CICS Transaction Server for z/OS

Messages and Codes

Version 3 Release 2

Note!

Before using this information and the product it supports, be sure to read the general information under "Notices" on page 1515.

This edition applies to Version 3 Release 2 of CICS Transaction Server for z/OS, program number 5655-M15, and to all subsequent versions, releases, and modifications until otherwise indicated in new editions.

Preface

What this manual is about

This manual contains messages unique to Version 3 Release 2 and is intended for use as a quick reference. It is closely linked with the *CICS Problem Determination Guide*, which should also be consulted if a message indicates that there is a CICS® problem.

Who this manual is for

This manual is for anybody who needs to understand and respond to CICS messages, including system operators, system programmers, and certain terminal users.

What you need to know to understand this manual

You can refer to this manual for the meaning of a message without understanding the manual as a whole. Your understanding of Version 3 Release 2, however, will be enhanced by a knowledge of the types of message CICS produces, the different places it sends messages, and the different audiences it intends to reach.

How to use this manual

When you are using CICS as a system operator or terminal user, or scanning a queue containing CICS messages, use this manual as a reference. If you want to suggest a change to the contents of a message or an abend code, please contact your IBM® branch instead of raising an RCF.

Online Messages and Codes

Version 3 Release 2 messages and abend code descriptions documented in this manual (with the exception of AXM messages, a small number of numeric abends and Transaction Dump Codes) are available online using the CICS transaction CMAC. For guidance on using CMAC, see *CICS Supplied Transactions*.

Changes for CICS Transaction Server for z/OS, Version 3 Release 2

For information about changes that have been made in CICS Transaction Server for z/OS®, Version 3 Release 2, please refer to *What's New* in the information center, or the following publications:

- *CICS Transaction Server for z/OS Release Guide*
- *CICS Transaction Server for z/OS Migration from CICS TS Version 3.1*
- *CICS Transaction Server for z/OS Migration from CICS TS Version 2.3*
- *CICS Transaction Server for z/OS Migration from CICS TS Version 2.2*
- *CICS Transaction Server for z/OS Migration from CICS TS Version 1.3*

Chapter 1. DFH messages

While CICS is running, it can produce several types of messages.

- Console messages advise the system operator of execution progress, or request a decision.
- Certain CICS-supplied support programs communicate directly with terminal operators.
- CICS management modules and support programs log significant events and error occurrences to transient data destinations; for example, to the control system master terminal (CSMT), or to the CICS database control log (CDBC) for the CICS-DBCTL interface.
- The CICS message switching program (DFHMSP) generates message switching responses (described in *CICS Supplied Transactions*).
- CICS directs informational macro notes (mnotes) to programmers. These are not documented.
- Messages produced by CICS utility programs such as DFH£MOLS and DFHMNDUP. These messages are self-explanatory and are not documented.

With the exception of the AXM messages, a small number of numeric abends and the Transaction Dump Codes, the messages described can also be viewed online using the CICS transaction CMAC. For guidance on using CMAC, see *CICS Supplied Transactions*.

CICS DFH message Identifiers

Message identifiers are of two types.

DFHnnnn identifiers

These consist of the prefix “DFH” followed by a four digit message number. “DFH” is the IBM assigned identifier for CICS modules. The first two digits are the CICS module reference code as follows:

01	DFHSSIN
42	DFHZCNR
51	DFHCSDUP
52	DFHCSDUP
55	DFHCSDUP
56	DFHCSDUP
7x	Command-level translators

The last two digits are assigned by CICS to identify the message or group of messages within an assembled program.

DFHccnnnn identifiers

These consist of the prefix “DFH” followed by a two-letter component identifier (*cc*), and a four-digit message number (*nnnn*). The component identifier shows the domain or the component which issues the message. Here is a list of component identifiers with associated domains and components:

AC	The abnormal condition program component
-----------	--

AD	The CICS Development Deployment Tool messages
AI	The auto-install terminal model manager (AITM)
AM	The RDO allocation manager
AP	The application domain
BA	The CICS business transaction services (BTS) domain
BR	Bridging to 3270 transactions
CA	RDO command utility routine
CC	The CICS catalog domain (local and global)
CE	The sign on program component
CF	CICS coupling facility data tables server
CP	The CPI Communications component
CQ	The CQ console messages
CR	The ISC remote scheduler component
CZ	The CICS class libraries domain
DB	The CICS database control component
DD	The directory manager
DH	Document handler component
DM	The domain manager domain
DP	The debugging profile domain
DS	The dispatcher domain
DU	The dump domain
DX	The CICS database control component
EJ	The Enterprise Java domain
EM	The Event Manager domain
ER	The user backout program
EX	The external CICS interface
FC	The file control component
FE	The FE terminal test program component
IC	The interval control program
IE	The IP ECI domain
II	The CORBA and IIOB domain
IN	The indoubt testing tool
IR	The interregion component
IS	The intersystem component
JC	The online journal control component
KC	The transaction/profile manager
KE	The kernel domain

LD	The loader domain
LG	The logger domain
LM	The lock manager domain
MC	The BMS message control program component
ME	The message domain
MN	The monitor domain
MQ	The WebSphere MQ domain
MU	The message editing utility program
MV	The MVS™ RESMGR exit stub
NC	The Named counter sequence number server
NQ	The enqueue manager domain
OT	The Object Transaction Services domain
PA	The parameter manager domain
PC	The program control program component
PD	The print dump exit routine DFHPDX
PG	The program manager domain
PI	The pipeline manager domain
PR	The partner resource manager
PS	The system spooler interface control module component
RD	The RDO allocation manager
RM	The recovery manager
RP	CICS ONC RPC
RS	The communications resynchronization program
RT	The ISC transaction routing component
RU	The recovery utility program
RX	The RRS-coordinated EXCI domain
RZ	The Request Streams domain
SH	The Sheduler domain
SI	The system initialization component
SJ	The Scaleable Java domain
SK	The sub task control program component
SM	The storage manager domain
SN	The signon component
SO	The CICS Sockets domain
SR	The system recovery component
ST	The statistics domain
SZ	The front end programming interface (FEPI)

TC	The terminal control program component
TD	The transient data component
TF	The terminal facility manager
TI	The timer domain
TM	The system termination program component
TO	The terminal object resolution program component
TP	The BMS terminal page retrieval program component
TR	The trace domain
TS	The temporary storage domain
UP	The measured usage license charging support macro
US	The user domain
WB	The CICS Web Interface
XA	The XRF alternate component
XC	The XRF CICS availability manager
XG	The XRF general component
XM	The transaction manager
XO	The XRF CICS availability manager
XQ	The shared temporary storage queue pool server
XS	The CICS security component
ZC	The terminal control working set component
ZE	The TCP error message writer component
ZN	The syncpoint component

Thus the CICS message DFHAP0002 is issued from the application domain, identified by the two-character identifier AP.

Action codes

Certain messages (for example, DFHDB8208D) include an action code after the message identifier. Action codes give guidance to the operator of the type of action needed when the message appears on the system console. The following action codes are used:

A	Immediate action (for example, mount a tape)
D	Immediate decision (reply to a request, for example, enter "GO" or "CANCEL")
E	Eventual – action is required, but does not have to be taken immediately
I	No action required (If issued via the message domain, these messages can be suppressed by specifying MSGLVL=0 as a system initialization override.)

Severity codes

Certain messages, especially those associated with messages to terminal operators and messages which come from CICS utilities, have a severity code.

(DFHST0210 I, is an example.) A severity code indicates to the operator whether a message is associated with an error, and if so, how serious it is. The following severity codes are used:

- E** Error. Something has gone wrong and action is required of the user before CICS processing can continue.
- I** Information only. No action is required.
- W** Alert. Something may have gone wrong, a program loop for example, but CICS processing continues.
- S** Severe error. Something serious has gone wrong and immediate action is required. CICS processing is suspended until action has been taken.

Format of information

Information about each message is presented in the following format:

- **Message identifier** – in the form DFHnnnn or DFHccnnnn
- **Message text** – the words and inserts that make up the message as displayed in CICS
- **Explanation** – the events leading to, or following, the production of the message
- **System action** – the action that has been or will be taken by CICS
- **User response** – the action recommended for the user (the console or terminal operator or system programmer)
- **Destination** – the device or log to which the message is sent. This is one of the following:
 - Console – refers to a terminal type attached to CICS. (Route codes are 2 and 11 unless otherwise stated.)
 - Terminal end user
 - TERMCDBC – terminals running the CDBC transaction.
 - SYSPRINT (System printer)
 - One of the following transient data queues:
 - CADL** VTAM® resource definition log
 - CADO** CICS Development Deployment Tool messages
 - CAIL** Autoinstall terminal model manager (AITM) log
 - CCPI** Common programming interface for communications (CPI Communications) messages
 - CCZM** CICS classes
 - CDBC** CICS-DBCTL interface log
 - CDB2** CICS DB2® messages
 - CDUL** Transaction dump messages
 - CEJL** Java
 - CIEO** IP ECI messages
 - CIIL** CORBA and IIOIP messages
 - CISL** IPCONN resource definition log
 - CISO** IPIC messages
 - CJRM** JRas logging and tracing facility messages (Java)

CKQQ CICS-MQ connection messages

CMIG Migration log for messages reporting the use of functions that are no longer supported

CMQM
CICS-MQ messages

CPIO CICS SOAP messages

CPLD PL/I dumps

CPLI PL/I sysprint output

CRDI Log for installed resource definitions

CRPO ONC RPC messages

CSBA BA domain message queue

CSBR Bridge facility messages

CSCC CICS client error log

CSCS Sign on/off security log

CSDH Document handler

CSDL CEDA command log

CSFL File allocation and related messages

CSJE Redirected error output from CICS JVM

CSJO Redirected output from CICS JVM

CSKL Log for transaction and profile resource definitions

CSLB LIBRARY resource definition log

CSML Sign on/off messages

CSMT Write term errors and abends from DFHTACP and DFHACP

CSNE Terminal error messages issued from DFHZNAC.

CSOO Sockets domain message queue

CSPL Log for program resource definitions

CSQL TDQUEUE messages

CSRL Log for partner resource definitions

CSSH Scheduler services

CSSL Statistics log

CSTL Term I/O error messages from DFHTACP

CSZL FEPI message queue

CWBO
CICS Web support messages

CWBW
HTTP warning headers on messages received by CICS Web support

Note: Destination CXRF is used by the alternate CICS system in an XRF environment until the other destinations are made available during the takeover.

- **Module(s)** – the name(s) of the module or modules that determined that the message should be sent. (This is not necessarily the module that issued the macro to write the message.)

XMEOUT parameters

Messages that can drive the XMEOUT global user exit include a list of XMEOUT parameters. The XMEOUT exit allows you to suppress or reroute messages that use the message domain.

A number of console messages should not be rerouted to a transient data queue. These include all DFHTDnnnn messages and certain DFHMEXMnnnn and DFHUSnnnn messages. A note to this effect is included in the descriptions of these messages.

For programming information about the XMEOUT user exit see the Message domain exit XMEOUT in the *CICS Customization Guide*.

Route codes

Console messages can be sent to a number of console types. The type of console to which a particular message is sent is determined by the MVS route code. Each route code maps onto one console type. The meanings of the route codes normally used by CICS are as follows:

Code Meaning

1	Master console action – indicates a change in system status demanding operator action
2	Master console information – indicates a change in system status (system default)
3	Tape pool status or other tape related information
4	Direct access pool status or other related information
5	Tape library information
6	Disk library information
7	Unit record pool information
8	Teleprocessing control status
9	System security checking
	Note: This route code suppresses the operator's reply on the screen and on SYSLOG
10	System error or maintenance information
11	Programmer information for the MVS log

Unless otherwise stated, console messages have the route codes '2' and '11'.

Message editing

You can use the message editing utility to change the text or language of those CICS messages that are issued via the message domain. Messages that cannot be changed using the utility include a note to this effect before the message destination. See the Message editing utility (DFHMEU) in the *CICS Operations and Utilities Guide* for more information about the message editing utility.

Console message reformatting

The “console message handling facility” is an optional feature of the CICS subsystem that can affect the appearance of CICS messages displayed on an MVS console. It is effective when you specify `FORMATMSG=YES` as an initialization parameter for the CICS subsystem, as described in The console message-handling facility in the *CICS Transaction Server for z/OS Installation Guide*.

Terminal identifiers

Some messages include a terminal identifier (*termid*) in the message text. This is normally shown as a 4-character identifier. However, when CICS cannot completely identify a terminal – for example, when intersystem communication is taking place, the terminal identifier is prefixed by the application identification (*applid*) of the system owning the terminal.

Abend code inserts

The transaction abend code insert (*abcode*) in some CICS messages is displayed as ‘????’ when neither the EXEC CICS ABEND request nor the DFHPC TYPE=ABEND macro request specifies an abend code.

Dumps

A dump is generally available for printing when a CICS system abend or abnormal termination occurs, provided the relevant data set has been specified. The dump can be used for problem determination.

Terminology

The terms “abnormally terminates” and “abnormal termination” are frequently used in a general sense to relate, as applicable, to one of the following:

- The termination of CICS as a result of an MVS ABEND macro. (The term “abend” may also be used.)
- The termination of a transaction (task) as a result of a CICS transaction ABEND macro.

Katakana terminal devices

Old-style Katakana terminals that support only single-byte character sets (SBCS) cannot display lower-case Western characters. Therefore, because of the requirement on CICS to issue certain messages in mixed-case, CICS cannot support display on terminal devices that are restricted to the SBCS Katakana part only of code page 930.

MVS user abend codes

DFH messages which accompany a CICS system, utility, or subtask abend have an associated MVS user abend code. Where possible, the value of this code is the numeric part of the corresponding DFH message. Thus DFH0305 has an 0305 user abend code. If an MVS abend code is issued but not the associated CICS message, the problem probably does not originate with CICS. See the description of the MVS abend code in the *MVS System Codes* manual for further information.

The highest possible value of an MVS user abend code is 4095, therefore any DFH message with a number higher than 4095 has an MVS user abend code that does

not follow the above convention. The following are lists of the abend codes for messages with numbers above 4095, in order of abend code, and in order of message number.

Ordered by abend code

- 0108 DFH5263
- 0121 DFH5100
- 0123 DFH5175
- 0125 DFH5180
- 0126 DFH5184
- 0127 DFH5148
- 0147 DFH5721

- DFH5184 0126
- DFH5263 0108
- DFH5721 0147

- DFH5722 0148
- DFH5723 0149
- DFH5754 0152
- DFH6529 0211

Note:

1. All messages which appear in the JES job log are prefixed by a time stamp and job number. Because of this, some messages will have their message text truncated. If the full message text is required, consult the MVS log as all messages in the JES log are duplicated in the MVS system log.
2. User abend 0225 is internal to CICS. It is issued by DFHDTES when, during backout, an entry in a hash table has been marked empty where it should not be possible. This causes the CICS region to be abnormally terminated. If this abend occurs, you will need help to resolve the problem.

DFH01nnnn messages

DFH0100 CICS SUBSYSTEM IS NOW INITIALIZED

Explanation: The CICS subsystem identified in an entry in an IEFSSNxx member of SYS1.PARMLIB has been successfully initialized.

System action: None.

User response: None.

Module: DFHSSIN

Destination: Console

LOAD GLOBAL=(YES,P) macro.

System action: The system issues message DFH0101 and does not initialize the subsystem.

User response: Investigate the reason why the module could not be loaded. After correction, re-IPL MVS to initialize the subsystem.

Module: DFHSSIN

Destination: Console

DFH0101 CICS SUBSYSTEM WAS NOT INITIALIZED

Explanation: The CICS subsystem identified in an entry in an IEFSSNxx member of SYS1.PARMLIB could not be successfully initialized.

System action: The system continues without the services of the subsystem.

User response: Use the preceding DFH01xx message to investigate the reason why the subsystem could not be initialized. After correction, re-IPL MVS to initialize the subsystem.

Module: DFHSSIN

Destination: Console

DFH0103 CICS PARAMETER MEMBER NAME member IS INVALID

Explanation: The third positional parameter in the subsystem definition for the CICS subsystem is not a valid member name because it contains more than eight characters. In the entry in an IEFSSNxx member of SYS1.PARMLIB that defines the CICS subsystem, a parameter is coded that is not a valid name for a member containing CICS initialization parameters.

System action: The parameter coded is truncated to eight characters and the result is used as the member name for reading CICS parameters from SYS1.PARMLIB. Whether or not the resultant parameters are valid, the system later issues message DFH0101 and does not initialize the subsystem.

User response: Correct the definition of the CICS subsystem in the IEFSSNxx member of SYS1.PARMLIB. After correction, re-IPL MVS to initialize the subsystem.

Module: DFHSSIN

Destination: Console

DFH0102 CICS SUBSYSTEM COULD NOT LOAD MODULE *module*

Explanation: When trying to initialize the CICS subsystem, module *module* could not be loaded into common storage. The module must either be in the MVS link pack or be capable of being loaded from a library in the MVS linklist concatenation by means of a

DFH0104 CICS PARAMETER ERROR IN *member - parameter*

Explanation: When examining CICS subsystem initialization parameters from the named member of SYS1.PARMLIB, a syntax error was detected. The record containing the error is shown in the message.

System action: The system issues message DFH0101 and does not initialize the subsystem.

User response: Correct the syntax error in the subsystem parameter. See the *CICS Intercommunication Guide* for details of the syntax of subsystem initialization parameters. After correction, re-IPL MVS to reinitialize the subsystem.

Module: DFHSSIN

Destination: Console

DFH42nn message

DFH4200 *jobname tranid*

Explanation: *jobname* is the jobname of CICS in the MVS system. CICS transaction *tranid* has issued a TC READ request to the operator console.

System action: The transaction is suspended pending a reply.

DFH51nn messages

DFH5100S SEVERE ERROR IN MODULE
modname. ABEND CODE: abcode

Explanation: An internal error has occurred in module *modname*, when invoked by a CSD utility command.

System action: Processing terminates abnormally with an operating system dump and abend code *abcode*. The CSD utility attempts to:

1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.

User response: See the description of abend code *abcode* for guidance.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5101I *command* **COMMAND EXECUTED SUCCESSFULLY.**

Explanation: The execution of a CSD utility command *command* completed successfully.

System action: Normal processing continues.

User response: None.

Module: DFHCSDUP

DFH0105 CICS SUBSYSTEM INITIALIZATION IS NOT SUPPORTED FOR THIS MVS RELEASE

Explanation: Initialization of the CICS subsystem is not supported on MVS releases earlier than MVS SP 2.2.0.

System action: The system issues message DFH0101 and does not initialize the subsystem.

User response: Defer implementation of the CICS subsystem services until after the prerequisite release of MVS is installed.

Module: DFHSSIN

Destination: Console

User response: Enter a reply at the console.

Module: DFHZCNR

Destination: Console

Destination: SYSPRINT

DFH5102I **WARNING MESSAGES ISSUED WHILE PROCESSING** *command* **COMMAND.**

Explanation: The CSD utility issued messages during syntax-checking and execution of the *command* command.

System action: Normal utility processing continues to the end of the job.

User response: Review the warning messages to see how they have affected utility processing. Then decide whether you need to submit a further CSD utility job.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5103I **ERROR(S) OCCURRED WHILE PROCESSING** *command* **COMMAND.**

Explanation: The CSD utility either found a syntax error in the utility command *command*, or the command *command* failed to execute correctly.

System action: Utility command execution is terminated.

If commands are being read from a SYSIN data stream by the utility, then subsequent commands (except LIST)

are checked for syntax only. (If the primary CSD file cannot be opened, LIST is not processed either.)

If commands are being read from a get-command exit, then DFHCSDUP attempts to process subsequent commands.

User response: If the command failed because of syntax errors, correct the command.

If the command failed to execute correctly, this may have been caused by a previous error. In such a situation, an associated error message, such as DFH5275, should have been issued. Refer to these error messages for further guidance.

Correct all errors before trying to open the CSD file again.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5104W SUBSEQUENT COMMANDS (EXCEPT LIST) ARE NOT EXECUTED BECAUSE OF ERROR(S) ABOVE.

Explanation: After the CSD utility program encounters an error, it ceases to execute any further commands read from a data stream (as opposed to supplied by a Put-Message exit routine). However, it continues to check the syntax of subsequent commands. The exception is the LIST command, which will still be executed if the primary CSD file can be opened.

System action: Subsequent CSD utility commands (except LIST) are ignored.

User response: Check for a syntax error in the commands used and correct it.

There should be associated error messages which identify the problem that caused DFHCSDUP to halt active processing. These messages should appear in DFHCSDUP output before message DFH5104 is issued.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5105W *command* COMMAND NOT EXECUTED BECAUSE OF PREVIOUS ERROR(S).

Explanation: If a syntax error (or an execution error) occurred in a command read from a data stream and processed earlier, no further commands (except for LIST commands) are executed. If the primary CSD file could not be opened, the LIST command is not executed either.

System action: The CSD utility command is not executed.

User response: Check for syntax errors or execution errors in commands processed earlier.

Correct the invalid commands.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5107I COMMANDS EXECUTED SUCCESSFULLY: *nn* COMMANDS GIVING WARNINGS: *nn* COMMANDS IN ERROR: *nn*

Explanation: The CSD utility has completed input command processing.

Commands giving warnings may or may not have been executed successfully.

System action: Normal processing continues to the end of the job.

User response: If any CSD utility commands in error were executed, decide if the results are what you want.

If they are NOT what you want, correct them and resubmit them in another job.

If any commands were not executed, you must resubmit them. (See message DFH5108.)

Module: DFHCSDUP

Destination: SYSPRINT

DFH5108I COMMANDS NOT EXECUTED AFTER ERROR(S): *nn*

Explanation: The CSD utility has completed input command processing. The number of commands not executed because of errors is indicated by *nn*.

System action: Normal processing continues to the end of the job.

User response: Correct the commands in error and resubmit them in another job.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5109I END OF DFHCSDUP UTILITY JOB. HIGHEST RETURN CODE WAS: *retcode*

Explanation: The CSD utility job is complete.

System action: Control returns to the invoker, that is, either the operating system or to an invoking program.

User response: None.

Module: DFHCSDUP

Destination: SYSPRINT

**DFH5110W ERROR FOUND IN 'PARM='
PARAMETER DATA ON EXEC JOB
STEP. THIS DATA IS IGNORED.**

Explanation: The value of the PARM parameter on the EXEC job in the JCL to run the DFHCSDUP utility is incorrect.

System action: The PARM parameter is ignored. The CSD is opened for read and write operations.

User response: Correct the erroneous PARM value. The incorrect value can be found in the job step.

The *CICS Operations and Utilities Guide* describes how to code the PARM parameter.

Module: DFHCSDUP

Destination: SYSPRINT

**DFH5114S THE {PRIMARY | SECONDARY} CSD
HAS NOT BEEN INITIALIZED.
COMMAND NOT EXECUTED.**

Explanation: The primary CSD file must be initialized before any CSD utility command (other than the INITIALIZE or SERVICE commands) can be processed. If a secondary CSD file is used, it must always be initialized before this command can be processed. CICS issues this message if you try to break either of these rules, or if an attempt to initialize a CSD file fails to complete successfully

System action: The CSD utility ignores the command.

User response: Initialize the CSD file. You may first have to determine why a previous initialization attempt failed.

Module: DFHCSDUP

Destination: SYSPRINT

**DFH5115S THE PRIMARY CSD IS ALREADY
INITIALIZED. COMMAND NOT
EXECUTED.**

Explanation: An INITIALIZE or a SERVICE command was encountered but the primary CSD file has already been initialized.

System action: The INITIALIZE or SERVICE command is ignored.

User response: Confirm that the correct CSD file was specified.

Module: DFHCSDUP

Destination: SYSPRINT

**DFH5116S THE PRIMARY CSD HAS BEEN
DEFINED WITH AN INVALID KEY
LENGTH. PROCESSING IS
TERMINATED.**

Explanation: The CSD utility cannot initialize the CSD file because it has been defined to VSAM with an invalid key length.

System action: The CSD file remains uninitialized, and no utility commands are processed.

User response: Delete the CSD file, using VSAM Access Method Services (AMS). In the JCL defining the CSD cluster, change the AMS control statements to specify KEYS(22 0). Use this JCL to redefine the CSD file, and use the CSD utility to reinitialize it.

Module: DFHCSDUP

Destination: SYSPRINT

**DFH5117S THE PRIMARY CSD HAS BEEN
DEFINED WITH AN INVALID RECORD
SIZE. PROCESSING IS TERMINATED.**

Explanation: The CSD utility cannot initialize the CSD file, because it has been defined to VSAM with an invalid record length.

System action: The CSD file remains uninitialized, and no utility commands are processed.

User response: Delete the CSD file, using VSAM Access Method Services (AMS). In the JCL defining the CSD cluster, change the AMS control statements to specify RECORDSIZE(200 2000). Use this JCL to redefine the CSD file, and use the CSD utility to reinitialize it.

Module: DFHCSDUP

Destination: SYSPRINT

**DFH5120I {PRIMARY | SECONDARY} CSD
OPENED; DDNAME: ddname**

Explanation: The VSAM data set specified in the JCL has been successfully opened, and is identified as the primary or secondary CSD file. (All utility commands processed will use the same primary CSD file. Different secondary CSD files may be accessed by different utility commands.)

System action: Normal processing continues.

User response: None.

Module: DFHCSDUP

Destination: SYSPRINT

**DFH5121S I/O ERROR WHILE OPENING {PRIMARY
I SECONDARY} CSD; DDNAME: ddname**

Explanation: An I/O error occurred when reading or writing control records of the VSAM data set identified in the JCL as the primary or secondary CSD file.

System action: The utility command is not executed.

User response: Retry the utility command that failed. If the problem persists, restore the CSD file from your own backup procedures.

Module: DFHCSDUP

Destination: SYSPRINT

**DFH5122S VSAM ERROR WHILE OPENING
{PRIMARY I SECONDARY} CSD;
DDNAME: ddname**

Explanation: A VSAM error occurred when opening the data set identified in the JCL as a primary or secondary CSD file.

System action: The utility command is not executed.

User response: Refer to the VSAM diagnostics output in message DFH5179 for further information and guidance.

Module: DFHCSDUP

Destination: SYSPRINT

**DFH5123I {PRIMARY I SECONDARY} CSD
CLOSED; DDNAME: ddname**

Explanation: The VSAM data set used as the primary or secondary CSD file has been successfully closed, with control records updated if necessary. (The primary CSD file is closed after all the utility commands have been processed; the secondary CSD file is closed after the command for which it was opened.)

System action: Normal processing continues.

User response: None.

Module: DFHCSDUP

Destination: SYSPRINT

**DFH5124S PROCESSING TERMINATED.
CORRUPTED CSD CONTROL RECORD
DETECTED WHILE CLOSING CSD;
DDNAME: ddname**

Explanation: A storage corruption is preventing the CSD control records from being updated when the CSD file is being closed.

System action: No further CSD utility commands are processed.

User response: Obtain a dump from DFHCSDUP together with a listing of the DFHCSDUP run and its

JCL. Also try to obtain a print out of the CSD, using either IDCAMS or the DFHCSDUP LIST ALL option. The LIST will indicate where the errors have occurred because they do not print and are therefore easily identifiable.

Using the information available, determine the cause of the errors and correct them.

Resubmit the CSD utility commands that failed.

If you cannot resolve the problem, or if the problem persists, you will need further help from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCSDUP

Destination: SYSPRINT

**DFH5125S ERROR OCCURRED WHILE CLOSING
THE CSD. FILE IS FULL; DDNAME
ddname**

Explanation: After processing the CSD utility commands, the CSD control records are updated before closing the data set.

Updating failed because data set *ddname* was full.

System action: Utility command processing is terminated.

User response: Initialize a new primary CSD file with a larger data set size. Then use the IDCAMS IMPORT and EXPORT commands to restore the CSD file onto a larger data set.

Module: DFHCSDUP

Destination: SYSPRINT

**DFH5126S I/O ERROR WHILE CLOSING THE
{PRIMARY I SECONDARY} CSD;
DDNAME: ddname**

Explanation: An I/O error occurred when reading or writing the control records of the CSD file, before closing VSAM data set *ddname*.

System action: No further utility commands are executed.

User response: Resubmit the utility commands that failed. If the problem persists, restore the CSD file from your own backup procedures.

Module: DFHCSDUP

Destination: SYSPRINT

**DFH5127S VSAM ERROR WHILE CLOSING
{PRIMARY I SECONDARY} CSD;
DDNAME: ddname**

Explanation: A VSAM error occurred when closing the

DFH5128S • DFH5133S

data set *ddname* in the JCL as the primary or secondary CSD file.

System action: No further CSD utility commands are executed.

User response: Refer to the VSAM diagnostics output in message DFH5179 for further information and guidance.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5128S PROCESSING TERMINATED. {PRIMARY / SECONDARY} CSD ACCESSED BY ANOTHER USER AND COULD NOT BE SHARED. DDNAME: *ddname*

Explanation: An attempt to open the CSD has returned an error from VSAM because the data set is not available for the type of processing requested.

This usually means that

- An attempt has been made to open the CSD in non-RLS access mode, but the CSD is already being accessed from elsewhere in RLS access mode.
- An attempt has been made to open the CSD in RLS access mode, but the CSD is already being accessed from elsewhere in non-RLS access mode.
- An attempt has been made to open the CSD in non-RLS access mode and the CSD is already being accessed in non-RLS access mode, but the CSD cluster has been defined with SHAREOPTIONS that restrict its concurrent use.

System action: The command is not executed.

User response: You can change the access mode in which you are trying to open the CSD. To open a recoverable CSD in RLS access mode from the DFHCSDUP utility program.

Alternatively, wait until the CSD file is no longer being accessed in the conflicting access mode, or until it becomes available again in accordance with the SHAREOPTIONS rules defined for the cluster.

If the conflict is due to SHAREOPTIONS and LIST is the only command you want to execute, you can specify PARM=CSD(READONLY).

Module: DFHCSDUP

Destination: SYSPRINT

DFH5130E UNABLE TO LOCATE MODULE DFHCICS. PRIMARY CSD NOT INITIALIZED.

Explanation: The DFHCICS module is missing from the library.

System action: Processing of the INITIALIZE command is terminated.

User response: Ensure that the DFHCICS module is present in the library.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5131I LIST *listid* CREATED.

Explanation: The INITIALIZE command has created the header for an IBM-protected list.

System action: Normal processing continues.

User response: None.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5132S UNABLE TO CREATE LIST *listid*

Explanation: The INITIALIZE command has failed when calling the CSD manager routing program, DFHDMP, to create a new list *listid* on the CSD file for the IBM-protected groups. The CSD file may be full or corrupt.

System action: Processing of the INITIALIZE command is terminated.

User response: Check that the data set size for the CSD file is large enough. If it is not, allocate more space.

If there is ample space and you suspect that the CSD file is corrupt, you need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5133S CSD CONTAINS ONE OR MORE LISTS. NO LISTS MAY BE PRESENT ON THE CSD WHEN THE INITIALIZE COMMAND IS ISSUED.

Explanation: The CEDA transaction was used to create a list while the INITIALIZE command was executing.

System action: Processing of the INITIALIZE command is terminated.

User response: Redefine the data set and re-run the INITIALIZE command. The CEDA transaction must not be used until the initialization of the CSD file has been successfully completed.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5134S ERROR OCCURRED WHILE ADDING GROUP *grpname* TO LIST *listid*

Explanation: A call to the CSD manager routing program, DFHDMP, to write the definition of group *grpname* to the CSD file as a member of an IBM-protected list *listid* created an error. The CSD file may be full or corrupt.

System action: Processing of the INITIALIZE command is terminated.

User response: Increase the data set size for the CSD file and repeat the INITIALIZE request. If this fails, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5135I GROUP *grpname* ADDED TO LIST *listid*

Explanation: A group definition *grpname* has been satisfactorily created on the CSD file in list *listid*.

System action: Processing continues.

User response: None.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5136W GROUP *grpname* IS ALREADY A MEMBER OF LIST *listid*

Explanation: Group *grpname* already exists in list *listid*. CICS does not create a duplicate entry.

System action: Normal utility processing continues.

User response: None.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5139W CONSIDER IMPLICATIONS OF MIGRATING TYPE=SHARED ENTRIES.

Explanation: The CSD utility detected a migrate of a TST TYPE=SHARED entry. A DFHTST TYPE=SHARED entry is not directly migrated. Only when a TYPE=REMOTE macro that specifies a SYSIDNT that matches a SYSID in the corresponding TYPE=SHARED macro is a TSMODEL created.

System action: The CSD utility continues processing of the MIGRATE command.

User response: If SYSID is explicitly specified on the EXEC CICS request, or added by a global user exit program, and the intent of the SYSID is to direct the request to a SHARED TS pool, you must use the migrated TST in order to satisfy the request to use the

pool. See the CICS Resource Definition Guide for more information.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5140I TOTAL *xxxxxxx* DEFINITIONS CREATED: *nn*

Explanation: CICS issued this message after migrating a CICS table. *nn* definitions of type *xxxxxxx* have been created on the CSD file.

System action: Normal utility processing continues.

User response: None.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5141S UNABLE TO CREATE NEW GROUP *grpname*

Explanation: The MIGRATE command failed when calling the CSD manager routing program, DFHDMP, to create a new group *grpname* on the CSD file for the data in the table being migrated. The CSD file may be full, corrupt, or not initialized. The group name may be invalid.

System action: Processing of the MIGRATE command is terminated.

User response: Check the group name in the TOGROUP parameter. Reinitialize the CSD file with the INITIALIZE command, providing a larger data set size if necessary.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5142E COMMAND NOT EXECUTED. *lgnme* WAS NOT UPDATED BECAUSE OF A PREVIOUS UPDATE FAILURE.

Explanation: The list or group *lgnme* cannot be used because an operation to update it, using the DFHCSDUP offline utility, failed to execute to completion.

This has probably happened in a previous execution of DFHCSDUP.

System action: The command is not executed, and the execution of subsequent DFHCSDUP commands in the job stream is suppressed.

User response: Use the DFHCSDUP VERIFY command to remove the in-flight flag detected when this message is produced.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5143I GROUP *grpname* CREATED.

Explanation: A new CSD group, *grpname*, has been created for the data in the table being migrated.

System action: Migration continues.

User response: None.

Module: DFHCSDUP

Destination: SYSPRINT

**DFH5145E COMMAND NOT EXECUTED. *lgnam*
HAS BEEN LOCKED BY APPLID *applid*,
OPID:*opid* TO PREVENT UPDATING.**

Explanation: The list or group *lgnam* cannot be used because a user of the CEDA or CEDB transaction has enforced a LOCK command to prevent updating by other users.

System action: The command is not executed.

If commands are being read from a SYSIN data stream, then subsequent commands (except the LIST command) are checked for syntax only. (If the primary CSD file cannot be opened, the LIST command is not processed either.)

If commands are being read from a get-command exit, then the DFHCSDUP utility attempts to process subsequent commands.

User response: Negotiate with the user with the specified OPID and APPLID, or create a new group or list by taking a copy of the definitions in the locked one.

Module: DFHCSDUP

Destination: SYSPRINT

**DFH5146E COMMAND NOT EXECUTED. *lgnam* IS
CURRENTLY BEING UPDATED BY
APPLID:*applid*, OPID:*opid***

Explanation: The list or group *lgnam* cannot be used because:

- A user of the CEDA or CEDB transaction is currently running a command to update it
- A previous operation to update it using CEDA or CEDB failed to execute to completion.

System action: The command is not executed.

If commands are being read from a SYSIN data stream, then subsequent commands (except the LIST command) are checked for syntax only. (If the primary CSD file cannot be opened, the LIST command is not processed either.)

If commands are being read from a get-command exit, then the DFHCSDUP utility attempts to process subsequent commands.

User response: Resubmit the utility job to retry the command that failed. Perform the subsequent

commands that were suppressed.

If this fails to resolve the problem, run the DFHCSDUP VERIFY command to remove the in-flight flag detected when this message is produced.

Module: DFHCSDUP

Destination: SYSPRINT

**DFH5147E COMMAND NOT EXECUTED. *lgnam*
ALREADY EXISTS AS A {GROUP |
LIST}**

Explanation: The name chosen for the target group (or list) duplicates that of an existing group or list on the CSD file.

System action: Processing of the utility command is terminated.

User response: Choose a different name for the target group.

Module: DFHCSDUP

Destination: SYSPRINT

**DFH5148E UNABLE TO GET STORAGE FOR {FCT
| RDT | LD} TABLE NAMED *table***

Explanation: There is insufficient storage to satisfy a GETMAIN request for table *table*.

System action: The system action depends on the table specified as follows:

LD (language definition table)

The CSD utility cannot process any commands, and terminates with a dump. The MVS user abend code is 0327.

FCT and RDT

The CSD utility cannot migrate the table, and terminates processing of the utility command.

User response: Allocate additional storage. If your TCT assembly and link-editing is successful, the RDT should be in the library. The LD is in the load library of the supplied pregenerated CICS system.

Module: DFHCSDUP

Destination: SYSPRINT

**DFH5149E COMMAND NOT EXECUTED. xxxxxxxx
IS IBM-PROTECTED.**

Explanation: A user attempted to add a definition to an IBM-supplied group or list (groups or lists beginning with DFH). This is not allowed.

System action: The CSD utility does not create a definition.

User response: Change the input command or TCT source data to name a target group or list whose name does not begin with DFH.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5150W *xxxxxxx* **OPTION CONFLICTS WITH**
yyyyyyy **OPTION AND IS IGNORED FOR**
restype resname

Explanation: The options, *xxxxxxx* and *yyyyyyy*, specified for the resource type *restype* with name *resname* are mutually exclusive.

System action: The utility ignores option *xxxxxxx*.

User response: None.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5151I **RESOURCE NOT ALTERED. xxxxxxxx IS**
IBM-PROTECTED.

Explanation: During the execution of an ALTER command containing a generic group name, a matching group was found which is an IBM-supplied group and is protected.

System action: The CSD utility does not alter the definition in the specified group.

User response: None.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5155W *{TDQUEUE} xxxxxxxx* **HAS SAME NAME**
AS AN IBM SUPPLIED DEFINITION IN
GROUP *grpname*.

Explanation: The name of the migrated table entry, *xxxxxxx*, matches the name of an IBM-supplied resource in IBM-protected group *grpname*, created by the INITIALIZE command.

System action: CICS migrates this entry normally.

User response: If necessary, rename the resource, using the CEDA transaction.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5156W *{TDQUEUE}* **DID NOT MIGRATE. ITS**
PROPERTIES MATCH AN
IBM-SUPPLIED DEFINITION IN GROUP
grpname.

Explanation: The properties of the resource defined in the user's table entry are the same as those of the IBM-supplied resource of the same name contained in IBM-protected group *grpname*.

System action: The entry for the user's resource is not migrated.

User response: None.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5159I *resource object* **DEFINED IN GROUP**
grpname

Explanation: The CSD utility has successfully added a resource definition to a group, where:

- *resource* is the type of resource (CONNECTION, FILE, JOURNALMODEL, LSRPOOL, MAPSET, PARTITIONSET, PARTNER, PROFILE, PROGRAM, SESSION, TDQUEUE, TERMINAL, TRANCLASS, TRANSACTION, or TYPETERM).
- *object* is the name of the object.
- *grpname* is the name of the group.

System action: Normal utility processing continues.

User response: None.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5161S **TABLE** *table* **MUST BE LINK-EDITED**
WITH AMODE(24) RMODE(24).

Explanation: After loading the table *table*, the migration routine checks that the table being processed has been link-edited with the correct AMODE and RMODE attributes. For migration purposes, DCTs, FCTs and TCTs must be link-edited with AMODE(24) RMODE(24). RCTs must be link-edited with RMODE(24).

System action: The MIGRATE command is not processed.

User response: Relink the table with the correct attributes. For example, when migrating a DCT to your CSD include the following statement in your DCT: DFHDCT TYPE=(INITIAL,MIGRATE). For more information about migrating tables to your CSD, refer to the *CICS Resource Definition Guide*.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5164W **NO DEFINITION OF** *resource object*
CREATED. THIS DUPLICATES AN
EXISTING DEFINITION IN GROUP
grpname

Explanation: The CSD utility detected a CSD record with a matching key before adding the definition to the CSD file, where:

- *resource* is the type of resource.
- *object* is the name of the object.
- *grpname* is the name of the group.

System action: The CSD utility does not migrate the

DFH5165S • DFH5174W

resource definition to the CSD file. (If it is a transaction, a generated profile is not created either.)

User response: Use the CEDA transaction to define the resource with a unique name.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5165S PROCESSING IS TERMINATED. AN ERROR OCCURRED WHILE WRITING *resource object* TO THE CSD.

Explanation: An error occurred when the CSD utility called DFHDMP to write the definition of the object *object* to the CSD file.

The CSD file may be full or corrupted.

resource is the type of resource.

System action: If the CSD is full, the CSD utility issues message DFH5176, and then terminates with a return code of 12 in message DFH5109.

If the CSD is not full, the CSD utility terminates abnormally with message DFH5175, usually accompanied by one or more of the explanatory messages, DFH5177, DFH5178, and DFH5179.

User response: Use the additional messages to determine the cause of the error and the appropriate user action required.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5166E DISALLOWED CHARACTER IN *resource* NAME *object*

Explanation: The call to module DFHDMP has failed to construct a valid key for the record created on the CSD file because of an invalid character, or the resource name for the migrated table entry may be invalid. *resource* is the type of resource, and *object* is the name of the object.

System action: A CSD record is not created for this definition. (If it is a transaction, a generated profile is not created either.)

User response: Use the CEDA transaction to define the resource with a valid name.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5167S THE CSECTS IN TABLE *table* HAVE BEEN LINK-EDITED IN THE WRONG ORDER.

Explanation: While processing a MIGRATE command, the CSD utility has detected that the CSECTS in table *table* are in the wrong order. Input to the linkage editor

omitted a control statement to order the CSECTS.

System action: The CSD utility does not process the MIGRATE command.

User response: Use the IBM-supplied procedure, DFHAUPLK, to assemble and link-edit CICS tables. This procedure ensures the correct ordering of CSECTS within the tables.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5168S TABLE LOADED FROM LIBRARY MEMBER *table* IS NOT A VALID {FCT / RDT / TCT}.

Explanation: After loading the table *table*, the migration routine checks the VMNAME field in the DFHVM expansion of the data area following the load point. This message is produced if VMNAME is not that of a valid table.

System action: The MIGRATE command is not processed.

User response:

1. Ensure that the correct table is present in the library, and that the TABLE parameter of the MIGRATE command is correct.
2. Ensure that an ORDER statement was processed in the JCL of the link-editing of the table.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5169S PROCESSING IS TERMINATED. TABLE *table* WAS ASSEMBLED FOR CICS RELEASE *rrr*. REASSEMBLE FOR RELEASE *sss*.

Explanation: After loading the table *table*, the migration routine checks the VMVERS field in the DFHVM expansion of the data area following the load point. This field indicates the CICS release (*rrr*) for which the table was assembled, and is invalid for the CICS system (release *sss*) that is running.

System action: The MIGRATE command is not processed.

User response: Reassemble the table for the correct release of CICS.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5174W PROCESSING IS TERMINATED. COMMAND CANNOT BE EXECUTED BECAUSE 'PARM=CSD(READONLY)' WAS SPECIFIED.

Explanation: This command requires the CSD to be

opened for read-write access. Your job step specified read-only access for the CSD in the DFHCSDUP utility job stream.

System action: This command is not executed.

If commands are being read from a SYSIN data stream, subsequent commands (except LIST) are checked for syntax only. (If the primary CSD file cannot be opened, LIST is not processed either.)

If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

User response: Amend the JCL to specify 'PARM=CSD(READWRITE)'.

accessing it in RLS mode, you cannot specify READWRITE access. To perform the command, access the CSD in non-RLS mode.

Module: DFHCSDUP

Destination: SYSPRINT

**DFH5175S PROCESSING IS TERMINATED.
UNEXPECTED RESPONSE FROM
function IN CSD MANAGER.**

Explanation: An invocation of the CSD manager, DFHDMP, has resulted in an error. The name of the function that failed is *function*.

System action: DFHCSDUP issues additional messages and then

- Terminates **normally** for CSD open/close errors, and the CSD-full condition, or
- Terminates **abnormally** for all other situations.

User response: Ensure that you have set up your CSD file correctly. If you have migrated your CSD file from a previous release, note that you should have increased your block size to 500. If necessary, use the diagnostics in the additional messages.

Module: DFHCSDUP

Destination: SYSPRINT

**DFH5176S PROCESSING IS TERMINATED. CSD IS
FULL.**

Explanation: The VSAM data set containing the CSD file is full.

System action: Execution of the CSD utility command is terminated.

If commands are being read from a SYSIN data stream, then subsequent commands (except LIST commands) are checked for syntax only. (If the primary CSD file cannot be opened, the LIST command is not processed either.)

If commands are being read from a get-command exit,

then the DFHCSDUP utility attempts to process subsequent commands.

The DFHCSDUP utility leaves a system lock on the group being created at the time of failure. This lock prevents processing of the group by the CSD utility or the CEDA transaction.

User response: First, use the DFHCSDUP VERIFY process to remove the system lock on the partly-created group. Normal RDO processing of the group should then be possible, enabling the group (or any unwanted definitions) to be deleted.

To recover the contents of the CSD file, define a larger data set and use the AMS REPRO command. Usually, you will be able to REPRO from the CSD file that became full. If you are unable to do this, use a backup copy. (You may be able to transfer definitions from the CSD file that filled up by using the DFHCSDUP COPY command with the FROMCSD option.)

Module: DFHCSDUP

Destination: SYSPRINT

**DFH5177S PROCESSING IS TERMINATED. CSD
I/O ERROR OCCURRED.**

Explanation: An I/O error occurred when executing a READ or WRITE of a CSD record on the primary or secondary CSD file.

System action: DFHCSDUP issues additional messages and terminates abnormally.

User response: Restore the CSD file to a new data set from your own backup, or create the new CSD file by using the INITIALIZE, COPY, and APPEND commands to restore existing definitions.

Module: DFHCSDUP

Destination: SYSPRINT

**DFH5178S PROCESSING IS TERMINATED.
SEVERE CSD ERROR OCCURRED.**

Explanation: An error occurred during execution of the CSD manager, DFHDMP, to access the primary or secondary CSD file.

System action: DFHCSDUP issues additional messages and terminates abnormally.

User response: See the VSAM diagnostics given in message DFH5179.

Module: DFHCSDUP

Destination: SYSPRINT

**DFH5179S VSAM ERROR. RETURN CODE = nn
ERROR CODE = ddd(yy) CONTROL
BLOCK TYPE = {RPL | ACB}**

Explanation: VSAM returned the following diagnostics when an error occurred, where:

- *nn* is the hexadecimal VSAM return code
- *yy* is the hexadecimal VSAM error code (*ddd* is its decimal equivalent)
- CONTROL BLOCK TYPE points to the relevant error code subset as follows:
 - RPL = Request macro responses from VSAM
 - ACB = OPEN/CLOSE responses

The error code is:

- For CONTROL BLOCK TYPE = RPL, the reason code from byte 3 of the feedback word field in the RPL (RPLERRCD)
- For CONTROL BLOCK TYPE = ACB, the reason code in the ERROR field in the ACB (ACBERFLG)

System action: The CSD utility terminates command processing, and in some situations, produces an operating system dump.

User response: For the meaning of the VSAM return and error codes, refer to the *DFSMS/MVS V1R3 Macro Instructions for Data Sets* manual.

When interpreting these diagnostics, ensure that the data set referenced in the JCL exists.

Check the following

- The data set is being concurrently accessed by CICS running in another region.
- You are not attempting to open a recoverable CSD as READWRITE if DFHCSDUP specifies RLS access mode. You must specify PARM=CSD(READONLY) in this case.
- LOG is defined on the base cluster if RLS access mode is specified.

If DFHCSDUP specifies RLS access mode, a 'record not found' error could mean that the CSD has not been initialized. a recoverable CSD.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5180S PROCESSING IS TERMINATED. ERROR OCCURRED WHILE CSD WAS BEING READ BY {SETBROWSE | GETNEXT} {SCANSETS | SCANOBJS}

Explanation: When the LIST command invoked DFHDMP to scan the objects on the CSD file, an error occurred during execution of the DFHDMP function.

System action: The CSD utility terminates with an MVS abend 0325.

User response: This error should be reported. You need further assistance from IBM to resolve this

problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5181W NO MATCH FOUND FOR GENERIC {GROUP | LIST} IDENTIFIER xxxxxxxx

Explanation: The LIST command was executed with a generic group or list name, but no qualifying group or list exists on the CSD file.

System action: Normal processing continues.

User response: None.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5182W {GROUP | LIST} xxxxxxxx DOES NOT EXIST.

Explanation: The LIST command or the DELETE command was executed using the name of a group or list that does not exist on the primary CSD file.

System action: The LIST command or the DELETE command is not processed. Subsequent commands may still be processed.

User response: Correct the LIST command or the DELETE command to use a valid group or list name.

If a CSD upgrade is being performed, no user action is required.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5183W {GROUP | LIST} xxxxxxxx EXISTS AS A {GROUP | LIST} NAME.

Explanation: The LIST command or the DELETE command was executed using a group name that is already in use as a list name, or using a list name that is already in use as a group name.

System action: The LIST command or the DELETE command is not processed. Subsequent commands may still be processed.

User response: Correct the LIST command or the DELETE command to use a valid group or list name.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5184S PROCESSING IS TERMINATED. INVALID OUTPUT FROM DFHPUP. CANNOT FORMAT DATA FOR UTILITY LISTING.

Explanation: There has been an internal logic error in

the DFHCSDUP utility program. The data in the back-translated output buffer is invalid. The length code may be out of range or the data fields in the wrong sequence. One or more of the data fields may be invalid.

System action: The CSD utility terminates with an MVS abend 0326.

User response: This error must be reported.

Obtain a dump from DFHCSDUP together with a listing of the DFHCSDUP run and its JCL. Also try to obtain a print out of the CSD, using either IDCAMS or the DFHCSDUP LIST ALL option. The LIST will indicate where the error(s) have occurred because they will refuse to print and are therefore easily identifiable.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5186W NO RESOURCES DEFINED IN GROUP
grpname **OR NO GROUPS DEFINED IN**
LIST *lstid*

Explanation: In executing a LIST command, the CSD utility has found a group or list header on the CSD file for which no corresponding group or list elements exist.

System action: The utility continues to process the LIST command, but will not tabulate elements of the group or list named in the message.

User response: Run the DFHCSDUP VERIFY utility.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5187I *resource* **IS LOCKED, BUT IS NOT THE**
NAME OF A GROUP OR LIST.

Explanation: The CSD utility detected a locked resource that is not a group or list. The reason is that an interrupt or failure occurred during a CEDA transaction or a previous utility job. A lock had been created but not the associated group or list.

System action: The utility continues normal processing of the VERIFY command.

User response: None.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5188I *{GROUP | LIST | RESERVED NAME}*
resource **IS NOW AVAILABLE FOR USE.**

Explanation: The VERIFY command discovered that the resource was not available for the CEDA transaction or offline commands. The restriction on its availability, which was due to the failure of some previous command affecting it, has now been removed.

System action: Normal processing of the VERIFY command continues.

User response: None.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5189I CSD VERIFY PROCESS COMPLETED
SUCCESSFULLY.

Explanation: The VERIFY command has been processed successfully, and any internal locks associated with groups and lists on the CSD file have been removed.

System action: Normal processing continues.

User response: None.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5190S COMMAND IS NOT EXECUTED.
UNABLE TO GET STORAGE FOR
SERVICE MODULE *progname*

Explanation: There is insufficient storage available to load the service module *progname*, that is to be loaded and executed by DFHCSDUP.

System action: Utility command execution is terminated.

If commands are being read from a SYSIN data stream, then subsequent commands (except LIST commands) are checked for syntax only. (If the primary CSD file cannot be opened, the LIST command is not processed either.)

If commands are being read from a get-command exit, then DFHCSDUP attempts to process subsequent commands.

User response: Ensure that there is sufficient storage allocated to load module *progname*.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5191I SERVICE PROGRAM *progrname* IS RUNNING.

Explanation: The service module *progrname* has been loaded correctly. Execution of the module has started.

System action: Normal processing continues.

User response: None.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5192S COMMAND IS NOT EXECUTED. CSD SERVICE LEVEL *ttt* IS INCOMPATIBLE WITH CURRENT SERVICE LEVEL *sss*

Explanation: Either the LEVEL parameter specified in the SERVICE command is wrong, or an incorrect version of the CSD file is being used as the secondary (input) CSD file.

System action: The SERVICE command is not executed.

If commands are being read from a SYSIN data stream, then subsequent commands (except LIST commands) are checked for syntax only. (If the primary CSD file cannot be opened, the LIST command is not processed either.)

If commands are being read from a get-command exit, then DFHCSDUP attempts to process subsequent commands.

User response: The SERVICE command may upgrade the service level of the CSD file only in increments of one. Check that the input CSD file is the intended one, and that the LEVEL parameter takes the value one higher than the current service level of the CSD file.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5193S COMMAND IS NOT EXECUTED. SERVICE MODULE *progrname* IS UNABLE TO UPGRADE CSD TO TARGET SERVICE LEVEL *ttt*

Explanation: The LEVEL parameter specified in the SERVICE command is incompatible with the status of the service module *progrname* being applied to the CSD file.

System action: The SERVICE command is not executed.

If commands are being read from a SYSIN data stream, then subsequent commands (except LIST commands) are checked for syntax only. (If the primary CSD file cannot be opened, the LIST command is not processed either.)

If commands are being read from a get-command exit,

then DFHCSDUP attempts to process subsequent commands.

User response: Ensure that the service module *progrname* being applied, is correctly updated with the service fix supplied by IBM. (It should have been amended so as to be able to process SERVICE commands at the target level *ttt*.)

Module: DFHCSDUP

Destination: SYSPRINT

DFH5194I UPGRADING SERVICE STATUS OF CSD FROM LEVEL *sss* TO LEVEL *ttt*

Explanation: The loaded service module is performing the required upgrade of the CSD file from service level *sss* to service level *ttt*.

System action: Normal processing continues.

User response: None.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5195I EXECUTION OF SERVICE PROGRAM *progrname* COMPLETE.

Explanation: The loaded service program *progrname* has run to completion. Control is being transferred back to the CSD offline utility program, DFHCSDUP.

System action: Normal processing continues.

User response: None.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5196S COMMAND IS TERMINATED. ERROR OCCURRED WHILE READING CONTROL SECONDARY CSD RECORD.

Explanation: An I/O error has occurred on the specified CSD file.

System action: The SERVICE command is terminated.

If commands are being read from a SYSIN data stream, then subsequent commands (except LIST) are checked for syntax only. (If the primary CSD file cannot be opened, LIST is not processed either.)

If commands are being read from a get-command exit, then DFHCSDUP attempts to process subsequent commands.

User response: Retry the command, ensuring that a sufficiently large data set size is specified for the output (primary) CSD file.

Module: DFHCSDUP

Destination: SYSPRINT

**DFH5197S COMMAND IS TERMINATED.
UNRECOGNIZED CONTROL RECORD
ENCOUNTERED WHILE SECONDARY
CSD WAS BEING READ.**

Explanation: The contents of a control record of the secondary input CSD are invalid.

System action: The SERVICE command is terminated.

If commands are being read from a SYSIN data stream, then subsequent commands (except LIST) are checked for syntax only. (If the primary CSD file cannot be opened, LIST is not processed either.)

If commands are being read from a get-command exit, then DFHCSDUP attempts to process subsequent commands.

User response: Check that the input and output data sets have been correctly defined, and that the DDNAME for the secondary CSD file in the JCL corresponds to the OLDCSD parameter in the SERVICE utility command.

If the problem persists, you will need further help from IBM. First, obtain a dump from DFHCSDUP together with a listing of the DFHCSDUP run and its JCL. Also try to obtain a print out of the CSD using either IDCAMS or the DFHCSDUP LIST ALL option. The LIST indicates where the errors have occurred because they do not print and are therefore easily identifiable. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5198I CSD RECORD MODIFIED FOR xxxxxxxx

Explanation: The specified modification to a record on the CSD file has taken place.

The insert, xxxxxxxx, is the element type.

System action: Normal processing continues. If the modified record is an element in a GROUP or LIST, its date-and-time field is updated when copied to the output (primary) CSD file.

User response: None.

Module: DFHCSDUP

Destination: SYSPRINT

**DFH5199W INVALID FIELD ENCOUNTERED IN
EXISTING RECORD FOR xxxxxxxx**

Explanation: An unexpected value was found in one of the fields of a CSD record that was to be modified for element xxxxxxxx.

System action: Normal processing continues, and the invalid record is left unchanged on the new (primary) CSD file.

User response: None.

Module: DFHCSDUP

Destination: SYSPRINT

DFH52nn messages

**DFH5200S COMMAND NOT EXECUTED. NO VALID
LANGUAGE TABLE WAS LOADED.**

Explanation: Either the CSD utility found that the RDO language table had not been loaded correctly, or that it contained invalid data.

System action: The CSD utility terminates, because it cannot process any commands.

User response: Check that the correct version of the RDO language table (DFHEITCU) is in the program library.

Module: DFHCSDUP

Destination: SYSPRINT

Module: DFHCSDUP

Destination: SYSPRINT

**DFH5202S INCORRECT SYNTAX FOR *command*
COMMAND. COMMAND NOT
EXECUTED.**

Explanation: The syntax of the command is incorrect.

System action: The CSD utility ignores the command.

User response: Correct the command.

Module: DFHCSDUP

Destination: SYSPRINT

**DFH5201S *command* COMMAND IS NOT VALID.
COMMAND NOT EXECUTED.**

Explanation: The CSD utility does not recognize the command.

System action: The utility ignores the command.

User response: Correct the command.

**DFH5203W RIGHT PARENTHESIS ASSUMED
AFTER THE VALUE OF xxxx.**

Explanation: The syntax of the command was incorrect. Either a right parenthesis has been omitted or a keyword value in excess of 256 bytes has been specified.

DFH5204E • DFH5212E

System action: The CSD utility executes the command as if the right parenthesis was present.

User response: Confirm that the correction applied by the utility generated the required command.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5204E COMMAND NOT EXECUTED. xxxx KEYWORD IS NOT VALID.

Explanation: The keyword *xxxx* is not valid on this command.

System action: The utility command is ignored.

User response: Correct the command.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5205E COMMAND NOT EXECUTED. NO VALUE WAS SPECIFIED FOR xxxx.

Explanation: The option *xxxx* is incomplete, possibly because a value has been omitted.

System action: This CSD utility command is ignored.

User response: Correct the command.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5206E COMMAND NOT EXECUTED. DUPLICATE SPECIFICATION OF xxxx.

Explanation: Option *xxxx* appears twice on a single CSD utility command.

System action: The utility ignores the command.

User response: Correct the command.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5207E COMMAND NOT EXECUTED. xxxxxxxx DOES NOT REQUIRE A VALUE.

Explanation: The CSD utility detected an input command coded with a value for option *xxxxxxx* when no value was required.

System action: The utility does not process the command.

User response: Correct the command.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5209W NO COMMAND ENCOUNTERED. THE INPUT FILE MIGHT BE EMPTY.

Explanation: The CSD utility detected that an input command was blank. A valid CSD input command was expected but not found.

System action: The utility stops processing input commands.

User response: Ensure that you have valid **DFHCSDUP** input commands in the **SYSIN** data stream. If you are using an **UPGRADE USING filename** command, ensure that the input file *filename* is not empty.

Note: This message cannot be changed with the message editing utility.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5210E COMMAND NOT EXECUTED. INVALID VALUE WAS SPECIFIED FOR xxxx.

Explanation: The CSD utility detected an input command coded with an invalid value for option *xxxx*.

System action: The utility does not process the command.

User response: Correct the value.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5211E COMMAND NOT EXECUTED. OPERAND DELIMITER x WAS MISPLACED.

Explanation: The CSD utility has detected an input command coded with a misplaced option delimiter *x*.

System action: The utility does not process the command.

User response: Place the delimiter correctly.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5212E COMMAND NOT EXECUTED. *comptype* *string* IS NOT UNIQUELY IDENTIFIABLE.

Explanation: An ambiguous **DFHCSDUP** command has been specified.

- *comptype* is the command component type
- *string* is the actual component.

System action: The command is not executed. If commands are being read from a **SYSIN** data stream, subsequent commands (except **LIST** commands) are checked for syntax only. If commands are being read

from a get-command exit, DFHCSDUP attempts to process subsequent commands.

User response: Correct the command syntax and retry. See accompanying message DFH5213 for further details of the command failure.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5213E SPECIFIED *input* COULD BE INTERPRETED AS *match1* OR *match2*.

Explanation: An ambiguous DFHCSDUP command has been specified.

- *input* is the ambiguous character string
- *match1* and *match2* are two possible interpretations of *input*.

System action: The command is not executed. If commands are being read from a SYSIN data stream, subsequent commands (except LIST commands) are checked for syntax only. If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

User response: Correct the command syntax and retry.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5214W *keyword* IS AN OBSOLETE KEYWORD. IT IS IGNORED.

Explanation: The CSD utility has detected an input command coded with an obsolete keyword. The keyword specifies an option not valid for this release of CICS, but the command can be used as input to the CSD utility for an earlier release.

System action: The utility ignores the keyword.

User response: Confirm that the resulting utility command is correct for this release of CICS.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5215E COMMAND NOT EXECUTED. A CLOSING PARENTHESIS HAS BEEN OMITTED FROM A NULL VALUE SPECIFIED ON AN ALTER COMMAND.

Explanation: A closing parenthesis was not added when a null value was specified for a keyword on an ALTER command. A closing parenthesis is automatically added for keyword values other than nulls.

System action: The command is not executed. If commands are being read from a SYSIN data stream, subsequent commands (except LIST commands) are checked for syntax only. If commands are being read

from a get-command exit, DFHCSDUP attempts to process subsequent commands.

User response: Correct the command syntax and retry.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5216E *restype* *resname* IS NOT IN GROUP *group*.

Explanation: A nonexistent resource of type *restype* and name *resname*, has been specified on an ALTER command.

System action: The command is not executed. If commands are being read from a SYSIN data stream, subsequent commands (except LIST commands) are checked for syntax only. If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

User response: Correct the command syntax and retry.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5217E COMMAND NOT EXECUTED. A CLOSING BRACKET HAS BEEN OMITTED FROM A *xxxx* KEYWORD.

Explanation: A closing bracket has been omitted from the *xxx* keyword on a DFHCSDUP DEFINE command.

System action: The DEFINE command is not executed.

User response: Correct the DEFINE command syntax and retry.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5218I ALTERING *Resourcetype* *Resourcenam* IN GROUP *Groupname*

Explanation: During the execution of a generic ALTER command, the CSD batch update utility scans the CSD file for matches to the specified generic resource name and/or GROUP keyword. For every match, the utility processes the request and informs the user of the resulting *resourcenam* and/or *groupname* respectively.

System action: Normal processing continues.

User response: None.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5219W NO MATCH FOUND ON CSD FILE FOR
Resourcetype Resourcename GROUP
Groupname

Explanation: The ALTER command was executed with a generic resource and/or group name, but no qualifying resource and/or group exist on the CSD file.

System action: Normal processing continues.

User response: None.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5220E COMMAND NOT EXECUTED. xxxxxxxx
MUST BE THE FIRST COMMAND.

Explanation: The CSD utility found an INITIALIZE command after other commands.

System action: The CSD utility ignores the command.

User response: Confirm that the INITIALIZE command was misplaced.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5222E COMMAND NOT EXECUTED. xxxxxxxx
KEYWORD WAS OMITTED OR
SPECIFIED INCORRECTLY.

Explanation: A required keyword xxxxxxxx was omitted from a CSD utility command.

System action: The utility ignores the command.

User response: Specify keyword xxxxxxxx.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5223E COMMAND NOT EXECUTED. xxxxxxxx
KEYWORD CONFLICTS WITH xxxxxxxx
KEYWORD.

Explanation: The syntax of the command is incorrect. Conflicting keywords have been specified.

System action: The utility command is ignored.

User response: Correct the command.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5224E COMMAND NOT EXECUTED. VALUE
OF xxxxxxxx IS OUT OF VALID RANGE.

Explanation: The CSD utility detected an input command coded with a numeric value for value xxxxxxxx which was outside the valid range.

System action: The utility does not process the command.

User response: Correct the value.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5225E COMMAND NOT EXECUTED. SAME
NAME SPECIFIED FOR 'TO' AND
 xxxxxxxx.

Explanation: This message is issued for one of the following reasons:

1. The utility COPY command has been coded with the same group name for the source and target group.
2. The APPEND command has been coded with the same list name for the source and target list.
3. The ADD command has been coded with the same group name and list name.

System action: The CSD utility or CICS ignores the command.

User response: Correct the name (or names) in error.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5227E COMMAND NOT EXECUTED. USE OF
GENERIC NAME CONFLICTS WITH
 xxxxxxxx **OPTION.**

Explanation: A CSD utility command used a generic name; that is, one containing asterisk (*) or plus sign (+) characters, in conjunction with an option that conflicted with the use of generic names.

System action: The utility ignores the command.

User response: Correct the command.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5228E COMMAND NOT EXECUTED. ONLY
ONE RESOURCE-TYPE KEYWORD
CAN BE SPECIFIED.

Explanation: The CSD utility detected an input command coded with more than one resource-type keyword.

System action: The utility does not process the command.

User response: Correct the command to refer to only one resource-type keyword.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5229E COMMAND NOT EXECUTED. xxxxxxxx
IS INVALID BECAUSE A
RESOURCE-TYPE KEYWORD WAS
SPECIFIED.

Explanation: The CSD utility detected an input command coded with a resource-type keyword (for example, PROGRAM, TRANSACTION) in a situation where a resource-type keyword is invalid.

System action: The utility does not process the command.

User response: Correct the command and resubmit.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5230I ERASE COMMAND IS OBSOLETE. USE
THE DELETE COMMAND.

Explanation: The CSD utility detected the obsolete ERASE command in its input.

System action: The utility processes the command as a DELETE command.

User response: In future, use the DELETE command instead of the ERASE command.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5231E COMMAND NOT EXECUTED. xxxxxxxx
IS INCOMPATIBLE WITH THE MIGRATE
COMMAND FOR *table-type* TABLES.

Explanation: An attempt has been made to execute the MIGRATE command with an invalid table type and (or) an invalid keyword specified.

System action: The CSD utility terminates.

User response: Correct the command syntax and resubmit the job.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5232E COMMAND NOT EXECUTED. xxxxxxxx
PARAMETER MUST NOT BEGIN WITH
'DFH'.

Explanation: In a CSD utility MIGRATE command, the xxxxxxxx parameter contained an invalid table name or group name.

System action: The utility does not process the command.

User response: Resubmit with a valid table name or group name.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5233E COMMAND NOT EXECUTED. xxx
TABLE TYPE IS NOT SUPPORTED BY
RDO.

Explanation: The CSD utility detected a TABLE parameter that referred to a CICS table type not supported by RDO.

RDO supports

- Program, transaction, and terminal definitions (RDT)
- Files (FCT)
- Transient data queues (DCT).

System action: The utility does not process the command.

User response: Correct the command.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5234E COMMAND NOT EXECUTED. *command*
IS NOT SUPPORTED.

Explanation: The CSD utility detected a command *command* in its input which is not supported by RDO.

System action: The utility does not process the command.

User response: Correct the command

Module: DFHCSDUP

Destination: SYSPRINT

DFH5235E COMMAND NOT EXECUTED. GROUP
OR LIST MUST BE SPECIFIED.

Explanation: A CSD utility EXTRACT command has been submitted. A GROUP or LIST name must be specified with an EXTRACT command.

System action: The utility command is not executed. This message is followed by DFH5104.

User response: Correct the invalid command by adding a valid GROUP or LIST name and rerun the utility job.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5236I A USER EXIT PROGRAM HAS BEEN
SPECIFIED ON THE ENTRY LINKAGE
AND ON THE USERPROGRAM
KEYWORD. THE PROGRAM SPECIFIED
ON THE ENTRY LINKAGE HAS BEEN
IGNORED.

Explanation: An EXTRACT user-exit program has been specified via the entry parameter list and on the USERPROGRAM keyword of the EXTRACT command.

System action: The program specified on the USERPROGRAM keyword is used.

User response: Ensure that the user program used is the one intended.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5240S PROCESSING TERMINATED. ERROR OCCURRED WHILE INPUT UTILITY COMMAND WAS BEING READ.

Explanation: The environment adaptor GETCARD utility cannot read an input utility command.

System action: The CSD utility terminates abnormally without processing the input commands.

User response: Check that the utility commands are prepared correctly and located correctly in the JCL. Check also that the DD statement defining the output data set startup job stream is correct. For JCL examples, refer to the *CICS Operations and Utilities Guide*.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5241S PROCESSING TERMINATED. INVALID RECORD LENGTH ON INPUT UTILITY COMMAND DATA STREAM.

Explanation: The CSD utility detected incorrectly formatted input in the SYSIN data stream.

System action: The CSD utility cannot process any commands. The utility attempts to

1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.

User response: Ensure that the output data set data stream is formatted with fixed length 80-byte records.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5242E COMMAND NOT PROCESSED. TOO MANY CONTINUATION RECORDS FOR INPUT UTILITY COMMAND.

Explanation: The CSD utility detected an input command that was too long and extended over too many records.

System action: The utility does not process the command.

User response: This message may be caused by an error in the rejected command or in the preceding or

subsequent commands in the input stream. Correct the commands in error.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5250E TO(*groupname*) CONTAINS TOO MANY NON CONTIGUOUS '*'

Explanation: During the execution of a generic COPY command, the batch update utility found the argument of the TO parameter specified too many non contiguous asterisks.

Only one '*' is allowed in the TO parameter during the execution of a generic copy.

System action: The utility rejects the command.

User response: Correct the command.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5251I *resource object* IN GROUP *grpname* IS REPLACED.

Explanation: A resource definition existed in both source and target groups. Based on the CSD utility commands submitted, the utility has replaced the definition in the target group with that from the source group.

- *resource* is the type of the resource
- *object* is the name of the object
- *grpname* is the name of the group.

System action: Normal utility processing continues.

User response: None.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5252I *resource object* COPIED TO GROUP *grpname*.

Explanation: The CSD utility has correctly copied a resource definition to the specified group, where:

- *resource* is the type of resource
- *object* is the name of the object
- *grpname* is the name of the group.

System action: Normal utility processing continues.

User response: None.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5253E GROUP *grpname* NOT FOUND IN CSD FILE - DDNAME: *ddname*

Explanation: The CSD utility has detected a COPY command that attempted to copy definitions from the non-existent group, *grpname*, in the CSD specified in DDNAME *ddname*.

System action: The utility does not process the command.

User response: Either correct the group name in the command, or make sure that the specified CSD file is the correct one.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5254E *resource object* ALREADY EXISTS IN THE TARGET GROUP.

Explanation: The CSD utility detected a command that attempted to add a definition to a group that already contained a definition of an object with the same name, where

- *resource* is the type of resource
- *object* is the name of the object.

System action: The CSD utility does not process the command.

User response: Change the name in the command, or alter the name of the existing definition.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5255E LIST *xxxxxxx* NOT FOUND IN CSD FILE - DDNAME: *ddname*

Explanation: The CSD utility detected an APPEND or REMOVE command that referred to a nonexistent list in the CSD file specified in DDNAME *ddname*.

System action: The utility does not process the command.

User response: Either correct the list name in the command, or make sure that the specified CSD file is the correct one.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5256E NO RESOURCES DEFINED IN GROUP *grpname*.

Explanation: In executing a LIST command, the CSD utility has found a group header on the CSD file for which no group elements exist.

System action: The CSD utility continues to process the LIST command, but will not list elements of the named group.

User response: Run the DFHCSDUP VERIFY utility to verify the group.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5257E LENGTH OF 'TO' PREFIX MUST BE LESS THAN OR EQUAL TO LENGTH OF 'GROUP' PREFIX.

Explanation: During the execution of a generic COPY command, the batch update utility found the length of the prefix of the generic group specified in the TO keyword to be greater than the length of the prefix of the generic GROUP keyword.

System action: The utility ignores the command to prevent truncation of the TO group name.

User response: Correct the command.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5258I COPYING GROUP *grpname1* TO *grpname2*

Explanation: During the execution of a generic COPY command, the CSD batch update utility scans the CSD file for matches to the generic GROUP keyword. For every match, the utility resolves the generic TO keyword, and informs the user of the resulting *grpname1* and *grpname2* respectively.

System action: Normal processing continues.

User response: None.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5259I UNRECOGNIZED RESOURCE TYPE FOUND IN THE CSD FILE AND HAS BEEN IGNORED.

Explanation: CICS has found an unrecognized resource type code in a CSD record. The unrecognized code does not match any of the function codes in the language definition table. This can occur for one of the following reasons

1. You are using a CICS release that does not support a type of definition that was created on the CSD file by a later CICS release.
2. The language definition table (DFHEITSP or DFHEITCU) is invalid for this CICS release.
3. The CSD manager (DFHDMP) has passed an invalid CSD record buffer to DFHPUP. This is a CICS internal logic error.

System action: The resource is ignored and the operation continues.

User response: Determine which of the possible reasons caused the error. If you can eliminate reasons 1 and 2, you can assume that reason 3 applies.

Take action corresponding to the reason you have established as follows

1. Ignore the message.
2. Ensure that the library contains versions of DFHEITSP and DFHEITCU that are valid for the CICS release you are running.
3. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5260E LENGTH OF 'TO' SUFFIX MUST BE EQUAL TO LENGTH OF 'GROUP' SUFFIX.

Explanation: During the execution of a generic COPY command, the batch update utility found the length of the suffix of the generic group specified in the TO keyword to be of different length than that of the suffix of the generic GROUP keyword.

System action: The utility ignores the command to prevent ambiguity on the TO group name.

User response: Correct the command.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5261W RDT IS EMPTY. NO VTAM RESOURCES IN ASSEMBLED TABLE.

Explanation: The CSD utility detected an attempt to migrate a TCT that either contains no RDO-supported terminal or sessions definitions, or whose TYPE=INITIAL entry specifies MIGRATE=COMPLETE.

System action: The utility does not create any CSD definitions.

User response: Check the TCT source code to see if it contains any RDO-supported definitions. If it does, check that it has been correctly assembled (MIGRATE=YES specified) and link-edited.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5262S INSUFFICIENT STORAGE TO BUILD TYPE-MATCHING CHAIN.

Explanation: During CSD utility processing, an internal error has occurred in the migration of a TCT. This is because of lack of storage for TYPETERM definitions.

System action: The utility attempts to:

1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.

In any of the above cases, definitions that have already been migrated will remain on the CSD.

User response:

1. Run the DFHCSDUP VERIFY utility.
2. Delete the groups created by the failing MIGRATE command.
3. Allocate a larger region size in the utility JCL, and retry the command.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5263S ERROR IN INPUT RDT. INCORRECT SEQUENCE OF COMMANDS.

Explanation: During CSD utility processing, an internal error has occurred in the migration of a TCT. This is because of abnormal data in the assembled table.

System action: The utility attempts to

1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.

Definitions that have already been migrated will remain on the CSD. The MVS user abend code is 0308.

User response:

1. Run the DFHCSDUP VERIFY utility.
2. Delete the groups created by the failing MIGRATE command.
3. Keep the assembly listing for the failing table and keep the DFHCSDUP dump, if available. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5264W RESOURCE *object* NOT DEFINED. GROUP *grpname* NOT AVAILABLE.

Explanation: During the migration of a TCT, the CSD utility could not define a resource *object* because the target group *grpname* was not available. The utility has issued a previous message indicating the reason.

System action: The utility creates no definition for resource *object*. Normal utility processing continues.

User response: Review the original message. If

necessary, recode the TYPE=GROUP macro in the TCT source to name a suitable group.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5265W ACTION REQUIRED TO FIND A SUITABLE TYPETERM FOR TERMINAL *termid*.

Explanation: While migrating a TCT, the CSD utility found a terminal definition for which it could not create a corresponding TYPETERM definition.

System action: The utility adds the terminal definition to the CSD file, but it refers to a TYPETERM that may be unsuitable for this device.

User response: Use the CEDA transaction to define a suitable TYPETERM and alter the TERMINAL definition to refer to the new TYPETERM.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5266W SESSIONS *sessions* NOT DEFINED BECAUSE OF ERROR IN ASSOCIATED CONNECTION.

Explanation: An error has been detected during the migration of a TCT. When migrating a session, DFHCSDUP checks that the associated CONNECTION has been defined successfully. If it has not, DFHCSDUP abnormally terminates the session definition.

System action: The specified SESSIONS resource is not migrated to the CSD. DFHCSDUP continues with the migration of subsequent TCT entries.

User response: Use the diagnostic information in the output listing from the MIGRATE utility to determine why the CONNECTION definition has failed. You can then use RDO to DEFINE the CONNECTION and the SESSIONS to the CSD.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5270I {GROUP | LIST} xxxxxxxx DELETED FROM THE CSD.

Explanation: The CSD utility has successfully deleted a group or list from the primary CSD file.

System action: Normal utility processing continues.

User response: None.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5271S UNABLE TO DELETE {GROUP | LIST} xxxxxxxx FROM THE CSD.

Explanation: During CSD utility processing, an error in accessing the CSD file caused a delete operation to fail.

System action: The utility does not process the DELETE command. The group or list to be deleted remains on the CSD file.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5272I resource object DELETED FROM GROUP.

Explanation: The CSD utility successfully deleted the named resource, where

- *resource* is the type of resource
- *object* is the name of the object.

System action: Normal utility processing continues.

User response: None.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5273W resource object IS NOT IS GROUP *grpname*.

Explanation: The CSD utility detected an attempt to delete a resource which did not exist in the named group, where

- *resource* is the type of resource
- *object* is the name of the object
- *grpname* is the name of the group.

System action: The utility does not process the DELETE command.

User response: Check that you have coded the group and resource names correctly.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5274W resource object NOT MIGRATED. GROUP *grpname* IS NOT AVAILABLE.

Explanation: During the migration of an RCT, the CSD utility could not define the resource *resource* because the target group *groupname* was not available. The utility has issued a previous message indicating the reason why.

System action: The utility creates no definition for the resource named *object*. Normal utility processing continues.

DFH5275S • DFH5283S

User response: Review the original message. If necessary recode the TYPE=GROUP macro in the RCT source to name a suitable group.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5275S COMMAND NOT EXECUTED. GROUP *grpname* IS NOT THE MEMBER OF LIST *listname*.

Explanation: The REMOVE command being executed names a GROUP that is not a member of LIST *listname*.

System action: The command is not executed.

If commands are being read from a SYSIN data stream, then subsequent commands (except LIST commands) are checked for syntax only. (If the primary CSD file cannot be opened, the LIST command is not processed either.)

If commands are being read from a get-command exit, then DFHCSDUP attempts to process subsequent commands.

User response: Correct the command and resubmit a DFHCSDUP job to execute the failing command and any subsequent commands that were suppressed.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5276I GROUP *grpname* REMOVED FROM LIST *listname*.

Explanation: The REMOVE command has successfully removed group *grpname* from LIST *listname*.

System action: Normal execution continues.

User response: None.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5277I LIST *list* DELETED FROM CSD.

Explanation: The final group has been removed from list *listname*. The list has therefore been deleted.

System action: Processing continues.

User response: None.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5280I PROCESSING DEFINITIONS FROM LIBRARY MEMBER *xxxxxxx*.

Explanation: The CSD utility has successfully loaded data from the named library member.

System action: Normal utility processing continues.

User response: None.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5281S DATA LOADED FROM LIBRARY MEMBER *xxxxxxx* IS INVALID.

Explanation: The CSD utility has found an error in data loaded from the named library member.

System action: The utility attempts to

1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.

User response: Obtain a dump containing the failing library member.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5282E UNABLE TO GET STORAGE FOR LIBRARY MEMBER *xxxxxxx*.

Explanation: There is insufficient storage available to load the library member *xxxxxxx*.

System action: The utility terminates processing of the command that required access to the named library member.

User response: Allocate a larger region size in the utility JCL and resubmit the job.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5283S RDL SUBCOMMAND EXCEEDS 1536 BYTES: *xxxxxxx*.

Explanation: The CSD utility found an internal error in the data loaded while processing the indicated (truncated) UPGRADE, INITIALIZE, or MIGRATE command.

System action: The CSD utility terminates abnormally.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCSDUP

Destination: SYSPRINT

**DFH5284E ERROR ANALYZING RDL
SUBCOMMAND: xxxxxxxx.**

Explanation: The CSD utility found an internal error in the data loaded while processing the indicated (truncated) UPGRADE, INITIALIZE, or MIGRATE command.

System action: The utility attempts to

1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCSDUP

Destination: SYSPRINT

**DFH5285E INVALID VERB IN RDL SUBCOMMAND:
xxxxxxx.**

Explanation: The CSD utility found an internal error in the data loaded while processing the indicated (truncated) UPGRADE, INITIALIZE, or MIGRATE command.

System action: The utility attempts to

1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCSDUP

Destination: SYSPRINT

**DFH5286E UNABLE TO CREATE RESOURCE
DEFINITION ON CSD FILE, RDL
SUBCOMMAND xxxxxxxx.**

Explanation: This message is issued during the processing of the indicated (truncated) command for one of the following reasons

1. The CSD is full (in which case, messages DFH5175 and DFH5176 accompanies this one)
2. The CSD was defined as read-only (in which case, message DFH5174 accompanies this message)
3. The TCT being migrated contained a terminal entry with a name unacceptable to RDO (in which case, message DFH5165 accompanies this message)

4. A list or group cannot be used due to the failure of a previous update operation (in which case, message DFH5142 accompanies this message)
5. The resource definition list being used to INITIALIZE or UPGRADE the CSD file contained a definition with an invalid resource name or group name
6. A logic error occurred in DFHCSDUP or an internal error was detected in the data contained in the loaded table.

System action: The system action depends on the reason the message is issued, as follows.

1. Migration of the TCT table is terminated immediately.
2. Processing of the UPGRADE or INITIALIZE command is terminated
3. The utility attempts to
 - a. Close any files previously opened internally.
 - b. Unload any extract exit routines that were dynamically loaded.
 - c. Invoke the termination exit routine (if supplied).
 - d. Return control to the invoker of the utility.
4. The command is not executed, and execution of further DFHCSDUP commands in the job stream is suppressed.
5. As in (3) above.
6. As in (3) above.

In ALL cases, all the definitions created by this command up to the point of failure remain on the CSD.

User response: The user response depends on the reason the message is issued, as follows.

1. See message DFH5175 and DFH5176.
2. See message DFH5174.
3. Change the name of the terminal and all references to it. Also refer to the user response for message DFH5165.
4. See message DFH5142.
5. This is a CICS logic error. See instruction for 6 below.
6. This is a CICS logic error. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. A CICS background trace of the failure may aid them in problem diagnosis.

Module: DFHCSDUP

Destination: SYSPRINT

**DFH5287E EXTRACT TERMINATED AT USER'S
REQUEST. RC=retcode.**

Explanation: A batch job has issued a CSD utility EXTRACT command. The EXTRACT command has been terminated because of a non-zero value in register 15 on return from a user exit program. Subsequent messages will indicate any further problems encountered by the utility.

System action: Execution of the utility command is

terminated. This message is followed by DFH5104.

User response: Determine the cause of the error detected by the user exit program using the return code *retcode* provided and the relevant documentation of the user exit program.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5288E GET-COMMAND TERMINATED AT USER'S REQUEST. RC=xx.

Explanation: The GET-COMMAND exit has returned a value other than UERCNORM ('00'X) or UERCDONE ('04'X) indicating that the GET-COMMAND exit was unsuccessful.

System action: Execution of the utility command is terminated.

User response: Correct the operation of the GET-COMMAND user exit before re-running the utility. Consult the documentation or listing supplied with the user exit for information on how to diagnose and fix the problem.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5290W TABLE *tabtype* MACRO *mactype=*value IS NOT SUPPORTED. VALUE IS CHANGED TO *newvalue*.

Explanation: During a table *tabtype* migration for macro *mactype*, *value* is not supported. *value* has been migrated as *newvalue*.

System action: The utility creates the definition for the resource with the changed value. Normal utility processing continues.

User response: Review the object definition to ensure that the modified definition is acceptable.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5291E UNABLE TO DEFINE OBJECT *object* IN GROUP *group*. MIGRATION IS TERMINATED.

Explanation: The DFHCSDUP migration utility could not define *object* in the *group* specified. The migration cannot continue.

System action: The utility terminates the migration of the table.

User response: Verify that the specified group is the correct group and review prior errors to determine why the migration utility could not create the definition in the group.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5292W OBJECT *object* NOT DEFINED FOR TABLE ITEM *name* DUE TO PREVIOUS ERROR. MIGRATION CONTINUES.

Explanation: The DFHCSDUP migration utility could not define *object* for the table item *name*. The migration continues.

During the migration of an RCT, the migration utility issues this message for all DB2TRAN definitions that refer to a DB2ENTRY definition that failed.

System action: The utility continues the table migration without defining the object.

User response: Correct the prior errors and manually define the skipped objects.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5293W TOTAL *object* DEFINITIONS SKIPPED DUE TO ERROR: *number*

Explanation: CICS issues this message after migrating a CICS table. *number* definitions of type *object* were not migrated. See one or more DFH5292 messages issued prior to this message.

System action: Utility processing continues.

User response: Correct the prior errors and manually define the skipped objects.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5294E *number object-1* WERE NOT MATCHED WITH A CORRESPONDING *object-2*.

Explanation: CICS issues this message if there are *object-1* table definitions that have not been defined because the table was not defined correctly. *object-1* table definitions must refer to a *object-2* in the table.

System action: The migration of the table ends.

User response: Reassemble the table with the current release macro source.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5296W TABLE *tabtype* TYPE=*mactype* *parameter* DOES NOT SUPPORT MULTIPLE VALUES.

Explanation: Multiple values were specified for TYPE=*mactype* *parameter*. The migration of the *tabtype* table supports only one value.

System action: The migration utility ignores the additional values. The migration continues.

User response: Review the migrated definition to ensure that the new single value is acceptable.

DFH55nn messages

DFH5501E **COMMAND NOT EXECUTED.** *keyword*
MUST BE SPECIFIED

Explanation: A keyword *keyword*, which is required in the command, has been omitted or was incorrectly specified. An earlier message identifies if the latter case is applicable.

System action: The utility ignores the command.

User response: Correct the command.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5502W *xxxxxxx* **IMPLIES** *yyyyyyy*

Explanation: The value *xxxxxxx* specified in a DEFINE command has caused another value *yyyyyyy*, which is not a normal default, to be assumed.

System action: Normal utility processing continues.

User response: Check that the resulting resource definition is acceptable. If you accept this default, no further action is required.

If the resultant default is not acceptable, you must decide whether to modify the definition, or to delete it and start again.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5503E **COMMAND NOT EXECUTED.** *xxxxxxx*
OPTION CONFLICTS WITH *yyyyyyy*
OPTION AND IS IGNORED.

Explanation: Two options, *xxxxxxx* and *yyyyyyy*, that are mutually exclusive have been specified.

System action: The utility ignores the command.

User response: Correct the command.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5504E **COMMAND NOT EXECUTED. USE OF**
xxxxxxx **OPTION IMPLIES** *yyyyyyy*
OPTION

Explanation: Option *xxxxxx* requires another value, *yyyyyy*.

System action: The utility ignores the command.

Module: DFHCSDUP

Destination: SYSPRINT

User response: Specify *yyyyyyy*.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5505W **PROGRAM DFHMSP REQUIRES A**
TWASIZE OF AT LEAST 512

Explanation: A DEFINE PROGRAM command for the message switching program, DFHMSP, has given it a TWASIZE of less than 512 bytes. If it is to be a definition for the CICS-supplied program of that name then it will not execute correctly.

System action: Normal utility processing continues.

User response: Check that the resulting resource definition is as you expect.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5506E **COMMAND NOT EXECUTED. FOR**
xxxxxxx **MANY OPTIONS, INCLUDING**
yyyyyyy **ARE MEANINGLESS**

Explanation: A keyword or value has been specified that is not consistent with another.

System action: The utility ignores the command.

User response: Correct the command.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5507E **COMMAND NOT EXECUTED.** *xxxxxxx*
VALUE MUST BE GREATER THAN
yyyyyyy **VALUE.**

Explanation: A value has been specified that is not consistent with another. *xxxxxxx* must be greater than *yyyyyy*.

System action: The utility ignores the command.

User response: Correct the command.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5508E **COMMAND NOT EXECUTED.** *xxxxxxx*
VALUE MUST BE LESS THAN OR
EQUAL TO *yyyyyyy* **VALUE.**

Explanation: A value has been specified that is not

DFH5509E • DFH5516W

consistent with another. The value *xxxxxxx* must be less than or equal to *yyyyyyy*.

System action: The utility ignores the command.

User response: Correct the command.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5509E COMMAND NOT EXECUTED. *xxxxxxx* NAME MUST NOT BE THE SAME AS *yyyyyyy* NAME

Explanation: Some values in DEFINE commands must not be the same as the name of the resource. *xxxxxxx* must not have the same name as *yyyyyyy*.

System action: The utility ignores the command.

User response: Correct the command.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5510W *xxxxxxx* NAMES BEGINNING WITH *yyyyyyy* ARE RESERVED AND MAY BE REDEFINED BY CICS

Explanation: CICS supplies standard programs and transactions whose names you should usually avoid.

System action: Normal utility processing continues.

User response: Check that the resulting resource definition is as you expect.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5511W *xxxxxxx* NAME *yyyyyyy* IS RESERVED AND MAY BE REDEFINED BY CICS

Explanation: CICS supplies standard programs and transactions whose names you should usually avoid.

System action: Normal utility processing continues.

User response: Check that the resulting resource definition is as you expect.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5512W PROGRAM NAME BEGINS WITH 'DFH' BUT TRANSACTION NAME DOES NOT BEGIN WITH 'C'

Explanation: CICS supplies standard programs and transactions whose naming conventions you should avoid.

System action: Normal utility processing continues.

User response: Check that the resulting resource definition is as you expect.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5513E COMMAND NOT EXECUTED. THE SECOND VALUE OF *xxxxxxx* MUST NOT BE GREATER THAN THE FIRST.

Explanation: Some keywords take pairs of values which are essentially maximum and minimum values.

System action: The utility ignores the command.

User response: Correct the command.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5514E COMMAND NOT EXECUTED. WITH SESSNAME THERE CAN ONLY BE ONE COUNT AND ITS VALUE MUST BE 1.

Explanation: The use of SESSNAME in a DEFINE SESSIONS command means that a single-session, either for sending or receiving, is required.

System action: The utility ignores the command.

User response: Correct the command.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5515W AUTOPAGE(NO) HAS BEEN SPECIFIED FOR A 3270 PRINT DEVICE

Explanation: A DEFINE TYPETERM command has AUTOPAGE(NO) and DEVICE(3270P) or DEVICE(LUTYPE3).

System action: Normal utility processing continues.

User response: Check that the resulting resource definition is as you expect.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5516W THE VALUES OF DEVICE AND SESSIONTYPE ARE EQUIVALENT TO DEVICE(*devtype*) AND HAVE BEEN REPLACED

Explanation: A DEFINE TYPETERM command has a valid but obsolete DEVICE and SESSIONTYPE combination.

This DEVICE and SESSIONTYPE combination has been replaced by a simpler equivalent indicated by *devtype*.

System action: Normal utility processing continues.

User response: Check that the resulting resource definition is as you expect. The *CICS Resource Definition Guide* provides further information about device equivalents.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5517E COMMAND NOT EXECUTED. xxxxxxx PFX AND COUNT TOGETHER MAKE MORE THAN 4 CHARACTERS.

Explanation: In a SESSIONS definition the RECEIVEPFX and SENDPFX values are used as prefixes for the names of as many sessions as are specified in the respective counts. These names cannot be more than 4 characters long.

System action: The utility ignores the command.

User response: Correct the command.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5518W XTRANIDS xxxxxxx ARE RESERVED AND MAY BE REDEFINED BY CICS

Explanation: CICS supplies programs and transactions whose names you should usually avoid.

System action: Normal utility processing continues.

User response: Check that the resulting resource definition is as you expect.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5519E COMMAND NOT EXECUTED. xxxxxxx VALUE CONTAINS AN INVALID y.

Explanation: All character values in DFHCSDUP commands are subject to rules which, depending on the value, disallow certain characters.

System action: The utility ignores the command.

User response: Correct the command.

The *CICS Resource Definition Guide* provides further information about these rules under the individual attributes for the syntax of the DFHCSDUP command.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5520W THE VALUE OF DEVICE IS EQUIVALENT TO xxxxxxx AND HAS BEEN REPLACED

Explanation: A DEFINE TYPETERM command has a valid but obsolete DEVICE value which has been replaced by a simpler equivalent.

System action: Normal utility processing continues.

User response: Check that the resulting resource definition is as you expect.

The *CICS Resource Definition Guide* provides further information about these simpler equivalent devices.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5521E COMMAND NOT EXECUTED. xxxxxxx VALUE yyyyyyy IS INVALID.

Explanation: A value yyyyyyy has been specified for keyword xxxxxxx which is not valid. It may for instance be non-numeric.

System action: The utility ignores the command.

User response: Correct the command.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5522E COMMAND NOT EXECUTED. LENGTH OF xxxxxxx VALUE IS MORE THAN ALLOWED.

Explanation: All character values in DEFINE commands are of limited length.

System action: The utility ignores the command.

User response: Correct the command.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5523E COMMAND NOT EXECUTED. FILE DFHCSD MUST BE DEFINED IN THE SIT AND NOT THE CSD.

Explanation: DFHCSD has been defined in the CSD rather than in the SIT. This is not allowed.

System action: The utility ignores the command.

User response: Correct the command. Define DFHCSD in the SIT.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5524W BMS ROUTE FOR CONSOLE MAY CAUSE UNPREDICTABLE RESULTS IF MAPS OR TEXT(ACCUM) USED ON DEVICE.

Explanation: The routing of multiline maps or accumulated text to the console is not supported.

System action: Normal processing continues.

User response: Ensure that the unsupported console operations are disabled.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5525W xxxxxxxx VALUE IS NOT VALID, yyyyyyyy HAS BEEN ASSUMED

Explanation: The value xxxxxxxx is not valid. The value yyyyyyyy has been assumed.

System action: The utility ignores the command.

User response: Correct the command.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5526E xxxxxxxx MUST HAVE ROWS AND COLUMNS SPECIFIED

Explanation: xxxxxxxx must have rows and columns specified.

System action: The utility ignores the command.

User response: Correct the command.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5527E REMOTE OPTIONS ARE IGNORED FOR PROGRAMS STARTING WITH DFH.

Explanation: CICS supplies standard programs which are not allowed to have remote attributes.

System action: The command is ignored.

User response: Correct the command by deleting the remote attributes from the program definition.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5528E COMMAND NOT EXECUTED. VALUE OF keyword IS OUT OF VALID RANGE.

Explanation: An invalid value has been supplied for the specified keyword.

System action: The utility ignores the command.

User response: Supply a valid keyword value and retry.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5529E keyword OR keyword MUST BE SPECIFIED.

Explanation: Neither of the indicated keywords has been specified. When defining a resource, you must specify one of these keywords.

System action: The utility ignores the command.

User response: Supply one of the indicated keywords and retry.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5530W XTRANIDS ENDING WITH string ARE RESERVED AND MAY BE REDEFINED BY CICS.

Explanation: CICS supplies programs and transactions whose names you should usually avoid.

System action: Normal utility processing continues.

User response: Check that the resulting resource definition is as you expect.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5531W XTRANIDS BEGINNING WITH string ARE RESERVED AND MAY BE REDEFINED BY CICS.

Explanation: CICS supplies programs and transactions whose names you should usually avoid.

System action: Normal utility processing continues.

User response: Check that the resulting resource definition is as you expect.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5532E COMMAND NOT EXECUTED. AN INVALID COMBINATION OF ROWS AND COLUMNS HAS BEEN SPECIFIED FOR ALTSCREEN.

Explanation: One of the specified values is zero and the other is non-zero. This is an invalid combination.

