of CICS persistent session support.

To prevent this message being issued when using an earlier release of VTAM, set the PSDINT system initialization parameter to zero, and when using the EXEC CICS SET VTAM command, either omit, or specify a value of zero for the PSDINTERVAL operand.

Module: DFHZSLS

XMEOUT Parameter: *applid*

Destination: Console

DFHZC0137 *applid* **PSDI value indicated persistence but the TCT assemble time VTAM does not support persistent sessions.**

Explanation: The PSDI value is nonzero. This specifies that VTAM sessions are to persist across CICS failures. However, DFHTCTxx was assembled against a release of VTAM that cannot support persistent sessions.

System action: CICS sets the PSDI value to 0 and continues without persistent session support.

User response: Reassemble the TCT against ACF/VTAM Release 3 Version 4 Modification 1 or higher in order to take advantage of CICS persistent session support.

To prevent this message being issued when using an earlier release of VTAM, set the PSDINT system initialization parameter to zero, and when using the EXEC CICS SET VTAM command, either omit, or specify a value of zero for the PSDINTERVAL operand.

Module: DFHZSLS

XMEOUT Parameter: *applid*

Destination: Console

DFHZC0140 *applid* **SETLOGON PERSIST failed. RTNCD,FDB2: X'rc',X'fd'. Code: X'code'**

Explanation: CICS was opening the VTAM ACB, setting the PSDI value from an operator command or doing a WARM shut down. It attempted to issue the VTAM command SETLOGON OPTCD=PERSIST or OPTCD=NPERSIST. However, VTAM returned a RTNCD,FDB2 of *rc,fd*.

System action: An AP exception trace entry, *code*, is made.

A system dump is taken unless you have specifically suppressed dumps in the dump table.

If the ACB was being opened, no VTAM sessions persist and the PSDI value is set to 0.

If just the PSDI value was being changed, either by the operator or during termination, the value is unchanged, both to CICS and to VTAM.

If this occurs during a VTAM shut down and some sessions are not closed, sessions may exist on VTAM start-up and are terminated then.

User response: Use the dump taken or the exception trace entry *code* and the *VTAM programming manual* to determine the meaning of the RTNCD,FDB2 and the actions necessary to correct it.

Module: DFHZGSL

XMEOUT Parameters: *applid, X'rc',X'fd', X'code'*

Destination: Console

DFHZC0144 *date time applid sysid termid* **Synclevel 2 conversation started by netname before completion of exchange lognames. sense ((instance) Module name: {DFHZGDA})**

Explanation: CICS has received an attach FMH5 for a synclevel 2 conversation from a partner with netname *netname* before exchange lognames processing is complete.

System action: A Deallocate(Aband) with sense code 08640001 is issued for the conversation.

User response: No further APPC synclevel 2 conversations can be started by the partner until exchange lognames has completed. Use CEMT to inquire on the status of the connection in order to determine whether exchange lognames has completed (see the *CICS Supplied Transactions* for more information).

Module: DFHZGDA

XMEOUT Parameters: *date, time, applid, sysid, termid, netname, sense, instance, {1=DFHZGDA}*

Destination: CSNE

DFHZC0145 *date time applid netname termid*
Synclevel 2 APPC conversation started before Exchange Lognames completed. Error occurred executing Deallocate(Abend). sense ((instance) Module name {DFHZGDA})

Explanation: The APPC session *termid* with *netname* persisted during a CICS persistent sessions restart. The partner initiated a new synclevel 2 conversation before Exchange Lognames processing had completed. CICS attempted to issue a Deallocate(Abend) for the conversation. The Deallocate(Abend) could not be completed for the reason indicated by the *instance* in the message as follows.

Instance

	Explanation
01	DFHZGDA called with chain Finite State Machine in unexpected state.
02	DFHZGDA called with bracket Finite State Machine in unexpected state

For the meaning of *sense*, see message DFHZC2400.

System action: The state of the session after the persistent sessions restart cannot be determined, and the session is deactivated in order to reset the states. The sessions are reactivated.

User response: If the session is not successfully reactivated, check the CSNE log for messages indicating why the new BIND failed. The session may have been set out of service by the VTAM operator.

Module: DFHZGDA

XMEOUT Parameters: *date, time, applid, netname, termid, sense, instance, {1=DFHZGDA, 2=DFHZGDA}*

Destination: CSNE

DFHZC0146 *date time applid VTAM session for termid*
successfully recovered following a persistent sessions restart sense ((instance) Module name {DFHZXRC})

Explanation: CICS has restored the VTAM persistent session for terminal *termid* following a persistent sessions restart.

The equivalent message for APPC sessions is DFHZC0156.

System action: If recovery notification is specified for this terminal, the recovery message is sent to the terminal, or the transaction requested to run at recovery notification time is started.

User response: If required, code an NEP to override the recovery notification option originally specified in the TYPETERM definition for this session. See the *CICS Resource Definition Guide* and the *CICS Customization Guide* for more information.

Module: DFHZXRC

XMEOUT Parameters: *date, time, applid, termid, sense, instance, {1=DFHZXRC}*

Destination: CSNE

DFHZC0147 *date time applid sysid termid*
Error occurred recovering persisting session. sense ((instance) Module name {DFHZGDA})

Explanation: An error has prevented the recovery of an APPC conversation which persisted across an emergency restart.

The session with a *termid* of *termid* is terminated. The reason and the corresponding AP exception trace entry are indicated by the *instance* in the message;

Instance

	Point ID and explanation
1	X'FB79 SEND not executed due to invalid bracket state.
2	X'FB7B Insufficient storage for session recovery.
3	X'FB76 Recovery status byte TCTE_PRSS contains an unexpected value.
4	X'FB7A RECEIVE not executed due to invalid bracket state.
5	X'FB78 Unexpected sense received during persistent sessions recovery.

System action: An AP exception trace with a point ID as above is issued. The session is terminated and CICS continues.

User response: If recovery failed due to insufficient storage, try increasing the DSA or EDSA size limits (see the *CICS Customization Guide*). If any of the other instances occur, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZGDA

XMEOUT Parameters: *date, time, applid, sysid, termid, sense, instance, {1=DFHZGDA, 2=DFHZGDA, 3=DFHZGDA, 4=DFHZGDA, 5=DFHZGDA}*

Destination: CSNE

DFHZC0148 *date time applid sysid termid*
VTAM send or receive failed during persistent sessions recovery. sense ((instance) Module name {DFHZGDA})

Explanation: As part of session recovery following a persistent session restart CICS issued a VTAM SEND or RECEIVE. The VTAM request failed leaving the session in an unknown state.

For the meaning of *sense*, see message DFHZC2400.

System action: The session is terminated.

User response: To determine the cause of the problem, see the associated DFHZCnnnn message in the CSNE log. This message gives further diagnostic information on the failing VTAM request.

Module: DFHZGDA

XMEOUT Parameters: *date, time, applid, sysid, termid, sense, instance, {1=DFHZGDA, 2=DFHZGDA}*

Destination: CSNE

DFHZC0149 *date time applid termid* **Connection failure occurred during a persistent sessions restart** *sense ((instance) Module name {DFHZNSP})*

Explanation: During a persistent sessions restart, CICS has been notified of the failure of a session initiation request issued during the previous instance of CICS.

For the meaning of *sense*, see message DFHZC2400.

System action: Processing continues.

User response: None

Module: DFHZNSP

XMEOUT Parameters: *date, time, applid, termid, sense, instance, {1=DFHZNSP}*

Destination: CSNE

DFHZC0150 *date time applid termid* **Error processing the session state data returned after a persistent sessions restart.** *sense ((instance) Module name {DFHZXRC})*

Explanation: The VTAM session for terminal *termid* persisted during a CICS persistent sessions restart, but an error occurred while processing the session state data returned by VTAM. The reason is indicated by the *instance* in the message as follows.

Instance

Explanation

- | | |
|----|---|
| 01 | DFHZXRC called with an invalid request. |
| 02 | TCTTEDA contains null characters instead of the expected address. |
| 03 | Reserved |
| 04 | The vector key of the data passed by VTAM is not correct. |
| 05 | The length of the vector_29 data is too short. |
| 06 | Unidentified cleanup action detected. |
| 07 | Unidentified recovery option detected. |
| 08 | Invalid cleanup action for RECOVOPTION(NONE). |

09 Invalid cleanup action for RECOVOPTION(MESSAGE).

10 Invalid cleanup action for RECOVOPTION(TRANSACTION).

11 Reserved.

12 DFHZXRC has been driven to process an LU6 session.

13 Neither XRF nor persistent sessions recovery is in progress DFHZXRC has been called in error.

For the meaning of *sense*, see message DFHZC2400.

System action: The state of the session after the persistent sessions restart cannot be determined, and the session is terminated in order to reset the states. Non-APPC sessions are restarted.

User response: If the session is not successfully restarted, check the CSNE log for messages indicating why the new BIND failed. The session may have been set out of service by the VTAM operator.

Module: DFHZXRC

XMEOUT Parameters: *date, time, applid, termid, sense, instance, {1=DFHZXRC, 2=DFHZXRC, 3=DFHZXRC, 4=DFHZXRC, 5=DFHZXRC, 6=DFHZXRC, 7=DFHZXRC, 8=DFHZXRC, 9=DFHZXRC, 10=DFHZXRC, 11=DFHZXRC, 12=DFHZXRC, 13=DFHZXRC}*

Destination: CSNE

DFHZC0151 *date time applid* **Transaction transid was started invalidly.** *transid will terminate.*

Explanation: Transaction *transid* was started invalidly. *transid* should only be ATTACHED by CICS. It should not be started by keying in through the terminal or by a START from a user program.

System action: *transid* will terminate.

User response: None

Module: DFHZSGN, DFHZPCT, DFHZRTP

XMEOUT Parameters: *date, time, applid, transid, transid*

Destination: CSNE

DFHZC0152 *date time applid termid* **Signon of user at termid termid failed following a persistent sessions restart. Return code rc was received from the user domain.**

Explanation: CICS attempted to sign on a user following a persistent sessions restart. The user domain replied with one of the following return codes:

Return code
Explanation

- 005 The user is already signed on.
- 006 The userid is not authorized for this terminal.
- 008 The user's access to the specific group has been revoked.
- 009 The security label associated with the userid in the ESM does not have the necessary authority.
- 010 The userid was not contained in the group specified.
- 011 The userid has been revoked.
- 012 The userid is not known to the ESM.
- 015 SEC=NO was specified in the SIT.
- 016 The ESM is not responding.
- 017 The ESM is not responding.
- 018 The ESM returned a response which was not recognized by the CICS security domain.
- 27 The user domain returned a disaster response.

System action: An AP exception trace with point ID FB9B is issued.

The terminal is available but the user is not signed on to it. The terminal has the attributes of the default user.

User response: Note the return code and take the necessary action. Look for messages output earlier by the ESM or the security domain. If no reason can be

Module: DFHZSGN

XMEOUT Parameters: *date, time, applid, termid, termid, rc*

Destination: CSNE

DFHZC0153 *date time applid* **A catalog write failed in the restart timer program.**

Explanation: The restart timer program DFHZRTP has failed in an attempt to write a timer record to the catalog. If no timer records are written to the catalog terminals will not be signed on again after a Persistent Sessions restart.

System action: An exception trace is output.

User response: Investigate the cause of the error. There may be a problem with the global catalog. Look for other messages confirming this.

Module: DFHZRTP

XMEOUT Parameters: *date, time, applid*

Destination: CSNE

DFHZC0154 *date time applid* **Timed start or cancellation of the restart timer program failed.**

Explanation: A timed start or cancellation of the restart timer program DFHZRTP failed. This means that no timer records will be written to the global catalog and terminals will be timed out if a Persistent Sessions restart occurs.

System action: CICS initialization continues. In the event of a Persistent Sessions restart terminals will not be signed on.

User response: Look for earlier messages and trace entries output by the timer domain which may indicate the reason for the failure. The most likely reason is that CICS is short on storage.

Module: DFHTCRP, DFHZPCT

XMEOUT Parameters: *date, time, applid*

Destination: CSNE

DFHZC0155 *date time applid sysid termid* **Error occurred during processing of session state data returned after restart of persisting session. sense ((instance) Module name {DFHZXPS})**

Explanation: The VTAM APPC session *sysid termid* persisted during a CICS persistent session restart, but an error occurred while processing the session state data returned by VTAM following an OPNDST OPTCD=RESTORE.

If the error needs further investigation, a dump is taken.

No dump is taken if one has already been taken for an earlier problem, or if the problem is known as one for which a session cannot be allowed to persist. An example of this is bind security processing not completing for this session when CICS terminated.

The reason and the corresponding AP exception trace entry are indicated by the *instance* in the message.

Instance

	Point ID and Explanation
1	X'FBFD During reject attach processing a call was made to DFHZGDA but DFHZGDA rejected the call with invalid format or invalid function.
2	X'FBFD An error occurred during reject attach processing. The session is in an unknown state.
3	X'FBD2

DFHZC0155

	The TCTE_PRSS status byte was set to 0 but reject attach processing was not taking place. This session state is not valid for entry to DFHZXPS.	15	X'FBD5	The bid flow data returned by VTAM was not recognized. This session is the contention winner.
4	X'FBE4			
	An error occurred during DEALLOCATE ABEND processing. This will have been handled by DFHZGDA so no dump is taken but the session is terminated.	16	X'FBD5	The bid flow data returned by VTAM contained a request that was not recognized where this session is the contention loser.
5	X'FBD2			
	The TCTE_PRSS byte (persistent sessions status byte) contained an unknown value on entry to DFHZXPS.	17	X'FBD5	The bid flow data returned by VTAM contained a negative X'088B response but there was nothing to indicate that the session was closing down. This session is the contention loser.
6	X'FBE6			
	The TCTE_PRSS_CV29_PTR (pointer to data returned by VTAM) contained zeroes on entry to DFHZXPS.	18	X'FBD5	The bid flow data returned by VTAM contained a response that was not recognized where this session is the contention loser.
7	X'FBD3			
	The CV29 data returned from VTAM had a zero length on entry to DFHZXPS.	19	X'FBD5	The bid flow data returned by VTAM was not recognized. This session is the contention loser.
8	X'FBD4			
	The BIS flow data returned by VTAM showed BIS RQE1 received but the outbound BIS flow was not consistent with this.	20	X'FBD8	The RU category returned by VTAM in the CV29 data was not valid for LU6.2. (This session was the primary and the last flow was an outbound request).
9	X'FBD4			
	The BIS flow data returned by VTAM showed BIS RQE3 received but the outbound BIS flow was not consistent with this.	21	X'FBD8	The RU category returned by VTAM in the CV29 data was not valid for LU6.2. (This session was the primary and the last flow was an inbound request).
10	X'FBD4			
	The BIS flow data returned by VTAM showed that no BIS flow had been received but the outbound BIS flow was not consistent with this.	22	X'FBD8	The RU category returned by VTAM in the CV29 data was not valid for LU6.2. (This session was the primary and the last flow was an outbound response.)
11	X'FBD4			
	The BIS flow data returned from VTAM was not recognized.	23	X'FBD8	The RU category returned by VTAM in the CV29 data was not valid for LU6.2. (This session was the primary and the last flow was an inbound response).
12	X'FBD5			
	The bid flow data returned by VTAM showed a request that was not recognized where this session is the contention winner.	24	X'FBD9	DFHZXPS could not determine the direction of the last flow from the CV29 data returned by VTAM. (This session was the primary).
13	X'FBD5			
	The bid flow data returned by VTAM showed that a negative X'088B response had been sent but there was nothing to indicate that the session was closing down. This session is the contention winner.	25	X'FBD8	The RU category returned by VTAM in the CV29 data was not valid for LU6.2. (This session was the secondary and the last flow was an inbound request.)
14	X'FBD5			
	The bid flow data returned by VTAM contained a response that was not recognized where this session is the contention winner.			

26	X'FBD8 The RU category returned by VTAM in the CV29 data was not valid for LU6.2. (This session was the secondary and the last flow was an outbound request.)		The last flow was a positive response outbound and was not for the previous request.
27	X'FBD8 The RU category returned by VTAM in the CV29 data was not valid for LU6.2. (This session was the secondary and the last flow was an inbound response).	38	X'FBDB The last flow was an inbound LUSTAT command that could not be identified.
28	X'FBD8 The RU category returned by VTAM in the CV29 data was not valid for LU6.2. (This session was the secondary and the last flow was an outbound response).	39	X'FBDB The last flow was an inbound RTR that was not processed by the bid analysis routine.
29	X'FBD9 CICS could not determine the direction of the last flow from the CV29 data returned by VTAM. (This session was the secondary.)	40	X'FBDB The last flow was an inbound command that could not be identified.
30	X'FBD9 The last_thing_to_flow byte contained an invalid value. This indicates a logic error in DFHZXPS.	41	X'FBDB The last flow was an outbound LUSTAT command that could not be identified.
31	X'FBDA The last inbound flow was a response that was not for the previous request.	42	X'FBDB The last flow was an outbound RTR request that was not processed by the bid analysis routine.
32	X'FBDA A negative response was received that was not for a command and was not a X'0846 negative response.	43	X'FEDB The last flow was an outbound command request that could not be identified.
33	X'FBDA The last inbound flow was a response that was not for this bracket. (This session is the primary and started the current bracket).	44	X'FBDC The last flow was an inbound response to BIS that was not processed with the BIS flow data.
34	X'FBDA The last inbound flow was a response that was not for this bracket. (This session is the secondary and started the current bracket).	45	X'FBDD The last flow was an inbound positive response to a command that could not be identified.
35	X'FBDA The last inbound flow was a response that was not for this bracket. (This session is the primary and did not start the current bracket).	46	X'FBDA The last flow was an inbound response to an LUSTAT command but there was no corresponding outbound request.
36	X'FBDA The last inbound flow was a response that was not for this bracket. (This session is the secondary and did not start the current bracket).	47	X'FBDA The last flow was an inbound negative response to an LUSTAT request which could not be identified.
37	X'FBDA The last inbound flow was a response that was not for this bracket. (This session is the secondary and did not start the current bracket).	48	X'FBDC The last flow was a negative response inbound to a BIS request that did not show up in the BIS flow data.
		49	X'FBDD The last flow was a negative response inbound to a command that could not be identified.
		50	X'FBDC The last flow was a positive response outbound to BIS that was not consistent with the BIS flow data.

DFHZC0155

- 51** X'FBDD
The last flow was a positive response outbound to a command that could not be identified.
- 52** X'FBDC
The last flow was a negative response outbound to BIS that was not consistent with the BIS flow data.
- 53** X'FBDD
The last flow was an outbound negative response to a command that could not be identified.
- 54** X'FBE1
The last request to flow was SIGNAL (expedited flow) but no normal flow data appears in the CV29 normal flow data area.
- 55** X'FBE1
The last flow was a SIGNAL request (expedited flow). However analysis of the normal flow data shows both sides sending which is not possible. (Outbound flow was with EC.)
- 56** X'FBE1
The last flow was a SIGNAL request (expedited flow). However analysis of the normal flow data shows both sides sending which is not possible. (Outbound flow was in chain.)
- 57** X'FBD5
The tctewin/tctelse bits in the TCTTE have not been set correctly.
- 58** X'FBDF
The session is not in CS mode when analysis of the CV29 data shows that a call to DFHZGDA to ABEND the current transaction is required.
- 59** X'FBE7
A SEND_FMH7 call to DFHZGDA was rejected with invalid_format or invalid_function.
- 60** X'FBE7
A SEND_FMH7 call to DFHZGDA was rejected because of a disastrous error in DFHZGDA.
- 61** X'FBE7
A RECEIVE_FMH7 call to DFHZGDA was rejected with invalid_format or invalid_function.
- 62** X'FBE7
A RECEIVE_FMH7 call to DFHZGDA was rejected because of a disastrous error in DFHZGDA.

- 63** X'FBE0
Internal DFHZXPS logic error. The input parameters are invalid when a call is about to be made to DFHZGDA.
- 64** X'FBE5
An invalid return code was received from a call to DFHTCPCL with ENTRY=DFHZRST1.
- 65** X'FBDE
The tcte_bid_status byte contained an unrecognized value.

The VTAM APPC session *sysid termid* persisted during a CICS persistent session restart, but an error occurred while processing the session state data returned by VTAM following an OPNDST OPTCD=RESTORE.

If the error needs further investigation, a dump is taken.

No dump is taken if one has already been taken for an earlier problem, or if the problem is known as one for which a session cannot be allowed to persist. An example of this is bind security processing not completing for this session when CICS terminated.

The reason and the corresponding AP exception trace entry are indicated by the *instance* in the message. See message DFHZC0155 in the *CICS Messages and Codes* manual for an explanation of these codes.

System action: An AP exception trace with a point ID is issued. The state of the session after the restart cannot be determined, and the session is terminated in order to reset the states. The session is restarted. A system dump is produced for all instances except 04.

User response: If the session is not successfully restarted, check the CSNE log for messages indicating why the new BIND failed. The session may have been set out of service by the VTAM operator.

Module: DFHZXPS

XMEOUT Parameters: *date, time, applid, sysid, termid, sense, instance, {1=DFHZXPS, 2=DFHZXPS, 3=DFHZXPS, 4=DFHZXPS, 5=DFHZXPS, 6=DFHZXPS, 7=DFHZXPS, 8=DFHZXPS, 9=DFHZXPS, 10=DFHZXPS, 11=DFHZXPS, 12=DFHZXPS, 13=DFHZXPS, 14=DFHZXPS, 15=DFHZXPS, 16=DFHZXPS, 17=DFHZXPS, 18=DFHZXPS, 19=DFHZXPS, 20=DFHZXPS, 21=DFHZXPS, 22=DFHZXPS, 23=DFHZXPS, 24=DFHZXPS, 25=DFHZXPS, 26=DFHZXPS, 27=DFHZXPS, 28=DFHZXPS, 29=DFHZXPS, 30=DFHZXPS, 31=DFHZXPS, 32=DFHZXPS, 33=DFHZXPS, 34=DFHZXPS, 35=DFHZXPS, 36=DFHZXPS, 37=DFHZXPS, 38=DFHZXPS, 39=DFHZXPS, 40=DFHZXPS, 41=DFHZXPS, 42=DFHZXPS, 43=DFHZXPS, 44=DFHZXPS, 45=DFHZXPS, 46=DFHZXPS, 47=DFHZXPS, 48=DFHZXPS, 49=DFHZXPS, 50=DFHZXPS,*

51=DFHZXPS, 52=DFHZXPS, 53=DFHZXPS,
54=DFHZXPS, 55=DFHZXPS, 56=DFHZXPS,
57=DFHZXPS, 58=DFHZXPS, 59=DFHZXPS,

Destination: CSNE

DFHZC0156 *date time applid sysid VTAM APPC session termid successfully recovered following a persistent sessions restart. sense ((instance) Module name: {DFHZXPS})*

Explanation: CICS has restored the VTAM APPC persisting session for *sysid termid* following a persistent sessions restart.

The equivalent message for non-APPC sessions is DFHZC0146. Note that the RECOVNOTIFY option that applies to message DFHZC0146 is not applicable to APPC sessions.

System action: Processing continues.

User response: None.

Module: DFHZXPS

XMEOUT Parameters: *date, time, applid, sysid, termid, sense, instance, {1=DFHZXPS, 2=DFHZXPS}*

Destination: CSNE

DFHZC0157 *date time applid sysid VTAM APPC session termid could not be recovered following a persistent sessions restart. The session will be unbound. sense ((instance) Module name {DFHZXPS})*

Explanation: CICS was unable to restore the APPC persisting session for *sysid termid* following a persistent sessions restart. There are three possible reasons for this

1. The BIND processing was incomplete when CICS failed.
2. Resynchronization was in progress for the session when CICS failed.
3. The recovery data returned by VTAM for the session was capable of more than one interpretation.

The TCTTE and TIOA are output for information only.

System action: The session is unbound and rebound.

User response: None.

Module: DFHZXPS

XMEOUT Parameters: *date, time, applid, sysid, termid, sense, instance, {1=DFHZXPS}*

Destination: CSNE

DFHZC0158 *date time applid Persistent sessions signon data for terminal termid could not be written to the catalog.*

Explanation: CICS was attempting to write signon data for *termid* to the global catalog so that the signon status could be recovered after a persistent sessions restart, but the catalog write failed.

System action: An exception trace is output. Loss of the data may mean that *termid* will not be signed on or off correctly after a persistent sessions restart.

User response: Investigate the cause of the error. Look for earlier messages and trace entries from the catalog domain indicating the cause of the error, for example the catalog may be full.

Module: DFHZSGN, DFHZPCT, DFHSNTU

XMEOUT Parameters: *date, time, applid, termid*

Destination: CSNE

DFHZC0160 *date time applid tranid CNOS changes for modename modename to node netname connection sysid are incomplete.*

Explanation: CICS has made two attempts to implement the change number of sessions (CNOS) command for the modename *modename* on the APPC connection *sysid*. The command was not successful because of other activity on the modegroup. This only happens on modegroups which are very busy. The state of one or more of the sessions has changed during the processing of the CNOS request.

The CNOS command results from a connection acquire, a connection release, or a request for a specific modename on this system or the connected system. If the connected system is not CICS, commands specific to that system may have been used.

System action: The modegroup is left in the state reached after the second attempt to implement the changes.

User response: Use the CEMT INQUIRE MODENAME command to determine the current state of the modegroup. The command may show the modegroup as you expect for successful CNOS completion. This is because the command only shows data for available and active sessions. CICS may have had problems with CNOS values for loser sessions, which would not be apparent by using CEMT. If the values are not as required, re-issue the original command.

Module: DFHZGCA

XMEOUT Parameters: *date, time, applid, tranid, modename, netname, sysid*

Destination: CSNE

DFHZC0161 *date time applid tranid* **CNOS command for modename modename to node netname connection sysid has failed with code X'code'.**

Explanation: CICS has encountered an error while attempting to execute a change number of sessions (CNOS) command for the modename *modename* on the APPC connection *sysid*. The failure code *X'code* is one of the following

X'FBA2

The request to create a lock manager lock for *modename* failed.

X'FBA3

CICS could not allocate a session for the CNOS negotiation conversation.

X'FBA6

The request to obtain a lock manager lock for *modename* failed.

X'FBAA

modename was not found or has been defined with one of the reserved names SNASVCMG or CPSVCMG.

X'FBAB

sysid is known, but not as a connection.

X'FBAC

The specified connection *sysid* has no modegroups. This is probably caused by a storage overwrite.

X'FBAD

The first modegroup on the specified connection *sysid* has no sessions. This is probably caused by a storage overwrite.

X'FBAF

The receive command for the CNOS reply failed.

X'FBB1

The send command for the CNOS command or CNOS reply failed.

X'FBB2

The session for the single-session connection could not be found. This is probably caused by a storage overwrite.

X'FBB3

sysid is not a known connection name.

X'FBB4

The connection is defined to CICS as not supporting CNOS. This is probably caused by a storage overwrite.

X'FBB9

CICS sent a CNOS command for a specific modename but the partner system returned a CNOS reply indicating all modegroups. This is a protocol violation.

System action: CICS makes an exception trace with ID AP△xxxx; where *xxxx* is the code in the message. CICS takes a system dump for all failure codes except X'FBA2, X'FBA3, X'FBA6, X'FBAF, X'FBB1, and X'FBB9. CICS continues without completing the request. The task does not abend. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: This depends on the error code as follows

X'FBA2

Follow the guidance given for the lock manager console message that precedes this.

X'FBA3

If all the sessions are busy, make one available and retry.

X'FBA6

Follow the guidance given for the lock manager message that precedes this.

X'FBAA

Reissue the request with the correct modename.

X'FBAB

Reissue the request with the correct connection name.

X'FBAC

See the *CICS Problem Determination Guide* for further guidance on storage problems.

X'FBAD

Same as for X'FBAC.

X'FBAF

The connected system, or the link to it, has failed. Determine the reason for this from any other messages produced.

X'FBB1

Same as for X'FBAF.

X'FBB2

Same as for X'FBAC.

X'FBB3

Reissue the request with the correct connection name.

X'FBB4

Same as for X'FBAC.

X'FBB9

Investigate why the connected system is not following the APPC protocols.

Module: DFHZGCM

XMEOUT Parameters: *date, time, applid, tranid, modename, netname, sysid, X'code'*

Destination: CSNE

DFHZC0162 *date time applid tranid* **CNOS transaction for connection *sysid* has failed with code *X'code'* subcode *X'subcode'*.**

Explanation: The change number of sessions (CNOS) transaction program DFHZLS1 could not complete successfully. The error code *X'code* is one of the following

X'FB92 The transaction was not started as an IC request with data or by an attach flow from a connected system. The insert *subcode* is the start code from XMIQ_START_CODE.

X'FB93 The transaction was started with data, but no data was found.

X'FB94 The transaction was started with data, but the data was not in the form of the correct parameter list.

X'FB95 The transaction was started with the correct format parameter list, but the function code was invalid.

X'FB96 The transaction was started by an attach from a connected system but there was no CNOS data.

X'FB97 The transaction was started by an attach from a connected system but the associated data was not a CNOS command.

X'FB9E

The transaction was started but CICS is shutting down and the VTAM ACB is closed.

This may have occurred because a number of CLS1 tasks were started before shutdown was issued but are held up because CICS was at MAXTASK. During shutdown the VTAM ACB was closed and this task was then started.

System action: CICS produces an exception trace, and except for in the case of an invalid start, a system dump is taken. The task terminates. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: This depends on the error code as follows

X'FB92 The transaction was probably started by entering the transaction ID at a terminal. This is not allowed.

X'FB93 Analyze the dump to determine why IC could not find the data.

X'FB94 Analyze the dump to determine what the data was.

X'FB95 Analyze the dump to determine what the data was.

X'FB96 Analyze the dump to determine why no data was available.

X'FB97 Analyze the dump to determine why the correct data was not sent with the attach.

X'FB9E

No action to take.

Module: DFHZLS1

XMEOUT Parameters: *date, time, applid, tranid, sysid, X'code', X'subcode'*

Destination: CSNE

DFHZC0163 *date time applid termid* **User signed on successfully at termid *termid* following a persistent sessions restart.**

Explanation: CICS successfully signed on a user at termid *termid* following a persistent sessions restart.

System action: CICS continues.

User response: None.

Module: DFHZSGN

XMEOUT Parameters: *date, time, applid, termid, termid*

Destination: CSNE

DFHZC0164 *date time applid termid* **Terminal *termid* was timed out by CICS following a persistent sessions restart.**

Explanation: CICS attempted to sign on a user following a persistent sessions restart. The user could not be signed on because the RSTSIGTIME value in the SIT had expired.

System action: CICS continues.

User response: The user is forced to sign on again.

Module: DFHZSGN

XMEOUT Parameters: *date, time, applid, termid, termid*

Destination: CSNE

DFHZC0165 *date time applid termid* **Termid *termid* was timed out after a multinode persistent sessions restart. The terminal has been signed off.**

Explanation: CICS signed off a user at termid *termid* following a multinode persistent sessions restart.

System action: CICS continues.

User response: None.

Module: DFHZSGN

XMEOUT Parameters: *date, time, applid, termid, termid*

Destination: CSNE

DFHZC0167 *date time applid termid* **An attempt to sign off a user at termid *termid* failed following a multinode persistent sessions restart. Response code *rc1* and reason code *rc2* were received.**

Explanation: CICS attempted to sign off a user at termid *termid* because of a signon timeout following a multinode persistent sessions restart. An exception or disaster response was received from the signon program DFHSNTU with one of the following reason codes:

Reason code

Explanation

- | | |
|------------|---|
| 002 | There is no active ESM. |
| 003 | The ESM is not responding. |
| 010 | The terminal type is invalid for this operation. |
| 017 | The terminal has preset security. |
| 019 | Security is not active for this CICS. |
| 022 | The terminal is a surrogate terminal. |
| 028 | The ESM returned a response which was not recognized by the CICS security domain. |
| 038 | The signon program went into recovery following an ABEND. |
| 048 | The signon program detected a loop and went into recovery. |
| 052 | The signon program received a bad response from transaction manager. |

System action: An AP exception trace with point ID FB9D is issued.

User response: Reason codes 002, 003, 019 and 028 indicate a problem with the ESM or the security domain. The remaining reason codes may indicate an internal error in CICS. Look for messages output earlier by the ESM or the security domain. If security was active when the problem occurred and there was no problem with the ESM or the security domain contact your IBM support center.

Module: DFHZSGN

XMEOUT Parameters: *date, time, applid, termid, termid, rc1, rc2*

Destination: CSNE

DFHZC0170I *applid* **CICS registered successfully to VTAM generic resource name *grname*.**

Explanation: CICS has registered as a VTAM generic resource in the group *grname*.

System action: CICS continues. It is now possible to log on using the generic resource name.

User response: None.

Module: DFHZGSL

XMEOUT Parameters: *applid, grname*

Destination: Console

DFHZC0171 *applid* **CICS registration as a VTAM generic resource in the group *grname* failed. VTAM return code: *X'rc'*. FDB2 *X'fd'*.**

Explanation: CICS failed to register as a VTAM generic resource in the group *grname*.

VTAM returned a RTNCD,FDB2 of *rc,fd* in response to the SETLOGON OPTCD=GNAMEADD macro.

System action: An AP exception trace entry is output with trace point FB8E.

CICS continues without generic resource support.

User response: Use the *VTAM programming manual* to determine the meaning of the RTNCD,FDB2 and the actions necessary to correct the problem.

When the problem has been corrected a further attempt may be made to register CICS as a generic resource by closing and reopening the VTAM ACB.

Module: DFHZGSL

XMEOUT Parameters: *applid, grname, X'rc', X'fd'*

Destination: Console

DFHZC0172I *applid* **CICS deregistered successfully from VTAM generic resource name *grname*.**

Explanation: CICS has deregistered from VTAM generic resource group *grname*.

System action: None. CICS will not reregister to the generic resource until the VTAM ACB has been closed and opened again.

User response: None.

Module: DFHZGSL

XMEOUT Parameters: *applid, grname*

Destination: Console

DFHZC0173 *applid* **CICS deregistration from VTAM generic resource name *grname* failed. VTAM return code: *X'rc'*. FDB2 *X'fd'*.**

Explanation: CICS failed to deregister from VTAM generic resource group *grname*.

VTAM returned a RTNCD,FDB2 of *rc,fd* in response to the SETLOGON OPTCD=GNAMEDEL macro.

This may be due to a hardware failure in another part of the sysplex or to corruption of the TCT prefix causing CICS to attempt to deregister with the wrong name.

System action: An AP exception trace entry is output with a trace point of X'FB8E.

User response: Use the *VTAM Programming Manual* to determine the meaning of the register 15 and register 0 values output by VTAM. If the problem is not caused by use of the wrong version of VTAM, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZGLS

XMEOUT Parameters: *applid, grname, X'rc', X'fd'*

Destination: Console

DFHZC0174 *applid* **Control block initialization has failed. Generic resource registration or deregistration will not be attempted.**
Return codes *r15, r0*.

Explanation: A call to a VTAM macro to initialize the node initialization block (NIB) before registering or deregistering as a VTAM generic resource has failed.

A possible explanation is that the wrong level of VTAM is being used.

System action: The values of register 15 and register 0 returned by VTAM are output.

An exception trace is output with trace point X'FBED.

If registration was about to be attempted, CICS continues without generic resource support.

If deregistration was about to be attempted, ACB shutdown continues. VTAM removes CICS as a member for the generic resource name when the ACB is closed.

User response: Use the *VTAM Programming Manual* to determine the meaning of the register 15 and register 0 values output by VTAM. If the problem is not caused by use of the wrong version of VTAM, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZGLS

XMEOUT Parameters: *applid, r15, r0*

Destination: Console

DFHZC0175 *applid* **A value was specified for GRNAME but the assemble time or run time VTAM does not support generic resource registration.**

Explanation: A value was specified for the GRNAME system initialization parameter. This indicates that CICS is to register as a VTAM generic resource. However, either DFHTCTxx was assembled against a release of VTAM that cannot support generic resource registration,

or CICS is running on a VTAM earlier than release 4 version 2.

System action: CICS sets the generic resource name to blanks and continues without attempting generic resource registration.

User response: If you are running with ACF/VTAM Release 4 Version 2 or higher, reassemble the TCT against this level of VTAM in order to take advantage of CICS support for generic resource registration.

To prevent this message being issued when using an earlier release of VTAM, do not specify a value for the GRNAME system initialization parameter.

Module: DFHZSLS

XMEOUT Parameter: *applid*

Destination: Console

DFHZC0176 *date time applid* **VTAM was unable to execute a CHANGE OPTCD=ENDAFFIN macro to end an affinity between this application, which is a member of generic resource *grname*, and a remote LU with netid *netid* netname *netname*. VTAM return code *X'rc'*, FDB2: *X'fd'*, R15: *X'r15'*.**

Explanation: An attempt was made to end an affinity between this CICS, which is a member of generic resource *grname*, and a remote LU with netid *netid* and netname *netname* by means of a SET CONNECTION ENDAFFINITY or PERFORM ENDAFFINITY command. The attempt has failed because a problem with VTAM prevented the VTAM CHANGE OPTCD=ENDAFFINITY macro from being issued.

VTAM has issued the return code-feedback (RTNCD, FDB2) *X'rc, X'fd'* in response to the CHANGE OPTCD=ENDAFFINITY macro.

R15 *r15* is the register 15 value returned by VTAM.

System action: Processing continues. VTAM has made no attempt to end the affinity.

User response: See the *VTAM programming manual* for the meaning of the RTNCD, FDB2 and for guidance on correcting the problem.

When the problem has been corrected retry the command.

Module: DFHZGCH

XMEOUT Parameters: *date, time, applid, grname, netid, netname, X'rc', X'fd', X'r15'*

Destination: CSNE

DFHZC0177 *date time applid* **Connection sysid has created an affinity between this application, which is a member of generic resource *grname*, and a remote LU with netid *netid* netname *netname*.**

Explanation: A generic resource member has established an APPC synclevel 2, APPC limited resource, or LU6.1 connection with another LU. For connections of these types VTAM creates affinities which are owned by CICS and have to be ended by the CICS operator using the SET CONNECTION ENDAFFINITY or PERFORM ENDAFFINITY command. The message is output whenever the connection is acquired but the affinity is not recreated for each acquire unless it has been ended in the meantime.

System action: Processing continues.

User response: None, but note that the affinity has to be ended before the partner LU can establish a connection with another generic resource member.

The affinity may be ended automatically by the connection quiesce transaction when the connection is released. However, it is not done if the system crashes or is shut down 'immediate' whilst the connection is still acquired.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, sysid, grname, netid, netname*

Destination: CSNE

DFHZC0178 *date time applid* **An attempt to end an affinity between this application, which is a member of generic resource *grname*, and a remote LU with netid *netid* netname *netname* was rejected by VTAM. VTAM return code: *X'rc'*. FDB2: *X'fd'*.**

Explanation: An attempt was made to end an affinity between this CICS, which is a member of generic resource *grname*, and a remote LU with netid *netid* and netname *netname* using a SET CONNECTION ENDAFFINITY or PERFORM ENDAFFINITY command. The request has been rejected by VTAM.

VTAM has issued the return code-feedback (RTNCD,FDB2) *X'rc,X'fd* in response to the CHANGE OPTCD=ENDAFFINITY macro.

System action: Processing continues.

User response: See the *VTAM programming manual* for the meaning of the RTNCD,FDB2 code and for guidance on correcting the problem.

When the problem has been corrected, retry the command if appropriate.

Module: DFHZGCH

XMEOUT Parameters: *date, time, applid, grname, netid, netname, X'rc', X'fd'*

Destination: CSNE

DFHZC0179I *date time applid* **Connection sysid netname *netname* is a link to generic resource *grname* member *membername*.**

Explanation: A connection *sysid* from netname *netname* to generic resource *grname* has been established.

The message is issued once for each connection acquire.

System action: Processing continues.

User response: None.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, sysid, netname, grname, membername*

Destination: CSNE

DFHZC0180 *date time applid* **An affinity between this application, which is a member of generic resource *grname*, and a remote LU with netid *netid* netname *netname* has ended successfully.**

Explanation: VTAM has responded positively to an attempt to end an affinity with remote LU netid *netid*, netname *netname*. The affinity was ended implicitly by the connection quiesce transaction when the connection was released or explicitly by a SET CONNECTION ENDAFFINITY or PERFORM ENDAFFINITY command.

System action: Processing continues. The remote LU can now establish a connection with a different generic resource member.

User response: None.

Module: DFHZGCH

XMEOUT Parameters: *date, time, applid, grname, netid, netname*

Destination: CSNE

DFHZC0181 *date time applid* **No affinity exists between this application, which is a member of generic resource *grname*, and a remote LU with netid *netid* netname *netname*. VTAM return code: *X'14'*, FDB2: *X'88'*.**

Explanation: An unsuccessful attempt was made to end an affinity between this CICS, which is a member of generic resource *grname*, and a remote LU with netid *netid* and netname *netname* using a SET CONNECTION ENDAFFINITY or PERFORM ENDAFFINITY command. VTAM has issued return

code-feedback (RTNCD,FDB2) of X'14,X'88 in response to the CHANGE OPTCD=ENDAFFINITY macro indicating that no such affinity exists.

System action: Processing continues.

User response: Ensure that the values input to the SET CONNECTION ENDAFFINITY or PERFORM ENDAFFINITY command are correct.

Module: DFHZGCH

XMEOUT Parameters: *date, time,applid, grname, netid, netname*

Destination: CSNE

DFHZC0182 *date time applid* **VTAM was unable to execute an INQUIRE OPTCD=NQN macro to determine the network qualified netname of logical unit *luname*. VTAM return code: *X'rc'*, FDB2: *X'fd'*, R15: *X'r15'*.**

Explanation: CICS has attempted to determine the network qualified netname of logical unit *luname*. The attempt has failed because a problem with VTAM prevented the VTAM INQUIRE OPTCD=NQN macro from being issued.

VTAM has issued the return code-feedback (RTNCD,FDB2) *X'rc,X'fd* in response to the INQUIRE OPTCD=NQN macro.

R15 *r15* is the register 15 value returned by VTAM.

System action: The CICS component which requires the network qualified netname of the logical unit determines whether any further action is called for.

User response: See the *VTAM Programming* manual for the meaning of the RTNCD,FDB2 and for guidance on correcting the problem.

Module: DFHZGIN

XMEOUT Parameters: *date, time,applid, luname, X'rc', X'fd', X'r15'*

Destination: CSNE

DFHZC0183 *date time applid* **An attempt to determine the network qualified name of logical unit *luname* was rejected by VTAM. VTAM return code: *X'rc'*. FDB2: *X'fd'*.**

Explanation: CICS has attempted to determine the network qualified name of logical unit *luname*. The request has been rejected by VTAM.

VTAM has issued the return code-feedback (RTNCD,FDB2) *X'rc,X'fd* in response to the INQUIRE OPTCD=NQN macro.

System action: The CICS component which requires the network qualified name of the logical unit decides

whether further action is called for.

User response: See the *VTAM Programming* manual for the meaning of the RTNCD,FDB2 code and for guidance on correcting the problem.

Module: DFHZGIN

XMEOUT Parameters: *date, time,applid, luname, X'rc', X'fd'*

Destination: CSNE

DFHZC0184 *date time applid* **VTAM was unable to execute an INQUIRE OPTCD=SESSNAME macro to determine the member of generic resource set *grname* to which logical unit *netid.luname* is logged on. VTAM return code: *X'rc'*, FDB2: *X'fd'*, R15: *X'r15'*.**

Explanation: CICS has attempted to determine the member of a generic resource set *grname* to which logical unit *netid.luname* is logged on. The attempt has failed because a problem with VTAM prevented the VTAM INQUIRE OPTCD=SESSNAME macro from being issued.

VTAM has issued the return code-feedback (RTNCD,FDB2) *X'rc,X'fd* in response to the INQUIRE OPTCD=NQN macro.

R15 *r15* is the register 15 value returned by VTAM.

System action: The CICS component which needs to know where the logical unit is logged on determines whether any further action is called for.

User response: See the *VTAM Programming* manual for the meaning of the RTNCD,FDB2 and for guidance on correcting the problem.

Module: DFHZGIN

XMEOUT Parameters: *date, time,applid, grname, netid, luname, X'rc', X'fd', X'r15'*

Destination: CSNE

DFHZC0185 *date time applid* **An attempt to determine the member of generic resource set *grname* to which logical unit *netid.luname* is logged on was rejected by VTAM. VTAM return code: *X'rc'*. FDB2: *X'fd'*.**

Explanation: CICS has attempted to determine the member of generic resource set to which *grname* logical unit *netid.luname* is logged on. The request has been rejected by VTAM.

VTAM has issued the return code-feedback (RTNCD,FDB2) *X'rc,X'fd* in response to the INQUIRE OPTCD=SESSNAME macro.

System action: The CICS component which requires

DFHZC0186 • DFHZC0200

the member name decides whether further action is called for.

User response: See the *VTAM Programming* manual for the meaning of the RTNCD,FDB2 code and for guidance on correcting the problem.

Module: DFHZGIN

XMEOUT Parameters: *date, time,applid, grname, netid, luname, X'rc', X'fd'*

Destination: CSNE

DFHZC0186 *date time applid* **Connection sysid which is a member of generic resource grname has a duplicate remote LU netname netname. sense ((instance) Module name {DFHZOPN})**

Explanation: Node *nodeid* attempted to log on to CICS but the logon is invalid.

The *nodeid* in the message always starts with the netname of the node attempting to connect to CICS. For some instances of the message resulting from an APPC log on, the modename of the session is concatenated to the netname with a dot separator. Since a string consisting of eight blanks is the default modename, this can lead to idiosyncratic formatting of the message.

If the message is issued by DFHZATA, CICS has failed in its attempt to autoinstall the terminal or connection.

The instance *instance* is one of the following

- 1 During the acquire process for a secondary session CICS attempted to add the membername of the partner to a table but this name already exists for a different generic resource connection.
- 2 During the acquire process for a secondary session CICS attempted to add the membername of the partner to a table but this name has just been used as the netname of a terminal by an install occurring at the same time as the install of this connection.

System action: The acquire of the connection continues.

User response: Use the instance number to determine why the netname already exists

- 1 Use the CEMT INQUIRE CONNECTION API to see which generic resource has the same membername.

Since this problem should not occur under normal circumstances, you may need further assistance from IBM.

- 2 Investigate why the LU name of the partner is the same as the LU name of a terminal and remove one of the definitions.

Module: DFHZOPN, DFHZOPN

1164 Messages and Codes

XMEOUT Parameters: *date, time,applid, sysid, grname, netname, sense, instance, {1=DFHZOPN, 2=DFHZOPN}*

Destination: CSNE

DFHZC0187 *date time applid* **Reset of connection sysid failed following the ending of an affinity between this a pplication and a remote LU with generic resource name grname member name applid. The connection was locked by task taskid, transaction tranid.**

Explanation: CICS has failed to reset connection *sysid* after an affinity was ended successfully. A lock was held by task *taskid*, transaction *tranid*.

| **System action:** Processing continues but the state of
| the connection is undetermined. The lock on the
| connection should be released when task *tranid* ends.

User response: If appropriate, use the information in the message to find out why there was a lock on the connection. If the connection is left in a state where it cannot be acquired, delete and reinstall it.

Module: DFHZGCH

XMEOUT Parameters: *date, time, applid, sysid, grname, applid, taskid, tranid*

Destination: CSNE

DFHZC0199 **CICS has recovered after a system failure. Execute recovery procedures. { Already signed on. | Please sign on.}**

Explanation: This message is sent to a terminal when the associated VTAM session is successfully recovered following a persistent sessions restart of CICS.

This is the default message issued by CICS if RECOVNOTIFY(MESSAGE) is specified on the TYPETERM for a device (see the *CICS Resource Definition Guide*), or in the node error program (see the *CICS Customization Guide*). If RECOVNOTIFY(MESSAGE) is used, it is recommended that the CICS supplied sample mapset DFHXMSG be tailored to meet the installation recovery requirements.

System action: Processing continues.

User response: Sign on if required, and take any recovery actions required.

Module: DFHZNAC

Destination: Terminal End User

DFHZC0200 *applid* **An attempt by the COVR transaction to OPEN VTAM has failed with return code X'retcode; CICS will retry.**

Explanation: The COVR transaction has attempted an

EXEC CICS SET VTAM OPEN, but the operation failed with the return code *retcode* from the OPEN ACB.

System action: CICS continues. The COVR transaction retries the operation every 5 seconds. This message is reissued every minute until the operation succeeds, or until 10 minutes has passed, in which case message DFHZC0201 is issued.

User response: Investigate the reason for VTAM being unavailable. See the *VTAM Programming* manual for an explanation of the ACB return code.

Module: DFHZCOVR

XMEOUT Parameters: *applid, X'retcode'*

Destination: Console

DFHZC0201 *applid* **An attempt by the COVR transaction to OPEN VTAM has failed with return code *X'retcode'*; the COVR transaction will terminate.**

Explanation: The COVR transaction has repeatedly attempted an EXEC CICS SET VTAM OPEN, but the operations have failed. The OPEN ACB has issued the return code *retcode*.

System action: CICS continues. The COVR transaction terminates and the SET VTAM OPEN is not retried.

User response: Investigate the reason for VTAM being unavailable. See the *VTAM Programming* manual for an explanation of the ACB return code.

Module: DFHZCOVR

XMEOUT Parameters: *applid, X'retcode'*

Destination: Console

DFHZC2109E *date time applid* **Unexpected response from Recovery Manager following resynchronization of LU6.1 session *termid* with remote system *sysid*.**

Explanation: Recovery manager was invoked during resynchronization of an LU6.1 session, but gave an unexpected response. This is due to an internal logic error.

System action: A system dump is taken unless dumps have been specifically suppressed in the dump table.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, sysid*

Destination: CSNE

DFHZC2114E *date time applid termid tranid* **A SEND response failed during receive-any processing. *sense* (*instance*) Module name {DFHZRAC}**

Explanation: A SEND response issued on a receive-any RPL failed, or was not accepted by VTAM.

For the meaning of *sense*, see message DFHZC2400.

System action: If a task is attached, it is abnormally terminated with a transaction dump. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: A subsequent message in the log indicates the reasons for the failure. Refer to this message for further information and guidance.

Module: DFHZRAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRAC, 2=DFHZRAC}*

Destination: CSNE

DFHZC2115 *applid termid* **Potential CICS hang detected following a SEND to node *netname*, CID *X'cid'*. Investigation is required. (*instance*) Module name: {DFHZRAC}**

Explanation: CICS has issued a VTAM SEND macro to send a response but no notification has been received that the response has completed. Until this SEND operation completes, one of the limited number of receive-any RPLs remains unusable (the number of receive-any RPLs is defined by the RAPOOL system initialization parameter).

This is a serious condition. If all the receive-any RPLs become unusable in this way, CICS is unable to accept any new requests from VTAM. Similarly, a reduction in the number of available receive-any RPLs can adversely affect terminal performance and transaction throughput.

Additionally, while the RPL is hanging, a normal CICS shutdown might be unable to complete.

The CID is the 32-bit VTAM communication identifier which was assigned when the session was established.

System action: CICS continues to monitor for the SEND operation to complete. Until this happens, CICS reissues this message at approximately three minute intervals.

User response: This problem is usually caused by a failure in the network which stops the SEND completing. Check the session and the associated logical unit to ensure that there is no error condition which stops VTAM completing the SEND request.

Module: DFHZRAC

XMEOUT Parameters: *applid, termid, netname, X'cid', instance, {1=DFHZRAC}*

Destination: Console

DFHZC2116E *date time applid* **Resynchronization of LU6.1 session termid with remote system sysid failed.**

Explanation: Resynchronization of an LU6.1 session with a remote system has failed to complete for one of the following reasons

1. There is an apparent inconsistency between the sequence numbers in the two systems
2. There was a protocol error during the exchange of the sequence numbers
3. Neither system requested resynchronization, but there was a shunted unit of work associated with the session.

System action:

1. A system dump is taken unless dumps have been specifically suppressed in the dump table.
2. The TCTTE for the session on which the error occurred is printed. The local system's sequence numbers, and the numbers or responses received from the remote system can be found in the TCTTE.
3. The failure of resynchronization is reported to recovery manager. Recovery manager issues diagnostics relating to any unit of work affected by the failure.

User response:

1. Determine whether changes to data in the local and remote system are synchronized. Diagnostics issued by recovery manager will help you to do this. If necessary, take action to resynchronize the data.
2. Determine why the resynchronization failure happened. You will normally need assistance from IBM to do this. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZRSY, DFHZSCX, DFHZSEX

XMEOUT Parameters: *date, time, applid, termid, sysid*

Destination: CSNE

DFHZC2117E *date time applid termid tranid* **Data received on pipeline session exceeds RAI A size. ((instance) Module name {DFHZRAC})**

Explanation: CICS has received data on a pipeline session which is larger than the initial I/O area allocated for the receive any RPL. The size of the receive any input area (RAIA) is specified on the RAMAX system initialization parameter.

System action: CICS ends the session which sent the data and marks it out of service. CICS will also attempt

to abnormally terminate any running transactions which were initiated from this session.

User response: Increase the value of the RAMAX system initialization parameter so that it is at least equal to the largest RUSIZE (from the CINIT) specified for a pipeline session.

Module: DFHZRAC

XMEOUT Parameters: *date, time, applid, termid, tranid, instance, {1=DFHZRAC}*

Destination: CSNE

DFHZC2118 *applid* **Receive Any stall for netname netname.**

Explanation: All the CICS Receive Any RPLs have been posted but the TCTTE for each one is waiting for a response from a VTAM terminal or session. All the Receive Any RPLs have been stalled for 10 dispatches of the TCP task (CSTP). This message is produced for each session that is in this situation. A VTAM session has not responded to a command such as BID or SHUTD sent by CICS. This is typically caused by a protocol error.

System action: CICS is NOT running with system initialization parameter RAPOOL=(n,n,FORCE) so CICS VTAM activity is held up until one of the commands completes.

User response: Issue the VTAM command V NET,INACT,ID=netname,I for one or more of the sessions indicated by *netname*, to try and free a Receive Any RPL. Note - if the sessions are LU6.2 then the above command will inactivate the partner APPLID to VTAM.

Investigate why the CICS terminal control commands that have caused the stall have not completed. If this is due to a protocol error from the partner or device, attempt to get the protocol error corrected.

Consider increasing the number of Receive Any RPLs specified in the RAPOOL System Initialization parameter. For instance, if you were using the old default of 2, increase this to the new default of 50.

If you still get this message after changing the RAPOOL value consider running CICS with system initialization parameter RAPOOL=(n,n,FORCE), which attempts to issue CLSDST for all the offending sessions or terminals and to re-issue the Receive Any RPLs.

Module: DFHZRAC

XMEOUT Parameters: *applid, netname*

Destination: Console

DFHZC2119E *date time applid termid tranid* LUSTAT received on pipeline session incorrectly requests a definite response. ((*instance*) Module name {DFHZRAC})

Explanation: CICS has received data on a pipeline session that violates the pipeline protocol. An LUSTAT SENSE 08310000 'Device Powered Off' was received from the device requesting a definite response, but only EXC responses are allowed.

System action: CICS ends the session that sent the data and marks it out of service. CICS also attempts to abnormally terminate any running transactions initiated from this session.

User response: Determine why the pool pipeline terminal is violating the protocol.

Module: DFHZRAC

XMEOUT Parameters: *date, time, applid, termid, tranid, instance, {1=DFHZRAC}*

Destination: CSNE

DFHZC2300 *applid* Recovery action requested for connection *sysid*.

Explanation: The XZIQUE global user exit program has been invoked by CICS because of a potential problem with the connection. The global user exit has used return code UERCAKLL indicating that throughput on the connection is abnormally low and some exceptional action is required. The poor performance of the connection can be caused by

- Poor response on the receiving end
- Increased load on the sending end.

The condition may be intermittent. Message DFHZC2301 may follow indicating that the connection has recovered.

This message may also occur when the XZIQUE global user exit is disabled but the connection has been at the QUEUELIMIT for MAXQTIME where both parameters are specified in the connection definition.

System action: CICS cancels all transactions which have outstanding queued requests to use the connection.

User response: Investigate the cause of the poor performance of the connection. Check the availability and condition of the connected system.

Module: DFHZISP

XMEOUT Parameters: *applid, sysid*

Destination: Console

DFHZC2301I *applid* Connection *sysid* operating normally following recovery action.

Explanation: Message DFHZC2300 has been issued for this connection. The connection has now recovered and is operating normally.

System action: Processing continues.

User response: None

Module: DFHZISP

XMEOUT Parameters: *applid, sysid*

Destination: Console

DFHZC2302 *applid* SETLOGON start command rejected

Explanation: CICS issues the SETLOGON START command after a successful OPEN VTAM ACB. The SETLOGON START command is rejected in the following cases

- The CICS OPEN VTAM ACB was successful, but VTAM subsequently terminated abnormally, or
- The CICS OPEN VTAM ACB was successful, but insufficient system storage was available to satisfy the SETLOGON START command, or
- The CICS OPEN VTAM ACB was successful, but VTAM was subsequently terminated by a VTAM HALT QUICK command.

System action: If the error occurs during CICS initialization, CICS abnormally terminates with a U2302 abend and a system dump.

If the error occurs as a result of a CEMT or EXEC CICS SET VTAM OPEN, CICS terminates the task abnormally with abend code ATC2 and a transaction dump, and the VTAM ACB is closed.

User response: The VTAM return code can be found in RTNCD-FDBK2 in the first RPL in the RA pool addressed from TCTVRVRA in the system dump or the transaction dump.

Use the *VTAM Programming* manual, (SC23-0115-3), to determine the cause of the error and the actions necessary to correct it.

After correcting the error, either reinitialize CICS (for abend U2302) or follow the suggestions documented for abend ATC2.

Module: DFHZSLS

XMEOUT Parameter: *applid*

Destination: Console

DFHZC2303 *applid* No storage available when initiating RECEIVE-ANY's. Code: X'code'

Explanation: While trying to acquire receive-any I/O areas, the SETLOGON START VTAM command found that storage was not available.

System action: CICS terminates with a dump. An exception entry *code* is made in the trace table.

A system dump is taken unless dumps have been specifically suppressed in the dump table.

Message DFHZC0133 is issued.

User response: Reduce the size of the RAMAX value in the system initialization table (SIT).

For further information, see the *CICS Performance Guide*.

Module: DFHZGRP

XMEOUT Parameters: *applid*, X'code'

Destination: Console

DFHZC2304 *applid* RECEIVE-ANY command rejected. Code: X'code'

Explanation: This message is issued when the ACB has been opened either during initialization or dynamic open. DFHZGRP was initiating the VTAM RECEIVE-ANY's but VTAM was short on storage or the VTAM HALT QUICK command was issued.

System action: An exception entry *code* is made in the trace table.

A system dump is taken unless you have specifically suppressed dumps in the dump table.

If the error occurs during CICS initialization, CICS issues message DFHZC0133 and terminates.

If the error occurs as a result of a CEMT or EXEC CICS SET VTAM OPEN, CICS closes the VTAM ACB.

User response: The VTAM return code can be found in RTNCD-FDBK2 in the RPL, which is either in the exception trace entry *code*, or in the RA pool addressed from TCTVRVRA in the system dump.

Use the *VTAM Programming* manual, (SC31-6436), to determine the cause of the error and the actions necessary to correct it.

After correcting the error, either reinitialize CICS or reopen the VTAM ACB.

Module: DFHZGRP

XMEOUT Parameters: *applid*, X'code'

Destination: Console

DFHZC2305I *applid* Termination of VTAM sessions beginning

Explanation: Either CICS or VTAM is being terminated, or a dynamic close of the VTAM ACB has been requested.

System action: All CICS-VTAM sessions are closed and the ACB is closed. If termination is not orderly, active transactions are abnormally terminated.

User response: When VTAM is active, communication may be resumed by using the master terminal operator command CEMT SET VTAM OPEN.

Module: DFHZSHU

XMEOUT Parameter: *applid*

Destination: Console

DFHZC2307 *applid* CICS VTAM ABNORMALLY QUIESCING (*modname*).

Explanation: An RPL request has completed without a TCTTE token, for other than a VTAM storage shortage.

System action: CICS performs a FORCECLOSE of the ACB.

CICS may produce this message twice as both module DFHZRAC and module DFHZSYX may detect the condition.

User response: When VTAM has been restarted, issue a CEMT SET VTAM OPEN.

Module: DFHZRAC, DFHZSYX

Destination: Console

DFHZC2308 *applid* TCP Task WAIT failed. Unexpected response from DSSR WAIT_OLDW call (RESPONSE X'xx', REASON X'yy').

Explanation: The TCP task wait has failed. The TCP dispatcher module, DFHZDSP, has received an unexpected response, with response code X'xx' and reason code X'yy' from the DSSR WAIT_OLDW call.

System action: CICS abends with abend U1800 and a system dump is produced.

User response: Determine the cause of the TCP task wait failure. Investigate the dump in conjunction with any other accompanying error messages or exception trace entries which may have been issued by dispatcher domain.

Module: DFHZDSP

XMEOUT Parameters: *applid*, X'xx', X'yy'

Destination: Console

DFHZC2309 *applid* **Recovery action requested for connection *sysid* using mode group *modename*.**

Explanation: The XZIQUE global user exit program has been invoked by CICS because of a potential problem with the connection. The global user exit has used return code UERCAKLM indicating that throughput on the connection is abnormally low and some exceptional action is required. The poor performance of the connection can be caused by

- Poor response on the receiving end
- Increased load on the sending end.

The condition may be intermittent. Message DFHZC2310 may follow indicating that the mode group has recovered.

System action: CICS cancels all transactions which have outstanding queued requests to use this mode group.

User response: Investigate the cause of the poor performance of the mode group. Check the availability and condition of the connected system.

Module: DFHZISP

XMEOUT Parameters: *applid, sysid, modename*

Destination: Console

DFHZC2310I *applid* **Connection *sysid* using mode group *modename* operating normally following recovery action.**

Explanation: Message DFHZC2309 has been issued for this mode group. The mode group has now recovered and is operating normally.

System action: Processing continues.

User response: None

Module: DFHZISP

XMEOUT Parameters: *applid, sysid, modename*

Destination: Console

DFHZC2312 * WELCOME TO CICS *****

Explanation: This is the CICS default good morning message for VTAM LUs. It is displayed unless an alternative GMTEXT has been specified as a system initialization parameter, or the typeterm definition logon message (LOGONMSG) has been set to NO.

System action: Processing continues.

User response: None.

Module: DFHSIT

Destination: Terminal End User

DFHZC2316 *applid* **VTAM ACB is closed**

Explanation: CICS and VTAM have been disconnected. This may be because

- CICS is terminating, or
- VTAM is terminating, or
- The CICS master terminal operator has issued
SET VTAM {CLOSED|IMMCLOSE|FORCECLOSE}

System action: The VTAM ACB is closed.

User response: If VTAM has not terminated, connection with VTAM can be reestablished by using master terminal operator commands.

Module: DFHZSHU

XMEOUT Parameter: *applid*

Destination: Console

DFHZC2318 *applid* **The autoinstall user program *progrname* is not enabled. Module *modname*.**

Explanation: While opening the VTAM ACB, CICS found that no installed program definition exists for the autoinstall user-program *progrname* specified in the SIT.

System action: Other processing continues.

User response: If you want to use autoinstall, produce an installed program definition for the autoinstall user-program *progrname* specified in the SIT.

Module: DFHSIJ1, DFHZOPA

XMEOUT Parameters: *applid, progrname, modname*

Destination: Console

DFHZC2319 *applid* **Unable to close VTAM ACB RC=*xx* error code=*yy***

Explanation: The VTAM ACB CLOSE request failed.

System action: CICS continues as if the ACB is closed. (It is not really closed.)

User response: Refer to the *VTAM Programming* manual for an explanation of the return and error codes.

The return code *xx* is the VTAM return code in Register 15. The error code *yy* is the ACB error flag 'ACBERFLG'.

Module: DFHZSHU

XMEOUT Parameters: *applid, xx, yy*

Destination: Console

DFHZC2320 **CORRUPTED TCTTE ADDRESS FOUND DURING SHUTDOWN.**

Explanation: A DFHTC CTYPE=LOCATE macro has returned an error indication while shutting down VTAM. This implies that the TCTTE chain has been corrupted,

possibly by an overlay of the table manager control blocks.

System action: CICS is abnormally terminated with a system dump.

User response: Investigate the dump to determine the cause of the problem.

Module: DFHZSHU

Destination: Console

DFHZC2350A *date time applid* **CICS Terminal Control shutdown threshold (*mm* minutes) exceeded. Sessions still active: *sesslist* ((*instance*) **Module name** {DFHZSHU})**

Explanation: CICS' attempt to shut down the network has not been completed within the time period allowed. This time period, the terminal control shutdown wait threshold, is specified by the TCSWAIT system initialization parameter.

In the message, *mm* is the value of TCSWAIT, and *sesslist* is the VTAM network names of the first 10 (if there are that many) hung VTAM terminals.

System action: CICS issues this message to both the CSNE transient data queue and the operating system console. This message is issued to the operating system console with an MVS write to operator (WTO) message descriptor code of 2. This means that the message is held by the operating system (that is, it does not roll off the screen) until the operator deletes it. For each hung VTAM session, message DFHZC2351 is also issued. DFHZC2351 gives further details of the session and is issued only to the CSNE transient data queue. CICS may attempt a FORCECLOSE on the session (see message DFHZC2351 for further details) but otherwise CICS terminal control shutdown continues as normal.

This message, DFHZC2350, is not processed by DFHZNAC (node abnormal condition program), so the condition cannot be intercepted by the installation's DFHZNEP (node error program). Note however that DFHZC2351 is processed by DFHZNAC and may be intercepted by the installation's DFHZNEP.

User response: Note the message, then delete it from the operating system console using the MVS CONTROL E (or K E) system command. See message DFHZC2351 for further guidance.

Module: DFHZSHU

XMEOUT Parameters: *date, time, applid, mm, sesslist, instance, {1=DFHZSHU}*

Destination: Console and Transient Data Queue CSNE

DFHZC2351 *date time applid termid netname* **Session still active after TC shutdown threshold expired. Reason: {01 Request in progress | 02 Task still active | 03 Waiting for SHUTC | 04 Waiting for BIS | 05 Waiting for UNBIND | 06 Waiting for RTR | 07 BID in progress | 08 Other TC work pending | 99 Undetermined} sense ((*instance*) **Module name** {DFHZSHU})**

Explanation: CICS' attempt to shut down the network has not been completed within the time period allowed. The time period, the terminal control shutdown wait threshold, is specified by the TCSWAIT system initialization parameter. This message is issued for each VTAM terminal that is still active (not shut down) after the time period has expired.

In the message *termid* and *netname* are respectively, the CICS terminal identifier, and the VTAM network name of the hung terminal. One of the following is also included in the message to indicate the reason for the hang

- | | |
|-----------|-----------------------|
| 01 | Request in progress |
| 02 | Task still active |
| 03 | Waiting for SHUTC |
| 04 | Waiting for BIS |
| 05 | Waiting for UNBIND |
| 06 | Waiting for RTR |
| 07 | BID in progress |
| 08 | Other TC work pending |
| 99 | Undetermined |

System action: CICS may attempt a FORCECLOSE on the session but otherwise CICS terminal control shutdown continues normally. Whether CICS attempts a FORCECLOSE depends upon

- The coding of the TCSACTN system initialization parameter, and
- How the installation's DFHZNEP (node error program) handles this condition.

If either of the following conditions is true

- TCSACTN=UNBIND, and this action is not changed by DFHZNEP,
- TCSACTN=NONE, and this action is changed to FORCECLOSE (UNBIND) by DFHZNEP

CICS terminal control issues a VTAM CLSDST and sends an SNA UNBIND command. If neither of the conditions is true, no special action is taken.

The first 10 terminals (if there are that many) reported by this message are also included in message DFHZC2350.

User response: Check the state of the terminal. Check whether the associated DFHZC3437 message includes CLSDST. If DFHZC3437 does not include CLSDST, or it does but the CLSDST still fails to complete, take appropriate action outside of CICS to shut down the terminal.

If after a reasonable interval, terminal control shutdown still fails to complete (message DFHZC2316 is not displayed), take one of the following actions

- FORCECLOSE the CICS/VTAM ACB.
- Perform a CICS CEMT PERFORM SHUTDOWN IMMEDIATE.
- Cancel the CICS job from the operating system console.

Warning: Do not perform one of these actions unless there are no other suitable actions to take.

The reason why the terminal does not shutdown is more likely to be a problem with the terminal device or the network, than with CICS.

If messages DFHZC2350, DFHZC2351, and DFHZC2352 are issued too early or too late in the shutdown process, take appropriate steps to change the TCSWAIT system initialization parameter on future runs of CICS. Once CICS has initialized, TCSWAIT cannot be changed.

Module: DFHZSHU

XMEOUT Parameters: *date, time, applid, termid, netname, {1=01 Request in progress, 2=02 Task still active, 3=03 Waiting for SHUTC, 4=04 Waiting for BIS, 5=05 Waiting for UNBIND, 6=06 Waiting for RTR, 7=07 BID in progress, 8=08 Other TC work pending, 99=99 Undetermined}, sense, instance, {1=DFHZSHU}*

Destination: CSNE

DFHZC2352 *date time applid sysid netname*
Intersystem parallel connection still active after TC shutdown threshold expired. ((instance) Module {DFHZSHU}).

Explanation: CICS' attempt to shut down the network has not been completed within the time period allowed. The time period, the terminal control shutdown wait threshold, is specified by the TCSWAIT system initialization parameter. This message is issued for the first VTAM intersystem parallel session in each connection (LU Type 6.1 and LU Type 6.2, but not LU Type 6.2 single-session APPC terminals) that is still active (not shut down) after the time period has expired.

In the message *sysid* and *netname* are respectively, the CICS system identifier and the VTAM network name.

System action: If the TCSACTN=FORCE system initialization parameter has been specified CICS will

attempt to force close the CICS VTAM ACB, provided that CNOS close processing has completed for LU Type 6.2 parallel session connections, otherwise CICS terminal control shutdown continues as normal. This message is not processed by DFHZNAC (node abnormal condition program), so the condition cannot be intercepted by the installation's DFHZNEP (node error program). Parallel connections reported by this message are not included in message DFHZC2350.

User response: If the TCSACTN=FORCE system initialization parameter has not been specified, or has been specified but the VTAM ACB still does not close, check the state of the connection. Take appropriate action outside of this CICS system to shut down the connection.

If messages DFHZC2350, DFHZC2351, and DFHZC2352 are issued too early or too late in the shutdown process, take appropriate steps to change the TCSWAIT system initialization parameter on future runs of CICS. Once CICS has initialized TCSWAIT cannot be changed.

Module: DFHZSHU

XMEOUT Parameters: *date, time, applid, sysid, netname, instance, {1=DFHZSHU}*

Destination: Console and Transient Data Queue CSNE

DFHZC2400E *date time applid termid tranid* **Error not supported. sense ((instance) Module name: {DFHZSYX})**

Explanation: CICS received an unexpected error code from VTAM.

For the meaning of *sense*, see message DFHZC2400.

The *sense* data consists of three hexadecimal values *-xx yy zzzz*, where *xx* is the VTAM sense information byte, *yy* is the VTAM sense modifier byte, and *zzzz* represents two bytes of user sense information. The possible values of *xx* are as follows

xx	meaning
X'00	User sense data only (see zzzz)
X'08	Request reject
X'10	Request error
X'20	State error
X'40	Request header (RH) usage error
X'80	Path error

For the meaning of *yy*, see the *SNA Formats* manual.

System action: CICS terminates the session. If a task is attached, it is abnormally terminated with a transaction dump.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Use the symptom string, and if

DFHXC2401E • DFHXC2403E

necessary the transaction dump, to determine the source of the error.

Module: DFHZSYX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSYX, 2=DFHZSYX, 3=DFHZSYX, 4=DFHZSYX, 5=DFHZSYX, 6=DFHZSYX, 7=DFHZSYX, 8=DFHZSYX, 9=DFHZSYX, 10=DFHZSYX}*

Destination: CSNE

DFHXC2401E *date time applid termid tranid RPL Active. sense ((instance) Module name {DFHZRVL | DFHZRVS | DFHZSDA | DFHZSDL | DFHZSDR | DFHZSDS | DFHZSES | DFHZSKR})*

Explanation: CICS attempted to request VTAM services using a request parameter list (RPL) that is currently active.

For the meaning of *sense*, see message DFHXC2400.

System action: CICS terminates the session. If a task is attached, it is abnormally terminated with a transaction dump.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Use the symptom string, and if necessary, the transaction dump to determine the source of the error.

Module: DFHZRVS, DFHZSDA, DFHZSDR, DFHZSDS, DFHZSES, DFHZSDL, DFHZRVL, DFHZSKR

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRVS, 2=DFHZSDA, 3=DFHZSDL, 4=DFHZSDS, 5=DFHZSES, 6=DFHZSKR, 7=DFHZRVL, 8=DFHZSDR, 9=DFHZRVL, 10=DFHZRVL, 11=DFHZRVL, 12=DFHZSDL}*

Destination: CSNE

DFHXC2402I *date time applid termid tranid netname VTAM has returned error on synchronous receive. sense ((instance) Module name {DFHZRAS})*

Explanation: VTAM has indicated that a synchronous receive issued by DFHZRAS during receive-any slow-down processing did not complete successfully. This indicates a serious mismatch between CICS's view of the state of the session and that of VTAM.

For the meaning of *sense*, see message DFHXC2400.

System action: The request is ignored. CICS prints the associated session TCTTE on the CSNE transient data destination. The RPL returned by VTAM is included in exception trace entry AP FCA2.

User response: Determine from the RPL in the exception trace why VTAM raised the error.

Module: DFHZRAS

XMEOUT Parameters: *date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZRAS}*

Destination: CSNE

DFHXC2403E *date time applid termid tranid Bind failure. sense ((instance) Module name {DFHZSYX})*

Explanation: An attempt to establish a session has failed. This can be because a physical path to the device could not be found, for one of the following reasons:

- The device does not exist
- The device has been defined incorrectly
- The device has rejected the bind

For the meaning of *sense*, see message DFHXC2400.

If this is a LU62 or LU61 session and the partner LU has sent sense bytes of X'0835nnnn' where nnnn is the offset of the NETNAME in the BIND. This indicates that the partner LU was unable to find a suitable session.

If the sense bytes are X'08010000', this can mean that the partner LU has failed to autoinstall a connection.

If the VTAM RETURN CODE FEEDBACK is X'1018' then VTAM generic resource is in use but the coupling facility is unavailable.

If *instance* is 1 with *sense* code X'0805', and the following are true:

- This system (TOR2) is a member of a generic resource (GR) and the partner (AOR) is not
- An affinity already exists between another member (TOR1) of the same generic resource (GR) and the AOR

this indicates that it is not valid to acquire this connection.

This message is normally accompanied by DFHXC2411 instance 36 for the equivalent sessions in the AOR. DFHXC2411 indicates that the AOR cannot find a connection defined with the real name of TOR2. The AOR connection is defined with the generic resource name of the TOR.

System action: Because communication cannot be established with a node, a VTAM CLSDST macro is issued to release any control blocks previously built, and the node could be placed out of service.

User response: Use the VTAM sense code given in the message to determine the cause of failure. If appropriate, ensure that the node name was included in

the network control program/virtual storage (NCP/VIS) generation deck and investigate for a possible bad communication line.

If the sense bytes were X'0835nnnn' (where nnnn is the offset of the NETNAME in the BIND), the partner LU was unable to find a suitable session. If the partner LU is CICS, look in the partner LU's log for DFHZC2411 and previous messages for the same session. This should give some indication as to why no session could be found.

If LU62 autoinstall is in use and the sense bytes were X'08010000' look in the partner LU's log for messages DFHZC2411 and DFHZC69xx which should indicate the reason for failure to autoinstall a connection.

If the VTAM RETURN CODE FEEDBACK is X'1018': the logon can be retried once the coupling facility becomes available.

If *instance* is 1 with *sense* X'0805', determine if TOR2 was started intentionally with a different APPLID and the same generic resource name and if not, correct the problem. If it was and you need a connection between these two systems you need to end the affinity between AOR and TOR1. The affinity can be ended by

1. Bring up TOR1, acquire the connection and release it or
2. Bring up TOR1 and use the CEMT SET CONNECTION ENDAFFIN, CEMT PERFORM ENDAFFIN or EXEC CICS ENDAFFIN command.
3. Use a batch program described in 'Writing a batch program to end affinities' in the *CICS Intercommunication Guide*.

However, if the AOR is within the same sysplex as the TOR you should be using MRO connections rather than APPC - you then get no problems with affinities.

If the AOR is outside the sysplex and the connection is acquired from the TOR you need to use a HUB as described in 'Using a HUB' in the *CICS Intercommunication Guide* to prevent two TORs from attempting to connect to one AOR using the generic resource name.

Alternatively you can change the AOR connection to address TOR2 by its real name as opposed to its generic resource name and always acquire the connection from the AOR. This implies that you must not use AUTOCONNECT in the TOR connection.

You should release the connection as soon as possible.

Module: DFHZSYX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSYX, 2=DFHZSYX}*

Destination: CSNE

DFHZC2404E *date time applid termid tranid* **VTAM Detected Logic Error.** *sense ((instance) Module name {DFHZLEX})*

Explanation: VTAM detected an error in a request. The request was either incomplete or not executable.

For the meaning of *sense*, see message DFHZC2400.

System action: CICS breaks communication with the node (CLSDST), abnormally terminates any attached task, places the node out of service and produces a transaction dump.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Ensure that all application programs running concurrently have proper addressability, thereby avoiding alteration of CICS control blocks such as the TCTTE or the RPL. If this message occurs during normal system execution, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

This message may also occur if VTAM is terminating. Under these conditions it is not a serious problem, and usually no response is necessary.

Module: DFHZLEX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZLEX, 2=DFHZLEX, 3=DFHZLEX, 4=DFHZLEX, 5=DFHZLEX, 6=DFHZLEX}*

Destination: CSNE

DFHZC2405E *date time applid termid tranid* **Node netname not activated.** *sense ((instance) Module name {DFHZSIM | DFHZSIX | DFHZSYX})*

Explanation: The node was not activated, or was deactivated by the network operator, or a generic resource affinity already exists with another system in the same generic resource.

Instance 6 - If the partner is a member of a generic resource (TOR2) and this system (AOR) is not and an affinity already exists between the AOR and another member of the same generic resource (TOR1) because TOR1 crashed, then VTAM has indicated that you cannot acquire this connection.

For the meaning of *sense*, see message DFHZC2400.

System action: All outstanding SEND and RECEIVE requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. A VTAM CLSDST macro is issued to halt communication with the node, and internal LOGONs are prevented.

If this message is issued during takeover, the acquire is retried at intervals of 1, 2, 4 and 8 minutes after the first attempt. This allows time for sessions which require manual intervention before the acquire can succeed.

DFHZC2406E • DFHZC2408E

User response: Use the VTAM VARY command to activate the node before using it in the network. Alternatively, for ISC with IMS, enable IMS for LOGONS.

It is possible that the node in question has previously been used as a generic APPLID (or in VTAM terms – a USERVAR). Use the VTAM operator command DISPLAY USERVAR to see if this is the case. If it is, you can use MODIFY USERVAR,OPTION=DELETE,ID=node to delete the USERVAR.

Instance 6 - Determine if TOR2 was started intentionally with a different APPLID and the same GR name and if not, correct the problem. If it was and you need a connection between these two systems then you need to end the affinity between the AOR and TOR1. The affinity can be ended by

1. Bring up TOR1, acquire the connection and release it cleanly or
2. Bring up TOR1 and use ENDAFFIN via CEMT or EXEC CICS or
3. Use a batch program described in 'Writing a batch program to end affinities' in the CICS Intercommunication Guide.

However, if the AOR is within the same sysplex as the TOR you should be using MRO connections rather than APPC - you then get no problems with affinities.

If the AOR is outside the sysplex and the connection is acquired from the TOR then you need to use a HUB as described in 'Using a HUB' in the CICS Intercommunication Guide to prevent two TORs from attempting to connect to one AOR using the generic resource name.

Alternatively you can change the AOR connection to address TOR2 by its real name as opposed to its generic resource name and always acquire the connection from the AOR. This implies that you must not use AUTOCONNECT in the TOR2 connection.

Module: DFHZSYX, DFHZSIX, DFHZSIM

XMEOUT Parameters: *date, time, applid, termid, trandid, netname, sense, instance, {1=DFHZSIM, 2=DFHZSIM, 3=DFHZSIM, 4=DFHZSIM, 5=DFHZSIM, 6=DFHZSYX, 7=DFHZSYX, 8=DFHZSYX, 9=DFHZSIX, 10=DFHZSYX, 11=DFHZSYX}*

Destination: CSNE

DFHZC2406E *date time applid termid trandid* **Terminate self command received. sense ((instance) Module name {DFHZSYX})**

Explanation: The logical unit (LU) has requested termination of the session.

For the meaning of *sense*, see message DFHZC2400.

System action: The VTAM CLSDST macro is issued to stop communications with the node. If a task is

attached, it is abnormally terminated with a transaction dump.

User response: None.

Module: DFHZSYX

XMEOUT Parameters: *date, time, applid, termid, trandid, sense, instance, {1=DFHZSYX}*

Destination: CSNE

DFHZC2407E *date time applid termid trandid* **Permanent channel failure. sense ((instance) Module name: {DFHZSYX})**

Explanation: Network Control Program/Virtual Storage (NCP/VS) was either shut down by the network operator or was abnormally terminated. Alternatively, there could have been a channel failure.

For the meaning of *sense*, see message DFHZC2400.

System action: Since communication with the logical unit was broken, the VTAM CLSDST macro instruction is issued to release control blocks previously built by VTAM. If a task is attached, it is abnormally terminated with a transaction dump.

User response: Use the supplied dump to check for a possible NCP/VS or channel problem.

Module: DFHZSYX

XMEOUT Parameters: *date, time, applid, termid, trandid, sense, instance, {1=DFHZSYX, 2=DFHZSYX}*

Destination: CSNE

DFHZC2408E *date time applid termid trandid* **Apparent VTAM Error. sense ((instance) Module name: {DFHZSYX})**

Explanation: VTAM encountered an error during its own processing.

For the meaning of *sense*, see message DFHZC2400.

System action: If a task is attached, it is abnormally terminated with a transaction dump. The node is placed out of service.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Use the sense data to determine the nature of the error.

Module: DFHZSYX

XMEOUT Parameters: *date, time, applid, termid, trandid, sense, instance, {1=DFHZSYX, 2=DFHZSYX, 3=DFHZSYX, 4=DFHZSYX}*

Destination: CSNE

DFHZC2409I *date time applid termid tranid* **VTAM Recovered Node. LOSTERM Error Code X'xx'. sense ((instance) Module name {DFHZLTX})**

Explanation: VTAM successfully reestablished communication with a node. The reason for entering the LOSTERM exit is given by *xx*, which has one of the following values

Value	Meaning
0	Dial-disconnect on dial-in.
4	Dial-disconnect on dial-out.
0C	Deactivate immediate.
14	Unconditional terminate self.
1C	Segmenting error.
20	Conditional terminate self.
24	BUFLIM value exceeded.

For the meaning of *sense*, see message DFHZC2400.

System action: CICS reestablishes communication and places the node in service.

User response: None.

Module: DFHZLTX

XMEOUT Parameters: *date, time, applid, termid, tranid, X'xx', sense, instance, {1=DFHZLTX, 2=DFHZLTX}*

Destination: CSNE

DFHZC2410E *date time applid termid tranid* **Node Unrecoverable. VTAM LOSTERM Error Code X'xx'. sense ((instance) Module name {DFHZLTX})**

Explanation: Communication with a node was interrupted and cannot be reestablished by VTAM. The reason for entering the LOSTERM exit is given by the error code *X'xx*.

For the meaning of *sense*, see message DFHZC2400.

System action: The VTAM CLSDST macro is issued to release any control blocks previously built for the node. If a task is attached, it is abnormally terminated with a transaction dump.

User response: See the appropriate *VTAM Programming* manual for an explanation of the error code.

Module: DFHZLTX

XMEOUT Parameters: *date, time, applid, termid, tranid, X'xx', sense, instance, {1=DFHZLTX, 2=DFHZLTX, 3=DFHZLTX, 4=DFHZLTX}*

Destination: CSNE

DFHZC2411E *date time applid termid tranid nodeid* **attempted invalid logon. sense ((instance) Module name {DFHTFP | DFHZATA | DFHZBLX | DFHZLTX | DFHZSCX | RESERVE})**

Explanation: Node *nodeid* attempted to log on to CICS but the logon is invalid.

The *nodeid* in the message will always start with the 'netname' of the node attempting to connect to CICS. For some instances of the message resulting from an LU6.2 log on, the modename of the session will be concatenated to the 'netname' with a dot separator. Since a string consisting of eight blanks is the default modename, this can lead to idiosyncratic formatting of the message.

If the message is issued by DFHZATA, CICS has failed in its attempt to autoinstall the terminal or connection.

The instance *instance* is one of the following

- 1 For LU6.1 no suitable TCTTE can be found, or no session TCTTE exists This could occur for one of the following reasons
 1. The bind did not contain a modename.
 2. There is an RDO definition for a member name connection in a generic resource communicating with another generic resource over an LU6.1 link.
- 2 No PLUNAME has been found in the LU6.2 bind processed by CICS.
- 3 An attempt to autoinstall a member name connection in a generic resource system has failed because the bind was not for a SNA service manager.
- 4 Autoinstall is not allowed because the system is terminating.
- 5 Autoinstall is not allowed because the VTAM ACB is closing.
- 6 ISC support is not present because ISC=NO specified in the SIT.
- 7 Used by DFHZATA for several reasons, for example BIND bad and user exit bad.
- 8 The TCTTE address restored and the address found by NIBSEARCH do not agree.
- 9 The system is terminating.
- 10 VTAM is terminating.
- 11 RESERVED.
- 12 RESERVED.
- 13 No address is present in the RPL.
- 14 LU6.1 cannot autoinstall.

If both CICS systems are registered as different generic resources, the LU61

- connections must be defined with each other's generic resource netnames; they cannot communicate by member name. In this case CICS looked for the generic resource netname and was unable to find it.
- 15** ISC support is not present.
- 16** A CINIT arrived for an APPC parallel session. This is not supported All input for an APPC parallel session should be via a BIND. Also, no connection exists with this NETNAME.
- 17** Session is not bound.
- 18** Not used.
- 19** LU is not enabled. Typically it is an XRF alternate CICS.
- 20** A second CINIT with the same netname has arrived.
- 21** Logon rejected due to CATAabend.
- 22** A CINIT initiated by SIMLOGON occurred for an APPC parallel session. A matching connection exists, but it is being deleted. This should not occur because either the delete should have been cancelled (if it had been scheduled but not started) or the SIMLOGON should have been queued until the delete was attempted and fails because there is SIMLOGON activity.
- 23** A BIND was received for an LU6.1 connection. This CICS is registered as a generic resource but the partner addressed CICS by its MEMBER name instead of its generic resource name.
- Change the partner's connection definition for this system to use a NETNAME of this system's generic resource name.
- 24** Not used.
- 25** A CINIT was received for an LU6.1 connection. This CICS is registered as a generic resource but the partner addressed CICS by its MEMBER name instead of its generic resource name.
- Change the partner's connection definition for this system to use a NETNAME of this system's generic resource name.
- 26** A BIND was received for an LU6.1 connection. This CICS is registered as the same generic resource as the partner. However, the partner addressed CICS by the generic resource name instead of the member name which it should use for intra-plex communication.
- Change the partner's connection definition for this system to use a NETNAME of this system's member name.
- 27** A CINIT was received for an LU6.1 connection. This CICS is registered as the same generic resource as the partner. However, the partner addressed CICS by the generic resource name rather than the member name which it should use for intra-plex communication.
- Change the partner's connection definition for this system to use a NETNAME of this system's member name.
- 28** An LU62 bind was received for the netname specified. CICS has found a connection with the relevant netname but the connection was not defined as APPC.
- 29** A system entry for the connection indicated by the bind has been found but none of its sessions are usable.
- 30** No modename field UDSS02 was found in the bind.
- 31** Examination of the session tctte has indicated it to be out of service, a non-SNA service manager session and to have the associated connection released.
- 32** An attempt to autoinstall a GR name or XRF connection has failed because the bind was not for a SNA service manager.
- 33** This bind is a SNA service manager request for an existing partner.
- 34** There is a problem with the user data supplied in the bind. Specifically one of the following.
- There is no user data.
 - The user data supplied is too short.
 - The user data is not architected.
- 35** A delete is pending for the connection found. This delete is for a non-transient terminal definition and has been requested explicitly.
- 36** For a non-generic resource request, examination of the bind has indicated that it is not for a SNA service manager.
- This instance also indicates that you should not acquire this connection if the partner is a member of a generic resource, and this system is not, and an affinity already exists between this system and another member of the same generic resource. See message DFHZC2403, which is issued for the partner's equivalent sessions, for how you correct the situation.
- 37** The current session count has exceeded the maximum session count indicated in the mode group entry.
- This can be caused by a VTAM LU definition with a duplicate netname. At session initiation time VTAM cannot detect that there may be two Independent Logical Units (ILUs) with the

same netname. This can lead to CICS being requested to bind more sessions than specified in the mode group.

- 38** An attempt to acquire a generic resource connection failed because there is a member name connection defined for the generic resource member to which VTAM has chosen to route it.
- 39** This CICS has deregistered from a generic resource but a remote partner is attempting to bind an APPC session using a generic resource name. This indicates that VTAM affinities have not been ended on both sides.
- 40** This CICS has deregistered from a generic resource but a remote partner is attempting to bind an LU6.1 session using a generic resource name. This indicates that VTAM affinities have not been ended on both sides.
- 41** A bind has been received for an APPC SNA Service Manager session while the connection is in the process of being released. As the maximum number of SNASVCMG sessions has already been set to zero, acceptance of this bind would leave the connection in a Freeing state and is therefore rejected. Retry the Acquire of the connection when all the user sessions have been CLSDST and the connection is released.

For the meaning of *sense*, see message DFHZC2400.

If ???????? is displayed in the second half of the *nodeid* field, the BIND may contain a SESSION QUALIFIER or MODENAME with an invalid length.

System action: The logon is rejected. If the reject is from DFHZSCX via the dummy TCTTE, an attempt is made to print the failing BIND and sense code with which it was rejected as part of the message.

User response: Use the instance number to determine why the attempted logon has been rejected and take the appropriate action.

Module: DFHZLGX, DFHZSCX, DFHZATA, DFHZBLX

XMEOUT Parameters: *date, time, applid, termid, tranid, nodeid, sense, instance, {1=DFHZSCX, 2=DFHZBLX, 3=DFHZBLX, 4=DFHZBLX, 5=DFHZBLX, 6=DFHZBLX, 7=DFHZATA, 8=DFHZLGX, 9=DFHZLGX, 10=DFHZLGX, 11=DFHZSCX, 12=RESERVE, 13=DFHZLGX, 14=DFHZLGX, 15=DFHZLGX, 16=DFHZLGX, 17=DFHZLGX, 18=DFHZLGX, 19=DFHZLGX, 20=DFHZLGX, 21=DFHTFP, 22=DFHZLGX, 23=DFHZSCX, 24=DFHZLGX, 25=DFHZLGX, 26=DFHZSCX, 27=DFHZLGX, 28=DFHZBLX, 29=DFHZBLX, 30=DFHZBLX, 31=DFHZBLX, 32=DFHZBLX, 33=DFHZBLX, 34=DFHZBLX, 35=DFHZBLX, 36=DFHZBLX, 37=DFHZBLX, 38=DFHZLGX, 39=DFHZBLX, 40=DFHZSCX, 41=DFHZBLX}*

Destination: CSNE

DFHZC2412E *date time applid termid tranid* **Receive any request failed.** *sense ((instance) Module name {DFHZRAC})*

Explanation: A receive-any request to VTAM failed. VTAM was terminated.

For the meaning of *sense*, see message DFHZC2400.

System action: The VTAM RPL control block is logged to the CSMT log for visual inspection.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Determine the reason why the receive-any failed. First, check to see if the VTAM RPL has been altered. If it has been altered, check to see if the alterations could have caused any problems. Correct any obvious errors. It may be useful to refer to the *VTAM Programming* manual, (SC23-0115), during problem determination.

Module: DFHZRAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRAC, 2=DFHZRAC}*

Destination: CSNE

DFHZC2413E *date time applid termid tranid nodeid* **CLSDST failed.** *sense ((instance) Module name {DFHZATA | DFHZLGX | DFHTFP})*

Explanation: A CLSDST request for the node identified by *nodeid* failed. VTAM may not have sufficient space to respond to the request.

For the meaning of *sense*, see message DFHZC2400.

System action: No further communication with the node is initiated.

User response: Inspect the CSNE, CSMT and CSTL logs for indication of a VTAM storage problem or error message. Also check for any messages indicating an I/O problem.

Module: DFHTFP, DFHZATA, DFHZLGX

XMEOUT Parameters: *date, time, applid, termid, tranid, nodeid, sense, instance, {1=DFHZATA, 2=DFHZLGX, 3=DFHTFP}*

Destination: CSNE

DFHZC2414E *date time applid termid tranid* **Temporary VTAM Storage Problem.** *sense ((instance) Module name {DFHZSYX})*

Explanation: Temporary VTAM storage problem. VTAM is currently short of storage.

DFHXC2415E • DFHXC2418E

For the meaning of *sense*, see message DFHXC2400.

System action: The failing VTAM request is retried until VTAM is able to accept it.

User response: Increase the VTAM working buffer storage if this condition recurs and causes undue problems.

Module: DFHZSYX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSYX}*

Destination: CSNE

DFHXC2415E *date time applid termid tranid* **Node netname out of service.** *sense ((instance) Module name {DFHZNAC})*

Explanation: A node error condition has occurred on node *nodeid*.

For the meaning of *sense*, see message DFHXC2400.

System action: CICS places the node out of service.

User response: Use the sense data to determine the nature of the error.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHXC2416E *date time applid termid tranid* **VTAM is halting.** *sense ((instance) Module name {DFHZSYX})*

Explanation: A VTAM HALT command was entered by the network operator while a SIMLOGON or OPNDST request was in progress. The instance number indicates what type of halt was requested

- 1 Orderly shutdown
- 2 Quick shutdown.

For the meaning of *sense*, see message DFHXC2400.

System action: The VTAM network is quiesced to prevent further requests and the node is placed out of service.

User response: None.

Module: DFHZSYX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSYX, 2=DFHZSYX}*

Destination: CSNE

DFHXC2417E *date time applid termid tranid* **VTAM Inactive to TCB.** *sense ((instance) Module name {DFHZCLS | DFHZCLX | DFHZOPN | DFHZOPX | DFHZRAC | DFHZRCLP | DFHZRST | DFHZRVL | DFHZRVS | DFHZRVX | DFHZSDA | DFHZSDL | DFHZSDR | DFHZSDS | DFHZSES | DFHZSIM | DFHZSIX | DFHZSKR | DFHZSLX | DFHZSYX | DFHZTAX})*

Explanation: Either CICS has not opened its VTAM ACB or VTAM has halted.

For the meaning of *sense*, see message DFHXC2400.

System action: The VTAM network is quiesced to prevent further requests and a dump is produced.

User response: If VTAM was not halted by the network operator, use the supplied dump to determine the problem.

Module: DFHZSYX, DFHZCLS, DFHZCLX, DFHZOPN, DFHZOPX, DFHZRAC, DFHZRCLP, DFHZRST, DFHZRVL, DFHZRVS, DFHZRVX, DFHZSDL, DFHZSDR, DFHZSDS, DFHZSES, DFHZSIM, DFHZSIX, DFHZSKR, DFHZSLX, DFHZTAX, DFHZSDA

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZOPX, 2=DFHZCLS, 3=DFHZOPN, 4=DFHZRCLP, 5=DFHZRST, 6=DFHZRVS, 7=DFHZRVX, 8=DFHZSDA, 9=DFHZSDL, 10=DFHZSDS, 11=DFHZSES, 12=DFHZSIM, 13=DFHZSKR, 14=DFHZSLX, 15=DFHZRAC, 16=DFHZCLX, 17=DFHZRVL, 18=DFHZSDR, 19=DFHZSIX, 20=DFHZTAX, 21=DFHZOPX, 22=DFHZSYX}*

Destination: CSNE

DFHXC2418E *date time applid termid tranid* **Unknown command in RPL.** *sense ((instance) Module name {DFHZSEX})*

Explanation: An unknown command was detected in the VTAM request parameter list (RPL) by the CICS SESSIONC exit routine. The RPL address could be invalid or the RPL could have been altered.

For the meaning of *sense*, see message DFHXC2400.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

Message DFHME0116 should be produced containing the symptom string for this problem.

A CLSDST is issued to halt communication with the node, and the node is placed out of service.

User response: First, check if the VTAM RPL has an invalid address. If the address is valid, check to see if the RPL has been altered. If it has been altered, check

to see if the alterations could have caused any problems. Correct any obvious errors. It may be useful to refer to the *VTAM Programming* manual, (SC23-0115), while carrying out problem determination.

Module: DFHZSEX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSEX, 2=DFHZSEX}*

Destination: CSNE

DFHZC2419E *date time applid termid tranid* **Unknown command in RPL. sense ((instance) Module name {DFHZRAC | DFHZSLX | DFHZSSX})**

Explanation: An unknown command was detected in the request parameter list (RPL) by the send-data-flow synchronous exit routine. The RPL address could be invalid or the RPL could have been altered.

For the meaning of *sense*, see message DFHZC2400.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

Message DFHME0116 should be produced containing the symptom string for this problem.

A VTAM CLSDST macro is issued to halt communication with the node, and the node is placed out of service.

User response: In the first instance, check if the VTAM RPL has an invalid address. If the address is valid, check to see if the RPL has been altered. If it has been altered, check to see if the alterations could have caused any problems. Correct any obvious errors. It may be useful to refer to the *VTAM Programming* manual, (SC23-0115-3), while carrying out problem determination.

Module: DFHZSSX, DFHZSLX, DFHZRAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSSX, 2=DFHZSLX, 3=DFHZRAC, 4=DFHZRAC, 5=DFHZRAC, 6=DFHZRAC, 7=DFHZRAC, 8=DFHZRAC}*

Destination: CSNE

DFHZC2420E *date time applid termid tranid* **Unknown command in RPL. sense ((instance) Module name {DFHZSAX})**

Explanation: An unknown command was detected in the request parameter list (RPL) by the send-data-flow asynchronous exit routine. The RPL address could be invalid or the RPL could have been altered.

For the meaning of *sense*, see message DFHZC2400.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

Message DFHME0116 should be produced containing the symptom string for this problem.

A VTAM CLSDST macro is issued to halt communication with the node, and the node is placed out of service.

User response: In the first instance, check if the VTAM RPL has an invalid address. If the address is valid, check to see if the RPL has been altered. If it has been altered, check to see if the alterations could have caused any problems. Correct any obvious errors. It may be useful to refer to the *VTAM Programming* manual, (SC23-0115), while carrying out problem determination.

Module: DFHZSAX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSAX}*

Destination: CSNE

DFHZC2421E *date time applid termid tranid* **Unsupported command received. sense ((instance) Module name {DFHZRAC | DFHZRLP | DFHZRVX})**

Explanation: An unknown command or request was detected, or the RPL contains logical unit (LU) status.

For the meaning of *sense*, see message DFHZC2400.

System action: If an invalid command or request was detected, all outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. A VTAM CLSDST macro is issued to halt communication with the node.

For ISC sessions, this error may be caused by specifying incompatible session types at each node. (For example, SESSIONTYPE=SEND in one node and SESSIONTYPE=FASTRECV in the other node.)

If the RPL contains logical unit (LU) status, one of the following messages is issued: DFHZC2461, DFHZC2462, DFHZC2464, DFHZC2465, or DFHZC2466.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: An invalid command or request indicates inconsistencies or errors in the definitions of the named terminals/sessions in CICS, VTAM or the connected system for LU6 sessions. Ensure that these definitions are consistent and correct for the device or session characteristics.

Module: DFHZRAC, DFHZRVX, DFHZRLP

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRLP, 2=DFHZRLP, 3=DFHZRVX, 4=DFHZRVX, 5=DFHZRAC, 6=DFHZRAC, 7=DFHZRAC, 8=DFHZRAC, 9=DFHZRAC}*

Destination: CSNE

DFHZC2422E *date time applid termid tranid ZCP*
Logic Error. *sense ((instance) Module*
name {DFHZARL | DFHZDET |
DFHZERH | DFHZE1 | DFHZE2 |
DFHZNAC | DFHZOPN | DFHZRAC |
DFHZRVS | DFHZSDS | DFHZSIM |
DFHZSKR | DFHZSLX | DFHZSSX})

Explanation: During terminal processing, CICS detected an invalid internal state in DFHZCP.

Instance 1 of the message could be caused by a loss of data following a persistent sessions restart in a partner system. In this case, no logic error has occurred because any updates are backed out. This normally follows an AZCD for the same session and the message DFHZC0144 for the partner session.

For the meaning of *sense*, see message DFHZC2400.

System action: All outstanding send and receive requests are purged, and the task is abnormally terminated with a transaction dump. The node is placed out of service and the TCTTE, RPL, and action flags are logged to the CSMT destination for debugging purposes.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Ensure that the application programs running concurrently do not alter the TCTTE. If the TCTTE is not being altered, use the dump to locate the source of the error.

It may be useful to examine the debugging data printed on the CSMT log for clues about what possibly went wrong.

Module: DFHZARL, DFHZDET, DFHZERH, DFHZE1, DFHZE2, DFHZOPN, DFHZRAC, DFHZRVS, DFHZSDS, DFHZSIM, DFHZSKR, DFHZSLX, DFHZNAC, DFHZSSX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZDET, 2=DFHZSIM, 3=DFHZSIM, 4=DFHZERH, 5=DFHZERH, 6=DFHZERH, 7=DFHZERH, 8=DFHZERH, 9=DFHZERH, 10=DFHZERH, 11=DFHZERH, 12=DFHZERH, 13=DFHZERH, 14=DFHZNAC, 15=DFHZERH, 16=DFHZERH, 17=DFHZERH, 18=DFHZERH, 19=DFHZSDS, 20=DFHZE1, 21=DFHZE1, 22=DFHZOPN, 23=DFHZOPN, 24=DFHZRVS, 25=DFHZRVS, 26=DFHZSKR, 27=DFHZSSX, 28=DFHZSLX, 29=DFHZSLX, 30=DFHZRAC, 31=DFHZRAC, 32=DFHZRAC, 33=DFHZRAC, 34=DFHZRAC, 35=DFHZRAC, 36=DFHZRAC, 37=DFHZRAC, 38=DFHZRAC, 39=DFHZARL, 40=DFHZARL, 41=DFHZE2, 42=DFHZE2, 43=DFHZRAC, 44=DFHZRAC, 45=DFHZOPN}*

Destination: CSNE

DFHZC2423E *date time applid termid tranid*
Attempted to send unsupported
command. *sense ((instance) Module*
name {DFHZSDS})

Explanation: A request to send data synchronously was incomplete. Possible reasons are as follows

1. The TCTTE was altered.
2. A logic error was encountered.
3. The TCTTE was inadvertently placed on the send-synchronous queue.

For the meaning of *sense*, see message DFHZC2400.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing the VTAM CLSDST macro instruction.

User response: For reasons 1 to 3 listed above, ensure that application programs running concurrently do not alter the TCTTE.

If you suspect a logic error (2), check that the VTAM RPL has not been corrupted. If you still cannot resolve the problem, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZSDS

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSDS}*

Destination: CSNE

DFHZC2424E *date time applid termid tranid*
SESSIONC command request invalid.
sense ((instance) Module name
{DFHZSES | RESERVE})

Explanation: A SESSIONC request is incomplete or invalid. Possible reasons are as follows

1. The TCTTE was altered.
2. The command request bits are incomplete. DFHZSES checks TCTEISDT for a Start Data Traffic (SDT) command, TCTEISTS for a Set and Test Sequence Number (STSN) command, and TCTEICLR for a CLEAR command. If it does not find any of these, DFHZSES causes the message to be issued.
3. The wrong request was queued to SESSIONC.

For the meaning of *sense*, see message DFHZC2400.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

Message DFHME0116 should be produced containing the symptom string for this problem.

Communication with the node is terminated by issuing the VTAM CLSDST macro instruction.

User response: Ensure that application programs running concurrently do not alter the TCTTE.

If the TCTTE is not altered, check for conditions 2 or 3.

Module: DFHZSES

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSES, 2=DFHZSES, 3=RESERVE}*

Destination: CSNE

DFHZC2425E *date time applid termid tranid* **ASYNC command request invalid.** *sense ((instance) Module name {DFHZSDA})*

Explanation: A request to send data asynchronously was incomplete or invalid. This condition can be caused by the TCTTE being altered.

For the meaning of *sense*, see message DFHZC2400.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

Message DFHME0116 should be produced containing the symptom string for this problem.

Communication with the node is terminated by issuing the VTAM CLSDST macro instruction.

User response: Check the TCTTE. Ensure that application programs running concurrently do not alter the TCTTE.

Module: DFHZSDA

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSDA, 2=DFHZSDA}*

Destination: CSNE

DFHZC2426E *date time applid termid tranid* **Node Status Error. Node is out of service or receive only.** *sense ((instance) Module name {DFHZATT})*

Explanation: Input was received from a node identified either as output-only or as permanently out of service.

For the meaning of *sense*, see message DFHZC2400.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User response: Change the terminal entry in the TCT to indicate that the node is not an output-only device. If the node is out of service, the master terminal operator should place the node back into service.

Module: DFHZATT

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZATT, 2=DFHZATT, 3=DFHZATT}*

Destination: CSNE

DFHZC2427I *date time applid termid tranid* **NCP Restarted.** *sense ((instance) Module name {DFHZSYX})*

Explanation: Network Control Program/Virtual Storage (NCP/VS) has been restarted after failing during an OPNDST.

For the meaning of *sense*, see message DFHZC2400.

System action: The OPNDST request is reissued.

User response: None.

Module: DFHZSYX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSYX}*

Destination: CSNE

DFHZC2428E *date time applid termid tranid* **Send DFSYN request incomplete.** *sense ((instance) Module name {DFHZSDS})*

Explanation: A send-synchronous request was issued without indicating that either a command or data was to be sent.

For the meaning of *sense*, see message DFHZC2400.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Check the VTAM RPL for obvious errors. Ensure that application programs running concurrently do not alter the TCTTE. If the TCTTE is not being altered, use the symptom string, and if necessary, the dump to determine the source of the error.

Module: DFHZSDS

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSDS}*

Destination: CSNE

DFHZC2429E *date time applid termid tranid* **RESETSR request invalid RTYPE.** *sense ((instance) Module name {DFHZRST})*

Explanation: An invalid RESETSR request was made in the VTAM macro issued by CICS. The invalid request can be because an RTYPE was not specified or was incorrectly specified, or the TCTTE was altered.

For the meaning of *sense*, see message DFHZC2400.

System action: All outstanding receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

DFHXC2430E • DFHXC2433E

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Check the VTAM RPL for obvious errors. Ensure that application programs running concurrently do not alter the TCTTE. If the TCTTE is not being altered, use the symptom string, and if necessary the dump, to determine the source of the error.

Module: DFHZRST

XMEOUT Parameters: *date, time,applid, termid, trandid, sense, instance, {1=DFHZRST, 2=DFHZRST, 3=DFHZRST}*

Destination: CSNE

DFHXC2430E *date time applid termid trandid* **Send response command request invalid.** *sense ((instance) Module name {DFHZSDR})*

Explanation: A send-response request was invalid. Either the request did not specify the response level (DR1 or DR2), or the TCTTE was altered.

For the meaning of *sense*, see message DFHXC2400.

System action: All outstanding send requests are purged. If a task is attached, it is abnormally terminated with a transaction dump and the node is placed out of service.

User response: Check the VTAM RPL for obvious errors. Ensure that application programs running concurrently do not alter the TCTTE. If the TCTTE is not being altered, use the dump to determine the source of the error.

Module: DFHZSDR

XMEOUT Parameters: *date, time,applid, termid, trandid, sense, instance, {1=DFHZSDR}*

Destination: CSNE

DFHXC2431E *date time applid termid trandid* **Request to a released node.** *sense ((instance) Module name {DFHZSYX})*

Explanation: CICS requested VTAM to perform a close destination for a node currently "owned" by CICS.

For the meaning of *sense*, see message DFHXC2400.

System action: If the CICS ACB is open, all outstanding requests are purged and the task is abnormally terminated with a transaction dump if a task is attached.

User response: If the CICS ACB is open, use the dump to determine the source of the error. Check that the TCTTE is valid.

Module: DFHZSYX

XMEOUT Parameters: *date, time,applid, termid, trandid,*

sense, instance, {1=DFHZSYX}

Destination: CSNE

DFHXC2432E *date time applid termid trandid* **Exception response received.** *sense ((instance) Module name: {DFHZRAC | DFHZRVX | DFHZSSX})*

Explanation: CICS has received an exception response.

For the meaning of *sense*, see message DFHXC2400.

System action: Another CICS message is issued in conjunction with this message.

User response: Perform the action specified for the associated CICS message.

Module: DFHZRAC, DFHZRVX, DFHZSSX

XMEOUT Parameters: *date, time,applid, termid, trandid, sense, instance, {1=DFHZRVX, 2=DFHZRVX, 3=DFHZRVX, 4=DFHZRVX, 5=DFHZRVX, 6=DFHZRVX, 7=DFHZRVX, 8=DFHZSSX, 9=DFHZSSX, 10=DFHZSSX, 11=DFHZSSX, 12=DFHZRAC, 13=DFHZRAC, 14=DFHZRAC, 15=DFHZRAC, 16=DFHZRAC, 17=DFHZRAC, 18=DFHZRAC, 19=DFHZRAC, 20=DFHZRAC, 21=DFHZRAC, 22=DFHZRAC, 23=DFHZRAC}*

Destination: CSNE

DFHXC2433E *date time applid termid trandid nodeid* **Logon has failed because autoinstall is disabled.** *sense ((instance) Module name {DFHZBLX | DFHZLGX})*

Explanation: Node *nodeid* attempted to log on to CICS. The logon has failed because autoinstall is disabled. Possible reasons are

- Autoinstall system initialization parameters have been incorrectly defined.
- An error has been detected in CICS terminal attach processing.
- The system is short on storage. Autoinstall is reenabled once the SOS condition ends.

System action: The logon is rejected.

User response: Ensure that the value for the AIQMAX system initialization parameter is greater than zero. If an autoinstall user program has been specified for system initialization parameter AIXIT, check that the program name has been defined to CICS. See the *CICS System Definition Guide* for further information about autoinstall parameters.

If the system is short on storage, see the associated messages for further guidance.

Module: DFHZLGX, DFHZSCX, DFHZBLX

XMEOUT Parameters: *date, time,applid, termid, trandid,*

nodeid, sense, instance, {1=DFHZLGX, 2=DFHZLGX, 3=DFHZBLX, 4=DFHZBLX}

Destination: CSNE

DFHZC2434E *date time applid termid tranid* **Invalid copy request - Copy not supported.**
sense ((instance) Module name {DFHZARQ})

Explanation: A DFHTC TYPE=COPY request has been issued to a 3270 compatibility mode logical unit. The request is invalid because the 3270 COPY command is not supported by a 3270 compatibility mode logical unit.

For the meaning of *sense*, see message DFHZC2400.

System action: The task abends.

User response: Change the application program to avoid issuing a COPY request.

Module: DFHZARQ

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZARQ}*

Destination: CSNE

DFHZC2435E *date time applid termid tranid* **RPL missing.** *sense ((instance) Module name {DFHZRVS})*

Explanation: CICS issued a receive-specific request VTAM without specifying a request parameter list (RPL). This condition could result from one of the following reasons

- An RPL was not allocated
- An RPL was allocated, but later freed
- TCTERPLA was altered.

For the meaning of *sense*, see message DFHZC2400.

System action: All outstanding receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. A CLSDST macro is issued to terminate communication with the node.

User response: Use the dump to determine whether the TCTTE was altered by an application program. If it was, correct the error. If the TCTTE has not been altered, check for potential RPL problems.

Module: DFHZRVS

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRVS}*

Destination: CSNE

DFHZC2436E *date time applid termid tranid* **TIOA missing.** *sense ((instance) Module name {DFHZRVS | DFHZRVX})*

Explanation: The TIOA was missing while a receive-specific request was being processed. This condition could result from the TIOA being freed or TCTTEDA being altered.

For the meaning of *sense*, see message DFHZC2400.

System action: All outstanding receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User response: Use the dump to determine if the TCTTE was altered by an application program.

Module: DFHZRVS, DFHZRVX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRVS, 2=DFHZRVX, 3=DFHZRVS}*

Destination: CSNE

DFHZC2437E *date time applid termid tranid* **Invalid WRITE request to an input only device.**
sense ((instance) Module name {DFHZSDS})

Explanation: An output request was issued to a VTAM terminal that is defined as an input-only device. Either the TCTTETS was altered or a task that was attached issued a send request.

For the meaning of *sense*, see message DFHZC2400.

System action: All outstanding send requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. The terminal status remains unchanged.

User response: Either ensure that the node is defined correctly in the TCTTE, or prevent the task from issuing an output request to the node.

Module: DFHZSDS

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSDS}*

Destination: CSNE

DFHZC2438E *date time applid termid tranid* **Invalid READ request to an output only device.** *sense ((instance) Module name {DFHZRVS | DFHZSDS})*

Explanation: An input request was issued to a VTAM terminal that is identified as an output-only device. Either the TCTTETS was altered or a task was attached that issued a read request.

For the meaning of *sense*, see message DFHZC2400.

System action: All outstanding receive requests are

purged. If a task is attached, it is abnormally terminated with a transaction dump. The terminal status remains unchanged.

User response: Either change the definition of the terminal in the TCTTE, or prevent the task from issuing input requests to the node.