System action: The utility ignores the command.

User response: Ensure that a valid combination of ALTSCREEN rows and columns is specified. See the

CICS Resource Definition Guide for details of valid combinations.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5533W SPECIFIED *keyword1* VALUE IS LESS THAN *keyword2* VALUE. THE DEFAULT VALUE HAS BEEN ASSUMED.

Explanation: A value has been specified for *keyword1* that is incompatible with the value for *keyword2*.

System action: DFHCSDUP assumes the default value for *keyword1* and processes the command.

User response: Ensure that the resulting resource definition is acceptable.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5534W WHEN YOU CHANGE THE VALUE OF DEVICE MANY OTHER VALUES MAY BE CHANGED FOR YOU.

Explanation: When ALTERing the DEVICE in a TYPETERM resource definition, the batch update utility changes forced values that are incompatible with the new DEVICE. However, dependent default values are not changed, and may now be incompatible.

System action: Normal utility processing continues.

User response: Check that the resulting resource definition is as you expect. See the *CICS Resource Definition Guide* for more guidance.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5535E COMMAND NOT EXECUTED. *restype* NAME *resname* IS RESERVED BY CICS.

Explanation: The user specified a resource name *resname* for resource type *restype* which is reserved for use by CICS.

System action: The utility ignores the command.

User response: Specify a different resource name.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5536W *keyword1* AND *keyword2* ATTRIBUTES ARE INCONSISTENT IF DEFINITION IS BEING SHARED WITH A BACK LEVEL RELEASE.

Explanation: *keyword1* has been preceded by *keyword2*. However, *keyword1* has been kept for compatibility reasons. After updating the definition, the

value specified for *keyword1* has become inconsistent with the value specified for *keyword2*.

System action: The definition is created or updated.

User response: If sharing the CSD file with a back level release, ensure that the resulting resource definition is acceptable. Otherwise, ignore the message.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5537W PREFIX ALLOWED TO DEFAULT. USE OF DEFAULTS IS RECOMMENDED FOR MRO SESSIONS ONLY.

Explanation: A null value has been accepted for a send or receive prefix for an LU6.1 or MRO session. The default value '>' is supplied by CICS for send sessions and '<' for receive sessions. These values are the default prefixes for MRO session names. The use of these prefixes is allowed for LU6.1 sessions, but is not recommended if MRO session names with the same prefixes are in use because duplicate names may occur if large numbers of sessions are defined.

System action: CICS will generate session names using these prefixes.

User response: If this is an LU6.1 session it is recommended that a different prefix should be chosen.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5538W *resource* NAMES STARTING WITH *x* MAY CONFLICT WITH SYSTEM SESSIONS NAMES.

Explanation: The resource *resource* has been given a name starting with the character *x* which might be used for system generated SESSIONS names.

System action: The definition is created or updated.

User response: Ensure there is no conflict with the name given to the resource and SESSIONS names.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5539S *keyword* IS NOT VALID BECAUSE IT STARTS WITH THE RESERVED CHARACTER OR STRING *string*.

Explanation: The name you have given to *keyword* is not valid because the name begins with a reserved character or string such as "c" or "dfh".

System action: The definition is not created.

User response: Change the name of the keyword.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5540W xxxxxxxx VALUE IS GREATER THAN
yyyyyyyy VALUE. THE LOWER VALUE
TAKES PRECEDENCE.

Explanation: A value has been specified that is not consistent with another. The value xxxxxxxx is greater than value yyyyyyy. Value yyyyyyy takes precedence and overrides the higher value.

System action: The definition is created or updated with the two values as specified.

User response: Ensure that the two values are defined as you expect. You may decide to leave the values as specified and dynamically change the values online once the resource has been installed in the CICS system.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5541E PROGRAM OR REMOTESYSTEM MUST
BE SPECIFIED.

Explanation: None of the indicated keywords has been specified. When defining a transaction, you must specify one of these keywords.

System action: The utility ignores the command.

User response: Supply one of the indicated keywords and retry.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5544E COMMAND NOT EXECUTED. xxxxxxxx
MUST BE SPECIFIED AS yyyyyyy
BECAUSE A PREVIOUS VALUE IS
GENERIC.

Explanation: The options, xxxxxxxx, must be specified as yyyyyyy because as previous option value was specified as generic.

System action: The utility ignores the command.

User response: Correct the command.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5545W PROGRAM SHOULD BE SPECIFIED
WITH BREXIT.

Explanation: If the BREXIT option is specified, the PROGRAM option should also be specified. For compatibility with the Bridge transaction definitions in CTS 1.2, this is not mandatory, but if PROGRAM is not specified the transaction definition will not work.

System action: The transaction definition is accepted.

User response: Correct the command when migration from CTS 1.2 has been made.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5546E COMMAND NOT EXECUTED. xxxxxxxx IS
NOT VALID AS A TYPE yyyyyyy
PARAMETER.

Explanation: The options specified conflict. If TYPE EJB is specified, the respective ejb-type options must be specified. The ejb-type attributes are BEANNAME and INTFACETYPE. Likewise, for TYPE CORBA, the corba-type attributes must be specified. These are MODULE and INTERFACE. For TYPE GENERIC, either attributes may be specified but they should be generic.

System action: The utility ignores the command.

User response: Correct the command.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5547E COMMAND NOT EXECUTED. xxxxxxxx
VALUE yyyyyyy IS INVALID.

Explanation: A value yyyyyyy has been specified for keyword xxxxxxxx which is not valid. It may for instance be non-numeric.

System action: The utility ignores the command.

User response: Correct the command.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5548E date time applid COMMAND NOT
EXECUTED. xxxxxxxx OPTION IS
INVALID FOR A BACK LEVEL
REQUESTMODEL.

Explanation: The options specified conflict. If CORBASERVER name is blank and the respective previous level attributes (OMGMODULE, OMGOPERATION, and OMGINTERFACE) are specified, the use of BEANNAME, MODULE, INTERFACE and OPERATION is not allowed. It is not possible to give a back level requestmodel definition new attributes. The old requestmodel must be discarded and redefined with the new attributes if it is required to be used on this level of CICS.

System action: The utility ignores the command.

User response: Correct the command. If this requestmodel is being maintained for a back level CICS system, specify only the attributes OMGMODULE, OMGOPERATION, OMGINTERFACE and TRANSID. However, to use an old requestmodel on this level of

CICS, it must be discarded and redefined with the new attributes.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5549E COMMAND NOT EXECUTED. *xxxxxx* VALUE MUST NOT BE THE SAME AS *yyyyyy* VALUE.

Explanation: The values specified for the two attributes must not be the same. For instance, SSLPORT number must be different from PORT number on CORBASERVER definitions.

System action: The utility ignores the command.

User response: Correct the command.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5550E *keyword1* IMPLIES *keyword2*. THE DEFAULT VALUE HAS BEEN ASSUMED

Explanation: *keyword1* has been specified with a value that is incompatible with the value for *keyword2*.

System action: DFHCSDUP changes *keyword1* to set the default value and processes the command.

User response: Ensure that the resulting resource definition is acceptable.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5551E COMMAND NOT EXECUTED. *keyword1* CANNOT BE SPECIFIED AS GENERIC UNLESS *keyword2* IS ALSO GENERIC.

Explanation: *keyword1* has been specified with a generic name containing wildcard characters (asterisks or plus signs). But this is only permitted when *keyword2* is also specified as a generic name.

System action: The utility ignores the command.

User response: If it is required that *keyword1* must be generic, ensure that *keyword2* is also specified with a generic name.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5552E COMMAND NOT EXECUTED. CIPHER VALUE '*value*' IS NOT IN THE VALID SET (*list*).

Explanation: The CIPHER attribute has been specified with an invalid value, *value*, which is not in the valid set of cipher values as indicated by *list*.

System action: The utility ignores the command.

User response: Ensure that you have defined a set of CIPHER values which are correct for this CICS address space.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5553E COMMAND NOT EXECUTED. *field* CANNOT START WITH A '*char*'.

Explanation: The named attribute field, *field*, starts with an invalid character, *char*. This is commonly caused by the field starting with an '*' which is not allowed.

System action: The utility ignores the command.

User response: Change the named attribute field to start with a permitted character.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5554W USE OF STATIC ATTRIBUTE *field1* FORCES *field2*.

Explanation: The Server URIMAP attribute field, *field1*, is within the set that returns a static response. This has forced the setting of *field2*. This is commonly caused by specifying MEDIATYPE, CHARACTERSET, HOSTCODEPAGE, TEMPLATENAME or HFSFILE with ANALYZER(YES) when ANALYZER(NO) is required.

System action: The utility continues.

User response: None.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5555E COMMAND NOT EXECUTED. THERE MUST BE AT LEAST ONE *attribute* SPECIFIED.

Explanation: At least one of the named attribute fields, *attribute*, must be specified for this resource.

System action: The utility ignores the command.

User response: Ensure that you have specified at least one of the required attributes.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5556E COMMAND NOT EXECUTED. *resource* NAMES BEGINNING WITH '*yyy*' ARE RESERVED AND CANNOT BE USED.

Explanation: CICS supplies standard programs and transactions whose names you should avoid. For this

DFH5557E • DFH5602E

type of resource, however, you must not use reserved CICS names.

System action: The utility ignores the command.

User response: Rename the resource definition to an appropriate name.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5557E COMMAND NOT EXECUTED. 'xxxxxxx' IS A RESERVED NAME AND CANNOT BE USED AS A *resource* NAME.

Explanation: Certain names are reserved and not allowed to be used as resource names.

System action: The utility ignores the command.

User response: Rename the resource definition to an appropriate name.

Module: DFHCSDUP

DFH56nn messages

DFH5600E UNABLE TO GET STORAGE FOR MODULE DFHCICS. PRIMARY CSD HAS NOT BEEN INITIALIZED.

Explanation: There is insufficient storage to load module DFHCICS.

System action: Processing of the INITIALIZE command is terminated.

User response: Ensure that there is sufficient storage to load the DFHCICS module.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5601E UNABLE TO LOAD THE {FCT | RDT | LD} TABLE NAMED *table*.

Explanation: Table *table* cannot be loaded.

System action: The system action depends on the type of table.

LD DFHCSDUP cannot process the command. The utility attempts to

1. Close any files previously opened internally.
2. Unload any EXTRACT exit routines that were dynamically loaded.
3. Invoke the termination exit routine, if supplied.
4. Return control to the invoker of the utility.

FCT or RDT

The CSD utility cannot load the table, and terminates the processing of the utility command.

User response: Refer to the preceding MVS message which should specify the reason for the failure.

Destination: SYSPRINT

DFH5558W A RANKING VALUE LESS THAN 10 FOR LIBRARY '*resource*' MEANS IT WILL APPEAR BEFORE DFHRPL IN THE SEARCH ORDER.

Explanation: The ranking value of 10 is reserved for DFHRPL library. If you specify a ranking value less than 10 your LIBRARY *resource* will appear ahead of the DFHRPL in the library search order.

System action: The utility continues.

User response: Ensure that you definitely want this LIBRARY to appear before the DFHRPL in the library search order. Otherwise, define the LIBRARY *resource* with a RANKING value greater than 10.

Module: DFHCSDUP

Destination: SYSPRINT

If your FCT or TCT assembly and link-editing is successful, the FCT or RDT should be in the library. The LD is in the load library of the supplied pregenerated CICS system.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5602E UNABLE TO UNLOAD THE {FCT | RDT | LD} TABLE NAMED *table*.

Explanation: Table *table* cannot be unloaded.

System action: The system action depends on the type of table.

LD DFHCSDUP cannot process the command. The utility attempts to

1. Close any files previously opened internally.
2. Unload any EXTRACT exit routines that were dynamically loaded.
3. Invoke the termination exit routine, if supplied.
4. Return control to the invoker of the utility.

FCT or RDT

The CSD utility cannot unload the table, and terminates the processing of the utility command.

User response: Refer to the preceding MVS message which should specify the reason for the failure.

If your FCT or TCT assembly and link-editing is successful, the FCT or RDT should be in the library. The LD is in the load library of the supplied pregenerated CICS system.

Module: DFHCSDUP

Destination: SYSPRINT

**DFH5603E UNABLE TO LOCATE THE {FCT | RDT
|LD | DCT} TABLE NAMED *table*.**

Explanation: Table *table* cannot be located.

System action: The system action depends on the type of table specified.

LD DFHCSDUP cannot process the command. The utility attempts to

1. Close any files previously opened internally.
2. Unload any EXTRACT exit routines that were dynamically loaded.
3. Invoke the termination exit routine, if supplied.
4. Return control to the invoker of the utility.

FCT, RDT or DCT

The CSD utility cannot locate the table, and terminates the processing of the utility command.

User response: Determine the reason for the failure.

If your FCT, TCT or DCT assembly and link-editing is successful, the FCT, RDT or DCT should be in the library. The LD is in the load library of the supplied pregenerated CICS system.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5604E UNABLE TO OBTAIN STORAGE FOR THE CROSS-REFERENCE TABLE NAMED *table*.

Explanation: DFHCSDUP was unable to obtain storage for table *table*.

System action: DFHCSDUP cannot process the command.

If commands are being read from a SYSIN data stream, subsequent commands (except LIST) are checked for syntax only. (If the primary CSD file cannot be opened, LIST is not processed either.)

If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

User response: Increase the region size and retry the command.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5605E DISALLOWED CHARACTER IN GROUP OR LIST NAME *object*.

Explanation: The call to module DFHDMP has failed to construct a valid key for the record created on the CSD file. This is because the group or list name contains an invalid character.

System action: A CSD record is not created for this definition. (If it is a transaction, a generated profile is not created either.)

User response: Use the CEDA transaction to define the resource with a valid name.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5606S COMMAND IS NOT EXECUTED. UNABLE TO LOAD THE SERVICE MODULE *progrname*.

Explanation: The service module, *progrname*, cannot be loaded due to insufficient storage.

System action: Utility command execution is terminated. If commands are being read from a SYSIN data stream by the utility, then subsequent commands are checked for syntax only.

User response: Retry the utility command with an increased region size.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5607S COMMAND IS TERMINATED. AN ERROR OCCURRED WHILE READING THE FIRST SECONDARY CSD RECORD.

Explanation: An I/O error has occurred on the secondary CSD file.

System action: The SERVICE command is terminated. If commands are being read from a SYSIN data stream by the utility, then subsequent commands are checked for syntax only.

User response: Check that the input and output data sets have been correctly defined, and that the DDNAME for the secondary CSD file in the JCL corresponds to the FROMCSD parameter in the SERVICE utility command.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5608S COMMAND IS TERMINATED. AN ERROR OCCURRED WHILE READING A SECONDARY CSD RECORD.

Explanation: An I/O error has occurred on the secondary CSD file.

System action: The SERVICE command is terminated. If commands are being read from a SYSIN data stream by the utility, then subsequent commands are checked for syntax only.

User response: Check that the input and output data sets have been correctly defined, and that the DDNAME

DFH5609S • DFH5617S

for the secondary CSD file in the JCL corresponds to the FROMCSD parameter in the SERVICE utility command.

If the problem persists, try to obtain a print out of the CSD, using either IDCAMS or the DFHCSDUP LIST ALL option. The LIST will indicate where errors have occurred because they will not print and are therefore easily identifiable.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5609S COMMAND IS TERMINATED. AN ERROR OCCURRED WHILE WRITING A PRIMARY CSD RECORD.

Explanation: An I/O error has occurred on the primary CSD file.

System action: The SERVICE command is terminated. If commands are being read from a SYSIN data stream by the utility, then subsequent commands are checked for syntax only.

User response: Retry the command, ensuring that a sufficiently large data set is specified for the output (primary) CSD file.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5611E COMMAND NOT EXECUTED. *parameter* PARAMETER MUST BEGIN WITH 'DFH'.

Explanation: In a CSD utility MIGRATE command, the specified parameter contained an invalid table name or group name.

System action: The utility does not process the command.

User response: Resubmit the MIGRATE command with a valid table name or group name.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5612I *resource object* IN GROUP *grpname* IS UNCHANGED.

Explanation: A resource definition existed in both source and target groups. Based on the CSD utility commands submitted, the utility has replaced the resource definition in the target group.

System action: Normal utility processing continues.

User response: None.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5613E UNABLE TO LOCATE THE LIBRARY MEMBER *member*.

Explanation: The member is not in the libraries named in the JCL.

System action: The utility terminates processing of the command that required access to library member *member*.

User response: Ensure that the member is correctly link-edited into the library and resubmit the job.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5614E UNABLE TO LOAD THE LIBRARY MEMBER *member*.

Explanation: DFHCSDUP could not load library member *member*.

System action: The utility terminates processing of the command that required access to the library member.

User response: Ensure that the member is correctly link-edited into the library and resubmit the job.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5617S COMMAND IS TERMINATED. AN UNRECOGNIZED TYPE OF RECORD WAS ENCOUNTERED WHILE SECONDARY CSD WAS BEING READ.

Explanation: The record-type field of an input CSD record is invalid.

System action: The SERVICE command is terminated. If commands are being read from a SYSIN data stream by the utility, then subsequent commands are checked for syntax only.

User response: Check that the input and output data sets have been correctly defined, and that the DDNAME for the secondary CSD file in the JCL corresponds to the FROMCSD parameter in the SERVICE utility command.

If the problem persists, try to obtain a print out of the CSD, using either IDCAMS or the DFHCSDUP LIST ALL option. The LIST will indicate where errors have occurred because they will not print and are therefore easily identifiable.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5618I AN ATTENTION INTERRUPT WAS REQUESTED DURING DFHCSDUP EXECUTION.

Explanation: An attention interrupt has been requested while DFHCSDUP is executing in a TSO environment.

System action: Normal utility processing continues.

Control is passed to a put-message exit if one has been specified on the extended entry linkage. Refer to the *CICS Customization Guide* for more information about put-message exits.

User response: None.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5619W AN INVALID VALUE OF THE PAGESIZE PARAMETER HAS BEEN SPECIFIED. THE DEFAULT VALUE OF 60 LINES PER PAGE WILL BE USED.

Explanation: A value of the PAGESIZE parameter outside the allowed range (4–9999) has been specified.

System action: The default value of 60 lines per page is taken.

User response: Ensure that a valid PAGESIZE value is specified in future.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5620E AN ILLEGAL RETURN CODE (RC= *ret-code*) HAS BEEN RETURNED FROM THE {INITIALIZATION | GET-COMMAND | TERMINATION} EXIT.

Explanation: The specified user-exit routine has returned a disallowed return code.

System action: Processing of the utility command is terminated. The exit is not disabled.

User response: Investigate the specified exit routine for the cause of the illegal return code.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5621E A NON-ZERO RETURN CODE HAS BEEN RETURNED FROM THE PUT-MESSAGE EXIT.

Explanation: The put-message exit routine has returned a disallowed return code.

System action: Processing of the utility command is terminated and the put-message exit is disabled.

User response: Investigate the put-message exit

routine for the cause of the illegal return code.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5622S THE SECONDARY CSD HAS BEEN CLOSED DURING CLEAN-UP PROCESSING FOLLOWING THE INTERCEPTION OF AN ABEND.

Explanation: An Abend has occurred during DFHCSDUP processing. The secondary CSD has been closed during post ABEND clean up processing.

System action: Processing of the utility command is terminated.

User response: Refer to prior messages for further information regarding this problem.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5623S THE PRIMARY CSD HAS BEEN CLOSED DURING CLEAN-UP PROCESSING FOLLOWING THE INTERCEPTION OF AN ABEND.

Explanation: An abend has occurred during DFHCSDUP processing. The primary CSD has been closed during post ABEND clean up processing.

System action: Processing of the utility command is terminated.

User response: Refer to prior messages for further information regarding this problem.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5624S THE EXTRACT EXIT PROGRAM HAS BEEN UNLOADED DURING CLEAN-UP PROCESSING FOLLOWING THE INTERCEPTION OF AN ABEND.

Explanation: An abend has occurred during the processing of an EXTRACT command. The extract exit program specified on the USERPROGRAM keyword of the EXTRACT utility command has been unloaded during post-abend clean-up processing.

System action: The EXTRACT command is terminated.

User response: Refer to prior messages for further information regarding the problem.

Module: DFHCSDUP

Destination: SYSPRINT

DFH5625 THE USER PROGRAM HAS PASSED AN INVALID DDNAME PARAMETER FOR *ddname* TO DFHCSDUP.

Explanation: The user program has supplied an alternative *ddname* as a parameter for either DFHCSD, SYSIN or SYSPRINT. The alternative *ddname* is invalid because it begins with a blank.

System action: The default DDNAME is used instead.

User response: Correct the invalid DDNAME parameter.

Module: DFHCSDUP

Destination: Console

DFH5630W NO IBM SUPPLIED DEFINITION FOUND FOR *resourcetype resourcename*.

Explanation: While performing a SCAN command, the named resource type was not found in the CSD file on any of the IBM supplied groups. Note that compatibility groups are not used for the SCAN command.

System action: The utility continues.

User response: None.

Module: DFHCSDUP

Destination: Console

DFH5631I *resourcetype resourcename* IN GROUP *groupname1* MATCHES THE IBM SUPPLIED DEFINITION IN GROUP *groupname2*.

Explanation: While performing a SCAN command, the resource *resourcetype* name *resourcename* was found in group *groupname1* and it matches the IBM supplied definition in group *groupname2*

System action: The utility continues.

User response: None.

Module: DFHCSDUP

Destination: Console

DFH5632I *resourcetype resourcename* IN GROUP *groupname1* DOES NOT MATCH THE IBM SUPPLIED DEFINITION IN GROUP *groupname2*.

Explanation: While performing a SCAN command, the resource *resourcetype* name *resourcename* was found in group *groupname1* and it does not match the IBM supplied definition in group *groupname2*

System action: The utility continues.

User response: None.

Module: DFHCSDUP

Destination: Console

DFH5633I *resourcetype resourcename* FOUND IN GROUP *groupname*.

Explanation: While performing a SCAN command, the resource *resourcetype* name *resourcename* was found in group *groupname*. No IBM supplied definition was found to perform a compare against.

System action: The utility continues.

User response: None.

Module: DFHCSDUP

Destination: Console

DFH5634W *resourcetype resourcename* NOT FOUND IN USER GROUPS.

Explanation: While performing a SCAN command, the resource *resourcetype* name *resourcename* was not found in any user groups.

System action: The utility continues.

User response: None.

Module: DFHCSDUP

Destination: Console

DFH7xxx (DFHEXP) command-level translator diagnostic messages

Diagnostic messages may be issued by the command-level translator (DFHEAP for assembler language, DFHECP for COBOL, DFHEDP for C, and DFHEPP for PL/I) in the course of processing programs written in assembler language, COBOL, C, or PL/I.

Assembler-language messages are inserted as macro notes (MNOTES) in the translator output file and can be seen by either printing or assembling the translator output file.

COBOL, C, and PL/I messages are delivered to SYSPRINT.

The same diagnostics are issued by the command-level interpreter, by the master terminal transaction (CEMT), and by CEDA.

A diagnostic message can have three components: a message number, a severity code, and message text. Each message is of the form DFH7nnnl *c line text* where

- *nnn* is a number,
- *l* is the information message identifier,
- *c* is the severity code
- *line* is the line number of the error and
- *text* is the text of the message.

In assembler language, COBOL, C, and PL/I, diagnostic messages can be allocated a severity code. This severity code is represented by a letter that, if present, will appear in the message immediately following the message number and preceding the message text. There are five levels of severity. Those for assembler language, C and PL/I are different from those for COBOL. The meanings of the codes and the associated return codes for the languages are as follows:

Assembler, C or PL/I	Return code	COBOL
U = Unrecoverable	16	D = Disaster
S = Severe	12	E = Error
E = Error	8	C = Conditional
W = Warning	4	W = Warning
I = Information	0	I = Information

The message text consists of the message itself, which may or may not include inserts. The inserts are positions within the message text where, in the actual message, specific information is given on the reasons for the diagnostic message. Not all the diagnostic messages, however, require inserts.

Messages issued by the command-level translator are usually self-explanatory, and DFH7000 is an example of this type of message.

DFH7000I LISTING FILE CANNOT BE OPENED

Explanation: The listing data set was not opened.

System action: The command-level translator is abnormally terminated. A dump is produced if a SYSABEND or SYSUDUMP DD statement has been provided.

User response: Ensure the JCL is correct, or determine what is causing the error and preventing opening.

Module: DFHEAP (for assembler language), DFHECP (for COBOL), DFHEDP (for C), DFHEPP (for PL/I)

Destination: Console

DFH7002IU UNRECOVERABLE TRANSLATOR

ERROR:- xxxxxxxx. xxxxxxxx
TRANSLATION TERMINATED.
CORRECTION OF SOURCE PROGRAM
ERRORS MAY BYPASS THE
PROBLEM.

Explanation: An error has occurred and the translator is unable to recover and resume normal processing.

System action: The translator terminates its processing in an orderly fashion, by issuing this error message and closing all files which have been successfully opened. All messages issued by the translator during this execution should have been directed to the SYSPRINT dataset.

User response: This message may contain the inserted text -

NOT ENOUGH MAIN STORAGE AVAILABLE

in which case the user should check that a REGION size of at least 2M (2048K) has been specified in the JCL EXEC statement for the translator job step.

Module: DFHEIM01

Destination: SYSPRINT

**DFH7003IU UNABLE TO OPEN xxxxxxxx FILE.
xxxxxxx TRANSLATION TERMINATED.**

Explanation: The translator has detected an error after opening the INPUT, PUNCH or LISTING file.

Usually this means that either the record format or the record length of the file is not supported by the translator.

The INPUT file, defined in the Job Control stream by a SYSIN DD statement, may contain fixed or variable length records but the record length must not be greater than 100.

The PUNCH file, defined in the Job Control stream by a SYSPUNCH DD statement, must contain fixed length records and the record length must not be greater than 80.

The LISTING file, defined in the Job Control stream by a SYSPRINT DD statement, can contain either fixed length or variable length records which must have a length in the range 121 through 256.

System action: The translator terminates processing.

User response: Check the record format and length of the file which caused the error. Recreate or change the file so that it meets the requirements of the translator.

Module: DFHEIM15

Destination: SYSPRINT

DFH7004IW THE EXCI OPTION HAS BEEN SPECIFIED BUT CONFLICTS WITH THE CICS OPTION, OR ANOTHER OPTION THAT IMPLIES THE CICS OPTION. THE CICS OPTION HAS BEEN IGNORED.

Explanation: The EXCI option of the translator has been specified, but it conflicts with another specified option such as the CICS option, or an option (for example, the SP option) which implies the CICS option.

The EXCI option implies that the program is to execute in a batch, non-CICS, environment, and therefore other options such as CICS and SP are in conflict.

System action: The translator ignores the EXCI option. If the program contains any EXEC CICS LINK commands, they are interpreted as on-line CICS commands and not as batch commands.

User response: If the program is intended to be a batch program, ensure that neither the CICS option, nor any other options which imply the CICS option, are specified to the translator.

If the program is intended to run as a CICS application, remove the EXCI option.

Module: DFHEIM08

Destination: SYSPRINT

DFH7005IW THE EXCI OPTION HAS BEEN SPECIFIED BUT CONFLICTS WITH THE DLI OPTION. THE DLI OPTION HAS BEEN IGNORED.

Explanation: Both the EXCI and DLI translator options have been specified, but these two options are mutually exclusive.

System action: The translator ignores the DLI option.

User response: If the program is intended to be a DLI program, remove the specification of the EXCI option. Otherwise remove the DLI option.

Module: DFHEIM08

Destination: SYSPRINT

DFH7006IW THE EXCI OPTION IS NOT SUPPORTED BY THE INTEGRATED TRANSLATOR.

Explanation: The EXCI translator option has been specified for the integrated translator. This is not supported.

System action: The translation and compilation proceeds, but the resulting program is not guaranteed to execute correctly.

User response: If the program is intended to be an EXCI program, use a separate translation step. Otherwise remove the EXCI option.

Module: DFHEIM08

Destination: SYSPRINT

DFH7010IW INVALID OPTION STRING:- 'INS#1' IGNORED.

Explanation: The options specified contain either an option which is not recognised by the translator, or an option which is not valid for the language in which your program is written.

For example, in a COBOL program, the following options specification -

```
CBL XOPTS(CICS DCBS)
```

is invalid because DCBS does not represent a valid option. In this case DCBS should probably be DBCS which is a valid option.

Also for example, the following options specification -

```
CBL XOPTS(CICS GRAPHIC)
```

is invalid because the GRAPHIC option, although recognised by the translator, is only valid for PLI programs.

System action: The translator ignores the invalid option and continues processing.

User response: Refer to the *CICS Application Programming Guide* for information about options specification, and amend your options specifications accordingly.

Module: DFHEIM06 DFHEIM08

Destination: SYSPRINT

DFH7011IW INVALID *INS#1* SPECIFICATION IGNORED.

Explanation: An option which is specified with a value or values, is specified with a value which the translator cannot accept.

For example, in a COBOL program, the following options specification -

```
CBL XOPTS(CICS FLAG(X))
```

is invalid because the value specified for flag must be 'I', 'W', 'E' or 'S'

Also for example, the following options specification -

```
CBL XOPTS(CICS LC(256))
```

is invalid because the value associated with the LINECOUNT option must be in the range 1 thru 255.

When an option takes an integer value it must always be less than 256.

System action: The translator ignores the option and applies the default value or values.

User response: Refer to the *CICS Application Programming Guide*. for information about options specification, and amend your options specifications accordingly.

Module: DFHEIM06 DFHEIM08

Destination: SYSPRINT

DFH7012IW CONFLICTING OPTIONS SPECIFIED. xxxxxxxx ASSUMED.

Explanation: An option which is specified with a value, or values, is specified more than once, or an option is specified in both its positive and negative form, or mutually exclusive options are specified.

For example, in a COBOL program, the following options specification -

```
CBL XOPTS(CICS FLAG(I) NOVREF QUOTE FLAG(S) VBREF QUOTE)
```

will generate three error messages.

FLAG(I) conflicts with FLAG(S), NOVREF conflicts with VBREF, and QUOTE conflicts with APOST.

System action: The translator uses the last definition found for each option. In the above example therefore the options used are FLAG(S), VBREF and APOST. The translator then continues with its normal processing.

User response: Refer to the *CICS Application Programming Guide* for information about options specification, and amend your options specifications accordingly.

Module: DFHEIM06 DFHEIM08

Destination: SYSPRINT

DFH7013IW RIGHT PARENTHESIS ASSUMED AFTER '*INS#1*'.

Explanation: An option which is specified with a value, or values, is not delimited with a right parenthesis.

For example, in a COBOL program, in the following options specification

```
CBL XOPTS(CICS FLAG(I NOVREF QUOTE)
```

the value 'I' specified for the FLAG option should be followed by a right bracket.

System action: The translator assumes that a right bracket exists following the option specification and continues processing.

User response: Refer to the *CICS Application Programming Guide* for information about options specification, and amend your options specifications accordingly.

Module: DFHEIM06 DFHEIM08

Destination: SYSPRINT

DFH7014IW ERROR IN *PROCESS CARD. TEXT AFTER SEMI-COLON IGNORED.

Explanation: Text has been placed on a *PROCESS statement following the semi-colon which signifies the end of the statement.

This error should only occur in a program written in PLI.

System action: The translator ignores the misplaced text and continues processing. However, the misplaced text is placed in the translated program, and this will probably cause errors to be detected by the compiler.

User response: User action depends on the purpose of the misplaced text. Refer either to the *CICS Application Programming Guide*, or the relevant programming language manual.

Module: DFHEIM07

Destination: SYSPRINT

**DFH7015IW ERROR IN *ASM STATEMENT.
CONTINUATION IGNORED.**

Explanation: An *ASM statement contains a continuation character in column 72. The next line in the program is ignored by the translator. This error should only occur in a program written in Assembler.

System action: The translator ignores the continuation line and continues processing. However both the *ASM statement and the continuation line are placed in the translated program.

User response: User action depends on the purpose of the continuation. Refer either to the *CICS Application Programming Guide* or the *High Level Assembler Programmer's Guide*.

Module: DFHEIM07

Destination: SYSPRINT

**DFH7016IW THE NATLANG OPTION HAS ALREADY
BEEN SPECIFIED FOR THIS BATCH
AND CANNOT BE ALTERED -
CONFLICTING VALUE HAS BEEN
IGNORED.**

Explanation: The batch facility of the COBOL translator is in use, but an attempt has been made to change the value of the NATLANG option.

System action: The translator ignores the NATLANG specification and continues to use the specification for NATLANG established at the start of this batch.

User response: Specify the NATLANG option only once either in the PARM statement of the JCL EXEC statement or in the CBL statement preceding the first program in the batch. If programs in this batch require different NATLANG options, split this batch into two or more separate batches specifying the appropriate NATLANG value for each batch.

Module: DFHEIM06

Destination: SYSPRINT

**DFH7017IW MESSAGES WERE ISSUED DURING
OPTIONS PROCESSING - REFER TO
TOP OF LISTING FOR FURTHER
DETAILS.**

Explanation: This message indicates that one or more messages have been issued by the translator during options processing.

System action: None.

User response: Refer to the options error messages which have been placed at the top of the translator listing file following the list of options selected for this translation.

Take whatever action is appropriate depending on the messages found.

Module: DFHEIM01

Destination: SYSPRINT

**DFH7020IS END OF SOURCE TEXT
ENCOUNTERED IN THE MIDDLE OF A
LITERAL CONSTANT.**

Explanation: The translator has read the last line of text from the input program, but has detected that the program ends with an unfinished literal constant.

System action: The translator copies all text unchanged from the start of the last literal constant to the end of the program into the translated program. This would result in errors if the following compiler stage were executed.

User response: The cause of this error is almost certainly due to the programmer omitting to code the required delimiter at the end of a literal constant.

Locate and code the missing delimiter, and then rerun the translator.

Module: DFHEIM01 DFHEIM15

Destination: SYSPRINT

**DFH7021IW PROGRAM DOES NOT BEGIN WITH A
PROCEDURE STATEMENT.**

Explanation: The translator has not located a correctly coded PROCEDURE or PROC statement at or near the beginning of a PLI program.

After checking for the existence of a *PROCESS statement at the start of the program, and allowing for the existence of one or more compiler directives such as %INCLUDE, the translator expects to locate a PROCEDURE or PROC statement. Various syntax checks are performed when the statement is located.

This message is issued if either the statement is not found, or a syntax error is found in the statement.

System action: The translator continues processing as normal, but it is probable that the following compile step would fail if allowed to execute.

When the main PROCEDURE statement cannot be located, the translator does not insert an EIB structure into the translated program, which would usually result in errors if the following compiler stage were executed.

User response: Ensure that a correctly coded PROCEDURE statement is coded near the beginning of the program. Only a *PROCESS statement (if required) and compiler directives should be coded before the first PROCEDURE statement.

Module: DFHEIM10

Destination: SYSPRINT

DFH7022IE SEMI-COLON INSERTED AT END OF INITIAL PROCEDURE STATEMENT.

Explanation: The main PROCEDURE statement in a PLI program is not followed by a semi-colon.

System action: The translator inserts a semi-colon to delimit the PROCEDURE statement in the translated program, and then processing continues normally.

User response: Insert a semi-colon following the PROCEDURE statement to prevent the warning message being issued in a subsequent translation.

Module: DFHEIM10

Destination: SYSPRINT

DFH7023IS END OF SOURCE TEXT ENCOUNTERED IN THE MIDDLE OF A COMMENT.

Explanation: The translator has read the last line of text from the input program, but has detected that the program ends with an unfinished comment.

System action: The translator copies all text unchanged from the start of the last comment to the end of the program into the translated program. This would result in errors if the following compiler stage were executed.

User response: The cause of this error is almost certainly due to the programmer omitting to code the required delimiter at the end of a comment. Locate and code the missing delimiter, and then rerun the translator.

Module: DFHEIM01 DFHEIM11 DFHEIM15

Destination: SYSPRINT

DFH7024IS END OF SOURCE TEXT ENCOUNTERED IN THE MIDDLE OF PSEUDO-TEXT.

Explanation: The translator has read the last line of text from a COBOL program, but has detected that the program ends in the middle of pseudo text.

System action: The translator copies all text unchanged from the start of pseudo text to the end of the program into the translated program. This would result in errors if the following compiler stage were executed.

User response: The cause of this error is almost certainly due to the programmer omitting to code the required delimiter at the end of the pseudo text. Locate and code the missing delimiter, and then rerun the translator.

Module: DFHEIM01 DFHEIM15

Destination: SYSPRINT

DFH7025IS A PERIOD SHOULD IMMEDIATELY FOLLOW THE PROGRAM NAME 'xxxxxxx'. THE END OF FILE WAS ENCOUNTERED BEFORE THIS PERIOD.

Explanation: In an END PROGRAM statement in a COBOL program, the program name is not followed by a period, and the end of the source text is detected before a period is found.

System action: The translator copies the END PROGRAM statement into the translated program but this would result in errors if the following compiler step were executed.

User response: Delimit the END PROGRAM statement with a period and rerun the translation step.

Module: DFHEIMSC

Destination: SYSPRINT

DFH7026IS A PERIOD SHOULD IMMEDIATELY FOLLOW THE PROGRAM NAME 'xxxxxxx'. INTERVENING TEXT HAS BEEN IGNORED.

Explanation: In an END PROGRAM statement in a COBOL program, the program name is not immediately followed by a period.

System action: The translator copies the END PROGRAM statement into the translated program but this would result in errors if the following compiler step were executed.

User response: Edit the END PROGRAM statement, removing the text between the program name and the period, and rerun the translation step.

Module: DFHEIMSC

Destination: SYSPRINT

DFH7027IW CHARACTER CONSTANT ASSUMED TERMINATED AT RIGHT MARGIN

Explanation: In a C or C++ program a character constant (a string delimited by single quotes) is neither delimited with a quote nor continued to the next line.

System action: The translator copies the character constant into the translated program assuming that the constant is correctly terminated on this line. This would probably cause compiler error messages to be issued if the compilation were allowed to proceed.

User response: Edit the character constant, either terminating the constant with a single quote or continuing the constant to the next line. Then rerun the translation.

Module: DFHEIM11

Destination: SYSPRINT

**DFH7028IW STRING CONSTANT ASSUMED
TERMINATED AT RIGHT MARGIN**

Explanation: In a C or C++ program a string constant (a string delimited by double quotes) is neither delimited with a double quote nor continued to the next line.

System action: The translator copies the string constant into the translated program assuming that the constant is correctly terminated on this line. This would probably cause compiler error messages to be issued if the compilation were allowed to proceed.

User response: Edit the character constant, either terminating the constant with a double quote or continuing the constant to the next line. Then rerun the translation.

Module: DFHEIM11

Destination: SYSPRINT

**DFH7029IW HEADER FILE NAME ASSUMED
TERMINATED AT RIGHT MARGIN**

Explanation: In a C or C++ program a

User response: Edit the
??

Module: DFHEIM11

Destination: SYSPRINT

**DFH7030IW LITERAL WAS BEING CONTINUED
WHEN COMMENT ENCOUNTERED.
COMMENT IGNORED.**

Explanation: In a COBOL program, a literal is being continued to the next line but the next line is a comment.

System action: The translator removes the comment indication and terminates the literal. However it is likely that the comment or the literal continuation has been discarded by the translator.

User response: Correct the program, either by correctly terminating the literal or correctly continuing the literal on to the next line. Then rerun the translator.

Module: DFHEIM14

Destination: SYSPRINT

**DFH7031IW EXEC COMMAND WAS BEING
CONTINUED WHEN COMMENT
ENCOUNTERED. COMMENT IGNORED.**

Explanation: In a COBOL program, a comment has been imbedded in an EXEC CICS statement.

System action: The translator ignores the comment

and it is not copied into the translated program. However the EXEC CICS statement is processed in the normal way.

User response: Either remove the comment or move the comment so that it precedes or follows the EXEC CICS statement. DFHEIM14

**DFH7032IE QUOTE ASSUMED BEFORE 'xxxxxxx'.
NON-NUMERIC LITERAL WAS BEING
CONTINUED.**

Explanation: In a COBOL program, a non-numeric literal is being continued but the first significant character in area B of the continuation line is not a quotation symbol.

System action: The translator inserts a suitable quotation symbol into the required position in the translated program.

User response: Edit the program by inserting an appropriate quotation symbol in the literal continuation line.

Module: DFHEIM14

Destination: SYSPRINT

**DFH7033IE CONTINUATION IGNORED. A
NON-NUMERIC LITERAL CAN ONLY
CONTINUE AN INCOMPLETE
NON-NUMERIC LITERAL.**

Explanation: In a COBOL program, a non-numeric literal is being continued but the previous line does not contain an incomplete non-numeric literal.

System action: The translator removes the continuation indicator from the translated program. However it is probable that a compilation error will occur.

User response: Edit the program by coding a correct literal continuation, or removing the incorrect text.

Module: DFHEIM14

Destination: SYSPRINT

**DFH7034IE CONTINUATION ASSUMED. A
NON-NUMERIC LITERAL WAS BEING
CONTINUED.**

Explanation: In a COBOL program, a non-numeric literal is being continued but a continuation character has not been coded in the continuation line.

System action: The translator inserts a continuation indicator into the translated program.

User response: Edit the program by coding an appropriate continuation character.

Module: DFHEIM14

Destination: SYSPRINT

DFH7035IE CONTINUATION AND TWO QUOTES ASSUMED. A NON-NUMERIC LITERAL WAS BEING CONTINUED.

Explanation: In a COBOL program, a non-numeric literal is being continued but the next line is not a valid continuation.

System action: The translator inserts a continuation indicator and two quotation marks into the translated program which provides a valid continuation of the literal and then immediately ends the literal. Although this action ensures that the literal is syntactically correct, it is possible that if any text follows the literal it will not be a valid COBOL statement.

User response: Edit the program by coding an appropriate continuation character and quotation marks, or by preventing the continuation.

Module: DFHEIM14

Destination: SYSPRINT

DFH7036IW PROGRAM DOES NOT BEGIN WITH AN IDENTIFICATION DIVISION.

Explanation: A COBOL program does not contain an IDENTIFICATION DIVISION statement.

System action: This prevents the translator from inserting temporary variables and an EIB structure into the program's DATA DIVISION. However EXEC CICS commands and builtin in functions such as DFHVALUE and DFHRESP will be processed as usual.

User response: If the code being translated is a copybook, the translation may in fact be successful and this warning message can be ignored.

However, if the code being translated constitutes a complete program, it will be necessary to edit the program inserting an appropriate IDENTIFICATION DIVISION statement.

Module: DFHEIM07 DFHEIM10

Destination: SYSPRINT

DFH7037IE INVALID CHARACTER IN CONTINUATION COLUMN. CONTINUATION ASSUMED.

Explanation: In a COBOL program, a non-numeric literal is being continued but an invalid continuation character has been coded in the continuation line.

System action: The translator replaces the invalid continuation indicator with a valid continuation character in the translated program.

User response: Edit the program by coding an appropriate continuation character.

Module: DFHEIM14

Destination: SYSPRINT

DFH7038IW XXXXXXXX SEQUENCE ERRORS IN SOURCE PROGRAM.

Explanation: In a COBOL program, the SEQ translator option has been specified and one or more statements are out of sequence.

System action: In the listing file, each out of sequence statement is prefixed with two asterisks. The message contains the count of out of sequence statements. Otherwise the translator processes the program in the usual way.

User response: The message can be prevented by editing the file so that statement numbers are in sequence, or by setting all sequence fields to blanks, or by specifying the translator option 'NOSEQ'.

However no action is absolutely necessary, since this message is only a warning, and does not prevent a successful translation.

Module: DFHEIMEE

Destination: SYSPRINT

DFH7039IS PROGRAM DOES NOT CONTAIN A PROCEDURE DIVISION.

Explanation: This message is issued when the translator finds an IDENTIFICATION DIVISION as the last or only COBOL statement in a program.

System action: The translation is terminated.

User response: It is necessary to edit the program inserting an appropriate PROCEDURE DIVISION and then rerun the translation step.

Module: DFHEIM10

Destination: SYSPRINT

DFH7041IW NO END CARD FOUND - COPYBOOK ASSUMED.

Explanation: An assembler program does not contain an END statement.

System action: The translator assumes that the program is in fact a copybook, and consequently does not insert invocations of the macros DFHEIRET, DFHEISTG and DFHEIEND at the end of the translated code.

User response: Possibly no action is required in response to this message, but the user should be aware that it is may be necessary to specify the options NOPROLOG and NOEPILOG when translating a copybook.

Module: DFHEIMSA

Destination: SYSPRINT

DFH7046IS 'EXIT' OR 'EXITALL' OR 'STOP' OR 'TASKSTART' OR 'SHUTDOWN' OR 'FORMATEDF' OR 'SPI' OR 'PURGEABLE' OPTION MUST BE SPECIFIED. COMMAND NOT TRANSLATED.

Explanation: An EXEC CICS DISABLE PROGRAM command has been specified without at least one of the required options listed in this message.

System action: The command is rejected and not translated.

User response: Refer to the *CICS Application Programming Reference* for more information about the usage of this command, and then edit the program to insert one or more options in the DISABLE command.

Module: DFHEIMS2

Destination: SYSPRINT

DFH7047IS 'INTO' OR 'SET' OR 'RTRANSID' OR 'RTERMID' OR 'QUEUE' OPTION MUST BE SPECIFIED. COMMAND NOT TRANSLATED.

Explanation: An EXEC CICS RETRIEVE command has been specified without at least one of the required options listed in this message.

System action: The command is rejected and not translated.

User response: Refer to the *CICS Application Programming Reference* for information about the usage of this command, and then edit the program to insert one or more options in the RETRIEVE command.

Module: DFHEIMS2

Destination: SYSPRINT

DFH7048IE 'xxxxxxx' IS NOT VALID AND IS IGNORED.

Explanation: In an assembler program, an EXEC CICS command contains text which cannot be processed as an option.

For example, if the following were coded -
EXEC CICS DELAY INTERVAL 500

instead of -

EXEC CICS DELAY INTERVAL(500)

this message would be generated.

System action: The command is rejected and not translated.

User response: Refer to the *CICS Application Programming Reference* for more information on the rules for coding EXEC CICS commands. Ensure that

self-defining terms used as arguments, such as numeric literals used in the example above, are enclosed in parentheses.

It is likely that an error of this nature will produce additional error messages. Check if the same command has generated more than one error message, in which case one of the other messages may give a more specific indication of what is actually wrong.

Module: DFHEIMKW

Destination: SYSPRINT

DFH7050IS xxxxxxxx FUNCTION NOT COMPLETELY SPECIFIED. xxxxxxxx MUST BE SPECIFIED. COMMAND NOT TRANSLATED.

Explanation: This CICS command requires a qualifier without which the translator is unable to determine the specific command.

For example, if the following were coded -

EXEC CICS ISSUE CONVID(MYCONV)

instead of -

EXEC CICS ISSUE PREPARE CONVID(MYCONV)

this message would be generated.

System action: The command is rejected and not translated.

User response: The message contains a list of all the possible qualifiers which may be specified in this command.

Refer to the *CICS Application Programming Reference* for more information about the coding of the command. Edit the command ensuring that an appropriate qualifier is specified.

Module: DFHEIMAN

Destination: SYSPRINT

DFH7053IE OPTION 'xxxxxxx' IS NOT VALID AND IS IGNORED.

Explanation: An EXEC CICS command specification contains text which does not represent a valid option.

System action: The text is rejected and subsequently ignored, but the translator continues to process the command otherwise in the normal way.

User response: Refer to the *CICS Application Programming Reference* for more information about the coding of the command. Edit the command ensuring that the incorrect text is removed or replaced with a valid option.

Module: DFHEIMKW DFHEIMS2

Destination: SYSPRINT

DFH7054IS xxxxxxxx **COMMAND IS NOT SUPPORTED AND IS NOT TRANSLATED.**

Explanation: A C or C++ program contains a PUSH, POP, HANDLE or IGNORE command. None of these EXEC CICS commands are supported for these languages, with the exception of HANDLE ABEND with the PROGRAM option.

System action: The command is rejected and not translated.

User response: In C and C++ programs, the RESP, RESP2 and NOHANDLE options should be utilised to manage condition handling.

Refer to the *CICS Application Programming Guide* for information on dealing with exceptional conditions.

Module: DFHEIMS2

Destination: SYSPRINT

DFH7055IS xxxxxxxx **OPTION IS INCOMPLETE. COMMAND NOT TRANSLATED.**

Explanation:

System action: The command is rejected and not translated.

User response: Refer to the *CICS Application Programming Guide* for information on dealing with exceptional conditions.

Module: DFHEIM??

Destination: SYSPRINT

DFH7057IW **DUPLICATE SPECIFICATION FOR** xxxxxxxx **OPTION IS IGNORED.**

Explanation: The same option has been specified more than once in an EXEC CICS command.

System action: The duplicate specification is ignored and the translator continues normal processing of the command. The message contains the name of the option.

User response: Remove the duplicate specification and rerun the translator.

Module: DFHEIMXS

Destination: SYSPRINT

DFH7058IE 'xxxxxxx' **ASSUMED AFTER** 'xxxxxxx'.

Explanation: An EXEC CICS command is not correctly delimited. For C, C++ and PLI programs this means that a semi-colon does not follow the last option specified. For COBOL programs this message means that END-EXEC does not follow the last option specified. This message should never occur for assembler programs.

System action: Since the delimiter is missing, it is difficult for the translator to establish that the command specification is complete. Consequently subsequent text in the program is treated as possible options and arguments. The translator decides that a delimiter must be missing either when it locates the next delimiter or when it finds text which cannot be a keyword, whichever happens first.

If another EXEC CICS command immediately follows the command without a delimiter the two commands are treated as one command. This may lead to a large number of error messages being generated.

User response: Edit the program and insert the missing delimiter.

Module: DFHEIMAN

Destination: SYSPRINT

DFH7059IS xxxxxxxx **COMMAND IS NOT VALID AND IS NOT TRANSLATED.**

Explanation: An EXEC CICS command is not known to the translator.

System action: The command is rejected and not translated.

User response: This error may be caused by a simple typographical error, or because a translator option has not been specified.

For example, if a program contains an EXEC DLI command, the DLI translator option must be specified, otherwise DLI commands are 'not known' to the translator.

User response: Establish why the command is not known, possibly with reference to the *CICS Application Programming Reference* and the *CICS Application Programming Guide*.

Module: DFHEIMAN

Destination: SYSPRINT

DFH7060IE **INCORRECT SPECIFICATION FOR** xxxxxxxx **VALUE :- 'xxxxxxx'. OPTION IGNORED.**

Explanation: An argument consists of a self-defining term which is either not of the correct datatype for that option or is outside of the range of permitted values. For example, this message would result from the following commands -

```
EXEC CICS DELAY INTERVAL('TIME')
EXEC CICS START TRANSID(MYTRAN) TIME(250000)
```

System action: The option with the incorrect argument is rejected, but the translator continues processing the command.

User response: Establish why the argument is

incorrect by reference to the *CICS Application Programming Reference*.

Module: DFHEIMKW

Destination: SYSPRINT

DFH7061IE RIGHT PARENTHESIS ASSUMED BEFORE 'xxxxxxx'.

Explanation: A right hand bracket has been omitted either in an EXEC CICS command or when using one of the translator builtin functions DFHRESP or DFHVALUE.

System action: The translator makes an assumption about the correct position of the missing right hand bracket. The assumed position is likely to be the wrong position however, which in turn is likely to produce incorrect results at runtime or possibly cause a compilation error.

For example in the following statement in a PLI program -

```
EXEC CICS SEND TEXT FROM(MYTEXT FREEKB ERASE;
```

the translator assumes that the position of the missing right hand bracket is immediately before the semicolon which delimits the command. This results in the options FREEKB and ERASE becoming part of the argument of the FROM option.

In the following example -

```
STATUS = DFHVALUE(CONNECTED ;
```

the translator's assumption about the position of the missing bracket is correct, and in this case the builtin function is correctly processed.

User response: Establish the correct position of the missing bracket and edit the program accordingly.

Module: DFHEIM11 DFHEIM12

Destination: SYSPRINT

DFH7063IE IMPLEMENTATION RESTRICTION: MORE THAN xxxxxxxx OPTIONS IN ONE COMMAND. xxxxxxxx OPTION IGNORED.

Explanation: An EXEC CICS command contains too many options with arguments. The number of options with arguments allowed is, for most commands, kept within the allowed maximum by the command definition. However certain commands such as the HANDLE and IGNORE commands allow more options than the maximum allowed on each command instance.

System action: When the maximum number of options is reached, this number usually being 16, the remaining options specified are rejected. In other words the command together with the first 16 options specified is accepted.

User response: If the problem occurs on a HANDLE or IGNORE command, spread the options over two or more commands. However if a program is trying to deal with a large number of conditions, this may be accomplished more easily by using the RESP and NOHANDLE options.

Module: DFHEIMS2 DFHEIMS3

Destination: SYSPRINT

DFH7065IS USE OF xxxxxxxx OPTION IMPLIES xxxxxxxx OPTION MUST BE SPECIFIED.

Explanation: An option has been specified for a command which implies that some other option should also have been specified.

This message usually means that the RESP2 option has been specified but not the RESP option.

System action: The translator rejects the command.

User response: Edit the program and insert a specification of the required missing option (usually the RESP option). Then rerun the translation step.

Module: DFHEIMS2

Destination: SYSPRINT

DFH7066II BEFORE TRACING OF ANY SYSTEM CONTROL PROGRAM OCCURS THE MASTER SYSTEM TRACE FLAG MUST BE ON.

Explanation:

System action: The command is rejected and not translated.

User response: Refer to the *CICS Application Programming Guide* for information on dealing with exceptional conditions.

Module: DFHEIM??

Destination: SYSPRINT

DFH7067IW 'xxxxxxx' IS NOT VALID. 'xxxxxxx' ASSUMED.

Explanation: A command or option has been misspelt in an EXEC CICS statement. The translator executes an algorithm which compares the misspelt verb or option with valid option spellings and, in most cases, manages to select the option intended by the user.

In some cases, the translator may select an unintended command or option. For example, in the misspelt command -

```
EXEC CICS SENT SYSTEM GMMTEXT('hello world')
```

SENT is assumed to be SEND, whereas the user clearly intended to code SET.

System action: The translator substitutes the misspelled command or option with an assumed command or option.

This will probably cause the translator to detect further errors, and issue additional messages.

User response: Edit the program and correct the spelling of the misspelled command or option. Then rerun the translation step.

Module: DFHEIMS2

Destination: SYSPRINT

DFH7074IS USE OF 'LENGTH' OPTION IMPLIES 'INTO' OR 'SET' OPTION MUST BE SPECIFIED. COMMAND NOT TRANSLATED.

Explanation: An EXEC CICS RETRIEVE command has been specified with a LENGTH option but without either a SET or INTO option. The LENGTH option is not valid unless the SET or INTO option is also specified.

System action: The command is rejected and not translated.

User response: Refer to the *CICS Application Programming Reference* for more information about the usage of this command, and then edit the command by specifying either a SET or INTO option.

Module: DFHEIMS2

Destination: SYSPRINT

DFH7075IS USE OF 'SYSID' OPTION IMPLIES 'KEYLENGTH', 'RBA', 'XRBA' OR 'RRN' MUST BE SPECIFIED. COMMAND NOT TRANSLATED.

Explanation: When the SYSID option is specified in any of the file control commands, either RIDFLD and KEYLENGTH, or RBA, or XRBA, or RRN must also be specified. The local file control table cannot supply this information for remote files.

System action: The command is rejected and not translated.

User response: Refer to the *CICS Application Programming Guide* for more information about the usage of this command, and then edit the command by specifying one or more additional options.

Module: DFHEIMS2

Destination: SYSPRINT

DFH7076IS USE OF 'SYSID' OPTION IMPLIES 'LENGTH' OPTION MUST BE SPECIFIED. COMMAND NOT TRANSLATED.

Explanation: When the SYSID option is specified in a

C or C++ program in a command which reads from or writes to a file, temporary storage queue or transient data queue, the LENGTH option must be specified when either the FROM or INTO options are specified.

System action: The command is rejected and not translated.

User response: Refer to the *CICS Application Programming Guide*, if necessary, for more information about the usage of this command, and then edit the program by specifying a LENGTH option.

Module: DFHEIMS2

Destination: SYSPRINT

DFH7077IE 'xxxxxxx' IS NOT A VALID LANGUAGE DEFINITION TABLE.

Explanation: The translator has loaded a language definition table into storage, but the table does not appear to be valid. The translator checks the address held in a certain pointer in the table, and also checks an 'eyecatcher' value. If either of these contain unexpected values, the translator considers the table to be corrupted, and issues this message.

System action: The table is flagged as unusable by the translator, and it will not allow the use of any commands or builtin functions defined in this table.

User response: Refer the problem to your installation's CICS systems programming personnel.

Module: DFHEIM06

Destination: SYSPRINT

DFH7078II LITERAL BEGINNING xxxxxxxx CONTAINS A xxxxxxxx. A QUOTE MAY BE MISSING.

Explanation: A PLI program contains a literal which has a length exceeding 40 characters and a semicolon character has been found in the literal which may indicate that a quote symbol is missing and should have been coded before the semicolon.

System action: The translator cannot make any assumption about the extent of any literal because a literal may legitimately contain any characters including delimiters such as parentheses and semicolons. Therefore the translator continues to scan the program until a quote symbol is found.

User response: This is only an informational message and does not necessarily indicate that the program is incorrectly coded.

Module: DFHEIM11

Destination: SYSPRINT

DFH7080IW CONTINUATION OF EXEC COMMAND IGNORED.

Explanation: In an Assembler program, an EXEC CICS command is being continued to the next line, but column 1 of the continuation line contains a non-blank character.

System action: The translator ignores the continuation indicator and assumes that the EXEC CICS command ends on this line. The following line is then assumed to be the start of another command or assembler statement.

User response: Either remove the continuation indicator, or ensure that the continuation line contains a blank character in column 1.

Module: DFHEIMAN

Destination: SYSPRINT

**DFH7082IW ARITHMETIC OPERAND NOT APPROPRIATE FOR OPERAND TO
xxxxxxxx.**

Explanation:

System action: The command is rejected and not translated.

User response: Refer to the *CICS Application Programming Guide* for information on dealing with exceptional conditions.

Module: DFHEIM??

Destination: SYSPRINT

DFH7085IW %INCLUDE DFHEIBLK STATEMENT ENCOUNTERED. THIS HAS BEEN DELETED SINCE THE EIB FIELDS HAVE ALREADY BEEN GENERATED.

Explanation: A PLI program contains a %INCLUDE DFHEIBLK statement.

System action: The translator automatically generates an EIB structure in a PLI program. The %INCLUDE statement is ignored and not copied into the translated program.

User response: Remove the line containing the %INCLUDE statement.

Module: DFHEIMSP

Destination: SYSPRINT

DFH7086IE RIGHT PARENTHESIS ASSUMED AT END OF COMMAND.

Explanation: In an Assembler program, a right hand bracket has been omitted in an EXEC CICS command.

System action: The translator makes an assumption about the correct position of the missing right hand

bracket. The assumed position is likely to be the wrong position however, which in turn is likely to produce incorrect results at runtime or possibly cause an assembly error.

User response: Establish the correct position of the missing bracket and edit the program accordingly.

Module: DFHEIM12

Destination: SYSPRINT

DFH7089IE 'LABEL' OPTION IS NOT SUPPORTED AND IS IGNORED.

Explanation: In a PLI, C or C++ program, a HANDLE ABEND command has been specified with a LABEL option.

System action: The command is rejected by the translator.

User response: HANDLE ABEND is only supported when the PROGRAM option is defined in PLI, C and C++ programs.

Module: DFHEIM12

Destination: SYSPRINT

DFH7200IE TOO MANY ARGUMENTS FOR 'xxxxxxxx'. EXCESS ARGUMENTS IGNORED.

Explanation: In an EXEC CICS command, an option has been coded with too many arguments.

Currently most options which carry an argument only allow a single argument. The text of this message allows for the possibility that an option may carry multiple arguments (or a sub-operand list).

The current meaning of this message for nearly all options which carry an argument is that more than one argument has been coded.

System action: The first argument is processed but the remaining argument(s) are ignored. Otherwise the command is processed in the normal way.

User response: Remove the excess arguments and repeat the translation step.

Module: DFHEIMKW

Destination: SYSPRINT

DFH7201IS TOO FEW ARGUMENTS FOR 'xxxxxxxx'. COMMAND NOT TRANSLATED.

Explanation: In an EXEC CICS command, an option has been defined with too few arguments.

Currently most options which carry an argument only allow a single argument. The text of this message allows for the possibility that an option may carry multiple arguments (or a sub-operand list), and that a

minimum number of arguments must be specified. This message therefore should rarely, if ever, occur in the current implementations of CICS.

System action: The complete command is rejected.

User response: Insert the additional arguments required and repeat the translation step.

Module: DFHEIMKW

Destination: SYSPRINT

DFH7204IS 'xxxxxxx' **KEYWORD REQUIRES
xxxxxxx SUB-OPERAND(S).
STATEMENT NOT TRANSLATED.**

Explanation: In an EXEC CICS command, an option has been defined without any arguments, but requires at least one argument.

Currently most options which require an argument only allow a single argument. The text of this message allows for the possibility that an option may carry multiple arguments (or a sub-operand list).

System action: The complete command is rejected.

User response: Insert the additional argument(s) required and repeat the translation step.

Module: DFHEIMKW DFHEIMS2

Destination: SYSPRINT

DFH7205IU **INSUFFICIENT STORAGE FOR
TRANSLATOR. REASON** xxxxxxx.

Explanation: This message indicates that the translator has insufficient working storage with which to translate an EXEC CICS command.

System action: The command is rejected and not translated.

User response: The most likely reason for this error is that the REGION size specified in the JCL EXEC statement for this translation is too small. Ensure a REGION size of least 2M is specified.

If this is not the reason for the error, refer the problem to your installation's CICS systems programming facility.

Module: DFHEIMAB DFHEIMG1 DFHEIMKW
DFHEIMS2 DFHEIMG1

Destination: SYSPRINT

DFH7206IE **UNABLE TO APPLY DEFAULT FOR
KEYWORD** 'xxxxxxx'.

Explanation: The translator is unable to supply a default argument in an EXEC CICS command. The message usually occurs when either the FROM option is omitted from a SEND MAP command or the INTO option is omitted from a RECEIVE MAP command.

When the argument of the MAP option is a literal, i.e.

self-defining, argument, the translator is able to generate the required FROM or INTO argument from the MAP argument.

However when the MAP argument is a data reference, i.e. the name of a variable which contains the MAP name, the translator cannot default the FROM or INTO argument and issues this message.

System action: The option in error is ignored, but the translator continues to process the command.

User response: Edit the program inserting an appropriate specification of the FROM or INTO option.

Module: DFHEIMS2

Destination: SYSPRINT

DFH7207IW 'xxxxxxx xxxxxxxx' **ENCOUNTERED
BUT NO TRANSLATOR OPTION FOR
PROCESSING COMMAND. COMMAND
IGNORED.**

Explanation: The translator has located a potential CICS command, but 'EXEC' or 'EXECUTE' is not followed either by 'CICS' or by some other text, such as 'DLI', which indicates that this is a CICS command.

The translator refers to words such as 'EXEC', 'CICS' and 'DLI' as 'triggers' since they cause the invocation of the translator's command processing routines.

When a trigger is not known to the translator, this message is issued.

System action: The command is ignored and not translated.

User response: Ensure that the required triggers have been coded in the command.

Module: DFHEIMTG

Destination: SYSPRINT

DFH7208IU **IMPLEMENTATION RESTRICTION.
STATEMENT TOO LONG.**

Explanation: The translator has encountered a program statement which has been continued over a large number of lines in the program. The translator attempts to read the whole statement into a buffer. This buffer is of a considerable size however, and a program statement would normally have to occupy more than 400 lines before this error occurred.

System action: The translator terminates processing after issuing this message.

User response: The error may have occurred due to a syntax error such as a missing quotation mark. Check any other messages which have been issued during this translation. Correcting other errors may also correct this error.

If the program statement is syntactically correct, it will

be necessary to split the statement into two or more statements in order to avoid the buffer size restriction imposed by the translator. It is possible that the compiler for which ever language is in use will also impose a similar restriction.

Module: DFHEIM14

Destination: SYSPRINT

DFH7209IE A BLANK IS ASSUMED BETWEEN 'xxxxxxx' AND ' xxxxxxx'.

Explanation: The translator has encountered an incorrect option in an EXEC CICS command, but has established that inserting a blank results in a correct option specification.

For example in the following incorrect command -
EXEC CICS SEND MAP(MYMAP) FROM(MYMAPO) FREEKBERASE

the translator assumes a blank between 'FREEKB' and 'ERASE'.

System action: The translator continues to process the command after insertion of the blank. It is possible however there will still be errors in the command specification.

User response: Review the statement specification and insert the missing blank if this is the correct action.

Module: DFHEIMKW

Destination: SYSPRINT

DFH7210IU MODULE 'xxxxxxx' NOT FOUND. PLEASE CHECK LIBRARIES.

Explanation: The translator has attempted to load a component, such as a language definition table, but the component was not found in any of the libraries specified for use in this execution of the translator.

System action: The translator attempts to continue processing. If the missing component is a language definition table, none of the commands specified in that table can be used in this execution of the translator. It is probable therefore that the translation will be unsuccessful.

User response: Review the Job Control statements used for the translation. If you are using a procedure provided by your installation CICS systems programming facility, refer the problem to them.

If you have constructed your own job stream, ensure that a JOBLIB or STEPLIB statement references a library which contains the missing component specified in this message.

Module: DFHEIM15

DFH7213IE SUB-OPERAND 'xxxxxxx' OF 'xxxxxxx' KEYWORD SHOULD BE A LITERAL.

Explanation: An argument must be coded as a literal and must be of an appropriate data type, depending on whether the option carries a character or arithmetic argument.

System action: In its current implementation, the translator should never issue this message since all arguments are allowed to be data references. There are no arguments which can only be literal, i.e. self-defining, terms.

User response: Refer the problem to your installation CICS systems programming facility.

Module: DFHEIMKW

Destination: SYSPRINT

DFH7215IW SUB-OPERAND 'xxxxxxx' OF 'xxxxxxx' KEYWORD SHOULD BE DATATYPE CHARACTER.

Explanation: An argument has been coded as a literal value, i.e. self-defining term, but the literal is either a numeric term or a length reference instead of the expected character constant.

For example the following incorrect statement would cause this message to be issued -

```
EXEC CICS SEND MAP(1234567)
```

System action: The argument is accepted even though this will result in errors occurring at either compile time or run time.

User response: Code a literal of the required type, if necessary with reference to the *CICS Application Programming Reference*.

Module: DFHEIMKW

Destination: SYSPRINT

DFH7216IW SUB-OPERAND 'xxxxxxx' OF 'xxxxxxx' KEYWORD SHOULD BE DATATYPE ARITHMETIC.

Explanation: An argument has been coded as a literal value, i.e. self-defining term, but the literal is a character constant instead of the expected arithmetic term.

For example the following incorrect command would cause this message to be issued -

```
EXEC CICS DELAY INTERVAL('TIME')
```

System action: The argument is accepted at this point in the processing. However the argument will be subsequently rejected with message 7060.

User response: Code a literal of the required type, if necessary with reference to *CICS Application Programming Reference*.

In the example above, if 'TIME' is intended to be a data reference, i.e. a reference to a variable named 'TIME', then remove the enclosing quotes.

Module: DFHEIMKW

Destination: SYSPRINT

**DFH7217IS FIRST SUB-OPERAND OF 'xxxxxxx'
CANNOT BE NULL. COMMAND NOT
TRANSLATED.**

Explanation: An argument has been coded as a null argument. With only a few exceptions, null arguments are not excepted as a valid argument.

For example, the following statement contains null arguments which would be rejected by the translator -

```
EXEC CICS SEND TEXT FROM( ) LENGTH()
```

System action: The complete command is rejected.

User response: Code an argument of the required type, if necessary with reference to the *CICS Application Programming Reference*.

Module: DFHEIMKW

Destination: SYSPRINT

**DFH7218IS SUB-OPERAND(S) OF 'xxxxxxx'
CANNOT BE NULL. COMMAND NOT
TRANSLATED.**

Explanation: In this EXEC CICS command, an option may be defined with a list of arguments, i.e. more than one sub-operand, but none of the items specified are allowed to be null arguments.

This message is issued when one or more arguments other than the first argument in the list are null arguments. Currently most options which carry an argument only allow a single argument. The text of this message allows for the possibility that an option may carry multiple arguments (or a sub-operand list).

Consequently, in the current implementation of CICS this message should rarely, if ever, be issued.

System action: The complete statement is rejected.

User response: Ensure that all arguments are non-null for the option given in the message text.

Module: DFHEIMKW

Destination: SYSPRINT

**DFH7219IE 'xxxxxxx' MUST BE PRECEDED BY:
'xxxxxxx' IS ASSUMED.**

Explanation: In the EXEC DLI command syntax, there are some options defined as 'second' options. This means that when a 'second' option is coded in an EXEC DLI statement, it must be preceded by an associated 'first' option. These second options are 'PCB', 'PARENT',

'UNIQUE', 'NEXT' and 'CHECKPOINT'.

System action: The translator assumes the existence of the required preceding option. For example if 'PCB' is found without a preceding 'USING', the 'USING' option is assumed.

User response: Ensure that the required 'first' option is coded preceding the 'second' option. step.

Module: DFHEIMKW

Destination: SYSPRINT

**DFH7220IE MULTIPLE OCCURRENCE OF 'xxxxxxx'
KEYWORD IS IGNORED.**

Explanation: In an EXEC CICS command, an option which carries an argument has been specified more than once.

System action: The translator processes the first instance of the option specification and ignores all additional instances.

In the following example -

```
EXEC CICS SEND TEXT FROM(TEXT1) LENGTH(80) FROM(TEXT2)
```

the translator takes FROM(TEXT1) as the FROM specification and ignores FROM(TEXT2).

User response: Decide which instance of the option specification is required and delete all other instances.

Module: DFHEIMKW

Destination: SYSPRINT

**DFH7221IU IMPLEMENTATION RESTRICTION -
TABLE TOO COMPLEX. xxxxxxxx .**

Explanation: This message may be issued following message 7119, but should only occur when either an extremely large number of options have been specified on an EXEC DLI statement, or the REGION size specified for the execution of the translator is too small.

It is expected that this message would never be issued.

System action: The translator rejects the complete command.

User response: This problem might be caused by a syntax error such as a missing quotation mark. Check through other messages issued by the translator. Solving another error in the program might also resolve this problem. Ensure that an appropriate REGION size has been specified in your JCL procedure.

Module: DFHEIMKW

Destination: SYSPRINT

**DFH7222IE SUB-OPERAND LIST FOLLOWING
'xxxxxxx' KEYWORD SHOULD NOT BE
PRESENT AND IS IGNORED.**

Explanation: An option has been coded with an argument in an EXEC CICS command, but the option does not carry an argument.

System action: The argument is ignored and the translator continues processing the statement.

For example, in the following statement -

```
EXEC CICS SEND TEXT FROM(MYTEXT) LENGTH(80) ERASE(SCREEN)
```

the argument 'SCREEN' following the ERASE option is ignored.

User response: Delete the incorrect argument specification.

Module: DFHEIMKW

Destination: SYSPRINT

**DFH7225IW SUB-OPERAND 'xxxxxxx' OF 'xxxxxxx'
KEYWORD IS TOO LONG AND IS
TRUNCATED.**

Explanation: A character literal has been coded as an argument in an EXEC command but the literal exceeds the length specified for the argument.

System action: The argument is truncated by removing characters from the rightmost end of the character string.

For example, in the following statement -

```
EXEC CICS SEND MAP('HUURSLEY')
```

since map names must be seven characters in length, the character string 'HUURSLEY' is truncated to 'HUURSLE'. The translator continues processing the statement using this truncated map name.

User response: Its probable that the truncated value is not the intended value, and will cause a runtime error.

Refer to the *CICS Application Programming Guide* to determine the correct length required for this argument. Then recode the literal with the correct length.

Module: DFHEIMKW DFHEIMS1

Destination: SYSPRINT

**DFH7226IS SUB-OPERAND 'xxxxxxx' OF 'xxxxxxx'
KEYWORD SHOULD BE A DATA
REFERENCE NOT AN EXPRESSION
OR A CONSTANT. COMMAND NOT
TRANSLATED.**

Explanation: An argument has been defined as a literal, i.e. a self-defining term, but a data reference type argument is required for this option.

System action: The command is rejected and not translated.

User response: An example of this error is -

```
EXEC CICS SEND MAP('MYMAP ') FROM('Hello')
```

where the FROM option must be a data reference.

The above command should be correctly coded as -

```
EXEC CICS SEND MAP('MYMAP ') FROM(MYMAP0)
```

Module: DFHEIMKW DFHEIMS1 DFHEIMS2

Destination: SYSPRINT

**DFH7228IE SUB-OPERAND 'xxxxxxx' OF 'xxxxxxx'
KEYWORD SHOULD BE AN
IDENTIFIER.**

Explanation: This error is only likely to occur in an EXEC DLI statement, when a field name is incorrectly coded in a WHERE statement.

The following example would cause this message to be issued -

```
WHERE(IGNORANCE = 'BLISS')
```

because the field name 'IGNORANCE' starts with a numeric character.

System action: The incorrect field name is accepted by the translator, although this will probably cause the compilation of the translated program to fail.

User response: Edit the field name so that it begins with an alphabetic character, and rerun the translator step.

Module: DFHEIMS1

Destination: SYSPRINT

**DFH7229IS 'xxxxxxx' REQUIRED BUT NOT
SPECIFIED FOR xxxxxxxx. COMMAND
NOT TRANSLATED.**

Explanation: A mandatory option has been omitted from an EXEC CICS command, and the translator cannot make a default specification.

System action: The command is rejected and not translated.

User response: An example of this error is -

```
EXEC CICS SEND TEXT ERASE
```

where the FROM option is omitted but is mandatory.

The user must code an appropriate specification of the missing option, and then execute the translation step again.

Module: DFHEIMXK

Destination: SYSPRINT

DFH7230IE 'option1' CONFLICTS WITH 'option2'
AND HAS BEEN IGNORED.

Explanation: Mutually exclusive options have been specified in an EXEC CICS command.

System action: The option which appears first in the EXEC CICS command is accepted and the other option is ignored. The translator then continues normal processing of the command.

User response: An example of this error is -
EXEC CICS SEND PAGE RELEASE RETAIN

Here the translator accepts the RELEASE option but ignores the RETAIN option. The user must decide which of the mutually exclusive options is required in the command and then remove the conflicting option specification.

Module: DFHEIMXK

Destination: SYSPRINT

DFH7232IS 'xxxxxxx' MUST SPECIFY A LENGTH
FOR 'xxxxxxx'.

Explanation: A mandatory option which specifies a length has been omitted in an EXEC CICS command and the translator is unable to supply a default specification of the option.

System action: The CICS API contains many options which supply lengths. These options usually provide the length of a variable length character argument supplied with another option in that command.

For example, in the EXEC CICS WRITEQ TS command the LENGTH option specifies the length of the FROM argument.

The translator is usually aware of this association between options and is able to default the length specification. However when the associated argument is a data reference, the ability of the translator to default the length argument depends on the programming language of the user program.

When the language is C or C++, the translator issues this message and rejects the complete command. The 'C' languages provide the 'sizeof' function, but this cannot be used with all data types supported by those languages.

User response: The user must code an appropriate length specification in the EXEC CICS command, and then rerun the translation step.

Module: DFHEIMAB DFHEIMXS

Destination: SYSPRINT

DFH7235IE MORE THAN xxxxxxxx OCCURRENCES
OF xxxxxxxx. EXCESS IGNORED.

Explanation: The SEGMENT option has been coded more than 15 times in an EXEC DLI command.

System action: The excess instances of the SEGMENT option are rejected. The translator continues to process the command.

User response: This error might result from a missing quotation mark or some other syntactic error.

If the command is intended to contain more than 15 segments, the user should refer to the relevant IMS manuals for further information.

Module: DFHEIMG1

Destination: SYSPRINT

DFH7237IS INCORRECT SYNTAX AFTER 'xxxxxxx'
xxxxxxx'. COMMAND NOT
TRANSLATED.

Explanation: Following triggers such as 'EXEC' and 'CICS', the translator has found text which is syntactically incorrect. The translator is expecting either another 'trigger', or a command specification.

System action: The complete command is rejected and not translated.

User response: This error might be a typographical error, as in this example

```
EXEC CICS INQUIRE PROGRAM('MYPROGGY')
```

where INQUIRE has been keyed with 'I' instead of 'I'.

The translator expects to find an 'identifier' in this position. An identifier must begin with an alphabetic character, and the remaining characters must be either alphabetic or numeric. The text must not be coded as a literal, i.e. enclosed in quotation marks.

Module: DFHEIMAN

Destination: SYSPRINT

DFH7238IS 'xxxxxxx' COMMANDS ARE NOT
ALLOWED IN PROGRAMS WRITTEN IN
xxxxxxx. COMMAND IGNORED.

Explanation: An EXEC CICS command is not supported in the language in which this program is written.

System action: The complete command is rejected and not translated.

User response: In the current implementation of CICS, this restriction applies only to the GDS commands, which are not allowed in either COBOL or PLI programs.

DFH7239IW • DFH7253IE

The GDS commands may be coded in Assembler, C and C++ programs.

Module: DFHEIMSA DFHEIMSC DFHEIMSD
DFHEIMSP

Destination: SYSPRINT

DFH7239IW THE CSA OPTION IS NO LONGER SUPPORTED. THE CSA ADDRESS RETURNED BY CICS WILL BE INVALID AND SHOULD NOT BE USED.

Explanation: An EXEC CICS ADDRESS command specifies the CSA option.

System action: The CSA option is accepted by the translator. However when the program executes, the CSA address returned will be invalid unless the level of the CICS system executing the program is CICS/ESA 3.1.1 or an earlier version of CICS.

User response: The translator accepts the option in order to provide downward compatibility, i.e. to allow the latest level of the translator to process programs intended to execute both at the current and earlier release levels of CICS.

The user is responsible for any incorrect processing which results from the use of this option when used in CICS systems at a level later than CICS/ESA 3.1.1.

Module: DFHEIMS2

Destination: SYSPRINT

DFH7250IS 'xxxxxxx' OPTION REQUIRED BUT NOT SPECIFIED.

Explanation: An EXEC CICS command contains an 'AT', 'AFTER', 'FOR' or 'UNTIL' option, but does not contain the required specification of any of the 'HOURS', 'MINUTES' or 'SECONDS' options.

System action: The command is rejected and not translated.

User response: Refer to the *CICS Application Programming Guide* for a full description of the command syntax, and make suitable changes in the application program.

Module: DFHEIMS2

Destination: SYSPRINT

DFH7251IE THERE ARE MORE FIELDLENGTH OPERANDS THAN COMPARISON OPERATORS IN THE CORRESPONDING WHERE CLAUSE. EXCESS IGNORED.

Explanation: In an EXEC DLI command, a FIELDLENGTH option includes more expressions than the number of qualification statements in the preceding WHERE option.

The following statement would cause this error - EXEC DLI GU SEGMENT(PATIENT)
WHERE(PATNO>PATNO1 AND NAME=PATN)
FIELDLENGTH(3,4,8)

System action: The excess length or lengths are ignored.

The translator matches qualification statements and lengths reading from left to right. In the example above, the length of 8 cannot be matched and is ignored.

User response: Refer to the relevant IMS reference manual for a full description of the command syntax, and make suitable changes in the application program.

Module: DFHEIMS1

Destination: SYSPRINT

DFH7252IE MAXIMUM NUMBER OF BOOLEANS REACHED FOR 'xxxxxxx' BUT EXCESS TEXT ENCOUNTERED. 'xxxxxxx' IGNORED.

Explanation: In an EXEC DLI command, a WHERE option contains too many Boolean (or logical) operators, such as 'AND' and 'OR'. The translator sets a limit of 11 Boolean operators in each WHERE option, which allows 12 qualification statements to be connected.

System action: The remaining text in the WHERE option is ignored.

User response: Refer to the relevant IMS reference manual for a full description of the command syntax, and make suitable changes in the application program.

Module: DFHEIMS1

Destination: SYSPRINT

DFH7253IE MISSING QUALIFICATION STATEMENT IN 'xxxxxxx' OPERAND. OPERAND IGNORED.

Explanation: In an EXEC DLI command, a WHERE option ends with a Boolean operator.

Boolean operators must be followed by a qualification statement. The following example would cause this message to be issued -

```
WHERE(DOCTOR = 'SPOCK' OR DOCTOR = 'NO ' AND)
```

because 'AND' is not followed by a qualification statement.

System action: The Boolean operator at the end of the WHERE argument is ignored.

User response: The user should either remove the Boolean operator or code an appropriate qualification statement after the operator.

Refer to the relevant IMS reference manual for a full description of the command syntax, and make suitable

changes in the application program.

Module: DFHEIMS1

Destination: SYSPRINT

DFH7254IE MISSING COMPARISON OPERATOR IN 'xxxxxxx' OPERAND. OPERAND IGNORED.

Explanation: In an EXEC DLI command, a WHERE option contains a qualification statement which has no comparison operator.

The following example would cause this message to be issued -

```
WHERE(DOCTOR 'SPOCK' OR DOCTOR = 'NO  ')
```

because there is no comparison operator between 'DOCTOR' and 'SPOCK'.

System action: The incorrect qualification statement and the Boolean operator which follows it are ignored. In the example above, the WHERE option would be reduced to -

```
WHERE(DOCTOR = 'NO  ')
```

User response: The user should insert an appropriate comparison operator in the incorrect qualification statement.

Refer to the relevant IMS reference manual for a full description of the command syntax, and make suitable changes in the application program.

Module: DFHEIMS1

Destination: SYSPRINT

DFH7255IE ARGUMENT TO 'xxxxxxx' KEYWORD CONTAINS NO COMPARISON OPERATORS. KEYWORD IGNORED.

Explanation: In an EXEC DLI statement, a WHERE option contains only a single operand and no other text.

The following example would cause this message to be issued -

```
WHERE(DOCTOR)
```

because the field name 'DOCTOR' is not followed by either a comparison operator or a value.

System action: The entire WHERE option is ignored.

User response: Refer to the relevant IMS reference manual for a full description of the command syntax, and make suitable changes in the application program.

Module: DFHEIMS1

Destination: SYSPRINT

DFH7256IS SPECIFICATION OF 'xxxxxxx' IS INCOMPLETE AND IS NOT TRANSLATED.

Explanation: A program statement references a translator builtin function such as DFHRESP or DFHVALUE, but the function reference is not followed by a left bracket.

System action: The builtin function specification cannot be translated.

User response: DFHRESP or DFHVALUE must be followed by, respectively, a condition name or a CVDA name, and this name must be enclosed in parentheses.

Refer to the *CICS Application Programming Reference* for a description of the usage of the translator builtin functions.

Module: DFHEIM11

Destination: SYSPRINT

DFH7257IS 'xxxxxxx' IS NOT RECOGNISED AND IS NOT TRANSLATED.

Explanation: A program statement references a translator builtin function such as DFHRESP or DFHVALUE, but the function reference is not followed by a condition name or CVDA name which is known to the translator.

System action: The builtin function specification cannot be translated.

User response: Refer to the *CICS Application Programming Reference* for details of valid conditions and CVDAs.

If an EXEC CICS command might raise a condition, a list of the relevant conditions and their meanings in the context of this command is given in each command description.

If an EXEC CICS command contains options whose arguments can be expressed or interpreted using CVDAs, the command description specifies which CVDAs are valid for each option.

Module: DFHEIM11

Destination: SYSPRINT

DFH7258IS 'xxxxxxx' IS NOT VALID AS AN ARGUMENT TO 'xxxxxxx' AND IS NOT TRANSLATED.

Explanation: A program statement references a translator builtin function such as DFHRESP or DFHVALUE, but the function reference is not followed by text in the form of an identifier. A valid identifier is a string of text in which the first character is alphabetic and the remaining characters are either alphabetic or numeric. The string must not be enclosed in quotes.

System action: The builtin function specification cannot be translated.

User response: This error would be caused by the following statement -

```
IF MYRESP = DFHRESP('INVREQ') ....
```

because the argument of DFHRESP is coded as a literal, and also in the following statement -

```
IF STATUS = DFHVALUE(228) .....
```

because the argument of DFHVALUE is an arithmetic value.

Refer to the *CICS Application Programming Reference* for details of how to make use of the DFHRESP and DFHVALUE builtin translator functions.

Module: DFHEIM11

Destination: SYSPRINT

DFH7259IS OPERAND 'INS#1' OF KEYWORD 'INS#2' IS INVALID FOR COBOL. A DATA-AREA RATHER THAN A DATA-VALUE MUST BE SPECIFIED. COMMAND NOT TRANSLATED.

Explanation: In a COBOL program, an argument is coded as a data value but it must be coded as a data reference.

When arguments are coded as data values, i.e. literals or self-defining terms, in a COBOL program, such arguments are passed 'by content' in the 'Call' statement generated by the translator.

This error occurs when the data is of a type which cannot be passed 'by content', and is only likely to occur when the data type is pointer.

System action: The EXEC CICS command is rejected and not translated.

User response: This error would be caused by the following statement -

```
EXEC CICS FREEMAIN DATAPOINTER(54560) END-EXEC.
```

where the argument of the DATAPOINTER option must be a data reference, i.e. a reference to a variable in the program, and not a data value. Its unlikely that this statement would succeed anyway, since addresses of GETMAINed storage cannot be known at compilation time.

Module: DFHEIMAC

Destination: SYSPRINT

DFH7260IS ERROR WHEN PROCESSING DECLARATIVES SECTION. END OF FILE FOUND BEFORE END DECLARATIVES.

Explanation: In a COBOL program, the translator has found a DECLARATIVES section but has not found a subsequent END-DECLARATIVES statement.

System action: Any EXEC CICS commands which follow the DECLARATIVES statement are neither recognised nor translated.

User response: An END-DECLARATIVES statement should be coded in an appropriate position in the program.

Note that there are restrictions on the use of declaratives when used in CICS applications written in COBOL. For details refer to the *CICS Application Programming Guide*

Module: DFHEIM10

Destination: SYSPRINT

DFH7261W 'ins#1' IS NO LONGER SUPPORTED BUT HAS BEEN TRANSLATED.

Explanation: An obsolete option has been specified in an EXEC CICS statement.

System action: The obsolete option has been accepted by the translator and processed in the same way as in the earlier releases of CICS which fully supported this option. However at runtime the specification of this option is ignored.

User response: The translator accepts the option in order to provide downward compatibility, i.e. to allow the latest level of the translator to process programs intended to execute both at the current and earlier release levels of CICS.

The user is responsible for any unexpected results which may occur due to the removal of execution time support for this option when used in CICS systems in which the option is obsolete.

If the translated program is not intended to execute at earlier levels of CICS, the obsolete option specification should be removed so that unnecessary warning messages are no longer issued by the translator.

Module: DFHEIMKW

Destination: SYSPRINT

DFH7262IS TRANSLATOR OPTION 'INS#1' REQUIRED BUT NOT SPECIFIED. COMMAND NOT TRANSLATED.

Explanation: An EXEC CICS command is recognised by the translator, but is not allowed unless a certain translator option is specified.

For example, the program contains an EXEC CICS INQUIRE command but the translator option 'SP' has not been specified.

System action: The EXEC CICS command is rejected and not translated.

User response: The user should specify the option given as part of the message. If necessary, refer to the *CICS Application Programming Guide* for information about how to specify translator options.

Module: DFHEIMSA DFHEIMSC DFHEIMSD DFHEIMSP

Destination: SYSPRINT

DFH7263IW SHIFT-IN CODE ENCOUNTERED WHILE SCANNING SINGLE BYTE CHARACTERS. A SHIFT-OUT CODE MAY BE MISSING.

Explanation: The translator is validating DBCS data in the input program, either because this is a COBOL program and the translator option DBCS is in effect, or because this is a PLI program and the GRAPHIC option is in effect.

A shift out character (with hexadecimal code X'0F') has been found in SBCS data.

System action: The incorrect data is copied into the translated program, and this would most probably cause a compiler warning or error.

User response: If the translated output is compiled, the user should carefully check all messages in the compiler listing.

However the safest action is to establish the reason for the unexpected shift out character, change the program in an appropriate way, and rerun the translation step.

Module: DFHEIM11

Destination: SYSPRINT

DFH7264IW SHIFT-OUT CODE ENCOUNTERED WHILE SCANNING DOUBLE BYTE CHARACTERS. A SHIFT-IN CODE MAY BE MISSING.

Explanation: The translator is validating DBCS data in the input program, either because this is a COBOL program and the translator option DBCS is in effect, or because this is PLI program and the GRAPHIC option is in effect.

A shift in character (with hexadecimal code X'0E') has been found in DBCS data.

System action: The incorrect data is copied into the translated program, and this would most probably cause a compiler warning or error.

User response: If the translated output is compiled,

the user should carefully check all messages in the compiler listing.

However the safest action is to establish the reason for the unexpected shift in character, change the program in an appropriate way, and rerun the translation step.

Module: DFHEIM11

Destination: SYSPRINT

DFH7267IW END OF FILE ENCOUNTERED WHILE SCANNING DOUBLE BYTE CHARACTERS. A SHIFT-IN CODE MAY BE MISSING.

Explanation: The translator is validating DBCS data in the input program, either because this is a COBOL program and the translator option DBCS is in effect, or because this is PLI program and the GRAPHIC option is in effect.

The translator has reached the end of the source program but is still in 'DBCS mode'.

System action: The incorrect data is copied into the translated program, and this would most probably cause a compiler warning or error.

User response: A DBCS data string has not been terminated with a shift out character (hexadecimal code x'0F').

Insert the missing shift out character, and rerun the translation step.

Module: DFHEIM01 DFHEIM15

Destination: SYSPRINT

DFH7268IS RIGHT MARGIN ENCOUNTERED WHILE SCANNING DOUBLE BYTE CHARACTERS. A SHIFT-IN CODE MAY BE MISSING.

Explanation: The translator is validating DBCS data in the input program, either because this is a COBOL program and the translator option DBCS is in effect, or because this is PLI program and the GRAPHIC option is in effect.

When this message is issued, the translator is scanning a DBCS string and has reached the right hand margin of a line, but has not found a shift in character. Both compilers require shift in and shift out characters to be coded as 'matching pairs' on each program line where they are used.

System action: Because there are only one or two characters between the last (or only) shift out character and the right margin, there is insufficient space for a DBCS string. The translator removes both the shift out character, and the one or two characters following the shift out, from the data copied into the translated program.

User response: Although the translated program is syntactically correct, the data string is probably incorrect for the application's purposes.

The user should examine the incorrect data and make appropriate changes to the program and rerun the translation step.

Refer to the relevant Programming Language Reference manual for rules regarding the coding of DBCS strings.

Module: DFHEIM14

Destination: SYSPRINT

DFH7269IS RIGHT MARGIN ENCOUNTERED WHILE SCANNING DOUBLE BYTE CHARACTERS. A SHIFT-IN CODE IS ASSUMED.

Explanation: The translator is validating DBCS data in the input program, either because this is a COBOL program and the translator option DBCS is in effect, or because this is PLI program and the GRAPHIC option is in effect, or because this is a C or C++ program.

When this message is issued, the translator is scanning a DBCS string and has reached the right hand margin of a line, but has not found a shift in character. The compilers require each DBCS string to be contained on a single line within the program.

System action: For programs written in COBOL and PLI, the translator substitutes either the last or the penultimate character in the line with a shift in character, ensuring that an even number of characters are positioned between the shift out and shift in.

In the following examples, < represents shift out, > represents shift in and '.' represents x'42'. If a line ends with the following data characters -

<.A.B.C.D

the translator converts the string to -

<.A.B.C>D

If a line ends with following data characters -

<.E.F.G.

the translator converts the string to -

<.E.F.G>

For programs written in the C languages, the translator assumes the existence of a shift in character at the right margin, but copies the incorrect data string into the translated program.

User response: Although the translated program may be syntactically correct, the data string is probably incorrect for the application's purposes.

The user should examine the incorrect data and make appropriate changes to the program and rerun the translation step.

Module: DFHEIM11 DFHEIM14

Destination: SYSPRINT

DFH7270IS FOLLOWING A SHIFT-OUT CODE AN ODD NUMBER OF BYTES WERE ENCOUNTERED BEFORE A SHIFT-IN CODE. THE SHIFT-IN CODE HAS BEEN MOVED.

Explanation: The translator is validating DBCS data in the input program, either because this is a COBOL program and the translator option DBCS is in effect, or because this is PLI program and the GRAPHIC option is in effect.

When this message is issued, the translator is scanning a DBCS string and has found an odd number of characters between the shift out and shift in characters delimiting this string.

System action: The translator moves the shift in character so that it trades places with the character immediately preceding the shift in character.

In the following example, '<' represents shift out, '>' represents shift in and '.' represents x'42'.

If a line contains the following DBCS string -

<.A.B.C.>

the translator converts the string to -

<.A.B.C>.

in the translated program.

User response: Although the DBCS string is now syntactically correct, the data string is probably incorrect for the application's purposes.

The SBCS data following the DBCS data may also be incorrect because of the translator's action.

The user should examine the incorrect data and make appropriate changes to the program and rerun the translation step.

Module: DFHEIM14

Destination: SYSPRINT

DFH7271IE THE DATA FOLLOWING 'xxxxxxx' IS NOT CONSIDERED TO BE PART OF THE FIELD NAME AND IS IGNORED. PERHAPS THE FIELD NAME SHOULD BE ENCLOSED IN QUOTES.

Explanation: In an EXEC DLI statement, a field name in a WHERE clause has been misspelt or is followed by incorrect data.

The following example would cause this message to be issued -

WHERE(DOCTO% = 'SPOCK')

where the user has coded '%' instead of an alphameric character.

System action: The translator discards the incorrect text and continues processing the command.

User response: The user should edit the source program to change or remove the incorrect data in or following the field name.

Module: DFHEIMS1

Destination: SYSPRINT

DFH7272IE A FIELD VALUE SHOULD BE FOLLOWED BY A BOOLEAN OPERATOR OR A RIGHT PARENTHESIS. 'xxxxxxx' IS IGNORED.

Explanation: In an EXEC DLI statement, a Boolean operator has been omitted or misspelt in a WHERE option.

The following example would cause this message to be issued -

```
WHERE(DOCTOR = 'SPOCK' OF DOCTOR = 'NO  ')
```

where the user has coded 'OF' instead of 'OR'.

System action: The translator is unable to diagnose this error until it finds a non- alphabetic character following the misspelt or missing Boolean operator. The next non-alphabetic character will usually be the comparison operator in the next qualification statement.

The effect of this is that the translator misinterprets the value field which starts immediately before the missing or misspelt Boolean operator, and rejects the qualification statement following the misspelt or missing Boolean operator.

User response: The user should insert or correctly code an appropriate Boolean operator.

Refer to the relevant IMS reference manual for a full description of the command syntax, and make suitable changes in the application program.

Module: DFHEIMS1

Destination: SYSPRINT

DFH7273IW A SHIFT-IN CODE WAS FOUND IN THE SECOND BYTE OF A DBCS CHARACTER. THE SHIFT-IN HAS BEEN ACCEPTED.

Explanation: The translator is validating DBCS data in a C or C++ program. When this message is issued, the translator is scanning a DBCS string and has found an odd number of characters between the shift out and shift in characters delimiting this string.

System action: The translator moves the data unchanged into the translated program.

User response: The user should examine the incorrect data and make appropriate changes to the program and rerun the translation step.

Module: DFHEIM14

Destination: SYSPRINT

DFH7274IW AN INVALID DBCS CHARACTER HAS BEEN FOUND - IT IS ACCEPTED.

Explanation: The translator is validating DBCS data in a C or C++ program. When this message is issued, the translator is scanning a DBCS string and has found an invalid DBCS character.

A valid DBCS character must either contain the value X'4040', or each byte must contain a value in the range X'41' thru X'FE' inclusive.

System action: The translator moves the data unchanged into the translated program.

User response: The user should examine the incorrect data and make appropriate changes to the program and rerun the translation step.

Module: DFHEIM11

Destination: SYSPRINT

DFH7275IS THE FIGURATIVE CONSTANT VALUE *constant* IS NOT COMPATIBLE WITH THE DATA TYPE 'PACKED INTEGER' WHICH IS REQUIRED FOR THE ARGUMENT OF KEYWORD *keyword*.

Explanation: In a COBOL program, a figurative constant has been coded as the argument for an option which takes a binary data value.

However the translator only accepts the ZERO figurative constant (or the ZEROS and ZEROES equivalents) for binary arguments.

System action: The translator rejects the command.

User response: The user should replace the figurative constant with an argument of the correct data type.

Module: DFHEIMAC

Destination: SYSPRINT

DFH7276IS THE FIGURATIVE CONSTANT VALUE *constant* IS NOT COMPATIBLE WITH THE DATA TYPE 'BINARY INTEGER' WHICH IS REQUIRED FOR THE ARGUMENT OF KEYWORD *keyword*.

Explanation: In a COBOL program, a figurative constant has been coded as the argument for an option which takes a packed decimal data value.

However the translator only accepts the ZERO figurative constant (or the ZEROS and ZEROES equivalents) for packed decimal arguments.

System action: The translator rejects the command.

User response: The user should replace the figurative constant with an argument of the correct data type.

Module: DFHEIMAC

Destination: SYSPRINT

DFH7277IS EXEC COMMAND IS LOCATED IN A CLASS-ID PROCEDURE DIVISION. THE COMMAND IS NOT TRANSLATED.

Explanation: In a COBOL program, an EXEC CICS command has been placed in the PROCEDURE DIVISION of a class.

The COBOL compiler does not allow executable code in a class. In an object-oriented COBOL program, EXEC CICS commands must be placed in the PROCEDURE DIVISION of a method.

System action: The translator rejects the command.

User response: The user should refer to the COBOL manuals for further guidance.

Module: DFHEIMSC

Destination: SYSPRINT

DFH7278IW EXEC COMMAND SHOULD NOT BEGIN IN AREA A. IT WAS PROCESSED AS IF FOUND IN AREA B.

Explanation: In a COBOL program, an EXEC CICS command has been placed in Area A, that is it starts before column 12.

The translator converts EXEC CICS commands into a COBOL CALL statement and one or more MOVE statements, all of which should be coded in Area B.

System action: The translator normally generates statements so that they begin in the same column as the respective EXEC CICS command. However, when this error occurs, the translator places the generated CALL and MOVE statements in Area B, that is, beginning in column 12.

User response: The user should place the EXEC command in Area B.

Module: DFHEIMSC

Destination: SYSPRINT

DFHACnnnn messages

DFHAC2001 *date time applid* **Transaction 'trnid' is not recognized. Check that the transaction name is correct.**

Explanation: Either transaction *trnid* does not exist as an installed transaction definition, or it is disabled, or it contains invalid characters.

Note that destination CSMT is used for non-terminal transactions only.

System action: Processing continues.

User response: Enter a valid transaction identifier.

Module: DFHACP

XMEOUT Parameters: *date, time, applid, trnid*

Destination: CSMT and Terminal End User

DFHAC2002 *date time applid* **To use this transaction trnid you must sign on or have the right security level.**

Explanation: You are signed on using the default *userid* but this *userid* does not have access to the requested transaction.

System action: CICS does not initialize the invoked transaction. Other processing continues and message DFHAC2003 is sent to destination CSMT.

User response: Sign on with an authorized *userid*.

Module: DFHACP

Destination: Terminal End User

DFHAC2003 *date time applid* **Security violation has been detected term id = termid, trans id = trnid, userid = userid.**

Explanation: The operator with user ID *userid* has invoked a transaction *trnid* at terminal *termid* for which the operator is not authorized.

System action: CICS does not initialize the invoked transaction. Either message DFHAC2002 or DFHAC2033 is sent to the terminal operator. Other CICS processing continues.

User response: Refer to the *userid* in the preceding message, DFHXS1111 on the CSCS log, to determine the identity of the person trying to invoke transaction *trnid* and the reason for the attempt.

Module: DFHACP

XMEOUT Parameters: *date, time, applid, termid, trnid, userid*

Destination: CSMT

DFHAC2004 *time applid* **Transaction trnid has failed with abend AKCC. Resource backout was successful.**

Explanation: Transaction *trnid* is abnormally terminated with abend AKCC.

System action: The transaction (task) is purged.

User response: Resubmit the transaction.

Module: DFHTFP

Destination: Terminal End User

DFHAC2005 *time applid* **Transaction *tranid* has failed with abend *abcode*.**

Explanation: Transaction *tranid* has been defined with INDOUBT(WAIT) or INDOUBT(COMMIT) and has been in communication with a partner APPC system. A session failure has occurred while the session was INDOUBT during an explicit or implicit syncpoint. An immediate resync was attempted but could not be completed.

System action: The task is abnormally terminated with a transaction dump. Unless overridden, APPC resynchronization is retried when the remote system is available.

User response: For more information, see the abend code *abcode*. If necessary, resubmit the transaction after the cause of the abend has been removed.

Module: DFHACP

Destination: Terminal End User

DFHAC2006 *date time applid* **Transaction *tranid* program *program name* abend *primary abcode* at *termid*.**

Explanation: The system was unable to execute transaction *tranid*. *termid* identifies the terminal which initiated transaction *tranid*. If there is no associated terminal, *termid* appears as "????". Program *programe* is the highest level program and is taken from the installed program definition. *abcode* is the CICS abend code.

System action: The task is abnormally terminated with a dump.

User response: Refer to abend code *abcode* for further information and guidance on how to solve the problem. If the code is not available, it is a user code generated by an EXEC CICS ABEND ABCODE(*abcode*) command. This command has been issued by a user program or by an IBM program (for example, a programming language library module).

Module: DFHACP

XMEOUT Parameters: *date, time, applid, tranid, program name, primary abcode, termid*

Destination: CSMT

DFHAC2007 *date time applid* **Transaction *tranid* cannot run as CICS shutdown is in progress.**

Explanation: Transaction *tranid* cannot be run during system quiesce.

System action: The system is in quiesce mode.

Note that destination CSMT is used for non-terminal transactions only.

User response: Re-enter the transaction when CICS is in normal execution mode, or place an entry for this transaction in the transaction list table (XLT).

Module: DFHACP

XMEOUT Parameters: *date, time, applid, tranid*

Destination: CSMT and Terminal End User

DFHAC2008 *date time applid* **Transaction *tranid* has been disabled and cannot be used.**

Explanation: Terminal *tranid* has been disabled.

Note that destination CSMT is used for non-terminal transactions only.

System action: Other processing continues.

User response: Notify the programmer responsible for this area that transaction *tranid* has been disabled.

Module: DFHACP

XMEOUT Parameters: *date, time, applid, tranid*

Destination: CSMT and Terminal End User

DFHAC2009 *date time applid* **Invalid non-terminal transaction *tranid*.**

Explanation: Transaction *tranid* has been entered. No terminal is associated with this transaction. It may be that transaction *tranid* is a disabled transaction, or is one that cannot be run during system quiesce. Alternatively, an invalid transaction identifier may have been entered.

System action: Other processing continues.

User response: Determine and correct the reason for transaction *tranid*'s invalidity.

Module: DFHACP

XMEOUT Parameters: *date, time, applid, tranid*

Destination: CSMT

DFHAC2010 *time applid* **Transaction *tranid* is not executable on terminal *termid*.**

Explanation: A conflict has been detected between the options specified for transaction *tranid*'s definition and those specified on terminal *termid*'s DFHTCT table entry. For example, transaction *tranid* is reserved for the use of VTAM terminals but the input came from a non-VTAM terminal.

System action: The input is ignored.

User response: If transaction *tranid* is to be entered from terminal *termid*, ensure that the installed transaction definition value of DVSUPRT is compatible with the DFHTCT entry.

Module: DFHACP

Destination: Terminal End User

DFHAC2012 *date time applid* **Remote transaction *tranid* cannot be run on the local system.**

Explanation: Transaction *tranid* is specified as remote. An attempt to route the transaction to a remote system failed either because there is no MRO/ISC defined in the running CICS system, or because the remote system name specified in the definition of the transaction is the same as that of the local system.

Note that destination CSMT is used for nonterminal transactions only.

System action: The task is abnormally terminated.

User response: Ensure that

- MRO/ISC support is correctly defined
- The remote transaction definition is correct.

Module: DFHACP

XMEOUT Parameters: *date, time, applid, tranid*

Destination: CSMT and Terminal End User

DFHAC2014 *date time applid* **Transaction *tranid* is not executable because system *sysid* is not available.**

Explanation: Transaction *tranid* is specified as remote. An attempt to route the transaction to a remote system failed because the link is out of service.

This message is also issued if the connection definition for the remote system has QUEUELIMIT and MAXQTIME specified and a queued allocate has been rejected.

Note that destination CSMT is used for non-terminal transactions only.

System action: CICS continues.

User response: Wait until the link is available.

If QUEUELIMIT and MAXQTIME are specified and this message occurs frequently then see the Intersystem Session Queue Management section in the Intercommunication Guide.

Module: DFHACP

XMEOUT Parameters: *date, time, applid, tranid, sysid*

Destination: CSMT and Terminal End User

DFHAC2015 *date time applid* **Console *consname* has not been defined to CICS. Input is ignored.**

Explanation: The console operator at the console named *consname* has directed a MODIFY command to the CICS region, but no terminal definition for that

console is installed in the region, and autoinstall for consoles is not enabled.

System action: The MODIFY command from the console is ignored.

User response: Notify the system programmer, who should use RDO to DEFINE and INSTALL a console definition that matches the name of the console, or enable autoinstall for consoles. The system programmer may also consider using 'pooled' consoles by defining TERMINAL definitions with a CONSNAME of DFHCONxx, or increasing the number of pooled consoles.

Module: DFHACP, DFHZATA2

XMEOUT Parameters: *date, time, applid, consname*

Destination: CSMT and Terminal End User

DFHAC2016 *date time applid* **Transaction *tranid* cannot run because program *programname* is not available.**

Explanation: Transaction *tranid* is not executable because the initial program for transaction *tranid* is not available. Possible reasons for this are

1. The program is missing.
2. The installed program definition is missing.
3. The program is disabled.
4. The program name in the installed transaction definition is invalid.
5. The installed transaction has been defined as remote and therefore has no program name, but the name of the remote system is the same as that of the local system.
6. The program requires a JVM to run but JVM initialization failed.
7. The autoinstall program abended while attempting to load the program.
8. The Language Environment options specified in DFHJVMRO are too long.

Note that destination CSMT is used for non-terminal transactions only.

System action: Other processing continues.

User response: Determine the cause of the error using the list given in the **Explanation**. The response depends on the reason as follows

1. Load the program into the CICS program library.
2. Create an installed program definition for the program.
3. Enable the program.
4. Use a valid program name in the installed transaction definition.
5. Carry out whichever of the following is appropriate
 - Use a local version of this transaction.
 - Use the correct remote version of this transaction.
 - Logon to the correct system and retry the transaction.

6. For JVM programs check the CSMT log for further information as to why JVM initialization failed.
7. Check the job output for further information as to why the autoinstall program abended.
8. Remove any unnecessary options and abbreviate any Language Environment option keywords, where possible, in your source for DFHJVMRO.

Module: DFHACP

XMEOUT Parameters: *date, time,applid, tranid, programname*

Destination: CSMT and Terminal End User

DFHAC2017 *date time applid* **Transaction *tranid* cannot run because terminal profile *profname* for the transaction is not available.**

Explanation: Transaction *tranid* is not executable because the terminal profile for the transaction is not available. This is because it has not been defined, or it has not been installed.

Note that destination CSMT is used for non-terminal transactions only.

System action: Other processing continues.

User response: Notify the system programmer or system administrator.

Module: DFHACP

XMEOUT Parameters: *date, time,applid, tranid, profname*

Destination: CSMT and Terminal End User

DFHAC2018 *date time applid* **An unrecognized Process Initialization Parameter (PIP) has been received in ATTACH for transaction *tranid*.**

Explanation: CICS has received an LU type 6.2 attach header with invalid process initialization parameters (PIPs).

Note that destination CSMT is used for non-terminal transactions only.

System action: CICS rejects the attach request.

User response: Inspect the received PIP data and its associated generalized data stream (GDS) header to determine why the parameters are invalid.

Module: DFHACP

XMEOUT Parameters: *date, time,applid, tranid*

Destination: CSMT and Terminal End User

DFHAC2019 *date time applid* **Transaction *tranid* does not support unmapped conversations.**

Explanation: Transaction *tranid* received an attach request that required the use of the generalized data stream (GDS) to access unmapped conversations, but transaction *tranid* does not support the use of the GDS interface.

System action: CICS rejects the attach request.

Note that destination CSMT is used for non-terminal transactions only.

User response: Inspect the subsystem that sent the attach header to see if the correct transaction was requested. If the request was correct, check the CICS transaction definition.

Module: DFHACP

XMEOUT Parameters: *date, time,applid, tranid*

Destination: CSMT and Terminal End User

DFHAC2020 *time applid* **The conversation type requested by node *netname* was not recognized.**

Explanation: CICS received a conversation-type field in an attach header that was not TYPE=MAPPED or TYPE=UNMAPPED.

System action: The attach request is rejected.

User response: Notify the system programmer. The validity of the attach function management header (FMH) should be checked and the cause of the error identified.

Module: DFHACP

Destination: Terminal End User

DFHAC2021 *time applid* **An unsupported Data Blocking Algorithm (DBA) field in the attach Function Management Header (FMH) has been received from node *netname*.**

Explanation: The received attach header contained a value for the reserved data blocking algorithm (DBA) field.

System action: The attach request is rejected.

User response: Notify the system programmer. The validity of the attach function management header (FMH) should be checked and the cause of the error identified.

Module: DFHACP

Destination: Terminal End User

DFHAC2022 *date time applid* **Transaction *tranid* has initiated an incorrect sync point level request.**

Explanation: The requested Synclevel does not match the synclevel negotiated in the Bind request, or Synclevel 2 was requested, but Lognames were not exchanged.

Note that destination CSMT is used for non-terminal transactions only.

System action: The attach request is rejected.

User response: Notify the system programmer. The subsystem that sent the attach header should be inspected to determine that the correct transaction was requested. If it was, the CICS transaction definition should be checked.

Module: DFHACP

XMEOUT Parameters: *date, time,applid, tranid*

Destination: CSMT and Terminal End User

DFHAC2023 *time applid* **An invalid sync point level has been requested by node *netname*.**

Explanation: The synchronization level requested in the attach header is invalid for the session being used.

System action: The attach request is rejected.

User response: Notify the system programmer. The validity of the attach function management header (FMH) should be checked and the cause of the error identified. The value of the synchronization level in the attach header and the bind should be compared.

Module: DFHACP

Destination: Terminal End User

DFHAC2024 *date time applid* **A request from node *netname* has invalid security parameters.**

Explanation: The received attach header did not match the required security parameters specified in the bind.

Note that destination CSMT is used for non-terminal transactions only.

System action: The attach request is rejected.

User response: Notify the system programmer. The validity of the attach function management header (FMH) should be checked and the cause of the error identified. The value of the ACC requirements in the attach header and the bind should be compared.

Module: DFHACP

XMEOUT Parameters: *date, time,applid, netname*

Destination: CSMT

DFHAC2025 *time applid* **An invalid Unit of Work Identification (UOWID) has been supplied by node *netname*.**

Explanation: The received attach header contained an invalid unit of work ID (UOWID). Either the format was wrong, or no UOWID was received when the sync point level required it. This error may also be raised if no conversation correlator is supplied when it is needed.

System action: The attach request is rejected.

User response: Notify the system programmer. The validity of the attach function management header (FMH) should be checked and the cause of the error identified. The value of the UOWID/conversation correlator and the sync point level in the attach header should be compared.

Module: DFHACP

Destination: Terminal End User

DFHAC2026 *time applid* **An invalid Function Management Header (FMH) has been supplied by node *netname*.**

Explanation: The length field in the attach header was invalid.

System action: The attach request is rejected.

User response: Notify the system programmer. The validity of the attach function management header (FMH) should be checked and the cause of the error identified.

Module: DFHACP

Destination: Terminal End User

DFHAC2027 *date time applid* **Transaction *tranid* does not support conversation restart.**

Explanation: CICS will not accept LU type 6.2 attach headers with restart requested.

Note that destination CSMT is used for non-terminal transactions only.

System action: The attach request is rejected.

User response: Notify the system programmer. The subsystem that sent the attach header should be inspected to determine why restart was requested.

Module: DFHACP

XMEOUT Parameters: *date, time,applid, tranid*

Destination: CSMT and Terminal End User

DFHAC2028 *date time applid* **Transaction *tranid* cannot be used and has been ignored.**

Explanation: The transaction code CSAC or CESC, was entered from a terminal. This is not allowed.

System action: If the transaction is CSAC, the transaction is run with no effect. If the transaction is CESC, the transaction is abnormally terminated with abend code ATOA.

User response: Ensure that these transactions are not entered from a terminal.

Module: DFHACP

XMEOUT Parameters: *date, time, applid, tranid*

Destination: CSMT and Terminal End User

DFHAC2029 *date time applid* **Transaction *tranid* is not executable. The system specified by the dynamic routing program is unavailable.**

Explanation: Transaction *tranid* is specified as remote AND dynamic. An attempt to dynamically route transaction *tranid* to the remote system specified by the dynamic routing program has failed because the link is out of service.

Note that destination CSMT is used for non-terminal transactions only.

System action: CICS continues.

User response: Wait until the link becomes available, then try to dynamically route the transaction again.

Module: DFHACP

XMEOUT Parameters: *date, time, applid, tranid*

Destination: CSMT and Terminal End User

DFHAC2030 *date time applid* **All sessions are busy. Please try again.**

Explanation: Transaction *tranid* is specified as remote AND dynamic. An attempt to dynamically route transaction *tranid* to the remote system specified by the dynamic routing program has failed because no sessions are immediately available.

Note that destination CSMT is used for non-terminal transactions only.

System action: CICS continues.

User response: Wait until a session becomes available, then try to dynamically route the transaction again.

Module: DFHACP

XMEOUT Parameters: *date, time, applid*

Destination: CSMT and Terminal End User

DFHAC2031 *date time applid* **Automatic signon of operator of console *consname* has failed.**

Explanation: The console operator at the console named *consname* has directed a MODIFY command to the CICS region, and the console was defined with USERID(*FIRST) or USERID(*EVERY). When CICS tried to signon the operator automatically, the signon was rejected.

System action: The MODIFY command from the console is ignored.

User response: Contact the system programmer to give the userid in use at the console (which is identified in other messages on the log), the correct access to this console using RACF (or an equivalent External Security manager).

Module: DFHACP, DFHZATA2

XMEOUT Parameters: *date, time, applid, consname*

Destination: CSML and Terminal End User

DFHAC2032 *date time applid* **CICS autoinstall for console *consname* has failed.**

Explanation: The console operator at the console named *consname* has directed a MODIFY command to the CICS region, but no terminal definition for that console is installed in the region, and an autoinstall for it has failed.

System action: The MODIFY command from the console is ignored.

User response: Notify the system programmer, who should investigate the failure by looking for abends and messages on the log of the CICS system. For information on implementing autoinstall for MVS consoles see the *CICS Resource Definition Guide*.

Module: DFHACP, DFHZATA2

XMEOUT Parameters: *date, time, applid, consname*

Destination: CSML

DFHAC2033 *time applid* **You are not authorized to use transaction *tranid*. Check that the transaction name is correct.**

Explanation: Either an operator has attempted to execute transaction *tranid* while not authorized, or another transaction attempted to start transaction *tranid*, which was not authorized for this terminal.

System action: Other processing continues. Message DFHAC2003 is sent to CSMT.

User response: Either determine why the operator was trying to execute transaction *tranid* or enter an authorized transaction identifier.

Module: DFHACP

Destination: Terminal End User

DFHAC2034 *time applid* **CICS Logic Error. An invalid error code has been passed to DFHACP. Transaction: *tranid* Terminal *termid*.**

Explanation: An invalid error code has been passed to DFHACP.

System action: Transaction *tranid* is terminated with a transaction dump. The dump code is AACA. Message DFHAC2035 is sent to the CSMT.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHACP

Destination: Terminal End User

DFHAC2035 *date time applid* **An invalid error code has been passed to DFHACP. Transaction *tranid* is terminated. Terminal *termid*.**

Explanation: An invalid error code has been passed to DFHACP.

System action: Transaction *tranid* is terminated with a transaction dump. A transaction dump is taken. The dump code is AACA. Message DFHAC2034 is sent to the terminal user.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHACP

XMEOUT Parameters: *date, time, applid, tranid, termid*

Destination: CSMT

DFHAC2036 *date time applid* **Transaction *tranid* has failed with abend AKCC. Resource backout was successful.**

Explanation: Transaction *tranid* has abended AKCC.

System action: The transaction (task) is purged.

User response: Resubmit the transaction later.

Module: DFHTFP

XMEOUT Parameters: *date, time, applid, tranid*

Destination: CSMT

DFHAC2037 *date time applid* **Transaction *tranid* is not executable on terminal *termid*.**

Explanation: A conflict has been detected between the options specified for transaction *tranid*'s definition and those specified on terminal *termid*'s DFHTCT table entry. For example, transaction *tranid* is reserved for the use of VTAM terminals but the input came from a non-VTAM terminal.

System action: The input is ignored.

User response: If transaction *tranid* is to be entered from terminal *termid*, ensure that the installed transaction definition value of DVSUPRT is compatible with the DFHTCT entry.

Module: DFHACP

XMEOUT Parameters: *date, time, applid, tranid, termid*

Destination: CSMT

DFHAC2038 *date time applid* **The conversation type requested by node *netname* was not recognized.**

Explanation: CICS received a conversation-type field in an attach header that was not TYPE=MAPPED or TYPE=UNMAPPED.

System action: The attach request is rejected.

User response: Notify the system programmer. The validity of the attach function management header (FMH) should be checked and the failing subsystem identified.

Module: DFHACP

XMEOUT Parameters: *date, time, applid, netname*

Destination: CSMT

DFHAC2039 *date time applid* **An unsupported Data Blocking Algorithm (DBA) field in the attach Function Management Header (FMH) has been received from node *netname*.**

Explanation: The received attach header contained a value for the reserved data blocking algorithm (DBA) field.

System action: The attach request is rejected.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Notify the system programmer. Check the validity of the attach function management header (FMH), and identify the failing subsystem.

Module: DFHACP

XMEOUT Parameters: *date, time, applid, netname*

Destination: CSMT

DFHAC2040 *date time applid* **An invalid sync point level has been requested by node *netname*.**

Explanation: The synchronization level requested in the attach header is invalid for the session being used.

System action: The attach request is rejected.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Notify the system programmer. Check the validity of the attach function management header (FMH), and identify the failing subsystem. Compare the value of the synchronization level in the attach header and the bind.

Module: DFHACP

XMEOUT Parameters: *date, time, applid, netname*

Destination: CSMT

DFHAC2041 *date time applid* **An invalid Unit of Work Identification (UOWID) has been supplied by node *netname*.**

Explanation: The received attach header contained an invalid unit of work ID (UOWID). Either the format was wrong, or no UOWID was received when the sync point level required it. This error may also be raised if no conversation correlator is supplied when it is needed.

System action: The attach request is rejected.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Notify the system programmer. The validity of the attach function management header (FMH) should be checked and the failing subsystem identified. The value of the UOWID/conversation correlator and the sync point level in the attach header should be compared.

Module: DFHACP

XMEOUT Parameters: *date, time, applid, netname*

Destination: CSMT

DFHAC2042 *date time applid* **An invalid Function Management Header (FMH) has been supplied by node *netname*.**

Explanation: The length field in the attach header was invalid.

System action: The attach request is rejected.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Notify the system programmer. Check the validity of the attach function management header (FMH), and identify the failing subsystem.

Module: DFHACP

XMEOUT Parameters: *date, time, applid, netname*

Destination: CSMT

DFHAC2043 *date time applid* **Transaction has been rejected - CICS system is being recovered. Please wait for completion of recovery.**

Explanation: A request to initiate a transaction was received while the CICS system was in the process of recovering the session following an XRF takeover or persistent sessions restart. The error is detected by DFHZSUP, which then drives DFHACP to issue this message.

Note that destination CSMT is used for non-terminal transactions only.

System action: Depending upon the recovery notification requested for this terminal, the system will send either the recovery message or initiate the recovery transaction specified on the RECOVNOTIFY option of the typeterm definition for this terminal (see the *CICS Resource Definition Guide* for details).

User response: After the recovery notification has been received, the user is able to continue operations.

Module: DFHACP

XMEOUT Parameters: *date, time, applid*

Destination: CSMT and Terminal End User

DFHAC2044 *date time applid* **An error occurred while trying to send SYNCPOINT ROLLBACK to terminal *termid*.**

Explanation: An attempt was made to send a SYNCPOINT ROLLBACK request. A nonzero return code was received by the sender of the request.

System action: ABORT processing is initiated for terminal *termid*.

User response: Notify the system programmer. Use trace to find the value of the return code from the SYNCPOINT ROLLBACK request. For IRC, the meaning of the return code can be found in the *CICS Data Areas* manual.

Module: DFHZIS1

XMEOUT Parameters: *date, time, applid, termid*

Destination: CSMT

DFHAC2045 *date time applid* **CICS autoinstall for console *consname* was rejected by the autoinstall control program.**

Explanation: The console operator at the console named *consname* has directed a MODIFY command to the CICS region, but no terminal definition for that

console is installed in the region, and an autoinstall for it has failed because the autoinstall program has rejected the install request.

System action: The MODIFY command from the console is ignored.

User response: Notify the system programmer, who should alter the autoinstall program to allow this console to be installed.

Module: DFHACP, DFHZATA2

XMEOUT Parameters: *date, time,applid, consname*

Destination: CSMT

DFHAC2047 *date time applid* **While performing an attach for node *netname* a security violation was detected.**

Explanation: A request to attach a remote transaction failed due to a security problem. The security fields extracted from the Attach FMH5 were passed to the Security Domain to signon the user in the remote system, but the signon call failed.

System action: The attach request is rejected.

User response: Refer to previous security messages which are written to TDQ CSCS such as DFHSN1604 for further information and guidance. If no previous messages were issued, examine the trace to determine the reason for the signon failure. Check that if the userid, password or profile are passed on the Attach FMH5, then they are valid.

Module: DFHACP

XMEOUT Parameters: *date, time,applid, netname*

Destination: CSMT and Terminal End User

DFHAC2050 *time applid* **An invalid function management header (FMH) has been supplied by node *netname*.**

Explanation: The access security information length field in the attach header is invalid.

System action: An exception trace entry containing the invalid FMH5 is issued. The attach request is rejected.

User response: Notify the system programmer. Check the validity of the attach function management header and identify the cause of the error.

Module: DFHACP

Destination: Terminal End User

DFHAC2051 *date time applid* **An invalid Function Management Header (FMH) has been supplied by node *netname*.**

Explanation: The Access Security Information length field in the attach header was invalid.

System action: An exception trace entry containing the invalid FMH5 has been issued. The attach request is rejected.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Notify the system programmer. Check the validity of the attach function management header (FMH), and identify the failing subsystem.

Module: DFHACP

XMEOUT Parameters: *date, time,applid, netname*

Destination: CSMT

DFHAC2052 *time applid* **While performing an attach for node *netname* a security violation was detected.**

Explanation: A password was required in the attach FMH5, but was missing. A user ID was found, however, because the attach did not specify already verified (AV) or persistent signed-on (PV1), a password should have been present.

System action: An exception trace entry is issued tracing the invalid FMH5. The attach request is rejected.

User response: Notify the system programmer. Inspect the subsystem that sent the attach header to determine why the password was not sent.

Module: DFHACP

Destination: Terminal End User

DFHAC2053 *date time applid* **While performing an attach for node *netname* a security violation was detected.**

Explanation: A password was required in the attach FMH5, but was missing. A user ID was found, however, since the attach did not specify already verified (AV) or persistent signed-on (PV1), a password should have been present.

System action: An exception trace entry is issued tracing the invalid FMH5. The attach request is rejected. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Notify the system programmer. Inspect the subsystem that sent the attach header to determine why the password was not sent.

Module: DFHACP

XMEOUT Parameters: *date, time,applid, netname*

Destination: CSMT

DFHAC2054 *time applid* **You are not authorized to access this system.**

Explanation: The attach header that was sent to the remote system did not match the required security parameters specified in the bind.

System action: The attach request is rejected by the remote system and the session is unbound. The remote system issues messages DFHAC2055 on CSMT and DFHZC4946 on CSNE.

User response: Inform the system programmer. Investigate the reason why the attach request failed. See messages DFHAC2055 on CSMT and DFHZC4946 on CSNE issued by the remote system for more diagnostic information.

Module: DFHACP

Destination: Terminal End User

DFHAC2055 *date time applid* **An attach request from node *netname* has sent BIND/FMH5 security data that is invalid.**

Explanation: A request to attach a task has been received across an APPC link. However, there is an error in the FMH attach parameters. An attach parameter is present that is not authorized by the bind security indicators.

System action: The attach request is rejected and the session is unbound. An exception trace point (number 1737) for component TF is issued, tracing the invalid attach header (FMH type 5). Message DFHZC4946 on CSNE contains sense information to help identify the reason for the failure. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Investigate the cause of the error which is in the remote system. Use the FMH5 in the exception trace, to determine why the remote system sent an invalid attach request.

Module: DFHACP

XMEOUT Parameters: *date, time, applid, netname*

Destination: CSMT

DFHAC2056 *time applid* **You are not authorized to access this system.**

Explanation: The attach header that was sent to the remote system did not conform to the APPC protocol.

System action: The attach request is rejected by the remote system and the session is unbound. The remote system will produce messages DFHAC2057 on CSMT and DFHZC4947 on CSNE.

User response: Inform the system programmer.

Investigate the reason why the attach request failed. See messages DFHAC2057 on CSMT and DFHZC4947 on CSNE issued by the remote system for more diagnostic information.

Module: DFHACP

Destination: Terminal End User

DFHAC2057 *date time applid* **While performing an attach for node *netname* a security violation was detected.**

Explanation: A request to attach a task has been received across an APPC link. However, the FMH attach parameters do not conform to the APPC protocol.

System action: The attach request is rejected and the session is unbound. An exception trace point (number 1737) for component TF is issued tracing the invalid attach header (FMH type 5). Message DFHZC4947 is issued. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Investigate the cause of the error which is in the remote system. Use the FMH5 in the exception trace to determine why the remote system sent an invalid attach request. See message DFHZC4947 on CSNE which contains sense information to help identify the reason for the failure.

If the remote system has an earlier release of CICS or CICS on another platform then you may need to set USEDFTUSER. See Attach Time Security and the USEDFTUSER option in the *CICS RACF Security Guide*.

Module: DFHACP

XMEOUT Parameters: *date, time, applid, netname*

Destination: CSMT

DFHAC2201 *time applid* **Transaction *tranid* has lost contact with its coordinator system during syncpoint processing and has abended with code ASP1. The unit of work is shunted until contact is restored.** *condmsg*

Explanation: An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. The coordinator of the syncpoint is not this CICS system but is remote.

Transaction *tranid* has lost contact with its coordinator system during the critical period of syncpoint processing known as the 'indoubt window'.

In accordance with the transaction definition (WAIT YES), the unit of work is not completed but is allowed to wait for resynchronization with the coordinator system. The transaction is abnormally terminated with abend code ASP1. The unit of work is shunted to await the return of the coordinator system.

DFHAC2202 • DFHAC2205

If possible, a conditional message *condmsg* from the linked system is appended to this message.

System action: Message DFHAC2231 is sent to the master terminal operator (destination CSMT). Normal abend processing continues.

User response: None. Any updates performed by the unit of work are resolved automatically when resynchronization with the coordinator takes place.

Alternatively, the user may force resolution of the updates independently of the coordinator system by making a CEMT request to commit or to back out the unit of work.

Module: DFHTFP

Destination: Terminal End User

DFHAC2202 *time applid* Transaction *tranid* has lost contact with its coordinator system during syncpoint processing and has abended with code ASPO. All updates will be unilaterally committed. *condmsg*

Explanation: Transaction *tranid* has lost contact with its coordinator system during the critical period of syncpoint processing known as the 'indoubt window'. The transaction is abnormally terminated with abend code ASPO.

In accordance with the transaction definition (WAIT NO and ACTION COMMIT), all recoverable updates performed by the unit of work are unilaterally committed. Note that integrity of updates may be lost because the coordinator system may either commit or back out its changes.

If possible, a conditional message *condmsg* from the linked system is appended to this message.

System action: Message DFHAC2232 is sent to the master terminal operator (destination CSMT). Normal abend processing continues.

User response: None. In accordance with the transaction definition, all updates are unilaterally committed.

Module: DFHTFP

Destination: Terminal End User

DFHAC2203 *time applid* Transaction *tranid* has lost contact with its coordinator system during syncpoint processing and has abended with code ASPP. All updates will be unilaterally backed out. *condmsg*

Explanation: Transaction *tranid* has lost contact with its coordinator system during the critical period of syncpoint processing known as the 'indoubt window'. The transaction is abnormally terminated with abend code ASPP.

In accordance with the transaction definition (WAIT NO and ACTION BACKOUT), all recoverable updates performed by the unit of work are unilaterally backed out. Note that integrity of updates may be lost because the coordinator system may either commit or back out its changes.

If possible, a conditional message *condmsg* from the linked system is appended to this message.

System action: Message DFHAC2233 is sent to the master terminal operator (destination CSMT). Normal abend processing continues.

User response: None. In accordance with the transaction definition, all updates are unilaterally backed out.

Module: DFHTFP

Destination: Terminal End User

DFHAC2204 *time applid* A commit failure has occurred during syncpoint processing for transaction *tranid*. *condmsg*

Explanation: An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. Resources local to this CICS system, for example files, temporary storage, transient data, have been updated. A commit failure occurred during phase 2 of the syncpoint protocol for a local resource owner.

If possible, a conditional message *condmsg* from the linked system is appended to this message.

System action: Message DFHAC2234 is sent to the master terminal operator (destination CSMT). For an EXEC CICS SYNCPOINT, processing completes normally and processing continues with the next unit of work. For EXEC CICS RETURN, the transaction completes normally.

Resources affected by the commit failure remain locked and the unit of work is shunted.

User response: Refer to earlier messages output by the local resource owner to discover the cause of the commit failure.

Module: DFHTFP

Destination: Terminal End User

DFHAC2205 *time applid* A backout failure has occurred during syncpoint processing for transaction *tranid*. *condmsg*

Explanation: An attempt to backout a unit of work has suffered a backout failure. For the local resource owner(s) that suffered the backout failure, the resources updated by the unit of work remain locked. All other resources are backed out.

If possible, a conditional message *condmsg* from the

linked system is appended to this message.

System action: Message DFHAC2235 is sent to the master terminal operator (destination CSMT). For an EXEC CICS SYNCPOINT, processing completes normally and processing continues with the next unit of work. For EXEC CICS RETURN, the transaction completes normally.

Resources affected by the backout failure remain locked and the unit of work is shunted.

User response: Refer to earlier messages output by the local resource owner to discover the cause of the backout failure.

Module: DFHTFP

Destination: Terminal End User

DFHAC2206 *time applid* **Transaction *tranid* failed with abend *abcode*. Updates to local recoverable resources backed out.**
condmsg

Explanation: Transaction *tranid* is abnormally terminated with abend code *abcode*. Any changes to recoverable resources in the local system that have been performed by the current unit of work are backed out.

abcode is either a CICS transaction abend code or a user abend code generated by a CICS ABEND ABCODE(*abcode*) command. This command is issued either by a user program or by an IBM program (for example, a programming language library module).

If possible, a conditional message *condmsg* from the remote system will be appended to this message.

When this message is issued in the terminal owning region because a remote transaction has failed, there may be no recoverable resources to be backed out in the local system. In this case, the conditional message tells you whether or not resources in the remote system have been backed out.

System action: Message DFHAC2236 is sent to the master terminal operator (destination CSMT). Normal abend processing continues.

User response: Use the abend code, *abcode*, to diagnose the problem. In a transaction routing environment, the original cause of the failure is usually indicated in the conditional message. If the abend is issued by an IBM program product other than CICS, the code is documented in the library of that other product.

Resubmit the transaction after the cause of the original abend has been removed.

Module: DFHTFP

Destination: Terminal End User

DFHAC2215 *time applid* **A CICS-generated syncpoint request has failed because a connected system has requested that the UOW be rolled back. Transaction *tranid* has been abnormally terminated with code ASPF.**
condmsg

Explanation: CICS has been unable to comply with an internally generated syncpoint request because a connected system has notified it that the unit of work must be rolled back. (This may also occur as a result of a session failure or a protocol error).

Transaction *tranid* is abnormally terminated with abend code ASPF. Any changes to recoverable resources that have been performed by the current unit of work are backed out.

If possible, a conditional message *condmsg* from the linked system is appended to this message.

System action: Message DFHAC2245 is sent to the master terminal operator (destination CSMT). Normal abend processing continues.

User response: Determine why the connected system sent the indication to roll back the unit of work.

Resubmit the transaction after the cause of the indication to roll back has been removed.

Module: DFHTFP

Destination: Terminal End User

DFHAC2216 *time applid* **Transaction termination processing for transaction *tranid* has failed because a connected system has requested that the UOW be rolled back.**
condmsg

Explanation: A transaction has issued an EXEC CICS RETURN in backout required program state. The backout required program state is set when an application receives a backout request on a protected conversation.

Recoverable resources updated by the unit of work are backed out and locks released.

If possible, a conditional message *condmsg* from the linked system is appended to this message.

System action: Message DFHAC2246 is sent to the master terminal operator (destination CSMT). Termination processing continues.

User response: To avoid the error, the application should code an EXEC CICS SYNCPOINT command before the EXEC CICS RETURN. A syncpoint issued in 'backout required' program state results in a backout being performed, and the ROLLEDBACK condition returned on the EXEC CICS SYNCPOINT command. If this condition is then handled, a subsequent EXEC CICS RETURN will complete successfully.

DFHAC2217 • DFHAC2220

Resubmit the transaction after the cause of the indication to roll back has been removed.

Module: DFHTFP

Destination: Terminal End User

DFHAC2217 *time applid* Transaction *tranid* has requested rollback, but was using a type of processing for which rollback is not supported. The transaction has been abnormally terminated with code ASP8. *message*

Explanation: An application requested syncpoint rollback, but was using a type of processing that does not support rollback, for example LU6.1.

Transaction *tranid* is abnormally terminated with abend code ASP8. Any changes to recoverable resources that have been performed by the current unit of work will be backed out.

If possible, a conditional message *condmsg* from the linked system will be appended to this message.

System action: Message DFHAC2247 is sent to the master terminal operator (destination CSMT). Normal abend processing continues.

User response: Refer to the explanation of abend ASP8.

Module: DFHTFP

Destination: Terminal End User

DFHAC2218 *time applid* Transaction *tranid* has failed with abend ASP7 following the failure of a local resource owner in the prepare phase of syncpoint. Updates will be backed out. *condmsg*

Explanation: An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. Resources local to this CICS system, for example files, temporary storage, or transient data, have been updated, and so the local resource owners have been sent a syncpoint request. A local resource owner has replied 'No' to a request to 'Prepare', during the two phase syncpoint protocol.

Transaction *tranid* is abnormally terminated with abend code ASP7. Any changes to recoverable resources that have been performed by the current unit of work are backed out.

If possible, a conditional message *condmsg* from the linked system is appended to this message.

System action: Message DFHAC2248 is sent to the master terminal operator (destination CSMT). Normal abend processing continues.

User response: Refer to the explanation of abend ASP7.

Module: DFHTFP

Destination: Terminal End User

DFHAC2219 *time applid* Transaction *tranid* has failed with abend ASP7 following the failure of a remote system in the prepare phase of syncpoint. Updates will be backed out. *condmsg*

Explanation: An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. Resources remote to this CICS system, for example files, temporary storage, transient data on remote CICS systems, or database managers communicating via the RMI, have been updated, and so the remote resource owners have been sent a syncpoint request. A remote resource owner has replied 'No' to a request to 'Prepare', during the two phase syncpoint protocol.

Transaction *tranid* is abnormally terminated with abend code ASP7. Any changes to recoverable resources that have been performed by the current unit of work are backed out.

If possible, a conditional message *condmsg* from the linked system is appended to this message.

System action: Message DFHAC2249 is sent to the master terminal operator (destination CSMT). Normal abend processing continues.

User response: Refer to the explanation of abend ASP7.

Module: DFHTFP

Destination: Terminal End User

DFHAC2220 *time applid* The coordinator system has indicated that the current unit of work is to be backed out. Transaction *tranid* has been abnormally terminated with abend ASP3. *condmsg*

Explanation: An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. The coordinator of the syncpoint is not this CICS system but is remote. During the syncpoint protocol the remote coordinator has decided that the unit of work cannot be committed and must be backed out.

Transaction *tranid* is abnormally terminated with abend code ASP3. Any changes to recoverable resources that have been performed by the current unit of work are backed out.

If possible, a conditional message *condmsg* from the linked system is appended to this message.

System action: Message DFHAC2250 is sent to the master terminal operator (destination CSMT). Normal abend processing continues.

User response: Refer to the remote coordinator system to discover the reason why the unit of work was backed out.

Module: DFHTFP

Destination: Terminal End User

DFHAC2221 *time applid* Transaction *tranid* has failed with abend ASPQ. Syncpoint commit processing has failed while communicating with a remote system. *condmsg*

Explanation: An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. Resources remote to this CICS system such as files, temporary storage, and transient data on remote CICS systems have been updated, and so the remote resource owners have been sent a syncpoint request. A failure occurred during phase 2 of syncpoint protocol.

Transaction *tranid* has abnormally terminated with abend code ASPQ. Recoverable resources have successfully been committed but a subsequent error occurred.

If possible, a conditional message *condmsg* from the linked system is appended to this message.

System action: Message DFHAC2251 is sent to the master terminal operator (destination CSMT). Normal abend processing continues.

User response: Refer to the associated messages already issued by the communication components of CICS to determine the cause of the intersystem session problem.

Module: DFHTFP

Destination: Terminal End User

DFHAC2222 *time applid* Transaction *tranid* has lost contact with its coordinator system during syncpoint processing. No updates have been performed by this system; it has abended with code ASPR. *condmsg*

Explanation: An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. The coordinator of the syncpoint is not this CICS system but is remote.

Transaction *tranid* has lost contact with its coordinator system during the critical period of syncpoint processing known as the 'indoubt window'. However no recoverable resources have been updated by this system, so there is no data integrity problem.

Transaction *tranid* is abnormally terminated with abend code ASPR.

If possible, a conditional message *condmsg* from the

linked system is appended to this message.

System action: Message DFHAC2252 is sent to the master terminal operator (destination CSMT). Normal abend processing continues.

User response: Refer to messages on the remote system to determine if the remote resources were backed out or committed.

Module: DFHTFP

Destination: Terminal End User

DFHAC2223 *time applid* Transaction *tranid* has failed with abend ASP2 due to the links to the remote systems being in an invalid state. Updates will be backed out. *condmsg*

Explanation: An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. Resources remote to this CICS system, for example files, temporary storage, transient data on remote CICS systems, or database managers communicating via the RMI, have been updated, and so the remote resource owners would be sent a syncpoint request. The links to the remote resource owners are in an invalid state to be sent the PREPARE request of the two phase syncpoint protocol.

Transaction *tranid* is abnormally terminated with abend code ASP2. Any changes to recoverable resources that have been performed by the current unit of work are backed out.

System action: Message DFHAC2253 is sent to the master terminal operator (destination CSMT). Normal abend processing continues.

User response: See the explanation of abend ASP2 for guidance.

Module: DFHTFP

Destination: Terminal End User

DFHAC2230 *date time applid* Transaction *tranid* terminal *termid* not executed due to I/O error at session startup. *message*

Explanation: Transaction *tranid* could not be executed because an I/O error occurred in the start-up program on terminal *termid*.

System action: Transaction *tranid* is not executed.

User response: Correct the cause of the I/O error, which is probably due to the terminal not being powered on.

Module: DFHACP

XMEOUT Parameters: *date, time, applid, tranid, termid, message*

Destination: CSMT

DFHAC2231 *date time applid Transaction tranid running program program name term termid has lost contact with its coordinator system during syncpoint and has abended with code ASP1. The unit of work is shunted until contact is restored*{. EXCI job = }*exci_id. condmsg*

Explanation: An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. The coordinator of the syncpoint is not this CICS system but is remote.

Transaction *tranid* has lost contact with its coordinator system during the critical period of syncpoint processing known as the 'indoubt window'.

In accordance with the transaction definition (WAIT YES), the unit of work is not completed. It is allowed to wait for resynchronization with the coordinator system. The transaction is abnormally terminated with abend code ASP1. The unit of work is shunted to await the return of the coordinator system.

Exci Job =*exci_id* is added when *tranid* is a server transaction running on behalf of a non CICS job using the external CICS interface (EXCI). The *exci_id* consists of 'jobname.stepname.procname - MVSid' and identifies the EXCI client job. The stepname and procname may be omitted. The MVSid identifies the MVS system on which the EXCI client job is running. If MRO/XCF is being used, this can be different from the MVS system on which this CICS system is running. The MVSid is the SMF system identification (SID), hence the MVSid will be omitted if SMF is not active. Terminal *termid* represents the connection between the EXCI client and CICS rather than a real terminal.

In the case of an MRO or an ISC APPC (parallel sessions) connected system, *termid* is a terminal identifier (transaction routing) or a session identifier, *sysid* is the identifier of the linked CICS system. The display ends with the termination message *condmsg* issued by the linked system.

System action: If possible, message DFHAC2201 is sent to the terminal user. Normal abend processing continues.

User response: Refer to explanation of abend code ASP1.

Module: DFHTFP

XMEOUT Parameters: *date, time, applid, tranid, program name, termid, {1=. EXCI job = }, exci_id, condmsg*

Destination: CSMT

DFHAC2232 *date time applid Transaction tranid running program program name term termid has lost contact with its coordinator system during syncpoint and has abended with code ASPO. All updates will be unilaterally committed*{. EXCI job = }*exci_id. condmsg*

Explanation: Transaction *tranid* has lost contact with its coordinator system during the critical period of syncpoint processing known as the 'indoubt window'. The transaction is abnormally terminated with abend code ASPO.

In accordance with the transaction definition (WAIT NO and ACTION COMMIT), all recoverable updates performed by the unit of work are unilaterally committed. Note that integrity of updates may be lost since the coordinator system may either commit or back out its changes.

Exci Job =*exci_id* is added when *tranid* is a server transaction running on behalf of a non CICS job using the external CICS interface (EXCI). The *exci_id* consists of 'jobname.stepname.procname - MVSid' and identifies the EXCI client job. The stepname and procname may be omitted. The MVSid identifies the MVS system on which the EXCI client job is running. If MRO/XCF is being used, this can be different from the MVS system on which this CICS system is running. The MVSid is the SMF system identification (SID), hence the MVSid will be omitted if SMF is not active. Terminal *termid* represents the connection between the EXCI client and CICS rather than a real terminal.

In the case of an MRO or an ISC APPC (parallel sessions) connected system *termid* is a terminal identifier (transaction routing) or a session identifier, *sysid* is the identifier of the linked CICS system. The display ends with the termination message *condmsg* issued by the linked system.

System action: If possible, message DFHAC2202 is sent to the terminal user. Normal abend processing continues.

User response: None. In accordance with the transaction definition, all updates are unilaterally committed.

Module: DFHTFP

DFHAC2233 *date time applid Transaction tranid running program program name term termid has lost contact with its coordinator system during syncpoint and has abended with code ASPP. All updates will be unilaterally backed*

out{. EXCI job = }exci_id. condmsg

Explanation: Transaction *tranid* has lost contact with its coordinator system during the critical period of syncpoint processing known as the 'indoubt window'. The transaction is abnormally terminated with abend code ASPP.

In accordance with the transaction definition (WAIT NO and ACTION BACKOUT), all recoverable updates performed by the unit of work are unilaterally backed out. Note that integrity of updates may be lost since the coordinator system may either commit or back out its changes.

Exci Job =*exci_id* is added when *tranid* is a server transaction running on behalf of a non CICS job using the external CICS interface (EXCI). The *exci_id* consists of 'jobname.stepname.procname - MVSid' and identifies the EXCI client job. The stepname and procname may be omitted. The MVSid identifies the MVS system on which the EXCI client job is running. If MRO/XCF is being used, this can be different from the MVS system on which this CICS system is running. The MVSid is the SMF system identification (SID), hence the MVSid will be omitted if SMF is not active. Terminal *termid* represents the connection between the EXCI client and CICS rather than a real terminal.

In the case of an MRO or an ISC APPC (parallel sessions) connected system, *termid* is a terminal identifier (transaction routing) or a session identifier, and *sysid* is the identifier of the linked CICS system. The display ends with the termination message *condmsg* issued by the linked system.

System action: If possible, message DFHAC2203 is sent to the terminal user. Normal abend processing continues.

User response: None. In accordance with the transaction definition, all updates are unilaterally backed out.

Module: DFHTFP

XMEOUT Parameters: *date, time, applid, tranid, program name, termid, {1=. EXCI job = }, exci_id, condmsg*

Destination: CSMT

DFHAC2234 *date time applid* **A commit failure has occurred during syncpoint processing for transaction *tranid*, terminal *termid*. The transaction will be allowed to complete normally {. EXCI job = }exci_id. condmsg**

Explanation: An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. Resources local to this CICS system, for example files, temporary storage, or transient data, have been updated. A failure occurred during phase 2 of the syncpoint protocol for a local

resource owner. The affected unit of work has recorded its outcome (either forwards or backwards) on the system log, but the resources managed by the local resource owner that failed will remain locked.

Exci Job =*exci_id* is added when *tranid* is a server transaction running on behalf of a non CICS job using the external CICS interface (EXCI). The *exci_id* consists of 'jobname.stepname.procname - MVSid' and identifies the EXCI client job. The stepname and procname may be omitted. The MVSid identifies the MVS system on which the EXCI client job is running. If MRO/XCF is being used, this can be different from the MVS system on which this CICS system is running. The MVSid is the SMF system identification (SID), hence the MVSid will be omitted if SMF is not active. Terminal *termid* represents the connection between the EXCI client and CICS rather than a real terminal.

termid is a terminal identifier (transaction routing) or a session identifier.

System action: If possible, message DFHAC2204 is sent to the terminal user. For an EXEC CICS SYNCPOINT, processing completes normally and processing continues with the next unit of work. For EXEC CICS RETURN, the transaction completes normally.

Resources affected by the failure remain locked and the unit of work is shunted.

User response: Refer to earlier messages issued by the local resource owner to determine the cause of the failure.

Module: DFHTFP

XMEOUT Parameters: *date, time, applid, tranid, termid, {1=. EXCI job = }, exci_id, condmsg*

Destination: CSMT

DFHAC2235 *date time applid* **A backout failure has occurred during syncpoint processing for transaction *tranid*, terminal *termid*. The transaction will be allowed to complete normally {. EXCI job = }exci_id. condmsg**

Explanation: An attempt to back out a unit of work has suffered a backout failure. For the local resource owner(s) that suffered the backout failure, the resources updated by the unit of work remain locked. All other resources are backed out.

Exci Job =*exci_id* is added when *tranid* is a server transaction running on behalf of a non CICS job using the external CICS interface (EXCI). The *exci_id* consists of 'jobname.stepname.procname - MVSid' and identifies the EXCI client job. The stepname and procname may be omitted. The MVSid identifies the MVS system on which the EXCI client job is running. If MRO/XCF is being used, this can be different from the MVS system on which this CICS system is running. The MVSid is the

DFHAC2236 • DFHAC2245

SMF system identification (SID), hence the MVSid will be omitted if SMF is not active. Terminal *termid* represents the connection between the EXCI client and CICS rather than a real terminal.

termid is a terminal identifier (transaction routing) or a session identifier.

System action: If possible, message DFHAC2205 is sent to the terminal user. For an EXEC CICS SYNCPOINT, processing completes normally and processing continues with the next unit of work. For EXEC CICS RETURN, the transaction completes normally.

Resources affected by the backout failure remain locked and the unit of work is shunted.

User response: Refer to an earlier messages issued by the local resource owner to determine the cause of the backout failure.

Module: DFHTFP

XMEOUT Parameters: *date, time, applid, tranid, termid, {1=. EXCI job = }, exci_id, condmsg*

Destination: CSMT

DFHAC2236 *date time applid* Transaction *tranid* abend *secondary abcode* in program *program name term termid*. Updates to local recoverable resources will be backed out{. EXCI job = }*exci_id*.
condmsg

Explanation: Transaction *tranid* is abnormally terminated with abend code *abcode* in program *programe*. Any changes to recoverable resources in the local system that have been performed by the current unit of work are backed out.

EXCI Job =*exci_id* is added when *tranid* is a server transaction running on behalf of a non CICS job using the external CICS interface (EXCI). The *exci_id* consists of 'jobname.stepname.procname - MVSid' and identifies the EXCI client job. The stepname and procname may be omitted. The MVSid identifies the MVS system on which the EXCI client job is running. If MRO/XCF is being used, this can be different from the MVS system on which this CICS system is running. The MVSid is the SMF system identification (SID), hence the MVSid will be omitted if SMF is not active. Terminal *termid* represents the connection between the EXCI client and CICS rather than a real terminal.

In the case of an MRO or an ISC APPC (parallel sessions) connected system, *termid* is a terminal identifier (transaction routing) or a session identifier, and *sysid* is the identifier of the linked CICS system. The display ends with the termination message *condmsg* issued by the linked system.

When this message is issued in the Terminal Owning region because a remote transaction has failed, there may be no recoverable resources to be backed out in

the local system. In this case, the conditional message will tell you whether or not resources in the remote system have been backed out.

Program *programe* will be unknown when the message is issued in a Terminal Owning region.

System action: If possible, message DFHAC2206 is sent to the terminal user. Normal abend processing continues.

User response: See the description of the abend code *abcode* for guidance. In a transaction routing environment, the original cause of the failure is usually indicated in the conditional message. If *abcode* is not a CICS abend, it is a user code, in which case you should consult the programmer responsible for this area.

Module: DFHTFP

XMEOUT Parameters: *date, time, applid, tranid, secondary abcode, program name, termid, {1=. EXCI job = }, exci_id, condmsg*

Destination: CSMT

DFHAC2245 *date time applid* A CICS-generated syncpoint request could not be completed normally because a connected system has requested that the unit of work be rolled back. Transaction *tranid* running program *program name term termid* has been abnormally terminated with code ASPF{. EXCI job = }*exci_id*.
condmsg

Explanation: CICS has been unable to complete an internally generated syncpoint request because a connected system has notified it that the unit of work must be rolled back. (This may also occur as a result of a session failure or a protocol error).

Transaction *tranid* is abnormally terminated with abend code ASPF in program *programe*. Any changes to recoverable resources that have been performed by the current unit of work are backed out.

Exci Job =*exci_id* is added when *tranid* is a server transaction running on behalf of a non CICS job using the external CICS interface (EXCI). The *exci_id* consists of 'jobname.stepname.procname - MVSid' and identifies the EXCI client job. The stepname and procname may be omitted. The MVSid identifies the MVS system on which the EXCI client job is running. If MRO/XCF is being used, this can be different from the MVS system on which this CICS system is running. The MVSid is the SMF system identification (SID), hence the MVSid will be omitted if SMF is not active. Terminal *termid* represents the connection between the EXCI client and CICS rather than a real terminal.

In the case of an MRO or an ISC APPC (parallel sessions) connected system, *termid* is a terminal identifier (transaction routing) or a session identifier, and *sysid* is the identifier of the linked CICS system. The

display ends with the termination message *condmsg* issued by the linked system.

System action: If possible, message DFHAC2215 is sent to the terminal user. Normal abend processing continues.

User response: Determine why the connected system sent the indication to roll back the unit of work.

Resubmit the transaction after the cause of the indication to roll back has been removed.

Module: DFHTFP

XMEOUT Parameters: *date, time, applid, tranid, program name, termid, {1=. EXCI job = }, exci_id, condmsg*

Destination: CSMT

DFHAC2246 *date time applid Transaction termination processing for transaction tranid could not be completed normally because a connected system has requested that the unit of work be rolled back{. EXCI job = }exci_id. condmsg*

Explanation: A transaction has issued an EXEC CICS RETURN in backout required program state. The backout required program state is set when an application receives a backout request on a protected conversation.

Recoverable resources updated by the unit of work are backed out and locks released.

Exci Job =*exci_id* is added when *tranid* is a server transaction running on behalf of a non CICS job using the external CICS interface (EXCI). The *exci_id* consists of 'jobname.stepname.procname - MVSid' and identifies the EXCI client job. The stepname and procname may be omitted. The MVSid identifies the MVS system on which the EXCI client job is running. If MRO/XCF is being used, this can be different from the MVS system on which this CICS system is running. The MVSid is the SMF system identification (SID), hence the MVSid will be omitted if SMF is not active. Terminal *termid* represents the connection between the EXCI client and CICS rather than a real terminal.

In the case of an MRO or an ISC APPC (parallel sessions) connected system, *termid* is a terminal identifier (transaction routing) or a session identifier, and *sysid* is the identifier of the linked CICS system. The display ends with the termination message *condmsg* issued by the linked system.

System action: If possible, message DFHAC2216 is sent to the terminal user. Termination processing continues.

User response: To avoid the error, the application should code an EXEC CICS SYNCPOINT command before the EXEC CICS RETURN. A syncpoint issued in 'backout required' program state results in a backout

being performed, and the ROLLEDBACK condition returned on the EXEC CICS SYNCPOINT command. If this condition is then handled, a subsequent EXEC CICS RETURN will complete successfully.

Resubmit the transaction after the cause of the indication to roll back has been removed.

Module: DFHTFP

Module: DFHTFP

XMEOUT Parameters: *date, time, applid, tranid, program name, termid, {1=. EXCI job = }, exci_id, condmsg*

Destination: CSMT

DFHAC2259 *date time applid Transaction tranid abend primary abcode in program program name term termid DFHPEP not linked.*

Explanation: Transaction *tranid* is abnormally terminated with abend code *abcode*. An error occurred in attempting to link to the user-written program error program (DFHPEP). The error prevented DFHPEP from being given control.

If CICS terminates abnormally because of a program control restart failure, this message can appear during shutdown.

System action: Depending on the reason for the failure, CICS may abnormally terminate or continue.

User response: The transaction abend code, *abcode*, gives the reason for the original transaction failure.

Determine why DFHPEP could not be invoked. It may be disabled.

Module: DFHACP

XMEOUT Parameters: *date, time, applid, tranid, primary abcode, program name, termid*

Destination: CSMT

DFHAC2260 *date time applid* **Transaction tranid disabled by DFHPEP.**

Explanation: Transaction *tranid*, which has abnormally terminated, has been disabled. This is either as a result of user code in DFHPEP, or because the transaction has abended with abend ASRD or ASRE and DISMACP=YES has been specified (or allowed to default) in the startup parameters. No further use can be made of transaction *tranid*.

System action: Processing continues.

User response: Correct the cause of the abnormal termination and enable the transaction.

Module: DFHACP

XMEOUT Parameters: *date, time, applid, tranid*

Destination: CSMT

DFHAC2261 **System sysid sent message (sense code ccccccc).** *'tacbmsg'*.

Explanation: A transaction, which has abnormally terminated, has received a negative response and an explanatory warning message from system *sysid*. The message *tacbmsg* is supplied from the remote system.

System action: Processing continues.

User response: Correct the reason for the abnormal termination in the remote system and run the transaction again.

Module: DFHACP

Destination: Terminal End User

DFHAC2262 *date time applid* **System sysid sent message (sense code ccccccc).** *tacbmsg*

Explanation: A transaction, which has abnormally terminated, has received a negative response and an explanatory warning message from system *sysid*. The message *tacbmsg* is supplied from the remote system.

The *tacbmsg* may include the following CICS defined sense codes

'A0000100'x - session failure
'A0010100'x - read timeout
'A0010000'x - deadlock timeout

System action: Processing continues.

User response: Correct the reason for the abnormal termination in the remote system and run the transaction again.

Module: DFHACP

XMEOUT Parameters: *date, time, applid, sysid, ccccccc, tacbmsg*

Destination: CSMT

DFHAC2263 *date time applid* **Transaction tranid abend primary abcode in program program name term termid DFHPEP has abnormally terminated.**

Explanation: Transaction *tranid* has abended and the abnormal completion program (DFHACP) has linked to the user-written error program (DFHPEP). The error program has also abended.

System action: Processing continues.

User response: The transaction abend code *abcode* gives the reason for the original transaction failure. Correct the cause of the abnormal termination in the error program and run the transaction again.

Module: DFHACP

XMEOUT Parameters: *date, time, applid, tranid, primary abcode, program name, termid*

Destination: CSMT

DFHAC2603 **Syst.sense sysysense, termid, taskid, No authorization**

Explanation: An operator has attempted to execute a transaction for which the operator was not authorized. Alternatively, the operator's authorization was set to the capability of the default user and the requested transaction has a security value greater than 1.

System action: Other processing continues.

User response: Either sign on or confirm authority to enter this transaction as appropriate. See messages DFHAC2002 and DFHAC2003 for further information.

Module: DFHACP

Destination: Terminal End User

DFHAC2605 **Syst.sense sysysense, termid, taskid, Insufficient resource**

Explanation: The system was unable to execute the transaction at this time.

System action: The transaction is purged.

User response: Resubmit the transaction later.

Module: DFHACP

Destination: Terminal End User

DFHAC2606 **Syst.sense** *systsense,termid,taskid,*
Function not executable

Explanation: Either the transaction was not valid during system quiesce, or the transaction has been disabled.

System action: The system action is error specific. For an invalid transaction during system quiesce, refer

to the **System Action** of message DFHAC2007.

For a transaction that has been disabled, refer to the **System Action** of message DFHAC2008.

User response: The user response is error specific.

For an invalid transaction during system quiesce, refer to the **User Response** of message DFHAC2007. For a transaction that has been disabled, refer to the **User Response** of message DFHAC2008.

Module: DFHACP

Destination: Terminal End User

DFHADnnnn messages

DFHAD0001 *applid* **An abend (code *aaa/bbbb*) has occurred at offset *X'offset'* in module *modname*.**

Explanation: An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in CICS code.

Alternatively

- Unexpected data has been input,
- Storage has been overwritten, or
- There has been a program check within a user program.

The code *aaa* is, if applicable, a 3-digit hexadecimal MVS system completion code (for example, OC1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The 4-digit code *bbbb*, which follows *aaa*, is a user abend code produced either by CICS or by another product on the user's system.

If *X'offset* contains the value *X'FFFF*, module *modname* was in control at the time of the abend, but the program status word (PSW) was not addressing this module.

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Either this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Or CICS will continue unless you have specified in the dump table that CICS should terminate. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Notify the system programmer.

Look up the MVS code *aaa*, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

If the *modname* insert contains the value *????*, CICS was unable to determine which module has abnormally terminated. In this case, examine the system dump to

determine which area of code has caused the program check.

The user should examine other messages to determine what the module which issued this message was doing at the time the abend occurred. From these messages they can deduce which product has produced the abend code *bbbb*. If *bbbb* is identified as a CICS code, it may be either alphameric or numeric.

- If the CICS code is alphameric (for example AKEA), it is a CICS transaction abend code.
- If the CICS code is numeric (for example 1310), it refers to a CICS message (DFHTS1310 in our example).

If the user abend code is from another product (for example, IMS), refer to the appropriate messages and codes manual to determine the cause of the abend.

The entries in the appropriate manuals will give the user guidance regarding the nature of the error, and may also give some guidance concerning the appropriate user response. The program check may have occurred in a user program. If this is the case, the program check is usually followed by an ASRA or an ASRB transaction abend and a transaction dump.

If you want to suppress system dumps that precede ASRA and ASRB abends, you must specify this on an entry in the dump table, using either CEMT or an EXEC CICS command. Further guidance on suppressing system dumps can be found in the *CICS System Definition Guide*.

You may need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHADxx

XMEOUT Parameters: *applid, aaa/bbbb, X'offset', modname*

Destination: Console

DFHAD0201 Specified DJAR could not be found.

Explanation: A CICS DJAR resource with the specified name could not be found.

System action: The transaction continues.

User response: Enter the name of an INSERVICE DJAR installed in the local CICS region.

Module: DFHADDRM

Destination: Terminal End User

DFHAD0202 Specified DJAR is in the DISCARDING state and cannot be used.

Explanation: The specified DJAR resource is in the DISCARDING state and cannot be used.

System action: The transaction continues.

User response: Enter the name of an INSERVICE DJAR installed in the local CICS region.

Module: DFHADDRM

Destination: Terminal End User

DFHAD0203 Specified DJAR is in the INITING state. Please wait and retry.

Explanation: The specified DJAR resource is in the INITING state and cannot be used.

System action: The transaction continues.

User response: Enter the name of an INSERVICE DJAR installed in the local CICS region, or retry your request.

Module: DFHADDRM

Destination: Terminal End User

DFHAD0204 Specified DJAR is in the PENDINIT state. Please wait and retry.

Explanation: The specified DJAR resource is in the PENDINIT state and cannot be used.

System action: The transaction continues.

User response: Enter the name of an INSERVICE DJAR installed in the local CICS region, or retry your request.

Module: DFHADDRM

Destination: Terminal End User

DFHAD0205 Specified DJAR is in the PENDRESOLVE state. Please wait and retry.

Explanation: The specified DJAR resource is in the PENDRESOLVE state and cannot be used.

System action: The transaction continues.

User response: Enter the name of an INSERVICE

DJAR installed in the local CICS region, or retry your request.

Module: DFHADDRM

Destination: Terminal End User

DFHAD0206 Specified DJAR is in the RESOLVING state. Please wait and retry.

Explanation: The specified DJAR resource is in the RESOLVING state and cannot be used.

System action: The transaction continues.

User response: Enter the name of an INSERVICE DJAR installed in the local CICS region, or retry your request.

Module: DFHADDRM

Destination: Terminal End User

DFHAD0207 Specified DJAR is in the UNRESOLVED state and cannot be used.

Explanation: The specified DJAR resource is in the UNRESOLVED state and cannot be used.

System action: The transaction continues.

User response: Enter the name of an INSERVICE DJAR installed in the local CICS region.

Module: DFHADDRM

Destination: Terminal End User

DFHAD0208 Specified DJAR is in the UNUSABLE state and cannot be used.

Explanation: The specified DJAR resource is in the UNUSABLE state and cannot be used.

System action: The transaction continues.

User response: Enter the name of an INSERVICE DJAR installed in the local CICS region.

Module: DFHADDRM

Destination: Terminal End User

DFHAD0209 Fatal error occurred whilst reading shelf copy of specified DJAR.

Explanation: An unknown error occurred when DFHADJR attempted to read the shelf copy of the JAR file for the specified DJAR resource. As a result of this error the specified DJAR resource cannot be used by CREA/CREC.

System action: The transaction continues.

User response: Enter the name of an INSERVICE DJAR installed in the local CICS region, or retry your request.

Module: DFHADDRM

Destination: Terminal End User

DFHAD0210 Specified DJAR could not be found on the shelf.

Explanation: DFHADJR could not find the shelf copy of the JAR file for the specified DJAR resource. As a result of this error the specified DJAR resource cannot be used by CREA/CREC.

System action: The transaction continues.

User response: Enter the name of an INSERVICE DJAR installed in the local CICS region, or retry your request.

Module: DFHADDRM

Destination: Terminal End User

DFHAD0211 Shelf file for specified DJAR was not a valid JAR file.

Explanation: DFHADJR could not read the shelf copy of the JAR file for the specified DJAR resource, since it is not a valid JAR file. As a result of this error the specified DJAR resource cannot be used by CREA/CREC.

System action: The transaction continues.

User response: Check that the JAR file for the specified DJAR is a valid JAR file and that it contains a valid deployment descriptor. Alternatively enter the name of an INSERVICE DJAR installed in the local CICS region.

Module: DFHADDRM

Destination: Terminal End User

DFHAD0212 No JNDI name was supplied for bean lookup.

Explanation: DFHADJR could not find the name of JNDI server to use for performing bean lookups. As a result of this error the specified DJAR resource cannot be used by CREA/CREC.

System action: The transaction continues.

User response: Check that a JNDI naming provider is supplied in the JVM system properties file. Retry your request or enter another DJAR name.

Module: DFHADDRM

Destination: Terminal End User

DFHAD0213 TSQueue full error when retrieving information from specified DJAR.

Explanation: DFHADJR could not return information about the contents of the JAR file for the specified DJAR resource since the TS queue used to pass the

information became full. As a result of this error the specified DJAR resource cannot be used by CREA/CREC.

System action: The transaction continues.

User response: Retry your request when CICS has more available storage. You could also reduce the number of methods defined in the deployment descriptor, or split the beans within the JAR file into two or more JAR files.

Module: DFHADDRM

Destination: Terminal End User

DFHAD0214 The specified DJAR contains no session beans.

Explanation: DFHADJR could not find any session beans in the deployment descriptor of the JAR file related to the specified DJAR resource. As a result of this error the DJAR resource cannot be used by CREA/CREC.

System action: The transaction continues.

User response: Modify the deployment descriptor for the specified DJAR so that it contains references to one or more session beans and reinstall it into CICS.

Module: DFHADDRM

Destination: Terminal End User

DFHAD0215 The specified DJAR contains session beans with invalid lengths.

Explanation: DFHADJR found one or more session beans listed in the deployment descriptor of the JAR file related to the specified DJAR resource that had names exceeding the 240 character limit. As a result of this error the DJAR resource cannot be used by CREA/CREC.

System action: The transaction continues.

User response: Modify the names of the session beans listed in the deployment descriptor so that no name exceeds the 240 character limit and reinstall the JAR file into CICS.

Module: DFHADDRM

Destination: Terminal End User

DFHAD0216 An error occurred with the Java classloader when reading the DJAR.

Explanation: An error occurred when DFHADJR attempted to generate the IDL names for methods listed in the JAR file related to the specified DJAR resource. An attempt to use the Java classloader failed as classes that were needed could not be found on the classpath. As a result the DJAR resource cannot be used by CREA/CREC.

System action: The transaction continues.

User response: Ensure that all classes required by the beans in the JAR file related to the specified DJAR resource are available on the classpath.

Module: DFHADDRM

Destination: Terminal End User

DFHAD0231 Press Enter to confirm the change of DJAR or another key to revert.

Explanation: The name of the DJAR on the transaction ID association screen has been changed, indicating that the user wishes to work with a different DJAR resource.

System action: The transaction waits for the user to press the Enter key to confirm that they wish to work with a different DJAR.

User response: Press Enter to work with a different DJAR, or any other key to continue working with the current DJAR. If the DJAR name is changed again whilst this message is displayed, then the DJAR name will revert back to the original DJAR name.

Module: DFHADDRM

Destination: Terminal End User

DFHAD0232 Error generating REQUESTMODELS - IDL errors for indicated methods.

Explanation: One or more IDL strings generated for the operation field of a REQUESTMODEL are longer than the 255 character maximum. The methods with the IDL mangled names that are causing the problems are highlighted with an asterisk (*) character.

System action: The transaction continues.

User response: Alter the transaction IDs assigned to the problematic methods such that those methods do not require their own REQUESTMODELS, but can instead be handled by a more generic REQUESTMODEL. An example of a more generic REQUESTMODEL is the REQUESTMODEL that is created for all methods on a given bean, and would therefore have '*' in the operation field.

Module: DFHADDRM

Destination: Terminal End User

DFHAD0261 RequestModel *rmName* was successfully created.

Explanation: The REQUESTMODEL was successfully created, being installed into CICS and/or written to the CSD as specified.

System action: The transaction continues.

User response: None.

Module: DFHADDRM

Destination: Terminal End User

DFHAD0262 REQUESTMODEL could not be created.

Explanation: The REQUESTMODEL could not be created for some unknown reason.

System action: The transaction continues.

User response: Skip the REQUESTMODEL or alter the name value and try again.

If the problem persists check the trace data sets for more information. You may need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHADDRM

Destination: Terminal End User

DFHAD0263 No action was selected. Please select an action.

Explanation: The REQUESTMODEL can be installed into CICS and/or defined to the CSD, but no action was selected.

System action: The transaction continues.

User response: Adjust the 'Define to CSD' and/or 'Install into CICS' fields by overtyping the 'N' with a 'Y'. Alternatively skip creating the REQUESTMODEL.

Module: DFHADDRM

Destination: Terminal End User

DFHAD0264 REQUESTMODEL could not be written to the CSD.

Explanation: The specified REQUESTMODEL could not be written to the CSD for some unknown reason.

System action: The transaction continues.

User response: Ensure that the CSD is available for write access and that there are no locks held on the group that you are attempting to write to. You can then either skip the REQUESTMODEL, or alter the name and/or group value and try again.

If the problem persists check the trace data sets for more information. You may need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHADDRM

Destination: Terminal End User

DFHAD0265 REQUESTMODEL could not be installed.

Explanation: The specified REQUESTMODEL could not be installed into CICS for some unknown reason. If you have selected to define the REQUESTMODEL to the CSD, then this operation will not have been performed.

System action: The transaction continues.

User response: Skip the REQUESTMODEL or alter the name value and try again.

If the problem persists check the trace data sets for more information. You may need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHADDRM

Destination: Terminal End User

DFHAD0266 Please specify a valid CSD group name.

Explanation: The user attempted to write the REQUESTMODEL to the CSD, but did not provide a valid name for the group the REQUESTMODEL should be written into.

System action: The transaction continues.

User response: Enter a valid name for the CSD group into which this REQUESTMODEL is to be written, or deselect the option for writing it to the CSD.

Module: DFHADDRM

Destination: Terminal End User

DFHAD0267 A duplicate REQUESTMODEL is already installed.

Explanation: A duplicate copy of the specified REQUESTMODEL has already been installed into CICS. Since the option for replacing duplicate REQUESTMODELS ('Replace Dups') was not selected, this REQUESTMODEL has not been installed. If you have selected to define the REQUESTMODEL to the CSD, then this operation will not have been performed.

System action: The transaction continues.

User response: Either select the option for replacing duplicate REQUESTMODELS, or press PF9 (as prompted) to replace the duplicate for this REQUESTMODEL only. You can alternatively choose to skip the REQUESTMODEL or rename it and retry your request.

Module: DFHADDRM

Destination: Terminal End User

DFHAD0268 A duplicate REQUESTMODEL already exists in the CSD.

Explanation: A duplicate copy of the specified REQUESTMODEL has already been written to the CSD. Since the option for replacing duplicate REQUESTMODELS ('Replace Dups') was not selected, this REQUESTMODEL has not been written to the CSD. If you have selected to install the REQUESTMODEL into CICS, then this operation will be backed out.

System action: The transaction continues.

User response: Either select the option for replacing duplicate REQUESTMODELS, or press PF9 (as prompted) to replace the duplicate for this REQUESTMODEL only. You can alternatively choose to skip the REQUESTMODEL or alter the name and/or group and retry your request.

Module: DFHADDRM

Destination: Terminal End User

DFHAD0269 An error occurred whilst discarding a duplicate REQUESTMODEL.

Explanation: Whilst attempting to discard a REQUESTMODEL from CICS (as the result of a request to replace a REQUESTMODEL), an unknown error occurred. The REQUESTMODEL has not been installed into CICS. If you have selected to define the REQUESTMODEL to the CSD, then this operation will not have been performed.

System action: The transaction continues.

User response: Skip the REQUESTMODEL or alter the name and/or group value and try again.

If the problem persists check the trace data sets for more information. You may need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHADDRM

Destination: Terminal End User

DFHAD0270 An error occurred whilst replacing a duplicate REQUESTMODEL.

Explanation: Whilst attempting to replace an existing REQUESTMODEL an unknown error occurred. The REQUESTMODEL has not been installed into CICS.

System action: The transaction continues.

User response: Skip the REQUESTMODEL or alter the name and/or group value and try again.

If the problem persists check the trace data sets for more information. You may need further assistance from IBM to resolve this problem. See Part 4 of the *CICS*

Problem Determination Guide for guidance on how to proceed.

Module: DFHADDRM

Destination: Terminal End User

DFHAD0271 Error trying to delete a duplicate REQUESTMODEL from the CSD.

Explanation: Whilst attempting to delete a REQUESTMODEL from the CSD (as the result of a request to replace a duplicate REQUESTMODEL), an unknown error occurred. The new REQUESTMODEL has not been written to the CSD. If you have selected to install the REQUESTMODEL into CICS, then this operation will be backed out.

System action: The transaction continues.

User response: Ensure that the CSD is available for write access and that there are no locks held on the group that you are attempting to delete from. You can then either skip the REQUESTMODEL, or alter the name and/or group value and try again.

If the problem persists check the trace data sets for more information. You may need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

DFHAM4803E *applid* **Install failed because an**
existing definition for file *filename*
could not be deleted.

Explanation: An attempt was made to install file *filename*. File *filename* already exists and cannot be deleted. This condition can occur if an existing file definition in an FCT or on the CSD, was installed as enabled or open.

If the file is the Local Request Queue file (DFHLRQ), it is not possible to re-install it even if the file is closed and disabled.

System action: The install fails.

User response: Rectify the problem and try the install again.

Module: DFHAMP

XMEOUT Parameters: *applid, filename*

Destination: Console and Terminal End User

DFHAM4804E *applid* **Invalid LIST name** *lstname*.

Explanation: The GRPLIST parameter of the system initialization table (SIT) specifies a list name *lstname* that contains characters unacceptable to RDO.

System action: CICS issues the request 'ENTER ALTERNATIVE NAME OR CANCEL'.

User response: Enter a valid list name **or** enter 'CANCEL', correct the GRPLIST parameter in the SIT, and reinitialize CICS.

Module: DFHAMP

XMEOUT Parameters: *applid, listname*

Destination: Console and Terminal End User

DFHAM4805E *applid* **Unable to perform operation: name is locked to APPLID *applid*, OPID *opid* to prevent updating.**

Explanation: An attempt has been made to lock, or update, a group or a list that is currently locked to another user.

System action: Processing continues.

User response: Reenter the command when the group or the list is not locked.

Module: DFHAMP

Destination: Terminal End User

DFHAM4806E *applid* **Group name *grpname* exists as a LIST name.**

Explanation: The system initialization table (SIT) GRPLIST parameter names a list that contains an unusable group name *grpname*. CICS cannot find this group because no resources are defined as belonging to it, and also because a list of the same name already exists in the CSD.

System action: CICS issues the request 'IS START-UP TO BE CONTINUED? REPLY GO OR CANCEL'.

If you reply 'GO', CICS is initialized with all the valid definitions in the list.

User response: If you do not require group *grpname*, enter 'GO'.

If group *grpname* is essential, enter 'CANCEL', and reinitialize CICS with a different GRPLIST name as a SIT override parameter. Then use the CEDA transaction to review and correct the faulty list.

Module: DFHAMP

XMEOUT Parameters: *applid, grpname*

Destination: Console and Terminal End User

DFHAM4808E *applid* **Object already exists in this group.**

Explanation: An attempt has been made to define an object in a group, but an object with the same name already exists.

System action: The definition on the CSD is presented to the user to overtype.

User response: Reenter the command with a different object name, or change the existing definition.

Module: DFHAMP

Destination: Terminal End User

DFHAM4809E *applid* **Date/time fields do not match (object updated by another user).**

Explanation: The definition of an object on the CSD has been changed while the user was altering the definition.

System action: Processing continues.

User response: Reenter the command.

Module: DFHAMP

Destination: Terminal End User

DFHAM4810E *applid* **Object not found (deleted by another user).**

Explanation: The definition of an object on the CSD has been deleted while the user was altering the definition.

System action: Processing continues.

User response: Determine why the definition has been deleted. Recreate and update the object if necessary.

Module: DFHAMP

Destination: Terminal End User

DFHAM4811E *applid* ***name1* does not contain *name2*.**

Explanation: The required object *name2* could not be found on the CSD in group *name1*.

System action: Processing continues.

User response: Determine why the definition cannot be found.

Module: DFHAMP

XMEOUT Parameters: *applid, name1, name2*

Destination: Console and Terminal End User

DFHAM4812W *applid* **Install of LIBRARY *libname* encountered a data set {*allocation / concatenation / open*} failure. The LIBRARY is installed but disabled.**

Explanation: Install of the dynamic LIBRARY resource *libname* has completed but one of the steps required for the successful completion of the LIBRARY install process has failed. The error occurred while attempting to do one of the following

- Allocate a data set that was defined as one of the DSNAMES attributes in the LIBRARY resource definition
- Concatenate the data sets together
- Open the LIBRARY concatenation.

DFHAM4813W • DFHAM4816E

The message text indicates which of these errors has occurred. Due to the error, the LIBRARY has been installed, but with an enablement status of DISABLED, which means that it will not participate in the search order used when loading programs and program artifacts.

System action: Processing continues. Even if the LIBRARY was defined with enablement status of ENABLED, the resource has been installed as DISABLED. Also, this LIBRARY will not be searched when program artifacts are loaded. Therefore, program artifacts that reside in the data sets defined for LIBRARY *libname* will not be loaded from this LIBRARY.

User response: Examine the messages issued by the Loader domain to determine the type of failure that occurred during install processing for this LIBRARY. When the problem has been resolved, SET LIBRARY *libname* to ENABLED in order for the LIBRARY to participate in the dynamic library search order process.

Module: DFHAMP

XMEOUT Parameters: *applid, libname, {1=allocation, 2=concatenation, 3=open}*

Destination: Console and Terminal End User

DFHAM4813W *applid* Install of LIBRARY *libname* encountered an MVS ABEND. The LIBRARY is installed but disabled.

Explanation: Install of the dynamic LIBRARY resource *libname* has completed but one of the steps required for the successful completion of the LIBRARY install process has failed. Due to the error, the LIBRARY has been installed, but with an enablement status of DISABLED, which means that it will not participate in the search order used when loading programs and program artifacts.

System action: Processing continues. Even if the LIBRARY was defined with enablement status of ENABLED, the resource has been installed as DISABLED. Also, this LIBRARY will not be searched when program artifacts are loaded. Therefore, program artifacts that reside in the data sets defined for LIBRARY *libname* will not be loaded from this LIBRARY.

User response: Examine the messages issued by the Loader domain to determine the type of failure that occurred during install processing for this LIBRARY. When the problem has been resolved, SET LIBRARY *libname* to ENABLED in order for the LIBRARY to participate in the dynamic library search order process.

Module: DFHAMP

XMEOUT Parameters: *applid, libname*

Destination: Console and Terminal End User

DFHAM4814E *applid* List name *listname* exists as a group name.

Explanation: The GRPLIST parameter of the system initialization table (SIT) specifies an invalid list name *listname*. CICS cannot find the list because a group of the same name already exists in the CSD.

System action: CICS issues the request 'ENTER ALTERNATIVE NAME OR CANCEL'.

User response: Enter a valid list name, or enter 'CANCEL', correct the GRPLIST system initialization parameter and reinitialize CICS.

Module: DFHAMP

XMEOUT Parameters: *applid, listname*

Destination: Console and Terminal End User

DFHAM4815E *applid* Group *grpname* not found in this list.

Explanation: The AFTER/BEFORE name entered in the command could not be found in this list. The definition could have been deleted while the user was viewing the outcome of an EXPAND command.

System action: Processing continues.

User response: Reenter the command with a group name that exists on this list.

Module: DFHAMP

Destination: Terminal End User

DFHAM4816E *applid* Unable to install group *grpname* - group not found.

Explanation: The GRPLIST parameter of the system initialization table (SIT) names a list that contains an unusable group name *grpname*. CICS cannot find group *grpname* because no resources are defined as belonging to it.

System action: CICS issues the request 'IS START-UP TO BE CONTINUED? REPLY GO OR CANCEL'.

If you reply 'GO', CICS is initialized with all the valid definitions in the list.

User response: If you do not require group *grpname*, enter 'GO'.

If group *grpname* is essential, enter 'CANCEL', and reinitialize CICS with a different GRPLIST name as a SIT override parameter. Then use the CEDA transaction to review and correct the faulty list.

Module: DFHAMP

XMEOUT Parameters: *applid, grpname*

Destination: Console and Terminal End User

DFHAM4817E *applid* Install of LIBRARY *libname* failed with an MVS ABEND. The LIBRARY is not installed.

Explanation: Install of the dynamic LIBRARY resource *libname* has failed because of an MVS ABEND. Due to the error, the LIBRARY has not been installed, which means that it will not participate in the search order used when loading programs and program artifacts.

System action: Processing continues. This LIBRARY will not be searched when program artifacts are loaded. Therefore, program artifacts that reside in the data sets defined for LIBRARY *libname* will not be loaded from this LIBRARY.

User response: Examine the messages issued by the Loader domain to determine the type of MVS abend that occurred during install processing for this LIBRARY. When the problem has been resolved, re-install LIBRARY *libname* in order for the LIBRARY to participate in the dynamic library search order process.

Module: DFHAMP

XMEOUT Parameters: *applid, libname*

Destination: Console and Terminal End User

DFHAM4819E *applid* Group already exists in this list.

Explanation: The group already exists in the list.

System action: Processing continues.

User response: Determine why the group exists and reenter the command, perhaps with a different group name.

Module: DFHAMP

Destination: Terminal End User

DFHAM4820S *applid* Unable to perform request - CSD full.

Explanation: The CSD file is full.

System action: Processing continues.

User response: Reenter the command when more space is available.

Module: DFHAMP

Destination: Terminal End User

DFHAM4821S *applid* Unable to perform request - I/O error to CSD.

Explanation: An error occurred while the CSD file was being accessed during CICS initialization. This may be because the disk containing the CSD file was mounted incorrectly.

System action: CICS terminates.

User response: Retry the CICS initialization. If the problem persists, a hardware fault probably exists, and you should load a backup copy of the CSD.

Module: DFHAMP

XMEOUT Parameter: *applid*

Destination: Console and Terminal End User

DFHAM4822S *applid* Unable to perform request - DFHCSD data set is invalid.

Explanation: This message will occur during initialization when CICS tries to open the CSD file (DFHCSD) and finds that it has an incorrect maximum record size. The CSD file should be defined with a specific maximum record size as described in the CICS System Definition Guide. Also, if the CSD data set is dynamically allocated to a running CICS system with an incorrect record size, i.e. one that is too small, CICS will fail to open it and any changes made using CEDDA will not be permitted.

System action: CICS terminates.

User response: Ensure that you have defined the DFHCSD file as described in the CICS System Definition Guide.

Module: DFHAMP

XMEOUT Parameter: *applid*

Destination: Console and Terminal End User

DFHAM4823S *applid* Unable to perform request - DFHCSD not open.

Explanation: The CSD file (DFHCSD) is not open.

System action: Other processing continues.

User response: Ask the master terminal operator to open the file. The DFHCSD is defined in the bringup JCL and/or in the SIT.

Module: DFHAMP

XMEOUT Parameter: *applid*

Destination: Console and Terminal End User

DFHAM4824S *applid* Unable to perform request - Insufficient function in file definition for DFHCSD.

Explanation: During initialization, CICS has found a GRPLIST parameter in the SIT, but cannot access the CSD file because of an error in the file definition entry for DFHCSD.

The most likely cause of this error is an incorrectly coded CSDACC parameter in the SIT entry for DFHCSD.

System action: CICS terminates.

DFHAM4825S • DFHAM4831E

User response: Before the next CICS initialization, correct the error in the system initialization parameters for DFHCSD.

Module: DFHAMP

XMEOUT Parameter: *applid*

Destination: Console and Terminal End User

DFHAM4825S *applid* Unable to perform request - File Control has returned an INVREQ response.

Explanation: The file control file request handler (DFHFCFR) does not have sufficient function to support the CEDA command entered.

System action: The CEDA command is ignored.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHAMP

XMEOUT Parameter: *applid*

Destination: Console and Terminal End User

DFHAM4826S *applid* Unable to perform request - CSD corrupted or not initialized.

Explanation: During initialization, CICS finds a GRPLIST parameter in the SIT, but cannot access the CSD file because

1. The CSD file has not been initialized, or
2. CSD initialization did not complete successfully, or
3. the CSD file has been corrupted.

System action: CICS terminates.

User response: If you have not used the CSD file before, initialize it using the offline utility, DFHCSDUP, and check the output listing from the utility for successful completion.

If you have used the CSD file before, it has probably been corrupted. In this case, load a backup copy of the CSD file and use it in place of the corrupted file.

Module: DFHAMP

XMEOUT Parameter: *applid*

Destination: Console and Terminal End User

DFHAM4827S *applid* Unable to perform request - DFHCSD could not be installed.

Explanation: During initialization, CICS finds a GRPLIST parameter in the system initialization table (SIT), but cannot access the CSD file because file control failed to install it.

System action: CICS terminates.

User response: Before the next CICS initialization,

ensure that you have a SIT with the correct parameters for the definition of the DFHCSD file.

Assemble a new SIT as necessary.

Module: DFHAMP

XMEOUT Parameter: *applid*

Destination: Console and Terminal End User

DFHAM4828E *applid* Group *grpname* not found.

Explanation: The group name *grpname* in the command could not be found.

System action: The command is ignored.

User response: Retry the command with a group name that exists.

Module: DFHAMP

XMEOUT Parameters: *applid, grpname*

Destination: Console and Terminal End User

DFHAM4829S *applid* Storage violation. CSD primary control record not updated.

Explanation: The in-store version of the CSD primary record was corrupted.

System action: The version on the CSD was not updated and is not necessarily affected.

User response: None.

Module: DFHAMP

XMEOUT Parameter: *applid*

Destination: Console and Terminal End User

DFHAM4830E *applid* *restype* *resname* already exists in the target group.

Explanation: The COPY operation could not be performed, as a duplicate has been found in the target group.

System action: The COPY command is ignored.

User response: Reenter the command with the MERGE or the REPLACE option.

Module: DFHAMP

Destination: Terminal End User

DFHAM4831E *applid* The new name *name* is longer than the four characters allowed for *restype* names.

Explanation: The specified name *name* is invalid because it is longer than four characters.

System action: The command is ignored.

User response: Enter a valid name.

Module: DFHAMP

Destination: Terminal End User

DFHAM4832E *applid* **Unable to open TDQUEUE *tdqname* because the DFHINTRA data set is not open.**

Explanation: An attempt to install the transient data queue *tdqname* on the CICS system has been rejected because the DFHINTRA data set is not open.

System action: Processing continues. The definition is not installed.

User response: It is not possible to install intrapartition definitions on a system that does not have a DFHINTRA data set defined and opened. If DFHINTRA has been defined, it may have failed to open during initialization. It is necessary to repair the data set and restart the system in order to open it.

Module: DFHAMP

XMEOUT Parameters: *applid, tdqname*

Destination: Console and Terminal End User

DFHAM4833E *applid* **A security error has occurred while attempting to install TDQUEUE *tdqname*. The definition has not been installed.**

Explanation: An attempt to install the transient data queue *tdqname* on the CICS system has been rejected because of an error encountered while performing a security check for the userid included within the definition.

System action: Processing continues. The definition is not installed.

User response: Refer to the associated messages issued by the security manager for further guidance. Reinstall the definition once the error has been corrected.

Module: DFHAMP

XMEOUT Parameters: *applid, tdqname*

Destination: Console and Terminal End User

DFHAM4834E *applid* **Install of {TDQUEUE | PROCESSTYPE | LIBRARY | URIMAP} *resourcename* failed because the installed definition is not disabled.**

Explanation: An attempt to install the resource *resourcename* on the CICS system has failed because the resource is not disabled.

System action: Processing continues. The definition is not installed.

User response: The specified resource must be disabled before it can be installed. Ensure that the

resource is in the required state and then install the new definition.

Module: DFHAMP

XMEOUT Parameters: *applid, {1=TDQUEUE, 2=PROCESSTYPE, 5=LIBRARY, 10=URIMAP}, resourcename*

Destination: Console and Terminal End User

DFHAM4835E *applid* **Install of TDQUEUE *tdqname* failed because the queue has already been defined to the system, and initialization is still in progress.**

Explanation: An attempt to install the transient data queue *tdqname* on the CICS system has failed because the queue has already been defined to the system and initialization has not completed.

It is not possible to replace a TD resource definition while CICS is still initializing. This problem only occurs during a cold or initial start of the system where both DCT macro and RDO definitions are being used, or where more than one group is being installed as part of GRPLIST processing.

System action: Processing continues. The definition is not installed.

User response: Remove one of the entries from the macro definition or RDO group so that the failure does not recur on a subsequent cold or initial start.

Module: DFHAMP

XMEOUT Parameters: *applid, tdqname*

Destination: Console and Terminal End User

DFHAM4836E *applid* **Install of DB2CONN *db2conn-name* failed because a DB2CONN is already installed and is in use.**

Explanation: An attempt to install the DB2CONN *db2conn-name* on the CICS system has failed because there is an existing DB2CONN installed and it is in use by the CICS-DB2 adapter.

System action: Processing continues. The definition is not installed.

User response: Only one DB2CONN can be installed on the CICS system at a time. The install of a second DB2CONN implies the discarding of the first DB2CONN and all its associated DB2ENTRIES and DB2TRANS.

A DB2CONN definition can be replaced or discarded only when it is not in use by the CICS-DB2 adapter. Ensure that the CICS-DB2 interface has been stopped before trying to install a DB2CONN definition.

Module: DFHAMP

XMEOUT Parameters: *applid, db2conn-name*

DFHAM4837E • DFHAM4843W

Destination: Console and Terminal End User

DFHAM4837E *applid* Install of{ DB2ENTRY I DB2TRAN }name failed because a DB2CONN is not installed.

Explanation: An attempt to install the DB2ENTRY or DB2TRAN *name* on the CICS system failed because there is no DB2CONN installed. DB2TRANS and DB2ENTRYS can be installed only after a DB2CONN has been installed.

System action: Processing continues. The definition is not installed.

User response: Install a DB2CONN definition and then retry the install of the DB2ENTRY or DB2TRAN.

Module: DFHAMP

XMEOUT Parameters: *applid*, {1=DB2ENTRY , 2=DB2TRAN }, *name*

Destination: Console and Terminal End User

DFHAM4838E *applid* Install of DB2ENTRY *db2entry-name* failed because an existing definition could not be deleted. The existing definition is not disabled.

Explanation: An attempt to install the DB2ENTRY *db2entry-name* on the CICS system has failed because there is an existing DB2ENTRY of the same name which is not in a disabled state.

System action: Processing continues. The definition is not installed.

User response: Existing DB2ENTRY definitions can be replaced only when the DB2ENTRY is in a disabled state. Issue a command to disable the DB2ENTRY and then retry the install.

Module: DFHAMP

XMEOUT Parameters: *applid*, *db2entry-name*

Destination: Console and Terminal End User

DFHAM4839E *applid* List *listname* not found.

Explanation: The system initialization table (SIT) used for CICS initialization contains a GRPLIST parameter, but CICS cannot find the list *listname* in the CSD file.

System action: CICS issues the request 'ENTER ALTERNATIVE NAME OR CANCEL'.

User response: Enter a valid list name.

If no suitable user-defined list exists, you can initialize a minimum-function system with GRPLIST=DFHLIST, then use the CEDA transaction to review and correct the faulty list, to install the required group, and to rebuild a suitable list. Finally, cancel CICS, correct the GRPLIST parameter in the SIT, and reinitialize CICS.

Module: DFHAMP

XMEOUT Parameters: *applid*, *listname*

Destination: Console and Terminal End User

DFHAM4840W *applid* Group *grpname* not appended - group already exists in target list.

Explanation: The group *grpname* already exists in the target list.

System action: The group definition is not appended.

User response: None.

Module: DFHAMP

Destination: Terminal End User

DFHAM4841E *applid* Install failed because definition of *restype resname* is in use by task no. *taskno* (transaction id. *transid*).

Explanation: An attempt was made to install object definition *restype resname* on the CICS system, but the installation failed because a read lock was held on that definition by task *taskno*.

System action: No definitions have been installed.