Module: DFHZRVS, DFHZSDS

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRVS, 2=DFHZSDS}*

Destination: CSNE

DFHZC2439E *date time applid termid tranid* **Invalid RESUME request.** *sense ((instance) Module name: {DFHZACT})*

Explanation: An invalid resume request was received. The CICS activate-scan function detected a resume request in a TCTTE, but the TCTTE was not part of any transaction.

For the meaning of *sense*, see message DFHZC2400.

System action: The TCTTE is printed and logged to the CSNE destination for debugging purposes.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Use the symptom string to determine the cause of the problem. Check the TCTTE data printed and logged to the CSNE destination for obvious alterations and errors.

Module: DFHZACT

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZACT}*

Destination: CSNE

DFHZC2440I *date time applid termid tranid* **CICS quiesced by node.** *sense ((instance) Module name: {DFHZASX})*

Explanation: A VTAM logical unit has requested CICS to quiesce all I/O activity with that node.

For the meaning of *sense*, see message DFHZC2400.

System action: All data transmission to the node is halted until CICS receives a release-quiesce indicator.

User response: None.

Module: DFHZASX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZASX}*

Destination: CSNE

DFHZC2441I *date time applid termid tranid* **CICS released by node.** *sense ((instance) Module name: {DFHZASX})*

Explanation: CICS received a release-quiesce indicator from a VTAM logical unit that had previously quiesced CICS.

For the meaning of *sense*, see message DFHZC2400.

System action: Data transmission to the node is resumed by CICS.

User response: None.

Module: DFHZASX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZASX}*

Destination: CSNE

DFHZC2442E *date time applid termid tranid* **Exception response received to a definite response send.** *sense ((instance) Module name {DFHZRVX})*

Explanation: An exception response was received when a definite response protocol was requested.

For the meaning of *sense*, see message DFHZC2400.

System action: CICS issues a second message in conjunction with this message that explains the reason for the exception response.

User response: Perform the action specified for the second CICS message received.

Module: DFHZRVX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRVX, 2=DFHZRVX}*

Destination: CSNE

DFHZC2443E *date time applid termid tranid* **Request outstanding when node released.** *sense ((instance) Module name {DFHZRVL | DFHZRVS | DFHZSDL | DFHZSDS | DFHZSHU})*

Explanation: CICS received a request from an application program, when its node was either not in session or queued to be CLSDSTed.

For the meaning of *sense*, see message DFHZC2400.

System action: All outstanding requests are ignored. If a task is attached, it is abnormally terminated with a transaction dump.

User response: None.

Module: DFHZSDS, DFHZRVL, DFHZRVS, DFHZSDL, DFHZSHU

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRVS, 2=DFHZSDL,*

3=DFHZSDS, 4=DFHZSDS, 5=DFHZSDS,
6=DFHZSHU, 7=DFHZSHU, 8=DFHZRVL,
9=DFHZSHU}

Destination: CSNE

DFHZC2444E *date time applid termid tranid* **CICS bracket state error. sense ((instance) Module name: {DFHZRVS | DFHZSDS})**

Explanation: A CICS application program violated bracket protocol. It is possible that the application program issued an I/O request following a write (last) request.

For the meaning of *sense*, see message DFHZC2400.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User response: Correct the application program.

Module: DFHZRVS, DFHZSDS

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRVS, 2=DFHZSDS}*

Destination: CSNE

DFHZC2445E *date time applid termid tranid* **Output area exceeded. sense ((instance) Module name: {DFHZSDS})**

Explanation: The TIOA was not large enough to hold all the output data. The application program either set up the TIOA incorrectly or it overran the TIOA.

For the meaning of *sense*, see message DFHZC2400.

System action: All outstanding send requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User response: Correct the application program to acquire a larger TIOA.

Module: DFHZSDS

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSDS, 2=DFHZSDS}*

Destination: CSNE

DFHZC2446E *date time applid termid tranid* **Invalid response to a bid. sense ((instance) Module name: {DFHZRVX | DFHZSSX | DFHZRAC})**

Explanation: An invalid response was received for a bid request. A normal response was received in response to a bid indicator while the transaction was in bracket state. The controller application program is in error.

For the meaning of *sense*, see message DFHZC2400.

System action: All outstanding requests are purged. If

a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing a VTAM CLSDST macro instruction, and the node is placed out of service.

User response: Correct the controller application program to return an exception response to a bid indicator when in the bracket state, followed by a ready-to-receive indicator when ready to honor the bid.

Module: DFHZRAC, DFHZRVX, DFHZSSX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRVX, 2=DFHZSSX, 3=DFHZRAC}*

Destination: CSNE

DFHZC2447E *date time applid termid tranid* **A severe error has occurred as a result of a previous failure. sense ((instance) Module name {DFHZACT | DFHZFRE | DFHZGET | DFHZOPN | DFHZRAC | DFHZRLP | DFHZRVS | DFHZSDA})**

Explanation: A domain call failed and the response could not be handled by module *modname* because of a previous failure. The domain concerned should have issued a message to the console which gives further information about the failure.

For the meaning of *sense*, see message DFHZC2400.

System action: All outstanding send and receive requests for terminal *termid* are purged. If a task is attached, it is abnormally terminated with a transaction dump. Terminal *termid* is placed out of service and the TCTTE is logged to the CSNE destination.

User response: Refer to the message issued by the domain that is in error. It indicates the source of the original error.

Module: DFHZRAC, DFHZRVS, DFHZSDA, DFHZOPN, DFHZFRE, DFHZRLP, DFHZACT, DFHZGET

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZOPN, 2=DFHZRVS, 3=DFHZSDA, 4=DFHZRAC, 5=DFHZRAC, 6=DFHZOPN, 7=DFHZOPN, 8=DFHZFRE, 9=DFHZRLP, 10=DFHZACT, 11=DFHZGET, 12=DFHZGET, 13=DFHZOPN}*

Destination: CSNE

DFHZC2448E *date time applid termid tranid* **Invalid response requested. sense ((instance) Module name: {DFHZRVX | DFHZRAC})**

Explanation: An invalid response was requested. An application program transmitted data to CICS without requesting a response from CICS.

For the meaning of *sense*, see message DFHZC2400.

System action: All outstanding receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing a VTAM CLSDST macro, and the node is placed out of service.

User response: Correct the application program.

Module: DFHZRAC, DFHZRVX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRVX, 2=DFHZRAC, 3=DFHZRAC}*

Destination: CSNE

DFHXC2449E *date time applid termid tranid* **Bracket Error.** *sense ((instance) Module name {DFHZRAC | DFHZRVX})*

Explanation: The application program either sent a begin-bracket indicator while the transaction was in bracket state, or sent an end-bracket indicator.

For the meaning of *sense*, see message DFHXC2400.

System action: If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing the VTAM CLSDST macro, and the node is placed out of service.

User response: Correct the application program.

Module: DFHZRAC, DFHZRVX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRVX, 2=DFHZRVX, 3=DFHZRAC, 4=DFHZRAC}*

Destination: CSNE

DFHXC2450E *date time applid termid tranid* **Bid issued but ATI cancelled.** *sense ((instance) Module name: {DFHZRAC | DFHZRVX | DFHZSSX})*

Explanation: An automatic task initiation (ATI) request was issued without an ATI pending for that terminal.

For the meaning of *sense*, see message DFHXC2400.

System action: CICS will satisfy the BB pending condition by sending a standalone BB-EB.

User response: If ATI is time-initiated, increase the timer value.

Module: DFHZRAC, DFHZRVX, DFHZSSX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRVX, 2=DFHZRVX, 3=DFHZRVX, 4=DFHZSSX, 5=DFHZSSX, 6=DFHZSSX, 7=DFHZRAC, 8=DFHZRAC, 9=DFHZRAC}*

Destination: CSNE

DFHXC2451E *date time applid termid tranid* **Outstanding request when clear was issued.** *sense ((instance) Module name {DFHZSYX})*

Explanation: A request was outstanding when clear was issued. A receive-specific request was pending when a clear indicator was issued. A clear indicator is sent when any of the following occurs

- The logical unit is lost (LOSTERM).
- CICS issues a VTAM CLSDST macro.
- CICS issues the clear during message resynchronization.

For the meaning of *sense*, see message DFHXC2400.

System action: All outstanding requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User response: None.

Module: DFHZSYX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSYX}*

Destination: CSNE

DFHXC2452E *date time applid termid tranid* **Invalid command received.** *sense ((instance) Module name: {DFHZSCX})*

Explanation: CICS received an invalid command (VTAM indicator). The CICS session-control input exit-routine (SCIP) encountered an indicator other than request-recovery. This routine should be scheduled only when a request-recovery indicator is received from the controller application program.

For the meaning of *sense*, see message DFHXC2400.

System action: If a task is attached, it is abnormally terminated with a transaction dump. The session is terminated and the node is placed out of service.

User response: Check the VTAM RPL for obvious errors. Use the dump to help determine the source of the problem.

Module: DFHZSCX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSCX}*

Destination: CSNE

DFHXC2453E *date time applid termid tranid* **Request recovery received.** *sense ((instance) Module name: {DFHZSCX})*

Explanation: A request for recovery was received. The secondary logical unit requested message resynchronization by sending a request-recovery indicator, but a message sequence number is inconsistent with the sequence number maintained by

the 3601 application program.

For the meaning of *sense*, see message DFHZC2400.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Message resynchronization is then initiated by CICS.

User response: None.

Module: DFHZSCX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSCX}*

Destination: CSNE

DFHZC2454E *date time applid termid tranid*
Exception in chain. *sense ((instance)*
Module name: {DFHZSYX}

Explanation: An exception response was returned on a POST=RESP chain-data send. CICS normally does not send chained data using POST=RESP.

For the meaning of *sense*, see message DFHZC2400.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Use the symptom string, and if necessary the transaction dump, to determine the source of the error.

Module: DFHZSYX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSYX}*

Destination: CSNE

DFHZC2455E *date time applid termid tranid In CA*
mode - Task attached. *sense ((instance)*
Module name: {DFHZATT}

Explanation: An attempt to attach a task to a logical unit (LU) was made, despite the task being in continue-any (CA) mode. However, terminal *termid* already had a task attached to it.

For the meaning of *sense*, see message DFHZC2400.

System action: The task that is already attached to terminal *termid* is abnormally terminated with a transaction dump.

Message DFHME0116 should be produced containing the symptom string for this problem. Communication with the node is terminated by issuing the VTAM CLSDST macro. CICS then reestablishes communication with the node by issuing the SIMLOGON macro.

User response: Use the symptom string, and if

necessary the dump, to determine the source of the error. Try to determine why there was an attempt to attach a task to terminal *termid* while it already had a task attached to it.

Module: DFHZATT

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZATT}*

Destination: CSNE

DFHZC2456E *date time applid termid tranid*
Exception response received to a
command. *sense ((instance) Module*
name {DFHZRAC | DFHZSYX})

Explanation: CICS received an exception response to a command (VTAM indicator) that it sent to a logical unit.

For the meaning of *sense*, see message DFHZC2400.

System action: In conjunction with this message, CICS issues a second message that explains the reason for the exception response.

User response: Perform the action specified in the second CICS message received.

Module: DFHZSYX, DFHZSSX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSYX, 2=DFHZSYX, 3=DFHZSYX, 4=DFHZRAC}*

Destination: CSNE

DFHZC2457E *date time applid termid tranid Multiple*
Errors Encountered. *sense ((instance)*
Module name {DFHZEMW | DFHZRAC |
DFHZSYX})

Explanation: A node encountered consecutive errors. That is, the node abnormal condition program, NACP, encountered a second error while processing the first error.

For the meaning of *sense*, see message DFHZC2400.

System action: If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing a VTAM CLSDST macro. The first error is accompanied by an error message.

User response: Use the dump to determine the source of the errors. Refer to the error message produced by the first problem and to any VTAM messages that may have been issued.

Module: DFHZRAC, DFHZSYX, DFHZEMW

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZEMW, 2=DFHZSYX, 3=DFHZSYX, 4=DFHZRAC, 5=DFHZRAC}*

Destination: CSNE

DFHXC2458E *date time applid termid tranid*
Exception response received to an exception response send. *sense ((instance) Module name {DFHZRAC | DFHZRVX})*

Explanation: CICS received an exception response to a send for which an exception response was requested.

For the meaning of *sense*, see message DFHXC2400.

System action: In conjunction with this message, CICS issues a second message that explains the reason for the exception response.

User response: Perform the action specified in the second CICS message received.

Module: DFHZRAC, DFHZRVX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRVX, 2=DFHZRVX, 3=DFHZRVX, 4=DFHZRVX, 5=DFHZRAC, 6=DFHZRAC, 7=DFHZRAC, 8=DFHZRAC, 9=DFHZRAC, 10=DFHZRAC, 11=DFHZRAC, 12=DFHZRAC}*

Destination: CSNE

DFHXC2459E *date time applid termid tranid No TIOA available for send.* *sense ((instance) Module name: {DFHZSDS})*

Explanation: TCTTEDA was not loaded before issuing a DFHTC TYPE=WRITE, or it was inadvertently cleared.

For the meaning of *sense*, see message DFHXC2400.

System action: If a task is attached, it is abnormally terminated with a transaction dump. The send is purged.

User response: Ensure that TCTTEDA is loaded with the TIOA address before issuing the write.

Module: DFHZSDS

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSDS, 2=DFHZSDS}*

Destination: CSNE

DFHXC2460E *date time applid termid tranid Sense receive not supported.* *sense ((instance) Module name: {DFHZNAC})*

Explanation: Sense codes not supported by CICS were received from the logical unit.

For the meaning of *sense*, see message DFHXC2400.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing a

VTAM CLSDST macro, and the node is placed out of service.

User response: The user's node error program (DFHZNPE) can process the sense codes.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHXC2461E *date time applid termid tranid Intervention required.* *sense ((instance) Module name: {DFHZNAC})*

Explanation: Operator action is requested for a physical component of terminal *termid* before a request can be completed.

For the meaning of *sense*, see message DFHXC2400.

System action: The request is retried, unless the device is one that sends a logical unit status message after intervention is required. In the latter case, the relevant system action is taken.

User response: Correct the problem with the device.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHXC2462E *date time applid termid tranid Bracket Error.* *sense ((instance) Module name {DFHZNAC})*

Explanation: The secondary logical unit and CICS both sent a begin-bracket indicator concurrently.

For the meaning of *sense*, see message DFHXC2400.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing the VTAM CLSDST macro.

User response: Correct the controller application program so that it cannot send a begin-bracket indicator.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHZC2463E *date time applid termid tranid* **Node nodeid resource pending deletion, connection request rejected.** *sense ((instance) Module name {DFHZBLX | DFHZLGX})*

Explanation: Node *nodeid* tried to connect to CICS. CICS rejected the request because it was deleting the terminal definition for *termid*.

For the meaning of *sense*, see message DFHZC2400.

System action: CICS continues with the resource alteration, or for instance 3 of the message, the autoinstall delete transaction, CATD, is restarted.

User response: When the resource alteration is complete, retry the connection or logon request.

Module: DFHZSCX, DFHZBLX, DFHZLGX

XMEOUT Parameters: *date, time, applid, termid, tranid, nodeid, sense, instance, {1=DFHZBLX, 2=DFHZBLX, 3=DFHZLGX}*

Destination: CSNE

DFHZC2464E *date time applid termid tranid* **Terminate chain.** *sense ((instance) Module name {DFHZNAC})*

Explanation: The secondary logical unit asked CICS to terminate transmission of further data in the current chain.

For the meaning of *sense*, see message DFHZC2400.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. A cancel indicator is issued to the logical unit permitting discard of the data in the current chain.

User response: Use the supplied dump to determine why the logical unit requested the chain to be discarded.

For the meaning of the sense data, refer to the explanatory paragraph in message DFHZC2461.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHZC2465E *date time applid termid tranid* **Insufficient resources.** *sense ((instance) Module name {DFHZNAC})*

Explanation: The subsystem controller application program has insufficient resources to handle the request. For instance, in the case of 3601, the 3601 diskette might be full, or the data segment in the 3601 might not be large enough to handle the data set.

For the meaning of *sense*, see message DFHZC2400.

System action: The subsystem is temporarily suspended.

User response: Determine why the controller application program encountered this condition. For the meaning of the sense data, refer to the explanatory paragraph in message DFHZC2461.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHZC2466E *date time applid termid tranid* **Function not executable.** *sense ((instance) Module name {DFHZNAC})*

Explanation: The controller application program cannot transmit a message to terminal *termid*. Either a data check occurred, or the node is not available.

For the meaning of *sense*, see message DFHZC2400.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Terminal status remains unchanged.

User response: Use the supplied dump to determine why the application program could not execute the request.

For the meaning of the sense data, refer to the explanatory paragraph in message DFHZC2461.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHZC2467E *date time applid termid tranid* **Invalid communications ID (CID) detected.** *sense ((instance) Module name {DFHZLEX})*

Explanation: CICS issued a VTAM request containing a communications identifier (CID) which VTAM did not recognize. This may be due to the TCTECID field having been altered. Alternatively, it may mean that the session is in the process of being closed down by VTAM and that CICS has tried to use it before the process was complete.

For the meaning of *sense*, see message DFHZC2400.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. If the losterm exit was driven with return code X'0C, X'10, or X'14, CICS issues a CLSDST to VTAM.

User response: Ensure that application programs

DFHZC2468E • DFHZC2471E

running concurrently do not alter the TCTECID field in the TCTTE. Also check that the session is still active; that is, that the system being communicated with is still functioning.

Module: DFHZLEX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZLEX}*

Destination: CSNE

DFHZC2468E *date time applid termid tranid Name netname* **unknown or vary activate required. sense ((instance) Module name {DFHZLEX})**

Explanation: Either the node has not been activated by VARY ACTIVATE or CICS issued a VTAM request containing an invalid symbolic node name where

- The name may have been altered in the node initialization block (NIB)
- The name was specified during VTAM definition and does not agree with the name in the TCT.

For the meaning of *sense*, see message DFHZC2400.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. The node is placed out of service.

User response: Either issue VARY ACTIVATE for the node, or ensure that application programs running concurrently do not alter the NIB name. Names specified during VTAM definition must agree with those in the TCT.

Module: DFHZLEX

XMEOUT Parameters: *date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZLEX}*

Destination: CSNE

DFHZC2469E *date time applid termid tranid* **Exception response received. sense ((instance) Module name: {DFHZSYX})**

Explanation: An exception response (negative response) was sent by the secondary logical unit.

For the meaning of *sense*, see message DFHZC2400.

System action: For a non-3270 device, an exception response is returned to the node, along with the sense codes supplied by VTAM in the request parameter list (RPL) for the inbound message. For a 3270 device, the exception request contains 3270 sense/status.

User response: Analyze the sense codes in DFHZNEP.

Module: DFHZSYX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSYX, 2=DFHZSYX}*

Destination: CSNE

DFHZC2470E *date time applid termid tranid* **Task active at Shutdown. sense ((instance) Module name: {DFHZASX})**

Explanation: One of the following has occurred

- A request shutdown indicator was received from the controller application program on behalf of the node while a task was still attached.
- During VTAM shutdown, a shutdown complete indicator was received from the controller application program on behalf of the node while a task was still attached
- During VTAM shutdown, a task was still attached to a VTAM 3270 (which cannot send request shutdown or shutdown complete).

For the meaning of *sense*, see message DFHZC2400.

System action: In the first two cases, CICS honors the command. In all cases, all outstanding send and receive requests are purged, and if a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing a VTAM CLSDST macro.

User response: None.

Module: DFHZASX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZASX}*

Destination: CSNE

DFHZC2471E *date time applid termid tranid* **FMH length error. sense ((instance) Module name {DFHZATT | DFHZRAC})**

Explanation: The function management header (FMH) length was greater than that of the data received from the logical unit.

For the meaning of *sense*, see message DFHZC2400.

System action: All data received is purged. If a task is attached, it is abnormally terminated with a transaction dump.

User response: Correct the application program in the logical unit. The first 16 bytes of the I/O area in error are put to the CSNE log data set to aid in error determination.

Module: DFHZRAC, DFHZATT

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZATT, 2=DFHZATT, 3=DFHZATT, 4=DFHZATT, 5=DFHZATT, 6=DFHZRAC}*

Destination: CSNE

DFHZC2472E *date time applid termid tranid* **Unable to retrieve overlength data.** *sense* ((instance) Module name {DFHZRAC})

Explanation: The receive request for the remainder of data in excess of the input area for the receive-any module was not accepted by VTAM.

For the meaning of *sense*, see message DFHZC2400.

System action: All associated data is purged.

User response: A subsequent message follows in the log, indicating reasons for the request failing. Refer to this message for further information and guidance.

Module: DFHZRAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRAC, 2=DFHZRAC}*

Destination: CSNE

DFHZC2473E *date time applid termid tranid* **Outbound chaining not supported.** *sense* ((instance) Module name {DFHZSDS})

Explanation: The application program has attempted to send more data than the generated maximum allowable length.

For the meaning of *sense*, see message DFHZC2400.

System action: All send requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User response: Correct the application program so that it is sensitive to the maximum allowable length of data that can be sent to the terminal (such as checking the device type), providing the terminal does not support outbound chaining of data (such as a pipeline session).

Note: The generated maximum allowable length is specified in the TCTTE.

Module: DFHZSDS

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSDS, 2=DFHZSDS}*

Destination: CSNE

DFHZC2475E *date time applid termid tranid* **Function cancelled by LU device.** *sense* ((instance) Module name {DFHZNAC})

Explanation: The logical unit (LU) has terminated all processing connected with one of its components.

For the meaning of *sense*, see message DFHZC2400.

System action: All send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User response: Correct the problem with the LU

component and bring it back online. Possible causes of the problem include the following

- Power for the device is switched off
- A line that is down
- A hardware problem
- In the case of an LU6 link, the connected transaction, for example, CSML, has terminated abnormally.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHZC2476E *date time applid termid tranid* **Resource unavailable.** *sense* ((instance) Module name {DFHZNAC})

Explanation: A component of the logical unit (LU) is no longer available.

For the meaning of *sense*, see message DFHZC2400.

System action: All send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User response: Correct the problem with the LU component and bring it back online. Possible causes of the problem include the following.

- Power for the device is switched off.
- A line that is down.
- A hardware problem.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHZC2477E *date time applid termid tranid* **Chaining not supported.** *sense* ((instance) Module name {DFHZNAC})

Explanation: The logical unit (LU) does not support chaining of data from the host.

For the meaning of *sense*, see message DFHZC2400.

System action: All send requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User response: Ensure that the maximum amount of data being transmitted to the LU does not exceed the length specified in the buffer parameter of the DFHTCT macro instruction.

Note: The buffer parameter value can be increased only to the maximum acceptable limit of the LU.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHXC2478E *date time applid termid tranid* **Invalid FMH. sense ((instance) Module name {DFHZNAC})**

Explanation: The function management header (FMH) transmitted to the logical unit (LU) had no counterpart on the translate table.

For the meaning of *sense*, see message DFHXC2400.

System action: All send and receive requests are purged. If the batch data interchange program is not being used, the transaction is abnormally terminated with a transaction dump. The first part of the TIOA, containing the FMH, is written to the CSNE log.

User response: Correct the application program so that the LU has a counterpart on the translate table.

Module: DFHZNAC

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHXC2479E *date time applid termid tranid* **Function not supported. sense ((instance) Module name: {DFHZNAC})**

Explanation: The response unit (RU) received by the logical unit (LU) contains a request that this device does not support.

For the meaning of *sense*, see message DFHXC2400.

System action: All send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User response: Ensure that the terminal control table (TCT) generation specifications for the device are valid as well as able to accommodate the application requests. (For example, a read-only device being defined as transceive, yet having a bid sent to it.)

Module: DFHZNAC

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHXC2480E *date time applid termid tranid* **Retry requested. sense ((instance) Module name {DFHZNAC})**

Explanation: The logical unit (LU) has indicated, via sense codes contained in an exception response or an LU status message, that it requires the data to be retransmitted.

For the meaning of *sense*, see message DFHXC2400.

System action: Retransmission of data will be

attempted only in the case of protected tasks (message integrity). If the exception response containing the retry sense codes is received for an unprotected task while in chain processing, a cancel command will be sent to the LU and the task will be resumed. If CICS is not in chain processing, the transaction will be resumed.

User response: If message retransmission is necessary for the LU, ensure that the retry sense codes are imbedded in the exception response. Also ensure that the host transaction is defined as a protected task (message integrity).

Module: DFHZNAC

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHXC2481E *date time applid termid tranid* **RU Error. sense ((instance) Module name {DFHZNAC})**

Explanation: The response unit (RU) received by the logical unit (LU) was either not translatable or had an invalid length.

For the meaning of *sense*, see message DFHXC2400.

System action: All send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User response: Retrying the request a number of times by use of the node error program (NEP) mechanism may be necessary. This is because this type of error may stem from a bad communication line. If this fails, check for possible invalid or inappropriate terminal specifications at terminal control table (TCT) generation time.

Module: DFHZNAC

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHXC2482E *date time applid termid tranid* **Pipeline session bracket error. sense ((instance) Module name {DFHZNAC})**

Explanation: Terminal *termid* was defined in the terminal control table (TCT) as running in pipeline session mode. However, the BRACKET operand in that definition was either omitted or was specified as BRACKET=YES. Bracket protocol is not enforced on a pipeline session terminal.

For the meaning of *sense*, see message DFHXC2400.

System action: All send and receive requests are purged and the session is terminated. If a task is attached, it is abnormally terminated with a transaction dump.

User response: Correct the TCT entry by inserting the BRACKET=NO operand.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, trandid, sense, instance, {1=DFHZATT}*

Destination: CSNE

DFHZC2483E *date time applid termid trandid* **Receiver in transmit mode. sense ((instance) Module name {DFHZNAC})**

Explanation: Normal data flow has been interrupted.

For the meaning of *sense*, see message DFHZC2400.

System action: Processing continues.

User response: Retry the WRITE.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, trandid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHZC2484E *date time applid termid trandid* **Component not available. sense ((instance) Module name: {DFHZNAC})**

Explanation: An application request could not be satisfied because the required component was not available.

For the meaning of *sense*, see message DFHZC2400.

System action: If a task is attached, it is abnormally terminated with a transaction dump. All outstanding send and receive requests are purged.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Check the terminal environment, or use the symptom string, and if necessary the dump, to determine the cause of the error.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, trandid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHZC2485E *date time applid termid trandid* **Cancel received in 'CS'-mode. sense ((instance) Module name: {DFHZRVX})**

Explanation: A CANCEL indicator was received while a task was active.

For the meaning of *sense*, see message DFHZC2400.

System action: If a task is attached, it is abnormally terminated with a transaction dump. All outstanding send and receive requests purged.

User response: None.

Module: DFHZRVX

XMEOUT Parameters: *date, time, applid, termid, trandid, sense, instance, {1=DFHZRVX}*

Destination: CSNE

DFHZC2486E *date time applid termid trandid* **Cancel received in 'CA'-mode. sense ((instance) Module name: {DFHZRAC})**

Explanation: A CANCEL indicator was received while no task was active.

For the meaning of *sense*, see message DFHZC2400.

System action: Processing continues.

User response: None.

Module: DFHZRAC

XMEOUT Parameters: *date, time, applid, termid, trandid, sense, instance, {1=DFHZRAC}*

Destination: CSNE

DFHZC2487E *date time applid termid trandid nodeid* **Session connection failed. Node unavailability return code returncode. sense ((instance) Module name {DFHZBLX | DFHZLGX | DFHZSCX})**

Explanation: A connection request was rejected. CICS is temporarily unable to carry out the connection request. The TCTTE for node *nodeid* indicated that the session could not be established. *returncode* gives the reason, as follows

1. The CLSDST macro has been scheduled for this node
2. The node is in an abnormal condition
3. The node has an error condition raised against it
4. The node is already in use
5. CICS is terminating
6. VTAM is terminating.

For the meaning of *sense*, see message DFHZC2400.

System action: The connection request is rejected.

User response: Retry the connection request when the node becomes available. See the *CICS Customization Guide* for more information on the CLSDST macro and for an explanation of abnormal node conditions.

Module: DFHZLGX, DFHZSCX, DFHZBLX

XMEOUT Parameters: *date, time, applid, termid, trandid, nodeid, returncode, sense, instance, {1=DFHZSCX, 2=DFHZSCX, 3=DFHZSCX, 4=DFHZSCX, 5=DFHZSCX, 6=DFHZSCX, 7=DFHZBLX, 8=DFHZBLX, 9=DFHZLGX, 10=DFHZLGX, 11=DFHZLGX, 12=DFHZLGX, 13=DFHZLGX, 14=DFHZLGX, 15=DFHZLGX, 16=DFHZLGX}*

Destination: CSNE

DFHXC2488E *date time applid termid tranid nodeid*
logon request rejected as terminal
recovery is in progress. *sense*
((instance) Module name {DFHXBZLX |
DFHXLGX | DFHXSXC})

Explanation: A connection request was rejected because the CICS terminal recovery program was still executing.

For the meaning of *sense*, see message DFHXC2400.

System action: The connection request is rejected.

User response: Retry the connection request. Message DFHRU2800 is produced when the recovery program has completed processing.

Module: DFHXLGX, DFHXSXC, DFHXBZLX

XMEOUT Parameters: *date, time, applid, termid, tranid, nodeid, sense, instance, {1=DFHXLGX, 2=DFHXSXC, 3=DFHXBZLX}*

Destination: CSNE

DFHXC2489E *date time applid termid tranid 3270 -*
Invalid copy request. *sense ((instance)*
Module name {DFHXRARQ})

Explanation: The terminal control table terminal entry (TCTTE) of the device from which the information is to be copied ("from" device) did not specify the COPY feature. Alternatively, the "from" device

- Is not defined in the TCT, or
- Is not a 3270, or
- Is not connected to CICS via VTAM.

For the meaning of *sense*, see message DFHXC2400.

System action: If a task is attached, it is abnormally terminated with a transaction dump.

User response: Ensure that the application program is aware of the device configuration. Furthermore, ensure that the "from" device is defined in the TCT as a 3270 device AND is connected to CICS.

Module: DFHXRARQ

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHXRARQ, 2=DFHXRARQ, 3=DFHXRARQ}*

Destination: CSNE

DFHXC2490E *date time applid termid tranid* **Request**
for TOLTEP. *sense ((instance) Module*
name: {DFHXSXYX})

Explanation: On a request for TOLTEP, a receive request completes in error.

For the meaning of *sense*, see message DFHXC2400.

System action: If a transaction is currently attached, it is abnormally terminated. The terminal is disconnected from CICS by a VTAM CLSDST macro, and is queued for logon to CICS when TOLTEP has finished.

User response: None.

Module: DFHXSXYX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHXSXYX}*

Destination: CSNE

DFHXC2492E *date time applid termid tranid*
Intervention required on 3270 printer.
sense ((instance) Module name
{DFHXRNAC})

Explanation: This message is sent to the CSNE message log when an INTERVENTION REQUIRED condition is detected on a 3270 printer. This condition could occur for any of the reasons listed below.

- A transaction has requested the use of a printer that does not exist.
- The printer adapter feature is not present.
- There is no paper in the printer.
- The printer cover is open.
- The printer is offline.

For the meaning of *sense*, see message DFHXC2400.

System action: No action is performed except printing of the RPL and the TCTTE.

User response: Check that the terminal control table (TCT) is properly defined and that the transaction requests proper printer operations. If this is correct, check that the printer itself is in proper working order.

Module: DFHXRNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHXRNAC}*

Destination: CSNE

DFHXC2493E *date time applid termid tranid*
Intervention required on 3270 device.
sense ((instance) Module name
{DFHXRNAC})

Explanation: This message occurs when an INTERVENTION REQUIRED condition arises on the 3270 Information Display System.

For the meaning of *sense*, see message DFHXC2400.

System action: No action is performed.

User response: Correct the intervention condition.

Module: DFHXRNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHXRNAC}*

Destination: CSNE

DFHZC2494E *date time applid termid tranid Error status sense received from 3270.*
(*instance*) **Module name {DFHZNAC}**)

Explanation: An error status message *sense* was received from a 3270 Information Display System. An INTERVENTION REQUIRED condition causes an “intervention required” message to be output instead of this message.

System action: If a task is attached, it is abnormally terminated with a transaction dump. If bad data, sent by Basic Mapping Support (BMS), causes an operation check, the bad data is purged.

User response: Analyze the error status codes to determine the proper course of action required to correct the unit error or program error.

For non-SNA 3270 devices, the sense code is 0000 xxxx, where xxxx is sense data returned by the control unit to which the 3270 device is attached. Datastream errors are rejected with an Operation Check, and commands with a Command Reject. Details of error status codes are given in the *IBM 3270 Information Display System 3274 Control Unit Description and Programmer's Guide*.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHZC2495E *date time applid termid tranid Printer Outserv/int reqd/ineligible. Req queued. sense ((instance) Module name {DFHZNAC})*

Explanation: DFHZNAC has performed an interval control PUT to a 3270 printer on behalf of a DFHZC2497 “unavailable printer” condition. The printer is

- Out of service,
- Has an intervention situation, or
- Does not have a RECEIVE or TRANSCEIVE status.

For the meaning of *sense*, see message DFHZC2400.

System action: Other processing continues.

User response: Determine why the printer is unavailable. If the terminal is out of service, put it back into service. If the terminal has an intervention situation, determine what this situation is and correct it. If the terminal does not have a RECEIVE or TRANSCEIVE status, place it into RECEIVE or TRANSCEIVE status.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHZC2496E *date time applid termid tranid IC put to printer failed{ | IOERROR | TRNIDER | TRMIDER | INVREQ}. sense ((instance) Module name {DFHZNAC})*

Explanation: DFHZNAC has attempted to perform a DFHIC TYPE=PUT macro as the result of a DFHZC2497 “unavailable printer” condition and has failed. This message is written to the CSNE log.

For the meaning of *sense*, see message DFHZC2400.

System action: DFHZNAC is recalled by DFHZNAC to allow for further processing.

User response: Ensure that

- The interval control program (ICP) is capable of handling the request that DFHZNAC is issuing for the IOERROR and INVREQ errors
- CSPP is an installed transaction definition for the TRNIDER error
- DFHZNAC is passing DFHZNAC as a valid terminal address for the TRMIDER error.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, {1= , 2= IOERROR, 3= TRNIDER, 4=TRMIDER, 5= INVREQ}, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHZC2497E *date time applid termid tranid Unavailable printer. sense ((instance) Module name: {DFHZARQ})*

Explanation: A print function was requested on a 3270 display device. Neither the PRINTTO or the ALTPRT printer was available to receive the information.

For the meaning of *sense*, see message DFHZC2400.

System action: If no NEP action is specified, the print request is halted.

User response: A possible solution is to route the data available at TCTTEDA in the provided terminal entry to a transient data queue that causes automatic task initiation later to a printer. This would be done in DFHZNAC. For more information, see the *CICS Customization Guide*.

Module: DFHZARQ

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZARQ}*

Destination: CSNE

DFHZC2498E *date time applid termid tranid IC put to printer failed. sense ((instance) Module name: {DFHZARQ})*

Explanation: A 3270 print request has failed because transaction CSPP could not be initiated. Either transaction CSPP is not an installed transaction

DFHZC2499 • DFHZC3205E

definition, or the message to be printed cannot be written to temporary storage.

For the meaning of *sense*, see message DFHZC2400.

System action: Processing continues.

User response: Check that transaction CSPP is an installed transaction definition and that you have sufficient temporary storage to accommodate the data to be printed.

Module: DFHZARQ

XMEOUT Parameters: *date, time,applid, termid, trandid, sense, instance, {1=DFHZARQ}*

Destination: CSNE

DFHZC2499 *date time applid* **The following message was destined for a read only terminal. The text is 'msgtext'**

Explanation: The user has entered an invalid entry, the entry is rejected, and the request is backed out.

System action: Terminal Control backs out the request and issues this message with the error information contained in *msgtext*.

User response: Read the error information that is contained in *msgtext* and reenter the request.

XMEOUT Parameters: *date, time,applid, msgtext*

DFHZC3202E *date time applid* **Transaction CCIN - VTAM netname *netname*. The value *codepage* in the *codepage* parameter is not supported.**

Explanation: A CCIN transaction has been run from a CICS client. The codepage which the CICS client has requested is not supported.

netname is the VTAM netname of the CICS client.

System action: CICS cannot perform the translations required to support the CICS client with the requested character set and codepage. CICS continues but uses a default codepage instead of the supplied one. For details of the default codepage, see the *CICS Family: Communicating from CICS on zSeries* manual.

The request to install the CICS client continues, but uses the default codepage. A response code of EXCEPTION and a reason code of INVALIDCODEPAGE is sent to the client.

User response: See the *CICS Family: Communicating from CICS on zSeries* manual for a list of the client codepage values which are supported. It may be necessary to reconfigure the client locale.

Module: DFHZCN2

XMEOUT Parameters: *date, time,applid, netname, codepage*

Destination: CSCC

DFHZC3203E *date time applid* **Transaction CCIN - VTAM netname *netname*. The capabilities parameter is not valid.**

Explanation: A CCIN transaction has been run from a CICS client. The capabilities which have been received are not valid. The CICS client has specified that it supports features which no CICS client is supposed to support. The CICS client is violating the CICS client communications architecture.

netname is the VTAM netname of the CICS client.

System action: Exception trace point AP301A is written.

The request to install the CICS client is rejected. A response code of DISASTER and a reason code of INVALIDREQUEST is sent to the client.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZCN2

XMEOUT Parameters: *date, time,applid, netname*

Destination: CSCC

DFHZC3204E *date time applid* **Transaction CCIN - VTAM netname *netname*. The codepage parameter has not been specified.**

Explanation: A CCIN transaction has been run from a CICS client. One of the parameters which must be supplied is the codepage which the CICS client intends to use. This parameter is missing.

netname is the VTAM netname of the CICS client.

System action: Exception trace point AP301B is written.

The request to install the CICS client is rejected. A response code of DISASTER and a reason code of INVALIDREQUEST is sent to the client.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZCN1

XMEOUT Parameters: *date, time,applid, netname*

Destination: CSCC

DFHZC3205E *date time applid* **Transaction CTIN - virtual terminal *termid* VTAM netname *netname*. CICS cannot support the {*n.a.* | *n.a.* | *n.a.* | combination of client and virtual terminal codepage. | client codepage. | virtual terminal codepage.}**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation.

CICS was checking the codepage specified by the CICS client and the codepage specified by the virtual terminal. However one of the following occurred

- 1 – 3 *n.a.* - not applicable and should not occur.
- 4 *unsupported combination of CICS client and virtual terminal codepage.* indicates that the two codepages above are known about but CICS does not support data conversion between the CICS client codepage and the virtual terminal codepage.
- 5 *unsupported CICS client codepage* indicates that CICS is unable to support the codepage supplied by the CICS client in the CCIN or CTIN transaction.
- 6 *unsupported virtual terminal codepage* indicates that the CGCSGID parameter defining the virtual terminal codepage is not supported for CICS data conversion. If the virtual terminal was autoinstalled, CGCSGID was specified in the autoinstall model requested by the CICS client. If the virtual terminal was defined, CGCSGID was defined in the TYPETERM named by the virtual terminal definition.

CICS cannot perform the translations required to support the CICS client with the requested codepage.

netname is the VTAM netname of the CICS client.

System action: Exception trace point AP3035 is written.

- 4 *unsupported combination of CICS client and virtual terminal codepage.*
A response code of ERROR and a reason code of INSTALLCANCELLED is sent to the client. The virtual terminal is NOT installed.
- 5 *unsupported CICS client codepage.*
The request to install the virtual terminal continues and the invalid codepage is replaced by a default as specified in the *CICS Family: Communicating from CICS on zSeries* manual.
A response code of EXCEPTION and a reason code of INVALIDCODEPAGE is sent to the client.
- 6 *unsupported virtual terminal codepage.*
A response code of ERROR and a reason code of INSTALLCANCELLED is sent to the client. The virtual terminal is NOT installed.

User response: See the *CICS Family: Communicating*

from *CICS on zSeries* manual and check the list of the client codepage values then reconfigure the workstation locale or correct the virtual terminal TYPETERM definition.

The exception trace point AP3035 contains the CICS client codepage and the virtual terminal CGCSGID values.

Module: DFHZCT1

XMEOUT Parameters: *date, time, applid, termid, netname, {1=n.a., 2=n.a., 3=n.a., 4=combination of client and virtual terminal codepage., 5=client codepage., 6=virtual terminal codepage.}*

Destination: CSCC

DFHZC3206E *date time applid* **Transaction CTIN - virtual terminal termid VTAM netname netname. The client's terminal install limit has been exceeded.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. However the CICS client whose VTAM netname is *netname* already has 512 virtual terminals.

termid is the name that would have been given to the new virtual terminal. If the CICS client did not supply the name it is blank.

System action: The request to install the virtual terminal is rejected. A response code of DISASTER and a reason code of INVALIDREQUEST is sent to the client.

User response: Check why the CICS client has sent so many CTIN installs without corresponding CTIN uninstall functions.

To correct the problem the CICS client must send a CTIN uninstall for each virtual terminal that needs to be deleted.

Module: DFHZCT1

XMEOUT Parameters: *date, time, applid, termid, netname*

Destination: CSCC

DFHZC3207E *date time applid* **Transaction CTIN - VTAM netname netname. The request has failed because CCIN has not been run.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. However there was no previous CCIN install request for the CICS client with the VTAM netname of *netname*. CCIN must always run before CTIN.

This may have been caused by a CICS restart.

netname is the VTAM netname of the CICS client.

System action: If the request was to install a virtual terminal then it is rejected with a response code of CTIN_ERROR and a reason code of CTIN_CCIN_INACTIVE.

User response: The CICS client must carry out CCIN uninstall/install before the next CTIN install.

Module: DFHZCT1

XMEOUT Parameters: *date, time, applid, netname*

Destination: CSCC

DFHZC3208E *date time applid* **Transaction CTIN - virtual terminal *termid* VTAM netname *netname*. Model *modelid* cannot be found.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. However CICS was unable to find the model *modelid* which was specified in the CICS_EpiAddTerminal DEVTYPE parameter or terminal emulator ModelId parameter.

netname is the VTAM netname of the CICS client.

System action: The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of UNKNOWNMODEL is sent to the client.

User response: Either correct the DevType in the CICS_EpiAddTerminal function or terminal emulator parameter or install a model of this name using RDO to define the autoinstall model with the RDO TERMINAL and TYPETERM definitions.

Module: DFHZCT1

XMEOUT Parameters: *date, time, applid, termid, netname, modelid*

Destination: CSCC

DFHZC3209E *date time applid* **Transaction CTIN - VTAM netname *netname*. CICS cannot supply a terminal name because all available names are in use.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. The parameter list did not supply a NetName indicating that CICS should supply the name. However there are only 46,656 possible names available and they are all currently in use.

netname is the VTAM netname of the CICS client.

System action: The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of INSTALLCANCELLED is sent to the client.

User response: As CICS clients issue CTIN uninstalls for autoinstalled virtual terminals these termids will be freed.

It is possible that some of the CICS clients were switched off leaving autoinstalled virtual terminals around. When these are switched back on again they should issue CCIN install which will free the virtual terminals if they are not in use.

DISCARD can be used to delete a virtual terminal - but this should be done with discretion.

If the SIT VTPREFIX coincides with the first character of the termid allocated to a normal autoinstall terminal by the autoinstall URM (default DFHZATDX), there may be some names reserved because the autoinstall terminal existed when CTIN install tried to use the same name. Avoid doing this if possible because the only way to free these names is to restart CICS.

Module: DFHZCT1

XMEOUT Parameters: *date, time, applid, netname*

Destination: CSCC

DFHZC3210E *date time applid* **Transaction CTIN - virtual terminal *termid* VTAM netname *netname*. CICS cannot attach the CITS transaction.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. As part of the installation process the CITS transaction is called to create a virtual terminal *termid*. However CICS was unable to attach the CITS transaction.

netname is the VTAM netname of the CICS client.

System action: Exception trace point AP3025 is written.

The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of INSTALLCANCELLED is sent to the client.

User response: Check that the CITS transaction and the DFHZATS program are defined correctly as specified in the DFHSPI IBM supplied group and are installed.

Module: DFHZCT1

XMEOUT Parameters: *date, time, applid, termid, netname*

Destination: CSCC

DFHZC3211E *date time applid* **Transaction CTIN - virtual terminal *termid* VTAM netname *netname*. The NetName parameter starts with an invalid character.**

Explanation: A CTIN install request has been received

from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. The NetName parameter *termid* starts or ends with a character that conflicts with CICS standards.

netname is the VTAM netname of the CICS client.

System action: The request to install the virtual terminal is rejected. A response code of DISASTER and a reason code of INVALIDTERMID is sent to the client.

User response: Change the NetName to start or end with a different character. It can start with any character that is valid for a normal terminal name except for <, > or -. It cannot end with an -. If the NetName was specified correctly, check the input to the CTIN transaction.

Module: DFHZCT1

XMEOUT Parameters: *date, time, applid, termid, netname*

Destination: CSCC

DFHZC3212E *date time applid* **Transaction CTIN - virtual terminal *termid* VTAM netname *netname*. The transaction has timed out waiting for CITS to run.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. As part of the installation process the CITS transaction is called to create virtual terminal *termid*. However the CTIN transaction has waited for two minutes for the CITS transaction to run.

netname is the VTAM netname of the CICS client.

System action: Exception trace point AP3027 is written.

The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of INSTALLCANCELLED is sent to the client.

User response: Investigate why the CITS transaction was unable to start or was hanging.

You may need to increase MAXTASK or the CITS TRANCLASS allocation.

Module: DFHZCT1

XMEOUT Parameters: *date, time, applid, termid, netname*

Destination: CSCC

DFHZC3213E *date time applid* **Transaction CTIN - virtual terminal *termid* VTAM netname *netname*. CICS cannot attach the CDTS transaction.**

Explanation: A CTIN uninstall request has been

received from a CICS client as a result of a CICS_EpiDelTerminal function or terminal emulator operation. As part of the delete process the CDTS transaction is called to delete virtual terminal *termid*. However CICS was unable to attach the CDTS transaction.

netname is the VTAM netname of the CICS client.

System action: Exception trace point AP3028 is written. The attempt to delete the virtual terminal is rejected.

User response: Check to see if the CDTS transaction and the DFHZATS program are defined correctly as specified in IBM supplied group DFHSPI and that they are installed.

Module: DFHZCT1

XMEOUT Parameters: *date, time, applid, termid, netname*

Destination: CSCC

DFHZC3214E *date time applid* **Transaction CTIN - virtual terminal *termid* VTAM netname *netname*. The CTIN transaction has timed out waiting for CDTS to run.**

Explanation: A CTIN uninstall request has been received from a CICS client as a result of a CICS_EpiDelTerminal function or terminal emulator operation. As part of the installation process the CDTS transaction is called to delete virtual terminal *termid*. However the CTIN transaction has waited for the CDTS transaction for two minutes and so ends with this message.

netname is the VTAM netname of the CICS client.

System action: Exception trace point AP3029 is written. The CDTS attempt to delete the virtual terminal continues and will occur when the CDTS transaction starts or is 'unsuspended'.

User response: Check to see why the CDTS transaction was unable to start or was hanging.

You may need to increase MAXTASK or the CDTS TRANCLASS allocation.

Module: DFHZCT1

XMEOUT Parameters: *date, time, applid, termid, netname*

Destination: CSCC

DFHZC3215E *date time applid* **Transaction CTIN - virtual terminal *termid* VTAM netname *netname*. The terminal is in use by another transaction.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator

DFHZC3216E • DFHZC3219E

operation. However the virtual terminal *termid* is in use, that is the surrogate TCTTE indicates that a transaction is still running against this terminal.

netname is the VTAM netname of the CICS client.

System action: Exception trace point AP302E is written.

The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of ALREADYINSTALLED is sent to the client.

User response: Investigate why a transaction is still running for the virtual terminal.

Module: DFHZCT1

XMEOUT Parameters: *date, time,applid, termid, netname*

Destination: CSCC

DFHZC3216E *date time applid* Transaction CTIN - virtual terminal *termid* VTAM netname *netname*. CICS cannot find the terminal.

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. CTIN specified that a pre defined virtual terminal *termid* should be used, but CICS cannot find it and no ModelId was provided (DevType) so an autoinstall was not attempted.

netname is the VTAM netname of the CICS client.

System action: The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of UNKNOWNTERMINAL is sent to the client.

User response: Ensure that there is an installed predefined terminal for *termid* that has a remote system parameter (REMOTESYSTEM) specifying the name of this CICS clients connection and that the VTAM NETNAMEs match. Then install the definition with the correct parameters.

Module: DFHZCT1

XMEOUT Parameters: *date, time,applid, termid, netname*

Destination: CSCC

DFHZC3217E *date time applid* Transaction CTIN - VTAM netname *netname*. The specified function is not valid.

Explanation: A CTIN request has been received from a CICS client with a VTAM netname of *netname*. However the function specified was not INSTALL or UNINSTALL.

System action: Exception trace point AP3034 is

written. The CTIN transaction abnormally terminates with abend code AZAI.

User response: Determine where the request originated. Ensure that the input has not been corrupted. You may need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZCT1

XMEOUT Parameters: *date, time,applid, netname*

Destination: CSCC

DFHZC3218E *date time applid* Transaction CTIN - virtual terminal *termid* VTAM netname *netname*. A resource with the same name as the terminal is already installed.

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. CTIN specified that a virtual terminal *termid* should be autoinstalled. However another resource was installed with the same name after the CTIN transaction had ensured that the name was free.

netname is the VTAM netname of the CICS client.

System action: Exception trace point AP3026 is written.

The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of ALREADYINSTALLED is sent to the client.

User response: Investigate where the duplicate resource came from. It is possible that the terminal/APPC autoinstall URM created the name dynamically. If NetName was specified in the CTIN parameters, ensure that the CICS client names do not conflict with existing CICS terminal or connection names. If NetName was not specified, examine the SIT VTPREFIX override to check that the URM does not create names starting with the VTPREFIX character.

Module: DFHZCT1

XMEOUT Parameters: *date, time,applid, termid, netname*

Destination: CSCC

DFHZC3219E *date time applid* Transaction CTIN - virtual terminal *termid* VTAM netname *netname*. The terminal is already in use.

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. CTIN supplied a NetName *termid* but CICS found a resource with the same name which is either an existing virtual terminal for this client, an existing virtual

terminal for another client or another CICS terminal or connection resource.

netname is the VTAM netname of the CICS client.

System action: The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of ALREADYINSTALLED is sent to the client.

User response: Investigate where the duplicate resource came from. It is possible that the terminal/APPC autoinstall URM created the name dynamically and that the CICS client used a name that clashes with the URM.

It is also possible that a client created the virtual terminal and then tried to reuse it without an intervening uninstall, via CCIN or CTIN.

Module: DFHZCT1

XMEOUT Parameters: *date, time, applid, termid, netname*

Destination: CSCC

DFHZC3220E *date time applid* **Transaction CTIN - virtual terminal *termid* VTAM netname *netname*. The terminal has already been installed.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. CTIN specified that the virtual terminal *termid* should be autoinstalled. However, the virtual terminal was already installed.

netname is the VTAM netname of the CICS client.

System action: The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of ALREADYINSTALLED is sent to the client.

User response: The CICS client should issue CTIN uninstall before any attempt to issue another CTIN install for the same NetName.

Module: DFHZCT1

XMEOUT Parameters: *date, time, applid, termid, netname*

Destination: CSCC

DFHZC3221E *date time applid* **Transaction CTIN - virtual terminal *termid* VTAM netname *netname*. The name specified is already in use by another CICS resource.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. CTIN specified that the virtual terminal *termid* should be autoinstalled. However, the name specified is

already in use by another CICS resource.

netname is the VTAM netname of the CICS client.

System action: The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of ALREADYINSTALLED is sent to the client.

User response: Investigate where the duplicate resource came from. It is possible that the terminal/APPC autoinstall URM created the name dynamically.

If NetName was specified on the CTIN install ensure that NetName does not conflict with other CICS resources.

If NetName was not specified, examine the SIT VTPREFIX override to check that the URM does not create names starting with the VTPREFIX character.

Module: DFHZCT1

XMEOUT Parameters: *date, time, applid, termid, netname*

Destination: CSCC

DFHZC3222E *date time applid* **Transaction CTIN - virtual terminal *termid* VTAM netname *netname*. The CITS task has terminated abnormally.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. CICS attempted to autoinstall the virtual terminal *termid*. However, the CITS task which was attached to install the virtual terminal, abended.

If this ABEND was an AZVE, this is because a resource already exists with that name. However, this only occurs if the duplicate resource was added after this CTIN transaction started and checked for any duplicate.

netname is the VTAM netname of the CICS client.

System action: Exception trace point AP3030 is written.

The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of INSTALLCANCELLED is sent to the client.

User response: Investigate where the duplicate resource came from. It is possible that the terminal/APPC autoinstall URM created the name dynamically.

If NetName was specified on the CTIN install, ensure that the names do not conflict.

If NetName was not specified, examine the SIT VTPREFIX override to check that the URM does not create names starting with the VTPREFIX character.

DFHZC3223E • DFHZC3226E

For any other abend, see the description of the abend code for further guidance.

Module: DFHZCT1

XMEOUT Parameters: *date, time,applid, termid, netname*

Destination: CSCC

DFHZC3223E *date time applid* **Transaction CTIN - virtual terminal *termid* VTAM netname *netname*. The surrogate TCTTE is in use and cannot be deleted.**

Explanation: A CTIN uninstall request has been received from a CICS client as a result of a CICS_EpiDelTerminal function or terminal emulator operation. However, the surrogate TCTTE attached to the virtual terminal is still in use and cannot be deleted.

netname is the VTAM netname of the CICS client.

System action: Exception trace point AP302F is written. The attempt to delete the virtual terminal is rejected.

User response: Either wait for the transaction to finish or PURGE the transaction. Once the transaction has ended the virtual terminal will be deleted when the client issues CCIN install or uninstall.

Module: DFHZCT1

XMEOUT Parameters: *date, time,applid, termid, netname*

Destination: CSCC

DFHZC3224E *date time applid* **Transaction CTIN - virtual terminal *termid* VTAM netname *netname*. The terminal specified for deletion cannot be found.**

Explanation: A CTIN uninstall request has been received from a CICS client as a result of a CICS_EpiDelTerminal function or terminal emulator operation. However the virtual terminal *termid* does not exist as a remote terminal for this CICS client.

netname is the VTAM netname of the CICS client.

System action: The attempt to delete the virtual terminal is rejected.

User response: Determine why a CICS client requested that a non-existent virtual terminal be deleted.

If the CTIN uninstall was issued correctly and the virtual terminal should exist, examine the CICS log for message DFHZC5966 and for DFHZC32xx messages referring to this terminal.

Module: DFHZCT1

XMEOUT Parameters: *date, time,applid, termid, netname*

Destination: CSCC

DFHZC3225E *date time applid* **Transaction CTIN - VTAM netname *netname*. The terminal cannot be deleted because the NetName parameter is missing.**

Explanation: A CTIN uninstall request has been received from a CICS client as a result of a CICS_EpiDelTerminal function or terminal emulator operation. However the NetName parameter, defining which virtual terminal is to be deleted, is missing.

netname is the VTAM netname of the CICS client.

System action: Exception trace point AP3037 is written – data 2 contains the data received. The attempt to delete the virtual terminal is rejected.

User response: Examine the input to CTIN. You may need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZCT1

XMEOUT Parameters: *date, time,applid, netname*

Destination: CSCC

DFHZC3226E *date time applid* **Transaction CTIN - virtual terminal *termid* VTAM netname *netname*. CICS cannot access the builder parameter set.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. CICS is attempting to extract the details from the virtual terminal that has just been created and return them back to the CICS client. However the attempt to extract the details in the form of a builder parameter set (BPS) failed.

netname is the VTAM netname of the CICS client.

System action: Exception trace point AP3031 is written.

The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of INSTALLCANCELLED is sent to the client.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZCT1

XMEOUT Parameters: *date, time,applid, termid, netname*

Destination: CSCC

DFHZC3227E *date time applid* **Transaction CTIN - VTAM netname *netname*. The client data is longer than expected.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. However the data received was longer than expected. *netname* is the VTAM netname of the CICS client.

System action: Exception trace point AP302D is written – data 2 contains the length that was received. The CTIN transaction abnormally terminates with abend code AZAI.

User response: Examine the data sent to CICS from the CICS client. You may need to contact IBM for assistance. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZCT1

XMEOUT Parameters: *date, time, applid, netname*

Destination: CSCC

DFHZC3228E *date time applid* **Transaction CTIN - VTAM netname *netname*. The client header data contains an invalid group.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. However the header contains an invalid group. *netname* is the VTAM netname of the CICS client.

System action: Exception trace point AP3024 is written – data 2 contains the data received. The CTIN transaction abnormally terminates with abend code AZAI.

User response: Examine the data sent to CICS from the CICS client. You may need to contact IBM for assistance. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZCT1

XMEOUT Parameters: *date, time, applid, netname*

Destination: CSCC

DFHZC3229E *date time applid* **Transaction CTIN - VTAM netname *netname*. CICS has received invalid data from the client.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. CICS attempted to parse this data but found a discrepancy between the number of parameters, the length of the parameters and the length of the data

received. *netname* is the VTAM netname of the CICS client.

System action: Exception trace point AP3033 is written – data 2 contains the data received. The CTIN transaction abnormally terminates with abend code AZAI.

User response: Examine the data sent to CICS from the CICS client. You may need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZCT1

XMEOUT Parameters: *date, time, applid, netname*

Destination: CSCC

DFHZC3230E *date time applid* **Transaction CTIN - VTAM netname *netname*. CICS has received a client request on an unsupported sync level.**

Explanation: A CTIN request has been received on a conversation which is not at synchronization level 0 or 1. *netname* is the VTAM netname of the CICS client.

System action: Exception trace point AP302B is written. The CTIN transaction abnormally terminates with abend code AZAI.

User response: Ensure that the CICS client converses at sync level 0 or 1.

Module: DFHZCT1

XMEOUT Parameters: *date, time, applid, netname*

Destination: CSCC

DFHZC3231E *date time applid* **Transaction CTIN - VTAM netname *netname*. The client header data contains an invalid version number.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. However there is an invalid version number in the header. *netname* is the VTAM netname of the CICS client.

System action: Exception trace point AP3036 is written – data 2 contains the data received. The CTIN transaction abnormally terminates with abend code AZAI.

User response: Since the version used in the CICS client must match with the version used by the server, one or the other is at the wrong level and should be changed. You may need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSCC

DFHZC3240E *date time applid* **Transaction CCIN - VTAM netname *netname*. CICS has received a client request on an unsupported sync level.**

Explanation: A CCIN request has been received on a conversation which is not at synchronization level 0 or 1. *netname* is the VTAM netname of the CICS client.

System action: Exception trace point AP3003 is written. The CCIN transaction abnormally terminates with abend code AZAF.

User response: Ensure that the CICS client converses at sync level 0 or 1.

Module: DFHZCN1

XMEOUT Parameters: *date, time, applid, netname*

Destination: CSCC

DFHZC3241E *date time applid* **Transaction CCIN - VTAM netname *netname*. The client data is longer than expected.**

Explanation: A CCIN install request has been received from a CICS client. However the data received was longer than expected. *netname* is the VTAM netname of the CICS client.

System action: Exception trace point AP3004 is written – data 2 contains the length that was received. The CCIN transaction abnormally terminates with abend code AZAF.

User response: Examine the data sent to CICS from the CICS client. You may need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZCN1

XMEOUT Parameters: *date, time, applid, netname*

Destination: CSCC

DFHZC3242E *date time applid* **Transaction CCIN - VTAM netname *netname*. The client header data contains an invalid group.**

Explanation: A CCIN request has been received from a CICS client. However there is an invalid group in the header. *netname* is the VTAM netname of the CICS client.

System action: Exception trace point AP3002 is written – data 2 contains the data received. The CCIN transaction abnormally terminates with abend code AZAF.

User response: Examine the data sent to CICS from the CICS client.

Module: DFHZCN1

XMEOUT Parameters: *date, time, applid, netname*

Destination: CSCC

DFHZC3243E *date time applid* **Transaction CCIN - VTAM netname *netname*. The client header data contains an invalid version number.**

Explanation: A CCIN install request has been received from a CICS client. However the header contains an invalid version value. *netname* is the VTAM netname of the CICS client.

Either the CICS client is setting up the CCIN header incorrectly or a new version of the CICS client software is being used which is not supported on CICS Transaction Server for z/OS, Version 3 Release 2.

System action: Exception trace point AP300B is written – data 2 contains the data received. The CCIN transaction abnormally terminates with abend code AZAF.

User response: Since the version used in the CICS client must match with the version used by the server, one or the other is at the wrong level and should be changed. You may need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZCN1

XMEOUT Parameters: *date, time, applid, netname*

Destination: CSCC

DFHZC3244E *date time applid* **Transaction CCIN - VTAM netname *netname*. The client header data contains an invalid function.**

Explanation: A CCIN request has been received from a CICS client. However there is an invalid function in the header. *netname* is the VTAM netname of the CICS client.

System action: Exception trace point AP3002 is written - data 2 contains the data received. The CCIN transaction abnormally terminates with abend code AZAF.

User response: Investigate why the CICS client has sent an unknown function call to CCIN. You may need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZCN1

XMEOUT Parameters: *date, time, applid, netname*

Destination: CSCC

DFHZC3245E *date time applid* **Transaction CCIN - VTAM netname *netname*. The capabilities parameter has not been specified.**

Explanation: A CCIN transaction has been run from a CICS client. One of the parameters which must be supplied is the CAPABILITIES parameter which specifies the capabilities the CICS client can support. This parameter is missing.

netname is the VTAM netname of the CICS client.

System action: The request to install a CICS client is rejected. A response code of DISASTER and a reason code of INVALIDREQUEST is sent to the client.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZCN1

XMEOUT Parameters: *date, time, applid, netname*

Destination: CSCC

DFHZC3246 *date time applid* **Transaction CCIN - virtual terminal *termid* VTAM netname *netname*. CICS cannot attach the CDTS transaction.**

Explanation: A CCIN request has been received from a CICS client. As part of the processing, the CDTS transaction was called to delete virtual terminal *termid*. However CICS was unable to attach the CDTS transaction.

netname is the VTAM netname of the CICS client.

System action: The attempt to delete the virtual terminal fails. If this is a CCIN install request, the install continues.

User response: Ensure that the CDTS transaction and the DFHZATS program are defined correctly as specified in IBM supplied group DFHSP1 and that they are installed.

Module: DFHZCN2

XMEOUT Parameters: *date, time, applid, termid, netname*

Destination: CSCC

DFHZC3247 *date time applid* **Transaction CCIN - virtual terminal *termid* VTAM netname *netname*. The CCIN transaction has timed out waiting for CDTS to run.**

Explanation: A CCIN request has been received from a CICS client. As part of the processing, the CDTS transaction is called to delete virtual terminal *termid*. However the CCIN transaction has waited for the CDTS transaction for two minutes and has timed out.

netname is the VTAM netname of the CICS client.

System action: The CDTS attempt to delete the virtual terminal continues and occurs when the CDTS transaction starts or is 'unsuspended'.

If this is a CCIN install request, the install continues.

User response: Check to see why the CDTS transaction was unable to start or was hanging.

You may need to increase MAXTASK or the CITS TRANCLASS allocation.

Module: DFHZCN2

XMEOUT Parameters: *date, time, applid, termid, netname*

Destination: CSCC

DFHZC3248E *date time applid* **Transaction CCIN - virtual terminal *termid* VTAM netname *netname*. The surrogate TCTTE is in use and cannot be deleted.**

Explanation: A CCIN request has been received from a CICS client. There should not be any virtual terminals installed, however, one or more were located. The surrogate TCTTE attached to the virtual terminal is still in use and cannot be deleted. If this was caused by an immediate shut down of the client the transaction abend might not have completed before CICS attempted to delete the client.

netname is the VTAM netname of the CICS client.

System action: Exception trace point AP301C is written. The attempt to delete the virtual terminal is rejected.

If this is a CCIN install request, the install continues.

User response: Determine why the virtual terminal was installed when CCIN was run.

Either wait for the transaction to finish or PURGE the transaction. Once the transaction completes the virtual terminal will be deleted at the next CCIN install/uninstall.

Module: DFHZCN2

XMEOUT Parameters: *date, time, applid, termid, netname*

Destination: CSCC

DFHZC3249E *date time applid* **Transaction CCIN - VTAM netname *netname*. CICS has received invalid data from the client.**

Explanation: A CCIN install request has been received from a CICS client. CICS attempted to parse this data but found a discrepancy between the number of parameters, the length of the parameters, and the length of the data received. *netname* is the VTAM netname of the CICS client.

DFHXC3400E • DFHXC3406E

System action: Exception trace point AP300E is written – data 2 contains the data received. The CCIN transaction abnormally terminates with abend code AZAF.

User response: Examine the data sent to CICS from the CICS client. You may need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXCN1

XMEOUT Parameters: *date, time, applid, netname*

Destination: CSCC

DFHXC3400E *date time applid termid tranid* **Chain exceeds max chain size.** *sense ((instance) Module name: {DFHXRAC | DFHXRVS | DFHXRVSX})*

Explanation: If chain assembly (BUILDCHAIN) has been specified in the TCTTE, the chain being assembled does not fit into the IOAREALEN for a maximum chain (IOAREALEN Value 2). The remaining space in the IOAREALEN for a maximum chain is smaller than the maximum RECEIVESIZE.

If chain assembly (BUILDCHAIN) has been specified in the TCTTE, but maximum chain value equals zero, either the maximum chain value has been set incorrectly at build time or the value has been overwritten.

For the meaning of *sense*, see message DFHXC2400.

System action: If a task is attached, it is abnormally terminated with a transaction dump.

User response: Ensure that the maximum chain size, generated in CEDA TYPETERM with IOAREALEN (value 2) keyword, is large enough for the maximum chain expected.

Module: DFHXRVS, DFHXRVSX, DFHXRAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHXRVS, 2=DFHXRVS, 3=DFHXRVS, 4=DFHXRVS, 5=DFHXRVS, 6=DFHXRVSX, 7=DFHXRAC, 8=DFHXRAC}*

Destination: CSNE

DFHXC3401I *date time applid termid tranid* **Resource now available.** *sense ((instance) Module name: {DFHXCNAC})*

Explanation: A resource of the logical unit (LU) is now available. It had previously been temporarily unavailable or had required intervention.

For the meaning of *sense*, see message DFHXC2400.

System action: Any outstanding read or write operation is retried.

User response: None.

Module: DFHXCNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHXCNAC}*

Destination: CSNE

DFHXC3402E *date time applid termid tranid* **Invalid READ with outbound chain control.** *sense ((instance) Module name {DFHXRVS})*

Explanation: A DFHTC TYPE=READ request is being processed, although the previously issued DFHTC TYPE=WRITE request did not complete a chain.

For the meaning of *sense*, see message DFHXC2400.

System action: All outstanding receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User response: Correct the application program.

Module: DFHXRVS

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHXRVS}*

Destination: CSNE

DFHXC3405E *date time applid termid tranid* **Catastrophic bracket error.** *sense ((instance) Module name {DFHXCNAC})*

Explanation: The logical unit detected a failure of CICS to enforce bracket rules.

For the meaning of *sense*, see message DFHXC2400.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. The session is terminated.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Use the symptom string, a VTAM trace, and if necessary the dump, to determine the source of the problem.

Module: DFHXCNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHXCNAC}*

Destination: CSNE

DFHXC3406E *date time applid termid tranid* **Parameter error.** *sense ((instance) Module name {DFHXCNAC})*

Explanation: The request/response unit (RU) received by the logical unit (LU) contains a control function with invalid parameters.

For the meaning of *sense*, see message DFHXC2400.

System action: All send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. A portion of the TIOA is put to the CSNE log.

User response: Correct the application program.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFH3C3407E *date time applid termid tranid* **READ command does not carry change direction indicator.** *sense ((instance) Module name {DFHZNAC})*

Explanation: A request for input (for example, a READBUF command) sent to a logical unit (LU) type 2 (3270 compatibility mode logical unit) must carry the SNA change direction indicator. The LU has received such a request, but the indicator is not set.

Since the setting of the change direction indicator is controlled by terminal control, this message indicates that an internal logic error may have occurred. The error is not necessarily in terminal control, but may be in the logical unit or some other element of the network.

For the meaning of *sense*, see message DFH3C2400.

System action: The task and the VTAM session for the logical unit are abnormally terminated.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Identify the request that caused the error, and locate the element of the network responsible.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFH3C3408E *date time applid termid tranid* **Presentation space integrity lost.** *sense ((instance) Module name {DFHZNAC})*

Explanation: The contents of data for screen presentation by a logical unit has been altered. This is usually due to operator action. For example, the TEST/NORMAL key may have been used or the 3270 SYS REQ key may have been pressed.

It may also have been caused by factors other than operator action, for example, 3270 regeneration buffer failure.

For the meaning of *sense*, see message DFH3C2400.

System action: Any outstanding requests are canceled. If a task is attached, it is abnormally

terminated with a transaction dump.

User response: Determine reason for failure at the remote terminal.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFH3C3409E *date time applid termid tranid* **Unexpected negative response received.** *sense ((instance) Module name {DFH3C3409E})*

Explanation: CICS received a negative response to a command for which a negative response would not normally be expected.

For the meaning of *sense*, see message DFH3C2400.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. The node is placed out of service and the TCTTE, RPL, and action flags are logged to CSNE.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Ensure that the application programs running concurrently do not alter the TCTTE. Check that the SNA flows on the session are valid and that the logical unit is not violating SNA protocols.

Module: DFH3C3409E

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFH3C3409E}*

Destination: CSNE

DFH3C3410E *date time applid termid tranid* **Invalid input when LU status expected.** *sense ((instance) Module name {DFH3C3410E})*

Explanation: Input (other than a logical unit status message) was received after a request was rejected with a system sense code indicating a possibly rectifiable error condition at the terminal node: for example, Intervention Required. The subsequent LU status message indicates that the error situation has now been corrected, or that the request is permanently not executable.

For the meaning of *sense*, see message DFH3C2400.

System action: If a task is attached, it is abnormally terminated with a transaction dump.

User response: Conform to SNA protocol by ensuring that the next transmission is an LUSTATUS message with a system sense for either Resource Available (0001) or Function Not Executable (081C).

Module: DFH3C3410E

DFHZC3411E • DFHZC3415E

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRVX, 2=DFHZRVX, 3=DFHZRVX}*

Destination: CSNE

DFHZC3411E *date time applid termid tranid* **Resource temporarily unavailable.** *sense ((instance) Module name {DFHZNAC})*

Explanation: A terminal resource required to complete a request is temporarily unavailable.

For the meaning of *sense*, see message DFHZC2400.

System action: The request is retried unless the device is one that sends an LUSTATUS message after receiving a “resource temporarily unavailable” notification.

If “resource temporarily unavailable” notification is received, an associated VTAM message is usually issued.

User response: Refer to the associated VTAM message, if applicable, and follow the guidance provided.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHZC3412E *date time applid termid tranid* **Intervention required on secondary resource.** *sense ((instance) Module name {DFHZNAC})*

Explanation: Operator action is requested for the secondary resource of a logical unit (LU). However, no such resource is immediately available. In the case of a 3270-compatible LU, this message means that the printer most likely to be available for a PRINT request has an Intervention Required status.

For the meaning of *sense*, see message DFHZC2400.

System action: The system waits for a logical unit status message and, when this is received, takes appropriate system action.

User response: Correct the problem that relates to the device.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHZC3413E *date time applid termid tranid* **Logical Unit busy.** *sense ((instance) Module name {DFHZNAC})*

Explanation: The logical unit has rejected a request because its resources are busy (for example, it is communicating with the system services control point (SSCP)), and thus is unable to process the request.

For the meaning of *sense*, see message DFHZC2400.

System action: The system waits for a logical unit status message and then takes appropriate action.

User response: None.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHZC3414E *date time applid termid tranid* **Request not executable. Secondary resource unavailable.** *sense ((instance) Module name {DFHZNAC})*

Explanation: The secondary resource of a logical unit is permanently unavailable to complete a request. For a 3270-compatible LU, this means that a printer was not available for a PRINT request.

For the meaning of *sense*, see message DFHZC2400.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User response: Determine the reason why the resource is not available at the remote terminal.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHZC3415E *date time applid termid tranid* **No data available.** *sense ((instance) Module name {DFHZNAC})*

Explanation: A receive request has been rejected by the logical unit because it has no data to send for one of the following reasons

- The device is not capable of input (for instance, it is a printer)
- The logical unit is not capable of sending data at the time. For example, a requested 3790 data set is not available at the time.

For the meaning of *sense*, see message DFHZC2400.

System action: The receive request is halted. If a task is attached, it is abnormally terminated with a transaction dump.

User response: Verify that the request was issued to the correct device and that the device is capable of data transmission.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHZC3416E *date time applid termid tranid* **Session failure. A connection request for an invalid node *nodeid* could not be terminated. *sense* ((*instance*) Module name: {DFHZSCX})**

Explanation: The requested logon was to be rejected, but the attempt to send a negative response was rejected by VTAM.

For the meaning of *sense*, see message DFHZC2400.

System action: No further attempts are made to communicate with the invalid node.

User response: Inspect the CSNE, CSMT and CSTL logs for an indication of a VTAM storage problem or error message. Determine whether the node was invalid. If it was valid, update the CICS TCT for that node.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, nodeid, sense, instance, {1=DFHZSCX}*

Destination: CSNE

DFHZC3417E *date time applid termid tranid* **Session processing error. A request for synchronization has been ignored. *sense* ((*instance*) Module name {DFHZSDR})**

Explanation: A request for a sync point to be taken was ignored. COMMIT or ABORT has not been issued.

For the meaning of *sense*, see message DFHZC2400.

System action: If a task is attached, it is abnormally terminated with a transaction dump.

User response: To determine the cause of the problem, inspect the CSNE, CSMT and CSTL logs for further diagnostic information. Also inspect transaction *tranid*.

Module: DFHZSDR

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSDR}*

Destination: CSNE

DFHZC3418E *date time applid termid tranid* **System generation error. The *netname* logon request was rejected. *sense* ((*instance*) Module name {DFHZBLX | DFHZLGX | DFHZSCX})**

Explanation: A logon request was rejected because the TCTTE for the ISC session had been generated with an incompatible SESSIONTYPE.

For the meaning of *sense*, see message DFHZC2400.

System action: The request is rejected.

User response: Change the TCTTE generation to specify a secondary logical unit at one end of the connection, and a primary logical unit at the other end.

A primary logical unit should have SESSIONTYPE=SEND or SESSIONTYPE=FASTSEND, and a secondary logical unit should have SESSIONTYPE=RECEIVE or SESSIONTYPE=FASTREC.V.

Module: DFHZSCX, DFHZLGX, DFHZBLX

XMEOUT Parameters: *date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZSCX, 2=DFHZBLX, 3=DFHZLGX}*

Destination: CSNE

DFHZC3419E *date time applid termid tranid* **Session failure. The bind parameter for node *netname* is unacceptable. *sense* ((*instance*) Module name {DFHZBLX | DFHZSCX | RESERVE})**

Explanation: A connection request was rejected because the characteristics specified for the connecting system were unacceptable.

Possible reasons for the rejection are

- For a MEMBER name connection, the network identifier (NETID) passed to CICS is different from that already stored in the system entry (instance 39).
- For a MEMBER name connection, the GRNAME specified in the sessions bind - UDSS04 - is different from that already stored in the system entry (instance 40).
- For a GR name connection, the network identifier (NETID) passed to CICS is different from that already stored in the connections system entry (instance 41).

For the meaning of *sense*, see message DFHZC2400.

System action: The request is rejected. The bind parameter is printed on the CSNE log.

User response: Determine whether the connecting system has specified its characteristics correctly. If it has not, correct the requesting system.

Module: DFHZSCX

XMEOUT Parameters: *date, time, applid, termid, tranid,*

netname, sense, instance, {1=RESERVE, 2=DFHZBLX, 3=DFHZSCX, 4=DFHZSCX, 5=DFHZBLX, 6=DFHZBLX, 7=DFHZSCX, 8=DFHZBLX, 9=DFHZBLX, 10=DFHZBLX, 11=DFHZBLX, 12=DFHZBLX, 13=DFHZBLX, 14=DFHZBLX, 15=DFHZBLX, 16=DFHZBLX, 17=DFHZBLX, 18=DFHZBLX, 19=DFHZSCX, 20=DFHZBLX, 21=DFHZBLX, 22=DFHZBLX, 23=DFHZBLX, 24=DFHZBLX, 25=DFHZBLX, 26=DFHZBLX, 27=DFHZBLX, 28=DFHZBLX, 29=DFHZSCX, 30=DFHZBLX, 31=DFHZBLX, 32=DFHZBLX, 33=DFHZBLX, 34=DFHZBLX, 35=DFHZBLX, 36=DFHZBLX, 37=DFHZBLX, 38=DFHZBLX, 39=DFHZBLX, 40=DFHZBLX, 41=DFHZBLX}

Destination: CSNE

DFHZC3420E *date time applid termid tranid* **Session connection error. Node *netname* is out of service. *sense* ((*instance*) Module name {DFHZBLX | DFHZOPN})**

Explanation: A logon request was rejected because the TCTTE is out of service.

For the meaning of *sense*, see message DFHZC2400.

System action: The request is rejected.

User response: Place the terminal in service by using the master terminal program and reissuing the connection request.

Module: DFHZSCX, DFHZOPN, DFHZBLX

XMEOUT Parameters: *date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZOPN, 2=DFHZBLX, 3=DFHZBLX}*

Destination: CSNE

DFHZC3421E *date time applid termid tranid* **Session shutdown request received. Node *netname* is receiving orderly shutdown. *sense* ((*instance*) Module name {DFHZASX})**

Explanation: A shutdown request was received for the system. An orderly termination procedure has begun.

For the meaning of *sense*, see message DFHZC2400.

System action: Orderly termination of the session is started. Access to the remote system is stopped after the current transaction has finished.

User response: None.

Module: DFHZASX

XMEOUT Parameters: *date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZASX}*

Destination: CSNE

DFHZC3422E *date time applid termid tranid* **Connection failure. Request rejected before a session could be started. *sense* ((*instance*) Module name {DFHZNSP})**

Explanation: An error occurred while trying to connect the two systems. The request was terminated before a session had been established.

For the meaning of *sense*, see message DFHZC2400.

System action: The request is terminated.

User response: Determine the cause of the problem by inspecting the VTAM logs. If the problem is due to a shortage of storage or another temporary error, reissue the request when the system is less heavily loaded.

Module: DFHZNSP

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNSP, 2=DFHZNSP}*

Destination: CSNE

DFHZC3423I *date time applid termid tranid* **FM function not supported. A function requested in an FMD RU is not supported by the receiver. *sense* ((*instance*) Module Name: {DFHZNAC})**

Explanation: CICS has received a negative response (VTAM sense code 0826). The receiver does not support the function requested by the sender.

For the meaning of *sense*, see message DFHZC2400.

System action: All outstanding SENDs and RECEIVEs are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User response: Investigate the reason for issuing a request for a function that the receiver does not support.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHZC3424E *date time applid termid tranid* **Session failure. Session terminated immediately. *sense* ((*instance*) Module name {DFHZNSP})**

Explanation: Communication with a node was interrupted during a session because a session outage was detected, or because a VTAM VARY INACT command was issued.

Error messages produced for the same session after this message may be caused by the session failure and may not be the reason for it. If this is the case, they can be ignored.

For the meaning of *sense*, see message DFHZC2400.

System action: The session is canceled. The session may be recovered later by VTAM. See also messages DFHZC2409 and DFHZC2410.

User response: Check if the failure was caused by an operator-issued VTAM VARY INACT. If this is not the case, use the sense data and any associated messages to investigate the reason for the failure.

Module: DFHZNSP

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNSP, 2=DFHZNSP, 3=DFHZNSP}*

Destination: CSNE

DFHZC3426E *date time applid termid tranid* **Resource unknown. sense ((instance) Module name {DFHZNAC})**

Explanation: During intersystem connection, no matching TCTTE could be found.

For the meaning of *sense*, see message DFHZC2400.

System action: The request is terminated.

User response: Ensure that the name of the requested TCTTE is correctly specified in the requesting system.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHZC3427E *date time applid termid tranid* **Invalid parameter in bind area. sense ((instance) Module name {DFHZNAC})**

Explanation: During intersystem connection, either one or more parameters contained in the bind area of the request were invalid, or were not supported.

For the meaning of *sense*, see message DFHZC2400.

System action: The request is terminated.

User response: Determine which parameters in the bind area are incorrect, and correct them.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHZC3429E *date time applid termid tranid* **Resynch error - CICS did not resynchronize, other logical unit was expecting resynch. sense ((instance) Module name {DFHZRSY | DFHZSYX})**

Explanation: CICS did not go through a resynchronization process that was expected to occur by the other LU.

For the meaning of *sense*, see message DFHZC2400.

System action: Processing continues.

User response: Check whether this resynchronization mismatch is acceptable.

Module: DFHZRSY, DFHZSYX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRSY, 2=DFHZRSY, 3=DFHZRSY, 4=DFHZRSY, 5=DFHZSYX}*

Destination: CSNE

DFHZC3433E *date time applid termid tranid* **FMH7 was received on ISC session. Sense code is : xxxxxxxx{Error log data is : | No error log data received. | No error log data available. }xxxxxxx sense ((instance) Module name {DFHZERH | DFHZRAC | DFHZRVX})**

Explanation: The transaction is communicating with a logical unit (LU) type LU6.1 or LU6.2.

The logical unit sent an FMH7 which may carry error log data. If error log data is included, then the text is inserted in this message.

For the meaning of *sense*, see message DFHZC2400.

System action: The action taken depends upon the sense code.

User response: If the receiving transaction is designed to handle this situation, no action is necessary. However, if this is not the case, use the sense code and any error log data to determine why the connected logical unit sent the FMH7.

If the connected LU is another CICS system, the error log data is a CICS message.

If the connected LU is not a CICS system, see that product's documentation for details of error log data. Some products permit the user to define the contents of error log data.

Module: DFHZRVX, DFHZRAC, DFHZERH

XMEOUT Parameters: *date, time, applid, termid, tranid, xxxxxxxx, {1= Error log data is : , 2=No error log data received. , 3=No error log data available. }, xxxxxxxx, sense, instance, {1=DFHZRVX, 2=DFHZRAC, 3=DFHZRAC, 4=DFHZERH}*

Destination: CSNE

DFHZC3434E *date time applid termid tranid* **Unbind received while session still active.**
sense ((instance) Module name {DFHZSCX})

Explanation: One side of the intersystem link (secondary) received an unbind command without normal termination protocol being observed. This means an abnormal termination of the session was performed, possibly caused by the other side of the intersystem link abnormally terminating.

For the meaning of *sense*, see message DFHZC2400.

System action: The session is terminated.

User response: Determine the cause of the termination by using CICS Trace and the diagnostic information available on the CSNE log. Try to reestablish the session.

Module: DFHZSCX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSCX, 2=DFHZSCX, 3=DFHZSCX, 4=DFHZSCX, 5=DFHZSCX, 6=DFHZSCX, 7=DFHZSCX, 8=DFHZSCX, 9=DFHZSCX, 10=DFHZSCX}*

Destination: CSNE

DFHZC3435E *date time applid termid tranid* **Path error detected. Device cannot be contacted.** *sense ((instance) Module name {DFHZNAC})*

Explanation: VTAM can no longer transmit to a device because there is no access path to that device. This usually occurs because the device or 3270 has been powered off.

For the meaning of *sense*, see message DFHZC2400.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing a VTAM CLSDST macro, and the node is placed out of service. The session is terminated.

User response: Determine the cause of the termination. Try to reestablish the session.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHZC3436E *date time applid termid tranid* **End user not authorized.** *sense ((instance) Module name: {DFHZNAC})*

Explanation: A sense code has been received specifying that an unauthorized request was made to

the remote node. The request was rejected.

For the meaning of *sense*, see message DFHZC2400.

System action: The session is terminated.

User response: Determine why the end user is not authorized to perform the request.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHZC3437I *date time applid termid tranid* **Node netname action taken:** *action ((instance) Module name {DFHZNAC})*

Explanation: After an error has been processed by DFHZNAC, certain actions may be taken to correct the error. This message indicates the actions that were set. The actions taken can differ from the actions set, depending on the type and state of the node at the time of the error.

System action:

Action Effect

ABRECV

Cancel receive.

ABSEND

Cancel send.

ABTASK

Abend task

CLSDST

Close session.

GMM

Send good morning message.

OUTSRV

Place session out of service.

CREATE

Allow ATI to acquire the session if required.

NOCREATE

Do not allow ATI to acquire the session.

NEG RESP

Send an exception response.

SIMLOGON

Generate SIMLOGON request for the session.

CNTASK

Cancel the task.

SYSDUMP

Take a system dump.

PURGEBMS

Purge any BMS pages.

User response: The user action depends on what action has been taken by the system. This is indicated

by *action* in the message text.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, netname, action, instance, {1=DFHZNAC}*

Destination: CSNE

DFHZC3438E *date time applid termid tranid* **Device powered off. sense ((instance) Module name {DFHZNAC})**

Explanation: A request has been rejected by the logical unit because the associated device has been powered off. This message may be caused by operator action. For example, the TEST/NORMAL key may have been used.

For the meaning of *sense*, see message DFHZC2400.

System action: The system waits for a logical unit status message and, when the message has been received, takes appropriate system action.

User response: Correct the problem that relates to the device.

For the meaning of the sense codes, refer to the explanatory paragraph in message DFHZC2461.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHZC3439E *date time applid termid tranid* **Negative response received to SDT. sense ((instance) Module name {DFHZNAC})**

Explanation: A negative response has been received to the START DATA TRAFFIC (SDT) command.

For the meaning of *sense*, see message DFHZC2400.

System action: Processing continues.

User response: None.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHZC3440E *date time applid termid tranid* **Unable to send error message - session in free status. sense ((instance) Module name {DFHZEMW})**

Explanation: DFHZEMW was attempting to write a message to another node, but was unable to do so because the session was in "between bracket" status.

In this state, it is not possible to send the message in the normal way. The session was in free status,

probably because the application program had issued a SEND command with the LAST option.

For the meaning of *sense*, see message DFHZC2400.

System action: Processing continues.

User response: Check to see why the other node sent its request EXCEPTION response mode. Change the response mode to DEFINITE if error messages are to be sent.

Module: DFHZEMW

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZEMW, 2=DFHZEMW}*

Destination: CSNE

DFHZC3441I *date time applid* **Orderly termination of VTAM sessions requested. sense ((instance) Module name: {DFHZSHU})**

Explanation: A request for an orderly close of VTAM sessions and subsequent close of CICS VTAM ACB has been received. The request may have been initiated by the CICS master terminal command or by the VTAM network closing down.

For the meaning of *sense*, see message DFHZC2400.

System action: All nodes are quiesced and each session is closed as it becomes inactive. When all sessions have been closed, the ACB is closed.

User response: None.

Module: DFHZSHU

XMEOUT Parameters: *date, time, applid, sense, instance, {1=DFHZSHU}*

Destination: CSNE

DFHZC3442I *date time applid* **Immediate termination of VTAM sessions requested. sense ((instance) Module name: {DFHZSHU | DFHZTPX | RESERVE})**

Explanation: A request for an immediate close of all VTAM sessions and subsequent close of CICS VTAM ACB has been received. The request may have been initiated by the CICS master terminal command or by the VTAM network closing down.

This message is also issued if V NET,ID=...,INACT is issued by the VTAM operator.

For the meaning of *sense*, see message DFHZC2400.

System action: All requests on a VTAM session are abnormally terminated and the session is closed. The VTAM ACB is then closed.

If V NET,ID=...,INACT was issued by the VTAM operator, VTAM waits for all sessions to be closed before informing CICS. In this case there are no sessions to be abnormally terminated. This message

DFHXC3443I • DFHXC3447E

may be issued twice, once by DFHZTPX and once by DFHZSHU. The messages will have different instance numbers.

User response: None.

Module: DFHZSHU, DFHZTPX

XMEOUT Parameters: *date, time, applid, sense, instance, {1=DFHZSHU, 2=RESERVE, 3=RESERVE, 4=DFHZTPX, 5=DFHZSHU}*

Destination: CSNE

DFHXC3443I *date time applid* **VTAM has been cancelled or the ACB has been forceclosed. VTAM sessions terminated.***sense ((instance) Module name {DFHZSHU | DFHZSYX | DFHZTPX})*

Explanation: VTAM has been cancelled or force closed by the CICS/VTAM operator.

For the meaning of *sense*, see message DFHXC2400.

System action: CICS will close its ACB. All transactions running on VTAM sessions are abnormally terminated.

User response: None.

Module: DFHZSHU, DFHZTPX, DFHZSYX

XMEOUT Parameters: *date, time, applid, sense, instance, {1=DFHZSHU, 3=DFHZSYX, 4=DFHZTPX, 5=DFHZSHU}*

Destination: CSNE

DFHXC3444E *date time applid termid tranid* **Unexpected condition detected during RECEIVE processing.** *sense ((instance) Module name {DFHZRAC | DFHZRVS})*

Explanation: CICS has detected that more than 32k of data has been transmitted while receiving data from terminal "termid".

For the meaning of *sense*, see message DFHXC2400.

System action: CICS terminates the session and places the terminal out of service. If a task is attached, it is abnormally terminated with a transaction dump.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: To determine the cause of this error,

- Check for a terminal malfunction, for example the device may be sending the same data repeatedly, or
- Check for a network problem.

Module: DFHZRVS, DFHZRAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRVS, 2=DFHZRAC}*

Destination: CSNE

DFHXC3445E *date time applid termid tranid* **State error.** *sense ((instance) Module name {DFHZNAC})*

Explanation: CICS has received a state error negative response (VTAM sense code 20yy).

For the meaning of *sense*, see message DFHXC2400.

System action:

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing a VTAM CLSDST macro, and the node is placed out of service.

User response: Determine the reason for the error before restarting the session.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHXC3446E *date time applid termid tranid* **Request error.** *sense ((instance) Module name {DFHZNAC})*

Explanation: CICS has received a request error negative response (VTAM sense code 10yy) for which it does not recognize the minor code yy.

For the meaning of *sense*, see message DFHXC2400.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing a VTAM CLSDST macro, and the node is placed out of service.

User response: Determine the reason for the error.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHXC3447E *date time applid termid tranid* **Request reject error.** *sense ((instance) Module name: {DFHZNAC})*

Explanation: CICS has received a request reject negative response (VTAM sense code 08yy) for which it does not recognize the minor code yy.

For the meaning of *sense*, see message DFHXC2400.

System action: All outstanding send and receive requests are purged. If a task is attached, it is

abnormally terminated with a transaction dump. Communication with the node is terminated by issuing a VTAM CLSDST macro, and the node is placed out of service.

User response: Determine the reason for the error.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHZC3448E *date time applid termid tranid* **Security identification error. sense ((instance) Module name {DFHZNAC})**

Explanation: CICS has received a negative response to a request to access a resource because it was not authorized. If it was an OPNDST (BIND) request, CICS did not send the authorization sequence expected by a logical unit. CICS does not support the security feature in the bind.

For the meaning of *sense*, see message DFHZC2400.

System action: The logical unit is placed out of service and the session is closed.

User response: CICS does not support the security feature in the bind. Modify the authorization parameters in the remote logical unit so that it does not require authorization to initiate a session.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHZC3449I *date time applid termid tranid* **Leaving unattended mode. sense ((instance) Module name {DFHZNAC})**

Explanation: CICS has received a status message from a logical unit indicating that the terminal is now attended.

Note that this is the default mode of operation.

For the meaning of *sense*, see message DFHZC2400.

System action: The mode of operation bit TCTEMOPU is reset in the TCTTE.

User response: For logical units that can operate in unattended mode, the application programmer should test the mode of operation before starting a conversational sequence with the terminal operator. If the bit is on, no operator action can be expected.

For command level, use the EXEC CICS ASSIGN UNATTEND (data area) command to obtain the value of TCTEMOPU.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHZC3450I *date time applid termid tranid* **Entering unattended mode. sense ((instance) Module name {DFHZNAC})**

Explanation: CICS has received a status message from a logical unit indicating that the terminal is no longer attended.

For the meaning of *sense*, see message DFHZC2400.

System action: The mode of operation bit TCTEMOPU is set in the TCTTE.

User response: For logical units that can operate in unattended mode, the application programmer should test the mode of operation before starting a conversational sequence with the terminal operator. If the bit is on, no operator action can be expected.

For command level, use the EXEC CICS ASSIGN UNATTEND (data area) command to obtain the value of TCTEMOPU.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHZC3451I *date time applid termid tranid* **Currently no data to send. sense ((instance) Module name {DFHZNAC})**

Explanation: Following the issue of a READ command to a logical unit, or the completion of a transaction associated with the logical unit, CICS has received a status message from the logical unit indicating that it currently has no data to send.

For the meaning of *sense*, see message DFHZC2400.

System action: If a data interchange (DFHDI) receive request is outstanding, it will complete with DSSTAT condition and a response code X'15.

If no task is active and no work is outstanding for the terminal, the soft CLSDEST action flag is set and DFHZNEP is called. Unless it is reset by DFHZNEP, the session is terminated.

User response: Ensure that no more receive requests are issued to the terminal.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHZC3452E *date time applid termid tranid* **Signal received - Code** *xxxx. sense ((instance) Module name {DFHZASX})*

Explanation: CICS has received a SIGNAL command from a logical unit. The SIGNAL codes received with the SIGNAL command are made available to the DFHZNEP user program.

If a task is active, the SIGNAL condition is raised on return to the application program. This message is produced only when SIGNAL codes are passed to the node abnormal condition program (DFHZNAC). CICS does this for Type 4 logical units only.

For the meaning of *sense*, see message DFHZC2400.

System action: If the SIGNAL code is 0001 0000 (request change direction), any further output request will cause the IGRREQCD condition to be raised. All SIGNAL codes will cause the SIGNAL condition to be raised.

User response: For logical units for which CICS enforces SIGNAL request change direction, if the code is 0001 0000, issue a receive request or terminate transaction *tranid*.

If the code is NOT 0001 0000, terminate transaction *tranid* and refer to the *VTAM Programming* manual for further guidance.

Module: DFHZASX

XMEOUT Parameters: *date, time, applid, termid, tranid, xxxx, sense, instance, {1=DFHZASX, 2=DFHZASX}*

Destination: CSNE

DFHZC3453E *date time applid termid tranid* **RH usage error. sense ((instance) Module name {DFHZNAC})**

Explanation: CICS has received a request header (RH) usage error negative response for which it does not recognize the minor code *yy*.

For the meaning of *sense*, see message DFHZC2400.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing a VTAM CLSDST macro, and the node is placed out of service.

User response: None.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHZC3454E *date time applid termid tranid* **Session initiation failure. Bind response from node** *netname is unacceptable. sense ((instance) Module name {DFHZOPX})*

Explanation: A remote secondary's response to a negotiable bind contained unacceptable parameters.

For the meaning of *sense*, see message DFHZC2400.

System action: Session initialization fails. The sent and received bind parameters are printed on the CSNE log.

User response: Look at the parameters printed on the CSNE log. Ensure that the remote system has correctly specified its characteristics. If there is an invalid format, change it to LEN PSQ LEN SSQ.

Module: DFHZOPX

XMEOUT Parameters: *date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZOPX, 2=DFHZOPX, 3=DFHZOPX, 4=DFHZOPX, 5=DFHZOPX, 6=DFHZOPX, 7=DFHZOPX, 8=DFHZOPX, 9=DFHZOPX, 10=DFHZOPX, 11=DFHZOPX, 12=DFHZOPX, 13=DFHZOPX, 14=DFHZOPX, 15=DFHZOPX, 16=DFHZOPX, 17=DFHZOPX, 18=DFHZOPX, 19=DFHZOPX, 20=DFHZOPX, 21=DFHZOPX, 22=DFHZOPX, 23=DFHZOPX, 24=DFHZOPX, 25=DFHZOPX, 26=DFHZOPX, 27=DFHZOPX, 28=DFHZOPX, 29=DFHZOPX, 30=DFHZOPX, 31=DFHZOPX, 32=DFHZOPX, 33=DFHZOPX, 34=DFHZOPX, 35=DFHZOPX, 36=DFHZOPX, 37=DFHZOPX, 38=DFHZOPX, 39=DFHZOPX, 40=DFHZOPX, 41=DFHZOPX, 42=DFHZOPX, 43=DFHZOPX, 44=DFHZOPX, 45=DFHZOPX}*

Destination: CSNE

DFHZC3455E *date time applid termid tranid* **Session initiation failure. Bind response from node** *netname contains an invalid session qualifier pair. sense ((instance) Module name {DFHZOPX})*

Explanation: A remote secondary's response to a negotiable bind contained an invalid session qualifier pair in the user data field. Either it had an invalid format, or the primary SQ had been altered.

For the meaning of *sense*, see message DFHZC2400.

System action: Session initialization fails. The sent and received bind images are printed on the CSNE log.

User response: Correct the error in the remote system. If there is an invalid format, change it to LEN PSQ LEN SSQ.

Module: DFHZOPX

XMEOUT Parameters: *date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZOPX, 2=DFHZOPX, 3=DFHZOPX}*

Destination: CSNE

DFHZC3456E *date time applid termid tranid* **No outboard formats loaded.** *sense ((instance) Module name {DFHZNAC})*

Explanation: An outboard format has been referenced, but no outboard formats are loaded on this logical unit.

System action: Transaction *tranid* is abnormally terminated with a transaction dump.

User response: Load the necessary outboard formats.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHZC3457E *date time applid termid tranid* **Requested outboard format not loaded.** *sense ((instance) Module name {DFHZNAC})*

Explanation: An outboard format has been referenced, but the requested format is not loaded on this logical unit.

For the meaning of *sense*, see message DFHZC2400.

System action: Transaction *tranid* is abnormally terminated with a transaction dump.

User response: Load the requested outboard format.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHZC3458E *date time applid termid tranid* **Requested format group not loaded.** *sense ((instance) Module name {DFHZNAC})*

Explanation: An outbound format group has been referenced, but that format group is not loaded on this logical unit.

For the meaning of *sense*, see message DFHZC2400.

System action: Transaction *tranid* is abnormally terminated with a transaction dump.

User response: Load the required format group.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHZC3459E *date time applid termid tranid* **Unsupported data stream.** *sense ((instance) Module name {DFHZNAC})*

Explanation: The data stream sent to the device contains control data for functions that the device does not support.

For the meaning of *sense*, see message DFHZC2400.

System action: Transaction *tranid* is abnormally terminated.

User response: Either ensure that transaction *tranid* is not run against the terminal, or change the terminal to one that supports the data stream.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHZC3460E *date time applid termid tranid* **Requested character set not present.** *sense ((instance) Module name {DFHZNAC})*

Explanation: The Referenced Logical Character Set Identifier (LCID) specified in the define alternate character set is not known.

For the meaning of *sense*, see message DFHZC2400.

System action: Transaction *tranid* is abnormally terminated with a transaction dump.

User response: Ensure that the character set referenced by the LCID is loaded.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHZC3461I *date time applid termid tranid* **Node netname session started.** *sense ((instance) Module name {DFHZE1 | DFHZE2 | DFHZOPX})*

Explanation: CICS has successfully issued or received a bind to the node *netname*.

For the meaning of *sense*, see message DFHZC2400.

System action: Processing continues.

User response: None.

Module: DFHZOPX, DFHZE1, DFHZE2

XMEOUT Parameters: *date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZOPX, 2=DFHZOPX, 3=DFHZE1, 4=DFHZE2}*

Destination: CSNE

DFHZC3462I *date time applid termid tranid Node netname session terminated. sense ((instance) Module name {DFHZCLS})*

Explanation: A session with node *netname* has been closed.

For the meaning of *sense*, see message DFHZC2400.

System action: Processing continues.

User response: None.

Module: DFHZCLS

XMEOUT Parameters: *date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZCLS, 2=DFHZCLS}*

Destination: CSNE

DFHZC3463I *date time applid VTAM ACB opened. VTAM Return Code = X'rc'. Time = time sense ((instance) Module name {DFHZOPA})*

Explanation: The master terminal operator issued a CEMT or CSMT command to open the VTAM ACB.

For the meaning of *sense*, see message DFHZC2400.

System action: Processing continues.

User response: This depends on the return code

- If the value is zero, VTAM sessions can be enabled.
- If the value is 1, this is not a VTAM return code. It is inserted by DFHZOPA if a VTAM OPEN is received when the ACB is already open.
- If the return code is some other value, the operation has failed. See the section on *Open Macroinstructions* in the *VTAM Programming manual* to determine why the VTAM ACB was not opened.

Module: DFHZOPA

XMEOUT Parameters: *date, time, applid, X'rc', time, sense, instance, {1=DFHZOPA}*

Destination: CSNE

DFHZC3464I *date time applid termid tranid Node netname released by MT Operator/LU Services Manager. sense ((instance) Module name {DFHZSTU})*

Explanation: The master terminal operator issued a CEMT command to release the logical unit (LU).

For the meaning of *sense*, see message DFHZC2400.

System action: The LU is closed. Any task associated with the LU is terminated either abnormally (if the master terminal operator so desired) or normally.

User response: None.

Module: DFHZSTU

XMEOUT Parameters: *date, time, applid, termid, tranid,*

netname, sense, instance, {1=DFHZSTU}

Destination: CSNE

DFHZC3465E *date time applid termid tranid Unexpected response received. sense ((instance) Module name {DFHZRAC | DFHZRLP | DFHZRVX})*

Explanation: CICS received a positive response in one of the following circumstances

- The response was to data sent with exception response
- The response was to a command sent with exception response
- The response was to a send to which a response has already been sent.

For the meaning of *sense*, see message DFHZC2400.

System action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. The node is placed out of service and the TCTTE, RPL, and action flags are logged to CSNE.

User response: Ensure that the application programs running concurrently do not alter the TCTTE. Check that the SNA flows on the session are valid and that the logical unit is not violating SNA protocols.

Module: DFHZRVX, DFHZRAC, DFHZRLP

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRLP, 2=DFHZRVX, 3=DFHZRVX, 4=DFHZRVX, 5=DFHZRVX, 6=DFHZRAC, 7=DFHZRAC, 8=DFHZRAC, 9=DFHZRAC, 10=DFHZRAC, 11=DFHZRAC, 12=DFHZRAC}*

Destination: CSNE

DFHZC3466E *date time applid termid tranid Out of session during session start up .sense ((instance) Module name {DFHZSEX | DFHZSKR})*

Explanation: A CICS master terminal command was used to put terminal *termid* out of service while session startup was taking place.

For the meaning of *sense*, see message DFHZC2400.

System action: The session is terminated and the TCTTE for terminal *termid* is left out of service.

User response: To establish the session for use, the master terminal operator should issue the command CEMT SET TER (XXXX) INS ACQ. This puts the terminal back in service, and start up the session for use.

Module: DFHZSEX, DFHZSKR

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSEX, 2=DFHZSKR}*

Destination: CSNE

DFHZC3467E *date time applid termid tranid*
Permanent insufficient resource. *sense*
((instance) Module name {DFHZNAC})

Explanation: The PS buffer resource required by load PS is not available.

For the meaning of *sense*, see message DFHZC2400.

System action: If a task is attached, it is abnormally terminated with a transaction dump.

User response: Look at the CSNE log. A second message with a sense received code of 084C should have been issued. Refer to this message in the *VTAM Programming* manual for full details.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHZC3468E *date time applid termid tranid* **CLEAR command received.** *sense ((instance) Module name: {DFHZSCX})*

Explanation: An SNA clear command was received by the node. The other end of the session was unable to handle the current requests for some reason, and purged any outstanding messages on the session.

For the meaning of *sense*, see message DFHZC2400.

System action: The session is canceled immediately, and any transaction executing on that session is also abnormally terminated and a transaction dump is produced.

User response: Check the other end of the session to determine why the clear command was sent. It may be due to a lack of buffers in the VTAM region attached to the other session.

Module: DFHZSCX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSCX}*

Destination: CSNE

DFHZC3469E *date time applid termid tranid* **Session re-establishment being awaited.** *sense ((instance) Module name {DFHZSCX})*

Explanation: The secondary LU is being passed to a new application program via CLSDST(PASS).

For the meaning of *sense*, see message DFHZC2400.

System action: If a task is attached, it is abnormally terminated with a transaction dump.

User response: None.

Module: DFHZSCX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSCX}*

Destination: CSNE

DFHZC3470E *date time applid termid tranid* **LU session failure caused by:**
{restart/takeover. LU does not support ACTLU(ERP). I route extension to cluster failed. I LU abend, discontact, DACTPU or ANS. }sense ((instance) Module name {DFHZSCX})

Explanation: An LU session has failed because an UNBIND command has been received.

Possible reasons are

- Restart or takeover. LU does not support ACTLU(ERP)
- Route extension to cluster failed
- Session failed due to LU abend, disconnect, DACTPU, or ANS.

For the meaning of *sense*, see message DFHZC2400.

System action: If a task is attached, it is abnormally terminated with a transaction dump.

User response: Use the symptom string, a VTAM trace, and the dump, if available, to determine the source of the UNBIND before attempting to reestablish the session.

Module: DFHZSCX

XMEOUT Parameters: *date, time, applid, termid, tranid, {1=restart/takeover. LU does not support ACTLU(ERP)., 2=route extension to cluster failed., 3=LU abend, discontact, DACTPU or ANS. }, sense, instance, {1=DFHZSCX, 2=DFHZSCX, 3=DFHZSCX, 4=DFHZSCX}*

Destination: CSNE

DFHZC3471E *date time applid termid tranid* **Virtual route inoperative.** *sense ((instance) Module name {DFHZSCX})*

Explanation: The session has been broken because the virtual route it was using has failed.

For the meaning of *sense*, see message DFHZC2400.

System action: If a task is attached, it is abnormally terminated with a transaction dump. For APPC sessions, CICS attempts to reestablish the failing session.

User response: None.

Module: DFHZSCX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSCX}*

Destination: CSNE

DFHZC3472E *date time applid termid tranid* **Device end received.** *sense ((instance) Module name: {DFHZSYX})*

Explanation: Device end was received from a non-SNA VTAM supported 3270

For the meaning of *sense*, see message DFHZC2400.

System action: The good morning message is displayed, unless the terminal is associated with an active task.

User response: None.

Module: DFHZSYX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSYX}*

Destination: CSNE

DFHZC3474E *date time applid termid tranid* **Virtual route deactivated.** *sense ((instance) Module name {DFHZSCX})*

Explanation: The session has had to be deactivated because of a forced deactivation of the virtual route being used.

For the meaning of *sense*, see message DFHZC2400.

System action: If a task is attached, it is abnormally terminated with a transaction dump. Afterwards CICS attempts to reestablish the session.

User response: Determine the cause of the session failure and attempt to reestablish the session.

Module: DFHZSCX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSCX}*

Destination: CSNE

DFHZC3475E *date time applid termid tranid* **Unrecoverable LU failure.** *sense ((instance) Module name: {DFHZSCX})*

Explanation: The session has had to be deactivated because of an abnormal termination of an LU.

For the meaning of *sense*, see message DFHZC2400.

System action: If a task is attached, it is abnormally terminated with a transaction dump. Session reinitiation is not attempted.

User response: None.

Module: DFHZSCX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSCX}*

Destination: CSNE

DFHZC3476E *date time applid termid tranid* **Recoverable LU failure.** *sense ((instance) Module name: {DFHZSCX})*

Explanation: The session has had to be deactivated because of an abnormal termination of an LU; recovery of the session may be possible.

For the meaning of *sense*, see message DFHZC2400.

System action: If a task is attached, it is abnormally terminated with a transaction dump. CICS attempts to reinitiate the session.

User response: None.

Module: DFHZSCX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSCX}*

Destination: CSNE

DFHZC3477E *date time applid termid tranid* **Cleanup received.** *sense ((instance) Module name {DFHZSCX})*

Explanation: The sending LU has reset its half-session before receiving a response from CICS; recovery of the session may be possible.

For the meaning of *sense*, see message DFHZC2400.

System action: If a task is attached, it is abnormally terminated with a transaction dump. CICS attempts to reinitiate the session.

User response: None.

Module: DFHZSCX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSCX}*

Destination: CSNE

DFHZC3479E *date time applid termid tranid* **Unbind received after session failure detected.** *sense ((instance) Module name {DFHZSCX})*

Explanation: The logical unit in session with CICS has detected a session failure, and has unbound the session with CICS.

For the meaning of *sense*, see message DFHZC2400.

System action: The session is terminated, and the transaction using it is abnormally terminated or informed by return code.

User response: Determine the reason for the session failure by using Trace. Check the CSNE log for a second error message associated with DFHZC3479. This message should be located immediately after DFHZC3479.

Refer to the sense code shown in the associated message.

Module: DFHZSCX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSCX, 2=DFHZSCX}*

Destination: CSNE

DFHZC3480E *date time applid termid tranid* **Session could not be started due to insufficient CICS nucleus function - ISC not loaded.** *sense ((instance) Module name {DFHZBLX | DFHZLGX | DFHZSIM})*

Explanation: A session initiation has been attempted to an APPC system or terminal. The session cannot be established because the CICS ISC nucleus modules are required.

For the meaning of *sense*, see message DFHZC2400.

System action: The session initiation request is rejected.

User response: If APPC connections are to be used, ensure that ISC=NO is not used for CICS initialization.

Module: DFHZSCX, DFHZLGX, DFHZSIM

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSIM, 2=DFHZBLX, 3=DFHZLGX}*

Destination: CSNE

DFHZC3481E *date time applid termid tranid 3270* **Data Stream protocol error.** *sense ((instance) Module name {DFHZRVX | DFHZRAC})*

Explanation: CICS has received zero length data from a device defined in the TCT as a 3270 terminal. This violates the protocol for 3270 devices.

For the meaning of *sense*, see message DFHZC2400.

System action: CICS cancels the session and any transactions attached to the terminal.

User response: Determine why zero length data was received from a device purporting to be a 3270 terminal, and correct the error.

The most likely reasons are an incorrect TCT definition for the terminal, or incorrect programming of a terminal that is simulating 3270 protocols.

Module: DFHZRAC, DFHZRVX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRVX, 2=DFHZRAC}*

Destination: CSNE

DFHZC3482E *date time applid tranid* **Logon from node *nodeid* rejected. Insufficient storage for autoinstall request.** *sense ((instance) Module name {DFHZBLX | DFHZLGX | DFHZSCX})*

Explanation: A node *nodeid*, unknown to CICS, attempted to logon. CICS could not obtain sufficient storage to complete autoinstall processing.

For the meaning of *sense*, see message DFHZC2400.

System action: CICS rejects the logon request.

User response: Retry the logon.

Module: DFHZLGX, DFHZSCX, DFHZBLX

XMEOUT Parameters: *date, time, applid, tranid, nodeid, sense, instance, {1=DFHZLGX, 2=DFHZLGX, 3=DFHZBLX, 4=DFHZSCX}*

Destination: CSNE

DFHZC3484I *date time applid netname* **is now connected to *applid*.** *sense ((instance) Module name {DFHZNSP})*

Explanation: By successful execution of an ISSUE PASS command, a VTAM logical unit whose network name is *netname* has been passed to the VTAM application whose VTAM APPLID (*netname*) is *applid*.

For the meaning of *sense*, see message DFHZC2400.

System action: CICS processing continues.

User response: None.

Module: DFHZNSP

XMEOUT Parameters: *date, time, applid, netname, applid, sense, instance, {1=DFHZNSP}*

Destination: CSNE

DFHZC3485E *date time applid netname* **A CLSDST Pass Procedure error occurred at *applid*. Status byte *xx* Reason byte *yy*.** *sense ((instance) Module name: {DFHZNSP})*

Explanation: In executing an ISSUE PASS command, CICS attempted to pass control of a VTAM logical unit whose network name is *netname*, to a system whose VTAM APPLID is *applid*. VTAM has notified CICS of an error at *applid*.

For the meaning of *sense*, see message DFHZC2400.

System action: CICS saves the status byte *xx* and reason byte *yy* passed by VTAM in the Notify Request Unit. CICS processing continues.

User response: The reason for the error can be determined by investigating the status byte *xx* and reason byte *yy* given in the message. These bytes are

DFHZC3486E • DFHZC3489E

documented in the NSEXIT routine section of *VTAM Programming* (SC23-0115).

Module: DFHZNSP

XMEOUT Parameters: *date, time, applid, netname, applid, xx, yy, sense, instance, {1=DFHZNSP}*

Destination: CSNE

DFHZC3486E *date time applid netname* **The named LU cannot be connected for sessions at *applid*. *sense* ((*instance*) Module name {DFHZSYX})**

Explanation: In executing an ISSUE PASS command, CICS attempted to pass control of a VTAM logical unit whose network name is *netname*, to a system whose VTAM APPLID is *applid*. VTAM has notified CICS that *applid* is currently not available.

For the meaning of *sense*, see message DFHZC2400.

System action: Processing continues.

User response: None.

Module: DFHZSYX

XMEOUT Parameters: *date, time, applid, netname, applid, sense, instance, {1=DFHZSYX, 2=DFHZSYX}*

Destination: CSNE

DFHZC3487E *date time applid netname* **Unable to PASS to node *nodeid*. CLSDST PASS is not authorized. *sense* ((*instance*) Module name {DFHZLEX})**

Explanation: In executing an ISSUE PASS command, CICS attempted to pass control of a VTAM logical unit whose network name is *netname*. VTAM has notified CICS that CICS is not authorized to use this function.

For the meaning of *sense*, see message DFHZC2400.

System action: CICS continues.

CICS may or may not be able to display the *applid* it was being passed. If CICS can display this *applid*, it appears in the text of this message.

User response: To use the ISSUE PASS command, you must code AUTH=PASS on the VTAM definition of the CICS APPL, then reactivate the APPL.

Module: DFHZLEX

XMEOUT Parameters: *date, time, applid, netname, nodeid, sense, instance, {1=DFHZLEX, 2=DFHZLEX}*

Destination: CSNE

DFHZC3488E *date time applid netname* **ISC session connection failure. *sense* ((*instance*) Module name: {DFHZSIX})**

Explanation: A simlogon request to an ISC system was rejected because the *netname* was not known. CICS has now issued the INQUIRE OPTCD=USERVAR command in order to determine if *netname* had been defined as a user variable. That INQUIRE command has been rejected because the user variable does not exist in the USERVAR table. This may be because the USERVAR is either not known or invalid, or the MODIFY USERVAR command has not been issued to define the user variable.

For the meaning of *sense*, see message DFHZC2400.

System action: CLSDST is issued to reset the session.

User response: Determine if the netname has been defined correctly to CICS. If the netname is to be used as a user variable then determine why the MODIFY USERVAR command has not been issued to set it.

Module: DFHZSIX

XMEOUT Parameters: *date, time, applid, netname, sense, instance, {1=DFHZSIX}*

Destination: CSNE

DFHZC3489E *date time applid netname* **The LU is inhibited for sessions. *sense* ((*instance*) Module name: {DFHZSYX})**

Explanation: CICS has attempted to acquire a session to the logical unit (LU), but VTAM has rejected the request because the LU is inhibited for sessions.

The partner LU could be inhibited because it has issued the VTAM macro SETLOGON OPTCD=QUIESCE.

For the meaning of *sense*, see message DFHZC2400.

System action: The request is rejected and the session is set into NOINTLOG state to prevent further requests being issued.

User response: After the partner LU has enabled itself, it can initiate the session request to CICS. Alternatively, the CICS master terminal operator could reset the NOINTLOG state and allow CICS to initiate the session request.

Module: DFHZSYX

XMEOUT Parameters: *date, time, applid, netname, sense, instance, {1=DFHZSYX}*

Destination: CSNE

DFHZC3490E *date time applid netname* **Unable to pass to node *nodeid*. sense ((instance) Module name {DFHZLEX | DFHZSYX | DFHZCLX})**

Explanation: In executing an ISSUE PASS command, CICS attempted to pass control of the named VTAM logical unit to a system identified as node *nodeid*. VTAM has notified CICS that this request has failed.

This may occur if the LUNAME specified is a generic resource name and this CICS is the only system registered under this name. You are effectively passing the terminal to yourself.

However, if there is more than one CICS registered under the generic resource name, the terminal should pass successfully to another member (chosen by VTAM) in the same resource.

For the meaning of *sense*, see message DFHZC2400.

System action: A VTAM CLSDST macro is issued to halt communication with the node.

User response: Ensure that the node *nodeid* is defined and active to VTAM.

Module: DFHZSYX, DFHZLEX, DFHZCLX

XMEOUT Parameters: *date, time, applid, netname, nodeid, sense, instance, {1=DFHZLEX, 2=DFHZSYX, 3=DFHZCLX}*

Destination: CSNE

DFHZC3491E *date time applid netname* **Unable to make session XRF capable. sense ((instance) Module name {DFHZLEX})**

Explanation: The active CICS system has attempted to OPNDST the session as “XRF capable”, but has been refused because the Network Control Program (NCP) has insufficient space to hold the control blocks for a future backup session from the alternate CICS system.

For the meaning of *sense*, see message DFHZC2400.

System action: CICS performs a SIMLOGON, but does not deem the session to be “XRF capable”. CICS therefore treats the terminal as class 2.

User response: No immediate action is necessary. You may need to increase the number of buffers in the NCP.

Module: DFHZLEX

XMEOUT Parameters: *date, time, applid, netname, sense, instance, {1=DFHZLEX}*

Destination: CSNE

DFHZC3492E *date time applid tranid* **Logon for node *nodeid* contained invalid NIBUSER token. sense ((instance) Module name {DFHZLGX})**

Explanation: DFHZLGX has been driven for SIMLOGON with a token that is no longer a valid TCTTE address.

For the meaning of *sense*, see message DFHZC2400.

System action: An unexpected condition has occurred during SIMLOGON. CICS will continue processing normally.

User response: None.

Module: DFHZLGX

XMEOUT Parameters: *date, time, applid, tranid, nodeid, sense, instance, {1=DFHZLGX}*

Destination: CSNE

DFHZC3493E *date time applid termid tranid* **Invalid device type for a print request. sense ((instance) Module name {DFHZARQ})**

Explanation: A print function was requested on a 3270 information display system. However, the print function was unable to find an eligible printer because the function does not support the device type.

For the meaning of *sense*, see message DFHZC2400.

System action: If no other action is specified in the Network Error Program (NEP), the print request is halted. CICS processing continues.

User response: Check that the printers specified for the information display system are valid. Valid devices are 3270P and LUTYPE3.

Module: DFHZARQ

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZARQ}*

Destination: CSNE

DFHZC3494E *date time applid termid tranid* **Request error sense ((instance) Module name {DFHZNAC})**

Explanation: The request unit (RU) received by the secondary logical unit (LU) contains a request which terminal *termid* cannot handle.

For the meaning of *sense*, see message DFHZC2400.

System action: All send and receive requests are purged and transaction *tranid* is abnormally terminated with a dump.

User response: Check that the TYPETERM specifications for terminal *termid* are valid. This error could occur if, for example, QUERY was sent to a

DFHXC3495E • DFHXC3498E

nonqueriable 3270 defined with QUERY=COLD or QUERY=ALL.

Module: DFHZSYX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

Destination: CSNE

DFHXC3495E *date time applid* **Logon occurred for terminal with netname *netname* before Notify received *sense* ((*instance*) Module name {DFHZLGX})**

Explanation: A terminal with netname *netname* has logged on before a NOTIFY request was received for an outstanding CLSDST PASS with CLSDST=NOTIFY.

For the meaning of *sense*, see message DFHXC2400.

System action: CICS processing continues. Any subsequent NOTIFY requests for the terminal identified will be ignored.

User response: It is recommended that any user processing for CLSDST PASS messages incorporates this message.

Module: DFHZLGX

XMEOUT Parameters: *date, time, applid, netname, sense, instance, {1=DFHZLGX}*

Destination: CSNE

DFHXC3496E *date time applid* **System dump has been taken for terminal *termid* ((*instance*) Module name {DFHZNAC})**

Explanation: Terminal *termid* has been found to be in error by terminal control.

As terminal *termid* had no task attached to it at the time of the error, DFHZNAC was unable to cause a transaction abend with a transaction dump.

The TWAODNTA flag in the DFHZNAC-DFHZNEP commarea is set ON and DFHZNAC produces a system dump for terminal *termid* instead.

System action: An exception trace entry is made in the trace table at trace point FC73.

A system dump is produced unless you have specifically suppressed dumps in the dump table.

User response: To determine the nature of the problem that caused the dump to be taken, refer to the CSNE log. There should be an associated CICS message which will provide further information.

For more information about TWAODNTA, refer to the *CICS Customization Guide*.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, instance, {1=DFHZNAC}*

1224 Messages and Codes

Destination: CSNE

DFHXC3497E *date time applid* **Link to module DFHZNEP from DFHZNAC failed because {*module DFHZNEP is not AMODE 31. I module DFHZNEP could not be loaded. I module DFHZNEP could not be autoinstalled. I of an unexpected error.*} ((*instance*) Module name {DFHZNAC})**

Explanation: While processing an error for a VTAM terminal, CICS attempted to link to user-replaceable module DFHZNEP. The link failed.

See message DFHXC3437 for the default action or actions taken.

System action: The default action or actions set by DFHZNAC are taken.

User response: The reason for the failure is specified in the message. Possible solutions are

- Ensure that DFHZNEP is linked with AMODE 31.
- Ensure that DFHZNEP is contained in one of the data sets concatenated in the DFHRPL DD statement and has the correct name.
- Ensure that there is a valid entry for DFHZNEP in the PPT, and that DFHZNEP can be successfully autoinstalled.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, {1=module DFHZNEP is not AMODE 31., 2=module DFHZNEP could not be loaded., 3=module DFHZNEP could not be autoinstalled., 4=of an unexpected error.}, instance, {1=DFHZNAC}*

Destination: CSNE

DFHXC3498E *date time applid* **Abend *abcode* has occurred in module DFHZNEP. ((*instance*) Module name {DFHZNAC})**

Explanation: While processing an error for a VTAM terminal, user-replaceable module DFHZNEP was linked and the program abended with abend code *abcode*. See message DFHXC3437 for the default action or actions that are taken.

System action: Control is passed back to the calling module, DFHZNAC. DFHZNAC reinstates the default actions set before DFHZNEP was called. The actions are then taken.

User response: Refer to abend code *abcode* for details of the original error. Follow the user response given in the abend code to solve the problem.

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, abcode, instance, {1=DFHZNAC}*

Destination: CSNE

DFHZC3499E *date time applid OS Getmain failure in module DFHmodname with return code X'return_code' while attempting to process message DFHZCmessage_number. sense ((instance) Module name {DFHZATA | DFHZLEX | DFHZLGX | DFHZRAC | DFHZSCX | DFHZSHU | DFHZSYX | DFHZTPX})*

Explanation: An error has been detected by module *modname*. The OS GETMAIN request by this module has failed with return code *X'return_code*, and as a result, the diagnostic information relating to the original error has not been saved and cannot be processed by DFHZNAC.

The only information available for diagnosis of the error is *message_number* which is the number of the message that would have been issued had the OS GETMAIN request not failed.

For the meaning of *sense*, see message DFHZC2400.

System action: Processing continues normally.

User response: Refer to message *message_number* for further guidance.

Refer to the *MVS System Programming Library: Macro Reference* for the meaning of the OS GETMAIN return code.

Module: DFHZATA, DFHZLGX, DFHZRAC, DFHZSCX, DFHZSHU, DFHZTPX, DFHZLEX, DFHZSYX

XMEOUT Parameters: *date, time, applid, modname, X'return_code', message_number, sense, instance, {1=DFHZLEX, 2=DFHZSHU, 3=DFHZSCX, 4=DFHZSCX, 5=DFHZSYX, 6=DFHZSYX, 7=DFHZTPX, 8=DFHZRAC, 9=DFHZRAC, 10=DFHZATA, 11=DFHZLGX, 12=DFHZLGX}*

Destination: CSNE

DFHZC4900I *date time applid termid trandid CNOS {sent to | received from} Node netname System sysid Modename modename, Max = n1, Win=n2, {race detected | successful | values amended | modename not recognized | modename closed | CNOS failed}. ((instance) Module name: {DFHZGCN})*

Explanation: A CHANGE-NUMBER-OF-SESSIONS command has been sent or received. The inserts are identified as follows

- *sysid* is the system identifier.
- *modename* is the modename.
- *n1* is the maximum session count.
- *n2* is the maximum source contention winner sessions.

If the “values amended” option is displayed, the values of the *n1* (maximum session count) and *n2* (maximum source contention winner sessions) have been renegotiated by the target system.

If the “race detected” option is displayed, the CNOS command could not be implemented because the modename *modename* was already locked for a CNOS command from the other system.

If a modename of ALL is produced, it has been set internally by CICS and all of the modegroups for this connection will be affected by the CNOS command.

If the “CNOS failed” option is displayed, the CNOS command could not be implemented because the modename lock was still held on the remote system when a second CNOS command was sent by this CICS, as the CNOS race winner, following a previous CNOS race condition.

System action: The negotiated values are applied.

User response: None.

Module: DFHZGCN

XMEOUT Parameters: *date, time, applid, termid, trandid, {1=sent to, 2=received from}, netname, sysid, modename, n1, n2, {1=race detected, 2=successful, 3=values amended, 4=modename not recognized, 5=modename closed, 6=CNOS failed}, instance, {1=DFHZGCN}*

Destination: CSNE

DFHZC4901I *date time applid termid trandid Node netname System sysid Modename modename, Negotiated values: Max=n1, Win=n2. ((instance) Module name {DFHZGCN})*

Explanation:

- *modename* is the modename,
- *n1* is the maximum session count,
- *n2* is the maximum source contention winner sessions.

This message follows message DFHZC4900 when the maximum session count (*n1*) and the maximum source contention winner sessions (*n2*) have been renegotiated.

If a modename of ALL is produced, it has been set internally by CICS and all of the modegroups for this connection will be affected by the CNOS command.

System action: The negotiated values are applied.

User response: None.

Module: DFHZGCN

XMEOUT Parameters: *date, time, applid, termid, trandid,*

DFHZC4902E • DFHZC4905E

netname, sysid, modename, n1,n2, instance, {1=DFHZGCN}

Destination: CSNE

DFHZC4902E *date time applid termid trandid Attach FMH or subfield length error. sense ((instance) Module name {DFHZATT})*

Explanation: A request to attach a task has been received across an APPC link. However, there is an error in the function management header (FMH) length or in the length of one of the subfields. As a result, CICS is unable to determine which task to attach.

For the meaning of *sense*, see message DFHZC2400.

System action: The task is abnormally terminated with a dump.

User response: The remote APPC system is sending an invalid attach header (FMH type 5). Use the supplied dump to determine the error and investigate the cause at the remote system.

Module: DFHZATT

XMEOUT Parameters: *date, time,applid, termid, trandid, sense, instance, {1=DFHZATT, 2=DFHZATT, 3=DFHZATT, 4=DFHZATT, 5=DFHZATT, 6=DFHZATT, 7=DFHZATT}*

Destination: CSNE

DFHZC4903E *date time applid termid trandid Attach FMH not found. sense ((instance) Module name: {DFHZATT | DFHZRAC})*

Explanation: A request to attach a task has been received across an APPC link. However, no APPC attach header has been found at the start of the input data stream.

For the meaning of *sense*, see message DFHZC2400.

System action: The task is abnormally terminated with a dump.

User response: The remote APPC system is failing to send a valid attach header (FMH type 5). Use the supplied dump to determine the error and investigate the cause at the remote system.

Module: DFHZATT, DFHZRAC

XMEOUT Parameters: *date, time,applid, termid, trandid, sense, instance, {1=DFHZATT, 2=DFHZATT, 3=DFHZRAC}*

Destination: CSNE

DFHZC4904E *date time applid termid trandid Bracket FSM error. sense ((instance) Module name {DFHZRAC | DFHZRLP | DFHZSDL | DFHZSLX})*

Explanation: The bracket finite state machine (FSM)

has reported an error in the use of APPC bracket protocols.

For the meaning of *sense*, see message DFHZC2400.

System action: The task is abnormally terminated with a dump.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: If this message occurs after a persistent sessions restart, look for associated messages for more guidance. The problem might be temporary.

If this message occurs during normal system execution, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZRAC, DFHZRLP, DFHZSDL, DFHZSLX

XMEOUT Parameters: *date, time,applid, termid, trandid, sense, instance, {1=DFHZRLP, 2=DFHZRLP, 3=DFHZRLP, 4=DFHZRLP, 5=DFHZSDL, 6=DFHZSDL, 7=DFHZSLX, 8=DFHZSLX, 9=DFHZSLX, 10=DFHZSLX, 11=DFHZSLX, 12=DFHZSLX, 13=DFHZRAC, 14=DFHZRAC, 15=DFHZRAC}*

Destination: CSNE

DFHZC4905E *date time applid termid trandid Chain FSM error. sense ((instance) Module name {DFHZDET | DFHZERH | DFHZRAC | DFHZRLP | DFHZSDL | DFHZSLX})*

Explanation: The chain finite state machine (FSM) has reported an error in the use of APPC chaining protocols.

For the meaning of *sense*, see message DFHZC2400.

System action: The task is abnormally terminated with a dump.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: If this message occurs after a persistent sessions restart, look for associated messages for more guidance. The problem might be temporary.

If this message occurs during normal system execution, investigate any transactions running on the session at the time of failure because the error can be caused by using both the LAST and WAIT options on an EXEC CICS SEND command in an APPC DTP application. This combination of parameters is not recommended. See the *CICS Distributed Transaction Programming Guide* for more information. If this is not the cause of the problem, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZRAC, DFHZRLP, DFHZSDL, DFHZSLX, DFHZERH, DFHZDET

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRLP, 2=DFHZRLP, 3=DFHZRLP, 4=DFHZRLP, 5=DFHZRLP, 6=DFHZRLP, 7=DFHZRLP, 8=DFHZDET, 9=DFHZERH, 10=DFHZSDL, 11=DFHZSDL, 12=DFHZSLX, 13=DFHZSLX, 14=DFHZSLX, 15=DFHZSLX, 16=DFHZSLX, 17=DFHZSLX, 18=DFHZSLX, 19=DFHZSLX, 20=DFHZSLX, 21=DFHZSLX, 22=DFHZRAC, 23=DFHZRAC, 24=DFHZRAC, 25=DFHZRAC, 26=DFHZRAC, 27=DFHZRAC, 28=DFHZRAC}*

Destination: CSNE

DFHZC4906E *date time applid termid tranid*
Contention FSM error. sense ((instance)
Module name: {DFHZCLS | DFHZDET |
DFHZRAC | DFHZRLP})

Explanation: The contention finite state machine (FSM) has reported an error in the use of APPC contention protocols.

For the meaning of *sense*, see message DFHZC2400.

System action: The task is abnormally terminated with a dump.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: If this message occurs after a persistent sessions restart, look for associated messages for more guidance. The problem might be temporary.

If this message occurs during normal system execution, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZRAC, DFHZRLP, DFHZDET, DFHZCLS, DFHZCC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZDET, 2=DFHZRAC, 3=DFHZRAC, 4=DFHZRAC, 5=DFHZRAC, 6=DFHZRAC, 7=DFHZRAC, 8=DFHZRAC, 9=DFHZRAC, 10=DFHZRAC, 11=DFHZRLP, 12=DFHZRAC, 13=DFHZRAC, 14=DFHZRAC, 15=DFHZRAC, 16=DFHZRAC, 17=DFHZCLS}*

Destination: CSNE

DFHZC4907E *date time applid termid tranid* **Invalid request to send data routine. sense ((instance) Module name {DFHZSDL})**

Explanation: DFHZSDL was entered, but no valid request was passed to it.

For the meaning of *sense*, see message DFHZC2400.

System action: The task is abnormally terminated with a dump.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZSDL

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSDL, 2=DFHZSDL, 3=DFHZSDL, 4=DFHZSDL, 5=DFHZSDL}*

Destination: CSNE

DFHZC4909E *date time applid termid tranid* **Invalid request to receive data routine. sense ((instance) Module name {DFHZRVL})**

Explanation: DFHZRVL was entered, but no valid request was passed.

For the meaning of *sense*, see message DFHZC2400.

System action: The task is abnormally terminated with a dump.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZRVL

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRVL}*

Destination: CSNE

DFHZC4910E *date time applid termid tranid* **Receive buffer too small. sense ((instance) Module name {DFHZRVL})**

Explanation: The receive buffer passed to DFHZRVL is too small to accommodate a maximum size request unit.

For the meaning of *sense*, see message DFHZC2400.

System action: The task will be abnormally terminated with a dump.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZRVL

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRVL, 2=DFHZRVL, 3=DFHZRVL, 4=DFHZRVL}*

Destination: CSNE

DFHZA4911E *date time applid termid tranid LU6.2*
exception response received. sense
((instance) Module name {DFHZRPL})

Explanation: A non-process-level exception response has been received.

For the meaning of *sense*, see message DFHZA2400.

System action: The task is abnormally terminated with a dump.

User response: Incorrect flows have been received on an APPC session. The CICS trace gives further details of the flow. Try to recreate the error by running a VTAM trace TYPE=IO/BUF to obtain complete details of the line flow.

Module: DFHZRPL

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRPL}*

Destination: CSNE

DFHZA4912E *date time applid termid tranid BID*
received with invalid DFC indicators.
sense ((instance) Module name
{DFHZRPL | DFHZRAC})

Explanation: BID with data received, but not OIC.

For the meaning of *sense*, see message DFHZA2400.

System action: The task is abnormally terminated.

User response: Incorrect flows have been received on an APPC session. The CICS trace gives further details of the flow. It may help to run a VTAM trace TYPE=IO/BUF and repeat the error to obtain complete details of the line flow.

Module: DFHZRAC, DFHZRPL

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRPL, 2=DFHZRAC, 3=DFHZRAC}*

Destination: CSNE

DFHZA4913E *date time applid termid tranid BID with*
data received with invalid DFC
indicators. sense ((instance) Module
name {DFHZRPL})

Explanation: A BID with data was received in an invalid state for rejection.

For the meaning of *sense*, see message DFHZA2400.

System action: The task is abnormally terminated.

User response: Incorrect flows have been received on an APPC session. The CICS trace gives further details of the flow. It may help to run a VTAM trace

TYPE=IO/BUF and repeat the error to obtain complete details of the line flow.

Module: DFHZRPL

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRPL, 2=DFHZRPL, 3=DFHZRPL, 4=DFHZRPL}*

Destination: CSNE

DFHZA4914E *date time applid termid tranid Data*
length exceed max RU size. sense
((instance) Module name {DFHZRPL})

Explanation: The record length received exceeds the buffer length.

For the meaning of *sense*, see message DFHZA2400.

System action: The task is abnormally terminated.

User response: Incorrect flows have been received on an APPC session. The CICS trace gives further details of the flow. It may help to run a VTAM trace TYPE=IO/BUF and repeat the error to obtain complete details of the line flow.

Module: DFHZRPL

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRPL}*

Destination: CSNE

DFHZA4915E *date time applid termid tranid EOC*
received with invalid DFC indicators.
sense ((instance) Module name
{DFHZRPL})

Explanation: An end chain was received with invalid DFC indicators.

For the meaning of *sense*, see message DFHZA2400.

System action: The task is abnormally terminated.

User response: Incorrect flows have been received on an APPC session. The CICS trace gives further details of the flow. It may help to run a VTAM trace TYPE=IO/BUF and repeat the error to obtain complete details of the line flow.

Module: DFHZRPL

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRPL}*

Destination: CSNE

DFHZA4916E *date time applid termid tranid Send*
response failed. sense ((instance)
Module name: {DFHZRPL})

Explanation: A response, sent to acknowledge successful receipt of data, was rejected by VTAM.

For the meaning of *sense*, see message DFHZA2400.

System action: The task is abnormally terminated with a dump.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZRLP

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRLP}*

Destination: CSNE

DFHZC4917E *date time applid termid tranid* **BIS received with invalid DFC indicators.** *sense ((instance) Module name {DFHZRLP})*

Explanation: Bracket initiation stopped (BIS) received with invalid DFC flags.

For the meaning of *sense*, see message DFHZC2400.

System action: The task is abnormally terminated.

User response: Incorrect flows have been received on an APPC session. The CICS trace will give further details of the flow. It may help to run a VTAM trace TYPE=IO/BUF and repeat the error to obtain complete details of the line flow.

Module: DFHZRLP

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRLP, 2=DFHZRLP}*

Destination: CSNE

DFHZC4918E *date time applid termid tranid* **Unexpected response received.** *sense ((instance) Module name {DFHZRLP})*

Explanation: An unexpected response was received that was either a positive response to data of a previous bracket, or a response to a command that cannot be accepted when the logical unit is in "continue specific" mode.

For the meaning of *sense*, see message DFHZC2400.

System action: The task is abnormally terminated.

User response: Incorrect flows have been received on a APPC session. The CICS trace will give further details of the flow. It may help to run a VTAM trace TYPE=IO/BUF and repeat the error to obtain complete details of the line flow.

Module: DFHZRLP

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRLP, 2=DFHZRLP, 3=DFHZRLP, 4=DFHZRLP, 5=DFHZRLP}*

Destination: CSNE

DFHZC4919E *date time applid termid tranid* **Invalid indicators received.** *sense ((instance) Module name: {DFHZARER | DFHZARL})*

Explanation: An indicator other than CD, CEB, RQD2, or error response has been received.

For the meaning of *sense*, see message DFHZC2400.

System action: The task is abnormally terminated with a dump.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARL, DFHZARER, DFHZARL

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZARL, 2=DFHZARL, 3=DFHZARL, 4=DFHZARL, 5=DFHZARER}*

Destination: CSNE

DFHZC4920E *date time applid termid tranid* **Invalid data received.** *sense ((instance) Module name: {DFHZARER | DFHZARL | DFHZERH})*

Explanation: Data received from the remote system or terminal is not in correct generalized data stream (GDS) format.

For the meaning of *sense*, see message DFHZC2400.

System action: The task is abnormally terminated with a dump.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARL, DFHZARER, DFHZERH

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZERH, 2=DFHZERH, 3=DFHZERH, 4=DFHZERH, 5=DFHZERH, 6=DFHZERH, 7=DFHZARL, 8=DFHZARL, 9=DFHZARL, 10=DFHZARER, 11=DFHZARER, 12=DFHZARER}*

Destination: CSNE

DFHZC4921E *date time applid sysid* **LU services manager failure.** **R15 =X'xxxxx' R0 =X'yyyyy'**

Explanation: An error situation has been detected during the operation of the LU services manager transaction program (DFHLUP).

DFHXC4922E • DFHXC4924E

Registers 15 and 0 are set to indicate the nature of the error as shown below

Register 15 = X'0' Task invalidly started ...
Register 0 = X'3' ... via a perm transid.
Register 0 = X'4' ... by a TD trigger.
Register 0 = X'5' ... without data.
Register 0 = >X'6' ... or is out of range of a valid start code for this service

Register 15 = X'4' Call code did not match a supported function (1-5).
Register 0 = call code

Register 15 = X'8' Invalid parameters passed for this function.
Register 0 = keyword #

Register 15 = X'0C' Function-specific checks failed for this keyword.
Register 0 = keyword #

Register 15 = X'10' No input data supplied.
Register 0 = ^0 The IC_GET for the TS START data failed.
Register 0 = X'0' The LUTYPE6.2 RECEIVE returned data length=0.

Register 15 = X'14' The GDS-ID is not for XLN.
Register 0 = GDS-ID

System action: The task is allowed to complete but the required function is not executed.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: If one of the errors mentioned above has occurred, try to discover the reason for the failure. If you fail in this, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHLUP

XMEOUT Parameters: *date, time,applid, sysid, X'xxxx', X'yyyyy'*

Destination: CSNE

DFHXC4922E *date time applid termid tranid* **Single session shutdown with DRAIN=CLOSE.**
sense ((instance) Module name {DFHZERH | DFHZGDA | DFHZRAC})

Explanation: The connected logical unit has sent Bracket Initiation Stopped (BIS) and can accept no more work.

For the meaning of *sense*, see message DFHXC2400.

System action: If a conversation was active, it is treated as though rollback had occurred on it for full syncpoint (syncpoint level 2), or as session failure for confirm-level syncpoint (syncpoint level 1).

If there was no conversation, it is treated as a BID failure (as for 0813 sense code).

User response: None.

Module: DFHZRAC, DFHZGDA, DFHZERH

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZRAC, 2=DFHZGDA, 3=DFHZERH}*

Destination: CSNE

DFHXC4923I *date time applid termid tranid*
Conversation abnormally terminated by transaction end in system sysid

Explanation: Transaction *tranid*, engaged in an SNA session with a CICS system, issued a command that was inconsistent with the transaction's current state in the conversation.

System action: The conversation terminates and CICS sends this message to the connected logical unit at the nonfailing end of the conversation.

The application in system *sysid* abnormally terminates with an abend.

User response: Correct the application program. To find the command in error, use the state diagrams in the *CICS Intercommunication Guide*.

Module: DFHZARL

XMEOUT Parameters: *date, time,applid, termid, tranid, sysid*

Destination: CSMT

DFHXC4924E *date time applid termid tranid* **Bind security password missing or invalid.**
sense ((instance) Module name {DFHZBLX | DFHZOPX | DFHZSCX})

Explanation: Bind-time security data sent to CICS by its partner LU is missing or invalid. CICS's password for the partner LU system differs from the partner's password for CICS. This can be caused by an attempt to sign on to CICS by an unauthorized user.

For the meaning of *sense*, see message DFHXC2400.

System action: The bind is rejected.

User response: Check that an unauthorized user has not tried to log on to CICS. Ensure that the unsuccessful connection is correctly defined to CICS (using RDO or the DFHTCT macro) and to its partner LU system. Ensure that the security requirements are equal at both partners, that is, both have security off, or both have security on. A mismatch is one cause of this message.

Module: DFHZSCX, DFHZOPX, DFHZBLX

XMEOUT Parameters: *date, time,applid, termid, tranid, sense, instance, {1=DFHZOPX, 2=DFHZBLX, 3=DFHZBLX, 4=DFHZBLX, 5=DFHZBLX, 6=DFHZOPX, 7=DFHZOPX, 8=DFHZOPX, 9=DFHZOPX, 10=DFHZSCX}*

Destination: CSNE

DFHZC4925E *date time applid termid tranid*
Inconsistent attach security required.
sense ((instance) Module name
{DFHZOPN | DFHZOPX})

Explanation: This message can be issued for any of the reasons listed below.

1. CICS has received a bind request specifying attach time security requirements different from those specified in the first bind.
2. CICS has received a bind requesting persistent verification.
3. CICS has received a bind which does not include an SNA functional management header (FMH12).

For the meaning of *sense*, see message DFHZC2400.

System action: CICS rejects the bind.

User response: CICS does NOT allow subsequent binds to specify different security requirements from the first bind. It will not support persistent verification on input either.

Where applicable, alter your applications to meet these requirements.

Module: DFHZOPX, DFHZOPN

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZOPX, 2=DFHZOPN, 3=DFHZOPN, 4=DFHZOPX}*

Destination: CSNE

DFHZC4926E *date time applid termid tranid Bind*
security encryption error. sense
((instance) Module name {DFHZE1 |
DFHZE2 | DFHZE1})

Explanation: CICS detected an error while verifying an encrypted bind security password.

For the meaning of *sense*, see message DFHZC2400.

System action: CICS rejects the bind.

User response: Investigate the CSNE and CSMT logs.

Find out whether an unauthorized user tried to log on to CICS, or whether an authorized user entered his password incorrectly.

Module: DFHZE1, DFHZE2

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZE1, 2=DFHZE2, 3=DFHZE1}*

Destination: CSNE

DFHZC4927E *date time applid termid tranid Bind FMH*
response error. sense ((instance)
Module name: {DFHZRAC})

Explanation: CICS received a bind with bind security without an FMH12.

For the meaning of *sense*, see message DFHZC2400.

System action: CICS rejects the bind.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: This is an error either in CICS or in SNA. Keep the CSNE and CSMT logs. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZRAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRAC, 2=DFHZRAC, 3=DFHZRAC, 4=DFHZRAC}*

Destination: CSNE

DFHZC4928E *date time applid termid tranid Bind*
security GETMAIN of a TIOA failed.
sense ((instance) Module name
{DFHZE1})

Explanation: CICS required a TIOA work area for bind security validation, but the GETMAIN failed because insufficient storage was available.

System action: CICS rejects the bind.

User response: Consider increasing the size of the CICS region or reducing the number of concurrent CICS tasks (MXT parameter in the system initialization table).

Module: DFHZE1

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZE1}*

Destination: CSNE

DFHZC4929 *date time applid termid tranid Invalid or*
unsupported BIND for logmode
logmode. Response X'response', Reason
X'reason' ((instance) Module
{DFHZOPN})

Explanation: CICS has detected an error while validating the BIND supplied by VTAM for a CICS typeterm definition defined with LOGMODE=0 or LOGMODE=logmode.

The *response* code indicates

X'04 The BIND supplied does not match the TCTTE – detected by DFHZBANS.

X'08 The BIND supplied is unsupported – detected by DFHZBANV.

DFHZC4930E • DFHZC4931E

X'0C The BIND supplied is invalid – detected by DFHZBANV.

The *reason* code for a response of X'04 is as follows

- X'1B** Unsupported TCTTE type or not VTAM
- X'1C** No NIB descriptor chained from TCTTE
- X'1D** No BMS extension chained from TCTTE
- X'1E** Same as for reason code X'1D
- X'1F** LU6.2 BIND, but TCTTE does not match.

The *reason* code for a response of X'08 or X'0C is as follows

Reason Hex	Invalid byte	Explanation
1	3	Should be hex 02, 03, 04 or 07
2-8	4 5 6 7	Invalid for this FM profile
9	2	Should be hex 00, 02, 03, 04, 07, 13 or 14
0A,0D,10	1	Invalid for LUTYPE 1,2 or 3 - must be hex 01
0B	4 5 6 7	Invalid for LUTYPE 1
0C	22	Invalid for LUTYPE 1
0E	4 5 6 7	Invalid for LUTYPE 2
0F	24	Invalid for LUTYPE 2 should be hex 00, 01, 02, 03, 7E, or 7F
11	4 5 6 7	Invalid for LUTYPE 3
12	24	Invalid for LUTYPE 3 should be hex 00, 01, 02, 03, 7E, or 7F
13	16	Invalid for LUTYPE 6.2
14	23	Invalid for LUTYPE 6.2
15-18	24	Invalid for LUTYPE 6.2
19	15	Should be hex 00 or 02
1A	14	Should be hex 00, 01, 02, 03, 06
1B and over	User Data	The reason code matches the byte position in the BIND for the error detected. These can be <ul style="list-style-type: none"> - Session ID length unsupported - should be 3 to 11 - PLU/SLU name length unsupported - should be 2 to 19 - PLU/SLU defined twice - Length invalid - Session qualifier pairs have inconsistent lengths.

System action: CICS rejects the logon request. The BIND being validated is printed with this message.

User response: Use the response and reason codes and the printed BIND, together with the VTAM definition of the BIND for the relevant LOGMODE to determine the reason for the rejection.

Either change the logmode or use a different one that matches CICS requirements.

Module: DFHZOPN

XMEOUT Parameters: *date, time, applid, termid, tranid,*

logmode, X'response', X'reason', instance, {1=DFHZOPN}

Destination: CSMT

DFHZC4930E *date time applid termid tranid* **Session unbound following read timeout. sense** *((instance) Module name {DFHZARL I DFHZARER})*

Explanation: A READ timeout has occurred on the SNA link. SNA unbinds the session and CICS returns control to the application program. This allows the program to override the system action (for example, the program could free the APPC session).

For the meaning of *sense*, see message DFHZC2400.

System action: CICS abends the task abnormally with a dump.

User response: This is probably a network problem caused by a high level of network traffic. To avoid this problem, increase the Read Timeout (RTIMOUT) to a sufficiently high value to compensate for the level of network traffic. Alternatively, this problem may have arisen simply because the partner application failed to respond due to a programming error. If this is the case, correct the partner application and retry the request.

Module: DFHZARL, DFHZARER.

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZARL, 2=DFHZARL, 3=DFHZARER}*

Destination: CSNE

DFHZC4931E *date time applid termid tranid* **VTAM detected bad logmode name. sense** *((instance) Module name {DFHZLEX})*

Explanation: Either a MODENAME passed to VTAM during an attempt to bind an APPC session is not known to VTAM, or the logmode name of a VTAM 3270-type terminal is not valid.

For the meaning of *sense*, see message DFHZC2400.

System action: CICS places the session permanently out of service and for APPC, the mode entry is flagged unusable.

User response: Either redefine the sessions using a MODENAME that is known to VTAM, or add the MODENAME to the VTAM LOGMODE table. Alternatively, if the logmode name specified for a VTAM terminal is invalid, redefine the terminal entry using the correct name.

Module: DFHZLEX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZLEX}*

Destination: CSNE

DFHZC4932E *date time applid termid trandid Invalid conversation type requested. sense ((instance) Module name {DFH62XM})*

Explanation: A request to attach a task has been received across an APPC link. However, there is an error in the conversation type field. It must be TYPE=MAPPED or TYPE=UNMAPPED.

For the meaning of *sense*, see message DFHZC2400.

System action: The task is abended and a dump is produced. The session is unbound.

User response: The remote APPC system sends an invalid attach header (FMH Type 5). Use the supplied dump to determine the error and investigate the cause at the remote system.

Module: DFH62XM

XMEOUT Parameters: *date, time, applid, termid, trandid, sense, instance, {1=DFH62XM}*

Destination: CSNE

DFHZC4933E *date time applid termid trandid Invalid DBA requested. sense ((instance) Module name {DFH62XM})*

Explanation: A request to attach a task has been received across an APPC link. However, there is an error in the DBA field.

For the meaning of *sense*, see message DFHZC2400.

System action: The task abends and a dump is produced. The session is unbound.

User response: The remote APPC system sends an invalid attach header (FMH Type 5). Use the supplied dump to determine the error and investigate the cause at the remote system.

Module: DFH62XM

XMEOUT Parameters: *date, time, applid, termid, trandid, sense, instance, {1=DFH62XM}*

Destination: CSNE

DFHZC4934E *date time applid termid trandid Invalid syncpoint level requested. sense ((instance) Module name {DFH62XM})*

Explanation: A request to attach a task has been received across an APPC link. However, the synchronization level requested is invalid.

For the meaning of *sense*, see message DFHZC2400.

System action: The task abends and a dump is produced.

User response: The remote APPC system sends an invalid attach header (FMH Type 5). Use the supplied dump to determine the error and investigate the cause at the remote system.

Check the sync level in the ATTACH header against that in the BIND.

Module: DFH62XM

XMEOUT Parameters: *date, time, applid, termid, trandid, sense, instance, {1=DFH62XM}*

Destination: CSNE

DFHZC4935E *date time applid termid trandid Invalid UOWID supplied. sense ((instance) Module name {DFH62XM})*

Explanation: A request to attach a task has been received across an APPC link and either the unit of work ID is invalid, or no UOWID was received when the sync point level required it.

For the meaning of *sense*, see message DFHZC2400.

System action: The task abends and a dump is produced. The session is unbound.

User response: The remote APPC system sends an invalid attach header (FMH Type 5). Use the supplied dump to determine the error and investigate the cause at the remote system.

Module: DFH62XM

XMEOUT Parameters: *date, time, applid, termid, trandid, sense, instance, {1=DFH62XM, 2=DFH62XM, 3=DFH62XM, 4=DFH62XM, 5=DFH62XM, 6=DFH62XM}*

Destination: CSNE

DFHZC4936E *date time applid termid trandid Attach FMH or subfield length error. sense ((instance) Module name {DFH62XM})*

Explanation: A request to attach a task has been received across an APPC link. However, there is an error in the FMH length or in the length of one of the sub-fields. This results in CICS being unable to determine which task to attach.

The instance *instance* is one of the following

- 1 The FMH Length is not equal to the length of the fixed length portion + the length of all the sub fields.
- 2 The Conversation Correlator length within the FMH is greater than 8.

For the meaning of *sense*, see message DFHZC2400.

System action: The task abends and a dump is produced.

User response: The remote APPC system sends an invalid attach header (FMH Type 5). Use the supplied dump to determine the error and investigate the cause at the remote system.

Module: DFH62XM

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFH62XM, 2=DFH62XM}*

Destination: CSNE

DFHZC4937E *date time applid* **SAF request for LU6.2 bind has been rejected. Return Codes from the Security Manager are: RF= X'rf' and R0= X'r0' sense ((instance) Module name {DFHZE1 | DFHZE2 | DFHZOPN})**

Explanation: A security authorization facility (SAF) request to extract APPC bind-time security information from the external security manager (ESM) has been rejected with return code RF=X'rf. and RO=X'r0.

This is due either to the ESM being inactive or to the appropriate APPC profile not being defined to the ESM.

For the meaning of *sense*, see message DFHZC2400.

System action: CICS rejects the bind.

User response: Refer to the ESM manuals appropriate to your system to obtain information about the meanings of any return codes which may have been produced by the ESM.

If you are using RACF as your security manager, refer to the RACXTRT macro guidance documented in the *System Programming Library RACF* manual for the meaning of the return codes.

If the appropriate APPC profile had not been defined to the ESM, define the profile, perform a CICS security rebuild and then attempt to reestablish the APPC connection.

Module: DFHZE1, DFHZE2, DFHZOPN

XMEOUT Parameters: *date, time, applid, X'rf', X'r0', sense, instance, {1=DFHZOPN, 2=DFHZOPN, 3=DFHZOPN, 4=DFHZOPN, 5=DFHZOPN, 6=DFHZOPN, 7=DFHZOPN, 8=DFHZOPN, 9=DFHZE1, 10=DFHZE1, 11=DFHZE1, 12=DFHZE1, 13=DFHZE2, 14=DFHZE2, 15=DFHZE2, 16=DFHZE2}*

Destination: CSNE

DFHZC4938E *date time applid* **SAF request for LU6.2 bind has failed with ESM return code RF= X'rf' and reason code R0= X'r0' sense ((instance) Module name: {DFHZE1 | DFHZE2 | DFHZOPN})**

Explanation: The external security manager (ESM) was attempting to process a security authorization facility (SAF) request. Processing has failed with return code RF=X'rf and reason code R0=X'r0.

For the meaning of *sense*, see message DFHZC2400.

System action: CICS rejects the bind.

User response: Refer to the ESM manuals

appropriate to your system to obtain information about the meanings of any return codes or reason codes produced by the ESM.

If you are using RACF as your security manager, refer to the RACXTRT macro guidance documented in the *System Programming Library RACF* manual for the meaning of the return code and the reason code.

Module: DFHZE1, DFHZE2, DFHZOPN

XMEOUT Parameters: *date, time, applid, X'rf', X'r0', sense, instance, {1=DFHZOPN, 2=DFHZOPN, 3=DFHZE1, 4=DFHZE2}*

Destination: CSNE

DFHZC4939E *date time applid* **Extraction of LU6.2 security data has failed with ESM returncode RF= X'rf' and reason code R0= X'r0' sense ((instance) Module name {DFHZE1 | DFHZE2 | DFHZOPN})**

Explanation: A request to extract APPC bind-time security information has failed with return code RF=X'rf and reason code R0=X'r0. The profile information which was requested had not been previously defined to the external security manager (ESM).

For the meaning of *sense*, see message DFHZC2400.

System action: CICS rejects the bind.

User response: Check the profiles defined to the ESM. Create the missing APPC profile entry.

Refer to the ESM manuals appropriate to your system to obtain information about the meanings of any return codes or reason codes produced by the ESM.

If you are using RACF as your security manager, refer to the RACXTRT macro guidance documented in the *System Programming Library RACF* manual for the meaning of the return code and the reason code.

Module: DFHZE1, DFHZE2, DFHZOPN

XMEOUT Parameters: *date, time, applid, X'rf', X'r0', sense, instance, {1=DFHZOPN, 2=DFHZOPN, 3=DFHZE1, 4=DFHZE2}*

Destination: CSNE

DFHZC4940E *date time applid* **Bind time failure. No session key found in LU6.2 profile. sense ((instance) Module name {DFHZE1 | DFHZE2 | DFHZOPN})**

Explanation: APPC bind-time validation has failed. No session key has been found in the requested APPC profile information. When bind-time security has been defined between two logical units (LUs), a valid session key must have been defined for the encryption process. A null session key (that is, when no key is defined) is regarded as an error.

For the meaning of *sense*, see message DFHZC2400.

System action: CICS rejects the bind.

User response: Check the profiles defined to the external security manager (ESM). Create a valid session key for the appropriate APPC profile entry. DO NOT use the NOESSKEY ESM option for XAPPC security profiles when using RACF.

Refer to the ESM manuals appropriate to your system to obtain information about the meanings of any return and reason codes which produced by the ESM.

If you are using RACF as your security manager, refer to the RACXTRT macro guidance documented in the *System Programming Library RACF* manual for the meaning of the return code and the reason code.

Module: DFHZEV1, DFHZEV2, DFHZOPN

XMEOUT Parameters: *date, time, applid, sense, instance, {1=DFHZOPN, 2=DFHZOPN, 3=DFHZEV1, 4=DFHZEV2}*

Destination: CSNE

DFHZC4941E *date time applid* **Bind time failure. LU6.2 profile locked.** *sense ((instance) Module name {DFHZEV1 | DFHZEV2 | DFHZOPN})*

Explanation: The external security manager (ESM) has requested profile information during bind-time validation but the requested profile is locked. When a profile is locked no sessions can be established.

For the meaning of *sense*, see message DFHZC2400.

System action: CICS rejects the bind.

User response: Check the profiles defined to the ESM. The system administrator may have locked the profile. Request that the profile be unlocked. Try once more when the profile has been unlocked.

If you are using RACF as your security manager, refer to the RACXTRT macro guidance documented in the *System Programming Library RACF* manual for further information.

Module: DFHZEV1, DFHZEV2, DFHZOPN

XMEOUT Parameters: *date, time, applid, sense, instance, {1=DFHZOPN, 2=DFHZOPN, 3=DFHZEV1, 4=DFHZEV2}*

Destination: CSNE

DFHZC4942E *date time applid* **Bind time failure. Expired LU6.2 profile found.** *sense ((instance) Module name: {DFHZEV1 | DFHZEV2 | DFHZOPN})*

Explanation: The external security manager (ESM) has requested profile information during bind-time validation but the requested profile has expired.

For the meaning of *sense*, see message DFHZC2400.

System action: CICS rejects the bind.

User response: Check the profiles defined to the ESM. The system administrator needs to update the required profile. Request that the profile be updated. Try once more when the profile has been updated.

If you are using RACF as your security manager, refer to the RACXTRT macro guidance documented in the *System Programming Library RACF* manual for further information.

Module: DFHZEV1, DFHZEV2, DFHZOPN

XMEOUT Parameters: *date, time, applid, sense, instance, {1=DFHZOPN, 2=DFHZOPN, 3=DFHZEV1, 4=DFHZEV2}*

Destination: CSNE

DFHZC4943E *date time applid termid tranid RPL B* **FSM error.** *sense ((instance) Module name {DFHZSDL})*

Explanation: The finite state machine (FSM), for the APPC alternate RPL (RPL 'B'), has detected an error in the use of the RPL.

For the meaning of *sense*, see message DFHZC2400.

System action: The task is abnormally terminated with abend code ATNI and a dump is produced.

User response: If this message occurs when VTAM is terminating, it is not a serious problem and usually no response is necessary.

If this message occurs during normal system execution, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZSDL

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSDL}*

Destination: CSNE

DFHZC4944 *date time applid termid tranid* **Protocol Violation detected within bind security indicators.** *sense ((instance) MODULE NAME {DFHZBLX | DFHZOPX})*

Explanation: CICS has detected an error while validating the bind security specification. LOCAL security has been specified, but the bind contains data that indicates NON LOCAL security.

For the meaning of *sense*, see message DFHZC2400.

System action: CICS rejects the bind.

User response: Ensure that the correct data is sent in the bind for the required type of security.

Module: DFHZSCX, DFHZOPX, DFHZBLX

XMEOUT Parameters: *date, time, applid, termid, tranid,*

DFHXC4945E • DFHXC4947E

sense, instance, {1=DFHZBLX, 2=DFHZBLX, 3=DFHZOPX, 4=DFHZOPX}

Destination: CSMT

DFHXC4945E *date time applid termid tranid* **Session unbind request due to the forcepurge of a task.** *sense ((instance) Module name {DFHZARER})*

Explanation: A task was purged or forcepurged while it was suspended, waiting for an ISC request to complete.

For the meaning of *sense*, see message DFHXC2400.

System action: An unbind is requested for the session against which the ISC request was waiting and the task is abended. A FORCEPURGE command causes the task to be abended irrespective of the state of the session. Other VTAM error messages may result from this action.

User response: Investigate the reasons the task was purged or forcepurged because it may have been the result of an application error. In addition, the partner task in the connected CICS system will have session failure notification returned on the next ISC request after the session has been unbound. Check that the partner task has handled the situation.

Module: DFHZARER

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZARER}*

Destination: CSNE

DFHXC4946E *date time applid termid tranid* **Invalid attach parameter was received.** *sense ((instance) Module name {DFH62XM})*

Explanation: A request to attach a task has been received across an APPC link. However there is an error in the FMH attach parameters. An attach parameter is present that is not authorized by the bind security indicators.

The *instance* data can take the following values

instance

Meaning

- | | |
|---|---|
| 1 | The bind security indicators show that the connection is defined as ATTACHSEC(LOCAL) indicating that this LU does not accept any security parameters in an attach from the partner LU. One or more of the following security parameters has been found: Userid, Password, Profile, AV, PV1 and PV2. |
| 2 | An already-verified (AV) indicator has been received in an attach from the partner LU, but the bind security indicators show that this LU does not support the receipt of the AV indicator. |

- | | |
|---|---|
| 3 | A persistent verification signon (PV2) indicator, or a persistent verification signed-on (PV1) indicator, has been received in an attach from the partner LU, but the bind security indicators show that this LU does not support the receipt of the PV indicators. |
|---|---|

System action: The task abends and a dump is produced and the session is unbound. An exception trace point (number 1737) for component TF is issued, tracing the invalid attach header (FMH type 5).

User response: Investigate the cause of the error which is in the remote system. Use the FMH5 in the exception trace to determine why the remote system sent an invalid attach request.

Module: DFH62XM

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFH62XM, 2=DFH62XM, 3=DFH62XM}*

Destination: CSNE

DFHXC4947E *date time applid termid tranid* **Attach time security check has failed. Security not valid.** *sense ((instance) Module name {DFH62XM})*

Explanation: A request to attach a task has been received over an APPC link. However the FMH5 attach parameters do not conform to the APPC protocol.

The *instance* data can take the following values

instance

Meaning

- | | |
|---|--|
| 1 | Unrecognized access security subfield |
| 2 | Multiple userid access security subfields present |
| 3 | Multiple profile access security subfields present |
| 4 | Multiple password access security subfields present |
| 5 | Userid required in FMH but not received |
| 6 | PV1 and PV2 security indicators both present in FMH5 |
| 7 | Password received when AV indicator set |
| 8 | Password received when PV1 indicator set |
| 9 | Password required for PV2 but not received. |

System action: The attach request is rejected and the session is unbound. An exception trace point (number 1737) for component TF is issued tracing the invalid attach header (FMH type 5).

User response: Investigate the cause of the error which is in the remote system. Use the FMH5 in the exception trace, to determine why the remote system

sent an invalid attach request.

If the remote system has an earlier release of CICS or CICS on another platform and the sense value given is 5 then you may need to set USEDFLTUSER. See 'Attach Time Security and the USEDFLTUSER option' in chapter 12 of the *CICS RACF Security Guide*.

Module: DFH62XM, DFHZGXA

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFH62XM, 2=DFH62XM, 3=DFH62XM, 4=DFH62XM, 5=DFH62XM, 6=DFH62XM, 7=DFH62XM, 8=DFH62XM, 9=DFH62XM}*

Destination: CSNE

DFHZC4948E *date time applid* **An error has been detected when processing an { unknown | inbound | outbound } request. | Persistent Verify Signoff request. | Persistent Verify Timeout request.} Transaction tranid is { continuing. | terminating. | terminating abnormally.} Error code: X'xxxxx' Connection: yyyy**

Explanation: An error has been detected during the execution of transaction CLS3. The error code indicates the nature of the error

- X'01** Transaction CLS3 issued an unsuccessful communications request on an APPC session.
- X'02** Transaction CLS3 was started by a START command with data, but the format of the data was incorrect.
- X'04** Transaction CLS3 is attempting to send a signoff request to a remote system, but the connection to the remote system is not an APPC connection.
- X'06** Transaction CLS3 was not started by terminal input, nor by a START command.
- X'09** Transaction CLS3 was started by a START command with data, but the data could not be retrieved.
- X'0A** Transaction CLS3 is attempting to send a signoff request to a remote system, but there is no connection to the remote system.
- X'0B** Transaction CLS3 unsuccessfully attempted to allocate an APPC session to a remote system.

System action: Depending upon the nature of the event that gave rise to the message, the transaction continues execution, terminates normally, or terminates abnormally. The message text indicates which action is being taken.

User response: This depends upon the error code

- X'01** Determine why the communications request on the APPC session failed. Possible reasons are
 - There has been a session failure.

- The connected transaction has abended.

:pc.This error produces an exception trace, which helps to determine the cause of the problem.

- X'02** Ensure that transaction CLS3 was started by CICS-supplied code, and not by application code. If it was started by CICS-supplied code, contact your IBM Support Center.
- X'04** Check the connection definition for the remote system. It should be an APPC connection.
- X'06** Ensure that transaction CLS3 was started by CICS-supplied code, and not by application code. If it was started by CICS-supplied code, contact your IBM Support Center.
- X'09** Determine why the data could not be retrieved. If you are unable to do so, contact your IBM Support Center
- X'0A** Ensure that the connection has been correctly defined
- X'0B** Ensure that the connection is acquired and in service

Module: DFHCLS3

XMEOUT Parameters: *date, time, applid, {1= unknown, 2= inbound, 3= outbound}, {1= request., 2=Persistent Verify Signoff request., 3=Persistent Verify Timeout request.}, tranid, {1= continuing., 2= terminating., 3= terminating abnormally.}, X'xxxxx',yyyy*

Destination: CSNE

DFHZC4949E *date time applid termid tranid netname* **Receive Any stall - {data lost. | response lost. | command lost.} CLSDST return code X'rc' sense ((instance) Module name {DFHZRAC})**

Explanation: All the CICS Receive Any RPLs have been posted but the TCTTE for each one is waiting for a response from a VTAM terminal or session. All the Receive Any RPLs have been stalled for 10 dispatches of the TCP task (CSTP). This message is produced for each session that is in this situation. A VTAM session has not responded to a command such as BID or SHUTD sent by CICS. This is typically caused by a protocol error.

System action: CICS is running with system initialization parameter RAPOOL=(n,n,FORCE) causing CICS to issue a VTAM CLSDST against the session, which causes the TCTTE's RPL to be completed and the session to be unbound.

The default NEP action is CLSDST, which causes CICS to clean up the TCTTE after the pending command has been terminated.

The Receive Any data received is discarded and the RA RPL is reissued.

DFHZC4950E • DFHZC4951E

User response: Investigate the reason why the command has not completed. The TCTTE RPL is printed with the message.

It is important to look at any earlier DFHZC4949 messages because of the asynchronous nature of DFHZNAC. If the CLSDST has not completed, the RPL printed will be active and will show the RPL that can not complete. If the CLSDST has completed when DFHZNAC runs, the RPL printed will have a RTNCD/FDB2 of X'0C0B but RPLREQ still shows what command would not complete.

If the CLSDST return code *rc* is non 0, the CLSDST macro has failed in DFHZRAC and the session remains hung. You may be able to free the session by using VTAM command V NET,INACT,ID=*netname*,I. You can find the reason for the CLSDST failure by looking at the RPL in the AP FC90 trace point for the CLSDST.

Module: DFHZRAC

XMEOUT Parameters: *date, time, applid, termid, tranid, netname, {1=data lost. , 2=response lost. , 3=command lost. }, X'rc', sense, instance, {1=DFHZRAC, 2=DFHZRAC, 3=DFHZRAC}*

Destination: CSNE

DFHZC4950E *date time applid* **An error has occurred when attempting to attach the outbound Connection Quiesce Protocol transaction CQPO on session *termid*. Release of connection *sysid* is continuing. ((*instance*) Module name {DFHZCLS})**

Explanation: An error has been detected while attempting to attach the outbound transaction for the Connection Quiesce Protocol (CQPO) on an APPC session.

System action: The release of the connection continues, but the Connection Quiesce Protocol will take place only if the partner system successfully initiates it.

User response: Determine why transaction CQPO failed to attach. If you have installed the correct definition for the transaction, you should never see this message, and you may need to contact your IBM Support Center for assistance.

If the partner system did not initiate the Connection Quiesce Protocol, you may need to determine if there are units of work awaiting resync, or VTAM affinities to be ended before you can INITIAL start either of the connected systems.

Module: DFHZCLS

XMEOUT Parameters: *date, time, applid, termid, sysid, instance, {1=DFHZCLS}*

Destination: CSNE

DFHZC4951E *date time applid* **An error has been detected when processing an{ *unknown* / *inbound* / *outbound*} Connection Quiesce Protocol request. Transaction *tranid* is{ *continuing*. / *terminating*. / *terminating abnormally*.} **Error code** X'xxxx' **Connection:** *yyyy***

Explanation: An error has been detected during the execution of transaction *tranid*. The error code indicates the nature of the error

- X'01** Transaction *tranid* was not started by terminal input, nor by an internal CICS command.
- X'02** Transaction *tranid* was started by an inbound FMH5, but the TPN was not the correct value for the Connection Quiesce Protocol.
- X'03** Transaction *tranid* issued an unsuccessful communications request on an APPC session.
- X'04** Transaction *tranid* has been attached by an inbound FMH5. The format of the data received from the remote system did not comply with the architecture for the Connection Quiesce Protocol.
- X'05** Transaction *tranid* has received an unexpected response from the Recovery Manager.
- X'06** Transaction *tranid* has been attached by an internal CICS command and has sent a Connection Quiesce Protocol request to the remote system. The format of the reply received from the remote system did not comply with the architecture for the Protocol.
- X'07** Transaction *tranid* was started, but its principal facility is not a terminal or session.

System action: Depending upon the nature of the event that gave rise to the message, the transaction continues execution, terminates normally, or terminates abnormally. The message text indicates which action is being taken.

User response: This depends upon the error code

X'01, 02, 07

Ensure that transaction *tranid* was started by CICS-supplied code, and not by application code. If it was started by CICS-supplied code, contact your IBM Support Center.

- X'03** Determine why the communications request on the APPC session failed. Possible reasons are
 - There has been a session failure.
 - The connected transaction has abended.

:pc.This error produces an exception trace, which helps to determine the cause of the problem.

In other cases, contact your IBM Support Center.

Module: DFHCLS5

XMEOUT Parameters: *date, time,applid, {1= unknown, 2= inbound, 3= outbound}, tranid, {1=continuing., 2= terminating., 3=terminating abnormally.}, X'xxxx', yyyy*

Destination: CSNE

DFHZC5900E *date time applid* **System sysid has shipped definitions but connection cccc is not known to this system.**

Explanation: CICS has received definitions from remote system *sysid*, but cannot find a connection named *cccc*.

System action: CICS continues.

User response: If you want these definitions to be accepted, install the necessary connection using CEDA, and retransmit the definitions from the remote system.

Module: DFHBSTZ1, DFHBSTZ2

XMEOUT Parameters: *date, time, applid, sysid, cccc*

Destination: CSMT

DFHZC5901E *date time applid* **Install for resource failed. xxxx could not obtain yyyy storage**

Explanation: When installing resource *resource*, CICS module *xxxx* could not get storage for the extent specified by the value of *yyyy*.

System action: CICS continues.

User response: If possible, increase the size of your CICS address space. Otherwise, consider reducing the number of resources used in one CICS run.

Module: DFHBSMIR, DFHBSPMP, DFHBSPM62, DFHBSS, DFHBSSZM, DFHBSTS, DFHBSTB, DFHBSTB3, DFHBSTC, DFHBSTZ, DFHBSTZB, DFHBSTZO, DFHBSTZR, DFHBSTZV, DFHBSTZ1, DFHBSTZ2, DFHBSTZS

XMEOUT Parameters: *date, time,applid, resource, xxxx, yyyy*

Destination: CSMT

DFHZC5902E *date time applid* **Deletion of terminal termid failed. BMS Paging session still active**

Explanation: CICS cannot delete terminal *termid* because a BMS paging session is still active for the terminal.

System action: CICS continues.

User response: Sign on to terminal *termid* and purge the pages.

Module: DFHBSTB

XMEOUT Parameters: *date, time,applid, termid*

Destination: CSMT

DFHZC5903E *date time applid* **Deletion of terminal termid failed. CICS logic error**

Explanation: CICS cannot delete the terminal *termid*, because the CICS batch data attach function (DIP) is still active for this terminal.

System action: CICS continues. A system dump is taken with dumpcode ZC5903. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHBSTD

XMEOUT Parameters: *date, time,applid, termid*

Destination: CSMT

DFHZC5904E *date time applid* **Deletion of terminal termid failed. CEDF is still active**

Explanation: CICS cannot delete the terminal *termid* because an EDF session is still active for this terminal.

System action: CICS continues.

User response: Deactivate EDF for the terminal, and reinstall the group.

Module: DFHBSTE

XMEOUT Parameters: *date, time,applid, termid*

Destination: CSMT

DFHZC5905E *date time applid* **Deletion of terminal termid failed. CICS logic error**

Explanation: CICS cannot delete terminal *termid* because the command level interface is still active for this terminal.

System action: CICS continues. A system dump is taken with dumpcode ZC5905. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHBSTH

XMEOUT Parameters: *date, time,applid, termid*

Destination: CSMT

DFHZC5906E *date time applid* **Install failed because 'xxxx' is not a permitted value for a terminal or connection name**

Explanation: A name of hexadecimal zeros has been used for a TERMINAL or CONNECTION definition.

This is a reserved value. CICS has failed to install the terminal or connection.

xxxx is the reserved value converted to printable hexadecimal. The error has probably been made using autoinstall.

System action: CICS continues.

User response: Correct the definition to use a valid name and reinstall the group.

Module: DFHBSS, DFHBSTZ, DFHBSTZ1, DFHBSTZ2 DFHBSPMP

XMEOUT Parameters: *date, time, applid, xxxx*

Destination: CSMT

DFHZC5907E *date time applid* **Deletion of remote shipped terminal failed for connection cccc.**

Explanation: During the deletion of connection *cccc*, the connection was found to have shipped remote terminals. The deletion of one or more of these shipped remote terminals has failed.

System action: CICS continues.

User response: See message DFHZC5915 for further information.

Use CEMT to release the connection and put it OUT OF SERVICE, then retry the install of the connection.

Module: DFHBSSZ

XMEOUT Parameters: *date, time, applid, cccc*

Destination: CSMT

DFHZC5908E *date time applid* **Install for terminal termid failed. The security manager gave return code retcode**

Explanation: CICS cannot install terminal *termid*. DFHXSMN gave the return code *retcode*.

System action: CICS continues.

User response: Check the value of the return code *retcode* in the *CICS Customization Guide*.

Module: DFHBSTS

XMEOUT Parameters: *date, time, applid, termid, retcode*

Destination: CSMT

DFHZC5909E *date time applid* **Install of resource resource failed. Call to DFHIRP irp_function Return_code did not succeed, See DFHIRSDS for return code.**

Explanation: When installing resource *resource*, the CICS module DFHBSSZR made a call to an IR service *irp_function* which failed due to the specified return code,

System action: CICS continues. The MRO connection *resource* is not installed.

User response: For an explanation of the return code, see DFHIRSDS in the *CICS Data Areas* manual.

Also see the user response section of message DFHIR3780. This gives a list of reasons why starting IRC can fail. However, some of the reasons are now also applicable when adding an IRC connection when IRC is OPEN. For instance a return code of E8 is issued if you add an IRC connection when cross memory is requested on the new connection but is not being used on any existing connection and when the CICS DB2 attachment has been initialized.

Module: DFHBSSZR

XMEOUT Parameters: *date, time, applid, resource, irp_function, Return_code*

Destination: CSMT

DFHZC5911E *date time applid* **Install for resource resource failed. Connection cccc not found**

Explanation: CICS could not find the connection *cccc* associated with resource *resource*.

System action: CICS continues.

User response: Install connection *cccc*.

Module: DFHBSMIR

XMEOUT Parameters: *date, time, applid, resource, cccc*

Destination: CSMT

DFHZC5912E *date time applid* **Install for terminal termid failed. It is incompatible with connection cccc**

Explanation: The terminal *termid* and the connection *cccc* are mutually incompatible.

System action: CICS continues.

User response: Modify your definition of *termid* or *cccc*.

Module: DFHBSTZ, DFHBSTZ2

XMEOUT Parameters: *date, time, applid, termid, cccc*

Destination: CSMT

DFHZC5913E *date time applid* **Deletion of node *id* failed.** {A table entry is locked. | A table entry was not found. | There was a logic error.} **Table=tablename Key(key) Module(modname) Instance=inst.**

Explanation: CICS cannot delete node *id*. The message explains the reason for the failure.

1. One of its TMP table entries is locked by other tasks.
2. A TMP table entry could not be found, possibly because the node was already deleted by another task.
3. There was a CICS logic error. A DFHTM0002 error message may have been issued as well.

The TMP table entry is identified by *tablename*. The key used in the table has a value *key*. The module that issued the message is identified by *modname* and the instance of the message in that module by *inst*.

System action: The resource is not deleted. If the entry was locked, CICS issues one or more message DFHZC5980.

User response: Choose the action which corresponds to the reason identified in the message

1. See message DFHZC5980 for further information and guidance.
2. If the node is deleted, no action is needed. If the node exists, determine whether it was replaced while this request was running. If the entry exists and has not been replaced, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.
3. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHBSS, DFHBSSZ, DFHBSTZ, DFHBSTZ1, DFHBSTZ2, DFHBSTZV, DFHBSTZS, DFHBSTZZ

XMEOUT Parameters: *date, time, applid, id, {1=A table entry is locked., 2=A table entry was not found., 3=There was a logic error.}, tablename, key, modname, inst*

Destination: CSMT

DFHZC5914E *date time applid* **Deletion of terminal *termid* found another deletion of it in progress**

Explanation: CICS has failed to delete terminal *termid* because it is already marked as pending deletion.

It is likely that a CEDA user is installing this terminal.

System action: CICS continues.

User response: Check if a CEDA user is installing the terminal.

Module: DFHBSMIR, DFHBSMPP, DFHBSS, DFHBSTZ

XMEOUT Parameters: *date, time, applid, termid*

Destination: CSMT

DFHZC5915E *date time applid* **Deletion of node *id* failed.** {The node is still in service. | The system entry is still in service. | The node has a task attached.} **Module(modname).**

Explanation: CICS cannot delete node *id*. The reason is identified in the message.

1. The terminal or session is still in service.
2. The system entry of this session is still in service.
3. A task is still attached to this terminal or session.

The module issuing the message is identified as *modname*.

System action: CICS continues and does not delete the node.

User response: Before retrying the deletion or replacement, perform the action which corresponds to the reason given in the message.

1. Set the node OUT OF SERVICE
2. Set the system entry OUT OF SERVICE.
3. Wait for activity to cease for this node.

Module: DFHBSMIR, DFHBSTZ, DFHBSTZP

XMEOUT Parameters: *date, time, applid, id, {1=The node is still in service., 2=The system entry is still in service., 3=The node has a task attached.}, modname*

Destination: CSMT

DFHZC5916E *date time applid* **Deletion of terminal *termid* failed. It has pending DFHZCP activity**

Explanation: CICS cannot delete resource *termid* because DFHZCP activity is pending for this terminal. The resource could be a session belonging to a connection or a terminal TCTTE.

System action: CICS continues.

User response: Use exception trace point AP FCDE to determine what sort of activity is pending.

If this indicates that the VTAM CLSDST command is in progress, VTAM could be trying to contact a nonexistent or unavailable resource (indicated by NETNAME in the CEDA definition for the resource). In this case, wait for a few minutes and retry the reinstall or discard. If you have access to the JOBLLOG, message DFHZC3462 for the resource in question indicates that the CLSDST has finished.

DFHZC5917E • DFHZC5923E

If the resource is a terminal, put the terminal briefly into service and then take it out of service again, using the CEMT transaction.

Module: DFHBSTZA

XMEOUT Parameters: *date, time,applid, termid*

Destination: CSMT

DFHZC5917E *date time applid* **Deletion of terminal *termid* failed. Error message writer still active**

Explanation: CICS cannot delete terminal *termid* because the error message writer is still active for this terminal.

System action: CICS continues.

User response: Put the terminal briefly into service and then take it out of service again, using the CEMT transaction.

Module: DFHBSTZE

XMEOUT Parameters: *date, time,applid, termid*

Destination: CSMT

DFHZC5918E *date time applid* **Deletion of terminal *termid* Console *consname* failed. It has pending DFHZCP activity.**

Explanation: The MVS console *consname* has outstanding activity that prevents its deletion.

System action: CICS continues.

User response: After replying to any outstanding replies requested of this console, put the console briefly into service and then take it out of service again, using the CEMT transaction.

Module: DFHBSZTO

XMEOUT Parameters: *date, time,applid, termid, consname*

Destination: CSMT

DFHZC5919E *date time applid* **Deletion of terminal *termid* failed. CICS logic error**

Explanation: CICS cannot delete terminal *termid* because of an error in disconnecting remote terminals.

System action: CICS continues. A system dump is taken with dumpcode ZC5919. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHBSSZ

XMEOUT Parameters: *date, time,applid, termid*

Destination: CSMT

DFHZC5920E *date time applid* **Install of terminal *termid* failed. CICS logic error**

Explanation: This CICS system failed to install terminal *termid*. No terminals can be accepted yet because the system does not have a local system entry. There was probably a failure during CICS initialization.

System action: CICS continues. A system dump is taken with dumpcode ZC5920. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHBSTZ

XMEOUT Parameters: *date, time,applid, termid*

Destination: CSMT

DFHZC5921E *date time applid* **Install of terminal *termid* failed. VTAM support not loaded.**

Explanation: CICS failed to install terminal *termid* because CICS was initialized without VTAM support.

System action: CICS continues processing.

User response: To use VTAM, shut down CICS and restart with the system initialization parameter VTAM=YES, a TCT assembled with ACCESSMETHOD=VTAM, and appropriate RDO terminal definitions.

Module: DFHBSZZV

XMEOUT Parameters: *date, time,applid, termid*

Destination: CSMT

DFHZC5923E *date time applid* **Install for terminal *termid* failed. CICS logic error**

Explanation: CICS failed to install terminal *termid* because the bind-image was invalid.

System action: CICS continues. A system dump is taken with dumpcode ZC5923. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHBSZZV

XMEOUT Parameters: *date, time,applid, termid*

Destination: CSMT

DFHZC5924E *date time applid* Install for terminal *termid* failed. CICS logic error

Explanation: CICS failed to install terminal *termid* because the TCTTE contained no node information block (NIB) descriptor.

System action: CICS continues. A system dump is taken with dumpcode ZC5924. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHBSZZV

XMEOUT Parameters: *date, time, applid, termid*

Destination: CSMT

DFHZC5925E *date time applid* Deletion of connection *cccc* failed. Its AID-Chains are not empty

Explanation: CICS did not delete connection *cccc* because the AID-chains for the remote system *cccc* are not empty.

System action: CICS continues.

User response: Using the CEMT transaction, put the connection into service to allow the outstanding AIDs to be processed. Then take the connection out of service to allow deletion.

Module: DFHBSSA

XMEOUT Parameters: *date, time, applid, cccc*

Destination: CSMT

DFHZC5926E *date time applid* Install for connection *cccc* failed. CICS logic error

Explanation: CICS did not install the connection *cccc* because DFHZCP received no DATASTREAM operand.

System action: CICS continues. A system dump is taken with dumpcode ZC5926. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHBSSZ6

XMEOUT Parameters: *date, time, applid, cccc*

Destination: CSMT

DFHZC5927E *date time applid* Install for connection *cccc* failed. CICS logic error

Explanation: CICS did not install the connection *cccc* because DFHZCP did not receive a RECORDFORMAT operand.

System action: CICS continues. A system dump is taken with dumpcode ZC5927. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHBSSZ6

XMEOUT Parameters: *date, time, applid, cccc*

Destination: CSMT

DFHZC5930E *date time applid* Remote connection (*sysid*) could not be deleted because it was in use by *number* sessions.

Explanation: When remote connection *sysid* was being deleted, it was still in use by *number* of sessions.

System action: The resource is not deleted. CICS continues.

User response: Wait until access to this remote connection has quiesced and then retry the deletion.

Module: DFHBSTZ2

XMEOUT Parameters: *date, time, applid, sysid, number*

Destination: CSMT

DFHZC5931E *date time applid* Install for modename *modename* failed. Maximum number of APPC sessions would have been exceeded

Explanation: CICS did not install a SESSIONS definition using MODENAME *modename* because it would have exceeded the maximum number of permitted sessions.

The maximum number of sessions depends on whether the PTF shipped for APAR PQ27823 is installed. The basic limit is 46656 and the names are in the range -AAA to -999. The APAR doubles this limit to 93312 giving an additional range of AAA- to 999-.

System action: CICS continues.

User response: Either wait for the system to become less busy, or delete some APPC sessions.

The system programmer should consider increasing the number of CICS TORs.

Module: DFHBSM61

XMEOUT Parameters: *date, time, applid, modename*

Destination: CSMT

DFHZC5932E *date time applid* **Install for modename modename failed. Connection cccc not found**

Explanation: CICS did not install a SESSIONS definition using MODENAME *modename* because of an unknown name *cccc* in the CONNECTION parameter.

System action: CICS continues.

User response: Install connection *cccc*.

Module: DFHBSM62

XMEOUT Parameters: *date, time, applid, modename, cccc*

Destination: CSMT

DFHZC5933E *date time applid* **Install for modename modename failed. Connection cccc is not valid here**

Explanation: CICS did not install a SESSIONS definition using MODENAME *modename* because the CONNECTION is not valid in this context.

System action: CICS continues.

User response: Modify your definition of remote system *cccc*.

Module: DFHBSM62

XMEOUT Parameters: *date, time, applid, modename, cccc*

Destination: CSMT

DFHZC5934E *date time applid* **Install for modename modename failed. Single-session connection cccc is already in use.**

Explanation: CICS did not install a SESSIONS definition using MODENAME *modename* because the single-session CONNECTION *cccc* is already in use.

System action: CICS continues.

User response: Modify the definition of *cccc*.

Module: DFHBSM61, DFHBSM62

XMEOUT Parameters: *date, time, applid, modename, cccc*

Destination: CSMT

DFHZC5936E *date time applid* **Install for modename modename failed. Connection cccc has active modegroup xxxx**

Explanation: CICS has not installed a SESSIONS definition with MODENAME *modename* because the connection *cccc* already has an active MODEGROUP, *xxxx*.

System action: CICS continues.

User response: Put the connection briefly into service and then take it out of service again, using the CEMT transaction.

Module: DFHBSM62

XMEOUT Parameters: *date, time, applid, modename, cccc, xxxx*

Destination: CSMT

DFHZC5937I *date time applid* **Deletion of modename modename found another deletion of it in progress**

Explanation: CICS has not deleted a SESSIONS definition with MODENAME *modename* because the definition is already pending deletion.

System action: CICS continues.

User response: Check if a CEDA user was installing the SESSIONS definition.

Module: DFHBSM62

XMEOUT Parameters: *date, time, applid, modename*

Destination: CSMT

DFHZC5938E *date time applid* **Deletion of modename modename failed. Unable to delete session(s)**

Explanation: CICS is unable to delete a SESSIONS definition with MODENAME *modename* because of one or more errors reported in previous messages.

System action: CICS continues.

User response: Refer to any preceding messages for further information and guidance. Correct the reported errors.

Module: DFHBSM61

XMEOUT Parameters: *date, time, applid, modename*

Destination: CSMT

DFHZC5939E *date time applid* **Install for name failed. Duplicate session- or modegroup-name for connection sysid**

Explanation: CICS is unable to install a session or modegroup as the session-name or modegroup-name *name* is duplicated. The duplicate might be another connection, session, modegroup or terminal. However it might also be the local connection which has the name specified by SYSIDNT in the system initialization table.

System action: CICS continues processing, but the session or modegroup is not installed.

User response: Change the duplicated session-name or modegroup-name.

Module: DFHBSMIR, DFHBSM62

XMEOUT Parameters: *date, time,applid, name, sysid*

Destination: CSMT

DFHZC5940E *date time applid* **Install for terminal *termid* failed. Error console cannot be deleted**

Explanation: You have tried to replace the error console, CERR. CICS does not allow this.

System action: CICS continues with original error console.

User response: Note this restriction.

Module: DFHZCQDL

XMEOUT Parameters: *date, time,applid, termid*

Destination: CSMT

DFHZC5941E *date time applid* **Install for terminal *termid* failed. Console *consname* has a conversation outstanding**

Explanation: CICS was unable to install terminal *termid* because the console *consname* has posted an ECB.

System action: Processing continues.

User response: Put the terminal briefly into service and then take it out of service again, using the CEMT transaction.

Module: DFHBSTZO

XMEOUT Parameters: *date, time,applid, termid, consname*

Destination: CSMT

DFHZC5942E *date time applid* **Node *nodeid* was not installed. The addition of key *key* to table *tablename* failed. RC=*X'return'*. Module(*modname*).**

Explanation: CICS cannot install the definition of node *nodeid* because an addition to a TMP table failed. CICS was trying to add the key *key* to the table *tablename*.

The return code from TMP is given in *return*. If the return code is 4, the entry was a duplicate. It is possible that another entry was added at the same time as this entry and used the same key. If this is not the case, CICS has suffered a logic error. The module that issued the message is indicated by *modname*.

System action: CICS does not install the definition.

User response: If the entry was not overlapped by another definition which conflicted with its key, or if the return code is not 4, you will need assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHBSS, DFHBSTZ, DFHBSTZS, DFHBSTZZ, DFHBSTZ1, DFHBSTZ2

XMEOUT Parameters: *date, time,applid, nodeid, key, tablename, X'return', modname*

Destination: CSMT

DFHZC5943E *date time applid* **MRO connection *conname* could not be deleted because IRC is open.**

Explanation: CICS cannot delete the connection *conname* because it is an MRO connection and interregion communication (IRC) is open.

System action: The connection is not deleted.

User response: Close the IRC definition and retry the Delete or Replace.

Module: DFHBSS

XMEOUT Parameters: *date, time,applid, conname*

Destination: CSMT

DFHZC5944E *date time applid* **Install for *type(id)* has failed. It would make a loop of connection definitions. Module(*modname*).**

Explanation: CICS cannot install definition of *type* called *id* because it would make a loop of connection definitions. The connection *type* may be an indirect connection or a remote connection. Indirect connections point to other connections with the INDSYS field, and remote connections point to other connections with the REMOTESYSTEM field. The module that issued the message is identified by *modname*.

System action: CICS does not install the definition.

User response: Determine the source of the loop either in the already installed definitions or in this definition, and change it before attempting to reinstall this definition.

Module: DFHBSSZI, DFHBSTZ2

XMEOUT Parameters: *date, time,applid, type, id, modname*

Destination: CSMT

DFHZC5945E *date time applid* **Deletion of sessions *ssss* failed. Connection *cccc* is defined to IRC**

Explanation: CICS has not deleted the SESSIONS definition, *ssss*, because the CONNECTION is still defined to IRC.

System action: CICS continues.

User response: Issue a CEMT SET IRC CLOSED command.

DFHZC5946E • DFHZC5951E

Module: DFHBSTZR

XMEOUT Parameters: *date, time,applid, ssss, cccc*

Destination: CSMT

DFHZC5946E *date time applid* **Install for sessions ssss failed. Connection cccc is defined to IRC**

Explanation: CICS has not installed the SESSIONS definition, *ssss*, because the CONNECTION is already defined to IRC.

System action: CICS continues.

User response: Issue a CEMT SET IRC CLOSED command.

Module: DFHBSTZR

XMEOUT Parameters: *date, time,applid, ssss, cccc*

Destination: CSMT

DFHZC5947E *date time applid* **Install for sessions ssss failed. CICS logic error**

Explanation: CICS has not installed the SESSIONS definition, *ssss*, because the CONNECTION name is not specified.

System action: CICS continues. A system dump is taken with dumpcode ZC5947. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHBSTMIR, DFHBSTZR

XMEOUT Parameters: *date, time,applid, ssss*

Destination: CSMT

DFHZC5948E *date time applid* **Install for sessions ssss failed. Connection cccc is not suitable for IRC**

Explanation: CICS has not installed the SESSIONS definition, *ssss*, because the CONNECTION specified is not suitable for IRC.

System action: CICS continues.

User response: Modify your definition of *cccc*.

Module: DFHBSTZR

XMEOUT Parameters: *date, time,applid, ssss, cccc*

Destination: CSMT

DFHZC5949E *date time applid* **Install for sessions ssss failed. It is incompatible with connection cccc**

Explanation: CICS has not installed the SESSIONS definition, *ssss*, because the CONNECTION specified does not support the required type of session. If you are replacing a connection of the same name but of a different type and the install fails for some other reason then this message may occur.

System action: CICS continues.

User response: Modify your definition of *cccc*.

Module: DFHBSTMIR, DFHBSTZS, DFHBSTZR

XMEOUT Parameters: *date, time,applid, ssss, cccc*

Destination: CSMT

DFHZC5950E *date time applid* **Install for terminal termid failed. Console consname already exists**

Explanation: CICS has not installed the CONSOLE definition *termid* because the console ID, *consname*, already exists.

System action: CICS continues without installing the terminal.

User response: Use the CEDA transaction to define a different console ID in the CONSNM of the terminal definition and reinstall the terminal.

Module: DFHBSTZO

XMEOUT Parameters: *date, time, applid, termid, consname*

Destination: CSMT

DFHZC5951E *date time applid* **Deletion of connection ssss failed. Unable to delete sessions**

Explanation: CICS has not deleted the CONNECTION definition, *ssss*, because it cannot delete one or more sessions. A preceding message or messages should explain this failure.

System action: CICS continues.

User response: Refer to the preceding message for further information and guidance.

Module: DFHBSSZR, DFHBSSZ6

XMEOUT Parameters: *date, time,applid, ssss*

Destination: CSMT

DFHZC5952E *date time applid* **Deletion of terminal
termid failed. It needs to be SET
RELEASED**

Explanation: CICS cannot delete terminal *termid* because of its current state.

System action: CICS continues.

User response: Use the CEMT transaction to set terminal *termid* released and out of service.

Module: DFHBSTZV

XMEOUT Parameters: *date, time, applid, termid*

Destination: CSMT

DFHZC5953E *date time applid* **CICS logic error**

Explanation: An object being installed did not have a bind-image.

System action: CICS continues. A system dump is taken with dumpcode ZC5953. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHBSM62

XMEOUT Parameters: *date, time, applid*

Destination: CSMT

DFHZC5954E *date time applid* **Install for resource
resource failed. Unable to install
sessions component**

Explanation: CICS has failed to install resource *resource*. Previous message(s) should give the reason for the failure.

System action: CICS continues.

User response: Refer to any preceding messages for further information and guidance.

Module: DFHBSTZC

XMEOUT Parameters: *date, time, applid, resource*

Destination: CSMT

DFHZC5957E *date time applid* **Arch. User-Data ID
X'xx occurs in bind. CICS logic error**

Explanation: The APPC SESSIONS object being installed is invalid because architected user-data IDs greater than X'02 occur in bind.

System action: CICS does not install the object. A system dump is taken with dumpcode ZC5957. Message DFHME0116 should be produced containing the symptom string for this problem. You need further

assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

User response:

Module: DFHBSM62

XMEOUT Parameters: *date, time, applid, xx*

Destination: CSMT

DFHZC5958E *date time applid* **Install failed for xxxx.
This is the name of the local system
which must not be replaced.**

Explanation: A terminal or a connection was defined with the same name as the local system entry during the last run of CICS. This is not allowed as the local system entry cannot be replaced.

During cold or initial start of the current run of CICS, CICS attempted to install the group which included the invalid definition. CICS then issued this message.

System action: CICS continues, but this terminal or connection is not installed.

User response: Use the CEDA transaction to correct the terminal or connection name and install the group.

Module: DFHBSSZL

XMEOUT Parameters: *date, time, applid, xxxx*

Destination: CSMT

DFHZC5961E *date time applid* **Deletion of surrogate
xxxx failed. CICS logic error**

Explanation: CICS cannot delete a surrogate TCT entry.

System action: CICS continues. A system dump is taken with dumpcode ZC5961. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHBSTZ1, DFHBSTZ2

XMEOUT Parameters: *date, time, applid, xxxx*

Destination: CSMT

DFHZC5962E *date time applid* **Install for resource
resource failed. Modename parameter
not found**

Explanation: CICS has failed to install resource *resource* because the MODENAME parameter is missing.

System action: CICS continues.

User response: Supply the missing parameter.

DFHZC5963E • DFHZC5968E

Module: DFHBSTZS

XMEOUT Parameters: *date, time,applid, resource*

Destination: CSMT

DFHZC5963E *date time applid operation* **RUSIZE** *xxxx*
from terminal *termid* **was greater than**
TYPETERM RUSIZE *yyyy*.

Explanation: An autoinstall has been attempted with terminal *termid* that has a VTAM RECEIVESIZE greater than the corresponding TYPETERM RECEIVESIZEISENDSIZE.

System action: CICS continues. The autoinstall is rejected.

User response: Increase the TYPETERM RECEIVESIZE or the TYPETERM SENDSIZE, OR decrease the RECEIVESIZES in the VTAM LOGMODE table.

Module: DFHBSSZZV

XMEOUT Parameters: *date, time,applid, operation, xxxx, termid, yyyy*

Destination: CSMT

DFHZC5964E *date time applid* **Install for sessions**
ssss **failed. CICS logic error.**

Explanation: CICS has failed to install SESSIONS *ssss* because the length of the BINDPASSWORD exceeds the limit of 8.

System action: CICS continues. A system dump is taken with dumpcode ZC5964. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHBSSZS

XMEOUT Parameters: *date, time,applid, ssss*

Destination: CSMT

DFHZC5965 *date time applid* **Pool delete for pool**
poolid **failed. Terminal** *termid* **was being**
replaced at the same time.

Explanation: CICS failed in an attempt to install or delete POOL definition *poolid*. A terminal *termid* in the pool was being deleted at the same time as the pool was being installed or deleted. This probably due to changing the terminal from a pooled terminal to a non-pooled terminal, or changing the pool name for a terminal in the same group. CICS cannot continue to modify the pool until the change to the terminal has completed.

System action: CICS continues.

User response: Once the deletion or modification of the terminal has succeeded, retry the installation.

Module: DFHBSMPP

XMEOUT Parameters: *date, time,applid, poolid, termid*

Destination: CADL

DFHZC5966I *date time applid {INSTALL | DELETE |*
RESTORE} **started for** *resource (termid)*
(Module name: *modname***).**

Explanation: CICS is starting to install, delete or restore *resource*. The *resource* may be either a terminal, a connection, a modegroup, a session, or a pool_entry. Other messages are issued after this one if this installation, deletion or restoration fails.

System action: CICS continues.

User response: None.

Module: DFHBSTZ, DFHBSMPP, DFHBSM62,
DFHBSS, DFHBSMIR

XMEOUT Parameters: *date, time,applid, {1=INSTALL,*
2=DELETE,3=RESTORE}, resource, termid,modname

Destination: CADL

DFHZC5967E *date time applid* **Install for modename**
modename **failed. Unable to install**
sessions

Explanation: CICS has failed to install a SESSIONS definition using MODENAME *modename*. Previous message(s) should give the reason for the failure.

System action: CICS continues.

User response: Refer to the preceding message for further information and guidance.

Module: DFHBSM61

XMEOUT Parameters: *date, time,applid, modename*

Destination: CSMT

DFHZC5968E *date time applid* **Unable to install LU**
Services Manager for modename
modename

Explanation: CICS has failed to install a CONNECTION definition for MODEGROUP *modename*. Previous message(s) should give the reason for the failure.

System action: CICS continues.

User response: Refer to any preceding messages for further information and guidance.

Module: DFHBSSZP

XMEOUT Parameters: *date, time,applid, modename*

Destination: CSMT

DFHZC5969E *date time applid* **Deletion of dependent modename(s) failed for connection**
modename

Explanation: CICS has failed to replace a CONNECTION definition for MODEGROUP *modename*. Previous message(s) should give the reason for the failure.

System action: CICS continues.

User response: Refer to any preceding messages for further information and guidance.

Module: DFHBSSZS

XMEOUT Parameters: *date, time,applid, modename*

Destination: CSMT

DFHZC5971E *date time applid* **Delete of resource resource failed. CICS logic error**

Explanation: CICS failed to delete resource *resource* because of an unexpected signon state during the destroy operation.

System action: CICS continues. A system dump is taken with dumpcode ZC5971. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHBSTS

XMEOUT Parameters: *date, time,applid, resource*

Destination: CSMT

DFHZC5972E *date time applid* **Delete of resource resource failed. It is still signed on**

Explanation: CICS failed to delete a TERMINAL or SESSIONS resource *resource* because a terminal or session is still signed on.

System action: CICS continues.

User response: Run the signoff transaction CESF and retry.

Module: DFHBSTS

XMEOUT Parameters: *date, time,applid, resource*

Destination: CSMT

DFHZC5973E *date time applid* **Install for sessions ssss failed. Max session-count reached for modename modename**

Explanation: CICS failed to delete a SESSIONS definition *ssss* because the maximum session-count was reached for MODENAME *modename*.

System action: CICS continues.

User response: Delete some sessions in *modename*, or redefine *modename* with a higher maximum session-count.

Module: DFHBSTZS

XMEOUT Parameters: *date, time,applid, ssss, modename*

Destination: CSMT

DFHZC5974E *date time applid* **Delete of pool pppp failed. Unable to delete pool entries**

Explanation: CICS failed to delete a POOL *pppp*. Previous messages(s) should explain the cause of this failure.

System action: CICS continues.

User response: Refer to any previous messages for further guidance and information.

Module: DFHBSMPP

XMEOUT Parameters: *date, time,applid, pppp*

Destination: CSMT

DFHZC5975E *date time applid* **Install for resource pppp failed. CICS logic error**

Explanation: CICS failed to install the POOL definition *pppp* because the required POOLID parameter was missing. This is a CICS logic error (probably in DFHTRZPP).

System action: CICS continues. A system dump is taken with dumpcode ZC5975. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHBSMPP, DFHBSTZP

XMEOUT Parameters: *date, time,applid, pppp*

Destination: CSMT

DFHZC5976E *date time applid* **CICS logic error**

Explanation: CICS failed to install a POOL definition because the required POOLCNT parameter was missing. This is a CICS logic error (probably in DFHTRZPP).

System action: CICS continues. A system dump is taken with dumpcode ZC5976. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem*

DFHZC5977E • DFHZC5983E

Determination Guide for guidance on how to proceed.

Module: DFHBSMPP

XMEOUT Parameters: *date, time,applid*

Destination: CSMT

DFHZC5977E *date time applid* **Failure building pool entries**

Explanation: CICS failed to install a POOL definition, because of a failure in building pool entries. Previous messages should explain the cause of this failure.

System action: CICS continues.

User response: Refer to any previous messages for further information and guidance.

Module: DFHBSMPP

XMEOUT Parameters: *date, time,applid*

Destination: CSMT

DFHZC5978E *date time applid* **Unable to replace pool pppp**

Explanation: CICS failed in an attempt to install or delete a POOL definition. Previous messages should explain the cause of this failure.

System action: CICS continues.

User response: Refer to previous messages for further information and guidance.

Module: DFHBSMPP, DFHBSTZP

XMEOUT Parameters: *date, time,applid, pppp*

Destination: CSMT

DFHZC5979E *date time applid* **Deletion of pool pppp failed. It still has session termid**

Explanation: CICS has failed to delete pool *pppp* because the pool still has an active session for terminal *termid*.

System action: CICS continues.

User response: Put the terminal out of service (using the CEMT transaction) and retry.

Module: DFHBSTZP

XMEOUT Parameters: *date, time,applid, pppp, termid*

Destination: CSMT

DFHZC5980E *date time applid* **Resource resource is in use by task taskid Transaction tranid**

Explanation: The resource *resource* is in use. *taskid* is the task number, and *tranid* is the transaction ID.

System action: CICS continues.

User response: Wait for the termination of task *taskid*, and retry the operation.

Module: DFHBSS, DFHBSSZ, DFHBSTZ, DFHBSTZ1, DFHBSTZ2, DFHBSTZS, DFHBSTZZ, DFHBST2V

XMEOUT Parameters: *date, time,applid, resource, taskid, tranid*

Destination: CSMT

DFHZC5981E *date time applid* **Pool pppp not found**

Explanation: CICS has failed to install a resource because POOL *pppp* does not exist. Previous messages should explain the cause of this failure.

System action: CICS continues.

User response: Refer to the previous messages for further information and guidance.

Module: DFHBSTZP

XMEOUT Parameters: *date, time,applid, pppp*

Destination: CSMT

DFHZC5982E *date time applid* **Deletion of pool pppp failed. Pool entry is in use for termid**

Explanation: CICS has failed to delete POOL *pppp* because the pool still has an entry in use for terminal *termid*.

System action: CICS continues.

User response: Put the terminal out of service (using the CEMT transaction) and retry.

Module: DFHBSMPP

XMEOUT Parameters: *date, time,applid, pppp, termid*

Destination: CSMT

DFHZC5983E *date time applid* **Unable to replace resource**

Explanation: CICS failed to install resource *resource* either because it already exists, or for reasons explained in previous messages.

Possible causes are

- Non-VTAM and VTAM terminals defined with the same name. If a non-VTAM terminal is installed, CICS will not autoinstall a VTAM terminal with the same name.
- An attempt to replace your own terminal, or a terminal with the same name as the terminal being used to issue the CEDA command.
- An attempt to replace a terminal with the same REMOTENAME and REMOTESYSTEM as an earlier definition in the same group.

System action: CICS continues.

User response: Refer to previous messages for further information and guidance.

If no previous messages were issued, check your terminal identifiers.

Module: DFHBSS, DFHBSTZ, DFHBSTZ1, DFHBSTZ2

XMEOUT Parameters: *date, time,applid, resource*

Destination: CSMT

DFHZC5984E *date time applid* **The installation or deletion of *restype1 resname1* has failed. Task *taskname taskid* is updating related system definition *sysname*. Module *modname*.**

Explanation: The installation or deletion of the communications resource, *resname1* of resource type *restype1* has failed. This resource refers to a system entry, *sysname*, which is being updated by another task. The other task is identified by *taskname* and *taskid*. The resource type *restype1* can be terminal, remote terminal, connection, remote connection, or indirect connection. The message is issued by module *modname*.

System action: CICS continues but reverses the effects of the installation or deletion.

User response: Wait until the other task has completed then retry the action.

Module: DFHBSTZ, DFHBSTZ1, DFHBSTZ2, DFHBSSZI

XMEOUT Parameters: *date, time,applid, restype1, resname1, taskname, taskid, sysname, modname*

Destination: CSMT

DFHZC5985E *date time applid* **Install for resource *resource* failed. Unable to install connection component**

Explanation: CICS has failed to install resource *resource*. Previous message(s) should give the reason for the failure.

System action: CICS continues.

User response: Refer to previous messages for further information and guidance.

Module: DFHBSTZC

XMEOUT Parameters: *date, time,applid, resource*

Destination: CSMT

DFHZC5986E *date time applid* **CICS logic error**

Explanation: Either the warm keypoint program (DFHWKP), or the query transaction (DFHQRY), made an invalid request which could not be implemented.

System action: CICS continues. A system dump is taken with dumpcode ZC5986. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZCQCH

XMEOUT Parameters: *date, time,applid*

Destination: CSMT

DFHZC5987E *date time applid* **The install or delete of *restype1 resname1* has failed. Task *taskname taskid* is changing a definition which uses the *restype2 resname2*. Module *modname*.**

Explanation: The installation or deletion of communications resource *resname1* of resource type *restype1* has failed. Table builder services cannot complete the change because another task is updating a definition which uses the resource *resname2* of resource type *restype2*. The other task is identified by *taskid* and *taskname*. *Restype2* can be a termid, netname, a unique network-qualified ID, or a pipeline terminal pool_name *Restype1* can be a terminal, a session, a remote terminal, a connection, a remote connection, or a pipeline terminal. The message was issued by module *modname*.

System action: CICS continues but reverses this install or delete.

User response: Wait until the other task has completed and then retry the action.

Module: DFHBSS, DFHBSTZ, DFHBSTZS, DFHBSTZV, DFHBSTZZ, DFHBSTZ1, DFHBSTZ2, DFHBSPMP, DFHBSTZP

XMEOUT Parameters: *date, time,applid, restype1, resname1, taskname, taskid, restype2, resname2, modname*

Destination: CSMT

DFHZC5988E *date time applid* **Install for resource *resource* failed. VTAM support not generated**

Explanation: CICS failed to install resource *resource* because CICS was initialized without VTAM support.

System action: CICS continues.

User response: If you want to install VTAM resources

DFHXC5989E • DFHXC5994E

urgently, shut down CICS, and restart it with the system initialization parameter ACCESSMETHOD=VTAM, and appropriate TCT or RDO terminal definitions.

Module: DFHBSSZS, DFHBSSZ6, DFHBSTZV

XMEOUT Parameters: *date, time,applid, resource*

Destination: CSMT

DFHXC5989E *date time applid* **Deletion of resource resource failed. Remote deletion in connection cccc failed**

Explanation: CICS failed to delete resource *resource* because a remote delete in system *cccc* failed.

Previous messages should explain the cause of this failure.

System action: CICS continues.

User response: Refer to the previous message for further information and guidance.

Module: DFHBSTZ1, DFHBSTZ2

XMEOUT Parameters: *date, time,applid, resource, cccc*

Destination: CSMT

DFHXC5990E *date time applid* **CICS logic error**

Explanation: CICS rejected an INSTALL or DELETE request because it does not recognize the request code.

System action: CICS continues. A system dump is taken with dumpcode ZC5990. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXCQ00

XMEOUT Parameters: *date, time,applid*

Destination: CSMT

DFHXC5991E *date time applid* **CICS logic error**

Explanation: CICS rejected a VALIDATE BIND request because no BIND was supplied.

System action: CICS continues. A system dump is taken with dumpcode ZC5991. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXCQ00

XMEOUT Parameters: *date, time,applid*

Destination: CSMT

DFHXC5992E *date time applid* **Resource Types Table does not support recovery record**

Explanation: CICS rejected RESTORE request because the resource types table (DFHXCQRT) in DFHXCQ is incompatible with the recovery record from the log or CICS catalog.

System action: CICS continues. A system dump is taken with dumpcode ZC5992. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: CICS is unable to warm start correctly. You should therefore shut CICS down and perform a cold or initial start.

Module: DFHXCQRS

XMEOUT Parameters: *date, time,applid*

Destination: CSMT

DFHXC5993E *date time applid* **CICS logic error**

Explanation: CICS rejected a RESTORE request because the resource types table (DFHXCQRT) in DFHXCQ is incompatible with the recovery record from the log or CICS catalog.

System action: CICS continues. A system dump is taken with dumpcode ZC5993. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXCQRS

XMEOUT Parameters: *date, time,applid*

Destination: CSMT

DFHXC5994E *date time applid* **CICS logic error**

Explanation: CICS rejected a RESTORE request because no recovery record was passed.

System action: CICS continues. A system dump is taken with dumpcode ZC5994. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXCQRS

XMEOUT Parameters: *date, time,applid*

Destination: CSMT

DFHZC5995E *date time applid* **CICS logic error.**
Resource Type Code *xxxx* **Subtype** *yyyy*
not recognized with associated bind image

Explanation: CICS failed to install a resource with resource type code (RTC) *xxxx* and subtype *yyyy* (from the Builder Parameter Set) because a resource with type code *xxxx*, sub-type *yyyy*, and the associated BIND-image, is not a builder resource type. The RTC and subtype are defined in module DFHZCQRT.

This is a CICS logic error (probably in DFHTRZxP).

System action: CICS continues. A system dump is taken with dumpcode ZC5995. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZCQIS

XMEOUT Parameters: *date, time,applid, xxxx, yyyy*

Destination: CSMT

DFHZC5996E *date time applid* **CICS logic error**

Explanation: CICS has rejected an INSTALL request because the resource type code in the request is zero.

System action: CICS continues. A system dump is taken with dumpcode ZC5996. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZCQIS

XMEOUT Parameters: *date, time,applid*

Destination: CSMT

DFHZC5997E *date time applid* **CICS logic error**

Explanation: CICS has rejected an INQUIRE request because no TCT entry was passed.

System action: CICS continues. A system dump is taken with dumpcode ZC5997. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZCQIQ

XMEOUT Parameters: *date, time,applid*

Destination: CSMT

DFHZC5998E *date time applid* **Install specified a resource that cannot be replaced**

Explanation: CICS rejected a DELETE request because the entry passed is of a type that cannot be deleted, for example, a non-VTAM terminal.

System action: CICS continues.

User response: The failing delete/replace was necessitated by an INSTALL request. Correct the resource type in that request.

Module: DFHZCQCH, DFHZCQDL

XMEOUT Parameters: *date, time,applid*

Destination: CSMT

DFHZC5999E *date time applid* **CICS logic error.**

Explanation: If DFHZCQCH issues this message, CICS has rejected a CATALOG request because the required entry parameter was not passed.

If DFHZCQDL issues this message, CICS has rejected a DELETE request because the required entry parameter was not passed.

System action: CICS continues. A system dump is taken with dumpcode ZC5999. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZCQCH, DFHZCQDL

XMEOUT Parameters: *date, time,applid*

Destination: CSMT

DFHZC6201E *applid* **CICS table builder services has detected a severe error in module *modname* code *X'code'*.**

Explanation: While executing a request, CICS table builder services detected a severe error. The error is identified by the error code *code* and the module *modname*.

System action: CICS rejects the request and takes a dump. CICS writes an exception trace record identified by *code*, then issues message DFHZC6208 either to the user of the CEDA transaction, or if the request did not originate from CEDA, to the CSMT transient data queue

User response: This failure indicates either an error in CICS, or a storage overlay. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHTBSB, DFHTBSD, DFHTBSBP, DFHTBDSP, DFHTBSL, DFHTBSLP, DFHTBSS

DFHXC6202E • DFHXC6208E

XMEOUT Parameters: *applid, modname, X'code'*

Destination: Console

DFHXC6202E *date time applid* **Pattern pattern not valid for builder**

Explanation: While executing a request, CICS table builder services has detected that the pattern *pattern* cites a builder that is not declared with DFHBSHDR(ENTRY). *pattern* is the name of the pattern as coded in the DFHBSPTTE macro.

System action: CICS rejects the request. A system dump is taken with dumpcode ZC6202. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHTBSB, DFHTBSL, DFHTBSQ, DFHTBSR

XMEOUT Parameters: *date, time, applid, pattern*

Destination: CSMT

DFHXC6204E *date time applid* **Illegal subpattern definition pattern**

Explanation: While executing a request, CICS table builder services has detected that the subpattern *pattern* cites a builder that is not declared with DFHBSHDR(ENTRY). *pattern* is the name of the subpattern as coded in the DFHBSPTTE macro.

System action: CICS rejects the request. A system dump is taken with dumpcode ZC6204. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHTBSBP, DFHTBSDP

XMEOUT Parameters: *date, time, applid, pattern*

Destination: CSMT

DFHXC6205E *date time applid* **Illegal subpattern definition pattern**

Explanation: While executing a request, CICS table builder services has detected that the subpattern *pattern* is invalidly defined. *pattern* is the name of the subpattern as coded in the DFHBSPTTE macro.

System action: CICS rejects the request. A system dump is taken with dumpcode ZC6205. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem*

Determination Guide for guidance on how to proceed.

Module: DFHTBSBP, DFHTBSDP

XMEOUT Parameters: *date, time, applid, pattern*

Destination: CSMT

DFHXC6206E *date time applid* **Pattern pattern not valid for destroy**

Explanation: While executing a DESTROY request, CICS table builder services has detected that the pattern *pattern* is not valid for a DESTROY request. *pattern* is the name of the pattern as coded in the DFHBSPTTE macro.

System action: CICS rejects the request. A system dump is taken with dumpcode ZC6206. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHTBSD

XMEOUT Parameters: *date, time, applid, pattern*

Destination: CSMT

DFHXC6207E *date time applid* **Catalog key too long or zero. Pattern pattern**

Explanation: While executing a request, CICS table builder services has detected that builder cited in the pattern *pattern* has returned an invalid CC key on MAKEKEY. *pattern* is the name of the pattern as coded in the DFHBSPTTE macro.

System action: CICS rejects the request. A system dump is taken with dumpcode ZC6207. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHTBSBP, DFHTBSDP, DFHTBSL

XMEOUT Parameters: *date, time, applid, pattern*

Destination: CSMT

DFHXC6208E *date time applid* **CICS table builder services has detected a severe error in module modname, code(X'code')**

Explanation: While executing a request, CICS table builder services detected a severe error. The error is identified by the error code *code* and the module *modname*.

System action: CICS rejects the request. It has already issued message DFHXC6201, written an

exception trace record identified by *code*, and taken a dump.

User response: This failure indicates either an error in CICS, or a storage overlay. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHTBSB, DFHTBSD, DFHTBSBP, DFHTBSDP, DFHTBSL, DFHTBSLP, DFHTBSS

XMEOUT Parameters: *date, time, applid, modname, X'code'*

Destination: CSMT

DFHZC6209E *date time applid Invalid ZC catalog request code xxxx*

Explanation: While executing a request, CICS table builder services has detected that the code, *xxxx*, for a catalog request is invalid.

System action: CICS rejects the request. A system dump is taken with dumpcode ZC6209. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHTBSL

XMEOUT Parameters: *date, time, applid, xxxx*

Destination: CSMT

DFHZC6210E *date time applid Table builder could not obtain storage for control block code X'code', module modname.*

Explanation: While executing a BUILD, a DESTROY or a RESTORE request, CICS table builder services could not obtain storage for a control block. The control block could be a RRAB, a RABN, an action_block, a recovery record, or a recovery segment. The error code *code* identifies the element that could not be obtained by the module *modname*.

System action: CICS rejects the request. It has already written an exception trace record identified by *code*.

User response: This failure may be a symptom of a expanded dynamic storage area (EDSA) that is too small. If so, you can solve the problem by increasing the size of your CICS region. For guidance on estimating the size of the DSA and the CICS region, see the *CICS System Definition Guide* and the *CICS Performance Guide*. You can identify which control block that could not be obtained by formatting the exception trace record.

The failure may also be caused by an error in another

transaction, for example, a looping program with an EXEC CICS GETMAIN within the loop.

Module: DFHTBSB, DFHTBSD, DFHTBSL, DFHTBSBP, DFHTBSDP, DFHTBSLP, DFHTBSS

XMEOUT Parameters: *date, time, applid, X'code', modname*

Destination: CSMT

DFHZC6212E *date time applid Level mismatch with catalog record. DFHBS xxx*

Explanation: While executing a request during a warm or emergency start, CICS Table Builder Services has detected that the CC record is not compatible with the pattern it names. *xxx* is the builder ID.

System action: CICS rejects the request.

User response: The CC record was probably written by an earlier level of CICS. That is, you have applied one or more PTF maintenance fixes to the system since the CC record was written. Assuming this is the case, you must either

- Cold or initial start CICS, or
- Remove the maintenance to enable a warm start or emergency restart.

Module: DFHTBSR, DFHTBSRP

XMEOUT Parameters: *date, time, applid, xxx*

Destination: CSMT

DFHZC6213E *date time applid Recovery record abandoned. Key is key*

Explanation: While processing a RESTORE request, CICS Table Builder Services detected an error reported in a previous message. *key* is the catalog key for the abandoned record, or, if the key is unknown to CICS, *key* is the single character ?.

System action: See the previously issued message for the cause of the problem, and follow the recommended user action.

Module: DFHTBSR

XMEOUT Parameters: *date, time, applid, key*

Destination: CSMT

DFHZC6214E *date time applid Unable to obtain recovery record storage*

Explanation: While processing a CATALOG request, CICS Table Builder Services could not obtain recovery record storage.

System action: CICS rejects the request.

User response: This failure may be a symptom of a dynamic storage area (DSA) that is too small. If so, you can solve the problem by increasing the size of your

CICS region. For advice on estimating the size of the DSA and the CICS region, see the *CICS System Definition Guide* and the *CICS Performance Guide*.

The failure may also be caused by an error in another transaction, for example, a looping program with an EXEC CICS GETMAIN within the loop.

Module: DFHTBSLP

XMEOUT Parameters: *date, time, applid*

Destination: CSMT

DFHZC6216E *date time applid* **Install for *restype1* (*resname1*) failed and caused the backout of the whole set of RDO resources for *restype2* (*resname2*).**

Explanation: The RDO definition for a resource of type *restype1* named *resname1* could not be installed because of an error. This causes the installable set of RDO definitions associated with *restype2* named *resname2* to be backed out.

The resource type of the definition that failed *restype1* can be connection, session, modegroup, pool, or pooled terminal. The resource type of the associated definition *restype2* can be connection, or a pool_name for pipeline terminals.

System action: CICS backs out the installation of the set of associated RDO definitions and continues without them.

User response: Correct the reason for the failure of the definition, identified by previous DFHZXnnnn messages, and then retry the install.

Module: DFHTBSB

XMEOUT Parameters: *date, time, applid, restype1, resname1, restype2, resname2*

Destination: CSMT

DFHZC6301E *date time applid* **Install for *tttt* failed. Duplicate netname *netname* for resource *rrrr* found.**

Explanation: A resource *tttt* was being installed but was found to have the same network name *netname* as resource *rrrr*.

System action: The resource is not installed, CICS continues.

User response: If you want the definitions to be installed, use CEDA to correct the network name and reinstall the definition.

Module: DFHBSTZV

XMEOUT Parameters: *date, time, applid, tttt, netname, rrrr*

Destination: CSMT

DFHZC6302E *date time applid* **Install for connection *cccc* failed. Duplicate netname *netname* for resource *rrrr* found.**

Explanation: A connection *cccc* was being installed but was found to have the same network name *netname* as resource *rrrr*.

System action: The resource is not installed, CICS continues.

User response: You cannot have an APPC connection with the same network name as another APPC connection or an LU6.1 connection. That is, you cannot have more than one APPC connection between two systems and an APPC connection cannot be installed with an LU6.1 connection between two systems.

Neither APPC or LU6.1 network names can be the same as a terminal's network name.

Also you cannot have an IRC (or XM) connection with the same network name as another IRC (or XM) connection. However, an IRC network name can be the same as any VTAM network name (APPC or LU61 connection or terminal).

If you want the definitions to be installed, use CEDA to correct the network name and then reinstall the definition.

If you need to replace a connection with a different network name, it must have the same connection name as the one you are replacing.

Module: DFHBSS

XMEOUT Parameters: *date, time, applid, cccc, netname, rrrr*

Destination: CSMT

DFHZC6303E *date time applid* **Install for *tttt* failed. Duplicate netname *netname* found.**

Explanation: A resource *tttt* was being installed but was found to have a duplicate network name *netname*.

This message occurs

- If the duplicate NETNAME occurred in the same group as this definition, or
- If two CEDA transactions were run at the same time and the other CEDA transaction added a NETNAME between the BUILD and CONNECT routines of DFHBSTZV.

System action: The resource is not installed; CICS continues.

User response: If you want the definitions to be installed, use CEDA to correct the network name and then reinstall the definition.

Module: DFHBSTZV

XMEOUT Parameters: *date, time, applid, tttt, netname*

Destination: CSMT

DFHZC6304W *date time applid* **Deletion of remote terminal *termid* failed because it is in use by another transaction.**

Explanation: CICS has issued a logoff transaction to the remote terminal *termid* but this terminal cannot be deleted because it is in use by another transaction.

System action: The remote terminal can be reused. CICS continues.

User response: This situation usually occurs because the remote CICS is under stress. Consider allocating more resources. For example, you might need to allocate more storage.

Module: DFHBSTZ

XMEOUT Parameters: *date, time, applid, termid*

Destination: CSMT

DFHZC6305E *date time applid* **Install for EXCI generic connection *cccc* failed. Duplicate EXCI generic connection *rrrr* found.**

Explanation: A connection *cccc* specifying protocol(*exci*) and conntype(*generic*) was being installed but an existing EXCI generic connection *rrrr* was found.

System action: The resource is not installed. CICS continues.

User response: There can be only one EXCI generic connection installed in a CICS system. Determine which EXCI generic connection definition is required and remove the duplicate definition.

If you need to replace the EXCI generic connection definition, it must have the same connection name as the one you are replacing.

Module: DFHBSS

XMEOUT Parameters: *date, time, applid, cccc, rrrr*

Destination: CSMT

DFHZC6307E *date time applid* **Install for connection *cccc* failed. Netname *netname* is the same as the generic resource name.**

Explanation: A connection *cccc* was being installed but the netname *netname* is the same as the generic resource name for this CICS (as defined in the SIT GRNAME parameter).

Communication within a SYSPLEX (intra-plex) must be done using member names.

System action: The resource is not installed, CICS continues.

User response: If this connection is for

communication within a sysplex, use CEDA to change the NETNAME to the member name of the connection with which you wish to communicate.

If this is for communication between two sysplexes, change the NETNAME to the generic resource name of the partner sysplex.

Module: DFHBSS

XMEOUT Parameters: *date, time, applid, cccc, netname*

Destination: CSMT

DFHZC6308E *date time applid* **Restore for connection *cccc* failed. Netname *netname* is the same as the generic resource name.**

Explanation: During an emergency or warm restart CICS tried to restore connection *cccc*. However its netname *netname* is the same as the generic resource name for this CICS (as defined in the GRNAME system initialization parameter).

This is probably because the GRNAME specified in the SIT has been changed. It should only be changed at INITIAL start time.

System action: Processing continues. The resource is not installed.

User response: If this connection is for communication within a sysplex, use CEDA to change the NETNAME to the member name of the connection with which you wish to communicate.

If this is for communication between two sysplexes, change the NETNAME to the generic resource name of the partner sysplex.

If you need to change the GRNAME parameter, remember to do so only during an INITIAL start.

Module: DFHBSS

XMEOUT Parameters: *date, time, applid, cccc, netname*

Destination: CSMT

DFHZC6312E *date time applid* **Install for connection *cccc* failed. An IPCONN with this name already exists and its applid is not *netname*.**

Explanation: A CONNECTION *cccc* install failed because there is already an IPCONN of this name installed in the system and its APPLID is not the same as the NETNAME *netname* of this CONNECTION. This is not permitted.

System action: The resource is not installed. CICS continues.

User response: An IPCONN and a CONNECTION of the same name must represent a link to the same system, so either the IPCONN APPLID or the

DFHZC6315E • DFHZC6334E

CONNECTION NETNAME is incorrect. Establish which of these is the case and re-install with the correct value.

Module: DFHBSS

XMEOUT Parameters: *date, time,applid, cccc, netname*

Destination: CSMT

DFHZC6315E *date time applid* **User userid is not authorized to install terminal *tttt* with preset security.**

Explanation: User *userid* was attempting to install terminal *tttt* but the *userid* does not have sufficient authority. This is because the terminal has preset authority (the definition for terminal *tttt* specifies a *userid* value.) Installing a resource with preset security requires special authorization.

System action: Resource security violation messages are logged to the CSCS transient data queue and to the system console. The resource is not installed. CICS continues.