User response: Try the command again later.

Module: DFHAMP

XMEOUT Parameters: *applid*, *restype,resname*, *taskno*, *transid*

Destination: Console and Terminal End User

DFHAM4842E *applid* Install failed because *restype resname* is currently in use.

Explanation: An attempt was made to install object definition *restype resname* on the CICS system, but the installation failed because the object was in use.

System action: No definitions have been installed.

User response: Try the command again later.

Module: DFHAMP

XMEOUT Parameters: *applid*, *restype,resname*

Destination: Console and Terminal End User

DFHAM4843W *applid* *ttttttt nnnnnnnn* is internally locked to OPID *opid* APPLID *applid*.

Explanation: The identified group or list *ttttttt* is internally locked to operator *opid* on CICS system *applid* when an install is attempted. This could occur at a cold or initial start when the CSD is shared between several CICS regions and operations on that group or list are incomplete.

System action: The install continues.

User response: Check that the installed definitions correspond to your requirements.

Module: DFHAMP

XMEOUT Parameters: *applid, tttttt, nnnnnnnn, opid, applid*

Destination: Console and Terminal End User

DFHAM4844W *applid restype resname1 in group grpname1 has the same name as a restype later in group grpname2.*

Explanation: The CHECK command encountered a duplicate object name.

System action: None in the CHECK command, but the earlier definition will be ignored when the definitions are installed, because they both belong to the same CICS table in which duplicate entries may not exist.

User response: Determine why the duplicate condition exists and rectify it if necessary.

Module: DFHAMP

Destination: Terminal End User

DFHAM4845W *applid restype1 resname1 referenced by restype2 resname2 in group grpname cannot be found.*

Explanation: The CHECK command found a reference in a transaction definition to an object definition that does not exist.

System action: None in the CHECK command, but errors may occur if that definition is installed and used.

User response: Determine why the object definition cannot be found and rectify it if necessary.

Module: DFHAMP

Destination: Terminal End User

DFHAM4846W *applid The xxxxxxxx of transaction tranid1 in group grpname duplicates that of transaction tranid2 in group grpname.*

Explanation: The CHECK command found a transaction definition with the same alias as another transaction.

System action: No system action occurs for the CHECK command. However, errors may occur if that definition is installed and used.

User response: Determine why the duplicate situation occurs and rectify it if necessary.

Module: DFHAMP

Destination: Terminal End User

DFHAM4847W *applid RELOAD(YES) has been specified for non-RPG program progname referenced by transaction tranid in group grpname.*

Explanation: The CHECK command found a transaction definition that referenced a non-RPG II program for which RELOAD=YES was specified.

System action: If the definition is installed, CICS will not release storage for the first program invoked by a transaction unless the language is RPG II.

User response: Specify RELOAD (NO).

Module: DFHAMP

Destination: Terminal End User

DFHAM4848W *applid Program progname in group grpname specifies language RPG which is not supported on CICS.*

Explanation: The CHECK command, executing under CICS Transaction Server for OS/390 encountered an RPG II program definition. RPG II is not supported on CICS.

System action: If the definition is installed, the program language is overwritten.

User response: Change the language as appropriate.

Module: DFHAMP

Destination: Terminal End User

DFHAM4849W *applid NETNAME netname of {CONNECTION | TERMINAL} rsrcname1 in group grpname1 duplicates that of {CONNECTION | TERMINAL} rsrcname2 in group grpname2.*

Explanation: The CHECK command found a connection or terminal definition with a NETNAME that is the same as the NETNAME defined in another connection or terminal definition.

System action: None in the CHECK command. However, it is not possible to install two terminals or a terminal and a connection with the same NETNAME. Also, you cannot have two or more APPC links with the same NETNAME, an APPC link and an LUTYPE6.1 link with the same NETNAME or two or more IRC connections with the same NETNAME.

User response: Determine why the duplication exists and rectify the problem.

Module: DFHAMP

Destination: Terminal End User

DFHAM4850E *applid* Install of DB2TRAN
db2tran-name failed because
DB2ENTRY *db2entry-name* to which it
refers has not been installed.

Explanation: An attempt to install the DB2TRAN *db2tran-name* on the CICS system has failed because the DB2ENTRY to which it refers, *db2entry-name*, has not been installed.

System action: Processing continues. The definition is not installed.

User response: Ensure that the name of DB2ENTRY in the DB2TRAN definition is correct. Install the necessary DB2ENTRY definition first then retry the install of the DB2TRAN.

Module: DFHAMP

XMEOUT Parameters: *applid*, *db2tran-name*,
db2entry-name

Destination: Console and Terminal End User

DFHAM4851E *applid* Install of { DB2ENTRY |
DB2TRAN | DB2CONN | LIBRARY }*name*
failed because of a security error.

Explanation: An attempt to install the DB2CONN, DB2ENTRY, DB2TRAN, or LIBRARY *name* on the CICS system has been rejected because of an error encountered while performing a security check.

System action: Processing continues. The definition is not installed.

User response: See the associated messages issued by the security manager for further guidance. Correct the error. Then reinstall the definition.

Module: DFHAMP

XMEOUT Parameters: *applid*, {1=DB2ENTRY , 2=
DB2TRAN , 3= DB2CONN , 5= LIBRARY }, *name*

Destination: Console and Terminal End User

DFHAM4852W *applid* *restype name* *resname* begins
with 'DFH'. Such names are reserved
and may be redefined by CICS.

Explanation: A name beginning with DFH was specified.

System action: If the definition is installed, errors may occur.

User response: Names beginning with "DFH" are reserved and may be redefined by CICS. You should avoid starting names with "DFH".

Module: DFHAMP

Destination: Terminal End User

DFHAM4853E *applid* Install of DB2TRAN
db2tran-name failed because another
DB2TRAN is installed with the same
transid.

Explanation: An attempt to install the DB2TRAN *db2tran-name* on the CICS system has failed because there is an another DB2TRAN installed that specifies the same transid. You cannot install two DB2TRANs that specify the same transid.

System action: Processing continues. The definition is not installed.

User response: Examine the installed DB2TRAN definitions using inquire DB2TRAN commands to determine the name of the DB2TRAN specifying the same transid. If appropriate, discard that DB2TRAN and then reinstall this DB2TRAN.

Module: DFHAMP

XMEOUT Parameters: *applid*, *db2tran-name*

Destination: Console and Terminal End User

DFHAM4854W *applid* The specified {GROUP | LIST}
contains *objtype* objects but no *restype*
found.

Explanation: The specified GROUP or LIST contains objects that need a resource type of *restype* but no such resource type is listed in the GROUP or LIST.

System action: Processing continues.

User response: This may not be an error, but ensure that the resource type *restype* is installed before installing the GROUP or LIST.

Module: DFHAMP

Destination: Terminal End User

DFHAM4855W *applid* DVSUPRT(VTAM) must be
specified for PROFILE *profname*
referenced by transaction *transid* in
group *grpname*.

Explanation: The CHECK command found a definition for a CICS-supplied transaction *transid* without DVSUPRT(VTAM) specified in profile *progname*.

System action: Unpredictable results occur if the definition is installed and used.

User response: Specify DVSUPRT(VTAM).

Module: DFHAMP

Destination: Terminal End User

DFHAM4856W *applid* INBFMH(ALL) must be specified for PROFILE *profname* referenced by transaction *tranid* in group *grpname*.

Explanation: The CHECK command found a definition for a CICS-supplied transaction *tranid* without INBFMH(ALL) specified in profile *profname*.

System action: The system abnormally terminates with abend code AXFO if the definition is installed and used.

User response: Specify INBFMH(ALL).

Module: DFHAMP

Destination: Terminal End User

DFHAM4857W *applid* The specified {GROUP | LIST} contains more than one *objtype*.

Explanation: The specified GROUP or LIST contains more than one resource type *objtype*.

System action: Processing continues.

User response: Remove the duplication.

Module: DFHAMP

Destination: Terminal End User

DFHAM4858S *applid* Unable to perform request - DFHCSD not enabled.

Explanation: The system initialization table (SIT) used for CICS initialization contains a GRPLIST parameter, but CICS cannot use the CSD file because it is disabled.

System action: CICS terminates.

User response: If you want to use the CSD file, check the system initialization parameters for DFHCSD and your JCL **before** the next CICS initialization.

Module: DFHAMP

XMEOUT Parameter: *applid*

Destination: Console and Terminal End User

DFHAM4859S *applid* Unable to perform request - The CSDSTRNO operand in the System Initialization Table (SIT) is too small.

Explanation: Insufficient VSAM strings are available to allow CEDA to proceed.

System action: No CEDA commands may be executed.

User response: Wait until other CEDA users have terminated their sessions, or specify a CSDSTRNO value of twice the number of concurrent CEDA transactions in the SIT.

Module: DFHAMP

XMEOUT Parameter: *applid*

Destination: Console and Terminal End User

DFHAM4860W *applid* The specified LIST contains DB2ENTRY or DB2TRAN definitions before a DB2CONN definition.

Explanation: The specified LIST contains DB2ENTRY and/or DB2TRAN definitions in a group containing no DB2CONN definition. No DB2CONN definition precedes it in the list.

System action: Processing continues.

User response: A DB2CONN definition must be installed before DB2ENTRY and DB2TRAN definitions can be successfully installed. Ensure a DB2CONN definition is placed in a group before all DB2ENTRY and DB2TRAN definitions in the list, or in the first group in the list containing DB2ENTRIES or DB2TRANS.

Module: DFHAMP

Destination: Terminal End User

DFHAM4861W *applid* XTRANID of transaction *tranid* in group *grpname* duplicates transaction ID *tranid* in group *grpname*.

Explanation: The check command found a transaction *tranid* in group *grpname* whose XTRANID duplicated a previous transaction ID.

System action: No system action occurs for the CHECK command. However, the alias is ignored if the definitions are installed.

User response: Determine why the duplication exists and rectify the problem.

Module: DFHAMP

Destination: Terminal End User

DFHAM4862W *applid* Transaction id *tranid* in group *grpname* duplicates XTRANID of transaction *tranid* in group *grpname*.

Explanation: The check command found a transaction *tranid* in group *grpname* whose XTRANID duplicated a previous transaction ID.

System action: No system action occurs for the CHECK command. However, the first transaction in the message is ignored if the definitions are installed.

User response: Determine why the duplication exists and rectify the problem.

Module: DFHAMP

Destination: Terminal End User

DFHAM4863I *applid name is now locked. No group or list of that name exists.*

Explanation: The LOCK command executed successfully, but no group or list of name *name* was found on the CSD file.

System action: The name is locked.

User response: None.

Module: DFHAMP

Destination: Terminal End User

DFHAM4864S *applid Unable to perform operation - DFHCSD cannot be opened.*

Explanation: The system initialization table (SIT) used for CICS initialization contains a GRPLIST parameter, but CICS cannot use the CSD file for one of the following reasons

1. The startup JCL does not contain the definition of the CSD file (DFHCSD).
2. The DDNAME or data set name of the CSD file is incorrectly coded in the startup JCL.
3. VSAM has diagnosed that the CSD file cannot be opened.
4. CICS file control cannot open DFHCSD because insufficient storage has been allocated by the job REGION= parameter.

System action: CICS terminates.

User response: The action to solve the problem depends on the cause as follows

1. Correct the JCL.
2. Correct the JCL.
3. Check the system operator's console for VSAM messages, and correct all VSAM errors.
4. Increase the size limit of the DSAs or EDSAs.

Module: DFHAMP

XMEOUT Parameter: *applid*

Destination: Console and Terminal End User

DFHAM4865S *applid Unable to perform operation - DFHCSD currently accessed by another user.*

Explanation: The system initialization table (SIT) used for CICS initialization contains a GRPLIST parameter. However, CICS cannot get read access to the CSD file because another region is accessing it, and the CSD cluster is defined to VSAM with SHAREOPTIONS(1).

System action: CICS terminates.

User response: To avoid a recurrence of this problem, recreate the CSD file specifying SHAREOPTIONS(2). See the *CICS System Definition Guide* for further details.

Module: DFHAMP

XMEOUT Parameter: *applid*

Destination: Console and Terminal End User

DFHAM4866E *applid Unable to perform operation: name is IBM protected.*

Explanation: The user has attempted to change the contents of a group or list whose name begins with "DFH". These are IBM-protected.

System action: The command is not executed.

User response: You can copy from IBM-supplied groups or lists and change the **copied** group or list.

Module: DFHAMP

Destination: Terminal End User

DFHAM4867E *applid File name DFHCSD is reserved and must not be modified.*

Explanation: You cannot define the CSD on the CSD itself.

System action: The command is not executed.

User response: Define DFHCSD via SIT options.

Module: DFHAMP

Destination: Terminal End User

DFHAM4868W *applid The LSRPOOLID of the LSRPOOL *lsrname* in group *grpname* duplicates that of LSRPOOL *lsrname* in group *grpname*.*

Explanation: When invoking the CEDA CHECK command, an LSRPOOL definition *lsrname* in group *grpname* was found which duplicated the LSRPOOLID of another LSRPOOL.

System action: Processing continues.

User response: Determine why the duplication exists and rectify the problem.

Module: DFHAMP

Destination: Terminal End User

DFHAM4869E *applid Single resource install of *restype resname* in group *grpname* is not allowed.*

Explanation: The install of *restype resname* is not allowed via single resource install. It must be installed via group install.

System action: The command is not executed.

User response: Install group *grpname* via group install.

Module: DFHAMP

Destination: Terminal End User

DFHAM4870E *applid* **Install failed for program *progname* - language RPG is not supported under MVS.**

Explanation: The GRPLIST parameter of the system initialization table (SIT) names a list in which a group contains a program *progname* that was defined with LANGUAGE(RPG).

System action: CICS initialization continues. The definition in error is ignored.

User response: Redefine program *progname* with the correct LANGUAGE definition.

Module: DFHAMP

XMEOUT Parameters: *applid, progname*

Destination: Console and Terminal End User

DFHAM4871W *applid* **File *filename* has been installed but set *filename* failed.**

Explanation: Setting DSNAME and ENABLED takes place separately from the main part of INSTALL for a FILE, and can fail.

System action: The file is installed but its state is not set.

User response: Use the CEMT SET FILE command.

Module: DFHAMP

XMEOUT Parameters: *applid, filename, filename*

Destination: Console and Terminal End User

DFHAM4872S *applid* **Unable to connect to CICS catalog.**

Explanation: DFHAMP was unable to connect to the CICS catalog for terminal installs.

System action: CICS terminates.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHAMP

XMEOUT Parameter: *applid*

Destination: Console and Terminal End User

DFHAM4873S *applid* **Unable to disconnect the CICS catalog.**

Explanation: DFHAMP was unable to disconnect the CICS catalog for terminal installs.

System action: CICS terminates.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHAMP

XMEOUT Parameter: *applid*

Destination: Console and Terminal End User

DFHAM4874E *applid* **Install of {TSMODEL | ENQMODEL} *rsrce-name1* failed because {PREFIX | ENQNAME} *attribute-name* already exists in {TSMODEL | ENQMODEL} *rsrce-name2*.**

Explanation: An attempt to install the resource *rsrce-name1* on the CICS system has failed because the attribute *attribute-name* already exists in the installed resource *rsrce-name2*.

If the resource being installed is an ENQMODEL, another ENQMODEL with the same or a more generic nested enqname is installed and enabled.

System action: Processing continues. The definition is not installed.

User response: If you are sure you need to install resource *rsrce-name1* you need to discard resource *rsrce-name2* before attempting the re-install.

Module: DFHAMP

XMEOUT Parameters: *applid, {2=TSMODEL, 3=ENQMODEL}, rsrce-name1, {2=PREFIX, 3=ENQNAME}, attribute-name, {2=TSMODEL, 3=ENQMODEL}, rsrce-name2*

Destination: Console and Terminal End User

DFHAM4875E *applid* **Unable to perform operation: *name* is currently being updated by APPLID *applid* OPID *opid* - please retry later.**

Explanation: The command which you issued cannot be performed because another user of CEDA is currently changing the contents of the group/list to which you referred.

System action: The command is not executed.

User response: Try the command again.

Module: DFHAMP

Destination: Terminal End User

DFHAM4876W *applid* **PARTNER *partername* specifies NETNAME *netname* which is not found in any CONNECTION definition that specifies access method = VTAM.**

Explanation: There is no VTAM connection within the

DFHAM4877W • DFHAM4882W

current group for the netname referenced in the specified partner.

System action: Other processing continues.

User response: None.

Module: DFHAMP

Destination: Terminal End User

DFHAM4877W *applid* **PARTNER** *partnename* specifies a NETNAME and PROFILE for which there is no common implied SESSIONS definition.

Explanation: The netname in a partner definition implies an associated connection definition which is in turn associated with a session definition. The profile definition referenced in a partner definition specifies a modename which can be associated with a sessions definition.

Within the current group, there is no common sessions definition implied by the specified partner definition.

System action: Other processing continues.

User response: None.

Module: DFHAMP

Destination: Terminal End User

DFHAM4878E *applid* **Install of {IPCONN}** *resourcename* failed because one with this name is already installed and is in use.

Explanation: An attempt to install the resource specified, *resourcename*, on the CICS system has failed because there is already an existing resource of this name installed and in use.

System action: Processing continues. The definition is not installed.

User response: The specified resource definition can be replaced or discarded only when it is out of service. Put the resource out of service before attempting to re-install it.

Module: DFHAMP

XMEOUT Parameters: *applid*, {9=IPCONN}, *resourcename*

Destination: Console and Terminal End User

DFHAM4879W *applid* {GROUP | LIST} *name* has been partially installed.

Explanation: During the execution of an INSTALL command for the group or list *name*, some of the elements in the group or list installed successfully, but at least one failed.

System action: Messages are produced indicating

why the element or elements failed to install.

User response: Use the messages already produced to determine why the install failed and to rectify the problem.

Module: DFHAMP

Destination: Terminal End User

DFHAM4880S *applid* **Unable to perform operation - not allowed by file attributes for DFHCSD.**

Explanation: The CSDACC parameter in the system initialization table for DFHCSD does not allow CEDA to complete the command entered. The CSDACC parameter specifies the type of access permitted to the file. This can be one of the following

READWRITE
READONLY

In order for a particular command to function, the access must be set appropriately.

System action: The CEDA command is ignored.

User response: Correct the CSDACC parameter in the SIT. The DFHCSD is defined in the bringup JCL and/or in the SIT.

Module: DFHAMP

XMEOUT Parameter: *applid*

Destination: Console and Terminal End User

DFHAM4881I *applid* **Group name deleted.**

Explanation: The Group *grpname* has been deleted from the CSD.

System action: Processing continues.

User response: Check that the deleted group is not present on any list.

Module: DFHAMP

Destination: Terminal End User

DFHAM4882W *applid* **The {TPNAME | XTPNAME} of transaction *trandid* in group *grpname* duplicates the {TPNAME | XTPNAME} of transaction *trandid* in group *grpname*.**

Explanation: The CHECK command found a transaction whose XTPNAME matches the TPNAME of another transaction.

System action: No system action occurs for the CHECK command, but the XTPNAME or TPNAME for the first transaction in the message is ignored if the definitions are installed.

User response: Determine why the duplication exists.

To rectify the problem, rename either the TPNAME or the XTPNAME.

Module: DFHAMP

Destination: Terminal End User

DFHAM4883I *applid* List *listname* deleted.

Explanation: The List *listname* has been deleted from the CSD.

System action: Processing continues.

User response: Ensure that the deleted list is not used at a cold or initial start as the GRPLIST DFHSIT parameter.

Module: DFHAMP

Destination: Terminal End User

DFHAM4884S *applid* *restype* name *resname* is reserved by CICS.

Explanation: The name *resname* you have selected for resource type *restype* is reserved by CICS and cannot be user defined.

System action: The command is rejected.

User response: Redefine *resname* and resubmit the command.

Module: DFHAMP

Destination: Terminal End User

DFHAM4885E *applid* Install of IPCONN *resourcename* failed. Duplicate *applid* *applid* found.

Explanation: IPCONN resource *resourcename* was being installed but was found to have the same *applid* as an IPCONN which is already installed.

System action: The resource is not installed; CICS continues.

User response: If you want the definitions to be installed, use CEDA to correct the *applid* on this IPCONN and then reinstall the definition.

Module: DFHAMP

XMEOUT Parameters: *applid*, *resourcename*, *applid*

Destination: Console and Terminal End User

DFHAM4886I *applid* Installing list *listname* which matches specified generic list *genlist*.

Explanation: The GRPLIST parameter of the system initialization table (SIT) specifies a list name *genlist* that contains generic characters. While searching the CSD file, the list name *listname* was found to match the specified generic list.

System action: The list name *listname* is installed.

User response: None.

Module: DFHAMP

XMEOUT Parameters: *applid*, *listname*, *genlist*

Destination: Console

DFHAM4887I *applid* Unrecognized resource type found in the CSD file and has been ignored.

Explanation: CICS has found an unrecognized resource type code in a CSD record. The unrecognized code does not match any of the function codes in the language definition table. This can occur for one of the following reasons

1. You are using a CICS release that does not support a type of definition that was created on the CSD file by a later CICS release.
2. The language definition table (DFHEITSP or DFHEITCU) is invalid for this CICS release.
3. The CSD manager (DFHDMP) has passed an invalid CSD record buffer to DFHPUP. This is a CICS internal logic error.

System action: The resource is ignored and the operation continues.

User response: Determine which of the possible reasons caused the error. If you can eliminate reasons 1 and 2, you can assume that reason 3 applies.

Take action corresponding to the reason you have established as follows

1. Ignore the message.
2. Ensure that the library contains versions of DFHEITSP and DFHEITCU that are valid for the CICS release you are running.
3. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHAMP

XMEOUT Parameter: *applid*

Destination: Console and Terminal End User

DFHAM4888I *applid* Group *groupname* removed from list *listname*.

Explanation: During the execution of a DELETE command, the group *groupname* was deleted from the CSD. As a result of that, the list *listname* was updated to remove the deleted group from it.

System action: Processing continues.

User response: None.

Module: DFHAMP

Destination: Terminal End User

DFHAM4889E *applid* **Install of {JOURNALMODEL | TSMODEL | TCPIPSERVICE | CORBASERVER | IPCONN | URIMAP} resource name failed because attribute attrname is invalid.**

Explanation: An attempt to install the JOURNALMODEL, TSMODEL, TCPIPSERVICE, CORBASERVER, IPCONN, or URIMAP named *resource name* on the CICS system failed because the *attribute attrname* specified is not valid. If the *attribute* is CERTIFICATE, this may be due to one of the following reasons

- The specified certificate does not exist
- The specified certificate is not properly constructed
- The specified certificate does not have an associated private key
- The specified certificate is not connected to the key ring with a correct USAGE.

System action: The definition is not installed.

User response: Correct the invalid parameter of the resource definition.

Module: DFHAMP

XMEOUT Parameters: *applid*, {1=JOURNALMODEL, 2=TSMODEL, 7=TCPIPSERVICE, 8=CORBASERVER, 9=IPCONN, 10=URIMAP}, *resource name*, *attribute*, *attrname*

Destination: Console and Terminal End User

DFHAM4890E *applid* **Install of TDQUEUE *tdqname* failed because the TYPE has not been specified.**

Explanation: An attempt to install the named TDQUEUE *tdqname* on the local CICS system failed because it has been defined with the REMOTESYSTEM attribute and the TYPE cannot be determined.

System action: The definition is not installed.

User response: Make the definition a dual purpose one by specifying both REMOTE attributes and TYPE.

Module: DFHAMP

XMEOUT Parameters: *applid*, *tdqname*

Destination: Console and Terminal End User

DFHAM4891W *applid* **restype name *resname* begins with 'C'. Such names are reserved and may be redefined by CICS.**

Explanation: A resource name starting with C was specified. Names starting with C are reserved and may be redefined by CICS.

System action: If the definition is installed, errors may occur.

User response: Specify a different resource name.

Module: DFHAMP

Destination: Terminal End User

DFHAM4892W *date time applid* **Install for group *grpname* has completed with errors.**

Explanation: The install of group *grpname* is now complete. All resources that are valid for installation have been installed, and recorded if appropriate, on the CICS catalog. There were errors during the installation of some resources in the group and these resources have been backed-out.

System action: CICS continues. CICS issues messages identifying the cause of each installation failure.

User response: Use the associated messages, available via the messages panel if CEDA is being used, or issued to transient data queues CSMT and CADL during system startup, to determine the cause of the errors. Once the cause of the errors has been eliminated, reinstall the group to install the missing definitions.

Module: DFHAMP

XMEOUT Parameters: *date*, *time*, *applid*, *grpname*

Destination: CADL

DFHAM4893I *date time applid* **Install for group *grpname* has completed successfully.**

Explanation: The install of group *grpname* is now complete. All resources that are valid for installation have been installed, and recorded if appropriate, on the CICS catalog.

System action: CICS continues

User response: None

Module: DFHAMP

XMEOUT Parameters: *date*, *time*, *applid*, *grpname*

Destination: CADL

DFHAM4894E *applid* **Install of {ENQMODEL} *rsrcname1* failed because installed {ENQMODEL} *rsrcname2* is not disabled.**

Explanation: An attempt to install the resource *rsrcname1* on the CICS system has failed because the resource *rsrcname2* is already installed and is not disabled.

System action: Processing continues. The definition is not installed.

User response: Resource *rsrscename2* must be disabled or discarded before resource *rsrscename1* can be installed. Ensure that resource *rscename2* is in the required state and then install the new definition.

Module: DFHAMP

XMEOUT Parameters: *applid*, {3=ENQMODEL},
rsrscename1, {3=ENQMODEL}, *rsrscename2*

Destination: Console and Terminal End User

DFHAM4895E *applid* Install of TSMODEL
resourcenamename in group *groupname*
failed because TS was started using an
assembled TST without the MIGRATE
option.

Explanation: An attempt to install the TSMODEL
resource_name in group *groupname* on the CICS
system has failed because the system was started
using an assembled TST without the MIGRATE option.

System action: Processing continues. The definition is
not installed.

User response: If you want to install TSMODELs
using RDO then either start CICS with a TST
assembled with the TYPE=(INITIAL,MIGRATE) option or
don't specify a TST in your SIT parameters.

Module: DFHAMP

XMEOUT Parameters: *applid*, *resourcenamename*,
groupname

Destination: Console and Terminal End User

DFHAM4896E *applid* Install of TDQUEUE *tdqname*
failed because the queue is not closed.

Explanation: An attempt to install the transient data
queue *tdqname* on the CICS system has failed because
the data set associated with this extrapartition TD queue
is not closed.

System action: Processing continues. The definition is
not installed.

User response: Intrapartition queues must be
disabled, and extrapartition queues must be disabled
and closed before they can be redefined. Ensure that
the queue is in the required state and then install the
new definition.

Module: DFHAMP

XMEOUT Parameters: *applid*, *tdqname*

Destination: Console and Terminal End User

DFHAM4897W *applid* The definition of {TDQUEUE
/TCPIPSERVICE} *resourcenamename*
specified {OPENTIME=INITIAL /
STATUS=OPEN} but the open failed.

Explanation: An attempt to install the resource

resourcenamename on the CICS system has succeeded but
the resource cannot be opened.

System action: The definition is installed.

User response: Determine the cause of the failure
and then open the resource.

Module: DFHAMP

XMEOUT Parameters: *applid*, {1=TDQUEUE,
7=TCPIPSERVICE},
resourcenamename, {1=OPENTIME=INITIAL,
7=STATUS=OPEN}

Destination: Console and Terminal End User

DFHAM4898E *applid* Installation of {TDQUEUE
/PROCESSTYPE / LIBRARY}
resourcenamename failed because of
insufficient storage.

Explanation: An attempt to install the resource
resourcenamename on the CICS system has failed because
insufficient storage is available to build the entry.

System action: The definition is not installed.

User response: Inform your system programmer. See
the *CICS Problem Determination Guide* for guidance on
dealing with storage problems.

Module: DFHAMP

XMEOUT Parameters: *applid*, {1=TDQUEUE,
2=PROCESSTYPE, 5=LIBRARY}, *resourcenamename*

Destination: Console and Terminal End User

DFHAM4899E *applid* TDQUEUE *tdqname* cannot be
replaced because the existing
definition is for a different queue type.

Explanation: An attempt to install the transient data
queue *tdqname* on the CICS system failed because its
definition type is different from that of the definition
already defined to the system.

System action: The definition is not installed.

User response: Either change the new definition so
that it has the same type as the one currently installed
on the system, or discard the current definition and then
install the new one.

Module: DFHAMP

XMEOUT Parameters: *applid*, *tdqname*

Destination: Console and Terminal End User

DFHAM4901E *applid* Install of REQUESTMODEL
resourcenamename1 failed because a
duplicate pattern already exists in
resourcenamename2.

Explanation: An attempt to install the resource
resourcenamename1 on the CICS system has failed because

DFHAM4902E • DFHAM4906W

a duplicate pattern has been found in *resourcename2*.

System action: The definition is not installed.

User response: Verify the patterns being installed for resource *resourcename1* against those for *resourcename2* before re-trying the install.

Module: DFHAMOP

XMEOUT Parameters: *applid, resourcename1, resourcename2*

Destination: Console and Terminal End User

DFHAM4902E *applid* Install of{ CORBASERVER | REQUESTMODEL }*resourcename* failed because it is not a valid{ CORBASERVER | REQUESTMODEL }for this level of CICS.

Explanation: An attempt to install the resource *resourcename* on this CICS system has failed because it did not contain the attributes required for the current level of CICS. If the resource being defined was a REQUESTMODEL, the error is that the corbaserver name was blank. Having a blank corbaserver name indicates that the requestmodel is not at the correct level for this CICS system. If the resource being defined was a CORBASERVER, the error is that the UNAUTH tcpipSERVICE name, which is mandatory for this level of CICS, was missing from the definition.

System action: The definition of resource *resourcename* is not installed.

User response: Ensure that you are using the correct level CSD or redefine the resource *resourcename* using the new attributes as required.

Module: DFHAMOP, DFHAMEJ

XMEOUT Parameters: *applid, {1=CORBASERVER, 2=REQUESTMODEL}, resourcename, {1=CORBASERVER, 2=REQUESTMODEL}*

Destination: Console and Terminal End User

DFHAM4903E *applid* Install for TCPIP SERVICE *tcpipSERVICE* has failed because the service is open.

Explanation: The install of TCPIP SERVICE *tcpipSERVICE* has failed because the service is open.

System action: The install fails.

User response: Close the service and retry the install.

Module: DFHAMP

XMEOUT Parameters: *applid, tcpipSERVICE*

Destination: Console and Terminal End User

DFHAM4904W *applid* Opening TCPIP SERVICE *tcpipSERVICE* has failed because port *portno* is already in use.

Explanation: Opening TCPIP SERVICE *tcpipSERVICE* has failed because the specified port number is in use.

System action: The resource is installed but left in the closed state. Message DFHSO0109 is issued to the transient data queue CSOO.

User response: Check that the port number specified is not already in use. Refer to the description of the message DFHSO0109 for more information.

Module: DFHAMP

XMEOUT Parameters: *applid, tcpipSERVICE, portno*

Destination: Console and Terminal End User

DFHAM4905E *applid* Install failed for resource. Option *opt* is not available on this system.

Explanation: The install of the resource *resource* has failed because the current CICS system has not been configured to support the specified option *opt*.

System action: The install fails.

User response: Reconfigure the CICS system by specifying appropriate system initialization parameters to support the specified option. Then restart CICS.

Module: DFHAMDH

XMEOUT Parameters: *applid, resource, opt*

Destination: Console and Terminal End User

DFHAM4906W *applid* Opening TCPIP SERVICE *tcpipSERVICE* has failed because port *portno* is not authorized.

Explanation: Opening TCPIP SERVICE *tcpipSERVICE* has failed because the specified port number is not authorized.

System action: The resource is installed and left in the closed state. The message DFHSO0111 is written to the transient data queue CSOO.

User response: Select a port that is authorized. See the description of message DFHSO0111 for more information.

Module: DFHAMP

XMEOUT Parameters: *applid, tcpipSERVICE, portno*

Destination: Console and Terminal End User

DFHAM4907W *applid* Opening TCPIP SERVICE *tcpipSERVICE* has failed because the IP address is not known.

Explanation: Opening TCPIP SERVICE *tcpipSERVICE* has failed because the specified IP address is not known.

System action: The resource is installed but left in the closed state. The message DFHSO0110 is written to the transient data queue CSOO.

User response: Select an IP address which is known. Refer to the description of message DFHSO0110 for more information.

Module: DFHAMP

XMEOUT Parameters: *applid, tcpipSERVICE*

Destination: Console and Terminal End User

DFHAM4908E *applid* Install of DOCTEMPLATE *doctemplate1* failed because **TEMPLATENAME(*template*)** already exists in DOCTEMPLATE *doctemplate2*.

Explanation: The install of DOCTEMPLATE *doctemplate1* has failed because the TEMPLATENAME selected is already in use as the full template name for document template *doctemplate2*.

System action: The install fails.

User response: Either select a different TEMPLATENAME for *doctemplate1*, or discard the document template definition for *doctemplate2*.

Module: DFHAMMDH

XMEOUT Parameters: *applid, doctemplate1, template, doctemplate2*

Destination: Console and Terminal End User

DFHAM4909E *applid* Install of DOCTEMPLATE *doctemplate* failed. **DDNAME(*ddname*)** not found.

Explanation: The install of DOCTEMPLATE *doctemplate* has failed because the DDNAME(*ddname*) selected is not the name of a Data Definition statement for a partitioned dataset in the JCL for the current CICS job. *ddname* should be allocated to a PDS containing document templates to be used by the Document Handler domain.

System action: The install fails.

User response: Either select a DDNAME that does exist in the JCL for the current CICS job, or stop and restart CICS with the required DD statement added.

Module: DFHAMMDH

XMEOUT Parameters: *applid, doctemplate, ddname*

Destination: Console and Terminal End User

DFHAM4910E *applid* Install of DOCTEMPLATE *doctemplate* failed. **MEMBER(*membername*)** not found in *ddname*.

Explanation: The install of DOCTEMPLATE *doctemplate* has failed because member *membername* was not found in any of the partitioned datasets specified in the *ddname* concatenation.

System action: The install fails.

User response: Ensure that member *membername* exists in one of the template libraries specified before installing the DOCTEMPLATE that references it.

Module: DFHAMMDH

XMEOUT Parameters: *applid, doctemplate, membername, ddname*

Destination: Console and Terminal End User

DFHAM4911W *applid* Transaction *tranid* installed but at least one of **ALIAS, TASKREQ or XTRANID** failed to be replaced because it exists as a primary transaction.

Explanation: Transaction *tranid* was successfully installed but at least one of the specified aliases (ALIAS, TASKREQ or XTRANID) failed to be installed because it already exists as a primary transaction, and this includes the current transaction.

System action: The resource is installed but the alias is not.

User response: Find out which of the aliases is conflicting with a primary transaction id and change its name.

Module: DFHAMP

XMEOUT Parameters: *applid, tranid*

Destination: Console and Terminal End User

DFHAM4912E *applid* Install of *resource* *resourcename* failed because **attribute** is invalid for this release.

Explanation: An attempt to install the resource *resource* named *resourcename* on this CICS system failed because the *attribute* specified is not valid as it is an obsolete attribute.

System action: The definition is not installed.

User response: Remove the invalid parameter of the resource definition.

Module: DFHAMP

XMEOUT Parameters: *applid, resource, resourcename, attribute*

Destination: Console and Terminal End User

DFHAM4913E *applid* Install of {*IPCONN*} *resourcename* failed because a **CONNECTION resource with this name and a different APPLID is already installed.**

Explanation: An attempt to install the resource specified, *resourcename*, on the CICS system has failed because there is already an existing CONNECTION resource of this name installed that has a different APPLID.

System action: Processing continues. The definition is not installed.

User response: An IPCONN and a CONNECTION with the same name must represent the same system, so the IPCONN APPLID and the CONNECTION NETNAME must be the same. Establish which is incorrect and re-install.

Module: DFHAMP

XMEOUT Parameters: *applid*, {*9=IPCONN*}, *resourcename*

Destination: Console and Terminal End User

DFHAM4914E *applid* Install of *resourcetype* *resourcename* failed. The specified *targetresource* is unusable.

Explanation: Resource *resourcename* cannot be installed because the target resource *targetresource* with which it is associated is not usable.

System action: The resource is not installed.

User response: Discover why the target resource is not usable. It may not exist, or may not have been defined before it is being used. Create or define the referenced target resource.

Module: DFHAMP

XMEOUT Parameters: *applid*, *resourcetype*, *resourcename*, *targetresource*

Destination: Console Routecodes 2 and 10 and Terminal End User

DFHAM4915E *applid* Install of *resourcetype* *resourcename* failed. Open for data set *dsname* has abended.

Explanation: Resource *resourcename* cannot be installed because an abend occurred when opening the data set *dsname* that contains it.

System action: The resource is not installed.

User response: Look for an earlier IEC143I, IEC144I, IEC145I, IEC148I, IEC150I, or IEC153I message that explains why the dataset could not be opened. Correct whatever problem is described in the related message.

Module: DFHAMP

XMEOUT Parameters: *applid*, *resourcetype*, *resourcename*, *dsname*

Destination: Console Routecodes 2 and 10 and Terminal End User

DFHAM4916E *applid* TCPIP SERVICE *tcpipSERVICE* has not been opened because the **MAXSOCKETS limit has been reached.**

Explanation: TCPIP SERVICE *tcpipSERVICE* has not been opened because the number of active sockets in the system is equal to the current MAXSOCKETS value.

System action: The resource is installed but left in the closed state.

User response: Determine whether your MAXSOCKETS setting is adequate to handle normal system loads. If it is, then this may be a transient condition caused by a peak in work that uses sockets, and you may be able to use CEMT to open the TCPIP SERVICE once the workload diminishes. If not, use CEMT SET SYSTEM to increase the number of sockets in the system.

Module: DFHAMP

XMEOUT Parameters: *applid*, *tcpipSERVICE*

Destination: Console and Terminal End User

DFHAM4917W *applid*{ *CORBASERVER* | *TCPIP SERVICE* | *IPCONN* | *URIMAP* }*resourcename* was installed with a **reduced set of CIPHER codes.**

Explanation: The specified resource *resourcename* was installed but the the set of cipher codes which the resource was originally defined with has been reduced at install time because the running system did not support all of the ciphers specified.

System action: The resource is installed with a reduced set of cipher codes.

User response: Determine whether your CIPHERS setting is acceptable.

Module: DFHAMP

XMEOUT Parameters: *applid*, {*1=CORBASERVER* , *7=TCPIP SERVICE* , *9=IPCONN* , *10=URIMAP* }, *resourcename*

Destination: Console and Terminal End User

DFHAM4918E *applid* The installation of { *CORBASERVER* | *TCPIP SERVICE* | *IPCONN* | *URIMAP* }*resourcename* has failed because its requested CIPHER list was rejected.

Explanation: Resource *resourcename* cannot be installed because all of the cipher codes specified for the resource have been rejected by the running system.

System action: The resource is not installed.

User response: Determine what your CIPHERS setting should be for the current MVS system.

Module: DFHAMP

XMEOUT Parameters: *applid*, {1=CORBASERVER , 7=TCPIPSERVICE , 9=IPCONN , 10=URIMAP }, *resourcename*

Destination: Console and Terminal End User

DFHAM4920E *applid* The installation of { CORBASERVER | DJAR | PIPELINE | WEBSERVICE | LIBRARY } *resourcename* has failed because it is a duplicate of one which already exists.

Explanation: The installation of the specified resource *resourcename* has failed because the specified resource (corbaserver, djar, library, pipeline, or webservice) already exists with this name.

System action: The resource is not installed.

User response: Select a different resource name which is not known to the system. For EJ resources, it is not possible to do an update (add/replace). It is necessary to delete the resource and do a re-define if you want to use the same resource name. For PI resources, the resource needs to be disabled before it can be updated.

Module: DFHAMP

XMEOUT Parameters: *applid*, {1=CORBASERVER , 2=DJAR , 3= PIPELINE , 4= WEBSERVICE , 5= LIBRARY }, *resourcename*

Destination: Console and Terminal End User

DFHAM4921E *applid* The installation of CORBASERVER *cname* has failed because the specified {CORBASERVER ISTATE | SESSBEANTIME | CERTIFICATE | HOST | PORT | SSL | SSLPORT |SHELF | JNDIPREFIX} is not valid.

Explanation: The installation of CORBASERVER *cname* has failed because the specified keyword value is not valid.

System action: The resource is not installed.

User response: Enter valid values for the specified keyword. Nulls are not accepted.

Module: DFHAMP

XMEOUT Parameters: *applid*, *cname*, {1=CORBASERVER, 2=STATE, 3=SESSBEANTIME, 4=CERTIFICATE, 5=HOST, 6=PORT, 7=SSL, 8=SSLPORT, 9=SHELF, 10=JNDIPREFIX}

Destination: Console and Terminal End User

DFHAM4922E *applid* The installation of { CORBASERVER | DJAR } *resourcename* has failed because the EJ resource resolution transaction, CEJR, could not attach.

Explanation: The installation of CORBASERVER or DJAR *resourcename* has failed because the specified EJ resource could not be resolved as the resolution transaction, CEJR, failed to attach. The transaction may have been disabled manually to stop resolution, or it may not be defined to your CICS system.

System action: The resource is not installed.

User response: Ensure that the CEJR transaction is defined and installed on your CICS system and that the program DFHEJITL is also defined and available.

Module: DFHAMP

XMEOUT Parameters: *applid*, {1=CORBASERVER , 2=DJAR }, *resourcename*

Destination: Console and Terminal End User

DFHAM4923E *applid* The installation of DJAR *dname* has failed because the specified CORBASERVER *cname* does not exist.

Explanation: DJAR *dname* has not been installed successfully because the specified DJAR has been defined with a corbaserver which does not exist.

System action: The resource is not installed.

User response: Redefine the DJAR with a valid corbaserver name.

Module: DFHAMP

XMEOUT Parameters: *applid*, *dname*, *cname*

Destination: Console and Terminal End User

DFHAM4924E *applid* The installation of DJAR *dname* has failed because the specified {CORBASERVER | STATE |HFSFILE | DJAR} is not valid.

Explanation: DJAR *dname* has not been installed successfully because the specified DJAR has been defined with an invalid keyword.

System action: The resource is not installed.

User response: Redefine the DJAR with valid parameters. Null values are not accepted.

Module: DFHAMP

XMEOUT Parameters: *applid*, *dname*, {1=CORBASERVER, 2=STATE, 3=HFSFILE, 4=DJAR}

Destination: Console and Terminal End User

DFHAM4925E *applid* The installation of CORBASERVER *cname* has failed because at least one of its associated tcpiptservices has not been installed.

Explanation: The installation of CORBASERVER *cname* has failed because at least one of the TCPIPTSERVICES specified in the CORBASERVER definition has not been previously installed. When doing an individual install of a CORBASERVER, in order for the CORBASERVER to become inservice, the required TCPIPTSERVICES must already be available.

System action: The resource is not installed. Message DFHEJ0745, containing the TCPIPTSERVICE name which is missing, is also written to the CEJL transient data queue.

User response: Ensure that the TCPIPTSERVICES specified for the UNAUTH, CLIENTCERT, and SSLUNAUTH parameters on the CORBASERVER definition are installed first before attempting to install the CORBASERVER.

Module: DFHAMP

XMEOUT Parameters: *applid, cname*

Destination: Console and Terminal End User

DFHAM4926E *applid* The installation of DJAR *dname* has failed because the specified CORBASERVER *cname* is not in a valid state.

Explanation: DJAR *dname* has not been installed successfully because the specified DJAR has been defined with a corbaserver which is in an unusable state. Valid STATE values would be anything other than UNUSABLE, UNRESOLVED or DISCARDING.

System action: The resource is not installed.

User response: Redefine the DJAR with a corbaserver which is in the correct state. CEMT can be used to inquire on corbaserver STATE values.

Module: DFHAMP

XMEOUT Parameters: *applid, dname, cname*

Destination: Console and Terminal End User

DFHAM4927E *applid* The installation of {CORBASERVER | DJAR }*resourcename* has failed because its HFSFILE is a duplicate of one which already exists.

Explanation: The installation of the specified resource *resourcename* has failed because the specified resource *resourcename* has a duplicate HFSFILE name.

System action: The resource is not installed.

User response: Determine why the HFSFILE name is duplicated.

Module: DFHAMP

XMEOUT Parameters: *applid, {1=CORBASERVER, 2=DJAR }, resourcename*

Destination: Console and Terminal End User

DFHAM4928E *applid* Install of {TCPIPTSERVICE | CORBASERVER | IPCONN | URIMAP} *resourcename* failed because the specified certificate is {expired | not yet current | does not have a private key | not trusted}.

Explanation: Resource *resourcename* cannot be installed because the specified certificate is unusable. An explanatory phrase in the message describes why **expired**

The date and time at which the certificate is no longer valid has already passed.

not yet current

The date and time at which the certificate is to become active has not yet been reached.

does not have a private key

The specified certificate does not have a private key. SSL with client authentication is only possible if you possess the private key associated with the certificate.

not trusted

The certificate has been given the NOTRUST attribute by the security administrator. This indicates that the certificate is not to be used.

System action: The resource is not installed.

User response: Replace the certificate in the keyring with one that is usable, or specify a different certificate.

Module: DFHAMP

XMEOUT Parameters: *applid, {7=TCPIPTSERVICE, 8=CORBASERVER, 9=IPCONN, 10=URIMAP}, resourcename, {1=expired, 2=not yet current, 3=does not have a private key, 4=not trusted}*

Destination: Console and Terminal End User

DFHAM4929E *applid* {URIMAP}(*resourcename*) was not installed because of conflicting attributes.

Explanation: Resource *resourcename* cannot be installed because the specified attributes are inconsistent. This could indicate an internal problem within CICS, because attribute inconsistencies should be resolved in the RDO DEFINE command.

System action: The resource is not installed.

User response: Remove the conflicting attributes.

Module: DFHAMP

XMEOUT Parameters: *applid, {10=URIMAP}, resourcename*

Destination: Console and Terminal End User

DFHAM4930E *applid* **URIMAP(urimap1) not installed because it maps the same URI as urimap2.**

Explanation: URIMAP *urimap1* cannot be installed because it will map the same HOST and PATH (and optional TCPIPSERVICE) as *urimap2*, which is already installed. Each URIMAP must map a unique combination of these parameters.

System action: The resource is not installed.

User response: Specify a different HOST, PATH, or TCPIPSERVICE attribute.

Module: DFHAMP

XMEOUT Parameters: *applid, urimap1, urimap2*

Destination: Console and Terminal End User

DFHAM4931E *applid* **The installation of WEBSERVICE *resourcename* failed because the associated {WSBIND file | PIPELINE} does not exist.**

Explanation: WEBSERVICE *webservice* cannot be installed because the associated PIPELINE cannot be found.

System action: The resource is not installed.

User response: Ensure that the PIPELINE definition is correct and the PIPELINE is installed.

Module: DFHAMP

XMEOUT Parameters: *applid, resourcename, {2=WSBIND file, 3=PIPELINE}*

Destination: Console and Terminal End User

DFHAM4932E *applid* **The installation of {PIPELINE | WEBSERVICE} *resourcename* failed because the {hfsfile | PIPELINE} setup was not correct.**

Explanation: WEBSERVICE *webservice* or PIPELINE *pipeline* cannot be installed because of setup errors. Either the hfsfile does not have the correct authorization or the PIPELINE mode is not correct.

System action: The resource is not installed.

User response: Ensure that the hfsfile definitions of the pipeline and webservice are correct.

Module: DFHAMP

XMEOUT Parameters: *applid, {3=PIPELINE, 4=WEBSERVICE}, resourcename, {2=hfsfile, 3=PIPELINE}*

Destination: Console and Terminal End User

DFHAM4933E *applid* **The installation of PIPELINE *resourcename* failed because the WSDIR file specified is not accessible.**

Explanation: PIPELINE *pipeline* cannot be installed because the WSDIR specified is not correct and therefore the directory cannot be accessed.

System action: The resource is not installed.

User response: Ensure that the hfsfile definitions of the WSDIR are correct, remembering that case is significant.

Module: DFHAMP

XMEOUT Parameters: *applid, resourcename*

Destination: Console and Terminal End User

DFHAM4934E *applid* **The installation of URIMAP *resourcename* failed because HOSTCODEPAGE *hcodepage* is not valid in combination with CHARACTERSET *charset*.**

Explanation: The URIMAP resource *resourcename* cannot be installed because the specified attributes are inconsistent. Most inconsistencies are eliminated at resource definition time. However, for a URIMAP resource, the consistency between the value specified for the HOSTCODEPAGE attribute and that specified for the CHARACTERSET attribute cannot be determined until install time.

System action: The resource is not installed.

User response: Check that the combination of CHARACTERSET and HOSTCODEPAGE values specified for the URIMAP is supported by the CICS system on which you are attempting to install the resource *resourcename*.

Module: DFHAMP

XMEOUT Parameters: *applid, resourcename, hcodepage, charset*

Destination: Console and Terminal End User

DFHAM4935E *applid* **Install of {TCPIPSERVICE | CORBASERVER | IPCONN | URIMAP} *resourcename* failed because the KEYRING has no default certificate.**

Explanation: The specified resource *resourcename* is not installed because no certificate label was specified in the CERTIFICATE attribute, and no default certificate exists in the keyring for this CICS system.

System action: The resource is not installed.

User response: Either specify a valid certificate label in the CERTIFICATE attribute for *resourcename*, or designate one of the certificates in the keyring as a default.

DFHAM4999E • DFHAP0001

If you are using the z/OS Security Server (RACF) you designate a certificate as default using the RACDCERT command. Removing certificates, or by changing a certificate's status to or from default, the changes are not reflected in CICS until you restart the CICS address space.

Module: DFHAMP

XMEOUT Parameters: *applid*, {7=TCPIP SERVICE, 8=CORBASERVER, 9=IPCONN, 10=URIMAP}, *resourcename*

Destination: Console and Terminal End User

DFHAM4999E *applid* Install of *resourcetype* resources is not supported.

DFHAPnnnn messages

DFHAP0001 *applid* An abend (code *aaa/bbbb*) has occurred at offset *X'offset'* in module *modname*.

Explanation: An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in CICS code.

Alternatively

- Unexpected data has been input,
- Storage has been overwritten, or
- There has been a program check within a user program.

The code *aaa* is, if applicable, a 3-digit hexadecimal MVS system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The 4-digit code *bbbb*, which follows *aaa*, is a user abend code produced either by CICS or by another product on the user's system.

If *X'offset'* contains the value X'FFFF', then module *modname* was in control at the time of the abend, but the program status word (PSW) was not addressing this module.

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Either this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Or CICS will continue unless you have specified in the dump table that CICS should terminate. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Notify the system programmer.

Look up the MVS code *aaa*, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

Explanation: An attempt to install resource type *resource* on this CICS system is not possible as the code for install has been disabled for this resource type.

System action: Processing continues. The definition is not installed.

User response: You may define resource definitions for resource *resource* but until full support is available, you cannot INSTALL them.

Module: DFHAMP

XMEOUT Parameters: *applid*, *resourcetype*

Destination: Console and Terminal End User

If the *modname* insert contains the value *????*, then CICS was unable to determine which module has abnormally terminated. In this case, examine the system dump to determine which area of code has caused the program check.

The user should examine other messages to determine what the module which issued this message was doing at the time the abend occurred. From these messages they can deduce which product has produced the abend code *bbbb*. If *bbbb* is identified as a CICS code, it may be either alphameric or numeric.

- If the CICS code is alphameric (for example AKEA) then it is a CICS transaction abend code.
- If the CICS code is numeric (for example 1310), it refers to a CICS message (DFHTS1310 in our example).

If the user abend code is from another product (for example, IMS), refer to the appropriate messages and codes manual to determine the cause of the abend.

The entries in the appropriate manuals will give the user guidance regarding the nature of the error, and may also give some guidance concerning the appropriate user response. The program check may have occurred in a user program. If this is the case, the program check is usually followed by an ASRA or an ASRB transaction abend and a transaction dump.

If you want to suppress system dumps that precede ASRA and ASRB abends, you must specify this on an entry in the dump table, using either CEMT or an EXEC CICS command. Further guidance on suppressing system dumps can be found in the *CICS System Definition Guide*.

You may need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHABAB, DFHAFMT, DFHAPDM, DFHAPDN, DFHAPEX, DFHAPIQ, DFHAPJC,

DFHAPNT, DFHAPSM, DFHAPST, DFHAPSI, DFHAPXM, DFHAPXME, DFHDKMR, DFHEDFE, DFHEISR, DFHICXM, DFHMRXM, DFHSAIQ, DFHSIPLT, DFHSRP, DFHSTDT, DFHSTFC, DFHSTLK, DFHSTLS, DFHSTSZ, DFHSTTD, DFHSTTM, DFHSTTR, DFHSTTS, DFHSUEX, DFHTDXM, DFHTMP, DFHTSUT, DFH62XM

XMEOUT Parameters: *applid, aaa/bbbb, X'offset', modname*

Destination: Console

DFHAP0002 *applid* **A severe error (code X'code') has occurred in module modname.**

Explanation: An error has been detected in module *modname*. The code X'code' is the exception trace point id which uniquely identifies what the error is and where the error was detected.

System action: An exception entry is made in the trace table (X'code' in the message). A system dump is taken, unless you have specifically suppressed dumps in the dump table.

If this message is issued from DFHAPEX or DFHSUEX, and the exit point is XDUREQ, then a system dump is not taken in order to prevent recursive dumping.

Either this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Or CICS will continue unless you have specified in the dump table that CICS should terminate. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Notify the system administrator. This failure indicates a serious error in CICS. If you have not requested termination in the dump table, you may want to terminate CICS. For further information about CICS exception trace entries, see the *CICS Problem Determination Guide*.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHABAB, DFHAFMT, DFHAPDM, DFHAPDN, DFHAPEX, DFHAPJC, DFHAPLI, DFHAPLJ, DFHAPSI, DFHAPSIP, DFHAPSM, DFHAPST, DFHAPTI, DFHAPTIM, DFHAPTIX, DFHAPXM, DFHAPXME, DFHDKMR, DFHERM, DFHEISR, DFHICXM, DFHPCPG, DFHSIPLT, DFHSTDT, DFHSTFC, DFHSTJC, DFHSTLK, DFHSTLS, DFHSTSZ, DFHSTTD, DFHSTTM, DFHSTTR, DFHSTTS, DFHSUEX, DFHSUZX, DFHTMP, DFHTDXM, DFHVEH, DFHXCPA, DFHXSWM, DFHZCUT

XMEOUT Parameters: *applid, X'code', modname*

Destination: Console

DFHAP0003 *applid* **Insufficient storage (code X'code') in module modname.**

Explanation: A CICS GETMAIN was issued by module *modname*, but there was insufficient storage available to satisfy the request.

The code X'code' is the exception trace point id which uniquely identifies the place where the error was detected.

System action: An exception entry is made in the trace table (code X'code' in the message). A system dump is taken, unless you have specifically suppressed dumps in the dump table. CICS will continue unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message will be issued to this effect. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Inform the system programmer.

Try increasing the size of the DSA or EDSA. See the *CICS System Definition Guide* or the *CICS Customization Guide* for further information on controlling CICS storage.

You may need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHAPDM, DFHAPSIP

XMEOUT Parameters: *applid, X'code', modname*

Destination: Console

DFHAP0004 *applid* **A possible loop has been detected at offset X'offset' in module modname.**

Explanation: A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset X'offset'. This is the offset of the instruction which was executing at the time the error was detected.

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

If this message is issued from DFHAPEX or DFHSUEX, and the exit point is XDUREQ, then a system dump is not taken in order to prevent recursive dumping.

Either this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Or CICS will continue unless you have specified in the dump table that CICS should terminate. Message DFHME0116 should be produced containing the

symptom string for this problem.

User response: Notify the system programmer. If CICS has not been terminated, it will be necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS will purge a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that the module *modname* will be terminated and CICS will continue.

But if you have declared ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you will have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname*, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You will have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHAFMT, DFHAPDM, DFHAPDN, DFHAPEX, DFHAPIQ, DFHAPJC, DFHAPSM, DFHAPST, DFHAPSI, DFHAPXM, DFHAPXME, DFHDKMR, DFHEDFE, DFHEISR, DFHICXM, DFHSAIQ, DFHSIPLT, DFHSTDT, DFHSTFC, DFHSTJC, DFHSTLK, DFHSTLS, DFHSTSZ, DFHSTTD, DFHSTTM, DFHSTTR, DFHSTTS, DFHSUEX, DFHTDXM, DFHTSUT

XMEOUT Parameters: *applid, X'offset', modname*

Destination: Console

DFHAP0005 *applid* **A hardware error has occurred (module *modname*, code *X'code*). MVS Store Clock found inoperative.**

Explanation: A hardware error has occurred during the running of module *module*. The MVS store clock facility is the timing mechanism for the operating system.

The code *X'code* is the exception trace point ID which uniquely identifies the place where the error was detected.

System action: An exception entry (code *code* in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

This is a critical error and CICS is terminated, even if

you have specified in the dump table that CICS should not terminate.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Investigate the MVS store clock to determine whether it is working properly. If this is the cause, you should take the appropriate action to have it repaired or replaced.

In the unlikely event that this is not a hardware problem, you need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZCUT

XMEOUT Parameters: *applid, modname, X'code'*

Destination: Console

DFHAP0100 *applid* **Suffixed module *modname* cannot be loaded. Enter new suffix, 'YES'(unsuffixed), 'NONE'(dummy), or 'CANCEL'**

Explanation: During AP domain initialization, a suffixed CICS module or table could not be loaded.

System action: The AP domain initialization routines wait for the operator to

- Enter an alternative two-character suffix,
- Enter 'YES' to request the unsuffixed version,
- Enter 'NONE' to request that a dummy version of the program or table be loaded, or
- Enter 'CANCEL'.

If 'CANCEL' is entered, CICS is abnormally terminated at the end of the nucleus process.

User response: Determine whether the suffix is correct. If it is not, enter one of the replies listed in the System Action.

If you enter 'CANCEL', correct the error by adding the module to the appropriate library and then restart CICS.

Module: DFHSIB1

XMEOUT Parameters: *applid, modname*

Destination: Console

DFHAP0101 *applid* **Suffixed module *modname* cannot be loaded.**

Explanation: During AP domain initialization, a suffixed CICS module or table could not be loaded. This message is issued for all suffixable modules which cannot be located after CANCEL has been specified in response to a preceding DFHAP0100 message.

System action: The AP domain initialization continues until the end of the nucleus load process. CICS is then abnormally terminated with a dump.

User response: Determine whether the suffix is correct. If it is not, either correct the SIT or name the correct suffix via an override for the next initialization of CICS. Otherwise correct the error by adding the module to the appropriate library.

Module: DFHSIB1

XMEOUT Parameters: *applid, modname*

Destination: Console

DFHAP0360 *date time applid* **An attempt to establish security for userid *userid* has failed. SAF codes are (*X'safresp'*,*X'safreas'*). ESM codes are (*X'esmresp'*,*X'esmreas'*).**

Explanation: An attempt was made to establish security for userid *userid* but it was rejected by the external security manager (ESM). Check that the userid has been defined correctly.

System action: Security has not been established for the userid. The attempt to start the transaction has failed.

User response: The response and reason codes (*safresp* and *safreas*) returned by the system authorization facility (SAF), and the response and reason codes (*esmresp* and *esmreas*) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=VERIFY or RACROUTE REQUEST=EXTRACT macros. These return codes are described in the *OS/390 MVS Programming: Authorized Assembler Services Guide*, and in *External Security Interface (RACROUTE) Macro Reference for MVS and VM (SC28-1366)*. See these manuals for an explanation of the codes.

There may be further messages produced by CICS or the external security manager (ESM) which provide more information.

Module: DFHICXM DFHIEXM

XMEOUT Parameters: *date, time,applid, userid, X'safresp', X'safreas', X'esmresp', X'esmreas'*

Destination: CSCS

DFHAP0501 *date time applid* **Program *programe* has issued an ADDRESS CSA command that is no longer supported.**

Explanation: The program *programe* has attempted to address the CSA. This function is no longer supported. The address returned is now fetch protected. Any attempt to reference this address results in an abend.

System action: CICS continues.

User response: Remove this command from the application program. Translate and compile. Remove any references to the address that was previously returned.

Module: DFHEEI

XMEOUT Parameters: *date, time,applid, programe*

Destination: CMIG

DFHAP0601 *applid* **Force purge of transaction id *transid* transaction number *trannum* has been deferred because the transaction is executing post commit syncpoint processing.**

Explanation: CICS has received a request to force purge a transaction. The target of the force purge request is part way through processing the second phase of a two phase syncpoint. If the purge was accepted at this time, the target transaction would be abended and this would cause CICS to fail with a U0408 abend. There is no way of purging the target transaction while it is in this state. Transactions should only remain in this state for a short period of time. A subsequent attempt to force purge the transaction may preempt the deferred abend issued by the system when this condition was detected. This would result in the transaction being purged from the system faster than if the deferred purge is left to take effect.

System action: CICS defers the purge until the target transaction is no longer protected against purge.

User response: Retry the purge after a short interval if the target transaction has not ended.

Module: DFHAPXME

XMEOUT Parameters: *applid, transid, trannum*

Destination: Console

DFHAP0602 *applid* **Force purge of transaction id *transid* transaction number *trannum* has been deferred because the transaction is executing transaction backout.**

Explanation: CICS has received a request to force purge a transaction. The target of the force purge request is part way through transaction backout processing (either as a result of an earlier transaction abend, or a syncpoint rollback request). If the purge was accepted at this time, the target transaction would be abended and this would cause CICS to fail with a U0405 abend. There is no way of purging the target transaction while it is in this state. Transactions should only remain in this state for a short period of time. A subsequent attempt to force purge the transaction may preempt the deferred abend issued by the system when this condition was detected. This would result in the transaction being purged from the system faster than if the deferred purge is left to take effect.

System action: CICS defers the purge until the target transaction is no longer protected against purge.

User response: Retry the purge after a short interval if the target transaction has not ended.

Module: DFHAPXME

XMEOUT Parameters: *applid, tranid, trannum*

Destination: Console

DFHAP0603 *applid* Forcepurge of transaction ID *tranid*, transaction number *trannum*, recovery token *X'rtoken'* has been deferred because the transaction is waiting for a DLI request in DBCTL to complete.

Explanation: CICS has received a request to forcepurge a transaction. The target of the forcepurge request is waiting in DBCTL (or an IMS DC system which CICS thinks is a DBCTL) for the DLI request to complete. If the forcepurge was accepted at this time, the IMS system would fail with a U113 abend. The target transaction cannot be purged while it is in this state. Transactions should only remain in this state for a short time, unless the transaction is requesting some data or resource held by some other task in DBCTL. The recovery token may be used to identify which DBCTL thread corresponds to your task. (Issue /DIS CCTL ALL against the relevant DBCTL). One of the other active threads probably holds the resource you are waiting for. A subsequent attempt to forcepurge the transaction may preempt the deferred abend issued by the system when this condition was detected. This would result in the transaction being purged from the system faster than if the deferred purge is left to take effect.

System action: CICS defers the forcepurge until the target transaction is no longer protected against purge.

User response: Retry the forcepurge after a short interval if the target transaction has not ended. If the purge is still deferred, you will not be able to purge this transaction until the resource it is waiting for is released.

Module: DFHAPXME

XMEOUT Parameters: *applid, tranid, trannum, X'rtoken'*

Destination: Console

DFHAP0604 *applid* Forcepurge of transaction ID *tranid*, transaction number *trannum*, recovery token *X'rtoken'* has been deferred because the transaction is on a CICS-DB 2 ready queue waiting for a thread or TCB to become available.

Explanation: CICS has received a request to forcepurge a transaction. The target of the forcepurge request is queued on a CICS-DB2 ready queue awaiting a DB2 thread or TCB to become available. The target transaction cannot be purged while it is in this state.

If the CEMT INQUIRE TASK panel shows the task with an htype value of 'CDB2TCB', this means the task is awaiting a CICS-DB2 subtask TCB to become available,

meaning that the DB2CONN defined TCBLIMIT has been reached.

If the CEMT INQUIRE TASK panel shows the task with an htype value of 'CDB2CONN', this means the task is awaiting a CICS-DB2 connection to become available with which to associate with the CICS open tcb to be used for the request. This indicates that the DB2CONN defined TCBLIMIT has been reached which limits the number of open TCBs that can be used for DB2.

If the htype value is 'CDB2RDYQ', this means the task is awaiting a CICS-DB2 thread to become available, and Hvalue identifies the pool, or the particular DB2ENTRY against which it is queued.

Transactions should remain in these states only for a short time.

System action: CICS defers the forcepurge until the target transaction is no longer protected against purge.

User response: If the task is queued awaiting a CICS-DB2 subtask TCB, you can increase the value of TCBLIMIT in the DB2CONN. If the transaction is awaiting a CICS-DB2 thread, you can increase the THREADLIMIT value in the DB2ENTRY, or in the DB2CONN for the pool.

Module: DFHAPXME

XMEOUT Parameters: *applid, tranid, trannum, X'rtoken'*

Destination: Console

DFHAP0701 *applid* An abend (code *abcode*) has occurred in exit program *programe* at exit point *xxxxxxx*.

Explanation: An abnormal end (abend) or program check has occurred in the program *programe*. This implies that there is an error in the error program, that unexpected data has been input, or storage has been overwritten.

The code is a three digit hexadecimal MVS code (if applicable), followed by a four digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action: CICS makes an exception entry in the trace table and returns a zero return code to the exit point. CICS also produces a system dump unless

- The module producing the error message is DFHUEH, or
- You have specifically suppressed dumps in the dump table, or
- The exit point is XDUREQ. No dump is taken in order to avoid recursive dumping.

Either CICS continues unless you have specified in the dump table that CICS should terminate.

Or This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate. If this is the case, a zero return code is returned to the CICS management module.

User response: There might be a logic error in the user exit program *progname*. DISABLE the exit program from all exit points, by using the EXITALL operand in the EXEC CICS DISABLE, and correct the error.

For programming information about coding user exit programs see the *CICS Customization Guide*.

Module: DFHSUEX, DFHUEH

XMEOUT Parameters: *applid, abcode,progname, xxxxxxxx*

Destination: Console

DFHAP0704 *applid* **A possible loop has been detected in exit program *progname* at exit point *xxxxxxx*.**

Explanation: The exit program *progname* was in control and the transaction has consumed more CPU time than has been specified in the ICVR. There is probably a loop.

System action: CICS returns a zero return code to the exit point. CICS also produces a system dump unless

- The module producing the error message is DFHUEH, or
- You have specifically suppressed dumps in the dump table, or
- The exit point is XDUREQ. No dump is taken in order to avoid recursive dumping.

User response: There is a probable logic error in the user exit program *progname*. DISABLE the exit program from all exit points by using the EXITALL operand in the EXEC CICS DISABLE, and correct the error.

Refer to the *CICS Customization Guide* for further information about coding user exit programs.

If you think there is no loop, you can increase the runaway task time interval in the ICVR by using CEMT. This is explained in the *CICS Supplied Transactions manual*.

Module: DFHSUEX, DFHUEH

XMEOUT Parameters: *applid, progname, xxxxxxxx*

Destination: Console

DFHAP0705W *date time applid* **The enable of task related user exit program *progname* has caused CICS to force TASKDATALOC(BELOW) for all transactions.**

Explanation: Task-related user exit program *progname* has been enabled with options TASKSTART and LINKEDITMODE, and *progname* has been linkedited AMODE 24. This ensures that it is always invoked in amode 24. An amode 24 task-related user exit program can only be invoked if the calling transaction is defined with TASKDATALOC(BELOW).

By enabling the AMODE 24 task-related user exit for task start, the user has forced CICS to force all subsequent transactions to run with TASKDATALOC(BELOW).

System action: CICS continues, but for the remainder of the CICS run, CICS insists that all transactions run with TASKDATALOC(BELOW).

User response: To avoid all transactions having to run with TASKDATALOC(BELOW), modify the task-related user exit so that it is capable of running AMODE(31) when invoked for task start.

Ideally the task-related user exit should be modified so that it always runs AMODE 31 for whoever is the caller. In this case the exit program can be linkedited with the AMODE 31 attribute, and enabled with the LINKEDITMODE option. This ensures CICS always invokes it in AMODE 31.

Alternatively the task-related user exit could be modified so it is capable of being invoked in either amode. In this case the exit should be enabled without the LINKEDITMODE option. This means the exit will be invoked in the amode of its caller. For CICS calls such as task start, this will always be AMODE 31, but it does allow the exit to be invoked AMODE 24 for calls from an amode 24 application if this is desired.

See the *CICS Resource Definition Guide* for more information on the TASKDATALOC option.

See the *CICS Customization Guide* for programming information on the LINKEDITMODE option when enabling task-related user exits.

Module: DFHUEM

XMEOUT Parameters: *date, time,applid, progname*

Destination: Console and Transient Data Queue CSMT

DFHAP0706 *applid* **A probable loop has been detected in task related user exit program *progname*.**

Explanation: The task related user exit program *progname* was in control and the transaction has consumed more CPU time than has been specified in the ICVR. There is probably a loop.

System action: CICS produces a system dump unless you have specifically suppressed dumps in the dump table.

User response: There is a probable logic error in the task related user exit program *progname*. DISABLE the exit program and correct the error.

Refer to the *CICS Customization Guide* for programming information about task-related user exit programs.

If there is no loop, you can avoid this problem by increasing the runaway task time interval in the ICVR using CEMT. This is explained in the *CICS Supplied Transactions*.

Module: DFHERM

XMEOUT Parameters: *applid, progname*

Destination: Console

DFHAP0707 *applid* An abend (code *abcode*) has occurred in task related user exit program *progname*.

Explanation: An abnormal end (abend) or program check has occurred in the task related user exit program *progname*. This implies that there is an error in the exit program, that unexpected data has been input, or storage has been overwritten.

The code is a three digit hexadecimal MVS code (if applicable), followed by a four digit alphanumeric CICS code. The MVS code is a system completion code (for example, X'0C1 or X'D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action: CICS makes an exception entry in the trace table. A system dump is produced if requested via an entry in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

User response: There might be a logic error in the task related user exit program *progname*. DISABLE the task related user exit program and correct the error.

For programming information about coding task related user exit programs see the *CICS Customization Guide*.

Module: DFHERM

XMEOUT Parameters: *applid, abcode, progname*

Destination: Console

DFHAP08011 *applid* z/OS Conversion Services are not available.

Explanation: Character conversion is not possible using z/OS conversion services because these services are not enabled.

System action: CICS continues.

User response: None. You can suppress this message with the system initialization parameter, MSGLVL=0. If z/OS conversion services are to be used by CICS then they must be enabled by following the steps in the z/OS Support for Unicode manual.

Module: DFHCCNVG

XMEOUT Parameter: *applid*

Destination: Console

DFHAP0802 *applid* Data conversion using CCSID *ccsid1* and CCSID *ccsid2* is not supported by this system.

Explanation: CICS has received a request to convert some character data from one CCSID encoding to another. This CCSID combination is not currently supported by the region.

System action: The conversion process fails and no data is converted

User response: If z/OS conversion services are being used then add this CCSID combination to the conversion image and retry the request.

Module: DFHCCNVG

XMEOUT Parameters: *applid, ccid1, ccid2*

Destination: Console

DFHAP0900 *applid* MQ support for CICS Web Services is not available.

Explanation: An attempt has been made to use Websphere MQ as the transport for CICS Web Services, but the Websphere MQ stub CSQCSTUB could not be loaded during CICS Initialisation. The Websphere MQ library CSQCLOAD needs to be included in the DFHRPL concatenation to permit use of Websphere MQ as a transport for CICS Web Services

System action: The attempt to use Websphere MQ as a transport for CICS Web Services has been rejected. Any further such attempts will also be rejected, and this message will be produced again.

User response: The Websphere MQ library CSQCLOAD must be included in the DFHRPL concatenation to allow use of Websphere MQ as a transport for CICS Web Services. This is in addition to the other Websphere MQ libraries needed for MQ support in CICS.

Module: DFHPITQ1, DFHPILSQ

XMEOUT Parameter: *applid*

Destination: Console

DFHAP1006 *applid* **Resource definition recovery has failed with code X'code' in module modname.**

Explanation: An error has been detected in module *modname* during startup. The code X'code' is the exception trace point ID which uniquely identifies the error and where it was detected.

System action: An exception entry is made in the trace table (X'code' in the message). A system dump is taken, unless you have specifically suppressed dumps in the dump table.

This is a critical error and CICS is terminated even if you have specified in the dump table that CICS should not terminate.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Notify the system programmer. This failure indicates a serious error in CICS. For further information about CICS exception trace entries, see the *CICS Diagnosis Reference*.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHAPRDR, DFHTCRP

XMEOUT Parameters: *applid, X'code', modname*

Destination: Console

DFHAP1007 *applid* **A GETMAIN has failed for a resource definition control block code X'code' in module modname.**

Explanation: An storage request has failed in module *modname*. The code X'code' is the exception trace point ID which uniquely identifies the error and where it was detected.

System action: An exception entry is made in the trace table (X'code' in the message). A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Notify the system administrator. This failure may indicate that you need to increase the size limits of the EDSAs. EDSA storage limits are specified by the EDSALIM system initialization parameter. See the *CICS System Definition Guide* for more guidance on EDSALIM. For further information about CICS exception trace entries, see the *CICS Diagnosis Reference*.

Module: DFHAPRDR

XMEOUT Parameters: *applid, X'code', modname*

Destination: Console

DFHAP1200 *applid* **A CICS request to the Language Environment has failed. Reason code rc.**

Explanation: CICS has attempted to communicate with AD/Cycle Language Environment, but due to an error, the function requested by CICS could not be performed.

System action: If the error occurs during system initialization, then the initialization continues but without support for the Language Environment. If the error occurs in a user application program, then the transaction is abnormally terminated.

User response: For an explanation of the Language Environment return code *rc*, refer to the Language Environment *Debugging Guide and Runtime Messages* manual.

If the error occurs during system initialization, check that the Language Environment modules and the modules required for the languages supported by that environment have been correctly installed. In particular ensure that

- The interface module CEECCICS has been placed in a library concatenated to the STEPLIB DD statement of the CICS startup job stream
- The required modules in the CSD have been defined (these modules are listed in the file CEESAMP which is supplied with the sample files on the distribution tape).

Module: DFHAPLI

XMEOUT Parameters: *applid, rc*

Destination: Console

DFHAP1203I *applid* **Language Environment is being initialized.**

Explanation: This is an informative message indicating that CICS is initializing support for the Language Environment.

System action: System initialization continues.

User response: None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Module: DFHAPLI

XMEOUT Parameter: *applid*

Destination: Console

DFHAP1206 *applid* CEECCICS module not found.

Explanation: This is an informatory message indicating that CICS is unable to locate the Language Environment CEECCICS module either via the BLDL mechanism or in the LPA, and consequently CICS cannot call Language Environment to initialize.

System action: System initialization continues. However it will not be possible to execute application programs written in a high level language.

User response: If you wish to execute programs written in a high level language, you must ensure that the CEECCICS module, which is distributed in the Language Environment SCEERUN library, can be located either via STEPLIB or in the LPA.

Module: DFHAPLI

XMEOUT Parameter: *applid*

Destination: Console

DFHAP1207 *applid* CEEPIPI module not found.

Explanation: This is an informatory message indicating that CICS is unable to locate the Language Environment CEEPIPI module either via the BLDL mechanism or in the LPA.

System action: System initialization continues. However it will not be possible for CICS to establish the pre-initialized environment required by CICS to support the JVM and sockets.

User response: If you need this CICS system to support the JVM and sockets, you must ensure that the CEEPIPI module, which is distributed in the Language Environment SCEERUN library, can be located either via STEPLIB or in the LPA. Also ensure that the Language Environment SCEERUN2 library is included in STEPLIB or LPA.

Module: DFHAPLI

XMEOUT Parameter: *applid*

Destination: Console

DFHAP1208 *applid* Language Environment cannot support the Cobol language.

Explanation: This is an informatory message indicating that Language Environment has initialized successfully but is unable to execute programs written in the Cobol language.

System action: System initialization continues. However it will not be possible for CICS to run applications written in Cobol.

User response: If you need this CICS system to support the Cobol language you should search the joblog for any messages issued by Language Environment. One possible reason is that the

CEEEV005 program, which is the Language Environment interface module to the Cobol runtime, has not been defined in the CICS System Definition (CSD) file. Refer to the Language Environment for OS/390 Customization for further guidance.

Module: DFHAPLI

XMEOUT Parameter: *applid*

Destination: Console

DFHAP1209 *applid* Language Environment cannot support the C/C++ languages.

Explanation: This is an informatory message indicating that Language Environment has initialized successfully but is unable to execute programs written in the C and C++ languages.

System action: System initialization continues. However it will not be possible for CICS to run applications written in C or C++.

User response: If you need this CICS system to support the C and C++ languages you should search the joblog for any messages issued by Language Environment. One possible reason is that the CEEEV003 program, which is the Language Environment interface module to the C runtime, has not been defined in the CICS System Definition (CSD) file. Refer to the Language Environment for OS/390 Customization for further guidance.

Module: DFHAPLI

XMEOUT Parameter: *applid*

Destination: Console

DFHAP1210 *applid* Language Environment cannot support the PL/I language.

Explanation: This is an informatory message indicating that Language Environment has initialized successfully but is unable to execute programs written in the PL/I language.

System action: System initialization continues. However it will not be possible for CICS to run applications written in PL/I.

User response: If you need this CICS system to support the PL/I language you should search the joblog for any messages issued by Language Environment. One possible reason is that the CEEEV010 program, which is the Language Environment interface module to the PL/I runtime, has not been defined in the CICS System Definition (CSD) file. Refer to the Language Environment for OS/390 Customization for further guidance.

Module: DFHAPLI

XMEOUT Parameter: *applid*

Destination: Console

DFHAP1211I *applid* **Language Environment initialization completed.**

Explanation: This is an informatory message indicating that Language Environment initialization has completed.

System action: System initialization continues.

User response: None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Module: DFHAPLI

XMEOUT Parameter: *applid*

Destination: Console

DFHAP1212 *date time applid* **The program *program_name* was defined as *language1* but CICS has redefined it as *language2*.**

Explanation: You have defined program *program_name* as *language1*. During validation CICS determined that *language1* is not a valid language for *program_name* and has redefined the program with *language2*.

CICS is able to determine the program language automatically. It is therefore not necessary for users to pass the language of a program to CICS via an autoinstall exit.

System action: Processing continues.

User response: None. This message is issued for information only.

Module: DFHAPLI

XMEOUT Parameters: *date, time, applid, program_name, language1, language2*

Destination: CSTL

DFHAP1213 *applid* **An unexpected error has occurred during the LOAD of the *modname* module with system completion code *compcode* and reason code *reason*.**

Explanation: Either an error was detected when CICS tried to load one of the required language interface modules, or the region size you have defined for CICS is too small.

During the language initialization phase of CICS startup, an unexpected error has occurred while CICS was initializing the necessary support. Possibly CICS has determined that there is insufficient storage to enable run-time language support to be correctly installed. Application program execution is likely to be severely restricted if CICS continues.

System action: CICS initialization continues.

User response: You should examine the console log for any error messages which may have been issued by the operating system immediately preceding this CICS message. If no operating system messages were issued, it is likely that there is insufficient storage for CICS to continue and you should restart CICS with a larger region size.

Module: DFHAPLI

XMEOUT Parameters: *applid, modname, compcode, reason*

Destination: Console

DFHAP1214 *applid* **Language Environment global ENVAR option defined with invalid CICS program options.**

Explanation: An error has been detected in the Language Environment global runtime ENVAR option. The ENVAR string contains a substring in the form 'CICSVAR=xx....xx', but 'xx....xx' is an invalid or unsupported program option. At this level of CICS, the only valid options are 'OPENAPI', 'THREADSAFE' or 'QUASIRENT'.

System action: The incorrect ENVAR substring is ignored.

User response: Refer to the *CICS System Definition Guide* for information on how to define program options in the ENVAR string.

Module: DFHAPLI

XMEOUT Parameter: *applid*

Destination: Console

DFHAP1215 *applid* **Invalid CICS program options found in ENVAR string in program *pgmname*.**

Explanation: The application program contains user-defined Language Environment runtime options, and an error has been detected in the specification of the ENVAR option. The ENVAR string contains a substring in the form 'CICSVAR=xx....xx', but 'xx....xx' is an unsupported or invalid program option. At this level of CICS, the only supported options are 'OPENAPI', 'THREADSAFE' or 'QUASIRENT'.

System action: The incorrect ENVAR substring is ignored.

User response: Refer to the *CICS System Definition Guide* for information on how to define program options in the ENVAR string.

Module: DFHAPLI

XMEOUT Parameters: *applid, pgmname*

Destination: Console

DFHAP1217 *date time applid* **Attempt to fetch user replaceable module DFHJVMAT has failed.**

Explanation: The CICS JVM interface issued a fetch to load user replaceable module DFHJVMAT. The native C fetch request failed.

System action: The CICS transaction is abended with abend code AJM9.

User response: Ensure that C program DFHJVMAT is present in a dataset in the CICS STEPLIB concatenation. Examine messages output by language environment to determine why the fetch request failed.

Module: DFHAPLJ

XMEOUT Parameters: *date, time, applid*

Destination: CSMT

DFHAP1218 *date time applid* **CEEPIPI function pipifn failed with return code r15rc.**

Explanation: CICS XPLINK called CEEPIPI with one of the following function codes

- 1 = `init_main` to initialize a new PIPI execution environment
- 2 = `call_main` to invoke the main program in the PIPI environment
- 5 = `term` to terminate a PIPI execution environment
- 6 = `add_entry` to add an entry to the PIPI PreInit Table
- 11 = `delete_entry` to delete an entry from the PIPI PreInit Table

A non-zero return code from CEEPIPI indicates that the function failed.

System action: Language Environment may have written diagnostic information to the CESE destination. CICS abends the transaction with an abend code of ALX1, ALX2, ALX3, ALX4 or ALX5 depending upon the reason for the call to CEEPIPI.

User response: Look at SYSOUT or the CESE destination for Language Environment messages. Look in *Language Environment Programmers Guide (SC28-1939)* for the CEEPIPI function and the explanation of the return code which is in Register 15.

Module: DFHAPLX

XMEOUT Parameters: *date, time, applid, pipifn, r15rc*

Destination: CSMT

DFHAP1226 *date time applid* **Program program is defined as EXECCKEY(USER) but transaction transaction as TASKDATAKEY(CICS) these attributes are incompatible.**

Explanation: An attempt has been made to run a

program defined as EXECCKEY(USER) as part of a transaction defined as TASKDATAKEY(CICS). These attributes are incompatible. This incompatibility could occur as a result of the program definition being autoinstalled. See the CICS Customization Guide and the CICS Resource Definition Guide for more information about program autoinstall.

System action: The transaction will be abnormally terminated with abend code AEZD.

User response: Redefine and install a new definition either for the transaction with TASKDATAKEY(USER), or for the program with EXECCKEY(CICS).

If this message occurs when running a CICS transaction, a possible cause is that you are not using the CICS-supplied definition for the program. If you are using your own copies of CICS-supplied program definitions, they must be defined as EXECCKEY(CICS).

Module: DFHAPLI

XMEOUT Parameters: *date, time, applid, program, transaction*

Destination: CSMT

DFHAP1300 *date time applid* **The JVM at address *X'jvm_anchor'* on thread *X'thread_anchor'* has encountered an error (reason code: *X'reason_code'*) and has requested further diagnostic data from CICS. More information may be found in the STDERR file: *stderr*.**

Explanation: An error condition was detected by one of the JVMs in the JVMPool. The JVM invoked CICS services to capture a system dump. The JVM may recover, and continue processing, or may terminate. The JVM may write further data to the current *stderr* file indicated in the message.

System action: A system dump is taken. For critical errors in the JVM, the JVM is terminated. If a CICS program was in control at the time of the failure, the program is abended. If the failure occurred during task termination, the current transaction is rolled back. Processing continues by recreating the JVM or using other JVMs in the JVMPool.

User response: Read the STDERR log for the JVM. The JVM will have written any of its own diagnostics messages to this location. Examine the system dump using the JVM formatting utility. Use the address (*jvm_anchor*) shown in the message to identify the JVM. Optionally, use the address (*thread_anchor*) shown in the message to identify the thread in the JVM. The failure may be due to a JVM internal error, or to a component loaded by the JVM as a Native method or plug-in. The reason code given (*reason_code*) may be a signal handle or other code defined by the JVM. Use the information generated by the JVM in the *stderr* file to assist in the diagnosis of the problem.

Module: LIBDFHAPJVM.TSO

XMEOUT Parameters: *date, time, applid, X'jvm_anchor', X'thread_anchor', X'reason_code', stderr*

Destination: CSMT

| **DFHAP1301** *date time applid* **Language Environment has detected a corruption of its control blocks. Transaction *tranid* currently executing.**

| **Explanation:** Language Environment has issued a return code 8 indicating its control blocks are corrupted.

| **System action:** The transaction abnormally ends with abend code 0C3.

| **User response:** Investigate the cause of the corruption of the Language Environment control blocks.

| **Module:** DFHAPLI

| **XMEOUT Parameters:** *date, time, applid, tranid*

| **Destination:** Console

DFHBAnnnn messages

DFHBA0001 *applid* **An abend (code *code*) has occurred at offset *X'offset'* in module *module*.**

Explanation: An unexpected program check or abend occurred with abend code *aaa/bbbb*.

The program status word (PSW) at the time of the program check or abend indicated that CICS was executing at offset *X'offset'* in module *modname*. This may have been caused by corruption of CICS code or control blocks.

System action: A system dump is taken and the system attempts to continue operation unless otherwise directed by entries in the dump table.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Investigate the cause of the program check or abend using the system dump and any previously output diagnostic information provided by CICS, the access methods, or the operating system.

If you cannot resolve the problem, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHBAAC, DFHBAAC1, DFHBAAC2, DFHBAAC3, DFHBAAC4, DFHBAAC5, DFHBAAC6, DFHBAAR1, DFHBABR, DFHBACO1, DFHBACR, DFHBADM, DFHBALR1, DFHBALR2, DFHBALR3, DFHBALR4, DFHBALR5, DFHBALR6, DFHBALR7, DFHBALR8, DFHBALR9, DFHBAPR, DFHBAPT1, DFHBASP, DFHBATT, DFHBAUE, DFHBAVP1, DFHBAXM

DFHAP1500 *applid* **The CICS time-of-day is no longer synchronized with the system time-of-day.**

Explanation: The CICS time-of-day differs from the system time-of-day by more than 30 minutes.

System action: CICS continues. However, as SIT parameter AUTORESETTIME is set to NO, a CEMT PERFORM RESET is needed to synchronize the CICS time-of-day with the system time-of-day.

User response: Use the CEMT PERFORM RESET (or EXEC CICS PERFORM RESETTIME) command to ensure that CICS immediately resynchronizes its local time with that of the MVS TOD clock. This will ensure that the correct local time is used by all CICS functions, including the API.

Module: DFHAPTIM

XMEOUT Parameter: *applid*

Destination: Console

XMEOUT Parameters: *applid, code, X'offset', module*

Destination: Console

DFHBA0002 *applid* **A severe error (code *X'code'*) has occurred in module *module*.**

Explanation: The BA domain has received an unexpected error response from some other part of CICS. The operation requested by recovery manager is described by code *X'code'*.

For further information about CICS exception trace entries, refer to the *CICS Problem Determination Guide*.

System action: A system dump is taken and the system attempts to continue operation unless specifically inhibited by dump table entries.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Investigate the cause of the problem as follows

1. Determine if the problem can be explained by any previous messages issued from some other CICS component.
2. Examine the symptom string.
3. Examine the dump.

If you cannot resolve the problem, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHBAAC, DFHBAAC1, DFHBAAR1, DFHBABR, DFHBACO1, DFHBACR, DFHBADM, DFHBALR1, DFHBAPR, DFHBAPT1, DFHBASP,

Destination: Console

DFHBA0101 *date time applid* **An error has occurred while writing an auditlog record to log logname. Logging has been suspended.**

Explanation: The BA Write audit record request has failed.

System action: Normal processing continues with logging of audit records to the specified log suspended.

User response: Determine if the problem can be explained by any previous messages issued from some other CICS component. If the log is successfully reconnected, audit logging will be resumed, see message DFHBA0102. If you cannot resolve the problem, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHBAAR2

XMEOUT Parameters: *date, time,applid, logname*

Destination: Console and Transient Data Queue CSBA

DFHBA0102 *date time applid* **Auditlog writing to log logname has been successfully resumed.**

Explanation: The BA Write audit record requests has resumed after being suspended.

System action: Audit logging has resumed.

User response: None.

Module: DFHBAAR2

XMEOUT Parameters: *date, time,applid, logname*

Destination: Console and Transient Data Queue CSBA

DFHBA0103 *date time applid terminal userid tranid* **processtype definition entry processtype has been deleted.**

Explanation: This is an audit log message indicating that Processtype entry *processtype* has been deleted using the DISCARD command Where

- *terminal* is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- *userid* is the user identifier of the user associated with the transaction issuing the message.
- *tranid* is the transaction issuing the message.

System action: The system continues normally.

User response: None.

Module: DFHBATT

XMEOUT Parameters: *date, time,applid, terminal, userid, tranid, processtype*

Destination: CSBA

DFHBA0104 *date time applid* **The root activity of process processname of processtype processtype has completed status ABENDED, code abendcode. TRANSID(tranid) USERID(userid).**

Explanation: This indicates that the root activity of the process *processname*, of processtype *processtype*, has completed abnormally with abendcode *abendcode*.

- *tranid* is the tranid of the activation that completed the activity.
- *userid* is the user identifier of the transaction that completed the activity.

System action: The root activity is marked complete abended in the BTS repository in the normal way and the system continues normally.

User response: None.

Module: DFHBAAC

XMEOUT Parameters: *date, time,applid, processname, processtype,abendcode, tranid, userid*

Destination: CSBA

DFHBA0105 *date time applid terminal userid tranid* **processtype definition entry processtype has been installed.**

Explanation: This is an audit log message indicating that Processtype entry *processtype* has been added to the system or modified via the INSTALL command. Where

- *terminal* is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- *userid* is the user identifier of the user associated with the transaction issuing the message.
- *tranid* is the transaction issuing the message.

System action: The system continues normally.

User response: None.

Module: DFHBATT

XMEOUT Parameters: *date, time,applid, terminal, userid, tranid, processtype*

Destination: CSBA

DFHBA0201 Module *module* load of DFHMEBM failed, reason code *X'rcode'* system code *X'scode'*.

Explanation: The program has failed to load module DFHMEBM.

The message contains the name of the module that detected the error, the reason code and the system code from the failed load.

System action: The program terminates with return code 12.

User response: Use the reason code and system code contained in the message to determine the reason for the failed load.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module: DFHATUP DFHBARUP

Destination: Console

DFHBA0202 Module *module* load of *modname* failed, reason code *X'rcode'* system code *X'scode'*.

Explanation: The program has failed to load the language table.

The message contains the name of the module that detected the error, the language table name, the reason code and the system code from the failed load.

System action: The program terminates with return code 12.

User response: Use the reason code and system code contained in the message to determine the reason for the failed load.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module: DFHATUP DFHBARUP

Destination: Console

DFHBA0203 Error opening SYSPRINT in module *module*.

Explanation: Error opening SYSPRINT.

The message contains the name of the module with the error.

System action: The program terminates with return code 12.

User response: Check if any additional system messages have been issued that may help you to determine the cause of the problem.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module: DFHATUP DFHBARUP

Destination: Console

DFHBA0204 Module *module* exec parameter error, missing open bracket at position *position(+)*.

Explanation: An exec parameter error has been detected.

An open bracket is missing after a keyword. The name of the module that detected the error and the approximate position of the missing bracket are contained in the message.

System action: The program terminates with return code 12.

User response: Correct the error and submit the job again.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module: DFHATUP DFHBARUP

Destination: Console

DFHBA0205 Module *module* exec parameter error, missing close bracket at position *position(+)*.

Explanation: An exec parameter error has been detected.

A close bracket is missing after the keyword field. The message contains the name of the module that detected the error and the approximate position of the missing bracket.

System action: The program terminates with return code 12.

User response: Correct the error and submit the job again.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module: DFHATUP DFHBARUP

Destination: Console

DFHBA0206 Module *module* exec parameter error, invalid keyword at position *position*.

Explanation: An exec parameter error has been detected.

A invalid keyword has been found. The message contains the module name that detected the error and the position of the invalid keyword.

System action: The program terminates with return code 12.

User response: Correct the error and submit the job again.

DFHBA0207 • DFHBA0212

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module: DFHATUP DFHBARUP

Destination: Console

DFHBA0207 Module *module* exec parameter error, invalid translate field at position *position*.

Explanation: An exec parameter error has been detected.

An invalid translate keyword field has been located. The message contains the name of the module that detected the error and the position of the invalid keyword field.

System action: The program terminates with return code 12.

User response: Correct the error and submit the job again.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module: DFHATUP DFHBARUP

Destination: Console

DFHBA0208 Module *module* exec parameter error, duplicate translate keyword at position *position*.

Explanation: An exec parameter error has been detected.

A duplicate translate keyword has been found. The message contains the name of the module that detected the error and the position of the duplicate translate keyword.

System action: The program terminates with return code 12.

User response: Correct the error and submit the job again.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module: DFHATUP DFHBARUP

Destination: Console

DFHBA0209 Module *module* exec parameter error, invalid pagesize field at position *position*.

Explanation: An exec parameter error has been detected.

An invalid pagesize field has been found. The message contains the name of the module that detected the error and the position of the invalid field.

System action: The program terminates with return code 12.

User response: Correct the error and submit the job again.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module: DFHATUP DFHBARUP

Destination: Console

DFHBA0210 Module *module* exec parameter error, duplicate pagesize keyword at position *position*.

Explanation: An exec parameter error has been detected.

A duplicate pagesize keyword has been found. The message contains the name of the module that detected the error and the position of the duplicate keyword.

System action: The program terminates with return code 12.

User response: Correct the error and submit the job again.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module: DFHATUP DFHBARUP

Destination: Console

DFHBA0211 Module *module* exec parameter error, invalid NATLANG field at position *position*.

Explanation: An exec parameter error has been detected.

An invalid natlang field has been found. The message contains the name of the module that detected the error and the position of the invalid field.

System action: The program terminates with return code 12.

User response: Correct the error and submit the job again.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module: DFHATUP DFHBARUP

Destination: Console

DFHBA0212 Module *module* exec parameter error, duplicate NATLANG keyword at position *position*.

Explanation: An exec parameter error has been detected.

A duplicate natlang keyword has been found. The message contains the name of the module that detected the error and the position of the duplicate keyword.

System action: The program terminates with return code 12.

User response: Correct the error and submit the job again.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module: DFHATUP DFHBARUP

Destination: Console

DFHBA0213 Open of SYSIN failed in module *module*.

Explanation: An open of SYSIN failed.

The message contains the name of the module that detected the error.

System action: The program terminates with return code 12.

User response: Check if any additional system messages have been issued that may help you to determine the cause of the problem.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module: DFHATUP DFHBARUP

Destination: SYSPRINT

DFHBA0214 Module *module* invalid keyword at position *position*.

Explanation: A SYSIN parameter error has been detected.

An invalid keyword has been found. The message contains the name of the module that detected the error and the position of the invalid keyword.

System action: The program terminates with return code 12 after all the SYSIN parameters have been processed.

User response: Correct the error and submit the job again.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module: DFHATUP DFHBARUP

Destination: SYSPRINT

DFHBA0215 Module *module* invalid keyword field length at position *position*.

Explanation: A sysin parameter error has been detected.

An invalid keyword field length has been detected. The message contains the name of the module that detected the error and the position of the invalid field.

System action: The program terminates with return code 12 after all the sysin parameters have been processed.

User response: Correct the error and submit the job again.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module: DFHATUP DFHBARUP

Destination: SYSPRINT

DFHBA0216 Module *module* invalid keyword field at position *position*.