User response: In order to install this resource, do one of the following

- Use the CESN transaction to sign on with a *userid* that is permitted to install terminals with preset security.
- Ask your security administrator to authorize *userid* to install terminals with preset security. See the *CICS System Definition Guide* for guidance.
- Remove the USERID specification from the resource definition and install the resource without preset security.

Module: DFHBSTS

XMEOUT Parameters: *date, time,applid, userid, tttt*

Destination: CSMT

DFHZC6330E *date time applid* **Install for *tttt* failed. LDCLIST parameter *ldclist* not found.**

Explanation: A resource *tttt* was being installed but was found to have an invalid LDCLIST *ldclist*.

System action: The resource is not installed, CICS continues.

User response: If you want the definition to be installed, use the DFHTCT TYPE=LDCLIST macro to define the listname.

Module: DFHBSTBL

XMEOUT Parameters: *date, time,applid, tttt, ldclist*

Destination: CSMT

DFHZC6331E *date time applid* **Install for connection *tttt* failed. Non-VTAM terminal with same name already exists.**

Explanation: A connection *tttt* was being installed but a non-VTAM terminal with the same name already exists.

System action: The resource is not installed; CICS continues.

User response: Change the name of the connection and reinstall.

Module: DFHBSS

XMEOUT Parameters: *date, time,applid, tttt*

Destination: CSMT

DFHZC6332E *date time applid* **Install for terminal *tttt* failed. Non-VTAM terminal with same name already exists.**

Explanation: A terminal *tttt* was being installed but a non-VTAM terminal with the same name already exists.

System action: The resource is not installed; CICS continues.

User response: Change the name of the terminal and reinstall.

Module: DFHBSTZ

XMEOUT Parameters: *date, time,applid, tttt*

Destination: CSMT

DFHZC6333E *date time applid* **INSTALL for *modename modename* failed. Zero sessions specified**

Explanation: CICS has not installed a mode group *modename* because the maximum number of sessions specified was 0. The CEDA SESSION MAXIMUM parameter cannot be set to 0, so this was possibly caused by a storage overwrite, or by an invalid builder parameter set being shipped into CICS.

System action: The install fails, but CICS continues.

User response: Find the offending builder parameter set and set ZC_MAXSESS_1 to a minimum value of 1.

Module: DFHBSM61

XMEOUT Parameters: *date, time,applid, modename*

Destination: CSMT

DFHZC6334E *date time applid* **Install for connection *tttt* failed. A session with the same name already exists.**

Explanation: A connection *tttt* was being installed but a session with the same name already exists.

System action: The resource is not installed; CICS continues.

User response: Change the name of the connection and reinstall.

Module: DFHBSS

XMEOUT Parameters: *date, time,applid, tttt*

Destination: CSMT

DFHZC6340E *date time applid* **CICS has detected an error in delete processing for *termid*.
Module name: *modname*.**

Explanation: CICS has found terminal input output areas (TIOAs) chained to a TCTTE during deletion of a terminal. This is a CICS logic error.

System action: A system dump is taken, the TCTTE is deleted and CICS continues. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

It would aid IBM support if you used the system dump to determine why TIOAs are still chained to the TCTTEs. The TIOAs are normally freemained before deletion.

Answers to the following questions would also be helpful

- Is this is a shipped TCTTE?
- Why is the TCTTE being deleted?
- Is the correct TCTTE being deleted?

Module: DFHBST

XMEOUT Parameters: *date, time,applid, termid, modname*

Destination: CADL

DFHZC6341E *date time applid* **Loop or ABEND has been detected in *inmodule* by module *bymodule*.**

Explanation: CICS has previously detected a loop or abend. Module *bymodule* called module *inmodule* which looped or abended.

System action: CICS issues message DFHZC0001 if an abend is detected or DFHZC0004 if a loop is detected. The install or delete being performed is backed out. CICS continues. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: See the associated message for more guidance.

Module: DFHBSM61 DFHBSTZS, DFHBSTZR

XMEOUT Parameters: *date, time,applid, inmodule, bymodule*

Destination: CADL

DFHZC6350I *date time applid* **The *type* session name BITMAP was corrupt and has been rebuilt. Error code: AP FB05.**

Explanation: A connection was being installed but the APPC or MRO session name BITMAP which is used to create a session name, was corrupt. The corrupt BITMAP has been rebuilt.

The APPC session name BITMAP is always used for an APPC session, however the MRO session name BITMAP is only used if the session name is prefixed with '<' or '>'.

System action: A dump is taken with dumpcode ZC6350. Trace point ID AP X'FB05 is produced. The install continues. CICS continues.

User response: Use the dump provided to determine the cause of the storage overwrite. See the *CICS Problem Determination Guide* for guidance on dealing with storage problems.

Module: DFHZGBM

XMEOUT Parameters: *date, time,applid, type*

Destination: CSMT

DFHZC6360W *date time applid* **A GETMAIN failed to obtain storage for a message set.**

Explanation: A ZCP install has failed. This would normally result in a message being issued. However, the GETMAIN attempting to obtain storage from the CDSA for use as a message area has failed. This means that there is no more free storage available in the CDSA.

System action: The message which should have reported the ZCP install failure cannot be issued. Subsequent messages also cannot be issued while there is no free storage available in the CDSA. However, subsequent messages can be issued if storage becomes available on subsequent GETMAIN attempts.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Use trace to determine the source of the problem. Trace point AP FCDD, the TBSM entry, gives the message number which should have been issued and the message insert data. Refer to the description of this message for further guidance.

Module: DFHBSTS, DFHBSTZO, DFHZATA2

XMEOUT Parameters: *date, time,applid*

Destination: CSMT

DFHZC6361E *date time applid {Install | Signon} for {netname | console |terminal }portname with userid userid failed because the preset userid is invalid.*

Explanation: The resource could not be installed or signed on with preset userid *userid* because the userid is not known to the external security manager (ESM).

System action: CICS continues.

User response: Correct the userid, or contact your security administrator to have the unknown userid added to your ESM. Then either reinstall the resource definition, or attempt to send a command to CICS via this console.

Module: DFHBSTS, DFHBSTZO

XMEOUT Parameters: *date, time,applid, {1=Install, 2=Signon}, {1=netname , 2=console , 3=terminal }, portname, userid*

Destination: CSMT

DFHZC6362E *date time applid {Install | Signon} for {netname | console |terminal }portname with userid userid failed because the preset userid has been revoked.*

Explanation: The resource could not be installed or signed on with preset userid *userid* because the userid has been revoked by the external security manager (ESM).

System action: CICS continues.

User response: Contact your security administrator, who can reauthorize the revoked userid by issuing the ALTUSER RESUME function. Then reinstall the resource definition or try another command from the affected console.

Module: DFHBSTS, DFHBSTZO

XMEOUT Parameters: *date, time,applid, {1=Install, 2=Signon}, {1=netname , 2=console , 3=terminal }, portname, userid*

Destination: CSMT

DFHZC6363E *date time applid {Install | Signon} for {netname | console |terminal }portname with userid userid failed because the preset userid's group access has been revoked.*

Explanation: The resource could not be installed or signed on with preset userid *userid* because the access of that userid to the group containing it has been revoked by the external security manager (ESM).

System action: CICS continues.

User response: Contact your security administrator who can restore the access of the preset userid to its

group by issuing the CONNECT RESUME function. Then reinstall the resource definition or try another command from the console.

Module: DFHBSTS, DFHBSTZO

XMEOUT Parameters: *date, time,applid, {1=Install, 2=Signon}, {1=netname , 2=console , 3=terminal }, portname, userid*

Destination: CSMT

DFHZC6364E *date time applid {Install | Signon} for {netname | console |terminal }portname with userid userid failed because the external security manager returned an unrecognized response.*

Explanation: The resource could not be installed or signed on with preset userid *userid* because of unexpected return codes from the external security manager (ESM).

System action: CICS continues. Either message DFHSN1401 or DFHSN1801 is issued.

User response: See the accompanying message for further guidance. Reinstall the resource definition or try another command from the console when you have corrected the problem.

Module: DFHBSTS, DFHBSTZO

XMEOUT Parameters: *date, time,applid, {1=Install, 2=Signon}, {1=netname , 2=console , 3=terminal }, portname, userid*

Destination: CSMT

DFHZC6365E *date time applid {Install | Signon} for {netname | console |terminal }portname with userid userid failed because the external security manager is inactive.*

Explanation: The resource could not be installed or signed on with preset userid *userid* because the external security manager (ESM) is no longer active.

System action: CICS continues.

User response: Contact your security administrator to restart the ESM. Reinstall the resource definition or try the command from a console again when the ESM is active again.

Module: DFHBSTS, DFHBSTZO

XMEOUT Parameters: *date, time,applid, {1=Install, 2=Signon}, {1=netname , 2=console , 3=terminal }, portname, userid*

Destination: CSMT

DFHZC6366E *date time applid {Install | Signon} for {netname | console |terminal }portname with userid userid failed because the userid is not authorized to access this CICS system.*

Explanation: The resource could not be installed or signed on with a preset userid because the preset userid is not authorized to use application *applid*.

System action: CICS continues.

User response: Contact your security administrator who can authorize the preset userid to access the application *applid* by issuing the PERMIT function for the APPL resource class. Then reinstall the resource definition or try the command again from the console.

Module: DFHBSTS, DFHBSTZO

XMEOUT Parameters: *date, time,applid, {1=Install, 2=Signon}, {1=netname , 2=console , 3=terminal }, portname, userid*

Destination: CSMT

DFHZC6367E *date time applid {Install | Signon} for {netname | console |terminal }termid with userid userid failed because the SECLABEL check failed.*

Explanation: The resource could not be installed or signed on with preset userid *userid* because the security label associated with the userid in the external security manager (ESM) does not have the necessary authority.

System action: CICS continues.

User response: Contact your security administrator to assign a new security label to the preset userid. Then reinstall the resource definition or try the command from the console again.

Module: DFHBSTS, DFHBSTZO

XMEOUT Parameters: *date, time,applid, {1=Install, 2=Signon}, {1=netname , 2=console , 3=terminal }, termid, userid*

Destination: CSMT

DFHZC6368E *date time applid {Install | Signon} for {netname | console | terminal }portname with userid userid failed because the external security manager is quiesced.*

Explanation: The resource could not be installed or signed on with preset userid *userid* because the external security manager (ESM) has been placed in a "tranquil" state and is not allowing new users to be added to the system.

System action: CICS continues.

User response: Contact your security administrator to establish when the ESM will be fully available again.

When it is, reinstall the resource definition or try the command from the console again.

Module: DFHBSTS, DFHBSTZO

XMEOUT Parameters: *date, time,applid, {1=Install, 2=Signon}, {1=netname , 2=console , 3= terminal }, portname, userid*

Destination: CSMT

DFHZC6369E *date time applid {Install | Signon} for {netname | console |terminal }portname failed because national language langcode is invalid.*

Explanation: The resource could not be installed or signed on because the national language *langcode* specified in the resource definition is not recognized.

System action: CICS continues.

User response: Change the national language on the resource definition to a valid value and reinstall the resource definition.

Module: DFHBSTS, DFHBSTZO, DFHZSGN

XMEOUT Parameters: *date, time,applid, {1=Install, 2=Signon}, {1=netname , 2=console , 3=terminal }, portname, langcode*

Destination: CSMT

DFHZC6370E *date time applid {Install | Signon} for {netname | console |terminal }portname failed because national language langcode is unavailable.*

Explanation: The resource could not be installed or signed on because the national language *langcode* specified in the resource definition is not supported in this run of CICS.

System action: CICS continues.

User response: Change the national language in the resource definition to one that has been initialized. Then reinstall the resource definition.

Module: DFHBSTS, DFHBSTZO, DFHZSGN

XMEOUT Parameters: *date, time,applid, {1=Install, 2=Signon}, {1=netname , 2=console , 3=terminal }, portname, langcode*

Destination: CSMT

DFHZC6371E *date time applid {Install | Signon} for {netname | console |terminal }portname with userid userid failed because the userid is not authorized to use this portname.*

Explanation: The resource could not be installed or signed on with preset userid *userid* because the specified userid is not authorized to use that resource.

System action: CICS continues. Either message DFHSN1401 or DFHSN1801 is issued.

User response: See the accompanying message for further guidance. Reinstall the resource definition or retry the command from the console when you have corrected the problem.

Module: DFHBSTS, DFHBSTZO

XMEOUT Parameters: *date, time, applid, {1=Install, 2=Signon}, {1=netname, 2=console, 3=terminal}, portname, userid*

Destination: CSMT

DFHXC6380E *date time applid* **Install for connection cccc failed. Netname *netname* is the same as the member name of a generic resource connection *grcon* which is already in use.**

Explanation: A connection *cccc* was being installed but the netname *netname* is the same as the member name of a generic resource connection *grcon* which is already in use.

System action: The resource is not installed. CICS continues.

User response: If the NETNAME is incorrect, use CEDA to change it. Alternatively if you wish to communicate with the generic resource member by its member name, discard the generic resource connection after ending the VTAM affinity and try again.

Module: DFHBSS

XMEOUT Parameters: *date, time, applid, cccc, netname, grcon*

Destination: CSMT

DFHXC6590I *date time applid termid tranid* **Node *netname* conversation restarted. *sense* ((*instance*)) Module name {DFHZXRC}}**

Explanation: The node specified has been switched to this system following an XRF takeover.

For the meaning of *sense*, see message DFHXC2400.

System action: Processing continues.

User response: None.

Module: DFHZXRC

XMEOUT Parameters: *date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZXRC, 2=DFHZXRC, 3=DFHZXRC, 4=DFHZXRC, 5=DFHZXRC}*

Destination: CSNE

DFHXC6591E *date time applid termid tranid* **Error processing XRF switch command. *sense* ((*instance*)) Module name {DFHZXRC}}**

Explanation: The terminal has been switched to this CICS system following an XRF takeover, but an error was encountered processing the response data.

For the meaning of *sense*, see message DFHXC2400.

System action: The state of the session at takeover is uncertain and the session is unbound in order to reset the states. The session is simlogged on, and proceeds as a normal emergency restart.

User response: Proceed as for a normal emergency restart.

Module: DFHZXRC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZXRC, 2=DFHZXRC, 3=DFHZXRC, 4=DFHZXRC, 5=DFHZXRC, 6=DFHZXRC, 7=DFHZXRC, 8=DFHZXRC, 9=DFHZXRC, 10=DFHZXRC, 11=DFHZXRC}*

Destination: CSNE

DFHXC6593I *date time applid termid tranid* **Node *netname* backup session started. *sense* ((*instance*)) Module name {DFHZOPX}}**

Explanation: Node *netname* has successfully issued an OPNDST OPTCD=BACKUP command to the connected LU.

For the meaning of *sense*, see message DFHXC2400.

System action: Processing continues.

User response: None.

Module: DFHZOPX

XMEOUT Parameters: *date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZOPX, 2=DFHZOPX}*

Destination: CSNE

DFHXC6594I *date time applid termid tranid* **Node *netname* backup session reset - active session ended. *sense* ((*instance*)) Module name {DFHZSCX}}**

Explanation: The backup system has received a "hierarchical reset" UNBIND on the backup session to the named terminal. This implies that the active session has ended normally.

For the meaning of *sense*, see message DFHXC2400.

System action: CLSDST the backup session.

User response: None.

Module: DFHZSCX

XMEOUT Parameters: *date, time, applid, termid, tranid,*

netname, sense, instance, {1=DFHZSCX}

Destination: CSNE

DFHZC6595I *date time applid termid tranid Node netname backup session not attempted. sense ((instance) Module name {DFHZOPN})*

Explanation: Before the OPNDST is issued, the backup system has abandoned the attempt to establish a backup session for one of the following reasons

- There is no XRF support in VTAM (TCTVXRFS), or
- the TCTTE is flagged as a secondary. This CICS receives the BIND, but does not send it (TCTE2RY), or
- the TCTTE indicates that the LOGMODE keyword was specified on the terminal definition.

For the meaning of *sense*, see message DFHZC2400.

System action: If this system takes over, the autoconnect process attempts to acquire a session. In this case, it probably takes longer for the session to become available for use.

User response: Do not attempt a backup session.

Rectify error, or downgrade the recovery option specified for this terminal.

Module: DFHZOPN

XMEOUT Parameters: *date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZOPN, 2=DFHZOPN, 3=DFHZOPN}*

Destination: CSNE

DFHZC6596 *applid CICS terminal control program cannot support XRF functions. sense ((instance) Module name: {DFHZSEX | DFHZSLS})*

Explanation: The VTAM ACB has been opened, and the function level of the terminal control program (ZCP) and VTAM has been examined. It has been determined that XRF terminal functions cannot be supported in this execution of CICS.

This can be because one of the DFHZCx modules, or the TCT, was assembled against a version of VTAM earlier than 3.1, or because the level of VTAM that has just been opened is pre-3.1.

For the meaning of *sense*, see message DFHZC2400.

System action: Processing continues. Processing continues, but no VTAM XRF functions can be supported.

User response: If VTAM XRF functions are required, check the assembly of each of the DFHZCx modules and the TCT.

If a pre-3.1 release of VTAM was used in the assembly

process, then a warning MNOTE will have been issued.

The relevant modules should then be reassembled against the correct level of VTAM.

If the assembly of all modules is correct, then the VTAM used in this execution is at a pre-3.1 level.

Module: DFHZSEX,DFHZSLS

XMEOUT Parameters: *applid, sense, instance, {1=DFHZSEX, 2=DFHZSLS}*

Destination: Console

DFHZC6598 *applid VTAM Shutdown in XRF Alternate system. CICS will abend. sense ((instance) Module name: {DFHZTPX})*

Explanation: The TPEND exit has been driven because VTAM has been shutdown. This is an XRF Alternate system and it cannot continue without VTAM.

For the meaning of *sense*, see message DFHZC2400.

System action: The system is abnormally terminated.

User response: Determine why and how VTAM was shutdown.

Module: DFHZTPX

XMEOUT Parameters: *applid, sense, instance, {1=DFHZTPX}*

Destination: Console

DFHZC6901W *date time applid Autoinstall BIND for NETNAME netname is invalid. Internal RC(X'response).*

Explanation: The bind passed for AUTOINSTALL of a resource has shown an error in the bind image check call. The fixed part of the BIND is printed (this is the part on which the validation code operates — see the *SNA Network Protocol Formats* for details of the BIND RU). The internal return code *X'code* identifies the location within the module that invalidated the BIND.

System action: CICS continues but the session is not installed. The request is rejected and message DFHZC2411 is issued. The terminal is not usable until a VTAM LOGOFF command is issued.

User response: Investigate the fixed part of the BIND data to determine the reason for the rejection. The internal return code gives more information that can be used by IBM to help you to determine the cause of the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZATA

XMEOUT Parameters: *date, time, applid, netname, X'response'*

Destination: CADL

DFHZC6902E *date time applid* **Autoinstall failed because no {terminal | console} models are defined.**

Explanation: An attempt was made to autoinstall either a VTAM device or a console; however, there are no appropriate autoinstall models defined.

System action: CICS processing continues, but the autoinstall logon attempt is rejected.

User response: Use CEDA to define autoinstall model(s). For further information, refer to the *CICS Resource Definition Guide*.

Module: DFHZATA, DFHZATA2

XMEOUT Parameters: *date, time, applid, {1=terminal, 2=console}*

Destination: CADL

DFHZC6903W *date time applid* **Autoinstall for resource resid, {netname | consolename} id using model model failed.**

Explanation: The connection or terminal or console build process failed. The reason is given in a following DFHZC59xx, DFHZC62xx or DFHZC63xx message referring to the same *resid*. These messages are followed by message DFHZC6942.

System action: Processing continues.

User response: Refer to following messages for further information.

Module: DFHZATA, DFHZATA2

XMEOUT Parameters: *date, time, applid, resource, resid, {1=netname, 2=consolename}, id, model*

Destination: CADL

DFHZC6904W *date time applid* **Autoinstall for {netname | consolename} id failed. CATA task abended (abend abend).**

Explanation: Transaction CATA was autoinstalling a terminal or console, *id*, when the task abended with abend *abend*. If the resource being autoinstalled was a terminal, then the issuing module was DFHZATA. Otherwise, the issuing module was DFHZATA2 if the resource was a console. The *id* can be either a netname or a consolename.

System action: CICS continues but the resource is not installed.

User response: Retry the logon attempt. If the abend indicates a TIMEOUT and this occurs frequently, increase the CATA DTIMOUT value. If you do not want the CATA transaction to time out, remove the DTIMOUT parameter from the CATA DEFINE TRANSACTION command. However, if you do this, and if the system is short on storage, a large number of CATA transactions

running at the same time with no other transactions present could cause a deadlock.

Module: DFHZATA, DFHZATA2

XMEOUT Parameters: *date, time, applid, {1=netname, 2=consolename}, id, abend*

Destination: CADL

DFHZC6905W *date time applid* **Autoinstall delete for resource resid, {netname | consolename} id failed. CATD task abended (abend abend).**

Explanation: Transaction CATD, program DFHZATD was deleting an autoinstalled *resource resid*, when the task abended with abend *abend*.

System action: CICS continues. If the resource still exists, it is reused next time the same TERMID or SYSID is used.

User response: See the description of abend *abend* for further guidance.

If the abend indicates a TIMEOUT and this occurs frequently, increase the CATD DTIMOUT value. If you do not want the CATD transaction to time out, remove the DTIMOUT parameter from the CATD DEFINE TRANSACTION command. However, a large number of CATD tasks running at the same time with no purgeable tasks present could cause a deadlock if the system is also short on storage.

Module: DFHZATD

XMEOUT Parameters: *date, time, applid, resource, resid, {1=netname, 2=consolename}, id, abend*

Destination: CADL

DFHZC6906 *date time applid* **Install or delete of remote terminal termid failed. transid task abended (abend abend).**

Explanation: One of the functions of DFHZATS (transaction CITS, CDTS, CMTS or CFTS) has abended with abend *abend*.

System action: CICS continues.

For CITS (remote install), if the remote terminal (skeleton) was actually built, CICS might use it.

For CDTS (remote delete), if the remote terminal (skeleton) has not been deleted, it might be reused.

For CMTS (remote mass delete), terminals which have not been deleted by CMTS might be deleted at a later stage.

For CFTS (remote mass flag), terminals which have been flagged for deletion might be deleted at a later stage. If any terminals have not been flagged, attempts might be made to reuse them. This can have unpredictable results.

User response: See the description of *abend abend* for further guidance.

The most likely reason for this message is a timeout of CITS or CDTS. In the case of CITS, reissue your transaction if necessary.

If the TIMEOUTs occur frequently, consider increasing the CITS or CDTS DTIMOUT values. If you do not want the transactions to time out, remove the DTIMOUT parameter from the CITS or CDTS DEFINE TRANSACTION command. However, a large number of CITS tasks running at the same time with no purgeable tasks present could cause a deadlock if the system is also short on storage.

Note that CFTS and CMTS do not have a DTIMOUT parameter and should not be given one because they only run once after a warm or emergency restart and should not be allowed to time out.

Module: DFHZATS

XMEOUT Parameters: *date, time, applid, termid, tranid, abend*

Destination: CADL

DFHZC6907I *date time applid* **Autoinstall starting for netname *netname*. Network qualified name is *netid.realnet*.**

Explanation: CICS has started to autoinstall a terminal or a connection. This message shows the *netname* by which CICS will know the device and network qualified name *netid.realnet* showing the origin of the resource.

System action: CICS continues.

User response: None. This message is for information only.

Module: DFHZATA

XMEOUT Parameters: *date, time, applid, netname, netid, realnet*

Destination: CADL

DFHZC6908I *date time applid* **Autoinstall in progress for netname *netname*. TN3270 IP address is *tnaddr*.**

Explanation: CICS is autoinstalling a terminal. This message shows the *netname* by which CICS will know the device and the TN3270 IP address, port number and host name (if present).

System action: CICS continues.

User response: None. This message is for information only.

Module: DFHZATA

XMEOUT Parameters: *date, time, applid, netname, tnaddr*

Destination: CADL

DFHZC6910W *date time applid* **Install for remote terminal *termid* failed.**

Explanation: An INSTALL for the remote terminal *termid* has failed. The reason for the failure is specified in associated DFHZC59xx and DFHZC62xx messages.

System action: DFHZATS terminates abnormally with a CICS transaction dump.

User response: See the associated messages for further guidance.

Module: DFHZATS

XMEOUT Parameters: *date, time, applid, termid*

Destination: CADL

DFHZC6911W *date time applid* **Delete for remote terminal *termid* failed.**

Explanation: A DELETE for remote terminal *termid* has failed. Possible causes are that the terminal has already been deleted or that it is in use by another task.

If this message is repeated a number of times, there could be a more serious problem.

System action: If the message is associated with message DFHZC6912, CICS continues normally. If message DFHZC6912 is not issued, DFHZATS is abnormally terminated with a transaction dump.

User response: If the message is associated with message DFHZC6912, no action is necessary. If DFHZC6912 is not issued, see the associated DFHZC59xx, DFHZC62xx and DFHZC63xx messages for the reason for the DELETE failure.

Module: DFHZATS

XMEOUT Parameters: *date, time, applid, termid*

Destination: CADL

DFHZC6912I *date time applid* **Unable to delete remote terminal.**

Explanation: This message is issued during a mass delete of remote terminals following a warm or emergency restart. A terminal which had been flagged for deletion could not be deleted. The most likely explanation is that the terminal has already been deleted by another task.

An associated DFHZC6911 message gives the identity of the terminal. This might be associated with one or more DFHZC59xx and DFHZC62xx messages giving the reason for the failure.

System action: Processing continues normally.

User response: See the associated messages for further information.

DFHZC6913I • DFHZC6921W

Module: DFHZATS

XMEOUT Parameters: *date, time,applid*

Destination: CADL

DFHZC6913I *date time applid* **Remote delete of terminal *termid* failed. Terminal not found.**

Explanation: A remote DELETE has been attempted for a terminal which has already been deleted by another task.

System action: Processing continues normally.

User response: None.

Module: DFHZATS

XMEOUT Parameters: *date, time,applid, termid*

Destination: CADL

DFHZC6914E *date time applid* **Autoinstall for resource *termid*, {*netname* / *consolename*} *id* failed. Bad Return Code (RC = *X'retcode'*) from an internal function call.**

Explanation: The TCTTE build process failed due to the failure of an internal function call.

System action: The terminal autoinstall process fails. CICS processing continues.

User response: Retry the logon attempt.

Module: DFHZATA, DFHZATA2

XMEOUT Parameters: *date, time,applid, termid, {1=*netname*,2=*consolename*}, id, X'retcode'*

Destination: CADL

DFHZC6915E *date time applid* **Unable to sign off remote terminal *termid*. Bad Return Code (RC = *X'SNUS_RESPONSE'*) from signon domain call.**

Explanation: An unexpected response (INVALID, DISASTER or EXCEPTION) has been received on a call by DFHZATS to function SIGNOFF_TERMINAL_USER during sign-off processing for a remote terminal session running under CRTE.

System action: The terminal sign-off process fails to complete and the terminal user remains signed on. CICS processing continues.

User response: See the related message produced by the domain that detected the original error.

Module: DFHZATS

XMEOUT Parameters: *date, time,applid, termid, X'SNUS_RESPONSE'*

Destination: CADL

DFHZC6920E *date time applid* **APPC autoinstall for NETNAME *netname* failed. RC *x***

Explanation: An autoinstall attempt to install APPC NETNAME *netname* has failed. The autoinstall program call to the autoinstall control program failed with return code *x*.

The return codes are mapped from the program manager LINK_URM response and reason. More precise reasons for failure can be obtained from trace point PG 0A02.

System action: CICS continues.

User response: The appropriate response depends on the return code as follows

- 1 The user exit program should be linked with AMODE(31). Ensure that the user exit is linked to the correct AMODE.
- 2 The user exit program has no PPT entry. Ensure that the PPT entry for the user exit program exists and is valid.
- 3 The user exit program could not be loaded. Ensure that the user exit program is contained in one of the data sets concatenated in the DFHRPL DD statement and has the correct name.
- 4 The user exit program has abended. This is a possible error within the user exit program. Check for any abend codes that may have been issued.
- 5 Loading of the user exit program failed for some other reason. Check the DFHPGLU exit trace entry (PG 0A02) to see why the program manager was unable to load the program.

Module: DFHZGAI

XMEOUT Parameters: *date, time,applid, netname, x*

Destination: CADL

DFHZC6921W *date time applid* **Autoinstall for NETNAME *netname* has been disallowed by the autoinstall control program. Code *X'code'***

Explanation: An APPC connection not known to CICS has attempted to connect to CICS. However, the autoinstall control program has given a nonzero return code indicating that the install cannot go ahead.

If you do not support APPC autoinstall, the autoinstall control program (DFHZATDX is the default name) automatically returns a nonzero return code to disallow this function.

System action: The exception trace entry *code* shows the parameter list for the autoinstall control program. The session is terminated. CICS continues.

User response: The failure code *X'code* is as follows

X'FA07 If APPC autoinstall is not supported, use the *netname* to determine which device is attempting autoinstall.

If APPC autoinstall is supported, examine the autoinstall control program to determine why it has not set the return code to allow the install.

Module: DFHZGAI

XMEOUT Parameters: *date, time, applid, netname, X'code'*

Destination: CADL

DFHZC6922E *date time applid* **Parameter list error during autoinstall for NETNAME**
netname. Code X'code'

Explanation: An APPC connection not known to CICS has attempted to connect to CICS. However, the autoinstall control program has returned an invalid parameter, or a parameter that has led to an invalid template being used.

System action: The exception trace entry *code* shows the parameter list for the autoinstall control program. The session is terminated. CICS continues.

User response: The failure code *X'code* is one of the following

X'FA08 No netname or sysid was supplied for the template. Change the autoinstall control program to supply either the netname or the sysid.

X'FA09 The sysid for the new connection has invalid characters. It can only contain A-Z a-z 0-9 and £#@ (where £ is X'5B) Redefine the connection name in the autoinstall control program.

X'FA0A
The sysid for the new connection already exists. Change the autoinstall control program to supply a unique name.

X'FA0B
CICS is unable to locate the supplied template netname. Change the autoinstall control program to supply the correct template name, or use CEDA to install the template connection.

X'FA0C
CICS is unable to locate the supplied template sysid. Change the autoinstall control program to supply the correct template sysid or use CEDA to install the template connection.

X'FA0D
The template is not an APPC connection. Change the autoinstall control program to supply the correct template name, or use CEDA to reinstall the template correctly.

X'FA0E

The bind indicates that a parallel session connection is required. The template is a single session connection. Change the autoinstall control program to supply the correct template name, or use CEDA to reinstall the template correctly.

X'FA0F The bind indicates that a single session connection is required. The template is a parallel session connection. Change the autoinstall control program to supply the correct template name or use CEDA to reinstall the template correctly.

X'FA10 The modename in the bind does not match the modename in the connection.

For parallel sessions, the SNASVCMG modegroup is missing. The install for the template may have failed - check for any CADL messages mentioning the template name. The template connection may have been corrupted. Try and re-install the template.

For single sessions, the user modegroup name does not match. Change the autoinstall control program to supply the correct template name or use CEDA to reinstall the template correctly.

X'FA11 The program that attempted to INQUIRE on the template has detected an error in the template and is unable to create a BPS with which to install the new connection. This problem may be caused by a failure in the initial install of the template. Check the console and CADL log to determine whether the template installed correctly. Also, use CEMT to ensure that the CONNECTION is correct.

X'FA12 The program that attempted to INQUIRE on a user modegroup for the named template has detected an error in the template and is unable to create a BPS with which to install a user modegroup. This problem may be caused by a failure in the initial install of the template. Check the console and CADL log to determine whether the template installed correctly. Also use CEMT to ensure that the MODEGROUP is correct.

X'FA13 The template connection has no user modegroup. This problem may be caused by a failure in the initial install of the template. Check the console and the CADL log to determine whether the template installed correctly. Also, use CEMT to ensure that the MODEGROUP is correct.

X'FA14 The template connection is out of service so this install cannot continue. If the install should have been allowed to continue, put the relevant template connection INSERVICE using CEMT.

X'FA15 The incoming bind user data does not have a PLUNAME Network Name subfield (id 04). This is required and should have been supplied by the PLU.

X'FA16 The incoming bind user data does not have a MODENAME Network Name subfield (id 02). This is required and should have been supplied by the PLU.

Module: DFHZGAI

XMEOUT Parameters: *date, time, applid, netname, X'code'*

Destination: CADL

DFHZC6923E *date time applid* **Unacceptable bind parameter during autoinstall for NETNAME *netname*. Code *X'code'***

Explanation: CICS has received a BIND from an unknown APPC node. The autoinstall process was initiated, but an invalid bind parameter has been detected. The parameter in error is indicated by the failure code *X'code* which is one of the following

X'FA18 There was no session instance ID field in the bind user data.

X'FA19 There was no primary logical unit (PLU) name in the bind user data.

X'FA1A
The PLU name in the bind user data is the same as the LU name of this CICS.

X'FA1B
Security information (an encryption seed) was expected, but not present, in the bind user data.

X'FA1C
Security information (an encryption seed) was found in the bind user data but its length was too high for it to be valid.

X'FA1D
Security information (an encryption seed) was found in the bind user data when none was expected.

X'FA1E
The received bind indicated that it was not negotiable. This is not acceptable for an APPC connection.

X'FA1F The received bind specified a primary RU size of zero.

X'FA20 The received bind specified a secondary RU size of zero.

X'FA21 The received bind contained inconsistent access security indicators.

X'FA22 Two security information fields (seed and

nonce field) were found in the received BIND where only one was expected.

X'FA23 The received BIND contained a nonce field with an incorrect length.

X'FA24 The received BIND did not contain a nonce field.

X'FA25 The received BINDs security mechanisms field length was smaller than the minimum defined by the Architecture.

X'FA26 The received BINDs security mechanisms field contained an invalid length for the mechanism identifier field.

System action: The exception trace entry with trace point ID 'AP xxxx' (where xxxx is *X'code*) shows the bind that was received. The session is terminated. CICS continues.

User response: Change the definitions on the connecting LU so that the bind parameters are acceptable to CICS.

Module: DFHZGAI

XMEOUT Parameters: *date, time, applid, netname, X'code'*

Destination: CADL

DFHZC6935I *date time applid* **Autoinstall for *restype resid* with *{netname | consolename}* id using model or template *model* successful.**

Explanation: CICS has successfully installed resource *restype resid*, with id *id*, using model or template *model*. The *restype* can be TERMINAL or CONNECTION or CONSOLE depending on whether a terminal, an APPC connection, or a console has just been autoinstalled.

System action: CICS continues.

User response: None.

Module: DFHZATA, DFHZATA2

XMEOUT Parameters: *date, time, applid, restype, resid, {1=netname, 2=consolename}, id, model*

Destination: CADL

DFHZC6936I *date time applid* **Autoinstall for NETNAME *netname*, model *modelname* in MTS control vector not known to CICS.**

Explanation: The VTAM MTS control vector contained a model name *modelname* not defined to CICS.

System action: CICS continues. This message is informational.

User response: There are four possible ways of correcting this problem

- Use the CEDA transaction to define and install the autoinstall model
- Change the VTAM MTS MDLTAB MODEL= entry to the name of an existing autoinstall model.
- Logon to CICS with a MODEL= parameter that defines an existing autoinstall model.
- Code an Autoinstall User Program. Examples are given in the Customization Guide in the Sample Programs and Copybooks section.

Module: DFHZATA

XMEOUT Parameters: *date, time, applid, netname, modelname*

Destination: CADL

DFHZC6937I *date time applid* **Autoinstall for NETNAME netname, MTS model modelname and bind image mismatch.**

Explanation: An autoinstall attempt occurred using the modelname printed. The MODEL BIND (from the CICS model definition) did not match with the incoming bind in CINIT. The MISMATCH_BITS show which bind bits did not match.

System action: CICS continues.

User response: There are four possible ways of correcting this problem

- Change the CICS autoinstall MODEL *modelname* to produce a bind that matches the incoming CINIT.
- Change the MTS MDLTAB MODEL= entry to a model name defined to CICS whose bind matches the CINIT defined in the LOGMODE for this terminal.
- Change the VTAM LOGMODE for this terminal to match the chosen CICS MODEL_BIND.
- Code an autoinstall user program. Examples are given in the Sample Programs and Copybooks section of the *CICS Customization Guide*.

Module: DFHZATA

XMEOUT Parameters: *date, time, applid, netname, modelname*

Destination: CADL

DFHZC6939W *date time applid* **Autoinstall for NETNAME netname, Invalid length nn found in cinit control vector at offset offset**

Explanation: CICS verification checks on the format of the control vectors in the CINIT have failed.

offset indicates the first point of failure. This is either a length field greater than 128, or a length field which would cause CICS to overrun the end of a CINIT vector or subvector.

This is either due to incorrect format of the CINIT RU (and therefore probably a VTAM logic error), or due to

incorrect parsing of the CINIT RU by DFHZATD, which is a CICS logic error.

System action: CICS continues. The logon request is rejected.

User response: Inspect the format of the CINIT RU as captured by the autoinstall program for all rejected logon requests. The first point of failure may be at *offset* or before it since CICS verification checks are permissive.

If the format is incorrect, the origin of the invalid CINIT should be tracked and the problem resolved there.

If the format is correct, this is a CICS logic error. In this case you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZATA

XMEOUT Parameters: *date, time, applid, netname, nn, offset*

Destination: CADL

DFHZC6942W *date time applid* **Autoinstall for resource resid failed.**

Explanation: An AUTOINSTALL attempt to install *resource resid* has failed.

System action: CICS continues.

User response: For the cause of the failure, look for a previous message containing the same *resid*.

Module: DFHZATA, DFHZATA2

XMEOUT Parameters: *date, time, applid, resource, resid*

Destination: CADL

DFHZC6943W *date time applid* **Autoinstall delete for resource resid, {netname | consolename} id failed.**

Explanation: An AUTOINSTALL attempt to delete *resource resid* has failed.

System action: CICS continues.

User response: For the cause of the failure, look for a previous message containing the same *resid*.

Module: DFHZATD

XMEOUT Parameters: *date, time, applid, resource, resid, {1=netname, 2=consolename}, id*

Destination: CADL

DFHZC6944W *date time applid* **Autoinstall for**
{netname | consolename} id failed. RC x

Explanation: An autoinstall attempt to install terminal *id* has failed. The autoinstall program call to the user exit program failed with return code *x*. The *id* is either a netname or a consolename.

System action: CICS continues.

User response: Possible causes of the problem and an indication of how to solve them are given in the following list of return code meanings

Return code

Meaning and solution

- 1 The user exit program should be linked with AMODE(31). Ensure that the user exit is linked to the correct AMODE.
- 2 The user exit program has no PPT entry. Ensure that the PPT entry for the user exit program exists and is valid.
- 3 The user exit program could not be loaded. Ensure that the user exit program is contained in one of the data sets concatenated in the DFHRPL DD statement and has the correct name.
- 4 The user exit program has abended. This is a possible error within the user exit program. Check for any abend codes that may have been issued.

Module: DFHZATA, DFHZATA2

XMEOUT Parameters: *date, time, applid, {1=netname, 2=consolename}, id, x*

Destination: CADL

DFHZC6945W *date time applid* **Autoinstall delete for**
{netname | consolename} id failed. RC x

Explanation: An autoinstall attempt to install resource *id* has failed. The issuing module, either DFHZATA or DFHZATA2, called the user exit program for DELETE but the user exit failed for reasons given in return code *x*. If the resource being installed was a terminal, the issuing module was DFHZATA. Otherwise, if a console was being installed, DFHZATA2 was the issuing module.

System action: CICS continues.

User response: Possible causes of the problem and an indication of how to solve them are given in the following list of return code meanings

Return code

Meaning and solution

- 1 The user exit program should be linked with AMODE(31). Ensure that the user exit is linked to the correct AMODE.

- 2 The user exit program has no PPT entry. Ensure that the PPT entry for the user exit program exists and is valid.

DFHZC6958W *date time applid* **Autoinstall for**
{netname | consolename} id, resource
X'termid' failed. {RESOURCE | PRINTER
| ALTPRINTER} ID is invalid. RC=n.

Explanation: The *RESOURCE*, *PRINTER*, or *ALTPRINTER* ID supplied by the AUTOINSTALL exit program is invalid. The return code *n* can be one of the following

- | | |
|----------|-----------------------------|
| n | Meaning |
| 1 | Invalid blank in column one |
| 2 | Invalid imbedded blank |

3 Invalid character used.

System action: CICS continues but does not install the object.

User response: Change the AUTOINSTALL exit program to create IDs that contain only valid characters. These are specified in the *CICS Resource Definition Guide*.

Module: DFHZATA, DFHZATA2

XMEOUT Parameters: *date, time, applid, {1=netname, 2=consolename}, id, X'termid', {1=RESOURCE, 2=PRINTER, 3=ALTPRINTER}, n*

Destination: CADL

DFHZC6966I *date time applid* **Autoinstall delete for** *restype resid* **with** *{netname | consolename}* *id* **was successful.**

Explanation: CICS has successfully deleted the autoinstalled resource *restype resid*. The *restype* can be a terminal, an APPC connection, or a console.

System action: CICS continues.

User response: None.

Module: DFHZATD

XMEOUT Parameters: *date, time, applid, restype, resid, {1=netname, 2=consolename}, id*

Destination: CADL

DFHZC6987W *date time applid* **Autoinstall best failure for NETNAME** *netname* **was model** *model*.

Explanation: An autoinstall attempt has failed for lack of an exact match.

netname is the netname of the LU which failed to logon,

model is the name of the model that gave the best failure (that is, the one that had the fewest bits different from the BIND image supplied by VTAM).

The following associated information is also written to CADL

xxxxxxx... is a string of hexadecimal digits, where *xx* represents one byte, and each byte position represents the corresponding byte position in the BIND image.

CINIT BIND:xxxxxxx is the bind image supplied by VTAM.

MODEL BIND:xxxxxxx is the best model.

MISMATCH BITS: xxxxxxxx represents a comparison of the relevant bits from above. A bit set to '1' indicates a mismatch in that position between the BIND image from VTAM and the BIND image associated with the model.

System action: CICS continues.

User response:

1. Determine whether the model *model* is suitable. If there are several models which have options, such as TRANSECKEYS, then only the first such model is named in the above message. It will be up to the user-program to make the choice, when the logmode table entry is corrected.
2. Identify the entry in the VTAM logmode table that is being used.
3. Check that this logmode table entry is not successfully in use with other applications, so that to change it might cause this other use of it to fail.
4. Amend the logmode table entry by switching the bits corresponding to '1' bits in the mismatch string. That is, if the bit in the VTAM bind image corresponding to the bit position set to '1' in xxxxxxxx... is '1', set it to '0'. If it is '0', set it to '1'.

For further information, refer to the *CICS Customization Guide*.

More on the meaning of the various bits in a bind image may be found in *ACF/VTAM Programming manual*, (SC27-0611).

Details of the preparation of VTAM logmode table entries are given in *ACF/VTAM Customization manual*, (SC27-0613).

Explanation: The task to be detached did not completely process the inbound data chain.

System action: Purging of data is done until

end-of-chain (EOC) or CANCEL has been received.

User response: None.

Module: DFHZDET

Destination: Terminal End User

DFHZNnnnn messages

DFHZN2130 *date time applid* **A unit of work has been shunted but the connection with the remote system does not support the shunt protocols. Resources on the remote system may be out of sync with those on this CICS after the UOW is resynchronized. Failure date mm/dd/yy failure time hh:mm:ss remote system netname transaction tranid task number trannum operator terminal termid user userid network UOW netuowid local UOW X'localuow'.**

Explanation: This message is preceded by message DFHAC2231. An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. The coordinator of the syncpoint is not this CICS system but is remote.

Transaction *tranid* has lost contact with its coordinator system during the indoubt period.

System action: In accordance with the transaction definition, the unit of work is not completed. It is allowed to wait for resynchronization with the coordinator system. The transaction is abnormally terminated with abend code ASP1. The unit of work is shunted to await the return of the coordinator system.

As part of this processing, CICS has attempted to pass on the shunt request to another partner system. However, this partner does not support the shunting protocols, and so this partner may backout or commit changes to its resources independently of this shunted unit of work.

User response: Following resynchronization with the coordinator system, determine whether the remote function shipped resources are out of synchronization. The action to take depends on local procedures and the design of the application program. For example, it may be possible to rerun the application but only making updates to remote resources. Refer to the *CICS Intercommunication Guide* for information on design considerations in a distributed environment.

Module: DFHCR2U

XMEOUT Parameters: *date, time,applid, mm/dd/yy, hh:mm:ss, netname, tranid,trannum, termid, userid, netuowid, X'localuow'*

Destination: CSMT

DFHZN2131 *date time applid* **Intersystem session failure during CICS synclevel one commit. Local resources may be out of sync with those on the remote system. Failure date mm/dd/yy failure time hh:mm:ss remote system netname transaction tranid task number trannum operator terminal termid user userid network UOW netuowid local UOW X'localuowid'.**

Explanation: A CICS application has been using APPC synclevel 1 to process remote function shipped resources. The application took a syncpoint, either implicitly or explicitly, and this has caused all local resources and synclevel 2 partners to be committed. However, a session failure occurred at a critical time during the synclevel 1 commit processing, and the synclevel 1 function shipped resources may have committed successfully or may have backed out.

System action: CICS synclevel 1 commit processing continues, with the intention of committing as many synclevel 1 resources as possible. For APPC synclevel 1, CICS does not attempt to resolve the situation any further.

On completion of the syncpoint, CICS abends the user task.

User response: Determine whether the remote function shipped resources are out of synchronization. The action to take depends on local procedures and the design of the application program. For example, it may be possible to rerun the application but only making updates to remote resources. Refer to the *CICS Intercommunication Guide* for information on design considerations in a distributed environment.

Module: DFHCR2U

XMEOUT Parameters: *date, time,applid, mm/dd/yy, hh:mm:ss, netname, tranid,trannum, termid, userid, netuowid, X'localuowid'*

Destination: CSMT

DFHZN2132 *date time applid* **Rollback received in response to CICS synclevel one commit. Local resources are out of sync with those on the remote system. Failure date mm/dd/yy failure time hh:mm:ss remote system netname transaction tranid task number trannum operator terminal termid user userid network UOW netuowid local UOW X'localuowid'.**

Explanation: A CICS application has been using APPC synclevel 1 to process remote function shipped resources. The application took a syncpoint, either implicitly or explicitly, and this has caused all local resources and synclevel 2 partners to be committed. However, when a commit message was sent to a synclevel 1 function shipped resource, the resource voted to backout.

System action: Synclevel 1 commit processing continues with the intention of committing as many synclevel 1 resources as possible. For APPC synclevel 1, CICS does not attempt to resolve the situation any further.

On completion of the syncpoint, CICS abends the user task.

User response: The action to take depends on local procedures and the design of the application program. For example, it may be possible to rerun the application but only making updates to remote resources. Refer to the *CICS Intercommunication Guide* for information on design considerations in a distributed environment.

Module: DFHCR2U

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, netname, tranid, trannum, termid, userid, netuowid, X'localuowid'*

Destination: CSMT

DFHZN2133 *date time applid* **Error detected during CICS synclevel one commit. Reason code rc. Local resources may be out of sync with those on the remote system. Failure date mm/dd/yy failure time hh:mm:ss remote system sysid transaction tranid task number trannum operator terminal termid user userid network UOW netuowid local UOW X'localuowid'.**

Explanation: A CICS application has been using APPC synclevel 1 to process remote function shipped resources. The application took a syncpoint, either implicitly or explicitly, and this has caused all local resources and synclevel 2 partners to be committed. However, when a commit message was sent to a synclevel 1 function shipped resource, the reply indicated that an error has occurred. The reason code

provides details of the error and has the following values

- 01** Protocol violation by partner system – unexpected FMH data
- 02** Protocol violation by partner system – unexpected syncpoint message data
- 03** Abend received
- 04** Deadlock or read timeout.

System action: CICS synclevel 1 commit processing continues, with the intention of committing as many synclevel 1 resources as possible.

For reason code 01, a transaction dump with dump code ASPI is taken. For reason code 02, a transaction dump with dump code ASPJ is taken. On completion of the syncpoint, CICS abends the user task.

User response: The action to take depends on local procedures.

For reason codes 01 and 02, examine the dump to determine what message data was received from the partner. This information is held in one of the terminal input/output areas. A failure in the communication system might have caused corruption of the data.

Reason code 03 indicates that the partner system has sent an abend. There is an error in the partner system which may need to be investigated.

Reason code 04 indicates that the partner system took too long to respond to the synclevel 1 commit. There could be a problem with the remote system, or the communication system. It may be necessary to increase the deadlock timeout or read timeout values to prevent this recurring.

Module: DFHCR2U

XMEOUT Parameters: *date, time, applid, rc, mm/dd/yy, hh:mm:ss, sysid, tranid, trannum, termid, userid, netuowid, X'localuowid'*

Destination: CSMT

DFHZN2200 *date time applid* **FREE IMPLICIT failed during syncpoint processing for session session id, remote system netname. Transid transid. The original abend code was abend code.**

Explanation: A DFHTC FREE IMPLICIT request for a non-principal facility MRO session has failed.

System action: CICS writes an exception trace entry with code '0D86' before issuing a DFHTC FREE DETACH request for the session.

User response: If the task was purged by the operator causing abend AZI9 or a read timeout occurred causing abend AZIG this error may be expected and no further action may be necessary.

Otherwise this failure may represent an error. To investigate further set up a system dump table entry for

system dump code ZN2200. You may need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRIU

XMEOUT Parameters: *date, time,applid, session id, netname, transid, abend code*

Destination: CSMT

DFHZN2701 *date time applid* **Log data sent on ISC session is xxxxxxxx**

Explanation: This is an informational message. The transaction is communicating with a logical unit type LU6.2. It has sent an FMH (function management header) which carries log data.

System action: The transaction continues processing.

User response: None.

Module: DFHZERH

XMEOUT Parameters: *date, time,applid, xxxxxxxx*

Destination: CSNE

Chapter 2. AXM server environment messages

The following messages are issued by the authorized cross-memory (AXM) server environment, which is a package of run-time services used by the Named counter sequence number server, CICS coupling facility (CF) data tables and the CICS shared temporary storage (TS) queue pool server. See the *CICS System Definition Guide* for more information about AXM and the CICS TS queue pool server.

Note:

1. AXM messages are not issued by a CICS region and hence do not use the CICS message domain. They cannot be viewed with the CMAC transaction, suppressed with the XMEOUT user exit, or changed with the message editing utility.
2. These messages are normally displayed in mixed case English. If your terminals cannot display lowercase English characters, see the *CICS Customization Guide* for guidance on converting the messages to uppercase.

REQTEXT

AXM error recovery messages

AXMER0001 ABEND *xxx-rr* occurred at *address*, data
word1 word2 word3.

Explanation: The AXM error recovery routine has intercepted an abend in a task running under an AXM server region TCB. The abend code is shown as three hexadecimal digits for a system completion code or four decimal digits for a user completion code. The data consists of the twelve bytes around the PSW address as provided by MVS in the SDWA.

System action: The error recovery routine will first call AXMWH which attempts to identify the module and procedure in which the abend occurred and writes out a further message if successful. After this, if recovery is allowed, the error recovery routine terminates the affected AXM internal task and resumes normal processing, otherwise it percolates the error, causing the server region to be abnormally terminated.

The system will normally produce a symptom dump message on the job log, and a full dump may be produced if an appropriate DD statement (SYSUDUMP, SYSMDUMP or SYSABEND) is present in the server region JCL.

User response: Look up the completion code to identify the cause of the abend.

Module: AXMER

AXM event management messages

**AXMEV0001 AXM only supports operating system
WAIT on MVS.**

Destination: Console and print file

AXMER0002 TRAP occurred at offset *offset* in
procname.

Explanation: An internal logic error in a server resulted in a TRAP macro being executed at the specified location.

The system will normally produce a symptom dump message on the job log, and a full dump may be produced if an appropriate DD statement (SYSUDUMP, SYSMDUMP or SYSABEND) is present in the server region JCL.

System action: The AXM task is abnormally terminated.

User response: This probably indicates a logic error in server code, or an attempt to use some internal component of the server outside its correct context.

If the procedure name in the message begins with AXM, this probably indicates that the server code which called it has passed inconsistent parameters, such as an invalid address when releasing main storage.

Module: AXMER

Destination: Console and print file

Explanation: An attempt has been made to issue an operating system WAIT within an AXM server, but the server is not running on MVS. In this case, the MVS

AXMEV0003 • AXMLF0001S

POST exit mechanism used by AXM is unavailable and operating system waits cannot be supported.

System action: The program is abnormally terminated.

User response: None.

Module: AXMEV

Destination: Console

AXMEV0003 The AXM POST exit could not be created because AXM system services are not available.

Explanation: AXM server region initialization needed to define the MVS POST exit used by AXM for operating system waits, but AXM system services were not available within the current MVS image.

System action: The server region is terminated with return code 8.

User response: Start up AXM system services first then restart the server region. AXM system services are normally started at IPL using a subsystem definition in IEASSNxx specifying AXM as the subsystem name and AXMSI as the initialization routine. They can also be started up without an IPL by defining the subsystem dynamically using the SETSSI command.

Module: AXMEV

Destination: Console and print file

AXMEV0004 The AXM POST exit could not be created, return code was rc.

Explanation: The MVS POST exit used by AXM for operating system waits could not be created because the AXM system services routine gave a non-zero return code. The only known reason for this is that AXM system services have been withdrawn, which should not be possible in a production environment.

System action: The server region is terminated with return code 8.

AXM stack (LIFO) storage messages

AXMLF0001S LIFO storage cannot be set up because the PRV size exceeds 4K.

Explanation: AXM initialization has detected that the total link-edited size of the pseudo-register vector (PRV) for the server application load module exceeds the maximum size of 4096 supported by AXM. The PRV contains task-related variables used by AXM resource management plus any task-related data areas defined by server code using the Assembler DXD operation code or Q-type address constants.

System action: The server is abnormally terminated.

User response: The server programmer needs to

User response: None.

Module: AXMEV

Destination: Console and print file

AXMEV0005I The AXM POST exit had already been created for this address space.

Explanation: During server initialization, AXM system services found that the MVS POST exit used by AXM for operating system waits had already been created for this address space. AXM therefore bypassed trying to create the same POST exit again as this would have resulted in an abend 702-04.

This can occur when a previous server execution in the same address space was terminated abnormally.

System action: Processing continues

User response: None.

Module: AXMEV

Destination: Console and print file

AXMEV0006I The AXM POST exit could not be deleted, return code was rc.

Explanation: The MVS POST exit used by AXM for operating system waits could not be deleted because the AXM system services routine gave a non-zero return code. The only known reason for this is that AXM system services have been withdrawn, which should not be possible in a production environment.

System action: Processing continues.

User response: None.

Module: AXMEV

Destination: Console.

decrease the size of task-related variables defined in the PRV. When a large amount of task-related information needs to be stored, it is better to store the information in some separately acquired storage area (such as AXM heap storage) and put only a pointer to it in the PRV.

Module: AXMLF

Destination: Console

AXM lock management messages

AXMLK0001 Lock at *address* is already owned for shared use by this task.

Explanation: An AXM server program attempted to acquire exclusive ownership of an AXM lock which was already in shared ownership for the current task. This is not allowed, as the task cannot wait for itself.

System action: The AXM lock request is rejected.

User response: The server programmer needs to modify the program logic. It could for example use an AXM lock PROMOTE to convert the shared lock to an exclusive lock.

Module: AXMLK

Destination: Console and print file

AXMLK0002 *function* failed because lock at *address* is not owned by this task.

Explanation: An AXM server program tried to release, demote or promote an AXM lock but the lock was not owned by the current AXM task.

System action: The AXM lock request is rejected.

User response: The server program logic is in error.

Module: AXMLK

Destination: Console and print file

AXM operating system interface messages

AXMOS0001I The main procedure entry point is *name* at address *address*.

Explanation: This message is written to the print file during AXM initialization to indicate the name and entry point address of the server main procedure. This is primarily for debugging purposes.

System action: Processing continues.

User response: None.

Module: AXMOS

Destination: Print file

Explanation: The AXM server load module which is being executed does not contain a procedure which has been identified as the AXM main procedure.

System action: The server region is terminated with return code 16.

User response: Check that the main procedure was correctly included in the link edit. If it was, make sure that its entry point name was correctly specified on the END statement and that it was assembled using AXM macros with the macro AXMSET appearing before the MODULE statement and the option ENVIRON=AXM specified on the MODULE statement.

Module: AXMOS

Destination: Console and SYSPRINT

AXMOS0002 The main procedure is missing, or the END statement does not name the entry point.

AXM storage page pool management messages

AXMPG0001I The main free area above 16M was at address *xxxxxx*, size *nnnnK*.

Explanation: This message is written to the print file during AXM initialization to indicate the size of the largest area of 31-bit addressable private region storage available at that time.

System action: Processing continues.

User response: None.

Module: AXMPG

Destination: Print file

System action: Processing continues.

User response: None.

Module: AXMPG

Destination: Print file

AXMPG0002I The main free area below 16M was at address *xxxxxx1*, size *nnnnK*.

Explanation: This message is written to the print file during AXM initialization to indicate the size of the largest area of 24-bit addressable private region storage available at that time.

AXMPG0003I Storage page pool *areaname* created, address *xxxxxx*, size *nnnnK*.

Explanation: This message is written to the print file during AXM initialization to show the size and address of each storage page pool as it is created. Once this has been done, most AXM storage requests are allocated from this page pool rather than with MVS GETMAIN.

System action: Processing continues.

User response: None.

Module: AXMPG

Destination: Print file

AXMPG0004I Usage statistics for storage page pool *areaname*:

Explanation: This message shows statistics for the named storage page pool (since the most recent statistics reset, if any). It is automatically written to the print file at AXM region termination, and may also be requested at other times by the server.

The detailed message layout is as follows:

Size	In Use	Max Used	Free	Min Free
nK	nK	nK	nK	nK
100%	n%	n%	n%	n%
	Gets	Frees	Retries	Fails
	n	n	n	n

Each of the storage statistics is shown in two forms, as a number of kilobytes and as a percentage of the total size.

The individual fields have the following meanings:

Size Total size of the storage pool.

In Use The amount of storage which is currently in use.

Max Used
The highest amount of storage which has been in use.

AXM resource tracking messages

AXMRS0001 Tidy-up routine at *address* failed to free resource tracking cell.

Explanation: A server routine established an AXM resource tracking element specifying that a procedure was to be called to release the resource if the task was terminated without releasing the resource. The AXM task is now terminating, and the procedure identified in the tracking element was called, but the resource tracking element was still in existence when it returned. The entry point address of the relevant procedure is indicated in the message.

Free The amount of storage within the pool which is current free.

Min Free
The lowest amount of storage which has been free.

Gets The number of requests to obtain storage within the pool.

Frees The number of requests to release storage within the pool.

Retries The number of times that a storage request initially failed and was retried after merging any adjacent small free areas to form larger areas.

Fails The number of times that a storage request was unable to obtain the requested amount of storage even after a retry.

System action: Processing continues.

User response: None.

Module: AXMPG

Destination: Print file

System action: The tracking element is released on the assumption that the resource has now been deleted, and AXM task termination continues.

User response: The server programmer needs to ensure that the procedure to release the resource also frees the resource tracking element.

Module: AXMRS

Destination: Console and print file

AXM server connection and system services messages

AXMSC00111 AXM system services initialization is in progress.

Explanation: AXM system services are being started up, normally as a result of being called by the AXM subsystem initialization routine.

System action: Processing continues.

User response: None.

Module: AXMSC

Destination: Console

Explanation: AXM system services are now fully available in the current MVS image.

System action: AXM cross-memory server connection requests and requests for the POST exit system services will now be accepted.

User response: None.

Module: AXMSC

Destination: Console

AXMSC0013 AXM system services have already been initialized.

Explanation: An attempt was made to set up AXM

system services again when they are already active in the current MVS image.

System action: The attempt is ignored.

User response: None.

Module: AXMSC

Destination: Console

AXMSC0021I AXM system services termination is in progress.

Explanation: AXM system services are being withdrawn. This is only possible if they were initialized using the AXM system region program AXMSR instead of being set up via subsystem initialization.

System action: The AXM system services program call table is deleted and all entry points in the AXM system services anchor are replaced with dummy routines which return an indication that the service are not available.

User response: Note that the results of attempting to call any AXM system service around this time are unpredictable. AXM system services should never be withdrawn in a production environment at any time when it is possible that they could be in use.

Module: AXMSC

Destination: Console

AXMSC0022I AXM system services termination has completed.

Explanation: AXM system services have been closed down for this MVS image.

System action: AXM system services are no longer available.

User response: None.

Module: AXMSC

Destination: Console

AXMSC0031I Connection to server *prefix.name* has been opened.

Explanation: The current region has established an AXM connection to the AXM server *prefix.name*.

System action: Processing continues.

User response: None.

Module: AXMSC

Destination: Console

AXMSC0032 Connection to server *prefix.name* failed because the server was not found.

Explanation: The current region tried to establish an AXM connection to the AXM server *prefix.name* but could not do so because there is no active server of that name enabled for AXM connections.

System action: The connection attempt is rejected with return code 8, reason code 32.

User response: Ensure that the server is started and that its name was specified correctly.

Module: AXMSC

Destination: Console

AXMSC0033 Connection to server *prefix.name* was rejected by the security system.

Explanation: The current region tried to establish an AXM connection to the AXM server *prefix.name* but the request was rejected by the security system.

System action: The connection attempt is rejected with return code 8, reason code 33.

User response: See the previous AXM message giving details of the results of the security check.

Module: AXMSC

Destination: Console

AXMSC0034 Connection to server *prefix.name* failed because all AXM connections are in use.

Explanation: The current region tried to establish an AXM connection to the AXM server *prefix.name* but the maximum number of AXM connections supported within an MVS image (currently 4096) has been reached.

System action: The connection is rejected with return code 8, reason code 34.

User response: If you anticipate a need for more than 4096 AXM server connections within a single MVS image, you will need assistance from IBM. See the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: AXMSC

Destination: Console

AXMSC0035 Connection to server *prefix.name* failed because request limit *reqs* exceeds 9999.

Explanation: The current region tried to establish an AXM connection to the AXM server *prefix.name* but the connection parameter specifying the maximum number of concurrent requests to be supported exceeds 9999.

AXMSC0036 • AXMSC0052

System action: The connection is rejected with return code 8, reason code 35.

User response: Check whether the server interface program is specifying the correct value for the maximum number of concurrent requests.

Module: AXMSC

Destination: Console

AXMSC0036 Connection to server *prefix.name* was rejected by the server.

Explanation: The current region tried to establish an AXM connection to the AXM server *prefix.name* but the server-defined connection exit rejected the request.

System action: The connection is rejected with return code 8, reason code 36.

User response: The reason for the rejection depends on the server code, but this typically occurs if the server is preparing to close down or has insufficient resources to accept another connection.

Module: AXMSC

Destination: Console

AXMSC0037 Connection to server *prefix.name* failed because the server is terminating.

Explanation: The current region tried to establish an AXM connection to the AXM server *prefix.name* but the server entered termination processing while the connection request was in progress.

System action: The connection is rejected with return code 8, reason code 37. The instance of the server that was being terminated will no longer be visible to any new connection attempts.

User response: Retry the connection when the server has been restarted.

Module: AXMSC

Destination: Console

AXMSC0038 Connection to server *prefix.name* failed because this address space is already connected to it.

Explanation: The current region tried to establish an AXM connection to the AXM server *prefix.name* but it already has a connection to the same server region. AXM does not support multiple connections from the same region to the same server region.

System action: The connection is rejected with return code 8, reason code 38.

User response: None.

Module: AXMSC

Destination: Console

1282 Messages and Codes

AXMSC0041 Connection to server *prefix.name* has been closed.

Explanation: An AXM connection from the current region to the named server has been terminated, either as a result of being explicitly closed by this region or as a result of the termination of the MVS TCB which originally established the connection.

System action: Processing continues.

User response: None.

Module: AXMSC

Destination: Console

AXMSC0042 Connection close failed for token *xxxxxxx*, reason is *n*.

Explanation: An attempt was made to close an AXM connection explicitly but the specified connection token did not refer to an active connection owned by the current region, or the connection could not be closed for some other reason.

The reason code indicates which validity check failed within procedure AXMSCCLS. Reason code 9 indicates that a request issued via the connection has not yet completed. Any other reason code probably indicates an incorrect token.

System action: The attempt is rejected with return code 8, reason code 42.

User response: Check that the connection close request is specifying the correct connection token and that there are no incomplete requests for the connection.

Module: AXMSC

Destination: Console

AXMSC0051 Server *prefix.name* is now enabled for connections.

Explanation: This AXM server has completed initialization and is now available for connections from other address spaces.

System action: Processing continues.

User response: None.

Module: AXMSC

Destination: Console

AXMSC0052 Server *prefix.name* cannot be enabled because it is already active in another address space.

Explanation: Only one instance of a given AXM server name can be active in an MVS image at a time.

System action: The attempt to enable the server

interface is rejected with return code 8, reason code 52.

User response: None.

Module: AXMSC

Destination: Console

AXMSC0053 Server *prefix.name* cannot be enabled because caller is not APF authorized.

Explanation: AXM requires that an AXM server region must be running APF authorized in order to be allowed to enable its server interface.

System action: The attempt to enable the server interface is rejected with return code 8, reason code 53.

User response: Ensure that the server program is executed from an APF authorized library and is link-edited with AC(1).

Module: AXMSC

Destination: Console

AXMSC0054 Server *prefix.name* cannot be enabled because the security system rejected the request.

Explanation: The security system detected that the server region userid was not correctly authorized to act as an AXM server with the specified server name.

System action: The attempt to enable the server interface is rejected with return code 8, reason code 54.

User response: See the previous AXM message giving details of the results of the security check.

Module: AXMSC

Destination: Console

AXMSC00611 Server *prefix.name* is now disabled for connections.

Explanation: This AXM server is terminating and is no longer available for connections from other address spaces. This occurs either when the server explicitly disables its interface or when the server job step task terminates.

System action: Processing continues.

User response: None.

Module: AXMSC

Destination: Console

AXMSC0062 Server disable failed for token xxxxxxxx, reason is *n*.

Explanation: An attempt to disable the server interface failed because the specified server interface token did not correctly identify an active server interface established by the current address space.

The reason code provides an internal indication of which validity check failed within procedure AXMSCDIS. All reason codes probably indicate an incorrect token.

System action: The attempt to disable the server interface is rejected with return code 8, reason code 62. If the server interface is still enabled, it will be disabled automatically when the job step task terminates.

User response: As the server interface token is stored internally by AXM, the only known possible reason for this message is storage overwriting within the server region.

Module: AXMSC

Destination: Console

AXMSC0063 Server *prefix.name* cannot be disabled because caller is not APF authorized.

Explanation: AXM requires that an AXM server region must be running APF authorized in order to be allowed to disable its server interface.

System action: The attempt to disable the server interface is rejected with return code 8, reason code 63.

User response: Ensure that the server program is executed from an APF authorized library and is link-edited with AC(1).

Module: AXMSC

Destination: Console

AXMSC0071 Server name *prefix.name* has incorrect syntax for access checks.

Explanation: The security checking routine has detected that the AXM server name specified on a connection request or on a server enable request is not in the correct form, for example because either the prefix or name is blank. This means that the security check cannot be performed.

System action: A return code is set to indicate that the security check failed.

User response: Check that the server prefix and name are specified correctly. The prefix is normally defined by the server, but the name may be set from a user-specified server parameter.

Module: AXMSC

Destination: Console

AXMSC0072 *level* access authorization was denied for FACILITY *facility*.

Explanation: The external security manager has indicated that the current region is not authorized for the required level of access to the specified facility.

System action: A return code is set to indicate that the security check failed.

AXMSC0073 • AXMSI0002I

User response: Check whether the userid for the region has been authorized to access the specified facility resource name.

Module: AXMSC

Destination: Console

AXMSC0073 *level* access authorization is unavailable for FACILITY *facility*.

Explanation: The external security manager has indicated that it is unable to determine whether the current region is authorized for the required level of access to the specified facility. This message is only issued if it is not possible for the security routine to determine whether security checking is actually required. In cases where it is obvious that no security check is required (for example because no external security manager is installed), access is granted anyway.

System action: A return code is set to indicate that the security check failed.

User response: Check whether the external security manager is available and whether the security definitions for the specified facility have been provided.

Module: AXMSC

Destination: Console

AXMSC0074 RACROUTE REQUEST=AUTH gave R15=xxxxxxx, SAFPRRET=xxxxxxx, SAFPRREA=xxxxxxx.

Explanation: This message provides additional details about the results of a security check in any case where access is not granted. See the documentation of the RACROUTE macro for further information.

System action: Processing continues.

User response: None.

AXM subsystem initialization messages

AXMSI0001I AXM subsystem initialization is in progress.

Explanation: The AXM subsystem initialization program has been started in order to initialize AXM system services.

System action: AXM system services will be loaded and initialized.

User response: None.

SAFPRREA=xxxxxxx.

Explanation: This message provides additional details about the results of a security check in any case where access is not granted. See the documentation of the RACROUTE macro for further information.

System action: Processing continues.

User response: None.

Module: AXMSC

Destination: Console

AXMSC0991I Creating new AXM system services anchor at *address*.

Explanation: This message is issued during AXM system services initialization to enable the system services anchor to be located if necessary for diagnostic purposes.

System action: AXM system services initialization processing continues.

User response: None.

Module: AXMSC

Destination: Console

AXMSC0992I Deleting old AXM system services anchor at *address*.

Explanation: This message is issued during AXM system services initialization if AXM system services were previously active but had been terminated (which is not possible in normal production environment). The old system services anchor is retained after AXM termination because it contains the system LX to be used if AXM is restarted. This message gives the address of the old system services anchor for diagnostic purposes.

System action: AXM system services initialization processing continues.

User response: None.

Module: AXMSC

Destination: Console

Module: AXMSI

Destination: Console

AXMSI0002I AXM subsystem initialization has completed.

Explanation: The AXM subsystem initialization program has completed execution.

System action: The program returns control to MVS.

User response: None.

Module: AXMSI

Destination: Console

AXMSI0003 AXM subsystem initialization return code *retcode*, reason code *rsncode*.

Explanation: The AXM subsystem initialization routine has not completed normally. This message indicates the final return code and reason code. This is normally the return code from AXM system services initialization.

System action: The subsystem initialization routine returns control to MVS.

User response: See the previous AXM message describing the cause of the problem. The reason code will normally be the number of an error message issued by AXMSC.

Module: AXMSI

AXM system region messages

AXMSR00011 AXM system region initialization is in progress.

Explanation: An AXM system region is being started. This is used to initialize AXM system services in a testing environment for development purposes, and allows AXM system services to be closed down and restarted without an IPL.

System action: Processing continues.

User response: None.

Module: AXMSR

Destination: Console

AXMSR00021 AXM system region initialization has completed.

Explanation: AXM system services have been successfully initialized from the AXM system region.

System action: Processing continues.

User response: The system region may be closed down again using the MVS STOP command but this should only be done when it is certain that no AXM services are being used within the MVS image.

Module: AXMSR

Destination: Console

AXMSR00031 AXM system region termination is in progress.

Explanation: The operator has requested termination of the AXM system region using the MVS STOP command.

System action: AXM system services are terminated.

Destination: Console

AXMSI0004 AXM subsystem initialization can only run in Master Scheduler address space.

Explanation: An attempt has been made to invoke the AXM subsystem initialization program AXMSI in some other way than as an MVS subsystem initialization program running in the Master Scheduler region (ASID 0001).

System action: The subsystem initialization program is abnormally terminated.

User response: None.

Module: AXMSI

Destination: Console

User response: None.

Module: AXMSR

Destination: Console

AXMSR00041 AXM system region termination has completed.

Explanation: The AXM system region has completed termination.

System action: Control is returned to MVS and the job step ends.

User response: None.

Module: AXMSR

Destination: Console

AXMSR00011 AXM system region can only run under MVS/ESA.

Explanation: An attempt was made to execute the AXM system region program AXMSR in a non-MVS environment.

System action: The system region program terminates.

User response: None.

Module: AXMSR

Destination: Console

AXMSR00012 AXM system region program AXMSR needs to be APF authorized.

Explanation: An attempt was made to execute the

AXMSR0013 • AXMWH0002I

AXM system region program AXMSR without APF authorization.

System action: The system region program terminates.

User response: Ensure that the module AXMSR is stored in an APF-authorized library and is link-edited with AC(1).

Module: AXMSR

Destination: Console

AXMSR0013 AXM system region LOAD for *name* failed with completion code *xxx-nn*.

Explanation: The attempt to LOAD the system services module (AXMSC) failed.

System action: The system region program terminates.

User response: See the description of the system completion code *xxx* in *MVS/ESA System Codes* for the reason that the LOAD failed.

Module: AXMSR

Destination: Console

Explanation: An attempt was made to issue a command to the AXM system region using the MVS MODIFY command. The AXM system region only supports the MVS STOP command, and does not support commands entered via MODIFY.

System action: The command is ignored.

User response: If the intention was to close down the system region, use the MVS STOP command instead.

Module: AXMSR

Destination: Console

AXMSR0022I AXM system region STOP command has been accepted.

Explanation: An operator has issued a STOP command to close down the AXM system region.

System action: AXM system services will be terminated.

User response: None.

Module: AXMSR

Destination: Console

AXMSR0021 AXM system region does not support this command: *text*

AXM trace and print file management messages

AXMTR0001 The *ddname* print file could not be opened.

Explanation: The AXM trace and print file with the specified *ddname* (usually AXMPRINT or SYSPRINT) could not be opened during AXM initialization.

System action: Print file output requests will be ignored.

User response: Ensure that the appropriate DD

statement is present. The default *ddname* is AXMPRINT, but this may be overridden to SYSPRINT by an AXMTRDEF definition within the server code if the server does not need to reserve the name SYSPRINT for any other purpose.

Module: AXMTR

Destination: Console

AXM address lookup (WHERE) messages

AXMWH0001I Address *address* is at *+offset* in *modtype* **module *modname*.**

Explanation: This message may be produced after an abend or TRAP message to identify the module containing the error address, if the module is known to MVS. The information about the module and type is obtained using the MVS macros CSVQUERY or NUCLKUP.

System action: Processing continues.

User response: None.

Module: AXMWH

Destination: Console and print file

AXMWH0002I Address *address* is at *+offset* in **procedure *procname*.**

Explanation: This message may be produced after an abend or TRAP message to identify the procedure containing the error address, if the storage is within a known module and a standard SAVE sequence including a procedure identifier appears at some point before the error address.

System action: Processing continues.

User response: None.

Module: AXMWH

Destination: Console

AXM cross-memory interface messages

AXMXM0011 Server *prefix.name* cannot be enabled because AXM system services are not available.

Explanation: An attempt has been made to enable a server interface but AXM system services have not been initialized within this MVS image.

System action: The server enable request is rejected.

User response: Ensure that AXM system services are started then start the server again.

Module: AXMXM

Destination: Console and SYSPRINT

AXMXM0012 Enable failed for server *prefix.name*, return code *retcode*, reason *rsncode*.

Explanation: The server interface could not be enabled. The specific reason will have been indicated by an earlier AXMSC message.

System action: The server enable request is rejected.

User response: None.

Module: AXMXM

Destination: Console and SYSPRINT

AXMXM0021 ABEND *xxx-rr* occurred at *address*, data *word1 word2 word3*.

Explanation: The ARR routine for an AXM cross-memory program call routine has intercepted an abend in a cross-memory mode AXM task and has passed the associated SDWA to a task in the server address space to issue the appropriate diagnostic messages. The abend code is shown as three hexadecimal digits for a system completion code or four decimal digits for a user completion code. The data consists of the twelve bytes around the PSW address as provided by MVS in the SDWA.

System action: The ARR will already have completed processing when this message is issued, as the message is written out by the server region. If recovery is allowed, the ARR terminates the affected AXM internal task, in which case the return code from the cross-memory request will consist of the completion code in the usual MVS format but with the high-order bit set to indicate an abend. If recovery is not allowed, the ARR percolates the error, passing the abend to the requesting region.

The diagnostic routine which writes this message will call AXMWH which attempts to identify the module and procedure in which the abend occurred and writes out a further message if successful. It then releases the MVS SDWA. Server execution is not directly affected by an abend in cross-memory mode.

User response: Look up the completion code to identify the cause of the abend.

Module: AXMXM

Destination: Console and SYSPRINT

AXMXM0022 TRAP occurred at offset *offset* in *procname*.

Explanation: An internal logic error in a server module or invalid parameters on a server request resulted in a TRAP macro being executed at the specified location in cross-memory mode.

The system will normally produce a symptom dump message on the job log, and a full dump of the connected region may be produced if an appropriate DD statement (SYSUDUMP, SYSMDUMP or SYSABEND) is present in the JCL for the connected region.

System action: The AXM task is abnormally terminated.

User response: This probably indicates a logic error in server code, or an attempt to use some internal component of the server outside its correct context.

If the procedure name in the message begins with AXM, this probably indicates that the server code which called it has passed inconsistent parameters, such as an invalid address when releasing main storage.

Module: AXMXM

Destination: Console

Chapter 3. Transaction abend codes

When abnormal conditions occur, CICS can send a message to the CSMT transient data destination containing the transaction ID, the program name and the abend code. Here is an example:

Alternatively, the application can intercept abends by including an active EXEC CICS HANDLE ABEND command. The actual abend code can be determined by issuing the EXEC CICS ASSIGN command with the ABCODE option.

The transaction identification code *transid* usually consists of the 4 characters defined to CICS. However, when a transaction is initiated by using a light pen, an operator identification (OPID) card reader, or 3270 PA or PF keys (specified in the TASKREQ= operand), CICS creates an internal transaction identification in the form of a 1-byte 3270 attention identification (AID) code followed by 3 bytes of X'FF'.

The code that may actually appear in the message in place of the internally-created transaction identification will be *xx*, where xx is the character translation of the 3270 AID code. To prevent ambiguity, the user should avoid using these codes as transaction identifiers.

The keys, the light pen (LPA), and OPID, and their corresponding printed AID codes are given in the following list:

PF1	*F1*	PF13	*C1*	LPA	*7E*
PF2	*F2*	PF14	*C2*	OPID	*E6*
PF3	*F3*	PF15	*C3*	PA1	*6C*
PF4	*F4*	PF16	*C4*	PA2	*6E*
PF5	*F5*	PF17	*C5*	PA3	*6B*
PF6	*F6*	PF18	*C6*		
PF7	*F7*	PF19	*C7*		
PF8	*F8*	PF20	*C8*		
PF9	*F9*	PF21	*C9*		
PF10	*7A*	PF22	*4A*		
PF11	*7B*	PF23	*4B*		
PF12	*7C*	PF24	*4C*		

An abend code indicates the cause of an error that may have been originated by CICS or by a user program. For most of the abend codes described, a CICS transaction dump is provided at abnormal termination.

All CICS transaction abend codes *abcode* are 4-character alphanumeric codes of the form **A**xy, where:

Aack 'M'

is the IBM-assigned designation of a CICS transaction abend.

xx is the 2-character code assigned by CICS to identify the module that detected an error.

y is the 1-character alphanumeric code assigned by CICS.

DFHAC2236 *date time applid* **Transaction** *tranid*
abend *primary abcode* **in program**
program name **term** *termid* **backout**
successful { *batchid=* } *batchid. message*

Format of information

For each transaction abend code, the following information is given:

- An explanation of events leading to or following the message.
- The action that has been or will be taken by CICS (system action).
- The action recommended for the user (console or terminal operator).
- The module or modules that can determine that the message should be sent (not necessarily the module or modules that can issue the macro to write the message.)

AAxx abend codes

AACA

Explanation: An invalid error code has been passed to the DFHFTP or DFHACP programs.

System action: CICS terminates the task abnormally with a dump.

User response: Notify the system programmer.

Module: DFHFTP,DFHACP

AAL1

Explanation: DFHALP was processing a request that deadlocked. The most likely reason for the abend is that an ALLOCATE QUEUE request has been suspended because there are no contention-winning links available.

AAL1 is issued for non time-out related deadlocks, for instance the task may have been cancelled.

AAL8 is issued for stall purges and deadlock time-outs.

System action: CICS terminates the task abnormally. A dump is taken.

User response: Ensure that there are enough contention-winning sessions available to satisfy the ALLOCATE QUEUE request.

If you are running with modegroups, ensure that there are contention-winning sessions available to satisfy the ALLOCATE request in that modegroup.

Module: DFHALP

AAL2

Explanation: Either an incorrect response (other than PURGED) was returned from the suspend of the allocated task, or an incorrect response was returned from the resume.

System action: The transaction is abnormally terminated with a dump.

User response: Check the return code from the resume or the suspend to determine the cause of the error.

Module: DFHALP

AAL3

Explanation: The task has been purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The task that first detected the purged condition provides an exception trace.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate the reason why the task was purged. It was purged either by the master terminal operator or as a result of a deadlock timeout.

Module: DFHALP

AAL4

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error provides an exception trace, a console message, and possibly a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related message produced by the domain that detected the original error.

Module: DFHALP

AAL6

Explanation: An error (INVALID, DISASTER or EXCEPTION response) has occurred on a call to SIGNOFF_TERMINAL_USER by DFHALP during

sign-off for a surrogate terminal session running CRTE. The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related message produced by the domain that detected the original error.

Module: DFHALP

AAL7

Explanation: An error (INVALID, DISASTER or EXCEPTION response) has occurred on a call to schedule a remote terminal delete by DFHALP during sign-off for a surrogate terminal session running CRTE. The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related message produced by the domain that detected the original error.

Module: DFHALP

AAL8

Explanation: DFHALP was processing a request that deadlocked. The most likely reason for the abend is that an ALLOCATE QUEUE request has been suspended because there are no contention-winning links available.

AAL1 is issued for non time-out related deadlocks.

AAL8 is issued for stall purges and deadlock time-outs.

System action: CICS terminates the task abnormally. A transaction or system dump is not taken unless the transaction dump table has been modified for AAL8.

User response: Ensure that there are enough contention-winning sessions available to satisfy the ALLOCATE QUEUE request.

If you are running with modegroups, ensure that there are contention-winning sessions available to satisfy the ALLOCATE request in that modegroup.

It might be necessary to increase the deadlock timeout (DTIMEOUT) value for the transaction to prevent this abend from recurring.

If you require a transaction or system dump for this abend then add AAL8 to the transaction dump table.

Module: DFHALP

AALM

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the log manager (LM) domain. The domain that detected the original error provides an exception trace, a console message, and possibly a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related message produced by the domain that detected the original error.

Module: DFHAMLML

AALN

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the TD manager. The domain that detected the original error provides a trace entry and possibly a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Inform the system programmer. Examine the trace and the dump to identify the point of error.

Module: DFHAMTD

AALO

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the CICS/DB2 table manager DFHD2TM. The domain that detected the original error provides a trace entry and possibly a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Inform the system programmer. Examine the trace and the dump to identify the point of error.

Module: DFHAMD2

AALP

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the Program Manager. The domain that detected the original error provides a trace entry and possibly a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Inform the system programmer.

AALQ • AALW

Examine the trace and the dump to identify the point of error.

Module: DFHAMPG

AALQ

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the Business Application Manager. The domain that detected the original error provides a trace entry and possibly a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Inform the system programmer. Examine the trace and the dump to identify the point of error.

Module: DFHAMBA

AALR

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the Temporary Storage Manager. The domain that detected the original error provides a trace entry and possibly a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Inform the system programmer. Examine the trace and the dump to identify the point of error.

Module: DFHAMBA

AALS

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the Global Enqueue Manager. The domain that detected the original error provides a trace entry and possibly a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Inform the system programmer. Examine the trace and the dump to identify the point of error.

Module: DFHAMBA

AALT

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the Internet Inter-Orb Protocol Manager. The domain that detected the original error provides a trace

entry and possibly a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Inform the system programmer. Examine the trace and the dump to identify the point of error.

Module: DFHAMOP

AALU

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the Sockets Domain Manager. The domain that detected the original error provides a trace entry and possibly a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Inform the system programmer. Examine the trace and the dump to identify the point of error.

Module: DFHAMSO

AALV

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the Enterprise Java Domain. The domain that detected the original error provides a trace entry and possibly a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Inform the system programmer. Examine the trace and the dump to identify the point of error.

Module: DFHAMEJ

AALW

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the Web Domain. The domain that detected the original error provides a trace entry and possibly a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Inform the system programmer. Examine the trace and the dump to identify the point of error.

Module: DFHAMWB

AALX

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the Pipeline Manager. The domain that detected the original error provides a trace entry and possibly a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Inform the system programmer. Examine the trace and the dump to identify the point of error.

Module: DFHAMPI

AALY

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the ISC/IP Domain. The domain that detected the original error provides a trace entry and possibly a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Inform the system programmer. Examine the trace and the dump to identify the point of error.

Module: DFHAMIS

AALZ

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the Document Handler. The domain that detected the original error provides a trace entry and possibly a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Inform the system programmer. Examine the trace and the dump to identify the point of error.

Module: DFHAMDH

AAM1

Explanation: DFHXMCL has returned an unexpected response during the install of a transaction class. This can be caused by the task being purged during the install.

System action: The transaction is abnormally terminated with a CICS transaction dump.

If an error has occurred, at the time the error is detected, CICS issues a DFHXMnnnn console

message, records an exception trace entry and takes a system dump.

User response: Determine why the task has failed. If there is a system dump, use it together with the trace entry and the console message to resolve the problem. If there is no system dump, the task has been purged either by the master terminal operator or as a result of deadlock timeout.

Module: DFHAMP

AAM2

Explanation: DFHMXD has returned an unexpected response during the install of a transaction definition. This can be caused by the task being purged during the install.

System action: The transaction is abnormally terminated with a CICS transaction dump.

If an error has occurred, at the time the error is detected, CICS issues a DFHXMnnnn console message, records an exception trace entry and takes a system dump.

User response: Determine why the task has failed. If there is a system dump, use it together with the trace entry and the console message to resolve the problem. If there is no system dump, the task has been purged either by the master terminal operator or as a result of deadlock timeout.

Module: DFHAMP

AAM3

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the Loader Domain. The domain that detected the original error provides a trace entry and possibly a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Inform the system programmer. Examine the trace and the dump to identify the point of error.

Module: DFHAMLD

AAMA

Explanation: There is an internal logic error in DFHAMP.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

AAMC • AAMN

Module: DFHAMP

AAMC

Explanation: The task was purged before a GETMAIN request to the storage manager domain was able to complete successfully.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate the reason the task was purged. It was purged either by the master terminal operator or as a result of deadlock timeout.

Module: DFHAMP

AAMD

Explanation: An unexpected return code has been received from DFHDMP. This is due to an internal logic error.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHAMP

AAMF

Explanation: An unexpected return code has been received following a call to the kernel (KE) domain. This might be due to an internal logic error.

System action: CICS terminates the task abnormally with a dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHAMP

AAMH

Explanation: An unexpected return code has been received following a call to DFHFCMT. This might be due to an internal logic error.

System action: CICS terminates the task abnormally with a dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHAMP

AAMI

Explanation: An unexpected return code has been received following a call to DFHFCRL. This might be due to an internal logic error.

System action: CICS terminates the task abnormally with a dump. You need further assistance from IBM to resolve this problem. See the *CICS Problem Determination Guide* for guidance on how to proceed.

User response:

Module: DFHAMP

AAMJ

Explanation: While installing a file, using RDO, a call was made to DFHFCFS to enable the file. An irrecoverable error was returned from DFHFCFS.

System action: The task is abnormally terminated with a CICS transaction dump.

At the time the error is detected, CICS writes a message to the console, records an exception trace entry and takes a system dump.

User response: Inform the system programmer. Examine the trace and the dump to identify the point of error.

Module: DFHAMP

AAMK

Explanation: While installing a file, using RDO, a call was made to DFHFCDN. An irrecoverable error was returned from DFHFCDN.

System action: The task is abnormally terminated with a CICS transaction dump. At the time the error is detected, CICS writes a message to the console, records an exception trace entry, and takes a system dump.

User response: Inform the system programmer, Examine the trace and dump to identify the point of error.

Module: DFHAMP

AAMN

Explanation: There has been an unexpected return code from a call to DFHPRPT. This might be due to an internal logic error.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHAMP

AAMO

Explanation: An invalid return code was returned from DFHTOR, the CICS terminal object resolution program.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHAMP

AAMP

Explanation: An unexpected return code has been received from DFHPUP. This might be due to an internal logic error.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHAMP

AAMQ

Explanation: An attempt has been made to install a partner using RDO. However, the partner resource manager (PRM) is unavailable having failed to initialize during CICS initialization.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: If you need to use the PRM, correct the problem which prevented the PRM from initializing, and restart CICS.

Module: DFHAMP

AAMS

Explanation: There has been an unexpected return code following a GETMAIN request to the storage manager. This is due to an internal logic error.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHAMP

AAMT

Explanation: There is an internal logic error in DFHAMP due to an unexpected return code from DFHTMP.

System action: The task is abnormally terminated

with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHAMP

AAMZ

Explanation: An unexpected return code has been received from DFHZCP. This is due to an internal logic error.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHAMP

AAO2

Explanation: CPI Communications has detected an unexpected response from DFHLUC.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: This is a CICS internal logic error.

A level 2 CICS trace for "CP" of the transaction documents the course of events prior to this error (such as the modules called and their parameters). The level 2 trace also provides details of the error itself.

You need further assistance from IBM to resolve this problem. See the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHPCBA

AAO3

Explanation: The CPI interface detected that a call was made to a CPI Communications function without CPI Communications being initialized. This implies that CPI Communications initialization failed while CICS was initializing.

System action: The transaction is abnormally terminated with a CICS transaction dump. An exception trace entry is also written when this event occurs.

User response: Check the console listing to determine the reason why CPI Communications failed to initialize during CICS initialization. Correct the problem and restart CICS.

If the console listing indicates that CPI Communications initialized successfully, you need further assistance to resolve the problem. Collect the console listing, the traces and the transaction dump. See the *CICS Problem Determination Guide* for guidance on how to proceed.

AAO4 • AAOA

Module: DFHCPI

AAO4

Explanation: DFHZARL, or a module called by DFHZARL, has detected a logic error. This error is almost certainly caused by the module receiving invalid data or indicators from VTAM.

System action: Before returning to the CPI Communications layer, DFHZARL calls DFHZNAC to clean up the session and put out messages on the CSNE log. CPI Communications abnormally terminates the transaction with a CICS transaction dump, and produces an exception trace entry.

User response: Check the CSNE log to determine the type of error. You may need further assistance from IBM to fully resolve this problem. See the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCPCLR

AAO5

Explanation: The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The domain that first detected the purged condition provides an exception trace.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate the reason why the task was purged. It was purged either by the master terminal operator or as a result of deadlock timeout.

Module: DFHPCBA, DFHPCBI, DFHPCBS

AAO7

Explanation: The CPI Communications syncpoint request handler has been passed an invalid DFHLUC parameter list. This is a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: A level 2 trace for “CP” of the transaction shows the course of events before this error occurred (such as the modules called and their parameters) plus details of the error itself. You need further assistance from IBM to resolve this problem. See the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCPSRH

AAO8

Explanation: The CPI Communications syncpoint request handler has been passed an invalid conversation control block (CPC). This is a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: A level 2 trace for “CP” of the transaction shows the course of events before this error occurred (such as the modules called and their parameters) plus details of the error itself. You need further assistance from IBM to resolve this problem. See the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCPSRH

AAO9

Explanation: A task has been purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate why the task was purged.

If the task was purged by the master terminal operator, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, the number of tasks in the system should be reduced to avoid short-on-storage situations. Another possibility would be to increase the value of the DTIMOUT option for the transaction.

Module: DFHCPCLR

AAOA

Explanation: An application has issued a CPI verb which CICS does not support. The entry point referenced in the application program was resolved in the link edit stub, but the function requested could not be resolved when control passed to CICS.

There are two possible reasons for this

- You have linkedited your application program with a CPI stub which supports more function than this release of CICS.
- The linkedit stub has been corrupted.

System action: The transaction is abnormally terminated with a CICS transaction dump. An exception trace entry is also written.

User response: At the time of the error, general register 0 points to an 8-byte character string which should match the name of the issued CPI call. Use the trace or the dump to verify that this character string is the name of a CPI function which is supported.

If the character string is not an intelligible character

string, the stub has probably been corrupted.

Module: DFHCPI

AAOB

Explanation: An application has issued a CPI verb which specifies more than eight parameters.

System action: The transaction is abnormally terminated with a CICS transaction dump and an exception trace entry is also written.

User response: Change your application program so that the correct number of parameters is specified on the CPI call.

Module: DFHCPI

AAOC

Explanation: CPI Communications is invoked with an invalid number of parameters for call

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: The exception trace point produced with this abend contains the incorrectly issued CPI Communications verb name. Use this to determine where the application program was in error and amend it accordingly.

The *SAA CPI Communications Reference* manual, SC26-4399, provides a detailed description of all the CPI Communications verbs and how they should be called.

Module: DFHCPARH

AAOD

Explanation: The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The domain that first detected the purged condition provides an exception trace.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate the reason the task was purged. It was purged either by the master terminal operator or as a result of deadlock timeout.

Module: DFHCPCBI

AAOE

Explanation: The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The domain that first detected the purged condition provides an exception trace.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate the reason the task was

purged. It was purged either by the master terminal operator or as a result of deadlock timeout.

Module: DFHCPCBA

AAOF

Explanation: The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The domain that first detected the purged condition provides an exception trace.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate the reason the task was purged. It was purged either by the master terminal operator or as a result of deadlock timeout.

Module: DFHCPCBS

AAOG

Explanation: During the processing of CMACCP (accept conversation), CPI Communications detected that the application was attached with an unsupported sync level.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: This condition is caused by a back-end CPI Communications transaction being attached with a sync level that is not CM_NONE (0) or CM_CONFIRM (1).

Change the front-end transaction, (that is, the initiator of the conversation in the other system) so that it defines the sync level correctly.

Module: DFHCPCBA

AAOH

Explanation: Journaling of data sent on a CPI communications mapped conversation has failed. This condition is caused by a nonzero response from the CICS log manager.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Use the dump to ascertain why the journal or log record could not be written correctly. If a journal record length error is indicated, TIOATDL may have been corrupted.

Problem determination: Register 12 addresses the current TCA and field TCAJCAAD and register 4 address the JCA. The log manager request is contained in JCATR2 and the response code is in JCAJCRC.

Possible request codes are

X'8001' - WRITE
X'8003' - PU

AAOI • AAOL

Possible response codes are

X'01' - IDERROR - Journal identification error
X'02' - INVREQ - Invalid request
X'03' - STATERR - Status error
X'05' - NOTOPEN - Journal not open
X'06' - LERROR - Journal record length error
X'07' - IOERROR - I/O error.

The address of the TIOA is contained in register 8 and its data length is in TIOATDL.

Analysis:

Register	Label	Description
R4=@JCA	TCZARQPJ	JCAJCRC is nonzero.

Module: DFHPCOJ

AAOI

Explanation: The journaling of data received on a CPI Communications mapped conversation has failed.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: This condition is caused by an invalid response from the log manager. Use the dump to ascertain why the journal or log record could not be written correctly. If a journal record length error is indicated, TIOATDL may have been corrupted.

Problem determination: Register 12 addresses the current TCA and field TCAJCAAD and register 4 address the JCA. The CICS log manager request is contained in JCATR2 and the response code is in JCAJCRC.

Possible request codes are

X'8001' - WRITE
X'8003' - PUT

Possible response codes are

X'01' - IDERROR - Journal identification error
X'02' - INVREQ - Invalid request
X'03' - STATERR - Status error
X'05' - NOTOPEN - Journal not open
X'06' - LERROR - Journal record length error
X'07' - IOERROR - I/O error

The address of the TIOA is contained in register 8 and its data length is in TIOATDL.

Analysis:

Register	Label	Description
R4=@JCA	TCZARQPJ	JCAJCRC is nonzero.

Module: DFHPCRI, DFHPCRW

AAOJ

Explanation: CPI Communications has detected an unexpected response from one of its internal routines.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: This is a CICS internal logic error.

A level 2 trace for "CP" of the transaction shows the course of events prior to this error. For example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

You need further assistance from IBM to resolve this problem. See the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCPIC

AAOK

Explanation: CPI Communications has detected an unexpected call to one of its internal routines.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: This is a CICS internal logic error.

A level 2 trace for "CP" of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

You need further assistance from IBM to resolve this problem. See the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCPIC

AAOL

Explanation: CPI Communications has made an invalid call to DFHLUC.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: This is a CICS internal logic error.

A level 2 trace for "CP" of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

You need further assistance from IBM to resolve this problem. See the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCPCLR

AAOM

Explanation: The CPI Communications and the DFHZUSR state machines are out of synchronization.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: This is a CICS internal logic error.

A level 2 trace for “CP” of the transaction shows the course of events prior to this error. For example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

You need further assistance from IBM to resolve this problem. See the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCPCLR, DFHCPSRH

AAON

Explanation: CPI Communications has detected an unexpected response from DFHLUC.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: This is a CICS internal logic error.

A level 2 trace for “CP” of the transaction shows the course of events prior to this error. For example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

You need further assistance from IBM to resolve this problem. See the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCPCLR, DFHCPCLC

AAOO

Explanation: CPI Communications has been invoked with an invalid first parameter. The first parameter should be the code of the function to be performed. This is a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: A level 2 trace for “CP” of the transaction shows the course of events before this error occurred (such as the modules called and their parameters) plus details of the error itself.

You need further assistance from IBM to resolve this problem. See the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCPARH

AAOP

Explanation: The CPI Communications state machine has been requested to perform a state transition request that is considered to be an “impossible” situation. (The *SAA CPI Communications Reference* manual, (SC26-4399) documents all these situations.)

There are two possible causes of this error

- The CPC (conversation control block) has been overwritten in such a way that the conversation state has been altered, or
- There is an error in the CPI Communications state machine.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: A level 2 trace for “CP” of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

The transaction dump shows the CPC. You may need further assistance from IBM to fully resolve this problem. See the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCPCFS

AAOQ

Explanation: The return code generated by CPI Communications does not have an entry in the state table against the current CPI Communications verb. This error is detected by the CPI Communications state machine.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: This is a CICS internal logic error.

A level 2 trace for “CP” of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

You need further assistance from IBM to resolve this problem. See the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCPCFS

AAOR

Explanation: CPI Communications has detected an invalid value in the CPC (conversation control block).

There are 2 possible causes of this error

- The CPC (conversation control block) has been overwritten, or
- There is an error in CPI Communications which causes it to reject valid values.

AAOS • AAOW

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: A level 2 trace for “CP” of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

Module: DFHCPIC

AAOS

Explanation: CPI Communications has detected that the conversation state is RESET for a situation where this should not occur. That is, the conversation control block (CPC) is about to be deleted.

There are two possible causes of this error

- The CPC has been overwritten, or
- There is an error in CPI communications.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: A level 2 trace for “CP” of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself. You may need further assistance from IBM to fully resolve this problem. See the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCPIC

AAOT

Explanation: While chaining through the CPCs (conversation control blocks) for a given conversation, CPI Communications detected that the chain was broken.

There are two possible causes of this error.

1. The CPC chain has been overwritten, or
2. There is an error in the CPI Communications chaining mechanism.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Determine which of the above caused the error.

A level 2 trace for “CP” of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

You may need further assistance from IBM to fully resolve this problem. See the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHPCBI

AAOU

Explanation: CPI Communications has detected an error in the TP_name or partner_LU_name while processing an initialize conversation request. The TP_name or partner_LU_name is obtained by lookup of the sym_dest_name in the partner resource table (PRT).

There are two possible causes of this error.

1. The entry in the PRT contains invalid data, or
2. There is an error in the mechanism that returns the data from the PRT and interprets it.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: A level 2 trace for “CP” of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHPCBI

AAOV

Explanation: CPI Communications has detected that its internal state table is corrupted.

This error is detected by the CPI Communications state machine.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: This is a CICS internal logic error.

A level 2 trace for “CP” of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

You need further assistance from IBM to resolve this problem. See the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHPCFS

AAOW

Explanation: CPI Communications has detected an internal logic error in DFHCPCLC.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: This is a CICS internal logic error.

A level 2 trace for “CP” of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

You need further assistance from IBM to resolve this problem. See the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCPCLC

AAOX

Explanation: CPI Communications has detected a bad syncpoint return code which has been set on a synclevel 0 or 1 conversation. The bad return code is only expected on a synclevel 2 conversation.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: This is a CICS internal logic error.

A level 2 trace for “CP” of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

You need further assistance from IBM to resolve this problem. See the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCPIC

AAOY

Explanation: CPI Communications detected an invalid LL field in the GDS records from which it was receiving on a mapped conversation.

Although it is possible that the remote system is sending invalid records, it is more likely to be an error in the receive logic because DFHZARRC (a lower level receive module) also checks the LLs before passing them to CPI Communications.

System action: The transaction is abnormally terminated with a CICS transaction dump.

ABxx abend codes

ABAC

Explanation: An activity issued EXEC CICS RETURN (without the ENDACTIVITY option) but no events were processed during the activation. The activity was executed with a RUN command.

System action: The task is abnormally terminated with a CICS transaction dump. The EXEC CICS HANDLE ABEND command cannot handle this abend.

User response: Investigate why the activity did not process any events.

Module: DFHBASP

ABAD

Explanation: An activity issued EXEC CICS RETURN ENDACTIVITY while there were activity completion

User response: Use CICS traces and, possibly a VTAM trace, to determine the data that was sent between both systems.

A level 2 CICS trace for “CP” of the transaction documents the course of events prior to this error (such as the modules called and their parameters). The level 2 trace also provides details of the error itself.

You may need further assistance from IBM to fully resolve this problem. See the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCPCRB

AAOZ

Explanation: CPI Communications has detected an invalid ID field in the GDS records it was receiving on a mapped conversation. The exception trace point that accompanies this abend gives the ID field in data 3. The valid IDs are '12FF'X for application data and '12F1'X for null data.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Use CICS traces and, possibly, a VTAM trace to determine the data that was sent between both systems.

A level 2 CICS trace for “CP” of the transaction documents the course of events prior to this error (such as the modules called and their parameters). The level 2 trace also provides details of the error itself.

You may need further assistance from IBM to fully resolve this problem. See the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCPCRB

events pending. The activity was executed with a RUN command.

System action: The task is abnormally terminated with a CICS transaction dump. The EXEC CICS HANDLE ABEND command cannot handle this abend.

User response: Investigate why the activity had pending activity completion events.

Module: DFHBASP

ABAAE

Explanation: An activity issued EXEC CICS RETURN (without the ENDACTIVITY option) but no events were processed during the activation. The activity was executed with a LINK command.

System action: The task which issued the LINK is

ABAF • ABM1

abnormally terminated with a CICS transaction dump. The EXEC CICS HANDLE ABEND command cannot handle this abend.

User response: Investigate why the activity did not process any events.

Module: DFHEIBAM

ABAF

Explanation: An activity issued EXEC CICS RETURN ENDACTIVITY while there were activity completion events pending. The activity was executed with a LINK command.

System action: The task which issued the LINK is abnormally terminated with a CICS transaction dump. The EXEC CICS HANDLE ABEND command cannot handle this abend.

User response: Investigate why the activity had pending activity completion events.

Module: DFHEIBAM

ABLA

Explanation: The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The domain that first detected the purged condition provides an exception trace.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate why the task was purged. It was purged either by the master terminal operator or as a result of deadlock timeout.

If the task was purged by the master terminal operator, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, the number of tasks in the system should be reduced to avoid short-on-storage situations. Another possibility would be to increase the value of the DTIMOUT option for the transaction.

Module: DFHMCP, DFHMCPE, DFHM32, DFHPBP, DFHRLR

ABLB

Explanation: An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated

with a CICS transaction dump.

User response: Please see the related message produced by the domain that originally detected the error.

Module: DFHMCP, DFHMCPE, DFHM32, DFHPBP, DFHRLR

ABM0

Explanation: The map specified for a basic mapping support (BMS) request could not be located.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Check if the map has been defined. If it has, check that it has been specified correctly.

Module: DFHMCP, DFHMCX, DFHMCY

ABM1

Explanation: A basic mapping support (BMS) service is requested by a task associated with a terminal that is not supported by BMS. The request is not a routing request.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Do not use terminals not supported by BMS for applications using BMS services.

Check the terminal type and model number. Confirm that it is a terminal that is not supported by BMS. A list of terminals supported by BMS is given in the *CICS Application Programming Guide*. Check that the TCT macro for the terminal accurately describes the physical terminal.

Problem determination: At the time of the abend, register 11 addresses the TCTTE, and TCTTETE and register 6 address the TCTTE extension, TCTETTE.

Relevant fields are

TCTTEDDS the device dependent suffix.

TCTTEMSS the map set suffix.

Analysis: DFHRLR tests the device dependent suffix and the map set suffix in the TCTTE extension. If both of these are zero, the terminal is not supported by BMS and DFHRLR abends the task with the abend code ABM1.

Register	Label	Description
R4=	RLRSFXCK	TCTEDDS=X'00' and TCTEMSS=X'00'.
@TCTTETE		The device dependent suffix and the map set suffix have loaded into the lower two bytes of register 3 by the subroutine RLRSUFXS.

Module: DFHRLR

ABM2

Explanation: No user data was supplied for this BMS request. That is, the address of a user data area was not found in either TCTTEDA or TCAMSIOA.

When a BMS macro level output request is issued, the user must have placed the address of the data to be passed to BMS in TCTTEDA or TCAMSIOA before issuing the macro. The choice is made on the following criteria

- If the data is to be passed in a TIOA by a terminal-oriented task, the address of this TIOA may be placed either at TCTTEDA, or in TCAMSIOA together with the setting of binary zeros into TCTTEDA.
- If the data is being passed by a terminal-oriented task but not in a TIOA, the address of the TIOA-like area of this data must be placed in TCAMSIOA and binary zeros set into TCTTEDA.
- If the data is being passed by a non-terminal-oriented task, the address of the TIOA-like area of this data must be placed in TCAMSIOA. TCTTEDA cannot be referenced, because there is no TCTTE associated with this task.

If a task attempts to pass addresses from both TCTTEDA and TCAMSIOA, the address in TCTTEDA is the one selected.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: The programmer must place the address of the data into TCTTEDA or TCAMSIOA, whichever is appropriate.

Firstly, check that the user has loaded TCTTEDA or TCAMSIOA with the address of the user data, by checking the application listing and the contents of TCTTEDA and/or TCAMSIOA.

Next, check that the BMS request has been correctly decoded by CICS by referring to the OSPWA request bytes (OSPTR1-8) or decoding the last BMS entry in the trace table. See OSPIND01 to check correct decoding of PAGEBLD or TEXTBLD, and TCAFCI bit 7 to identify whether the task is terminal-oriented or not.

At the abend point, register 1 contains the user data address last loaded, and register 4 the address of OSPTIOA as an address of null data.

If a CICS error is suspected, concentrate initially on subroutine MCPFTIOA, because this is a simple piece of code that shows the data-fetch logic. ABM2 condition is trapped early in the CICS decoding of the DFHBM request and involves module DFHMCP only.

Case/Register Label Description

R9=@OSPWA MCPMAP OSPTR4 has OSPTRM (X'04') bit set for TYPE=MAP.

R9=@OSPWA MCPPGBLD OSPTR5 has OSPTRB (X'80') bit set and BMS sets bit OSPLMPB (X'08') in OSPIND01 for TYPE=PAGEBLD. OSPTR4 has X'40', X'80', or X'C0' set for DATA=NO, ONLY, or YES respectively, so should be X'80' or X'C0'.

R9=@OSPWA MCPTXBLD OSPTR7 has OSPTRX (X'80') bit set and BMS sets bit OSPLMTB (X'04') in OSPIND01 for TYPE=PAGEBLD. OSPTR4 has X'40', X'80', or X'C0' set for DATA=NO, ONLY, or YES respectively, so should be X'80' or X'C0'.

R9=@OSPWA MCPMAPNG OSPTR3 has OSPTSN (X'01'), OSPTSA (X'02'), or OSPTMN (X'04') bits set, or OSPTR4 has OSPTMA (X'10') bit set for mapping. OSPTR4 has X'04' or X'80' or X'C0' set for DATA=NO, ONLY, or YES respectively, so should be X'80' or X'C0'.

All R12=@TCA MCPFTIOA TCAFCI has TCAFCTRM (X'01') bit set if the task is terminal-oriented.

All R11=@TCTTE MCPFTIOA TCTTEDA could point to a use TIOA but does not, thus causing the abend.

All R12=@TCA MCPFTIOA TCAMSIOA could point to a user data area (TIOA or otherwise), but does thus causing the abend.

All R9=@OSPWA MCPNTOTM OSPTIOA contains the address of the user area found, so is zero. OSPSIOA points to OSPIOA (which is copied from TCAMSIOA) as being the second-dry data area sought by BMS for data . OSPIA (TCAMSIOA) was also zero so causing the abend.

ABM3 • ABM4

Problem determination: The output services work area (OSPWA) is addressed by register 9. The TCTTE is addressed by register 11. The TCA is addressed by register 12.

The relevant fields are

OSPIND01

OSPWA indicator byte 1

OSPIOA

Alternate I/O area address

OSPSIOA

Address of address of data
(TCTTEDA/TCAMSIOA)

OSPTIOA

Address of user data found by BMS

OSPTR1-8

BMS request data saved from the TCA

TCTTEDA

Terminal data area address

TCAFCI

Facility control indicator

TCAMSIOA

Alternate I/O area address

Analysis: The ABM2 abend is invoked at one point in DFHMCP, at label MCPABEND. There are five regions in DFHMCP in which the user's data is sought

	Labels
TYPE=MAP	MCPMAP
TYPE=PAGEBLD,DATA=YES/ONLY	MCPPGBLD MCPGTIOA
TYPE=TEXTBLD,DATA=YES/ONLY	MCPPGBLD MCPGTIOA
Mapping but not PAGEBLD,DATA=YES/ONLY	MCPMAPNG
No (mapping,PAGEBLD,TEXTBLD,PAGEOUT)	MCPDFALT

"Mapping" refers to BMS requests that specify maps, that is OSPTR3 bits 5 or 6 or 7 or OSPTR4 bit 3 set on.

Each of these functional regions does a BAL to subroutine MCPFTIOA to search for a user data area. If a valid area (abend ABMU if not) is found, its address is put into OSPTIOA and the address of the data address (of TCAMSIOA or TCTTEDA) is set into OSPSIOA. If a data area is not found, OSPTIOA is cleared and OSPSIOA is now loaded with the address of OSPTIOA as a null data area.

On the BAL return, OSPTIOA is tested for a nonzero value. If it is zero, a branch to MCPABEND is taken.

Module: DFHMCP

ABM3

Explanation: A BMS input or output request has been issued from a task that is not terminal-oriented.

System action: The task is abnormally terminated with a CICS dump.

User response: The task issuing a BMS input or output request must be attached to a terminal.

Module: DFHMCP

ABM4

Explanation: An invalid request response has been received to a temporary storage PUT or PUTQ request issued by BMS. The data passed to the temporary storage program has an invalid length.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Determine from the trace table whether the abend occurred in DFHMCP or DFHTPP.

Check the length of the appropriate area.

If the MCR length is invalid, possible reasons are

- The title record specified in the TITLE option on a BMS ROUTE request has an invalid format, that is, it does not begin with a halfword length field or is more than 64 characters.
- The message is being routed to more terminals than intended. OSPTTCNT is very large, for example, if LIST=ALL is specified on a ROUTE request and there are a large number of terminals in the TCT.

If the page buffer length is too large, this may be because more data than intended is being built into the page. If the page buffer length is greater than the length of the storage area indicated in the preceding storage accounting area, an error has occurred in page or text building, and the page buffer extends beyond the area allocated to it (that is, storage violation).

Problem determination: Abend in DFHMCP (see Analysis)

The OSPWA (output services work area) is in user storage and is printed in a transaction dump. It is addressed by register 9 at the time of the abend. Relevant fields are

OSPTITLE
OSPTTCNT
OSPPLTI
OSPTOTPG

The message control record (MCR) is an area of user storage obtained by BMS. It is addressed by register 8 at the time of the abend. The first 8 bytes contain

storage accounting information. MCRLB contains the length of the MCR (halfword) abend in DFHTPP.

The page buffer is addressed by register 7 at the time of the abend. It contains storage accounting fields in the first 8 bytes and a halfword length at offset 8 (TSIOAVRL).

In both cases, the temporary storage use map (DFHTSMAP) is addressed from CSATSATA. TSMAPCOM contains the number of available bytes in a control interval on the temporary storage data set.

Analysis: If the temporary storage request preceding the abend is a DFHTS PUT, the abend occurred in DFHMCP. If the temporary storage request preceding the abend is a DFHTS PUTQ, the abend occurred in DFHTPP. If the abend occurred in DFHMCP, DFHMCP is attempting to put the message control record to temporary storage. Check the length of the MCR (MCRLB). It may be negative.

The length of the MCR is calculated by code following label MCPNODDS and is

$$28 + 21 * OSPTCNT + (\text{length of title record}) + (\text{space for page/LDC table, if needed})$$

The address of the title record is at OSPTITLE and the length is contained in the first halfword. Space for the page/LDC table is required if OSPPLT1 is nonzero, which should occur only for messages routed to LDC devices (3600, 3650, 3767, 3770, 3790). The number of entries is in OSPTOTPG. 2 bytes are required per entry.

If the abend occurred in DFHTPP, BMS is attempting to add a page to the temporary storage queue, and the page buffer will not fit in the control interval. TSIOAVRL contains the length of the page buffer.

For messages directed to 3270 devices, the page buffer consists of a 3270 data stream with a 4-byte page control area following it (a 3270 data stream may be larger than the number of characters available on the screen, particularly if extended 3270 attributes are used). For messages directed to other devices, the page buffer consists of a message formatted with NL characters, a 4-byte page control area following it. The length in TSIOAVRL should be less than the length in the preceding storage accounting area, otherwise an error has occurred in constructing the page, possibly in prior BMS requests.

In either of the above cases, if the length of the area being output appears valid, it is necessary to increase the control interval size for the temporary storage data set.

Register Label Description

DFHMCP

R8=@MCR MCPMCRS The MCR is too long or has invalid length (\$4).

DFHTPP
R7=@pgbuf TPNOPGL The page buffer is too large.
or
TPNODDS

Module: DFHMCP, DFHTPP

ABM5

Explanation: A DFHTS TYPE=PURGE request has been issued with an invalid REQID. This incorrect request was issued by basic mapping support (BMS).

DFHTPR cannot find the terminal identifier for the current terminal in the terminal list in the message control record (MCR).

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Check the trace table and find the preceding PUT/PUTQ TS requests. Check whether the identifier for the PUT/PUTQ is the same as that for the PURGE. If it is not, find out how they differ. Check to see if the OSPWA has been corrupted.

This error is very unlikely, as the label indicates (TPRSNH - "Should Not Happen"). DFHTPS has scanned the MCR to identify the terminals to which this message is directed, and has created an AID to initiate CSPG (DFHTPR) at each of them. However, when DFHTPR retrieves the MCR, it cannot find the current terminal identifier in the list of terminals. Presumably the MCR has been corrupted between creation of the AID and dispatching of CSPG at the terminal. Check back through the trace table to find the instance of DFHTPS that built the AID for this terminal (transaction CSPS); it will have issued a TC LOCATE request to verify that the terminal identifier is valid, and this identifier can be seen in the trace entry.

Problem determination: The TS identifier is built in TCATSDI before the TS purge is issued, although this has probably been overwritten before the dump is taken. The trace table entry for the DFHTS TYPE=PURGE contains the TS identifier in the last 8 bytes.

The OSPWA is addressed by register 9.

OPSTSID temporary storage identifier (8 bytes).

Register 8 points to the MCR.

Register 5 points to the current entry.

Register 0 points to the end of table.

Register 9 points to the TCTTE.

The terminal list starts at MCRIDLST and the terminal identifier is at the start of the terminal entry. Each terminal entry is X'15 bytes long.

ABM6 • ABMA

Analysis: DFHMCP uses the temporary storage identifier in OSPTSID.

Cannot find the terminal identifier for this terminal in the terminal list in the MCR.

Register	Label	Description
R9=@(OSPWA)	MCPCKPGS	Code builds the temporary storage code in TCATSDI and issues DFHTS TYPE=PURGE macro, specifying IDERROR exit of MCPTSIDE, where the abend is raised.
R8=@(MCR)	TPRCKID	Code scans terminal list for a terminal entry that has the id of the current terminal, and if it cannot be found, links to TPRSNI to raise the abend.

Module: DFHMCP, DFHTPR

ABM6

Explanation: Transaction CSPS, scheduled internally by BMS, has not been installed.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Install the transaction CSPS (Group DFHBMS).

Module: DFHMCP

ABM7

Explanation: The trailer specified to be used while building pages of text data is longer than the page.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Correct the application program that issues the request with too long a trailer.

Module: DFHPBP

ABM8

Explanation: A BMS text request specified a value for the JUSTIFY option which is zero or too large for the page being built.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Correct the application program that specified too large or zero value for the JUSTIFY option.

Module: DFHPBP

ABM9

Explanation: The text data overflow routines have been reentered while text overflow was in process. This condition occurs when the line requirements for the text header and/or trailer exceed the line capacity of the page for which data is being formatted.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Reduce the number of lines required for the header and/or trailer or increase the page size of the terminal.

Module: DFHPBP

ABMA

Explanation: The user has supplied a terminal I/O area (TIOA) with an invalid data length that was either equal to zero or greater than the storage accounting length minus 12.

Alternatively, the length field of a header or trailer area provided by the application program is invalid (that is, not positive).

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Correct the program that supplied the erroneous data length.

Check the TIOA. If either of the conditions described is present, check the application program. For programs using command-level interface, the TIOA is obtained by CICS using the length of the data item passed in the FROM option on an EXEC CICS SEND MAP or EXEC CICS SEND TEXT command, or in the TRAILER or HEADER option on an EXEC CICS SEND TEXT or an EXEC CICS SEND PAGE command. Check the data item for zero length.

Header and trailer records have a special format described in the *CICS Application Programming Reference*. An ABMA abend occurs if the first halfword (the length) is not positive. Check the remainder of the header/trailer record for validity when the length is checked.

Problem determination: The output services work area (OSPWA) is in user storage and will be printed in a transaction dump. It is addressed by register 2 at the time of the abend. Relevant fields are

- OSPTR7
- OSPHDRA
- OSPTRLA

Register 4 or OSPTIOA points to the TIOA. In the TIOA, the following fields are relevant

- TIOATDL
- TIOASAL

Analysis:

Register	Label	Description
R4=@TIOA	PBCKTDL	TIOATDL is zero or greater than TIOASAL-12.
R2=@OSPWA R0=length of trailer R8=@trailer	PBD20080	R0 (= first halfword of trailer) is zero. R8=OSPTRLA. OSPTR7 has X'20' bit set.
R2=@OSPWA R8=@header R0=length of header.	PBDTXHDR	R0 (= first halfword of header) is zero. R8=OSPHDRA. OSPTR7 has X'40' bit set.

Module: DFHPBP, DFHMCP

ABMB

Explanation: The user has specified a cursor position in the BMS output request. It is larger than the current screen size for the 3270 for which output is being built.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Correct the program that specified the incorrect cursor location.

Use trace to identify the statement issuing the request. Check that the cursor position is being correctly set. The program may have been designed to run in alternate screen size mode but is being run in default screen size mode, or it may have been designed to run on a 3270 model different from the one in use. If the program is routing a message, the route list should be checked. If the program is to run with various 3270 models, the cursor position should be within the size of the smallest screen.

Problem determination: If the abend occurs in DFHPBP

At the time of the abend, register 2 points to the OSPWA and register 1 to the TTP. Relevant fields are

- OSPTR3 has X'10 bit set to indicate a user-specified cursor position
- OSPCP contains a halfword cursor position specified by user
- TTPSCSZ contains the halfword value of the screen size to compare against.

If the abend occurs in DFHMCP or DFHMCX

- Register 6 points to the OSPWA (in LIFO storage)
- OSPCP contains a halfword cursor position specified by user
- OSPTR3 has X'10 bit set to indicate a user-specified cursor position
- OSPSCSZ contains the halfword value of the screen size to compare against.

Analysis:

Register	Label	Description
----------	-------	-------------

In DFHPBP

R2=@OSPWA	PBDBADC	OSPTR3 X'10' bit set indicates the user-specified cursor position.
R1=@TTP		TTPSCSZ halfword screen size. OSPCP halfword cursor position.

In DFHKCP or DFHMCX

R6=@OSPWA	MCENEAU2	OSPTR3 X'10' bit set indicates the user-specified cursor position. OSPSCSZ halfword screen size. OSPCP halfword cursor position.
-----------	----------	--

Module: DFHPBP, DFHMCP (for minimum-function BMS), DFHMCX

ABMC

Explanation: The CMSG transaction is attempting to send a message to a greater number of terminals than is possible. There is no fixed maximum because the value depends on the other operands specified on the routing command.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Redefine the route list.

Module: DFHMCP

ABMD

Explanation: DFHTPR or DFHTPP has issued a DFHDI TYPE=SEND and has received a return code other than "FUNCERR-REQUEST FOR CHANGE DIRECTION SIGNALLED" or "NORESP"

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Inform your system programmer.

Module: DFHTPP, DFHTPR

ABME

Explanation: DFHTPR or DFHTPP has detected an invalid datastream or DFHWBBMS detected invalid forms data while processing a basic mapping support (BMS) request.

System action: The transaction is abnormally terminated with a CICS transaction dump. If the ABEND was issued from DFHTPR or DFHTPP then register 7 indicates the location at which the ABEND was detected.

User response: If DFHTPR or DFHTPP issued the ABEND then examine the transaction dump for bad

ABMF • ABML

data in the TIOA. If the origin of the bad data is an application program, correct the program. If DFHWBBS issued the ABEND then check the validity of the incoming forms data in the CICS trace.

Module: DFHTPP, DFHTPR, DFHWBBS

ABMF

Explanation: The value specified for the length option of the basic mapping support (BMS) send map is greater than the length of the “from” area.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Redefine the value for the length option.

Module: DFHPBP

ABMG

Explanation: The user has requested a basic mapping support (BMS) service that was not specified at system generation, or at initialization.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Correlate services requested against options specified in the system generation of BMS.

Follow this procedure

1. Scan the trace table for the transaction ID that issued the abend. If this is CSPQ (page cleanup), module DFHTPQ abnormally terminated because a message purge delay of zero has been specified and CSPQ has been entered via a terminal. The message purge delay is specified in the PRGDLAY of the DFHSIT macro, and its value can be found in SITPRGD.
2. Scan the trace table for the last BMS request (code “FA”). Use the option bytes at the start of the failing module to see if the requested functions have been generated. For example, paging may have been requested, but standard or minimum BMS was specified in the SIT.”
3. If the BMS request is compatible with the BMS options in the CICS system generation, some incompatible suffixing amongst BMS modules must have occurred. This can happen if the DFHSIT macro specified individual suffixes for the BMS modules.

The following modules differ between standard and full-function BMS

DFHMCP
DFHRLR
DFHPBP
DFHTPP

Module: DFHMCP, DFHTPQ

ABMI

Explanation: The map specified for a BMS input mapping request was not an input map.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Either define another input map or redefine the existing map.

Module: DFHMCP, DFHMCX, DFHMCY

ABML

Explanation: The terminal control locate routine received invalid data from DFHRLR and returns with an error return code. DFHRLR is attempting to scan the TCT for a BMS ROUTE request with LIST=ALL or operator class or operator ID specified in the route list. The terminal control table may have been corrupted.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

The terminal control table has probably been corrupted during execution. Attempt to scan through the TCT in a dump. (Because the system dump uses the same technique for printing all TCTTEs, the system dump fails at the same point.)

Determine which entry is incorrect. It may be that the TCTTE has been overwritten by user data that is recognizable in the dump.

Check the application program for references to the TCTTE pointer. Check for user data that may be addressed from the same pointer.

In an assembler program, there may be multiple equates for the TCTTE base register.

It may be that the TCT is being overwritten by some earlier transaction. If this is so, it is probably one associated with the terminal whose TCTTE is overwritten.

Problem determination: Register 11 points to the current TCTTE in the search.

The TCT prefix (DFHTCTFX) can be located from CSATCTBA.

The first terminal entry (TCTTE) in the TCT is addressed by TCTVTEBA.

TCTTETEL is the halfword offset from current TCTTE to the next.

Analysis: The current TCTTE address is either not on a full-word boundary or is not within the limits of the TCT, or the address of the next TCTTE, obtained by adding TCTTETEL to the current address, is invalid. This check is made by locate code (DFHZLOC) in DFHZCX.

Register	Label	Description
R11=0TCTTE	RLRLOCN	Issue DFHTC CTYPE=LOCATE

Module: DFHRLR for full-function BMS

ABMM

Explanation: An invalid map was specified.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Use the supplied dump to diagnose the problem. Register 6 contains the address of the BMS instruction being executed when the error was recognized.

Module: DFHPBP

ABMO

Explanation: The map specified for a BMS output mapping request was not an output map.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Either define another output map or redefine the existing map.

Module: DFHMCP, DFHMCX, DFHMCY

ABMQ

Explanation: The query transaction (CQRY) has been initiated and either the task is not terminal-oriented, or the associated terminal is not defined to CICS as a 3270 or SCSPRINT device. This abend will occur if CQRY is entered at a console, even when the console is a 3270 device, since the console has the appearance to CICS of a keyboard/printer device. The CQRY transaction does not have an operator interface, and under normal conditions there is no need for an operator to invoke CQRY or for a user transaction to START the CQRY transaction. CQRY is run automatically by CICS when a 3270 or SCSPRINT device connects. In the transaction dump, register 8 contains the address of the TCTTE for the associated terminal. If register 8 contains zero, this indicates that the task is not terminal-oriented.

System action: The task is abnormally terminated with a CICS dump.

User response: Ensure that the terminal associated with CQRY is of the 3270 or SCSPRINT family of devices.

Module: DFHQRY

ABMR

Explanation: The Page Retrieval transaction (CSPG) has been initiated but the task is not terminal-oriented.

System action: The task is abnormally terminated with a CICS dump.

User response: Ensure that a terminal is associated with the CSPG transaction.

Module: DFHTPR

ABMU

Explanation: The application program supplied an address that is not within region boundaries. The low-order 3 bytes of general register 1 in the transaction dump contain the erroneous address. The high-order byte of register 1 indicates the address type as follows

X'01' - Title address (TCAMSTA)
 X'02' - Alternate I/O area address (TCAMSIOA)
 X'03' - Map address (TCABMSMA)
 X'04' - Header address (TCAMSHDR)
 X'05' - Route list address (TCAMSRLA)
 X'06' - Trailer address (TCAMSTRL)
 X'07' - Map set address (TCAMSMSA)
 X'08' - TIOA address (TCTTEDA)

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Correct the application program that is supplying the erroneous address.

Module: DFHMCP, DFHEMS

ABMV

Explanation: DFHRLR has detected an invalid route list entry.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Check that the route list is correctly built with reserved field in the entry containing blank and a stopper of halfword X'FFFF' to terminate the list.

Module: DFHRLR

ABMX

Explanation: A text string passed to BMS contained a set attribute order that was invalid for one of the following reasons

1. The set attribute sequence was less than three characters.
2. The attribute type was invalid.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Correct the application program.

Module: DFHPBP

ABMY

Explanation: BMS is building a TTP (Terminal Type Parameter) control block but the pagesize selected for a terminal by BMS is zero because either the default or alternate screensize has been defined as zero.

In the transaction dump, significant general purpose register contents are as follows

1. Register 6 points to the BMS extension of the TCTTE
2. Register 10 points to the TTP (Terminal Type Parameter) control block
3. Register 11 points to the TCTTE

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check the TERMINAL and TERMTYPE definitions which determined the attributes of the offending TCTTE.

Module: DFHRLR

ABMZ

Explanation: The address of the terminal I/O area (TIOA) in TCTTEDA was found to be zero.

When using BMS fast path as a result of an EXEC CICS RECEIVE MAP, DFHEMS always initializes TCTTEDA with the address of the TIOA. If TCTTEDA is subsequently found to be zero by DFHMCX, an overwrite must have occurred.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Investigate why TCTTEDA is zero.

Scan the trace table for the last BMS request (code FA) for the failing task and try to determine which user programs have been given control since that BMS request.

Module: DFHMCP, DFHMCX, DFHMCY

ABNA

Explanation: No route list was supplied with a route request received from the :i1.DFHTPS abend codes remote system.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHTPS

ABNB

Explanation: Either the principal facility of the task is not a TCTTE of the correct type, or the task has no principal facility.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Ensure that DFHTPS has not been specified as the initial program of a transaction other than CSPS. Check that the operator did not enter CSPS from the terminal.

Module: DFHTPS

ABNC

Explanation: An attempt to access a temporary storage queue failed.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Ensure that temporary storage is correctly generated.

Module: DFHTPS

ABNE

Explanation: An error response was received from an invocation of a BMS TYPE=ROUTE or TYPE=STORE request.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check that BMS was correctly generated.

Module: DFHTPS

ABNF

Explanation: The transaction was not in send mode when it sent data to the remote system.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHTPS

ABNG

Explanation: An attach request was received from the remote system without any data indicating the reason for the request.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM

to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHTPS

ABNH

Explanation: An attempt to ship data to the remote system failed.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHTPS

ABNI

Explanation: CICS could not find a profile for an LU6.2 transaction routing request.

System action: CICS terminates the task abnormally.

User response: Either you have specified an incorrect name in the PROFILE parameter of an EXEC CICS ALLOCATE command, or you have not installed the profile. Correct the error before resubmitting the transaction.

Module: DFHTPS

ABNJ

Explanation: The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The task that first detected the purged condition provides an exception trace.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate the reason why the task was purged. It was purged either by the master terminal operator or as a result of a deadlock timeout.

Module: DFHTPS

ABNK

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related message produced by the domain that detected the original error.

Module: DFHTPS

ABR3

Explanation: An unsupported BMS request was received by the bridge exit.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: The bridge only supports minimum function BMS and SEND TEXT. This transaction cannot be used in a bridge environment.

Module: DFHEMS

ABR4

Explanation: The link DFHL3270 command did not specify a commarea.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: The link DFHL3270 command must specify a commarea to contain the BRIH and any message vectors.

Module: DFHBRMR

ABR5

Explanation: The commarea specified in the link DFHL3270 command is shorter than the BRIH.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: The link DFHL3270 command must specify a commarea to contain the BRIH and any message vectors.

Module: DFHBRMR

ABR6

Explanation: The commarea specified in the link DFHL3270 command does not contain a valid BRIH.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: The link DFHL3270 command must specify a commarea which must contain a valid BRIH.

Module: DFHBRMR

ABRC

Explanation: The bridge exit is not defined and could not be autoinstalled.

System action: The task is abnormally terminated with a CICS transaction dump. The user transaction will not be started.

User response: Either define the program using RDO or change the program autoinstall exit to allow it to be autoinstalled.

Module: DFHBRMS, DFHBRTC

ABRD

Explanation: The bridge exit is disabled.

System action: The task is abnormally terminated with a CICS transaction dump. The user transaction will not be started.

User response: Identify why the bridge exit is disabled. Enable the bridge exit and retry the action.

Module: DFHBRMS, DFHBRTC

ABRE

Explanation: The bridge exit could not be loaded.

System action: The task is abnormally terminated with a CICS transaction dump. The user transaction will not be started.

User response: Investigate why it cannot be loaded. It may not have been defined in the DFHRPL library.

Module: DFHBRMS, DFHBRTC

ABRF

Explanation: The bridge exit is defined as remote.

System action: The task is abnormally terminated with a CICS transaction dump. The user transaction will not be started.

User response: Define the bridge exit as a local program.

Module: DFHBRMS, DFHBRTC

ABRG

Explanation: An invalid bridge facility token was specified

System action: The task is abnormally terminated with a CICS transaction dump. The user transaction will not be started.

User response: This error was probably caused by the incorrect data being sent to the bridge exit from the client application.

Check the data set by tracing the data sent from the client application.

Ensure that the bridge facility token in the data transmitted by the application is correct.

Module: DFHBRXM

ABRH

Explanation: The bridge facility token specified is not known to CICS.

System action: The task is abnormally terminated with a CICS transaction dump. The user transaction will not be started.

User response: The most likely error is that the client application specified too small a keep time for the bridge facility. Before the client reused the bridge facility token, CICS had already discarded it. Check the bridge facility keep time in the outbound messages. CICS will use the keep time value specified in the last message used by a transaction. Alternatively use the trace or CEDX to look at the keep time in the BRXA passed back on the terminate call to the bridge exit.

Another possible error is that the client application passed a request to a CICS system other than that on which the original request was sent. Bridge facilities are only valid on a single CICS system.

Module: DFHBRXM

ABRI

Explanation: There are no free bridge facility tokens available. This is probably due to excessive keep time values being specified on the bridge exit termination call.

System action: The task is abnormally terminated with a CICS transaction dump. The user transaction will not be started.

User response: Review the keep time values used by the client applications. If some client applications are returning excessive values, modify the bridge exit to specify a limit to the values.

Module: DFHBRXM

ABRJ

Explanation: An invalid FACILITYLIKE value was specified.

The FACILITYLIKE value can be specified on the bridge exit initialization call. If the default value (blanks) is returned, the value in the user transaction profile definition is used. If no FACILITYLIKE value is specified in the profile definition, a value of CBRF is used.

The name must be that of an installed VTAM 3270 terminal.

System action: The task is abnormally terminated with a CICS transaction dump. The user transaction will not be started.

User response: Define the terminal specified by FACILITYLIKE, change the value on the profile definition, change the value supplied by the client application, or install a terminal definition for CBRF

Module: DFHBRXM

ABRK

Explanation: The USERID check failed following the call to the bridge exit.

System action: The task is abnormally terminated with a CICS transaction dump. The user transaction will not be started.

User response: Enter the correct password. If the password is correct or was not supplied, review the RACF definitions.

Module: DFHBRXM

ABRN

Explanation: The bridge exit returned a value in BRXA_RESP that is not valid for the command for which it was invoked.

System action: The transaction is backed out.

User response: Change the bridge exit to only return valid response settings.

Module: DFHBRIC, DFHBRMS, DFHBRSP, DFHBRTC

ABRP

Explanation: The bridge client is no longer available.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Determine why the bridge client is no longer available. It might have been purged.

Module: DFHBRME

ABRQ

Explanation: The bridge exit issued an abend.

System action: The transaction is backed out.

User response: Identify why the bridge exit abended.

Module: DFHBRMS, DFHBRTC

ABRR

Explanation: The user transaction's profile could not be found.

System action: The task is abnormally terminated with a CICS transaction dump. The user transaction is not started.

User response: Check that the profile name in the user transaction definition is correct, and that this profile has been defined.

Module: DFHBRXM

ABRX

Explanation: The bridge facility was invalid when a transaction started. This can occur when MAXTASK is reset to a low value on a busy system. The bridge facility can time out and be deleted before the user transaction is started.

System action: The user transaction will abend during initialisation.

User response: None.

Module: DFHBRXM

ABRY

Explanation: CICS returned an unexpected error running the bridge exit. This is a CICS internal error.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHBRMS, DFHBRTC

ABRZ

Explanation: The bridge exit returned invalid data in the BRXA.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: If a user supplied bridge exit was used, review the format of the data returned by the exit.

If a CICS supplied exit was used, this is a CICS error. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHBRIC, DFHBRMS, DFHBRSP, DFHBRTC, DFHXMBR

ABSA

Explanation: A message passed to DFHBSMSG is too long. This is a CICS internal error.

System action: CICS terminates the task abnormally with a dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHTBS

ABX1

Explanation: The bridge exit or formatter was called with an invalid BRXA-HEADER. This indicates a storage overwrite.

System action: An exception trace is made of the data in error. The task is abnormally terminated with a CICS transaction dump.

As CICS also does a check of the BRXA on return from the call to the exit, there will probably be a subsequent ABRZ abend.

User response: Investigate the cause of the storage error, and retry.

Module: DFH0CBAE,DFH0CBRE,DFH0CBRF

ABX2

Explanation: The bridge exit or formatter was called with an invalid BRXA-TRANSACTION-AREA. This indicates a storage overwrite.

System action: An exception trace is made of the data in error. The task is abnormally terminated with a CICS transaction dump.

As CICS also does a check of the BRXA on return from the call to the exit, there will probably be a subsequent ABRZ abend.

User response: Investigate the cause of the storage error, and retry.

Module: DFH0CBAE,DFH0CBRE,DFH0CBRF

ABX3

Explanation: The bridge exit or formatter was called with an invalid BRXA-COMMAND-AREA. This indicates a storage overwrite.

System action: An exception trace is made of the data in error. The task is abnormally terminated with a CICS transaction dump.

As CICS also does a check of the BRXA on return from the call to the exit, there will probably be a subsequent ABRZ abend.

User response: Investigate the cause of the storage error, and retry.

Module: DFH0CBAE,DFH0CBRE,DFH0CBRF

ABX5

Explanation: The bridge exit or formatter was called without a user-area. This probably indicates an error in the bridge exit.

System action: An exception trace is made of the data in error. The task is abnormally terminated with a CICS transaction dump.

User response: Investigate the cause of the storage error, and retry.

Module: DFH0CBAE,DFH0CBRE,DFH0CBRF

ABX6

Explanation: The bridge exit or formatter was called with an invalid user-area. This indicates a storage overwrite or an error in the bridge exit.

System action: An exception trace is made of the data in error. The task is abnormally terminated with a CICS transaction dump.

User response: Investigate the cause of the storage error, and retry.

Module: DFH0CBAE,DFH0CBRE,DFH0CBRF

ABX7

Explanation: A TC command passed to the formatter, exceeded the maximum message size.

System action: An exception trace is made of the first 4K of data in error. The task is abnormally terminated with a CICS transaction dump.

User response: Check that the user transaction is passing the correct data. If it is, it will be necessary to change the size of the buffer. This is in field block-length in the sample exit. Recompile and reload the exit and retry.

Module: DFH0CBRF

ABX8

Explanation: A next BMS BRMQ vector in the input message passed to the formatter does not contain the mapset requested to answer a RECEIVE MAP request.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: This may just indicate that the transaction has gone down an error path which should result in a transaction backout. If not, the input message should have a BRMQ vector for this mapset. Change the client application, recompile and retry.

Module: DFH0CBRF

ABX9

Explanation: A next BMS BRMQ vector in the input message passed to the formatter does not contain the mapname requested to answer a RECEIVE MAP request.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: This may just indicate that the transaction has gone down an error path which should

result in a transaction backout. If not, the input message should have a BRMQ vector for this mapname. Change the client application, recompile and retry.

Module: DFH0CBRF

ABXA

Explanation: A next BRMQ vector in the input message passed to the formatter is the wrong type of a RECEIVE vector. RECEIVE and RECEIVE MAP have separate vectors.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: This may just indicate that the transaction has gone down an error path which should result in a transaction backout. If not, the input message should have a BRMQ vector for this command. Change the client application, recompile and retry.

Module: DFH0CBRF

ABXB

Explanation: The BRIH requested that outbound BMS vector must include the ADS descriptor. The map did not contain an ADS descriptor. This means that the mapset was not assembled with CICS TS 1.2 or later.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Either reassemble the mapset using the current level of BMS macros, or set BRIH-ADSDIRECTOR to BRIHADSD-NO (the default value is BRIHADSD-YES). Note that BRIHADSD-YES is required when codepage conversion of the Link3270 message is required (e.g. using ECI). If you need to reassemble the mapset and don't have the mapset source, the utility DFHBMSUP can be used to recreate it.

Module: DFHBRMF

ABXC

Explanation: An error occurred when a SYNCPOINT request was issued by the bridge exit.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check for other CICS messages and exception trace entries to investigate the cause of the SYNCPOINT error.

Module: DFH0CBRE

ABXD

Explanation: An error occurred when a SYNCPOINT ROLLBACK request was issued by the bridge exit.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check for other CICS messages and exception trace entries to investigate the cause of the SYNCPOINT ROLLBACK error.

Module: DFH0CBRE

ABXE

Explanation: The bridge exit was expecting data to be passed on the BRDATA parameter of the START command. No data was found.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Correct the transaction which issued the START. Recompile, reload and retry.

Module: DFH0CBAE,DFH0CBRE

ABXF

Explanation: An error was detected by the bridge exit when it tried to input the next message.

System action: An exception trace is made of any error information. The task is abnormally terminated with a CICS transaction dump.

User response: Check for other CICS messages and exception trace entries to investigate the cause of the input error.

Module: DFH0CBAE,DFH0CBRE,DFH0CBAI

ABXG

Explanation: An error was detected by the bridge exit when it tried to output the next message.

System action: An exception trace is made of any error information. The task is abnormally terminated with a CICS transaction dump.

User response: Check for other CICS messages and exception trace entries to investigate the cause of the output error.

Module: DFH0CBAE,DFH0CBRE

ABXH

Explanation: The user transaction issued a request which requires more data (such as a RECEIVE request). No data was available in the message, and mqcih-conversationaltask was set to mqcct-no which specifies that the transaction is non conversational.

System action: The task is abnormally terminated

ABXI • ABXQ

with a CICS transaction dump.

User response: This may be correct behaviour as defined by the client application. If it is not, the client application should either supply additional data, or be redesigned to allow the transaction to be conversational.

Module: DFH0CBRF

ABXI

Explanation: A message received by the bridge exit, exceeded the maximum message size.

System action: An exception trace is made of the first 4K of data in error. The task is abnormally terminated with a CICS transaction dump.

User response: Check that the client application is passing the correct data. If it is, it will be necessary to change the size of the buffer. This is in field block-length in the sample exit. Recompile and reload the exit and retry.

Module: DFH0CBAE,DFH0CBRE

ABXJ

Explanation: The bridge exit detected an error in the MQCIH header passed by the client application.

System action: An exception trace is written containing the MQCIH header. The task is abnormally terminated with a CICS transaction dump.

User response: The client application has either not set the MQCIH header, or is using a version of the header which is incompatible with the bridge exit. Correct the client application. Recompile, reload and retry.

Module: DFH0CBAE,DFH0CBRE

ABXK

Explanation: The bridge exit detected an error in the data passed on the BRDATA parameter of the START command.

System action: An exception trace is made of the data in error. The task is abnormally terminated with a CICS transaction dump.

User response: Correct the transaction which issued the START. Recompile, reload and retry.

Module: DFH0CBAE,DFH0CBRE

ABXM

Explanation: The bridge exit or formatter was called with a function or command which it doesn't support. This either indicates a storage overwrite, or that the bridge exit is not designed for this command.

System action: An exception trace is made of the

data in error. The task is abnormally terminated with a CICS transaction dump.

User response: Check the BRXA data in the trace to see if there has been a storage overwrite, or whether the exit supports this command.

Module: DFH0CBAE,DFH0CBRE,DFH0CBRF

ABXN

Explanation: The formatter detected that the input message was truncated.

System action: An exception trace is made of the first 4K of the message. The task is abnormally terminated with a CICS transaction dump.

User response: Check that the transport mechanism allows for messages of this length. If this is correct, it indicates that the client application is issuing an incorrect message. Trace the outbound message on the client application. Recompile, reload and retry.

Module: DFH0CBRF

ABXO

Explanation: The formatter detected an error in a BRMQ vector passed by the client application.

System action: The field MQCIH-ERROROFFSET is set to indicate the position of the error in the message. An exception trace is made of the MQCIH and BRMQ vector. The task is abnormally terminated with a CICS transaction dump.

User response: Correct the client application. Recompile, reload and retry.

Module: DFH0CBRF

ABXP

Explanation: The formatter detected an error in a BRMQ vector header passed by the client application.

System action: The field MQCIH-ERROROFFSET is set to indicate the position of the error in the message. An exception trace is made of the MQCIH and BRMQ vector. The task is abnormally terminated with a CICS transaction dump.

User response: Correct the client application. Recompile, reload and retry.

Module: DFH0CBRF

ABXQ

Explanation: The formatter could not find an ADSD vector as part of the BRMQ-RM vector when MQCIH-ADSDDESCRIPTOR specified MQCADSD-MSGFORMAT.

System action: An exception trace is made of the

request. The task is abnormally terminated with a CICS transaction dump.

User response: Correct the client application. Recompile, reload and retry.

Module: DFH0CBRF

ABXS

Explanation: An error was detected by the bridge exit when it tried to open the queue for the input or output message.

System action: An exception trace is made of any error information. The task is abnormally terminated with a CICS transaction dump.

User response: Check for other CICS messages and exception trace entries to investigate the cause of the open error.

Module: DFH0CBRE

ABXU

Explanation: The conversion between client code page and server code page is not supported by

CICS/390; for example conversion has been requested between Japanese code page 932 and Latin-1 code page 500.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Ensure that the Client codepage, both default and overrides are in the same group as the Server codepage. For example client code page 852 from Latin-2 group, is only supported to server code page 870.

Module: DFHBRMF

ABXV

Explanation: The client code page which has been requested by the client is not one which CICS can support.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Ensure that the Client codepage is valid.

Module: DFHBRMF

ACxx abend codes

ACAA

Explanation: This explanation applies to the two transaction abend codes, ACAA and ACAD. CICS cannot find a match for a function code in the language definition table because the parameterized resource definition contains an unrecognized resource type code. The abend code issued depends on the DFHCAP operation that was invoked before the error occurred

Abend DFHCAP operation

ACAA ANALYZE
ACAD DEFAULTS

The cause of the abend is either

- The language definition table, DFHEITCU, in the library is invalid for the release of CICS you are running, **or**
- A CICS logic error has occurred.

System action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User response: Ensure that the DFHEITCU module is in the library and is valid for this release of CICS.

If a valid version of DFHEITCU is already in the library, a CICS logic error has occurred. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCAP

ACAD

Explanation: See **ACAA**.

Module: DFHCAP

ACAI

Explanation: An internal error has occurred when module DFHCAP was invoked. There was an invalid function code for a domain call to DFHCAP.

System action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCAP

ACAJ

Explanation: An internal error has occurred when module DFHCAP was invoked while processing an EXEC CICS CREATE command. The preallocated dynamic storage area was too small.

System action: The transaction executing the EXEC

ACAM • ACCD

CICS CREATE command is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCAP

ACAM

Explanation: An internal error has occurred when module DFHECBAM was invoked while processing a CBAM transaction.

System action: CBAM is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHECBAM

ACC1

Explanation: Abend codes with "ACC" as the first three characters are issued by the C/370 compiler running under CICS. These are documented in the *C/370 User's Guide*.

ACC2

Explanation: Abend codes with "ACC" as the first three characters are issued by the C/370 compiler running under CICS. These are documented in the *C/370 User's Guide*.

ACC3

Explanation: Abend codes with "ACC" as the first three characters are issued by the C/370 compiler running under CICS. These are documented in the *C/370 User's Guide*.

ACC4

Explanation: Abend codes with "ACC" as the first three characters are issued by the C/370 compiler running under CICS. These are documented in the *C/370 User's Guide*.

ACC5

Explanation: Abend codes with "ACC" as the first three characters are issued by the C/370 compiler running under CICS. These are documented in the *C/370 User's Guide*.

ACC6

Explanation: Abend codes with "ACC" as the first three characters are issued by the C/370 compiler running under CICS. These are documented in the *C/370 User's Guide*.

ACC7

Explanation: Abend codes with "ACC" as the first three characters are issued by the C/370 compiler running under CICS. These are documented in the *C/370 User's Guide*.

ACC8

Explanation: Abend codes with "ACC" as the first three characters are issued by the C/370 compiler running under CICS. These are documented in the *C/370 User's Guide*.

ACC9

Explanation: Abend codes with "ACC" as the first three characters are issued by the C/370 compiler running under CICS. These are documented in the *C/370 User's Guide*.

ACCA

Explanation: Abend codes with "ACC" as the first three characters are issued by the C/370 compiler running under CICS. These are documented in the *C/370 User's Guide*.

ACCB

Explanation: Abend codes with "ACC" as the first three characters are issued by the C/370 compiler running under CICS. These are documented in the *C/370 User's Guide*.

ACCC

Explanation: Abend codes with "ACC" as the first three characters are issued by the C/370 compiler running under CICS. These are documented in the *C/370 User's Guide*.

ACCD

Explanation: Abend codes with "ACC" as the first three characters are issued by the C/370 compiler running under CICS. These are documented in the *C/370 User's Guide*.

ACCU

Explanation: Abend codes with “ACC” as the first three characters are issued by the C/370 compiler running under CICS. These are documented in the *C/370 User's Guide*.

ACCV

Explanation: Abend codes with “ACC” as the first three characters are issued by the C/370 compiler running under CICS. These are documented in the *C/370 User's Guide*.

ACCW

Explanation: Abend codes with “ACC” as the first three characters are issued by the C/370 compiler running under CICS. These are documented in the *C/370 User's Guide*.

ACCx

Explanation: Abend codes with “ACC” as the first three characters are issued by the C/370 compiler running under CICS. These are documented in the *C/370 User's Guide*.

ACCY

Explanation: Abend codes with “ACC” as the first three characters are issued by the C/370 compiler running under CICS. These are documented in the *C/370 User's Guide*.

ACCZ

Explanation: Abend codes with “ACC” as the first three characters are issued by the C/370 compiler running under CICS. These are documented in the *C/370 User's Guide*.

ACFA

Explanation: During the loading of a Coupling Facility Data Table by the CFCL transaction, an abend was detected or a domain call returned a response (such as DISASTER) after which normal processing could not continue.

System action: A message is issued (one of DFHFC7100, DFHFC7101, DFHFC7103 or DFHFC7104). Loading of the data table is terminated and CFCL abends.

User response: If this abend is produced as a result of an abend during loading, message DFHFC7103 is issued. If it is a result of a domain call failure, depending on which domain the failure was returned by, one of the messages DFHFC7100, DFHFC7101 or DFHFC7104 is issued. Refer to the description of the

message for further information and guidance.

Module: DFHFCDL

ACFB

Explanation: A transaction has issued a request to a coupling facility data table for which it holds an active lock, but after the lock was acquired, the coupling facility data table server for the pool in which this coupling facility data table resides failed and was restarted. This request is of a type which cannot continue against a new instance of the server, because it is reliant on the lock which was acquired before the server failed.

System action: The requesting transaction abends with a transaction dump.

CICS continues normally.

User response: Retry the failed transaction.

Module: DFHEIFC

ACFC

Explanation: A transaction has issued a request to a coupling facility data table which was last accessed using a previous instance of the coupling facility data table server (that is, the server for the pool in which this coupling facility data table resides has failed and been restarted one or more times since the last access). We therefore need to reopen the access between this CICS file and the coupling facility data table, but the attempt to reopen access has failed.

System action: The requesting transaction abends with a transaction dump.

CICS continues normally.

User response: Retry the failed transaction. If the error continues to occur, issue an explicit close request for the file, followed by an explicit open request.

Module: DFHEIFC

ACFD

Explanation: During the loading of a Coupling Facility Data Table by the CFCL transaction, a call to the CICS Transaction Manager has returned a response (such as DISASTER) after which normal processing could not continue.

System action: Message DFHFC7121 is issued. Loading of the data table is terminated and CFCL abends.

User response: Refer to the description of the message for further information and guidance.

Module: DFHFCDL

ACFE

Explanation: An attempt was made to attach a transaction specifying DFHFCDL as the program to be given control, but the transaction was not internally attached by CICS.

DFHFCDL is for use by CICS system transaction CFCL. This loads a Coupling Facility Data Table.

System action: The transaction is abnormally terminated. CICS processing continues.

User response: Establish why an attempt was made to attach CFCL illegally, or why a transaction definition specified DFHFCDL as the program to be given control.

Module: DFHFCDL

ACHA

Explanation: The remote server transaction, CEHS, is not at a compatible level to operate with the CICS/CMS system. This usually indicates that the service levels of CICS/CMS and the remote server are different.

System action: CICS terminates the remote server transaction abnormally with a dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Problem determination: To diagnose a problem with the remote server, it is generally helpful to obtain a trace of the remote server's activity up to the point of failure.

A remote server trace is obtained by invoking the remote server with the TRACE option, (type CEHS TRACE). The remote server operates as normal but causes entries to be written to a trace log in temporary storage. Note that main storage, not auxiliary, is used for this queue hence large amounts of memory can be used up if this trace is left on for long.

The trace is found in a queue whose name is "CEHSxxxx", where 'xxxx' is the four-character terminal identifier. The queue can be browsed in text form or in hexadecimal form using CEBR. To find the terminal identifier, invoke CEBR on the terminal that has run CEHS, without giving a queue name. The queue name will default to 'CEBRxxxx', where "xxxx" is the terminal identifier. "

Note: CEBR requires the queue name to be in UPPER CASE.

For a description of the remote server and its trace entries and abend codes, see the *CICS/VS Remote Server Diagnosis Manual* (LC33-0438).

Module: DFHCHS

ACHB

Explanation: The remote server has received a data frame from CICS/CMS that is out of sequence. A frame may have been lost in transmission.

System action: CICS terminates the remote server abnormally with a dump.

User response: Reestablish the connection between CICS/CMS and the remote CICS system and try to use the remote server again. For further information, see the "Problem Determination" section for abend code ACHA.

If the problem persists, you will need assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCHS

ACHC

Explanation: The remote server did not receive the expected acknowledgement type data frame from CICS/CMS.

System action: CICS terminates the remote server abnormally with a dump.

User response: Reestablish the connection between CICS/CMS and the remote CICS system and try to use the remote server again. For further information, see the "Problem Determination" section for abend code ACHA.

If the problem persists, you will need assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCHS

ACHD

Explanation: The remote server did not receive the expected response type data frame from CICS/CMS.

System action: CICS terminates the remote server abnormally with a dump.

User response: Reestablish the connection between CICS/CMS and the remote CICS system and try to use the remote server again. For further information, see the "Problem Determination" section for abend code ACHA.

If the problem persists, you will need assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCHS

ACHE

Explanation: The remote server received an unexpected data frame from CICS/CMS. This indicates a logic error in the remote server.

System action: CICS terminates the remote server abnormally with a dump.

User response: Reestablish the connection between CICS/CMS and the remote CICS system and try to use the remote server again. For further information, see the “Problem Determination” section for abend code ACHA.

If the problem persists, you will need assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCHS

ACHF

Explanation: The remote server attempted to send one of a series of data frames to CICS/CMS when, at this time, only a single frame is allowed. This indicates a logic error in the remote server.

System action: CICS terminates the remote server abnormally with a dump.

User response: Reestablish the connection between CICS/CMS and the remote CICS system and try to use the remote server again. For further information, see the “Problem Determination” section for abend code ACHA.

If the problem persists, you will need assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCHS

ACHG

Explanation: The remote server attempted to send data to CICS/CMS. However, it was not set to the correct mode to do so. This indicates a logic error in the remote server.

System action: CICS terminates the remote server abnormally with a dump.

User response: Reestablish the connection between CICS/CMS and the remote CICS system and try to use the remote server again. For further information, see the “Problem Determination” section for abend code ACHA.

If the problem persists, you will need assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCHS

ACHH

Explanation: A TIOA has not been created from the data received by the remote server from CICS/CMS.

System action: CICS terminates the remote server abnormally with a dump.

User response: Reestablish the connection between CICS/CMS and the remote CICS system and try to use the remote server again. For further information, see the “Problem Determination” section for abend code ACHA.

If the problem persists, you will need assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCHS

ACHI

Explanation: The remote server has received an unexpected return code from the Transformer 2 program.

System action: CICS terminates the remote server abnormally with a dump.

User response: For further information, see the “Problem Determination” section for abend code ACHA.

Module: DFHCHS

ACHJ

Explanation: An error has occurred processing a request from CICS/CMS which had the “No-Reply” option. The remote server cannot, therefore, return the error condition to CICS/CMS.

System action: CICS terminates the remote server abnormally with a dump.

User response: Reestablish the remote server and diagnose the problem by executing the same command from CECI under CICS/CMS without the NOCHECK option. For further information, see the “Problem Determination” section for abend code ACHA.

Module: DFHCHS

ACHK

Explanation: The transformer program has requested neither EIP nor DLI to execute the request received from CICS/CMS. This indicates a logic error because the request has to be destined for either EIP or DLI.

System action: CICS terminates the remote server abnormally with a dump.

User response: For further information, see the “Problem Determination” section for abend code ACHA.

Module: DFHCHS

ACHL

Explanation: CICS/CMS has supplied a buffer to the remote server which is not large enough to hold the reply that the remote server has to return.

System action: CICS terminates the remote server abnormally with a dump.

User response: Reestablish the connection between CICS/CMS and the remote CICS system and try to use the remote server again. For further information, see the “Problem Determination” section for abend code ACHA.

If the problem persists, you will need assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCHS

ACHM

Explanation: The remote server has tried to receive a response from CICS/CMS which failed repeatedly until the retry limit was exceeded.

System action: CICS terminates the remote server abnormally with a dump.

User response: Reestablish the connection between CICS/CMS and the remote CICS system and try to use the remote server again. For further information, see the “Problem Determination” section for abend code ACHA.

If the problem persists, you will need assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCHS

ACHN

Explanation: The remote server has tried to receive a request from CICS/CMS which failed repeatedly until the retry limit was exceeded.

System action: CICS terminates the remote server abnormally with a dump.

User response: Reestablish the connection between CICS/CMS and the remote CICS system and try to use the remote server again. For further information, see the “Problem Determination” section for abend code ACHA.

If the problem persists, you will need assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCHS

ACHO

Explanation: The remote server has tried to receive a reply from CICS/CMS which failed repeatedly until the retry limit was exceeded.

System action: CICS terminates the remote server abnormally with a dump.

User response: Reestablish the connection between CICS/CMS and the remote CICS system and try to use the remote server again. For further information, see the “Problem Determination” section for abend code ACHA.

If the problem persists, you will need assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCHS

ACHP

Explanation: CICS/CMS has made a request to the remote server for which the reply would need more than the maximum storage allowed (32660 bytes). This indicates that a logic error has occurred.

System action: CICS terminates the remote server abnormally with a dump.

User response: For further information, see the “Problem Determination” section for abend code ACHA.

Module: DFHCHS

ACHR

Explanation: The CICS/CMS remote server transaction (CEHS) has been initiated and either the task is not terminal-oriented, or the associated terminal is a console.

System action: CICS abnormally terminates the remote server with a dump.

User response: Ensure the transaction is initiated with an associated terminal and that the terminal is not defined as a console. For further information, see the “Problem Determination” section for abend code ACHA.

Module: DFHCHS

ACHS

Explanation: The CICS/OS2 remote server transaction (CEHP) has been initiated and either the task is not terminal-oriented, or the associated terminal is a console.

System action: CICS abnormally terminates the remote server with a dump.

User response: Ensure the transaction is initiated with an associated terminal and that the terminal is not defined as a console. For further information, see the

ACLO • ACL7

“Problem Determination” section for abend code ACHA.

Module: DFHCHS

ACLO

Explanation: The new operator failed to allocate storage whilst creating an object. This problem will occur if there is insufficient storage available to the CICS region to satisfy the request.

System action: CICS abnormally terminates the transaction.

User response: This abend may occur if you are in a loop creating objects and not deleting them. Alternatively CICS might be short on storage and you should try resubmitting the transaction.

Module: ICCGLBIC

ACL1

Explanation: The CICS Foundation Classes have thrown an exception which the application programmer failed to catch.

System action: CICS abnormally terminates the transaction.

User response: Check that you have coded your application to catch exceptions. Interrogate the message object contained within the exception object to establish the cause of the exception being thrown.

Another possible cause of this abend is that you are running a Foundation Classes program on a machine that does not have the C++ runtime installed. Check that your machine has the C++ runtime installed.

Module: ICCGLBIC

ACL2

Explanation: The CICS Foundation Classes invoked the default handleEvent method (defined in class IccResource) in order to handle a CICS condition because the application programmer did not implement his own handleEvent method.

System action: CICS abnormally terminates the transaction.

User response: Implement your own handleEvent method or customize your resource objects so they do not call the handleEvent method for any of the possible CICS conditions.

Module: ICCRESEC

ACL3

Explanation: The CICS Foundation Classes responded to an application programmer's request to abend a CICS task.

System action: CICS abnormally terminates the transaction.

User response: The application programmer requested that the CICS Foundation Classes abend the transaction using the appropriate return enumeration from the handleEvent method (see IccResource class).

Module: ICCRESIC

ACL4

Explanation: The CICS Foundation Classes detected an internal error.

System action: CICS abnormally terminates the transaction.

User response: This abend indicates a CICS Foundation Classes internal problem. Please contact your support organization.

Module: ICCGLIBC

ACL5

Explanation: The CICS Foundation Classes received an error from a CICS storage request (GETMAIN). In response to a new operator request the CICS Foundation Classes issued a CICS GETMAIN request to allocate storage which CICS was unable to satisfy.

System action: CICS abnormally terminates the transaction.

User response: This abend may occur if you are in a loop creating objects and not deleting them. Alternatively CICS might be short on storage and you should try resubmitting the transaction.

Module: ICCBASEC

ACL6

Explanation: The CICS Foundation Classes detected an error while processing a storage release request.

System action: CICS abnormally terminates the transaction.

User response: This abend can occur if you try to delete an object that does not exist (that is, it has already been deleted). It may also indicate a CICS memory management problem, or a storage corruption problem. If the error persists, please contact your support organization.

Module: ICCBASEC

ACL7

Explanation: The CICS Foundation Classes have thrown an exception which the application programmer failed to catch.

System action: CICS abnormally terminates the transaction.

User response: Check that you have coded your application to catch exceptions. Interrogate the message object contained within the exception object to establish the cause of the exception being thrown.

Another possible cause of this abend is that you are running a Foundation Classes program on a machine that does not have the C++ runtime installed. Check that your machine has the C++ runtime installed.

Module: ICCGLBIC

ACL8

Explanation: The CICS Foundation Classes have thrown an exception which the application programmer failed to catch.

System action: CICS abnormally terminates the transaction.

User response: Check that you have coded your application to catch exceptions. Interrogate the message object contained within the exception object to establish the cause of the exception being thrown.

Another possible cause of this abend is that you are running a Foundation Classes program on a machine that does not have the C++ runtime installed. Check that your machine has the C++ runtime installed.

Module: ICCGLBIC

ACL9

Explanation: The CICS Foundation Classes responded to an application programmer's request to abend a CICS task.

System action: CICS abnormally terminates the transaction.

User response: A resource object was customized to cause a transaction abend if a particular CICS condition was raised, and this condition was subsequently raised by CICS.

Module: ICCRESIC

ACLA

Explanation: The CICS Foundation Classes detected an internal error.

System action: CICS abnormally terminates the transaction.

User response: This abend indicates a CICS Foundation Classes internal problem. Please contact your support organization.

Module: ICCGLBIC

ACLB

Explanation: The CICS Foundation Classes detected an internal error.

System action: CICS abnormally terminates the transaction.

User response: This abend indicates a CICS Foundation Classes internal problem. Please contact your support organization.

Module: ICCGLBIC

ACLC

Explanation: The CICS Foundation Classes detected an internal error.

System action: CICS abnormally terminates the transaction.

User response: This abend indicates a CICS Foundation Classes internal problem. Please contact your support organization.

Module: ICCGLBIC

ACLD

Explanation: The CICS Foundation Classes detected an internal error.

System action: CICS abnormally terminates the transaction.

User response: This abend indicates a CICS Foundation Classes internal problem. Please contact your support organization.

Module: ICCGLBIC

ACLE

Explanation: The CICS Foundation Classes detected an internal error.

System action: CICS abnormally terminates the transaction.

User response: This abend indicates a CICS Foundation Classes internal problem. Please contact your support organization.

Module: ICCGLBIC

ACLF

Explanation: The CICS Foundation Classes detected an internal error.

System action: CICS abnormally terminates the transaction.

User response: This abend indicates a CICS Foundation Classes internal problem. Please contact your support organization.

ACLG • ACN7

Module: ICCGLIBC

ACLG

Explanation: The CICS Foundation Classes detected an internal error.

System action: CICS abnormally terminates the transaction.

User response: This abend indicates a CICS Foundation Classes internal problem. Please contact your support organization.

Module: ICCGLIBC

ACLH

Explanation: The CICS Foundation Classes detected an error while processing a storage release request.

System action: CICS abnormally terminates the transaction.

User response: This abend can occur if you try to delete an object that does not exist (that is, it has already been deleted). It may also indicate a CICS memory management problem, or a storage corruption problem. If the error persists, please contact your support organization.

Module: ICCBASEC

ACN1

Explanation: The table DFHCNV cannot be loaded. This is probably because a table has not been pregenerated. It could also occur if the table DFHCNV has been linked above 16MB but DFHCCNV has been linked below 16MB.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Check that the DFHCNV module is in the library and is valid for this release of CICS. Check the linkage of DFHCNV and relink it with the correct AMODE if necessary.

Module: DFHCCNV

ACN2

Explanation: The table DFHCNV has been loaded but the first record is in the wrong format. This is probably due to an error during assembly or linkedit, but could also be the result of a storage overwrite.

System action: The transaction is abnormally terminated with a transaction dump.

User response: The table should be reassembled and linked. Check the assemble and linkedit output. Check for any messages issued from CICS indicating that storage overwrites have occurred.

Module: DFHCCNV

ACN3

Explanation: The program DFHUCNV cannot be linked. A user conversion program must be available (even if it only returns).

System action: The transaction is abnormally terminated with a transaction dump.

User response: Check that the DFHUCNV module is in the library and is valid for this release of CICS. Check the linkage of DFHUCNV and relink it with the correct AMODE if necessary.

Module: DFHCCNV

ACN4

Explanation: An unrecognized format of a DFHCNV table has been encountered.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Re-assemble and re-link edit the DFHCNV macro.

Module: DFHCCNV

ACN5

Explanation: An override for the default client code page has been received; however the value is not recognized.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Check that the client system is using one of the client code pages supported by CICS/390.

Module: DFHCCNV

ACN6

Explanation: The client sent data in unicode but the client and server code pages are not the same. Unicode data is only tolerated provided that conversion is not required.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Ensure that the Client codepage and the Server codepage are the same.

Module: DFHCCNV

ACN7

Explanation: An override for the default binary format has been received; however the value is not recognized.

System action: The transaction is abnormally

terminated with a transaction dump.

User response: Data formats should be either S/370 or INTEL, anything else is unsupported by CICS/390.

Module: DFHCCNV

ACN8

Explanation: CICS data conversion is processing a FIELD defined as containing GRAPHIC characters (which are only DBCS): that is DFHCCNV TYPE=FIELD,DATATYP=GRAPHIC,... However the client code page (defined in the CLINTCP operand), and the server code page (defined in the SRVERCP operand) imply that the FIELD contains only SBCS characters, for example DFHCCNV TYPE=ENTRY,CLINTCP=437,SRVERCP=037

System action: The transaction is abnormally terminated with a transaction dump.

User response: Correct the FIELD definition.

Module: DFHCCNV

ACN9

Explanation: The table DFHCCNV cannot be loaded. This abend code is issued following a NOTAUTH condition being raised during loading of the DFHCCNV table.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Ensure the resource security definitions are correct.

Module: DFHCCNV

ACNA

Explanation: The table DFHCCNV cannot be loaded. This is a general purpose abend code indicating that the LOAD request for the conversion table, DFHCCNV, has failed.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Examine the transaction dump to determine the exact condition returned from LOAD request.

Module: DFHCCNV

ACNB

Explanation: The program DFHUCNV cannot be linked This is a general purpose abend code indicating that the LINK request for the conversion program DFHUCNV, has failed.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Examine the transaction dump to determine the exact condition returned from LINK request.

Module: DFHCCNV

ACNC

Explanation: The client code page which has been requested by the client is not one which CICS can support.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Ensure that the Client codepage is valid.

Module: DFHCCNV

ACND

Explanation: The conversion between client code page and server code page is not supported by CICS/390; for example conversion has been requested between Japanese code page 932 and Latin-1 code page 500.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Ensure that the Client codepage, both default and overrides are in the same group as the Server codepage. for example client code page 852 from Latin-2 group, is only supported to server code page 870.

Module: DFHCCNV

ACNE

Explanation: The conversion between client code page and server code page is not supported by CICS/390. Although the code pages are in the same group, CICS does not have a conversion table to match the requested server code page for the client code page specified.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Ensure that the Client codepage and the server codepage are correct. If they are as intended, then CICS can not support the requested conversion.

Module: DFHCCNV

ACP1

Explanation: DFHIC TYPE=GET response code is other than the normal response during print key processing.

System action: The transaction is abnormally terminated with a CICS transaction dump. The keyboard

ACP2 • ACRC

of the terminal on which the print key was depressed remains locked to indicate the failure of the operation.

User response: Analyze the dump. The response code is in the low order byte of register 0.

Module: DFHCPY

ACP2

Explanation: DFHIC TYPE=INITIATE response code is other than the normal response during print key processing.

System action: The transaction is abnormally terminated with a CICS transaction dump. The keyboard of the terminal on which the print key was depressed remains locked to indicate the failure of the operation.

User response: Analyze the dump. The response code is in low-order byte of register 0.

Module: DFHCPY

ACQA

Explanation: The Connection Quiesce Protocol transaction has been initiated by user action, such as a START command or by typing the transaction identifier at a terminal. The transaction is not intended to be initiated in this way.

System action:

1. If the transaction was not initiated by terminal input, message DFHZC4951 is written to destination CSNE.
2. An exception trace record is written to all active trace destinations.
3. The transaction is abnormally terminated with a CICS transaction dump.

User response: Determine what caused the transaction to be initiated. The exception trace record contains information which will help you.

Module: DFHCLS5

ACQB

Explanation: The Connection Quiesce Protocol transaction has encountered an error when communicating with another system on an APPC session.

System action:

1. Message DFHZC4951 is written to destination CSNE.
2. An exception trace record is written to all active trace destinations.
3. The transaction is abnormally terminated with a CICS transaction dump.

User response: Determine what caused the failure. A

likely cause is a failure of the session with the partner system.

Module: DFHCLS5

ACQC

Explanation: The Connection Quiesce Protocol transaction has encountered an unexpected error.

System action:

1. Message DFHZC4951 is written to destination CSNE.
2. An exception trace record is written to all active trace destinations.
3. The transaction is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCLS5

ACRA

Explanation: The relay program has been invoked without a terminal as its principal facility.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Ensure that DFHAPRT has not been specified as the initial program of a task that is not terminal-related.

Module: DFHAPRT

ACRB

Explanation: The relay program has been invoked by a transaction that is not defined as remote.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check that the relay program is defined correctly. Determine why DFHAPRT was invoked if the transaction is not a remote transaction.

Module: DFHAPRT

ACRC

Explanation: The relay program received an invalid response from DFHZCX.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHAPRT

ACRD

Explanation: The system entry for the system to which routing is to be performed could not be found.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check the installed transaction definition to confirm that the system was correctly specified. Check that the system entry is defined in the TCT.

Module: DFHAPRT

ACRE

Explanation: A transaction invoked from an APPC terminal and specified in the installed transaction definition as remote has abnormally terminated because the link is out of service.

System action: The task is abnormally terminated.

User response: Wait until the link is available. The CICS supplied transaction CEMT INQUIRE CONNECTION can be used to check the states of the links.

Module: DFHAPRT

ACRF

Explanation: The relay program received a nonzero return code from the dynamic router following its first invocation.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Use the dump to determine why the dynamic routing program has failed by checking the contents of the passed COMMAREA DFHDYE for correctness. The COMMAREA address can be found from field TCACOMM in the system TCA for the task. The COMMAREA fields are mapped via the DFHDYPDS DSECT.

Module: DFHAPRT

ACRG

Explanation: An ATI initiated remote transaction defined with DYNAMIC(YES) has failed because there is no matching entry in the AID chain.

Each AID in the chain has been checked and none has been found where

- The AID terminal ID matches that of the TCTTE
- The installed transaction definition and the AID transaction IDs match
- The AID is for a remote transaction
- The AID has not been canceled.

System action: The task is abnormally terminated with a CICS system dump.

User response: The dump can be used to help ascertain the mismatch. Check the transactions listed in the TCTTE and PCT fields of the system dump against the AID chain.

Module: DFHAPRT

ACRH

Explanation: The profile for the session that will carry intersystem flows during transaction routing could not be found.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check the installed transaction definition to confirm that TRPROF is correctly specified.

Module: DFHAPRT

ACRI

Explanation: An error occurred when attempting to link to the dynamic routing program.

System action: The transaction is abnormally terminated with a CICS transaction dump.

A message in the range DFHRT4417 to DFHRT4420 is written to the CSMT log.

User response: Refer to the message sent to the CSMT log. It identifies the cause of the link failure and provides further user guidance.

Module: DFHAPRT, DFHEPC

ACRJ

Explanation: An abend has occurred in the dynamic routing program after a link has been executed from DFHAPRT or DFHEPC.

System action: The transaction is abnormally terminated with a CICS transaction dump. Message DFHRT4416 is written to the CSMT log.

User response: Refer to message DFHRT4416. It identifies the abend in the dynamic routing program and provides further user guidance.

Module: DFHAPRT, DFHEPC

ACRK

Explanation: The relay program has been invoked with no address for the principal facility.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHAPRT

ACRL

Explanation: The task does not own the facility.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHAPRT

ACRM

Explanation: In response to a request from the dynamic routing program, DFHAPRT has attempted an INITIAL_LINK to a program that is not the initial program of the transaction for which the dynamic router has been invoked. The attempt has failed.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Examine the following possibilities

- The autoinstall user-replaceable module (URM) was called but is unable to do the autoinstall.
- The autoinstall URM was called but data supplied by the autoinstall URM is invalid.
- The autoinstall URM was called, but there is no processing program table (PPT) entry for the autoinstall model.
- There is a problem with the autoinstall URM.
- There is no PPT entry for the program, and either autoinstall is not active or the autoinstall URM indicated that the program should not be autoinstalled.
- The program is disabled.
- The program cannot be loaded.
- The program is defined as remote.

Module: DFHAPRT

ACRN

Explanation: The dynamic routing program has indicated that the transaction should not be routed, but execute in the local system. Prior to invoking the application program, a security check is performed. This check has failed.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Ensure that the transaction security definition is correct.

Module: DFHAPRT

ACRO

Explanation: An attempt has been made to invoke the CRSQ transaction from a terminal. CRSQ is an internal CICS transaction and cannot be invoked in this way.

System action: The task is abnormally terminated.

User response: None. You can use CEMT and EXEC CICS commands to cancel AIDs.

Module: DFHCRQ

ACRP

Explanation: The dynamic router has supplied a sysid whose supported functions are unknown. This may be due to either a backlevel release, or APPC is used for communication and no work has flowed across this connection.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Give an alternative sysid, or revert to the old style START, or flow some routed work across the connection.

Module: DFHAPRT

ACSA

Explanation: The remote scheduler task (CRSR) does not own an intersystem link TCTTE as its principal facility.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Ensure that DFHCRS is not specified as the initial program of a task other than CRSR. Check that the terminal operator did not enter CRSR.

Module: DFHCRS

ACSB

Explanation: An unexpected reply was received from a remote system in response to a request to schedule a task on that system.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRS

ACSC

Explanation: An unexpected request was received from a remote system when expecting a request to schedule a task.

System action: The task is abnormally terminated

with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRS

ACSD

Explanation: An internal logic error has been detected.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRS

ACSE

Explanation: Module DFHCRS has been attached in an unsupported manner.

System action: CICS abnormally terminates the transaction with a transaction dump.

User response: Module DFHCRS should be executed only by transaction CRSR, which executes with an MRO session, an LU6.1 session or an LU type 6.2 conversation as its principal facility. Ensure that the transaction is being attached by a CRSR transaction in the connected system, and not by a user transaction.

If the transaction is being attached by a CRSR transaction, you will need assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRS

ACSF

Explanation: The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The task that first detects the purged condition provides an exception trace.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate the reason why the task was purged. It was purged either by the master terminal operator or as a result of a deadlock timeout.

Module: DFHCRS

ACSG

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error will have provided an

exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Please see the related error message produced by the domain that detected the original error.

Module: DFHCRS

ACSH

Explanation: The processing of APPC mapped data requires the generation of an LU6.2 attach FMH with default values. In particular, the sync level requested is defaulted to 2. However, the session that is to be used has been bound with a sync level of 1.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check that

- The entry in the TCT for the remote system has been defined with parallel sessions
- The remote system can support a sync level of 2
- The correct sync level has been requested.

Module: DFHCRS

ACSI

Explanation: An APPC conversation failure occurred when an attach between CICS systems was issued.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check the connection to the remote CICS system and try to reestablish it.

Module: DFHCRS

ACSJ

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the recovery manager (RM) domain. The domain provides an exit trace, and possibly a console message and a system dump (depending on the options specified in the dump table). This failure is either the result of a task purge, or a CICS logic error.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related diagnostic material produced by the recovery manager domain and determine the reason for the failure.

In the case of a CICS logic error, you need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRS

ACSK

Explanation: The transaction wait was purged while waiting for a VTAM INQUIRE macro to complete.

CICS issued a VTAM INQUIRE OPTCD=NQN or INQUIRE OPTCD=SESSNAME request then waited for VTAM to post the ECB, but the wait was terminated either as a result of an explicit FORCEPURGE request, or due to a 3 minute time out.

System action: A transaction dump is taken together with CICS issuing message DFHZC0001.

User response: Investigate the reason why the wait was terminated.

In the case of a time out, you may need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZGIN

ACSL

Explanation: CICS has been unable to attach a transaction to perform a mass flag (CFTS) or mass remote delete (CDTS) request.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRS

ACSM

Explanation: Transaction CFTS has abended. The mass flagging of terminals for deletion has failed.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRS

ACSN

Explanation: Transaction CFTS has stalled. The mass flagging of terminals for deletion has exceeded the expected time and is therefore assumed to have failed.

System action: The task is abnormally terminated with a CICS transaction dump. A flag is set in the remote work element (RWE) to indicate that the mainline transaction has assumed that CFTS has failed.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRS

ACTA

Explanation: The relay program running in the terminal-owning region has received an unexpected request from the application owning region. The request received is in violation of CICS transaction routing protocols.

The request will be in the DFHLUCDS DSECT in DFHZTSP's LIFO – field LUCOPN0

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZTSP

ACTB

Explanation: The relay program running in the terminal-owning region issued a terminal control WRITE, LAST request to the application-owning system, and received a nonzero return code from terminal control.

This is the usual return code from terminal control in TCATPAPR.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Use the transaction dump to determine why terminal control was unable to process the request.

Module: DFHZTSP

ACTC

Explanation: The relay program running in the terminal-owning region issued a terminal control request to free its session to the application-owning system, and received a nonzero return code from terminal control.

This is the usual return code from terminal control in TCATPAPR.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Use the transaction dump to determine why terminal control was unable to process the request.

Module: DFHZTSP

ACTD

Explanation: The relay program running in the terminal-owning region issued a terminal control WRITE, WAIT, READ request to the application-owning system, and received a nonzero return code from terminal control.

This is the usual return code from terminal control in TCATPAPR.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Use the transaction dump to determine why terminal control was unable to process the request.

Module: DFHZTSP

ACTE

Explanation: The relay program running in the terminal-owning region attempted to free its session with the APPC terminal, and received a nonzero return code from terminal control.

The return code will be in the DFHLUCDS DSECT in DFHZTSP's LIFO field, LUCRCODE.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Use the transaction dump to determine why terminal control was unable to process the request. The terminal session may have failed.

Module: DFHZTSP

ACTF

Explanation: The relay program running in the terminal-owning region issued a terminal control request to free its session to the application-owning system, and received a nonzero return code from terminal control.

This return code can be found in the TCA field, TCATPAPR.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Use the transaction dump to determine why terminal control was unable to process the request. The transaction on the application-owning region may have abnormally terminated or the session may have failed.

Module: DFHZTSP

ACTG

Explanation: The relay program running in the terminal-owning region issued a request to attach a transaction in the application-owning region, but the response received from that region was invalid.

The return code in the TCA (field TCATPAPR) will be nonzero, and either there will be no TIOA (field TCTTEDA in the TCTTE is zero) or there will be no FMH7 at the start of the TIOA.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Use the transaction dump to determine why terminal control was unable to process the request. The transaction on the application-owning region may have abnormally terminated or the session may have failed.

Module: DFHZTSP

ACTH

Explanation: A privileged allocate was issued against a remote LU 6.2 system.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZISP

ACTI

Explanation: The relay transaction has an ISC or MRO session as its principal facility. However the TCTTE for that session is not owned by the task.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRT

ACTJ

Explanation: The principal facility of the relay transaction is not a TCTTE.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Task CXRT should only be started in a terminal-owning region by an ALLOCATE request issued in an application-owning region against a remote APPC device. The principal facility of the task should be an ISC or MRO link. Check that your CICS system is defined in such a way that this will always be the case. Also ensure that program DFHCRT is started only by task CXRT.

Module: DFHCRT

ACTK

Explanation: The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The task that first detected the purged condition will have provided an exception trace.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate the reason why the task was purged. It was either purged by the master terminal operator or as a result of a deadlock timeout.

Module: DFHZISP

ACTL

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error will have provided an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related message produced by the domain that detected the original error.

Module: DFHZISP

ACU0

Explanation: The transaction routing program in the application-owning region issued a terminal control WRITE, LAST, WAIT request to the terminal-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZARQ.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when

- The relay program in the terminal-owning region terminates abnormally. In this case, determine the reason why the relay program has abnormally terminated.
- The session has failed.

Module: DFHZXRL

ACU1

Explanation: Refer to the description of abend ACU0.

Module: DFHZXRL

ACU2

Explanation: The transaction routing program in the application-owning region received a response from the terminal-owning region which violates CICS transaction routing protocols.

The trace from the terminal-owning region will show its response to the application-owning region.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZXRL

ACU3

Explanation: The transaction routing program in the application-owning region attempted to set the conversation state machine to a state which violates CICS transaction routing protocols.

The register containing the state can be determined from the assembler listing.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZXRL

ACU4

Explanation: The transaction routing program in the application-owning region issued a SET request to the conversation state machine and received a nonzero return code. This violates CICS transaction routing protocols.

The trace entry on return from DFHZUSR will show the request type and current state.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZXRL

ACU5

Explanation: An program running in an application-owning region has issued an ALLOCATE against an APPC device attached to a terminal owning region, but the connection between the two systems is not installed.

System action: The task is abnormally terminated

with a transaction dump and an exception trace entry.

User response: Install the connection between the two regions.

Module: DFHZXRL

ACU6

Explanation: A request to DFHRTSU to prepare the surrogate TCTTE for syncpoint gave an unexpected response and reason code. The response and reason code are included in DFHRTSU's parameter list which is printed in the exception trace.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZXRL

ACU7

Explanation: A request to allocate a session between the application-owning region and the terminal-owning region was issued, but the connection with the remote system is not an APPC or MRO connection.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Redefine the connection as APPC or MRO, or avoid using transaction routing on this connection.

Module: DFHZXRL

ACU8

Explanation: A request to DFHRTSU to get the recovery status of a surrogate TCTTE gave an unexpected response and reason code. The response and reason code are included in DFHRTSU's parameter list which is printed in the exception trace.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZXRL

ACU9

Explanation: A request to recovery manager to set the recovery status of a link gave an unexpected response and reason code. The response and reason code are included in DFHRMLN's parameter list which is printed in the exception trace.

System action: The task is abnormally terminated

with a transaction dump and an exception trace entry.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZXRL

ACUA

Explanation: DFHZXRL was called with a request which is not supported for transaction routing.

The request is located in the DFHLUC parameter list which is printed in the exception trace. DFHZXRL is called from DFHZARL, which will put details of the request in its trace entry.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZXRL

ACUB

Explanation: The parameter list passed to DFHZXRL for an ALLOCATE request does not contain the TCTSE address of a remote APPC terminal.

The TCTSE address is located in the DFHLUC parameter list which is printed in the exception trace. DFHZXRL is called from DFHZARL, which will put details of the request in its trace entry.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZXRL

ACUC

Explanation: The TCTSE address passed to DFHZXRL is not that of a remote LU 6.2 terminal.

The TCTSE address is located in the DFHLUC parameter list which is printed in the exception trace. DFHZXRL is called from DFHZARL, which will put details of the request in its trace entry.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZXRL

ACUD

Explanation: The profile DFHCICSR could not be located as an installed profile definition.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Check that the IBM-supplied profile DFHCICSR is correctly defined and installed to CICS.

Module: DFHZXRL

ACUE

Explanation: A request to DFHZTSP to build a surrogate TCTTE was not satisfied.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZXRL

ACUF

Explanation: A session between the application-owning region and the terminal-owning region was not allocated because the request was incorrectly specified.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZXRL

ACUG

Explanation: A request to allocate a session between the application-owning region and the terminal-owning region failed. The return code from the ALLOCATE request indicated that the profile could not be located as an installed transaction definition, although an earlier attempt to locate it was successful.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZARQ.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZXRL

ACUH

Explanation: A request to allocate a session between the application-owning region and the terminal-owning region failed. The return code from the ALLOCATE request indicated that the requested session is already owned by the TCA.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZARQ.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZXRL

ACUI

Explanation: An ISC session between the application-owning region and the terminal-owning region was not allocated because the MODENAME named in the profile could not be found. The profile DFHCICSR as supplied by IBM does not specify a MODENAME. Therefore, this error will occur when a MODENAME has been added to the IBM-supplied profile, but that MODENAME is not defined in the SESSIONS definition for the terminal-owning region.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Ensure that the MODENAME specified in profile DFHCICSR was also specified when defining the SESSIONS to the terminal-owning region.

Module: DFHZXRL

ACUJ

Explanation: A session between the application-owning region and the terminal-owning region was not allocated because the maximum session count for the mode group specified in profile DFHCICSR is zero.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Use the CEMT transaction to set sessions in the required mode group available for use.

Module: DFHZXRL

ACUK

Explanation: No TCT entry was found for the terminal-owning region specified in the TCTSE for the remote terminal.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Ensure that the terminal-owning region defined in the remote system entry is also defined with a system entry in the TCT.

Module: DFHZXRL

ACUL

Explanation: The transaction routing program in the application-owning region issued a terminal control WRITE, WAIT, READ request to the terminal-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZARQ.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when

- The relay program in the terminal-owning region terminates abnormally. In this case, determine the reason why the relay program has abnormally terminated.
- The session has failed.

Module: DFHZXRL

ACUM

Explanation: A request to DFHZTSP to free a surrogate TCTTE was not satisfied.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZXRL

ACUO

Explanation: A terminal control READ request has failed. The transaction routing program in the application-owning region attempted to receive data from the terminal-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZARQ.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when

- The relay program in the terminal-owning region terminates abnormally. In this case, determine the reason why the relay program has abnormally terminated.

- The session has failed.

Module: DFHZXRL

ACUP

Explanation: The transaction routing program in the application-owning region did not receive a rollback from the terminal-owning region. This violates CICS transaction routing protocols.

The trace from the terminal-owning region will show its response to the application-owning region.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZXRL

ACUQ

Explanation: Refer to the description of abend ACUO.

Module: DFHZXRL

ACUR

Explanation: Refer to the description of abend ACUP.

Module: DFHZXRL

ACUS

Explanation: Refer to the description of abend ACUO.

Module: DFHZXRL

ACUT

Explanation: The transaction routing program in the application-owning region did not receive either a syncpoint or a rollback from the terminal-owning region. This violates CICS transaction routing protocols.

The trace from the terminal-owning region will show its response to the application-owning region.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZXRL

ACUV

Explanation: The transaction routing program in the application-owning region issued a terminal control ISSUE ABEND request on an MRO link to the

ACUW • ACVC

terminal-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZIS1.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when

- The relay program in the terminal-owning region terminates abnormally. In this case, determine the reason why the relay program has abnormally terminated.
- The session has failed.

Module: DFHZXRL

ACUW

Explanation: The transaction routing program in the application-owning region issued a terminal control ISSUE ERROR request on an MRO link to the terminal-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZIS1.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when

- The relay program in the terminal-owning region terminates abnormally. In this case, determine the reason why the relay program has abnormally terminated.
- The session has failed.

Module: DFHZXRL

ACUX

Explanation: Refer to the description of abend ACUL.

Module: DFHZXRL

ACUY

Explanation: The transaction routing program in the application-owning region issued a terminal control WRITE,WAIT request to the terminal-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZARQ.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Use the transaction dump to determine why terminal control was unable to process

the request. This abend code may result when

- The relay program in the terminal-owning region terminates abnormally. In this case, determine the reason why the relay program has abnormally terminated.
- The session has failed.

Module: DFHZXRL

ACUZ

Explanation: Refer to the description of abend ACUL.

Module: DFHZXRL

ACVA

Explanation: The transaction routing program in the terminal-owning region issued a terminal control WRITE,WAIT,READ request to the application-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZARQ.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when

- The program in the application-owning region terminates abnormally. In this case, determine the reason why the program has abnormally terminated.
- The session has failed.

Module: DFHZXRT

ACVB

Explanation: The transaction routing program in the terminal-owning region attempted to issue an ISSUE SIGNAL request on an MRO link to the application-owning region. This violates CICS transaction routing protocols.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZXRT

ACVC

Explanation: The transaction routing program in the terminal-owning region issued an ISSUE SIGNAL request on an LU 6.2 link to the application-owning region, and received a nonzero return code from terminal control.

The return code is located in the DFHLUC parameter

list which is printed in the exception trace.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when

- The program in the application-owning region terminates abnormally. In this case, determine the reason why the program has abnormally terminated.
- The session has failed.

Module: DFHZXRT

ACVD

Explanation: The transaction routing program in the terminal-owning region issued a READ,WAIT request to the application-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZARQ.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when

- The program in the application-owning region terminates abnormally. In this case, determine the reason why the program has abnormally terminated.
- The session has failed.

Module: DFHZXRT

ACVE

Explanation: The transaction routing program in the terminal-owning region issued a WRITE request to the application-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZARQ.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when

- the program in the application-owning region terminates abnormally. In this case, determine the reason why the program has abnormally terminated.
- the session has failed.

Module: DFHZXRT

ACVF

Explanation: The transaction routing program in the terminal-owning region issued a WRITE,LAST,WAIT request to the application-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZARQ.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when

- The program in the application-owning region terminates abnormally. In this case, determine the reason why the program has abnormally terminated.
- The session has failed.

Module: DFHZXRT

ACVG

Explanation: The transaction routing program in the terminal-owning region issued a FREE request to free the session with the LU 6.2 terminal, and received a nonzero return code from terminal control.

The return code is located in the DFHLUC parameter list which is printed in the exception trace.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Use the transaction dump to determine why terminal control was unable to process the request. The terminal session may have failed.

Module: DFHZXRT

ACVH

Explanation: The transaction routing program in the terminal-owning region issued a FREE request to free the session with the application-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZARQ.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when

- The program in the application-owning region terminates abnormally. In this case, determine the reason why the program has abnormally terminated.
- The session has failed.

Module: DFHZXRT

ACVK

Explanation: The transaction routing program in the terminal-owning region issued an ISSUE ABEND request on an LU 6.2 link, and received a nonzero return code from terminal control.

The return code is located in the DFHLUC parameter list which is printed in the exception trace.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when

- The program in the connected region terminates abnormally. In this case, determine the reason why the program has abnormally terminated.
- The session has failed.

Module: DFHZXRT

ACVL

Explanation: The transaction routing program in the terminal-owning region issued an ISSUE ABEND request on an MRO link to the application-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZIS1.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when

- The program in the application-owning region terminates abnormally. In this case, determine the reason why the program has abnormally terminated.
- The session has failed.

Module: DFHZXRT

ACVM

Explanation: The transaction routing program in the terminal-owning region issued an ISSUE ERROR request on an LU 6.2 link, and received a nonzero return code from terminal control.

The return code is located in the DFHLUC parameter list which is printed in the exception trace.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when

- The program in the connected region terminates abnormally. In this case, determine the reason why the program has abnormally terminated.

- The session has failed.

Module: DFHZXRT

ACVN

Explanation: The transaction routing program in the terminal-owning region issued an ISSUE ERROR request on an MRO link to the application-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZIS1.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when

- The program in the application-owning region terminates abnormally. In this case, determine the reason why the program has abnormally terminated.
- The session has failed.

Module: DFHZXRT

ACVO

Explanation: The transaction routing program in the terminal-owning region issued an ISSUE PREPARE request and received either a nonzero return code or a response which violates CICS transaction routing protocols.

The return code is located in TCASPRC and the response is located in TCASPSN1.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Use the transaction dump to determine whether the problem is caused by the return code or the response. If terminal control was unable to process the request, the abend may occur when

- The program in the connected region terminates abnormally. In this case, determine the reason why the program has abnormally terminated.
- The session has failed.

Otherwise the distributed application programs may have violated APPC conversation protocols.

Module: DFHZXRT

ACVP

Explanation: The transaction routing program in the terminal-owning region did not receive an FMH43 from the application-owning region. This violates CICS transaction routing protocols.

The trace from the application-owning region will show its response to the terminal-owning region.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZXRT

ACVQ

Explanation: The transaction routing program in the terminal-owning region issued a request to the APPC terminal, and received a nonzero return code from terminal control.

Both the request and the return code are located in the DFHLUC parameter list which is printed in the exception trace.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Use the transaction dump to determine why terminal control was unable to process the request. The terminal session may have failed or be in the wrong state, for example, as the result of both the terminal and application issuing SYNCPOINT ROLLBACK at the same time.

Module: DFHZXRT

ACVR

Explanation: The transaction routing program in the terminal-owning region issued a SEND, LAST, WAIT request to the LU 6.2 terminal, and received a nonzero return code from terminal control.

The return code is located in the DFHLUC parameter list which is printed in the exception trace.

System action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User response: Use the transaction dump to

ADxx abend codes

AD21

Explanation: The CICS-DB2 attachment facility received a request for a resource manager with the incorrect name. Message DFHDB2045 is output to transient data detailing the invalid name.

System action: The transaction is abnormally terminated with a transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2EX1

determine why terminal control was unable to process the request. The terminal session may have failed.

Module: DFHZXRT

ACWA

Explanation: CICS CWTO transaction has failed because the task does not own a terminal (TCTTE) as its principal facility. This has probably happened because CWTO has been started as an EXEC CICS START transid without a terminal ID.

System action: The transaction is abnormally terminated without a transaction dump.

User response: Retry with a terminal ID value or enter CWTO from a terminal.

Module: DFHCWTO

ACXA

Explanation: The catch-up transaction, CXCU, has failed. CXCU runs either in response to a transaction request from an end-user, or is run automatically by an active CICS system in response to the appearance of an alternate CICS system. Its purpose is to inform the alternate system of the active system's state regarding terminals and DBCTL connection.

System action: The catch-up transaction, CXCU, is abnormally terminated with a CICS transaction dump. Both active and alternate CICS systems continue, but the alternate CICS system is less effective in the event of a takeover. For example, terminal back-up sessions may not be established. This abend is accompanied by DFHDX8313.

User response: Retry by entering "CXCU" from a terminal. If the error persists, diagnose the problem from the dump.

Module: DFHCXCU

AD22

Explanation: The CICS-DB2 attachment facility EDF processor was unable to interpret the SQL request.

System action: The command is not interpreted by EDF. A CICS transaction dump is taken with abend code AD22.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2EDF

AD23

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a LOCK call to the lock manager (LM) domain made by the CICS-DB2 attachment facility service transaction CEX2. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The CICS-DB2 service task initiates a force shutdown of the CICS-DB2 interface.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2EX2

AD24

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on an UNLOCK call to the lock manager (LM) domain made by the CICS-DB2 attachment facility service transaction CEX2. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The CICS-DB2 Service task initiates a force shutdown of the CICS-DB2 interface.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2EX2

AD25

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a LOCK call to the lock manager (LM) domain made by the CICS-DB2 attachment facility while processing a DSNCR command. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The DSNCR command fails and the transaction is abnormally terminated with a transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2CC

AD26

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on an UNLOCK call to the lock manager (LM) domain made by the CICS-DB2 attachment facility while processing a

DSNCR command. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The DSNCR command fails and the transaction is abnormally terminated with a transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2CC

AD27

Explanation: The CICS-DB2 attachment facility attempted to attach a TCB on which a DB2 thread was to be created to service the SQL request from the application. The attach of the TCB failed due to lack of storage.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Increase the size of the CICS region or lower the TCBLIMIT value specified in the DB2CONN.

Module: DFHD2EX1

AD28

Explanation: The CICS-DB2 attachment facility attempted to attach a TCB on which a DB2 thread was to be created to service the SQL request from the application. The attach of the TCB failed.

System action: The transaction is abnormally terminated with a transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2EX1

AD29

Explanation: The CICS-DB2 attachment facility was unable to link to its EDF processor DFHD2EDF.

System action: The command is not interpreted by EDF. Message DFHDB2048 is output to transient data and a transaction dump is taken with abend code AD29.

User response: Examine the trace in the CICS transaction dump to determine why the link to module DFHD2EDF failed.

Module: DFHD2EDF

AD2A

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a LOCK call to the lock manager (LM) domain. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2EX1

AD2B

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on an UNLOCK call to the lock manager (LM) domain. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2EX1

AD2C

Explanation: An unexpected EXCEPTION response has occurred on a locate call to directory manager (DD) domain to locate a DB2TRAN control block. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2EX1

AD2D

Explanation: An error (INVALID or DISASTER response) has occurred on a locate call to directory manager (DD) domain to locate a DB2TRAN control block. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2EX1

AD2E

Explanation: An unexpected EXCEPTION response has occurred on a locate call to directory manager (DD) domain to locate a DB2ENTRY control block. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2EX1

AD2F

Explanation: An error (INVALID or DISASTER response) has occurred on a locate call to directory manager (DD) domain to locate a DB2ENTRY control block. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2EX1

AD2G

Explanation: A transaction attempted to use a DB2ENTRY that is DISABLED or is DISABLING. The DISABLEDACT attribute of the DB2ENTRY specified ABEND meaning that new transactions that attempt to use the DB2ENTRY should be abended.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Use CEMT INQ DB2TRAN TRANSID(tttt) where tttt is the transid, to determine the name of the DB2ENTRY involved. Re-enable the DB2ENTRY or discard the DB2ENTRY so that the transid will use a pool thread.

Module: DFHD2EX1

AD2H

Explanation: The CICS-DB2 attachment facility detected that a dynamic plan exit program abended.

System action: CICS trapped the abend from the dynamic plan exit, issued message DFHDB2050, and then abnormally terminated the task with a CICS transaction dump.

User response: See the associated DFHDB2050 transient data message to determine the abend code with which the dynamic plan exit program abended. Determine why the exit program abended.

Module: DFHD2EX1

AD2I

Explanation: The CICS-DB2 attachment facility failed to link to a dynamic plan exit program because it was not link edited AMODE 31.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the associated DFHDB2051 transient data message to determine the name of the dynamic plan exit program involved. Re-linkedit the dynamic plan exit program AMODE 31.

Module: DFHD2EX1

AD2J

Explanation: The CICS-DB2 attachment facility failed to link to a dynamic plan exit program because it is disabled.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the associated DFHDB2053 transient data message to determine the name of the dynamic plan exit program involved. Enable the dynamic plan exit program.

Module: DFHD2EX1

AD2K

Explanation: The CICS-DB2 attachment facility failed to link to a dynamic plan exit program because no program definition was found.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the associated DFHDB2057 transient data message to determine the name of the dynamic plan exit program involved. Ensure that the dynamic plan exit program has been correctly defined to CICS.

Module: DFHD2EX1

AD2L

Explanation: The CICS-DB2 attachment facility failed to link to a dynamic plan exit program because the program could not be loaded.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the associated DFHDB2058 transient data message to determine the name of the dynamic plan exit program involved. Ensure that the dynamic plan exit program has been correctly defined and is in a load library accessible to CICS.

Module: DFHD2EX1

AD2M

Explanation: The CICS-DB2 attachment facility failed to link to a dynamic plan exit program because the program is defined as remote.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the associated DFHDB2066 transient data message to determine the name of the dynamic plan exit program involved. Correct the program definition for the dynamic plan exit program so that it is defined as local.

Module: DFHD2EX1

AD2N

Explanation: The CICS-DB2 attachment facility failed to link to a dynamic plan exit program.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the associated DFHDB2054 transient data message to determine the name of the dynamic plan exit program involved. Examine the transaction dump to determine why the link failed.

Module: DFHD2EX1

AD2O

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on an WAIT_MVS call to the dispatcher (DS) domain. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2EX1

AD2P

Explanation: The transaction was unable to obtain a DB2 thread from a DB2ENTRY or the pool. See the associated transient data message DFHDB2011 to determine which DB2ENTRY was involved or whether it was the pool. The transaction was abended because the DB2ENTRY or the pool specified threadwait(no) meaning do not wait for a thread if all threads are currently in use. Note if message DFHDB2011 indicates that the pool was being used, it means the transaction was using the pool directly rather than overflowing to the pool. (An abend AD3T is produced when a transaction overflows to the pool and no pool threads are available.)

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Determine whether more threads should be allocated to the DB2ENTRY or the pool, or whether the number of instances of this transaction should be limited using TRANCLASS.

Module: DFHD2EX1

AD2Q

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on an getmain call to the storage manager (SM) domain. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2EX1

AD2R

Explanation: The CICS-DB2 thread TCB processing the DB2 request for this transaction has abended. An exception trace (AP 319D) is written containing the MVS abend code and reason code as well as the relevant CICS-DB2 control blocks used by the CICS task and the CICS-DB2 thread TCB. In particular the CSUB control block contains data from the MVS SDWA at the time of the abend, for example fields CSB_SDWA_REGS (regs 0 -15) and CSB_SDWA_PSW.

| The thread TCB is terminated if a CICS transaction is
| forcepurged from CICS and the thread is still active in
| DB2.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Examine the trace in the CICS

transaction dump to determine why the CICS-DB2 thread TCB abended.

Module: DFHD2EX1

AD2S

Explanation: The thread TCB servicing the DB2 request for the transaction issued a sign-on request to DB2 which failed. The installed DB2CONN specifies THREADERROR(N906D) or THREADERROR(ABEND).

System action: If THREADERROR(N906D) is specified in the DB2CONN, processing continues. A -906 sqlcode is returned to the application, and a transaction dump is taken with abend code AD2S.

If THREADERROR(ABEND) is specified in the DB2CONN, the task is abnormally terminated with a CICS transaction dump.

User response: Examine the AUTHID or AUTHTYPE parameter of the DB2ENTRY or pool used for the transaction. Ensure the id is authorised to access the plan in DB2.

Module: DFHD2EX1

AD2T

Explanation: An attempt to create a DB2 thread by the TCB servicing the DB2 request for the transaction failed with DB2 reason code 00F30040. The installed DB2CONN specifies THREADERROR(N906D) or THREADERROR(ABEND).

System action: If THREADERROR(N906D) is specified in the DB2CONN, processing continues. A -906 sqlcode is returned to the application and a transaction dump is taken with abend code AD2T.

If THREADERROR(ABEND) is specified in the DB2CONN, the task is abnormally terminated with a CICS transaction dump.

User response: Either the plan is unavailable or is not known to DB2.

Module: DFHD2EX1

AD2U

Explanation: An attempt to create a DB2 thread by the TCB servicing the DB2 request failed. The installed DB2CONN specifies THREADERROR(N906D) or THREADERROR(ABEND).

System action: If THREADERROR(N906D) is specified in the DB2CONN, processing continues. A -906 sqlcode is returned to the application and a transaction dump is taken with abend code AD2U.

If THREADERROR(ABEND) is specified in the DB2CONN, the task is abnormally terminated with a CICS transaction dump.

AD2V • AD2Z

User response: Examine the dump to determine why the create thread failed.

Module: DFHD2EX1

AD2V

Explanation: The CICS-DB2 attachment facility issued a commit or abort request to DB2 but received a reason code 00F30805 indicating that connection to DB2 has been lost. This is due to DB2 terminating abnormally or being in the process of terminating abnormally. If the commit or abort request was preceded by a prepare request, DB2 may well still be indoubt. In this case, the CICS-DB2 attachment facility instructs CICS to remember the outcome of the UOW pending resynchronisation, which will happen when CICS and DB2 are reconnected. For an abort request not preceded by a prepare, i.e. a transaction abend or syncpoint rollback, DB2 will not be indoubt as the UOW was still inflight. DB2 will backout updates made by the UOW when restarted so there is no need for CICS to remember the outcome of the UOW.

System action: The transaction completes normally but a transaction dump is taken with abend code AD2V. If DB2 is indoubt about the outcome of the UOW it will be resolved when CICS and DB2 are reconnected.

User response: Contact your system programmer to restart the DB2 subsystem.

Module: DFHD2EX1

AD2W

Explanation: The CICS-DB2 attachment facility issued a single-phase commit call to DB2 but received an unexpected response. Transient data message DFHDB2055 details the DB2 reason code received. The commit request may have been processed or it may have been ended. There is no resynchronisation needed, as no CICS recoverable resources were updated.

System action: The CICS-DB2 attachment facility abnormally terminates the transaction with abend code AD2W. The CICS recovery manager will supersede the AD2W abend code with abend code ASPR. A transaction dump is taken.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2EX1

AD2X

Explanation: The CICS-DB2 attachment facility detected that the CICS task and the thread TCB were in an invalid state. A console message is output, an exception trace written and, possibly, a system dump

taken (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2EX1

AD2Y

Explanation: The transaction was unable to obtain a DB2 thread from a DB2ENTRY or the pool because there were no TCBs available on which to create the thread. The number of thread TCBs currently running is at the TCBLIMIT defined in the DB2CONN. Message DFHDB2010 is output to transient data. The transaction was abended because either

- The DB2ENTRY specifies threadwait(no), meaning do not wait for a thread, including having to wait to create a thread because a TCB is not available - that is, do not wait for a TCB either.
- The DB2ENTRY specified threadwait(pool), but the pool definition within the DB2CONN specifies threadwait(no), and again there were no TCBs available.
- The transaction was using the pool directly, the pool specifies threadwait(no) and no TCB was available.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Determine whether TCBLIMIT should be increased or whether the number of transactions using DB2 at any one instance should be limited using transaction classes.

Module: DFHD2EX1

AD2Z

Explanation: DB2 detected a deadlock and the CICS-DB2 attachment facility attempted a syncpoint rollback command for the transaction as DROLLBACK(YES) was specified for the DB2ENTRY or POOL. The syncpoint rollback command failed. Message DFHDB2070 is output to transient data detailing the transid involved and the EIBRESP2 from the failed syncpoint rollback command.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Examine the eibresp2 value to determine why the syncpoint rollback request failed. One possible reason could be that the transaction running is a DPL server transaction which was DPLed to by a client transaction without specifying the SYNCONRETURN parameter. In this case syncpoints, or syncpoint rollbacks, cannot be taken by the server

transaction, so DROLLBACK(YES) is invalid in this case.

Module: DFHD2EX1

AD3A

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a LOCK call to the lock manager (LM) domain made by the CICS-DB2 attachment facility startup program. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: Startup of the CICS-DB2 interface is terminated, and the interface is closed. The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2STR

AD3B

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on an UNLOCK call to the lock manager (LM) domain made by the CICS-DB2 Attachment facility startup program. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: Startup of the CICS-DB2 interface is terminated, and the interface is closed. The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2STR

AD3C

Explanation: An error (INVALID, DISASTER response) has occurred on a CONNECT_TO_DB2 function call to the CICS-DB2 Coordinator program DFHD2CO made by the CICS-DB2 Attachment facility startup program. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: Startup of the CICS-DB2 interface is terminated, and the interface is closed. The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2STR

AD3D

Explanation: An unexpected response was received while attempting to delete a record from a temporary storage queue during processing of a DSNCR STRT command. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The DSNCR STRT command fails. The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2CM1

AD3E

Explanation: During processing of a DB2 request for the transaction, an identify request was made to identify the calling TCB to DB2. The identify request failed. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The DB2 request fails. The task is abnormally terminated with a CICS transaction dump.

User response: Examine the exception trace in the dump to determine why the identify request failed. The CSUB control block is output as part of the exception trace entry, and it contains a record of all calls to DB2 starting at field CSB_TRACE_ENTRIES_START. The identify request contains eyecatcher "IDEN" and is followed by the DB2 FRB response and reason codes.

Module: DFHD2D2

AD3F

Explanation: During processing of a DB2 request for the transaction, a terminate thread request was made to DB2 which failed. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The DB2 request fails. The task is abnormally terminated with a CICS transaction dump.

User response: Examine the exception trace in the dump to determine why the terminate thread request failed. The CSUB control block is output as part of the exception trace entry, and it contains a record of all calls to DB2 starting at field CSB_TRACE_ENTRIES_START. The terminate thread request contains eyecatcher "TERM" and is followed by the DB2 FRB response and reason codes.

Module: DFHD2D2

AD3G

Explanation: An unexpected response was received from an EXEC CICS GETMAIN issued during processing of a CICS-DB2 DSNB command. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The DSNB command fails. The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2CM1

AD3H

Explanation: The issuing of an EXEC SQL command or IFI call from a Dynamic Plan Exit is not allowed.

System action: The task is abnormally terminated.

User response: Remove any EXEC SQL commands or IFI calls from the Dynamic Plan Exit.

Module: DFHD2EX1

AD3I

Explanation: An unexpected response was received from an EXEC CICS INQUIRE DB2CONN command issued during startup of the CICS-DB2 interface. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: Startup of the CICS-DB2 interface is terminated, and the interface is closed. The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2CM1

AD3J

Explanation: A commit request to DB2, issued during the second phase of syncpoint, failed. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump. CICS maintains a record that the UOW committed pending a future resynchronization request with DB2.

User response: Examine the exception trace in the dump to determine why the commit request failed. The CSUB control block is output as part of the exception trace entry, and it contains a record of all calls to DB2

starting at field CSB_TRACE_ENTRIES_START. The commit request contains eyecatcher "COMM" and is followed by the DB2 FRB response and reason codes.

Module: DFHD2D2

AD3K

Explanation: An abort request to DB2, issued during the second phase of syncpoint, failed. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump. CICS maintains a record that the UOW backed out pending a future resynchronization request with DB2.

User response: Examine the exception trace in the dump to determine why the abort request failed. The CSUB control block is output as part of the exception trace entry, and it contains a record of all calls to DB2 starting at field CSB_TRACE_ENTRIES_START. The abort request contains eyecatcher "ABRT" and is followed by the DB2 FRB response and reason codes.

Module: DFHD2D2

AD3L

Explanation: During processing of a DB2 request for the transaction, an associate request was made to associate the DB2 connection with the calling TCB. The associate request failed. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The DB2 request fails. The task is abnormally terminated with a CICS transaction dump.

User response: Examine the exception trace in the dump to determine why the associate request failed. The CSUB control block is output as part of the exception trace entry, and it contains a record of all calls to DB2 starting at field CSB_TRACE_ENTRIES_START. The associate request contains eyecatcher "ASSO" and is followed by the DB2 FRB response and reason codes.

Module: DFHD2D2

AD3M

Explanation: An unexpected error occurred during processing of a DSNB MODIFY command. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The DSNB MODIFY command fails. The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2CM1

AD3P

Explanation: An unexpected error occurred during processing of a DSNP STOP command. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The DSNP STOP command fails. The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2CM1

AD3Q

Explanation: An unexpected response was received while attempting to read a record from a temporary storage queue during processing of a DSNP STRT command. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The DSNP STRT command fails. The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2CM1

AD3R

Explanation: An unexpected response was received while attempting to read a record from a temporary storage queue during startup of the CICS-DB2 interface. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: Startup of the CICS-DB2 interface is terminated, the interface is closed. The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2STR

AD3S

Explanation: An unexpected response was received from an EXEC CICS SET DB2CONN command issued during startup of the CICS-DB2 interface. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: Startup of the CICS-DB2 interface is terminated, and the interface is closed. The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2CM1

AD3T

Explanation: The transaction was unable to obtain a DB2 thread from the pool. Message DFHDB2011 is output to transient data. The transaction was abended because the transaction tried using a DB2ENTRY but all threads were in use on the DB2ENTRY, and despite threadwait(pool) being specified, all threads in the pool were also in use. The pool definition within the DB2CONN specifies threadwait(no).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Determine whether more threads should be allocated to the DB2ENTRY or the pool, or whether the number of instances of this transaction should be limited using TRANCLASS.

Module: DFHD2EX1

AD3U

Explanation: An error (INVALID or DISASTER response) has occurred on a locate call to transaction manager (XM) domain to locate a transaction definition. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2EX1

AD3W

Explanation: An unexpected response was received while attempting to write a record to a temporary storage queue during startup of the CICS-DB2 interface. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the

AD3X • ADCD

options specified in the dump table).

System action: Startup of the CICS-DB2 interface is terminated, and the interface is closed. The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2STR

AD3X

Explanation: An unexpected response was received while attempting to write a record to a temporary storage queue during processing of a DSNC STRT command. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System action: The DSNC STRT command fails. The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2CM1

AD3Z

Explanation: The CICS-DB2 thread TCB processing the DB2 request for this transaction has abended because the DB2 adapter is being shutdown.

System action: The task is abnormally terminated.

User response: If this abend should occur at CICS or DB2 shutdown then it can be ignored, because the DB2 adapter is abending the task as part of shutdown processing, otherwise you will need assistance from IBM.

Module: DFHD2EX1

ADCA

Explanation: This abend is issued if DBCTL returns a non-zero response code when a DL/I request has been issued from an application program.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Look up accompanying message DFHDB8109 that appears on the CDBC transient data destination.

Module: DFHDLIDP

ADCB

Explanation: This abend occurs when DBCTL has notified CICS that a task has issued a DL/I request, but it did not have a PSB scheduled. If your application does have a PSB scheduled then a possible cause for this abend is that the DBCTL STOP THREAD command may have been used to terminate the DBCTL thread that corresponds to this task.

System action: CICS abnormally terminates the transaction with a transaction dump. CICS processing continues.

User response: Check if the DBCTL operator has issued a STOP THREAD command for the task that has abnormally terminated. Look up DBCTL response code 28 in the DBCTL return code section of the IMS Messages and Codes.

Module: DFHDLIDP

ADCC

Explanation: This abend occurs when DBCTL has notified CICS that a task has issued program specification block (PSB) request, but it has a PSB already scheduled. CICS prevents a task from issuing a PSB schedule request to DBCTL when it has already issued a PSB schedule request by returning a PSBSCH response in UIBDLTR. However, in this case it is DBCTL that has rejected the subsequent PSB schedule request. A possible cause for this abend is a storage over-write.

System action: CICS abnormally terminates the transaction with a transaction dump. CICS processing continues.

User response: Check for any messages issued from your CICS system indicating that storage over-writes have taken place. Look up DBCTL response code 32 in the DBCTL return code section of the IMS Messages and Codes.

Module: DFHDLIDP

ADCD

Explanation: This abend is issued when a deadlock has been detected by IMS and this transaction has been selected for abnormal termination.

This abend can occur when a transaction is accessing IMS resources via DBCTL or via a remote DLI request to a remote CICS region. The remote CICS region can be accessing IMS via DBCTL, or if it is a CICS 4.1 region or earlier, accessing IMS via local DLI.

System action: Access to IMS resources via DBCTL is withdrawn for this transaction. Further attempts to access IMS will result in an AEY9 abend.

CICS abnormally terminates the transaction with a transaction dump. CICS processing continues.

User response: If ADCD abends occur infrequently in your system, no action is required although you may like to consider setting your system up in such a way that, after an ADCD abend is issued, the transaction is automatically restarted. See the *CICS Recovery and Restart Guide* for further information.

If ADCD abends are occurring frequently in your system, you may need to review the design of your applications. Some general techniques for deadlock avoidance are described in the *CICS Recovery and Restart Guide*.

Module: DFHDLIDP

ADCE

Explanation: This abend is issued when the module DFHDBAT returns a nonzero return code in reply to a DL/I request issued from an application program to DBCTL. DFHDBAT is a task related user exit and forms part of the CICS-DBCTL interface. This abend is accompanied by message DFHDB8110.

System action: CICS abnormally terminates the transaction with a transaction dump. CICS processing continues.

User response: Look up the accompanying message DFHDB8110 that appears on the CDBC transient data destination.

Module: DFHDLIDP

ADCF

Explanation: This abend is issued when the module DFHDLIDP detects that the CICS-DBCTL interface has been configured using a DRA startup table (DFSPZPxx) which specifies option PCBLOC=31, and the application is amode 24.

PCBLOC=31 specifies that the PCB address list and the PCBs can be stored above the line. This is incompatible with amode 24 applications.

System action: CICS abnormally terminates the transaction with a transaction dump. CICS processing continues.

User response: Linkedit the application amode 31 or change the DRA startup table option to PCBLOC=24.

Module: DFHDLIDP

ADCI

Explanation: This abend is issued when IMS returns a user abend 3303 response for a DL/I request issued from an application program.

System action: Access to IMS resources via DBCTL is withdrawn for this transaction. Further attempts to access IMS will result in an AEY9 abend.

CICS abnormally terminates the transaction with a

transaction dump. CICS processing continues.

User response: Check the description in the IMS Messages and Codes for the meaning of IMS user abend 3303.

Module: DFHDLIDP

ADCJ

Explanation: This abend is issued when an application has been using DBCTL, and while the application was still scheduled to DBCTL, the CICS-DBCTL interface was terminated.

System action: CICS abnormally terminates the transaction with a transaction dump. CICS processing continues.

User response: Check the CDBC transient data destination for messages indicating the reason for termination of the CICS-DBCTL interface. If you do not know where the CDBC transient is, then please check with your system programmer. Check for messages issued from the DBCTL system.

Module: DFHDLIDP

ADCP

Explanation: When checking the DBCTL program specification block (PSB), the external security manager checked the usage of the PSB, and found that

- The user was unauthorized to access the PSB, or
- The PSB was unknown to the external security manager, or
- The user was set to the capability of the default user.

The meaning of the term “user” in the above context depends on the way the transaction was invoked.

- If the transaction is being run from a local terminal, or has been routed from a remote terminal, the user is the terminal user. (For a routed transaction, if PSBCHK=NO is specified in the SIT, or RESSEC=NO is specified in the transaction definition (CEDA DEFINE TRANSACTION command), the security manager does *not* check the terminal user.)
- If the transaction is being run as a result of a request from another CICS MRO region, the user is the owner of the other CICS system (as defined to the external security manager in the JOB statement of the initializing JCL).
- If the transaction is being run as a result of a request from a connected ISC system, the user is defined in the SECURITYNAME operand of the installed CONNECTION definition that defines the link between the remote system and the local system. Ensure that the name in the SECURITYNAME operand is the same as that supplied by the connected CICS system. This will depend upon the

ADCQ • ADDA

type of CONNECTION between the two systems. For further information about this, refer to the *CICS Intercommunication Guide*.

Notes.

By the above definitions, a PSB used by a routed transaction has two users, the terminal user and the communicating region. Therefore, for routed transactions, the external security manager makes two checks, on the terminal user (as qualified in 1 above), and on the communicating region (2 or 3 above).

System action: CICS abnormally terminates the task attempting to schedule the PSB. CICS processing continues.

User response: Ensure that the PSB is defined to the external security manager, and that all users have the correct level of authorization. If the system setup is correct, note the security violation.

Module: DFHDLIDP

ADCQ

Explanation: This abend occurs when an application has issued an EXEC DLI SCHED request for a PSB that contains no DBPCBs, and the SYSSERVE keyword was not specified. This abend also occurs when an application has issued a PCB request for a PSB that contains no DBPCBs, and the IOPCB option was not specified.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Check that the application program has scheduled the appropriate PSB.

Module: DFHDLIDP

ADCR

Explanation: This abend occurs when an application has issued a DL/I request other than a schedule request, and the DBCTL DRA return code of 40 indicates that there was no active communication with DBCTL.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Check the CDBC transient data destination for messages indicating the reason for termination of the CICS-DBCTL interface. If you do not know where the CDBC transient data destination is, check with your system programmer. Check for messages issued from the DBCTL system.

Module: DFHDLIDP

ADCS

Explanation: CICS issued a single-phase commit request to DBCTL and an unexpected response was returned from DBCTL.

System action: CICS issues message DFHDB8119 to transient data queue CDBC, then terminates the task abnormally with a CICS transaction dump.

User response: Message DFHDB8119 shows the unexpected response from DBCTL, along with the recovery token of the LUW involved. The explanation of message DFHDB8119 indicates how the outcome of the LUW can be determined.

Module: DFHDBAT

ADCT

Explanation: A user has attempted to invoke the CICS-DBCTL control transaction from a terminal.

System action: CICS rejects the request.

User response: Do not try to invoke CICS internal transactions directly.

Module: DFHDBCT

ADCV

Explanation: The connection to DBCTL was terminated and then re-established. The failing task had issued a schedule request against an earlier run of DBCTL and is therefore no longer scheduled.

System action: CICS abnormally terminates the transaction with a transaction dump. CICS processing continues.

User response: No action is required, although you may like to consider setting your system up in such a way that, after an abend ADCV is issued, the transaction is automatically restarted.

Module: DFHDLIDP

ADDA

Explanation: An error (INVALID or DISASTER response) has occurred on a call to the storage manager domain. The domain that detected the original error provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump (depending on the options in the dump table).

User response: See related message from the domain that detected the original error.

Module: DFHDBME, DFHDLI, DFHDLIDP

ADDB

Explanation: An error (INVALID or DISASTER response) has occurred on a call to the catalog (CC) domain. The domain that detected the original error provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump (depending on the options in the dump table).

User response: See related message from the domain that detected the original error.

Module: DFHDBCON, DFHDBDSC

ADDC

Explanation: An error (INVALID or DISASTER response) has occurred on a call to the loader (LD) domain. The domain that detected the original error will have provided an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump (depending on the options in the dump table).

User response: See related message from the domain that detected the original error.

Module: DFHDBCON, DFHDBDI

ADDI

Explanation: CICS has been notified of a DBCTL failure. However, it has been unable to complete the search for a DBCTL alternate. This is possibly due to an unexpected return code from an IEFSSREQ request.

System action: A CICS transaction dump is produced. CICS continues as if no XRF DBCTL alternate has been found. This abend is accompanied by message DFHDX8323.

User response: Refer to message DFHDX8323 for further information. It may be necessary to restart DBCTL manually.

Module: DFHDBCT

ADDJ

Explanation: CICS has failed to connect to DBCTL because program DFHDBAT could not be ENABLED.

System action: A CICS transaction dump is produced. The state of the CICS/DBCTL interface remains not connected.

User response: Refer to the transaction dump to determine why the ENABLE failed.

Module: DFHDBCON

ADEF

Explanation: A severe error has been encountered when executing transaction CLS3.

System action: CLS3 is abnormally terminated with a transaction dump. CICS issues message DFHZC4948.

User response: See message DFHZC4948 for further guidance.

Module: DFHCLS3

ADIR

Explanation: The abend code is issued for either of the following reasons

- A DFHDI or DFHBMS request was issued when the DFHDIP program was generated as a dummy.
- A DFHDI TYPE=RECEIVE or TYPE=NOTE was attempted but the transaction identification did not specify either INBFMH=DIP or INBFMH=ALL.

System action: A CICS transaction dump is provided to assist in problem determination.

User response: Either generate a DFHDIP program into the system or specify INBFMH correctly on the profile definition.

Module: DFHDIP

ADLE

Explanation: A DL/I request was made for a remote database, but the system named in the remote PDIR entry was unknown to CICS, that is, not specified in a DFHTCT TYPE=SYSTEM macro or CEDA DEFINE CONNECTION command.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Either correct the SYSIDNT parameter in the relevant DFHDLPSB entry, or define the remote system to CICS with a DFHTCT TYPE=SYSTEM macro or a CEDA DEFINE CONNECTION command.

Module: DFHDLIRP

ADLF

Explanation: A DL/I request was made for a remote database, but the link to the system on which the database resides was down.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Notify the system programmer. Once the link to the remote system has been reestablished, resubmit the transaction.

ADLG • ADMD

Module: DFHDLIRP

ADLG

Explanation: A DL/I request was made for a remote database, but there were errors in the DL/I argument list that was provided by the user.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Ensure that any errors in the DL/I argument are corrected.

Module: DFHDLIRP

ADLP

Explanation: When checking the DLI program specification block (PSB), the external security manager checked the usage of the PSB, and found that

- The user was unauthorized to access the PSB, or
- The PSB was unknown to the external security manager, or
- The user was set to the capability of the default user.

The meaning of the term “user” in the above context depends on the way the transaction was invoked.

- If the transaction is being run from a local terminal, or has been routed from a remote terminal, the user is the terminal user. (For a routed transaction, if PSBCHK=NO is specified in the SIT, or RESSEC=NO is specified in the transaction definition (CEDA DEFINE TRANSACTION command), the security manager does *not* check the terminal user.)
- If the transaction is being run as a result of a request from another CICS MRO region, the user is the owner of the other CICS system (as defined to the external security manager in the JOB statement of the initializing JCL).
- If the transaction is being run as a result of a request from a connected ISC system, the user is defined in the SECURITYNAME operand of the installed CONNECTION definition that defines the link between the remote system and the local system. Ensure that the name in the SECURITYNAME operand is the same as that supplied by the connected CICS system. This will depend upon the type of CONNECTION between the two systems. For further information about this, refer to the *CICS Intercommunication Guide*.

By the above definitions, a PSB used by a routed transaction has two users, the terminal user and the communicating region. Therefore, for routed transactions, the external security manager makes two checks, on the terminal user (as qualified in 1 above), and on the communicating region (2 or 3 above).

System action: The task attempting to schedule the PSB abnormally terminates.

User response: Ensure that the PSB is defined to the

external security manager, and that all users have the correct level of authorization. If the system setup is correct, note the security violation.

Module: DFHDLIRP

ADMA

Explanation: The alternate CICS task responsible for tracking the DBCTL connection status of the active CICS has received an error from the CICS Availability Manager (CAVM) message input service.

System action: The tracking transaction terminates with a CICS transaction dump. No further action is taken in response to DBCTL status changes. The global exits, XXDFB and XXDTO, are never invoked and no attempt at a DBCTL restart is made in the event of a takeover. This abend is accompanied by DFHDX8331.

User response: Check for any other messages relating the CAVM dataset problems. In the event of a takeover, it may be necessary to restart DBCTL manually.

Module: DFHDBCR

ADMB

Explanation: The CICS/XRF DBCTL tracking task has received an unrecognizable message from the CICS/XRF message manager. This abend is preceded by message DFHDX8333.

System action: The CICS/XRF DBCTL tracking task abends.

User response: Refer to the instructions for message DFHDX8333.

Module: DFHDBCR.

ADMD

Explanation: The alternate CICS system task responsible for tracking the DBCTL connection status of the active CICS has been unable to complete its search for a DBCTL alternate, possibly due to an unexpected return code from an IEFSSREQ request.

System action: A CICS transaction dump is produced. The tracking transaction continues as if no DBCTL alternate had been found. This abend is accompanied by message DFHDX8335.

User response: Refer to message DFHDX8335 for further information. It may be necessary to restart DBCTL manually.

Module: DFHDBCR.

ADPA

Explanation: The CICS supplied transaction for managing debugging profiles, CADP, has received an exception response from the file manager, with reason file error. The file manager will have issued a message to the CICS joblog containing a code which indicates the precise nature of the error. For example this abend will be issued if the underlying file DFHDPFMB used by CADP is disabled or doesn't exist.

System action: CICS abends the transaction with a transaction dump.

User response: Examine the CICS joblog for associated messages, correct the problem and retry the CADP transaction.

Module: DFHDPLU

ADPB

Explanation: The CICS supplied transaction for managing debugging profiles, CADP, has received a disaster response from the file manager, with reason internal error. There is an error in the file manager program.

System action: CICS abends the transaction with a transaction dump.