Explanation: A sysin parameter error has been detected.

An invalid keyword field has been found. The message contains the name of the module that detected the error and the position of the invalid keyword.

System action: The program terminates with return code 12 after all the sysin parameters have been processed.

User response: Correct the error and submit the job again.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module: DFHATUP DFHBARUP

Destination: SYSPRINT

DFHBA0217 Module *module* unexpected keyword at position *position*.

Explanation: A sysin parameter error has been detected.

An unexpected keyword has been found. The message contains the name of the module that detected the error and the position of the unexpected keyword.

System action: The program terminates with return code 12.

User response: Correct the error and submit the job again.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module: DFHATUP DFHBARUP

Destination: SYSPRINT

DFHBA0218 Module *module* duplicate auditlog keyword at position *position*.

Explanation: A sysin parameter error has been detected.

A duplicate auditlog keyword has been found. The message contains the name of the module that detected the error and the position of the duplicate keyword.

System action: The program terminates with return code 12 after all the sysin parameters have been processed.

User response: Correct the error and submit the job again.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module: DFHATUP DFHBARUP

Destination: SYSPRINT

DFHBA0219 Module *module* continuation not allowed.

Explanation: A sysin parameter error has been detected.

A parameter card contains an invalid continuation character. The message contains the name of the module that detected the error.

System action: The program terminates with return code 12 after all the sysin parameters have been processed.

User response: Correct the error and submit the job again.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module: DFHATUP DFHBARUP

Destination: SYSPRINT

DFHBA0220 Module *module* unexpected end of file.

Explanation: A sysin parameter error has been detected.

The last sysin card read before end of file was reached has a continuation indicator. The message contains the name of the module that detected the error.

System action: The program terminates with return code 12.

User response: Correct the error and submit the job again.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module: DFHATUP DFHBARUP

Destination: SYSPRINT

DFHBA0221 Error opening *file* in module *module*.

Explanation: An open of the auditlog has failed.

The message contains the name of the module that detected the error and the name of auditlog data set.

System action: The program terminates with return code 12.

User response: Check if any additional system messages have been issued that may help you to determine the cause of the problem.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module: DFHATUP

Destination: SYSPRINT

DFHBA0222 Module *module* terminated because of errors, check SYSPRINT for details.

Explanation: The program has detected errors that have caused it to terminate.

Additional error messages have been output to SYSPRINT.

System action: The program terminates with return code 12.

User response: Use the additional messages output to SYSPRINT to determine the cause of the problem.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module: DFHATUP DFHBARUP

Destination: Console

DFHBA0223 Module *module* terminated because of errors, check previous console messages for details.

Explanation: The program has detected errors that have caused it to terminate.

Additional error message will have been issued at the console.

System action: The program terminates with return code 12.

User response: Use the additional messages issued at the console to determine the cause of the problem.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module: DFHATUP DFHBARUP

Destination: Console

DFHBA0224 Gencb failed in module *module*. R15 = *X'r15val'* R0 = *X'r0val'*.

Explanation: A Vsam gencb macro call has failed.

The message contains the name of the module that issued the failed gencb and the register 15 and 0 values at the time of the error. At the time of the error register 15 contains the return code and register 0 contains the reason code. The reason code is only valid if the return code is 4.

System action: The program terminates with return code 12.

User response: Use the return code and reason code values to determine the cause of the problem.

Check if any additional system messages have been issued that may help you to determine the cause of the problem.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module: DFHBARUP

Destination: SYSPRINT

DFHBA0225 Modcb failed in module *module*. R15 = *X'r15val'* R0 = *X'r0val'*.

Explanation: A Vsam modcb macro call has failed.

The message contains the name of the module that issued the failed modcb and the register 15 and 0 values at the time of the error. At the time of the error register 15 contains the return code and register 0 contains the reason code. The reason code is only valid if the return code value is 4.

System action: The program terminates with return code 12.

User response: Use the return code and reason code values to determine the cause of the problem.

Check if any additional system messages have been issued that may help you to determine the cause of the problem.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module: DFHBARUP

Destination: SYSPRINT

DFHBA0226 Showcb failed in module *module*. R15 = *X'r15val'* R0 = *X'r0val'*.

Explanation: A Vsam showcb macro call has failed.

The message contains the name of the module that issued the failed showcb and the register 15 and 0 values at the time of the error. At the time of the error register 15 contains the return code and register 0

contains the reason code. The reason code is only valid if the return code value is 4.

System action: The program terminates with return code 12.

User response: Use the return code and reason code values to determine the cause of the problem.

Check if any additional system messages have been issued that may help you to determine the cause of the problem.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module: DFHBARUP

Destination: SYSPRINT

DFHBA0227 Error opening file in module *module*. R15 = *X'r15val'* reason code = *X'reasval'*.

Explanation: A Vsam open macro call has failed.

The message contains the name of the data set being opened, the name of the module issuing the open, the register 15 and reason code values at the time of the error. At the time of the error register 15 contains the return code.

System action: If the register 15 value is 4 the program continues. If the register 15 value is 8 or greater the program terminates with return code 12.

User response: Use the return code and reason code values to determine the cause of the problem.

Check if any additional system messages have been issued that may help you to determine the cause of the problem.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module: DFHBARUP

Destination: SYSPRINT

DFHBA0228 Error closing file in module *module*. R15 = *X'r15val'* reason code = *X'reasval'*.

Explanation: A Vsam close macro call has failed.

The message contains the name of the data set being closed, the name of the module issuing the close, the register 15 and reason code values at the time of the error. At the time of the error register 15 contains the return code.

System action: The program continues. This may indicate a problem with the repository data set.

User response: Use the return code and reason code values to determine the cause of the problem.

Check if any additional system messages have been issued that may help you to determine the cause of the problem.

DFHBA0229 • DFHBA0234

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module: DFHBARUP

Destination: SYSPRINT

DFHBA0229 Get for file failed in module *module*.
R15 = X'r15val' reason code = X'reasval'.

Explanation: A Vsam get macro call has failed.

The message contains the name of the data set that the get is being issued against, the name of the module issuing the get, the register 15 and reason code values at the time of the error. At the time of the error register 15 contains the return code.

System action: The program terminates with return code 12.

User response: Use the return code and reason code values to determine the cause of the problem.

Check if any additional system messages have been issued that may help you to determine the cause of the problem.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module: DFHBARUP

Destination: SYSPRINT

DFHBA0230 Point for file failed in module *module*.
R15 = X'r15val' reason code = X'reasval'.

Explanation: A Vsam point macro call has failed.

The message contains the name of the data set that the point failed on, the name of the module issuing the point, the register 15 and reason code values at the time of the error. At the time of the error register 15 contains the return code.

System action: The program terminates with return code 12.

User response: Use the return code and reason code values to determine the cause of the problem.

Check if any additional system messages have been issued that may help you to determine the cause of the problem.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module: DFHBARUP

Destination: SYSPRINT

DFHBA0231 The set of records associated with the activity or process being read are not complete.

Explanation: The set of process or activity records being read is incomplete.

System action: The program continues processing with the next process or activity.

User response: If the repository file is being accessed by a CICS region while the DFHBARUP job is running the CICS region or regions have deleted the set of records being processed by DFHBARUP.

If this is not the case then further investigation will be required.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module: DFHBARUP

Destination: SYSPRINT

DFHBA0232 No records selected by module *module*.

Explanation: No records have been selected for printing.

The message contains the name of the module involved.

System action: The program completes with return code 0.

User response: Check that the selection parameters are correct and the correct file is being processed.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module: DFHATUP DFHBARUP

Destination: Console

DFHBA0233 Module *module* has completed processing.

Explanation: Processing has completed.

The message contains the name of the module involved.

System action: The program completes with return code 0.

User response: None

Module: DFHATUP DFHBARUP

Destination: Console

DFHBA0234 Module *module* has a duplicate repository keyword at position *position*.

Explanation: A sysin parameter error has been detected.

A duplicate repository keyword has been found. The message contains the name of the module that detected the error and the position of the duplicate keyword.

System action: The program terminates with return code 12 after all the sysin parameters have been processed.

User response: Correct the error and submit the job again.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module: DFHBARUP

Destination: SYSPRINT

DFHBA0235 The container record being processed is not complete.

DFHBRnnnn messages

DFHBR0201 *date time applid* **Transaction** *tranid*
abend *abcode* **in bridge exit** *brexid*
bridge transaction *bridge*

Explanation: The Bridge exit *brexid* terminated abnormally with abend code *abcode*.

abcode is either a CICS transaction abend code or a user abend code generated by a CICS ABEND ABCODE(*abcode*) command. This command is issued either by a user program or by an IBM program (for example, a programming language library module).

Unless the abend occurred whilst the bridge exit was processing the termination or abend call, this abend will also result in CICS issuing a ABRQ abend. In this case a DFHAC2236 abend message will follow this message. See that message for details about recoverable resources.

System action: Abend ABRQ will be issued unless the transaction is calling the bridge exit for termination or abend processing.

User response: Use the abend code *abcode* to diagnose the problem. If the abend is issued by an IBM program product other than CICS, the code is documented in the library of that other product.

Alternatively, there might be a logic error in the bridge exit program *brexid*. For programming information about coding bridge exit programs see the *CICS Customization Guide*.

Module: DFHBRIC, DFHBRMS, DFHBRSP, DFHBRTC, DFHBRXM, DFHBRRM

XMEOUT Parameters: *date, time, applid, tranid, abcode, brexid, bridge*

Destination: CSBR

Explanation: The container being processed is incomplete.

System action: The program continues processing with the next process or activity.

User response: If the repository file is being accessed by a CICS region while the DFHBARUP job is running the CICS region or regions may be altering the container records as DFHBARUP is processing them.

If this is not the case then further investigation will be required.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module: DFHBARUP

Destination: SYSPRINT

DFHBR0202 *date time applid userid tranid* **Bridge facility autoinstall URM** *urmname* **has abended with code** *abcode*. **The autoinstall function has been disabled.**

Explanation: The Bridge facility autoinstall URM terminated abnormally with abend code *abcode*.

abcode is either a CICS transaction abend code or a user abend code generated by a CICS ABEND ABCODE(*abcode*) command.

System action: The autoinstall URM is disabled. This prevents the autoinstalling of new bridge facilities, as well as the other functions of the autoinstall exit.

User response: Use the abend code *abcode* to diagnose the problem. If the abend is issued by an IBM program product other than CICS, the code is documented in the library of that other product.

Alternatively, there might be a logic error in the autoinstall URM.

When the error has been found and the problem corrected enable the autoinstall URM to re-enabled the mechanism.

Module: DFHBRAI

XMEOUT Parameters: *date, time, applid, userid, tranid, urmname, abcode*

Destination: CSBR

DFHBR0203 *date time applid userid tranid* **Bridge facility autoinstall URM** *urmname* **could not be linked. The autoinstall function has been disabled.**

Explanation: The Bridge facility autoinstall URM could not be linked.

System action: The autoinstall URM is disabled. This prevents the autoinstalling of new bridge facilities, as well as the other functions of the autoinstall exit.

User response: Unless there are other messages preceding this message indicating the cause of the problem, the probable cause is that the URM cannot be found in the DFHRPL concatenation.

When the error has been found and the problem corrected enable the autoinstall URM to re-enabled the mechanism.

Module: DFHBRAI

XMEOUT Parameters: *date, time,applid, userid, tranid, urmname*

Destination: CSBR

DFHBR0204 *date time applid userid tranid* **Bridge facility autoinstall URM *urmname* is disabled. The request will fail.**

Explanation: The Bridge facility autoinstall URM is disabled (other than as a result of an error detected by the bridge).

System action: This prevents the autoinstalling of new bridge facilities, as well as the other functions of the autoinstall exit.

User response: The probable cause of this is either that the URM was disabled by the operator, or as a result of some action of one of the other functions of the autoinstall URM.

The mechanism can be re-started by enabling the URM. Alternatively the command SET AUTOINSTALL AIBRIDGE(AUTO) can be issued to allow autogeneration of bridge facilities.

Module: DFHBRAI

XMEOUT Parameters: *date, time,applid, userid, tranid, urmname*

Destination: CSBR

DFHBR0205 *date time applid userid tranid* **Bridge facility autoinstall URM *urmname* returned an invalid termid name *termid*. The name contains invalid characters.**

Explanation: The Bridge facility autoinstall URM returned an invalid termid. See the *CICS External Interfaces Guide* for a description of the valid character set for Bridge facility termids.

System action: The request fails. If it is using the Link3270 mechanism the request fails with a reason code of BRIHRC-TERMID-INVALID. Other bridge mechanisms fail with an ABRU abend code.

User response: Correct the URM so that it generates or accepts valid termid names from clients.

Module: DFHBRAI

XMEOUT Parameters: *date, time,applid, userid, tranid, urmname, termid*

Destination: CSBR

DFHBR0206 *date time applid userid tranid* **Bridge facility autoinstall URM *urmname* returned an invalid netname *netname*. The name contains invalid characters.**

Explanation: The Bridge facility autoinstall URM returned an invalid netname. See the *CICS External Interfaces Guide* for a description of the valid character set for Bridge facility netnames.

System action: The request fails. If it is using the Link3270 mechanism the request fails with a reason code of BRIHRC-TERMID-INVALID. Other bridge mechanisms fail with an ABRU abend code.

User response: Correct the URM so that it generates or accepts valid netnames from clients.

Module: DFHBRAI

XMEOUT Parameters: *date, time,applid, userid, tranid, urmname, netname*

Destination: CSBR

DFHBR0207 *date time applid userid tranid* **Bridge facility autoinstall URM *urmname* returned termid *termid* netname *netname*.**

Explanation: The Bridge facility autoinstall URM returned termid and netname. This information is for audit purposes only.

System action: The name is used when running the user transaction.

User response: None.

Module: DFHBRAI

XMEOUT Parameters: *date, time,applid, userid, tranid, urmname, termid, netname*

Destination: CSBR

DFHBR0208 *date time applid userid tranid* **Bridge facility autoinstall URM *urmname* rejected termid *termid* netname *netname*.**

Explanation: The Bridge facility autoinstall URM returned a non zero return code to reject termid and netname.

System action: The Link3270 request is rejected with a return code of brihrc_ai_rejected.

User response: None.

Module: DFHBRAI

XMEOUT Parameters: *date, time, applid, userid, tranid, urmname, termid, netname*

Destination: CSBR

DFHBR0403 *date time applid* **Transaction tranid definition conflicts with Bridge Link3270 routing requirements.**

Explanation: The client request to execute the transaction in the BRIH cannot be routed to the AOR region because the transaction definition routing information conflicts with the routing information for the bridge facility.

The first application transaction definition that uses a bridge facility is used to determine where all transactions that use that facility are to be executed. The transaction definition of the transaction that the client has supplied in the BRIH conflicts with that definition.

All transactions that are to be executed under a bridge facility must have the same routing characteristics as the first transaction executed under the bridge facility.

System action: The BRIH returned to the client contains information to enable the client to identify the reason for the error.

User response: Ensure that the transaction definition of all transactions that are to be used by a bridge facility do not cause routing conflicts.

Module: DFHBRMR

XMEOUT Parameters: *date, time, applid, tranid*

Destination: CSBR

DFHBR0410 *date time applid* **Dynamic transaction routing program prog has abended with abend code abend.**

Explanation: The dynamic transaction routing program has abnormally terminated with abend code *abcode*.

System action:

1. If the dynamic transaction routing program was processing a route selection, a route selection error or a route notify request at the time of the abend, the BRIH returned to the client will contain information to enable the client to identify the reason for the error.
2. If the dynamic routing program was processing a route terminate or route abend request at the time of the abend, the BRIH returned to the client will not contain information about the dynamic transaction routing program abend.

User response: See the description of abend code *abcode* for further guidance.

If the code is not a CICS transaction abend code, it is a user abend code. Request an explanation from the

programmer responsible for this area.

Module: DFHBRMR

XMEOUT Parameters: *date, time, applid, prog, abend*

Destination: CSBR

DFHBR0411 *date time applid* **Dynamic transaction routing program prog must be AMODE=31.**

Explanation: CICS has failed to link to the dynamic transaction routing program because it is not AMODE 31.

System action:

1. If making a route selection, route selection error or route notify link to the dynamic transaction routing program, the BRIH returned to the client will contain information to enable the client to identify the reason for the error.
2. If making a route terminate or route abend link to the dynamic transaction routing program, the BRIH returned to the client will not contain information about the failed link to the dynamic routing program.

User response: Recompile and link edit the dynamic transaction routing program to AMODE 31.

Module: DFHBRMR

XMEOUT Parameters: *date, time, applid, prog*

Destination: CSBR

DFHBR0412 *date time applid* **Dynamic transaction routing program prog PPT entry not found.**

Explanation: CICS was unable to find a PPT entry for the dynamic transaction routing program.

System action:

1. If making a route selection, route selection error or route notify link to the dynamic routing program, the BRIH returned to the client contains information to enable the client to identify the reason for the error.
2. If making a route terminate or route abend link to the dynamic routing program, the BRIH returned to the client does not contain information about the failed link to the dynamic transaction routing program.

User response: Ensure that the dynamic routing program specified by the system initialization parameter *DTRPGM=program name*, or specified via the EXEC CICS SET SYSTEM *DTRPROGRAM(program name)* has been correctly defined to CICS.

Module: DFHBRMR

XMEOUT Parameters: *date, time, applid, prog*

Destination: CSBR

DFHBR0413 *date time applid* **Dynamic transaction routing program prog fetch failed.**

Explanation: CICS was unable to load the dynamic transaction routing program.

System action:

1. If making a route selection, route selection error or route notify link to the dynamic routing program, the BRIH returned to the client contains information to enable the client to identify the reason for the error.
2. If making a route terminate or route abend link to the dynamic routing program, the BRIH returned to the client does not contain information about the failed link to the dynamic transaction routing program.

User response: Ensure that the dynamic routing program specified by the system initialization parameter DTRPGM=*program name*, or specified via the EXEC CICS SET SYSTEM DTRPROGRAM(*program name*) has been correctly defined. Ensure that it is also in a load library accessible to CICS.

Module: DFHBRMR

XMEOUT Parameters: *date, time, applid, prog*

Destination: CSBR

DFHBR0414 *date time applid* **Dynamic transaction routing program prog is disabled.**

Explanation: The dynamic transaction routing program was disabled.

System action:

1. If making a route selection, route selection error or route notify link to the dynamic routing program, the BRIH returned to the client contains information to enable the client to identify the reason for the error.
2. If making a route terminate or route abend link to the dynamic routing program, the BRIH returned to the client does not contain information about the failed link to the dynamic transaction routing program.

User response: Ensure that the dynamic routing program specified by the system initialization parameter DTRPGM=*program name*, or specified via the EXEC CICS SET SYSTEM DTRPROGRAM(*program name*) has been correctly defined to CICS and is enabled.

Module: DFHBRMR

XMEOUT Parameters: *date, time, applid, prog*

Destination: CSBR

DFHBR0415 *date time applid* **Dynamic transaction routing program prog is defined as remote.**

Explanation: The dynamic transaction routing program was defined as remote.

System action:

1. If making a route selection, route selection error or route notify link to the dynamic routing program, the BRIH returned to the client contains information to enable the client to identify the reason for the error.
2. If making a route terminate or route abend link to the dynamic routing program, the BRIH returned to the client does not contain information about the failed link to the dynamic transaction routing program.

User response: Ensure that the dynamic routing program specified by the system initialization parameter DTRPGM=*program name*, or specified via the EXEC CICS SET SYSTEM DTRPROGRAM(*program name*) has been correctly defined to CICS.

Module: DFHBRMR

XMEOUT Parameters: *date, time, applid, prog*

Destination: CSBR

DFHBR0427 *date time applid* **The Bridge Link3270 connection for {request allocate_facility (| request delete_facility (| request continue_conversation (| request get_more_message (| request resend_message (| transaction }trandid) to system | to system }sysid has failed.**

Explanation: The Bridge Link3270 request has been routed to a remote CICS region. An irrecoverable error occurred during the conversation with the mirror program DFHBRMP (for example, if a session fails, or the server region fails).

System action: The BRIH returned to the client contains information to enable the client to identify the reason for the error.

User response: After the connection has been restored the client can issue a resend message request to determine the status of the application transaction in the AOR.

Module: DFHBRMR

XMEOUT Parameters: *date, time, applid, {1=request allocate_facility (, 2=request delete_facility (, 3=request continue_conversation (, 4=request get_more_message (, 5=request resend_message (, 6=transaction }, trandid, {1=} to system , 2= to system }, sysid*

Destination: CSBR

DFHBR0430 *date time applid* Routing of the Bridge Link3270 request for transaction *tranid* to system *sysid* failed. The dynamic transaction routing program completed with return code 8. Last attempt to route request failed because the remote system could not be found in the intersystem table.

Explanation: The transaction *tranid* supplied by the client in the BRIH is defined as dynamic. The dynamic transaction routing program completed with return code 8. The last attempt to route the Bridge Link3270 request to the remote system failed because the remote system could not be found in the intersystem table.

System action: The BRIH returned to the client contains information to enable the client to identify the reason for the error.

User response: Ensure that the connection definitions are correct and that the dynamic transaction routing URM supplies a valid system for the request.

Module: DFHBRMR

XMEOUT Parameters: *date, time, applid, tranid, sysid*

Destination: CSBR

DFHBR0431 *date time applid* Routing of the Bridge Link3270 request for transaction *tranid* to system *sysid* failed. The dynamic transaction routing program completed with return code 8. Last attempt to route request failed because the remote system was out of service.

Explanation: The transaction *tranid* supplied by the client in the BRIH is defined as dynamic. The dynamic transaction routing program completed with return code 8. The last attempt to route the request failed because the remote system was out of service.

System action: The BRIH returned to the client contains information to enable the client to identify the reason for the error.

User response: Investigate the reason for the remote system being out of service.

When the remote system is back in service the client can retry the Bridge Link3270 request.

Module: DFHBRMR

XMEOUT Parameters: *date, time, applid, tranid, sysid*

Destination: CSBR

DFHBR0432 *date time applid* Routing of the Bridge Link3270 request for transaction *tranid* to system *sysid* failed. The dynamic transaction routing program completed with return code 8. Last attempt to route request failed because the session allocation was rejected.

Explanation: The transaction *tranid* supplied by the client in the BRIH is defined as dynamic. The dynamic transaction routing program completed with return code 8. The last attempt to route the request failed because the remote session allocation was rejected.

System action: The BRIH returned to the client contains information to enable the client to identify the reason for the error.

User response: Investigate the reason for the rejection of the allocation of the session.

The transaction definition *queuelimit* value and global user exit *XZIQUE* can be used to control the size of the session queue and decide if a request is to be rejected or not. Refer to the *CICS Resource Definition Guide*, the *CICS Customization Guide* and the *CICS Intercommunication Guide* manuals for further information.

Module: DFHBRMR

XMEOUT Parameters: *date, time, applid, tranid, sysid*

Destination: CSBR

DFHBR0433 *date time applid* Routing of the Bridge Link3270 request for transaction *tranid* to system *sysid* failed. The dynamic transaction routing program completed with return code 8. Last attempt to route request failed because the session allocation queue was purged.

Explanation: The transaction *tranid* supplied by the client in the BRIH is defined as dynamic. The dynamic transaction routing program completed with return code 8. The last attempt to route the request failed because the remote session allocation queue was purged.

System action: The BRIH returned to the client contains information to enable the client to identify the reason for the error.

User response: Investigate the reason for the purge of the session allocation queue.

The transaction definition *queuelimit* and *maxqtime* field values determine when the queue will be purged. Global user exit *XZIQUE* can also be used to control the queue. Refer to the *CICS Resource Definition Guide*, the *CICS Customization Guide* and the *CICS Intercommunication Guide* manuals for further information.

Module: DFHBRMR

XMEOUT Parameters: *date, time, applid, tranid, sysid*

Destination: CSBR

DFHBR0434 *date time applid* **Routing of the Bridge Link3270 request for transaction *tranid* to system *sysid* failed. The dynamic transaction routing program completed with return code 8. Last attempt to route request failed because the remote system did not support the function.**

Explanation: The transaction *tranid* supplied by the client in the BRIH is defined as remote. The dynamic transaction routing program completed with return code 8. The last attempt to route the request failed because the remote system did not support the function. The remote system would not support the function for one of the following reasons.

1. The remote system is connected via a LUTYPE 6.1 connection.
2. The remote system does not support the Bridge Link3270 function.

System action: The BRIH returned to the client contains information to enable the client to identify the reason for the error.

User response: Ensure that the dynamic transaction routing program does not route Bridge Link3270 request over TYPE6.1 connections and that the requests are routed to a remote region that is at the correct level to support Bridge Link3270 requests.

Module: DFHBRMR

XMEOUT Parameters: *date, time, applid, tranid, sysid*

Destination: CSBR

DFHBR0436 *date time applid* **Routing of the Bridge Link3270 request for transaction *tranid* to system *sysid* failed. The dynamic transaction routing program completed with return code 8 on the first route selection call.**

Explanation: The transaction *tranid* supplied by the client in the BRIH is defined as dynamic. The dynamic transaction routing program completed with return code 8 during the route selection call. An attempt to route the transaction has not been made.

System action: The BRIH returned to the client contains information to enable the client to identify the reason for the error.

User response: Investigate why the dynamic transaction routing program completed with return code 8 during the route selection call.

Module: DFHBRMR

XMEOUT Parameters: *date, time, applid, tranid, sysid*

Destination: CSBR

DFHBR0437 *date time applid* **Routing of the Bridge Link3270 request for transaction *tranid* to system netname '*netname*' failed. The dynamic transaction routing program completed with return code 8. Last attempt to route request failed because the remote system could not be found in the intersystem table.**

Explanation: The transaction *tranid* supplied by the client in the BRIH is defined as dynamic. The dynamic transaction routing program completed with return code 8. The last attempt to route the Bridge Link3270 request to the remote system failed because the remote netname could not be found in the intersystem table.

System action: The BRIH returned to the client contains information to enable the client to identify the reason for the error.

User response: Ensure that the connection definitions are correct and that the dynamic transaction routing program URM supplies a valid netname routing value.

Module: DFHBRMR

XMEOUT Parameters: *date, time, applid, tranid, netname*

Destination: CSBR

DFHBR0438 *date time applid* **Routing of the Bridge Link3270 request for transaction *tranid* to system '*sysid*' netname '*netname*' failed. The dynamic transaction routing program completed with return code 8. Last attempt to route request failed because the remote system and netnames do not match.**

Explanation: The transaction *tranid* supplied by the client in the BRIH is defined as dynamic. The dynamic transaction routing program completed with return code 8. The last attempt to route the Bridge Link3270 request to the remote system failed because the remote system name and netname do not match.

System action: The BRIH returned to the client contains information to enable the client to identify the reason for the error.

User response: Ensure that the connection definitions are correct and that the dynamic transaction routing program URM supplies matching *sysid* and *netname* values.

Module: DFHBRMR

XMEOUT Parameters: *date, time, applid, tranid, sysid, netname*

Destination: CSBR

DFHBR0501 *date time applid File filename is not available. {The file is disabled | The file is not open | The file was not found | SMSVSAM server is not available | CFDT server is not available | The dataset is being copied | An IO error occurred | The file is defined as recoverable}.*

Explanation: One of the following errors was detected when attempting to access the file

- The file is disabled.
- The file is not open.
- The file was not found.
- The SMSVSAM server is not available.
- The CFDT server is not available.
- The dataset is being copied.
- An I/O error occurred.
- The file is defined as recoverable.

System action: The file is not available. The BRIH returned to the client will contain an unsuccessful return code.

User response: Investigate the error which caused the file to be made unavailable. Correct the cause of the problem and retry the failed transaction.

Module: DFHBRNS

XMEOUT Parameters: *date, time,applid, filename, {1=The file is disabled, 2=The file is not open, 3=The file was not found, 4=SMSVSAM server is not available, 5=CFDT server is not available, 6=The dataset is being copied, 7=An IO error occurred,8=The file is defined as recoverable}*

Destination: CSBR

DFHBR0502 *date time applid Not authorized to access file filename.*

Explanation: The external security manager would not allow the file to be accessed.

System action: The BRIH returned to the client contains an unsuccessful return code.

User response: If the user should have access to the file, allow access and retry the transaction.

Module: DFHBRNS

XMEOUT Parameters: *date, time,applid, filename*

Destination: CSBR

DFHBR0503 *date time applid File filename is full.*

Explanation: The file is full. New records cannot be added to the file.

System action: The BRIH returned to the client contains an unsuccessful return code.

User response: Increase the size of the file and retry the failed transaction.

Module: DFHBRNS

XMEOUT Parameters: *date, time,applid, filename*

Destination: CSBR

DFHBR0504 *date time applid File filename record has been suppressed by user exit.*

Explanation: A user exit has suppressed the writing of records to the file.

System action: The BRIH returned to the client contains an unsuccessful return code.

User response: The exit should not be allowed to suppress records being written to the file.

Module: DFHBRNS

XMEOUT Parameters: *date, time,applid, filename*

Destination: CSBR

DFHBR0505 *date time applid Bridge facility ranges have reached percent percent of total allocation.*

Explanation: Bridge facilities are allocated in ranges. The allocation of the Bridge facility range has increased the number of allocated ranges above the warning threshold. The message gives the percentage of available ranges that have been allocated and is issued if the allocation causes the percentage to increase above 90%. The message is reissued for every allocation that causes a percentage point increase in available ranges that have been allocated.

System action: The user transaction continues.

User response: This is an indication that the CICS regions that are sharing file DFHBRNSF are reaching the limit of the number of allocation ranges.

Module: DFHBRNS

XMEOUT Parameters: *date, time,applid, percent*

Destination: Console and Transient Data Queue CSBR

DFHBR0506 *date time applid Bridge facility ranges have reduced below percent percent of total allocation.*

Explanation: Bridge facilities are allocated in ranges. A release of a Bridge facility range has caused the number of available ranges to fall below a warning threshold.

System action: The user transaction continues.

User response: The number of available Bridge facility ranges is increasing.

DFHBR0507 • DFHCA5100S

Module: DFHBRNS

XMEOUT Parameters: *date, time, applid, percent*

Destination: Console and Transient Data Queue
CSBR

DFHBR0507 *date time applid* **All Bridge facility ranges have been allocated.**

Explanation: Bridge facilities are allocated in ranges. The allocation of the Bridge facility range failed because all ranges have been allocated.

System action: The BRIH returned to the client contains information to enable the client to identify the reason for the error.

User response: The request can be retried when Bridge facility ranges are available for allocation.

Module: DFHBRNS

XMEOUT Parameters: *date, time, applid*

Destination: Console and Transient Data Queue
CSBR

DFHBR0508 *date time applid* **File filename is not available. Sysid sysid error.**

Explanation: The attempt to access the remote file failed with a sysiderr.

System action: The file is not available. The BRIH returned to the client contains an unsuccessful return code.

User response: Investigate the error which caused the file to be made unavailable. Correct the cause of the problem and retry the failed transaction.

Module: DFHBRNS

XMEOUT Parameters: *date, time, applid, filename, sysid*

Destination: CSBR

DFHBR0509 *date time applid* **You are approaching or have reached the maximum number of times a Link3270 bridge routing region can be started.**

Explanation: The number of times that Link3270 bridge routing regions, which use the same DFHBRNSF data set, can be started is approaching or has already reached the maximum. An invalid facilitytoken is allocated if the number of times these CICS routing regions are connected (connection_number), exceeds the maximum.

This message is issued if you have exceeded 90% of the available times that routing regions can be started when using the same DFHBRNSF data set.

System action: The Link3270 bridge request continues to be processed. When CICS reaches the maximum number of times that routing regions can be started using the same DFHBRNSF data set, the request abends with abend code AEXZ.

User response: At a convenient time, stop all regions that use the Link3270 bridge routing data set, DFHBRNSF, and redefine it. Redefining the data set resets connection_number to 0. Restart your routing regions.

Module: DFHBRNS

XMEOUT Parameters: *date, time, applid*

Destination: Console and CSBR transient data queue

DFHBR0601 *date time applid* **Bridge Link3270 security error. User userid1 attempting to use facility allocated to userid2.**

Explanation: The Bridge Link3270 has detected a security error. A different userid than the one that allocated the Bridge Link3270 facility is attempting to use that facility.

System action: The request is rejected and the BRIH returned to the client contains information to enable the client to identify the reason for the error.

User response: Ensure that the same user that allocated the Bridge Link3270 facility is the only user that uses that facility.

Module: DFHBRFR, DFHBRMP

XMEOUT Parameters: *date, time, applid, userid1, userid2*

Destination: CSBR

DFHCAnnnn messages

DFHCA5100S *date time applid netname tranid* **Severe error in module modname. Abend code: abcode**

Explanation: An internal error has occurred in module *modname*, when invoked by a CSD utility command.

System action: Processing terminates abnormally with an operating system dump and abend code *abcode*.

The CSD utility attempts to

1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.

User response: See the description of abend code *abcode* for guidance.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, modname, abcode*

Destination: CSMT

DFHCA5101I *date time applid netname tranid command*
command executed successfully.

Explanation: The execution of a CSD utility command *command* completed successfully.

System action: Normal processing continues.

User response: None.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, command*

Destination: CSMT

DFHCA5102I *date time applid netname tranid* **Warning message(s) issued while processing command command.**

Explanation: The CSD utility issued messages during syntax-checking and execution of the *command* command.

System action: Normal utility processing continues to the end of the job.

User response: Review the warning messages to see how they have affected utility processing. Then decide whether you need to submit a further CSD utility job.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, command*

Destination: CSMT

DFHCA5103I *date time applid netname tranid* **Error(s) occurred while processing command command.**

Explanation: The CSD utility either found a syntax error in the utility command *command*, or the command *command* failed to execute correctly.

System action: Utility command execution is terminated.

If commands are being read from a SYSIN data stream by the utility, subsequent commands (except LIST) are checked for syntax only. (If the primary CSD file cannot be opened, LIST is not processed either.)

If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

User response: If the command failed because of syntax errors, correct the command.

If the command failed to execute correctly, this may

have been caused by a previous error. In this case, an associated error message, such as DFHCA5275, should have been issued. Refer to these error messages for further guidance.

Correct all errors before trying to open the CSD file again.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, command*

Destination: CSMT

DFHCA5104W *date time applid netname tranid*
Subsequent commands (except LIST) are not executed because of error(s) above.

Explanation: After the CSD utility program encounters an error, it ceases to execute any further commands read from a data stream (as opposed to supplied by a put-message exit routine). However, it continues to check the syntax of subsequent commands. The exception is the LIST command, which is still executed if the primary CSD file can be opened.

System action: Subsequent CSD utility commands (except LIST) are ignored.

User response: Check for a syntax error in the commands used, and correct it.

There should be associated error messages which identify the problem that caused DFHCSDUP to halt active processing. These messages should appear in the DFHCSDUP output before message DFHCA5104 is issued.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid*

Destination: CSMT

DFHCA5105W *date time applid netname tranid command*
command not executed because of previous error(s).

Explanation: If a syntax error (or an execution error) occurred in a command read from a data stream and processed earlier, no further commands (except for LIST commands) are executed. If the primary CSD file could not be opened, the LIST command is not executed either.

System action: The CSD utility command is not executed.

User response: Check for syntax errors or execution errors in commands processed earlier.

Correct the invalid commands.

Module: DFHCAP

DFHCA5107I • DFHCA5115S

XMEOUT Parameters: *date, time,applid, netname, tranid, command*

Destination: CSMT

DFHCA5107I *date time applid netname tranid*
Commands executed successfully: *ns*
Commands giving warning(s): *nw*
Commands in error: *ne*

Explanation: The CSD utility has completed input command processing.

Commands giving warnings may or may not have been executed successfully.

System action: Normal processing continues to the end of the job.

User response: If any CSD utility commands in error were executed, decide if the results are what you want.

If not, correct them and resubmit in another job.

If any commands were not executed, you must resubmit them. (See message DFHCA5108.)

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, ns, nw, ne*

Destination: CSMT

DFHCA5108I *date time applid netname tranid*
Commands not executed after error(s):
nn

Explanation: The CSD utility has completed input command processing. The number of commands not executed because of errors is indicated by *nn*.

System action: Normal processing continues to the end of the job.

User response: Correct the commands in error and resubmit them in another job.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, nn*

Destination: CSMT

DFHCA5109I *date time applid netname tranid* **End of DFHCSDUP utility job. Highest return code was:** *retcode*

Explanation: The CSD utility job is complete.

System action: Control returns to the invoker, that is, either to the operating system or to an invoking program.

User response: None.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, retcode*

Destination: CSMT

DFHCA5110W *date time applid netname tranid* **Error found in 'PARM=' parameter data on EXEC job step. This data is ignored.**

Explanation: The value of the PARM parameter on the EXEC statement in the JCL to run the DFHCSDUP utility is incorrect.

System action: The PARM parameter is ignored. The CSD is opened for read and write operations.

User response: Correct the erroneous PARM value. The incorrect value can be found in the job control language used to execute DFHCSDUP.

The *CICS Operations and Utilities Guide* describes how to code the PARM parameter.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid*

Destination: CSMT

DFHCA5114S *date time applid netname tranid* **The csdtype CSD has not been initialized. Command not executed.**

Explanation: The primary CSD file must be initialized before any CSD utility command (other than the INITIALIZE or SERVICE commands) can be processed. If a secondary CSD file is used, it must always be initialized before this command can be processed. CICS issues this message if you try to break either of these rules, or if an attempt to initialize a CSD file fails to complete successfully.

System action: The CSD utility ignores the command.

User response: Initialize the CSD file. You may first have to determine why a previous initialization attempt failed.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, csdtype*

Destination: CSMT

DFHCA5115S *date time applid netname tranid* **The primary CSD is already initialized. Command not executed.**

Explanation: An INITIALIZE or a SERVICE command was encountered but the primary CSD file has already been initialized.

System action: The INITIALIZE or SERVICE command is ignored.

User response: Confirm that the correct CSD file was specified.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid*

Destination: CSMT

DFHCA5116S *date time applid netname tranid* **The primary CSD has been defined with an invalid key length. Processing is terminated.**

Explanation: The CSD utility cannot initialize the CSD file because it has been defined to VSAM with an invalid key length.

System action: The CSD file remains uninitialized, and no utility commands are processed.

User response: Delete the CSD file, using VSAM Access Method Services (AMS). In the JCL defining the CSD cluster, change the AMS control statements to specify KEYS(22 0). Use this JCL to redefine the CSD file, and use the CSD utility to reinitialize it.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid*

Destination: CSMT

DFHCA5117S *date time applid netname tranid* **The primary CSD has been defined with an invalid record size. Processing is terminated.**

Explanation: The CSD utility cannot initialize the CSD file, because it has been defined to VSAM with an invalid record length.

System action: The CSD file remains uninitialized, and no utility commands are processed.

User response: Delete the CSD file, using VSAM Access Method Services (AMS). In the JCL defining the CSD cluster, change the AMS control statements to specify RECORDSIZE(200 2000). Use this JCL to redefine the CSD file, and use the CSD utility to reinitialize it.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid*

Destination: CSMT

DFHCA5120I *date time applid netname tranid csdtype* **CSD opened; ddname: ddname**

Explanation: The VSAM data set specified in the JCL has been successfully opened, and is identified as the primary or secondary CSD file. (All utility commands

processed will use the same primary CSD file. Different secondary CSD files may be accessed by different utility commands.)

System action: Normal processing continues.

User response: None.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, csdtype, ddname*

Destination: CSMT

DFHCA5121S *date time applid netname tranid I/O* **error while opening csdtype CSD; ddname: ddname**

Explanation: An I/O error occurred when reading or writing control records of the VSAM data set identified in the JCL as the primary or secondary CSD file.

System action: The utility command is not executed.

User response: Retry the utility command that failed. If the problem persists, restore the CSD file from your own backup procedures.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, csdtype, ddname*

Destination: CSMT

DFHCA5122S *date time applid netname tranid VSAM* **error while opening csdtype CSD; ddname: ddname**

Explanation: A VSAM error occurred when opening the data set identified in the JCL as a primary or secondary CSD file.

System action: The utility command is not executed.

User response: Refer to the VSAM diagnostics output in message DFHCA5179 for further information and guidance.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, csdtype, ddname*

Destination: CSMT

DFHCA5123I *date time applid netname tranid csdtype* **CSD closed; ddname: ddname**

Explanation: The VSAM data set used as the primary or secondary CSD file has been successfully closed, with control records updated if necessary. (The primary CSD file is closed after all the utility commands have been processed; the secondary CSD file is closed after the command for which it was opened.)

System action: Normal processing continues.

User response: None.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, csdtype, ddname*

Destination: CSMT

DFHCA5124S *date time applid netname tranid*
Processing terminated. Corrupted
csdtype **CSD control record detected**
while closing CSD; ddname: ddname

Explanation: A storage corruption is preventing the CSD control records from being updated when the CSD file is being closed.

System action: No further CSD utility commands are processed.

User response: Obtain a dump from DFHCSDUP together with a listing of the DFHCSDUP run and its JCL. Also try to obtain a print out of the CSD, using either IDCAMS or the DFHCSDUP LIST ALL option. The LIST will indicate where the errors have occurred because they do not print and are therefore easily identifiable.

Using the information available, determine the cause of the errors and correct them.

Resubmit the CSD utility commands that failed.

If you cannot resolve the problem, or if the problem persists, you will need further help from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, csdtype, ddname*

Destination: CSMT

DFHCA5125S *date time applid netname tranid* **Error**
occurred while closing *csdtype* **CSD.**
File is full; ddname: ddname

Explanation: After processing the CSD utility commands, the CSD control records are updated before closing the data set.

Updating failed because data set *ddname* was full.

System action: Utility command processing is terminated.

User response: Initialize a new primary CSD file with a larger data set size. Then use the IDCAMS IMPORT and EXPORT commands to restore the CSD file onto a larger data set. If you have a recoverable CSD and you update it from CICS in RLS mode, there are extra steps required to ensure that any retained locks remain associated with the data set. These are explained in the *CICS Recovery and Restart Guide*.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, csdtype, ddname*

Destination: CSMT

DFHCA5126S *date time applid netname tranid* **I/O**
error while closing *csdtype* **CSD;**
ddname: ddname

Explanation: An I/O error occurred when reading or writing the control records of the CSD file before closing VSAM data set *ddname*.

System action: No further utility commands are executed.

User response: Resubmit the utility commands that failed. If the problem persists, restore the CSD file from your own backup procedures.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, csdtype, ddname*

Destination: CSMT

DFHCA5127S *date time applid netname tranid* **VSAM**
error while closing *csdtype* **CSD;**
ddname: ddname

Explanation: A VSAM error occurred when closing the data set *ddname* in the JCL as the primary or secondary CSD file.

System action: No further CSD utility commands are executed.

User response: Refer to the VSAM diagnostics output in message DFHCA5179 for further information and guidance.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, csdtype, ddname*

Destination: CSMT

DFHCA5128S *date time applid netname tranid*
Processing terminated. *csdtype* **CSD**
accessed by another user and could
not be shared. *ddname: ddname*

Explanation: An attempt to open the CSD has returned an error from VSAM because the data set is not available for the type of processing requested.

This usually means that

- An attempt has been made to open the CSD in non-RLS access mode, but the CSD is already being accessed from elsewhere in RLS access mode.

- An attempt has been made to open the CSD in RLS access mode, but the CSD is already being accessed from elsewhere in non-RLS access mode.
- An attempt has been made to open the CSD in non-RLS access mode, and the CSD is already being accessed in non-RLS access mode, but the CSD cluster has been defined with SHAREOPTIONS that restrict its concurrent use.

System action: The command is not executed.

User response: You can change the access mode in which you are trying to open the CSD. To open a recoverable CSD in RLS access mode from the DFHCSDUP utility program.

Alternatively, wait until the CSD file is no longer being accessed in the conflicting access mode, or until it becomes available again in accordance with the SHAREOPTIONS rules defined for the cluster.

If the conflict is due to SHAREOPTIONS and LIST is the only command you want to execute, you can specify PARM=CSD(READONLY).

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, csdtype, ddname*

Destination: CSMT

DFHCA5130E *date time applid netname tranid* **Unable to locate module DFHCICS. Primary CSD not initialized.**

Explanation: The DFHCICS module is missing from the library.

System action: Processing of the INITIALIZE command is terminated.

User response: Ensure that the DFHCICS module is present in the library.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid*

Destination: CSMT

DFHCA5131I *date time applid netname tranid* **List listid created.**

Explanation: The INITIALIZE command has created the header for an IBM-protected list.

System action: Normal processing continues.

User response: None.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, listid*

Destination: CSMT

DFHCA5132S *date time applid netname tranid* **Unable to create list listid**

Explanation: The INITIALIZE command has failed when calling the CSD manager routing program, DFHDMP, to create a new list *listid* on the CSD file for the IBM-protected groups. The CSD file may be full or corrupt.

System action: Processing of the INITIALIZE command is terminated.

User response: Check that the data set size for the CSD file is large enough. If it is not, allocate more space.

If there is ample space and you suspect that the CSD file is corrupt, you need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, listid*

Destination: CSMT

DFHCA5133S *date time applid netname tranid* **CSD contains one or more lists. No lists may be present on the CSD when the INITIALIZE command is issued.**

Explanation: The CEDA transaction was used to create a list while the INITIALIZE command was executing.

System action: Processing of the INITIALIZE command is terminated.

User response: Redefine the data set and rerun the INITIALIZE command. The CEDA transaction must not be used until the initialization of the CSD file has been successfully completed.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid*

Destination: CSMT

DFHCA5134S *date time applid netname tranid* **Error occurred while adding group grpname to list listid**

Explanation: A call to the CSD manager routing program, DFHDMP, to write the definition of group *grpname* to the CSD file as a member of an IBM-protected list *listid* created an error. The CSD file may be full or corrupt.

System action: Processing of the INITIALIZE command is terminated.

User response: Increase the data set size for the CSD file and repeat the INITIALIZE request. If this fails,

DFHCA5135I • DFHCA5142E

you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, grpname, listid*

Destination: CSMT

DFHCA5135I *date time applid netname tranid Group grpname* **added to list** *listid*

Explanation: A group definition *grpname* has been satisfactorily created on the CSD file in list *listid*.

System action: Processing continues.

User response: None.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, grpname, listid*

Destination: CSMT

DFHCA5136W *date time applid netname tranid Group grpname* **is already a member of list** *listid*

Explanation: Group *grpname* already exists in list *listid*. CICS does not create a duplicate entry.

System action: Normal utility processing continues.

User response: None.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, grpname, listid*

Destination: CSMT

DFHCA5139W *date time applid netname tranid* **Consider implications of migrating TYPE=SHARED entries.**

Explanation: The CSD utility detected a migrate of a TST TYPE=SHARED entry. A DFHTST TYPE=SHARED entry is not directly migrated. Only when a TYPE=REMOTE macro that specifies a SYSIDNT that matches a SYSID in the corresponding TYPE=SHARED macro is a TSMODEL created.

System action: The CSD utility continues processing of the MIGRATE command.

User response: If SYSID is explicitly specified on the EXEC CICS request, or added by a global user exit program, and the intent of the SYSID is to direct the request to a SHARED TS pool, you must use the migrated TST in order to satisfy the request to use the pool. See the CICS Resource Definition Guide for more information.

Module: DFHCSDUP

XMEOUT Parameters: *date, time,applid, netname, tranid*

Destination: CSMT

DFHCA5140I *date time applid netname tranid Total xxxxxxxx* **definitions created:** *nn*

Explanation: CICS issued this message after migrating a CICS table. *nn* definitions of type xxxxxxxx have been created on the CSD file.

System action: Normal utility processing continues.

User response: None.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, xxxxxxxx, nn*

Destination: CSMT

DFHCA5141S *date time applid netname tranid* **Unable to create new group** *grpname*

Explanation: The MIGRATE command failed when calling the CSD manager routing program, DFHDMP, to create a new group *grpname* on the CSD file for the data in the table being migrated. The CSD file may be full, corrupt, or not initialized. The group name may be invalid.

System action: Processing of the MIGRATE command is terminated.

User response: Check the group name in the TOGROUP parameter. Reinitialize the CSD file with the INITIALIZE command, providing a larger data set size if necessary.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, grpname*

Destination: CSMT

DFHCA5142E *date time applid netname tranid* **Command not executed. Igrname was not updated because of a previous update failure.**

Explanation: The list or group *igrname* cannot be used because an operation to update it, using the DFHCSDUP offline utility, failed to execute to completion.

This has probably happened in a previous execution of DFHCSDUP.

System action: The command is not executed, and the execution of subsequent DFHCSDUP commands in the job stream is suppressed.

User response: Use the DFHCSDUP VERIFY

command to remove the in-flight flag detected when this message is produced.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, lgrname*

Destination: CSMT

DFHCA5143I *date time applid netname tranid* **Group**
grpname **created.**

Explanation: A new CSD group, *grpname*, has been created for the data in the table being migrated.

System action: Migration continues.

User response: None.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, grpname*

Destination: CSMT

DFHCA5145E *date time applid netname tranid*
Command not executed. lgrname has
been locked by applid: applid opid: opid
to prevent updating.

Explanation: The list or group *lgrname* cannot be used because a user of the CEDA or CEDB transaction has enforced a LOCK command to prevent updating by other users.

System action: The command is not executed.

If commands are being read from a SYSIN data stream, subsequent commands (except the LIST command) are checked for syntax only. (If the primary CSD file cannot be opened, the LIST command is not processed either.)

If commands are being read from a get-command exit, the DFHCSDUP utility attempts to process subsequent commands.

User response: Negotiate with the user with the specified OPID and APPLID, or create a new group or list by taking a copy of the definitions in the locked one.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, lgrname, applid, opid*

Destination: CSMT

DFHCA5146E *date time applid netname tranid*
Command not executed. lgrname is
currently being updated by applid
applid opid: opid

Explanation: The list or group *lgrname* cannot be used because

- A user of the CEDA or CEDB transaction is currently running a command to update it
- A previous operation to update it using CEDA or CEDB failed to execute to completion.

System action: The command is not executed.

If commands are being read from a SYSIN data stream, subsequent commands (except the LIST command) are checked for syntax only. (If the primary CSD file cannot be opened, the LIST command is not processed either.)

If commands are being read from a get-command exit, the DFHCSDUP utility attempts to process subsequent commands.

User response: Resubmit the utility job to retry the command that failed. Perform the subsequent commands that were suppressed.

If this fails to resolve the problem, run the DFHCSDUP VERIFY command to remove the in-flight flag detected when this message is produced.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, lgrname, applid, opid*

Destination: CSMT

DFHCA5147E *date time applid netname tranid*
Command not executed. lgrname
already exists as a group-or-list

Explanation: The name chosen for the target group (or list) duplicates that of an existing group or list on the CSD file.

System action: Processing of the utility command is terminated.

User response: Choose a different name for the target group.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, lgrname, group-or-list*

Destination: CSMT

DFHCA5148E *date time applid netname tranid* **Unable**
to get storage for tabletype table named
table

Explanation: There is insufficient storage to satisfy a GETMAIN request for table *table*.

System action: The system action depends on the table specified as follows

LD (language definition table)

The CSD utility cannot process any commands, and terminates with a dump. The MVS user abend code is 0327.

FCT and RDT

The CSD utility cannot migrate the table, and terminates processing of the utility command.

User response: Allocate additional storage. If your TCT assembly and link-editing is successful, the RDT should be in the library. The LD is in the load library of the supplied pregenerated CICS system.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, tabletype, table*

Destination: CSMT

DFHCA5149E *date time applid netname tranid*
Command not executed. xxxxxxxx is IBM-protected.

Explanation: A user attempted to add a definition to an IBM-supplied group or list (groups or lists beginning with DFH). This is not allowed.

System action: The CSD utility does not create a definition.

User response: Change the input command or TCT source data to name a target group or list whose name does not begin with DFH.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, xxxxxxxx*

Destination: CSMT

DFHCA5151I *date time applid netname tranid*
Resource not altered. xxxxxxxx is IBM-protected.

Explanation: During the execution of an ALTER command containing a generic group name a matching group was found which is an IBM-supplied group and is protected.

System action: The CSD utility does not alter the definition in the specified group.

User response: None.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, xxxxxxxx*

Destination: CSMT

DFHCA5155W *date time applid netname tranid*
tdqueue xxxxxxxx **has same name as an IBM-supplied definition in group grpname**

Explanation: The name of the migrated table entry, xxxxxxxx, matches the name of an IBM-supplied

resource in IBM-protected group *grpname*, created by the INITIALIZE command.

System action: CICS migrates this entry normally.

User response: If necessary, rename the resource, using the CEDA transaction.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, tdqueue, xxxxxxxx, grpname*

Destination: CSMT

DFHCA5156W *date time applid netname tranid*
TDqueue xxxxxxxx **did not migrate. Its properties match an IBM-supplied definition in group grpname**

Explanation: The properties of the resource defined in the user's table entry are the same as those of the IBM-supplied resource of the same name contained in IBM-protected group *grpname*.

System action: The entry for the user's resource is not migrated.

User response: None.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, TDqueue, xxxxxxxx, grpname*

Destination: CSMT

DFHCA5159I *date time applid netname tranid resource*
object **defined in group grpname**

Explanation: The CSD utility has successfully added a resource definition to a group, where

- *resource* is the type of resource (CONNECTION, FILE, JOURNALMODEL, LSRPOOL, MAPSET, PARTITIONSET, PARTNER, PROFILE, PROGRAM, SESSION, TDQUEUE, TERMINAL, TRANCLASS, TRANSACTION, or TYPETERM).
- *object* is the name of the object.
- *grpname* is the name of the group.

System action: Normal utility processing continues.

User response: None.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, resource, object, grpname*

Destination: CSMT

DFHCA5161S *date time applid netname tranid* **Table**
table **must be link-edited with**
AMODE(24) RMODE(24)

Explanation: After loading the table *table*, the migration routine checks that the table being processed

has been link-edited with the correct AMODE and RMODE attributes. For migration purposes, DCTs, FCTs and TCTs must be link-edited with AMODE(24) RMODE(24). RCTs must be link-edited with RMODE(24).

System action: The MIGRATE command is not processed.

User response: Relink the table with the correct attributes. For example, when migrating a DCT to your CSD include the following statement in your DCT: DFHDCT TYPE=(INITIAL,MIGRATE). For more information about migrating tables to your CSD, refer to the *CICS Resource Definition Guide*.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, table*

Destination: CSMT

DFHCA5164W *date time applid netname tranid* **No definition of resource object created. This duplicates an existing definition in group grpname**

Explanation: The CSD utility detected a CSD record with a matching key before adding the definition to the CSD file, where

- *resource* is the type of resource.
- *object* is the name of the object.
- *grpname* is the name of the group.

System action: The CSD utility does not migrate the resource definition to the CSD file. (If it is a transaction, a generated profile is not created either.)

User response: Use the CEDA transaction to define the resource with a unique name.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, resource, object, grpname*

Destination: CSMT

DFHCA5165S *date time applid netname tranid* **Processing is terminated. An error occurred while writing resource object to the CSD.**

Explanation: An error occurred when the CSD utility called DFHDMP to write the definition of the object *object* to the CSD file.

The CSD file may be full or corrupted.

resource is the type of resource.

System action: If the CSD is full, the CSD utility issues message DFHCA5176, and then terminates with a return code of 12 in message DFHCA5109.

If the CSD is not full, the CSD utility terminates

abnormally with message DFHCA5175, usually accompanied by one or more of the explanatory messages, DFHCA5177, DFHCA5178, and DFHCA5179.

User response: Use the additional messages to determine the cause of the error and the appropriate user action required.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, resource, object*

Destination: CSMT

DFHCA5166E *date time applid netname tranid* **Disallowed character in resource name object**

Explanation: The call to module DFHDMP has failed to construct a valid key for the record created on the CSD file because of an invalid character, or the resource name for the migrated table entry may be invalid. *resource* is the type of resource, and *object* is the name of the object.

System action: A CSD record is not created for this definition. (If it is a transaction, a generated profile is not created either.)

User response: Use the CEDA transaction to define the resource with a valid name.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, resource, object*

Destination: CSMT

DFHCA5167S *date time applid netname tranid* **The CSECTs in table table have been link-edited in the wrong order.**

Explanation: While processing a MIGRATE command, the CSD utility has detected that the CSECTs in table *table* are in the wrong order. Input to the linkage editor omitted a control statement to order the CSECTs.

System action: The CSD utility does not process the MIGRATE command.

User response: Use the IBM-supplied procedure, DFHAUPLK, to assemble and link-edit CICS tables. This procedure ensures the correct ordering of CSECTs within the tables.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, table*

Destination: CSMT

DFHCA5168S *date time applid netname tranid* **Table loaded from library member *table* is not a valid *tabletype*.**

Explanation: After loading the table *table*, the migration routine checks the VMNAME field in the DFHVM expansion of the data area following the load point. This message is produced if VMNAME is not that of a valid table.

System action: The MIGRATE command is not processed.

User response:

1. Ensure that the correct table is present in the library, and that the TABLE parameter of the MIGRATE command is correct.
2. Ensure that an ORDER statement was processed in the JCL of the link-editing of the table.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, table, tabletype*

Destination: CSMT

DFHCA5169S *date time applid netname tranid*
Processing is terminated. Table *table* was assembled for CICS release *rrr*. Reassemble for release *sss*.

Explanation: After loading the table *table*, the migration routine checks the VMVERS field in the DFHVM expansion of the data area following the load point. This field indicates the CICS release (*rrr*) for which the table was assembled, and is invalid for the CICS system (release *sss*) that is running.

System action: The MIGRATE command is not processed.

User response: Reassemble the table for the correct release of CICS.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, table, rrr, sss*

Destination: CSMT

DFHCA5174S *date time applid netname tranid*
Processing is terminated. Command cannot be executed because 'PARM=CSD(READONLY)' was specified.

Explanation: This command requires the CSD to be opened for read-write access. Your job step specified read-only access for the CSD in the DFHCSDDUP utility job stream.

System action: This command is not executed.

If commands are being read from a SYSIN data stream,

subsequent commands (except LIST) are checked for syntax only. (If the primary CSD file cannot be opened, LIST is not processed either.)

If commands are being read from a get-command exit, DFHCSDDUP attempts to process subsequent commands.

User response: Amend the JCL to specify 'PARM=CSD(READWRITE)'. accessing it in RLS mode, you cannot specify READWRITE access. In order to perform the command, you need to access the CSD in non-RLS mode.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid*

Destination: CSMT

DFHCA5175S *date time applid netname tranid*
Processing is terminated. Unexpected response from function in CSD manager.

Explanation: An invocation of the CSD manager, DFHDMP, has resulted in an error. The name of the function that failed is *function*.

System action: DFHCSDDUP issues additional messages, then

- Terminates **normally** for CSD open/close errors, and the CSD-full condition, or
- Terminates **abnormally** for all other situations.

User response: Ensure that you have set up your CSD file correctly. If you have migrated your CSD file from a previous release, note that you should have increased your block size to 500. If necessary, use the diagnostics in the additional messages.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, function*

Destination: CSMT

DFHCA5176S *date time applid netname tranid*
Processing is terminated. CSD is full.

Explanation: The VSAM data set containing the CSD file is full.

System action: Execution of the CSD utility command is terminated.

If commands are being read from a SYSIN data stream, subsequent commands (except LIST commands) are checked for syntax only. (If the primary CSD file cannot be opened, the LIST command is not processed either.)

If commands are being read from a get-command exit, the DFHCSDDUP utility attempts to process subsequent commands.

The DFHCSDUP utility leaves a system lock on the group being created at the time of failure. This lock prevents processing of the group by the CSD utility or the CEDA transaction.

User response: First, use the DFHCSDUP VERIFY process to remove the system lock on the partly-created group. Normal RDO processing of the group should then be possible, enabling the group (or any unwanted definitions) to be deleted.

To recover the contents of the CSD file, define a larger data set and use the AMS REPRO command. Usually, you will be able to REPRO from the CSD file that became full. If you are unable to do this, use a backup copy.

If your CSD is a recoverable data set and you update it from CICS in RLS mode, there are additional steps to be taken when using REPRO to ensure that any retained locks remain associated with the data set. These are explained in the *CICS Recovery and Restart Guide*.

You may be able to transfer definitions from the CSD file that filled up by using the DFHCSDUP COPY command with the FROMCSD option.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid*

Destination: CSMT

DFHCA5177S *date time applid netname tranid*
Processing is terminated. CSD I/O error occurred.

Explanation: An I/O error occurred when executing a READ or WRITE of a CSD record on the primary or secondary CSD file.

System action: DFHCSDUP issues additional messages and terminates abnormally.

User response: Restore the CSD file to a new data set from your own backup, or create the new CSD file by using the INITIALIZE, COPY, and APPEND commands to restore existing definitions.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid*

Destination: CSMT

DFHCA5178S *date time applid netname tranid*
Processing is terminated. Severe CSD error occurred.

Explanation: An error occurred during execution of the CSD manager, DFHDMP, to access the primary or secondary CSD file.

System action: DFHCSDUP issues additional

messages and terminates abnormally.

User response: See the VSAM diagnostics given in message DFHCA5179.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid*

Destination: CSMT

DFHCA5179S *date time applid netname tranid VSAM*
error. Return code = nn Error code = ddd(yy) Control block type = type

Explanation: VSAM returned the following diagnostics when an error occurred, where:

- *nn* is the hexadecimal VSAM return code
- *yy* is the hexadecimal VSAM error code (*ddd* is its decimal equivalent)
- CONTROL BLOCK TYPE points to the relevant error code subset as follows:
 - RPL = Request macro responses from VSAM
 - ACB = OPEN/CLOSE responses

The error code is:

- For CONTROL BLOCK TYPE = RPL, the reason code from byte 3 of the feedback word field in the RPL (RPLERRCD)
- For CONTROL BLOCK TYPE = ACB, the reason code in the ERROR field in the ACB (ACBERFLG)

System action: The CSD utility terminates command processing, and in some situations, produces an operating system dump.

User response: For the meaning of the VSAM return and error codes, refer to the *DFSMS/MVS V1R3 Macro Instructions for Data Sets* manual.

When interpreting these diagnostics, ensure that the data set referenced in the JCL exists.

Check the following

- The data set is being concurrently accessed by CICS running in another region.
- You are not attempting to open a recoverable CSD as READWRITE if DFHCSDUP specifies RLS access mode. You must specify PARM=CSD(READONLY) in this case.
- LOG is defined on the base cluster if RLS access mode is specified.

If DFHCSDUP specifies RLS access mode, a 'record not found' error could mean that the CSD has not been initialized. a recoverable CSD.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, nn, ddd(yy), type*

Destination: CSMT

DFHCA5180S *date time applid netname tranid*
Processing is terminated. Error occurred while CSD was being read by function subfunction

Explanation: When the LIST command invoked DFHDMP to scan the objects on the CSD file, an error occurred during execution of the DFHDMP function.

System action: The CSD utility terminates with an MVS abend 0325.

User response: This error should be reported. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, function, subfunction*

Destination: CSMT

DFHCA5181W *date time applid netname tranid* **No match found for generic group-or-list identifier xxxxxxxx**

Explanation: The LIST command was executed with a generic group or list name, but no qualifying group or list exists on the CSD file.

System action: Normal processing continues.

User response: None.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, group-or-list, xxxxxxxx*

Destination: CSMT

DFHCA5182W *date time applid netname tranid group-or-list xxxxxxxx* **does not exist.**

Explanation: The LIST command or the DELETE command was executed using the name of a group or list that does not exist on the primary CSD file.

System action: The LIST command or the DELETE command is not processed. Subsequent commands may still be processed.

User response: Correct the LIST command or the DELETE command to use a valid group or list name.

If a CSD upgrade is being performed, no user action is required.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, group-or-list, xxxxxxxx*

Destination: CSMT

DFHCA5183W *date time applid netname tranid group-or-list xxxxxxxx* **exists as a list-or-group name.**

Explanation: The LIST command or the DELETE command was executed using a group name that is already in use as a list name, or using a list name that is already in use as a group name.

System action: The LIST command or the DELETE command is not processed. Subsequent commands may still be processed.

User response: Correct the LIST command or the DELETE command to use a valid group or list name.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, group-or-list, xxxxxxxx, list-or-group*

Destination: CSMT

DFHCA5184S *date time applid netname tranid*
Processing is terminated. Invalid output from DFHPUP. Cannot format data for utility listing.

Explanation: There has been an internal logic error in the DFHCSDUP utility program. The data in the back-translated output buffer is invalid. The length code may be out of range or the data fields in the wrong sequence. One or more of the data fields may be invalid.

System action: The CSD utility terminates with an MVS abend 0326.

User response: This error must be reported.

Obtain a dump from DFHCSDUP together with a listing of the DFHCSDUP run and its JCL. Also try to obtain a print out of the CSD, using either IDCAMS or the DFHCSDUP LIST ALL option. The LIST indicates where the error(s) have occurred because they do not print and are therefore easily identifiable.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid*

Destination: CSMT

DFHCA5186W *date time applid netname tranid* **No objects defined in grpname listid**

Explanation: In executing a LIST command, the CSD utility has found a group or list header on the CSD file for which no corresponding group or list elements exist.

System action: The utility continues to process the LIST command, but will not tabulate elements of the

group or list named in the message.

User response: Run the DFHCSDUP VERIFY utility.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, objects, grpname, listid*

Destination: CSMT

DFHCA5187I *date time applid netname tranid resource*
is locked, but is not the name of a group or list.

Explanation: The CSD utility detected a locked resource that is not a group or list. The reason is that an interrupt or failure occurred during a CEDA transaction or a previous utility job. A lock had been created but not the associated group or list.

System action: The utility continues normal processing of the VERIFY command.

User response: None.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, resource*

Destination: CSMT

DFHCA5188I *date time applid netname tranid*
object-type name is now available for use.

Explanation: The VERIFY command discovered that the resource was not available for the CEDA transaction or offline commands. The restriction on its availability, which was due to the failure of some previous command affecting it, has now been removed.

System action: Normal processing of the VERIFY command continues.

User response: None.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, object-type, name*

Destination: CSMT

DFHCA5189I *date time applid netname tranid* **CSD**
verify process completed successfully.

Explanation: The VERIFY command has been processed successfully, and any internal locks associated with groups and lists on the CSD file have been removed.

System action: Normal processing continues.

User response: None.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid*

Destination: CSMT

DFHCA5190S *date time applid netname tranid*
Command is not executed. Unable to get storage for service module
progrname

Explanation: There is insufficient storage available to load the service module *progrname*, that is to be loaded and executed by DFHCSDUP.

System action: Utility command execution is terminated.

If commands are being read from a SYSIN data stream, subsequent commands (except LIST commands) are checked for syntax only. (If the primary CSD file cannot be opened, the LIST command is not processed either.)

If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

User response: Ensure that there is sufficient storage allocated to load module *progrname*.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, progrname*

Destination: CSMT

DFHCA5191I *date time applid netname tranid* **Service**
program *progrname* **is running.**

Explanation: The service module *progrname* has been loaded correctly. Execution of the module has started.

System action: Normal processing continues.

User response: None.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, progrname*

Destination: CSMT

DFHCA5192S *date time applid netname tranid*
Command is not executed. CSD
service level *ttt* **is incompatible with**
current service level *sss*

Explanation: Either the LEVEL parameter specified in the SERVICE command is wrong, or an incorrect version of the CSD file is being used as the secondary (input) CSD file.

System action: The SERVICE command is not executed.

If commands are being read from a SYSIN data stream, subsequent commands (except LIST commands) are

DFHCA5193S • DFHCA5197S

checked for syntax only. (If the primary CSD file cannot be opened, the LIST command is not processed either.)

If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

User response: The SERVICE command may upgrade the service level of the CSD file only in increments of one. Check that the input CSD file is the intended one, and that the LEVEL parameter takes the value one higher than the current service level of the CSD file.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, ttt, sss*

Destination: CSMT

DFHCA5193S *date time applid netname tranid*
Command is not executed. Service module *progrname* is unable to upgrade CSD to target service level *ttt*

Explanation: The LEVEL parameter specified in the SERVICE command is incompatible with the status of the service module *progrname* being applied to the CSD file.

System action: The SERVICE command is not executed.

If commands are being read from a SYSIN data stream, subsequent commands (except LIST commands) are checked for syntax only. (If the primary CSD file cannot be opened, the LIST command is not processed either.)

If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

User response: Ensure that the service module *progrname*, being applied, is correctly updated with the service fix supplied by IBM. (It should have been amended so as to be able to process SERVICE commands at the target level *ttt*.)

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, progrname, ttt*

Destination: CSMT

DFHCA5194I *date time applid netname tranid*
Upgrading service status of CSD from level *sss* to level *ttt*

Explanation: The loaded service module is performing the required upgrade of the CSD file from service level *sss* to service level *ttt*.

System action: Normal processing continues.

User response: None.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, sss, ttt*

Destination: CSMT

DFHCA5195I *date time applid netname tranid*
Execution of service program *progrname* complete.

Explanation: The loaded service program *progrname* has run to completion. Control is being transferred back to the CSD offline utility program, DFHCSDUP.

System action: Normal processing continues.

User response: None.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, progrname*

Destination: CSMT

DFHCA5196S *date time applid netname tranid*
Command is terminated. Error occurred while reading control secondary CSD record.

Explanation: An I/O error has occurred on the specified CSD file.

System action: The SERVICE command is terminated.

If commands are being read from a SYSIN data stream, subsequent commands (except LIST) are checked for syntax only. (If the primary CSD file cannot be opened, LIST is not processed either.)

If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

User response: Retry the command, ensuring that a sufficiently large data set size is specified for the output (primary) CSD file.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid*

Destination: CSMT

DFHCA5197S *date time applid netname tranid*
Command is terminated. Unrecognized control record encountered while secondary CSD was being read.

Explanation: The contents of a control record of the secondary input CSD are invalid.

System action: The SERVICE command is terminated.

If commands are being read from a SYSIN data stream, subsequent commands (except LIST) are checked for syntax only. (If the primary CSD file cannot be opened, LIST is not processed either.)

If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

User response: Check that the input and output data sets have been correctly defined, and that the DDNAME for the secondary CSD file in the JCL corresponds to the OLDCSD parameter in the SERVICE utility command.

If the problem persists, you will need further help from IBM. First, obtain a dump from DFHCSDUP together with a listing of the DFHCSDUP run and its JCL. Also try to obtain a printout of the CSD using either IDCAMS or the DFHCSDUP LIST ALL option. The LIST indicates where the errors have occurred because they do not print and are therefore easily identifiable. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid*

Destination: CSMT

DFHCA5198I *date time applid netname tranid* **CSD record modified for** *resource-type resource-name, group-or-list group-or-list-name*

Explanation: The specified modification to a record on the CSD file has taken place.

System action: Normal processing continues. If the modified record is an element in a GROUP or LIST, its date-and-time field is updated when copied to the output (primary) CSD file.

User response: None.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, resource-type, resource-name, group-or-list, group-or-list-name*

Destination: CSMT

DFHCA5199W *date time applid netname tranid* **Invalid field encountered in existing record for** *resource-type: resource-name group-or-list: group-or-list-name*

Explanation: An unexpected value was found in one of the fields of a CSD record that was to be modified for element *resource-name* of type *resource-type*.

System action: Normal processing continues, and the

invalid record is left unchanged on the new (primary) CSD file.

User response: None.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, resource-type, resource-name, group-or-list, group-or-list-name*

Destination: CSMT

DFHCA5200S *date time applid netname tranid*
Command not executed. No valid language table was loaded.

Explanation: The utility found that the RDO language table had not been loaded correctly, or that it contained invalid data.

System action: The utility terminates because it cannot process any commands.

User response: Check that the correct version of the RDO language table (DFHEITSP) is in the program library.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid*

Destination: CSMT

DFHCA5201S *date time applid netname tranid*
'command' command is not valid. Command not executed.

Explanation: The CSD utility does not recognize the command.

System action: The utility ignores the command.

User response: Correct the command.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, command*

Destination: CSMT

DFHCA5202S *date time applid netname tranid*
Incorrect syntax for 'command' command. Command not executed.

Explanation: The syntax of the command is incorrect.

System action: The CSD utility ignores the command.

User response: Correct the command.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, command*

Destination: CSMT

DFHCA5203W *date time applid netname tranid* **Right parenthesis assumed after the value of 'xxxx'.**

Explanation: The syntax of the command was incorrect. Either a right parenthesis has been omitted or a keyword value in excess of 256 bytes has been specified.

System action: The utility executes the command as if the right parenthesis was present.

User response: Confirm that the correction applied by the utility generated the required command.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, xxxx*

Destination: CSMT

DFHCA5204E *date time applid netname tranid* **Command not executed. 'xxxx' keyword is not valid.**

Explanation: The keyword *xxxx* is not valid on this command.

System action: The utility command is ignored.

User response: Correct the command.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, xxxx*

Destination: CSMT

DFHCA5205E *date time applid netname tranid* **Command not executed. No value was specified for 'xxxx'.**

Explanation: The option *xxxx* is incomplete, possibly because a value has been omitted.

System action: The utility command is ignored.

User response: Correct the command.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, xxxx*

Destination: CSMT

DFHCA5206E *date time applid netname tranid* **Command not executed. Duplicate specification of 'xxxx'.**

Explanation: Option *xxxx* appears twice on a single utility command.

System action: The utility ignores the command.

User response: Correct the command.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, xxxx*

Destination: CSMT

DFHCA5207E *date time applid netname tranid* **Command not executed. 'xxxxxxx' does not require a value.**

Explanation: The utility detected an input command coded with a value for option *xxxxxxx* when no value was required.

System action: The utility does not process the command.

User response: Correct the command.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, xxxxxxxx*

Destination: CSMT

DFHCA5210E *date time applid netname tranid* **Command not executed. Invalid value was specified for 'xxxx'.**

Explanation: The utility detected an input command coded with an invalid value for option *xxxx*.

System action: The utility does not process the command.

User response: Correct the value.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, xxxx*

Destination: CSMT

DFHCA5211E *date time applid netname tranid* **Command not executed. Operand delimiter 'x' was misplaced.**

Explanation: The utility has detected an input command coded with a misplaced option delimiter *x*.

System action: The utility does not process the command.

User response: Place the delimiter correctly.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, x*

Destination: CSMT

DFHCA5212E *date time applid netname tranid*
Command not executed. *comptype*
'string' is not uniquely identifiable.

Explanation: An ambiguous DFHCSDUP or CREATE command has been specified.

- *comptype* is the command component type
- *string* is the actual component.

System action: The command is not executed. For DFHCSDUP, if commands are being read from a SYSIN data stream, subsequent commands (except LIST commands) are checked for syntax only. If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

User response: Correct the command syntax and retry. See accompanying message DFHCA5213 for further details of the command failure.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, comptype, string*

Destination: CSMT

DFHCA5213E *date time applid netname tranid*
Specified *input* could be interpreted as
match1* or *match2

Explanation: An ambiguous DFHCSDUP or CREATE command has been specified.

- *input* is the ambiguous character string
- *match1* and *match2* are two possible interpretations of *input*.

System action: The command is not executed. For DFHCSDUP, if commands are being read from a SYSIN data stream, subsequent commands (except LIST commands) are checked for syntax only. If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

User response: Correct the command syntax and retry.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, input, match1, match2*

Destination: CSMT

DFHCA5214W *date time applid netname tranid*
keyword is an obsolete keyword. It is
ignored.

Explanation: The utility has detected an input command coded with an obsolete keyword. The keyword specifies an option not valid for this release of CICS.

System action: The utility ignores the keyword.

User response: Confirm that the resulting utility

command is correct for this release of CICS.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, keyword*

Destination: CSMT

DFHCA5215E *date time applid netname tranid*
Command not executed. A closing
parenthesis has been omitted from a
null value specified on an ALTER
command.

Explanation: A closing parenthesis was not added when a null value was specified for a keyword on an ALTER command. A closing parenthesis is automatically added for keyword values other than nulls.

System action: The command is not executed. If commands are being read from a SYSIN data stream, subsequent commands (except LIST commands) are checked for syntax only. If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

User response: Correct the command syntax and retry.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid*

Destination: CSMT

DFHCA5216E *date time applid netname tranid restype*
resname* is not in group *group

Explanation: A nonexistent resource of type *restype* and name *resname*, has been specified on an ALTER command.

System action: The command is not executed. If commands are being read from a SYSIN data stream, subsequent commands (except LIST commands) are checked for syntax only. If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

User response: Correct the command syntax and retry.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, restype, resname, group*

Destination: CSMT

DFHCA5217E *date time applid netname tranid*
Command not executed. A closing
bracket has been omitted from a *xxxx*
keyword.

Explanation: A closing bracket has been omitted from

DFHCA5218I • DFHCA5224E

the *xxxx* keyword on a CREATE or DFHCSDUP DEFINE command.

System action: The command is not executed.

User response: Correct the command syntax and retry.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, xxxx*

Destination: CSMT

DFHCA5218I *date time applid netname tranid* **Altering Resource type Resource name in group Group name**

Explanation: During the execution of a generic ALTER command, the CSD batch update utility scans the CSD file for matches to the specified generic resource name and/or GROUP keyword. For every match, the utility processes the request and informs the user of the resulting *resource name* and/or *group name* respectively.

System action: Normal processing continues.

User response: None.

Module: DFHCSDUP

XMEOUT Parameters: *date, time, applid, netname, tranid, Resource type, Resource name, Group name*

Destination: CSMT

DFHCA5219W *date time applid netname tranid* **No match found on CSD file for Resource type Resource name group Group name**

Explanation: The ALTER command was executed with a generic resource and/or group name, but no qualifying resource and/or group exist on the CSD file.

System action: Normal processing continues.

User response: None.

Module: DFHCSDUP

XMEOUT Parameters: *date, time, applid, netname, tranid, Resource type, Resource name, Group name*

Destination: CSMT

DFHCA5220S *date time applid netname tranid* **Command not executed. 'xxxxxxx' must be the first command.**

Explanation: The CSD utility found an INITIALIZE command after other commands.

System action: The CSD utility ignores the command.

User response: Confirm that the INITIALIZE command was misplaced.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, xxxxxxxx*

Destination: CSMT

DFHCA5222E *date time applid netname tranid* **Command not executed. 'xxxxxxx' keyword was omitted or specified incorrectly.**

Explanation: A required keyword *xxxxxxx* was omitted from a CSD utility command.

System action: The utility ignores the command.

User response: Specify keyword *xxxxxxx*.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, xxxxxxxx*

Destination: CSMT

DFHCA5223E *date time applid netname tranid* **Command not executed. 'xxxxxxx' keyword conflicts with 'xxxxxxx' keyword.**

Explanation: The syntax of the command is incorrect. Conflicting keywords have been specified.

System action: The utility command is ignored.

User response: Correct the command.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, xxxxxxxx, xxxxxxxx*

Destination: CSMT

DFHCA5224E *date time applid netname tranid* **Command not executed. The value of operand is outside the valid range for keyword.**

Explanation: A numeric value of *operand* was detected, which is outside the permitted range of values for the keyword *keyword*.

System action: The command is not executed.

User response: Correct the value.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, operand, keyword*

Destination: CSMT

DFHCA5225E *date time applid netname tranid*
Command not executed. Same name specified for 'xxxxxxx' and 'xxxxxxx'.

Explanation: This message is issued for one of the following reasons

1. The utility COPY command has been coded with the same group name for the source and target group.
2. The APPEND command has been coded with the same list name for the source and target list.
3. The ADD command has been coded with the same group name and list name.

System action: The CSD utility or CICS ignores the command.

User response: Correct the name (or names) in error.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, xxxxxxxx, xxxxxxxx*

Destination: CSMT

DFHCA5227E *date time applid netname tranid*
Command not executed. Use of generic name conflicts with 'xxxxxxx' option.

Explanation: A CSD utility command used a generic name; that is, one containing asterisk (*) or plus sign (+) characters, in conjunction with an option that conflicted with the use of generic names.

System action: The utility ignores the command.

User response: Correct the command.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, xxxxxxxx*

Destination: CSMT

DFHCA5228E *date time applid netname tranid*
Command not executed. Only one resource-type keyword may be specified.

Explanation: The CSD utility detected an input command coded with more than one resource-type keyword.

System action: The utility does not process the command.

User response: Correct the command to refer to only one resource-type keyword.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid*

Destination: CSMT

DFHCA5229E *date time applid netname tranid*
Command not executed. 'xxxxxxx' is invalid because a resource-type keyword was specified.

Explanation: The CSD utility detected an input command coded with a resource-type keyword (for example, PROGRAM, TRANSACTION) in a situation where a resource-type keyword is invalid.

System action: The utility does not process the command.

User response: Correct the command and resubmit.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, xxxxxxxx*

Destination: CSMT

DFHCA5230I *date time applid netname tranid* **ERASE command is obsolete. Use the DELETE command.**

Explanation: The CSD utility detected the obsolete ERASE command in its input.

System action: The utility processes the command as a DELETE command.

User response: In future, use the DELETE command instead of the ERASE command.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid*

Destination: CSMT

DFHCA5231E *date time applid netname tranid*
Command not executed. 'xxxxxxx' is incompatible with the MIGRATE command for *tabletype* tables.

Explanation: An attempt has been made to execute the MIGRATE command with an invalid table type and (or) an invalid keyword specified.

System action: The CSD utility terminates.

User response: Correct the command syntax and resubmit the job.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, xxxxxxxx, tabletype*

Destination: CSMT

DFHCA5232E *date time applid netname tranid*
Command not executed. 'xxxxxxx'
parameter must not begin with 'DFH'.

Explanation: In a CSD utility MIGRATE command, the xxxxxxx parameter contained an invalid table name or group name.

System action: The utility does not process the command.

User response: Resubmit with a valid table name or group name.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, xxxxxxxx*

Destination: CSMT

DFHCA5233E *date time applid netname tranid*
Command not executed. 'tabletype'
table type is not supported by RDO.

Explanation: The CSD utility detected a TABLE parameter that referred to a CICS table type not supported by RDO.

RDO supports

- Program, transaction, and terminal definitions (RDT)
- Files (FCT)
- Transient data queues (DCT).

System action: The utility does not process the command.

User response: Correct the command.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, tabletype*

Destination: CSMT

DFHCA5234E *date time applid netname tranid*
Command not executed. 'command'
command is not supported.

Explanation: The CSD utility detected a command *command* in its input which is not supported by RDO.

System action: The utility does not process the command.

User response: Correct the command

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, command*

Destination: CSMT

DFHCA5235E *date time applid netname tranid*
Command not executed. Group or list
must be specified.

Explanation: A CSD utility EXTRACT command has been submitted. A GROUP or LIST name must be specified with an EXTRACT command.

System action: The utility command is not executed. This message is followed by DFHCA5104.

User response: Correct the invalid command by adding a valid GROUP or LIST name and rerun the utility job.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid*

Destination: CSMT

DFHCA5236I *date time applid netname tranid* **A**
user-exit program has been specified
on the entry linkage and on the
userprogram keyword. The program
specified on the entry linkage has been
ignored.

Explanation: An EXTRACT user-exit program has been specified via the entry parameter list and on the USERPROGRAM keyword of the EXTRACT command.

System action: The program specified on the USERPROGRAM keyword is used.

User response: Ensure that the user program used is the one intended.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid*

Destination: CSMT

DFHCA5240S *date time applid netname tranid*
Processing terminated. Error occurred
while input utility command was being
read.

Explanation: The environment adaptor GETCARD utility cannot read an input utility command.

System action: The CSD utility terminates abnormally without processing the input commands.

User response: Check that the utility commands are prepared correctly and located correctly in the JCL. Check also that the DD statement defining the output data set startup job stream is correct. For JCL examples, refer to the *CICS Operations and Utilities Guide*.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid*

Destination: CSMT

DFHCA5241S *date time applid netname tranid*
Processing terminated. Invalid record length on utility command data stream.

Explanation: The CSD utility detected incorrectly formatted input in the SYSIN data stream.

System action: The CSD utility cannot process any commands. The utility attempts to

1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.

User response: Ensure that the output data set data stream is formatted with fixed length 80-byte records.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid*

Destination: CSMT

DFHCA5242E *date time applid netname tranid*
Command not processed. Too many continuation records for input utility command.

Explanation: The CSD utility detected an input command that was too long and extended over too many records.

System action: The utility does not process the command.

User response: This message may be caused by an error in the rejected command or in the preceding or subsequent commands in the input stream. Correct the commands in error.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid*

Destination: CSMT

DFHCA5250E *TO(groupname)* **contains too many non contiguous '*'**

Explanation: During the execution of a generic COPY command, the batch update utility found the argument of the TO parameter specified too many non contiguous asterisks.

Only one '*' is allowed in the TO parameter during the execution of a generic copy.

System action: The utility rejects the command.

User response: Correct the command.

Module: DFHCSDUP

Destination: SYSPRINT

DFHCA5251I *date time applid netname tranid resource object in group grpname* **is replaced.**

Explanation: A resource definition existed in both source and target groups. Based on the CSD utility commands submitted, the utility has replaced the definition in the target group with that from the source group.

- *resource* is the type of the resource
- *object* is the name of the object
- *grpname* is the name of the group.

System action: Normal utility processing continues.

User response: None.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, resource, object, grpname*

Destination: CSMT

DFHCA5252I *date time applid netname tranid resource object copied to group grpname*

Explanation: The CSD utility has correctly copied a resource definition to the specified group, where

- *resource* is the type of resource
- *object* is the name of the object
- *grpname* is the name of the group.

System action: Normal utility processing continues.

User response: None.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, resource, object, grpname*

Destination: CSMT

DFHCA5253E *date time applid netname tranid Group grpname* **not found in CSD file - ddname: ddname**

Explanation: The CSD utility has detected a command that attempted to retrieve definitions from the non-existent group, *grpname*, in the CSD specified in DDNAME *ddname*.

System action: The utility does not process the command.

User response: Either correct the group name in the command, or make sure that the specified CSD file is the correct one.

Module: DFHCAP

DFHCA5254E • DFHCA5259I

XMEOUT Parameters: *date, time, applid, netname, tranid, grpname, ddname*

Destination: CSMT

DFHCA5254E *date time applid netname tranid*
resource object already exists in the target group.

Explanation: The CSD utility detected a command that attempted to add a definition to a group that already contained a definition of an object with the same name, where

- *resource* is the type of resource
- *object* is the name of the object.

System action: The CSD utility does not process the command.

User response: Change the name in the command, or alter the name of the existing definition.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, resource, object*

Destination: CSMT

DFHCA5255E *date time applid netname tranid List*
xxxxxxx not found in CSD file -
ddname: ddname

Explanation: The CSD utility detected an APPEND or REMOVE command that referred to a nonexistent list in the CSD file specified in DDNAME *ddname*.

System action: The utility does not process the command.

User response: Either correct the list name in the command, or make sure that the specified CSD file is the correct one.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, xxxxxxx, ddname*

Destination: CSMT

DFHCA5256E *date time applid netname tranid No*
resources defined in group grpname

Explanation: In executing a LIST command, the CSD utility has found a group header on the CSD file for which no group elements exist.

System action: The CSD utility continues to process the LIST command, but will not list elements of the named group.

User response: Run the DFHCSDUP VERIFY utility to verify the group.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, grpname*

Destination: CSMT

DFHCA5257E *date time applid netname tranid Length*
of 'TO' prefix must be less than or equal to length of 'GROUP' prefix.

Explanation: During the execution of a generic COPY command, the batch update utility found the length of the prefix of the generic group specified in the TO keyword to be greater than the length of the prefix of the generic GROUP keyword.

System action: The utility ignores the command to prevent truncation of the TO group name.

User response: Correct the command.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid*

Destination: CSMT

DFHCA5258I *date time applid netname tranid Copying*
group grpname1 to grpname2

Explanation: During the execution of a generic COPY command, the CSD batch update utility scans the CSD file for matches to the generic GROUP keyword. For every match, the utility resolves the generic TO keyword, and informs the user of the resulting *grpname1* and *grpname2* respectively.

System action: Normal processing continues.

User response: None.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, grpname1, grpname2*

Destination: CSMT

DFHCA5259I *date time applid netname tranid*
Unrecognized resource type found in the CSD file and has been ignored.

Explanation: CICS has found an unrecognized resource type code in a CSD record. The unrecognized code does not match any of the function codes in the language definition table. This can occur for one of the following reasons

1. You are using a CICS release that does not support a type of definition that was created on the CSD file by a later CICS release.
2. The language definition table (DFHEITSP or DFHEITCU) is invalid for this CICS release.
3. The CSD manager (DFHDMP) has passed an invalid CSD record buffer to DFHPUP. This is a CICS internal logic error.

System action: The resource is ignored and the operation continues.

User response: Determine which of the possible reasons caused the error. If you can eliminate reasons 1 and 2, you can assume that reason 3 applies.

Take action corresponding to the reason you have established as follows

1. Ignore the message.
2. Ensure that the library contains versions of DFHEITSP and DFHEITCU that are valid for the CICS release you are running.
3. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid*

Destination: CSMT

DFHCA5260E Length of 'TO' suffix must be equal to length of 'GROUP' suffix.

Explanation: During the execution of a generic COPY command, the batch update utility found the length of the suffix of the generic group specified in the TO keyword to be of different length than that of the suffix of the generic GROUP keyword.

System action: The utility ignores the command to prevent ambiguity on the TO group name.

User response: Correct the command.

Module: DFHCSDUP

Destination: SYSPRINT

DFHCA5261W *date time applid netname tranid* RDT is empty. No VTAM resources in assembled table.

Explanation: The CSD utility detected an attempt to migrate a TCT that either contains no RDO-supported terminal or sessions definitions, or whose TYPE=INITIAL entry specifies MIGRATE=COMPLETE.

System action: The utility does not create any CSD definitions.

User response: Check the TCT source code to see if it contains any RDO-supported definitions. If it does, ensure that it has been correctly assembled (MIGRATE=YES specified) and link-edited.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid*

Destination: CSMT

DFHCA5262S *date time applid netname tranid* Insufficient storage to build types-matching chain.

Explanation: During CSD utility processing, an internal error has occurred in the migration of a TCT. This is because of lack of storage for TYPETERM definitions.

System action: The utility attempts to

1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.

In any of the above cases, definitions that have already been migrated remain on the CSD.

User response:

1. Run the DFHCSDUP VERIFY utility.
2. Delete the groups created by the failing MIGRATE command.
3. Allocate a larger region size in the utility JCL, and retry the command.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid*

Destination: CSMT

DFHCA5263S *date time applid netname tranid* Error in input RDT. Incorrect sequence of commands.

Explanation: During CSD utility processing, an internal error has occurred in the migration of a TCT. This is because of abnormal data in the assembled table.

System action: The utility attempts to

1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.

Definitions that have already been migrated remain on the CSD. The MVS user abend code is 0308.

User response:

1. Run the DFHCSDUP VERIFY utility.
2. Delete the groups created by the failing MIGRATE command.
3. Keep the assembly listing for the failing table and keep the DFHCSDUP dump, if available.

4. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid*

Destination: CSMT

DFHCA5264W *date time applid netname tranid*
Resource object not defined. Group
grpname not available.

Explanation: During the migration of a TCT, the CSD utility could not define a resource *object* because the target group *grpname* was not available. The utility has issued a previous message indicating the reason.

System action: The utility creates no definition for resource *object*. Normal utility processing continues.

User response: Review the original message. If necessary, recode the TYPE=GROUP macro in the TCT source to name a suitable group.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, object, grpname*

Destination: CSMT

DFHCA5265W *date time applid netname tranid* **Action**
required to find a suitable typeterm for
terminal *termid*.

Explanation: While migrating a TCT, the CSD utility found a terminal definition for which it could not create a corresponding TYPETERM definition.

System action: The utility adds the terminal definition to the CSD file, but it refers to a TYPETERM that may be unsuitable for this device.

User response: Use the CEDA transaction to define a suitable TYPETERM and alter the TERMINAL definition to refer to the new TYPETERM.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, termid*

Destination: CSMT

DFHCA5266W *date time applid netname tranid*
Sessions *sessions* not defined, because
of error in associated connection.

Explanation: An error has been detected during the migration of a TCT. When migrating a session, DFHCSDUP checks that the associated CONNECTION has been defined successfully. If it has not, DFHCSDUP abnormally terminates the session definition.

System action: The specified SESSIONS resource is not migrated to the CSD. DFHCSDUP continues with the migration of subsequent TCT entries.

User response: Use the diagnostic information in the output listing from the MIGRATE utility to determine why the CONNECTION definition has failed. You can then use RDO to DEFINE the CONNECTION and the SESSIONS to the CSD.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, sessions*

Destination: CSMT

DFHCA5270I *date time applid netname tranid*
group-or-list xxxxxxxx **deleted from the**
CSD .

Explanation: The CSD utility has successfully deleted a group or list from the primary CSD file.

System action: Normal utility processing continues.

User response: None.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, group-or-list, xxxxxxxx*

Destination: CSMT

DFHCA5271S *date time applid netname tranid* **Unable**
to delete *group-or-list xxxxxxxx* **from the**
CSD .

Explanation: During CSD utility processing, an error in accessing the CSD file caused a delete operation to fail.

System action: The utility does not process the DELETE command. The group or list to be deleted remains on the CSD file.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, group-or-list, xxxxxxxx*

Destination: CSMT

DFHCA5272I *date time applid netname tranid resource*
object **deleted from group** *grpname*

Explanation: The CSD utility successfully deleted the named resource, where

- *resource* is the type of resource
- *object* is the name of the object.

System action: Normal utility processing continues.

User response: None.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, resource, object, grpname*

Destination: CSMT

DFHCA5273W *date time applid netname tranid resource object is not in group grpname*

Explanation: The CSD utility detected an attempt to delete a resource which did not exist in the named group, where

- *resource* is the type of resource
- *object* is the name of the object
- *grpname* is the name of the group.

System action: The utility does not process the DELETE command.

User response: Check that you have coded the group and resource names correctly.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, resource, object, grpname*

Destination: CSMT

DFHCA5274W *date time applid netname tranid resource object not defined. Group grpname not available.*

Explanation: During the migration of an RCT, the CSD utility could not define the resource *resource* because the target group *groupname* was not available. The utility has already issued a message indicating the reason.

System action: The utility creates no definition for the resource named *object*. Normal utility processing continues.

User response: Review the original message. If necessary, recode the TYPE=GROUP macro in the RCT source to name a suitable group.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, resource, object, grpname*

Destination: CSMT

DFHCA5275E *date time applid netname tranid Group grpname is not a member of list listname*

Explanation: The REMOVE command being executed names a GROUP that is not a member of LIST *listname*.

System action: The command is not executed.

If commands are being read from a SYSIN data stream, subsequent commands (except LIST commands) are

checked for syntax only. (If the primary CSD file cannot be opened, the LIST command is not processed either.)

If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

User response: Correct the command and resubmit a DFHCSDUP job to execute the failing command and any subsequent commands that were suppressed.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, grpname, listname*

Destination: CSMT

DFHCA5276I *date time applid netname tranid Group grpname removed from list listname*

Explanation: The REMOVE command has successfully removed group *grpname* from LIST *listname*.

System action: Normal execution continues.

User response: None.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, grpname, listname*

Destination: CSMT

DFHCA5277I *date time applid netname tranid List list deleted from CSD .*

Explanation: The final group has been removed from list *listname*. The list has therefore been deleted.

System action: Processing continues.

User response: None.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, list*

Destination: CSMT

DFHCA5280I *date time applid netname tranid Processing definitions from library member xxxxxxxx*

Explanation: The CSD utility has successfully loaded data from the named library member.

System action: Normal utility processing continues.

User response: None.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, xxxxxxxx*

Destination: CSMT

DFHCA5281S *date time applid netname tranid* **Data loaded from library member xxxxxxxx is invalid**

Explanation: The CSD utility has found an error in data loaded from the named library member.

System action: The utility attempts to

1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.

User response: Obtain a dump containing the failing library member.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, xxxxxxxx*

Destination: CSMT

DFHCA5282E *date time applid netname tranid* **Unable to get storage for library member xxxxxxxx**

Explanation: There is insufficient storage available to load the library member xxxxxxxx.

System action: The utility terminates processing of the command that required access to the named library member.