User response: Examine the CICS joblog for associated messages. Contact IBM for assistance with this type of error.

Module: DFHDPLU

ADPC

Explanation: The CICS supplied transaction for managing debugging profiles, CADP, has received a disaster response from the file manager, with reason disaster percolation. There is an error in one of the CICS domains called by the file manager.

System action: CICS abends the transaction with a transaction dump.

User response: Examine the CICS joblog for associated messages. Contact IBM for assistance with this type of error.

Module: DFHDPLU

ADPD

Explanation: The CICS supplied transaction for managing debugging profiles, CADP, has received a purged response from the file manager. reason disaster precolation. It is likely that an underlying request to CICS File Control has timed out because the record that CADP is trying to access, is held up by another transaction. For example this would occur if CECL was being used to access the underlying file, DFHDPFMB, at the same time as using CADP.

System action: CICS abends the transaction with a transaction dump.

User response: Investigate if there are other tasks running against the file used by CADP.

Module: DFHDPLU

ADPI

Explanation: The CICS supplied program for inactivating all debugging profiles, DFHDPIN, has received an exception response from the file manager, with reason file error. The file manager will have issued a message to the CICS joblog containing a code which indicates the precise nature of the error. For example this abend will be issued if the underlying file DFHDPFMB used by CADP was disabled or deleted whilst DFHDPIN was running.

System action: CICS abends the transaction with a transaction dump.

User response: Examine the CICS joblog for associated messages, correct the problem and retry the CADP transaction.

Module: DFHDPIN

ADPL

Explanation: A server program has issued a command which is restricted in the distributed program link (DPL) environment. Certain API and CPI-RR requests, and the DL/I terminate request are not allowed in the DPL environment. See the *CICS Application Programming Guide* for a list of these restricted commands.

A server program is a program which has been remotely linked, or a program defined to run with the DPL subset.

System action: CICS abends the transaction with a transaction dump.

User response: Remove the restricted commands from the server program, or run the server program locally.

Module: DFHEIP, DFHCPIR, DFHDLI

ADXA

Explanation: The XRF DBCTL state catch-up transaction, DXCU, has failed.

System action: DXCU is abnormally terminated with a CICS transaction dump. This abend is accompanied by DFHDX8319.

User response: Diagnose the error from the CICS transaction dump. Refer to DFHDX8319 for further information.

Module: DFHDXCU

ADXB

Explanation: The XRF DBCTL state catch-up transaction, DXCU, has failed.

System action: DXCU is abnormally terminated with a CICS transaction dump. This abend is accompanied by DFHDX8318.

User response: Use the dump to help diagnose the problem. Refer to DFHDX8318 for further information. Check for any other messages relating to CICS availability manager (CAVM) data set problems.

Module: DFHDXCU

AExx abend codes

AEC1

Explanation: An attempt has been made to use the Command Level Interpreter (CECI) or the Enhanced Master Terminal (CEMT) or an RDO (CEDA, CEDB, CEDC) transaction on a terminal that is not supported.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Use a terminal that is supported by the Command Level Interpreter, Enhanced Master Terminal, or RDO transaction.

Module: DFHECIP, DFHECSP, DFHEMTP, DFHESTP, DFHEOTP, DFHEDAP

AEC2

Explanation: An attempt has been made to use the Command Level Interpreter (CECI) or the Enhanced Master Terminal (CEMT) or an RDO (CEDA, CEDB, CEDC) transaction on a display terminal of size less than 24 X 80.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Use a display terminal that is supported by the Command Level Interpreter or Enhanced Master Terminal or RDO transaction.

Module: DFHECIP, DFHECSP, DFHEMTP, DFHESTP, DFHEOTP, DFHEDAP

AEC7

Explanation: Language Environment has encountered an unexpected error during the THREAD INITIALIZATION phase while attempting to execute a Language Environment enabled program. The return code received from Language Environment is placed into the field EIBRESP2.

System action: Message DFHAP1200 is issued and the transaction is abnormally terminated. The program is disabled.

User response: Refer to the error message or messages issued by Language Environment to determine the cause of the problem.

Module: DFHAPLI

AEC8

Explanation: Language Environment has encountered an unexpected error during the RUNUNIT INITIALIZATION phase while attempting to execute a Language Environment enabled program.

System action: The return code received from Language Environment is placed into the field EIBRESP2. Message DFHAP1200 is issued and the transaction is abnormally terminated. The program is disabled.

User response: Refer to the error message or messages issued by Language Environment to determine the cause of the problem.

Module: DFHAPLI

AEC9

Explanation: Language Environment has encountered an unexpected error during the RUNUNIT BEGIN INVOCATION phase while attempting to execute a Language Environment enabled program.

System action: The return code received from Language Environment is placed into the field EIBRESP2. Message DFHAP1200 is issued and the transaction is abnormally terminated. The program is disabled.

User response: Refer to the error message or messages issued by Language Environment to determine the cause of the problem.

Module: DFHAPLI

AED1

Explanation: This abend is produced as a result of either

- An attempt to use the execution diagnostic facility (EDF) on an unsupported terminal,
- Using the temporary storage browse transaction (CEBR) on an unsupported device, or
- An attempt to initiate the temporary storage browse transaction (CEBR) with a non-terminal principal facility.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Use a terminal or device that is properly supported.

Module: DFHEDFP, DFHEDFBR

AED2

Explanation: The program EDF has terminated a task and placed this abend code in the terminated task's TCA. This occurs because execution of EDF is about to be abnormally terminated. A probable reason for EDF being terminated is that a line, control unit, or a terminal has been put out of service.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Use a terminal that is supported as a display terminal by EDF. A CICS transaction dump of the task terminated with this abend code is available for review.

Module: DFHEDFX

AED3

Explanation: The program EDF has terminated a task and placed this abend code in the terminated task's TCA. The termination occurs because execution of EDF is about to be abnormally terminated.

One possible cause of an abend in EDF is incorrect data being sent to the terminal by the user task.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: A CICS transaction dump of the terminated task and also a similar dump for EDF, when its termination was abnormally terminated, are available for review.

Module: DFHEDFX

AED4

Explanation: An internal logic error has been detected in EDF module DFHEDFP.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: This indicates a CICS logic error. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHEDFP

AED5

Explanation: An internal logic error was been detected in EDF. Insufficient dynamic storage was pre-allocated.

System action: EDF is terminated abnormally with

dumps having dump codes CXSP, RMIN, PAGE, LDIN. The user task continues.

User response: The problem may be avoided by less complex user interactions with EDF. If the problem persists, you may need further assistance. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHEDFD

AED6

Explanation: An internal logic error was detected in EDF.

System action: EDF is terminated abnormally with dumps having dump codes CXSP, RMIN, PAGE, LDIN. The user task continues.

User response: The problem may be avoided by less complex user interactions with EDF. If the problem persists, you may need further assistance. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHEDFU

AED7

Explanation: The installed definition of the transaction CEDF has a TWA size which is too small.

System action: CICS abnormally terminates the transaction with a CICS transaction dump.

User response: If you have an updated copy of the CEDF transaction installed, ensure that you have a TWA size at least as big as the one defined by the IBM supplied definition. If you do not have an updated CEDF you may need further assistance to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHEDFP

AED8

Explanation: A terminal control error has occurred in DFHEDFX.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHEDFX

AED9

Explanation: A temporary storage error has occurred in EDF. This could be caused by an input/output error on temporary storage or because temporary storage data is full.

AEDA • AEDH

System action: EDF is abnormally terminated with a CICS transaction dump.

User response: Investigate the reason for the temporary storage request failure. Ensure that the definition of the temporary storage data set is correct.

See the *CICS Problem Determination Guide* for further guidance in dealing with temporary storage problems.

Module: DFHEDFD

AEDA

Explanation: The CEDF transaction has been started with an invalid start code. This could be the result of attempting to start the execution diagnostic facility (EDF) with EXEC CICS START(CEDF).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Use the transaction dump to determine why the start has failed.

Module: DFHEDFX

AEDB

Explanation: DFHEDFP has been passed an invalid EDFXA. This is an internal CICS error.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHEDFX

AEDC

Explanation: The program EDF has terminated because a GETMAIN request to the storage manager failed.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Use the transaction dump to determine why the request has failed.

Module: DFHEDFX

AEDD

Explanation: CICS has attempted to attach the EDF task to display the user request but the attach has failed.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Use the transaction dump to determine why the attach has failed.

Module: DFHEDFX

AEDE

Explanation: CICS has suspended the user task to allow the EDF task to complete but an error has occurred while performing the suspend.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Use the transaction dump to determine why the suspend has failed.

Module: DFHEDFX

AEDF

Explanation: CICS has suspended the user task to allow the EDF task to complete. The user task has been purged while suspended, before control was returned from EDF.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: The task was probably purged by the master terminal operator.

Investigate the reason why the task was purged. This may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

Module: DFHEDFX

AEDG

Explanation: CICS has suspended the user task to allow the EDF task to complete. The user task has gone away while suspended, before control was returned from EDF.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Use the transaction dump to determine the reason why the task finished before being resumed.

Module: DFHEDFX

AEDH

Explanation: An error occurred when CICS called the Program Manager in order to discover details of the user program that has invoked EDF.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Use the transaction dump to determine why the call has failed.

Module: DFHEDFX

AEIO

Explanation: PGMIDERR condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEI1

Explanation: TRANSIDERR condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEI2

Explanation: ENDDATA condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEI3

Explanation: INVTSREQ condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEI4

Explanation: EXPIRED condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEI8

Explanation: TSIOERR condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEI9

Explanation: MAPFAIL condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEIA **AEID to AEI9, AEXC, AEXF, AEXG, AEXI to AEXL, AEXV to AEXX, AEX0 to AEX9, AEYA to AEYC, AEYE to AEY3, AEY7, and AEZE to AEZX.**

Explanation: The EXEC interface program issues an abend when an exceptional condition has occurred but the command does not have the RESP option (or NOHANDLE option), or the application program has not executed an EXEC CICS HANDLE CONDITION command for that condition. This will cause DFHEIP to take the system action for the condition in question. In most cases, the system action will be to abend the transaction.

Because of their similar characteristics, the above-named abend codes for the EXEC interface program are described as a group. The codes and their corresponding exceptional conditions are as follows:

Code	Condition
AEIA	ERROR
AEID	EOF
AEIE	EODS
AEIG	INBFMH
AEIH	ENDINPT
AEII	NONVAL
AEIJ	NOSTART
AEIK	TERMIDERR

AEZX	TIMEDOUT
AEZY	CODEPAGEERR

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Change the application program either to prevent the condition recurring, to check it by using the RESP option, or to handle the condition when

it does occur (by using the EXEC CICS HANDLE CONDITION command). If necessary, use the contents of the EIBRESP2 field or the EIBRCODE in the EIB to assist in determining the cause of the exceptional condition.

Problem determination: The function code of the command that produced the exceptional response and the response code can be found in the EXEC interface block (EIB). The EIB is part of a larger control block, used by DFHEIP, known as the EXEC interface storage block (EIS). The EIS is addressed by the TCAEISA, which is the system part of the TCA + X'90. The EIB is pointed to from the EIS + X'8.

The function code may be located at offset X'1B in the EIB while the response codes may be one of the following at the given offsets

EIBRCODE
X'1D

EIBRESP
X'4C

EIBRESP2
X'50

The *CICS Application Programming Reference* gives translations of the encoded functions and their responses.

Analysis: Because these abend codes are directly related to exceptional conditions that can be specified in HANDLE CONDITION commands, the application programmer should decide whether the condition is one that should be handled by the application (for example ENDFILE), or one that requires modifications to the application or CICS tables.

Module: DFHEIP

AEID

Explanation: EOF condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEIE

Explanation: EODS condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEIG

Explanation: INBFMH condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEIH

Explanation: ENDINPT condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEII

Explanation: NONVAL condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEIJ

Explanation: NOSTART condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEIK

Explanation: TERMIDERR condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEIL

Explanation: FILENOTFOUND condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

AEIM • AEIW

See the description of abend AEIA for further details.

Module: DFHEIP

AEIM

Explanation: NOTFND condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEIN

Explanation: DUPREC condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEIO

Explanation: DUPKEY condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEIP

Explanation: INVREQ condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEIQ

Explanation: IOERR condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEIR

Explanation: NOSPACE condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEIS

Explanation: NOTOPEN condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEIT

Explanation: ENDFILE condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEIU

Explanation: ILLOGIC condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEIV

Explanation: LENGERR condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEIW

Explanation: QZERO condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEIZ

Explanation: ITEMERR condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AELA

Explanation: The executing function has been purged before control could be returned.

System action: The transaction is marked to be abnormally terminated with abend code AELA.

User response: Investigate the reason the task was purged. It was purged either by the master terminal operator, or as a result of a deadlock timeout.

If the task was purged by the master terminal operator, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased then the number of tasks in the system should be reduced to avoid short-on-storage situations. Another possibility would be to increase the value of the DTIMOUT option for the transaction.

Module: DFHETL

AELB

Explanation: The executing function has been purged before control could be returned.

System action: The transaction is marked to be abnormally terminated with abend code AELB.

User response: Investigate the reason the task was purged. It was purged either by the master terminal operator, or as a result of a deadlock timeout.

If the task was purged by the master terminal operator, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased then the number of tasks in the system should be reduced to avoid short-on-storage situations. Another possibility would be to increase the value of the DTIMOUT option for the transaction.

Module: DFHEGL

AEMA

Explanation: An error (INVALID or DISASTER response) has occurred on a call to the application (AP) domain when a request for set user exit active could not be serviced.

System action: The task is abnormally terminated. The domain that detected the original error issues a console message and might provide an exception trace, and depending on the options specified in the dump table, a system dump.

User response: See the associated console message for further guidance.

Module: DFHUEM

AEMB

Explanation: An error (INVALID or DISASTER response) has occurred on a call to the loader (LD) domain. The domain that detected the original error will have provided an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump (depending on the options in the dump table).

User response: See the related message from the domain that detected the original error.

Module: DFHUEM

AEMP

Explanation: The task was purged before a set active request to the application (AP) domain was able to complete successfully. The domain that first detected the purged condition may provide an exception trace.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate why the task was purged. This is either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another

AEMQ • AETH

possibility is to increase the value of the DTIMOUT option for the transaction.

Module: DFHUEM

AEMQ

Explanation: The task was purged before an IDENTIFY_PROGRAM request to the loader (LD) domain was able to complete successfully. The domain that first detected the purged condition provides an exception trace.

System action: The task is abnormally terminated with a CICS transaction dump (depending on the options in the dump table).

User response: Investigate why the task was purged. This is either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Module: DFHUEM

AETA

Explanation: A CICS transaction has issued a non-CICS command via an application "stub" (an expansion of a DFHRMCAL macro). Program DFHERM has determined that the exit has been disabled since the previous DFHRMCAL request was issued from the transaction.

System action: The task is abnormally terminated with a transaction dump

User response: Notify your system programmer.

Module: DFHERM

AETC

Explanation: A CICS transaction has issued a non-CICS command via an application "stub" (an expansion of a DFHRMCAL macro). However, the task-related user exit (TRUE) is not known to program manager.

System action: The task is abnormally terminated with a transaction dump

User response: Ensure that the TRUE as identified to the DFHRMCAL macro has been correctly defined to CICS.

Module: DFHERM

AETF

Explanation: The task was purged before a request to the storage manager (SM) domain was able to complete successfully. The domain that first detected the purged condition will have provided an exception trace.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate why the task was purged. This is either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Module: DFHERM

AETG

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error will have provided an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related message produced by the domain that detected the original error.

Module: DFHERM

AETH

Explanation: The task was purged before a request to the storage manager (SM) domain was able to complete successfully. The domain that first detected the purged condition will have provided an exception trace.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate why the task was purged. This is either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Module: DFHERM

AETI

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error will have provided an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related message produced by the domain that detected the original error.

Module: DFHERM

AETJ

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR or PURGED) has occurred on an ADD_LINK call to the recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHERM provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHERM

AETK

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR or PURGED) has occurred on an SET_LINK call to the recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHERM provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHERM

AETL

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR or PURGED) has occurred on an SET_UOW call to the recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHERM provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHERM

AETM

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR, or PURGED) has occurred on an INQUIRE_TRANSACTION call to the transaction manager (XM) domain. For errors other than EXCEPTION, the XM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHRMSY provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

AETN • AETS

Module: DFHRMSY

AETN

Explanation: An EXCEPTION response with an unexpected reason occurred on an INITIATE_RECOVERY call to recovery manager (RM) domain. DFHRMSY provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHRMSY

AETO

Explanation: An error (DISASTER, INVALID, KERNERROR, or PURGED) has occurred on an INITIATE_RECOVERY call to the recovery manager (RM) domain. The RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

DFHRMSY also provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHRMSY

AETP

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR, or PURGED) has occurred on an TERMINATE_RECOVERY call to recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHRMSY provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHRMSY

AETQ

Explanation: An EXCEPTION response with an unexpected reason occurred on an INQUIRE_UOW call to the recovery manager (RM) domain. DFHRMSY provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHRMSY

AETR

Explanation: An error (DISASTER, INVALID, KERNERROR, or PURGED) has occurred on an INQUIRE_UOW call to the recovery manager (RM) domain. The RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

DFHRMSY also provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHRMSY

AETS

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR, or PURGED) has occurred on an INQUIRE_STARTUP call to recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHRMSY provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHRMSY

AEX0**Explanation:** TCIDERR condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEX1**Explanation:** DSNNOTFOUND condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEX2**Explanation:** LOADING condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEX3**Explanation:** MODELIDERR condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEX4**Explanation:** UOWNOTFOUND condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEX5**Explanation:** PARTNERIDERR condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEX6**Explanation:** PROFILEIDERR condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEX7**Explanation:** NETNAMEIDERR condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEX8**Explanation:** LOCKED condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEX9**Explanation:** RECORDBUSY condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEXC**Explanation:** RESIDERR condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEXF • AEXX

AEXF

Explanation: ESCERROR condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEXG

Explanation: UOWLNOTFOUND condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEXI

Explanation: TERMERR condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEXJ

Explanation: ROLLEDBACK condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEXK

Explanation: END condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEXL

Explanation: DISABLED condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEXU

Explanation: During execution of an EXEC CICS command, a NOTPOSS condition has been raised on encountering an invalid parameter. This is probably caused by a previous storage overlay.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Refer to abend AEIA for an explanation of how to determine the function code of the CICS command that caused the abend.

It is not possible to set an EXEC CICS HANDLE CONDITION for NOTPOSS.

The system programmer should investigate the cause of the storage overlay.

Module: DFHEIDTI, DFHEIQDS, DFHEIQSA, DFHEIQSC, DFHEIQSM, DFHEIQSP, DFHEIQST, DFHEIQSX

AEXV

Explanation: VOLIDERR condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEXW

Explanation: SUPPRESSED condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEXX

Explanation: TASKIDERR condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEXY

Explanation: The executing transaction has been purged before control could be returned.

This can arise when the transaction is purged while

- A CICS command was being processed
- The transaction was waiting to be dispatched

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Contact your system programmer to determine why the transaction has been purged.

Module: DFHACP, DFHBEP, DFHBREX, DFHBRIC, DFHBRMS, DFHBRSP, DFHBRTC, DFHBSTS, DFHBSTZO, DFHD2CC, DFHD2EX1, DFHD2EX2, DFHD2STR, DFHEDCP, DFHEDFP, DFHEDI, DFHEEI, DFHEGL, DFHEICRE, DFHEIDEF, DFHEIDEL, DFHEIINS, DFHEIIC, DFHEIP, DFHEIPA, DFHEIPI, DFHEIPRT, DFHEIPSE, DFHEIPSH, DFHEIQDE, DFHEIQDN, DFHEIQDS, DFHEIQDU, DFHEIQD2, DFHEIQEJ, DFHEIQIR, DFHEIQMS, DFHEIQMT, DFHEIQPF, DFHEIQPI, DFHEIQPN, DFHEIQRQ, DFHEIQSA, DFHEIQSC, DFHEIQSJ, DFHEIQSK, DFHEIQSL, DFHEIQSM, DFHEIQSP, DFHEIQSQ, DFHEIQST, DFHEIQSX, DFHEIQSY, DFHEIQTM, DFHEIQTR, DFHEIQTS, DFHEIQUE, DFHEIQVT, DFHEIQWB, DFHEIQWR, DFHEIUOW, DFHEIWB, DFHEK, DFHEMS, DFHEOP, DFHEPC, DFHERM, DFHESC, DFHESE, DFHESN, DFHETC, DFHETL, DFHETRX, DFHTACP, DFHTFP, DFHTIEM, DFHUEM, DFHWBTC, DFHXMBR, DFHXTP, DFHZATS, DFHZNCA, DFHZNCE, DFHZTSP, DFHZXQO, DFHZXST

AEXZ

Explanation: A command has failed due to a serious failure in a CICS component (resource manager).

System action: The transaction is abnormally terminated with abend code AEXZ. CICS takes a transaction dump, unless module DFHDUIO is not loaded.

User response: Use the transaction dump to determine the cause of the failure. For further assistance, or if module DFHDUIO is not loaded and no transaction dump is available, contact your system programmer.

Module: DFHACP, DFHBEP, DFHBREX, DFHBRIC, DFHBRMS, DFHBRSP, DFHBRTC, DFHBSTS, DFHBSTZO, DFHCDKRN, DFHEDCP, DFHEDFP, DFHEDI, DFHEEI, DFHEGL, DFHEIACQ, DFHEICRE, DFHEICRE, DFHEIDEF, DFHEIDEL, DFHEIINS, DFHEIIC, DFHEIP, DFHEIPA, DFHEIPI, DFHEIPRT, DFHEIPSE, DFHEIPSH, DFHEIQDE, DFHEIQDN, DFHEIQDS, DFHEIQDU, DFHEIQD2, DFHEIQEJ, DFHEIQIR, DFHEIQMS, DFHEIQMT, DFHEIQPF, DFHEIQPI, DFHEIQPN, DFHEIQRQ, DFHEIQSA, DFHEIQSC, DFHEIQSJ, DFHEIQSK, DFHEIQSL,

DFHEIQSM, DFHEIQSP, DFHEIQSQ, DFHEIQST, DFHEIQSX, DFHEIQSY, DFHEIQTM, DFHEIQTR, DFHEIQTS, DFHEIQUE, DFHEIQVT, DFHEIQWB, DFHEIQWR, DFHEIUOW, DFHEIWB, DFHEK, DFHEMS, DFHEOP, DFHEPC, DFHESC, DFHESE, DFHESN, DFHETC, DFHETL, DFHETRX, DFHFCFL, DFHMQTRU, DFHSJIN, DFHTACP, DFHTFP, DFHTIEM, DFHUEH, DFHUEM, DFHWBTC, DFHXMBR, DFHXTP, DFHZATS, DFHZNCA, DFHZNCE, DFHZTSP, DFHZXQO, DFHZXST

AEY0

Explanation: INVEXITREQ condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEY1

Explanation: INVPARTNSET condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEY2

Explanation: INVPARTN condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEY3

Explanation: PARTNFAIL condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEY6

Explanation: Internal logic error in DFHUEM. This arises when using EXITALL to DISABLE an exit program from all exit points for which it has been enabled. The entire user exit table has been scanned and all associations of the program have been found.

AEY7 • AEYD

But the activation count for the program in its exit program block indicates there should be more associations (for example, the activation count has not been reduced to zero). The user exit table and associated control blocks (EPBs and EPLs) are out of step and have probably been corrupted.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHUEM

AEY7

Explanation: NOTAUTH condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEY8

Explanation: No DSA was found on the chain while trying to free dynamic storage for an assembler language program using an EXEC CICS command.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Ensure that the DFHEIENT, DFHEISTG, and DFHEIEND macro invocations are correctly positioned and retry. If the error persists, you will need further assistance. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHEIP

AEY9

Explanation: One of the following

- An EXEC CICS command has been issued that is not supported by the EXEC interface program DFHEIP.
- A transaction has issued an EXEC CICS command which is supported in principle by the EXEC interface program DFHEIP, but for which the prerequisite function has not been included in the current CICS start-up.
- A non-CICS command has been issued via an application “stub” (expansion of a DFHRMCAL macro), and the program DFHERM has detected that the necessary non-CICS support is not available.
- An attempt has been made to use remote resources, but the local SYSID has been specified in an EXEC CICS command, or vice versa.

- An attempt has been made to use remote resources, but ISC is not supported.
- An EXEC CICS command contains an invalid AID or CONDITION identifier. This indicates that the EXEC CICS command has become corrupted.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Check that the sysid specified and the resource names were correct. If not, notify the system programmer. Either the command (or an application stub) has become corrupted, or the unavailable function needs to be generated (CICS command), ENABLEd (non-CICS command), or exceptionally the non-CICS support has suffered damage and is attempting to withdraw itself from the CICS system.

Module: DFHEIP, DFHEEI

AEYA

Explanation: INVERRTERM condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEYB

Explanation: INVMPSZ condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEYC

Explanation: IGREQID condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEYD

Explanation: A transaction has requested that CICS access a storage area that the transaction itself could not access. This occurred when an invalid storage area was passed to CICS as an output parameter on an EXEC CICS command.

System action: The transaction is abnormally

terminated with a CICS transaction dump.

User response: Examine the trace to find the exception trace entry created by DFHEISR and then identify the parameter in error. If the abend is handled, EXEC CICS ASSIGN ASRASTG, ASRAKEY, ASRASPC, and ASRAREGS give additional information about the abend. At the time of the abend, register 2 points to the storage area at fault.

Change one or more of the following

- Correct the code in error in the transaction issuing the EXEC CICS command in order to supply a valid storage area.
- If storage protection is active, change the EXECKEY on the CEDA definition for the program that issued the EXEC CICS command from USER to CICS.
- If storage protection is active, change the TASKDATAKEY attributes on the transaction definition from CICS to USER.
- If transaction isolation is active, change the ISOLATE attribute on the transaction definition from YES to NO.

Module: DFHSRP

AEYE

Explanation: INVLDC condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEYF

Explanation: A transaction has requested that CICS access a storage area that the transaction itself could not access. This occurred when an invalid storage area was passed to CICS on a PUT CONTAINER or a GET CONTAINER command. The error can occur when

- Either the FROM or INTO address is specified incorrectly.
- The FLENGTH value specifies a value large enough to cause the area to include storage which the transaction can not access.

A common cause of this error is specifying the address of a halfword area in the FLENGTH parameter, which expects a fullword area. This error can arise when a program which previously used commareas, which have halfword lengths, has been modified to use containers which have fullword lengths.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Examine the trace to find the entry trace entry created by DFHEISR and then identify the

parameter in error. If the abend is handled, EXEC CICS ASSIGN ASRASTG, ASRAKEY, ASRASPC, and ASRAREGS give additional information about the abend. At the time of the abend, register 2 points to the storage area at fault.

You will most likely need to do the following

- Correct the program in error that issued the EXEC CICS PUT CONTAINER or EXEC CICS GET CONTAINER command. Ensure that it supplies the address of a valid storage area and that it supplies an FLENGTH such that no part of the storage area is inaccessible to the transaction. Ensure that FLENGTH refers to a fullword length.

You may also need to consider changing one or more of the following

- If storage protection is active, change the EXECKEY on the CEDA definition for the program that issued the EXEC CICS command from USER to CICS.
- If storage protection is active, change the TASKDATAKEY attributes on the transaction definition from CICS to USER.
- If transaction isolation is active, change the ISOLATE attribute on the transaction definition from YES to NO.

Module: DFHEIP

AEZA

Explanation: A transaction has been defined with a TASKDATALOC(ANY), but the programs within the transaction are running amode 24. The exec interface program is therefore unable to access the TCA for the application. Furthermore, any reference to the EIB would cause the transaction to fail with an OC4 protection exception.

System action: The transaction is abnormally terminated.

User response: Either redefine and install a new definition for the transaction with TASKDATALOC(BELOW), or relink the programs as amode 31.

Module: DFHEIP

AEZB

Explanation: A transaction has been defined with a TASKDATALOC(ANY), and the application is attempting to call a task related user exit. However the task related user exit has been linkedit AMODE 24 and enabled with the LINKEDITMODE option, thereby directing CICS to invoke it in AMODE 24. An AMODE 24 task related user exit cannot run when the calling application is running with TASKDATALOC(ANY), as this would cause

a protection exception, or a storage overwrite.

System action: The transaction is abnormally terminated.

User response: Either redefine and install a new definition for the transaction with TASKDATALOC(BELOW), or modify the task related user exit so that it is invoked in AMODE 31.

Module: DFHERM

AEZC

Explanation: A transaction has been defined with a TASKDATALOC(ANY), but a program within the transaction is defined to run AMODE 24. CICS cannot invoke the AMODE 24 program when the transaction is running with TASKDATALOC(ANY), as this would cause a protection exception, or a storage overwrite.

System action: The transaction is abnormally terminated.

User response: Either redefine and install a new definition for the transaction with TASKDATALOC(BELOW), or relink the program as AMODE 31.

Module: DFHAPLI

AEZD

Explanation: An attempt has been made to run a program defined as EXECKEY(USER) as part of a transaction defined as TASKDATAKEY(CICS). These attributes are incompatible and the transaction is abended. This incompatibility could occur as a result of the program definition being autoinstalled. See the CICS Customization Guide and the CICS Resource Definition Guide for more information about program autoinstall.

System action: The transaction is abnormally terminated. Message DFHAP1226 will show the incompatible program and transaction.

User response: Redefine and install a new definition either for the transaction with TASKDATAKEY(USER), or for the program with EXECKEY(CICS).

If this abend occurs when running a CICS transaction, a possible cause is that you are not using the CICS-supplied definition for the program. If you are using your own copies of CICS-supplied program definitions, they must be defined as EXECKEY(CICS).

Module: DFHEIP

AFxx abend codes

AFC0

Explanation: An attempt has been made to update a file after file control restart failed.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Determine the cause of the failure in file control restart. Restart CICS.

Module: DFHEIFC, DFHDMPCA

AFC2

Explanation: DFHFCU issued a call to DFHFCFS to open a file. A disastrous error was returned from DFHFCFS.

System action: The task is abnormally terminated with a CICS transaction dump.

At the time the disastrous error is detected, CICS writes a message to the console, records an exception trace entry and takes a system dump.

CICS processing continues.

User response: The system programmer should examine the trace, the system dump and any related CICS messages to identify the cause of the error.

Module: DFHFCU

AFC7

Explanation: The CICS definition file (CSD) manager (DFHDMPCA) issued a request to DFHFCFS to enable, open or close the DFHCSD file. A "disastrous error" response was returned from DFHFCFS to DFHDMPCA.

System action: The task is abnormally terminated with a CICS transaction dump.

At the time the disastrous error is detected, CICS writes a message to the console, records an exception trace entry and takes a system dump.

CICS processing continues.

User response: The system programmer should examine the trace, the system dump and any related CICS messages to identify the cause of the error.

Module: DFHDMPCA

AFCB

Explanation: Module DFHEIFC issued a resource level security check (RSLC) request to module DFHXSRC and received a response other than OK or EXCEPTION.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Examine the trace to find the exception trace entry created by DFHXSRC at the time of the error. Use this trace entry to determine the cause of the return code from DFHXSRC.

Module: DFHEIFC

AFCC

Explanation: An internal logic error was detected when calling the file control request processing module DFHFCFR. Either DFHFCFR returned an INVALID response to its caller indicating an error in the caller's parameter list, or DFHFCFR passed back a return code that was not recognized by its caller.

System action: The transaction is abnormally terminated with a transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHEIFC, DFHDMPCA

AFCE

Explanation: A GETMAIN for FFLE storage has failed.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Retry the failed transaction.

Module: DFHEIFC

AFCF

Explanation: A deadlock has been detected between two or more tasks issuing file control requests.

System action: The task that would have entered deadlock is abended with a CICS transaction dump.

User response: Examine this transaction and other transactions in the system that update the same files to find the cause of the deadlock, then correct the error.

When transactions update several files within the same unit of work, all transactions should update these files in the same order. A transaction that abends AFCF may be retried by specifying RESTART(YES) in the transaction definition and by coding a suitable DFHREST program.

Module: DFHEIFC, DFHDMPCA

AFCG

Explanation: A transaction has issued a sequence of file control requests that would cause the file to deadlock itself. This response arises for different reasons depending upon the file type.

If the file is being accessed in non-RLS mode, the

response is caused by the transaction making conflicting requests against the same CI. For example, if the file is being accessed using LSR, a self deadlock will arise when an attempt is made to read a record that is in the same CI as a record that is the subject of a READ UPDATE or WRITE MASSINSERT request issued by the same transaction.

If the file is accessed in RLS mode there is no CI locking, but self deadlock responses can still arise. They are caused by sequences of requests that are either logically meaningless or which cannot be performed by VSAM RLS.

With VSAM RLS the most likely causes of this abend are as follows

- Two successive READ UPDATE requests against the same record by the same transaction without an intervening REWRITE, DELETE or UNLOCK command.

This is an incorrect use of file control requests.

- A transaction has created a record by WRITE MASSINSERT and then, without terminating the WRITE MASSINSERT sequence by issuing an UNLOCK request, the same transaction has attempted to modify the same record by issuing a READ UPDATE or DELETE request.

This sequence of requests fails if VSAM has not written the record out to disk. The only way to guarantee that the record has been written to disk is to issue the UNLOCK request.

- A transaction has updated or deleted a record using a browse for update sequence and then, without terminating the browse for update sequence by issuing an ENDBR request, the same transaction has attempted to modify the same record by issuing a separate READ UPDATE or DELETE or WRITE request.

This sequence of requests fails if VSAM has not written the record out to disk. The only way to guarantee that the record has been written to disk is to issue the ENDBR request.

If the file is used to access a coupling facility data table, then self deadlock responses are caused by sequences of requests that are either logically meaningless or which cannot be performed by coupling facility data tables support.

For coupling facility data tables, the most likely cause of this abend is as follows

- Two successive READ UPDATE requests have been issued against the same record by the same transaction without an intervening REWRITE, DELETE or UNLOCK command.

This is an incorrect use of file control requests.

System action: The task that would have entered deadlock is abended with a CICS transaction dump.

User response: Examine the previous requests made

by this transaction against this file to identify the cause of the deadlock, then correct the error. In some cases (particularly when the file is being accessed in RLS mode or is using a coupling facility data table) this abend may indicate a programming error in the program that issued the file control requests.

Module: DFHEIFC, DFHDMPCA

AFCH

Explanation: The transaction has issued a request for a remote shared data table for which it has an active browse, but in the meantime the table has been disabled or closed by the owning CICS system, or the owning CICS system has failed.

System action: The requesting transaction abends with a transaction dump.

CICS continues normally.

User response: In the application owning region, take whatever action normally follows the issue of a FORCE request in, or the failure of, the file owning CICS system.

See the *CICS Shared Data Tables Guide* for further guidance.

Module: DFHEIFC

AFCI

Explanation: The transaction issued a file request resulting in a call to the main file control program (DFHFCFR). During the processing of the request the transaction was purged. That is, the transaction was the subject of an explicit PURGE or FORCEPURGE request, was timed out, or was selected by CICS for termination in an attempt to alleviate an SOS condition.

System action: A CICS transaction dump is issued with abend code AFCI.

A “purged” response is returned from DFHFCFR to its caller. The transaction issuing the file control request will eventually issue an AFCY abend with a further transaction dump.

User response: In some instances, for example if the transaction was explicitly purged, no further action is necessary.

Otherwise examine the exception trace and the transaction dump to identify the point at which the purge occurred.

Module: DFHFCFR

AFCJ

Explanation: DFHFCU issued a call to DFHFCFS to open a file. A purged error was returned from DFHFCFS because the task has been waiting for a resource longer

AFCK • AFCR

than the DTIMEOUT interval specified for the CSFU transaction.

System action: The task is abnormally terminated with a CICS transaction dump. CICS processing continues.

User response: Examine the dump to determine the cause of the error. A system dump can be produced by adding the appropriate dump table entry using the CEMT SET TRDUMPCODE command.

Module: DFHFUCU

AFCK

Explanation: The transaction issued a file update request (READ UPDATE, WRITE or DELETE) against an RLS mode data set for which a DFSMSdss non-BWO backup was in progress.

System action: The transaction is abnormally terminated with a CICS transaction dump. CICS processing continues.

User response: All new file update requests are prohibited when a non-BWO backup is in progress for an RLS mode data set. This restriction is automatically lifted when the backup completes. (A non-BWO backup is any type of backup operation other than a Backup While Open backup.) When the backup has completed, retry the transaction.

Module: DFHDMPCA, DFHEIFC

AFCL

Explanation: During the loading of a Shared Data Table by the CFTL transaction, a call to the CICS Transaction Manager has returned a response (such as DISASTER) after which normal processing could not continue.

System action: Message DFHFC0949 is issued. Loading of the data table is terminated and CFTL abends.

User response: Refer to the description of the message for further information and guidance.

Module: DFHDTLX

AFCM

Explanation: During the loading of a data table by the CFTL transaction, an abend was detected, or a domain call returned a response (such as DISASTER) after which normal processing could not continue.

System action: A message is issued (one of DFHFC0945, DFHFC0946, or DFHFC0947). Loading of the data table is terminated and CFTL abends.

User response: If this abend is produced as a result of an abend during loading, message DFHFC0945 is issued. If it is a result of a domain call failure,

depending on which domain the failure was returned by, one of the messages DFHFC0946 or DFHFC0947 is issued. Refer to the description of the message for further information and guidance.

Module: DFHDTLX

AFCN

Explanation: The transaction issued a file request that caused file control to attempt to create a journal record but the record was too large for the journal buffer to accommodate. This indicates that a journal referenced in the file definition is using an MVS logstream, which in turn, is using a coupling facility structure which has been defined with a MAXBUFSIZE parameter less than the recommended 64000.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Redefine the coupling facility structure that the logstream is using with a MAXBUFSIZE parameter of 64000. The journal in error can be the forward recovery log or the journal used for auto-archiving. If the module that detected the error is DFHDMPCA, the error is associated with a journal referenced in the definition of the CSD (DFHCSD).

Module: DFHDMPCA, DFHEIFC

AFCO

Explanation: An attempt was made to attach a transaction specifying DFHDTLX as the program to be given control, but the transaction was not internally attached by CICS.

DFHDTLX is for use by CICS system transaction CFTL. This loads a Shared Data Table.

System action: The transaction is abnormally terminated. CICS processing continues.

User response: Establish why an attempt was made to attach CFTL illegally, or why a transaction definition specified DFHDTLX as the program to be given control.

Module: DFHDTLX

AFCR

Explanation: The program issued a file control request against a file opened in RLS mode. While executing this request, CICS detected that the SMSVSAM server address space had failed.

System action: The task is abnormally terminated with a CICS transaction dump.

CICS disables all further RLS accesses and initiates error recovery.

User response: Retry the transaction when the server is available again

If the SMSVSAM server fails, it should normally automatically restart itself as quickly as possible. If this does not happen, consult the VSAM documentation which provides further guidance on debugging problems in the SMSVSAM server.

Module: DFHEIFC, DFHDMPCA

AFCS

Explanation: The program issued a file control request against a file opened in RLS mode. VSAM was unable to perform this request because the SMSVSAM server address space was inactive.

However, if an offsite restart is being performed (that is, OFFSITE=YES was specified as a system initialization override), this transaction abend is also issued even if the SMSVSAM server address space is active. This is because RLS access is not allowed during an offsite restart for any RLS file control requests other than those issued by transactions which have been attached by CICS to perform RLS recovery work.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Retry the transaction when the server is available again.

If the SMSVSAM server fails, it should normally automatically restart itself as quickly as possible. If this does not happen, consult the VSAM documentation which provides further guidance on debugging problems in the SMSVSAM server.

If an offsite restart is being performed, retry the transaction after RLS recovery has been completed when RLS access by user transactions is allowed again.

Module: DFHEIFC, DFHDMPCA

AFCT

Explanation: The program has made a file control request against a file opened in RLS mode. The SMSVSAM server has been recycled since an earlier RLS request from the same unit of work. The same unit of work cannot issue requests against two different instances of the SMSVSAM server. Note that this abend will occur even if the earlier request was not successful.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Resubmit the transaction.

Module: DFHEIFC, DFHDMPCA

AFCU

Explanation: A program made a file control request against a file that is being accessed in VSAM RLS mode. The underlying data set is in lost locks state. File

control requests are not allowed against a data set that is in lost locks state.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Recovery from lost locks is normally automatic. See the *CICS Recovery and Restart Guide* for a full explanation of lost locks recovery. You will not be able to issue any file control requests against this data set until all systems that owned locks at the time of the lock structure failure have completed their lost locks recovery.

See the *CICS Recovery and Restart Guide* for guidance on how to determine which CICS systems still have lost locks recovery pending, for information on commands that allow you to find the work that these systems have outstanding, and on commands that allow you to force a system to immediately complete lost locks recovery. The commands that force immediate completion of lost locks recovery should only be used as a last resort as they may cause loss of data integrity. It is better to allow the automatic recovery procedures to complete normally.

Module: DFHEIFC, DFHDMPCA

AFCV

Explanation: A request made against a file opened in RLS mode was unable to acquire a record lock. It waited for the lock, but the wait time exceeded the maximum wait time applicable to that request.

System action: The task is abnormally terminated with a CICS transaction dump.

CICS prints message DFHFC0164 and message(s) DFHFC0165 or DFHFC0175 which identify the transaction(s) or Transactional VSAM unit(s) of recovery that were immediately in front of this transaction in the queue for the lock. Normally these transaction(s) or Transactional VSAM unit(s) of recovery are the owners of the lock, although this is not the case if a chain of requests for the record has built up.

User response: Retry the transaction.

If the problem recurs, see messages DFHFC0164 and DFHFC0165 or DFHFC0175 to determine the transaction or Transactional VSAM unit of recovery that is holding the lock. In most cases the problem lies with the lock owner rather than the transaction that has failed.

Examples of reasons why CICS transactions may cause a timeout

- The transaction that holds the lock has a design error. For example
 - A conversational transaction updates a recoverable record and then issues a terminal control read. It does not issue syncpoint (and therefore does not release the lock) until the end

AFCW • AFCZ

user has responded to the terminal control read. It may therefore hold the lock for a considerable period.

- A transaction updates very many records in recoverable files before issuing syncpoint. You are recommended to keep the number of updates made within a unit of work small and to issue frequent syncpoints to ensure that locks are released regularly.
- The system in which the lock holder is running is experiencing severe performance degradation. Investigate the reason for the performance degradation.
- There is a deadlock between RLS and another resource manager. For example one transaction may be holding an RLS lock and waiting for a lock on a transient data queue. The transaction that times out may hold the lock on the transient data queue and be waiting for the RLS lock. RLS can detect deadlocks only when all the locks involved in the deadlock are RLS locks. A deadlock such as this can appear to RLS to be a long wait for a lock and is reported as a time out. Examine the design of the transactions to determine whether resource manager deadlocks can occur.
- It may be possible for RLS deadlocks to be reported as RLS timeouts if VSAM does not perform deadlock detection until after the time out value for the request occurred. For example, assume that DEADLOCK_DETECTION is specified as (15,4) in SYS1.PARMLIB, member IGDSMSxx. This means that VSAM does not attempt to detect cross-MVS deadlocks until 4 periods of 15 (that is, 60) seconds have elapsed. If DTIMOUT was not active for the transaction and the SIT specified FTIMEOUT=30, the RLS request times out after 30 seconds, before VSAM has attempted to detect cross-MVS deadlocks. Adjust FTIMEOUT, DTIMOUT, and DEADLOCK_DETECTION to avoid such effects.

DFHFC0175 messages identify Transactional VSAM units of recovery owning an RLS lock. If a Transactional VSAM application is the lock owner it should be investigated to determine why it is holding the lock. Some of the above considerations will be similar for Transactional VSAM applications.

Module: DFHEIFC, DFHDMPCA

AFCW

Explanation: The program issued a file control request against a file opened in RLS mode. VSAM RLS detected that this request would cause a deadlock. This transaction is abended in order to break the deadlock chain.

System action: The task is abnormally terminated with a CICS transaction dump.

CICS prints message DFHFC0166 and message(s)

DFHFC0167 or DFHFC0177 which identify the other transactions or Transactional VSAM units of recovery in the deadlock chain.

User response: Retry the transaction.

Examine the logic of all the programs involved in the deadlock chain to determine whether they could be improved to avoid possible sources of deadlock. See the *CICS Application Programming Guide* for guidance on how to write programs that avoid deadlocks.

Module: DFHEIFC, DFHDMPCA

AFCY

Explanation: The transaction issued a file request resulting in a call to the main file control program (DFHFCFR). During the processing of the request the transaction was purged (that is, was the subject of an explicit PURGE or FORCEPURGE request, was timed out, or was selected by CICS for termination in an attempt to alleviate an SOS condition). A “purged” response was returned from DFHFCFR to its caller.

System action: The task is abnormally terminated with a CICS transaction dump.

Exception trace entries are made between the point at which the purge is detected and the issuing of the abend.

If a task times out while waiting for a lock on a record in a coupling facility data table, CICS will issue message DFHFC7130 identifying the key of the locked record and the system and unit of work that owns the lock.

A transaction dump with abend code AFCL is taken when the purged response is detected by DFHFCFR.

User response: In some instances, for example if the transaction was explicitly purged, no further action is necessary.

If using a coupling facility data table, look for any relevant DFHFC7130 messages.

Otherwise examine the exception trace and the AFCL/AFCY transaction dumps to identify the point at which the purge occurred.

Module: DFHDMPCA, DFHEIFC

AFCZ

Explanation: The transaction issued a file request resulting in a call to the main file control program (DFHFCFR). A “disastrous error” response was returned from DFHFCFR to its caller.

System action: At the time the error is detected, CICS writes a message to the console, records an exception trace entry, and takes a system dump. The trace and dump identify the point of error.

Subsequently, the task is abnormally terminated with a CICS transaction dump.

User response: The system programmer should use the trace and dumps to determine what the error is, and why it has occurred.

Module: DFHDMPCA, DFHEIFC

AFDA

Explanation: An attempt was made to attach a transaction specifying DFHFCQT as the program to be given control, but the transaction was not internally attached by CICS.

DFHFCQT is for use by CICS system transactions CFQS and CFQR. These provide support for VSAM RLS data set quiesce and unquiesce operations, DFSMSdss BWO and non-BWO backups, and certain other data set related operations.

System action: The transaction is abnormally terminated. CICS processing continues.

User response: Establish why an attempt was made to illegally attach CFQS or CFQR, or why a transaction definition specified DFHFCQT as the program to be given control.

Module: DFHFCQT

AFDB

Explanation: An attempt was made by CICS to internally attach a transaction specifying DFHFCQT as the program to be given control, and the transaction id was other than CFQS or CFQR.

DFHFCQT is for use by CICS system transactions CFQS and CFQR. These provide support for VSAM RLS data set quiesce and unquiesce operations, DFSMSdss BWO and non-BWO backups, and certain other data set related operations.

System action: The transaction is abnormally terminated with a CICS transaction dump. CICS processing continues but it is probable that VSAM RLS data set quiesce support has been lost.

User response: Restart CICS. If the problem reoccurs, a more severe error is indicated. In this case, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCQT

AFDC

Explanation: CICS system transaction CFQS has failed due to a serious error. An attempt will be made to reattach the transaction. CICS messages should indicate the cause of the error.

CFQS provides support for the initiation of VSAM RLS data set quiesce and unquiesce operations.

System action: CFQS is abnormally terminated with a

CICS transaction dump. CFQS is reattached and CICS processing continues.

User response: Check Transient Data Queue CSFL for message DFHFC6028, indicating that the reattach of CFQS was successful. If the reattach fails, VSAM RLS data set quiesce initiation support is lost. If this support is required, CICS must be restarted.

If it is not possible to restore VSAM RLS quiesce initiation support, a more severe error is indicated. In this case, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCQT

AFDD

Explanation: CICS system transaction CFQR has failed due to a serious error. An attempt will be made to reattach the transaction. CICS messages should indicate the cause of the error.

CFQR provides support for VSAM RLS data set quiesce and unquiesce operations, DFSMSdss BWO and non-BWO backups, and certain other data set related operations.

System action: CFQR is abnormally terminated with a CICS transaction dump. CFQR is reattached and CICS processing continues.

User response: Check Transient Data Queue CSFL for message DFHFC6028, indicating that the reattach of CFQR was successful. If the reattach fails, VSAM RLS data set quiesce support is lost. If this happens, CICS must be restarted.

If it is not possible to restore VSAM RLS quiesce support, a more severe error is indicated. In this case, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCQT

AFDE

Explanation: An attempt was made to attach a transaction specifying DFHFCRD as the program to be given control, but the transaction was not internally attached by CICS.

DFHFCRD is for use by CICS system transaction CSFR. This provides support for error recovery after a failure of the SMSVSAM server.

System action: The transaction is abnormally terminated. CICS processing continues.

User response: Establish why an attempt was made to illegally attach CSFR, or why a transaction definition specified DFHFCRD as the program to be given control.

Module: DFHFCRD

AFDF • AFDJ

AFDF

Explanation: An attempt was made to attach a transaction specifying DFHFCOR as the program to be given control, but the transaction was not internally attached by CICS.

DFHFCOR is for use by CICS system transaction CFOR. This provides part of the RLS offsite recovery support.

System action: The transaction is abnormally terminated. CICS processing continues.

User response: Establish why an attempt was made to illegally attach CFOR, or why a transaction definition specified DFHFCOR as the program to be given control.

Module: DFHFCOR

AFDG

Explanation: CICS system transaction CFOR has failed due to a serious error. CICS messages should indicate the cause of the error.

DFHFCOR provides part of the RLS offsite recovery support.

This abend indicates that this CICS system has completed its RLS offsite recovery, but an error occurred either in attempting to issue message DFHFC0575D which reports this fact, or in attempting to process the reply to message DFHFC0575D.

System action: CFOR is abnormally terminated with a CICS transaction dump. CICS processing continues.

User response: If you are using an automated procedure to check for and reply to message DFHFC0575D, then you should shut this CICS down and restart it specifying OFFSITE=YES again. If you are using manual procedures to check for completion of all RLS offsite recovery and to reply to message DFHFC0575D then you can "tick" this CICS off the list of systems which have completed their recovery, but you must ensure that it is not restarted with OFFSITE=NO until all other CICS systems have completed their RLS offsite recovery. Also note that until the system is restarted, RLS access will not be allowed by this system.

Module: DFHFCOR

AFDH

Explanation: VSAM has returned a response indicating that the RLS lock structure in the coupling facility is full. VSAM RLS is unable to create any new locks.

This abend code is usually issued from various CICS systems residing within the same sysplex.

System action: The transaction which issued the VSAM RLS request is abnormally terminated with a

CICS transaction dump. CICS processing continues.

User response: Allocate a larger VSAM RLS lock structure and rebuild the RLS structure into the new larger structure. See *OS/390 MVS Setting up a Sysplex*, (GC28-1779) and *DFSMS/MVS DFSMSdfp Storage Administration Reference*, (SC26-4920) for further details on creating RLS lock structures and rebuilding lock structures.

Module: DFHEIFC, DFHDMPCA

AFDI

Explanation: A call to directory domain failed when trying to locate an fct entry.

System action: The task is abnormally terminated with a CICS transaction dump. CICS processing continues.

User response: Examine the dump to determine the cause of the error. A system dump can be produced by adding the appropriate dump table entry using the CEMT SET TRDUMPCODE command.

Module: DFHFUCU

AFDJ

Explanation: A call to lock manager failed when trying to locate an fct entry.

System action: The task is abnormally terminated with a CICS transaction dump. CICS processing continues.

User response: Examine the dump to determine the cause of the error. A system dump can be produced by adding the appropriate dump table entry using the CEMT SET TRDUMPCODE command.

Module: DFHFUCU

AGxx abend code

AGMA

Explanation: An attempt to initiate the good morning message transaction was made without specifying a termid for it to be displayed.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Use the dump to determine how the attempt to start the transaction was made. Ensure that no EXEC CICS STARTs are made for the good morning message transaction where no termid is specified.

Module: DFHGMM

Alxx abend codes

AICA

Explanation: A task has been executing for longer than the runaway time interval (defined by the ICVR operand on the system initialization table macro, DFHSIT) without giving up control. The runaway task condition indicates a possible loop in the application.

System action: The task is terminated with an AICA transaction dump.

User response: See the *CICS Problem Determination Guide* for guidance on dealing with loops.

Module: DFHSRP

Module: DFHICP

AICE

Explanation: An incorrect response was returned from a dispatcher (DS) domain request (other than AICG).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHICP

AICB

Explanation: A RETRIEVE WAIT request has been reissued in system shutdown.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: None

Module: DFHICP

AICF

Explanation: An incorrect response was returned from a transaction manager (TM) domain request.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHICP

AICC

Explanation: An incorrect response was returned from a timer (TI) domain request.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHTAJP, DFHICP

AICG

Explanation: A PURGED response was returned from a dispatcher domain (DS) request, with a reason code of TASK_CANCEL. TASK_CANCEL was returned as the transaction had been explicitly cancelled.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Notify your system programmer to determine why the task has been purged.

Module: DFHICP

AICD

Explanation: An incorrect response was returned from a kernel (KE) domain request.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

AICH

Explanation: The task was purged before a request to the storage manager (SM) domain was able to complete successfully. The domain that first detected the purged condition will have provided an exception trace.

System action: The task is abnormally terminated

AICJ • AICO

with a CICS transaction dump.

User response: Investigate why the task was purged. This is either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Module: DFHICP, DFHEIIC

AICJ

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error will have provided an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related message produced by the domain that detected the original error.

Module: DFHICP

AICK

Explanation: Module DFHEIIC has issued a resource level security check (RSLC) request to module DFHXSRC and received a response other than OK or EXCEPTION.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Examine the trace to find the exception trace entry created by DFHXSRC at the time of the error. Use this trace entry to determine the cause of the return code from DFHXSRC.

Module: DFHEIIC

AICL

Explanation: DFHEIIC detected an invalid function code in the command level parameter list. This is caused either by a storage overwrite or a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, a level 1 trace of the IC and EI components would aid problem determination. Look in the program storage section of the transaction dump and compare argument 0, the exec interface descriptor (EID), for the command being processed with the argument 0 produced by the translator for the same command. Any differences mean that an overwrite of the application program may have occurred. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHEIIC

AICN

Explanation: An incorrect response has been returned from a user domain (US) request.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHICP

AICO

Explanation: An unexpected EXCEPTION response was received from a call to the user (US) domain.

The call was issued during initialization of a transaction that was started without a terminal. The call was made as part of processing to associate the transaction with its intended user. The attempt to associate the intended user with the transaction has failed.

The userid for the intended user of the transaction may not be correctly defined.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Determine why the intended user of the transaction is not correctly defined.

Examine messages produced for the CICS job by the external security manager (ESM). This may require the assistance of a security administrator.

It may be necessary to examine the transaction dump to determine why the external security manager has informed CICS that the user is not correctly defined.

When the user has been correctly defined, consider rerunning the transaction.

Module: DFHICXM

AICQ

Explanation: Module DFHDFST is executing at a terminal which is not permitted.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Determine why this transaction is executing at a terminal.

Module: DFHDFST

AICR

Explanation: A DFHTC write request has failed for IRC. The return codes within TCATPAPR and TCTEIRET should be examined to determine the cause of failure.

System action: The CSNC transaction is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRR

AICS

Explanation: Module DFHDFST has encountered an error during Retrieve processing.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Use level 1 trace entries to determine the cause of the failure.

Module: DFHDFST

AICT

Explanation: Module DFHDFST has encountered an error during START processing.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Use level 1 trace entries to determine the cause of the error.

Module: DFHDFST

AIEA

Explanation: An unexpected EXCEPTION response was received from a call to the user (US) domain.

The call was issued during initialization of a transaction that was started without a terminal. The call was made as part of processing to associate the transaction with its intended user. The attempt to associate the intended user with the transaction has failed.

The userid for the intended user of the transaction may not be correctly defined.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Determine why the intended user of the transaction is not correctly defined.

Examine messages produced for the CICS job by the external security manager (ESM). This may require the assistance of a security administrator.

It may be necessary to examine the transaction dump to determine why the external security manager has informed CICS that the user is not correctly defined.

When the user has been correctly defined, consider rerunning the transaction.

Module: DFHIEXM

AIEB

Explanation: The transaction id (CIEP) of the ECI for TCP/IP listener task has been initiated invalidly, probably by entering the id at a terminal. This transaction must only be initiated by CICS internal processes.

System action: The transaction is abnormally terminated.

User response: Do not initiate CIEP directly.

Module: DFHIEP

AII1

Explanation: An IOP Request Receiver transaction (default CIRR) was started invalidly. This transaction can only be initiated internally by CICS.

System action: The transaction is abnormally terminated.

User response: Do not issue this transaction.

Module: DFHIIRRS

AII2

Explanation: The IOP Request Receiver program DFHIIRR returned an exception which may have been caused by data received from the client.

System action: The transaction is abnormally terminated.

User response: DFHIIRR will have issued an exception trace point and a message and attempted to send a `messageError` or `systemException` to the client.

Examine this information to determine why the request receiver rejected the request.

Module: DFHIIRRS

AI13

Explanation: An IIOB Request Receiver task has been purged.

System action: The transaction is abnormally terminated.

User response: None.

Module: DFHIIRRS

AI14

Explanation: The IIOB Request Receiver program DFHIIRR has returned a disaster response due to a call to another CICS program failing.

System action: The transaction is abnormally terminated.

User response: DFHIIRR, or the program it called, will have issued an exception trace point and a message.

Examine this information to determine why the request receiver failed.

Module: DFHIIRRS

AI15

Explanation: The IIOB Request Receiver stub program was invoked from the sockets domain. However the TCPIP SERVICE defined in RDO did not specify a PROTOCOL of IIOB.

System action: The transaction is abnormally terminated.

User response: Change the TCPIP SERVICE definition to specify PROTOCOL(IIOB).

Module: DFHIIRRS

AI1A

Explanation: An error occurred in the IIOB Request Processor which prevented it from sending a reply to the Request Receiver.

System action: The transaction is abnormally terminated.

User response: The Request Processor will have issued an exception trace and a message.

Examine this information to determine why the Request Processor failed.

Module: com.ibm.cics.iioB.RequestProcessor

AI1D

Explanation: The IIOB Request Processor attempted to use a CorbaServer that has been disabled or failed to initialize.

System action: The transaction is abnormally terminated.

User response: Determine why the CorbaServer has been disabled or failed to initialize.

Module: com.ibm.cics.iioB.RequestProcessor

AI1P

Explanation: An EJB was running in an OTS transaction and the timeout for this transaction was exceeded.

System action: The transaction is abnormally terminated.

User response: Check that an appropriate value has been set for the OTS timeout.

Module: com.ibm.cics.iioB.RequestProcessor

AI1T

Explanation: The IIOB Request Processor timed out waiting for a request from a Request Receiver. It received a timed out notification from the RZ domain in response to a listen on the RequestStream of which it is the target.

Reasons for this problem include:-

- the RTIMOUT value for this RequestProcessor transaction is too low.
- the client program has failed to send a further method request when one is expected by a transactional object.
- a CICS failure or logic error may have occurred.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See any related diagnostic material and determine the reason for the failure. In the case of a CICS logic error, you need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: com.ibm.cics.iioB.RequestProcessor

AINA

Explanation: An application program has issued an EXEC CICS LINK command to the indoubt testing tool program DFHINDT but has failed to pass a commarea containing the request to be executed. Valid requests are ON, OFF, RESYNC COMMIT or RESYNC BACKOUT.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Correct the application program so that it passes a commarea to DFHINDT containing a valid request for DFHINDT.

Module: DFHINDT

AINB

Explanation: An application program has issued an EXEC CICS LINK command to the indoubt testing tool program DFHINDT passing a commarea that did not contain a valid request to be executed. Valid requests are ON, OFF, RESYNC COMMIT or RESYNC BACKOUT

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Correct the application program so that it passes a commarea to DFHINDT containing a valid request for DFHINDT.

Module: DFHINDT

AINC

Explanation: The indoubt testing tool issued a EXEC CICS INQUIRE EXITPROGRAM command to inquire on the status of the indoubt testing tool task related user exit program DFHINTRU, and the command failed with a NOTAUTH response.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: The indoubt testing tool can be run under transaction CIND , under a user transaction where the program EXEC CICS LINKs to DFHINDT. or under a transaction where the program EXEC CICS LINKs to DFHINDAP. If command security checking is active for the transaction (CMDSEC=YES), check that the user has read access to resource EXITPROGRAM. If resource security checking is active for the transaction (RESSEC=YES), check that the user has read access to resource DFHINTRU.

Module: DFHINDT, DFHINDAP

AIND

Explanation: The indoubt testing tool issued a EXEC CICS INQUIRE EXITPROGRAM command to inquire on the status of the indoubt testing tool task related user exit program DFHINTRU, and the command failed with an unexpected response.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHINDT, DFHINDAP

AINE

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR or PURGED) has occurred on an START_LINK_BROWSE command issued by the indoubt tool to recovery manager (RM) domain. For

errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHINDT provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHINDT

AINF

Explanation: An EXCEPTION response with an unexpected reason occurred on an GET_NEXT_LINK call issued by the indoubt testing tool to recovery manager (RM) domain. DFHINDT provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHINDT

AING

Explanation: An error (DISASTER, INVALID, KERNERROR, or PURGED) has occurred on an GET_NEXT_LINK call issued by the indoubt testing tool to recovery manager (RM) domain. The RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

DFHINDT also provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHINDT

AINH

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR or PURGED) has occurred on an END_LINK_BROWSE command issued by the indoubt tool to recovery manager (RM) domain. For

AINI • AINM

errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHINDT provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHINDT

AINI

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR or PURGED) has occurred on an INQUIRE_UOW command issued by the indoubt testing tool to recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHINDT provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHINDT

AINJ

Explanation: An EXCEPTION response with an unexpected reason occurred on an INITIATE_RECOVERY call issued by the indoubt testing tool to recovery manager (RM) domain. DFHINDT provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHINDT

AINK

Explanation: An error (DISASTER, INVALID, KERNERROR, or PURGED) has occurred on an INITIATE_RECOVERY call issued by the indoubt testing tool to recovery manager (RM) domain. The RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

DFHINDT also provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHINDT

AINL

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR or PURGED) has occurred on an SET_RECOVERY_STATUS command issued by the indoubt testing tool to recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHINDT provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHINDT

AINM

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR or PURGED) has occurred on an TERMINATE_RECOVERY command issued by the indoubt testing tool to recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHINDT provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM

to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHINDT

AINN

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR or PURGED) has occurred on an ADD_LINK command issued by the indoubt testing tool to recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHINTRU provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHINTRU

AINO

Explanation: The indoubt testing tool task related user exit DFHINTRU issued an EXEC CICS INQUIRE TRANSACTION command to inquire whether the current transaction was in the indoubt transaction class DFHTCIND. The command failed with a NOTAUTH response.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: When the indoubt testing tool is active, the task related user exit DFHINTRU is invoked whenever a CICS transaction is started. For all transactions for which command security checking is active, ensure that the user has read access to resource TRANSACTION. If started transaction resource security checking is specified, for all transactions for which resource security checking is active, ensure that the user has read access to the transaction name in the specified RACF resource class.

For more information on command security and resource security see the *CICS RACF Security Guide*.

Module: DFHINTRU

AINP

Explanation: The indoubt testing tool task related user exit DFHINTRU issued an EXEC CICS INQUIRE TRANSACTION command to inquire whether the current transaction was in the indoubt transaction class DFHTCIND. The command failed with an unexpected response.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHINTRU

AINQ

Explanation: The indoubt testing tool task related user exit DFHINTRU issued an EXEC CICS INQUIRE TASK command to inquire on the current task to obtain the unit of work ID to include in message DFHIN1009. The command failed with a TASKIDERR response.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHINTRU

AINR

Explanation: The indoubt testing tool task related user exit DFHINTRU issued an EXEC CICS INQUIRE TASK command to inquire on the current task to obtain the unit of work ID to include in message DFHIN1009. The command failed with a NOTAUTH response.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: When the indoubt testing tool is active, the task related user exit DFHINTRU is invoked whenever a CICS transaction is started. For all transactions for which command security checking is active (CMDSEC=YES), ensure that the user has read access to resource TASK.

Module: DFHINTRU

AINS

Explanation: The indoubt testing tool task related user exit DFHINTRU issued an EXEC CICS INQUIRE TASK command to inquire on the current task to obtain the unit of work ID to include in message DFHIN1009. The command failed with an unexpected response.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHINTRU

AIPA

Explanation: IP interconnectivity program DFHISCOP has been initiated invalidly, probably by entering a transaction id that refers to it, for example CISC or CISS, at a terminal. This program must only be initiated by CICS internal processes.

System action: The task is abnormally terminated.

User response: Do not initiate CISC or CISS directly.

Module: DFHISCOP

AIPB

Explanation: IP interconnectivity receiver program DFHISRRP has been initiated invalidly, probably by entering a transaction id that refers to it, for example CISR, at a terminal. This program must only be initiated by CICS internal processes.

System action: The task is abnormally terminated.

User response: Do not initiate CISR directly.

Module: DFHISRRP

AIPC

Explanation: IP interconnectivity error and message program DFHISEMP has been initiated invalidly, probably by entering a transaction id that refers to it, for example CISE, at a terminal. This program must only be initiated by CICS internal processes.

System action: The task is abnormally terminated.

User response: Do not initiate CISE directly.

Module: DFHISEMP

AIPD

Explanation: IP interconnectivity program DFHISCOP has been initiated with invalid attach parameters by CICS internal processes. This could be the result of a configuration error or a storage overwrite.

DFHISCOP should be defined as the initial program for the IS domain connectivity transactions; these are CISC and the transactions for TCPIP SERVICES with protocol IPIC, CISS by default. This error could occur if DFHISCOP is defined as the initial program for some other CICS internal transaction.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check that DFHISCOP is correctly defined.

If necessary, examine the dump and any exception trace entries to determine why the attach parameters are missing or invalid.

Module: DFHISCOP

AIPE

Explanation: IP interconnectivity program DFHISCOP received an INVALID, DISASTER, or EXCEPTION response from a call to the intersystems communication (IS) domain to acquire or release an IPCONN.

The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump.

System action: The task is abnormally terminated with a transaction dump.

User response: See the related message from the domain that detected the original error and examine the dump and any exception trace entries for further information if necessary.

Module: DFHISCOP

AIPF

Explanation: IP interconnectivity program DFHISCOP received an PURGED response from a call to the intersystems communication (IS) domain to acquire or release an IPCONN.

The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump.

System action: The task is abnormally terminated with a transaction dump.

User response: Investigate why the task was purged. This is either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Module: DFHISCOP

AIPG

Explanation: IP interconnectivity long-running request/response receiver program received an INVALID, DISASTER, or EXCEPTION response from its PROCESS_INPUT call to the intersystems communication (IS) domain.

The domain that detected the original error provides an

exception trace, a console message and, possibly, a system dump.

System action: The task is abnormally terminated with a transaction dump.

User response: See the related message from the domain that detected the original error and examine the dump and any exception trace entries for further information if necessary.

Module: DFHISRRP

AIPH

Explanation: IP interconnectivity long-running error and message program received an INVALID, DISASTER, or EXCEPTION response from its PROCESS_ERROR call to the intersystems communication (IS) domain.

The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump.

System action: The task is abnormally terminated with a transaction dump.

User response: See the related message from the domain that detected the original error and examine the dump and any exception trace entries for further information if necessary.

Module: DFHISEMP

AIPI

Explanation: IP interconnectivity program DFHISREX has been initiated invalidly, probably by entering a transaction id that refers to it, CISX, at a terminal. This program must only be initiated by CICS internal processes.

System action: The task is abnormally terminated.

User response: Do not initiate CISX directly.

Module: DFHISREX

AIPJ

Explanation: The IS attach client module DFHISXM received an INVALID, DISASTER, or unexpected EXCEPTION response from its INITIALIZE_RECEIVER call to module DFHISIS.

The call was issued during initialization of a transaction that was started by a transaction attach message received on an IP connection. The call was made as part of processing to associate the transaction with its intended user. The attempt to associate the intended user with the transaction has failed.

The userid for the intended user of the transaction may not be correctly defined.

Security attributes defined for the IPCONN may not be

consistent with the security parameters received in the transaction attach message.

System action: The task is abnormally terminated with a transaction dump.

User response: Examine the dump and any exception trace entries for further information if necessary.

Verify the userid for the intended user is correctly defined to the external security manager.

Verify the IPCONN security attributes are correctly defined.

Module: DFHISXM

AIPK

Explanation: The IS attach client module DFHISXM received a PURGED response from its INITIALIZE_RECEIVER call to module DFHISIS.

The call was issued during initialization of a transaction that was started by a transaction attach message received on an IPIC connection. The INITIALIZE_RECEIVER function failed to receive the initial data for the transaction.

The ISSB representing the IPIC receive session allocated to this transaction has been flagged for abend following an error on the IPCONN or purge request from the initiating system.

System action: The task is abnormally terminated with a transaction dump.

User response: Look for related messages reported in the error log. Examine the dump and any exception trace entries for further information if necessary.

Module: DFHISXM

AIPL

Explanation: The IS attach client module DFHISXM received an INVALID, DISASTER, or unexpected EXCEPTION response from its BIND_RECEIVER call to module DFHISIS.

The call was issued during initialization of a transaction that was started by a transaction attach message received on an IPIC connection. The call was made as part of processing to bind the transaction to its distributed unit of work. The attempt failed.

The input message received may not be in the expected format.

System action: The task is abnormally terminated with a transaction dump.

User response: Examine the dump and any exception trace entries for further information if necessary.

Module: DFHISXM

AIS1

Explanation: An unexpected return code has been returned after a DFHMROQM FUNC=ENQ command was issued.

This command was issued when enqueueing work for the IRC control task (CSNC) during IRC initialization.

System action: If IRC is being initialized during CICS initialization (as a result of IRCSTRT being specified in the DFHSIT or override parameters), then CICS is abnormally terminated.

If IRC is being initialized during the execution of a CEMT SET IRC OPEN command, then the CEMT transaction is abnormally terminated.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRSP

AIS2

Explanation: An unexpected return code has been returned after a DFHMROQM FUNC=WAIT_Q command was issued.

This command was issued when waiting for more IRC work to process.

System action: CSNC is abnormally terminated with a system dump. All tasks using MRO links to other systems are abnormally terminated.

All tasks in other CICS regions (including shared database batch regions) that are currently communicating with this system are also abended.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRNP

AIS3

Explanation: An attempt to issue a STCK (Store Clock) instruction failed.

System action: CSNC is abnormally terminated with a system dump.

All tasks using MRO links to other systems are abnormally terminated.

All tasks in other CICS regions (including shared database batch regions) that are currently communicating with this system are also abended.

User response: Repair or enable the system clock.

Module: DFHCRNP

AIS4

Explanation: An unexpected return code has been returned after a DFHMROQM FUNC=ENQUEUE command. This command was issued when enqueueing work to the IRC “delayed work” queue.

System action: CSNC is abnormally terminated with a system dump. All tasks using MRO links to other systems are abnormally terminated.

All tasks in other CICS regions (including shared database batch regions) that are currently communicating with this system are also abended.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRNP

AIS5

Explanation: An unexpected return code has been returned after a DFHMROQM FUNC=ENQUEUE command was issued.

This command was issued when enqueueing work to the IRC “immediate work” queue.

System action: CSNC is abnormally terminated with a system dump. All tasks using MRO links to other systems are abnormally terminated.

All tasks in other CICS regions (including shared database batch regions) that are currently communicating with this system are also abended.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRNP

AIS6

Explanation: An INVALID, DISASTER or EXCEPTION condition has occurred on a call to the storage manager domain (SM) to GETMAIN or FREEMAIN a file control read set buffer.

The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump.

System action: The task is abnormally terminated with a transaction dump.

User response: See the related message from the domain that detected the original error.

Module: DFHMIRS

AIS7

Explanation: A PURGED condition has occurred on a call to the storage manager domain (SM) to FREEMAIN a file control read set buffer.

The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump.

System action: The task is abnormally terminated with a transaction dump.

User response: Investigate the reason why the task was purged. It was purged either by the master terminal operator , or as a result of a deadlock timeout.

Module: DFHMIRS

AIS8

Explanation: An internal logic error has been detected in module DFHMIRS.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHMIRS

AIS9

Explanation: The mirror program has detected that a DPL server program has returned in an invalid state following the completion of the LINK command. The server program or a program it linked to has initiated a synclevel 2 conversation with another program which in turn has issued a syncpoint. The server program has not responded to the syncpoint request which is still outstanding when control returns to the mirror program.

The mirror program only issues this abend code if the LINK request did not specify SYNCONRETURN.

System action: The task is abnormally terminated with a transaction dump.

User response: Correct the design of the DTP application or applications initiated by the server program. If the SYNCONRETURN option is not specified on the LINK request, only the client program should initiate the syncpoint. If it is necessary to issue syncpoint requests from the DTP applications, consider using the SYNCONRETURN option on the LINK request. See the *CICS Intercommunication Guide* for further details of the LINK command and its options.

Module: DFHMIRS

AISA

Explanation: The mirror transaction (CSMI) has been attached from some facility other than a terminal. This is not permitted.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Using the dump, check the field TCAFCAAA to identify the invalid attach.

Module: DFHMIRS

AISB

Explanation: The mirror transaction (CSMI) has detected errors in the data passed to it from the attaching transaction.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: The invalid input will be visible in the transaction dump. This error is likely to be caused by some mismatch between the two systems. A typical example might be a DL/I request received on a system generated without DL/I.

Module: DFHMIRS

AISC

Explanation: The mirror transaction (CSMI) has not received a TIOA from the terminal.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Use the trace in the dump and the dumped TCTTE to analyze the problem further.

Module: DFHMIRS

AISD

Explanation: The mirror program executed the request and received a nonzero return code as a result. The data flow control state of the intersystem link being used was such that this information could not be returned normally.

System action: The mirror task is abnormally terminated with a CICS transaction dump.

User response: The transaction dump provided will provide information required to analyze the source of the nonzero return code at its point of origin.

Module: DFHMIRS

AISF

Explanation: The CICS mirror program DFHMIRS has been attached in an unsupported manner. The principal facility for the mirror transaction is defined as APPC, however the conversation is unmapped.

System action: CICS abnormally terminates the transaction with a transaction dump.

User response: There is a problem with the system that caused the mirror transaction to be attached. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHMIRS

AISG

Explanation: The mirror program executed the request and produced the reply. This would not be sent because the data flow control state of the intersystem link was such that this could not be done.

System action: The task (CSMI) is abnormally terminated with a CICS transaction dump.

User response: Use the transaction dump provided to analyze the problem.

Module: DFHMIRS

AISH

Explanation: The new connection task, CSNC, has been invoked in an incorrect manner (for example, from a terminal or via an EXEC CICS START request).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: None.

Module: DFHCRNP

AISI

Explanation: A function shipping request was passed by DFHEIP to DFHISP. This was found to be invalid by the transformer, DFHXFP.

System action: The transaction issuing the function shipping request is abnormally terminated with a CICS transaction dump.

User response: The transaction dump will provide information to further analyze the problem.

Module: DFHISP

AISJ

Explanation: The IRC control task CSNC has abended because the attempt to LINK to DFHCRR failed.

System action: CSNC is abnormally terminated with a system dump. All tasks using MRO links to other systems are abnormally terminated. All tasks in other CICS regions (including shared database batch regions) that are currently communicating with this system are also abnormally terminated.

User response: Ensure that program DFHCRR is available.

Module: DFHCRNP

AISK

Explanation: The user transaction has been abnormally terminated during the execution of a function shipping request on an APPC session. This has happened because the mirror transaction on the remote system has abnormally terminated, and caused a request for syncpoint rollback to be sent across the session. CICS abends the user transaction in these circumstances so that function shipping remains transparent to the transaction.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check the log on the mirror system to determine the reason for the original abend of the mirror task.

Module: DFHISP

AISL

Explanation: The LU services manager transaction has been started directly from a user terminal. This is not permitted.

System action: The task is abnormally terminated with a transaction dump.

User response: None. The LU services manager transaction must be started internally by CICS.

Module: DFHLUP, DFHCLS3, DFHCLS4, DFHZLS1

AISN

Explanation: Task CSNC attempted to acquire a SUSPEND TOKEN to enable it to suspend itself until further work arrives. The attempt failed.

System action: CSNC is abnormally terminated with a dump. The IRC facility is disabled.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRNP

AISO

Explanation: Task CSNC attempted to suspend itself, awaiting further work. The attempt failed.

System action: CSNC is abnormally terminated with a dump. The IRC facility is disabled.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRNP

AISP

Explanation: A mirror transaction (transaction identifiers CSHR, CSM1, CSM2, CSM3, CSM5, or CSMI) has been invoked with an invalid principal facility. The mirror transaction executes with an MRO session, an LU6.1 session or an APPC session as its principal facility.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Do not attempt to invoke the mirror transaction by entering the transaction identifier at a terminal.

Module: DFHMIRS

AISQ

Explanation: An EXEC CICS command has been issued against a CPI Communications session. A CPI Communications session is one that has a CPI-Communications Control Block (CPC) associated with it.

System action: The mirror task is abnormally terminated with a CICS transaction dump.

User response: Do not mix EXEC commands with CPI Communications calls on the same end of a conversation.

Module: DFHMIRS

AISR

Explanation: The CICS Inter-Region Session Recovery Program (DFHCRR) has been invoked in an incorrect manner, for example, from a terminal.

System action: The program DFHCRR is abnormally terminated with a CICS transaction dump.

User response: None.

Module: DFHCRR

AISS

Explanation: A security violation has occurred while CICS was attempting to start a conversation with a remote APPC system. The security access level of the requestor was insufficient to access the transaction on the connected APPC system. Depending on the nature of the request and the way security has been set up, the requestor with an insufficient access level can be the local CICS system, the requesting transaction, or the terminal user. DTP programs do not abend with code AISS after a security failure in the remote region.

System action: The transaction is abnormally terminated with a transaction dump.

User response: First, verify that the access was correctly denied. Then, if required, change the access level.

Module: DFHZARM

AIST

Explanation: An unexpected return code has been returned after a DFHTC TYPE=LOCATE command.

System action: CSNC is abnormally terminated with a system dump. All tasks using MRO links to other systems are abnormally terminated. All tasks in other CICS regions (including shared database batch regions) that are currently communicating with this system are also abended.

User response: The trace in the system dump should be used to analyze the problem further.

Module: DFHCRNP

AISU

Explanation: An INVALID, DISASTER, or EXCEPTION condition has occurred on a call to the storage manager domain (SM) to FREEMAIN a FCENT control block.

The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump.

System action: The task is abnormally terminated with a transaction dump.

User response: See the related message from the domain that detected the original error.

Module: DFHMIRS

AISV

Explanation: A PURGED condition has occurred on a call to the storage manager domain (SM) to FREEMAIN a FCENT control block.

The domain that detected the original error provides an

AISW • AITA

exception trace, a console message and, possibly, a system dump.

System action: The task is abnormally terminated with a transaction dump.

User response: Investigate why the task was purged. This is either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Module: DFHMIRS

AISW

Explanation: An INVALID, DISASTER, or EXCEPTION condition has occurred on a call to the storage manager domain (SM) to GETMAIN or FREEMAIN a CRB control block.

The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump.

System action: The task is abnormally terminated with a transaction dump.

User response: See the related message from the domain that detected the original error.

Module: DFHCRSP

AISX

Explanation: A PURGED condition has occurred on a call to the storage manager domain (SM) to GETMAIN or FREEMAIN a CRB control block.

The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump.

System action: The task is abnormally terminated with a transaction dump.

User response: Investigate why the task was purged. It was purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Module: DFHCRSP

AISY

Explanation: The LU services manager transaction has been started, but invalid parameters have been detected.

System action: The task is abnormally terminated with a transaction dump.

User response: See message DFHZC4921 for further guidance.

Module: DFHLUP

AISZ

Explanation: DFHMXP has received an unexpected reply when committing START PROTECT NOCHECK requests sent on a LUTYPE6.2 synclevel 1 conversation.

System action: The task is abnormally terminated.

User response: Determine what happened to transaction CVMI in the partner system. If the START PROTECT NOCHECK requests had been committed, no further action is necessary. If they had not been committed, user-defined action is required to recover from the error.

Module: DFHMXP

AITA

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the recovery manager (RM) domain to initialize the recovery status of an IRC session. The domain provides an exit trace, and possibly a console message and a system dump (depending on the options specified in the dump table).

This failure is either the result of a task purge, or a CICS logic error,

System action: The CSNC task is abnormally terminated with a CICS transaction dump.

User response: See the related diagnostic material produced by the recovery manager domain and determine the reason for the failure. In the case of a

CICS logic error, you need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRNP

AITB

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the recovery manager (RM) domain. The domain provides an exit trace, and possibly a console message and a system dump (depending on the options specified in the dump table).

This failure is either the result of a task purge, or a CICS logic error,

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related diagnostic material produced by the recovery manager domain and determine the reason for the failure. In the case of a CICS logic error, you need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHISP DFHMXP

AITC

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the recovery manager (RM) domain. The domain provides an exit trace, and possibly a console message and a system dump (depending on the options specified in the dump table).

This failure is either the result of a task purge, or a CICS logic error,

System action: The mirror task is abnormally terminated with a CICS transaction dump.

User response: See the related diagnostic material produced by the recovery manager domain and determine the reason for the failure. In the case of a CICS logic error, you need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHMIRS

AITD

Explanation: The mirror program has received an unexpected response from the RX domain.

There are several reasons why this error may occur

- A request received from an EXCI client is inconsistent with an earlier request in the same Unit of Work
- CICS has received an unexpected response from the Recoverable Resource Management Services component of MVS.

- There has been an internal error in the RX domain.

System action: The mirror task is abnormally terminated with a CICS transaction dump.

User response: Use the exception trace provided by the RX domain to determine the reason for the failure. If the error is caused by an inconsistent request from an EXCI client, there may be an error in the client program.

In the other cases, you might need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHMIRS

AITE

Explanation: A transaction has executed a transactional EXCI request from a batch region, and has been waiting for one of the following events for longer than the interval specified in the RTIMOUT or DTIMOUT value for the transaction.

- A further transactional EXCI request from the batch region
- A sync point initiated by Resource Recovery Management Services (RRMS).

System action: The mirror task is abnormally terminated with a CICS transaction dump.

User response: Determine why the expected event has not occurred. If a further transactional EXCI request is expected:

- The batch program might be suspended

If a sync point is expected:

- The batch program might be suspended before reaching sync point.
- RRMS might have started sync point processing but is waiting for another Resource Manager to respond to the sync point request.

See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHMIRS

AITF

Explanation: A transaction has executed a transactional EXCI request from a batch region, and has been purged while waiting for one of the following events

- A further transactional EXCI request from the batch region
- A syncpoint initiated by Resource Recovery Management Services (RRMS).

System action: The mirror task is abnormally terminated with a CICS transaction dump.

User response: Determine why the expected event

AITG • AITK

has not occurred. If a further transactional EXCI request is expected:

- The batch program may be suspended

If a syncpoint is expected:

- The batch program may be suspended before reaching syncpoint
- RRMS may have started syncpoint processing but is waiting for another Resource Manager to respond to the syncpoint request.

See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHMIRS

AITG

Explanation: A transaction has executed a transactional EXCI request from a batch region, and both of the following events has occurred

- A further transactional EXCI request from the batch region
- A syncpoint initiated by Resource Recovery Management Services (RRMS).

Normally, only one event should occur, and not both.

System action: The mirror task is abnormally terminated with a CICS transaction dump.

User response: Determine why both events have occurred. This situation may arise when an EXCI client times out on a DPL request that CICS is not ready to receive and then proceeds to take a syncpoint. If this is not the case, you may need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHMIRS

AITH

Explanation: A mirror transaction processing an ECI request from a TCP/IP connected client has failed while trying to receive data from, or send data to, a client. This could be a read time out, or a more serious error in the flows that prevented CICS from correctly processing the data.

System action: The mirror task is abnormally terminated with a CICS transaction dump.

User response: If the error was a time out, determine why the client has not continued with the extended ECI conversation. Other errors will have associated IE domain messages to aid in problem determination.

Module: DFHMIRS

AITI

Explanation: A mirror transaction processing a START CHANNEL or LINK CHANNEL request has failed while trying to receive data from, or send data to, a connected CICS system. Because a channel may include a considerable amount of data, it may require many calls to terminal control to transmit channel data. DFHMIRS calls program DFHAPCR to perform all the inter-system transmission of channel data. Terminal control has detected an error in one of these calls. The error could be a read time out, or a more serious error in the flows that prevented CICS from correctly processing the data.

System action: The mirror task is abnormally terminated with a CICS transaction dump.

User response: If the error was a time out, determine why the other end has not continued with the conversation. Other errors will have associated terminal control messages to aid in problem determination. Examine trace entries from DFHAPCR to determine terminal control error and sense information.

Module:

AITJ

Explanation: A mirror transaction processing a request from a client connected using IP interconnectivity has failed while trying to receive data from, or send data to, a client. This could be a read time out, or a more serious error in the flows that prevented CICS from correctly processing the data.

System action: The mirror task is abnormally terminated with a CICS transaction dump.

User response: If the error was a time out, determine why the client has not continued with the conversation. Other errors will have associated IS domain messages to aid in problem determination.

Module: DFHMIRS

AITK

Explanation: The ISCINVREQ condition has been raised. This can happen when the resource proves to be on yet another remote system, that is, when daisy-chaining is active.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check that daisy-chaining of requests is intended and that all relevant intersystem links are in service.

Module: DFHMIRS

AITL

Explanation: The IPIC client sent a CCSID that was not recognized.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check that the client system is using one of the client code pages supported by CICS TS.

Module: DFHMIRS

AITM

Explanation: A command has been received by the mirror program to call itself.

AJxx abend codes

AJ01

Explanation: The main method of the Java environment setup class, Wrapper, has been invoked without an argument. Wrapper main expects the class name of the user's main to be passed as the first argument.

The callUserCode method of Wrapper detects this, sets return code INVALID_ARGUMENTS and invokes native method SetAbend to abend the task.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCICS

AJ02

Explanation: A CICS AbendError has been caught by the Java environment setup class, Wrapper.

The callUserCode method of Wrapper detects this, sets return code ABEND_RECEIVED and invokes native method SetAbend to abend the task.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See related messages to determine the reason for the original abend.

Module: DFJCICS

AJ03

Explanation: A CicsConditionException has been caught by the Java environment setup class, Wrapper.

The callUserCode method of Wrapper detects this, sets return code CONDITION_RECEIVED and invokes native method SetAbendForCondition to abend the task.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Correct the API command in the client system program so that it does not request an EXEC CICS LINK PROGRAM to run that specifies the name of the mirror program.

Module: DFHMIRS

The appropriate default abend code for the condition should be issued but, if for some reason this is not possible, an AJ03 abend may be issued.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See related messages to determine the reason for the original CicsConditionException.

Module: DFJCICS

AJ04

Explanation: An unexpected error has been caught by the Java environment setup class, Wrapper, attempting to invoke the user class.

The callUserCode method of Wrapper detects this, sets return code UNEXPECTED_EXCEPTION and invokes native method SetAbend to abend the task.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCICS

AJ05

Explanation: An unhandled exception has been caught by the Java environment setup class, Wrapper, as an InvocationTargetException from the user class.

The callUserCode method of Wrapper detects this, sets return code INVOCATION_TARGET_EXCEPTION and invokes native method setAbend to abend the task.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See related messages to determine the reason for the original Exception.

AJ07 • AJAA

Module: DFJCICS

AJ07

Explanation: The Java environment setup class, Wrapper, has been unable to invoke the user's main method. The class whose name was passed as an input parameter to its CallUserClass method was not found.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check that CICS has been granted read permission to the target class and the entire HFS directory structure in which the class or Jar file is located.

Module: DFJCICS

AJ09

Explanation: The Java environment setup class, Wrapper, has been unable to invoke the user's main method. A public static method, taking either a CommAreaHolder or a String array as input, was not found in the class whose name was passed as an input parameter to the CallUserClass method of Wrapper.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check that you have provided a main method, with an appropriate method signature, in the specified class. Also check that the target class explicitly uses the 'public' class modifier and that it is stored in a jar file on the JVM's classpath. CICS must have read permission for the jar file.

Module: DFJCICS

AJ10

Explanation: The Java environment setup class, Wrapper, has detected that the user's class has used JDBC or SQLJ. It however has been unable to load the DB2 JDBC classes necessary to call back the JDBC/SQL driver for cleanup processing following completion of the user class.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCICS

AJ11

Explanation: The Java environment setup class, Wrapper, has detected that the user's class has used JDBC or SQLJ. It however has been unable to find the DB2 JDBC static method to call back the JDBC/SQL

driver for cleanup processing following completion of the user class.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCICS

AJ12

Explanation: The Java environment setup class, Wrapper, has detected that the user's class has used JDBC or SQLJ. It however has been unable to invoke the DB2 JDBC static method to call back the JDBC/SQL driver for cleanup processing following completion of the user class.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCICS

AJ99

Explanation: The Java environment setup class, Wrapper, has detected an AbendException and issued setAbend. The abend code extracted from the AbendException is too long.

System action: Task abnormal termination continues with the abend code set to AJ99

User response: Correct the abend code String used to create the AbendException.

Module: DFJCICS

AJAA

Explanation: The native method SetAbendForCondition has been passed an invalid Resp value by the Wrapper class.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCICS

AJAA

Explanation: The CREA/CREC transaction could not allocate the shared memory it required. The transaction will free all allocated memory and issue this abend.

System action: The transaction is terminated.

User response: Examine the trace to determine why the GETMAIN failed. If the CICS region was short on storage then take the necessary steps to correct this. If your region was not short on storage you may need help from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHADDRM

AJAB

Explanation: The CREA/CREC transaction could not free the shared memory it allocated.

System action: The transaction is terminated.

User response: Examine the trace to determine why the FREEMAIN failed. You may need help from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHADDRM

AJAC

Explanation: The CREA/CREC transaction browses the installed REQUESTMODELS. An attempt to start or continue the browse of the REQUESTMODELS failed with an unexpected return code.

System action: The transaction is terminated.

User response: Examine the trace to determine why the INQUIRE REQUESTMODEL call failed. You may need help from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHADDRM

AJAD

Explanation: The CREA/CREC transaction received an unexpected return code from an EXEC CICS call and could not continue.

System action: The transaction is terminated.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHADDRM

AJAE

Explanation: The CREA/CREC transaction used the EXEC CICS SEND MAP call to display a BMS map. This call returned an expected return code.

System action: The transaction is terminated.

User response: Examine the trace to determine why the SEND MAP call. You may need help from IBM to resolve this problem. See Part 4 of the *CICS Problem*

Determination Guide for guidance on how to proceed. failed.

Module: DFHADDRM

AJAF

Explanation: The CREA/CREC transaction used the EXEC CICS RECEIVE MAP call to receive data from a BMS map. This call returned an expected return code.

System action: The transaction is terminated.

User response: Examine the trace to determine why the RECEIVE MAP call failed. You may need help from IBM to resolve this problem. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHADDRM

AJAG

Explanation: The CREA/CREC transaction must be invoked using the transaction ID of 'CREA' or 'CREC'. You are not able to use another transaction ID to invoke DFHADDRM (the program invoked for the CREA/CREC transaction).

System action: The transaction is terminated.

User response: Use CREA or CREC to invoke the CREA/CREC transaction.

Module: DFHADDRM

AJCD

Explanation: An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related message from the domain that detected the original error.

Module: DFHJCP

AJCE

Explanation: The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The domain that first detected the purged condition provides an exception trace.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate why the task was purged. It was purged either as a result of a purge from the

AJCS • AKCO

master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Module: DFHJCP

AJCS

Explanation: An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to the log manager (LM) domain. The domain that detected the original error provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related message from the domain that detected the original error.

Module: DFHJCP

AJCT

Explanation: An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to the recovery manager (RM) domain. The domain that detected the original error provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related message from the domain that detected the original error.

Module: DFHJCP

AJCU

Explanation: A purge response has been received from either the log manager or the recovery manager.

AKxx abend codes

AKCO

Explanation: An attempt has been made to run the CICS internal task CSSY as a user transaction.

The domain that detected the original purge condition provides an exception trace.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate why the task was purged. It was purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Module: DFHJCP

AJMB

Explanation: The CICS-JVM interface has rejected an attempt to invoke a Java program to run under control of a JVM because a previous JVM for the same CICS task terminated abnormally. The CICS-JVM interface is unable to create a JVM to run the Java program.

This error occurs when the previous JVM was terminated because of a Java program invoking the Java system.exit method and because errors occurred during the subsequent JVM termination. A system.exit invocation causes a forced termination of the JVM and the Language Environment enclave.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Examine why the previous JVM termination failed. Wherever possible avoid the use of system.exit to return from Java programs.

Module: DFHAPLJ

System action: CICS terminates the task with a transaction dump.

User response: Investigate why the attempt was

made to run CSSY as a user transaction.

Module: DFHAPATT

AKC1

Explanation: A DFHKC WAIT request was issued when the ECB was already marked as waiting.

System action: There is a probable user error. The transaction is abnormally terminated.

User response: Correct the program that issued the request.

Module: DFHXCP

AKC2

Explanation: A bad response has been received from a dispatcher (DS) domain call.

System action: The transaction is abnormally terminated with a transaction dump and a trace entry.

User response: Examine the trace entry for further information.

Module: DFHXCP

AKC3

Explanation: The task has been purged, probably due to operator action such as a CEMT TASK PURGE command. The task might also have been purged as a result of CICS issuing a purge request.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Use the transaction dump to determine why the task was purged. In particular, if the purge was operator initiated, the dump should be useful in determining why this task needed to be explicitly purged.

Module: DFHXCP, DFHXMAT, DFHXMCL, DFHXMIQ, DFHXMTA

AKC6

Explanation: DFHKC RESUME should always be preceded by DFHKC SUSPEND. If this protocol is violated then the transaction is abnormally terminated with abend code AKC6.

System action: Transaction is abnormally terminated with abend code AKC6.

User response: Examine the trace entry for further information.

Module: DFHXCP

AKC8

Explanation: A bad response has been received from a call to the kernel (KE) domain during the processing of a task purge request.

System action: The transaction is abended with a transaction dump.

User response: Examine the dump and any exception trace entries for further information.

Module: DFHXCP

AKC9

Explanation: An incorrect response has been received from a call to the enqueue (NQ) domain during the processing of a DFHKC TYPE=ENQ or a DFHKC TYPE=DEQ request.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Examine the dump and any exception trace entries for further information. Since the DFHKC service is only used for internal enqueues, this abend indicates an error in CICS. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXCP

AKCB

Explanation: The CICS transaction manager restart task could not complete because a necessary step failed. The task has done some essential recovery operations and abnormally terminated itself with code AKCB.

System action: CICS writes a transaction dump for the transaction manager restart task.

CICS sends three messages to the console, one to identify the error detected by the transaction manager restart task, one to say that the task has failed, and one that gives you the option of cancelling CICS or letting it continue. Depending on the nature of the original error, you may see messages from some other system component (for example, an access method).

User response: Use the messages and dumps to find out the cause of the failure.

Module: DFHKCRP

AKCC

Explanation: The CICS transaction manager has abended the transaction because the purge threshold of its TRANCLASS has been reached. This is specified by the PURGETHRESH parameter on CEDA DEFINE TRANCLASS. See the *CICS Resource Definition Guide*

AKCE • AKCS

manual for more details of this parameter.

System action: The transaction is abended and messages DFHAC2004 and DFHAC2236 are issued. The transaction dump is suppressed for this abend code.

User response: Resubmit the transaction. The cause of the abend may be a temporary stress condition in the system.

If the problem persists, determine why the TRANCLASS purge threshold has been reached. Ensure that PURGETHRESH has been specified correctly. Also, ensure that the MAXACTIVE value of the TRANCLASS has not been set too low. Transactions attached after the MAXACTIVE limit has been reached are immediately queued subject to the PURGETHRESH limit.

If PURGETHRESH and MAXACTIVE are set correctly, look for a more general problem which has caused a decrease in the capacity of the system to execute transactions in the TRANCLASS. The decrease might, for example, be caused by a connected CICS region which processes requests for transactions in the TRANCLASS, if this connected region has slowed down.

Examine all resources (files, links, storage, and so on) used by the transactions in the TRANCLASS which is reaching the purge threshold and determine why the capacity of the system is reduced.

Module: DFHXMAT, DFHXMCL

AKCE

Explanation: While CICS transaction manager was recording changes to a transaction or profile definition, a write to the system log failed.

System action: CICS terminates the transaction with a transaction dump.

User response: Use the dumps to find out why the write to the log failed.

Module: DFHKCQ

AKCF

Explanation: While CICS transaction manager was recording changes to a profile definition, a write to the catalog failed.

System action: CICS terminates the transaction with a transaction dump.

User response: Use the dumps to find out why the write to the catalog failed.

Module: DFHKCQ

AKCR

Explanation: Transaction manager has received an invalid request code. The last AP F000 trace entry before the program control program (PCP) ABEND TRACE entry (TRACE ID "F2", request code X'6000) will contain the invalid transaction manager request code in the fifth byte of the first section of the trace. "

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Determine the cause of the invalid request code and correct the problem.

Module: DFHXCP

AKCS

Explanation: A deadlock timeout condition has been detected. This condition may occur within a transaction that specifies DTIMOUT to be nonzero on its installed transaction definition. Deadlock timeout occurs when a transaction has been waiting or has been suspended for longer than the time specified in DTIMOUT.

The abend may be driven by a variety of internal CICS events, for example

- A short on storage condition
- A temporary storage shortage
- ENQUEUE
- An ALLOCATE request
- A RETRIEVE WAIT request.

The abend can also occur if CICS stops running for a time, for example while an sdump is taken. This is because deadlock timeout is based on total elapsed time, and not just the time CICS is executing.

Analysis: The transaction receiving the AKCS abend must have been suspended or must be waiting for a reason such as a short on storage, enqueued on a lock, a short on temporary storage, a suspend after RETRIEVE WAIT, a suspend after ALLOCATE, or an implicit ALLOCATE within function shipping or terminal sharing support. If none of these apply, the trace might reveal some event that has caused CICS to stop running for a time.

System action: The transaction is abnormally terminated. A dump is not provided unless the dump table entry for transaction dump code AKCS indicates that one should be taken.

User response: The transaction should be reexecuted, and the situation causing the SUSPEND to occur may clear itself.

The AKCS abend is to be expected occasionally, unless DTIMOUT is set to zero. No special action is necessary.

Module: DFHXCP

AKCT

Explanation: A terminal read-time-out condition has been detected. The transaction has been waiting for a terminal input message for an interval longer than specified in the RTIMOUT value for that transaction.

If an EXEC CICS HANDLE ABEND has been issued for this task, the read that was timed-out is still outstanding. To cancel this read you should issue an EXEC CICS ABEND at the end of the user exit routine so that CICS can clean up the terminal's TCTTE.

System action: The transaction is abnormally terminated. A transaction dump is not provided.

User response: This abend is a normal one. Coding RTIMOUT in the PROFILE entry asks for the task to be abnormally terminated if the terminal does not send input within the specified time.

Module: DFHXCP

AKCV

Explanation: A bad return code was passed as a result of the resume of a task suspended by ICP.

System action: The transaction is terminated with a dump.

User response: Check the response from the resume in the trace to determine the cause of the error.

Module: DFHALP

AKEA

Explanation: A program check has been detected by the kernel (KE) domain.

System action: If an application is in control, the ASRA abend is presented to the application. Otherwise, the functional recovery routine of the CICS module in control at the time is given control. This recovery routine produces suitable diagnostics and may terminate CICS.

User response: Look at the kernel domain section of the system dump to determine where the program check has occurred.

Module: DFHKESTX

AKEB

Explanation: An operating system abend has been detected by the kernel (KE) domain.

System action: If an application is in control, the ASRB abend is presented to the application. Otherwise, the functional recovery routine of the CICS module in control at the time is given control. This recovery routine produces suitable diagnostics and may terminate CICS.

User response: Check the console for any MVS messages that may have caused this abend.

Look at the kernel domain section of the system dump to determine where the abend has occurred.

Module: DFHKESTX

AKEC

Explanation: The kernel (KE) domain has detected runaway.

System action: If an application is in control, the AICA abend is presented to the application. Otherwise, the functional recovery routine of the CICS module in control at the time is given control. This recovery routine produces suitable diagnostics and may terminate CICS.

User response: Look at the kernel domain section of the system dump to determine where the runaway has occurred.

Module: DFHKESTX, DFHKERRU

AKED

Explanation: The kernel (KE) domain has been requested to initiate abend processing as a result of a deferred abend request.

System action: Abend processing starts for the task that is subject to the deferred abend request.

User response: The task is not abended with AKED but by an abend code specified by the requestor of the deferred abend. See the description of this abend for further guidance.

Module: DFHKEEDA

AKEF

Explanation: The kernel (KE) domain has detected an error while processing a domain call. The error may have been caused by a domain gate that was not yet active during initialization

System action: If an application is in control, the transaction terminates with a system dump. Otherwise, the functional recovery routine of the CICS module in control at the time is given control. This recovery routine produces suitable diagnostics and may terminate CICS.

User response: See any related messages from the kernel domain.

Look at the kernel domain section of the system dump to determine where the error has occurred. Check that a call has not been made to a domain gate that has not yet been made active. Check that the caller has NOT specified KERNERROR(YES).

| If the abend occurs during CICS system initialization,
| ensure that the utility (DFHCCUTL) used to initialize the
| local catalog (DFHLCD) is at the correct level. A sample
| job is provided in SDFHINST(DFHDEFDS).

Module: DFHKERKE

AKEG

Explanation: The kernel (KE) domain issued an SM GETMAIN for kernel stack storage, but the GETMAIN request failed.

System action: If an application is in control, the transaction terminates with a system dump. Otherwise, the functional recovery routine of the CICS module in control at the time is given control. This recovery routine produces suitable diagnostics and may terminate CICS.

User response: Look at the kernel domain section of the system dump to determine why sufficient storage was not available.

If the short-on-storage condition persists, consider increasing the size limit of the CICS DSA. You can vary the DSA dynamically using the DSALIM parameter on the CEMT master terminal command.

Module: DFHKESGM

AKEH

Explanation: The transaction was purged while running outside the control of CICS.

System action: CICS terminates the transaction abnormally.

The EXEC CICS HANDLE ABEND command can not handle this abend.

User response: Investigate the reason why the transaction was purged.

Possible reasons are

- An operator purged the transaction
- The transaction was purged because DTIMEOUT has been exceeded
- Another transaction purged the transaction

Module: DFHKESTX

AKEI

Explanation: The kernel (KE) domain has detected runaway while the transaction is running outside the control of CICS.

System action: If an application is in control, the AICA abend is presented to the application. Otherwise, the functional recovery routine of the CICS module which was last in control at the time of runaway detection is given control. This recovery routine produces suitable diagnostics and may terminate CICS.

The EXEC CICS HANDLE ABEND command can not handle this abend.

User response: See the *CICS Problem Determination Guide* for guidance on dealing with loops.

Module: DFHKESTX

AKEX

Explanation: A program check has been detected by the kernel (KE) domain while executing under a TCB that is not enabled for EXEC CICS commands. This is probably because of an attempt to execute a CICS command in an environment where this is not possible.

System action: If an application is in control, the ASRA abend is presented to the application. Otherwise, the functional recovery routine of the CICS module in control at the time is given control. This recovery routine produces suitable diagnostics and may terminate CICS.

User response: Look at the kernel domain section of the system dump to determine where the program check has occurred.

Module: DFHKESTX

AKEZ

Explanation: A user attach has failed because there are insufficient kernel tasks available. This indicates an internal logic error.

System action: Message DFHKE0001 is issued and a system dump is taken. The attach of the user transaction fails.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHKETA

AKKA

Explanation: A kill request has been actioned when a transaction was not protected from purge or force purge. The transaction is either in a dispatcher suspend, the deferred abend processor is in control, the application is calling CICS, CICS is returning to the application, or the application is outside of the control of CICS.

System action: If an application is in control, the abend is presented to the application. Otherwise, the functional recovery module of the CICS module in control at the time is given control. This recovery routine produces diagnostics and might terminate CICS. This abend code cannot be handled by the application.

User response: Notify the system programmer to determine why the task has been killed.

Module: DFHDSSR, DFHKEEDA, DFHEIP, DFHKEDS

AKKB

Explanation: A kill request has been actioned when a transaction was not protected from forcepurge but was protected from purge. The transaction is either in a dispatcher suspend, the deferred abend processor is in control, the application is calling CICS, CICS is

returning to the application, or the application is outside of the control of CICS.

System action: If an application is in control, the abend is presented to the application. Otherwise, the functional recovery module of the CICS module in control at the time is given control. This recovery routine produces diagnostics and might terminate CICS. This abend code cannot be handled by the application.

User response: Notify the system programmer to determine why the task has been killed.

Module: DFHDSSR, DFHKEEDA, DFHEIP, DFHKEDS

AKKC

Explanation: A kill request has been actioned when a transaction was protected from force purge. The transaction is either in a dispatcher suspend, the deferred abend processor is in control, the application is calling CICS, CICS is returning to the application, or the application is outside of the control of CICS.

System action: If an application is in control, the abend is presented to the application. Otherwise, the functional recovery module of the CICS module in control at the time is given control. This recovery routine produces diagnostics and might terminate CICS. This abend code cannot be handled by the application.

User response: Notify the system programmer to determine why the task has been killed.

Module: DFHDSSR, DFHKEEDA, DFHEIP, DFHKEDS

AKKD

Explanation: A CEKL purge has been requested. Abend processing has started for the task that is subject to the deferred abend request.

System action: The task is abended with abend code AKKD.

User response: Notify the system programmer to determine why the task has been purged.

Module: DFHKEEDA

AKKE

Explanation: A CEKL force purge has been requested. Abend processing has started for the task that is subject to the deferred abend request.

System action: The task is abended with abend code AKKE.

User response: Notify the system programmer to determine why the task has been purged.

Module: DFHKEEDA

AKKG

Explanation: The kernel (KE) domain has detected a kill request from the runaway exit program. The task was not protected from runaway when the kill request was actioned.

System action: If an application is in control, the abend is presented to the application. Otherwise, the functional recovery module of the CICS module in control at the time is given control. This recovery routine produces diagnostics and might terminate CICS. This abend code cannot be handled by the application.

User response: Notify the system programmer to determine why the task has been killed.

Module: DFHKESTX, DFHKERRU, DFHKEKIL

AKKH

Explanation: The kernel (KE) domain has detected a kill request from the runaway exit program. The task was protected from runaway when the request was actioned.

System action: If an application is in control, the abend is presented to the application. Otherwise, the functional recovery module of the CICS module in control at the time is given control. This recovery routine produces diagnostics and might terminate CICS. This abend code cannot be handled by the application.

User response: Notify the system programmer to determine why the task has been killed.

Module: DFHKESTX, DFHKERRU, DFHKEKIL

AKSE

Explanation: A user has generated an addition to the keyword table, but code has not been added to process this keyword.

System action: The transaction is abnormally terminated and a dump is taken.

User response: Add code to process the keyword.

Module: DFH99KC

ALxx abend codes

ALGA

Explanation: An error has occurred obtaining a lock within the log manager domain.

System action: The recovery routine of the module in control is invoked which issues message DFHLG0002 with a system dump. DFHLG0002 reports the module in control at the time of the error.

User response: See the description of message DFHLG0002 for further guidance.

Module: DFHLGGL, DFHLGJN, DFHLGLD, DFHLGST

ALGB

Explanation: An error has occurred releasing a lock within the log manager domain.

System action: The recovery routine of the module in control is invoked which issues message DFHLG0002 with a system dump. DFHLG0002 reports the module in control at the time of the error.

User response: See the description of message DFHLG0002 for further guidance.

Module: DFHLGGL, DFHLGJN, DFHLGLD, DFHLGST

ALGC

Explanation: A disaster response has been detected when processing the building block code used by the log manager.

System action: The recovery routine of the module in control is invoked which issues message DFHLG0002 with a system dump. DFHLG0002 reports the module in control at the time of the error.

User response: See the description of message DFHLG0002 for further guidance.

Module: DFHLGGL, DFHLGJN, DFHLGLD, DFHLGST

ALGD

Explanation: A disaster response has been detected when processing the building block storage interface code used by the log manager.

System action: The recovery routine of the module in control is invoked which issues message DFHLG0002 with a system dump. DFHLG0002 reports the module in control at the time of the error.

User response: See the description of message DFHLG0002 for further guidance.

Module: DFHLGCM, DFHLGGL, DFHLGJN, DFHLGLD, DFHLGST

ALGE

Explanation: An unexpected error has occurred while the log manager was attempting to find a journal model definition.

System action: The recovery routine of the module in control is invoked which issues message DFHLG0002 with a system dump. DFHLG0002 reports the module in control at the time of the error.

User response: See the description of message DFHLG0002 for further guidance.

Module: DFHLGJN

ALGF

Explanation: An unexpected error occurred when the log manager was attempting an enqueue or dequeue operation.

System action: The recovery routine of the module in control is invoked which issues message DFHLG0002 with a system dump. DFHLG0002 reports the module in control at the time of the error.

User response: See the description of message DFHLG0002 for further guidance.

Module: DFHLGGL, DFHLGJN, DFHLGST

ALGG

Explanation: Transaction CSQC has been issued from a terminal. This is not permitted. The transaction can only be started internally by CICS.

System action: The transaction is abnormally terminated.

User response: Do not try to invoke CSQC from a terminal.

Module: DFHLGQC

ALIC

Explanation: CICS has issued a GETMAIN request during the initialization phase for an application program in order to obtain run time execution storage for Language Environment above the 31-bit line. However insufficient storage was available to satisfy the request.

System action: CICS abnormally terminates the task. CICS processing continues.

User response: See the related message from the Storage Manager domain where the original error was detected.

Module: DFHAPLI

ALID

Explanation: CICS has issued a GETMAIN request during the initialization phase for an application program in order to obtain run time execution storage for Language Environment below the 31-bit line. However insufficient storage was available to satisfy the request.

System action: CICS abnormally terminates the task. CICS processing continues.

User response: See the related message from the Storage Manager domain where the original error was detected.

Module: DFHAPLI

ALIF

Explanation: CICS has issued a GETMAIN request during the initialization phase for an application program in order to obtain thread storage for Language Environment. However insufficient storage was available to satisfy the request.

System action: CICS abnormally terminates the task. CICS processing continues.

User response: See the related message from the Storage Manager domain where the original error was detected.

Module: DFHAPLI

ALIG

Explanation: CICS has been unable to determine the language of the user application program about to be executed. Either the program was compiled against an old level of compiler that is no longer supported by CICS, or the language of the program is not supported by CICS.

System action: CICS abnormally terminates the task and disables the program. CICS processing continues.

User response: Ensure that the program to be run is written in one of the languages and compiled against a level of compiler supported by CICS. See the *CICS Application Programming Guide* for details of the languages and compilers currently supported.

Module: DFHAPLI

ALIH

Explanation: CICS has determined the language of a program to be VS COBOL II, but Language Environment has indicated that it is unable to execute the program. Normally Language Environment is able to execute VS COBOL II programs in compatibility code.

System action: CICS abnormally terminates the task and disables the program. CICS processing continues.

User response: Ensure that the program to be run is

written in one of the languages supported by CICS and Language Environment, and compiled against a level of compiler supported by Language Environment. See the Language Environment Migration Guide for details of the languages and compilers currently supported, and any actions which may be necessary by the user such as re-compilation or re-linking.

Module: DFHAPLI

ALII

Explanation: CICS has determined the language of a program to be OS/PLI, but Language Environment has indicated that it is unable to execute the program. Normally Language Environment is able to execute OS/PLI programs in compatibility code.

System action: CICS abnormally terminates the task and disables the program. CICS processing continues.

User response: Ensure that the program to be run is written in one of the languages supported by CICS and Language Environment, and compiled against a level of compiler supported by Language Environment. See the Language Environment Migration Guide for details of the languages and compilers currently supported, and any actions which may be necessary by the user such as re-compilation or re-linking.

Module: DFHAPLI

ALIJ

Explanation: CICS has determined that an C or C++ program compiled with the XPLINK option is about to be executed but the program is defined with attribute CONCURRENCY(QUASIRENT). XPLINK programs execute on open TCBS and cannot rely on quasi-reentrancy. They must be coded to threadsafe standards and defined to CICS with CONCURRENCY(THREADSAFE).

System action: CICS abnormally terminates the task and disables the program. CICS processing continues.

User response: Ensure that the program is coded to threadsafe standards and defined as CONCURRENCY(THREADSAFE), or recompile the program without the XPLINK option.

A program can be defined as threadsafe by using standard CICS or CPSM resource definition facilities, via program autotinstall, or by using a Language Environment runtime option. The runtime option can be specified in the source of the program by means of a #pragma runopts(ENVAR(CICSVAR=THREADSAFE)) statement. Alternatively ENVAR=('CICSVAR=THREADSAFE') can be specified in a CEEUOPT CSECT which is then linkedited with the program.

Module: DFHAPLI

ALIK

Explanation: CICS has determined that an OS/VS COBOL program is about to be executed. However CICS no longer supports such programs.

System action: CICS abnormally terminates the task and disables the program. CICS processing continues.

User response: Ensure that the program is recompiled against a level of COBOL compiler supported by CICS. See the *CICS Application Programming Guide* for details of the languages and compilers currently supported.

Module: DFHAPLI

ALX1

Explanation: CICS has issued an initialize request to the Language Environment preinitialized services system (CEEPIPI). However, CEEPIPI has returned an error condition. This error strongly indicates an internal failure in Language Environment.

System action: CICS abnormally terminates the task. CICS processing continues.

User response: The full trace entry will indicate the return code from Language Environment. Consult the Language Environment Programming Guide manual for an explanation of the return code.