User response: Allocate a larger region size in the utility JCL and resubmit the job.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, xxxxxxxx*

Destination: CSMT

DFHCA5283S *date time applid netname tranid* **RDL subcommand exceeds 1536 bytes: xxxxxxxxxxxx....**

Explanation: The CSD utility found an internal error in the data loaded while processing the indicated (truncated) UPGRADE, INITIALIZE, or MIGRATE command.

System action: The CSD utility terminates abnormally.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, xxxx, xxxx, xxxx*

Destination: CSMT

DFHCA5284E *date time applid netname tranid* **Error analyzing RDL subcommand: xxxxxxxxxxxx....**

Explanation: The CSD utility found an internal error in the data loaded while processing the indicated (truncated) UPGRADE, INITIALIZE, or MIGRATE command.

System action: The utility attempts to

1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, xxxx, xxxx, xxxx*

Destination: CSMT

DFHCA5285E *date time applid netname tranid* **Invalid verb in RDL subcommand: xxxxxxxxxxxx....**

Explanation: The CSD utility found an internal error in the data loaded while processing the indicated (truncated) UPGRADE, INITIALIZE, or MIGRATE command.

System action: The utility attempts to

1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, xxxx, xxxx, xxxx*

Destination: CSMT

DFHCA5286E *date time applid netname tranid* **Unable to create resource definition on CSD file: xxxxxxxxxxxx....**

Explanation: This message is issued during the processing of the indicated (truncated) command for one of the following reasons

1. The CSD is full (in which case, messages DFHCA5175 and DFHCA5176 accompanies this one)
2. The CSD was defined as read-only (in which case, message DFHCA5174 accompanies this message)
3. The TCT being migrated contained a terminal entry with a name unacceptable to RDO (in which case, message DFHCA5165 accompanies this message)
4. A list or group cannot be used due to the failure of a previous update operation (in which case, message DFHCA5142 accompanies this message)
5. The resource definition list being used to INITIALIZE or UPGRADE the CSD file contained a definition with an invalid resource name or group name
6. A logic error occurred in DFHCSDUP or an internal error was detected in the data contained in the loaded table.

System action: The system action depends on the reason the message is issued, as follows.

1. Migration of the TCT table is terminated immediately.
2. Processing of the UPGRADE or INITIALIZE command is terminated
3. The utility attempts to
 - a. Close any files previously opened internally.
 - b. Unload any extract exit routines that were dynamically loaded.
 - c. Invoke the termination exit routine (if supplied).
 - d. Return control to the invoker of the utility.
4. The command is not executed, and execution of further DFHCSDUP commands in the job stream is suppressed.
5. As in (3) above.
6. As in (3) above.

In ALL cases, all the definitions created by this command up to the point of failure remain on the CSD.

User response: The user response depends on the reason the message is issued, as follows.

1. See message DFHCA5175 and DFHCA5176.
2. See message DFHCA5174.
3. Change the name of the terminal and all references to it. Also refer to the user response for message DFHCA5165.
4. See message DFHCA5142.
5. This is a CICS logic error. See instruction for 6 below.

6. This is a CICS logic error. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. A CICS background trace of the failure may aid them in problem diagnosis.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, xxxx, xxxx, xxxx*

Destination: CSMT

DFHCA5287E *date time applid netname tranid* **Extract terminated at user's request. RC=retcode**

Explanation: A batch job has issued a CSD utility EXTRACT command. The EXTRACT command has been terminated because of a nonzero value in register 15 on return from a user exit program. Subsequent messages indicate any further problems encountered by the utility.

System action: Execution of the utility command is terminated. This message is followed by DFHCA5104.

User response: Determine the cause of the error detected by the user exit program, using the return code *retcode* provided and the relevant documentation of the user exit program.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, retcode*

Destination: CSMT

DFHCA5288E **Get-command terminated at user's request. RC=retcode**

Explanation: The GET-COMMAND exit has returned a value other than UERCNORM ('00'X) or UERCDONE ('04'X) indicating that the GET-COMMAND exit was unsuccessful.

System action: Execution of the utility command is terminated.

User response: Correct the operation of the GET-COMMAND user exit before re-running the utility. Consult the documentation or listing supplied with the user exit for information on how to diagnose and fix the problem.

Module: DFHCAP

Destination: SYSPRINT

DFHCA5290W Table *tabtype* macro *mactype=value* is not supported. Value is changed to *newvalue*.

Explanation: During a table *tabtype* migration for macro *mactype*, *value* is not supported. *value* has been migrated as *newvalue*.

System action: The utility creates the definition for the resource with the changed value. Normal utility processing continues.

User response: Review the object definition to ensure that the modified definition is acceptable.

Module: DFHCSDUP

Destination: SYSPRINT

DFHCA5291E Unable to define object *object* in group *group*. Migration is terminated.

Explanation: The DFHCSDUP migration utility could not define *object* in the *group* specified. The migration cannot continue.

System action: The utility terminates the migration of the table.

User response: Verify that the specified group is the correct group and review prior errors to determine why the migration utility could not create the definition in the group.

Module: DFHCSDUP

Destination: SYSPRINT

DFHCA5292W Object *object* not defined for table item *name* due to previous error. Migration continues.

Explanation: The DFHCSDUP migration utility could not define *object* for the table item *name*. The migration continues.

During the migration of an RCT, the migration utility issues this message for all DB2TRAN definitions that refer to a DB2ENTRY definition that failed.

System action: The utility continues the table migration without defining the object.

User response: Correct the prior errors and manually define the skipped objects.

Module: DFHCSDUP

Destination: SYSPRINT

DFHCA5293W Total *object* definitions skipped due to error: *number*

Explanation: CICS issues this message after migrating a CICS table. *number* definitions of type *object* were not migrated. See one or more DFHCA5292 messages issued prior to this message.

System action: Utility processing continues.

User response: Correct the prior errors and manually define the skipped objects.

Module: DFHCSDUP

Destination: SYSPRINT

DFHCA5294E *number object-1* were not matched with a corresponding *object-2*.

Explanation: CICS issues this message if there are *object-1* table definitions that have not been defined because the table was not defined correctly. *object-1* table definitions must refer to a *object-2* in the table.

System action: The migration of the table ends.

User response: Reassemble the table with the current release macro source.

Module: DFHCSDUP

Destination: SYSPRINT

DFHCA5296W Table *tabtype* TYPE=*mactype parameter* does not support multiple values.

Explanation: Multiple values were specified for TYPE=*mactype parameter*. The migration of the *tabtype* table supports only one value.

System action: The migration utility ignores the additional values. The migration continues.

User response: Review the migrated definition to ensure that the new single value is acceptable.

Module: DFHCSDUP

Destination: SYSPRINT

DFHCA5501E *date time applid netname tranid* Command not executed. *keyword* must be specified.

Explanation: A keyword *keyword*, which is required in the command, has been omitted or was incorrectly specified. An earlier message identifies if the latter case is applicable.

System action: The utility ignores the command.

User response: Correct the command.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, keyword*

Destination: CSMT

DFHCA5502W *date time applid netname tranid*
xxxxxxx **implies** yyyyyyy.

Explanation: The value xxxxxxxx specified in a DEFINE or CREATE command has caused another value yyyyyyy, which is not a normal default, to be assumed.

System action: Normal utility processing continues.

User response: Check that the resulting resource definition is acceptable. If you accept this default, no further action is required.

If the resultant default is not acceptable, you must decide whether to modify the definition, or to delete it and start again.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, xxxxxxx, yyyyyyy*

Destination: CSMT

DFHCA5503E *date time applid netname tranid*
Command not executed. xxxxxxx option conflicts with yyyyyyy option and is ignored.

Explanation: Two options, xxxxxxx and yyyyyyy, that are mutually exclusive have been specified.

System action: The utility ignores the command.

User response: Correct the command.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, xxxxxxx, yyyyyyy*

Destination: CSMT

DFHCA5504E *date time applid netname tranid*
Command not executed. Use of xxxxxxx option implies yyyyyyy option must be specified.

Explanation: Option xxxxxxx requires another value, yyyyyyy.

System action: The utility ignores the command.

User response: Specify yyyyyyy.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, xxxxxxx, yyyyyyy*

Destination: CSMT

DFHCA5505W *date time applid netname tranid*
Program DFHMSP requires a TWASIZE of at least 528.

Explanation: A DEFINE or CREATE TRANSACTION command for the message switching program, DFHMSP, has given it a TWASIZE of less than 528 bytes. If it is to be a definition for the CICS-supplied program of that name, it will not execute correctly.

System action: Normal utility processing continues.

User response: Check that the resulting resource definition is as you expect.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid*

Destination: CSMT

DFHCA5506E *date time applid netname tranid*
Command not executed. For xxxxxxx many options, including yyyyyyy, are meaningless.

Explanation: A keyword or value has been specified that is not consistent with another.

System action: The utility ignores the command.

User response: Correct the command.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, xxxxxxx, yyyyyyy*

Destination: CSMT

DFHCA5507E *date time applid netname tranid*
Command not executed. xxxxxxx value must be greater than yyyyyyy value.

Explanation: A value has been specified that is not consistent with another. xxxxxxx must be greater than yyyyyyy.

System action: The utility ignores the command.

User response: Correct the command.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, xxxxxxx, yyyyyyy*

Destination: CSMT

DFHCA5508E *date time applid netname tranid*
Command not executed. xxxxxxx value must be less than or equal to yyyyyyy value.

Explanation: A value has been specified that is not consistent with another. The value xxxxxxx must be less than or equal to yyyyyyy.

DFHCA5509E • DFHCA5515W

System action: The utility ignores the command.

User response: Correct the command.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, xxxxxxx, yyyyyyy*

Destination: CSMT

DFHCA5509E *date time applid netname tranid*
Command not executed. xxxxxxx name must not be the same as yyyyyyy name.

Explanation: Some values in DEFINE or CREATE commands must not be the same as the name of the resource. xxxxxxx must not have the same name as yyyyyyy.

System action: The utility ignores the command.

User response: Correct the command.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, xxxxxxx, yyyyyyy*

Destination: CSMT

DFHCA5510W *date time applid netname tranid*
xxxxxxx names beginning with yyyyyyy
are reserved and may be redefined by CICS.

Explanation: CICS supplies standard programs and transactions whose names you should usually avoid.

System action: Normal utility processing continues.

User response: Check that the resulting resource definition is as you expect.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, xxxxxxx, yyyyyyy*

Destination: CSMT

DFHCA5511W *date time applid netname tranid*
xxxxxxx name yyyyyyy
is reserved and may be redefined by CICS.

Explanation: CICS supplies standard programs and transactions whose names you should usually avoid.

System action: Normal utility processing continues.

User response: Check that the resulting resource definition is as you expect.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, xxxxxxx, yyyyyyy*

Destination: CSMT

DFHCA5512W *date time applid netname tranid*
Program name begins with 'DFH' but transaction name does not begin with 'C'.

Explanation: CICS supplies standard programs and transactions whose naming conventions you should avoid.

System action: Normal utility processing continues.

User response: Check that the resulting resource definition is as you expect.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid*

Destination: CSMT

DFHCA5513E *date time applid netname tranid*
Command not executed. The second value of xxxxxxx must not be greater than the first.

Explanation: Some keywords take pairs of values which are essentially maximum and minimum values.

System action: The utility ignores the command.

User response: Correct the command.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, xxxxxxx*

Destination: CSMT

DFHCA5514E *date time applid netname tranid*
Command not executed. With SESSNAME there can only be one COUNT and its value must be 1.

Explanation: The use of SESSNAME in a DEFINE or CREATE SESSIONS command means that a single-session, either for sending or receiving, is required.

System action: The utility ignores the command.

User response: Correct the command.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid*

Destination: CSMT

DFHCA5515W *date time applid netname tranid*
AUTOPAGE(NO) has been specified for a 3270 print device.

Explanation: A DEFINE or CREATE TYPETERM command has AUTOPAGE(NO) and DEVICE(3270P) or DEVICE(LUTYPE3).

System action: Normal utility processing continues.

User response: Check that the resulting resource definition is as you expect.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid*

Destination: CSMT

DFHCA5516W *date time applid netname tranid* **The values of DEVICE and SESSIONTYPE are equivalent to DEVICE(*devtype*) and have been replaced.**

Explanation: A DEFINE or CREATE TYPETERM command has a valid but obsolete DEVICE and SESSIONTYPE combination.

This DEVICE and SESSIONTYPE combination has been replaced by a simpler equivalent indicated by *devtype*.

System action: Normal utility processing continues.

User response: Check that the resulting resource definition is as you expect. The *CICS Resource Definition Guide* provides further information about device equivalents.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, devtype*

Destination: CSMT

DFHCA5517E *date time applid netname tranid* **Command not executed. *prefix* and COUNT together make more than four characters.**

Explanation: In a SESSIONS definition, the *prefix* parameter (SENDPFX or RECEIVEPFX) is used to generate session names by adding numeric suffixes up to the corresponding count value (SENDCOUNT or RECEIVECOUNT). Since the session names cannot be longer than four characters, when the count of sessions exceeds 99 the prefix can only be one character.

System action: The command is not executed.

User response: Correct the command.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, prefix*

Destination: CSMT

DFHCA5518W *date time applid netname tranid* **XTRANIDS *xxxxxxx* are reserved and may be redefined by CICS.**

Explanation: CICS supplies programs and transactions whose names you should usually avoid.

System action: Normal utility processing continues.

User response: Check that the resulting resource definition is as you expect.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, xxxxxxx*

Destination: CSMT

DFHCA5519E *date time applid netname tranid* **Command not executed. *xxxxxxx* value contains an invalid *y*.**

Explanation: All character values in CREATE and DFHCSDUP commands are subject to rules which, depending on the value, disallow certain characters.

System action: The utility ignores the command.

User response: Correct the command.

The *CICS Resource Definition Guide* provides further information about these rules under the individual attributes for the syntax of the DFHCSDUP command.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, xxxxxxx, y*

Destination: CSMT

DFHCA5520W *date time applid netname tranid* **The value of DEVICE is equivalent to *xxxxxxx* and has been replaced.**

Explanation: A DEFINE or CREATE TYPETERM command has a valid but obsolete DEVICE value which has been replaced by a simpler equivalent.

System action: Normal utility processing continues.

User response: Check that the resulting resource definition is as you expect.

The *CICS Resource Definition Guide* provides further information about these simpler equivalent devices.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, xxxxxxx*

Destination: CSMT

DFHCA5521E *date time applid netname tranid*
**Command not executed. xxxxxxxx value
 yyyyyyyy is invalid.**

Explanation: A value yyyyyyyy has been specified for keyword xxxxxxxx which is not valid. It may for instance be non-numeric.

System action: The utility ignores the command.

User response: Correct the command.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname,
 tranid, xxxxxxxx, yyyyyyyy*

Destination: CSMT

DFHCA5522E *date time applid netname tranid*
**Command not executed. Length of
 xxxxxxxx value is more than allowed.**

Explanation: A character value in a DEFINE or CREATE command is too long.

System action: The utility ignores the command.

User response: Correct the command.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname,
 tranid, xxxxxxxx*

Destination: CSMT

DFHCA5523E *date time applid netname tranid*
**Command not executed. File DFHCSD
 must be defined in the SIT and not the
 CSD.**

Explanation: DFHCSD has been defined in the CSD rather than in the SIT. This is not allowed.

System action: The utility ignores the command.

User response: Correct the command. Define DFHCSD in the SIT.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname,
 tranid*

Destination: CSMT

DFHCA5524W *date time applid netname tranid* **BMS
 route for console may cause
 unpredictable results if maps or
 TEXT(ACCUM) used on device.**

Explanation: The routing of multiline maps or accumulated text to the console is not supported.

System action: Normal processing continues.

User response: Ensure that the unsupported console operations are disabled.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname,
 tranid*

Destination: CSMT

DFHCA5525W *date time applid netname tranid*
 xxxxxxxx **value is not valid, yyyyyyyy
 has been assumed.**

Explanation: The value xxxxxxxx is not valid. The value yyyyyyyy has been assumed.

System action: The utility ignores the command.

User response: Correct the command.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname,
 tranid, xxxxxxxx, yyyyyyyy*

Destination: CSMT

DFHCA5526E *date time applid netname tranid*
 xxxxxxxx **must have rows and columns
 specified.**

Explanation: xxxxxxxx must have rows and columns specified.

System action: The utility ignores the command.

User response: Correct the command.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname,
 tranid, xxxxxxxx*

Destination: CSMT

DFHCA5527E *date time applid netname tranid*
**Command not executed. Remote
 options are ignored for programs
 starting with DFH.**

Explanation: CICS supplies standard programs which are not allowed to have remote attributes.

System action: The command is ignored.

User response: Correct the command by deleting the remote attributes from the program definition.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname,
 tranid*

Destination: CSMT

DFHCA5528E *date time applid netname tranid*
**Command not executed. Value of
 keyword is out of valid range.**

Explanation: An invalid value has been supplied for the specified keyword.

System action: The utility ignores the command.

User response: Supply a valid keyword value and retry.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, keyword*

Destination: CSMT

DFHCA5529E *date time applid netname tranid keyword* **or keyword must be specified.**

Explanation: Neither of the indicated keywords has been specified. When defining a resource, you must specify one of these keywords.

System action: The utility ignores the command.

User response: Supply one of the indicated keywords and retry.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, keyword, keyword*

Destination: CSMT

DFHCA5530W *date time applid netname tranid*
XTRANIDS ending with *string* are reserved and may be redefined by CICS.

Explanation: CICS supplies programs and transactions whose names you should usually avoid in resource definitions.

System action: Normal utility processing continues.

User response: Check that the resulting resource definition is as you expect.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, string*

Destination: CSMT

DFHCA5531W *date time applid netname tranid*
XTRANIDS beginning with *string* are reserved and may be redefined by CICS.

Explanation: CICS supplies programs and transactions whose names you should usually avoid in resource definitions.

System action: Normal utility processing continues.

User response: Check that the resulting resource definition is as you expect.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, string*

Destination: CSMT

DFHCA5532E *date time applid netname tranid*
Command not executed. An invalid combination of rows and columns has been specified for ALTSCREEN.

Explanation: One of the specified values is zero and the other is nonzero. This is an invalid combination.

System action: The utility ignores the command.

User response: Ensure that a valid combination of ALTSCREEN rows and columns is specified. See the *CICS Resource Definition Guide* for details of valid combinations.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, ALTSCREEN*

Destination: CSMT

DFHCA5533W *date time applid netname tranid*
Specified *keyword1* value is less than *keyword2* value. The default value has been assumed.

Explanation: A value has been specified for *keyword1* that is incompatible with the value for *keyword2*.

System action: The utility assumes the default value for *keyword1* and processes the command.

User response: Ensure that the resulting resource definition is acceptable.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, keyword1, keyword2*

Destination: CSMT

DFHCA5534W *date time applid netname tranid* **When you change the value of DEVICE many other values may be changed for you.**

Explanation: When ALTERing the DEVICE in a TYPETERM resource definition, the batch update utility changes forced values that are incompatible with the new DEVICE. However, dependent default values are not changed, and may now be incompatible.

System action: Normal utility processing continues.

User response: Check that the resulting resource definition is as you expect. See the *CICS Resource Definition Guide* for more guidance.

Module: DFHCAP

DFHCA5535E • DFHCA5540W

XMEOUT Parameters: *date, time, applid, netname, tranid*

Destination: CSMT

DFHCA5535E *date time applid netname tranid*
Command not executed. restype name resname is reserved by CICS.

Explanation: The user specified a resource name *resname* for resource type *restype* which is reserved for use by CICS.

System action: The utility ignores the command.

User response: Specify a different resource name.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, restype, resname*

Destination: CSMT

DFHCA5536W *date time applid netname tranid keyword1 and keyword2 attributes are inconsistent if definition is being shared with a back-level release.*

Explanation: *keyword1* has been preceded by *keyword2*. However, *keyword1* has been kept for compatibility reasons. After updating or creating the resource, the value specified for *keyword1* has become inconsistent with the value specified for *keyword2*.

System action: The resource is created or updated.

User response: If sharing the resource with a back level release, ensure that the resulting resource definition is acceptable. Otherwise, ignore the message.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, keyword1, keyword2*

Destination: CSMT

DFHCA5537W *date time applid netname tranid Prefix allowed to default. Use of defaults is recommended for MRO sessions only.*

Explanation: A null value has been accepted for a send or receive prefix for an LU6.1 or MRO session. The default value '>' is supplied by CICS for send sessions and '<' for receive sessions. These values are the default prefixes for MRO session names. The use of these prefixes is allowed for LU6.1 sessions, but is not recommended if MRO session names with the same prefixes are in use, because duplicate names may occur if large numbers of sessions are defined.

System action: CICS generates session names using these prefixes.

User response: If this is an LU6.1 session, it is recommended that a different prefix should be chosen.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid*

Destination: CSMT

DFHCA5538W *date time applid netname tranid resource names starting with x may conflict with system sessions names.*

Explanation: The resource *resource* has been given a name starting with the character *x*, which might be used for system-generated SESSIONS names.

System action: The definition is created or updated.

User response: Ensure there is no conflict with the name given to the resource and SESSIONS names.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, resource, x*

Destination: CSMT

DFHCA5539S *date time applid netname tranid keyword is not valid because it starts with the reserved character or string string.*

Explanation: The name you have given to keyword *keyword* is not valid because the name begins with a reserved character or string such as "C" or "DFH".

System action: The definition is not created.

User response: Change the name of the keyword.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, keyword, string*

Destination: CSMT

DFHCA5540W *date time applid xxxxxxx value is greater than yyyyyyy value. The lower value takes precedence.*

Explanation: A value has been specified that is not consistent with another. The value *xxxxxxx* is greater than value *yyyyyyy*. Value *yyyyyyy* takes precedence and overrides the higher value.

System action: The definition is created or updated with the two values as specified.

User response: Ensure that the two values are defined as you expect. You may decide to leave the values as specified and dynamically change the values online once the resource has been installed in the CICS system.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, xxxxxxx, yyyyyyy*

Destination: CSMT

DFHCA5542E *date time applid netname tranid*
Command not executed. xxxxxxx and yyyyyyy must be the same length.

Explanation: Two options, xxxxxxx and yyyyyyy, have been specified but the length of the respective operands must be the same.

System action: The utility ignores the command.

User response: Correct the command.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, xxxxxxx, yyyyyyy*

Destination: CSMT

DFHCA5543E *date time applid netname tranid*
Command not executed. Generic characters must be in the same position in xxxxxxx and yyyyyyy.

Explanation: Two options, xxxxxxx and yyyyyyy, have been specified containing generic characters. The generic characters must be placed in the same position for both keywords.

System action: The utility ignores the command.

User response: Correct the command.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, xxxxxxx, yyyyyyy*

Destination: CSMT

DFHCA5544E *date time applid* **Command not executed. xxxxxxx must be specified as yyyyyyy because a previous value is generic.**

Explanation: The options, xxxxxxx, must be specified as yyyyyyy because a previous option value was specified as generic.

System action: The utility ignores the command.

User response: Correct the command.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, xxxxxxx, yyyyyyy*

Destination: CSMT

DFHCA5546E *date time applid* **Command not executed. xxxxxxx is not valid as a type yyyyyyy parameter.**

Explanation: The options specified conflict. If TYPE EJB is specified, the respective ejb-type options must be specified. The ejb-type attributes are BEANNAME and INTFACETYPE. Likewise, for TYPE CORBA, the corba-type attributes must be specified. These are MODULE and INTERFACE. For TYPE GENERIC, either attributes may be specified but they should be generic.

System action: The utility ignores the command.

User response: Correct the command.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, xxxxxxx, yyyyyyy*

Destination: CSMT

DFHCA5547E *date time applid netname tranid*
Command not executed. xxxxxxx value yyyyyyy is invalid.

Explanation: A value yyyyyyy has been specified for keyword xxxxxxx which is not valid. It may for instance be non-numeric.

System action: The utility ignores the command.

User response: Correct the command.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, xxxxxxx, yyyyyyy*

Destination: CSMT

DFHCA5548E *date time applid* **Command not executed. xxxxxxx option is invalid for a back level REQUESTMODEL.**

Explanation: The options specified conflict. If CORBASERVER name is blank and the respective previous level attributes (OMGMODULE, OMGOPERATION, and OMGINTERFACE) are specified, the use of BEANNAME, MODULE, INTERFACE and OPERATION is not allowed. It is not possible to give a back level requestmodel definition new attributes. The old requestmodel must be discarded and redefined with the new attributes if it is required to be used on this level of CICS.

System action: The utility ignores the command.

User response: Correct the command. If this requestmodel is being maintained for a back level CICS system, specify only the attributes OMGMODULE, OMGOPERATION, OMGINTERFACE and TRANSID. However, to use an old requestmodel on this level of CICS, it must be discarded and redefined with the new attributes.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, xxxxxxx*

Destination: CSMT

DFHCA5549E *date time applid* **Command not executed. xxxxxxx value must not be the same as yyyyyyy value.**

Explanation: The values specified for the two attributes must not be the same. For instance, SSLPORT number must be different from PORT number on CORBASERVER definitions.

System action: The utility ignores the command.

User response: Correct the command.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, xxxxxxx, yyyyyyy*

Destination: CSMT

DFHCA5550W *date time applid netname tranid keyword1* **implies keyword2 . The default value has been assumed.**

Explanation: *keyword1* has been specified with a value that is incompatible with the value for *keyword2*.

System action: The utility changes *keyword1* to set the default value and processes the command.

User response: Ensure that the resulting resource definition is acceptable.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, keyword1, keyword2*

Destination: CSMT

DFHCA5551E *date time applid* **Command not executed. keyword1 cannot be specified as generic unless keyword2 is also generic.**

Explanation: *keyword1* has been specified with a generic name containing wildcard characters (asterisks or plus signs). But this is only permitted when *keyword2* is also specified as a generic name.

System action: The utility ignores the command.

User response: If it is required that *keyword1* must be generic, ensure that *keyword2* is also specified with a generic name.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, keyword1, keyword2*

Destination: CSMT

DFHCA5552E *date time applid* **Command not executed. CIPHER value 'value' is not in the valid set (list).**

Explanation: The CIPHER attribute has been specified with an invalid value, *value*, which is not in the valid set of cipher values as indicated by *list*.

System action: The utility ignores the command.

User response: Ensure that you have defined a set of CIPHER values which are correct for this CICS address space.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, value, list*

Destination: CSMT

DFHCA5553E *date time applid netname tranid* **Command not executed. field cannot start with a 'char'.**

Explanation: The named attribute field, *field*, starts with an invalid character, *char*. This is commonly caused by the field starting with an '*' which is not allowed.

System action: The utility ignores the command.

User response: Change the named attribute field to start with a permitted character.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, field, char*

Destination: CSMT

DFHCA5554W *date time applid netname tranid* **Use of static attribute field1 forces field2.**

Explanation: The Server URIMAP attribute field, *field1* is within the set that returns a static response. This has forced the setting of *field2*. This is commonly caused by specifying MEDIATYPE, CHARACTERSET, HOSTCODEPAGE, TEMPLATENAME or HFSFILE with ANALYZER(YES) when ANALYZER(NO) is required.

System action: The utility continues.

User response: None.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, field1, field2*

Destination: CSMT

DFHCA5555E *date time applid netname tranid* **Command not executed. There must be at least one attribute specified.**

Explanation: At least one of the named attribute fields, *attribute*, must be specified for this resource.

System action: The utility ignores the command.

User response: Ensure that you have specified at least one of the required attributes.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, attribute*

Destination: CSMT

DFHCA5556E *date time applid netname tranid*
Command not executed. resource names beginning with 'yyy' are reserved and cannot be used.

Explanation: CICS supplies standard programs and transactions whose names you should avoid. For this type of resource, however, you must not use reserved names.

System action: The utility ignores the command.

User response: Rename the resource definition to an appropriate name.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, resource, yyy*

Destination: CSMT

DFHCA5557E *date time applid netname tranid*
Command not executed. 'xxxxxxx' is a reserved name and cannot be used as a resource name.

Explanation: Certain names are reserved and are not allowed to be used as resource names.

System action: The utility ignores the command.

User response: Rename the resource definition to an appropriate name.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, xxxxxx, resource*

Destination: CSMT

DFHCA5558W *date time applid netname tranid* **A ranking value less than 10 for LIBRARY 'resource' means it will appear before DFHRPL in the search order.**

Explanation: The ranking value of 10 is reserved for DFHRPL library. If you specify a ranking value less than 10 this LIBRARY *resource* will appear ahead of the DFHRPL in the library search order.

System action: The utility continues.

User response: Ensure that you definitely want the

specified LIBRARY to appear before the DFHRPL in the library search order. Otherwise, define the LIBRARY *resource* with a RANKING value greater than 10.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, resource*

Destination: CSMT

DFHCA5600E *date time applid netname tranid* **Unable to get storage for module DFHCICS. Primary CSD not initialized.**

Explanation: There is insufficient storage to load module DFHCICS.

System action: Processing of the INITIALIZE command is terminated.

User response: Ensure that there is sufficient storage to load the DFHCICS module.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid*

Destination: CSMT

DFHCA5601E *date time applid netname tranid* **Unable to load the tabletype table named table.**

Explanation: Table *table* cannot be loaded.

System action: The system action depends on the type of table.

- LD** DFHCSDUP cannot process the command. The utility attempts to
1. Close any files previously opened internally.
 2. Unload any EXTRACT exit routines that were dynamically loaded.
 3. Invoke the termination exit routine, if supplied.
 4. Return control to the invoker of the utility.

FCT or RDT

The CSD utility cannot load the table, and terminates the processing of the utility command.

User response: Refer to the preceding MVS message which should specify the reason for the failure.

If your FCT or TCT assembly and link-editing is successful, the FCT or RDT should be in the library. The LD is in the load library of the supplied pregenerated CICS system.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, tabletype, table*

Destination: CSMT

DFHCA5602E *date time applid netname tranid* **Unable to unload the *tabletype* table named *table*.**

Explanation: Table *table* cannot be unloaded.

System action: The system action depends on the type of table.

LD DFHCSDUP cannot process the command. The utility attempts to

1. Close any files previously opened internally.
2. Unload any EXTRACT exit routines that were dynamically loaded.
3. Invoke the termination exit routine, if supplied.
4. Return control to the invoker of the utility.

FCT or RDT

The CSD utility cannot unload the table, and terminates the processing of the utility command.

User response: Refer to the preceding MVS message which should specify the reason for the failure.

If your FCT or TCT assembly and link-editing is successful, the FCT or RDT should be in the library. The LD is in the load library of the supplied pregenerated CICS system.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, tabletype, table*

Destination: CSMT

DFHCA5603E *date time applid netname tranid* **Unable to locate the *tabletype* table named *table*.**

Explanation: Table *table* cannot be located.

System action: The system action depends on the type of table specified.

LD DFHCSDUP cannot process the command. The utility attempts to

1. Close any files previously opened internally.
2. Unload any EXTRACT exit routines that were dynamically loaded.
3. Invoke the termination exit routine, if supplied.
4. Return control to the invoker of the utility.

FCT, RDT or DCT

The CSD utility cannot locate the table, and terminates the processing of the utility command.

User response: Determine the reason for the failure.

If your FCT, TCT or DCT assembly and link-editing is successful, the FCT, RDT or DCT should be in the library. The LD is in the load library of the supplied pregenerated CICS system.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, tabletype, table*

Destination: CSMT

DFHCA5604E *date time applid netname tranid* **Unable to obtain storage for the cross-reference table named *table*.**

Explanation: DFHCSDUP was unable to obtain storage for table *table*.

System action: DFHCSDUP cannot process the command.

If commands are being read from a SYSIN data stream, subsequent commands (except LIST) are checked for syntax only. (If the primary CSD file cannot be opened, LIST is not processed either.)

If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

User response: Increase the region size and retry the command.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, table*

Destination: CSMT

DFHCA5605E *date time applid netname tranid* **Disallowed character in group or list name *object*.**

Explanation: The call to module DFHDMP has failed to construct a valid key for the record created on the CSD file. This is because the group or list name contains an invalid character.

System action: A CSD record is not created for this definition. (If it is a transaction, a generated profile is not created either.)

User response: Use the CEDA transaction to define the resource with a valid name.

Module: DFHCAP

XMEOUT Parameters: *date, time,applid, netname, tranid, object*

Destination: CSMT

DFHCA5606S *date time applid netname tranid* **Command is not executed. Unable to load the service module *progrname*.**

Explanation: The service module, *progrname*, cannot be loaded due to insufficient storage.

System action: Utility command execution is terminated. If commands are being read from a SYSIN

data stream by the utility, subsequent commands are checked for syntax only.

User response: Retry the utility command with an increased region size.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, progname*

Destination: CSMT

DFHCA5607S *date time applid netname tranid*
Command is terminated. An error occurred while reading the first secondary CSD record.

Explanation: An I/O error has occurred on the secondary CSD file.

System action: The SERVICE command is terminated. If commands are being read from a SYSIN data stream by the utility, subsequent commands are checked for syntax only.

User response: Check that the input and output data sets have been correctly defined, and that the DDNAME for the secondary CSD file in the JCL corresponds to the FROMCSD parameter in the SERVICE utility command.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid*

Destination: CSMT

DFHCA5608S *date time applid netname tranid*
Command is terminated. Error occurred while reading a secondary CSD record.

Explanation: An I/O error has occurred on the secondary CSD file.

System action: The SERVICE command is terminated. If commands are being read from a SYSIN data stream by the utility, subsequent commands are checked for syntax only.

User response: Check that the input and output data sets have been correctly defined, and that the DDNAME for the secondary CSD file in the JCL corresponds to the FROMCSD parameter in the SERVICE utility command.

If the problem persists, try to obtain a print out of the CSD, using either IDCAMS or the DFHCSDUP LIST ALL option. The LIST indicates where errors have occurred because they will not print and are therefore easily identifiable.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid*

Destination: CSMT

DFHCA5609S *date time applid netname tranid*
Command is terminated. Error occurred while writing a primary CSD record.

Explanation: An I/O error has occurred on the primary CSD file.

System action: The SERVICE command is terminated. If commands are being read from a SYSIN data stream by the utility, subsequent commands are checked for syntax only.

User response: Retry the command, ensuring that a sufficiently large data set is specified for the output (primary) CSD file.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid*

Destination: CSMT

DFHCA5611E *date time applid netname tranid*
Command not executed. 'parameter' parameter must begin with 'DFH'.

Explanation: In a CSD utility MIGRATE command, the specified parameter contained an invalid table name or group name.

System action: The utility does not process the command.

User response: Resubmit the MIGRATE command with a valid table name or group name.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, parameter*

Destination: CSMT

DFHCA5612I *date time applid netname tranid resource*
object in group grpname is unchanged.

Explanation: A resource definition existed in both source and target groups. Based on the CSD utility commands submitted, the utility has replaced the resource definition in the target group.

System action: Normal utility processing continues.

User response: None.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, resource, object, grpname*

Destination: CSMT

DFHCA5613E *date time applid netname tranid* **Unable to locate the library member** *member*.

Explanation: The member is not in the libraries named in the JCL.

System action: The utility terminates processing of the command that required access to library member *member*.

User response: Ensure that the member is correctly link-edited into the library and resubmit the job.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, member*

Destination: CSMT

DFHCA5614E *date time applid netname tranid* **Unable to load the library member** *member*.

Explanation: DFHCSDUP could not load library member *member*.

System action: The utility terminates processing of the command that required access to the library member.

User response: Ensure that the member is correctly link-edited into the library and resubmit the job.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, member*

Destination: CSMT

DFHCA5617S *date time applid netname tranid*
Command is terminated. Unrecognised type of record encountered while secondary CSD was being read.

Explanation: The record-type field of an input CSD record is invalid.

System action: The SERVICE command is terminated. If commands are being read from a SYSIN data stream by the utility, subsequent commands are checked for syntax only.

User response: Check that the input and output data sets have been correctly defined, and that the DDNAME for the secondary CSD file in the JCL corresponds to the FROMCSD parameter in the SERVICE utility command.

If the problem persists, try to obtain a print out of the CSD, using either IDCAMS or the DFHCSDUP LIST ALL option. The LIST indicates where errors have occurred because they will not print and are therefore easily identifiable.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid*

Destination: CSMT

DFHCA5618I *date time applid netname tranid* **An attention interrupt was requested during DFHCSDUP execution.**

Explanation: An attention interrupt has been requested while DFHCSDUP is executing in a TSO environment.

System action: Normal utility processing continues.

Control is passed to a put-message exit if one has been specified on the extended entry linkage. Refer to the *CICS Customization Guide* for more information about put-message exits.

User response: None.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid*

Destination: CSMT

DFHCA5619W *date time applid netname tranid* **An invalid value of the PAGESIZE parameter has been specified. The default value of 60 lines per page will be used.**

Explanation: A value of the PAGESIZE parameter outside the allowed range (4–9999) has been specified.

System action: The default value of 60 lines per page is taken.

User response: Ensure that a valid PAGESIZE value is specified in future.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid*

Destination: CSMT

DFHCA5620E *date time applid netname tranid* **An illegal return code (RC=*ret-code*) has been returned from the exit exit.**

Explanation: The specified user-exit routine has returned a disallowed return code.

System action: Processing of the utility command is terminated. The exit is not disabled.

User response: Investigate the specified exit routine for the cause of the return code.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid, ret-code, exit*

Destination: CSMT

DFHCA5621E *date time applid netname tranid* **A non-zero return code has been returned from the put-message exit.**

Explanation: The put-message exit routine has returned a disallowed return code.

System action: Processing of the utility command is terminated and the put-message exit is disabled.

User response: Investigate the put-message exit routine for the cause of the return code.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid*

Destination: CSMT

DFHCA5622S *date time applid netname tranid* **The secondary CSD has been closed during clean-up processing following the interception of an abend.**

Explanation: An abend has occurred during DFHCSDUP processing. The secondary CSD has been closed during post-ABEND cleanup processing.

System action: Processing of the utility command is terminated.

User response: Refer to prior messages for further information regarding this problem.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid*

Destination: CSMT

DFHCA5623S *date time applid netname tranid* **The primary CSD has been closed during clean-up processing following the interception of an abend.**

Explanation: An abend has occurred during DFHCSDUP processing. The primary CSD has been closed during post-ABEND cleanup processing.

System action: Processing of the utility command is terminated.

User response: Refer to prior messages for further information regarding this problem.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid*

Destination: CSMT

DFHCA5624S *date time applid netname tranid* **The extract exit program has been unloaded during clean-up processing following the interception of an abend.**

Explanation: An abend has occurred during the processing of an EXTRACT command. The extract exit program specified on the USERPROGRAM keyword of the EXTRACT utility command has been unloaded during post-ABEND cleanup processing.

System action: The EXTRACT command is terminated.

User response: Refer to prior messages for further information regarding the problem.

Module: DFHCAP

XMEOUT Parameters: *date, time, applid, netname, tranid*

Destination: CSMT

DFHCA5630W *date time applid* **No IBM supplied definition found for *resourcetype* *resourcenam*.**

Explanation: While performing a SCAN command, the named resource type was not found in the CSD file on any of the IBM supplied groups. Note that compatibility groups are not used for the SCAN command.

System action: The utility continues.

User response: None.

Module: DFHCSDUP

XMEOUT Parameters: *date, time, applid, resourcetype, resourcenam*

Destination: CSMT

DFHCA5631I *date time applid resourcetype resourcenam* **in group *groupname1* matches the IBM supplied definition in group *groupname2*.**

Explanation: While performing a SCAN command, the resource *resourcetype* name *resourcenam* was found in group *groupname1* and it matches the IBM supplied definition in group *groupname2*.

System action: The utility continues.

User response: None.

Module: DFHCSDUP

XMEOUT Parameters: *date, time, applid, resourcetype, resourcenam, groupname1, groupname2*

Destination: CSMT

DFHCA5632I *date time applid resourcetype
resourcename in group groupname1
does not match the IBM supplied
definition in group groupname2.*

Explanation: While performing a SCAN command, the resource *resourcetype* name *resourcename* was found in group *groupname1* and it does not match the IBM supplied definition in group *groupname2*.

System action: The utility continues.

User response: None.

Module: DFHCS DUP

XMEOUT Parameters: *date, time, applid, resourcetype, resourcename, groupname1, groupname2*

Destination: CSMT

DFHCA5633I *date time applid resourcetype
resourcename found in group
groupname.*

Explanation: While performing a SCAN command, the resource *resourcetype* name *resourcename* was found in group *groupname*. No IBM supplied definition was found to perform a compare against.

DFHCCnnnn messages

DFHCC0001 *applid An abend (code aaa/bbbb) has
occurred at offset X'offset' in the {local |
global} catalog, module modname*

Explanation: An abnormal end (abend) or program check has occurred in module *modname* and will have occurred in either the local (DFHLCD) or the global (DFHGCD) catalog domains. This implies that there may be an error in CICS code.

Alternatively,

- Unexpected data has been input, or
- Storage has been overwritten.

The code *aaa/bbbb* is a three digit hexadecimal MVS code (if applicable), followed by a four digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

During initialization, CICS may not have access to the user's *applid* coded in the SIT. If CICS produces this message in these circumstances, it uses the default *applid* value DBDCCICS.

System action: An exception entry is made in the trace table, provided that trace is available at this time. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

System action: The utility continues.

User response: None.

Module: DFHCS DUP

XMEOUT Parameters: *date, time, applid, resourcetype, resourcename, groupname*

Destination: CSMT

DFHCA5634W *date time applid resourcetype
resourcename not found in user
groups.*

Explanation: While performing a SCAN command, the resource *resourcetype* name *resourcename* was not found in any user groups.

System action: The utility continues.

User response: None.

Module: DFHCS DUP

XMEOUT Parameters: *date, time, applid, resourcetype, resourcename*

Destination: CSMT

This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Notify the system programmer.

Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

Then look up the CICS alphanumeric code in this manual. This will tell you, for example, whether the error was a program check, an abend, a runaway or a recovery percolation, and may give you some guidance concerning user response.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCCCC, DFHCCDM

XMEOUT Parameters: *applid, aaa/bbbb, X'offset', {1=local, 2=global}, modname*

Destination: Console

DFHCC0004 *applid A possible loop has been
detected in the {local | global} catalog at
offset X'offset' in module modname*

Explanation: A CICS function is taking more time to

process than CICS expects. A possible loop has been detected in module *modname* at offset *X'offset*. This is the offset of the instruction which was executing at the time the error was detected.

During initialization, CICS may not have access to the user's *applid* coded in the SIT. If CICS produces this message in these circumstances, it uses the default *applid* value DBDCCICS.

System action: An exception entry is made in the trace table.

A system dump is taken, unless you have specifically suppressed dumps in the dump table.

This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Notify the system programmer.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCCDM, DFHCCCC

XMEOUT Parameters: *applid*, {1=*local*, 2=*global*}, *X'offset*, *modname*

Destination: Console

DFHCC0100 *applid* Global Catalog initialization failure. {GENERATE ACB | OPEN ACB | GENERATE RPL | OPEN, SHOWCB.} R15 = X'yy' VSAM error code = X'zz'

Explanation: A VSAM error has occurred during global catalog initialization.

The VSAM codes given are explained in the OS/390 DFSMS Macro Instructions for Data Sets manual.

The possible versions of this message include the text

- "GENERATE ACB".
- "GENERATE RPL".

The GENCB failed with the R15 condition given in X'yy.

The X'zz code is only meaningful if X'yy is X'04 when X'zz is the error code returned by VSAM Register 0 in response to a GENCB macro.

- "OPEN ACB".

OPEN has failed with the R15 condition code X'yy. This was followed by a successful SHOWCB which has placed the OPEN error code into X'zz. Also see the message that VSAM writes to the operator console and programmer's listing.

- "OPEN, SHOWCB".

OPEN has failed with the R15 condition code X'yy.

This was followed by a SHOWCB which failed, and the R0 return code from the SHOWCB is given in X'zz. Also see the message that VSAM writes to the operator console and programmer's listing.

During initialization, CICS may not have access to the user's *applid* coded in the SIT. If CICS produces this message in these circumstances, it uses the default *applid* value DBDCCICS.

System action: A system dump is produced, then CICS is terminated.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Look up the error codes in the *VSAM Programmer's Guide*, correct it then retry.

If this fails, notify the system programmer. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCCDM

XMEOUT Parameters: *applid*, {1=*GENERATE ACB*, 2=*OPEN ACB*, 3=*GENERATE RPL*, 4=*OPEN, SHOWCB*}, *yy*, *zz*

Destination: Console

DFHCC0101 LOCAL CATALOG INITIALIZATION ERROR. {GENERATE ACB | OPEN ACB | GENERATE RPL | OPEN, SHOWCB.}R15 = X'yy' VSAM ERROR CODE = X'zz'

Explanation: A VSAM error has occurred during local catalog initialization.

The VSAM codes given are explained in the OS/390 DFSMS Macro Instructions for Data Sets manual.

The possible versions of this message include the text

- "GENERATE ACB".
- "GENERATE RPL".

The GENCB failed with the R15 condition given in X'yy.

The X'zz code is only meaningful when X'yy is X'04 when X'zz is the error code returned by VSAM Register 0 in response to a GENCB macro.

- "OPEN ACB".

OPEN has failed with the R15 condition code X'yy. This was followed by a successful SHOWCB which has placed the OPEN error code into X'zz. Also see the message that VSAM writes to the operator console and programmer's listing.

- "OPEN, SHOWCB".

OPEN has failed with the R15 condition code X'yy.

This was followed by a SHOWCB which failed, and the R0 return code from the SHOWCB is given in

X'zz. Also see the message that VSAM writes to the operator console and programmer's listing.

System action: A system dump is produced, then CICS is terminated.

User response: Look up the error codes in the *VSAM Programmer's Guide*, correct it then retry. If this fails, notify the system programmer.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCCDM

Destination: Console

DFHCC0102 *applid* Global Catalog data set is already in use.

Explanation: The VSAM error reported in the previous DFHCC0100 message suggests that the global catalog is already being used, possibly by another CICS region. The global catalog data set cannot be shared.

System action: CICS is terminated.

User response: Ensure that the DFHGCD DD statement for this CICS specifies a different global catalog data set from any CICS job that is already running.

If CICS still fails, notify the system programmer. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCCDM

XMEOUT Parameter: *applid*

Destination: Console

DFHCC0103 LOCAL CATALOG DATA SET IS ALREADY IN USE.

Explanation: The VSAM error reported in the previous DFHCC0101 message suggests that the local catalog is already being used, possibly by another CICS region. The local catalog data set cannot be shared.

System action: CICS is terminated.

User response: Ensure that the DFHLCD DD statement for this CICS specifies a different local catalog data set from any CICS job that is already running.

If CICS still fails, notify the system programmer. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCCDM

Destination: Console

DFHCC0104 AN ABEND HAS OCCURRED DURING INITIALIZATION OF CATALOG DOMAIN IN MODULE DFHCCDM.

Explanation: DFHCCDM's recovery routine received control during pre-initialization of the local catalog (CC) domain.

System action: A system dump with dump code KERNDUMP is taken and CICS terminates.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCCDM

Destination: Console

DFHCC0200 *applid* VSAM error on the {local |global} catalog data set. VSAM return code in R15 = X'yy' RPL-FDBK=X'zz'.

Explanation: A catalog VSAM operation has produced the VSAM error given.

An exception trace, code CC 2B60 or GC 2B60 has also been made.

System action: A system dump is produced, then CICS is terminated. This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: If possible, correct the VSAM error and restart CICS. For the meaning of the return codes, refer to the *VSAM Programmer's Guide GC26-3838*.

Inform the system programmer because this indicates a possible error in CICS code. You may need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCCCC

XMEOUT Parameters: *applid*, {1=local, 2=global}, yy, zz

Destination: Console

DFHCC0201 VSAM ERROR ON THE LOCAL CATALOG DATA SET, VSAM RETURN CODE IN R15 = X'yy' FDBK=X'zz'.

Explanation: A local catalog VSAM operation has produced the VSAM error given.

An exception trace, code CC 2B60 or GC 2B60 has also been made.

System action: A system dump is produced then CICS is terminated. This is a critical error and CICS is terminated, even if you have specified in the dump table

that CICS should not terminate.

User response: If possible correct the VSAM error and restart CICS. For the meaning of the return codes, refer to the *VSAM Programmer's Guide GC26-3838*.

Inform the system programmer as this indicates a possible error in CICS code. You may need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCCCC

Destination: Console

DFHCC0202 *applid* The {local | global} catalog has started to use new secondary space allocation.

Explanation: Secondary space may be specified when the catalog data sets DFHLCD and DFHGCD are defined. This message is issued when the catalog starts using an additional space allocation.

See the *CICS System Definition Guide* for more information on controlling CICS storage.

System action: An exception entry is made in the trace table, provided that trace is available at this time.

User response: There are two possibilities.

- The system is in a loop which involves calls to the catalog to write onto the catalog data set. This is the most likely cause if the system suddenly starts to produce this message repeatedly.
- Insufficient primary space was allocated for the catalog when it was defined. This is the most likely cause if this message is produced either
 - during or shortly after CICS initialization, or
 - this message is only produced infrequently (and only a few are ever produced).

Look for any other symptoms of possible looping, and act accordingly. If looping has occurred then the system programmer should redefine the catalog during the next CICS initial start.

If CICS was not looping then notify the system programmer, who should increase the primary space allocated for this data set during the next CICS initial start.

Module: DFHCCCC

XMEOUT Parameters: *applid*, {1=local, 2=global}

DFHCEnnnn messages

DFHCE3500 Unable to interpret keyword data. Sign-on is terminated.

Explanation: The keyword data supplied when invoking the sign on transaction is invalid.

Destination: Console

DFHCC0203 *applid* The {local | global} catalog is full.

Explanation: The specified catalog data set (DFHLCD or DFHGCD) is full. There are two possible reasons for this error

- The system is in a loop which involves calls to the catalog to write onto the catalog data set.
- Insufficient primary space was allocated for the catalog when it was defined. This is the most likely cause if this message is issued during or shortly after CICS initialization.

System action: If the error occurs during initialization, a system dump is produced then CICS is terminated. If the error occurs after initialization, the domain invoking the catalog services will decide what action is appropriate.

User response: Check for any other symptoms of looping and act accordingly.

If CICS is not looping, notify the system programmer who should increase the primary space allocated for this data set during the next CICS initial start.

If CICS is looping, this indicates an error in CICS code. You may need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCCCC

XMEOUT Parameters: *applid*, {1=local, 2=global}

Destination: Console

DFHCC0300 DFHCCUTL ERROR REPORT. ERROR {OPENING DFHLCD.IWRITING TO DFHLCD. R15 = X'yy' VSAM RPL FEEDBACK CODE = X'zz'}

Explanation: The initialization of the local catalog data set, DFHLCD, has failed for the reasons given in the resulting job output.

System action: Job terminates.

User response: For the meaning of the VSAM codes, refer to the *VSAM Programmer's Guide GC26-3838*. Correct cause of error indicated and retry.

Module: DFHCCUTL

Destination: SYSPRINT

System action: Signon terminates.

User response: Use the correct format to invoke the sign on transaction. The correct format is

DFHCE3501 • DFHCE3522

CESN USERID=*userid*,GROUPID=*groupid*,
PS=*password*,NEWPS=*new_password*,
LANGUAGE=*language_code*

See the *CICS Supplied Transactions* manual.

Module: DFHSNP

Destination: Terminal End User

DFHCE3501 Invalid keyword. Sign-on is terminated.

Explanation: The keyword which was entered was invalid.

System action: The sign on transaction terminates.

User response: Use a valid character keyword within the range 1-8.

Module: DFHSNP

Destination: Terminal End User

DFHCE3502 Your userid must be 1-8 characters. Sign-on is terminated.

Explanation: The value of the USERID keyword has less than 1 or more than 8 characters.

System action: Sign on terminates.

User response: Use a valid userid.

Module: DFHSNP

Destination: Terminal End User

DFHCE3503 Your password must be 1-8 characters. Sign-on is terminated.

Explanation: The value of the PS keyword has less than 1 or more than 8 characters.

System action: Sign on terminates.

User response: Use a valid password.

Module: DFHSNP

Destination: Terminal End User

DFHCE3504 Your new password must be 1-8 characters. Sign-on is terminated.

Explanation: The value of the NEWPS keyword has less than 1 or more than 8 characters.

System action: Signon terminates.

User response: Use a valid new password.

Module: DFHSNP

Destination: Terminal End User

DFHCE3506 Your groupid must be 1-8 characters. Sign-on is terminated.

Explanation: The value of the GROUPID keyword has less than 1 or more than 8 characters.

System action: Signon terminates.

User response: Use a valid group name.

Module: DFHSNP

Destination: Terminal End User

DFHCE3507 Your language code must be three characters. Sign-on is terminated.

Explanation: The value of the LANGUAGE keyword is not a three-letter code.

System action: Signon terminates.

User response: Use a valid language code.

Module: DFHSNP

Destination: Terminal End User

DFHCE3520 Please type your userid.

Explanation: The system requests a userid.

System action: None.

User response: Enter your userid.

Module: DFHSNP

Destination: Terminal End User

DFHCE3521 CICS sign-on. Please type your userid.

Explanation: The system requests a userid.

System action: The system waits for a response.

User response: Enter your userid.

Module: DFHSNP

Destination: Terminal End User

DFHCE3522 CICS sign-on. Please type your userid==>

Explanation: The system requests a userid.

System action: The system waits for a response.

User response: Enter your userid.

Module: DFHSNP

Destination: Terminal End User

DFHCE3523 Please type your password.

Explanation: The system requests a password.

System action: The system waits for a response.

User response: Enter your password.

Module: DFHSNP

Destination: Terminal End User

DFHCE3524 Please type your password==>@@@@@@@@

Explanation: The system requests a password. @@@@@@@@@@ represents a character string provided by CICS to prevent the password being seen.

System action: The system waits for a response.

User response: Enter your password.

Module: DFHSNP

Destination: Terminal End User

DFHCE3525 Your password has expired. Please type your new password.

Explanation: The system requires a new password.

System action: The system waits for a response.

User response: Enter a new password.

Module: DFHSNP

Destination: Terminal End User

DFHCE3526 Your password has expired. Please type your new password==>@@@@@@@@

Explanation: The system requests a new password. @@@@@@@@@@ represents a character string provided by CICS to prevent the new password being seen.

System action: The system waits for a response.

User response: Enter a new password.

Module: DFHSNP

Destination: Terminal End User

DFHCE3527 Use your magnetic (OPID) card or press ENTER to cancel.

Explanation: A magnetic card is required.

System action: The system waits for an opid (magnetic) card.

User response: Supply badge or terminate transaction.

Module: DFHSNP

Destination: Terminal End User

DFHCE3528 Signon failed during SECLABEL checking.

Explanation: The signon request has failed because the external security manager (ESM) detected a critical error.

System action: The signon transaction terminates.

User response: Refer to message DFHSN1108 on the CSCS log for the information and actions necessary to resolve this problem.

Module: DFHSNP

Destination: Terminal End User

DFHCE3529 The ESM is currently not accepting signons. Please try later.

Explanation: The signon request has failed because the external security manager (ESM) was in a tranquil state. When in a tranquil state, only signons from special users are accepted.

System action: The sign on transaction terminates.

User response: The ESM has probably been put into a tranquil state to allow for ESM database maintenance. Determine whether maintenance is currently occurring and how long it will take. When maintenance is finished the tranquil state should be removed from the ESM which will allow you to sign on to CICS. If the ESM has not been put into a tranquil state then, refer to message DFHSN1108 on the CSCS log for the information and actions necessary to resolve this problem.

User response: Enter a valid language code.

Module: DFH SNP

Destination: Terminal End User

DFHCE3539 Please reenter the new password for verification.

Explanation: You have entered a new password in the new password field and you are now being prompted to reenter the same password to assure yourself of the new password data.

System action: The system waits for a response.

User response: Reenter the new password in the password field.

Module: DFH SNP

Destination: Terminal End User

DFHCE3540 Ensure that passwords are entered in the correct case.

Explanation: This message is issued on systems whose External Security Manager supports mixed case passwords. It is to remind you that passwords must be entered with exactly the correct lower-case and upper-case letters.

System action: The password will not be folded to uppercase.

User response: Enter passwords in the correct case.

Module:

Destination: Terminal End User

DFHCE3541 Security interface error (rc). Sign-on is terminated.

Explanation: An error has been detected in an external security manager. *rc* is the return code from the external security manager.

System action: Signon terminates.

User response: For a RACF signon, *rc* is the return

code from the RACINIT macro. See the appropriate RACF manual for details of the macro return codes. The return codes are macro specific.

Module: DFHNSP

Destination: Terminal End User

DFHCE3542 Sign-on is not allowed at this terminal. Your sign-on is ignored.

Explanation: The sign on transaction cannot be executed at the current terminal for one of the following reasons

- The terminal is defined with a preset userid that cannot be changed by signing on
- The terminal is a surrogate of a terminal in another CICS region, but the sign on transaction is not executing within a session established by the CRTE transaction.

System action: The sign on transaction terminates.

User response: Do not use the sign on transaction at this terminal.

Module: DFHNSP

Destination: Terminal End User

DFHCE3543 You have cancelled your sign-on request. Sign-on is terminated.

Explanation: The user has pressed ENTER when an OPID card was requested or has entered PF3 on a 3270 terminal device.

System action: The sign on transaction terminates.

User response: Retry the sign on procedure.

Module: DFHNSP

Destination: Terminal End User

DFHCE3544 Terminal authorization failed. Sign-on is terminated.

Explanation: RACF has responded to a security request with 'Terminal not authorized' and RACF response code X'30.

System action: The sign on transaction terminates.

User response: Inform the systems programmer, who should refer to message DFHSN1118 on the CSCS log for the relevant information and actions necessary to resolve this problem.

Module: DFHNSP

Destination: Terminal End User

DFHCE3545 Application authorization failed. Sign-on is terminated.

Explanation: RACF has responded to a security request with 'Application not authorized' and RACF response code X'34.

System action: The sign on transaction terminates.

User response: Inform the systems programmer, who should refer to message DFHSN1119 on the CSCS log for the relevant information and actions necessary to resolve this problem.

Module: DFHNSP

Destination: Terminal End User

DFHCE3546 Your signon {userid / group access} has been revoked. Signon is terminated.

Explanation: The response from RACF indicates that either the userid that you use to signon to CICS, or your access to the RACF group that contains it, has been revoked by the system.

System action: The signon transaction terminates.

User response: Contact your RACF administrator, who can re-authorize the revoked user ID.

Module: DFHNSP

Destination: Terminal End User

DFHCE3547 Security is not active. Sign-on cannot be performed.

Explanation: A request to sign on to the CICS system was rejected because the CICS security system was not active.

A user can only sign on to CICS when CICS security is active.

The CICS security system is activated using the system initialization parameter SEC=YES.

System action: The sign on transaction terminates.

User response: None.

Module: DFHNSP

Destination: Terminal End User

DFHCE3548 *date time applid* Critical error has occurred in DFHNSP. Codes: 1,2,3,4,5.

Explanation: The sign on program, DFHNSP, is abnormally terminated due to a critical error.

The five codes indicate the cause of the error and where the error occurred.

Code 1 is an abend code. It can be one of ASNA, ASNB or ASNC.

Codes 2, 3, 4 and 5 are codes which help IBM to

identify the source of the error. They are `id_location`, `EIBFRCODE`, `EIBRESP` and `EIBRESP2`.

System action: DFH SNP is abnormally terminated with a transaction dump.. Message DFHAC2206 is normally issued, but if no terminal is associated with the task, DFHAC2236 may be issued instead.

User response: Refer to message DFHAC2206 or DFHAC2236. If DFHAC2236 has been issued, the absence of a terminal is probably the reason for the abend.

Use the abend code given in the message to determine the reason for the error and the course of action to take. This enables you to determine whether the abend was caused by user error or by an error in CICS code. (An error in CICS code is signalled by abend code ASNA.)

If you suspect an error in CICS code, you need further assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFH SNP

XMEOUT Parameters: *date, time, applid, 1, 2, 3, 4, 5*

Destination: CSMT

DFHCE3549 Sign-on is complete (Language language).

Explanation: The user has successfully signed on to the CICS system.

System action: CICS is ready to receive user transactions.

User response: Use terminal as required for CICS transactions.

Module: DFH SNP

Destination: Terminal End User

DFHCE3550 Sign-off option must be LOGOFF or GOODNIGHT. Sign-off is ignored.

Explanation: An option other than LOGOFFGOODNIGHT was detected.

System action: The sign-off transaction terminates.

User response: Specify the correct option when invoking sign-off.

Module: DFH SFP

Destination: Terminal End User

DFHCE3551 *date time applid termid* DFH SNP has detected an invalid COMMAREA. It has been ignored. The data is lost.

Explanation: While processing a CESN transaction DFH SNP was passed a commarea that was not its own. This may be the result of an application issuing the

EXEC CICS RETURN TRANSID(...) COMMAREA(...) with a *transid* of nulls (X'00000000). This could be because the pointer to the *transid* is incorrectly set up or may be part of the system design.

System action: DFH SNP continues with CESN transaction processing.

User response: Investigate whether this message is issued validly as part of the system design, in which case the message can be ignored, or is an error. Investigate the previous transaction at this terminal.

Module: DFH SNP

XMEOUT Parameters: *date, time, applid, termid*

Destination: CSMT

DFHCE3560 Sign-off is not allowed at this terminal. Sign-off is ignored.

Explanation: The sign-off transaction cannot be executed at the current terminal for one of the following reasons

- The terminal is defined with a preset userid that cannot be changed by signing off
- The terminal is a surrogate of a terminal in another CICS region, but the sign-off transaction is not executing within a session established by the CRTE transaction.

System action: The sign-off transaction terminates.

User response: Do not use the sign-off transaction at this terminal.

Module: DFH SFP

Destination: Terminal End User

DFHCE3570 Your groupid is invalid. Please retype.

Explanation: Your group identifier is invalid.

The system requests a group identifier.

System action: The system waits for a response.

User response: Enter a valid group identifier.

Module: DFH SNP

Destination: Terminal End User

DFHCE3571 Your groupid is invalid. Please retype==>

Explanation: Your group identifier is invalid.

The system requests a group identifier.

System action: The system waits for a response.

User response: Enter a valid group identifier.

Module: DFH SNP

Destination: Terminal End User

DFHCE3587 You cannot signon at this terminal at this time.

Explanation: You cannot signon at this terminal at this time. The SNSCOPE initialization parameter disallows signon to more than one terminal at a time. An internal failure during SNSCOPE checking means that CICS is unable to confirm if the user is already signed on elsewhere. The failure has occurred because the limit of concurrent MVS ENQ requests has been reached.

System action: The signon transaction terminates. Message DFHUS0120 will have been written to the console. See the explanation of this message for further information.

User response: Please report this problem to your CICS systems programmer.

Module: DFHNSP

Destination: Terminal End User

DFHCE3588 You are already signed on at another terminal. Signon cannot be performed.

Explanation: You cannot sign on at the current terminal because you are already signed on at another terminal. The SNSCOPE initialization parameter for the CICS system does not allow you to sign on to more than one terminal at a time.

System action: The sign on transaction terminates.

User response: Sign off from the other terminal before you attempt to sign on again.

Module: DFHNSP

Destination: Terminal End User

DFHCE3589 The external security manager is inactive. Signon cannot be performed.

Explanation: You cannot sign on because the external security manager is not active.

System action: The sign on transaction terminates.

User response: Wait until the external security manager has been reactivated before attempting to sign on again.

Module: DFHNSP

Destination: Terminal End User

DFHCE3590 Sign-off is complete.

Explanation: If the user issued a CESN to sign on to the system, then sign-off has been successful. If the user was not signed on, and CICS security was active (SEC=YES system initialization parameter) then message DFHSN1213 is written to the CSCS log to indicate that the user has logged off but has not been allowed to sign off.

System action: Other processing continues.

User response: Use the terminal as required for CICS transactions.

Module: DFHSFP

Destination: Terminal End User

DFHCE3591 Sign-off is complete. LOGOFF option is invalid when using CRTE.

Explanation: The terminal is now signed off. The LOGOFF option which was specified has been ignored as it is invalid when using CRTE.

System action: The CICS system, to which the user has connected via CRTE, has been signed off.

User response: Do not use the LOGOFF option when signing off via CRTE.

Module: DFHSFP

Destination: Terminal End User

DFHCE3592 Sign-off is complete. GOODNIGHT option is invalid when using CRTE.

Explanation: The terminal is now signed off. The GOODNIGHT option which was specified has been ignored as it is invalid when using CRTE.

System action: The CICS system, to which the user has connected via CRTE, has been signed off.

User response: Do not use the GOODNIGHT option when signing off via CRTE.

Module: DFHSFP

Destination: Terminal End User

DFHCE3598 *date time applid* Critical error has occurred in DFHSFP. Codes: 1,2,3,4,5.

Explanation: The signoff program, DFHSFP, will abnormally terminate due to a critical error.

The five codes indicate the cause of the error and where the error occurred.

Code 1 is an abend code. It can be ASFA, ASFB or ASFC.

Codes 2, 3, 4 and 5 are codes which help IBM to identify the source of the error. They are id_location (in hexadecimal), EIBFRCODE, EIBRESP and EIBRESP2.

System action: DFHSFP is abnormally terminated with a transaction dump. Message DFHAC2206 is normally issued, but if no terminal is associated with the task, DFHAC2236 may be issued instead.

User response: Refer to message DFHAC2206 or DFHAC2236. If DFHAC2236 has been issued, the absence of a terminal is probably the reason for the abend.

DFHCF0101I • DFHCF0113

Use the abend code given in the message to determine the reason for the error and the course of action to take. This will enable you to determine whether the abend was caused by user error or by an error in CICS code. (An error in CICS code is signalled by abend code ASFA.)

If you suspect an error in CICS code, you need further assistance from IBM to resolve the problem. See Part 4

of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHSFP

XMEOUT Parameters: *date, time, applid, 1, 2, 3, 4, 5*

Destination: CSMT

DFHCFnnnn messages

DFHCF0101I CF data table server initialization is in progress.

Explanation: The coupling facility data table server program has started execution.

System action: Initialization continues.

User response: None.

Module: DFHCFMN

Destination: Console and SYSPRINT

DFHCF0102I CF data table server for pool *poolname* is now active.

Explanation: The coupling facility data table server for the named pool has completed initialization and is now ready to accept connections.

System action: The server waits for connection requests or operator commands.

User response: None.

Module: DFHCFMN

Destination: Console and SYSPRINT

DFHCF0103 CF data table server initialization failed because the POOLNAME parameter was not specified.

Explanation: The coupling facility data table server program needs to know the name of the associated coupling facility data table pool in order to complete initialization, but no pool name was specified in the SYSIN or PARM field parameters.

System action: The server is terminated.

User response: Ensure that the parameter **POOLNAME=***name* is specified either in the SYSIN parameters or in the PARM field of the JCL for the server.

Module: DFHCFMN

Destination: Console and SYSPRINT

DFHCF0104 CF data table server initialization failed because program DFHCFMN is not APF authorized.

Explanation: The coupling facility data table server main program DFHCFMN cannot complete initialization because it is not running with APF authorization.

System action: The server is terminated.

User response: Ensure that the coupling facility data table server program DFHCFMN is loaded from an APF authorized library and has been link-edited with the option AC(1).

Module: DFHCFMN

Destination: Console and SYSPRINT

DFHCF0111I CF data table server for pool *poolname* is terminating.

Explanation: The coupling facility data table server has started termination processing, so no further requests will be processed.

System action: Termination continues.

User response: None.

Module: DFHCFMN

Destination: Console and SYSPRINT

DFHCF0112I CF data table server has terminated, return code *retcode*, reason code *rsncode*.

Explanation: The coupling facility data table server has completed termination processing. For normal termination, the return code and reason code are both zero. If the termination was caused by an error, the return code will be 8 and the reason code will be the number of the previous DFHCFnnnn message giving the reason for termination.

System action: The coupling facility data table server program returns control (via the AXM termination routines) to MVS for job step termination.

User response: None.

Module: DFHCFMN

Destination: Console and SYSPRINT

DFHCF0113 CF data table server completion code is *cmpcode*, reason code *rsncode*.

Explanation: The coupling facility data table server has terminated after intercepting an abnormal termination (ABEND) request. If the completion code is a system completion code, it is shown as three hexadecimal digits, otherwise it is shown as four decimal digits for a user completion code. Any associated reason code is shown as a four byte hexadecimal value, which will be zero if no reason code was provided.

System action: The coupling facility data table server program returns control (via the AXM termination routines) to MVS for job step termination.

User response: None.

Module: DFHCFMN

Destination: Console and SYSPRINT

DFHCF0121I Automatic restart support is not available because &SYSCLONE may not be unique within the sysplex.

Explanation: The server attempted to generate a default ARM element identifier to use for automatic restart registration, using the one or two character &SYSCLONE value to identify the MVS system. Normally, MVS verifies during start-up that &SYSCLONE is unique within the sysplex. However, the server is running on a level of MVS where this check is optional and has not been performed, so the server is unable to generate a unique element identifier.

System action: The server is terminated.

User response: Servers should not normally be run on a level of MVS which does not enforce unique &SYSCLONE values. However, the problem can be bypassed by specifying an ARM element name explicitly on the server ARMELEMENT parameter.

Module: DFHCFRS

Destination: Console and SYSPRINT

DFHCF0122 IXCARM REQUEST=reqtype failed, return code retcode, reason code rsncode.

Explanation: A request to the MVS automatic restart manager (ARM) gave an unexpected return code. The return code and reason code are shown in hexadecimal notation.

System action: The server is terminated.

User response: See the IXCARM macro in *OS/390 MVS Programming Sysplex Services Reference* (GC28-1772) for the explanation of the return and reason code.

Module: DFHCFRS

Destination: Console and SYSPRINT

DFHCF0123 IXCARM REQUEST=reqtype failed, return code retcode, reason code rsncode.

Explanation: Automatic restart support is not available. The MVS automatic restart manager (ARM) gave a return code and reason code which indicates that ARM services are not available, but the reason could possibly be intentional or unavoidable, so the server is being allowed to continue execution without automatic restart support. The return code and reason code are shown in hexadecimal notation.

System action: The server continues initialisation without automatic restart support.

User response: See the IXCARM macro in *OS/390 MVS Programming Sysplex Services Reference* (GC28-1772) for the explanation of the return and reason code.

Module: DFHCFRS

Destination: Console and SYSPRINT

DFHCF0201I Processing type parameters

Explanation: The coupling facility data table server parameter processing routine is interpreting the specified parameter string. The first word gives the type of parameter (SYSIN/PARM/SET/DISPLAY/PRINT) and the rest is the specified parameters optionally followed by descriptive comment text after one or more spaces. If the parameters start with an asterisk or a space, the whole line is taken as descriptive comments.

System action: Any specified parameters will be processed.

User response: None.

Module: DFHCFPR

Destination: SYSPRINT

DFHCF0202 Unknown parameter keyword: keyword

Explanation: This parameter keyword did not match any of the defined parameter keywords for the coupling facility data table server.

System action: Processing of the current parameter string (command parameter list, PARM field or SYSIN input line) is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response: Correct the parameter keyword (or remove the incorrect parameter) and reenter the command or restart the server.

Module: DFHCFPR

Destination: Console and SYSPRINT

DFHCF0203 Value *value* for parameter *keyword* is incorrect. It must be a name of up to *maxlength* characters.

Explanation: The value of this parameter should have been specified as a name containing not more than the indicated number of characters.

System action: Processing of the current parameter string (command parameter list, PARM field or SYSIN input line) is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response: Correct the parameter value and reenter the command or restart the server.

Module: DFHCFPR

Destination: Console and SYSPRINT

DFHCF0204 Value *value* for parameter *keyword* is incorrect. It must be a decimal number.

Explanation: The value of this coupling facility data table server parameter should have been specified as a decimal number but was not in a valid format. (Numeric parameters can optionally be followed by the letter K, M, G or T to denote the appropriate powers of 1024).

System action: Processing of the current parameter string (command parameter list, PARM field or SYSIN input line) is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response: Correct the parameter value and reenter the command or restart the server.

Module: DFHCFPR

Destination: Console and SYSPRINT

DFHCF0205 Value *value* for parameter *keyword* is greater than the maximum allowed value *maximum*.

Explanation: The value of this coupling facility data table server parameter exceeded the maximum allowed value, given in the message. This message also occurs if the numeric part of a decimal value exceeds the maximum unsigned 32-bit integer (4294967295) even if a larger value is allowed to be specified by using a suffix "K", "M", "G" or "T".

System action: Processing of the current parameter string (command parameter list, PARM field or SYSIN input line) is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response: Correct the parameter value and

reenter the command or restart the server.

Module: DFHCFPR

Destination: Console and SYSPRINT

DFHCF0206 Value *value* for parameter *keyword* is less than the minimum allowed value *minimum*.

Explanation: The value of this coupling facility data table server parameter was less than the minimum allowed value, given in the message.

System action: Processing of the current parameter string (command parameter list, PARM field or SYSIN input line) is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response: Correct the parameter value and reenter the command or restart the server.

Module: DFHCFPR

Destination: Console and SYSPRINT

DFHCF0207 Value *value* for parameter *keyword* is incorrect. It should be a time hh:mm:ss or hh:mm or a number of seconds.

Explanation: The value of this coupling facility data table server parameter did not conform to the correct syntax for a time interval.

System action: Processing of the current parameter string (command parameter list, PARM field or SYSIN input line) is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response: Correct the parameter value and reenter the command or restart the server.

Module: DFHCFPR

Destination: Console and SYSPRINT

DFHCF0208 Parameter keyword *keyword* is not supported for *command*.

Explanation: A coupling facility data table server parameter keyword was specified in a context where it is not valid, such as an attempt to **SET** a parameter which can only be specified at initialization time, or to specify at initialization time a parameter which is only valid on **DISPLAY**.

System action: Processing of the current parameter string (command parameter list, PARM field or SYSIN input line) is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response: If the error occurred at initialization, remove the incorrect parameter and restart the server. If it occurred on a server command, check that the command and parameter were correctly entered.

Module: DFHCFPR

Destination: Console and SYSPRINT

DFHCF0209 Parameter text contains invalid character: *text*

Explanation: The coupling facility data table server parameter processing routine found some unexpected text when attempting to process parameters.

System action: Processing of the current parameter string (command parameter list, PARM field or SYSIN input line) is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response: Correct the parameters (or remove the incorrect parameter) and reenter the command or restart the server.

Module: DFHCFPR

Destination: Console and SYSPRINT

DFHCF0210 Parameter keyword *keyword* should not have a value for *command*.

Explanation: A coupling facility data table server parameter keyword was specified in the form *keyword=value* in a context where it was not expected, for example on a **DISPLAY** command.

System action: Processing of the current line of parameters is terminated.

User response: Reenter the command without specifying a value for the parameter to be displayed.

Module: DFHCFPR

Destination: Console and SYSPRINT

DFHCF0211I Parameter value: *keyword=value*

Explanation: This message is issued to show the current value of a coupling facility data table server parameter setting in response to a **DISPLAY** or **PRINT** command.

System action: Processing continues normally.

User response: None.

Module: DFHCFPR

Destination: Console and SYSPRINT

DFHCF0212 Value *value* for parameter *keyword* is incorrect. It must be one of *validlist*.

Explanation: The value of this coupling facility data table server parameter was not recognized. It should have been specified as one of the indicated list of values.

System action: Processing of the current parameter string (command parameter list, PARM field or SYSIN input line) is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response: Correct the parameter value and reenter the command or restart the server.

Module: DFHCFPR

Destination: Console and SYSPRINT

DFHCF0213 Value for parameter *keyword* is missing. The correct form is *keyword=value*.

Explanation: A parameter keyword was specified without an associated parameter value on a coupling facility data table server **SET** command or in a SYSIN or PARM parameter string. Note that the only character which should appear between the parameter keyword and its intended value is the equals sign, without any extra spaces.

System action: Processing of the current parameter string (command parameter list, PARM field or SYSIN input line) is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response: Reenter the parameter specification in the correct form *keyword=value*.

Module: DFHCFPR

Destination: Console and SYSPRINT

DFHCF0214 Value *value* for parameter *keyword* is incorrect. Pattern matching is not supported in this context.

Explanation: A parameter value containing one of the pattern matching (wild card) characters '*', '%', or '?' was specified in a context where only a single identifier is supported.

System action: Processing of the current parameter string (command parameter list, PARM field or SYSIN input line) is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response: Correct the parameter value and reenter the command.

Module: DFHCFPR

Destination: Console and SYSPRINT

DFHCF0215 Value *value* for applid.uowid parameter *keyword* is incorrect. The APPLID part should be a name of up to 8 characters.

Explanation: The value of this coupling facility data table server parameter did not conform to the correct syntax for the APPLID part of a unit of work identifier.

System action: Processing of the current line of parameters is terminated.

User response: Correct the parameter value and reenter the command.

Module: DFHCFPR

Destination: Console and SYSPRINT

DFHCF0216 Value *value* for applid.uowid parameter *keyword* is incorrect. The UOWID part should be 16 hexadecimal digits or '*'.

Explanation: The value of this coupling facility data table server parameter did not conform to the correct syntax for a unit of work identifier.

System action: Processing of the current line of parameters is terminated.

User response: Correct the parameter value and reenter the command.

Module: DFHCFPR

Destination: Console and SYSPRINT

DFHCF0217 Parameter keyword *keyword* requires a table name. It should be preceded by TABLE=*name* in the same command line.

Explanation: This coupling facility data table server parameter can only be set for a specific table, but it was not preceded by a TABLE=*name* parameter in the same command line.

System action: Processing of the current line of parameters is terminated.

User response: Insert the parameter TABLE=*name* before the specified keyword and reenter the command.

Module: DFHCFPR

Destination: Console and SYSPRINT

DFHCF0218 TABLE=*table* was specified without any table-related parameter.

Explanation: A coupling facility data table server SET command was issued including a parameter of the form TABLE=*name* to select a specific table, but it was not followed by any table-related parameter within the same command.

System action: The table name parameter is ignored.

User response: If a table-related parameter was to be set, ensure that it is included on the same SET command as the table name.

Module: DFHCFPR

Destination: Console and SYSPRINT

DFHCF0301I Console operator *consname* issued command: *command*

Explanation: A coupling facility data table server operator command has been issued via the MVS MODIFY or STOP command. This message identifies the console name (or TSO userid) from which the command was issued and the text of the command.

System action: Processing continues.

User response: None.

Module: DFHCFOP

Destination: SYSPRINT

DFHCF0302I *command* command ignored because no valid parameters were given.

Explanation: A coupling facility data table server command was issued which had no valid parameters on it but was otherwise syntactically valid. The command has had no effect.

System action: Processing continues normally.

User response: Ensure that the command was entered correctly.

Module: DFHCFOP

Destination: Console and SYSPRINT

DFHCF0303I *command* command has been processed.

Explanation: A coupling facility data table server command has been processed successfully.

System action: Processing continues.

User response: None.

Module: DFHCFOP

Destination: Console and SYSPRINT

DFHCF0304I STOP command is waiting for connections to be closed. Number of active connections = *connections*.

Explanation: A coupling facility data table server **STOP** command has been issued (either via an MVS **STOP** command or via an MVS **MODIFY** command with the text **STOP**) but there are still active connections to the server, so the **STOP** command has not yet taken effect.

System action: The server rejects any further attempts to establish new connections, but continues processing requests for existing connections. Each time a connection is terminated, this message will be repeated as long as there are more active connections.

User response: Further information about the connections which are still active may be obtained using the command **DISPLAY CONNECTIONS**.

If the server needs to be shut down without waiting for connections to be closed, issue the server **CANCEL** command. Note that this will immediately terminate any active connections, causing any further requests for that server to be given a SYSIDERR indication. (The MVS **CANCEL** command can also be used, but should preferably be avoided because it will prevent the server from producing its normal closedown statistics and reports).

Note that if a CICS region is abnormally terminated while server connect or disconnect processing is in progress, or is terminated without going through end of task processing (for example using the **FORCE** command) there is a slight chance that the server will not be notified that the connection has been terminated. In this case the server will not be able to be closed down with the server **STOP** command, but only with the server **CANCEL** command.

Module: DFHCFOP

Destination: Console and SYSPRINT

DFHCF0305I STOP command has been processed.

Explanation: Processing of a coupling facility data table server **STOP** command has now been successfully completed. This means that there are no longer any active connections and the server is ready to close down.

System action: The coupling facility data table server starts termination processing.

User response: None.

Module: DFHCFOP

Destination: Console and SYSPRINT

DFHCF0306 CF data table server does not support this command: *command*

Explanation: An operator command was addressed to the coupling facility data table server using the MVS **MODIFY** command, but the first word of the **MODIFY** parameter text is not a recognized server command (**SET**, **DISPLAY**, **PRINT**, **STOP**, **CANCEL** or an accepted abbreviation for one of these).

System action: The command is ignored.

User response: Correct and reenter the command.

Module: DFHCFOP

Destination: Console and SYSPRINT

DFHCF0307I CANCEL *parm* command has been processed. Number of active connections = *connections*.

Explanation: A coupling facility data table server **CANCEL** command has been issued, either from an operator console or internally by the server in response to a severe error such as coupling facility failure. This message includes any restart parameter specified on the command and the number of active connections which may be affected by this command.

System action: The server terminates immediately, without waiting to close connections.

User response: None.

Module: DFHCFOP

Destination: Console and SYSPRINT

DFHCF0308 CF data table server does not support CICS commands. To close it down, you can use the STOP command.

Explanation: An operator command which appears to be a CICS command (a four-character transaction code of the form 'CExx') was addressed to the coupling facility data table server using the MVS **MODIFY** command.

System action: The command is ignored.

User response: Correct and reenter the command. If the intention is to close down the server, use the server **STOP** or **CANCEL** command.

Module: DFHCFOP

Destination: Console and SYSPRINT

DFHCF0309 Parameter *parm* on CANCEL command is incorrect. The only valid parameters are RESTART=YES or RESTART=NO.

Explanation: A coupling facility data table server **CANCEL** command was issued with a parameter which did not match the valid parameter keywords.

System action: The command is ignored.

User response: Correct and reenter the command.

Module: DFHCFOP

Destination: Console and SYSPRINT

DFHCF0310 Parameter *parm* on STOP command is incorrect. No parameters should be specified.

Explanation: A coupling facility data table server STOP command was issued with parameters, but the STOP command does not support any parameters.

System action: The command is ignored.

User response: Correct and reenter the command.

Module: DFHCFOP

Destination: Console and SYSPRINT

DFHCF0321 Pool state error, reason code *reason*, processing request request for table *table*, key *key*, task *task*, region *region*.

Explanation: Integrity checks during coupling facility data table request processing found that data or control information in the pool list structure was in a state that should not be possible in normal processing. The reason codes are based on the response codes returned by the internal coupling facility interface.

- Reason codes

- | | |
|---|--|
| 2 | Entry exceeds maximum data length. |
| 3 | Entry not found. |
| 4 | Wrong version. |
| 5 | Wrong list authority. |
| 6 | Maximum number of entries in list reached. |
| 7 | No space left in structure. |

All of these conditions can also occur in normal processing. This message is only issued if the condition occurs in a case where it should not occur, or when the normal retry action following the condition cannot be performed. For example, a wrong version response from the coupling facility interface normally simply indicates that an entry has changed, causing the entry to be read again, and this is only treated as a pool state error if the data or control information in the changed entry is not consistent with the expected state of the record.

System action: The request is terminated with a pool state error exception.

User response: This indicates that some data in the pool has become inconsistent or corrupted. There is no known way that this can happen unless a program other than the coupling facility data table server is used to access the pool. If this error occurs for data records in a

particular table, it may be necessary to delete the table to clear up the problem. If it occurs for other control information, it may be necessary to recreate the pool.

Module: DFHCFRQ

Destination: Console and SYSPRINT

DFHCF0331I Table *table* maximum records limit now set to *maxrec* (was *oldmax*). Current number of records is *records*.

Explanation: The maximum number of records allowed to be stored in the specified table has been successfully modified in response to a coupling facility data table server SET TABLE command with the MAXRECS parameter. The previous maximum number is shown, and the current number of records. The new or previous maximum number may also be shown as NOLIMIT for the special value indicating that no limit applies. (For a recoverable table with uncommitted updates, this number includes the original versions of changed records, as these are retained until syncpoint time to allow for possible backout).

System action: Processing continues using the new value for the maximum number of records. If the current number of records already exceeds this value, no further records can be added (or, for a recoverable table, updated) until enough records have been deleted to bring the current number below the limit.

User response: None.

Module: DFHCFOC

Destination: Console and SYSPRINT

DFHCF0332I Table *table* was not found.

Explanation: The table specified on a coupling facility data table server SET TABLE command was not found in the pool.

System action: The command is ignored.

User response: Ensure that the table name was entered correctly, and that the command was addressed to the correct pool server.

Module: DFHCFOC

Destination: Console and SYSPRINT

DFHCF0333 Pool state error, reason code *reason*, processing SET command for table *table*.

Explanation: The status of the table specified on a coupling facility data table server SET TABLE command could not be modified because the control information in the list structure was in a state that should not be possible in normal processing. The reason codes are based on the response codes returned by the internal coupling facility interface.

- Reason codes
- 2 Entry exceeds maximum data length.
- 3 Entry not found.
- 4 Wrong version.
- 5 Wrong list authority.
- 6 Limit number of entries in list reached.
- 7 No space left in structure.

All of these conditions can also occur in normal processing. This message is only issued if the condition occurs in a case where it should not occur, or when the normal retry action following the condition cannot be performed.

System action: The command is ignored.

User response: This indicates that some data in the pool has become inconsistent or corrupted. There is no known way that this can happen unless a program other than the coupling facility data table server is used to access the pool. If this error occurs for attempts to modify a particular table, it may be necessary to delete the table to clear up the problem. If it occurs for other control information, it may be necessary to recreate the pool.

Module: DFHCFOC

Destination: Console and SYSPRINT

DFHCF0334 Table *table* status could not be modified, CF access error.

Explanation: During processing of a coupling facility data table server **SET TABLE** command, an unexpected error response was received. This message is preceded by message DFHCF0441 giving the details of the coupling facility access error.

System action: The command is ignored.

User response: Check the system log for a preceding DFHCF0441 message and see the explanation of that message.

Module: DFHCFOC

Destination: Console and SYSPRINT

DFHCF0335I Table *table* is now marked as available.

Explanation: The state of the specified table has been changed from unavailable to available in response to a coupling facility data table server **SET TABLE** command with the option **AVAILABLE=YES**.

System action: Processing continues. New OPEN requests for the table will now be allowed.

User response: None.

Module: DFHCFOC

Destination: Console and SYSPRINT

DFHCF0336I Table *table* is now marked as unavailable.

Explanation: The state of the specified table has been changed from available to unavailable in response to a coupling facility data table server **SET TABLE** command with the option **AVAILABLE=NO**.

System action: Processing continues. New OPEN requests for the table will be rejected with an indication that the table is unavailable.

User response: None.

Module: DFHCFOC

Destination: Console and SYSPRINT

DFHCF0337I Table *table* was already marked as available.

Explanation: This is a response to the coupling facility data table server **SET TABLE** command with the parameter **AVAILABLE=YES** when the table is already marked as available.

System action: Processing continues.

User response: None.

Module: DFHCFOC

Destination: Console and SYSPRINT

DFHCF0338I Table *table* was already marked as unavailable.

Explanation: This is a response to the coupling facility data table server **SET TABLE** command with the parameter **AVAILABLE=NO** when the table is already marked as unavailable.

System action: Processing continues.

User response: None.

Module: DFHCFOC

Destination: Console and SYSPRINT

DFHCF0341I Server request statistics for table *table*

Explanation: This message gives table access statistics for the current coupling facility data table server, listing the total number of requests of each type handled since the previous statistics reset. It is issued in response to a **DISPLAY** or **PRINT** command which includes the **TABLESTATS** parameter, and may also be produced on the SYSPRINT file during interval statistics if the statistics options include print file output. Note that this message is suppressed if all statistics are zero.

The detailed message layout is as follows

DFHCF0342I

9'.

Table:	Open	Close	Set Attr	Delete
	n	n	n	n
	Stats			
	n			
Record:	Point	Highest	Read	Read Del
	n	n	n	n
	Unlock	Load	Write	Rewrite
	n	n	n	n
	Delete	Del Mult		
	n	n		

System action: Processing continues.

User response: The statistics are described in detail in the DFHCFS7D data area. The individual fields have the following meanings

- Table requests

- Open** Number of successful OPEN requests for the table
- Close** Number of successful CLOSE requests for the table
- Set Attr** Number of times new table status was set
- Delete** Number of times the table of that name was deleted
- Extract** Number of times table access statistics were extracted

- Record requests

- Point** Number of POINT requests
- Highest** Number of requests for current highest key
- Read** Number of READ requests (including those for UPDATE)
- Read Del** Number of combined READ and DELETE requests
- Unlock** Number of UNLOCK requests
- Loads** Number of records written by initial load requests
- Write** Number of WRITE requests for new records
- Rewrite** Number of REWRITE requests
- Delete** Number of DELETE requests
- Del Mult** Number of multiple (generic) delete requests

The coupling facility architecture supports some options and types of request such as combined READ and DELETE which are not currently supported by CICS File Control, but the server supports them for completeness. Server request counts for such options and request types are always zero.

Module: DFHCF0342I

Destination: Console and SYSPRINT

DFHCF0342I Server request statistics for all tables

Explanation: This message gives overall request statistics for the current coupling facility data table server, listing the total number of requests of each type handled since the previous statistics reset. It is issued in response to a **DISPLAY** or **PRINT** command which includes the **TABLESTATS** parameter, and may also be produced on the SYSPRINT file during interval statistics if the statistics options include print file output.

The detailed message layout is as follows

9'.

Table:	Open	Close	Set Attr	Delete
	n	n	n	n
	Stats	Inquire		
	n	n		
Record:	Point	Highest	Read	Read Del
	n	n	n	n
	Unlock	Load	Write	Rewrite
	n	n	n	n
	Delete	Del Mult		
	n	n		
UOW:	Prepare	Retain	Commit	Backout
	n	n	n	n
	Inquire	Restart		
	n	n		

System action: Processing continues.

User response: The statistics are described in detail in the DFHCFS8D data area. The individual fields have the following meanings

- Table requests

- Open** Number of successful OPEN requests for the table
- Close** Number of successful CLOSE requests for the table
- Set Attr** Number of times new table status was set
- Delete** Number of times the table of that name was deleted
- Extract** Number of times table access statistics were extracted

- Inquire** Number of inquire table requests

- Record requests

- Point** Number of POINT requests
- Highest** Number of requests for current highest key
- Read** Number of READ requests (including those for UPDATE)
- Read Del** Number of combined READ and DELETE requests
- Unlock** Number of UNLOCK requests

Loads	Number of records written by initial load requests
Write	Number of WRITE requests for new records
Rewrite	Number of REWRITE requests
Delete	Number of DELETE requests
Del Mult	Number of multiple (generic) delete requests
• UOW requests	
Prepare	Number of units of work prepared
Retain	Number of units of work whose locks were retained
Commit	Number of units of work committed
Backout	Number of units of work backed out
Inquire	Number of unit of work inquire requests
Restart	Number of times recoverable connections were restarted

The coupling facility architecture supports some options and types of request such as combined READ and DELETE which are not currently supported by CICS File Control, but the server supports them for completeness. Server request counts for such options and request types are always zero.

Module: DFHCFCN

Destination: Console and SYSPRINT

DFHCF0343I The number of recently accessed tables matching *table* is *number*.

Explanation: This gives the number of tables matching the specified name expression which were accessed via this coupling facility data table server within the current statistics interval. This is shown at the end of the response to a **DISPLAY TABLESTATS=*name*** command, following any DFHCF0341I messages for matching tables and a DFHCF0342I message if all tables were selected.

System action: Processing continues.

User response: None.

Module: DFHCFCN

Destination: Console and SYSPRINT

DFHCF0351I Connection: Job *jobname* Applid *applid* Idle *idletime*

Explanation: This describes a single connection from a CICS region to the coupling facility data table server, in response to the server command **DISPLAY CONNECTIONS** or **PRINT CONNECTIONS**. The information shows the job name, the generic APPLID and the time in hours, minutes and seconds since the most recent table request or inquire call was issued using the connection.

System action: A message in this form is issued for each active connection to the current server, then message DFHCF0352I is issued to show the total number of active connections.

User response: None.

Module: DFHCFCN

Destination: Console and SYSPRINT

DFHCF0352I Total connections to this server: *connections*.

Explanation: This describes the total number of active connections from CICS regions to the coupling facility data table server, in response to the server command **DISPLAY CONNECTIONS** or **PRINT CONNECTIONS**.

System action: Processing continues.

User response: None.

Module: DFHCFCN

Destination: Console and SYSPRINT

DFHCF0361I Table names: *table1 table2 table3 table4 table5*

Explanation: This message lists up to five table names in response to the coupling facility data table server command **DISPLAY TABLES** or **PRINT TABLES**.

System action: This message is issued as many times as is necessary to list all current table names, then message DFHCF0362I is issued to show the total number of tables.

User response: None.

Module: DFHCFIQ

Destination: Console and SYSPRINT

DFHCF0362I The total number of tables in the pool is *tables*.

Explanation: This describes the total number of tables within the the pool, in response to the coupling facility data table server command **DISPLAY** (or **PRINT**) **TABLES** or **TABLEUSERS**.

System action: Processing continues.

DFHCF0363I • DFHCF0364

User response: None.

Module: DFHCFIQ

Destination: Console and SYSPRINT

DFHCF0363I Details for table *table*

Explanation: This message shows table details in response to the coupling facility data table server command **DISPLAY TABLE=*name*** or **PRINT TABLE=*name***.

The detailed message layout is as follows

9'.

Attributes:	Recline	Keylength	Max recs	Upd Model
	n	n	n	x
	Init Load			
	x			
Status:	Available	Open mode	Access	Sharing
	x	x	x	x
	Loaded			
	x			
Statistics:	Users	Servers	Opens	Records
	n	n	n	n

System action: Processing continues.

User response: The individual fields have the following meanings

- Attributes

Recline

Record size specified when table was created.

Keylength

Key length specified when table was created.

Max recs

Indicates the current limit value if any which has been set on the number of records in the table, or 'NO' if there is no current limit value.

Upd model

Indicates the update model being used: 'CONT' or 'CONT+' for the contention model, 'LOCK' for the non-recoverable locking model or 'RECOV' for the recoverable locking model. For a contention model table where the maximum record size is 63 or less, this usually shows 'CONT+', which indicates that access has been further optimized by storing the record data in the coupling facility entry adjunct area, instead of using separate data elements.

Init Load

Indicates whether initial load was required 'YES' or 'NO'.

- Status

Available

Indicates whether new opens are currently allowed 'YES' or 'NO'.

Open mode

Indicates whether the table is open for read/write access, open for read-only access or not open 'R/W', 'R/O' or 'NONE'.

Access

Indicates whether the table is currently open for exclusive access, or otherwise indicates shared 'EXCL' or 'SHR'.

Sharing

Indicates what level of shared access is currently allowed for the table, 'R/W', 'R/O' or 'NONE'.

Loaded

Indicates 'YES' if the table has been loaded or if loading is not required, otherwise 'NO'.

- Statistics

Users

Indicates the current number of users of this table, which is normally the number of CICS regions that currently have it open. It is also possible for a CICS region to have the same table open more than once at a time using different file names.

Servers

Indicates the number of server regions that currently have the table open internally for recoverable access. For a non-recoverable table this is zero. For a recoverable table, this is normally the same as the number of CICS regions which have currently have the table open, but when there are unresolved recoverable changes a server may have the table open internally even when the CICS region has not explicitly opened it, or has explicitly closed it.

Opens

Indicates the total number of opens issued for this table since it was created.

Records

Indicates the current number of records in the table.

Module: DFHCFIQ

Destination: Console and SYSPRINT

DFHCF0364 No table was found matching *table*.

Explanation: A table name specified on the coupling facility data table server command **DISPLAY** (or **PRINT**) **TABLE=*name*** or **TABLEUSERS=*name*** did not match any existing table in the pool.

System action: The command is ignored.