Module: DFHAPLX

ALX2

Explanation: CICS has issued an add_entry request to the Language Environment preinitialized services system (CEEPIPI). However, CEEPIPI has returned an error condition. This error strongly indicates an internal failure in Language Environment.

System action: CICS abnormally terminates the task. CICS processing continues.

User response: The full trace entry will indicate the return code from Language Environment. Consult the Language Environment Programming Guide manual for an explanation of the return code.

Module: DFHAPLX

ALX3

Explanation: CICS has issued a call_main request to the Language Environment preinitialized services

AMxx abend codes

AMI1

Explanation: When the mirror task is resumed, a bad response other than a time out or a cancellation was given by the dispatcher.

system (CEEPIPI). However, CEEPIPI has returned an error condition. This error strongly indicates an internal failure in Language Environment.

System action: CICS abnormally terminates the task. CICS processing continues.

User response: The full trace entry will indicate the return code from Language Environment. Consult the Language Environment Programming Guide manual for an explanation of the return code.

Module: DFHAPLX

ALX4

Explanation: CICS has issued a remove_entry request to the Language Environment preinitialized services system (CEEPIPI). However, CEEPIPI has returned an error condition. This error strongly indicates an internal failure in Language Environment.

System action: CICS abnormally terminates the task. CICS processing continues.

User response: The full trace entry will indicate the return code from Language Environment. Consult the Language Environment Programming Guide manual for an explanation of the return code.

Module: DFHAPLX

ALX5

Explanation: CICS has issued a terminate request to the Language Environment preinitialized services system (CEEPIPI). However, CEEPIPI has returned an error condition. This error strongly indicates an internal failure in Language Environment.

System action: CICS abnormally terminates the task. CICS processing continues.

User response: The full trace entry will indicate the return code from Language Environment. Consult the Language Environment Programming Guide manual for an explanation of the return code.

Module: DFHAPLX

System action: The mirror transaction is abnormally terminated with a transaction dump.

User response: Use the dump and the trace to determine the cause of the error.

Module: DFHMIRS

AMNA

Explanation: An exception response has been received from the monitoring (MN) domain while processing a user event monitoring point (EMP) request. The exception response is produced when the 4-byte DATA1 field in the user parameter contains an invalid address.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Use the transaction dump to determine why the DATA1 value passed to the monitoring (MN) domain was invalid.

Module: DFHCMP

AMNB

Explanation: An exception response has been received from the monitoring (MN) domain whilst processing a user event monitoring point (EMP) request. The exception response is produced when the 4-byte DATA2 field in the user parameter contains invalid data.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Use the transaction dump to determine why the DATA2 value passed to the monitoring (MN) domain was invalid.

Module: DFHCMP

AMNZ

Explanation: An unexpected error response has been received from the monitoring (MN) domain while processing a user event monitoring point (EMP) request.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: This indicates a possible error in CICS code. An earlier CICS message is issued from the monitoring domain. Follow the user response for that message.

Module: DFHCMP

AMQA

Explanation: DFHMQCON had enabled DFHMQTRU with a global work area smaller than that needed by DFHMQTRU. This could be due to a mismatch of version level between DFHMQCON and DFHMQTRU.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Check that the versions of

DFHMQCON and DFHMQTRU are compatible. If you are unable to solve the problem, contact your IBM support center.

Module: DFHMQTRU

AMQB

Explanation: DFHMQCON had enabled DFHMQTRU with a task local work area smaller than that needed by DFHMQTRU. This could be due to a mismatch of version level between DFHMQCON and DFHMQTRU.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Check that the versions of DFHMQCON and DFHMQTRU are compatible. If you are unable to solve the problem, contact your IBM support center.

Module: DFHMQTRU

AMQC

Explanation: Unrecognizable WMQ API call. All supported API calls are documented in the *WebSphere MQ Application Programming Reference* manual.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: See the *WebSphere MQ Application Programming Reference* manual for details of the supported WMQ API.

Module: DFHMQTRU

AMQD

Explanation: Unrecognizable RMI API call. The CICS-MQ task related user exit (TRUE) was invoked with an unrecognizable request type.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Contact your IBM support center.

Module: DFHMQTRU

AMQE

Explanation: An attempt to EXEC CICS LOAD the data conversion service module CSQAVICM was unsuccessful.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Ensure that the WMQ SCSQAUTH library has been specified in the CICS DFHRPL concentration and that CSQAVICM is defined as a program to CICS. A definition for CSQAVICM is supplied in the DFHMQ CSD group.

Module: DFHMQCON

AMQF

Explanation: An internal logic error has been detected in the CICS bridge monitor.

System action: Message DFHMQ0750 is written to the CICS CSMT transient data queue and the CICS bridge monitor task is ended abnormally.

User response: See the description of message DFHMQ0750 for more information.

Module: DFHMQBR0

AMQG

Explanation: The CICS DPL bridge program has detected an error in a request message for this unit of work.

System action: All request messages for this unit of work are copied to the dead-letter queue with an MQFB_CICS_* reason code. Corresponding error messages are written to the CICS CSMT transient data queue. An MQCRC_BRIDGE_ERROR reply is sent to the reply-to queue if requested. The CICS bridge task is ended abnormally.

User response: See the description of the accompanying messages for more information.

Module: DFHMQBP0

AMQH

Explanation: The CICS bridge monitor or DPL bridge program abended due to an unexpected return code from an EXEC CICS API call.

System action: Message DFHMQ0704 is written to the CICS CSMT transient data queue and the CICS bridge monitor or DPL bridge program is abnormally terminated.

User response: See the description of message DFHMQ0704 for more information.

Module: DFHMQBR2

AMQI

Explanation: The CICS bridge monitor or DPL bridge program abended due to an unexpected return code from an MQ API call.

System action: Message DFHMQ0710 is written to the CICS CSMT transient data queue and the CICS bridge monitor or DPL bridge program is abnormally terminated.

User response: See the description of message DFHMQ0710 for more information.

Module: DFHMQBP2

AMQJ

Explanation: The CICS DPL bridge program abended before processing any messages for the unit of work.

System action: All request messages for this unit of work are left on the CICS bridge queue to be handled by the CICS bridge monitor.

User response: See the description of the accompanying messages for more information.

Module: DFHMQBP2

AMQK

Explanation: The CICS DPL bridge program abended during error processing.

System action: An unexpected error occurred during CICS DPL bridge error processing.

User response: See the description of the accompanying messages for more information. If the problem reoccurs, contact your IBM support center.

Module: DFHMQBP2

AMQL

Explanation: DFHMQCON issued a call to CICS enqueue domain to create an enqueue pool for use in later CICS-MQ adapter processing, but the call to enqueue domain failed.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Examine the trace in the dump to determine why the call failed. If the problem reoccurs, contact your IBM support center.

Module: DFHMQCON

AMQM

Explanation: DFHMQBP0 attempted to process a Link3270 Bridge request but received an unspecified error. This abend code is only ever issued within message DFHMQ0778.

System action: Input messages are backed out to the backout-requeue queue or dead-letter queue.

User response: Examine the CICS log immediately prior to the DFHMQ0778 message for further information on the type of error encountered. If the problem reoccurs, contact your IBM support center.

Module: DFHMQBP0

AMQN

Explanation: The Link3270 bridge has returned one or more bridge vectors. DFHMQBPO has detected that one of the bridge vector lengths is invalid.

System action: The transaction is abended. Input messages are backed out to the backout-queue or dead-letter queue.

User response: Check whether a transaction HANDLE ABEND routine has recovered from a 3270 Bridge abend and suppressed the abend. If this is the case the HANDLE ABEND routine should be coded to allow the 3270 Bridge abend to continue by reissuing the abend. If the problem reoccurs, contact your IBM support center.

Module: DFHMQBPO

AMSA

Explanation: An input data stream received from a 3270 begins with a set buffer address (SBA) order but is not followed by two 1-byte address fields. This is probably due to a hardware error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: It may be possible to bypass the problem by entering two spaces before the data to be entered.

If the problem persists, you need further assistance. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHMSP

AMSB

Explanation: An internal logic error has been detected in module DFHMSP.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Retry the CMSG transaction, specifying operands in a different order. If this fails, keep the dump and contact your IBM Support Center.

ANxx abend codes

ANQA

Explanation: An error has occurred obtaining a lock within the enqueue domain.

System action: The recovery routine of the module in control is invoked which issues message DFHNQ0002 with a system dump. DFHNQ0002 reports the module in control at the time of the error.

User response: See the description of message DFHNQ0002 for further guidance.

Module: DFHMSP

AMSC

Explanation: The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The task that first detected the purged condition will have provided an exception trace.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate why the task was purged. This is either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Module: DFHMSP

AMSD

Explanation: An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related error message produced by the domain that detected the original error.

Module: DFHMSP

Module: DFHNQED, DFHNQIB, DFHNQDQ, DFHNQST

ANQB

Explanation: An error has occurred releasing a lock within the enqueue domain.

System action: The recovery routine of the module in control is invoked. This routine issues message DFHNQ0002 with a system dump. DFHNQ0002 reports

ANQC • AOTB

the module in control at the time of the error.

User response: See the description of message DFHNQ0002 for further guidance.

Module: DFHNQED, DFHNQIB, DFHNQIQ, DFHNQST

ANQC

Explanation: An error has occurred obtaining a sysplex enqueue. The limit for the number of concurrent sysplex resource ENQ requests has been reached.

System action: Module DFHNQED issues message DFHNQ0103 and the task issuing the EXEC ENQ request is abended.

User response: See the description of message DFHNQ0103 for further guidance.

Module: DFHNQED

ANQD

Explanation: An error has occurred obtaining a sysplex enqueue. An unexpected environmental error has been detected.

System action: Module DFHNQED issues message DFHNQ0104 and the task issuing the EXEC ENQ request is abended.

User response: See the description of message DFHNQ0104 for further guidance.

Module: DFHNQED

ANQE

Explanation: An EXEC ENQ has been issued on a resource for which the enqmodel is either disabled or in the waiting state.

System action: Module DFHNQRN issues message DFHNQ0105 and the task issuing the EXEC ENQ request is abended.

User response: See the description of message DFHNQ0105 for further guidance.

AOxx abend codes

AOTA

Explanation: The OT domain resynchronization transaction CJTR has been started in an incorrect manner (for example, from a user terminal, or by a start request). This is not permitted.

System action: The task is abnormally terminated with a transaction dump.

User response: None. The OT domain resynchronization transaction must be started internally by CICS.

Module: DFHNQRN

ANQF

Explanation: An EXEC CICS ENQ request has been issued too early during transaction initialization, before a recoverable transaction environment has been established.

System action: The transaction is abnormally terminated.

User response: This error should only occur when an exit such as the 3270 Bridge Exit is executing. If the exit program is written in a high level language, the ENQ may have been issued by Language Environment.

Module: DFHEKC

ANSA

Explanation: An error has occurred obtaining the numberspace lock within the AP domain.

System action: The recovery routine of the module in control is invoked which issues message DFHAP0002 with a system dump. DFHAP0002 reports the module in control at the time of the error.

User response: See the description of message DFHAP0002 for further guidance.

Module: DFHBRNS

ANSB

Explanation: An error has occurred releasing a lock within the AP domain.

System action: The recovery routine of the module in control is invoked which issues message DFHAP0002 with a system dump. DFHAP0002 reports the module in control at the time of the error.

User response: See the description of message DFHAP0002 for further guidance.

Module: DFHBRNS

Module: DFHOTR

AOTB

Explanation: An unexpected error was encountered by the OT domain resynchronization transaction CJTR. The domain that detected the original error will have provided an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related message produced by the domain that detected the original error.

Module: DFHOTR

APxx abend codes

APC0

Explanation: A serious error occurred in a call to the program manager domain when trying to link a system program.

System action: CICS terminates the task with a transaction dump.

User response: Use the dump to investigate why the error occurred. Look at the trace records prior to the error for abnormal conditions in processing the PGLK domain call. This may be due to a problem with directory manager, loader, or storage manager. Check the program size. It may be necessary to increase the overall size limits of the DSAs or EDSAs.

Module: DFHEICRE, DFHEIDEF, DFHEIDEL, DFHEIINS, DFHPCP, DFHMCY

APC1

Explanation: A request for a TGT exceeding 64KB has been detected.

System action: CICS abnormally terminates the transaction and disables the installed program definition.

User response: Change the application program to reduce the working storage requirement. Perform CEMT NEWCOPY and ENABLE for the program when it has been corrected.

Module: DFHAPLI

APC2

Explanation: An illegal branch has been attempted by a Language Environment user program following an abend condition with an active handle label abend. Usually an Out-Of-Block GOTO will have resulted, implying that the program tried to branch to, for example, an inactive block.

System action: The transaction is abnormally terminated and the program is disabled.

User response: Use the dump and trace to determine the cause of the error and amend the GOTO in error.

Module: DFHAPLI

APC3

Explanation: An attempt to run the program has failed because CICS has identified the program as 'Language Environment enabled' but Language Environment support is not present in the system.

System action: The transaction is abnormally

terminated and the program is disabled.

User response: Refer to messages issued during CICS initialization to determine why Language Environment is not present in the system.

Module: DFHAPLI

APCF

Explanation: A CICS task has invoked a program which was defined as PL/I, but the program was not compiled with a supported PL/I compiler, or the program may not be written in the PL/I language.

System action: CICS terminates the task, and disables the program.

User response: Check that the program is PL/I. If the program is PL/I, recompile it with a Language Environment conforming compiler such as VisualAge PL/I for OS/390 in which case you may need to change the source program. If the program is not PL/I, redefine it correctly.

Module: DFHAPLI

APCG

Explanation: The transaction was purged either by master terminal actions or due to deadlock timeout actions as part of a request to the loader for a usable program copy. Deadlock timeout could be caused by a program whose size exceeds the available space in the DSAs or EDSAs.

System action: CICS terminates the task with a transaction dump.

User response: Use the dump to investigate why the transaction was purged. This may be due to waiting for loader resources or for program storage. Check the program size. It may be necessary to increase the overall size limits of the DSAs or EDSAs.

Module: DFHACP, DFHCRNP, DFHCRSP, DFHDBCT, DFHDBDSC, DFHEDFP, DFHEIP, DFHEICRE, DFHEIDEF, DFHEIDEL, DFHEIINS, DFHEIPSH, DFHEIQIR, DFHEIQSJ, DFHFICRP, DFHFEP, DFHICP, DFHKCQ, DFHMCP, DFHMCPE, DFHMCY, DFHMSP, DFHPCPG, DFHPHP, DFHPSIP, DFHPUP, DFHRDCAL, DFHRTC, DFHSI1, DFHSIJ1, DFHSPP, DFHSTP, DFHTACP, DFHTBSGB, DFHTCRP, DFHTDX, DFHTFP, DFHTSPA, DFHTSRP, DFHUSBP, DFHXRCP, DFHXRE, DFHXRSP, DFHZATA, DFHZATD, DFHZCPLN, DFHZGAI, DFHZQ00, DFHZNCA, DFHZOPA, DFHZXCU

APCH

Explanation: A request for a program which CICS has identified as VS COBOL II cannot be executed because either Language Environment is not active in this address space or Language Environment cannot provide support for the COBOL language.

System action: The transaction is abnormally terminated and the program is disabled.

User response: Ensure that the correct Language Environment support is present. Refer to messages issued during CICS initialization to determine why COBOL support is not present.

Module: DFHAPLI

APCI

Explanation: A request for a program which CICS as identified as an OS/PLI program cannot be executed because either Language Environment is not active in this address space or Language Environment cannot provide support for the PL/I language.

System action: The transaction is abnormally terminated and the program is disabled.

User response: Ensure that the correct Language Environment support is present. Refer to messages issued during CICS initialization to determine why PL/I support is not present.

Module: DFHAPLI

APCJ

Explanation: A request for a C/370 program could not be executed either because Language Environment was unable to recognize the program as having been compiled under the C/370 Compiler, or because the program was not link-edited with the attribute AMODE(31).

System action: The transaction is abnormally terminated and the program is disabled.

User response: Ensure that the program is link-edited with the attribute AMODE(31). If necessary, recompile the program with a Language Environment conforming compiler such as OS/390 C/C++.

Module: DFHAPLI

APCK

Explanation: A request for a C program could not be honored either because Language Environment is not active in this address space or because Language Environment cannot provide support for the C language.

System action: The transaction is terminated abnormally and the program is disabled.

User response: Ensure that the correct Language

Environment support is present. Refer to messages issued during CICS initialization to determine why C support is not present.

Module: DFHAPLI

APCL

Explanation: A request for a program which CICS has identified as enabled for Language Environment has failed because Language Environment is unable to execute the program.

System action: The transaction is abnormally terminated and the program is disabled.

User response: Ensure that the program has been compiled either with a Language Environment conforming compiler or with a compiler which is supported by Language Environment in compatibility mode. Refer to the Language Environment Migration Guide to verify this conformance.

If the compiler is supported, and the relevant language migration guides do not indicate any special actions, refer this problem to your installation systems programming facility.

Module: DFHAPLI

APCN

Explanation: An attempt to release an internal CICS program, a mapset, or a partitionset because the program, mapset or partitionset has not been loaded or has already been deleted. This is probably an internal CICS error.

System action: The transaction is abnormally terminated with a CICS transaction dump. The name of the program for which the RELEASE was attempted can be found in the abend dump at TCAPCPI.

User response: This is either an internal CICS error or is due to the overwriting of CICS internal control blocks. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHAMPEN, DFHFEP, DFHMCP, DFHMCPE, DFHMCY, DFHPHP, DFHTBSSP, DFHZCPLN

APCO

Explanation: A GETMAIN of storage for LEVEL 2 trace failed during transaction initialization.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: See the related message from the domain that detected the original error.

Module: DFHAPXM

APCS

Explanation: An attempt to run the program failed because CICS was unable to make a successful connection with Language Environment to determine the run-time characteristics of the program. This abend is accompanied by message DFHAP1200 which gives the reason code set by Language Environment indicating the nature of the error.

System action: The transaction is abnormally terminated and the program is disabled.

User response: Refer to the Language Environment *Debugging Guide and Runtime Messages* manual for the meaning of the reason code, and take whatever action is necessary to correct the error.

Module: DFHAPLI

APCT

Explanation: One of the following has occurred

1. The program name in the EXEC CICS HANDLE ABEND program is not usable at the time an abend occurs because
 - The program is not on the relocatable program library (RPL).
 - The program is disabled.
 - The program cannot be loaded.
2. An attempt to load a mapset or partitionset failed because although the program is defined to CICS
 - It is not available on the RPL, or
 - It is disabled, or
 - It cannot be autoinstalled.
3. An attempt to link to, load, or release an internal CICS program failed because
 - The program is not on the RPL.
 - The program is disabled.
 - The program cannot be loaded.

System action: The transaction requiring the program is abnormally terminated with a CICS transaction dump.

User response: In cases 1 and 2, define the program, mapset partitionset to CICS using CEDA and ensure it is enabled.

In case 3, the definition of a CICS-provided module is incorrect. Check for associated messages issued during CICS start up.

Problem determination: The trace preceding the abend indicates the program, mapset, or partitionset that could not be loaded, linked to, or released. The name is also in TCAPCEPI.

Module: DFHACP, DFHAMPEN, DFHCRSP, DFHEDFP, DFHEIP, DFHEICRE, DFHEIDEF, DFHEIDEL, DFHEIINS, DFHEIPSH, DFHEIQSJ, DFHFEP, DFHICP, DFHMCP, DFHMCPE, DFHMCY, DFHMELDE, DFHPCPG, DFHPHP, DFHPUP, DFHRDCAL, DFHSII1, DFHTBSGB, DFHTFP, DFHTSRP, DFHZCPLN, DFHZQ00, DFHZXCU

APCW

Explanation: The program language is defined as COBOL but the level of the compiler under which it is compiled cannot be determined. Most probably, the program was compiled under an OS/VS COBOL compiler but the required level of support for that compiler is not present in the system.

System action: The transaction is abnormally terminated and the program is disabled.

User response: The program source needs to be converted and compiled with a Language Environment conforming COBOL compiler such as Enterprise COBOL.

Module: DFHAPLI

APCY

Explanation: In an MVS/ESA environment, a CICS macro request has been issued from a PL/I or COBOL application. Alternatively, it is possible that the application program has been link edited without the EXEC interface module (for example, DFHECI or DFHELII) which is used by the CICS high-level language programming interface. See the *CICS System Definition Guide* for details of what has to be done to include this module.

System action: The transaction is abnormally terminated and the program is disabled.

User response: Remove the macro request from the application program.

Module: DFHAPLI

APCZ

Explanation: An attempt has been made to run either an 'old-style' application program (that is, a program with a pre-release 1.6 or a DFHE program stub), either having been link-edited with the RENT or REFR attributes. These types of programs are not reentrant and therefore cannot be loaded into read-only storage.

System action: The transaction is abnormally terminated.

User response: Relink the program without the RENT and REFR attributes.

Module: DFHAPLI

APGA

Explanation: An error has occurred obtaining a lock within the Program Manager domain.

System action: CICS abnormally terminates the task. CICS processing continues.

User response: Contact your local IBM support center for assistance.

APGB • APIH

Module: DFHPGAI, DFHPGAQ, DFHPGDD, DFHPGDM, DFHPGEX, DFHPGIS, DFHPGLD, DFHPGLE, DFHPGLK, DFHPGLU, DFHPGPG, DFHPGRE, DFHPGRP, DFHPGST, DFHPGUE, DFHPGXE, DFHPGXM

APGB

Explanation: An error has occurred releasing a lock within the Program Manager domain.

System action: CICS abnormally terminates the task. CICS processing continues.

User response: Contact your local IBM support center for assistance.

Module: DFHPGAI, DFHPGAQ, DFHPGDD, DFHPGDM, DFHPGEX, DFHPGIS, DFHPGLD, DFHPGLE, DFHPGLK, DFHPGLU, DFHPGPG, DFHPGRE, DFHPGRP, DFHPGST, DFHPGUE, DFHPGXE, DFHPGXM

APGC

Explanation: A transaction has tried to allocate an excessive amount of storage for containers. A transaction must not allocate more than 10% of the storage available for holding containers above the bar.

System action: CICS abnormally terminates the task. CICS processing continues.

User response: If the program is incorrect, correct it to allocate less container storage. If the program is correct, increase MEMLIMIT so that the program does not use more than 10% of the storage available.

Module: DFHPGCR

APIA

Explanation: The transaction id (CPIH) of the Pipeline Inbound HTTP router program has been initiated invalidly, probably by entering the id at a terminal. This transaction must only be initiated by CICS internal processes.

System action: The transaction is abnormally terminated.

User response: Do not initiate CPIH directly.

Module: DFHPIDSH

APIB

Explanation: The Pipeline HTTP outbound router program received an error response from the Pipeline Manager when it started the pipeline.

System action: The outbound router program is abnormally terminated.

User response: Examine the trace and associated

messages to determine why the Pipeline Manager failed to start successfully.

Module: DFHPIRT

APIC

Explanation: The Pipeline HTTP outbound router program received an error response from its attempt to do an EXEC CICS GET CONTAINER call to obtain the pipeline name from the DFHWS-PIPELINE container. Both a trace and message DFHPI0998 are issued and these will be an indication of what the error was. If the trace point id is '09DD'x then a CONTAINERERR was returned to DFHPIRT. A point id of '09DE'x indicates that a LENGERR was returned.

System action: The outbound router program is abnormally terminated.

User response: Examine the trace and associated messages to determine why the Pipeline failed to start successfully.

Module: DFHPIRT

APIG

Explanation: A provider mode Web service invocation has failed. This may be due to a problem whilst processing a SOAP request message or generating a SOAP response message.

System action: CICS abends the transaction and a SOAP Fault message is sent to the requester.

User response: Examine the CICS trace for exception traces issued from DFHPITL. These will identify the source of the failure. If validation is currently disabled for the failing WEBSERVICE then consider enabling it and reproduce the problem. This causes CICS to call a Java based program to validate the SOAP message against the WSDL for the WEBSERVICE. If the SOAP message is malformed then a message will be issued to describe the problem in more detail.

Module: DFHPITP

APIH

Explanation: The transaction id (CPIL) of the Pipeline MQ Listener program has been initiated invalidly, probably by entering the id at a terminal. This transaction must only be initiated by being triggered by an inbound Websphere MQ message.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Do not initiate CPIL directly.

Module: DFHPILSQ

APII

Explanation: An attempt has been made to use Websphere MQ as the transport for CICS Web Services, but the Websphere MQ stub CSQCSTUB could not be loaded during CICS Initialisation. The Websphere MQ library CSQCLOAD needs to be included in the DFHRPL concatenation to permit use of Websphere MQ as a transport for CICS Web Services

System action: The attempt to use Websphere MQ as a transport for CICS Web Services has been rejected. Any further such attempts will also be rejected.

Message DFHAP0900 is produced.

The task is abnormally terminated with a CICS transaction dump.

User response: The Websphere MQ library CSQCLOAD must be included in the DFHRPL concatenation to allow use of Websphere MQ as a transport for CICS Web Services. This is in addition to the other Websphere MQ libraries needed for MQ support in CICS.

Module: DFHPILSQ

APIJ

Explanation: A Websphere MQ function call issued by transaction CPIL was unsuccessful and has set a non-zero reason code. The transaction CPIL is used to start a PIPELINE for a message received from Websphere MQ.

System action: Message DFHPI0111 is produced, which includes the Websphere MQ reason code. The task is abnormally terminated with a CICS transaction dump.

User response: Check the Websphere MQ reason code in the MQ Messages and Codes manual, and examine the trace to determine why the MQ function call failed. You may need help from IBM to resolve this problem.

Module: DFHPILSQ

APIK

Explanation: The CICS supplied SOAP Handler received an unexpected response from another module.

System action: CICS attempts to run the pipeline in an error mode. No dump is taken.

User response: Examine the CICS joblog for associated messages.

Module: DFHPISN

APIL

Explanation: The CICS supplied SOAP Handler has failed with a disaster response.

System action: CICS attempts to run the pipeline in an error mode. A dump is taken.

User response: Keep the dump and contact your IBM Support Center.

Module: DFHPISN

APIM

Explanation: The transaction id (CPIQ) of the Pipeline Inbound MQ router program has been initiated invalidly, probably by entering the id at a terminal. This transaction must only be initiated by CICS internal processes.

System action: The transaction is abnormally terminated.

User response: Do not initiate CPIQ directly.

Module: DFHPIDSQ

APIN

Explanation: The Web Services Atomic Transaction (WS-AT) handler has detected a problem. The transaction id (CPIS) of the Pipeline WSAT resync program has been initiated invalidly, probably by entering the id at a terminal. This transaction must only be initiated by CICS internal processes.

System action: The transaction is abnormally terminated.

User response: Do not initiate CPIS directly.

Module: DFHPIR

APIO

Explanation: The Web Services Atomic Transaction (WS-AT) handler has detected a problem. The WSAT Registration Services program has encountered an error, which has prevented it from completing the processing of a registration or 2PC protocol request. The program is abnormally terminated.

User response: Examine the trace and associated messages to determine why the Registration Services program has failed.

Module: DFHPIRS

APIP

Explanation: The Web Services Atomic Transaction (WS-AT) handler has detected a problem. The WSAT Coordination Context header handler program has encountered an unrecoverable error, which has prevented it from successfully creating or processing a

APIQ • APL5

coordination context. The program is abnormally terminated.

User response: Examine the trace and associated messages to determine why the Coordination Services program has failed.

Module: DFHWSATH

APIQ

Explanation: The Web Services Atomic Transaction (WS-AT) handler has detected a problem. The WSAT application handler program has encountered an unrecoverable error, which has prevented it from creating or processing a registration message or a protocol message. The program is abnormally terminated.

User response: Examine the trace and associated messages to determine why the Registration/Protocol Services program has failed.

Module: DFHWSATX.

APIR

Explanation: The Web Services Atomic Transaction (WS-AT) handler has detected a problem. The WSAT application handler program has encountered an attempt to use one-way messages in a WS-AT message. This combination is not permitted in WS-AT. The program is abnormally terminated.

User response: Examine the trace and associated messages to determine which messages are at fault.

Module: DFHWSATH.

APIS

Explanation: CICS detected an error during transaction initialization for a Web services task.

System action: The transaction is abnormally terminated.

User response: Examine the trace to determine the root cause of this problem.

Module: DFHPIXM.

APIT

Explanation: The Web Services Atomic Transaction (WS-AT) handler has detected a problem. The attempt to resynchronize outstanding units of work has failed.

System action: The transaction is abnormally terminated.

User response: Investigate why the UOWs cannot be resynchronized.

Module: DFHPIR

APIU

Explanation: The Pipeline MQ Listener program has encountered an attempt to parse a target URI that is longer than 255 bytes. The maximum length of a target URI in the RFH2 header is expected to be 255 bytes.

System action: The program is abnormally terminated.

User response: Examine the trace and associated messages to determine which messages are at fault.

Module: DFHPILSQ

APP1

Explanation: The DFHIC TYPE=GET response code was not a normal response.

System action: The transaction is abnormally terminated with a CICS transaction :i1.DFHP3270 abend codes dump.

User response: Analyze the dump. The response code is in the low-order byte of register 0.

Module: DFHP3270

APP2

Explanation: The length of data that has been passed to DFHP3270 via temporary storage is less than or equal to 5.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Check the user DFHTEP. If it is not at fault, submit an APAR.

If this abend has occurred, the data that DFHP3270 obtained from temporary storage was probably put there with an incorrect length. The user may have requested indirectly that this data be placed in temporary storage either by an application request for printing (for example ISSUE PRINT) or by pressing the Print Request key. However, CICS should control the data length for this request. Under normal circumstances, the only way the user could have requested directly that data is to be placed in temporary storage is in the user's TEP. The user should check any invocations of DFHIC TYPE=PUT in handling print requests, particularly when dealing with the "printer unavailable or busy" condition, and ensure that the length field is set correctly.

Problem determination: Register 6 points to the data retrieved from temporary storage via a DFHIC TYPE=GET macro invocation. The layout of this data is

- Terminal data area length (2 bytes)
- Write control indicator (1 byte)
- Write control or carriage control character (1 byte)
- Data (variable length)

Analysis: DFHP3270 has been called to handle a print request from a 3270 Information Display System terminal. It obtains from temporary storage the data to be printed, via a DFHIC TYPE=GET invocation. It ensures that some data to be printed is present. The area returned from temporary storage contains the data to be printed preceded by 4 bytes as described above. DFHP3270 has found that, because the length of data passed to it is less than or equal to 5, there is no data to be printed.

Module: DFHP3270

APP3

Explanation: An attempt to request data has been sent to a nonprinter or unsupported device type by either

- A terminal operator entering CSPP as a transaction code, **or**
- A transaction issuing a DFHTEP request.

System action: The transaction is abnormally terminated. A CICS transaction dump **is not** provided.

User response:

1. Ensure that the terminal operator ceases to use CSPP as a transaction code, or
2. Correct the user DFHTEP program.

Module: DFHP3270

APR1

Explanation: An abnormal DFHIC TYPE=PUT response code was received during print key processing.

System action: The transaction is abnormally terminated with a CICS transaction dump. The keyboard of the terminal on which the print key was depressed remains locked to indicate the failure of the operation.

User response: Analyze the dump. The response code is in low-order byte of register 0.

Module: DFHPRK

APSJ

Explanation: The abending transaction invoked the system spooler initialization program (DFHPSIP) illegally, that is from a program other than the CICS module, DFHSIJ1.

System action: CICS terminates the transaction abnormally. The EXEC CICS HANDLE ABEND command can not handle this abend.

User response: Remove any calls or links to DFHPSIP from your application programs. If you can find no invocation of DFHPSIP in your application, you need further assistance to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHPSIP

APST

Explanation: A task issued a SPOOL command without the mandatory NOHANDLE operand.

System action: CICS terminates the task abnormally with a dump.

User response: Correct the syntax of the command, specifying NOHANDLE.

Module: DFHEPS

APSU

Explanation: The CICS SVC passed an invalid JES interface return code to the CICS system spooler (an MVS subtask).

System action: CICS terminates the task abnormally.

User response: This is an internal error – check any JES failures that occurred at the same time.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHPSPST

APSV

Explanation: A storage area for VSAM macro return codes contained an invalid value.

System action: CICS terminates the task abnormally with a dump.

User response: Check the syntax and input data of the spool commands issued by the failing transaction. Check any JES failures that occurred at the same time.

Module: DFHSPST

APSW

Explanation: An abend occurred within a CICS system spooler subtask.

System action: CICS terminates the task abnormally with a dump.

User response: This is an internal CICS error. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHSPST

APSX

Explanation: A CICS storage area used for notification of invalid parameters contained an invalid value.

System action: CICS terminates the task abnormally with a dump.

User response: Check the syntax and input data of the spool commands issued by the failing transaction. Check any JES failures that occurred at the same time.

Module: DFHSPST

APSY

Explanation: A CICS storage area for MVS macro return codes contained an invalid value.

System action: CICS terminates the task abnormally with a dump.

User response: Check the syntax and input data of the spool commands issued by the failing transaction. Check any JES failures that occurred at the same time.

Module: DFHSPST

APSZ

Explanation: A CICS area, used to store a JES interface return code, contained an invalid value.

System action: CICS terminates the task abnormally with a dump.

User response: Check the syntax and input data of the spool commands issued by the failing transaction.

Check any JES failures that occurred at the same time.

This is an internal CICS error. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHSPST

APTI

Explanation: The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The domain that first detected the purged condition will have provided an exception trace.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate why the task was purged. It was purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Module: DFHSPST

APTJ

Explanation: An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error will have provided an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related message from the domain that detected the original error.

Module: DFHSPST

APUA

Explanation: An internal error was detected when module DFHPUP was invoked. The GETSTG parameter is missing on a call to DFHPUP (PUPF).

System action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHPUP

APUB

Explanation: An internal error was detected when module DFHPUP was invoked. The GETSTG parameter is missing on a call to DFHPUP (PUPU).

System action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHPUP

APUC

Explanation: An internal error was detected when module DFHPUP was invoked. An invalid function code was supplied for a domain call to DFHPUP.

System action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHPUP

APUD

Explanation: The RDO language definition table (DFHEITSP) could not be located in the library.

System action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User response: Ensure that module DFHEITSP is in

the library and is valid for this release of CICS.

Module: DFHPUP

APUE

Explanation: The RDO language definition table (DFHEITSP) could not be loaded because of a lack of available storage.

System action: Processing is abnormally terminated with an operating system dump.

User response: Allocate more storage and resubmit the offline COPY or APPEND command(s) that failed.

Module: DFHPUP (Batch environment)

APUF

Explanation: Either the RDO language definition table is invalid or it is missing from the library.

System action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User response: Ensure that module DFHEITSP is in the library and is valid for this release of CICS.

Module: DFHPUP

APUG

Explanation: An internal error was detected in module DFHPUP. Storage could not be obtained for the CSD record buffer.

System action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHPUP

APUH

Explanation: An internal error was detected in module DFHPUP. Storage could not be obtained for the argument list.

System action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem*

APUI • APUP

Determination Guide for guidance on how to proceed.

Module: DFHPUP

APUI

Explanation: An internal error was detected in module DFHPUP. Storage cannot be freed for the argument list.

System action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHPUP

APUJ

Explanation: An internal error was detected in module DFHPUP. Storage cannot be freed for the CSD record buffer.

System action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHPUP

APUK

Explanation:

- In a CICS environment, storage could not be acquired for a buffer to contain logged RDO commands in the CEDA transaction.
- In a batch environment, storage could not be acquired for a buffer to contain back-translated resource definitions from the CSD.

System action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHPUP

APUL

Explanation: APUO.

CICS cannot find a match for a function code in the language definition table, because the parameterized resource definition contains an unrecognized resource type code.

The abend code issued depends on the DFHPUP operation that was invoked before the error occurred

Abend DFHPUP operation

APUL FLATTEN
APUM TRANCASE
APUN COMPARE
APUO BACKTRANS

The cause of the abend is either

1. A language definition table (DFHEITSP or DFHEITCU) in the library is invalid for the CICS release you are running, **or**
2. A CICS logic error has occurred.

System action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User response: Your response depends on which of the two possible reasons apply

1. Ensure that the DFHEITSP and DFHEITCU modules in the library are valid for this release of CICS.
2. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHPUP

APUM

Explanation: Refer to the description of abend APUL.

Module: DFHPUP

APUN

Explanation: Refer to the description of abend APUL.

Module: DFHPUP

APUO

Explanation: Refer to the description of abend APUL.

Module: DFHPUP

APUP

Explanation: An internal error occurred in DFHPUP processing of the language definition table for RDO. There was a stack error building a keyword list for the syntax tree.

System action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHPUP

APUQ

Explanation: An internal error occurred in DFHPUP processing of the language definition table for RDO. Too many keywords found in syntax expansion.

System action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHPUP

APUR

Explanation: An internal error occurred in DFHPUP processing of an argument list or a CSD record buffer. The data type for a keyword field conflicts with the data type specified in the language definition table.

System action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User response: Ensure that the module DFHEITSP is in the library and is valid for this release of CICS.

Module: DFHPUP

APUS

Explanation: An internal error occurred in DFHPUP processing of a CSD record buffer. The integer data length for a keyword field is invalid.

System action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User response: Ensure that the module DFHEITSP is in the library and is valid for this release of CICS.

Module: DFHPUP

APUT

Explanation: An internal error occurred in DFHPUP processing of an argument list or a CSD record buffer. The keyword existence bit number, which is the KEP(1) value in language definition table DFHEITSP, is not valid.

System action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User response: Ensure that the module DFHEITSP is in the library and is valid for this release of CICS.

Module: DFHPUP

*-----

APUZ

Explanation: CICS has found an unrecognized resource type code in a CSD record. The unrecognized code does not match any of the function codes in the language definition table. This abend can occur for one of the following reasons

1. You are using a CICS release that does not support a type of definition that was created on the CSD file by a later CICS release.
2. The language definition table (DFHEITSP or DFHEITCU) is invalid for this CICS release.
3. The CSD manager (DFHDMP) has passed an invalid CSD record buffer to DFHPUP. This is a CICS internal logic error.

System action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump
- In a batch environment, processing is abnormally terminated with an operating system dump.

User response: Determine which of the possible reasons caused the error. If you can eliminate reasons 1 and 2, you can assume that reason 3 applies.

Take action corresponding to the reason you have established as follows

1. Avoid operations on groups containing definition-types that are unsupported by the CICS release you are running.
2. Ensure that the library contains versions of DFHEITSP and DFHEITCU that are valid for the CICS release you are running.
3. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHPUP

APXA

Explanation: The user transaction's profile could not be found.

System action: The task is abnormally terminated with a CICS transaction dump. The user transaction is not started.

User response: Check that the profile name in the user transaction definition is correct, and that this profile has been defined.

Module: DFHAPXM

ARxx abend codes

ARCB

Explanation: CICS has attempted to enable a task-related user exit, or a global user exit during initialization, but failed because the exit program could not be found.

On all types of start, CICS attempts to enable DFHEDP, the EXEC DLI task-related user exit. On an emergency restart, CICS enables transaction backout exit programs as specified by the first two TBEXITS system initialization parameters.

On all types of start, CICS attempts to enable file control backout programs as specified by the third, fourth, fifth and sixth TBEXITS system initialization parameters.

System action: CICS issues a message to the console indicating which exit program is involved. CICS initialization then terminates abnormally with a system dump.

User response: If the associated message indicates that program DFHEDP could not be found, check that IBM-supplied group DFHEDP is included in the group list used at CICS cold or initial start time.

For transaction backout exit programs, including the file control backout programs, ensure the program has been defined and is in a library available to CICS.

If necessary, use the dump to find out why the exit program could not be enabled.

Module: DFHRCEX

Module: DFHCPIR

ARHB

Explanation: The SAA resource recovery interface has been invoked with an invalid number of parameters for the call.

System action: the transaction is abnormally terminated with a CICS transaction dump.

User response: The exception trace point produced with this abend contains the SAA resource recovery verb name that was issued incorrectly. Use this to determine where the application program was in error and amend application program accordingly. The *SAA Resource Recovery Reference Manual*, SC31-6821, provides a detailed description of the SAA resource recovery verbs and how they should be called.

Module: DFHCPIR

ARHC

Explanation: The SAA resource recovery interface has detected an unexpected return code from the syncpoint program. This is a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: A level 2 trace for "CP" of the transaction shows the course of events before this error occurred (such as the modules called and their parameters) plus details of the error itself. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCPIR

ARHA

Explanation: The SAA resource recovery interface has been invoked with an invalid first parameter. The first parameter should be the code of the function to be performed. This is a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: A level 2 trace for "CP" of the transaction shows the course of events before this error occurred (such as the modules called and their parameters) plus details of the error itself. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

ARMO

Explanation: An attempt was made to attach a transaction specifying DFHRMXN3 as the program to be given control, but the transaction was not internally attached by CICS.

DFHRMXN3 is for use by CICS system transaction CSKP. This provides support for activity keypoints,

System action: The transaction is abnormally terminated. CICS processing continues.

User response: Establish why an attempt was made to attach CSKP incorrectly, or why a transaction definition specified DFHRMXN3 as the program to be given control.

Module: DFHRMXN3

ARP2

Explanation: The server controller detected an internal error during CICS ONC RPC enable processing.

System action: One of the following messages is issued: DFHRP0508, DFHRP0509, DFHRP0528, DFHRP0529, DFHRP0590, DFHRP0591.

User response: See the user response for the message.

Module: DFHRPMS

ARP4

Explanation: The server controller has performed an exception disable because of an internal error.

System action: One of the following messages is issued: DFHRP0503, DFHRP0559, DFHRP0697, DFHRP0726, DFHRP0728, DFHRP0730, DFHRP0741.

User response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHRPMS

ARP5

Explanation: An invalid attempt was made to start the server controller.

System action: The following message is issued: DFHRP0640.

User response: See the user response for the message.

Module: DFHRPMS

ARP9

Explanation: There was not enough storage for the connection manager.

System action: None.

User response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHRPC01

ARPA

Explanation: An unexpected response from DFHSUSN has occurred when trying to sign off a user of the CRTE transaction in the target system when processing a CANCEL request.

This abend can be caused by incorrect use of the VTAM VARY INACT command. Otherwise it indicates that there may be an error in CICS.

System action: The CSSF transaction (CRTE cancel processor transaction) is terminated with an ARPA abend.

User response: Ensure that the VTAM VARY inact command is used correctly. If this is not the cause of the abend, you need further assistance from IBM to correct this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHRTC

ARPF

Explanation: The alias could not be initialized.

System action: One of the following messages is issued: DFHRP0103, DFHRP0104, DFHRP0106, DFHRP0108, DFHRP0109.

User response: See the user response for the message.

Module: DFHRPAS

ARPG

Explanation: The alias was not able to link to the CICS program or the **Encode** function of the converter one of the following reasons:

- The userid supplied for the alias was not valid.
- The CICS program is not defined as a resource to the external security manager.
- The CICS program name is not valid.
- The CICS program was on a different system from CICS ONC RPC, and the specified system name was not valid.
- The converter program name was not valid.
- The converter program is defined as remote.
- The alias is not authorized to use the converter

System action: One of the following messages is issued: DFHRP0121, DFHRP0131, DFHRP0138, DFHRP0139, DFHRP0141, DFHRP0156, DFHRP0157, DFHRP0159.

User response: See the user response for the message.

Module: DFHRPAS

ARPH • ARPU

ARPH

Explanation: The alias detected a global work area error.

System action: The following message is issued: DFHRP0118.

User response: See the user response for the message.

Module: DFHRPAS

ARPI

Explanation: The alias detected a logic error.

System action: One of the following messages is issued: DFHRP0107, DFHRP0133, DFHRP0135, DFHRP0137, DFHRP0143, DFHRP0144, DFHRP0148, DFHRP0149, DFHRP0155, DFHRP0164, DFHRP0168, DFHRP0170.

User response: See the user response for the message.

Module: DFHRPAS

ARPJ

Explanation: The alias ends for one of the following reasons:

- An unexpected response was received from CICS during transaction initialization.
- The external security manager is no longer available.
- The remote CICS region in which the CICS program was running abended.
- The CICS program, which was running in a remote CICS region, abended.
- The reply could not be sent to the client.

System action: One of the following messages is issued: DFHRP0105, DFHRP0132, DFHRP0136, DFHRP0140, DFHRP0145, DFHRP0146, DFHRP0147, DFHRP0150, DFHRP0165, DFHRP0166, DFHRP0167.

User response: See the user response for the message.

Module: DFHRPAS

ARPK

Explanation: The alias detected a CICS logic error.

System action: One of the following messages is issued: DFHRP0102, DFHRP0122, DFHRP0142, DFHRP0160.

User response: See the user response for the message.

Module: DFHRPAS

ARPL

Explanation: The alias detected an authorization error.

System action: One of the following messages is issued: DFHRP0119, DFHRP0120, DFHRP0132, DFHRP0134.

User response: See the user response for the message.

Module: DFHRPAS

ARPM

Explanation: The alias detected an error in user code.

System action: One of the following messages is issued: DFHRP0161, DFHRP0162, DFHRP0163, DFHRP0169.

User response: See the user response for the message.

Module: DFHRPAS

ARPN

Explanation: The alias detected an error while trying to switch TCBs.

System action: The following message is issued: DFHRP0151.

User response: See the user response for the message.

Module: DFHRPAS

ARPO

Explanation: The alias program detected an abend.

System action: One of the following messages is issued: DFHRP0181, DFHRP0182, DFHRP0183.

User response: See the user response for the message.

Module: DFHRPAS

ARPU

Explanation: The connection manager could not access the CICS ONC RPC data set, and received an error response when it tried to send message DFHRP1512.

System action: None.

User response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHRPC01

ARPV

Explanation: The connection manager received an unexpected response from CICS following an EXEC CICS command.

System action: One of the following messages is issued: DFHRP1540, DFHRP1651, DFHRP1954.

User response: See the user response for the message.

Module: DFHRPC0E

ARPW

Explanation: The connection manager received an unexpected response from CICS following an EXEC CICS command.

System action: The following message is issued: DFHRP1969.

User response: See the user response for the message.

Module: DFHRPC0E

ARPX

Explanation: The connection manager was started against an invalid terminal.

System action: The following message is issued: DFHRP1522.

User response: See the user response for the message.

Module: DFHRPC01

ARPZ

Explanation: The connection manager has insufficient authority.

System action: The following message is issued: DFHRP1902.

User response: See the user response for the message.

Module: DFHRPC0B

ARTA

Explanation: The task does not own a terminal as its principal facility.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Ensure that DFHRTE has not been specified as the program for a task other than CRTE. Ensure that CRTE has not been initiated by means other than terminal input.

Module: DFHRTE

ARTB

Explanation: There is no input TIOA or the data length is zero.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Ensure that DFHRTE has not been specified as the program for a task other than CRTE. Ensure that CRTE has not been initiated by means other than terminal input.

Module: DFHRTE

ARTC

Explanation: The link to the required system is not usable for an unknown reason.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHRTE

ARTD

Explanation: An internal logic error has been detected.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHRTE

ARTE

Explanation: An error was encountered when attempting to read from or write to temporary storage.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Determine the cause of the temporary storage problem and correct it.

Module: DFHRTE

ARTF

Explanation: An attempt has been made to use the routing transaction (CRTE) from a terminal that has a permanent transaction code set.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Inform the system programmer.

Module: DFHRTE

ARTG

Explanation: CICS could not find the profile specified for a transaction being routed.

System action: CICS terminates the task abnormally with a dump.

User response: Check your transaction and profile definitions.

Module: DFHRTE

ARTH

Explanation: An error (INVALID, DISASTER or EXCEPTION response) has occurred on a call to schedule a remote terminal delete by DFHRTE during sign-off for a surrogate terminal session running CRTE. The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System action: CICS terminates the task abnormally with a dump.

User response: See the related message produced by the domain that detected the original error.

Module: DFHRTE

ARUA

Explanation: An exception condition was returned on the ADD_LINK during the BIND phase of ATTACH for the transaction invoked by the RUN command.

System action: CICS terminates the invoked transaction abnormally with a dump. The RUN SYNCHRONOUS command that was issued by the application returns with an error response of INVREQ (RESP2 28).

User response: More details can be found in the trace.

Module: DFHXMRU

ARUB

Explanation: A RUN SYNCHRONOUS command caused an attempt to attach a transaction defined as remote. Only transactions defined as local may be run synchronously.

System action: CICS terminates the invoked transaction abnormally with a dump. The RUN SYNCHRONOUS command that was issued by the application returns with an error response of ACTIVITYERR or PROCESSERR (RESP2 27).

User response: More details can be found in the trace.

Module: DFHXMXM

ARUC

Explanation: A RUN SYNCHRONOUS command caused an attempt to attach a transaction with an invalid USERID.

System action: CICS terminates the invoked transaction abnormally with a dump. The RUN SYNCHRONOUS command that was issued by the application returns with a resp2 value of 27.

User response: More details can be found in the trace.

Module: DFHXMRU

ARXA

Explanation: A transactional EXCI request has been received from a batch region. CICS has encountered an error when attempting to express interest in an RRMS Unit of Recovery.

DFHRXUW provides an exception trace, console message DFHRX0002, and possibly a system dump (depending on the options in the dump table).

System action: The transaction is terminated with a CICS transaction dump.

User response: Resource Recovery Services (RRS) may have been shut down after the request was received by CICS. If this is the case, retry the EXCI request once RRS has been restarted.

If this is not the case, use the exception trace provided by the RX domain to determine the reason for the failure. You might need further assistance from IBM in this situation. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHRXUW

ARXB

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR or PURGED) has occurred on an ADD_LINK call to the recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHRXUW provides an exception trace, console message DFHRX0002, and possibly a system dump (depending on the options in the dump table).

System action: The transaction is terminated with a CICS transaction dump.

User response: See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHRXUW

ARXC

Explanation: A transactional EXCI request has been received from a batch region when either

- CICS did not register as a resource manager with Recoverable Resource Management Services (RRMS) because system initialization parameter RRMS=NO was specified.
- the RX domain did not successfully complete its initialization.

System action: The transaction is terminated with a CICS transaction dump.

User response: If CICS was started with system initialization parameter RRMS=NO, restart CICS specifying RRMS=YES (or route transactional EXCI requests to another CICS system).

Otherwise, investigate why the RX domain did not initialize successfully. A failure during initialization of the domain is accompanied by a console message and a system dump. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHRXUW

ARZ2

Explanation: An attempt to service a GIOP request failed during task attach due to required resources being unobtainable, or missing information from request data.

System action: The request fails and the task is abnormally terminated with abend code ARZ2. CICS takes a transaction dump, unless module DFHDUIO is not loaded.

User response: Use the transaction dump to determine the cause of the failure. For further assistance, or if module DFHDUIO is not loaded and no transaction dump is available, contact your system programmer.

Module: DFHRZXM

ARZ3

Explanation: An attempt to service a GIOP request failed during task attach due to required resources being unobtainable, or missing information from request data.

System action: The request fails and the task is abnormally terminated with abend code ARZ3. CICS takes a transaction dump, unless module DFHDUIO is not loaded.

User response: Use the transaction dump to determine the cause of the failure. For further assistance, or if module DFHDUIO is not loaded and no transaction dump is available, contact your system programmer.

Module: DFHRZIX, DFHRZTCX

ARZ4

Explanation: An attempt to service a GIOP request failed during task attach due to required resources being unobtainable, or missing information from request data.

System action: The request fails and the task is abnormally terminated with abend code ARZ4. CICS takes a transaction dump, unless module DFHDUIO is not loaded.

User response: Use the transaction dump to determine the cause of the failure. For further assistance, or if module DFHDUIO is not loaded and no transaction dump is available, contact your system programmer.

Module: DFHRZRM, DFHRZSO1

ARZ5

Explanation: The target request stream task detected that the source task was no longer active. The target task is unable to process the request it was attached for.

System action: The request fails and the task is abnormally terminated with abend code ARZ5. CICS takes a transaction dump, unless module DFHDUIO is not loaded.

User response: Investigate why the source task has terminated before this target began initialization. There might be relevant messages in the CICS log. Otherwise a CICS trace or system dump will be required to identify the problem. One possible cause is that the source task was timed out and purged before the target task started.

Module: DFHRZXM

ARZE

Explanation: A command has failed due to a serious failure in a CICS component (resource manager).

System action: The transaction is abnormally terminated with abend code ARZE. CICS takes a transaction dump, unless module DFHDUIO is not loaded.

User response: Use the transaction dump to determine the cause of the failure. For further assistance, or if module DFHDUIO is not loaded and no transaction dump is available, contact your system programmer.

Module: DFHRZLN, DFHRZRM, DFHRZSO, DFHRZSO1, DFHRZTA, DFHRZXM

ARZF • ASCP

ARZF

Explanation: A command has failed due to a serious failure in a CICS component (resource manager).

System action: The transaction is abnormally terminated with abend code ARZF. CICS takes a transaction dump, unless module DFHDUIO is not loaded.

User response: Use the transaction dump to determine the cause of the failure. For further assistance, or if module DFHDUIO is not loaded and no transaction dump is available, contact your system programmer.

Module: DFHRZLN, DFHRZRM, DFHRZSO, DFHRZSO1, DFHRZTA, DFHRZXM

ARZI

Explanation: A command has failed due to a serious failure in a CICS component (resource manager).

System action: The transaction is abnormally terminated with abend code ARZI. CICS takes a transaction dump, unless module DFHDUIO is not loaded.

ASxx abend codes

ASCA

Explanation: A DFHSC TYPE=GETMAIN request has resulted in a call to the storage manager (SM) domain which has returned an INVALID or DISASTER response.

System action: The transaction is terminated with a CICS transaction dump.

User response: There has been an earlier failure which led to the response from the storage manager domain. Investigate the earlier failure (which is accompanied by a console message and a system dump).

Module: DFHSMSCP

ASCB

Explanation: A DFHSC TYPE=FREEMAIN request has resulted in a call to the storage manager (SM) domain which has returned an INVALID or DISASTER response.

System action: The transaction is terminated with a CICS transaction dump.

User response: There has been an earlier failure which led to the response from the storage manager domain. Investigate the earlier failure (which is accompanied by a console message and a system dump).

Module: DFHSMSCP

User response: Use the transaction dump to determine the cause of the failure. For further assistance, or if module DFHDUIO is not loaded and no transaction dump is available, contact your system programmer.

Module: DFHRZLN, DFHRZRM, DFHRZSO, DFHRZSO1, DFHRZTA, DFHRZXM

ARZJ

Explanation: A command has failed due to a serious failure in a CICS component (resource manager).

System action: The transaction is abnormally terminated with abend code ARZJ. CICS takes a transaction dump, unless module DFHDUIO is not loaded.

User response: Use the transaction dump to determine the cause of the failure. For further assistance, or if module DFHDUIO is not loaded and no transaction dump is available, contact your system programmer.

Module: DFHRZLN, DFHRZRM, DFHRZSO, DFHRZSO1, DFHRZTA, DFHRZXM

ASCP

Explanation: A task which has issued an unconditional DFHSC TYPE=GETMAIN request has been purged while waiting for sufficient contiguous main storage to become free.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate why the task was purged. This will either have been as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the task was purged by the master terminal operator then this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded then this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased then the number of tasks in the system should be reduced to avoid short-on-storage situations. Another possibility would be to increase the value of the DTIMOUT option for the transaction.

Module: DFHSMSCP

ASCR

Explanation: A DFHSC macro request has been issued with an invalid request type.

System action: The transaction is terminated with a CICS transaction dump.

Detection of the invalid request by DFHSMSCP causes a console message and a system dump to be produced.

User response: Use the associated console message and system dump to investigate the problem.

Module: DFHSMSCP

ASDA

Explanation: The default shutdown transaction (CESD) has been started directly from a terminal. This is not permitted. This transaction can only be started internally by CICS.

System action: The transaction is abnormally terminated with a transaction dump.

User response: None.

Module: DFHCESD

ASFA

Explanation: An internal logic error occurred in DFHSFP because of an unexpected response from EXEC CICS. This abend code is usually accompanied by message DFHCE3598 which contains the associated return codes.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHSFP

ASFB

Explanation: An attempt was made to execute the CICS signoff program without an associated terminal.

System action: CICS terminates the transaction with a dump. This abend code is usually accompanied by message DFHCE3598.

User response: Only use the signoff program when there is a related terminal.

Module: DFHSFP

ASFC

Explanation: An attempt was made to execute the CICS signoff program against an APPC session.

System action: CICS terminates the transaction with

a dump. This abend code is usually accompanied by message DFHCE3598.

User response: Only use the signoff program when there is a related terminal.

Module: DFHSFP

ASH2

Explanation: An attempt to service a Scheduler Services request failed due to required resources being unobtainable. This may result in a request being unserviceable or an Activity being marked abended depending on the nature of the failure.

System action: The transaction is abnormally terminated with abend code ASH2. CICS takes a transaction dump, unless module DFHDUIO is not loaded.

User response: Check that any required links between regions are available. Check the Distributed Routing Program name is correct and the program is usable. Use the transaction dump to determine the cause of the failure. For further assistance, or if module DFHDUIO is not loaded and no transaction dump is available, contact your system programmer.

Module: DFHSHXM

ASH3

Explanation: A transaction bound to a Scheduler Services request has backed out. No other abend code has been set. The SH abend request uses this abend code by default.

System action: The transaction continues backing out. A subsequent task will process the SH abend request.

User response: None.

Module: DFHSHRM

ASH4

Explanation: A Scheduler Services request attempted to attach a transaction that is currently disabled.

System action: The transaction is abnormally terminated with abend code ASH4. CICS takes a transaction dump, unless module DFHDUIO is not loaded.

User response: Check the status of the transaction. For further assistance, or if module DFHDUIO is not loaded and no transaction dump is available, contact your system programmer.

Module: DFHSHXM

ASHA

Explanation: A command has failed due to a serious failure in a CICS component (resource manager).

System action: The transaction is abnormally terminated with abend code ASHA. CICS takes a transaction dump, unless module DFHDUIO is not loaded.

User response: Use the transaction dump to determine the cause of the failure. For further assistance, or if module DFHDUIO is not loaded and no transaction dump is available, contact your system programmer.

Module: DFHSHDM

ASHB

Explanation: A command has failed due to a serious failure in a CICS component (resource manager).

System action: The transaction is abnormally terminated with abend code ASHB. CICS takes a transaction dump, unless module DFHDUIO is not loaded.

User response: Use the transaction dump to determine the cause of the failure. For further assistance, or if module DFHDUIO is not loaded and no transaction dump is available, contact your system programmer.

Module: DFHSHDM

ASHR

Explanation: A command has failed due to a serious failure in a CICS component (resource manager).

System action: The transaction is abnormally terminated with abend code ASHR. CICS takes a transaction dump, unless module DFHDUIO is not loaded.

User response: Use the transaction dump to determine the cause of the failure. For further assistance, or if module DFHDUIO is not loaded and no transaction dump is available, contact your system programmer.

Module: DFHSHRSP

ASHU

Explanation: In the process of transferring the request from one region to another an abend occurred due to a routing failure. The Request cannot be routed to a suitable region. The request is unserviceable.

System action: The transaction is abnormally terminated with abend code ASHU. CICS takes a transaction dump, unless module DFHDUIO is not loaded.

User response: Check the links between regions are available. Check the Distributed Routing Program name is correct and the program is usable. Use the transaction dump to determine the cause of the failure. For further assistance, or if module DFHDUIO is not loaded and no transaction dump is available, contact your system programmer.

Module: DFHSHRSP

ASIA

Explanation: An error has occurred on a call to the storage manager (SM) domain. The domain that detected the original error will have provided an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump. CICS then terminates abnormally.

User response: See the related message from the domain that detected the original error.

Module: DFHSII1

ASIB

Explanation: An attempt has been made to run the CICS internal task CPLT as a user transaction.

System action: CICS terminates the task with a transaction dump.

User response: Investigate why the attempt was made to run CPLT as a user transaction.

Module: DFHSIPLT

ASJ1

Explanation: CICS attempted to initialize the Java environment for a task by issuing a JNI_CreateJavaVM call to the Java Native Interface. The call was not successful.

System action: Exception trace SJ 050C is created. The task is abnormally terminated with a CICS transaction dump.

User response: This abend usually implies that there is an error in the JVM Profile. Check that the LIBPATH and JAVA_HOME entries in the JVM Profile are correct. Also check that the CICS_HOME value has been set correctly.

Ensure that CICS is using the correct JVM Profile and that the correct version of Java is being used. Check that the CICS region id has read permission to the Java HFS files and that you have the latest Java maintenance applied.

Examine the HFS files used for stdout and stderr (as named by the environment variables STDOUT and

STDERR, whose default names are dfhjvmout and dfhjvmerr) for error messages output by the JVM. Also examine destination CEEMSG for error messages output by Language Environment and the Java Native Interface (JNI). The trace table from the transaction dump contains the exception trace mentioned above.

If the suggestions above do not help you should ensure that the JVM has not abended. To do this look in the WORK_DIR directory specified in the JVM Profile for any JAVADUMP files.

Module: DFHSJCS

ASJ3

Explanation: The CICS JVM interface invoked the JVM to find the main method of the CICS Wrapper class used to set up the operating environment before executing the user Java class. The JVM failed to find the main method of the CICS Wrapper class.

System action: DFHSJCS provides an exception trace, console message DFHSJ0002, and possibly a system dump (depending on the options in the dump table). The task is abnormally terminated with a CICS transaction dump.

User response: Examine the HFS files used for stdout and stderr (as named by the environment variables STDOUT and STDERR, whose default names are dfhjvmout and dfhjvmerr) for error messages output by the JVM. Also examine destination CEEMSG for error messages output by Language Environment and the Java Native Interface (JNI).

Ensure that the CICS_HOME entry in the JVM Profile is correct and that the CICS region id has permission to read the CICS_HOME HFS structure.

Module: DFHSJCS

ASJ4

Explanation: The SJ domain failed to build the argument list required to invoke the CICS Wrapper class used to set up the operating environment before executing the user Java class. This is possibly due to lack of free storage.

System action: DFHSJCS provides an exception trace, console message DFHSJ0002, and possibly a system dump (depending on the options in the dump table). The task is abnormally terminated with a CICS transaction dump.

User response: Examine the HFS files used for stdout and stderr (as named by the environment variables STDOUT and STDERR, whose default names are dfhjvmout and dfhjvmerr) for error messages output by the JVM. Also examine destination CEEMSG for error messages output by Language Environment and the Java Native Interface (JNI).

Module: DFHSJCS

ASJ5

Explanation: The CICS JVM interface invoked the CICS Wrapper class used to set up the operating environment before executing the user Java class. The Wrapper returned an exception.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Examine the HFS files used for stdout and stderr (as named by the environment variables STDOUT and STDERR, whose default names are dfhjvmout and dfhjvmerr) for error messages output by the JVM. Also examine destination CEEMSG for error messages output by Language Environment and the Java Native Interface (JNI).

Module: DFHSJCS

ASJ6

Explanation: The SJ domain issued a call to the kernel to ensure that CICS's ESTAE is the current ESTAE. This is required before calling CICS services from a native C environment which is running with Language Environment's ESTAE in effect. The call failed.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Examine the CICS Kernel or MVS messages and diagnostics that should be present as a result of the failure.

Module: DFHSJCS

ASJA

Explanation: An error has occurred obtaining a lock within the Java domain.

System action: CICS abnormally terminates the task. CICS processing continues.

User response: Contact your local IBM support center for assistance.

Module: DFHSJSM, DFHSJST

ASJB

Explanation: An error has occurred releasing a lock within the Java domain.

System action: CICS abnormally terminates the task. CICS processing continues.

User response: Contact your local IBM support center for assistance.

Module: DFHSJSM, DFHSJST

ASJC

Explanation: The CICS_HOME directory is inaccessible, does not exist, or contains a version of CICS Java support which is not the same as this release of CICS.

System action: CICS terminates the task with a transaction dump.

User response: Update the CICS_HOME option in the JVM profile.

Module: DFHSJCS

ASJD

Explanation: An attempt to load a DLL by SJ Domain has failed.

System action: CICS terminates the task with a transaction dump.

User response: See message DFHSJ0503 to determine the DLL name and the reason why the load failed.

Module: DFHSJCS

ASJE

Explanation: An attempt to locate the Wrapper class has failed.

System action: CICS terminates the task with a transaction dump.

User response: Verify the location and attributes of the CICS Wrapper class particularly the HFS permissions. If Java 2 security is active ensure the necessary permissions have been granted in the policy file. See message DFHSJ0501 for further information.

Module: DFHSJCS

ASJF

Explanation: An attempt to change the HFS working directory has failed.

System action: CICS terminates the task with a transaction dump.

User response: See message DFHSJ0502 to determine the directory name and the reason why the attempt failed.

Module: DFHSJCS

ASJG

Explanation: An attempt by SJ domain to fetch the user-replaceable module DFHJVMAT has failed.

System action: CICS terminates the task with a transaction dump.

User response: Verify that module DFHJVMAT is contained in a dataset referenced by ddname SDFHAUTH and that it is executable.

Module: DFHSJIN

ASJH

Explanation: A JVM has terminated due to a program check or other reason.

System action: CICS terminates the task with a transaction dump.

User response: Check the JVM's STDOUT and STDERR files, and any JVM dumps for further information.

Module: DFHSJIN

ASJJ

Explanation: The JAVA_HOME directory is inaccessible, does not exist, or contains a JVM which does not meet the minimum version requirements for this release of CICS.

System action: CICS terminates the task with a transaction dump.

User response: Update the version of Java specified in the JVM profile.

Module: DFHSJIN

ASJK

Explanation: An attempt was made to attach transaction CJGC, but the transaction was not attached internally by CICS.

The CICS system transaction CJGC provides support for initiating Garbage Collection in a JVM. It can only be attached internally by CICS.

System action: The transaction is abnormally terminated. CICS processing continues.

User response: Establish why an attempt was made to illegally attach CJGC.

Module: DFHSJGC

ASJL

Explanation: An attempt was made to attach a transaction specifying DFHSJGC as the program to be given control, but the transaction id was not CJGC.

DFHSJGC is for use by CICS system transaction CJGC, which provides support for initiating Garbage Collection in a JVM.

System action: The transaction is abnormally terminated. CICS processing continues.

User response: Establish why a transaction definition

specified DFHSJGC as the program to be given control.

Module: DFHSJGC

ASJM

Explanation: An attempt was made to attach transaction CJPI, but the transaction was not attached internally by CICS.

The CICS system transaction CJPI provides support for initializing new JVMs. It can only be attached internally by CICS.

System action: The transaction is abnormally terminated. CICS processing continues.

User response: Establish why an attempt was made to illegally attach CJPI.

Module: DFHSJPI

ASJN

Explanation: An attempt was made to attach a transaction specifying DFHSJPI as the program to be given control, but the transaction id was not CJPI.

DFHSJPI is for use by CICS system transaction CJPI, which provides support for initializing new JVMs.

System action: The transaction is abnormally terminated. CICS processing continues.

User response: Establish why a transaction definition specified DFHSJPI as the program to be given control.

Module: DFHSJPI

ASJR

Explanation: An attempt was made to start a JVM in resettable mode by specifying [-]Xresettable=YES or REUSE=RESET.

System action: CICS terminates the task with a transaction dump.

User response: The resettable mode of the Java Virtual Machine is obsolete and no longer supported. If [-]Xresettable=YES was specified in the JVM profile or properties file, remove it. If REUSE=RESET was specified in the JVM profile, change it to REUSE=YES or REUSE=NO. See message DFHSJ0524 for further information.

Module: DFHSJCS

ASJV

Explanation: An attempt was made to start a JVM at the wrong version.

An attempt was made to start a version 1.4.2 JVM when Java 5 is already active, or vice versa.

System action: CICS terminates the task with a transaction dump.

User response: CICS can support JVMs at the version 1.4.2 level, or at the Java 5 level, but not both simultaneously. Either run JVMs at the same version or perform a COLD start to change to a different Java version. The first JVM to run after a COLD start determines the current running level.

Module: DFHSJCS

ASNA

Explanation: An internal logic error occurred in DFHSNP because of an unexpected response from EXEC CICS.

System action: CICS terminates the transaction with a dump. This abend code is usually accompanied by message DFHCE3548.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHSNP

ASNB

Explanation: An attempt was made execute the CICS sign on program without an associated terminal. This abend code is usually accompanied by message DFHCE3548.

System action: CICS terminates the transaction with a dump.

User response: Only use the sign on program when there is a related terminal.

Module: DFHSNP

ASNC

Explanation: The signon program attempted to send a request to the user but failed to do so.

System action: CICS terminates the transaction with a dump. This abend code is usually accompanied by message DFHCE3548.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHSNP

ASND

Explanation: A request from DFHSNTU to ENQ on the address of the SNEX has failed during signoff terminal user.

System action: A transaction dump is taken and the task which issued the signoff is abended.

ASOA • ASP1

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHSNTU

ASOA

Explanation: The TCP/IP listener task CSOL has been incorrectly started from a terminal. It can only be enabled by the Sockets Domain at CICS system initialization or by using CEMT SET TCPIP OPEN or the equivalent SPI function.

System action: The transaction is abnormally terminated with a transaction dump.

User response: None.

Module: DFHSOL

ASOB

Explanation: Sockets domain has encountered a locking error while attempting to issue a lock.

System action: The transaction is abnormally terminated with a transaction dump.

User response: The exception trace prior to this abend gives more information as to why this abend was issued.

Module: DFHSOCK

ASOC

Explanation: The TCP/IP listener task CSOL has encountered an unlocking error while attempting to issue an unlock.

System action: The transaction is abnormally terminated with a transaction dump.

User response: The exception trace prior to this abend gives more information as to why this abend was issued.

Module: DFHSOL

ASOD

Explanation: The TCP/IP transaction attach module DFHSOXM encountered an error during the bind stage of transaction attach processing for a new task.

System action: The transaction is abnormally terminated with a transaction dump.

User response: The exception trace prior to this abend gives more information as to why this abend was issued.

Module: DFHSOXM

ASOL

Explanation: The TCP/IP listener task CSOL has abended.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Investigate why the transaction was abended. The exception trace prior to this abend gives more information as to why this abend was issued.

Module: DFHSOL

ASP1

Explanation: Intersystem communication failed while a syncpoint was being taken. Communication with the coordinator system has been interrupted, and the failure occurred during the critical indoubt period of syncpoint processing. As a result this CICS system is in doubt about the outcome of the unit of work for the transaction.

Alternatively, a transaction may have timed out while waiting for Recoverable Resource Management Services (RRMS) to provide the outcome of the unit of work, or RRMS may have failed during the critical indoubt period.

The transaction definition specifies WAIT(YES) as an indoubt attribute. Therefore the unit of work is not completed but is shunted and allowed to wait for resynchronization with the coordinator system. If the WAITTIME attribute is specified on the transaction definition, the unit of work waits for the specified time. If after that time the coordinator system has not resynchronized, a unilateral decision is made about the unit of work as specified by the ACTION keyword on the transaction definition. A WAITTIME of zero, the default, means an indefinite wait. The unit of work can also be forced to take a unilateral decision by means of a CEMT SET UOW command.

System action: The transaction is abnormally terminated. The EXEC CICS HANDLE ABEND command cannot handle this abend.

The associated unit of work is shunted awaiting the return of the coordinator system. Recoverable resources updated by the unit of work remain locked. The locks are released when the unit of work is backed out or committed at resynchronization time, or when a unilateral decision is made by this system.

Message DFHAC2201 is sent to the terminal end user if possible, and message DFHAC2231 is sent to transient data destination CSMT.

User response: None. Any updates performed by the unit of work are resolved automatically when resynchronization with the coordinator system takes place.

Alternatively, the user can force resolution of the updates independently of the coordinator system by

making a CEMT request to commit or back out the unit of work.

Module: DFHAPAC o*----- ABCODE ASP2
ALTERED BY APAR PQ47569 -----

ASP2

Explanation: A syncpoint has been attempted when an intersystem conversation is in a state in which the EXEC CICS SYNCPOINT command is not allowed. If CICS is connected to a system which must act as LAST AGENT, such as IMS, then this ABEND will be issued from SYNCPOINT processing if a PREPARE has been received on a link to another system. In order to support syncpointing CICS must act as COORDINATOR when it is directly connected to the LAST AGENT, the COORDINATOR system may send PREPARE syncpoint commands but never receives them.

System action: The task is abnormally terminated with a CICS transaction dump which includes terminal control information. In particular, the dump contains state information for the links used by this transaction. The EXEC CICS HANDLE ABEND command cannot handle this abend.

User response: Ensure that the application issues an EXEC CICS SYNCPOINT command only when its sync level 2 conversations are in the correct state. The EXEC CICS SYNCPOINT command may be issued only when each conversation is in one of the following states

```
SEND
PEND-RECEIVE (Not for MRO)
PEND-FREE
SYNC-RECEIVE
SYNC-SEND (Not for MRO)
SYNC-FREE
```

Module: DFHAPAC

ASP3

Explanation: An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. The coordinator of the syncpoint is not this CICS system but is remote. During the syncpoint protocol the remote coordinator has decided that the unit of work cannot be committed and must be backed out.

This error can occur with external resource managers connected to CICS via the resource manager interface (RMI) as well as CICS systems connected via LU 6.2, and MRO. If an external resource manager such as DB2 is the only recoverable resource updated in the transaction, the recovery manager (RM) domain can optimize the syncpoint protocol. In this instance, the external resource manager becomes the syncpoint coordinator. In this instance if the external resource manager returns with a backed out response, an ASP3 abend results.

System action: The transaction is abnormally

terminated and recoverable resources updated by the unit of work are backed out. The EXEC CICS HANDLE ABEND command cannot handle this abend.

Message DFHAC2220 is sent to the terminal end user if possible, and message DFHAC2250 is sent to transient data destination CSMT.

User response: Refer to the remote coordinator system to determine why the unit of work was backed out.

Module: DFHAPAC

ASP7

Explanation: A resource manager involved in syncpoint protocols has replied "No" to a request to "Prepare". The resource manager may be local to this CICS system, or may be a remote resource manager on another CICS system, or an external resource manager communicating through the resource manager interface (RMI).

System action: CICS terminates the transaction abnormally. Recoverable resources updated by the unit of work are backed out. The EXEC CICS HANDLE ABEND command cannot handle this abend.

If it is a local resource manager that has voted no, message DFHAC2218 is sent to the terminal end user if possible, and message DFHAC2248 is sent to transient data destination CSMT.

If it is a remote resource manager that has voted no, message DFHAC2219 is sent to the terminal end user if possible, and message DFHAC2249 is sent to transient data destination CSMT.

User response: This abend is caused by a prior problem. For example, the resource manager cannot flush its buffers because of an I/O error, or it cannot communicate with CICS because of a TP failure. Correct the earlier problem. An ASP7 can also occur during terminal or connection install if CICS is short on storage. For instance if message DFHAC2248 shows the transaction as CATA then look for earlier short on storage messages.

Module: DFHAPAC

ASP8

Explanation: The transaction requested syncpoint rollback, but was using a type of processing for which syncpoint rollback is not supported.

System action: CICS terminates the transaction abnormally. The EXEC CICS HANDLE ABEND command cannot handle this abend.

Message DFHAC2217 is sent to the terminal end user if possible, and message DFHAC2247 is sent to transient data destination CSMT.

User response: This error may be an application error

ASP9 • ASPD

or a configuration error. Some communication sessions, (for example, LU6.1) do not support syncpoint rollback, and if CICS detects such a session during rollback processing, the task is abended. This restriction is described in the *CICS Intercommunication Guide*. To resolve the problem, either

- Change the application so that it does not issue syncpoint rollback commands while the non-supporting sessions are allocated (e.g. issue an EXEC CICS FREE first), or
- Change the configuration so that either APPC or MRO sessions are used for communication. These are the only two session types which support syncpoint rollback.

Alternatively, following a session failure during a previous syncpoint, CICS may have decided to rollback this unit-of-work in order to preserve data integrity. Since the unit-of-work contains a session which does not support syncpoint rollback, this abend ensues. In this case, no action is required in response to this abend, although action may be required to deal with the original failure.

Module: DFHAPAC

ASP9

Explanation: The transaction requested syncpoint via EXEC CICS SYNCPOINT, but this is not allowed in a transaction that is acting on behalf of an Activity.

System action: CICS terminates the transaction abnormally. EXEC CICS HANDLE ABEND command cannot handle this abend.

User response: The error indicates an invalid attempt to syncpoint the transaction.

Module: DFHEISP

ASPA

Explanation: The task was purged before a request to recovery manager (RM) domain was able to complete successfully. The domain that first detected the purged condition provides an exception trace.

System action: The task is abnormally terminated with a CICS transaction dump. If processing is at a point where data integrity might not be maintained, CICS is abnormally terminated.

User response: Investigate why the task was purged. This is either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

If CICS is abnormally terminated, it should be emergency restarted to ensure that data integrity is maintained.

Module: DFHAPAC

ASPB

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the recovery manager (RM) domain. The domain that detected the original error will have provided an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump. If processing is at a point where data integrity might not be maintained, CICS is abnormally terminated.

User response: See the related message from the domain that detected the original error. If CICS was abnormally terminated, it should be emergency restarted to ensure that data integrity is maintained.

Module: DFHAPAC

ASPC

Explanation: An error (INVALID or DISASTER) has occurred on a call to the bridge syncpoint routine (DFHBRSP). The domain that detected the original error will have provided an exception trace, and, possibly, a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related message from the domain that detected the original error.

Module: DFHSPP

ASPD

Explanation: The transaction requested syncpoint via EXEC CICS SYNCPOINT, or rollback via EXEC CICS SYNCPOINT ROLLBACK, but this is not allowed in a transaction that is associated with an OTS transaction.

System action: CICS terminates the transaction abnormally. EXEC CICS HANDLE ABEND command cannot handle this abend.

User response: The error indicates an invalid attempt to syncpoint the transaction.

If DB2 is being accessed in the transaction, check that the DB2ENTRY or DB2CONN pool definition used by the transaction does not specify DROLLBACK(YES).

Module: DFHEISP

ASPF

Explanation: CICS issued an internal syncpoint request resulting in a syncpoint with an intersystem session which has returned ROLLEDBACK to recovery manager (RM) domain. As a result, the transaction is abnormally terminated because the unit of work which was being syncpointed has been backed out.

This could result from shutting down IRC or from the failure of a connected CICS region.

System action: The transaction is abnormally terminated. Recoverable resources updated by the unit of work are backed out and locks released. The EXEC CICS HANDLE ABEND command cannot handle this abend.

Message DFHAC2215 is sent to the terminal end user if possible, and message DFHAC2245 is sent to transient data destination CSMT.

User response: Determine why the remote intersystem session returned a ROLLEDBACK response to the syncpoint request. Once this has been corrected retry the transaction.

To avoid ASPF abends in future, ensure that no in-flight units of work exist before shutting down IRC.

Module: DFHAPAC

ASPI

Explanation: During CICS synchronization level 1 (synclevel 1) commit, an unexpected FMH or no data has been received from the partner system. Local resources and synclevel 2 partners have been committed, but synclevel 1 function-shipped resource updates may have been backed out.

System action: The transaction does not abend. CICS synclevel 1 commit processing continues, with the aim of committing as many synclevel 1 resources as possible.

User response: Examine the transaction dump to determine why the FMH was invalid or missing. It is likely that the error is in the remote system.

See the *CICS Family: Communicating from CICS on zSeries* for more information about syncpointing.

Module: DFHCR2U

ASPJ

Explanation: During CICS synchronization level 1 (synclevel 1) commit, unexpected syncpoint message data has been received from the partner system. Local resources and synclevel 2 partners have been committed, but synclevel 1 function-shipped resource updates may have been backed out.

System action: The transaction does not abend. CICS synclevel 1 commit processing continues, with the aim of committing as many synclevel 1 resources as possible.

User response: Examine the transaction dump to determine why the message data was invalid. It is likely that the error is in the remote system.

See the *CICS Family: Communicating from CICS on zSeries* for more information about syncpointing.

Module: DFHCR2U

ASPN

Explanation: A transaction has issued an EXEC CICS RETURN in backout required program state. The backout required program state is set when an application receives or issues an abend, or receives a backout request on a protected conversation.

System action: The transaction is abnormally terminated. Recoverable resources updated by the unit of work are backed out and locks released. The EXEC CICS HANDLE ABEND command cannot handle this abend.

Message DFHAC2216 is sent to the terminal end user if possible, and message DFHAC2246 is sent to transient data destination CSMT.

User response: To avoid the transaction abend, the application should code an EXEC CICS SYNCPOINT command before the EXEC CICS RETURN. A syncpoint issued in 'backout required' program state results in a backout being performed, and the ROLLEDBACK condition returned on the EXEC CICS SYNCPOINT command. If this condition is then handled, a subsequent EXEC CICS RETURN will complete successfully. For LU61 conversations the application should issue an EXEC CICS FREE followed by an EXEC CICS SYNCPOINT ROLLBACK, in order to avoid a subsequent ASP8 abend.

Module: DFHAPAC

ASPO

Explanation: An intersystem session failed while a syncpoint was being taken. The intersystem session that failed was the link to the coordinator system. The failure occurred during the indoubt period of syncpoint processing. As a result this CICS system is in doubt as to the outcome of the unit of work for the transaction.

ASPP

The unit of work is not shunted to await the return of the coordinator system, but is instead unilaterally committed. The unit of work is not shunted for one of the following reasons

- The transaction definition specifies WAIT(NO).
- The unit of work includes an MRO session to a back-level CICS system which does not support the WAIT(YES) option, and the role of the session in the unit of work is such that it cannot await the return of the coordinator system.
- The unit of work includes an LU6.1 session, and the role of the session in the unit of work is such that it cannot await the return of the coordinator system.
- The unit of work involves a task related user exit which is not enabled with the INDOUBTWAIT option.
- The unit of work has updated a recoverable transient data destination, which is defined with WAIT(NO).
- The unit of work involves the installation of CICS resource definitions from the CSD (CICS system definition) file.

The unit of work is committed, rather than backed out, because the transaction definition specifies ACTION(COMMIT).

The fact that the unit of work is committed is remembered by the recovery manager (RM) domain until the unit of work is resynchronized with the coordinator system. At this time, according to whether the coordinator system committed or backed out, the recovery manager domain issues resynchronization messages reporting whether or not the resolution of the unit of work in the subordinate system was consistent with the coordinator system.

System action: The transaction is abnormally terminated. Recoverable resources updated by the unit of work are committed and locks released. The EXEC CICS HANDLE ABEND command cannot handle this abend.

Message DFHAC2202 is sent to the terminal end user if possible, and message DFHAC2232 is sent to transient data destination CSMT.

User response: Any updates performed by the unit of work are committed. There is a danger that recoverable resources will be inconsistent with the coordinator system if the coordinator system has backed out. If the reason for the failure is the first of those listed above and if you wish CICS to ensure that data integrity is maintained, change the indoubt transaction definition to specify WAIT(YES) so that CICS automatically handles indoubt failures and resynchronizes the unit of work when the link to the coordinator system is reestablished.

Module: DFHAPAC

ASPP

Explanation: An intersystem session failed while a syncpoint was being taken. The intersystem session that failed was the link to the coordinator system, and the failure occurred during the critical indoubt period of syncpoint processing. As a result this CICS system is in doubt as to the outcome of the unit of work for the transaction.

The unit of work is not shunted to await the return of the coordinator system. Instead it is unilaterally backed out. The unit of work is not shunted for one of the following reasons

- The transaction definition specifies WAIT(NO).
- The unit of work includes an MRO session to a back-level CICS system which does not support the WAIT(YES) option, and the role of the session in the unit of work is such that it cannot await the return of the coordinator system.
- The unit of work includes an LU6.1 session, and the role of the session in the unit of work is such that it cannot await the return of the coordinator system.
- The unit of work involves a task related user exit which is not enabled with the INDOUBTWAIT option.
- The unit of work has updated a recoverable transient data destination, which is defined with WAIT(NO).
- The unit of work involves the installation of CICS resource definitions from the CSD (CICS system definition) file.

The unit of work is backed out, rather than committed, because the transaction definition specifies ACTION(BACKOUT).

The fact that the unit of work is backed out is remembered by recovery manager (RM) domain until the unit of work is resynchronized with the coordinator system. At this time, according to whether the coordinator system backed out or committed, the recovery manager domain issues resynchronization messages reporting whether or not the resolution of the unit of work in the subordinate system was consistent with the coordinator system.

System action: The transaction is abnormally terminated. Recoverable resources updated by the unit of work are backed out and locks released. The EXEC CICS HANDLE ABEND command cannot handle this abend.

Message DFHAC2203 is sent to the terminal end user if possible, and message DFHAC2233 is sent to transient data destination CSMT.

User response: Any updates performed by the unit of work are backed out. There is a danger that recoverable resources will be inconsistent with the coordinator system if the coordinator system has committed. If the reason for the failure is the first of those listed above and if you wish CICS to ensure that data integrity is maintained, change the indoubt transaction definition to

specify WAIT(YES) so that CICS automatically handles indoubt failures and resynchronizes the unit of work when the link to the coordinator system is reestablished.

Module: DFHAPAC

ASPQ

Explanation: During phase 2 of the two phase syncpoint protocol an error occurred while communicating with a remote system. The error occurred after the recoverable resources were committed or backed out, so data integrity is not in danger.

System action: The transaction is abnormally terminated. Recoverable resources updated by the unit of work will have backed out or committed depending on the decision taken by the recovery manager (RM) domain, which was not influenced by this later problem. The EXEC CICS HANDLE ABEND command cannot handle this abend.

Message DFHAC2221 is sent to the terminal end user if possible, and message DFHAC2251 is sent to transient data destination CSMT.

User response: Refer to earlier messages issued by the communication or remote resource management components of CICS to determine the cause of the intersystem communication problem.

Module: DFHAPAC

ASPR

Explanation: Intersystem communication failed while a syncpoint was being taken. Communication with the coordinator system has been interrupted, and the failure occurred during the critical indoubt period of syncpoint processing. As a result this CICS system is in doubt as to the outcome of the unit of work for the transaction.

However, this CICS system has not updated any recoverable resources in the unit of work and hence does not require the unit of work to be shunted to await resynchronization of its resources later. The coordinator system commits or backs out its resources. No resources on this system need to be kept in step.

This error can occur with external resource managers connected to CICS via the resource manager interface (RMI) as well as CICS systems connected via LU 6.2, and MRO. If an external resource manager such as DB2 is the only recoverable resource updated in the transaction, the recovery manager (RM) domain can optimize the syncpoint protocol. In this instance, the external resource manager becomes the syncpoint coordinator. If the link to the external resource manager is lost during this time, CICS will be indoubt as to whether the external resource manager updates were committed or backed out.

System action: The transaction is abnormally terminated. There are no recoverable resources affected

in this CICS system. The EXEC CICS HANDLE ABEND command cannot handle this abend.

Message DFHAC2222 is sent to the terminal end user if possible, and message DFHAC2252 is sent to transient data destination CSMT.

User response: Refer to messages on the remote system to determine if the remote resources were backed out or committed.

Module: DFHAPAC

ASQA

Explanation: The CLS2 transaction was processing resynchronization work but the communications session which it was using has failed.

System action: The work is reexecuted on a new session. If reexecution has already been attempted, the transaction terminates.

User response: The error may be caused by the failure of several sessions between communicating systems during the resynchronization process. To confirm this, examine the CSMT transient data queue for the relevant period.

Another cause could be logic errors within the resynchronization program, either on this system or on the partner system, which caused the session to be terminated. In this case, CSMT transient data messages indicate the nature of the error.

Module: DFHCRRSY

ASQB

Explanation: The CLS2 transaction was executing exchange log names or resynchronization with a remote system when a logic error occurred.

System action: The transaction is abnormally terminated with a transaction dump.

Message DFHRS2158 may also be issued.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRRSY

ASQC

Explanation: The CLS2 transaction was attached with an unexpected start code. The transaction can be attached due to terminal input (on a communications session), or via a system attach. Neither of these methods was used.

System action: The transaction is abnormally terminated.

User response: The error indicates an invalid attempt to start the transaction.

ASQD • ASQK

Module: DFHCRRSY

ASQD

Explanation: The CLS2 transaction was attached but could not use the transaction manager interface to obtain input parameters.

System action: The transaction is abnormally terminated.

User response: The error indicates a failure in the transaction manager. See the exception trace entries produced by the transaction manager to determine the reason for the error.

Module: DFHCRRSY

ASQE

Explanation: The CLS2 transaction was executing exchange log names with a remote system and 3 retry attempts have failed to solicit a warm exchange log names reply, in response to a warm exchange log names request sent by CICS.

System action: The transaction is abnormally terminated with a transaction dump.

User response: This abend indicates an error in the remote system. It should have saved the log name sent by CICS and, on receiving a later exchange lognames request, should then respond with a warm reply.

Module: DFHCRRSY

ASQG

Explanation: The CLS2 transaction was executing resynchronization work and has failed during the receipt of data from remote system via an MRO session. The data was longer than expected.

System action: The transaction is abnormally terminated with a transaction dump.

User response: The abend indicates a CICS logic error, possibly in the remote system. The transaction storage in the dump shows the data received. The transaction trace shows the preceding flows between the systems, which should match those documented in the *SNA LU6.2 Reference: Peer Protocols* manual, SC30-6808.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRRSY

ASQH

Explanation: The CLS2 transaction was executing resynchronization work and has failed during the receipt of data from remote system via an MRO session. The data was shorter than the minimum length expected.

System action: The transaction is abnormally terminated with a transaction dump.

User response: This indicates a CICS logic error, possibly in the remote system. The transaction storage in the dump shows the data received. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRRSY

ASQI

Explanation: The CLS2 transaction was executing the exchange lognames process as part of the initialization sequence for an APPC connection. An attempt to invoke the CICS recovery manager to save a logname failed.

System action: The transaction is abnormally terminated with a transaction dump.

Message DFHRS2157 may also be issued.

User response: This indicates an error in the CICS recovery manager which has produced its own exception trace records. Look at the trace records and the CSMT message log for further information about the error.

Module: DFHCRRSY

ASQK

Explanation: The CLS2 transaction was processing exchange lognames or resynchronization for a connected partner identified by a netname. The connection entry associated with the netname was located and locked, but could not be unlocked in subsequent processing. This indicates a CICS internal logic error.

System action: The transaction is abnormally terminated with a transaction dump.

Message DFHRS2156 may also be issued.

User response: This indicates an error either in the CICS table manager, (which may have produced its own exception trace records) or in the resynchronization program itself. Look at the trace records and the CSMT message log for further information which might have indicated an error in the table manager program or in the table entry for the connection. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRRSY

ASQL

Explanation: The CLS2 transaction was executing the resynchronization of a unit of work with a connected partner, and has locked the associated data managed by the CICS recovery manager. The invocation of the TERMINATE_RECOVERY command to unlock the data failed.

System action: The transaction is abnormally terminated with a transaction dump.

Message DFHRS2154 is also issued.

User response: This indicates an error either in the CICS recovery manager (which may have produced its own exception trace records) or in the resynchronization program itself. Look at the trace records and the CSMT message log for further information. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRRSY

ASQM

Explanation: A CICS internal logic error has occurred in the management of dynamic storage for the resynchronization program.

System action: The transaction is abnormally terminated with a transaction dump.

User response: This indicates that the resynchronization program has exhausted the available space for recording storage areas. The symptoms may indicate that the program was looping without executing the error recovery process. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRRSY

ASRA

Explanation: The task has terminated abnormally because of a program check.

System action: The task is abnormally terminated and CICS issues either message DFHAP0001 or DFHSR0001. Message DFHSR0622 may also be issued.

User response: Refer to the description of the associated message or messages to determine and correct the cause of the program check.

Module: DFHSRP

ASRB

Explanation: An operating system abend has occurred and CICS has been able to abend the current transaction.

System action: The task is abnormally terminated and CICS issues either message DFHAP0001 or DFHSR0001

User response: Refer to the description of the associated message to determine the cause of the original operating system abend, and take the necessary corrective action.

Module: DFHSRP

ASRD

Explanation: The task has been abnormally terminated for one of these reasons

- A program contains an assembler macro call which is no longer supported by CICS.
- An invalid attempt has been made to access the CSA or TCA.
- An attempt to access a TCA via field CSAQRTCA (previously CSACDTA) has been made.
- A non-assembler program has been wrongly defined to CICS as an assembler program.

This error appears as a program check.

System action: The task is abnormally terminated and CICS issues message DFHSR0618, followed by either DFHAP0001 or DFHSR0001.

User response: Refer to the description of the associated messages to determine and correct the error.

It is likely that either R12 which usually addresses the TCA or R13 which usually addresses the CSA is pointing to an area of storage that you are not allowed to access.

Module: DFHSRP

ASRE

Explanation: The task has been abnormally terminated because an attempt has been made to access a CICS-DB2 RCT load module.

The RCT no longer exists as a load module and cannot be accessed directly.

To access information held in the RCT use the CICS SPI commands EXEC CICS INQUIRE/SET DB2CONN, EXEC CICS INQUIRE/SET DB2ENTRY and EXEC CICS INQUIRE/SET DB2TRAN.

This error appears as a program check.

System action: The task is abnormally terminated and CICS issues message DFHSR0619, followed by either

ASRK • ATC5

DFHAP0001 or DFHSR0001.

User response: Change the application to use the CICS SPI commands to retrieve data from, or set fields in, the RCT.

Module: DFHSRP

ASRK

Explanation: The AP domain recovery stub, DFHSR1, has been invoked to deal with a program check, operating system abend, or another error within a transaction environment. However, DFHSR1 has been

unable to call the system recovery program, DFHSRP, because register 12, which should be pointing to the task control area (TCA), is null. This indicates that the caller of DFHSR1, has not set the address of the TCA..

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHSR1

ATxx abend codes

ATC1

Explanation: The CICS terminal control restart task could not complete because a necessary step failed. The task has done some essential recovery operations and abnormally terminated itself with code ATC1.

System action: CICS writes a transaction dump for the terminal control restart task.

CICS sends two messages to the console, one to identify the error detected by the terminal control restart task, and DFHTC1001 to report that the task has failed. A third message follows either to say that CICS has terminated abnormally with a dump, or to ask you to reply GO or CANCEL. Depending on the nature of the original error, you may see messages from some other system component (for example, an access method).

User response: First, if CICS has requested a response, you must reply. If you reply 'GO', CICS continues processing, but without terminal control. If you reply 'CANCEL', CICS terminates abnormally with a dump.

Use the messages and dumps to find out the cause of the failure.

Module: DFHTCRP

ATC2

Explanation: A CICS SET VTAM OPEN command has failed due to VTAM rejecting a CICS request.

System action: Message DFHZC2302, DFHZC2304 or DFHZC2307 is sent to the console, and CICS terminates the transaction abnormally with a transaction dump.

User response: The RPL with the VTAM request code and return code can be found in the RA pool addressed from TCTVRVRA. Use the *VTAM Programming* manual, to determine the cause of the error and the actions necessary to correct it. After correcting the error, either retry the request or terminate CICS and restart the network in your own time.

Module: DFHZSL5

ATC3

Explanation: A write to a TLX device was issued with a data length of 0 causing TIOA data length (TIOATDL) to be zero.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: For an error writing to a TLX device correct the error in the user program by ensuring that a data length for data to be placed in the terminal input/output area (TIOA) is provided at write time.

Module: DFHZARL DFHZARQ

ATC4

Explanation: A serious CAVM error has occurred. The XRF TCB has abended.

System action: CICS abnormally terminates with a system dump.

User response: Use the dump and the guidance in any messages issued by other system components to diagnose and correct the original error.

See the *CICS Problem Determination Guide* for further guidance on using system dumps.

Module: DFHTCRP

ATC5

Explanation: An internal logic error has been detected during APPC mapped processing. The conversation state maintained by DFHZARL does not match the state which is jointly maintained by DFHETL and DFHZARM.

This problem could also arise when CICS is receiving application data. CICS may receive and end of chain notification before receiving all the data expected.

System action: The task is abnormally terminated with a CICS transaction dump. CICS processing continues.

User response: You need further assistance from IBM

to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHETL

ATC6

Explanation: DFHETL has a SEND DATA request with a data length greater than 65528 bytes which is the maximum that it can process.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: This is a CICS internal logic error. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHETL

ATC7

Explanation: DFHZSUP has detected a bad response from an INITIAL-CALL request to DFHZARL. This response is returned to DFHZSUP in the DFHLUC parameter list.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Examine field LUCCDRCD in the DFHLUC parameter list. This appears in the ENTRY/EXIT trace points for DFHZARL. If trace is switched off, then it can be found in DFHZSUP's LIFO entry in the transaction dump.

- LUCCDRCD = 'A0000100' - session failure
- LUCCDRCD = 'A0010100' - read timeout
- LUCCDRCD = 'A0010000' - deadlock timeout.

(The offset for LUCCDRCD can be found in *CICS Data Areas*).

If LUCCDRCD is X'00000000, the error is the result of a connection failure. In this case examine the CSMT log for further diagnostic information.

Module: DFHZSUP

ATC8

Explanation: An error has occurred during the processing of an inbound function management header (FMH). Either a length error has been detected, for example, incomplete FMH received, or an invalid field has been detected within the FMH.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Notify the system programmer of the error. The problem is probably in the remote system that has sent the invalid FMH.

Module: DFHETL

ATC9

Explanation: A DFHKC RESUME macro call has been issued for a task without first issuing DFHKC SUSPEND. DFHKC RESUME must be preceded by DFHKC SUSPEND.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Examine the trace entry to locate the error.

Module: DFHZNCE

ATCA

Explanation: The system was in a final quiesce mode when the CICS application program issued a DFHTC macro.

System action: The task requesting the I/O is abnormally terminated with a CICS transaction dump.

User response: None.

Module: DFHZARQ

ATCB

Explanation: The CICS application program issued two consecutive DFHTC writes or two consecutive DFHTC reads, but in either case did not issue an intervening wait.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Take corrective action within the program being executed.

This is almost certainly an application program error. Determine the flow of control through the application and determine why an intervening wait is not issued. The trace table may be useful to discover where the application is issuing the read and write requests. If necessary, start trace or auxiliary trace using the master terminal command and rerun the transaction to obtain a trace. The output of the auxiliary trace can be printed using the trace utility program, DFHTU650.

Problem determination: A transaction dump is provided with this abend. In the dump, register 12 addresses the current TCA, and register 10 and the field TCAFCAAA address the TCTTE associated with this task. In TCATPOS2, bit TCATPOWR (X'01) indicates that a write is requested by the DFHTC macro, and bit TCATPORR (X'10) indicates that a read is requested. In TCTTEOS, bit TCTTEOWR (X'01) indicates that a write is in progress, and bit TCTTEORR (X'10) indicates that a read is in progress.

Problem determination: Analysis:

Register	Label	Description
R10=@TCTTE	TCZARQ05	Bit TCATPOWR is on in byte
R12=@TCA	(TCZAQ1W)	TCATPOS2, and bit TCTTEOWR

ATCC • ATCG

is on in byte TCTTEOS.

R10=@TCTTE TCZARQ05 Bit TCATPOWR is on in byte
R12=@TCA (TCZAQ2W) TCATPOS2, and bit TCTTEORR
is on in byte TCTTEOS.

R10=@TCTTE TCZARQ12 Bit TCATPORR is on in byte
R12=@TCA TCATPOS2, and bit TCTTEORR
is on in byte TCTTEOS.

Module: DFHZARQ

ATCC

Explanation: An application program, using a pipeline session, has either issued more than one write request or issued a read request.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Correct the application program so that it will not issue more than one consecutive WRITE to a pipeline session terminal.

Module: DFHZARQ

ATCD

Explanation: This abend code is used whenever a CTYPE request or a QUEUE request is issued and VTAM or a ZCP function has not been included in the system.

It is also used to abend a task that issues an APPC command when the CICS system is not at a level to support APPC.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Correct the transaction so that it does not issue a CTYPE macro instruction if VTAM is not generated into the system, or include the ZCP function for which the CTYPE or QUEUE request was issued.

Module: DFHZDSP, DFHZERH

ATCE

Explanation: A CICS application program has issued a DFHTC request without specifying the address of a TIOA, but the request is not an ERASE ALL UNPROTECTED or a READBUF request for a 3270 data stream terminal.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Correct the error in the user program by ensuring that a terminal input/output area (TIOA) is provided at write time.

This is almost certainly an application program error. Determine the flow of control through the application and determine why a TIOA has not been specified.

Problem determination: A transaction dump is

provided with this abend. In the dump, register 12 addresses the current TCA, and register 10 and the field TCAFCAAA addresses the TCTTE associated with this task. Register 8 and TCTTEDA should contain the address of the TIOA to be used in the I/O request, but actually they contain zero. For a 3270 data stream terminal, byte TCTETDST has bit TCTETTSI (X'01) set. An erase-all-unprotected request is indicated by the setting of bit TCTTEEUI (X'40) in byte TCTTEEUB, and a read buffer request is indicated by the setting of bit TCTTERBI (X'80) in byte TCTTERBB. **Analysis:**

Register	Label	Description
R10=@TCTTE	TCZARQ41	NIOABAR (register 8) contains zero.
R8=0		Register 8 has been loaded field TCTTEDA of the TCTTE associated with this task.

Module: DFHZARQ

ATCF

Explanation: A DFHTC CTYPE macro was issued to a non-VTAM terminal control table terminal entry (TCTTE), or a DFHTC CTYPE=COMMAND or RESPONSE macro was issued to a VTAM 3270 TCTTE.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Ensure that the program issues CTYPE macros to VTAM terminals only, and does not issue CTYPE=COMMAND or RESPONSE to a VTAM 3270.

Module: DFHZCRQ

ATCG

Explanation: A CICS application program has issued a DFHTC request for a terminal that it does not own. The problem of ownership may be because the task previously issued a WRITE, LAST request (which would have detached the terminal from that task) or because the task incorrectly specified the terminal to which the request is directed.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: This is most probably an application error (unless storage has been completely overwritten). Determine the flow from the trace table and when a request to the DFHZCP detach routine, DFHZDET, or a DFHTC WRITE, LAST was issued.

Problem determination: Register 12 addresses the current TCA and register 10 contains the address of the TCTTE. The address of the TCTTE was obtained either from TCAFCAAA in the case of a non-ISC transaction, or from TCATPTA if bit TCATPTTA (X'40) is on in byte TCATPOC3 (this indicates that TERM=YES was

specified on the DFHTC request and that this is an ISC transaction). In the TCTTE thus located, the field TCTTECA does not contain the address of the TCA, indicating that this TCA is not owned by this task.

Analysis: A DFHTC request has been issued specifying a TCTTE in which the field TCTTECA does not contain the address of the TCA.

Register	Label	Description
R10=@TCTTE	TCZARQ05	TCTTECA is not equal to register 12.

Module: DFHZARQ

ATCH

Explanation: The task was purged before a domain call was able to complete successfully. The task that first detected the purged condition provides an exception trace.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate why the task was purged. It was purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction, or by CICS issuing a purge request.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

When CICS purges a task, it does so to allow an operation to complete which would be held up by the presence of active tasks, or to ensure data integrity. For example, CICS will purge a task which has made recoverable updates to a coupling facility data table if it determines that the coupling facility data table server for the pool in which that table resides has recycled, to ensure that all updates in the unit of work will be backed out.

Module: DFHBSM62 DFHBSS DFHBSSZ DFHBSTZ DFHBSTZV DFHBSTZ1 DFHBSTZ2 DFHTBSB DFHTBSBP DFHTBSD DFHTBDP DFHTBSL DFHTBSLP DFHTBSQ DFHTBSR DFHTBSRP DFHTBSSP DFHTCRP DFHTOASE DFHTOATM DFHTOLCR DFHTOLUI DFHTRZCP DFHTRZIP DFHTRZPP DFHTRZXP DFHTRZYP DFHTRZZP DFHZCQCH DFHZCQDL DFHZCQIQ DFHZCQIS DFHZCQRS DFHZCQ00 DFHMRXM DFH62XM

ATCI

Explanation: An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to module DFHRTSU. The module that detected the original error provides an exception trace, a console message and, possibly a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related message produced by the module that detected the original error.

Module: DFHZSUP DFHMRXM DFH62XM

ATCJ

Explanation: This abend is issued by DFHZATA in the following circumstances

- Transaction CATA is issued from a terminal
- The address of the AWE (TCAFCAAA) is 0
- The AWE is invalid (TCTWETYP should be TCTTEAWE)
- An abend is issued early in DFHZATA.

This abend is issued by DFHZATD in the following circumstances

- Transaction CATD is issued from a terminal
- The address of the AWE (TCAFCAAA) is 0
- TCAFCAAA is an AWE and not a terminal
- An abend is issued early in DFHZATD.

This abend is issued by DFHZATR in the following circumstances

- Transaction CATR is issued from a terminal
- An abend is issued early in DFHZATD.

System action: CICS rejects the request.

User response: Determine the issuing program and the reason for the abend and take the appropriate action as follows

Do not try to invoke CATA, CATD or CATR from a terminal.

If the address in TCAFCAAA is incorrect, the calling mechanism has failed. This is a CICS logic error.

If an abend has been issued, use the transaction dump to determine where the abend occurred. This is a CICS logic error.

Module: DFHZATA DFHZATD DFHZATR

ATCK

Explanation: An application program has issued a WRITE to a VTAM terminal specifying CCOMPL=NO without being authorized to do so.

System action: The transaction is abnormally terminated with a CICS transaction dump.

ATCL • ATCQ

User response: Specify CHAINCONTROL in the transaction profile.

Module: DFHZARQ

ATCL

Explanation: An error has occurred either during automatic journaling or automatic logging of terminal messages to or from this transaction. The message being logged will be one associated with an explicit READ or WRITE in the application program.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Use the dump to ascertain why the journal or log record could not be written correctly. If a journal record length error is indicated, TIOATDL may have been corrupted.

Problem determination: Register 12 addresses the current TCA and field TCAJCAAD and register 4 address the JCA. The log manager request is contained in JCATR2 and the response code is in JCAJCRC.

Possible request codes are

X'8001' - WRITE
X'8003' - PUT

Possible response codes are

X'01' - IDERROR - Journal identification error
X'02' - INVREQ - Invalid request
X'03' - STATERR - Status error
X'05' - NOTOPEN - Journal not open
X'06' - LERROR - Journal record length error
X'07' - IOERROR - I/O error.

The address of the TIOA is contained in register 8 and its data length is in TIOATDL.

Analysis:

Register	Label	Description
----------	-------	-------------

R4=@JCA	TCZARQPJ	JCAJCRC is nonzero.
---------	----------	---------------------

Module: DFHETL, DFHTPCM, DFHZARQ

ATCN

Explanation: An error has occurred during the automatic journaling or automatic logging of the initial input message of this transaction. This input message is the message that actually caused the transaction to be invoked.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Use the dump to ascertain why the log record could not be written correctly.

If a journal record length error is indicated, TIOATDL (X'08) may have been corrupted.

Problem determination: Register 12 addresses the current TCA and field TCAJCAAD and register 4 address the JCA. The log manager request is contained in JCATR2 and the response code is in JCAJCRC.

Possible request codes are

X'8001' - WRITE
X'8003' - PUT

Possible response codes are

X'01' - IDERROR - Journal identification error
X'02' - INVREQ - Invalid request
X'03' - STATERR - Status error
X'05' - NOTOPEN - Journal not open
X'06' - LERROR - Journal record length error
X'07' - IOERROR - I/O error.

Module: DFHZSUP DFH62XM DFHTFXM

ATCO

Explanation: An application program has attempted to perform a function not supported by a terminal or system.

Possible errors are

1. SIGNAL not supported.

A DFHTC TYPE=SIGNALL request with the WAIT=YES option was issued to a VTAM logical unit that CICS does not support for the receipt of the SIGNAL indicator.

2. WRITE STRUCTURED FIELD not supported.

This write may have been attempted as a result of a SEND command with the STRFIELD keyword to a device that does not support this function.

3. APPC mapped conversation not supported.

The application has attempted to perform a normal terminal control command on a session that is in use for an APPC unmapped conversation. (Only EXEC CICS GDS commands are permitted.)

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Correct the application program.

Module: DFHZARQ

ATCQ

Explanation: The application program issued a write operation to a terminal that was in send status. In order to allow this write to proceed, a signal command was sent, and DFHZCP started to read data from the terminal waiting for the change direction indication. As each data record is received, it is placed on temporary

storage and, for one of these operations, a temporary storage error has occurred.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Check that temporary storage has been included in the system and that it has sufficient space.

If an invalid request is indicated, check that the length of the data being written to temporary storage is not greater than the VSAM control interval size minus 84. The length of the data is in TIOATDL (which is 8 greater than the length of the data that is read in by DFHZCP).

Problem determination: Register 12 addresses the current TCA. TCACCSV1 contains a saved copy of TCATSTR containing the temporary storage response code. The temporary storage response code may be one of

- X'04' - IOERROR - I/O error
- X'08' - NOSPACE - No temporary storage space
- X'20' - INVREQ - Invalid request.

The temporary storage identification is constructed by concatenating the character string "DFHQ" with the terminal identification from TCTTETI. The temporary storage identification is placed in TCATSDI.

Register 8 and field TCTTEDA address the TIOA that is being written to temporary storage. The address passed to temporary storage is that of TIOATDL.

Analysis: After the DFHTS TYPE=PUTQ, the temporary storage response code was not zero.

Register Label Description

R12=@TCA ZRAQ60 TCATSTR is nonzero.

Module: DFHZRAQ

ATCR

Explanation: An application program has issued a read operation, after a previous write operation has caused DFHZCP to read-ahead data from the terminal in order to avoid a lock-out. DFHZCP has now issued a DFHTS GETQ to retrieve the saved data from temporary storage, and an error has occurred.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Determine the cause of the temporary storage error and correct it.

If a temporary storage identification error is indicated, examine TCTTETI for a valid terminal identification.

Problem determination: Register 12 addresses the current TCA. TCACCSV1 contains a saved copy of TCATSTR that contains the temporary storage response code. The temporary storage response code may be one of

- X'01' - ENERROR - Entry error
- X'02' - IDERROR - Identification error
- X'04' - IOERROR - I/O error
- X'20' - INVREQ - Invalid request

The temporary storage identification is constructed by concatenating the character string "DFHQ" with the terminal identification from TCTTETI. The temporary storage identification is placed in TCATSDI.

Analysis: After the DFHTS TYPE=GETQ, the temporary storage response code was not zero.

Register Label Description

R12=@TCA ZRAR90 TCATSTR is not zero.

Module: DFHZRAR

ATCS

Explanation: An application program attempted to send data to a logical unit after a SIGNAL data flow command with an RCD (request change direction) has been received. This condition arises when the application handles the IGREQCD exceptional condition incorrectly.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Handle the IGREQCD exceptional condition correctly.

Module: DFHZARQ

ATCT

Explanation: An attempt to build a surrogate TCTTE to represent a remotely-owned terminal failed.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZSUP DFHMRXM DFH62XM

ATCU

Explanation: An application program attempted to send data to a logical unit, but was in receive mode (EIBRECV is set), and read-ahead queuing was not specified in installed profile definition (RAQ=NO).

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Either change the application program to issue receives until EIBRECV is not set, or specify RAQ=YES in the installed profile definition (If RAQ=YES is specified, ensure that all input messages are read before the transaction is terminated.)

ATCV

Module: DFHZARQ

ATCV

Explanation: An application attempted an operation on a logical unit, but was not in the correct mode for one of the following reasons

1. When issued by DFHZARQ, CICS cannot perform the current request because another request is outstanding (EIBSYNC is set). This holds for APPC or non-APPC systems
2. When issued by DFHETL, the application is communicating with an APPC system, and is not in the correct state to perform the attempted operation. This holds for APPC systems only
3. When issued by DFHZISP, a TCTTE free was requested, and there is an outstanding sync point request. This holds for non-APPC systems only
4. When issued by DFHZISP, a TCTTE free was requested, the TCTTE is in receive mode, and RAQ=NO was specified in the installed profile definition. This holds for non-APPC systems only.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: The response depends on the reason for the error as follows

1. Issue a sync point and then issue the request.
2. Issue the free request and reallocate the session.
3. Either change the application to issue receives until EIBRECV is not set, or specify RAQ=YES in the installed profile definition. (If you specify RAQ=YES in the installed profile definition, ensure that all input messages are read before the transaction is terminated.)
4. See the *CICS Distributed Transaction Programming Guide* where rules for the correct use of commands are given. Then correct the application.

The application program has attempted an operation on a logical unit that is invalid, because the program's current status on the session with that logical unit does not permit it. An investigation of the TCTTE (that is, Session), status bytes, and TCA type of request bytes will reveal which of the above problems are relevant.

When the cause of the problem has been ascertained, the application program should be changed to ensure that the session-oriented information is acted upon before any further requests are sent across that session. The session status information is made available to the application program in the exec interface block (EIB) immediately following the execution of RECEIVE, CONVERSE, or RETRIEVE requests across the session. The relevant bytes must be tested, strictly in the order shown, and acted upon, before any further operations are attempted on the session. In addition, the status information bytes themselves are necessarily volatile in that they are reset before the execution of every EXEC CICS... statement. Thus it is

good programming practice to save them into application user storage after a RECEIVE, CONVERSE, or RETRIEVE for later testing. The states are

1. EIBSYNC

the application must take a syncpoint

2. EIBFREE

the application must free the session (or terminate when the session will be freed automatically)

3. EIBRECV

the application must continue receiving data by issuing further RECEIVE commands; by definition, data cannot be sent while in this state.

Some of these status tests can sometimes be omitted (for example, testing of the EIBSYNC status is not essential if it is known that the application program on the remote system never issues sync point requests itself). However, the tests should always be carried out, particularly if the remote application might be amended at a future date, in which event the session handling logic may well be altered. Also, it may be that the remote transaction itself causes an unsuspected flow on the session. For example, if the remote program issues EXEC CICS SEND..... LAST across the session, followed by RETURN, a syncpoint request (RQD2) will be added onto the transmitted data. (The application programmer is referred to the *CICS Distributed Transaction Programming Guide* for a discussion of this topic). As a result of this addition, an unsuspected syncpoint request is received by the local application, which abend if the session is freed without the sync point request being honored. An ATCV abend is also raised by module DFHETL if a state error occurs during processing of an APPC mapped application (that is, the program attempts to perform an operation while in the wrong state). The handling of APPC mapped applications is described in the *CICS Diagnosis Reference*. Some commands are processed by DFHZARQ, as above, and others by various other modules invoked by DFHETL. Rules for using commands for APPC are given in the *CICS Distributed Transaction Programming Guide*. Reference to this guide should reveal the programming error.