User response: Ensure that the table name was

entered correctly, and that the command was addressed to the correct pool server.

Module: DFHCFIQ

Destination: Console and SYSPRINT

DFHCF0365I The number of tables in the pool matching *table* is *tables*.

Explanation: This indicates the number of matching tables within the pool for which information was displayed in response to the coupling facility data table server command **DISPLAY** (or **PRINT**) **TABLES=*name*** or **TABLEUSERS=*name*** where the table name contained one or more wild card characters.

System action: Processing continues.

User response: None.

Module: DFHCFIQ

Destination: Console and SYSPRINT

DFHCF0366I Table *table* users: *region1 region2 region3 region4*

Explanation: This message lists the names (normally the CICS APPLIDs) of up to four regions which are currently using the named coupling facility data table, in response to the coupling facility data table server command **DISPLAY** (or **PRINT**) **TABLEUSERS**. A region is considered to be using a table if it has one or more files open for the table, or if it has one or more unresolved units of work which have made recoverable updates to the table.

System action: This message is issued as many times as is necessary to list all regions which are currently using the table (sorted by name). If one of the regions was in the process of loading the table, message DFHCF0367I is issued to identify that region. Finally, message DFHCF0368I is issued to show the total number of users.

User response: None.

Module: DFHCFIQ

Destination: Console and SYSPRINT

DFHCF0367I Table *table* is being loaded by region *region*.

Explanation: If a table specified on the coupling facility data table server command **DISPLAY** (or **PRINT**) **TABLEUSERS** is currently open for loading, this message is issued to identify the name (normally the CICS APPLID) of the region which is loading it. This name also appears in the list of regions using the table.

System action: Processing continues.

User response: None.

Module: DFHCFIQ

Destination: Console and SYSPRINT

DFHCF0368I The number of regions using table *table* is *users*.

Explanation: This indicates the total number of regions which are currently using the table specified on the coupling facility data table server command **DISPLAY** (or **PRINT**) **TABLEUSERS**.

System action: Processing continues.

User response: None.

Module: DFHCFIQ

Destination: Console and SYSPRINT

DFHCF0371I Table *table* has now been deleted.

Explanation: The specified table was successfully deleted in response to a coupling facility data table server **DELETE TABLE=*name*** command.

System action: Processing continues.

User response: None.

Module: DFHCFQC

Destination: Console and SYSPRINT

DFHCF0372I Table *table* was not found.

Explanation: The table specified on a coupling facility data table server **DELETE TABLE=*name*** command was not found in the pool.

System action: The command is ignored.

User response: Ensure that the table name was entered correctly, and that the command was addressed to the correct pool server.

Module: DFHCFQC

Destination: Console and SYSPRINT

DFHCF0373I Table *table* cannot be deleted because it is in use.

Explanation: The table specified on a coupling facility data table server **DELETE TABLE=*name*** command is currently open for access, so it cannot be deleted.

System action: The command is ignored.

User response: Check that the correct table name was entered. Ensure that the table is closed from all regions which are no longer using it. The server command **DISPLAY TABLE=*name*** can be used to determine how many users currently have the table open, or whether one or more servers have it open for recoverable access.

Module: DFHCFQC

Destination: Console and SYSPRINT

DFHCF0374 Table *table* could not be deleted, CF access error.

Explanation: During processing of a coupling facility data table server **DELETE TABLE=***name* command, an unexpected error response was received. This message is preceded by message DFHCF0441 giving the details of the coupling facility access error.

System action: The command is ignored.

User response: Check the system log for a preceding DFHCF0441 message and see the explanation of that message.

Module: DFHCF0C

Destination: Console and SYSPRINT

DFHCF0381I APPLID *applid* is connected on *system*.

Explanation: This message is issued in response to a successful coupling facility data table server **DISPLAY APPLID** command. This is issued for each recoverable connection matching the given APPLID name or pattern, or for all recoverable connections if no APPLID value was given.

System action: Processing continues.

User response: None.

Module: DFHCFSP

Destination: Console and SYSPRINT

DFHCF0382I APPLID *applid* is not currently connected.

Explanation: This message is issued in response to a coupling facility data table server **DISPLAY APPLID** command for a single APPLID when the given APPLID does not match any active recoverable connection.

System action: Processing continues.

User response: Check that the correct APPLID was entered.

Module: DFHCFSP

Destination: Console and SYSPRINT

DFHCF0383I APPLID *applid* total connections: *applids*.

Explanation: This message is issued at the end of the responses to a coupling facility data table server **DISPLAY APPLIDs** command to summarize the total number of connections listed. The total is zero if no matching connections were found.

System action: Processing continues.

User response: None.

Module: DFHCFSP

Destination: Console and SYSPRINT

DFHCF0384I APPLID *applid* UOW status: *indoubts in doubt, commits in commit, backouts in backout, active on system*

Explanation: This message is issued in response to a coupling facility data table server **DISPLAY UOWID** command where the APPLID identifies a CICS region that has an active recoverable connection to the pool on the indicated MVS system. If UOWID details were requested, this message follows the details for the individual units of work. The *indoubts* count represents units of works which have been prepared for commit but have not yet been scheduled to be committed or backed out. The *commits* count represents units of work for which commit processing is in progress. The *backouts* count represents units of work for which backout processing is in progress.

System action: Processing continues.

User response: None.

Module: DFHCFSP

Destination: Console and SYSPRINT

DFHCF0385I APPLID *applid* UOW status: *indoubts in doubt, commits in commit, backouts in backout, not active*

Explanation: This message is issued in response to a coupling facility data table server **DISPLAY UOWID** command for an APPLID which identifies a CICS region that previously established a recoverable connection to the pool and has recoverable work pending, but is not currently connected to the pool. If UOWID details were requested, this message follows the details for the individual units of work. The *indoubts* count represents units of work which have been prepared for commit but have not been scheduled to be committed nor backed out. These will normally be resolved by resynchronization processing when the connection is restarted. The *commits* count represents units of work for which commit processing has been started, and will be completed when the connection is restarted. The *backouts* count represents units of work for which backout processing has been started, and will be completed when the connection is restarted.

System action: Processing continues.

User response: None.

Module: DFHCFSP

Destination: Console and SYSPRINT

DFHCF0386I UOWID *applid.uowid* is in doubt.

Explanation: This message is issued in response to a coupling facility data table server **DISPLAY UOWID** command. The unit of work has been prepared for

commit, but has been neither committed nor backed out. If the APPLID is currently inactive, the state will normally be resolved by resynchronization processing the next time it is restarted.

System action: Processing continues.

User response: None.

Module: DFHCFSP

Destination: Console and SYSPRINT

DFHCF0387I UOWID *applid.uowid* is being committed.

Explanation: This message is issued in response to a coupling facility data table server **DISPLAY UOWID** command. The unit of work has started the commit process. If the APPLID is currently inactive, the commit process will be completed the next time it is restarted.

System action: Processing continues.

User response: None.

Module: DFHCFSP

Destination: Console and SYSPRINT

DFHCF0388I UOWID *applid.uowid* is being backed out.

Explanation: This message is issued in response to a coupling facility data table server **DISPLAY UOWID** command. The unit of work has started to be backed out. If the APPLID is currently inactive, the backout process will be completed the next time it is restarted.

System action: Processing continues.

User response: None.

Module: DFHCFSP

Destination: Console and SYSPRINT

DFHCF0389I UOWID *applid.uowid* was not found.

Explanation: This message is issued in response to a coupling facility data table server **DISPLAY UOWID** command.

System action: Processing continues.

User response: Check that the correct UOWID was entered.

Module: DFHCFSP

Destination: Console and SYSPRINT

DFHCF0390I UOWID *applid.uowid* total matching entries *uowids*

Explanation: This message is issued at the end of the responses to a coupling facility data table server **DISPLAY UOWIDs** command to summarize the total

number of units of work listed. The total is zero if no matching units of work were found.

System action: Processing continues.

User response: None.

Module: DFHCFSP

Destination: Console and SYSPRINT

DFHCF0391I APPLID *applid* does not have any unresolved units of work.

Explanation: This message is issued in response to a coupling facility data table server **SET** command which attempted to modify the recovery status for the given APPLID. There are no unresolved units of work in the pool which match the given APPLID.

System action: The requested function is ignored.

User response: Check that the correct APPLID was entered.

Module: DFHCFSP

Destination: Console and SYSPRINT

DFHCF0392I APPLID *applid* recovery status cannot be modified while it is connected.

Explanation: This message is issued in response to a coupling facility data table server **SET** command which attempted to modify recovery status for the given APPLID. This is not possible if the APPLID is already connected to the pool, on this server or another server.

System action: The requested function is ignored.

User response: Check whether the correct APPLID was entered.

Module: DFHCFSP

Destination: Console and SYSPRINT

DFHCF0393I APPLID *applid* recovery status cannot be modified because connection restart failed with reason code *reason*.

Explanation: This message is issued in response to a coupling facility data table server **SET** command which attempted to modify recovery status for the given APPLID. The attempt failed because the server was unable to establish a recoverable connection on behalf of that APPLID. The reason code from the failing internal FCCU RESTART function is included.

System action: The requested function is ignored.

User response: See the server trace file and job log for further details about the failure.

Module: DFHCFSP

Destination: Console and SYSPRINT

DFHCF0394 UOWID *applid.uowid* is not in doubt.

Explanation: This message is issued in response to a coupling facility data table server **SET** command which attempted to modify the recovery status of a specific unit of work. The APPLID had one or more unresolved units of work and was successfully restarted, but the UOWID did not match any in-doubt unit of work owned by that APPLID after restart completed. Note that if the unit of work was previously in the process of being committed or backed out, restart processing will have resolved it.

System action: The requested function is ignored. A further message will appear indicating whether any units of work remain unresolved after the successful restart.

User response: Check that the correct APPLID and UOWID were entered.

Module: DFHCFSP

Destination: Console and SYSPRINT

DFHCF0395I APPLID *applid* now has no unresolved units of work.

Explanation: This message is issued in response to a successful coupling facility data table server **SET** command to perform restart processing. All units of work associated with the APPLID were resolved by restart processing (which means that they must have been in commit or backout processing).

System action: Processing continues.

User response: None.

Module: DFHCFSP

Destination: Console and SYSPRINT

DFHCF0396I APPLID *applid* units of work remaining in doubt *indoubts*.

Explanation: This message is issued in response to a successful coupling facility data table server **SET** command to perform restart processing. One or more units of work remain in doubt.

System action: Processing continues.

User response: None.

Module: DFHCFSP

Destination: Console and SYSPRINT

DFHCF0397I APPLID *applid* units of work now committed: *commits*.

Explanation: This message is issued in response to a successful coupling facility data table server **SET** command which committed one or more units of work.

System action: Processing continues.

User response: None.

Module: DFHCFSP

Destination: Console and SYSPRINT

DFHCF0398I APPLID *applid* units of work now backed out: *backouts*.

Explanation: This message is issued in response to a successful coupling facility data table server **SET** command which backed out one or more units of work.

System action: Processing continues.

User response: None.

Module: DFHCFSP

Destination: Console and SYSPRINT

DFHCF0399 UOWID *applid.uowid* syncpoint failed, reason code *reason*.

Explanation: This message is issued in response to a coupling facility data table server **SET** command which attempted to commit or backout the given UOWID but failed. The reason code from the failing internal FCCU COMMIT or BACKOUT function is included.

System action: The requested function is ignored.

User response: See the server trace file and job log for further details about the failure.

Module: DFHCFSP

Destination: Console and SYSPRINT

DFHCF0401I Connected to CF structure *strname*.

Explanation: The coupling facility data table server has successfully established a connection to the coupling facility list structure for the table pool, using the IXLCONN macro.

System action: Processing continues.

User response: None.

Module: DFHCFCF

Destination: Console and SYSPRINT

DFHCF0402I CF structure *strname* was allocated by this connection.

Explanation: The coupling facility data table pool list structure did not previously exist and was allocated as part of the connection process.

System action: List structure initialization will be performed if necessary.

User response: None.

Module: DFHCFCF

Destination: Console and SYSPRINT

DFHCF0403 Connection to CF structure *strname* failed, IXLCONN return code *retcode*, reason code *rsncode*.

Explanation: The IXLCONN macro to connect the coupling facility data table server to its pool list structure failed.

System action: The coupling facility data table server is terminated.

User response: See the documentation of the IXLCONN macro in *OS/390 MVS Programming: Sysplex Services Reference* (GC28-1772) for the explanation of the return and reason code. If the reason code is of the form xxx0C08, indicating structure allocation failure, this message will be followed by message DFHCF0409 giving the facility reason code for each coupling facility in which allocation was attempted.

Module: DFHCFCF

Destination: Console and SYSPRINT

DFHCF0404 CF structure *strname* cannot be used because it has been allocated with attribute *attribute*.

Explanation: The coupling facility data table server has successfully connected to its pool list structure but has found that the structure has been allocated using an IXLCONN structure attribute keyword which is not supported by the server.

System action: The server is terminated.

User response: This probably indicates that the structure has been allocated or modified by some program other than the coupling facility data table server program. In this case, the incorrect structure should be deleted (using the MVS **SETXCF FORCE** command) so that it will be reallocated correctly when the server is restarted.

Module: DFHCFCF

Destination: Console and SYSPRINT

DFHCF0405 CF structure *strname* element size *elemsize* is incorrect. It should be a power of 2 in the range 256 to 4096.

Explanation: The list structure element size specified in the **ELEMSIZE** initialization parameter for the coupling facility data table server is not a power of two, or is outside the range supported by the coupling facility interface.

System action: The server is terminated (without attempting to connect to the list structure).

User response: Correct the **ELEMSIZE** parameter and restart the server.

Module: DFHCFCF

Destination: Console and SYSPRINT

DFHCF0406 Initialization failed for CF structure *strname* with response *response*.

Explanation: Coupling facility data table server processing to initialize the pool list structure failed with an abnormal internal response code.

System action: The server is terminated.

User response: If the response code is 8 (I/O error), it indicates that an IXLLIST macro gave an abnormal return code, in which case a previous DFHCF0441 message will have been issued giving the IXLLIST return code and reason code. If this response code is any other value, this indicates that the list structure is in a state which should not occur, probably indicating that it was allocated or modified by a program other than the coupling facility data table server. In this case the structure may need to be deleted (using the MVS **SETXCF FORCE** command) so that it will be reallocated when the server is restarted.

Module: DFHCFCF

Destination: Console and SYSPRINT

DFHCF0407 CF structure *strname* is not available for shared use.

Explanation: The coupling facility data table pool is currently locked for exclusive use by some other job such as a pool unload or reload job. (This serialization uses an MVS ENQ with scope SYSTEMS, major name 'SYSZDFH' and minor name equal to the structure name, 'DFHCFLS_poolname').

System action: The server is terminated.

User response: Check whether a pool maintenance job is currently running. If it is, wait until it has finished before trying to start the server again. You can find out what jobs are currently using the pool using this MVS command

```
DISPLAY GRS,RES=(SYSZDFH,'DFHCFLS_poo1name')
```

Note that for this command the pool name must be exactly eight characters, padded with trailing spaces if necessary.

Module: DFHCFCF

Destination: Console and SYSPRINT

DFHCF0408 CF structure *strname* is not available for exclusive use.

Explanation: The current coupling facility data table unload or reload job requires exclusive use of the pool, but some other job is running which already has shared or exclusive use of the pool. (This serialization uses an MVS ENQ with scope SYSTEMS, major name 'SYSZDFH' and minor name equal to the structure

DFHCF0409 • DFHCF0411I

name, 'DFHCFLS_poolname').

System action: The server is terminated.

User response: Check whether a coupling facility data table server or maintenance job is currently running. If it is, wait until it has finished before trying to run the current job again. You can find out what jobs are currently using the pool using this MVS command
DISPLAY GRS,RES=(SYSZDFH,'DFHCFLS_poo1name')

Note that for this command the pool name must be exactly eight characters, padded with trailing spaces if necessary.

Module: DFHCFCF

Destination: Console and SYSPRINT

DFHCF0409 CF structure *strname* could not be allocated in facility *cfname*, reason code *rsncode*.

Explanation: If a previous coupling facility data table server message DFHCF0403 indicated an IXLCONN failure because the structure could not be allocated, this message is issued for each coupling facility in which allocation was attempted to show the facility reason code indicating why structure allocation failed. If the reason code is known to the server, the name of the reason code is given (as defined in the MVS macro IXLYCONA, but without the 'ConaRsn' prefix), otherwise its decimal value is shown.

If the response indicates InvalidStructureSize, this means that the initial list structure size (specified on the server **POOLSIZE** parameter or in the CFRM policy **INITSIZE** parameter) is not large enough to contain the required structure control information. The size of the control information is affected by the number of list headers (determined by the server **MAXTABLES** parameter) and by the maximum structure size specified in the CFRM policy.

System action: The server is terminated.

User response: If further details are required, see the descriptions of the reason codes in the source of the MVS macro IXLYCONA which maps the connect answer area.

If the response was InvalidStructureSize, increase the initial structure size specification in the server **POOLSIZE** parameter or the CFRM policy **INITSIZE** parameter to ensure that there is enough space for data in addition to the structure control information. Also, check that the server **MAXTABLES** parameter and the maximum structure size specified in the CFRM policy are not unnecessarily large. See the *CICS System Definition Guide* for more information on how to estimate pool sizes.

Module: DFHCFCF

Destination: Console and SYSPRINT

DFHCF0410 CF structure *strname* cannot be used, coupling facility maintenance level is too low.

Explanation: Initialization test routines executed against the allocated list structure gave incorrect results, indicating that the coupling facility control code does not include all maintenance necessary to support coupling facility data tables.

System action: The server is terminated.

User response: Ensure that the required level of coupling facility maintenance is applied.

Module: DFHCFCF

Destination: Console and SYSPRINT

DFHCF0411I CF structure *strname* now has *percentage%* of entries in use.

Explanation: This message is issued by the coupling facility data table server when the percentage of list entries in use within the list structure increases past certain set threshold levels, or when it decreases past a threshold level after previously being at a higher level. This message is also issued immediately after a structure alter request has completed in order to show how the percentage has been affected by changes in the structure size or entry to element ratio. The percentage is calculated using information that is returned by successful coupling facility access requests, so if the message was triggered by structure alter completion and the current server has not processed any successful requests recently, the information may not be accurate.

System action: The warning threshold is increased to the next higher level (normally 5% higher if less than 95%, otherwise 1% higher), or decreased to the previous lower level depending on whether the usage is increasing or decreasing. If the structure usage is increasing and the structure element to entry ratio is not making full use of the available space, the server may issue an automatic IXLALTER request to adjust the ratio.

User response: Note that the structure may soon become full, preventing tables from being created. If the structure is currently allocated at less than its maximum size and the coupling facility has enough free space, the size of the structure can be increased dynamically using the MVS **SETXCF** command with the **START,ALTER** option, and any active servers will be able to use the increased space immediately.

Module: DFHCFCF

Destination: Console and SYSPRINT

**DFHCF0412I CF structure *strname* now has
percentage% of elements in use.**

Explanation: This message is issued by the coupling facility data table server when the percentage of list data elements in use within the list structure increases past certain set threshold levels, or when it decreases past a threshold level after previously being at a higher level. This message is also issued immediately after a structure alter request has completed in order to show how the percentage has been affected by changes in the structure size or entry to element ratio. The percentage is calculated using information that is returned by successful coupling facility access requests, so if the message was triggered by structure alter completion and the current server has not processed any successful requests recently, the information may not be accurate.

System action: The warning threshold is increased to the next higher level (normally 5% higher if less than 95%, otherwise 1% higher), or decreased to the previous lower level depending on whether the usage is increasing or decreasing. If the structure usage is increasing and the structure element to entry ratio is not making full use of the available space, the server may issue an automatic IXLALTER request to adjust the ratio.

User response: Note that the structure may soon become full, preventing tables from being created. If the structure is currently allocated at less than its maximum size and the coupling facility has enough free space, the size of the structure can be altered dynamically using the MVS **SETXCF** command with the **START,ALTER** option, and any active servers will be able to use the increased space immediately.

Module: DFHCFCF

Destination: Console and SYSPRINT

**DFHCF0413I Issuing alter request to adjust CF
structure *strname* entry/element ratio to
entries/elements.**

Explanation: The coupling facility data table server has determined that the ratio of free entries to free elements is significantly different from the ratio of entries to elements actually in use. It is issuing an IXLALTER macro to request the coupling facility to adjust the ratio to make better use of the coupling facility storage.

System action: The server continues by issuing the IXLALTER macro. A further message will be issued when the structure alter request is accepted or rejected by MVS.

User response: None.

Module: DFHCFCF

Destination: Console and SYSPRINT

**DFHCF0414I Alter request successfully started for
CF structure *strname*.**

Explanation: The coupling facility data table server has successfully started a structure alter request to change the entry to element ratio for the list structure.

System action: The server event exit will be notified by MVS when the structure alter request completes and a further message will then be issued.

User response: None.

Module: DFHCFCF

Destination: Console and SYSPRINT

**DFHCF0415I Alter request rejected for CF structure
strname, another alter request for this
structure is already active.**

Explanation: The coupling facility data table server attempted to start a structure alter request using IXLALTER to change the entry to element ratio for the list structure, but this was rejected by the system because another structure alter request was already active.

System action: The server event exit will be notified by MVS when the structure alter request completes and a further message will then be issued.

User response: None.

Module: DFHCFCF

Destination: Console and SYSPRINT

**DFHCF0416 Alter request failed for CF structure
strname, IXLALTER return code *retcode*,
reason code *rsncode*.**

Explanation: The coupling facility data table server attempted to start a structure alter request to change the entry to element ratio for the list structure, but this was rejected by the system with an unexpected return code.

System action: The current structure alter attempt is abandoned. Another attempt may be made when the minimum alter interval has expired.

User response: See the documentation of the IXLALTER macro in *OS/390 MVS Programming: Sysplex Services Reference* (GC28-1772) for the explanation of the return and reason code.

Module: DFHCFCF

Destination: Console and SYSPRINT

DFHCF0417I Alter request completed normally for CF structure *strname*.

Explanation: The coupling facility data table server has been notified by the system that a structure alter request has completed normally.

System action: New values for the structure size and numbers of elements and entries are stored. This message is followed by messages DFHCF0411 and DFHCF0412 to indicate the new usage percentages.

User response: None.

Module: DFHCF0417I

Destination: Console and SYSPRINT

DFHCF0418I Alter request ended abnormally for CF structure *strname* with status *status*.

Explanation: The coupling facility data table server has been notified by the system that a structure alter request has ended abnormally. The two bytes of status information in this message are taken from EEPLALTERENDSTATEFLAGS in the event exit parameter list (defined in the MVS macro IXL YEEPL).

System action: No action is taken as a result of this notification, but any problem which caused the alter request to fail may result in other related problems.

User response: If further information is required, look for MVS messages on the system log indicating the reason for the structure alter request failure. For further information about the status flags, see the source of the MVS macro IXL YEEPL.

Module: DFHCF0418I

Destination: Console and SYSPRINT

DFHCF0419I Alter request ended normally for CF structure *strname* but target was not attained.

Explanation: The coupling facility data table server has been notified by the system that a structure alter request has ended normally but that the target ratio or target size was not attained.

System action: New values for the structure size and numbers of elements and entries are stored. This message is followed by messages DFHCF0411 and DFHCF0412 to indicate the new usage percentages.

User response: None.

Module: DFHCF0419I

Destination: Console and SYSPRINT

DFHCF0424 Connectivity has been lost to CF structure *strname*. The CF data table server cannot continue.

Explanation: The coupling facility data table server has been notified by the system that connectivity has been lost to the coupling facility containing the pool list structure. If the loss of connectivity was due to an IPL of the coupling facility, all tables and data records are lost.

System action: The server issues an internal **CANCEL** command to terminate itself immediately.

User response: Restart the server when connectivity to the coupling facility from the current system has been reestablished. If connectivity is still available from other systems, CICS transactions which require access to the affected pool should be diverted to those systems if possible.

If the loss of connectivity was due to an IPL of the coupling facility the restart causes a fresh copy of the list structure to be allocated.

Module: DFHCF0424

Destination: Console and SYSPRINT

DFHCF0425 CF structure *strname* has failed. The CF data table server cannot continue.

Explanation: The coupling facility data table server has been notified by the system that the pool list structure has been lost due to coupling facility structure failure. All tables and data records in the pool have been lost.

System action: Each server for the affected pool issues an internal **CANCEL** command to terminate itself immediately.

User response: If another coupling facility is available and is included in the CFRM preference list for the failed structure, restart the servers to cause a fresh copy of the list structure to be allocated on the alternate coupling facility. If no other coupling facility is available, wait until the original coupling facility has been made available again before restarting the servers.

Module: DFHCF0425

Destination: Console and SYSPRINT

DFHCF0431I Access statistics for CF structure *strname*

Explanation: This message gives a summary of coupling facility access statistics. It is issued in response to a coupling facility data table server **DISPLAY** or **PRINT** command which includes the **CFSTATS** parameter, and may also be produced on the SYSPRINT file during interval statistics if the statistics options include print file output.

The detailed message layout is as follows

9'.

Requests:	Reads	Writes	Rewrites	Deletes						
Table data records	n	n	n	n						
Data list controls	n	n	n	n						
Table index list	n	n	n	n						
UOW index list	n	n	n	n						
APPLID index list	n	n	n	n						
Lock release msgs	n	n								
Responses:	Asynch	Unavail	Normal	Len err	Not fnd					
	n	n	n	n	n					
	Vers	chk	List	chk	List	full	Str	full	I/O	err
	n	n	n	n	n	n	n	n	n	n

System action: Processing continues.

User response: The statistics are described in detail in the DFHCFS6D data area. The individual fields have the following meanings

- Table data record request counts

Reads Number of data entry reads.

Writes Number of data entry writes.

Rewrites
Number of data entry rewrites.

Deletes
Number of data entry deletes.

- Data list controls request counts

Reads Number of reads to check list usage (open or inquire).

Writes Number of times a new data list was allocated.

Rewrites
Number of times data list controls were modified.

Deletes
Number of times a data list was deleted for reuse.

- Table index list request counts

Reads Number of table index reads.

Writes Number of table index writes to create new tables.

Rewrites
Number of table index writes to update table status.

Delete Number of table index deletes.

- Unit of work index list request counts

Reads Number of UOW list reads.

Writes Number of UOW list writes (usually at PREPARE).

Rewrites
Number of UOW list rewrites (usually at COMMIT).

Deletes

Number of UOW list deletes (usually after COMMIT).

- Lock release notify message request counts

Reads Number of lock release messages read by this server.

Writes Number of lock release messages sent by this server.

- Response counts

Asynch

Number of requests for which completion was asynchronous.

Normal

Number of normal responses.

Unavail

Number of times requests were deferred because the structure was temporarily unavailable, for example because system-managed rebuild was in progress.

Len error

Entry data was larger than the input buffer length, which normally results in a retry with a larger buffer.

Not fnd

The specified entry (table or item) was not found.

Vers chk

A version check failed for an entry being updated, indicating that another task had updated it first.

List chk

A list authority comparison failed, usually meaning that the table is in the process of being deleted.

List full

A table reached the maximum number of items, causing the relevant list to be marked as full.

Str full The list structure became full.

I/O err Some other error code was returned by IXLLIST.

Module: DFHCFCF

Destination: Console and SYSPRINT

DFHCF0432I Table pool statistics for CF structure *strname*

Explanation: This message gives a summary of the usage statistics for the table pool list structure. It is issued in response to a coupling facility data table server **DISPLAY** or **PRINT** command which includes the **POOLSTATS** parameter, and may also be produced on the SYSPRINT file during interval statistics if the

DFHCF0441

statistics options include print file output.

The detailed message layout is as follows

9'.

```

Structure: Size  Max size  Elem size
           nK      nK      n
Tables: Current Highest
           n      n
Lists:   Total  In use  Max used  Control
           n      n      n      n
           100%  n%    n%    n%
           Data
           n
           n%
Entries: Total  In use  Max used  Free
           n      n      n      n
           100%  n%    n%    n%
           Min free Reserve
           n      n
           n%    n%
Elements: Total  In use  Max used  Free
           n      n      n      n
           100%  n%    n%    n%
           Min free Reserve
           n      n
           n%    n%

```

System action: Processing continues.

User response: The statistics are described in detail in the DFHCFS6D data area. Pool usage statistics are calculated from information returned by recent coupling facility requests, and are not always very accurate, especially if the relevant information has not been accessed recently by the current server. The number of tables and the number of lists are updated each time the server opens or closes a table, but are not reliably updated at other times. The element and entry counts are updated on successful completion of most types of coupling facility access request.

The individual fields have the following meanings

- Structure

Size Current allocated size of the list structure.

Max size

Maximum size to which this structure could be altered.

Elem size

Data element size used for the structure.

- Tables

Current

Number of tables currently in existence.

Highest

Highest number of tables at any time (since last reset).

- Lists

Total Maximum number of list headers in the structure.

In Use Number currently in use.

Max Used

Maximum number in use (since last reset).

Control

Number of lists in use for control information.

Data

Number of lists in use for table data.

- Entries

Total

Total entries in the currently allocated structure (initially set at structure connection time and updated on completion of any structure alter request).

In Use

Number of entries currently in use.

Max Used

Maximum number in use (since last reset).

Free

Number of entries currently free (total minus used).

Min Free

Minimum number of free entries (since last reset).

Reserve

Number of entries reserved for rewrites and server use.

- Elements

Total

Total data elements in the currently allocated structure (initially set at structure connection time and updated on completion of any structure alter request).

In Use

Number of elements currently in use.

Max Used

Maximum number in use (since last reset).

Free

Number of elements currently free (total minus used).

Min Free

Minimum number of free elements (since last reset).

Reserve

Number of elements reserved for rewrites and server use.

Module: DFHCFCF

Destination: Console and SYSPRINT

DFHCF0441 CF structure *strname* request failed, IXLLIST return code *retcode*, reason code *rsncode*.

Explanation: A coupling facility access request issued by the coupling facility data table server using the IXLLIST macro gave an abnormal return code.

System action: The failing request is given an I/O error indication, giving an IOERR condition if it originated from a CICS API request.

User response: See the documentation of the IXLIST macro in *OS/390 MVS Programming: Sysplex Services Reference* (GC28-1772) for the explanation of the return and reason code.

Module: DFHCFCF

Destination: Console and SYSPRINT

DFHCF0442 CF structure *strname* request failed, structure is full.

Explanation: A coupling facility access request issued by the coupling facility data table server using the IXLIST macro failed because there are insufficient free entries or elements to store the new data in the structure.

System action: The failing request is given a NOSPACE indication if it originated from a CICS API request. For reload processing, if an automatic structure alter is in progress, the request may be suspended until the outcome of the alter request is known, then retried. This message will not be issued again for further failures until the used numbers of elements and entries fall well below the warning threshold.

User response: Any tables which are no longer in use should be deleted so that the space can be reused. If the structure is currently allocated at less than its maximum size and the coupling facility has enough free space, the size of the structure can be increased dynamically using the MVS **SETXCF** command with the **START,ALTER** option, and any active servers will be able to use the increased space immediately. However, if this action is possible it should normally have been taken in response to earlier warning message before the structure became full.

Module: DFHCFCF

Destination: Console and SYSPRINT

DFHCF0443 CF structure *strname* request failed, all lists are in use.

Explanation: A coupling facility access request issued by the coupling facility data table server using the IXLIST macro failed because all list headers defined in the structure are now in use. The number of list headers is determined by the **MAXTABLES** server initialization parameter when the structure is allocated.

System action: The failing request is given a NOSPACE indication if it originated from a CICS API request. This message will not be issued again for further failures while the shortage of list entries remains.

User response: Any tables which are no longer in use should be deleted to free up data lists. As the number of lists is fixed when the structure is allocated, the only way to increase the number of lists is to unload the structure, use the MVS **SETXCF FORCE,STR** command to delete it then reload it with a larger **MAXTABLES** parameter.

Module: DFHCFCF

Destination: Console and SYSPRINT

DFHCF0444I CF request has been suspended to await structure alter completion.

Explanation: A coupling facility access request issued from the coupling facility data table server address space (during reload processing) ran out of space in the list structure, but an automatic structure alter attempt to free up more space is either already active or is being started at this point. The request is therefore being suspended to await the outcome of the structure alter attempt.

System action: The request is suspended until the structure alter request completes (normally or abnormally), then message DFHCF0445I is issued and the request is retried.

User response: None.

Module: DFHCFCF

Destination: Console and SYSPRINT

DFHCF0445I CF request is being retried after structure alter completion.

Explanation: A coupling facility data table access request which was suspended to await the completion of a structure alter request is now being retried because the alter request has either completed or failed.

System action: The suspended request will be restarted.

User response: None.

Module: DFHCFCF

Destination: Console and SYSPRINT

DFHCF0446 CF structure *strname* free space is below reserve level. New records will be rejected.

Explanation: The coupling facility data table server has detected that the number of free list entries or data elements in the pool structure has fallen below the reserve levels specified on the server parameters **ENTRYRESERVEMIN**, **ENTRYRESERVEPC**, **ELEMENTRESERVEMIN** and **ELEMENTRESERVEPC**.

System action: Any request to create a new record or table in the pool will be rejected for as long as the amount of free space remains below the reserve levels. The failing request is given a NOSPACE indication if it originated from a CICS API request. If free space later increases beyond the reserve levels, requests will be allowed again, and when the amount of free space exceeds the reserve levels by a reasonable margin (based on the server **ENTRYWARNINGC** and

DFHCF0447 • DFHCF0471

ELEMENTWARNINGC parameters) message DFHCF0447 will be issued.

User response: Use the server command **DISPLAY POOLSTATS** to obtain further information about the current pool usage. Any tables which are no longer in use should be deleted so that the space can be reused. If the structure is currently allocated at less than its maximum size and the coupling facility has enough free space, the size of the structure can be increased dynamically using the MVS **SETXCF** command with the **START,ALTER** option, and any active servers will be able to use the increased space immediately. However, if this action is possible it should normally have been taken in response to earlier warning messages.

Module: DFHCFCF

Destination: Console and SYSPRINT

DFHCF0447 CF structure *strname* free space is no longer below reserve level.

Explanation: The coupling facility data table server issues this message after a recent shortage of free space caused message DFHCF0446 to be issued but the free space has now increased to beyond the reserve levels by a reasonable margin (based on the server **ENTRYWARNINGC** and **ELEMENTWARNINGC** parameters).

System action: Processing continues.

User response: Use the server command **DISPLAY POOLSTATS** to obtain further information about the current pool usage. Note that even if this message is produced, the structure may still be very short of space and further action may be necessary, as described for message DFHCF0446.

Module: DFHCFCF

Destination: Console and SYSPRINT

DFHCF0451 Purge for CF structure *strname* failed, IXLPURGE return code *retcode*, reason code *rsncode*.

Explanation: A coupling facility data table access request was terminated abnormally and the server issued an IXLPURGE macro to ensure any active IXLLIST request was purged before releasing the I/O buffer, but the IXLPURGE macro gave a non-zero return code.

System action: The error is ignored because this only occurs when a request is already being terminated abnormally.

User response: See the documentation of the IXLPURGE macro in *OS/390 MVS Programming: Sysplex Services Reference* (GC28-1772) for the explanation of the return and reason code.

Module: DFHCFCF

Destination: Console and SYSPRINT

DFHCF0461I Disconnected from CF structure *strname*.

Explanation: The coupling facility data table server has successfully disconnected from the pool list structure (using the IXLDISC macro) during termination.

System action: Processing continues.

User response: None.

Module: DFHCFCF

Destination: Console and SYSPRINT

DFHCF0462 Disconnect from CF structure *strname* failed, IXLDISC return code *retcode*, reason code *rsncode*.

Explanation: The IXLDISC macro to disconnect the coupling facility data table server from its pool list structure failed.

System action: The error is ignored, as disconnection only occurs when the server is already terminating.

User response: See the documentation of the IXLDISC macro in *OS/390 MVS Programming: Sysplex Services Reference* (GC28-1772) for the explanation of the return and reason code.

Module: DFHCFCF

Destination: Console and SYSPRINT

DFHCF0471 CF structure *strname* already has the maximum of *maxconn* servers active.

Explanation: An attempt was made to connect an additional coupling facility data table server to a pool list structure which already has the maximum number of active connections supported by the current version of the server. The coupling facility accepted the connection, but the server does not support this number of simultaneous connections to the pool, so the connection could not be used.

The server has been designed to support a fixed maximum number of connections per pool, which is the same as the maximum number of connections to a list structure supported by current coupling facility implementations, and the maximum number of systems in a sysplex. This means that if this message occurs, a level of coupling facility must be in use which supports more connections, and one or more of those connections must be in use by a program other than the coupling facility data table server, as the server only supports one connection per system within a sysplex.

System action: The server is terminated.

User response: Ensure that no programs other than the data table server are connected to the list structure.

Module: DFHCF0CF

Destination: Console and SYSPRINT

DFHCF0481I Waiting for structure *strname* to become available.

Explanation: The coupling facility data table server was unable to connect to its coupling facility structure because of an environmental error, such as the structure being unavailable, as described in a previous DFHCF0403 message. The server is now waiting for this problem to be fixed, and will retry the connection request when it is notified via the ENF facility that the specific structure may now be available or that some change has occurred in the status of general coupling facility resources.

System action: The server waits to be notified of a relevant event.

User response: No action is required, but the waiting server can optionally be terminated using the MVS CANCEL command if it is no longer required.

Module: DFHCFEN

Destination: Console and SYSPRINT

DFHCF0482I Retrying connection to structure *strname*.

Explanation: The coupling facility data table server has been notified via ENF that its list structure may now be available or that a change has occurred in the status of some general coupling facility resources, so it is about to make another attempt to connect to the structure.

System action: The original IXLCONN request is retried.

User response: None.

Module: DFHCFEN

Destination: Console and SYSPRINT

DFHCF0491 ENFREQ ACTION=*action* failed, return code *retcode*.

Explanation: An ENF request issued by the coupling facility data table server gave an unexpected return code.

System action: If this occurs on the ENFREQ ACTION=LISTEN request and the server is subsequently unable to connect to the list structure, the server will be terminated instead of waiting for the structure to become available.

User response: See the documentation of the ENFREQ macro in *OS/390 MVS Programming: Authorized Assembler Services Reference, Volume 2 (ENFREQ-ITTFMTB)* (GC28-1765) for the explanation of the return and reason code.

Module: DFHCFEN

Destination: Console and SYSPRINT

DFHCF0501 External security manager was not found, table security cannot be supported.

Explanation: Table-specific security checks for coupling facility data table OPEN, SET and DELETE requests were requested in the server parameters or assumed by default, but the external security manager data areas needed by the server security interface (in particular the RCVT) were not found.

System action: The server is terminated.

User response: If these security checks are not required, specify SECURITY=NO in the server parameters, in which case each CICS region that is authorized to connect to the server will be able to open or delete any table in the pool. If table security checks are required, ensure that the external security manager is installed and active before starting the server.

Module: DFHCFXS

Destination: Console and SYSPRINT

DFHCF0502 External security manager is inactive, table security cannot be supported.

Explanation: Table-specific security checks for coupling facility data table OPEN, SET and DELETE requests were requested in the server parameters or assumed by default, but the external security manager is not active.

System action: The server is terminated.

User response: If these security checks are not required, specify SECURITY=NO in the server parameters, in which case each CICS region that is authorized to connect to the server will be able to open or delete any table in the pool. If table security checks are required, ensure that the external security manager is installed and active before starting the server.

Module: DFHCFXS

Destination: Console and SYSPRINT

DFHCF0503 External security manager does not support global in-storage profiles, table security cannot be supported.

Explanation: Table-specific security checks for coupling facility data table OPEN, SET and DELETE requests were requested in the server parameters or assumed by default, but the external security manager does not support the GLOBAL option for loading security profiles (known as global RACLIST), which is required in order to support cross-memory mode security checking.

System action: The server is terminated.

User response: If these security checks are not required, specify **SECURITY=NO** in the server parameters, in which case each CICS region that is authorized to connect to the server will be able to open or delete any table in the pool. If table security checks are required, it will be necessary to upgrade the external security manager to a level which supports global in-storage profiles.

Module: DFHCFXS

Destination: Console and SYSPRINT

DFHCF0504 External security manager does not support cross-memory mode, table security cannot be supported.

Explanation: Table-specific security checks for coupling facility data table OPEN, SET and DELETE requests were requested in the server parameters or assumed by default, but the external security manager does not support authorization (FASTAUTH) requests in cross-memory mode, which are required in order to perform table security checks.

System action: The server is terminated.

User response: If these security checks are not required, specify **SECURITY=NO** in the server parameters, in which case each CICS region that is authorized to connect to the server will be able to open or delete any table in the pool. If table security checks are required, it will be necessary to upgrade the external security manager to a level which supports cross-memory mode authorization requests.

Module: DFHCFXS

Destination: Console and SYSPRINT

DFHCF0505 RACROUTE REQUEST=EXTRACT gave R15=rc, SAFPRRET=retcode, SAFPRREA=rsncode.

Explanation: Table-specific security checks for coupling facility data table OPEN, SET and DELETE requests were requested in the server parameters or assumed by default, but the external security manager EXTRACT function used to obtain the userid during server initialization gave an unexpected non-zero return code. This message shows the RACROUTE register 15 return code and the external security manager return and reason codes returned in the SAF request parameter list.

System action: The server is terminated with message DFHCF0506.

User response: See the documentation of the RACROUTE macro with REQUEST=EXTRACT in *OS/390 Security Server External Security Interface (RACROUTE) Macro Reference (GC28-1922)* for the explanation of the return and reason codes.

Module: DFHCFXS

Destination: Console and SYSPRINT

DFHCF0506 Security EXTRACT function failed, table security cannot be supported.

Explanation: Table-specific security checks for coupling facility data table OPEN, SET and DELETE requests were requested in the server parameters or assumed by default, but the external security manager EXTRACT function issued to obtain the userid during server initialization gave an unexpected return code.

System action: The server is terminated.

User response: See the preceding message DFHCF0505 for the details of the reason for the failure. If these security checks are not required, specify **SECURITY=NO** in the server parameters, in which case each CICS region that is authorized to connect to the server will be able to open or delete any table in the pool.

Module: DFHCFXS

Destination: Console and SYSPRINT

DFHCF0507 RACROUTE REQUEST=LIST, ENVIR=CREATE, CLASS='class', GLOBAL=YES gave R15=rc, SAFPRRET=retcode, SAFPRREA=rsncode.

Explanation: Table-specific security checks for coupling facility data table OPEN, SET and DELETE requests were requested in the server parameters or assumed by default, but the external security manager LIST function to load the security profiles during server initialization gave an unexpected non-zero return code. This message shows the RACROUTE register 15 return code and the external security manager return and reason codes returned in the SAF request parameter list.

System action: The server is terminated with message DFHCF0508.

User response: See the documentation of the RACROUTE macro with REQUEST=LIST in *OS/390 Security Server External Security Interface (RACROUTE) Macro Reference (GC28-1922)* for the explanation of the return and reason codes.

Module: DFHCFXS

Destination: Console and SYSPRINT

DFHCF0508 Security LIST function failed, table security cannot be supported.

Explanation: Table-specific security checks for coupling facility data table OPEN, SET and DELETE requests were requested in the server parameters or assumed by default, but the external security manager

LIST function issued to load the security profiles during server initialization gave an unexpected return code.

System action: The server is terminated.

User response: See the preceding message DFHCF0507 for the details of the reason for the failure. If these security checks are not required, specify **SECURITY=NO** in the server parameters, in which case each CICS region that is authorized to connect to the server will be able to open or delete any table in the pool.

Module: DFHCFXS

Destination: Console and SYSPRINT

DFHCF0511 Attempt to open table *table* was rejected because the external security manager is not available.

Explanation: The coupling facility data table server was attempting to perform a security check for whether the connected region was allowed to open that data table, but the external security manager was unexpectedly unavailable, even though it had been available at server initialization time.

System action: The table open request is rejected.

User response: Note that no further table open requests will succeed unless the external security manager is reactivated.

Module: DFHCFXS

Destination: Console and SYSPRINT

DFHCF0512 RACROUTE REQUEST=FASTAUTH for resource *resource* gave R15=*rc*, SAFPRRET=*retcode*, SAFPRREA=*rsncode*.

Explanation: A coupling facility data table OPEN, SET or DELETE security check gave a non-zero return code. This message indicates the resource name used for the check, the RACROUTE register 15 return code and the external security manager return and reason codes returned in the SAF request parameter list.

System action: Access to the table is rejected with message DFHCF0513.

User response: See the documentation of the RACROUTE macro with REQUEST=FASTAUTH in *OS/390 Security Server External Security Interface (RACROUTE) Macro Reference (GC28-1922)* for the explanation of the return and reason codes.

Module: DFHCFXS

Destination: Console and SYSPRINT

DFHCF0513 Attempt to open table *table* was rejected by the external security manager.

Explanation: A security check was performed by the coupling facility data table server to determine whether the connected region was allowed to open the named table, and the external security manager indicated that access was not allowed.

System action: The table open request is rejected.

User response: See the preceding message DFHCF0512 for the specific reason that access was rejected. Check that the correct table name was specified. Ensure that the client region is authorized to access the resource matching the table name (prefixed by the server region userid if **SECPRFX=YES** was specified) in the CICS file resource class (usually 'FCICSFCT').

Module: DFHCFXS

Destination: Console and SYSPRINT

DFHCF0521 RACROUTE REQUEST=LIST, ENVIR=DELETE, CLASS=*'class'* gave R15=*rc*, SAFPRRET=*retcode*, SAFPRREA=*rsncode*.

Explanation: The external security manager LIST function to unload the in-storage security profiles during coupling facility data table server termination gave an unexpected non-zero return code. This message shows the RACROUTE register 15 return code and the external security manager return and reason codes returned in the SAF request parameter list.

System action: Server termination processing continues.

User response: See the documentation of the RACROUTE macro with REQUEST=LIST in *OS/390 Security Server External Security Interface (RACROUTE) Macro Reference (GC28-1922)* for the explanation of the return and reason codes.

Module: DFHCFXS

Destination: Console and SYSPRINT

DFHCF06011 Starting statistics collection for interval since *lasttime*.

Explanation: The coupling facility data table server is about to collect interval, end of day or closedown statistics. This message identifies the start of the time interval to which the statistics apply, which is either the time that the server was started up or the time of the last reset, which occurs whenever interval or end of day statistics are produced. The format of the timestamp is yyyy-mm-dd hh:mm:ss.

System action: The server proceeds with statistics collection.

DFHCF0602I • DFHCF0651

User response: None.

Module: DFHCFST

Destination: SYSPRINT

DFHCF0602I Statistics collection completed, reset performed.

Explanation: Coupling facility data table server statistics have been collected and counters have been reset. This occurs for interval or end of day statistics.

System action: Processing continues.

User response: None.

Module: DFHCFST

Destination: SYSPRINT

DFHCF0603I Statistics collection completed.

Explanation: Coupling facility data table server statistics have been collected but counters have not been reset. This normally occurs at server closedown.

System action: Processing continues.

User response: None.

Module: DFHCFST

Destination: Console and SYSPRINT

DFHCF0604 Timer SET failed, return code *retcode*, reason code *rsncode*.

Explanation: The statistics subtask in the coupling facility data table server tried to set up a timer wait interval but failed.

System action: The interval statistics function is terminated with message DFHCF0606.

User response: Check the return code and reason code. A return code of 4 indicates an attempt to set up more than one concurrent timer interval, which indicates a logic error in the server. The reason code in this case is the MVS STIMERM identifier for the existing timer interval. A return code of 8 indicates that the MVS STIMERM macro failed, in which case the reason code indicates the return code received from STIMERM SET.

Module: DFHCFST

Destination: Console and SYSPRINT

DFHCF0605 Timer CANCEL failed, return code *retcode*, reason code *rsncode*.

Explanation: The statistics subtask in the coupling facility data table server tried to cancel a timer wait interval but failed.

System action: The interval statistics function is terminated with message DFHCF0606.

User response: Check the return code and reason code. A return code of 4 indicates an attempt to cancel a nonexistent timer interval, which indicates a logic error in the server. A return code of 8 indicates that the MVS STIMERM macro failed, in which case the reason code indicates the return code received from STIMERM CANCEL.

Module: DFHCFST

Destination: Console and SYSPRINT

DFHCF0606 Statistics collection function is no longer available.

Explanation: The statistics collection subtask in the coupling facility data table server was unable to continue processing and has terminated. The reason will have been indicated by an earlier message.

System action: The interval statistics subtask terminates and no further interval statistics or end of day statistics will be produced for this run of the server.

User response: See the earlier message indicating the reason for the termination of the subtask.

Module: DFHCFST

Destination: Console and SYSPRINT

DFHCF0610I Statistics written to SMF, return code was *retcode*.

Explanation: Coupling facility data table server statistics have been sent to SMF. The return code from the SMFEWMT macro is indicated in this message. A non-zero return code usually indicates that SMF recording was suppressed because of current SMF options or an installation exit.

System action: Processing continues.

User response: If the return code is non-zero but SMF statistics were expected to be successfully written, see the documentation of the SMFEWMT macro in *OS/390 MVS System Management Facilities (SMF)* (GC28-1783) for more information about return codes.

Module: DFHCFST

Destination: SYSPRINT

DFHCF0651 Restart processing cannot open table *table*, reason code *reason*.

Explanation: An application region has attempted to restart its connection to the coupling facility data table server, but an unresolved unit of work for that region has updated a table which cannot be opened at present, so restart processing cannot be completed. This message only occurs if the table is still in existence; if it has been deleted, the updates are simply discarded. The reason code is from the file open routine in module DFHCF0C, and indicates why the file could

not be opened. In the current implementation, there are no user functions which could prevent a file from being opened by restart, so this condition should not be possible.

System action: Restart processing is terminated and recoverable tables cannot be accessed until it is successfully retried.

User response: None.

Module: DFHCFSP

Destination: Console and SYSPRINT

DFHCF0652 Pool state error, reason code *reason*, processing function request for UOWID *uowid*, task *task*, region *region*.

Explanation: Integrity checks during coupling facility data table server syncpoint or restart processing found that data or control information in the list structure was in a state that should not be possible in normal processing. The reason codes are based on the response codes returned by the internal coupling facility interface.

- Reason codes
 - 2 Entry exceeds maximum data length.
 - 3 Entry not found.
 - 4 Wrong version.
 - 5 Wrong list authority.
 - 6 Limit number of entries in list reached.
 - 7 No space left in structure.

All of these conditions can also occur in normal processing. This message is only issued if the condition occurs in a case where it should not occur, or when the normal retry action following the condition cannot be performed. For example, a wrong version response from the coupling facility interface normally simply indicates that an entry has changed, causing the entry to be read again, and this is only treated as a pool state error if the data or control information in the changed entry is not consistent with the expected state of the record.

System action: The current syncpoint or restart operation is terminated with a pool state error exception.

User response: This indicates that some data in the pool has become inconsistent or corrupted. There is no known way that this can happen unless a program other than the coupling facility data table server is used to access the pool. If this error occurs for changes to a particular table, it may be necessary to delete the table to clear up the problem. If it occurs for other control information, it may be necessary to recreate the pool.

Module: DFHCFSP

Destination: Console and SYSPRINT

DFHCF0701I CF data table pool *poolname* is to be unloaded.

Explanation: The coupling facility data table server program has been started with the **UNLOAD** option requesting that the table pool is unloaded to a sequential data set.

System action: The server starts to process the unload request. In this case, the rest of cross-memory server initialization is bypassed as it will not be needed.

User response: None.

Module: DFHCFUL

Destination: Console and SYSPRINT

DFHCF0702I CF data table pool *poolname* has been successfully unloaded.

Explanation: The coupling facility data table pool has been unloaded successfully.

System action: The server closes down normally.

User response: None.

Module: DFHCFUL

Destination: Console and SYSPRINT

DFHCF0703I Number of unloaded tables: *tables*. Blocks written *blocks*.

Explanation: This message provides additional information about the results of the coupling facility data table pool unload process, giving the number of tables which were unloaded and the number of 4K data blocks written to the unloaded table pool data set.

System action: Server termination continues.

User response: None.

Module: DFHCFUL

Destination: Console and SYSPRINT

DFHCF0704 DFHCFUL data set for unload could not be opened.

Explanation: The data set to contain the unloaded coupling facility data table pool could not be opened.

System action: Unload processing is terminated and the server is closed down with message DFHCF0706.

User response: Check that the DFHCFUL DD statement is present in the JCL for the unload job.

Module: DFHCFUL

Destination: Console and SYSPRINT

DFHCF0705 Unload access to CF structure *strname* failed with response *response*.

Explanation: The coupling facility data table pool unload process failed because of a problem with coupling facility access.

System action: Unload processing is terminated and the server is closed down with message DFHCF0706.

User response: If the response code is 8, this indicates that an unexpected IXLLIST error occurred, for which a previous message DFHCF0441 will have been issued. Any other response code indicates an internal logic error.

Module: DFHCFUL

Destination: Console and SYSPRINT

DFHCF0706 Unload for CF data table pool *poolname* was unsuccessful.

Explanation: The coupling facility data table pool unload process failed. The reason will have been described in a previous message.

System action: The server is terminated.

User response: See the previous message giving the reason for the unload failure. Note that any unload data set produced in this case will be incomplete and will not be valid for reload purposes.

Module: DFHCFUL

Destination: Console and SYSPRINT

DFHCF0721 CF data table *table* has been successfully unloaded, *records* records.

Explanation: The named coupling facility data table has been unloaded. Note that if any recoverable updates were pending, the number of table entries unloaded may be slightly larger than the number of records, as the entry for the original record is retained until syncpoint in case it is needed for backout.

System action: Unload processing continues.

User response: None.

Module: DFHCFUL

Destination: SYSPRINT

DFHCF0731 *uowids* units of work were unloaded for recoverable connection *applid*.

Explanation: One or more unresolved recoverable units of work were found for the specified recoverable connection identifier during coupling facility data table pool unload processing.

System action: Unload processing will include the status of those units of work in the unloaded data, to allow them to be resolved after the pool is reloaded.

User response: None.

Module: DFHCFUL

Destination: SYSPRINT

DFHCF0801I CF data table pool *poolname* is to be reloaded.

Explanation: The coupling facility data table server program has been started with the **RELOAD** option requesting that the table pool is to be reloaded from a sequential data set produced using the **UNLOAD** option.

System action: The server starts to process the reload request. In this case, the rest of cross-memory server initialization is bypassed as it will not be needed.

User response: None.

Module: DFHCFRL

Destination: Console and SYSPRINT

DFHCF0802I CF data table pool *poolname* has been successfully reloaded.

Explanation: The coupling facility data table pool has been reloaded successfully.

System action: The server closes down normally.

User response: None.

Module: DFHCFRL

Destination: Console and SYSPRINT

DFHCF0803I Tables reloaded: *tables*. Tables bypassed: *duplicates*. Blocks read: *blocks*.

Explanation: This message provides additional information about the results of the coupling facility data table pool reload process. Tables on the unloaded data set are bypassed during reload processing if they already exist in the pool (for example as a result of a previous reload which could not be completed due to lack of space).

System action: Server termination processing continues.

User response: None.

Module: DFHCFRL

Destination: Console and SYSPRINT

DFHCF0804 DFHCFRL data set for reload could not be opened.

Explanation: The data set containing the coupling facility data table pool to be reloaded could not be opened.

System action: Reload processing is terminated and

the server is closed down with message DFHCF0808.

User response: Check that the DFHCFRL DD statement is present in the JCL for the reload job.

Module: DFHCFRL

Destination: Console and SYSPRINT

DFHCF0805 Reload access to CF structure *strname* failed with response *response*.

Explanation: The coupling facility data table pool reload process failed because of a problem with coupling facility access.

System action: Reload processing is terminated and the server is closed down with message DFHCF0808.

User response: If the response code is 8, this indicates that an unexpected IXLLIST error occurred, for which a previous message DFHCF0441 will have been issued. Any other response code indicates an internal logic error.

Module: DFHCFRL

Destination: Console and SYSPRINT

DFHCF0806 Unexpected end of file encountered on reload data set.

Explanation: End of file was encountered on the data set containing the unloaded coupling facility data table pool before the logical end of the unloaded data was encountered.

System action: Reload processing is terminated and the server is closed down with message DFHCF0808.

User response: This indicates that the unloaded data set is incomplete, perhaps because the unload process was abnormally terminated.

Module: DFHCFRL

Destination: Console and SYSPRINT

DFHCF0807 Reload data set contains incorrect data near block *block*, offset *offset*.

Explanation: The coupling facility data table pool reload process failed because the unloaded pool data set is not in the correct format.

System action: Reload processing is terminated and the server is closed down with message DFHCF0808.

User response: Check that the correct data set is being used and that the unload process completed normally.

Module: DFHCFRL

Destination: Console and SYSPRINT

DFHCF0808 Reload for CF data table pool *poolname* was unsuccessful.

Explanation: The coupling facility data table pool reload process could not be completed. The reason will have been described in a previous message.

System action: The program is terminated.

User response: See the previous message giving the reason for the reload failure.

Module: DFHCFRL

Destination: Console and SYSPRINT

DFHCF0809 Reload for CF structure *strname* failed, structure is full.

Explanation: Coupling facility data table pool reload processing failed because there are insufficient free entries or elements to store the new data in the structure.

System action: Reload processing is terminated and the server is closed down with message DFHCF0808.

User response: If the structure is currently allocated at less than its maximum size and the coupling facility has enough free space, the size of the structure can be increased dynamically using the MVS **SETXCF** command with the **START,ALTER** option, and the reload job can then be run again as soon as the alter request completes, in which case it will skip over duplicate information which has already been successfully reloaded. If the structure is at its maximum size, use the MVS **SETXCF FORCE** command to delete the structure, then increase the **SIZE** and **INITSIZE** parameters in the current CFRM policy and activate the updated policy, and rerun the reload job. The approximate amount of information which could not be reloaded can be estimated by comparing the numbers of blocks read and tables reloaded, as described by following message DFHCF0803, with the corresponding numbers from message DFHCF0703 in the unload job.

Module: DFHCFRL

Destination: Console and SYSPRINT

DFHCF0810 Reload for CF structure *strname* failed, all lists are in use.

Explanation: Coupling facility data table pool reload processing failed because all list headers defined in the structure are now in use.

System action: Reload processing is terminated and the server is closed down with message DFHCF0808.

User response: Use the MVS **SETXCF FORCE** command to delete the structure, then change the reload job **MAXTABLES** parameter to a value at least as large as the number of tables in the unloaded data,

DFHCF0821 • DFHCF0913I

preferably much larger to allow for future expansion, then rerun the reload job.

Module: DFHCFRL

Destination: Console and SYSPRINT

DFHCF0821 CF data table *table* has been successfully reloaded, *records* records.

Explanation: The named coupling facility data table has been reloaded. Note that if any recoverable updates were pending, the number of table entries reloaded may be slightly larger than the number of records, as the entry for the original record is retained until syncpoint in case it is needed for backout.

System action: Reload processing continues.

User response: None.

Module: DFHCFRL

Destination: SYSPRINT

DFHCF0822 CF data table *table* is already defined, reloading has been bypassed.

Explanation: A coupling facility data table which was being reloaded was found to have the same name as an existing table within the pool.

System action: Reloading of the table is bypassed, and reload processing continues with the next table.

User response: None.

Module: DFHCFRL

Destination: SYSPRINT

DFHCF0831 *uowids* units of work were reloaded for recoverable connection *applid*.

Explanation: Coupling facility data table pool reload processing has reloaded one or more unresolved recoverable units of work for the specified recoverable connection identifier.

System action: Reload processing restores the status of those units of work from the unloaded data, to allow them to be resolved when the connection is next restarted.

User response: None.

Module: DFHCFUL

Destination: SYSPRINT

DFHCF0832 *uowids* duplicate units of work were skipped for recoverable connection *applid*.

Explanation: Coupling facility data table pool reload processing found one or more unresolved recoverable units of work in the unloaded data which were found to

be already present in the current pool, so they were bypassed in this reload run. This should only happen if the reload job was run more than once, for example to resume reloading after increasing the pool size.

System action: Reload processing skips units of work which are already identified as active in the current pool.

User response: None.

Module: DFHCFUL

Destination: SYSPRINT

DFHCF0911I R12=*prv* RQ Entry *function* Table=*table* Task=*tasknum* *region*

Explanation: Coupling facility data table server request tracing is active and information from the FCCR parameter list is being traced on entry to the request module DFHCFRQ.

System action: Processing continues.

User response: This message is intended primarily for diagnostic use as advised by your IBM Support Center.

Module: DFHCFRQ

Destination: SYSPRINT

DFHCF0912I R12=*prv* RQ Exit *response* Table=*table* Task=*tasknum* *region*

Explanation: Coupling facility data table server request tracing is active and information from the FCCR parameter list is being traced on exit from the request module DFHCFRQ.

System action: Processing continues.

User response: This message is intended primarily for diagnostic use as advised by your IBM Support Center.

Module: DFHCFRQ

Destination: SYSPRINT

DFHCF0913I R12=*prv* RQ Lock *status* Table=*table* Task=*tasknum* *region*

Explanation: Coupling facility data table server request tracing is active and the state of a record lock is being traced. (This message is not used in the normal cases of reading a record whose lock is available or releasing a record when no other task expressed an interest in it).

- Record lock status values

OWNED

The lock is already held by the same task.

BUSY

The lock is held by another active task.

RETAINED

The lock has previously been marked as retained.

RETAIN

The lock is for an inactive task and will be retained.

RECLAIM

The lock is inactive and can be reclaimed immediately.

BACKOUT

The lock will be reclaimed after backing out any change.

POST

Other tasks are being notified that a lock was released.

WAIT

The current task is being suspended to await a lock.

System action: Processing continues.

User response: This message is intended primarily for diagnostic use as advised by your IBM Support Center.

DFHCPnnnn messages**DFHCP0101I applid CPI initialization has started.**

Explanation: This is an informational message indicating the start of CPI initialization.

System action: Initialization continues.

User response: None. You can suppress this message with the system initialization parameter MSGLVL=0.

Module: DFHCPIN1

XMEOUT Parameter: *applid*

Destination: Console

XMEOUT Parameter: *applid*

Destination: Console

DFHCP0102I applid CPI initialization has ended.

Explanation: This is an informational message indicating that CPI initialization has completed successfully.

System action: Initialization continues.

User response: None. You can suppress this message with the system initialization parameter MSGLVL=0.

Module: DFHCPIN1

XMEOUT Parameter: *applid*

Destination: Console

**DFHCP0701I date time applid tranid program name
CPI-C verb verb used unrecognized
CONVERSATION_ID Conversation_ID.**

Explanation: The application program has used an unrecognized conversation_ID on one of its calls to CPI-C. This could mean that

- The application program has not created a conversation successfully using either the CMINIT (Initialize_Conversation) or the CMACCP (Accept_Conversation) verbs, or
- The application program has used the conversation_ID supplied to it by CPI-C incorrectly.

System action: CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response: Determine which error has occurred and amend the application program accordingly.

The *SAA CPI-C Reference* manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Module: DFHCPIC

XMEOUT Parameters: *date, time, applid, tranid, program name, verb, Conversation_ID*

Destination: CCPI

DFHCP0103I applid CPI initialization has failed.

Explanation: CPI has failed to initialize successfully.

System action: Message DFHSI1522 will be issued following this message. CICS will terminate or continue initialization depending upon the operator's response to message DFHSI1522.

An exception trace entry will be written at the time the failure was detected.

Other CICS components called by CPI initialization may also issue messages or write trace entries.

User response: Decide whether CICS can continue execution without CPI support, and respond accordingly to message DFHSI1522.

You should also investigate why CPI failed to initialize.

Module: DFHCPIN1

**DFHCP0702I date time applid tranid program name
Conversation_ID CPI-C verb verb was
disallowed because of the
conversation state state.**

Explanation: The CPI-C state machine detected a state error. This means that the conversation was in the wrong state to issue this verb.

System action: CICS returns control to the application program with return_code CM_PROGRAM_STATE_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response: Use the state machine defined in the *SAA CPI Communications Reference* manual, (SC26-4399), and the CICS trace information to determine the sequence of CPI-C calls issued that caused the state error. Amend the application program in accordance with the supplied guidelines.

Module: DFHCPIC

XMEOUT Parameters: *date, time, applid, tranid, program name, Conversation_ID, verb, state*

Destination: CCPI

DFHCP0705I *date time applid tranid program name Conversation_ID invalid conversation_type parameter (X'conv_type') supplied on the CMSCT (Set_Conversation_Type) verb.*

Explanation: The application program has called CMSCT (Set_Conversation_Type) with an invalid conversation_type parameter value.

System action: CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response: Amend CMSCT in the application program to use a valid conversation_type parameter.

The *SAA CPI-C Reference* manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Module: DFHPCSA

XMEOUT Parameters: *date, time, applid, tranid, program name, Conversation_ID, X'conv_type'*

Destination: CCPI

DFHCP0706I *date time applid tranid program name conversation_ID the supplied conversation_type parameter of CM_MAPPED_CONVERSATION conflicts with the current setting of the fill characteristic CM_FILL_BUFFER.*

Explanation: The application program has called CMSCT (Set_Conversation_Type) with a conversation_type parameter of CM_MAPPED_CONVERSATION when it had previously used the CMSF (Set_Fill) verb to set the fill characteristic.

This is not allowed in CPI-C.

System action: CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response: Amend the application program so that it does not use these two verbs in this invalid combination.

The *SAA CPI-C Reference* manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Module: DFHPCSA

XMEOUT Parameters: *date, time, applid, tranid, program name, conversation_ID*

Destination: CCPI

DFHCP0707I *date time applid tranid program name conversation_ID the supplied conversation_type parameter CM_MAPPED_CONVERSATION conflicts with the current setting of log_data.*

Explanation: The application program has called CMSCT (Set_Conversation_Type) with a conversation_type parameter of CM_MAPPED_CONVERSATION when it had previously used the CMSLD (Set_Log_Data) verb to create some Log Data.

This is not allowed in CPI-C.

System action: CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response: Amend the application program so that it does not use these two verbs in this invalid combination.

The *SAA CPI-C Reference* manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Module: DFHPCSA

XMEOUT Parameters: *date, time, applid, tranid, program name, conversation_ID*

Destination: CCPI

DFHCP0708I *date time applid tranid program name conversation_ID invalid deallocate_type parameter (X'deallocate_type') supplied on the CMSDT (Set_Deallocate_Type) verb.*

Explanation: The application program has called CMSDT (Set_Deallocate_Type) with an invalid deallocate_type parameter.

System action: CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

DFHCP0709I • DFHCP0712I

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response: Amend CMSDT in the application program to use a valid deallocate_type parameter.

The *SAA CPI-C Reference* manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Module: DFHPCPSB

XMEOUT Parameters: *date, time,applid, tranid, program name,conversation_ID, X'deallocate_type'*

Destination: CCPI

DFHCP0709I *date time applid tranid program name conversation_ID* **the supplied deallocate_type parameter deallocate_type conflicts with the current setting of the sync_level characteristic sync_level.**

Explanation: The application program has called CMSDT (Set_Deallocate_Type) with a deallocate_type of *deallocate_type* and with the sync_level characteristic set to *sync_level*.

System action: CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response: Amend the application program to remove this conflict.

The *SAA CPI-C Reference* manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Module: DFHPCPSB

XMEOUT Parameters: *date, time,applid, tranid, program name,conversation_ID, deallocate_type, sync_level*

Destination: CCPI

DFHCP0710I *date time applid tranid program name conversation_ID* **invalid error_direction parameter (X'error_direction') supplied on the CMSED (Set_Error_Direction) verb.**

Explanation: The application program has called CMSED (Set_Error_Direction) with an invalid error_direction parameter.

System action: CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response: Amend CMSED in the application program to use a valid error_direction parameter.

Module: DFHPCPSC

XMEOUT Parameters: *date, time,applid, tranid, program name,conversation_ID, X'error_direction'*

Destination: CCPI

DFHCP0711I *date time applid tranid program name conversation_ID* **invalid fill parameter (X'fill') supplied on the CMSF (Set_Fill) verb.**

Explanation: The application program has called CMSF (Set_Fill) with an invalid fill parameter *fill*.

System action: CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response: Amend CMSF in the application program to use a valid fill parameter.

The *SAA CPI-C Reference* manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Module: DFHPCPSCD

XMEOUT Parameters: *date, time,applid, tranid, program name,conversation_ID, X'fill'*

Destination: CCPI

DFHCP0712I *date time applid tranid program name conversation_ID* **CMSF (Set_Fill) call conflicts with the current conversation_type of CM_MAPPED_CONVERSATION.**

Explanation: The application program has called CMSF (Set_Fill) when the conversation_type is CM_MAPPED_CONVERSATION.

System action: CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response: Amend the application program to remove this conflict.

The *SAA CPI-C Reference* manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Module: DFHPCPSCD

XMEOUT Parameters: *date, time,applid, tranid, program name,conversation_ID*

Destination: CCPI

DFHCP0713I *date time applid tranid program name conversation_ID CMSLD (Set_Log_Data) call conflicts with the current conversation_type of CM_MAPPED_CONVERSATION.*

Explanation: The application program has called CMSLD (Set_Log_Data) when the conversation_type is CM_MAPPED_CONVERSATION.

System action: CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response: Amend the application program to remove this conflict.

The *SAA CPI-C Reference* manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Module: DFHPCPSE

XMEOUT Parameters: *date, time, applid, tranid, program name, conversation_ID*

Destination: CCPI

DFHCP0714I *date time applid tranid program name conversation_ID log_data_length (log_data_length) supplied on CMSLD (Set_Log_Data) verb is not in the range 0-512.*

Explanation: The application program has called CMSLD (Set_Log_Data) with a log_data_length parameter that is not in the range 0–512.

System action: CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response: Amend CMSLD in the application program to use a valid log_data_length parameter.

The *SAA CPI-C Reference* manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Module: DFHPCPSE

XMEOUT Parameters: *date, time, applid, tranid, program name, conversation_ID, log_data_length*

Destination: CCPI

DFHCP0718I *date time applid tranid program name conversation_ID invalid mode_name_length parameter (mode_name_length) supplied on the CMSMN (Set_Mode_Name) verb.*

Explanation: The application program has called CMSMN (Set_Mode_Name) with a mode_name_length parameter outside the range of 0 –8.

System action: CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response: Amend CMSMN in the application program to use a valid mode_name_length parameter.

The *SAA CPI-C Reference* manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Module: DFHPCPSF

XMEOUT Parameters: *date, time, applid, tranid, program name, conversation_ID, mode_name_length*

Destination: CCPI

DFHCP0721I *date time applid tranid program name conversation_ID the partner_lu_name_length (partner_lu_name_len) supplied on the CMSPLN (Set_Partner_LU_Name) verb is not in the range 1-17.*

Explanation: The application program has called CMSPLN (Set_Partner_LU_Name) with a partner_lu_name_length parameter outside the range 1–17.

System action: CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect either on the conversation or conversation characteristics.

User response: Amend CMSPLN in the application program to use a partner_lu_name_length parameter within the range 1-17.

The *SAA CPI-C Reference* manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Module: DFHPCPSG

XMEOUT Parameters: *date, time, applid, tranid, program name, conversation_ID, partner_lu_name_len*

Destination: CCPI

DFHCP0724I *date time applid tranid program name conversation_ID* **invalid prepare_to_receive_type parameter (X'ptr_type) supplied on the CMSPTR (Set_Prepare_To_Receive_Type) verb.**

Explanation: The application program has called CMSPTR (Set_Prepare_To_Receive_Type) with an invalid prepare_to_receive_type parameter.

System action: CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response: Amend CMSPTR in the application program to use a valid prepare_to_receive_type parameter.

The *SAA CPI-C Reference* manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Module: DFHPCSH

XMEOUT Parameters: *date, time, applid, tranid, program name, conversation_ID, X'ptr_type'*

Destination: CCPI

DFHCP0725I *date time applid tranid program name conversation_ID* **the supplied prepare_to_receive_type parameter CM_PREP_TO_RECEIVE_CONFIRM is incompatible with the current setting of the sync_level characteristic CM_NONE.**

Explanation: The application program has called CMSPTR (Set_Prepare_To_Receive_Type) with a prepare_to_receive_type parameter of CM_PREP_TO_RECEIVE_CONFIRM and with the sync_level characteristic set to CM_NONE.

System action: CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response: Amend the application program to remove this conflict.

The *SAA CPI-C Reference* manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Module: DFHPCSH

XMEOUT Parameters: *date, time, applid, tranid, program name, conversation_ID*

Destination: CCPI

DFHCP0726I *date time applid tranid program name conversation_ID* **invalid receive_type parameter (X'receive_type) supplied on the CMSRT (Set_Receive_Type) verb.**

Explanation: The application program has called CMSRT (Set_Receive_Type) with an invalid receive_type parameter.

System action: CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response: Amend CMSRT in the application program to use a valid receive_type parameter.

The *SAA CPI-C Reference* manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Module: DFHPCSI

XMEOUT Parameters: *date, time, applid, tranid, program name, conversation_ID, X'receive_type'*

Destination: CCPI

DFHCP0727I *date time applid tranid program name conversation_ID* **invalid return_control parameter (X'return_control) supplied on the CMSRC (Set_Return_Control) verb.**

Explanation: The application program has called CMSRC (Set_Return_Control) with an invalid return_control parameter.

System action: CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response: Amend CMSRC in the application program to use a valid return_control parameter.

The *SAA CPI-C Reference* manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Module: DFHPCSI

XMEOUT Parameters: *date, time, applid, tranid, program name, conversation_ID, X'return_control'*

Destination: CCPI

DFHCP0728I *date time applid tranid program name conversation_ID* **invalid send_type parameter (X'send_type) supplied on the CMSST (Set_Send_Type) verb.**

Explanation: The application program has called

CMSST (Set_Send_Type) with an invalid send_type parameter.

System action: CICS returns control to the application program with return_code
CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response: Amend CMSST in the application program to use a valid send_type parameter.

The *SAA CPI-C Reference* manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Module: DFHPCPSK

XMEOUT Parameters: *date, time, applid, tranid, program name, conversation_ID, X'send_type'*

Destination: CCPI

DFHCP0729I *date time applid tranid program name conversation_ID* **the supplied send_type parameter CM_SEND_AND_CONFIRM is incompatible with the current setting of the sync_level characteristic CM_NONE.**

Explanation: The application program has called CMSST (Set_Send_Type) with a send_type parameter of CM_SEND_AND_CONFIRM and with the sync_level characteristic set to CM_NONE.

System action: CICS returns control to the application program with return_code
CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response: Amend the application program to remove this conflict.

The *SAA CPI-C Reference* manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Module: DFHPCPSK

XMEOUT Parameters: *date, time, applid, tranid, program name, conversation_ID*

Destination: CCPI

DFHCP0730I *date time applid tranid program name conversation_ID* **invalid sync_level parameter (X'sync_level') supplied on the CMSSL (Set_Sync_Level) verb.**

Explanation: The application program has called CMSSL (Set_Sync_Level) with an invalid sync_level parameter.

System action: CICS returns control to the application program with return_code

CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response: Amend CMSSL in the application program to use a valid sync_level parameter.

The *SAA CPI-C Reference* manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Module: DFHPCPSL

XMEOUT Parameters: *date, time, applid, tranid, program name, conversation_ID, X'sync_level'*

Destination: CCPI

DFHCP0731I *date time applid tranid program name conversation_ID* **the supplied sync_level parameter CM_NONE is incompatible with the current setting of the send_type characteristic CM_SEND_AND_CONFIRM.**

Explanation: The application program has called CMSSL (Set_Sync_Level) with a sync_level parameter of CM_NONE. The send_type is CM_SEND_AND_CONFIRM.

System action: CICS returns control to the application program with return_code
CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response: Amend the application program to remove this conflict.

The *SAA CPI-C Reference* manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Module: DFHPCPSL

XMEOUT Parameters: *date, time, applid, tranid, program name, conversation_ID*

Destination: CCPI

DFHCP0732I *date time applid tranid program name conversation_ID* **the supplied sync_level parameter sync_level is incompatible with the current setting of the deallocate_type characteristic deallocate_type.**

Explanation: The application program has called CMSSL (Set_Sync_Level) with a sync_level parameter of *sync_level*. The deallocate_type is *deallocate_type*.

System action: CICS returns control to the application program with return_code
CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation

DFHCP0733I • DFHCP0741I

or the conversation characteristics.

User response: Amend the application program to remove this conflict.

The *SAA CPI-C Reference* manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Module: DFHPCSL

XMEOUT Parameters: *date, time, applid, tranid, program name, conversation_ID, sync_level, deallocate_type*

Destination: CCPI

DFHCP0733I *date time applid tranid program name conversation_ID* **the supplied sync_level parameter CM_NONE is incompatible with the current setting of the prepare_to_receive_type characteristic CM_PREP_TO_RECEIVE_CONFIRM.**

Explanation: The application program has called CMSSL (Set_Sync_Level) with a sync_level parameter of CM_NONE.

CM_PREP_TO_RECEIVE_CONFIRM is the prepare_to_receive_type.

System action: CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response: Amend the application program to remove this conflict.

The *SAA CPI-C Reference* manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Module: DFHPCSL

XMEOUT Parameters: *date, time, applid, tranid, program name, conversation_ID*

Destination: CCPI

DFHCP0734I *date time applid tranid program name conversation_ID* **tp_name_length parameter (tp_name_length) supplied on the CMSTPN (Set_TP_Name) verb is not in the range 1-64.**

Explanation: The application program has called CMSTPN (Set_TP_Name) with an tp_name_length parameter outside the range 1–64.

System action: CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response: Amend CMSTPN in the application program to use a valid tp_name_length parameter.

The *SAA CPI-C Reference* manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Module: DFHPCSM

XMEOUT Parameters: *date, time, applid, tranid, program name, conversation_ID, tp_name_length*

Destination: CCPI

DFHCP0740I *date time applid tranid program name* **No incoming conversation to accept.**

Explanation: The application program has called CMAACP (Accept_conversation) when there is no incoming conversation.

System action: CICS returns control to the application program with return_code CM_PROGRAM_STATE_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response: Ensure that there is an incoming conversation to accept.

The *SAA CPI-C Reference* manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Module: DFHPCAC

XMEOUT Parameters: *date, time, applid, tranid, program name*

Destination: CCPI

DFHCP0741I *date time applid tranid program name* **Duplicate call to CMAACP (Accept_Conversation).**

Explanation: The application program has called CMAACP (Accept_conversation) more than once.

System action: CICS returns control to the application program with return_code CM_PROGRAM_STATE_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response: Amend the application program so that it only calls CMAACP once.

The *SAA CPI-C Reference* manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Module: DFHPCAC

XMEOUT Parameters: *date, time, applid, tranid, program name*

Destination: CCPI

DFHCP0742I *date time applid tranid program name*
Session is not available for CPI-C as it is already in use by another process.

Explanation: The application program has called CMACCP (Accept_conversation) when it was already using the session for another process, for example, EXEC Interface DTP.

System action: CICS returns control to the application program with return_code CM_PRODUCT_SPECIFIC_ERROR.

User response: Ensure that the application uses only CPI-C on this session.

Module: DFHCPAC

XMEOUT Parameters: *date, time, applid, tranid, program name*

Destination: CCPI

DFHCP0743I *date time applid tranid program name*
Unable to use CPI-C as this transaction was initiated by ATI.

Explanation: The application program has called CMACCP (Accept_conversation) after it was started by Automatic Transaction Initiation (ATI). This is not supported.

System action: CICS returns control to the application program with return_code CM_PRODUCT_SPECIFIC_ERROR.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response: Ensure that applications abide by this restriction.

Module: DFHCPAC

XMEOUT Parameters: *date, time, applid, tranid, program name*

Destination: CCPI

DFHCP0747I *date time applid tranid program name conversation_ID*
CMCFM (Confirm) call conflicts with sync_level CM_NONE.

Explanation: The application program has called CMCFM (Confirm) when the sync_level is set to CM_NONE. This is not allowed.

System action: CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response: Amend the application program so this conflict no longer occurs.

The *SAA CPI-C Reference* manual, (SC26-4399),

provides a detailed description of all the CPI-C verbs and how they should be called.

Module: DFHCPCCM

XMEOUT Parameters: *date, time, applid, tranid, program name, conversation_ID*

Destination: CCPI

DFHCP0749I *date time applid tranid program name*
Unrecognized sym_dest_name (sym_dest_name) supplied on the CMINIT (Initialize_Conversation) verb.

Explanation: The application program has called CMINIT (Initialize_Conversation). The sym_dest_name parameter is unrecognized.

System action: CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response: Amend the application program and the partner resource definition to ensure that the sym_dest_name parameter is correct.

The *CICS Resource Definition Guide* explains how to use the partner resource correctly.

The *SAA CPI-C Reference* manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Module: DFHPCIC

XMEOUT Parameters: *date, time, applid, tranid, program name, sym_dest_name*

Destination: CCPI

DFHCP0750I *date time applid tranid program name*
Unrecognized profile profile_name supplied in partner resource sym_dest_name.

Explanation: The application program has called CMINIT (Initialize_Conversation). The profile found in the sym_dest_name supplied is unrecognized.

System action: CICS returns control to the application program with return_code CM_PRODUCT_SPECIFIC_ERROR.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response: Amend the application program and the partner resource definition to ensure that the sym_dest_name parameter is correct.

The *SAA CPI-C Reference* manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

DFHCP0751I • DFHCP0754I

In addition, the *CICS Resource Definition Guide* gives further information on partner resource definitions.

Module: DFHPCIC

XMEOUT Parameters: *date, time, applid, tranid, program name, profile_name, sym_dest_name*

Destination: CCPI

DFHCP0751I *date time applid tranid program name conversation_ID* **invalid requested_length parameter requested_length supplied on CMRCV (Receive).**

Explanation: The application program has called CMRCV (Receive) with a requested_length parameter that has a value greater than 32767.

System action: CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response: Amend the application program to use a valid value for the requested_length parameter.

The *SAA CPI-C Reference* manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Module: DFHPCRI, DFHPCRW

XMEOUT Parameters: *date, time, applid, tranid, program name, conversation_ID, requested_length*

Destination: CCPI

DFHCP0752I *date time applid tranid program name conversation_ID* **data passed on call to CMSEND contains an invalid GDS record.**

Explanation: The application program has called CMSEND (Send_Data). Data passed on this call contains an invalid generalized data stream (GDS) record.

Note: This message is only issued on a basic conversation. That is, when conversation_type is set to CM_BASIC_CONVERSATION.

System action: The data is not sent.

CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response: Amend the application program to ensure that this parameter is correct.

The *SAA CPI-C Reference* manual, (SC26-4399), provides a detailed description of all the CPI-C verbs

and how they should be called together with information about GDS records.

The *CICS Distributed Transaction Programming Guide* provides additional information about GDS records.

Module: DFHPCCLR

XMEOUT Parameters: *date, time, applid, tranid, program name, conversation_ID*

Destination: CCPI

DFHCP0753I *date time applid tranid program name conversation_ID* **invalid send_length parameter send_length supplied on CMSEND (send_data).**

Explanation: The application program has called CMSEND (Send_Data) with a send_length parameter that is not in the range 0–32767 bytes.

System action: CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

User response: The send_length parameter should not exceed 32767 bytes. Amend CMSEND to send data that is within the range 0–32767 bytes. This may entail sending the data in two chunks.

The *SAA CPI-C Reference* manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Module: DFHPCPN1, DFHPCPN2, DFHPCPN3, DFHPCPN4, DFHPCPN5

XMEOUT Parameters: *date, time, applid, tranid, program name, conversation_ID, send_length*

Destination: CCPI

DFHCP0754I *date time applid tranid program name conversation_ID* **data sent so far is currently in the middle of a GDS record so cannot send CMDEAL, CMCFM or CMPTR requests.**

Explanation: The application is using a basic conversation (that is, the conversation_type characteristic has been set to CM_BASIC_CONVERSATION).

The application has not sent all the data associated with the last Generalized Data Stream (GDS) record.

However, the application has tried to send one of the following requests

- a CMDEAL (Deallocate),
- a CMCFM (Confirm), or
- a CMPTR (Prepare_to_receive).

System action: CICS returns control to the application program with return_code CM_PROGRAM_STATE_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response: Inspect the data sent to determine why the previous send was in error. Check if the error was caused by the application truncating the last record or if there was an error in one of the length fields which caused CPI-C to misinterpret the data-stream and amend the application program accordingly.

The *SAA CPI-C Reference* manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called together with information about GDS records.

The *CICS Distributed Transaction Programming Guide* provides additional information about GDS records.

Module: DFHCPCLR

XMEOUT Parameters: *date, time, applid, tranid, program name, conversation_ID*

Destination: CCPI

DFHCP0756 *date time applid tranid program name conversation_ID* **received an unrecognized sense_code**
X'sense_code' from the partner {program / program - }tp_name.

Explanation: A sense code received from the partner program on a remote system was unrecognized. This could be for one of two reasons.

- a protocol error, or
- the partner program is running on a later release and new sense codes have been added to the APPC architecture.

System action: CICS returns control to the application program with either return_code CM_DEALLOCATE_ABEND or CM_PROGRAM_ERROR_PURGING. This depends on whether the unrecognized sense code has been interpreted as an error or interpreted as a conversation abend. on the front-end system.

User response: Use the sense code provided in the message and your knowledge of the two communicating systems to determine which of the two possible cases documented above is the error.

If the error is a protocol error, you need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCPCLR

XMEOUT Parameters: *date, time, applid, tranid, program name, conversation_ID, X'sense_code', {2=program, 1=program - }, tp_name*

Destination: CCPI

DFHCP0757I *date time applid tranid program name conversation_ID* **unrecognized netname netname supplied for CMALLC (Allocate) verb.**

Explanation: The allocation of a session for this conversation failed due to an unrecognized netname *netname*.

This value is derived from the partner_lu_name specified either in the partner resource for the conversation, or on a CPI-C CMSPLN (set_partner_lu_name) verb.

System action: CICS returns control to the application program with return_code CM_PARAMETER_ERROR.

No session is allocated.

User response: Amend the application program to use a recognized netname.

Module: DFHCPCLR

XMEOUT Parameters: *date, time, applid, tranid, program name, conversation_ID, netname*

Destination: CCPI

DFHCP0758I *date time applid tranid program name conversation_ID* **unrecognized mode_name mode_name supplied for CMALLC (Allocate) verb.**

Explanation: The allocation of a session for this conversation failed due to an unrecognized mode name *mode_name*.

This value is specified either in the profile named in the partner resource for the conversation, or on a CPI-C CMSMN (Set_mode_name) verb.

System action: CICS returns control to the application program with return_code CM_PARAMETER_ERROR.

No session is allocated.

User response: Amend the application program to use a recognized mode_name.

Module: DFHCPCLR

XMEOUT Parameters: *date, time, applid, tranid, program name, conversation_ID, mode_name*

Destination: CCPI

DFHCP0759I *date time applid tranid program name conversation_ID* **invalid use of the SNA service TP X'tp_name'**

Explanation: The allocation of a session for conversation *conversation_id* failed because the transaction program (TP) specified in the conversation control block (CPC) is an SNA service TP. This is not allowed.

System action: CICS returns control to the application

DFHCP0760I • DFHCP0764I

program with return_code CM_PARAMETER_ERROR.

User response: Amend the application program so that it uses a different TP.

Module: DFHCPCAL

XMEOUT Parameters: *date, time, applid, tranid, program name, conversation_ID, X'tp_name'*

Destination: CCPI

DFHCP0760I *date time applid tranid program name conversation_ID* **an invalid partner_lu_name partner_lu_name was specified for the CMALLC (Allocate) verb.**

Explanation: The allocation of a session has failed. This is because the partner_lu_name specified in the conversation control block (CPC) does not conform to the following rules.

1. The partner_lu_name may take one of the following forms
 - Netname (1-8 characters long), or
 - Network.netname (where network and netname are EACH 1-8 characters long).
2. Netname and network both consist of the following character sets, where the first character is always alphabetic.
 - A-Z
 - a-z
 - @
 -
 - #
 - 0-9

Note: Lower case letters are translated to uppercase.

System action: The session is not allocated.

CICS returns control to the application program with return_code CM_PARAMETER_ERROR.

User response: Depending on the application, the partner_lu_name either comes from the partner resource (specified on the CMINIT (initialize_conversation) verb in the sym_dest_name parameter) or an optional CMSPLN (set_partner_lu_name) verb. This value needs to be changed to conform to the rules above.

Module: DFHCPCAL

XMEOUT Parameters: *date, time, applid, tranid, program name, conversation_ID, partner_lu_name*

Destination: CCPI

DFHCP0761I *date time applid tranid program name conversation_ID* **an invalid mode_name mode_name was specified for the CMALLC (Allocate) verb.**

Explanation: The allocation of a session for

conversation *conversation_id* has failed. This is because the mode_name *mode_name* specified in the conversation control block (CPC) is not allowed.

System action: No session is allocated.

CICS returns control to the application program with return_code CM_PARAMETER_ERROR.

User response: Amend the application program so that it uses a different mode_name.

Module: DFHCPCAL

XMEOUT Parameters: *date, time, applid, tranid, program name, conversation_ID, mode_name*

Destination: CCPI

DFHCP0763I *date time applid tranid program name conversation_ID* **the mode_name mode_name specified for the CMALLC (Allocate) verb is unknown to VTAM.**

Explanation: The allocation of a session for conversation *conversation_ID* has failed. This is because the mode_name specified in the conversation control block (CPC) is known to the remote system, but is unknown to VTAM.

System action: No session is allocated.

CICS returns control to the application program with return code CM_PARAMETER_ERROR.

User response: Amend the application program so that it uses a different mode_name.

Module: DFHCPCLR

XMEOUT Parameters: *date, time, applid, tranid, program name, conversation_ID, mode_name*

Destination: CCPI

DFHCP0764I *date time applid tranid program name* **Partner Resource Manager is unavailable.**

Explanation: The application program has called CMINIT (Initialize_Conversation), but the partner resource manager (which provides access to the partner resource table) is not available.

System action: CICS returns control to the application program with return_code CM_PRODUCT_SPECIFIC_ERROR.

User response: First determine whether message DFHPR0106 was issued during CICS initialization; if so, refer to the advice given for that message. Otherwise it appears that CICS-owned storage (either the static storage address list, or the PR static storage) has been overlaid. Refer to the *CICS Problem Determination Guide* for guidance on how to deal with storage violations.

Module: DFHCPCIC

XMEOUT Parameters: *date, time, applid, tranid, program name*

Destination: CCPI

DFHCP0765I *date time applid tranid program name conversation_ID* **CPI-C verb verb was disallowed because of the BACKOUT-REQUIRED program state.**

Explanation: The CPI-C state machine has detected a state error. The verb *verb* cannot be issued in BACKOUT-REQUIRED program state.

System action: CICS returns control to the application

program with return code
CM_PROGRAM_STATE_CHECK.

User response: Amend the application program in accordance with the supplied guidelines. See the *SAA CPI-C Reference* (SC26-4399), which contains a description of CPI-C verbs and how they should be called.

Module: DFHCPIC

XMEOUT Parameters: *date, time, applid, tranid, program name, conversation_ID, verb*

Destination: CCPI

DFHCQnnnn messages

DFHCQ0001 *applid* **An abend (code *aaa/bbbb*) has occurred at offset *X'offset'* in module *modname*.**

Explanation: An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a three 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; TS1310 refers to message DFHTS1310).

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the *OS/390 MVS System Codes* manual. Then look up the CICS alphanumeric code. This tells you, for example, whether the error is a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCQCQ, DFHCQSY

XMEOUT Parameters: *applid, aaa/bbbb, X'offset', modname*

Destination: Console

DFHCQ0002 *applid* **A severe error (code *X'code*) has occurred in module *modname*.**

Explanation: An error has been detected in module *modname*. The code *X'code* is the exception trace point id which uniquely identifies what the error is and where the error was detected. For further information about CICS exception trace entries, refer to the *CICS Problem Determination Guide*.

System action: An exception entry (code *X'code* in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: The severity of this error depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated.

If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the

full use of module *modname*, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCQCQ, DFHCQSY

XMEOUT Parameters: *applid, X'code',modname*

Destination: Console

DFHCQ0100I *applid* **Console queue initialization has started.**

Explanation: Console queue initialization has started.

System action: System initialization continues.

User response: None. The message can be suppressed with the system initialization parameter MSGLVL=0.

Module: DFHCQCQ

XMEOUT Parameter: *applid*

Destination: Console

DFHCQ0101I *applid* **Console queue initialization has ended.**

Explanation: Console queue initialization has completed successfully.

System action: System initialization continues.

User response: None. The message can be suppressed with the system initialization parameter MSGLVL=0.

Module: DFHCQSY

XMEOUT Parameter: *applid*

Destination: Console

DFHCQ0102I *applid* **Console queue initialization has failed.**

Explanation: Console queue initialization has failed.

System action: Provided there are no subsequent serious errors which prevent further initialization of CICS, CICS issues one of two messages depending on what other errors, if any, have occurred during initialization.

If DFHSI1521 is issued, CICS initialization is terminated. If DFHSI1522 is issued, decide if CICS initialization is to be continued in degraded mode or to be terminated.

User response: Check previous console messages, one of which should explain why console queue initialization has failed.

Module: DFHCQSY

XMEOUT Parameter: *applid*

Destination: Console

DFHCQ0103I *applid* **MVS console queue is open.**

Explanation: CICS sets a limit of 255, the MVS maximum, on the number of modify commands that can be queued at any time for the CICS server.

CICS also sets an internal limit of 254 on the number of modify commands that can be queued at any time to invoke transactions, for example CEMT.

If this internal limit is reached CICS will reject further modify commands unless these invoke transaction CEKL.

System action: System initialization continues.

User response: None. The message can be suppressed with the system initialization parameter MSGLVL=0.

Module: DFHCQSY

XMEOUT Parameter: *applid*

Destination: Console

DFHCQ0104I *applid* **MVS console queue is closed.**

Explanation: CICS will not accept any modify commands from MVS.

System action: System termination continues.

User response: None. The message can be suppressed with the system initialization parameter MSGLVL=0.

Module: DFHCQSY

XMEOUT Parameter: *applid*

Destination: Console

DFHCQ0105I *applid* **CICS is busy. MVS modify command has been rejected.**

Explanation: CICS can not accept the modify command as 254 modify commands to invoke transactions are currently queued.

System action: CICS rejects the modify command.

User response: The severity of this error depends on how many terminal definitions are being autoinstalled in your CICS system at the time you entered the modify command.

If the message recurs when you reenter the modify command you can use the CEKL INQUIRE and SET commands to identify the user tasks in your system and which, if any, should be removed from your system.

Module: DFHCQSY

Destination: Console

DFHCQ0200I *applid* CEKL transaction enabled.

Explanation: CICS supports CEKL INQUIRE and CEKL SET commands.

System action: CICS continues normally.

User response: You can use the CEKL INQUIRE and CEKL SET commands from a console device.

Module: DFHCQSY

XMEOUT Parameter: *applid*

Destination: Console

DFHCQ0201I *applid* CEKL transaction enabled only for INQUIRE.

Explanation: CICS supports only CEKL INQUIRE commands.

System action: CICS continues normally.

Support for kill in CICS Transaction Server for z/OS 2.2 is being shipped in two PTFs which can be applied independently of each other.

You must apply both PTFs if you want to use the CEKL SET command.

User response: If support for kill is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to install the second PTF.

Module: DFHCQSY

XMEOUT Parameter: *applid*

Destination: Console

DFHCQ0210I *applid* CEKL command ignored; INQUIRE or SET keyword must be specified.

Explanation: The CEKL command has been rejected.

The INQUIRE or SET keyword is expected; neither has been specified.

System action: The system continues normally.

User response: Check the syntax of the CEKL command.

Module: DFHCQSY

Destination: Console

DFHCQ0211I *applid* CEKL command ignored; input expected.

Explanation: The CEKL command has been rejected.

A keyword is expected but has not been specified.

System action: The system continues normally.

User response: Check the syntax of the CEKL command.

Module: DFHCQSY

Destination: Console

DFHCQ0212I *applid* CEKL command ignored; input beginning *input* is too long.