Problem determination: Register 12 addresses the current TCA. Register 10 and field TCAFCAAA address TCTTE. The terminal byte TCTTECRE has bit TCTEUCOM (X'02) set if sync point is required, and TCTEUFRT (X'04) set if Free Session is required; TCTESMDI has TCTEUSMD (X'02) set if the application is in SEND mode. TCTERCVI has TCTEURCV (X'01) set if the application is in RECEIVE mode. Bit TCTESRAQ (X'80) in byte TCTEIRAQ indicates that read-ahead queuing is coded on the installed profile definition for this transaction.

The type-of-request bits in the TCA are set as follows

- TCATPOS1 TCATPIS (X'01) Signal requested.

- TCATPFRE (X'03) Free TCTTE.
- TCATPOS2 TCATPORR (X'10) Receive requested.
 - TCATPOWR (X'01) Send requested.

Analysis:

Number	Label	Description
DFHZARQ		
1.	TCZAQW8	Attempting to receive when sync point or Free Session outstanding.
2.	TCZAQ2W	Attempting to send while in receive mode.
3.	ZARQNOPG	Issuing SIGNAL while in send mode.
DFHZISP		
4.	ZISPVTK	Attempting to free session while sync point request is outstanding.

ATCW

Explanation: The system has been generated without an installed profile definition for an LU6.1 or APPC session.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Notify the system programmer of the error.

Module: DFHZSUP DFHMRXM DFH62XM

ATCX

Explanation: An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

An application program that issues terminal control requests after an ATCX abend may cause further problems.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related message produced by the domain that detected the original error.

Module: DFHBSMIR, DFHBSMPP, DFHBSM62, DFHBSS, DFHBSTB, DFHBSTB3, DFHBSTC, DFHBSTZ, DFHBSTZB, DFHBSTZO, DFHBSTZR, DFHBSTZV, DFHBSTZ1, DFHBSTZ2, DFHBSZZS, DFHAPRT, DFHCRP, DFHQRY, DFHZARL, DFHZARQ, DFHZERH, DFHZGET, DFHZFRE, DFHZNAC, DFHZRVS, DFHZSUP, DFHMRXM, DFH62XM DFHZTSP, DFHZXST

ATCY

Explanation: An error has occurred during the processing of an inbound function management header (FMH). Either a length error has been detected, for example, incomplete FMH received, or an invalid field has been detected within the FMH.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Notify the system programmer of the error. The problem is probably in the remote system that has sent the invalid FMH.

If the inbound FMH is from a system with an earlier release of CICS then you may need to set USEDFTUSER. See 'Attach Time Security and the USEDFTUSER option' in chapter 12 of the *CICS RACF Security Guide*.

Module: DFHZARQ, DFHZSUP DFHMRXM DFH62XM

ATCZ

Explanation: An error (INVALID, DISASTER or EXCEPTION response) has occurred on the SET_NETWORK_IDENTIFIER call to the security domain as part of opening the CICS VTAM ACB (for example, EXEC CICS SET VTAM OPEN or CEMT SET VTAM OPEN). The domain that detected the original error provides an exception trace, a console message, and depending on the options specified in the dump table, a system dump.

System action: The task is abnormally terminated with a CICS transaction dump. The VTAM ACB is closed.

User response: Use the dump, the trace and the console message to diagnose and correct the original error. Retry the command when the earlier error is resolved.

Module: DFHZSLS

ATD3

Explanation: The task has been purged, probably due to operator action such as a CEMT TASK PURGE command. The task might also have been purged as a result of CICS issuing a purge request.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Use the transaction dump to determine why the task was purged. In particular, if the purge was operator initiated, the dump should be useful in determining why this task needed to be explicitly purged.

Module: DFHTDB

ATD9

Explanation: An incorrect response has been received from a call to the enqueue (NQ) domain during the processing of an ENQUEUE or a DEQUEUE request.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Examine the dump and any exception trace entries for further information. Since this is only used for internal enqueues, this abend indicates an error in CICS. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHTDB

ATDC

Explanation: A transaction has issued an EXEC CICS READQ, WRITEQ or DELETEQ command against a logically recoverable transient data queue. The task was enqueued because another task currently owns the enqueue. While waiting to obtain the enqueue, the task was purged.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Investigate why the transaction was purged. It may have been purged via CEMT or automatically, by DTIMEOUT for example.

Module: DFHETD

ATDS

Explanation: A deadlock timeout condition has been detected. This condition may occur within a transaction that specifies DTIMOUT to be nonzero on its installed transaction definition. Deadlock timeout occurs when a transaction has been waiting or has been suspended for longer than the time specified in DTIMOUT.

The abend is driven by the internal CICS event, ENQUEUE.

Analysis: The transaction receiving the ATDS abend must have been suspended after issuing an ENQUEUE request.

System action: The transaction is abnormally terminated. A dump is not provided (even if a dump table entry has been set up).

User response: The transaction should be reexecuted, and the situation causing the SUSPEND to occur may clear itself.

The ATDS abend is to be expected occasionally, unless DTIMOUT is set to zero. No special action is necessary.

Module: DFHTDB

ATDY

Explanation: Transient data initialization has failed. A console message, DFH12xx, gives the reason for the failure.

System action: Transient data initialization terminates abnormally. This abend is always followed by an ATDZ abend for the failing function, and by message DFHSI1521 (if CICS abends unconditionally), or message DFHSI1522, which prompts you to reply GO or CANCEL.

User response: See the associated console message for information regarding the cause of the failure. Then respond to message DFHSI1522, if it has been issued.

Module: DFHTDRP

ATDZ

Explanation: A CICS function invoked by transient data initialization has failed. If the failing function is a transient data routine, this abend is preceded by a console message and an ATDY abend.

System action: Transient data initialization terminates abnormally. This abend is always followed by message DFHSI1521 (if CICS abends unconditionally), or message DFHSI1522, which asks you to reply GO or CANCEL.

User response: Refer to the associated console message for further information regarding the cause of the failure. Then respond to message DFHSI1522, if it has been issued.

Module: DFHTDRP DFHTDB

ATFE

Explanation: A FREEMAIN request to the storage manager has failed while CICS was executing a CEDA CHECK or CEDA INSTALL command.

System action: CICS abnormally terminates the task with a transaction dump.

User response: Use the dump and any associated messages issued by the storage manager to investigate the FREEMAIN failure.

Module: DFHTOUT1

ATGE

Explanation: A GETMAIN request to the storage manager has failed while CICS was executing a CEDA CHECK or CEDA INSTALL command.

System action: CICS abnormally terminates the task with a transaction dump.

User response: Use the dump and any associated messages issued by the storage manager to investigate the GETMAIN failure.

Module: DFHTOUT1

ATMA

Explanation: The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The domain that first detected the purged condition will have provided an exception trace.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate why the task was purged. It was purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction, or by CICS issuing a purge request.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

When CICS purges a task, it does so to allow an operation to complete which would be held up by the presence of active tasks.

Module: DFHTMP

ATMB

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error will have provided an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related message from the domain that detected the original error.

Module: DFHTMP

ATNA

Explanation: A terminal operator entered the transaction identification for NACP.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Do not reenter the NACP transaction identification (CSNE).

Module: DFHZNAC

ATNB

Explanation: The application program has issued a terminal control request for a terminal for which a previous request was terminated with an abend AZCT, because of a read timeout condition. The terminal control blocks are not in a fit state to allow a new request to be processed.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Change the application program to issue an abend when handling an abend AZCT.

Module: DFHZARQ

ATNC

Explanation: The application program has issued a terminal control request for a terminal for which a previous terminal control request was terminated with an abend ATCH, because the task was purged. The terminal control blocks are not in a fit state to allow a new request to be processed.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Change the application program to issue an abend when handling an abend ATCH.

Module: DFHZARQ

ATND

Explanation: The node error program (NEP) or NACP decides that a task should abnormally terminate, but the task is at a critical point of processing and immediate termination would put the integrity of the system at risk.

System action: The task is abnormally terminated with a CICS transaction dump when the task next requests any action against the terminal, or issues a sync point request involving the terminal.

User response: Check destination CSMT for possible further information. Use the dump to determine why the task was abnormally terminated by NEP.

Module: DFHZARQ, DFHZARL, DFHZSUP

ATNI

Explanation: There are two forms of this abend **VTAM form**

The node error program (NEP) or NACP decides the task should be abnormally

ATOA • ATOF

terminated. DFHZNAC informs the request module to abend the transaction after the TC unit has completed.

Non-VTAM form

The terminal error program (TEP) or terminal abnormal condition program (TACP) decides the task should be abnormally terminated. DFHTACP informs DFHZARQ to abend the transaction after the TC unit has completed.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: This usually occurs when, due to a hardware failure, a network device rejects the data stream sent to it. The device itself may indicate an error code that will give a specific reason for the rejection. Check the CSMT log for further information.

This abend can also result from an error in a connected system such as a mirror transaction abend.

Abend ATNI can occur if a user application does not correctly handle an error return code from an external resource manager, such as DB2.

For the NEP (VTAM) form, run a VTAM trace type=BUF for the logical unit and repeat the error.

For the TEP (non-VTAM) form, run a link trace for the line or local channel address for the device.

Examine the data stream and error response to determine the cause of the error.

This type of error occurs if the definitions in the TCT do not match the attributes of the actual device.

Module: DFHZARL, DFHZARM, DFHZARQ, DFHZRAQ, DFHSUP

ATOA

Explanation: You have attempted to invoke the CESC transaction with a terminal as principal facility. This is not allowed.

System action: CICS terminates the CESC transaction. No dump is produced.

User response: Ensure that the CESC transaction is not run against a terminal.

Module: DFHCESC

ATOB

Explanation: CICS has received an abnormal response from an EXEC CICS START TRANSACTION(CESC) request. This is caused by an internal error.

System action: CICS terminates the CESC transaction with a dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem*

Determination Guide for guidance on how to proceed.

Module: DFHCESC

ATOC

Explanation: CICS has received an abnormal response from a request to DFHZCUT to timeout a local userid table (LUIT). This is caused by an internal error in DFHZCUT.

System action: CICS terminates the CESC transaction with a dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCESC

ATOD

Explanation: CICS has received an abnormal response from an EXEC CICS CANCEL TRANSACTION(CESC) request.

System action: CICS terminates the CESC transaction with a dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCESC

ATOE

Explanation: CICS cannot determine the time at which an XRF takeover began.

System action: CICS terminates the CESC transaction with a dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCESC

ATOF

Explanation: CICS has received an abnormal response from an EXEC CICS DELAY TRANSACTION(CESC) request.

System action: CICS terminates the CESC transaction with a dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCESC

ATOG

Explanation: CICS has received an abnormal response from an EXEC CICS START TRANSACTION(CEGN) request. This is caused by an internal error.

System action: CICS terminates the CEGN transaction with a dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCESC

ATOH

Explanation: An attempt has been made to invoke the CESC transaction with an invalid function code. The CESC transaction should only be invoked by CICS. Valid codes are TERM_TIMEOUT, XRF_TIMEOUT, and ENABLE_TIMEOUT.

The most likely cause of this error is an invalid attempt by a user to invoke CESC.

System action: CICS terminates the CESC transaction with a transaction dump.

User response: Determine how CESC was invoked. If it was invoked by CICS, you will need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCESC

ATOT

Explanation: An error has occurred in the invocation of the CEGN transaction. CEGN has issued an EXEC CICS RETRIEVE command to retrieve the CEGN parameter list. Either the EXEC CICS RETRIEVE command has failed or it has succeeded but the retrieved data is invalid.

The most likely cause of this error is an invalid attempt by a user to invoke CEGN (for example, from a terminal or via an EXEC CICS START request).

System action: CICS terminates the CEGN transaction with a transaction dump.

User response: Determine how CEGN was invoked. If it was invoked by CICS, you will need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCEGN

ATOU

Explanation: The CEGN transaction has attempted to issue an EXEC CICS RETURN but the command has failed.

System action: CICS terminates the transaction with a dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCEGN

ATOV

Explanation: The CEGN transaction has attempted to issue an EXEC CICS GETMAIN, ASSIGN, or SEND but the command has failed.

System action: CICS terminates the transaction with a dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCEGN

ATPA

Explanation: An error occurred when trying to estimate the length of a CICS message owned by the message domain.

System action: CICS terminates the transaction with a dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHTPR.

ATPB

Explanation: An error occurred when trying to retrieve a CICS message from the message domain.

System action: CICS terminates the transaction with a dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHTPR.

ATPC

Explanation: An error occurred when trying to estimate the length of a CICS message owned by the message domain.

System action: CICS terminates the transaction with a dump.

ATPD • ATSC

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHTPQ.

ATPD

Explanation: An error occurred when trying to retrieve a CICS message from the message domain.

System action: CICS terminates the transaction with a dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHTPQ.

ATPE

Explanation: The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The task that first detected the purged condition will have provided an exception trace.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate why the task was purged. It was purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction, or by CICS issuing a purge request.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

When CICS purges a task, it does so to allow an operation to complete which would be held up by the presence of active tasks.

Module: DFHTPQ, DFHTPR.

ATPF

Explanation: An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error will have provided an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related message produced by the domain that detected the original error.

Module: DFHTPQ, DFHTPR.

ATRA

Explanation: The field engineering global trap exit program, DFHTRAP, requested task abnormal termination. However, the currently active task was **not** a system task (for example, task dispatcher) and it was not about to abend.

System action: CICS disables the trap exit so that it will not be reentered, and terminates the currently active task abnormally.

User response: This is a user-requested task abend.

If you want to use the trap again, you must reactivate it as follows

```
CSFE DEBUG,TRAP=ON
```

You should use the global trap exit only in consultation with an IBM support representative.

Module: DFHTRP

ATSA

Explanation: The transaction CTSD was attached other than by an internal request from the TS domain.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Investigate why the CTSD transaction was started. This transaction is intended for CICS internal use only and should not be started by a user or from a terminal.

Module: DFHTSDQ

ATSB

Explanation: The transaction CTSD was attached with invalid parameters.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHTSDQ

ATSC

Explanation: The task was canceled during execution of a temporary storage command.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Investigate the reason the task was canceled. The task has been canceled by the master terminal operator or automatically by either the deadlock timeout (DTIMEOUT) mechanism or the read timeout (RTIMOUT) mechanism.

Module: DFHEITS, DFHICP, DFHTSP

ATSD

Explanation: An INVALID or DISASTER response was received from a request to the Temporary Storage (TS) Domain.

System action: The transaction is terminated with a CICS transaction dump.

User response: There has been an earlier failure which lead to the response from TS. Investigate the earlier failure (which is accompanied by a console message and a system dump).

Module: DFHEITS, DFHICP, DFHTSP

ATSP

Explanation: A task has attempted to issue a WRITEQ TS request for a recoverable TS queue that has already been deleted in the same unit of work.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Correct the application to avoid issuing a WRITEQ TS request to a recoverable queue in a unit of work in which the queue has already been deleted.

Module: DFHEITS, DFHTSP

ATSQ

Explanation: A move of data to or from temporary storage has failed. The probable reason is that the size of the area being passed to CICS is inconsistent with the data length being used.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Identify the failing temporary storage request in the application and verify whether the length supplied on the request agrees with the data area size. Correct the application as appropriate. If the error occurs in DFHTSP and not in DFHETS, there is probably an internal logic error in temporary storage. In this case you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHEITS

ATSU

Explanation: A DISASTER response caused by an IOERR was received from a request to the Temporary Storage (TS) Domain.

System action: The transaction is terminated with a CICS transaction dump.

User response: There has been a failure during the creation of a temporary storage record. The likelihood is that an IOERR occurred during the buffer preparation prior to the new record being added to it. It is recommended that the queue be deleted to avoid future references to the failed record.

Module: DFHEITS, DFHTSP, DFHICP

ATUF

Explanation: Insufficient space exists to build the parameter list for the DYNALLOC SVC.

System action: The task is abnormally terminated and a dump is taken.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFH99KO

AUxx abend codes

AUEL

Explanation: Internal logic error in CICS user exit management. This arises when an attempt to obtain or release the lock on the chain of EPB's fails unexpectedly.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHUEM, DFHERM.

AUEP

Explanation: The task has been abnormally terminated because a return code of UERCPURG has

been sent to the User Exit Handler by a User Exit Program. The value of UERCPURG is defined by the macro DFHUEXIT TYPE=EP, ID=xxxxxxx, where xxxxxxx is the exit point by which the exit program is enabled. This code does not apply to exit points in domains. The exit program returns this value when it has made a request for CICS services using the exit programming Interface (XPI) and when the XPI call has had a RESPONSE code of PURGED. Exit programs must not set UERCPURG return code under any other circumstance.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Refer to the *CICS Customization Guide* for the use of this return code.

Module: DFHUEH

AAxx abend codes

AWB2

Explanation: The CICS Web Interface has encountered an error while performing a transaction attach call for the alias task.

System action: Message DFHWB0727 describing the error is written to the CWBO transient data destination and a trace entry is made.

User response: See the associated message for guidance.

Module: DFHWBXN

User response: CICS Web Transaction Execution should only ever be started by Sockets Domain using DFHXMAT ATTACH, not by a user at a terminal or with data.

Module: DFHWBXN

AWB5

Explanation: The CICS Web Interface Server Controller could not continue with enable processing because the requested port is not available.

System action: An exception trace entry 4106 is written, and message DFHWB0131 is issued.

User response: Terminate the TCP/IP application which is using the requested port, and use CBWB to enable the feature again, or use CWBC to enable the CICS web Interface using a different port number.

Module: DFHWBM

AWB3

Explanation: CICS Web transaction, CWXN, has been illegally started either with data, or by a user at a terminal, with the wrong start code.

System action: The CICS Web Interface is not started.

User response: CICS Web Transaction Execution should only ever be started by Sockets Domain using DFHXMAT ATTACH, not by a user at a terminal or with data.

Module: DFHWBXN

AWB7

Explanation: The CICS Web Interface environment variables program was invoked, but the invoking transaction does not appear to be executing in a valid Web environment.

System action: The program writes an exception trace point 4623.

User response: Determine how the environment variables program was invoked. It is only meaningful to execute the program from a transaction that has been initiated from the Web, either through the CICS Web Interface or through the Business Logic Interface.

Module: DFHWBENV

AWB4

Explanation: The CICS Web Transaction Execution has received a bad response from an INQUIRE_TRANSACTION call to determine the start code for the CWXN transaction.

System action: The CICS Web Interface is not started.

AWB8

Explanation: The CICS Web Interface environment garbage collection task CWBG has been started directly from a terminal. This is not permitted.

System action: The transaction is abnormally terminated with a transaction dump.

User response: None.

Module: DFHWBGB

AWB9

Explanation: The CICS Web Interface connection manager failed due to lack of storage.

System action: A transaction dump is taken.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHWBC01

AWBA

Explanation: CICS Web Receive process has received an exception response from the Web Send Receive function, DFHWBSR, which could be one of the following errors

- An error in the Analyzer program
- No Analyzer program specified
- Unable to link to Analyzer program
- An Analyzer data length error
- An Analyzer header length error
- A codepage conversion error
- A storage error occurred
- An error that the connection has been closed
- A sockets receive error

System action: An error message is sent to the client and the CWBO transient data queue.

User response: Refer to any error messages accompanying this abend to determine why the abend has occurred.

Module: DFHWBXN

AWBB

Explanation: The incoming parameter list to the CICS Web Business Logic Interface program is not in the expected format. At present, the structure is assumed to be fixed and only a single version level is recognized.

System action: The CICS Web Business Logic Interface program is not executed.

User response: Ensure that the program receives a parameter list in the correct format.

Module: DFHWBBLI

AWBC

Explanation: No commarea was passed to a CICS Web Interface utility program. One of the utility programs supplied with the CICS Web Interface was executed, but the commarea that was passed was absent or was too short to contain valid information.

System action: The CICS Web Interface utility is not executed.

User response: Ensure that the program passes a commarea that is long enough to contain the expected parameters for the utility you are invoking.

Module: DFHWBENV, DFHWBTL

AWBE

Explanation: The CICS Web Interface detected that a Converter program attempted to change the address of the response buffer when it was not allowed to do so.

System action: The data in the new response buffer is not returned to the Web browser. A CICS transaction dump is taken.

User response: The Converter program is only allowed to replace the response buffer if the converter_volatile flag in the Converter parameter list is set to '1'. Check that your Converter program is not trying to return a new response buffer when this flag is set to '0'.

Module: DFHWBBLI

AWBF

Explanation: The CICS Web Interface alias detected an error in its initialization. The alias was not started by EXEC CICS START, or there was an error in the EXEC CICS RETRIEVE command for the start data.

System action: If there is an error in EXEC CICS RETRIEVE, message DFHWB0103 is written to the CWBO destination. A CICS transaction dump is taken.

User response: If the alias was not started by EXEC CICS START, check if it is being started from a terminal. This is not allowed. Otherwise, see the associated message for guidance.

Module: DFHWBA

AWBH

Explanation: The CICS Web Interface alias detected a logic error.

System action: An exception trace entry 454F is written. Message DFHWB0106 is written to the CWBO destination. A CICS transaction dump is taken.

AWBI • AWBQ

User response: Use related diagnostics to determine the user response.

Module: DFHWBA

AWBI

Explanation: The CICS Web Interface alias received an unexpected response from EXEC CICS ASSIGN STARTCODE

System action: An exception trace entry 4544 is written. Message DFHWP0102 is written to the CWBO destination.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHWBA

AWBJ

Explanation: The CICS Web Interface alias received an unexpected response when it switched to the RP TCB.

System action: An exception trace entry 454E is written. Message DFHWP0105 is written to the CWBO destination. A transaction dump is taken.

User response: See the associated message for guidance.

Module: DFHWBA

AWBK

Explanation: The CICS Web Interface alias detected an abend in the converter or the CICS program servicing the request.

System action: An exception trace entry 4550 is written. Message DFHWP0108 is written to the CWBO destination.

User response: Use related diagnostics to determine the user response.

Module: DFHWBA

AWBL

Explanation: The CICS Web Interface alias detected an error in an EXEC CICS LINK command for program DFHWPBLLI.

System action: An exception trace entry 4543 is written. Message DFHWP0101 is written to the CWBO destination. A transaction dump is taken.

User response: See the associated message for guidance.

Module: DFHWBA

AWBM

Explanation: The CICS Web Interface alias detected error response from the Business Logic Interface program DFHWPBLLI.

System action: Message DFHWP0101 is written to the CWBO destination. A transaction dump is taken.

User response: See the associated message for guidance.

Module: DFHWBA

AWBN

Explanation: The CICS Web Interface alias detected an error in an EXEC CICS LINK command for program DFHWPBEP.

System action: Message DFHWP0101 is written to the CWBO destination. A transaction dump is taken.

User response: See the associated message for guidance.

Module: DFHWBA

AWBO

Explanation: The CICS Web Interface alias program has received a non-HTTP request for an HTTP service or a SSL request has been sent to a non-SSL TCPIP SERVICE.

System action: Message DFHWP0114 is written to the CWBO transient data destination and a transaction dump is taken. An exception trace entry, 4567, is also written.

User response: See the associated message for guidance.

Module: DFHWBA

AWBP

Explanation: The CICS Web Interface alias has detected that the application has started sending a chunked response over the socket but has not terminated the sequence of web send chunk commands with a zero length chunk.

System action: A transaction dump is taken.

User response: Check the application to see why the terminating chunk was not sent.

Module: DFHWBA

AWBQ

Explanation: The CICS Web Business Logic Interface program detected an error in its parameter list.

System action: If the abend was issued from the Business Logic Interface program, DFHWPBLLI, an

exception trace entry '4581' is made and message DFHWB0119 is written to the CWBO transient data destination. If the abend was issued from the Web Interface program, DFHWBA1, an exception trace entry '4560' is written and message DFHWB0124 is sent to the CWBO destination. A transaction dump is taken.

User response: See the associated message for guidance.

Module: DFHWBA1, DFHWBBLI

AWBR

Explanation: The CICS Web Business Logic Interface program detected a logic error.

System action: If the abend was issued from the Business Logic Interface program, DFHWBBLI, an exception trace entry '4583' is made and message DFHWB0118 is written to the CWBO transient data destination. If the abend was issued from the Web Interface program, DFHWBA1, an exception trace entry '4558' is written and message DFHWB0123 is sent to the CWBO destination.

User response: Use related diagnostics to determine the user response.

Module: DFHWBA1, DFHWBBLI

AWBU

Explanation: The CICS Web Interface connection manager could not get storage to send a message to the terminal.

System action: Processing continues.

User response: Use related diagnostics to determine the user response.

Module: DFHWBC01

AWBV

Explanation: The CICS Web Interface connection manager detected an error response on EXEC CICS DEQ.

System action: An exception trace entry 4345 is written. Message DFHWB1651 is written to the CWBO destination.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHWBC04

AWBX

Explanation: The CICS Web Interface connection manager was started against an invalid terminal type.

System action: An exception trace entry 4308 is

written. Message DFHWB1522 is written to the CWBO destination.

User response: See the associated message for guidance.

Module: DFHWBC01

AWBZ

Explanation: The CICS Web Interface connection manager detected a NOTAUTH response to EXEC CICS EXTRACT EXIT.

System action: Message DFHWB1902 is written to the CWBO destination.

User response: See the associated message for guidance.

Module: DFHWBC0B

AWC1

Explanation: The CICS Web Interface 3270 bridge exit DFHWBLT could not establish a partnership with the Web terminal translation task which started the abended transaction.

System action: An exception trace entry 4106 is written, and message DFHWB0131 is issued.

User response: Use related diagnostics to determine the user response.

Module: DFHWBLT

AWC2

Explanation: The CICS Web Interface 3270 bridge exit DFHWBLT was passed an invalid state token by attach processing.

System action: An exception trace entry 410C is written, and message DFHWB0130 is issued.

User response: Use related diagnostics to determine the user response. On a busy CICS region, the most likely cause is that the bridged transaction started after the state data had been discarded by Web 3270 garbage collection process.

Module: DFHWBLT

AWC3

Explanation: An application using the CICS Web 3270 function issued an unsupported combination of BMS and Terminal Control commands.

System action: An exception trace entry is written.

User response: Use related diagnostics to determine the user response.

Module: DFHWBLT

AWC4

Explanation: The CICS Web Interface 3270 bridge exit DFHWBLT has been reinvoked after returning an earlier error.

System action: An exception trace entry is written.

User response: Use related diagnostics to determine the user response.

Module: DFHWBLT

AWC5

Explanation: The CICS Web Interface 3270 bridge exit DFHWBLT abended during attach processing because it could not getmain a brxa user area.

System action: Message DFHWB0132 is issued, and an exception trace entry 410D is written.

User response: Use related diagnostics to determine the user response. The most likely cause of this abend is that CICS is having storage problems.

Module: DFHWBLT

AWC6

Explanation: The CICS Web Interface 3270 bridge exit DFHWBLT has detected an inconsistency in its request parameters or state data.

System action: Message DFHWB0133 is issued, and an exception trace entry is written.

User response: Use related diagnostics to determine the user response. The most likely cause of this abend is a storage overwrite.

Module: DFHWBLT

AWC7

Explanation: CICS detected an error during transaction initialization for a CICS Web alias transaction.

System action: Message DFHWB0360 is issued. No transaction dump is taken for this abend.

User response: Use related diagnostics to determine the user response. The most likely cause of this abend is an invalid userid being passed to CICS by the CICS Web Interface Analyzer user replaceable module. The userid is invalid if

- It is not defined in the external security manager
- It is revoked
- It is not authorized to access this CICS region

Module: DFHWBXM

AWC8

Explanation: CICS detected an error during transaction initialization for a CICS Web alias transaction.

System action: A transaction dump is taken for this abend.

User response: Use related diagnostics to determine the user response.

Module: DFHWBXM

AWC9

Explanation: CICS detected an error during transaction initialization for a CICS IPCONN acquire server-side transaction.

System action: A severe error message and system dump should have preceeded this abend.

User response: Use related diagnostics to determine the cause of the problem.

Module: DFHWBXM

AWKY

Explanation: A request to PURGE or WRITE a record using the global catalog during warm keypointing has failed.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check for problems with the global or local catalog. See any DFHCCnnnn messages issued by the CICS catalog domain for further guidance.

Module: DFHWKP

AWSC

Explanation: A container which is required by a SOAP Feature pipeline stage was not found.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check that user-written programs in earlier pipeline stages use the correct containers.

Module: DFHWSPMI,DFHWSPMO

AWSH

Explanation: A BTS activity that represents a stage in the SOAP Feature pipeline was found by the pipeline manager to be in an incorrect state.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check that user-written programs in earlier pipeline stages use the correct BTS protocols.

Module: DFHWSPMI,DFHWSPMO

AWSL

Explanation: The SOAP Feature inbound pipeline manager could not link to the message adapter.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check previous CICS messages to determine why the message adapter could not be linked to.

Module: DFHWSPMI

AWSN

Explanation: An EXEC CICS DEFINE COUNTER or EXEC CICS GET COUNTER command has returned a bad response.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check the options table DFHNCOPT for possible errors. Look in the CICS job log for any AXMSCnnnn messages.

Module: DFHWSDSH

AWSP

Explanation: An application making a Web Service request passed a SOAPAction HTTP request header exceeding 256 bytes in length to the SOAP Feature pipeline.

System action: The task is abnormally terminated.

User response: Check that SOAPAction headers exceeding 256 bytes in length are not constructed by applications invoking Web Services.

Module: DFHWSRT

AWSQ

Explanation: This is normal behavior when a user stage of the pipeline abends.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Correct the user abend.

Module: DFHWSPMI

AWSR

Explanation: Either the TARGET-URI or the REQUEST-BODY container was not found when an application invoked the SOAP Feature pipeline to make a Web Service request.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check that the application making the Web Service request supplies the required containers.

Module: DFHWSRT

AWSS

Explanation: The SOAP Feature service provider pipeline was requested to invoke the message adapter under a different transaction ID or user ID to the pipeline, but was unable to satisfy the request.

System action: The task is abnormally terminated.

User response: Check that transaction ID and user ID requested are valid, and that the user ID with which the pipeline is running is a surrogate of the requested user ID.

Module: DFHWSPMI

AWST

Explanation: The HTTP or WebSphere MQ transport stage of the SOAP Feature pipeline has encountered an input or output error.

System action: The task is abnormally terminated.

User response: Use CICS or WebSphere MQ messages to help you determine the cause of the problem. The error may be transient, in which case you can retry.

Module: DFHWSTOH

AWSU

Explanation: An invalid URI was passed to the SOAP Feature requester pipeline as the location of a Web Service provider.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check that applications making Web Service requesting specify valid URIs for locations of Web Service providers.

Module: DFHWSRT

AWSY

Explanation: A problem was encountered in the DFHPIRT outbound router program. This usually implies that one of the containers used by DFHPIRT was not populated correctly.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check that applications using DFHPIRT correctly populate the control containers required for pipeline processing.

Module: DFHPIRT

AXxx abend codes

AXF0

Explanation: A task has been purged due to lack of storage in a dynamic storage area (DSA).

System action: The task is abnormally terminated with a transaction dump.

User response: Try the transaction again later.

If the short-on-storage condition persists, consider increasing the size limit of the CICS DSAs. You can vary the DSAs dynamically using the DSALIM and EDSALIM parameters on the CEMT master terminal command.

Module: DFHXFP

AXF1

Explanation: The storage manager module, DFHSMGF, has returned a condition not expected by DFHXFP.

System action: The task is abnormally terminated with a transaction dump.

User response: Look for any related CICS messages and abends to determine if there has been a prior failure in CICS storage.

Module: DFHXFP

AXF2

Explanation: A task has been purged due to lack of storage in the DSA.

System action: The task is abnormally terminated with a transaction dump.

User response: Try the transaction again later.

If the short-on-storage condition persists, increase the size of the dynamic storage area using the DFHSIT DSA parameter.

Module: DFHXFP

AXF3

Explanation: The storage manager module DFHSMMC has returned a condition not expected by DFHXFP.

System action: The task is abnormally terminated with a transaction dump.

User response: Look for any related CICS messages and abends to determine if there has been a prior failure in CICS storage.

Module: DFHXFP

AXF4

Explanation: The task was purged before a GET_BUFFER request to the EXEC interface service routines module (DFHEISR), was able to complete successfully. The domain that first detected the purged condition provides an exception trace.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate why the task was purged. It was purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Module: DFHXFX

AXF5

Explanation: An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to the EXEC interface service routines module (DFHEISR). The domain that detected the original error provides an exception trace, a console message, and possibly, a system dump (depending on the options specified the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related message from the domain that detected the original error.

Module: DFHXFX

AXF8

Explanation: A keyword such as TOKEN, CONSISTENT, REPEATABLE, UNCOMMITTED, or NOSUSPEND has been specified on a file control command for shipping to a system which does not support these functions.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Ensure that CICS in the file-owning

region is at the correct level.

Module: DFHXFX

AXFA

Explanation: The key length for a file control request that is to be sent to a remote system has to be obtained from the file control table, and has proved to be zero.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Ensure that the key length has been defined either in the remote file definition that is being used, or as a length option from the application program that is using it.

Module: DFHXFP

AXFB

Explanation: An unacceptable function management header (FMH) type has been found. It must be type 05, type 06, or type 43.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXFP

AXFC

Explanation: The request passed to the data transformation program is unknown to CICS. This abend can also occur in an MRO/IRC system as a result of an invalid EXEC CICS START request issued from the user's node error program (DFHZNEP).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the *CICS Customization Guide* for restrictions on the use of EXEC CICS commands from within an NEP. If this is not the cause of the abend, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXFP

AXFD

Explanation: The request that is passed to the data transformation program cannot be sent to a remote system; for example, a storage control request.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem*

Determination Guide for guidance on how to proceed.

Module: DFHXFP

AXFE

Explanation: The transformation requested does not exist; for example, a DL/I schedule reply is not recognized by the outbound request processor in the data transformation program.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXFP

AXFF

Explanation: An unacceptable queue organization has been found in a queue model function management header (FMH).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXFP

AXFG

Explanation: An unacceptable argument number has been found in the data following a function management header (FMH) of type 43.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXFP

AXFH

Explanation: The argument number in the data following a function management header (FMH) of type 43 is acceptable, however, the argument itself is not expected.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXFP

AXFI

Explanation: The data length for a WRITEQ TD or READQ TD, which is determined from the destination control table, is zero. The abend can also occur when determining the length for file control requests from the file control table.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Notify the system programmer.

Module: DFHXFP

AXFJ

Explanation: The error code held in UIBFCTR and UIBDLTR cannot be converted to an equivalent SNA error code.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXFP

AXFL

Explanation: Transformers 2 and 4 expect to receive a function management header (FMH), possibly followed by user data. A null chain of data has been received.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXFP

AXFM

Explanation: The ISCINVREQ condition has been raised. This can happen when the resource proves to be on yet another remote system, that is, when daisy-chaining is active.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check that daisy-chaining of requests is intended and that all relevant intersystem links are in service.

Module: DFHXFP

AXFO

Explanation: The check on the DS and DBA parameters in an attach function management header (FMH) has failed. This abend represents a user error resulting from a mismatch in the system definitions for both ends of an intersystem link.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Notify the system programmer.

Module: DFHXFP

AXFP

Explanation: CICS requires a second function management header (FMH) to follow an attach FMH. No second FMH was received.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Notify the system programmer.

Module: DFHXFP

AXFQ

Explanation: Either the function management header (FMH) just received is too short or too long to be a valid FMH, or an expected FMH is not present.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check that the transaction profile parameter, INBFMH, is set to ALL. If communicating across a distributed program link, ensure that the requested function is supported on the partner system.

Module: DFHXFP

AXFR

Explanation: The CICS command level interface imposes a maximum length of 32767 for data. The length of the data just received exceeds this limit.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Notify the system programmer.

Module: DFHXFP

AXFS

Explanation: A PSB has been scheduled successfully. However, the maximum possible length of an I/O area exceeded 65535. This abend is likely to occur if path calls are used to retrieve large segments, and/or if FLS causes excessive expansion of segments.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Notify the system programmer.

Module: DFHXFP

AXFT

Explanation: An estimate of the size of the output I/O area has been made, and it exceeds the maximum possible size of 65535. While the estimated size may exceed the actual size, the difference will only be a few bytes.

This abend is likely to occur if a database calls, inserts, or replaces multiple segments, and many qualified segment search arguments are specified.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Notify the system programmer.

Module: DFHXFP

AXFU

Explanation: A two-level cursor is present in a function management header (FMH) relating to a linear (temporary storage) queue. However, these cursors are valid only for hierarchical queues that are not supported by CICS.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXFP

AXFW

Explanation: An invalid length specification has been given in a CICS command-level request corresponding to one of the data variables.

The CICS-architected FMH is followed by zero or more self-describing data variables for each parameter specified.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check for an invalid or zero length specified in a CICS command-level request, or for data truncation in a user-written node error program (NEP).

Module: DFHXFP

AXFX

Explanation: A function shipping request by an APPC link failed because

- the remote system does not support full syncpoint protocols, or

- the exchange log name sequence could have failed, resulting in a mismatch, or
- the request has not completed within the allocated time (10 seconds).

System action: CICS terminates the task abnormally.

User response: Check that the request was directed to the correct remote system, and that the remote system is set up to support full syncpoint protocols (synclevel 2).

Module: DFHXFP

AXFY

Explanation: An APPC conversation failure has occurred when an attach between CICS systems was issued.

System action: The task is abnormally terminated with a transaction dump.

User response: Check the connection to the remote CICS system and try to reestablish it.

Module: DFHXFP

AXGA

Explanation: Program DFHAPCR has returned an unexpected response. DFHAPCR performs the following functions:-

- Extracts the contents of all containers making up a channel and transmits them to a remote system.
- Recreates the channel and containers from inbound data received from a remote system.

DFHAPCR has either detected an error in inbound data or has received an unexpected response whilst extracting or recreating channel data.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Look for any related CICS messages and abends to determine if there has been a prior failure in Program Manager, which manages containers. Look for exception trace entries from Program Manager or DFHAPCR to determine the cause of the error.

Module: DFHXFX,DFHXFP

AXMA

Explanation: An error has occurred obtaining a lock within the transaction manager domain.

System action: The recovery routine of the module in control is invoked which issues message DFHXM0002 with a system dump. DFHXM0002 reports the module in control at the time of the error.

User response: See the description of message DFHXM0002 for further guidance.

AXMB • AXSA

Module: DFHXMAT, DFHXMBD, DFHXMCL, DFHXMDD, DFHXMGD, DFHXMLD, DFHXMQD, DFHXMST, DFHXMTA, DFHXMXD, DFHXMXE

AXMB

Explanation: An error has occurred releasing a lock within the transaction manager domain.

System action: The recovery routine of the module in control is invoked. This routine issues message DFHXM0002 with a system dump. DFHXM0002 reports the module in control at the time of the error.

User response: See the description of message DFHXM0002 for further guidance.

Module: DFHXMAT, DFHXMBD, DFHXMCL, DFHXMDD, DFHXMGD, DFHXMLD, DFHXMQD, DFHXMST, DFHXMTA, DFHXMXD, DFHXMXE

AXMC

Explanation: A severe error has occurred allocating a unique transaction number to a new transaction.

System action: The recovery routine of the module in control is invoked. This routine issues message DFHXM0002 with a system dump. DFHXM0002 reports the module in control at the time of the error.

User response: See the description of message DFHXM0002 for further guidance.

Module: DFHXMAT, DFHXMXE

AXMD

Explanation: An attempt has been made to run the CICS internal task CSXM as a user transaction.

System action: CICS terminates the task with a transaction dump.

User response: Investigate why the attempt was made to run CSXM as a user transaction.

Module: DFHXMAB

AXMU

Explanation: During transaction attach the userid that had been assigned to the transaction was found to be invalid.

System action: CICS terminates the task with a transaction dump.

User response: Determine how the invalid userid had been assigned to the transaction. It might have been output by a user-replaceable module.

Module: DFHXMAT

AXMY

Explanation: During transaction attach an unexpected error occurred obtaining transaction class membership.

System action: The transaction is no longer considered for class membership. It is then abnormally terminated with a CICS transaction dump.

User response: Use the dump to determine why the transaction failed to obtain membership of its transaction class.

Module: DFHXMAT

AXMZ

Explanation: A serious failure in another component has been detected by the transaction manager domain.

System action: The task in control is abnormally terminated with a transaction dump. Further diagnostics should have been taken by the failing component.

User response: Look for earlier messages identifying the source of the problem. Refer to the descriptions of these messages for further guidance.

Module: DFHXMTA

AXSA

Explanation: The CICS security control task could not complete because a necessary step failed. The task has done some essential recovery operations and abnormally terminated itself with code AXSA.

System action: CICS writes a transaction dump for the security control restart task.

CICS sends messages to the console, one to identify the error detected by the security control task, and, if the error occurred during initialization, one to say that security initialization or CEMT PERFORM SECURITY REBUILD has failed. A third message follows either to say that CICS has terminated abnormally with a dump, or to ask you to reply GO or CANCEL. Depending on the nature of the original error, you may see messages from some other system component (for example, an access method).

User response: First, if CICS has requested a response, you must reply. If you reply 'GO', CICS continues processing, but without support for the external security manager. CICS security still operates. If you reply 'CANCEL', CICS terminates abnormally with a dump.

Use the messages and dumps to find out the cause of the failure.

Module: DFHXSMN

AXSC

Explanation: The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The task that first detected the purged condition will have provided an exception trace.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate why the task was purged. It was purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Module: DFHXSMN

AXSD

Explanation: An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related message produced by the domain that detected the original error.

Module: DFHTCRP

AXTA

Explanation: The calculation of the length of data to be shipped has failed.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXTP

AXTB

Explanation: An attempt to obtain a TIOA to ship data has failed.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXTP

AXTC

Explanation: An attempt to transform data ready for shipment has failed.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXTP

AXTD

Explanation: No TIOA received message was received from a remote system.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXTP

AXTE

Explanation: Incorrect data was received from a remote system. The data was not long enough.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXTP

AXTF

Explanation: No relay process function management header (FMH) was received from the remote system.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

AXTG • AXTM

Module: DFHXTP

AXTG

Explanation: Transformation of data received from remote system failed.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check that the reason for failure of the transformation process was not incorrect definition of the remote terminal. In particular check that the user area length specified for the terminal is the same in both local and remote systems. If the terminal definitions are correct, you need further assistance to resolve this problem. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXTP

AXTH

Explanation: An attempt to locate terminal identifier failed.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXTP

AXTI

Explanation: The major request byte LUCOPN0 of the DFHLUC parameter list specified to the transaction-routing transformer is invalid, or corresponds to a request that is not shipped to a remote system. The parameter list will be found in the dynamic storage of XTP's caller and may be located using the output from auxiliary trace.

System action: The task is abnormally terminated with a transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXTP

AXTJ

Explanation: An unexpected combination of bit settings in the fields XTSSTAT and XTSTCOPC in the parameter list of the transaction-routing transformer was made.

System action: The task is abnormally terminated with a transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXTP

AXTK

Explanation: An APPC conversation failure occurred when an attach between CICS systems was issued.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check the connection to the remote CICS system and try to reestablish it.

Module: DFHXTP

AXTL

Explanation: The processing of APPC mapped data requires the generation of an APPC attach FMH with default values. In particular, the sync level requested is defaulted to 2. However, the session that is to be used has been bound with a sync level of 1.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check that

- The entry in the TCT for the remote system has been defined with parallel sessions
- The remote system is capable of supporting a sync level of 2.
- Exchange lognames has completed for the connection. You can use the command CEMT INQUIRE CONNECTION to do this. See the *CICS Intercommunication Guide* for more details of the exchange lognames process.
- The correct sync level has been requested.

Module: DFHXTP

AXTM

Explanation: An attempt has been made to route a message-protected transaction over an APPC link bound at sync level 1. The attempt has failed because such transactions can be routed only over an APPC link that has been bound at sync level 2.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: If the transaction is to be routed to CICS OS/2 (which is bound at synclevel 1), remove the message protection option. If the transaction is to be routed to another host system and message protection is required, the link must be redefined so that it can be bound at synclevel 2.

Module: DFHXTP

AXTN

Explanation: Module DFHXTP detected that the application buffer chained off a TCTTE at offset TCTERCSA has a corrupted header. This is caused either by a CICS logic error or by a storage overwrite.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: This is a CICS internal logic error. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHETL

AXTO

Explanation: An exception response has been returned to the DFHXTP module from the CICS security manager. Prior to the call to the CICS security manager, the DFHXTP module detected that a shipped terminal definition had preset security. DFHXTP then invoked the CICS security manager in order to perform a preset security signon for the userid sent with the shipped terminal information. It is this preset security signon attempt which failed.

System action: The transaction routing request is terminated and a message is sent to the terminal owning region (TOR) to indicate that the transaction routing request has failed. The CICS security manager issues a DFHSNxxxx message to the transient data queue, CSCS.

User response: The most likely cause of this abend is that the terminal being shipped to the application owning region (AOR) has preset security with a userid which is not valid in the AOR. To confirm this, check the associated DFHSNxxxx message on the CSCS transient data queue in the AOR which gives the precise reason for the failure of the preset security signon request. This could be the result of an unauthorized transaction routing request.

Module: DFHXTP

AXTP

Explanation: An exception response has been returned to the DFHXTP module from DFHCCNV FUNCTION(CONVERT_DS3270_FOR_SBCS). The module was called for a CICS client virtual terminal which requested conversion from ASCII to EBCDIC for data coming from the client. However, the conversion failed.

System action: The transaction routing request is terminated and a message is sent to the terminal owning region (TOR) to indicate that the transaction routing request has failed. The CICS security manager issues a DFHSNxxxx message to the transient data queue, CSCS.

User response: Examine the response and reason returned in the DFHCCNV commarea DFHC32. The client and server codepages will have already been validated so this may be a CICS error. You may need to contact IBM for further assistance. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXTP

AXTQ

Explanation: An exception response has been returned to the DFHXTP module from DFHCCNV FUNCTION(CONVERT_DS3270_FOR_SBCS). The module was called for a CICS client virtual terminal which requested conversion from EBCDIC to ASCII for data to be sent to the client. However the conversion failed.

System action: The transaction routing request is terminated and a message is sent to the terminal owning region (TOR) to indicate that the transaction routing request has failed. The CICS security manager issues a DFHSNxxxx message to the transient data queue, CSCS.

User response: Examine the response and reason returned in the DFHCCNV commarea DFHC32. The client and server codepages will have already been validated so this may be a CICS error. You may need to contact IBM for further assistance. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXTP

AXTR

Explanation: An exception response has been returned to the DFHXTP module from DFHPGLE FUNCTION(LOAD_EXEC) whilst trying to load EXEC program DFHCCNV.

System action: The transaction routing request is terminated and a message is sent to the terminal owning region (TOR) to indicate that the transaction routing request has failed. The CICS security manager issues a DFHSNxxxx message to the transient data queue, CSCS.

User response: Examine the response and reason returned from DFHPGLE to determine why CICS was unable to call DFHCCNV.

Module: DFHXTP

AXTS

Explanation: One of the following conditions has occurred.

- A transaction running in an AOR has created a channel. The transaction has terminated by issuing EXEC CICS RETURN TRANSID CHANNEL to name

AXTU • AZAG

the next transaction in the pseudo-conversation and pass the channel to it. However the TOR is not at a high enough CICS level to support channels.

- A transaction running in an AOR has created a channel. The transaction has terminated by issuing EXEC CICS RETURN TRANSID CHANNEL to name the next transaction in the pseudo-conversation and pass the channel to it. The channel is transmitted to the TOR and is held there until the next transaction in the pseudo-conversation starts. However, when the next transaction is initiated, it is found to reside in an AOR that is not at a high enough CICS level to support channels.

System action: The transaction routing request is terminated and a message is sent to the terminal owning region (TOR) to indicate that the transaction routing request has failed.

User response: If channels are passed between transactions in a pseudo-conversation, you must ensure that all TOR and AOR systems involved in passing the channel are at a high enough CICS level to support channels.

Module: DFHXTP

AZxx abend codes

AZAB

Explanation: DFHZARM has a SEND DATA request with a data length greater than 65528 bytes which is the maximum that it can process.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: This is a CICS internal logic error. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARM

AZAD

Explanation: DFHZCN1 has been started from an unexpected system. The CCIN transaction can only be issued by a client.

System action: The transaction is abnormally terminated. Exception trace point AP3008 is written. Data1 holds the XMIQ start type.

User response: Issue the CCIN transaction only from a client.

Module: DFHZCN1

AZAE

Explanation: DFHZCN1 was started from a terminal facility, but not an LU6.2 session. The CCIN transaction may only be issued by a client.

AXTU

Explanation: Program DFHAPCR has returned an unexpected response. DFHAPCR performs the following functions:-

- Extracts the contents of all containers making up a channel and transmits them to a remote system.
- Recreates the channel and containers from inbound data received from a remote system.

DFHAPCR has either detected an error in inbound data or has received an unexpected response whilst extracting or recreating channel data.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Look for any related CICS messages and abends to determine if there has been a prior failure in Program Manager, which manages containers. Look for exception trace entries from Program Manager or DFHAPCR to determine the cause of the error.

Module: DFHXTP

System action: The transaction is abnormally terminated.

User response: Issue the CCIN transaction only from a client.

Module: DFHZCN1

AZAF

Explanation: DFHZCN1 was started for transaction CCIN. However either the environment is wrong or the client architecture has been violated. This abend is always issued in conjunction with a DFHZC32nn message which explains the problem in more detail.

System action: Exception trace point AP30xx is written. The transaction is abnormally terminated.

User response: Look for a DFHZC32nn message on the console or CSNE and look for exception trace points AP30xx. Use these to diagnose the problem.

Module: DFHZCN1

AZAG

Explanation: DFHZCT1 has been started from an unexpected system. The CTIN transaction can only be issued by a client.

System action: The transaction is abnormally terminated with a CICS transaction dump. Exception trace point AP302A is written. Data1 holds the XMIQ start type.

User response: Issue the CTIN transaction only from a client.

Module: DFHZCT1

AZAH

Explanation: DFHZCT1 was started from a terminal facility, but not an LU62 session. The CTIN transaction can only be issued by a client.

System action: The transaction is abnormally terminated with a CICS transaction dump. Exception trace point AP3032 is written. Data1 holds the principal facility address.

User response: Issue the CTIN transaction only from a client.

Module: DFHZCT1

AZAI

Explanation: DFHZCT1 was started for transaction CTIN. However either the environment is wrong or the client architecture has been violated. This abend is always issued in conjunction with a DFHZC32nn message which explains the problem in more detail.

System action: Exception trace point AP30xx is written. The transaction is abnormally terminated.

User response: Look for a DFHZC32nn message on the console or CSNE and look for exception trace points AP30xx. Use these to diagnose the problem.

Module: DFHZCT1

AZAJ

Explanation: DFHZCN1 was started for transaction CCIN. However, the CCIN transaction is being started on a surrogate, which means that it has been defined as a remote transaction. CCIN must be a local transaction and be run on a CICS region which is directly connected to a client.

System action: Exception trace point AP3041 is written. The transaction is abnormally terminated.

User response: Either use the default definitions for CCIN or ensure that it is defined as a local transaction.

Module: DFHZCN1

AZAK

Explanation: DFHZCT1 was started for transaction CTIN. However, the CTIN transaction is being started on a surrogate, which means that it has been defined as a remote transaction. CTIN must be a local transaction and be run on a CICS region which is directly connected to a client.

System action: Exception trace point AP3039 is written. The transaction is abnormally terminated.

User response: Either use the default definitions for CTIN or ensure that it is defined as a local transaction.

Module: DFHZCT1

AZCA

Explanation: An internal logic error has been detected during APPC mapped processing. The conversation state maintained by DFHZARL does not match that maintained jointly by DFHETL and DFHZARM.

The problem may also arise when CICS is assembling application data and receives end of chain before receiving all of the data that is expected.

System action: The task is abnormally terminated with a CICS transaction dump. CICS processing continues.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARM

AZCB

Explanation: CICS has received sense code X'088901xx during APPC mapped processing. This should be followed by an error data GDS (generalized data stream) variable.

CICS has attempted to receive the error data. However this attempt has failed because no data has been received or because the data received is not for an CICS ISSUE ERROR of the correct length.

CICS expects the error data to indicate that the other system does not recognize GDS ID X'12F2 (function management data).

System action: The task is abnormally terminated with a CICS transaction dump.

The erroneous GDS ID is returned to the remote system for further analysis there.

User response: Check for session failure and for abend by the transaction in the other system.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARM

AZCC

Explanation: The failing transaction has sent function management data to a transaction running in a system that does not provide support for application function management data.

System action: The task is abnormally terminated with a CICS transaction dump.

AZCD • AZCI

User response: Check that the remote system can support application function management data.

Module: DFHZARM

AZCD

Explanation: A possible intersystem logic error has been detected during APPC mapped processing. The length of application data that is to be received (as determined from the LL fields and concatenation flags) does not match the length actually received. CICS determines the length of application data that is to be received from the LL fields and concatenation flags. However, CICS has not received all of the data that is expected.

This abend can be caused by a loss of data following the failure of a persistent sessions restart in a partner system. In this case, no logic error has occurred because any updates are backed out.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: If this abend is not caused by the failure of a persistent sessions restart in a partner system, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHETL, DFHZARM

AZCE

Explanation: An intersystem error has been detected during APPC mapped processing. The length of application data that is to be received (as determined from the LL fields and concatenation flags) exceeds the CICS implementation limit of 32Δ767, for receive and converse commands, or 65Δ000 for CICS transaction routing or function shipping requests.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Reduce the amount of data that the transaction in the remote system is transmitting to CICS.

Module: DFHETL, DFHZARM

AZCF

Explanation: An internal logic error has been detected during APPC mapped processing. An invalid request has been passed to DFHZARL.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARM

AZCG

Explanation: An internal logic error has been detected during APPC mapped processing. DFHZARM expects the TCTTE passed to have been defined as APPC, TCTEILUC (TCTELUC) set on, and TCTECVT set to TCTEMAPD (to indicate a mapped conversation).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARM

AZCH

Explanation: Sense code X'0889xxxx has been received unexpectedly during the processing of APPC mapped data.

This represents a violation of the APPC architecture by the remote system.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHETL, DFHZARM

AZCI

Explanation: The processing of APPC mapped data requires generation of an APPC attach function management header (FMH) with default values. In particular, the sync level requested is defaulted to 2. However, the session that is to be used has been bound with a sync level of 1.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check that

- The entry in the TCT for the remote system has been defined with parallel sessions.
- The remote system is capable of supporting a sync level of 2.
- Exchange lognames has completed for the connection. You can use the CEMT INQUIRE CONNECTION to do this. See the *CICS Intercommunication Guide* for details of the exchange lognames process.

Module: DFHETL, DFHZARM, DFHZARQ

AZCJ

Explanation: An APPC structured field with GDS ID X'12F1 (null data) has been sent to a remote system that does not support the receipt of these fields. The remote system has responded negatively and has terminated the conversation.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: The problem is in the remote system. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARM

AZCK

Explanation: An internal logic error has been detected during error recovery for APPC mapped processing. The conversation was being switched to RECEIVE state by an internal CICS SEND INVITE, but the conversation had already been FREEd by the partner.

System action: The task is abnormally terminated with a CICS transaction dump. CICS processing continues.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARM

AZCL

Explanation: CICS has received sense code X'088901xx during APPC mapped processing. The generalized data stream (GDS) should contain a valid GDS identity in the error data but CICS does not recognize the value. The values recognized by CICS are

X'12F1'.null data
X'12F2'.function management data
X'12FF'.application data.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check for session failure and for an abend by the transaction in the other system.

Module: DFHZARM

AZCM

Explanation: An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the related message produced by the domain that detected the original error.

Module: DFHZARM

AZCN

Explanation: The task has been purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The task that first detected the purged condition provides an exception trace.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate why the task was purged. It was purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Module: DFHZARM

AZCO

Explanation: The VTAM persistent sessions initialization transaction CGRP has been started directly from a terminal. This is not permitted. This transaction can only be started internally by CICS.

System action: The transaction is abnormally terminated with a transaction dump.

User response: None.

Module: DFHZCGRP

AZCP

Explanation: A logic error has been detected in ZCP. An allocation request for a starting task cannot be satisfied.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem*

AZCQ • AZCV

Determination Guide for guidance on how to proceed.

Module: DFHZSUP DFH62XM

AZCQ

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the recovery manager (RM) domain to change the recovery status of an intercommunication session. The domain provides an exit trace, and possibly a console message and a system dump (depending on the options specified in the dump table).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: This failure is either the result of a task purge, or it represents a CICS logic error and you will need assistance from IBM.

See the related diagnostic material produced by the recovery manager domain.

Module: DFHZSUP DFHMRXM DFH62XM

AZCR

Explanation: A logic or protocol error has been detected during processing of an APPC SYNCPOINT ROLLBACK request. An attempt has been made to restore the conversation state to what it was after completion of the last successful unit of work. This saved state does not match flows received from the partner.

The problem arises during rollback in one of the following situations

- The saved state is receive, and the partner sent change direction on the last flow, indicating that the partner expects CICS to be in send state
- The saved state is send, and the partner did not send the change-direction indicator on the last flow, indicating that the partner expects CICS to be in receive state.

System action: The task is abnormally terminated with a CICS transaction dump. Other processing continues.

User response: The problem can arise because of a failure in CICS, or a failure in the partner. To determine which is failing, analyze the flows at the last successful syncpoint. Try to determine the states the two LUs were in at this point. Look at the last syncpoint flow into CICS from the partner, before the abend. From this flow, calculate whether the change-direction indicator on the SPCMOD modifier byte is on. (See the *SNA Formats* manual for further information on the SPCMOD modifier byte.) The indicator must only be set when the saved CICS conversation state is send. If the last CICS state was send, and the indicator is on, CICS is at fault. Similarly, if the last CICS state was receive, and the indicator is off, CICS is at fault.

If the last CICS state was send and the indicator is off, or the last CICS state was receive, and the indicator is on, CICS has received a change-direction indicator when it was not expecting one. In this case, examine the partner for a logic error.

Module: DFHZARL

AZCT

Explanation: A terminal read-time-out condition has been detected. The transaction has been waiting for a terminal input message for an interval longer than specified in the RTIMOUT value for that transaction.

Coding RTIMOUT in the PROFILE entry causes the task to be abnormally terminated if the terminal does not send input within the specified time.

System action: The transaction is abnormally terminated. A dump is not provided unless the dump table entry for transaction dump code AZCT indicates that one should be taken.

User response: If a HANDLE ABEND command has been issued for this task, the read that was timed-out is still outstanding. In order to cancel this read, issue an ABEND command at the end of the user exit routine so that CICS can clean up the terminal's TCTTE. No further terminal control commands should be issued.

Module: DFHZARQ

AZCU

Explanation: The COVR transaction has been started directly from a terminal, or by a START command. This is not permitted. This transaction can only be started internally by CICS.

System action: The transaction is abnormally terminated. No transaction dump is taken.

User response: None.

Module: DFHZCOVR

AZCV

Explanation: A logic error has been detected in the COVR transaction while trying to connect to VTAM.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZCOVR

AZCW

Explanation: An attempt has been made to run the CICS internal task CSTP as a user transaction.

System action: CICS terminates the task with a transaction dump.

User response: Investigate why the attempt was made to run CSTP as a user transaction.

Module: DFHZCSTP

AZI1

Explanation: An IRC data transmission request has been issued, but cannot be completed because the transmission protocol has been violated.

If the session is not used for distributed transaction processing, that is if it is used for function shipping or transaction routing, then the problem is caused by a CICS logic error.

If the session is used for distributed transaction processing, then the following are possible causes of the abend

- An invalid terminal control command, such as ISSUE SIGNAL, was issued
- A send request was issued but the session was not in send state, or a read request was issued but the session was not in receive state.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Determine the cause of the abend and if appropriate, correct the application. For further guidance, refer to the section on the EXEC Interface block (EIB) in the *CICS Intercommunication Guide*. The EIB describes the state of the session after a request has been issued.

Module: DFHZARQ

AZI2

Explanation: An IRC data transmission request has been issued but cannot be completed. Possible causes of the problem include

- The transaction running in the connected system has been purged, or
- The transaction running in the connected system has been timed out, or
- The abending transaction has attempted to SEND while in RECEIVE state, or
- The abending transaction has attempted to RECEIVE while in SEND state.

If the abend was caused by DFHIRP rejecting the transmission request, the dump will contain DFHIRP's return code in the field TCTEIRET for the TCTTE representing the failed IRC session. The address of this

TCTTE is in field B of the trace entry representing the DFHTC data transmission request.

The meanings of the DFHIRP return codes are given in the copybook, DFHIRSDS.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: If the cause of the error was a purge or a time-out, no further action is required.

If the error was caused by a condition such as an attempted SEND while in RECEIVE state or vice versa, analyze the dump and correct the protocol violation.

Module: DFHZARQ

AZI3

Explanation: A terminal control request issued by an application to a remotely-owned terminal failed because the conversation with the other system failed.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARQ

AZI4

Explanation: An IRC data transmission request has been issued, but cannot be completed because the other system has become unavailable for interregion communication.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Rerun the transaction when IRC is available.

Module: DFHZARQ

AZI5

Explanation: An IRC data transmission request has been issued, but the data sent by the connected system in response to the request violated IRC protocols.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARQ

AZI6

Explanation: The transaction was connected to another transaction in another CICS system via an IRC link. This other transaction has abnormally terminated.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Correct the cause of the abend in the connected transaction.

Module: DFHZARQ

AZI7

Explanation: The transaction was processing an MRO request which involved waiting for a response from a connected subsystem. The “wait” request was rejected by the CICS dispatcher.

System action: The transaction is abnormally terminated with a dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZIS2

AZI8

Explanation: The error log data received with an ISSUE-ABEND flow on an IRC connection was not in the correct format.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZIS1

AZI9

Explanation: The transaction was processing an MRO request which involved waiting for a response from a connected subsystem. During the wait, the failing transaction was purged. The purge can only have been the result of operator action, such as a CEMT SET TASK PURGE.

System action: The task is abnormally terminated with a dump.

User response: Investigate the reason the transaction was purged.

Module: DFHZIS2

AZIA

Explanation: The transaction attempted to acquire or free storage during MRO processing. The response from the CICS storage manager (SM) domain indicated that the request was invalid.

System action: The task is abnormally terminated with a dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZIS2

AZIB

Explanation: The transaction was purged whilst waiting for storage to receive MRO data from a connected subsystem. The purge may have been the result of operator action, such as CEMT SET TASK PURGE, or as the result of the waiting time exceeding the DTIMOUT value for the transaction.

System action: The task is abnormally terminated with a dump.

User response: If the condition is caused by time-out, examine the DTIMOUT value for the failing transaction and increase it if it is too low.

Module: DFHZIS2

AZIC

Explanation: An INVALID, DISASTER, or EXCEPTION condition has occurred on a call to the storage manager domain (DFHSMGFM) to FREEMAIN a CRB control block.

The domain that detected the original error provides an exception trace, a console message, and possibly a system dump.

System action: The task is abnormally terminated with a transaction dump.

User response: Please see the related message from the domain that detected the original error.

Module: DFHZIS2

AZID

Explanation: A PURGED condition has occurred on a call to the storage manager domain (DFHSMGFM) to FREEMAIN a CRB control block.

The domain that detected the original error provides an exception trace.

System action: The task is abnormally terminated with a transaction dump.

User response: Investigate why the task was purged. It was purged either as a result of a purge from the

master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Module: DFHZIS2

AZIE

Explanation: An interregion communication (IRC) ISSUE-ERROR or ISSUE-ABEND flow has been received in violation of IRC protocols. This can be caused by

- A CICS logic error. IRC protocols are not available to MRO distributed transaction processing applications. They are for CICS internal use only.
- A transaction abend on a connected system. This results in an FMH 7 flow over an LU6.2 connection and causes this abend to be issued.

System action: The task is abnormally terminated with a transaction dump.

User response: Check whether a mixture of mapped and unmapped conversations are being used as this can cause this abend. Check for any other reasons for transactions to be abending on the attached system.

If a CICS logic error is involved, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARQ

AZIF

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the recovery manager (RM) domain to change the recovery status of an intercommunication session. The domain provides an exit trace, and possibly a console message and a system dump (depending on the options specified in the dump table).

This is either the result of a task purge, a CICS logic error, or of the inappropriate use of the indoubt test transaction, CIND. CIND should be activated only on the CICS system where the syncpoint processing was initiated. In particular, CIND should not be used on any of the CICS mirror transactions.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Determine whether CIND has been activated for a transaction that did not initiate the syncpoint processing. If CIND is not being used see the related diagnostic material produced by the recovery manager domain and determine the reason for the failure.

In the case of a CICS logic error, you need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARQ

AZIG

Explanation: An MRO session read-time-out condition has been detected. The transaction has been waiting for an MRO session for an interval longer than specified in the RTIMOUT value for that transaction.

Coding RTIMOUT in the PROFILE entry causes the task to be abnormally terminated if the session does not respond within the specified time.

System action: The transaction is abnormally terminated. A dump is not provided unless the dump table entry for transaction dump code AZIG indicates that one should be taken.

User response: If a HANDLE ABEND command has been issued for this task, the read that was timed-out is still outstanding. In order to cancel this read, issue an ABEND command at the end of the user exit routine so that CICS can clean up the terminal's TCTTE. No further terminal control commands should be issued.

Module: DFHZIS2

AZR2

Explanation: Module DFHZARRA is unable to acquire main memory for a new application buffer because the storage manager GETMAIN failed.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Use the trace to identify the failing return from the storage manager and analyze the reason for failure.

Module: DFHZARRA

AZR3

Explanation: During a GETMAIN request, the storage domain detected that the task has been purged.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Use the trace to investigate why the

AZR4 • AZRE

task was purged. Check if the master terminal operator was responsible.

Module: DFHZARRA

AZR4

Explanation: An unexpected response has been received from a dispatcher domain call.

System action: The transaction is abnormally terminated with a transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARER

AZR5

Explanation: An unexpected response has been received from a dispatcher domain call.

System action: The transaction is abnormally terminated with a transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARR1

AZR6

Explanation: An exception condition was raised as the result of a request from the APPC communications routine DFHZARL to the CICS recovery manager domain. This is either caused by a CICS logic error or by the inappropriate use of the indoubt test transaction, CIND. CIND should be activated only on the CICS system where the syncpoint processing was initiated. In particular, CIND should not be used on any of the CICS mirror transactions.

System action: The transaction is abnormally terminated with a transaction dump.

User response: Determine whether CIND has been activated for a transaction that did not initiate the syncpoint processing. If CIND is not being used, you will need further assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARER

AZRA

Explanation: DFHZARRC detected that the address of an FMH in the APPC was not in the receive buffer. The cause could either be a storage overwrite or a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. Check the TCTTE in the transaction dump for printable characters or other signs of a storage violation error.

Module: DFHZARRC

AZRB

Explanation: Module DFHZARR0 was called with an invalid first parameter. The first parameter should be the code of the function to be performed. This is a CICS logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, then a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARR0

AZRD

Explanation: The logical and physical APPC receive buffers have become out of step. This problem is caused either by a storage overwrite or by a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, then a level 1 and 2 trace of the TC component would aid problem determination. Check the TCTTE in the transaction dump for printable characters or other signs of a storage violation error.

Module: DFHZARR0

AZRE

Explanation: The logical APPC receive buffer (addressed by TCTERBLA) starts before or after the physical receive buffer (addressed by TCTERBLA). This is not valid as the logical receive buffer is the part of the physical receive buffer that is yet to be processed. This problem could be caused either by a storage overwrite or by a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible then a level 1 and 2 trace of the TC component would aid problem determination. Check the TCTTE in the transaction dump for printable characters or other signs of a storage violation error.

Module: DFHZARR0

AZRF

Explanation: The DFHZUSR state machine has returned an invalid state error at a point where it should not be possible. This is a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, then a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARRF

AZRG

Explanation: The DFHZUSR state machine has returned an invalid state error at a point where it should not be possible. This is a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, then a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARR

AZRH

Explanation: The DFHZARR state variable RECEIVE_TYPE, used to control receive processing, has been set to an invalid value. The only other module that has access to this variable is DFHZARRF. This is a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, then a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARR

AZRI

Explanation: One of the parameters passed to DFHZARR1. was invalid. This is a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, then a

level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARR1

AZRJ

Explanation: The length of a record that DFHZARR0 has been requested to remove from the APPC receive buffer, is longer than the buffer itself. This problem could be caused either by a storage overwrite or by a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. Check the TCTTE in the transaction dump for printable characters or other signs of a storage violation error.

Module: DFHZARR0

AZRK

Explanation: The DFHLUC parameter list passed back from DFHZERH to DFHZARRF contained an invalid combination of LUCCIERR, LUCCIFRE, and LUCCIRBK fields. This is a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARRF

AZRL

Explanation: Module DFHZARRF was called with an invalid first parameter. The first parameter should be the code of the function to be performed. This is a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARRF

AZRM

Explanation: Module DFHZARR called one of its own internal routines at the wrong time. This is a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARR

AZRN

Explanation: The DFHLUC parameter list passed back from DFHZERH to DFHZARRF did not have LUCCIERR set on. This is a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARRF

AZRO

Explanation: Module DFHZARER was called with an invalid first parameter. The first parameter should be the code of the function to be performed. This is a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARER

AZRP

Explanation: Module DFHZARER detected an invalid response from DFHZNAC. This is a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARER

AZRQ

Explanation: Module DFHZARRA was called with an invalid parameter. This is a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARRA

AZRR

Explanation: Module DFHZARRA detected that the application buffer chained off of a TCTTE at offset TCTERCSA had a corrupted header. This is caused either by a CICS logic error or by a storage overwrite. The exception trace point that accompanies this abend code gives the TCTTE address.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. Check the TCTTE in the transaction dump for printable characters or other signs of a storage violation error.

Module: DFHZARRA

AZRS

Explanation: Module DFHZARRA is unable to acquire main memory for a new application buffer into which it is supposed to copy some data. This is because the DFHLUC receive request is SUBTYPE=LLID, SET=YES and DFHZARRA does not know the length to acquire on the GETMAIN. DFHZARRA requires the length of the record currently being received, but it has been set to 0 in error. This is a CICS logic error. The exception trace point that accompanies this abend code gives the TCTTE address.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARRA

AZRT

Explanation: Module DFHZARRA has detected that the application buffer, into which it is supposed to copy some data, is invalid. This is either because the address of the buffer is zero or because its length is less than that of the data to be copied into it. This is a CICS logic error. The exception trace point that accompanies this abend code gives the buffer address and length plus the data address and length.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARRA

AZRU

Explanation: Module DFHZARRF detected an unexpected response from DFHZARR0. This is a CICS logic error. The exception trace point that accompanies this abend code gives the invalid response code.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, then a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARRF

AZRV

Explanation: Module DFHZARR1 detected an unexpected response from DFHZARR0. This is a CICS logic error. The exception trace point that accompanies this abend code gives the invalid response code.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: One of the parameters passed to DFHZARR1

AZRW

Explanation: Module DFHZARRA detected a negative record length in the TCTTE (field TCTELLC). This is caused either by a CICS logic error or by a storage overwrite. The exception trace point that accompanies

this abend code gives the TCTTE address and the value of TCTELLC.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. Check the TCTTE in the transaction dump for printable characters or other signs of a storage violation error.

Module: DFHZARRA

AZRY

Explanation: Module DFHZARR detected an unexpected response from DFHZARRC. This is a CICS logic error. The exception trace point that accompanies this abend code gives the invalid response code.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARR

AZRZ

Explanation: Module DFHZARR detected an unexpected response from an internal subroutine. This is a CICS logic error. The exception trace point that accompanies this abend code gives the invalid response code.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARR

AZSO

Explanation: An invalid request was passed via the DFHZSTAM macro to the processing DFHZSTAP program. This is a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZSTAP

AZS1

Explanation: No TCTTE pointer was passed via the DFHZSTAM macro to the processing DFHZ program. This is a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZSTAP

AZS2

Explanation: The TCTTE passed via the DFHZSTAM macro to the processing DFHZSTAP program does not relate to an MRO or an APPC Conversation. This is a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZSTAP

AZS3

Explanation: The TCTTE passed via the DFHZSTAM macro to the processing DFHZSTAP program for an APPC Conversation, but the LUC Extension Control Block was not located. This is a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZSTAP

AZS4

Explanation: While processing a DFHZSTAM request in DFHZSTAP, the DFHZUSRM LUC State Machine was found to have an invalid setting. This is a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZSTAP

AZS5

Explanation: Whilst processing a DFHZSTAM request in DFHZSTAP, the Internal State number was found to have an invalid setting. This is a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZSTAP

AZS6

Explanation: Whilst processing a DFHZSTAM request in DFHZSTAP, the Internal State number was found to have an invalid setting. This is a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZSTAP

AZT1

Explanation: The task has been attached improperly in the application-owning region when transaction routing.

System action: CICS abnormally terminates the transaction with a transaction dump.

User response: The conversation with the routing system should be an MRO session or an LU type 6.2 conversation. Ensure that the transaction is being attached by the CICS relay program in the connected system and not by a user program.

If the transaction is being attached by the CICS relay program in the connected system, you need further assistance to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZTSP

AZT3

Explanation: The task is being routed back to the region from where it came.

System action: CICS abnormally terminates the transaction with a transaction dump.

User response: Correct the transaction definition.

Module: DFHZTSP

AZT6

Explanation: The task in the application-owning region has received a ROLLBACK request from the terminal-owning region, but the conversation is continuing. The terminal-owning region has violated the transaction routing protocol.

System action: CICS abnormally terminates the transaction with a transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZTSP

AZT7

Explanation: A session terminal control table (TCT) entry for a remotely owned APPC terminal or connection could not be added to the TCT.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZTSP

AZT8

Explanation: A session terminal control table (TCT) entry for a remotely owned APPC terminal or connection could not be deleted from the TCT.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZTSP

AZT9

Explanation: A session terminal control table (TCT) entry for a remotely owned APPC terminal or connection could not be deleted from the TCT because it is locked by another task.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: The other task may be transitory in nature, and if so, another attempt will succeed.

Module: DFHZTSP

AZTA

Explanation: The task does not own a terminal as its principal facility.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZTSP

AZTB

Explanation: An attempt to install or delete a remote terminal in this CICS system has failed. This may be because CATA was trying to install a local terminal at the same time as CITS was installing a remote terminal with the same termid. In this situation CICS gives priority to the locally installed terminal (CATA). This abend can also occur if the CITS/CDTS/CMTS/CFTS transactions are not available (that is , if the transactions have not been installed).

System action: DFHZTSP is abnormally terminated with a CICS transaction dump.

User response: If there was an abend AZI6/AZTS abend in the TOR then retry the request after the locally installed terminal with the same TERMID has logged off. Otherwise, verify that the listed transactions exist and have been installed. If the failure persists then you need further assistance to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZTSP

AZTC

Explanation: An attempt to install or delete a remote terminal in this system has failed. This is because a short-on-storage (SOS) condition has caused the failure of a GETMAIN for the attach of CITS, CDTS, or CFTS. This abend can also occur during shutdown if the transaction definition specifies SHUTDOWN(DISABLED).

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Investigate the reason for the SOS condition. See the *CICS Problem Determination Guide* for guidance on dealing with the SOS condition.

Retry the transaction later.

Module: DFHZTSP

AZTF

Explanation: DFHZTSP tried to GETMAIN or FREEMAIN a TCTTE whose length (TCTTETEL) is longer than the largest TCTTE SUBPOOL and is therefore invalid. This implies a storage violation or a CICS internal logic error.

System action: The transaction is abnormally terminated with a CICS transaction dump.

User response: Use the transaction dump to identify the TCTTE in error. First, check whether this is a storage overwrite. If so, check in your statistics to see if you are getting a number of storage violations caused by the same transaction. If this is the case, then a user-supplied application is probably causing the problem.

If it is not a storage violation problem, or if there is a random storage violation, there might be an error in CICS. In this case, you need further assistance to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZTSP

AZTG

Explanation: An attempt has been made to attach a task on a remotely-owned terminal without an intersystem TCTTE as its principal facility.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZTSP

AZTH

Explanation: An error response was received from the remote terminal control macro.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZTSP

AZTI

Explanation: An attempt has been made to attach a task on a remotely-owned terminal, but the terminal is not defined in this system as a remotely-owned terminal.

This may occur after an AZVK abend when CICS attempts to delete the surrogate TCTTE, but there is still a transaction running against it.

Alternatively, another task holds a lock on this terminal.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check the terminal control table definitions in the systems involved. If the definitions are correct, check that no other tasks have locks held on the terminal (CECI, for example).

Check to see if an AZVK abend occurred earlier for this terminal and determine if the link session timing out was the original cause. All should be well once the long running transaction finishes.

Module: DFHZTSP

AZTL

Explanation: An attempt has been made to attach a task to a remotely-owned terminal that cannot be used to run this transaction.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Inform the system programmer. Check the terminal control table definitions in the systems involved.

Module: DFHZTSP

AZTM

Explanation: The data received from the remote system does not contain an FMH (function management header).

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZTSP

AZTN

Explanation: Conversation with a remote system has been unexpectedly terminated.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZTSP

AZTO

Explanation: The TCTTE ownership chain is in error.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZTSP

AZTP

Explanation: A BMS TYPE=STORE request issued on behalf of a remote transaction failed.

System action: The task abnormally terminates with a CICS transaction dump.

User response: Inform the system programmer. Check that the required BMS support has been generated.

Module: DFHZTSP

AZTQ

Explanation: Invalid BMS data received from remote system.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZTSP

AZTR

Explanation: A BMS TYPE=PAGEOUT request issued on behalf of a remote system failed.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Ensure that the required BMS support has been generated.

Module: DFHZTSP

AZTS

Explanation: An attempt to send data to a remote system failed.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Investigate why the conversations with the remote system failed. The transaction on the remote system has probably been abnormally terminated or the session has failed.

If message 'DFHZC4930 Session unbound following read timeout.' occurred just before the AZTS then the AZTS is caused by a timeout occurring on an APPC session when CICS attempted to converse with the remote system.

Module: DFHZTSP

AZTT

Explanation: An attempt was made to attach a task on a remote system, but the connection with the remote system is not an APPC or MRO connection.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Redefine the connection as APPC or MRO, or avoid using transaction routing on this connection.

Module: DFHZTSP

AZTU

Explanation: The task does not own the link TCTTE after a sync point has been taken.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZTSP

AZTV

Explanation: An invalid function management header (FMH) has been received from the remote system.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZTSP

AZTW

Explanation: An attempt was made to attach a task on a remotely-owned terminal that was already running a task.

This may be caused by a read time out occurring in the terminal owning region for the link session being used by this transaction. The read timeout is specified in profile DFHCICSS. Although the session has timed out the transaction may still be running and the surrogate TCTTE is unable to accept any more transactions until the first one has finished.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check the terminal control table definitions in the systems involved.

Check to see if a read timeout abend occurred on the TOR for the same terminal to determine if this is the cause. Wait until the transaction terminates before retrying any further transactions on this terminal.

AZTY • AZVE

Module: DFHZTSP

AZTY

Explanation: A session TCT entry for a remotely owned APPC terminal or connection could not be created because to do so would exceed the maximum number of APPC sessions permitted.

The maximum number of sessions depends on whether the PTF shipped for APAR PQ27823 is installed. The basic limit is 46656 and the names are in the range -AAA to -999. The APAR doubles this limit to 93312 giving an additional range of AAA- to 999-.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Inform the system programmer. Either wait for the system to become less busy, or delete some APPC sessions.

The system programmer should consider increasing the number of CICS TORs.

Module: DFHZTSP

AZTZ

Explanation: The CICS relay program DFHCRT has been attached in an unsupported manner.

System action: CICS abnormally terminates the transaction with a transaction dump.

User response: The relay transaction executes with an MRO session or an LU type 6.2 conversation as its principal facility. Ensure that the transaction is being attached by APPC terminal sharing logic and not directly by a user transaction.

If the transaction is being attached by APPC terminal sharing logic, you need further assistance to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZTSP

AZVA

Explanation: DFHZTSP has timed out waiting for service transaction CITS to complete during the creation of a remote terminal while attaching a task in the application-owning region.

The probable cause of this is that the application-owning region is very busy, so the CITS transaction has been waiting to be dispatched for longer than the timeout value allowed by DFHZTSP. Lack of storage on the target system is one possible reason why CITS has not been dispatched, or has been dispatched but has not completed.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Retry the transaction when the system becomes less busy. For more information on improving transaction throughput on the target system, see the *CICS Performance Guide*.

Module: DFHZATS

AZVB

Explanation: DFHZCQ has failed to create the remote terminal definition. A previous message or messages should indicate the reason for the failure.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: See the previous message or messages for further guidance.

Module: DFHZATS

AZVC

Explanation: An unexpected error has occurred in DFHZATS. This is probably caused by DFHZATS being unable to address the CSA, EIB or the TCA. It can also occur if DFHZATS is called with an EXEC CICS START command for transactions CITS, CFTS, CMTS or CDTS. These are internal CICS transactions and should not be called in this way.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZATS

AZVD

Explanation: An unexpected error has occurred in the install procedure of DFHZATS.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: This is a CICS logic error. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZATS

AZVE

Explanation: DFHZATS is trying to install a remote terminal with the same terminal id as an existing TCT entry.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Change the terminal names to ensure that a duplicate does not occur in the same system.

Module: DFHZATS

AZVF

Explanation: One of the remote install or delete transactions of DFHZATS (CITS, CFTS, CMTS or CDTS) has been started directly from a terminal. This is not permitted. These transactions can only be started internally by CICS.

System action: The transaction is abnormally terminated with a transaction dump.

User response: None.

Module: DFHZATS

AZVG

Explanation: An error has occurred in the remote delete routines.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZATS

AZVH

Explanation: An error has occurred in the remote delete routine during the mass deletion of remote terminals.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZATS

AZVI

Explanation: An error has occurred in the remote delete routine while an attempt was being made to delete a single remote terminal.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Check the CADL transient data queue for any associated messages indicating the reason for the error. If you cannot resolve the problem, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZATS

AZVJ

Explanation: An error has occurred during the mass deletion of remote terminals. This is caused by a CICS logic error.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZATS

AZVK

Explanation: An unexpected return code has been received from the remote delete routine during the deletion of a single remote terminal.

This may occur after an AZTW abend when CICS attempts to delete the surrogate TCTTE, but there is still a transaction running against it. It may also occur without an AZTW if the link session timed out leaving the transaction in the AOR still running but followed by a logoff from the terminal which initiated the long running transaction.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Look for an accompanying DFHZC6911 message indicating the reason for the delete failure, and take appropriate action.

Check to see if the link session for this terminal timed out and whether the terminal then issued another transaction or logged off. All should be well once the long running transaction finishes.

Module: DFHZATS

AZVL

Explanation: An error has occurred during the mass flagging of remote terminals for deletion.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZATS

AZVM

Explanation: An error has occurred in DFHZATMF. This is probably caused by DFHZATMF being unable to address the CSA, EIB, or the TCA.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM

AZVN • AZXA

to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZATMF

AZVN

Explanation: The remote delete flag transaction of DFHZATMF (CRMF) has been started directly from a terminal. This is not permitted. This transaction can only be started internally by CICS.

System action: The transaction is abnormally terminated with a transaction dump.

User response: None.

Module: DFHZATMF

AZVO

Explanation: The remote delete transaction of DFHZATMD (CRMD) has been started directly from a terminal. This is not permitted. This transaction can only be started internally by CICS.

System action: The transaction is abnormally terminated with a transaction dump.

User response: None.

Module: DFHZATMD

AZVP

Explanation: An error has occurred in DFHZATMD. This is probably caused by DFHZATMD being unable to address the CSA, EIB, or the TCA.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZATMD

AZVQ

Explanation: A request to install a shipped terminal definition has been rejected by the autoinstall user program.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Retry the transaction when the system is less busy.

Module: DFHZATS

AZVR

Explanation: An attempt to install a shipped terminal definition has failed because the autoinstall user program has issued an unexpected return code.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Examine the autoinstall user program to determine why this return code was issued.

Module: DFHZATS

AZVS

Explanation: An attempt to install a shipped terminal definition has failed because an error has occurred in the autoinstall user program.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: Examine the autoinstall user program to determine the reason for the failure.

Module: DFHZATS

AZVU

Explanation: DFHZATS was attempting to autoinstall a shipped terminal, a virtual terminal or a shipped connection and the autoinstall URM was called. However the autoinstall failed for one of the following reasons

- The name returned by the URM in SELECTED_SHIPPED_TERMID started with one of these characters
- The value in the SIT VTPREFIX parameter contained imbedded blanks or a character that is not allowed for terminal names.

System action: The task is abnormally terminated with a CICS transaction dump.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZATS

AZXA

Explanation: An unexpected error, with reason code 5, has been detected in the catchup program, DFHZXCU. See the description of message DFHXG6492 for further details.

System action: Console message DFHXG6492 is issued, and CICS continues after abending the transaction.

User response: Refer to message DFHXG6492.

Module: DFHZXCU

AZXB

Explanation: An unexpected error, with reason code 4, has been detected in the catchup program, DFHZXCU. See the description of message DFHXG6492 for further details.

System action: Console message DFHXG6492 is issued, and CICS continues after abending the transaction.

User response: Refer to message DFHXG6492.

Module: DFHZXCU

Chapter 4. System abend and dump codes

Abend and dump codes used by:

- The CICS system
- IMS/ESA
- The CICS translator
- The CICS system dump program
- The CICS utility program, DFHCSDUP
- The external CICS interface
- The CICS JVM interface
- Language Environment

are described in the following topics.

CICS system dump codes

Whenever a CICS system dump is requested, CICS references a system dump code that corresponds to the event that caused the dump request to be made. This is done in order to see what further action should be taken. More information about this can be found in the *CICS Problem Determination Guide*.

In most cases, system dump codes correspond to a DFH message with the DFH tag stripped off. For example, system dump code DM0001 corresponds to message DFHDM0001 with the DFH tag removed. For further information, look up the relevant message where appropriate.

However, there are some exceptions to this format, as shown in the following list.

System dump code

Corresponding message or exception condition

ABNDU603

This system dump code refers to a USER abend code and is associated with message DFHSR0603.

ABNDU605

This system dump code refers to a USER abend code and is associated with message DFHSR0605.

APTRAPPC

This system dump code is associated with message DFHTR1001.

APTRAPUS

This system dump code is associated with message DFHTR1000.

APUSER

This system dump code is issued through the use of the CEBT transaction when performing a PERFORM SNAP command.

APXRFTO

This system dump code has no DFH message associated with it. An error in the currently active CICS system has occurred. An alternate CICS system is now taking control and is requesting that the active CICS system produces a dump of itself.

MT0001

This system dump code has no DFH message associated with it. It

indicates that a dump was requested by a user of CEMT, issuing either a PERFORM SNAP or a PERFORM DUMP.

DHxx (IMS/ESA) abend codes

If the IMS high-level programming interface (HLPI) has found a condition caused by a programming error, or if DL/I has returned a status code to HLPI which indicates an error, IMS/ESA returns a status code xx to CICS Transaction Server for z/OS. A few of the more common abend codes are listed below. For a full list of xx status codes that can make up a DHxx abend, refer to the *IMS/ESA Application Programming: EXEC DLI Commands* manual.

DHTA

Explanation: A task has issued a program specification block (PSB) schedule request but the PSB could not be found.

User response: See the description of the DL/I status code TA in the *IMS/ESA Application Programming: EXEC DLI Commands* manual for guidance.

DHTC

Explanation: A task has issued a program specification block (PSB) schedule request but the PSB has already been scheduled.

User response: See the description of the DL/I status code TC in the *IMS/ESA Application Programming: EXEC DLI Commands* manual for guidance.

DHTE

Explanation: A task has issued a program specification block (PSB) schedule request but a PSB initialization error occurred.

User response: See the description of the DL/I status code TE in the *IMS/ESA Application Programming: EXEC DLI Commands* manual for guidance.

DHTG

Explanation: A task has issued a terminate request but the request failed because the program specification block (PSB) is not scheduled.

User response: See the description of the DL/I status code TG in the *IMS/ESA Application Programming: EXEC DLI Commands* manual for guidance.

DHTH

Explanation: A task has issued a DL/I request but the request failed because the program specification block (PSB) is not scheduled.

User response: See the description of the DL/I status code TH in the *IMS/ESA Application Programming: EXEC DLI Commands* manual for guidance.

DHTJ

Explanation: A task has issued a program specification block (PSB) schedule request but the request failed because CICS is not connected to DBCTL.

User response: See the description of the DL/I status code TJ in the *IMS/ESA Application Programming: EXEC DLI Commands* manual for guidance.

DHTQ

Explanation: A task has issued a program specification block (PSB) schedule request but the request failed.

User response: See the description of the DL/I status code TQ in the *IMS/ESA Application Programming: EXEC DLI Commands* manual for guidance.

01xx (translator) abend codes

0100 LISTING FILE CANNOT BE OPENED

Explanation: The listing data set has not opened successfully.

System action: The CICS command level translator terminates abnormally. A system dump is produced if a SYSABEND or SYSUDUMP DD statement is provided.

User response: Ensure correct JCL or determine what is causing the open error.

Module: DFHEAP (for assembler language), DFHECP (for COBOL), DFHEDP (for C), DFHEPP (for PL/I)

0101 UNRECOVERABLE TRANSLATOR ERROR

Explanation: The translator encountered a program check from which it could not recover.

System action: The CICS command-level translator terminates abnormally. A system dump is produced if a

SYSABEND or SYSUDUMP DD statement is provided.

User response: You need further assistance from IBM to resolve this problem. See the *CICS Problem*

Determination Guide for guidance on how to proceed.

Module: DFHEAP (for assembler language), DFHECP (for COBOL), DFHEDP (for C), DFHEPP (for PL/I)

02xx (DFHPD650) abend codes

0211 RECURSIVE PROGRAM CHECK

Explanation: A program check has occurred while the system dump formatting program was handling an earlier program check.

System action: The system dump formatting program terminates abnormally. A system dump is produced if a SYSABEND or SYSUDUMP DD statement is provided.

User response: The program check preceding the abend is accompanied by message DFHPD0123. See the description of this message for more guidance.

Module: DFHPD

Explanation: A sixth program check has occurred during execution of the system dump formatting program.

System action: The system dump formatting program terminates abnormally. A system dump is produced if a SYSABEND or SYSUDUMP DD statement is provided.

User response: This abend is preceded by five DFHPD0123 messages, one for each of the five earlier program checks. See the description of this message for more guidance.

Module: DFHPD

0212 TOO MANY PROGRAM CHECKS

03xx (DFHCSDUP) abend codes

0300

Explanation: The SYSIN data set has not opened successfully.

System action: The CSD batch update utility terminates abnormally. If a SYSABEND or SYSDUMP DD statement is provided, a system dump is produced.

User response: Ensure that the JCL is correct and that the SYSIN data set exists in sequential form. If necessary, examine the SYSIN DD statement to determine the cause of the error.

Module: DFHCSDUP

User response: Ensure that the record length specified in the SYSIN data set is no greater than 80.

Module: DFHCSDUP

0303

Explanation: The SYSPRINT data set did not open successfully.

System action: The CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

User response: Ensure that the SYSPRINT data set exists. If necessary, examine the SYSPRINT DD statement to determine the cause of the error.

Module: DFHCSDUP

0301

Explanation: The RECFM parameter specified in the SYSIN data set is invalid.

System action: The CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

User response: Ensure that the RECFM parameter in the SYSIN data set is either F or V.

Module: DFHCSDUP

0304

Explanation: DFHCSDUP has found an unrecognized resource type code in a CSD record. The unrecognized code does not match any of the function codes in the language definition table. This can occur for one of the following reasons:

1. You are using a CICS release that does not support a type of definition that was created on the CSD file by a later CICS release.
2. The language definition table (DFHEITSP or DFHEITCU) is invalid for this CICS release.
3. The CSD manager (DFHDMP) has passed an invalid CSD record buffer to DFHPUP. This is a CICS internal logic error.

System action: The CSD batch update utility

0302

Explanation: The record length specified in the SYSIN data set is invalid.

System action: The CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

User response: Determine which of the possible reasons caused the error. If you can eliminate reasons 1 and 2, you can assume that reason 3 applies.

Take action corresponding to the reason you have established as follows:

1. Ignore the message.
2. Ensure that the library contains versions of DFHEITSP and DFHEITCU that are valid for the CICS release you are running.
3. You need further assistance from IBM to resolve this problem. See *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCSDUP

0305

Explanation: An unexpected return code was received either while trying to close the alternate SYSIN and SYSPRINT DCBs (CLOSEDCB) or while trying to free the task local storage (FREETLS).

System action: The CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

User response: You need further assistance from IBM to resolve this problem. See *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCSDUP

0307

Explanation: An attempt to print the input command failed. Since messages cannot be issued, the utility must terminate.

System action: The CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

User response: You need further assistance from IBM to resolve this problem. See *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCSDUP

0308

Explanation: During the migration of a TCT table, a bad command sequence was found. This can occur for one of the following reasons:

- TYPETERM was not preceded by TERMINAL
- TERMINAL was not followed by TYPETERM

System action: The CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

User response: Correct the TCT table to be migrated and rerun the job.

Module: DFHCSDUP

0309

Explanation: DFHCSDUP has found an unrecognized function code in a command. This is a CICS internal logic error.

System action: The CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

User response: You need further assistance from IBM to resolve this problem. See *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCSDUP

0321

Explanation: An internal error has occurred in module DFHCSDUP when invoked by a CSD utility command.

System action: Message DFH5100 is issued and the CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

User response: You need further assistance from IBM to resolve this problem. See *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCSDUP

0322

Explanation: While processing a MIGRATE command, the specified table to be migrated could not be loaded.

System action: Message DFH5601 is issued and the CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

User response: You need further assistance from IBM to resolve this problem. See the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCSDUP

0323

Explanation: While processing a command, VSAM detected an error.

System action: Message DFH5179 is issued preceded by either DFH5177 or DFH5178 depending on the error and the CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

User response: See the description of the issued messages to determine the cause of the error.

Module: DFHCSDUP

0325

Explanation: When the LIST command invoked DFHDMP to scan the objects on the CSD file, an error occurred during execution of the DFHDMP function.

System action: Message DFH5180 is issued and the CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

User response: You need further assistance from IBM to resolve this problem. See the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCSDUP

0326

Explanation: There has been an internal logic error in the DFHCSDUP utility program. The data in the back-translated output buffer is invalid. The length code may be out of range or the data fields in the wrong sequence. One or more of the data fields may be invalid.

System action: Message DFH5184 is issued and the CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

User response: You need further assistance from IBM to resolve this problem. See the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCSDUP

0327

Explanation: The language table DFHEITCU could not be loaded.

System action: The CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

User response: Refer to the preceding message which should specify the reason for the failure. You need further assistance from IBM to resolve this problem. See the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCSDUP

0328

Explanation: The language table DFHEITCU could not be unloaded.

System action: The CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

User response: Refer to the preceding message

which should specify the reason for the failure. You need further assistance from IBM to resolve this problem. See the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCSDUP

0330

Explanation: The cross reference table size for the table being migrated is too small.

System action: The CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP statement is provided, a system dump is produced.

User response: You need further assistance from IBM to resolve this problem. See the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCSDUP

0331

Explanation: DFHCSDUP was invoked to perform an EXTRACT command using a Language Environment-conforming HLL user exit, but the utility failed to initialize the CEE environment successfully.

System action: The CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP statement is provided, a system dump is produced. Register 15 contains the initialization return code.

User response: You need further assistance from IBM to resolve this problem. See the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCSDUP

0332

Explanation: DFHCSDUP was invoked to perform an EXTRACT command using a Language Environment-conforming HLL user exit, but during execution the utility received a bad return code from the Language Environment.

System action: The CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP statement is provided, a system dump is produced. Register 15 contains the Language Environment return code. code.

User response: You need further assistance from IBM to resolve this problem. See the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCSDUP

04xx (external CICS interface) abend codes

0401

Explanation: An external CICS interface (EXCI) request was issued using the CALL API or the EXEC API, and the EXCI stub DFHXCSTB link-edited with the application detected that it was running in AMODE 24. The external CICS interface only supports calls made in AMODE 31.

System action: The application terminates abnormally.

User response: Change the application so that EXCI calls are made in AMODE 31, or relink-edit the application AMODE 31.

Module: DFHXCSTB.

0402

Explanation: The external CICS interface module DFHXCPRH issued an MVS ESTAE macro to establish a recovery environment, but a nonzero return code was returned from MVS.

System action: The application terminates abnormally with a dump.

User response: Examine the dump and any associated MVS messages produced to determine why the MVS ESTAE request failed.

If the error occurred while processing an INITIALIZE_USER request on behalf of the application, an attempt to format the dump using the CICS IPCS dump formatter does not produce any formatted output. This is because the error occurred too early in EXCI initialization for there to be any control blocks.

Module: DFHXCPRH

0403

Explanation: The external CICS interface module DFHXCPRH issued an MVS GETMAIN request to obtain storage for its XCGLOBAL block, but a nonzero return code was returned from MVS.

System action: Module DFHXCPRH issues an MVS abend with abend code 0403 which invokes its ESTAE routine to clear up its environment. A SYSMDUMP is taken before returning control to the application. An application using the EXCI CALL API receives RESPONSE(SYSTEM_ERROR) REASON(XCGLOBAL_GETMAIN_ERROR) in its return area. The subreason1 field of the return area contains the R15 return code from MVS indicating why the GETMAIN failed. An application using the EXCI EXEC API receives RESP(LINKERR) RESP2(602).

User response: Use the MVS R15 return code obtained from the application or from the dump to determine why the MVS GETMAIN request failed. If the

reason is insufficient storage, increase the region size of the batch application.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter does not produce any formatted output for the job because the error occurred too early in EXCI initialization for there to be any control blocks.

Module: DFHXCPRH

0404

Explanation: The external CICS interface module DFHXCPRH needed to take an MVS SDUMP for an earlier reported problem. However the error has occurred too early in EXCI initialization for EXCI dump services to be available.

System action: Module DFHXCPRH issues an MVS abend with abend code 0404 which invokes its ESTAE routine from which a SYSMDUMP is taken instead of an SDUMP to capture the earlier reported problem.

User response: Examine the SYSMDUMP to determine the cause of the earlier reported problem.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter does not produce any formatted output for the job because the error occurred too early in EXCI initialization for there to be any control blocks.

Module: DFHXCPRH

0405

Explanation: The external CICS interface module DFHXCPRH issued an IEFSSREQ SSI verify request to MVS to determine the number of the CICS SVC type 3 SVC to use. The SSI VERIFY request failed.

System action: Module DFHXCPRH issues an MVS abend with abend code 0405 which invokes its ESTAE routine to clear up its environment. A SYSMDUMP is taken before returning control to the application. An application using the EXCI CALL API receives RESPONSE(SYSTEM_ERROR) REASON(SS_VERIFY_FAILED) in its return area. The subreason1 field of the return area contains the R15 return code from MVS indicating why the SSI verify failed. An application using the EXCI EXEC API receives RESP(LINKERR) RESP2(606).

User response: Use the MVS R15 return code obtained from the application or from the dump to determine why the SSI VERIFY request failed.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter does not produce any formatted output for the job because the error occurred too early in EXCI initialization for there to be any control blocks.

Module: DFHXCPRH

0406

Explanation: The external CICS interface module DFHXCPRH called the CICS SVC to initialize the EXCI environment. The CICS SVC call failed.

System action: Module DFHXCPRH issues an MVS abend with abend code 0406 which invokes its ESTAE routine to clear up its environment. A SYSMDUMP is taken before returning control to the application. An application using the EXCI CALL API receives RESPONSE(SYSTEM_ERROR) REASON(CICS_SVC_CALL_FAILURE) in its return area. The subreason1 field of the return area contains the R15 return code from the CICS SVC indicating why it failed. An application using the EXCI EXEC API receives RESP(LINKERR) RESP2(607).

User response: Use the MVS R15 return code obtained from the application or from the dump to determine why the CICS SVC call failed.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter does not produce any formatted output for the job because the error occurred too early in EXCI initialization for there to be any control blocks.

Module: DFHXCPRH

0407

Explanation: The external CICS interface module DFHXCPRH issued a call to the CICS SVC to check whether the SVC in use is at the correct level to be used with the external CICS interface. The check failed indicating that the CICS SVC is not at the correct level.

System action: Message DFHEX0100 is output, and module DFHXCPRH issues an MVS abend with abend code 0407 which invokes its ESTAE routine to clear up its environment. A SYSMDUMP is taken before returning control to the application. An application using the EXCI CALL API receives RESPONSE(SYSTEM_ERROR) REASON(INCORRECT_SVC_LEVEL) in its return area. An application using the EXCI EXEC API receives RESP(LINKERR) RESP2(627).

User response: See the explanation of message DFHEX0100 for guidance.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter does not produce any formatted output for the job because the error occurred too early in EXCI initialization for there to be any control blocks.

Module: DFHXCPRH

0408

Explanation: The external CICS interface module DFHXCPRH issued an MVS GETMAIN request for its working storage but a nonzero return code was returned from MVS.

System action: Module DFHXCPRH issues an MVS abend with abend code 0408 which invokes its ESTAE routine to clear up its environment. A SYSMDUMP is taken before returning control to the application. An application using the EXCI CALL API receives RESPONSE(SYSTEM_ERROR) REASON(WS_GETMAIN_ERROR) in its return area. The subreason1 field of the return area contains the R15 return code from MVS indicating why the GETMAIN failed. An application using the EXCI EXEC API receives RESP(LINKERR) RESP2(601).

User response: Use the MVS R15 return code obtained from the application or from the dump to determine why the MVS GETMAIN request failed. If the reason is insufficient storage, increase the region size of the batch application.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter does not produce any formatted output for the job because the error occurred too early in EXCI initialization for there to be any control blocks.

Module: DFHXCPRH

0409

Explanation: The external CICS interface module DFHXCPRH issued an MVS GETMAIN request for storage required for its SSI VERIFY request, but a nonzero return code was returned from MVS.

System action: Module DFHXCPRH issues an MVS abend with abend code 0409 which invokes its ESTAE routine to clear up its environment. A SYSMDUMP is taken before returning control to the application. An application using the EXCI CALL API receives RESPONSE(SYSTEM_ERROR) REASON(VERIFY_BLOCK_GM_ERROR) in its return area. The subreason1 field of the return area contains the R15 return code from MVS indicating why the GETMAIN failed. An application using the EXCI EXEC API receives RESP(LINKERR) RESP2(605).

User response: Use the MVS R15 return code obtained from the application or from the dump to determine why the MVS GETMAIN request failed. If the reason is insufficient storage, increase the region size of the batch application.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter does not produce any formatted output for the job because the error occurred too early in EXCI initialization for there to be any control blocks.

Module: DFHXCPRH

0410

Explanation: The external CICS interface module DFHXCPRH issued an MVS GETMAIN request for an XCUSER block but a nonzero return code was returned from MVS.

System action: Module DFHXCPRH issues an MVS abend with abend code 0410 which invokes its ESTAE routine to clear up its environment. A SYSMDUMP is taken before returning control to the application. An application using the EXCI CALL API receives RESPONSE(SYSTEM_ERROR) REASON(XCUSER_GETMAIN_ERROR) in its return area. The subreason1 field of the return area contains the R15 return code from MVS indicating why the GETMAIN failed. An application using the EXCI EXEC API receives RESP(LINKERR) RESP2(603).

User response: Use the MVS R15 return code obtained from the application or from the dump to determine why the MVS GETMAIN request failed. If the reason is insufficient storage, increase the region size of the batch application.

Module: DFHXCPRH

0411

Explanation: The external CICS interface dump module DFHXCDMP was attempting to call the CICS SVC in order for an MVS SDUMP to be taken to capture an earlier problem. DFHXCDMP was unable to call the SVC as no SVC number was available. DFHXCDMP issued an 0411 abend in order that the callers ESTAE routine is invoked which takes a SYSMDUMP instead.

System action: A SYSMDUMP is taken instead of an SDUMP for an earlier reported problem.

User response: Use the SYSMDUMP produced to diagnose the earlier reported problem.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter does not produce any formatted output for the job because the error occurred too early in EXCI initialization for there to be any control blocks.

Module: DFHXCDMP

0412

Explanation: The external CICS interface dump module DFHXCEIP was processing an EXCI EXEC API request and detected that the EXEC parameter list passed to it contained a function that is not supported by the external CICS interface.

System action: The application is abnormally terminated with a dump.

User response: This error indicates the parameter list being passed to the EXCI has not been generated by

the CICS translator. The translator should always be used. Correct the application to specify the correct EXCI EXEC API command.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter may not produce any formatted output for the job if this was the first EXCI request for this TCB.

Module: DFHXCEIP

0413

Explanation: The external CICS interface dump module DFHXCEIP was processing an EXCI EXEC API request and detected that the EXEC parameter list passed to it did not require the mandatory RETCODE parameter in which return codes are returned to the application.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter may not produce any formatted output for the job if this was the first EXCI request for this TCB.

System action: The application is abnormally terminated with a dump.

User response: This error indicates the parameter list being passed to the EXCI has not been generated by the CICS translator. The translator should always be used. Correct the application to specify RETCODE.

Module: DFHXCEIP

0414

Explanation: The external CICS interface module DFHXCEIP issued an MVS ESTAE macro to establish a recovery environment but a nonzero return code was returned from MVS.

System action: The application terminates abnormally with a dump.

User response: Examine the dump and any associated MVS messages to determine why the MVS ESTAE request failed.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter may not produce any formatted output for the job if this was the first EXCI request for this TCB.

Module: DFHXCEIP

0415

Explanation: The external CICS interface module DFHXCEIP detected an error early in EXCI initialization before EXCI dump services were available. DFHXCEIP issues abend 0415 so that its ESTAE routine is invoked from where an SYSMDUMP is taken instead to capture the error.

System action: The application terminates abnormally with a dump.

User response: Examine the SYSMDUMP to determine the cause of the earlier reported error.

An attempt to format the SYSMDUMP produced with

the CICS IPCS dump formatter does not produce any formatted output for the job because the error occurred too early in EXCI initialization for there to be any control blocks.

Module: DFHXCEIP

05xx CICS JVM Interface abend codes

0501

Explanation: Either a JCICS Java Class method or a CICS Domain call was invoked from a Java application running under control of a JVM and executing on a thread other than the initial process thread (IPT). CICS requests can only be issued when executing under the initial process thread.

System action: The thread is abended with a MVS 0501 user abend code causing the initial process thread to be abnormally terminated. Language environment recovery processing is driven causing a 4xxx abend to be issued under the J8 TCB on which the JVM is running. CICS recovery processing terminates the JVM and abnormally terminates the transaction with an ASRB abend code.

User response: If issued from a JCICS call, change the application so that these requests are issued when running under the initial process thread. Otherwise contact your local IBM support centre for assistance.

Module: DFHCALLA, DFHCDKRN, DFHMSGIF, DFHTRCIF

0505

Explanation: This abend occurs when a request for MVS storage waits for storage for a time longer than the global timeout value specified in SMVPA (storage management anchor).

CICS has determined that there is a shortage of MVS storage available for supporting JVMs, and has previously issued message DFHSM0139. Threads requiring MVS storage which cannot be satisfied are queued until MVS storage becomes available. If such a

thread waits for a time longer than the global timeout value, then CICS abends the thread with MVS abend code 0505, so forcing the requesting transaction to terminate, and release its resources.

System action: CICS will abend the requesting transaction which might help to relieve the shortage of MVS storage.

User response: You should decrease the MAXJVMTCBS parameter, to reduce the number of concurrent JVMs which may be requesting storage. For more information about how to do this, see the *CICS Performance Guide*.

Module: DFHSMVP

0555

Explanation: A program check occurred, or an operating system or CICS abend was issued within the CICS JVM interface. CICS recovery processing issues an MVS 555 user abend in order to drive the language environment ESTAE routine, which is still active, as part of its cleanup and termination of the CICS task.

System action: The 555 abend code drives language environment recovery processing. The JVM is terminated and the CICS task is abnormally terminated with the abend code that first initiated CICS recovery processing.

User response: None. The 555 abend is an internal mechanism to ensure that CICS and Language environment recovery facilities correctly terminate the CICS task and the JVM environment.

Module: DFHAPLJ

4xxx Language Environment abend codes

Abend codes in the range 4000 to 4095 are issued by Language Environment runtime library modules for Language Environment enabled applications running on CICS.

When Language Environment detects an unrecoverable error, Language Environment terminates the transaction with an EXEC CICS abend with an abend code numbered from 4000-4095. A write-to-operator (WTO) is performed to write a CEE1000S message to the system console. This message contains the abend code and the reason code associated with the abend.

Some of these abends can occur when the system is under stress and Language Environment is unable to acquire the resources required to report a previous abend

or failure. In this case there will usually be other symptoms that the system is under stress (for example short on storage messages or other transactions being purged with AEXY or AKC3 abends), and inspection of the transaction dump should allow identification of the original abend.

Language Environment abend codes and run-time messages are described in *IBM Language Environment for MVS and VM Debugging Guide and Run-Time Messages*.

Bibliography

The CICS Transaction Server for z/OS library

The published information for CICS Transaction Server for z/OS is delivered in the following forms:

The CICS Transaction Server for z/OS Information Center

The CICS Transaction Server for z/OS Information Center is the primary source of user information for CICS Transaction Server. The Information Center contains:

- Information for CICS Transaction Server in HTML format.
- Licensed and unlicensed CICS Transaction Server books provided as Adobe Portable Document Format (PDF) files. You can use these files to print hardcopy of the books. For more information, see “PDF-only books.”
- Information for related products in HTML format and PDF files.

One copy of the CICS Information Center, on a CD-ROM, is provided automatically with the product. Further copies can be ordered, at no additional charge, by specifying the Information Center feature number, 7014.

Licensed documentation is available only to licensees of the product. A version of the Information Center that contains only unlicensed information is available through the publications ordering system, order number SK3T-6945.

Entitlement hardcopy books

The following essential publications, in hardcopy form, are provided automatically with the product. For more information, see “The entitlement set.”

The entitlement set

The entitlement set comprises the following hardcopy books, which are provided automatically when you order CICS Transaction Server for z/OS, Version 3 Release 2:

Memo to Licensees, GI10-2559
CICS Transaction Server for z/OS Program Directory, GI13-0515
CICS Transaction Server for z/OS Release Guide, GC34-6811
CICS Transaction Server for z/OS Installation Guide, GC34-6812
CICS Transaction Server for z/OS Licensed Program Specification, GC34-6608

You can order further copies of the following books in the entitlement set, using the order number quoted above:

CICS Transaction Server for z/OS Release Guide
CICS Transaction Server for z/OS Installation Guide
CICS Transaction Server for z/OS Licensed Program Specification

PDF-only books

The following books are available in the CICS Information Center as Adobe Portable Document Format (PDF) files:

CICS books for CICS Transaction Server for z/OS

General

CICS Transaction Server for z/OS Program Directory, GI13-0515
CICS Transaction Server for z/OS Release Guide, GC34-6811
CICS Transaction Server for z/OS Migration from CICS TS Version 3.1, GC34-6858

CICS Transaction Server for z/OS Migration from CICS TS Version 1.3,

Licensed publications

The following licensed publications are not included in the unlicensed version of the Information Center:

CICS Diagnosis Reference, GC34-6862
CICS Data Areas, GC34-6863-00
CICS Supplementary Data Areas, GC34-6864-00
CICS Debugging Tools Interfaces Reference, GC34-6865

Other CICS books

The following publications contain further information about CICS, but are not provided as part of CICS Transaction Server for z/OS, Version 3 Release 2.

<i>Designing and Programming CICS Applications</i>	SR23-9692
<i>CICS Application Migration Aid Guide</i>	SC33-0768
<i>CICS Family: API Structure</i>	SC33-1007
<i>CICS Family: Client/Server Programming</i>	SC33-1435
<i>CICS Transaction Gateway for z/OS Administration</i>	SC34-5528
<i>CICS Family: General Information</i>	GC33-0155
<i>CICS 4.1 Sample Applications Guide</i>	SC33-1173
<i>CICS/ESA 3.3 XRF Guide</i>	SC33-0661

Determining if a publication is current

IBM regularly updates its publications with new and changed information. When first published, both hardcopy and BookManager® softcopy versions of a publication are usually in step. However, due to the time required to print and distribute hardcopy books, the BookManager version is more likely to have had last-minute changes made to it before publication.

Subsequent updates will probably be available in softcopy before they are available in hardcopy. This means that at any time from the availability of a release, softcopy versions should be regarded as the most up-to-date.

For CICS Transaction Server books, these softcopy updates appear regularly on the *Transaction Processing and Data Collection Kit* CD-ROM, SK2T-0730-xx. Each reissue of the collection kit is indicated by an updated order number suffix (the -xx part). For example, collection kit SK2T-0730-06 is more up-to-date than SK2T-0730-05. The collection kit is also clearly dated on the cover.

Updates to the softcopy are clearly marked by revision codes (usually a # character) to the left of the changes.

Accessibility

Accessibility features help a user who has a physical disability, such as restricted mobility or limited vision, to use software products successfully.

You can perform most tasks required to set up, run, and maintain your CICS system in one of these ways:

- using a 3270 emulator logged on to CICS
- using a 3270 emulator logged on to TSO
- using a 3270 emulator as an MVS system console

IBM Personal Communications provides 3270 emulation with accessibility features for people with disabilities. You can use this product to provide the accessibility features you need in your CICS system.