Explanation: The CEKL command has been rejected.

The input beginning *input* is too long; for example a transaction class name that is longer than 9 bytes.

System action: The system continues normally.

User response: Check the syntax of the CEKL command.

Module: DFHCQSY

Destination: Console

DFHCQ0213I *applid* CEKL command ignored. Keyword, *keyword* is repeated.

Explanation: The CEKL command has been rejected.

Keyword *keyword* has been specified more than once.

System action: The system continues normally.

User response: Check the syntax of the CEKL command.

Module: DFHCQSY

Destination: Console

DFHCQ0214I *applid* CEKL command ignored. Keyword, *invkwd* is not supported.

Explanation: The CEKL command has been rejected.

invkwd is not a valid keyword.

System action: The system continues normally.

User response: Check the syntax of the CEKL command.

Module: DFHCQSY

Destination: Console

DFHCQ0215I *applid* CEKL command ignored; Keyword, *invkwd* is ambiguous.

Explanation: The CEKL command has been rejected.

Keywords can be abbreviated provided that the abbreviated keyword is unique; for example TRANSID and TRANCLASS can be abbreviated to TRANS and TRANC respectively but not to TRAN.

System action: The system continues normally.

User response: Check the syntax of the CEKL command.

Module: DFHCQSY

Destination: Console

DFHCQ0216I *applid* **CEKL command ignored; invval is non-numeric.**

Explanation: The CEKL command has been rejected.

A non-numeric keyword value has been specified where a numeric value is expected; for example TASK(12345) is valid, TASK(abcde) is invalid.

System action: The system continues normally.

User response: Check the syntax of the CEKL command.

Module: DFHCQSY

Destination: Console

DFHCQ0217I *applid* **CEKL command ignored; invkwd is out of range.**

Explanation: The CEKL command has been rejected.

A keyword value has been specified which lies outside the range of values supported for the keyword; for example task numbers must be in the range 1-99999.

System action: The system continues normally.

User response: Check the syntax of the CEKL command.

Module: DFHCQSY

Destination: Console

DFHCQ0218I *applid* **CEKL command ignored; delim expected after kywd.**

Explanation: The CEKL command has been rejected.

A left paranthesis, '(', or a right paranthesis, ')' is expected but has not been specified.

System action: The system continues normally.

User response: Check the syntax of the CEKL command.

Module: DFHCQSY

Destination: Console

DFHCQ0220I *applid* **CEKL INQUIRE command ignored; TASK keyword must be specified.**

Explanation: The CEKL INQUIRE command has been rejected.

The TASK keyword is expected but has not been specified.

System action: The system continues normally.

User response: Check the syntax of the CEKL command.

Module: DFHCQSY

Destination: Console

DFHCQ0221I *applid* **CEKL INQUIRE command ignored; keyword expected.**

Explanation: The CEKL INQUIRE command has been rejected.

A keyword is expected but has not been specified.

System action: The system continues normally.

User response: Check the syntax of the CEKL command.

Module: DFHCQSY

Destination: Console

DFHCQ0224I *applid* **CEKL INQUIRE command ignored; keywords conflict.**

Explanation: The CEKL INQUIRE command has been rejected.

Conflicting keywords have been specified.

System action: The system continues normally.

User response: Check the syntax of the CEKL command.

Module: DFHCQSY

Destination: Console

DFHCQ0230I *applid* **CEKL SET command ignored; TASK keyword must be specified.**

Explanation: The CEKL SET command has been rejected.

The TASK keyword is expected but has not been specified.

System action: The system continues normally.

User response: Check the syntax of the CEKL command.

Module: DFHCQSY

Destination: Console

DFHCQ0231I *applid* **CEKL SET command ignored; keyword expected.**

Explanation: The CEKL SET command has been rejected.

A keyword is expected but has not been specified.

System action: The system continues normally.

User response: Check the syntax of the CEKL command.

Module: DFHCQSY

Destination: Console

DFHCQ0232I *applid* CEKL SET command ignored; task number must be specified.

Explanation: The CEKL SET command has been rejected.

The TASK keyword must be qualified by *taskno*.

System action: The system continues normally.

User response: Check the syntax of the CEKL command.

Module: DFHCQSY

Destination: Console

DFHCQ0233I *applid* CEKL SET command ignored; PURGE or FORCEPURGE or KILL keyword must be specified.

Explanation: The CEKL SET command has been rejected.

A keyword, PURGE or FORCEPURGE or KILL, is expected but has not been specified.

System action: The system continues normally.

User response: Check the syntax of the CEKL command.

Module: DFHCQSY

Destination: Console

DFHCQ0234I *applid* CEKL SET command ignored; keywords conflict.

Explanation: The CEKL SET command has been rejected.

Conflicting keywords have been specified.

System action: The system continues normally.

User response: Check the syntax of the CEKL command.

Module: DFHCQSY

Destination: Console

DFHCQ0240I *applid* CEKL INQUIRE: task number *taskno* not found.

Explanation: Task number *taskno* has not been found.

System action: The system continues normally.

User response: Check the value that you specified for *taskno*.

If this is correct then the task has been removed from the system.

Module: DFHCQSY

Destination: Console

DFHCQ0241I *applid* CEKL INQUIRE: task number *taskno*, found.

Explanation: Task number *taskno* has been found.

System action: CICS displays information about task *taskno* on the console and job log.

User response:

Module: DFHCQSY

Destination: Console

DFHCQ0242I *applid* CEKL INQUIRE: no tasks matched selection criteria.

Explanation: CICS has not found any tasks that match the options specified on the CEKL INQUIRE command.

System action: The system continues normally.

User response: Check the options specified on the CEKL command. For example specify a lower value for the SUSPENDED option.

Module: DFHCQSY

Destination: Console

DFHCQ0243I *applid* CEKL INQUIRE: *notasks* task(s) matched selection criteria.

Explanation: *notasks* tasks have been found matching the options specified on the CEKL INQUIRE command.

System action: CICS displays information about these tasks on the console and job log.

User response: You should use the information to determine, which task, if any, should be removed from your system.

If the list of tasks is too long you may decide to invoke the CEKL INQUIRE command again specifying a different set of options.

Module: DFHCQSY

Destination: Console

DFHCQ0250I *applid* CEKL SET: task number *taskno* not found.

Explanation: The request to remove task number *taskno* from the system has been rejected.

The task can not be found.

System action: The system continues normally.

DFHCQ0251I • DFHCQ0258I

User response: Check the value that you specified for *taskno*.

If this is correct then the task has been removed from the system.

Module: DFHCQSY

Destination: Console

DFHCQ0251I *applid* CEKL SET: deferred PURGE request issued for task number *taskno*.

Explanation: The request to remove task *taskno* from the system has been deferred as it has not yet been attached to the to the dispatcher; the task either belongs to a transaction class that is at its MAXACTIVE limit or the system is at its MXT limit.

System action: CICS will purge the task when it has been attached to the dispatcher.

User response: None.

Module: DFHCQSY

Destination: Console

DFHCQ0252I *applid* CEKL SET: PURGE request issued for task number *taskno*.

Explanation: A request has been passed to the dispatcher to purge task number *taskno*.

System action: CICS continues normally.

User response: The CEKL INQUIRE TASK(*taskno*) command can be used to display the progress of the request.

Module: DFHCQSY

Destination: Console

DFHCQ0253I *applid* CEKL SET: PURGE request ignored; task number *taskno* is being purged.

Explanation: The request to purge number *taskno* has been ignored.

A previous request was passed to the dispatcher to purge the task.

System action: CICS continues normally.

User response: None.

Module: DFHCQSY

Destination: Console

DFHCQ0254I *applid* CEKL SET: PURGE request ignored; task number *taskno* is being forcepurged.

Explanation: The request to purge number *taskno* has been ignored.

A previous request was passed to the dispatcher to forcepurge the task.

System action: CICS continues normally.

User response: None.

Module: DFHCQSY

Destination: Console

DFHCQ0255I *applid* CEKL SET: PURGE request ignored; task number *taskno* is being killed.

Explanation: The request to kill purge number *taskno* has been ignored.

A previous request was passed to the dispatcher to kill the task.

System action: CICS continues normally.

User response: None.

Module: DFHCQSY

Destination: Console

DFHCQ0256I *applid* CEKL SET: FORCEPURGE request issued for task number *taskno*.

Explanation: A request has been passed to the dispatcher to forcepurge task number *taskno*.

System action: CICS continues normally.

User response: The CEKL INQUIRE TASK(*taskno*) command can be used to display the progress of the request.

Module: DFHCQSY

Destination: Console

DFHCQ0257I *applid* CEKL SET: FORCEPURGE request ignored; task number *taskno* is being forcepurged.

Explanation: The request to kill forcepurge number *taskno* has been ignored.

A previous request was passed to the dispatcher to forcepurge the task.

System action: CICS continues normally.

User response: None.

Module: DFHCQSY

Destination: Console

DFHCQ0258I *applid* CEKL SET: FORCEPURGE request ignored; task number *taskno* is being killed.

Explanation: The request to forcepurge number *taskno* has been ignored.

A previous request was passed to the dispatcher to kill the task.

System action: CICS continues normally.

User response: None.

Module: DFHCQSY

Destination: Console

DFHCQ0259I *applid* **CEKL SET: KILL request issued for task number *taskno*.**

Explanation: A request has been passed to the dispatcher to kill task number *taskno*.

System action: CICS continues normally.

User response: The CEKL INQUIRE TASK(*taskno*) command can be used to display the progress of the request.

Module: DFHCQSY

Destination: Console

DFHCQ0260I *applid* **CEKL SET: KILL request ignored; task number *taskno* is being killed.**

Explanation: The request to kill task number *taskno* has been ignored.

A previous request was passed to the dispatcher to kill the task.

System action: CICS continues normally.

User response: The CEKL INQUIRE TASK(*taskno*) command can be used to display the progress of the request.

Module: DFHCQSY

Destination: Console

DFHCQ0261I *applid* **CEKL SET: PURGE request rejected for system task number *taskno*.**

Explanation: The request to purge system task number *taskno* from the system has been rejected.

System action: The system continues normally.

User response: None.

Module: DFHCQSY

Destination: Console

DFHCQ0262I *applid* **CEKL SET: FORCEPURGE request rejected for system task number *taskno*.**

Explanation: The request to forcepurge system task number *taskno* from the system has been rejected.

System action: The system continues normally.

User response: None.

Module: DFHCQSY

Destination: Console

DFHCQ0263I *applid* **CEKL SET: KILL request rejected for system task number *taskno*.**

Explanation: The request to kill system task number *taskno* from the system has been rejected.

System action: The system continues normally.

User response: None.

Module: DFHCQSY

Destination: Console

DFHCQ0264I *applid* **CEKL SET: PURGE request rejected; task number *taskno* is not purgeable.**

Explanation: The request to purge task number *taskno* from the system has been rejected. The transaction definition specifies SPURGE(NO).

System action: The system continues normally.

User response: Retry the request to remove the task from the system specifying either the FORCEPURGE or the KILL option.

Module: DFHCQSY

Destination: Console

DFHCQ0265I *applid* **CEKL SET: FORCEPURGE request ignored; task number *taskno* is being purged.**

Explanation: The request to forcepurge task number *taskno* has been rejected.

A request to remove the task from the system has been made and deferred as it has not yet been attached to the dispatcher; the task either belongs to a transaction class that is at its MAXACTIVE limit or the system is at its MXT limit.

System action: CICS will purge the task when it has been attached to the dispatcher.

User response: If the task can not be attached to the dispatcher because the system is under stress then

- the CEKL INQUIRE command can be used to identify another task that is already attached to the dispatcher
- the CEKL SET command can be used to remove that task from the system so reducing the stress

Module: DFHCQSY

Destination: Console

DFHCQ0266I *applid* **CEKL SET: KILL request ignored; task number *taskno* is being purged.**

Explanation: The request to kill task number *taskno* has been rejected.

A request to remove the task from the system has been made and deferred as it has not yet been attached to the dispatcher; the task either belongs to a transaction class that is at its MAXACTIVE limit or the system is at its MXT limit.

System action: CICS will purge the task when it has

been attached to the dispatcher.

User response: If the task can not be attached to the dispatcher because the system is under stress then

- the CEKL INQUIRE command can be used to identify another task that is already attached to the dispatcher
- the CEKL SET command can be used to remove that task from the system so reducing the stress

Module: DFHCQSY

Destination: Console

DFHCRnnnn messages

DFHCR4300 *date time applid* **Transaction *tranid* not executed on terminal *termid* on system *sysid*. Transaction invalid on that system**

Explanation: A request was made to schedule a task on remote system *sysid*. The request could not be executed because transaction *tranid* is not defined on system *sysid*.

System action: Other processing continues.

User response: Ensure that terminal *termid* and transaction *tranid* are defined on system *sysid*.

Module: DFHCRS

XMEOUT Parameters: *date, time, applid, tranid, termid, sysid*

Destination: CSMT

DFHCR4301 *date time applid* **Transaction *tranid* not executed on terminal *termid* on system *sysid*. Terminal invalid on that system**

Explanation: A request was made to schedule a task on remote system *sysid*. The request could not be executed because terminal *termid* is not defined on system *sysid*.

System action: Other processing continues.

User response: Ensure that terminal *termid* and transaction *tranid* are defined on system *sysid*.

Module: DFHCRS

XMEOUT Parameters: *date, time, applid, tranid, termid, sysid*

Destination: CSMT

DFHCR4302 *date time applid* **Transaction *tranid* not executed on terminal *termid* on system *sysid*. Schedule request failed on that system**

Explanation: A request was made to schedule a task

on remote system *sysid*. The request could not be executed.

System action: Other processing continues.

User response: Check the system definition tables of the remote system to determine why schedule requests might not be honored.

Module: DFHCRS

XMEOUT Parameters: *date, time, applid, tranid, termid, sysid*

Destination: CSMT

DFHCR4310 *date time applid* **Request from system *sysid* to initiate transaction *tranid* on that system on terminal *termid* was not executed. Transaction invalid on this system.**

Explanation: A request was received from remote system *sysid* to initiate transaction *tranid* on system *sysid* on terminal *termid*. The request could not be honored because transaction *tranid* is not defined in this system.

System action: Processing continues.

User response: Ensure that terminal *termid* and transaction *tranid* are defined on both systems.

Module: DFHCRS

XMEOUT Parameters: *date, time, applid, sysid, tranid, termid*

Destination: CSMT

DFHCR4311 *date time applid* **Request from system *sysid* to initiate transaction *tranid* on that system on terminal *termid* was not executed. Terminal invalid on this system.**

Explanation: A request was received from remote system *sysid* to initiate transaction *tranid* on system *sysid* on terminal *termid*. The request could not be

honored because terminal *termid* is not defined on this system.

System action: Processing continues.

User response: Ensure that terminal *termid* and transaction *tranid* are defined on both systems.

Module: DFHCRS

XMEOUT Parameters: *date, time, applid, sysid, tranid, termid*

Destination: CSMT

DFHCR4312 *date time applid* **Request from system *sysid* to initiate transaction *tranid* on that system on terminal *termid* was not executed. Schedule request failed**

Explanation: A request was received from remote system *sysid* to initiate transaction *tranid* on system *sysid* on terminal *termid*. The request could not be honored because the schedule request failed.

System action: Processing continues.

User response: Check the system definition tables of the local system to determine why schedule requests might not be honored.

Module: DFHCRS

XMEOUT Parameters: *date, time, applid, sysid, tranid, termid*

Destination: CSMT

DFHCR4314 *date time applid* **Request to initiate transaction *tranid* on remotely owned terminal *termid* has been purged. Request was not deliverable to system *sysid* within the ATI purge delay time interval.**

Explanation: A request to initiate transaction *tranid* was not delivered to system *sysid*, probably because a link to system *sysid* had not been made available.

System action: Processing continues.

User response: Ensure that a link to system *sysid* is made available between issuing the transaction initiation request and the elapse of the ATI purge delay time interval.

Module: DFHCRQ

XMEOUT Parameters: *date, time, applid, tranid, termid, sysid*

Destination: CSMT

DFHCR4315 *date time applid* **Request to initiate transaction *tranid* on remotely owned terminal *termid* has been purged. System *sysid* has not responded within the ATI purge delay time interval.**

Explanation: A request to initiate transaction *tranid* was sent to system *sysid*. System *sysid* acknowledged the request but did not respond within the ATI purge delay time interval. If system *sysid* eventually responds, the task will not be executed.

System action: Processing continues.

User response: Determine why system *sysid* did not respond. The system did not respond because

1. the task started and abnormally terminated, or
2. the task failed a security check, or
3. system *sysid* abnormally terminated and all details of the request were lost.

Module: DFHCRQ

XMEOUT Parameters: *date, time, applid, tranid, termid, sysid*

Destination: CSMT

DFHCZnnnn messages

DFHCZ0105 *date time applid userid termid tranid program name* **CICS event summary:**
class::method condition=X'resp'
(resptext) minor=X'resp2'

Explanation: This message is issued whenever the method `IccEvent::summary` is called, and it gives the summary details of the event (CICS call).

For further guidance, see the *CICS Family C++ OO Class Libraries*.

System action: The system creates an exception entry in the trace table and writes this message to the TD queue CCZM.

User response: This message is issued for information only and there is no specific user action needed in response.

Module: ICCEVTEC

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, class, method, X'resp', resptext, X'resp2'*

Destination: CCZM

DFHCZ0106 *date time applid userid termid tranid program name* **CICS exception summary:**
exceptno class::method type=type.

Explanation: This message is issued whenever the method `IccException::summary` is called, and it gives the summary details of the exception.

The message related to the exception can be obtained by calling the method `IccException::message`.

For further guidance, see the *CICS Family C++ OO Class Libraries*.

System action: The system creates an exception entry in the trace table and writes this message to the TD queue CCZM.

User response: This message is issued for information only and there is no specific user action needed in response.

Module: ICCEXCEC

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, exceptno, class, method, type*

Destination: CCZM

DFHCZ0108 *date time applid userid termid tranid program name class::method* **This method failed because an internal call to CICS returned the condition**
condition.

Explanation: The method reported in the message

failed because an internal call to CICS returned a failure condition.

For further guidance, see the *CICS Family C++ OO Class Libraries*.

System action: The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response: You need to correct the cause of the underlying CICS failure before retrying this command. You should look at other messages and the trace log for further indication of the root cause.

If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: ICCRESIC

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, class, method, condition*

Destination: CCZM

DFHCZ0109 *date time applid userid termid tranid program name class::method* **This method failed because of a severe internal error. Diagnostic information:**
diaginfo1, diaginfo2.

Explanation: The method reported in the message failed because of a severe internal error.

System action: The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response: Make a note of the diagnostic information and contact IBM for assistance. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: ICCBASIC, ICCCLKEC, ICCCTLEC, ICCFILEC, ICCFLIEC, ICCRESEC, ICCRESIC, ICCTIMEC, ICCTRMEC, ICCTSKEC

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, class, method, diaginfo1, diaginfo2*

Destination: CCZM

DFHCZ0110 *date time applid userid termid tranid program name class::method* **This constructor/operator failed because it is not supported on the current platform of env.**

Explanation: The constructor/operator reported in the message failed because it is not supported on the current platform (MVS).

For further guidance, see the *CICS Family C++ OO Class Libraries*.

System action: The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response: If the calling program is user written then you need to establish why this program was running on an MVS platform; and then, either change the program not to call this method, or change the platform as appropriate.

If you are using vendor written software that fails in this way, you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: ICCONEC, ICCJRNEC, ICCRIDEC, ICCSESEC, ICCUSREC

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, class, method, env*

Destination: CCZM

DFHCZ0111 *date time applid userid termid tranid program name class::method* **This constructor/operator failed because the system is configured with CICS family subset enforcement.**

Explanation: The method/operator reported in the message failed because CICS has been configured to restrict its functionality to that of the CICS family subset. This method/operator is not part of this subset.

For further guidance, see the *CICS Family C++ OO Class Libraries*.

System action: The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response: If the calling program is user written, then you need to establish why this method/operator was called; and if appropriate, switch off the CICS family subset enforcement or change the program to avoid using this method/operator.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: ICCONEC, ICCJRNEC, ICCRIDEC, ICCSESEC, ICCUSREC

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, class, method*

Destination: CCZM

DFHCZ0112 *date time applid userid termid tranid program name class::method* **This method failed because it is not supported on the current platform of env.**

Explanation: The method reported in the message failed because it is not supported on the current platform (MVS).

For further guidance, see the *CICS Family C++ OO Class Libraries*.

System action: The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response: If the calling program is user written then you need to establish why this program was running on an MVS platform, and then either change the program not to call this method or change the platform as appropriate.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: ICCABDEC, ICCCLKEC, ICCONEC, ICCCTLEC, ICCSESEC, ICCSRQIC, ICCTMDEC, ICCTRMEC, ICCTSKEC

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, class, method, env*

Destination: CCZM

DFHCZ0113 *date time applid userid termid tranid program name class::method* **This method failed because the system is configured with CICS family subset enforcement.**

Explanation: The method reported in the message failed because CICS has been configured to restrict its functionality to that of the CICS family subset. This method is not part of this.

For further guidance, see the *CICS Family C++ OO Class Libraries*.

System action: The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response: If the calling program is user written then you need to establish why this method was called, and if appropriate, switch off the CICS family subset enforcement or change the program to avoid using this method.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance

from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: ICCABDEC, ICCCLKEC, ICCONEC, ICCCTLEC, ICCSESEC, ICCSRQIC, ICCTMDEC, ICCTRMEC, ICCTSKEC

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, class, method*

Destination: CCZM

DFHCZ0114 *date time applid userid termid tranid program name class::method* **This method failed because the object being accessed was incomplete.**

Explanation: The method reported in the message failed because the object being accessed was incomplete as shown below

Method Name

Required Resource

lccSession::connectProcess

Partner Id

lccSession::convld

Conversation identifier name

lccSession::PIPList

PIP list

lccSession::process

Process name

lccSession::syncLevel

Sync level

For further guidance, see the *CICS Family C++ OO Class Libraries*.

System action: The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response: If the calling program is user written then you need to change it so that the object being accessed, is built correctly.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: ICCSESEC

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, class, method*

Destination: CCZM

DFHCZ0115 *date time applid userid termid tranid program name class::method* **This method failed because the object being accessed had a reference to an input message while the program was invoked via the remote program link.**

Explanation: The method reported in the message failed because the object being accessed had a reference to an input message and was invoked through the use of the remote program link. This combination is not supported.

For further guidance, see the *CICS Family C++ OO Class Libraries*.

System action: The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response: If the calling program is user written then you need to change it so that the object being accessed, either does not have an input message, or the program is not invoked through the use of the remote program link.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: ICCPRGEC

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, class, method*

Destination: CCZM

DFHCZ0116 *date time applid userid termid tranid program name class::method* **This method failed because the object being accessed was not one of the supported classes.**

Explanation: The method reported in the message failed because the object being accessed was not one of the supported classes; lccDataQueue, lccFile, lccFileIterator, lccProgram, lccStartRequestQ, lccTempStore.

For further guidance, see the *CICS Family C++ OO Class Libraries*.

System action: The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response: If the calling program is user written then you need to change it so that the object is of the correct type before it is accessed in this way.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance

from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: ICCRESEC

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, class, method*

Destination: CCZM

DFHCZ0117 *date time applid userid termid tranid program name class::method* **This method failed because the object being accessed was of type** *object_type*.

Explanation: The method reported in the message failed because the object being accessed was not of the correct type.

For example the method `IccSession::extractProcess()` is restricted to access objects of type Back-End only.

For further guidance, see the *CICS Family C++ OO Class Libraries*.

System action: The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response: If the calling program is user written then you need either to change it or the related CICS definitions, so that the object is of the correct type before it is accessed in this way.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: ICCSESEC

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, class, method, object_type*

Destination: CCZM

DFHCZ0118 *date time applid userid termid tranid program name class::method* **This method failed because the object being accessed did not have a reference for the resource** *resource*.

Explanation: The method reported in the message failed because the object being accessed did not have all the resources it needs allocated to it.

For example, the method call, `IccFile::readRecord(mode, updateToken)`, would fail in this way if the object being accessed did not have a valid reference of a record index.

For further guidance, see the *CICS Family C++ OO Class Libraries*.

System action: The system creates an exception entry in the trace table, writes this message to the TD

queue CCZM, and throws an exception.

User response: If the calling program is user written then you need to change it, so that the object has the correct resources allocated to it before it is accessed in this way.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: ICCFILEC, ICCFILIC

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, class, method, resource*

Destination: CCZM

DFHCZ0120 *date time applid userid termid tranid program name class::method* **This method failed because the current number of nested program calls made using this method is already at the maximum of** *max*.

Explanation: The method reported in the message failed because its usage is restricted to a maximum of 15 nested calls, while the current request would cause this to be exceeded.

For further guidance, see the *CICS Family C++ OO Class Libraries*.

System action: The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response: If the calling program is user written then you need to change it so that it does not cause the depth of nesting to exceed 15.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: ICCPRGEC

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, class, method, max*

Destination: CCZM

DFHCZ0121 *date time applid userid termid tranid program name class::method* **This method failed because the call is invalid for the object being accessed. The resource type of the object is** *resourcetype*.

Explanation: The method reported in the message failed because the method is only valid for a restricted

set of resource types, and is invalid for the object being accessed.

This method is valid for the following resource types; cDataQueue, cFile, cFileIterator, cProgram, cStartRequestQ, cTempStore.

For further guidance, see the *CICS Family C++ OO Class Libraries*.

System action: The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response: If the calling program is user written then you need to change it so that it does not call this method for this type of object.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: ICCFILEC

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, class, method, resourcetype*

Destination: CCZM

DFHCZ0122 *date time applid userid termid tranid program name class::method* **This method failed because the optional parameter named *pname* was set, which is invalid for the current environment of *env*.**

Explanation: The method reported in the message failed because it detected that an optional parameter was set which is invalid for the current environment.

For further guidance, see the *CICS Family C++ OO Class Libraries*.

System action: The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response: If the calling program is user written then you need to establish why the optional parameter was being used, and if appropriate, change the environment or change the program to avoid using this option.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: ICCFILEC ICCFLIIC ICCSEMEC ICCSESIC ICCSRQEC ICCSYSEC ICCTIMEC ICCTSKEC

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, class, method, pname, env*

Destination: CCZM

DFHCZ0123 *date time applid userid termid tranid program name class::method* **This method failed because the optional parameter named *pname* was set, which is invalid because the system is configured with CICS family subset enforcement.**

Explanation: The method reported in the message failed because it detected that an optional parameter was set which is invalid when CICS is configured to restrict its functionality to that of the CICS family.

For further guidance, see the *CICS Family C++ OO Class Libraries*.

System action: The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response: If the calling program is user written then you need to establish why the optional parameter was being used, and if appropriate, switch off the CICS family subset enforcement or change the program to avoid using this option.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: ICCFILEC, ICCFLIIC, ICCSEMEC, ICCSESIC, ICCSRQEC, ICCSYSEC, ICCTIMEC, ICCTSKEC

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, class, method, pname*

Destination: CCZM

DFHCZ0125 *date time applid userid termid tranid program name class::method* **This method failed because the object being accessed had a buffer containing function management headers(FMHs), which is invalid for the current environment of *env*.**

Explanation: The method reported in the message failed because the system detected a buffer containing a function management header(FMH), which is invalid for the current environment.

FMH headers are used in SNA communication protocols and during 3270 terminal error conditions.

For further guidance, see the *CICS Family C++ OO Class Libraries*.

System action: The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response: If the calling program is user written then you need to establish why the system used buffers containing FMH headers, and if appropriate, change the environment or change the program to avoid using this function.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: ICCSRQEC

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, class, method, env*

Destination: CCZM

DFHCZ0126 *date time applid userid termid tranid program name class::method* **This method failed because the object being accessed had a buffer containing function management headers(FMHs), which is invalid because the system is configured with CICS family subset enforcement.**

Explanation: The method reported in the message failed because the system detected a buffer containing a function management header(FMH), which is invalid when CICS is configured to restrict its functionality to that of the CICS family.

FMH headers are used in SNA communication protocols and during 3270 terminal error conditions.

For further guidance, see the *CICS Family C++ OO Class Libraries*.

System action: The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response: If the calling program is user written then you need to establish why the system used a buffer containing FMH headers, and if appropriate, switch off CICS family subset enforcement or change the program to avoid using this function.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: ICCSRQEC

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, class, method*

Destination: CCZM

DFHCZ0127 *date time applid userid termid tranid program name class::method* **This method failed because the value of the parameter named *pname*, specified as *length*, was not within the range 1 to *max*.**

Explanation: The method reported in the message failed because the value passed in for the named parameter was invalid.

For example, assuming the definition, `lccResource::lccResourceId(cFileId,"ABC")`, the call, `assign(9999,"PQRS")`, would fail because the length value of 9999 is invalid.

For further guidance, see the *CICS Family C++ OO Class Libraries*.

System action: The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, throws an exception, and completes the request having truncated the excess data.

User response: If the calling program is user written then you need to check the invalid parameter on the calling statement, and if appropriate, change it.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: ICCRIDEDEC

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, class, method, pname, length, max*

Destination: CCZM

DFHCZ0128 *date time applid userid termid tranid program name class::method* **This method failed because the length of the parameter named *pname*, specified as *length*, was not within the range 1 to *max*.**

Explanation: This is an internal logic error.

System action: The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response: You will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: ICCSESEC

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, class, method, pname, length, max*

Destination: CCZM

DFHCZ0129 *date time applid userid termid tranid program name class::method* **This method detected an exception which resulted in data being truncated.**

Explanation: The method/operator reported in the message failed because the target object was not big enough and could not be extended to accommodate the new string.

For example, assuming the definition, `lccBuf buffer(5,lccBuf::fixed)`, the assignment, `buffer = "toolong"`, would fail because the length of "toolong" is greater than 5. The resulting text value of the object buffer would be "toolo".

For further guidance, see the *CICS Family C++ OO Class Libraries*.

System action: The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, throws an exception, and completes the request having truncated the excess data.

User response: If the calling program is user written then you need to check the invalid parameter on the calling statement, and if appropriate, change it.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: ICCBUFIC

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, class, method*

Destination: CCZM

DFHCZ0130 *date time applid userid termid tranid program name class::method* **This method/operator failed because the parameter *pname* contained a string of length *length*, while the maximum allowed is *max*.**

Explanation: The method reported in the message failed because one of the string parameters supplied contained a value that was too long.

For example, the method call `lccFileId::lccFileId("LONGFILENAME")` would fail because the value "LONGFILENAME" is greater than `lccGl::maxFileNameLength`.

For further guidance, see the *CICS Family C++ OO Class Libraries*.

System action: The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response: If the calling program is user written then you need to check the invalid parameter on the

calling statement, and if appropriate, change it.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: ICCCTLEC ICCRESEC ICCRIDEDEC ICCSRQEC ICCSRQIC ICCTSKEC ICCUSREC

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, class, method, pname, length, max*

Destination: CCZM

DFHCZ0131 *date time applid userid termid tranid program name class::method* **This constructor failed to create an object because a parameter of type string contained a value that was too long. It was set to '*stringValue...*' while the maximum length allowed is *maxstringlength*.**

Explanation: The constructor method reported in the message failed because one of the string parameters supplied contained a value that was too long.

For example, the method call `lccFileId::lccFileId("LONGFILENAME")` would fail because the value "LONGFILENAME" is greater than `lccGl::maxFileNameLength`.

For further guidance, see the *CICS Family C++ OO Class Libraries*.

System action: The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response: If the calling program is user written then you need to check the invalid parameter on the calling statement, and if appropriate, change it.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: ICCRIDEDEC, ICCTIMEC

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, class, method, stringValue, maxstringlength*

Destination: CCZM

DFHCZ0132 *date time applid userid termid tranid program name class::method* **This constructor failed to create an object because the parameter named *pname* contained an invalid string of length *plength* while the maximum length allowed is *pmaxlength*.**

Explanation: This is an internal logic error.

System action: The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response: You will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: ICCSESI

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, class, method, pname, plength, pmaxlength*

Destination: CCZM

DFHCZ0134 *date time applid userid termid tranid program name class::method* **This method failed because the parameter named *pname* contained an invalid value.**

Explanation: The method reported in the message failed because one of the parameters supplied was invalid. For example, the method call `lccFile::readRecord(999,updateToken)` would fail because the read mode value of 999 is not within the valid range of 70 to 74.

For further guidance, see the *CICS Family C++ OO Class Libraries*.

System action: The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response: If the calling program is user written then you need to check the invalid parameter on the calling statement, and if appropriate, change it.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: ICCBASEC ICCBUFEC ICCCLKEC
ICCFILEC ICCFLIIC ICCGLBEC ICCPRGEC
ICCRESEC ICCSEMEC ICCSESEC ICCSESI
ICCSRQEC ICCSYSEC ICCTMPEC ICCTRMEC
ICCTSKEC

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, class, method, pname*

Destination: CCZM

DFHCZ0136 *date time applid userid termid tranid program name class::method* **This method failed because the parameter named *param_name* contained conflicting flags specified as *flag1* and *flag2*.**

Explanation: The method reported in the message failed because one of the parameters supplied was invalid.

This parameter of the method is defined as an integer, where each bit denotes a flag, some of which must not be set simultaneously. The calling parameter had a contradictory pair of flags set. For example, the method call `lccFile::setAccess(3)` would fail because the access value of 3 contains the two contradictory flags readable and notReadable.

For further guidance, see the *CICS Family C++ OO Class Libraries*.

System action: The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response: If the calling program is user written then you need to check the invalid parameter on the calling statement, and if appropriate, change it.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: ICCFILEC

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, class, method, param_name, flag1, flag2*

Destination: CCZM

DFHCZ0137 *date time applid userid termid tranid program name class::method* **This constructor failed to create an object because the parameter named *pname* contained an invalid value of *pvalue*.**

Explanation: The method reported in the message failed because one of the parameters supplied was invalid.

This parameter of the method is restricted to a defined range, while the value supplied on the call was not within this range. For example, the the constructor method call `lccJournalId::lccJournalId(987)` would fail because the journalNum value of 987 is outside the range 1 to 99.

For further guidance, see the *CICS Family C++ OO Class Libraries*.

System action: The system creates an exception

entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response: If the calling program is user written then you need to check the invalid parameter on the calling statement, and if appropriate, change it.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: ICCRIDEC

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, class, method, pname, pvalue*

Destination: CCZM

DFHCZ0138 *date time applid userid termid tranid program name class::method* **This method failed because the parameter named *pname* contained an invalid value of *pvalue*.**

Explanation: The method reported in the message failed because one of the parameters supplied was invalid.

This parameter of the method is defined as an integer (general sense), while the value supplied on the call was not sensible for the functional content of the method. For example the method call `lccTerminal::sendLine(9876,buffer)` would fail, because the column value of 9876 is greater than the height of the screen.

For further guidance, see the *CICS Family C++ OO Class Libraries*.

System action: The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response: If the calling program is user written then you need to check the invalid parameter on the calling statement, and if appropriate, change it.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: ICCBUFIC ICCONEC ICCDATEC ICCFILEC ICCRIDEC ICCTIMEC ICCTMPEC ICCTRMEC ICCTSKEC

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, class, method, pname, pvalue*

Destination: CCZM

DFHCZ0140 *date time applid userid termid tranid program name class::method* **This constructor failed to create an object because it is a singleton class which already exists.**

Explanation: The constructor method reported in the message failed to create an object because it is a singleton class which already exists. Such classes only allow a single instance of itself to exist at any one moment.

For further guidance, see the *CICS Family C++ OO Class Libraries*.

System action: The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response: If the calling program is user written, then you need to change it so that it does not call this method more than once per transaction.

You might consider using the method `instance()`. All CICS singleton classes provide a method of this name or similar, which returns a reference to the unique object, creating it should it not pre-exist. This method can be safely called multiple times, each time returning the reference to the same object.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: ICCABDEC ICCONEC ICCCTLEC ICCSRQEC ICCSYSEC ICCTMDEC ICCTRMEC ICCTSKEC

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, class, method*

Destination: CCZM

DFHCZ0141 *date time applid userid termid tranid program name class::method* **This method failed to create the object because the CICS task did not have a terminal as its principal facility.**

Explanation: The method reported in the message failed to create an object because the CICS transaction was not defined with a terminal as its principal facility. Typically, the program calling this method, should be running as a terminal initiated transaction in a front end CICS region (TOR).

For further guidance, see the *CICS Family C++ OO Class Libraries*.

System action: The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response: You need to change the CICS configuration definition so that the program calling this method runs in the correct environment.

If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: ICCCTLEC ICCTMDEC ICCTRMEC

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, class, method, object*

Destination: CCZM

DFHCZ0142 *date time applid userid termid tranid program name class::method* **This method failed to create an object of type *object* because the CICS task did not have a session as its principal facility.**

Explanation: The method reported in the message failed to create an object because the CICS transaction was not defined with a session as its principal facility. Typically, the program calling this method would be running as a system initiated transaction relating to CICS distributed transaction processing.

For further guidance, see the *CICS Family C++ OO Class Libraries*.

System action: The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response: You need to change the CICS configuration definition so that the program calling this method runs in the correct environment.

If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: ICCCTLEC

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, class, method, object*

Destination: CCZM

DFHCZ0143 *date time applid userid termid tranid program name class::method* **This virtual method has not been implemented by the derived class.**

Explanation: The method of the class reported in the message has not been implemented by a derived class.

This method is defined as a virtual method with the intent that it is redefined, when appropriate, by its sub-classes.

The default implementation simply throws an exception to alert the user of this condition.

For further guidance, see the *CICS Family C++ OO Class Libraries*.

System action: The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response: If you have written a class that inherits this class then you should provide a suitable implementation for this method.

If you are using vendor written software that may inherit this class then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: ICCRESEC

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, class, method*

Destination: CCZM

DFHCZ0200 *date time applid userid termid tranid program name* **JNI call 'GetStringUTFChars(envp, SysId)' in module failed.**

Explanation: A JNI call, GetStringUTFChars(envp, SysId), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (AttachInitiator.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0201 *date time applid userid termid tranid program name* **JNI call 'GetStringUTFChars(envp, profile)' in module failed.**

Explanation: A JNI call, GetStringUTFChars(envp, profile), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (AttachInitiator.c)

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0202 *date time applid userid termid tranid program name* **JNI call 'GetStringUTFChars(envp, process)' in module failed.**

Explanation: A JNI call, GetStringUTFChars(envp, process), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (AttachInitiator.c)

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0203 *date time applid userid termid tranid program name* **The process name passed to the CONNECT_PROCESS method in module was invalid.**

Explanation: The process name passed to the native method CONNECT_PROCESS was invalid.

System action: The system writes this message to the TD queue CCZM and ignores the invocation of CONNECT_PROCESS.

User response: Ensure that the process name is set correctly using the setProcess() method on the correct AttachInitiator Java object.

Module: DFJCZDTC (AttachInitiator.c)

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0204 *date time applid userid termid tranid program name* **JNI call 'GetFieldID() for DataHolder.value' in module failed.**

Explanation: A JNI call, GetFieldID() for DataHolder.value, in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS*

Problem Determination Guide for guidance on how to proceed.

Module: DFJCZDTC (Conversation.c)

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0205 *date time applid userid termid tranid program name* **An unexpected value for the control parameter was passed to the ISSUE_CONTROL() method in module.**

Explanation: An unexpected value for the control parameter was passed to the ISSUE_CONTROL() method.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (Conversation.c)

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0206 *date time applid userid termid tranid program name* **An attempt to issue an ASSIGN ABCODE command in module has failed.**

Explanation: Code written to support Java native methods used by the JCICS Java class library has unsuccessfully attempted to issue an ASSIGN ABEND.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (DTCAbend.c)

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0207 *date time applid userid termid tranid program name* **JNI call 'FindClass()' in module failed.**

Explanation: A JNI call, FindClass(), in code written to support Java native methods used by the JCICS Java class library has failed to find the class for CicsResponseConditionException.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (DTCCCondition.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0208 *date time applid userid termid tranid program name* **JNI call 'GetFieldID()' in module failed.**

Explanation: A JNI call, GetFieldID(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (DTCCCondition.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0209 *date time applid userid termid tranid program name* **JNI call 'GetStringUTFChars(envp, SysId)' in module failed.**

Explanation: A JNI call, GetStringUTFChars(envp, SysId), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (DTCFile.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0210 *date time applid userid termid tranid program name* **JNI call 'GetStringUTFChars(envp, fileName, NULL)' in module failed.**

Explanation: A JNI call, GetStringUTFChars(envp, fileName, NULL), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (DTCFile.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0211 *date time applid userid termid tranid program name* **A null filename has been passed to a native method in module.**

Explanation: A null filename has been passed to a native method used by the JCICS Java class library.

System action: The system writes this message to the TD queue CCZM and ignores the request.

User response: Ensure that a valid file name has been specified using the setName() method for each relevant file object.

If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (DTCFile.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0212 *date time applid userid termid tranid program name* **JNI call 'GetStringUTFChars()' in module failed.**

Explanation: A JNI call, GetStringUTFChars(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (DTCFile.c)

DFHCZ0213 • DFHCZ0217

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0213 *date time applid userid termid tranid program name* **A null filename has been passed to a native method in module.**

Explanation: A null filename has been passed to a native method used by the JCICS Java class library.

System action: The system writes this message to the TD queue CCZM and ignores the request.

User response: Ensure that a valid file name has been specified using the setName() method for each relevant file object.

If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCFile.c)

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0214 *date time applid userid termid tranid program name* **JNI call 'GetStringUTFChars(envp, SysId)' in module failed.**

Explanation: A JNI call, GetStringUTFChars(envp, SysId), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCFile.c)

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0215 *date time applid userid termid tranid program name* **An attempt in module to delete records from a KSDS has failed.**

Explanation: An attempt to delete records from a KSDS in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM. A Java exception or error will be thrown.

User response: Add appropriate code to the

application to catch the exception or error thrown by the JCICS Java class library.

If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCFile.c)

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0216 *date time applid userid termid tranid program name* **A relative record number greater than 32767 has been specified on a DELETE command in module.**

Explanation: A relative record number greater than 32766 has been passed to a Java native method used by the JCICS Java class library.

System action: The system writes this message to the TD queue CCZM and ignores the request.

User response: Ensure that the value specified on the relevant delete() method is valid.

If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCFile.c)

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0217 *date time applid userid termid tranid program name* **An attempt in module to delete records from an RRDS has failed.**

Explanation: An attempt to delete records from an RRDS in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM. A Java exception or error will be thrown.

User response: Add appropriate code to the application to catch the exception or error thrown by the JCICS Java class library.

If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCFile.c)

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0218 *date time applid userid termid tranid
program name JNI call 'GetFieldID()' in
module failed.*

Explanation: A JNI call, GetFieldID(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJ CZDTC (DTCFile.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0220 *date time applid userid termid tranid
program name JNI call
'GetStringUTFChars()' in module failed.*

Explanation: A JNI call, GetStringUTFChars(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJ CZDTC (DTCFile.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0221 *date time applid userid termid tranid
program name A null filename has been
passed to a native method in module.*

Explanation: A null filename has been passed to a native method used by the JCICS Java class library.

System action: The system writes this message to the TD queue CCZM, and ignores the request.

User response: Ensure that a valid file name has been specified using the setName() method for each relevant file object.

If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJ CZDTC (DTCFile.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0222 *date time applid userid termid tranid
program name JNI call
'GetStringUTFChars()' in module failed.*

Explanation: A JNI call, GetStringUTFChars(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJ CZDTC (DTCFile.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0223 *date time applid userid termid tranid
program name A null filename has been
passed to a native method in module.*

Explanation: A null filename has been passed to a native method used by the JCICS Java class library.

System action: The system writes this message to the TD queue CCZM and ignores the request.

User response: Ensure that a valid file name has been specified using the setName() method for each relevant file object.

If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJ CZDTC (DTCFile.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0224 *date time applid userid termid tranid
program name JNI call
'GetByteArrayElements()' in module
failed.*

Explanation: A JNI call, GetByteArrayElements(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

DFHCZ0225 • DFHCZ0230

Module: DFJCZDTC (DTCFile.c)

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0225 *date time applid userid termid tranid program name* **A null key has been passed to a native method in module.**

Explanation: A null key has been passed to a Java native method used by the JCICS Java class library.

System action: The system writes this message to the TD queue CCZM and ignores the request.

User response: Ensure that all relevant reset() methods executed against KeyedFileBrowse objects specify a valid key.

If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (DTCFile.c)

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0226 *date time applid userid termid tranid program name* **JNI call 'GetStringUTFChars()' in module failed.**

Explanation: A JNI call, GetStringUTFChars(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (DTCFile.c)

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0227 *date time applid userid termid tranid program name* **A null filename has been passed to a native method in module.**

Explanation: A null filename has been passed to a native method used by the JCICS Java class library.

System action: The system writes this message to the TD queue CCZM and ignores the request.

User response: Ensure that a valid file name has been specified using the setName() method for each relevant file object.

If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (DTCFile.c)

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0228 *date time applid userid termid tranid program name* **JNI call 'GetByteArrayElements()' in module failed.**

Explanation: A JNI call, GetByteArrayElements(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (DTCFile.c)

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0229 *date time applid userid termid tranid program name* **JNI call 'GetByteArrayElements()' in module failed.**

Explanation: A JNI call, GetByteArrayElements(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (DTCFile.c)

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0230 *date time applid userid termid tranid program name* **An attempt to allocate storage in module failed.**

Explanation: An attempt to obtain storage, for use as a RIDFLD parameter, in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCFile.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0231 *date time applid userid termid tranid program name* **JNI call 'GetStringUTFChars(envp, SysId)' in module failed.**

Explanation: A JNI call, GetStringUTFChars(envp, SysId), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCFile.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0232 *date time applid userid termid tranid program name* **JNI call 'GetStringUTFChars()' in module failed.**

Explanation: A JNI call, GetStringUTFChars(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCFile.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0233 *date time applid userid termid tranid program name* **A NULL filename has been passed to a native method in module.**

Explanation: A null filename has been passed to a native method used by the JCICS Java class library.

System action: The system writes this message to the TD queue CCZM and ignores the request.

User response: Ensure that a valid file name has been specified using the setName() method for each relevant file object.

If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCFile.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0234 *date time applid userid termid tranid program name* **JNI call 'GetStringUTFChars(envp, SysId)' in module failed.**

Explanation: A JNI call, GetStringUTFChars(envp, SysId), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCFile.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0235 *date time applid userid termid tranid program name* **JNI call 'GetStringUTFChars(envp, SysId)' in module failed.**

Explanation: A JNI call, GetStringUTFChars(envp, SysId), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

DFHCZ0236 • DFHCZ0241

Module: DFJCZDTC (DTCProgram.c)

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0236 *date time applid userid termid tranid program name* **JNI call 'GetStringUTFChars(envp, Transld)' in module failed.**

Explanation: A JNI call, GetStringUTFChars(envp, Transld), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (DTCProgram.c)

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0237 *date time applid userid termid tranid program name* **JNI call 'GetFieldID()' for 'DataLength.Length' in module failed.**

Explanation: A JNI call, GetFieldID(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (DTCProgram.c)

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0238 *date time applid userid termid tranid program name* **JNI call 'FindClass()' in module failed.**

Explanation: A JNI call, FindClass() to find the class for EndOfProgramException, in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will

need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (DTCProgram.c)

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0239 *date time applid userid termid tranid program name* **JNI call 'ThrowNew()' in module failed.**

Explanation: A JNI call, ThrowNew(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (DTCProgram.c)

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0240 *date time applid userid termid tranid program name* **JNI call 'FindClass()' in module failed.**

Explanation: A JNI call, FindClass(), to find the class for TransferOfControlException, in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (DTCProgram.c)

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0241 *date time applid userid termid tranid program name* **JNI call 'ThrowNew()' in module failed.**

Explanation: A JNI call, ThrowNew(), to throw a TransferOfControlException, in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (DTCProgram.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0242 *date time applid userid termid tranid program name* **JNI call 'FindClass()' in module failed.**

Explanation: A JNI call, FindClass(), to find the class for TransferOfControlException, in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (DTCProgram.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0243 *date time applid userid termid tranid program name* **JNI call 'ThrowNew()' in module failed.**

Explanation: A JNI call, ThrowNew(), to throw TransferOfControlException, in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (DTCProgram.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0244 *date time applid userid termid tranid program name* **An attempt to issue an ASSIGN APPLID SYSID command in module has failed.**

Explanation: Code written to support Java native methods used by the JCICS Java class library has unsuccessfully attempted to issue an ASSIGN APPLID(...) SYSID(...).

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (DTCAbend.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0245 *date time applid userid termid tranid program name* **JNI call 'FindClass()' in module failed.**

Explanation: A JNI call, FindClass(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (DTCSupport.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0246 *date time applid userid termid tranid program name* **JNI call 'ThrowNew()' in module failed.**

Explanation: A JNI call, ThrowNew(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (DTCSupport.c)

XMEOUT Parameters: *date, time, applid, userid, termid,*

trandid, program name, module

Destination: CCZM

DFHCZ0247 *date time applid userid termid trandid
program name* **A 'malloc' in module
failed.**

Explanation: A malloc in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: Increase the amount of heap storage available to the application.

If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCSupport.c)

XMEOUT Parameters: *date, time,applid, userid, termid, trandid, program name, module*

Destination: CCZM

DFHCZ0248 *date time applid userid termid trandid
program name* **A 'malloc' in module
failed.**

Explanation: A malloc in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: Increase the amount of heap storage available to the application.

If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCSupport.c)

XMEOUT Parameters: *date, time,applid, userid, termid, trandid, program name, module*

Destination: CCZM

DFHCZ0249 *date time applid userid termid trandid
program name* **JNI call 'FindClass(envp,
classname)' in module failed.**

Explanation: A JNI call, FindClass(), for the named class in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS*

Problem Determination Guide for guidance on how to proceed.

Module: DFJZDTC (DTCSupport.c)

XMEOUT Parameters: *date, time,applid, userid, termid, trandid, program name, classname, module*

Destination: CCZM

DFHCZ0250 *date time applid userid termid trandid
program name* **JNI call 'ThrowNew()' in
module failed.**

Explanation: A JNI call, ThrowNew(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCSupport.c)

XMEOUT Parameters: *date, time,applid, userid, termid, trandid, program name, module*

Destination: CCZM

DFHCZ0253 *date time applid userid termid trandid
program name* **JNI call 'NewByteArray()' in
module failed.**

Explanation: A JNI call, NewByteArray(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCSupport.c) DFJZDTC (Container.c)

XMEOUT Parameters: *date, time,applid, userid, termid, trandid, program name, module*

Destination: CCZM

DFHCZ0254 *date time applid userid termid trandid
program name* **JNI call 'FindClass()' in
module failed.**

Explanation: A JNI call, FindClass(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCSupport.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0255 *date time applid userid termid tranid program name* **JNI call 'ThrowNew()' in module failed.**

Explanation: A JNI call, ThrowNew(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCSupport.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0256 *date time applid userid termid tranid program name* **JNI call 'GetFieldID()' failed in module.**

Explanation: A JNI call, GetFieldID(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCSupport.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0257 *date time applid userid termid tranid program name* **JNI call 'GetMethodID()' in module failed.**

Explanation: A JNI call, GetMethodID() for setState(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to

the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCSupport.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0258 *date time applid userid termid tranid program name* **JNI call 'GetMethodID()' in module failed.**

Explanation: A JNI call, GetMethodID() for setConvld(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCSupport.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0259 *date time applid userid termid tranid program name* **An attempt to allocate storage in module failed.**

Explanation: An attempt to obtain storage in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCFile.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0260 *date time applid userid termid tranid program name* **JNI call 'NewObject()' in module failed.**

Explanation: A JNI call, NewObject(), to construct a Conversation object, in code written to support Java

native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCSupport.c)

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0261 *date time applid userid termid tranid program name* **JNI call 'GetMethodID()' in module failed.**

Explanation: A JNI call, GetMethodID(), to find the constructor for Conversation, in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCSupport.c)

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0262 *date time applid userid termid tranid program name* **JNI call 'FindClass()' in module failed.**

Explanation: A JNI call, FindClass(), to find com/ibm/cics/server/Conversation, in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCSupport.c)

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0263 *date time applid userid termid tranid program name* **An attempt to allocate storage in module failed.**

Explanation: An attempt to obtain storage in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCSupport.c)

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0264 *date time applid userid termid tranid program name* **JNI call 'CallVoidMethod()' in module failed.**

Explanation: A JNI call, CallVoidMethod(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCSupport.c)

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0265 *date time applid userid termid tranid program name* **JNI call 'GetMethodID()' in module failed.**

Explanation: A JNI call, GetMethodID() for setConvId(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCSupport.c)

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0266 *date time applid userid termid tranid
program name* **JNI call**
'CallVoidMethod()' in module failed.

Explanation: A JNI call, CallVoidMethod(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (DTCSupport.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0267 *date time applid userid termid tranid
program name* **JNI call**
'CallVoidMethod()' in module failed.

Explanation: A JNI call, CallVoidMethod() for setState(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (DTCSupport.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0268 *date time applid userid termid tranid
program name* **JNI call**
'CallVoidMethod()' in module failed.

Explanation: A JNI call, CallVoidMethod(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (DTCSupport.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0269 *date time applid userid termid tranid
program name* **JNI call 'GetMethodID()' in module failed.**

Explanation: A JNI call, GetMethodID() for setProcess(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (DTCSupport.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0270 *date time applid userid termid tranid
program name* **JNI call**
'CallVoidMethod()' in module failed.

Explanation: A JNI call, CallVoidMethod(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (DTCSupport.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0271 *date time applid userid termid tranid
program name* **JNI call 'GetMethodID()' in module failed.**

Explanation: A JNI call, GetMethodID(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

DFHCZ0272 • DFHCZ0277

Module: DFJCZDTC (DTCSupport.c)

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0272 *date time applid userid termid tranid
program name* **JNI call
'CallVoidMethod()' in module failed.**

Explanation: A JNI call, CallVoidMethod(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (DTCSupport.c)

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0273 *date time applid userid termid tranid
program name* **JNI call 'GetMethodID()'
in module failed.**

Explanation: A JNI call, GetMethodID(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (DTCSupport.c)

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0274 *date time applid userid termid tranid
program name* **JNI call
'CallVoidMethod()' in module failed.**

Explanation: A JNI call, CallVoidMethod(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS*

Problem Determination Guide for guidance on how to proceed.

Module: DFJCZDTC (DTCSupport.c)

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0275 *date time applid userid termid tranid
program name* **JNI call 'GetMethodID()'
in module failed.**

Explanation: A JNI call, GetMethodID(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (DTCSupport.c)

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0276 *date time applid userid termid tranid
program name* **JNI call
'CallVoidMethod()' in module failed.**

Explanation: A JNI call, CallVoidMethod(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (DTCSupport.c)

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0277 *date time applid userid termid tranid
program name* **JNI call 'GetMethodID()'
in module failed.**

Explanation: A JNI call, GetMethodID(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will

need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCSupport.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0278 *date time applid userid termid tranid program name* **JNI call 'CallVoidMethod()' in module failed.**

Explanation: A JNI call, CallVoidMethod(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCSupport.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0279 *date time applid userid termid tranid program name* **JNI call 'GetMethodID()' in module failed.**

Explanation: A JNI call, GetMethodID(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCSupport.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0280 *date time applid userid termid tranid program name* **JNI call 'NewObject()' in module failed.**

Explanation: A JNI call, NewObject() for a ConversationPrincipalFacility object, in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to

the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCSupport.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0281 *date time applid userid termid tranid program name* **JNI call 'GetMethodID()' in module failed.**

Explanation: A JNI call, GetMethodID(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCSupport.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0282 *date time applid userid termid tranid program name* **JNI call 'FindClass()' in module failed.**

Explanation: A JNI call, FindClass(), for com/ibm/cics/server/ConversationPrincipalFacility, in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCSupport.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0283 *date time applid userid termid tranid program name* **JNI call 'FindClass()' in module failed.**

Explanation: A JNI call, FindClass() to find the Conversation class, in code written to support Java

native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (DTCSupport.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0284 *date time applid userid termid tranid program name* **JNI call 'GetMethodID()' in module failed.**

Explanation: A JNI call, GetMethodID(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (DTCSupport.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0285 *date time applid userid termid tranid program name* **JNI call 'GetMethodID()' in module failed.**

Explanation: A JNI call, GetMethodID(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (DTCSupport.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0286 *date time applid userid termid tranid program name* **JNI call 'NewObject()' in module failed.**

Explanation: A JNI call, NewObject(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (DTCSupport.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0287 *date time applid userid termid tranid program name* **An attempt to allocate storage in module failed.**

Explanation: An attempt to obtain storage in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (DTCTFile.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0288 *date time applid userid termid tranid program name* **An attempt to allocate storage in module failed.**

Explanation: An attempt to obtain storage in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (DTCTFile.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0289 *date time applid userid termid tranid program name* **An attempt to allocate storage in module failed.**

Explanation: An attempt to obtain storage in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCFile.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0290 *date time applid userid termid tranid program name* **An attempt to allocate storage in module failed.**

Explanation: An attempt to obtain storage in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCFile.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0291 *date time applid userid termid tranid program name* **JNI call 'GetMethodID()' in module failed.**

Explanation: A JNI call, GetMethodID(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCSupport.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0292 *date time applid userid termid tranid program name* **JNI call 'FindClass()' in module failed.**

Explanation: A JNI call, FindClass(), for com/ibm/cics/server/RetrievedData, in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCSupport.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0293 *date time applid userid termid tranid program name* **JNI call 'GetFieldID()' in module failed.**

Explanation: A JNI call, GetFieldID() for taskNumber, in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCTask.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0294 *date time applid userid termid tranid program name* **JNI call 'GetFieldID()' in module failed.**

Explanation: A JNI call, GetFieldID() for transactionName, in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCTask.c)

XMEOUT Parameters: *date, time, applid, userid, termid,*

DFHCZ0295 • DFHCZ0300

trandid, program name, module

Destination: CCZM

DFHCZ0295 *date time applid userid termid trandid
program name* **JNI call
'GetObjectClass()' in module failed.**

Explanation: A JNI call, GetObjectClass(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (DTCTask.c)

XMEOUT Parameters: *date, time,applid, userid, termid,
trandid, program name, module*

Destination: CCZM

DFHCZ0296 *date time applid userid termid trandid
program name* **JNI call 'GetFieldID()' in
module failed.**

Explanation: A JNI call, GetFieldID() for principalFacility, in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (DTCTask.c)

XMEOUT Parameters: *date, time,applid, userid, termid,
trandid, program name, module*

Destination: CCZM

DFHCZ0297 *date time applid userid termid trandid
program name* **JNI call 'GetFieldID()' in
module failed.**

Explanation: A JNI call, GetFieldID() for FCI, in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (DTCTask.c)

XMEOUT Parameters: *date, time,applid, userid, termid,
trandid, program name, module*

Destination: CCZM

DFHCZ0298 *date time applid userid termid trandid
program name* **JNI call 'GetFieldID()' in
module failed.**

Explanation: A JNI call, GetFieldID(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (DTCTask.c)

XMEOUT Parameters: *date, time,applid, userid, termid,
trandid, program name, module*

Destination: CCZM

DFHCZ0299 *date time applid userid termid trandid
program name* **JNI call 'NewObject()' in
module failed.**

Explanation: A JNI call, NewObject() for a TerminalPrincipalFacility, in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (DTCTask.c)

XMEOUT Parameters: *date, time,applid, userid, termid,
trandid, program name, module*

Destination: CCZM

DFHCZ0300 *date time applid userid termid trandid
program name* **JNI call 'GetMethodID()' in
module failed.**

Explanation: A JNI call, GetMethodID() for the TerminalPrincipalFacility constructor, in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will

need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCTask.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0301 *date time applid userid termid tranid program name* **JNI call 'FindClass()' in module failed.**

Explanation: A JNI call, FindClass() for com/ibm/cics/server/TerminalPrincipalFacility, in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCTask.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0302 *date time applid userid termid tranid program name* **JNI call 'GetFieldID()' in module failed.**

Explanation: A JNI call, GetFieldID(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCTask.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0303 *date time applid userid termid tranid program name* **JNI call 'GetObjectClass()' in module failed.**

Explanation: A JNI call, GetObjectClass() for com/ibm/cics/server/Task, in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCTask.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0305 *date time applid userid termid tranid program name* **JNI call 'GetStringUTFChars(envp, abcode)' in module failed.**

Explanation: A JNI call, GetStringUTFChars(envp, abcode), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCTask.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0311 *date time applid userid termid tranid program name* **JNI call 'GetFieldID()' in module failed.**

Explanation: A JNI call, GetFieldID(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCTask.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0312 *date time applid userid termid tranid
program name* **JNI call**
**'GetStringUTFChars(envp, queueName,
NULL)'** in *module* **failed.**

Explanation: A JNI call, GetStringUTFChars(envp, queueName, NULL), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJ CZDTC (DTCTDQ.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0313 *date time applid userid termid tranid
program name* **JNI call**
'GetStringUTFChars(envp, SysId)' in
module **failed.**

Explanation: A JNI call, GetStringUTFChars(envp, SysId), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJ CZDTC (DTCTDQ.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0314 *date time applid userid termid tranid
program name* **JNI call**
**'GetStringUTFChars(envp, queueName,
NULL)'** in *module* **failed.**

Explanation: A JNI call, GetStringUTFChars(envp, queueName, NULL), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJ CZDTC (DTCTDQ.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0315 *date time applid userid termid tranid
program name* **JNI call**
'GetStringUTFChars(envp, SysId)' in
module **failed.**

Explanation: A JNI call, GetStringUTFChars(envp, SysId), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJ CZDTC (DTCTDQ.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0316 *date time applid userid termid tranid
program name* **JNI call**
**'GetStringUTFChars(envp, queueName,
NULL)'** in *module* **failed.**

Explanation: A JNI call, GetStringUTFChars(envp, queueName, NULL), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJ CZDTC (DTCTDQ.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0317 *date time applid userid termid tranid
program name* **JNI call**
'GetStringUTFChars(envp, SysId)' in
module **failed.**

Explanation: A JNI call, GetStringUTFChars(envp, SysId), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCTDQ.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0324 *date time applid userid termid tranid program name* **JNI call 'GetByteArrayElements()' in module failed.**

Explanation: A JNI call, GetByteArrayElements(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCTerminal.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0325 *date time applid userid termid tranid program name* **JNI call 'GetMethodID()' in module failed.**

Explanation: A JNI call, GetMethodID() for the toBinary() method, in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCTerminal.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0326 *date time applid userid termid tranid program name* **A text array passed to the SEND_TEXT() method in module was greater than 32767 bytes. The data has been truncated.**

Explanation: A text array passed to the

SEND_TEXT() method in code written to support Java native methods used by the JCICS Java class library was longer than 32767 bytes.

System action: The system writes this message to the TD queue CCZM and sends the first 32767 bytes in the array.

User response: Ensure that the length of text passed to the sendText() method does not exceed 32767.

Module: DFJZDTC (DTCTerminal.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0327 *date time applid userid termid tranid program name* **JNI call 'GetByteArrayElements()' in module failed.**

Explanation: A JNI call, GetByteArrayElements(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCTerminal.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0328 *date time applid userid termid tranid program name* **JNI call 'GetMethodID()' in module failed.**

Explanation: A JNI call, GetMethodID() for the toBinary() method, in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCTerminal.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0329 *date time applid userid termid tranid program name* **JNI call 'GetFieldID()' in module failed.**

Explanation: A JNI call, GetFieldID() for TCTUAlength, in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCTerminal.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0330 *date time applid userid termid tranid program name* **An attempt to allocate storage in module failed.**

Explanation: An attempt to obtain storage in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCFile.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0331 *date time applid userid termid tranid program name* **JNI call 'GetFieldID()' in module failed.**

Explanation: A JNI call, GetFieldID() for TERMCODE, in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCTerminal.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0332 *date time applid userid termid tranid program name* **JNI call 'FindClass()' in module failed.**

Explanation: A JNI call, FindClass(), for com/ibm/cics/server/TerminalPrincipalFacility, in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCTerminal.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0333 *date time applid userid termid tranid program name* **An attempt to allocate storage in module failed.**

Explanation: An attempt to obtain storage in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCFile.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0334 *date time applid userid termid tranid program name* **JNI call 'GetFieldID()' in module failed.**

Explanation: A JNI call, GetFieldID() for TCTUAP, in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCTerminal.c)

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0335 *date time applid userid termid tranid program name* **JNI call 'GetStringUTFChars(envp, SysId)' in module failed.**

Explanation: A JNI call, GetStringUTFChars(envp, SysId), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCTSQ.c)

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0336 *date time applid userid termid tranid program name* **An invalid value for item number was passed to the READITEM() method in module. The value passed was item_no .**

Explanation: An invalid value for item number was passed to the readItem() method, in code written to support Java native methods used by the JCICS Java class library.

System action: The system writes this message to the TD queue CCZM and ignores the request.

User response: Ensure that the item number specified on the readItem() method of the appropriate TSQ Java object is in the range 0 - 32767.

If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCTSQ.c)

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, module, item_no*

Destination: CCZM

DFHCZ0337 *date time applid userid termid tranid program name* **TSQ name tsqname has been truncated to 16 characters in the SETNAME() method in module.**

Explanation: The Temporary Storage queue identified in the message has been truncated to 16 characters.

System action: The system writes this message to

the TD queue CCZM and continues with the request.

User response: Ensure all TS queue names used in JCICS applications are 16 characters or less in length.

Module: DFJZDTC (DTCTSQ.c)

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, tsqname, module*

Destination: CCZM

DFHCZ0338 *date time applid userid termid tranid program name* **An invalid value for item number was passed to the REWRITE() method in module. The value passed was item_no.**

Explanation: An invalid value for item number was passed to the REWRITE() method, in code written to support Java native methods used by the JCICS Java class library.

System action: The system writes this message to the TD queue CCZM and ignores the request.

User response: Ensure that the item number specified on the REWRITE() method of the appropriate TSQ Java object is in the range 0 - 32767.

If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (DTCTSQ.c)

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, module, item_no*

Destination: CCZM

DFHCZ0340 *date time applid userid termid tranid program name* **JNI call 'GetByteArrayElements()' in module failed.**

Explanation: A JNI call, GetByteArrayElements(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (StartRequest.c)

XMEOUT Parameters: *date, time,applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0341 *date time applid userid termid tranid program name* **JNI call**
'GetStringUTFChars()' in module failed.

Explanation: A JNI call, GetStringUTFChars(envp, transactionName), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (StartRequest.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0342 *date time applid userid termid tranid program name* **JNI call**
'GetStringUTFChars(envp, SysId)' in module failed.

Explanation: A JNI call, GetStringUTFChars(envp, SysId), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (StartRequest.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0345 *date time applid userid termid tranid program name* **JNI call**
'GetStringUTFChars()' in module failed.

Explanation: A JNI call, GetStringUTFChars(envp, transactionName), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (StartRequest.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0347 *date time applid userid termid tranid program name* **JNI call**
'GetByteArrayElements()' in module failed.

Explanation: A JNI call, GetByteArrayElements(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (StartRequest.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0348 *date time applid userid termid tranid program name* **JNI call**
'GetStringUTFChars(envp, terminal)' in module failed.

Explanation: A JNI call, GetStringUTFChars(envp, terminal), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCZDTC (StartRequest.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0349 *date time applid userid termid tranid program name* **JNI call**
'GetStringUTFChars(envp, SysId)' in module failed.

Explanation: A JNI call, GetStringUTFChars(envp, SysId), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will

need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (StartRequest.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0350 *date time applid userid termid tranid program name* **JNI call**
'GetStringUTFChars()' in module failed.

Explanation: A JNI call, GetStringUTFChars(envp, rTransaction), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (StartRequest.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0351 *date time applid userid termid tranid program name* **JNI call**
'GetStringUTFChars(envp, rTerminal)' in module failed.

Explanation: A JNI call, GetStringUTFChars(envp, rTerminal), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (StartRequest.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0352 *date time applid userid termid tranid program name* **JNI call**
'GetByteArrayElements()' in module failed.

Explanation: A JNI call, GetByteArrayElements(envp, data, NULL), in code written to support Java native

methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (SynchronizationResource.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0353 *date time applid userid termid tranid program name* **JNI call**
'GetByteArrayElements()' in module failed.

Explanation: A JNI call, GetByteArrayElements(envp, data, NULL), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (SynchronizationResource.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0354 *date time applid userid termid tranid program name* **JNI call**
'GetByteArrayElements()' in module failed.

Explanation: A JNI call, GetByteArrayElements(envp, CommArea, NULL), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJZDTC (WrapperNative.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0355 *date time applid userid termid tranid program name* **JNI call 'NewByteArray(envp, Length)' in module failed.**

Explanation: A JNI call, NewByteArray(envp, Length), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJ CZDTC (WrapperNative.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0356 *date time applid userid termid tranid program name* **non-CICS security manager of class *className* installed.**

Explanation: The Environment constructor has been unable to install the CICS security manager because a non-CICS security manager of class *className* is installed.

System action: The system writes this message to the TD queue CCZM.

User response: The CICS security manager ensures, for example, that a Java program cannot issue the exit command. Check that the security manager you have installed is compatible with running a CICS java program.

Module: DFJ CICS
(com.ibm.cics.server.Environment.java)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, className*

Destination: CCZM

DFHCZ0357 *date time applid userid termid tranid program name* **Uncaught exception from application.**

Explanation: The jcics Wrapper class has caught an InvocationTargetException. This occurs when the application throws, or doesn't catch, an exception. Details of the application exception are given in accompanying message DFHCZ0358.

System action: The system writes this message to the TD queue CCZM.

User response: Correct the problem and rerun the task.

Module: DFJ CICS (com.ibm.cics.server.Wrapper.java)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name*

Destination: CCZM

DFHCZ0358 *date time applid userid termid tranid program name* **Exception *exception* occurred invoking main method in class *className*.**

Explanation: The jcics Wrapper class caught exception *exception* trying to invoke the main method in class *className*.

System action: An exception trace entry is made and the task is abnormally terminated.

User response: Correct the problem and rerun the task.

Module: DFJ CICS (com.ibm.cics.server.Wrapper.java)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, exception, className*

Destination: CCZM

DFHCZ0359 *date time applid userid termid tranid program name* **Exception *exception* occurred creating object reference for class *className*.**

Explanation: The _GenericFactoryImpl create_object method has caught exception *exception* issuing a Class.forName(*className*).newInstance()

System action: A CORBA NoFactory exception is returned to the client and the task terminates normally.

User response: Correct the problem and reissue the request. For a ClassNotFoundException, check that a program with an appropriate package alias is in a PDSE available to CICS. If the program copy is refreshed to correct an error it may be necessary to perform a CEMT SET PROGRAM() NEWCOPY or PHASEIN command on any program in the system to refresh cache storage. If the error condition persists, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJ GFAC
(com.ibm.CosLifeCycle._GenericFactoryImpl.java)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, exception, className*

Destination: CCZM

DFHCZ0360 *date time applid userid termid tranid program name* **Class name *className* is invalid.**

Explanation: The class name *className* is invalid. This is often caused by an erroneous leading '.' or '/' character.

System action: An exception trace entry is made and the task is abnormally terminated

User response: Correct the problem and rerun the task.

Module: com.ibm.cics.server.Wrapper

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, className*

Destination: CCZM

DFHCZ0361 *date time applid* **The CICS Java Wrapper class failed to find the requested plugin *plugin*.**

Explanation: The CICS JVM attempted to instantiate the requested plugin class *plugin* but the JVM could not find this class on the current classpath.

System action: The plugin is not loaded.

User response: Examine the value set for the classpath in the JVM profile being used from the XDFHENV dataset. The pathname for the requested plugin must be present in the classpath.

Module: com.ibm.cics.server.Wrapper

XMEOUT Parameters: *date, time, applid, plugin*

Destination: CSMT

DFHCZ0362 *date time applid* **The CICS Java Wrapper plugin *plugin* has thrown exception *exception*.**

Explanation: The CICS JVM Java Wrapper class caught an exception thrown from plugin *plugin*.

System action: The JVM attempts to continue processing the user application.

User response: Either contact the *plugin* vendor for further assistance or catch the exception in the body of your plugin.

Module: com.ibm.cics.server.Wrapper

XMEOUT Parameters: *date, time, applid, plugin, exception*

Destination: CSMT

DFHCZ0380 *date time applid userid termid tranid program name* **An attempt to allocate storage in module failed.**

Explanation: An attempt to obtain storage, for use as a RIDFLD parameter, in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you

need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: libcom_ibm_cics_server_DTC.so (Document.c) libcom_ibm_cics_server_DTC.so (DTCsupport.c) libcom_ibm_cics_server_DTC.so (HttpRequest.c) libcom_ibm_cics_server_DTC.so (TcpiplInfo.c) libcom_ibm_cics_server_DTC.so (TcpiplRequest.c) libcom_ibm_cics_server_DTC.so (WebInfo.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0381 *date time applid userid termid tranid program name* **JNI call 'GetByteArrayElements()' in module failed.**

Explanation: A JNI call, GetByteArrayElements(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: libcom_ibm_cics_server_DTC.so (Document.c) libcom_ibm_cics_server_DTC.so (HttpResponse.c) libcom_ibm_cics_server_DTC.so (Container.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0382 *date time applid userid termid tranid program name* **JNI call 'GetStringUTFChars()' in module failed.**

Explanation: A JNI call, GetStringUTFChars(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: libcom_ibm_cics_server_DTC.so (Document.c) libcom_ibm_cics_server_DTC.so (HttpRequest.c) libcom_ibm_cics_server_DTC.so (HttpResponse.c) libcom_ibm_cics_server_DTC.so (TcpiplRequest.c) libcom_ibm_cics_server_DTC.so

DFHCZ0383 • DFHCZ0399

(Container.c) libcom_ibm_cics_server_DTC.so
(ContainerIterator.c)

XMEOUT Parameters: *date, time, applid, userid, termid, tranid, program name, module*

Destination: CCZM

DFHCZ0383 *date time applid userid termid tranid program name* **JNI call 'NewObject()' in module failed.**

Explanation: A JNI call, NewObject(), to construct a Conversation object, in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: libcom_ibm_cics_server_DTC.so
(DTCSupport.c) libcom_ibm_cics_server_DTC.so
(HttpResponse.c)

DFHDBnnnn messages

DFHDB2001 *date time applid* **CICS-DB2 resynchronization with *db2id* for unit of work *X'uowid'* cannot take place due to initial start of CICS.**

Explanation: CICS cannot resolve the disposition of unit of work (UOW) *uowid* that DB2 subsystem *db2id* holds from a previous connection because CICS was initial started. A CICS initial start should be avoided when resynchronization is outstanding. CICS cold, warm and emergency starts do not affect resynchronization, which occurs automatically when CICS and DB2 are connected.

System action: The CICS is connected to DB2 but UOW *uowid* will remain indoubt in DB2.

User response: The UOW *uowid* will have to be resolved manually using DB2 -DISPLAY THREAD and -RECOVER INDOUBT operator commands.

Module: DFHD2EX1

XMEOUT Parameters: *date, time, applid, db2id, X'uowid'*

Destination: Console and Transient Data Queue CDB2

DFHDB2003 *date time applid* **The CICS-DB2 attachment facility is already active.**

Explanation: The CICS-DB2 attachment is already active and enabled to CICS.

System action: The CICS-DB2 attachment facility initialization does not complete.

User response: Only one CICS-DB2 attachment facility may be active in a CICS region.

Module: DFHD2STR

XMEOUT Parameters: *date, time, applid*

Destination: CDB2 and Terminal End User

DFHDB2004 *date time applid* **No threads were found for plan *plan-name***

Explanation: This message is in response to a CICS-DB2 attachment facility DSNC DISPLAY or DISCONNECT command. No threads were found using the specified plan name *plan-name*. The *plan-name* may be blank if a specific plan was not requested.

System action: The CICS-DB2 attachment facility command is not processed.

User response: Reenter the command with the correct plan name.

Module: DFHD2CC

Destination: Terminal End User

DFHDB2005 *date time applid* **RCT does not contain transaction *tran***

Explanation: This message is in response to a CICS-DB2 attachment facility DSNC DISPLAY or MODIFY command. The transaction *tran* specified in the command was not found in the RCT. That is, there was no DB2TRAN defined for the transid, or the DB2TRAN referred to a DB2ENTRY that does not exist, or the case of the DISPLAY command, no threads were found for the transaction.

System action: The CICS-DB2 attachment facility command is not processed.

User response: Reenter the command with the correct transaction name.

Module: DFHD2CM1

Destination: Terminal End User

DFHDB2006 *date time applid* **The *dest* destination ID is invalid.**

Explanation: This message is in response to a CICS-DB2 attachment facility DSNC MODIFY DESTINATION command. The destination ID *dest* specified on the command to be modified is not one of the destinations currently defined in the DB2CONN as a message queue.

System action: The CICS-DB2 attachment facility command is not processed.

User response: Reenter the command with the correct destination ID.

Module: DFHD2CM1

Destination: Terminal End User

DFHDB2007 *date time applid* **The command verb is missing or invalid.**

Explanation: The CICS-DB2 attachment facility does not recognize the verb entered on the DSNC command.

System action: The command is not processed.

User response: Reenter the command with the correct syntax.

Module: DFHD2CM1

Destination: Terminal End User

DFHDB2008 *date time applid* **Keyword missing or invalid.**

DFHDB2009 • DFHDB2013

Explanation: The CICS-DB2 attachment facility DSNC command contains an unknown positional keyword or a keyword is missing.

System action: The command is not processed.

User response: Reenter the command with the correct syntax.

Module: DFHD2CM1

Destination: Terminal End User

DFHDB2009 *date time applid* **The value in the command is invalid.**

Explanation: The numeric value in the DSNC modify command is invalid. The error is caused by one of the following

- The value in the command is greater than 2000.
- The value in the command is greater than the TCBLIMIT specified in the DB2CONN.
- If the pool is being changed - for example, using transaction id CEPL - the value is less than 3.

System action: The CICS-DB2 attachment facility command is not processed.

User response: Reenter the command with a correct value.

Module: DFHD2CM1

Destination: Terminal End User

DFHDB2010 *date time applid tranid* **Transaction abended because DB2 thread tcbs are unavailable.**

Explanation: The transaction was abnormally terminated because a DB2 thread TCB was not available on which to create a thread for the transaction.

System action: The transaction is abnormally terminated.

User response: Determine if more subtask TCBs should be made available to the CICS-DB2 connection by increasing the TCBLIMIT value of the DB2CONN. The TCBLIMIT value can be altered using a SET DB2CONN command.

Module: DFHD2EX1

XMEOUT Parameters: *date, time, applid, tranid*

Destination: CDB2

DFHDB2011 *date time applid tranid* **Transaction abended because threads are unavailable for resource** *resname*

Explanation: The transaction was abnormally terminated because a thread connection to DB2 was not available for the transaction. *Resname* identifies the name of the DB2ENTRY or the POOL from which the thread was to be allocated. This error can occur when

- The DB2ENTRY specifies Threadwait(no) and all threads are currently being used.
- The DB2ENTRY specified Threadwait(pool), but the pool definition within the DB2CONN specifies Threadwait(no), and all threads are currently being used both in the DB2ENTRY and the Pool.
- The transaction was using the pool directly, the pool specifies Threadwait(no) and all pool threads are currently in use.

System action: The transaction is abnormally terminated.

User response: Determine if more threads can be made available to the DB2ENTRY or the POOL by increasing the THREADLIMIT value on the DB2ENTRY or the DB2CONN respectively. The THREADLIMIT value can be increased using SET DB2ENTRY and SET DB2CONN commands.

Module: DFHD2EX1

XMEOUT Parameters: *date, time, applid, tranid, resname*

Destination: CDB2

DFHDB2012 *date time applid* **Stop quiesce of the CICS-DB2 attachment facility from DB2 subsystem** *db2-id* **is proceeding.**

Explanation: A DSNC STOP command entered by the master terminal operator is being processed. CICS is disconnected from DB2 subsystem *db2-id*. When the disconnect is complete message DFHDB2025 is output to the terminal.

System action: New CICS transactions attempting to issue SQL commands is abended or receives a negative SQL reason code dependent on the CONNECTERROR setting in the DB2CONN definition.

Existing transactions using the CICS-DB2 interface are allowed to complete before the CICS-DB2 attachment facility is stopped.

User response: If the quiesce is not completed within an acceptable time period, a DSNC STOP FORCE command should be issued from another terminal.

Module: DFHD2CM1

Destination: Terminal End User

DFHDB2013 *date time applid* **Display report follows for threads accessing DB2** *db2-id*

Explanation: A CICS-DB2 attachment display plan or display tran command was requested and the results follow this message. If not blank, *db2-id* is the name of the DB2 subsystem involved.

The following information is displayed for each thread

DB2ENTRY

The name of the DB2ENTRY which contains the thread.

S

The thread status

- * The thread is active within a unit of work and is currently executing in DB2.
- A** The thread is active within a unit of work but is not currently executing in DB2.
- I** The thread is inactive. It is a protected thread waiting for new work.

PLAN The current plan name.

PRI-AUTH

The DB2 primary authorization ID.

SEC-AUTH

The DB2 secondary authorization ID.

CORRELATION

The DB2 thread correlation ID. :lp.For active threads only

TRAN The CICS transaction ID.

TASK The CICS task number.

UOW-ID

The CICS unit-of-work ID.

System action: Processing continues normally.

User response: None.

Module: DFHD2CC

XMEOUT Parameters: *date, time, applid, db2-id*

Destination: CDB2 and Terminal End User

DFHDB2014 *date time applid* **Statistics report follows for db2conn-name accessing DB2 db2-id**

Explanation: A CICS-DB2 attachment facility statistics display was requested and follows this message. The name of the DB2CONN that is currently in use is *db2conn-name* and *db2-id*, if not blank, is the name of the DB2 subsystem involved.

The statistics displayed are those that have been accumulated after the expiry of the last statistics collection interval, end of day expiry, or requested reset. These statistics represent a subset of those available as CICS-DB2 Global and resource statistics collected via the CICS statistics spi commands.

The following information is displayed for each DB2ENTRY and for the command and pool sections of the DB2CONN

- DB2ENTRY

The name of the DB2ENTRY or 'COMMAND' for the command section and 'POOL' for the pool section.

- PLAN
DB2 Plan name
- CALLS
Total number of SQL calls made
- AUTHS
Total number of sign-on invocations for transactions associated with this entry. A sign-on does not indicate whether a new thread is created or an existing thread reused. If a thread is reused a sign-on may occur dependent on the ACCOUNTREC setting of the DB2ENTRY.
- W/P
Number of times all available threads for this entry were busy and the transaction had to wait or the thread request was diverted to the POOL.
- HIGH
Maximum number of concurrent threads required by transactions associated with this DB2ENTRY at any time since the last reset.
- ABORTS
Total number of units of work that were rolled back.
- COMMITS
One of the following two fields is incremented each time a DB2 transaction associated with this DB2ENTRY takes an explicit or implicit (end of task) syncpoint.
- 1-PHASE
The total number of single-phase commits for transactions associated with this DB2ENTRY.
- 2-PHASE
The total number of two-phase commits for transactions associated with this DB2ENTRY.

System action: Processing continues normally.

User response: None.

Module: DFHD2CC

XMEOUT Parameters: *date, time, applid, db2conn-name, db2-id*

Destination: CDB2 and Terminal End User

DFHDB2015 *date time applid* **The CICS-DB2 attachment facility is in standby for DB2 subsystem db2-id**

Explanation: The CICS-DB2 attachment facility has dropped into standby mode because DB2 subsystem *db2-id* has stopped and STANDBYMODE=RECONNECT was specified in the DB2CONN.

System action: The CICS-DB2 attachment facility waits for the DB2 subsystem to become active again, at which time it automatically reconnects. While in standby mode, all SQL requests receive a negative SQLCODE or an AEY9 abend depending on whether

CONNECTERROR=SQLCODE or
CONNECTERROR=ABEND was specified in the
DB2CONN.

User response: Notify the system programmer.

Module: DFHD2TM

XMEOUT Parameters: *date, time, applid, db2-id*

Destination: Console and Transient Data Queue
CDB2

DFHDB2016 *date time applid* **The connection of CICS to DB2 {subsystem | group} db2-id failed with reason X'reason-code'.**

Explanation: The CICS-DB2 attachment facility startup cannot complete because an error occurred while connecting to DB2 sub-system or group *db2-id*. The response from DB2 was *reason-code*.

System action: The CICS-DB2 attachment facility initialization does not complete.

User response: Analyze the DB2 reason code given and any prior messages issued to the attachment error destination or CDB2 TS queues to determine the source of the error. Some possible causes include

- incorrect DB2 subsystem or group specified
- the DB2 subsystem or group was not initialized during MVS IPL processing.
- Another CICS or IMS region has connected to the DB2 coordinator with the same name as the region issuing this message. For CICS the connection name is the same as the applid.

Module: DFHD2STR, DFHD2CM1

XMEOUT Parameters: *date, time, applid, {1=subsystem, 2=group}, db2-id, X'reason-code'*

Destination: CDB2

DFHDB2018 *date time applid db2-id* **DB2 {subsystem is not active. | group has no active members.}**

Explanation: The CICS-DB2 attachment facility startup cannot complete because the *db2-id* group or subsystem is not active.

System action: The CICS-DB2 attachment facility stops.

User response: Restart the CICS-DB2 attachment facility after starting DB2.

Module: DFHD2STR, DFHD2CM1

XMEOUT Parameters: *date, time, applid, db2-id, {1=subsystem is not active., 2=group has no active members.}*

Destination: CDB2

DFHDB2019 *date time applid* **The modify command is complete.**

Explanation: The DSNC MODIFY command completed successfully.

System action: Processing continues.

User response: None.

Module: DFHD2CM1

Destination: Terminal End User

DFHDB2020 *date time applid* **The display command is complete.**

Explanation: The DSNC DISPLAY command completed successfully.

System action: Processing continues normally.

User response: None.

Module: DFHD2CC

XMEOUT Parameters: *date, time, applid*

Destination: CDB2 and Terminal End User

DFHDB2021 *date time applid* **The disconnect command is complete.**

Explanation: The DSNC DISCONNECT command completed successfully.

System action: Processing continues normally.

User response: None.

Module: DFHD2CC

Destination: Terminal End User

DFHDB2022 *date time applid* **Stop force of the CICS-DB2 attachment facility from db2-id is proceeding.**

Explanation: A DSNC STOP FORCE command entered by the master terminal operator is being processed. CICS will be disconnected from DB2 subsystem *db2-id*. When the disconnect is complete, message DFHDB2025 is output to the terminal.

System action: New CICS transactions attempting to issue SQL commands are abended or receive a negative SQL reason code dependent upon the CONNECTERROR setting in the DB2CONN definition.

Existing transactions using the CICS-DB2 interface will be force purged.

User response: None.

Module: DFHD2CM1

Destination: Terminal End User

DFHDB2023I *date time applid* **The CICS-DB2 attachment has connected to DB2 subsystem *db2-id* { *l group* } *db2-group***

Explanation: The CICS-DB2 attachment facility startup has successfully connected to DB2 subsystem *db2-id* group *db2-group*

System action: The CICS-DB2 attachment facility is active.

User response: If a group name does not appear then group attach is not active. You can suppress this message with the SIT parameter, MSGLVL = 0.

Module: DFHD2STR, DFHD2CM1

XMEOUT Parameters: *date, time, applid, db2-id, {1=, 2= group }, db2-group*

Destination: Console and Transient Data Queue CDB2 and Terminal End User

DFHDB2024I *date time applid* **The CICS-DB2 attachment is in standby. For resync purposes only, connection has been made to DB2 restart-light subsystem *db2-id* { *l group* } *db2-group***

Explanation: The CICS-DB2 attachment facility startup has temporarily connected to DB2 subsystem *db2-id* group *db2-group*. The DB2 subsystem is running in restart-light mode and connection has been made purely to allow resynchronisation to take place.

System action: The CICS-DB2 attachment facility remains in standby for new work, but allows resynchronisation tasks to complete. The DB2 restart-light subsystem is terminated when resynchronisation is complete. If STANDBYMODE(RECONNECT) has been specified in the DB2CONN definition and when the DB2 restart-light subsystem is terminated, the CICS-DB2 attachment facility reverts to standbymode and connection to another active DB2 subsystem is made.

User response: If a group name does not appear, group attach is not active. You can suppress this message with the SIT parameter, MSGLVL = 0.

Module: DFHD2STR, DFHD2CM1

XMEOUT Parameters: *date, time, applid, db2-id, {1=, 2= group }, db2-group*

Destination: Console and Transient Data Queue CDB2 and Terminal End User

DFHDB2025I *date time applid* **The CICS-DB2 attachment has disconnected from DB2 subsystem *db2-id* { *l group* } *db2-group***

Explanation: The CICS-DB2 attachment facility has

successfully disconnected from DB2 *db2-id* subsystem group *db2-group*

System action: The CICS-DB2 attachment facility is inactive.

User response: If a group name does not appear then group attach was not being used. You can suppress this message with the SIT parameter, MSGLVL = 0.

Module: DFHD2STP, DFHD2CM1

XMEOUT Parameters: *date, time, applid, db2-id, {1=, 2= group }, db2-group*

Destination: Console and Transient Data Queue CDB2 and Terminal End User

DFHDB2027 *date time applid* **CICS-DB2 attachment is shutting down. DSNC DB2 commands may not be entered.**

Explanation: The CICS-DB2 attachment facility cannot accept commands directed to DB2 during or after the termination of the CICS-DB2 attachment facility.

System action: The command is rejected.

User response: Issue the command via the DB2 console instead.

Module: DFHD2CM1

Destination: Terminal End User

DFHDB2028 *date time applid* **The user is not authorised to issue DB2 commands via DSNC.**

Explanation: DB2 rejected the command request during sign-on of the user. Therefore, the user is assumed not to be authorized for the requested function in the command.

System action: The command is rejected.

User response: Notify the system programmer.

Module: DFHD2CM1

Destination: Terminal End User

DFHDB2029 *date time applid tranid* **DB2 command failed with IFCARC1=*rc*, IFCARC2=*X'reason-code'***

Explanation: The DB2 command submitted by *transaction* received IFI return code *rc* and reason code *reason-code*

System action: The command processing stops.

User response: Refer to the *DB2 Messages and Codes* for a description of the *rc* and *reason-code*.

Module: DFHD2CM1

XMEOUT Parameters: *date, time, applid, tranid, rc, X'reason-code'*

Destination: CDB2

DFHDB2031 *date time applid* **CICS-DB2 command is invalid. No DB2CONN is installed.**

Explanation: A DSNB command cannot be executed as there is no DB2CONN installed. For all DSNB commands (including the STRT command) a DB2CONN definition must be installed before issuing the command. CICS no longer supports running with a macro RCT. All macro RCTs should be migrated to the CSD and the resulting definitions installed before attempting to startup the CICS-DB2 Attachment Facility.

Likewise a CEMT or EXEC CICS SET DB2CONN CONNECTED command cannot be issued to startup the CICS-DB2 Attachment Facility if no DB2CONN definition is installed.

System action: The command is rejected.

User response: Install the necessary DB2CONN. The command can then be re-issued.

Module: DFHD2CM1, DFHD2STR

XMEOUT Parameters: *date, time, applid*

Destination: CDB2 and Terminal End User

DFHDB2032 *date time applid* **Alternate destination display command complete.**

Explanation: The DSNB DISPLAY command to an alternate destination is complete. The output should be available at the requested destination.

System action: Processing continues normally.

User response: None.

Module: DFHD2CC

XMEOUT Parameters: *date, time, applid*

Destination: CDB2 and Terminal End User

DFHDB2033 *applid* **Terminal *termid* is not supported by BMS or is invalid.**

Explanation: This message is issued in response to a CICS-DB2 attachment facility command, or DB2 command that requested an alternative destination for the response. CICS basic mapping support (BMS) encountered an error while routing to the requested terminal named *termid*.

System action: Output from the command may be suppressed.

User response: Ensure that the terminal ID was correctly entered. Otherwise notify the system programmer. This message may occur if the destination device is not supported by BMS, or is not defined to CICS.

Module: DFHD2CC

XMEOUT Parameters: *applid, termid*

Destination: Console and Terminal End User

DFHDB2035 *date time applid* **Indoubt resolution for Unit of Work *X'uowid*' is incomplete for DB2 subsystem *db2id***

Explanation: CICS indicates that recovery should not be required for *uowid* but DB2 subsystem *db2id* is indoubt.

System action: The CICS is connected to DB2 but the UOW remains indoubt in DB2.

User response: The indoubt UOW will have to be resolved manually using DB2 -DISPLAY THREAD and -RECOVER INDOUBT operator commands. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2EX1

XMEOUT Parameters: *date, time, applid, X'uowid', db2id*

Destination: Console and Transient Data Queue CDB2

DFHDB2037 *date time applid* **DB2 {*subsystem lgroup*} *db2-id*{*is not active. I has no active members.*} The CICS-DB2 attachment facility is waiting.**

Explanation: The CICS-DB2 attachment facility is waiting for notification from DB2. For a DB2 group no active sub-systems have been found. If a DB2 sub-system was specified then that sub-system is not active. The CICS-DB2 attachment facility completes initialization after either

- a sub-system belonging to the DB2 group
- or
- the specific DB2 sub-system

has been started.

User response: Notify the system programmer that a DB2 subsystem requires to be started according to the information supplied.

Module: DFHD2STR,DFHD2CM1

XMEOUT Parameters: *date, time, applid, {1=subsystem, 2=group}, db2-id, {1= is not active. ,2= has no active members.}*

Destination: Console and Transient Data Queue CDB2 and Terminal End User

DFHDB2038 *date time applid* **The command is invalid while waiting for *db2id***

Explanation: The CICS-DB2 attachment facility cannot accept commands directed to DB2 while it is waiting for the DB2 subsystem to start. The name of the DB2 subsystem that is not yet operational is *db2id*.

System action: The command is rejected.

User response: Re-issue the command when DB2 has been started and the attachment facility has connected to DB2.

Module: DFHD2CM1

Destination: Terminal End User

DFHDB2039 *date time applid* **The error destinations are: *dest1 dest2 dest3*.**

Explanation: This message is in response to a CICS-DB2 attachment facility DSNM MODIFY DESTINATION command and lists the currently active message destinations known to the attachment facility. Null entries show as '*****' and can be modified so they identify actual destinations.

System action: Processing continues.

User response: None.

Module: DFHD2CM1

Destination: Terminal End User

DFHDB2040 *date time applid tranid* **Module *modname* could not be found.**

Explanation: During CICS-DB2 attachment facility initialization, an attempt was made to locate and load the named module, but it was not found in any of the libraries accessible to MVS through the MVS LOAD macro.

System action: CICS-DB2 attachment facility initialization does not complete.

User response: Check the CICS JOBLIB/STEPLIB and ensure that the required DB2 library is defined there and contains the named module. Alternatively, ensure the required DB2 library is in the MVS linklist.

Module: DFHD2STR

XMEOUT Parameters: *date, time, applid, tranid, modname*

Destination: CDB2 and Terminal End User

DFHDB2041 *date time applid* **No active threads found.**

Explanation: A DSNM DISPLAY TRANSACTION or DSNM DISPLAY PLAN command was entered, but there were no active threads found. The CICS-DB2 attachment facility might have identified and signed on

some subtasks, but a create thread was not issued for any of the subtasks. Likewise, threads may have been created previously on the subtasks but were subsequently terminated when there were no more DB2 requests to service.

System action: Processing continues normally.

User response: None.

Module: DFHD2CC

Destination: Terminal End User

DFHDB2042 *date time applid* **Connection not authorized to *db2-id***

Explanation: The attempt to connect to the *db2-id* DB2 subsystem or group failed because the user was not authorized to access DB2. Authorization was denied by either RACF or a user-written connection exit.

System action: The CICS-DB2 attachment does not connect to DB2.

User response: The userid specified on the CICS job was not authorized to connect to the named DB2 subsystem or group. Refer to the *DB2 Administration Guide* and the *CICS DB2 Guide* for information on how to authorize a user to access DB2.

Module: DFHD2STR

XMEOUT Parameters: *date, time, applid, db2-id*

Destination: CDB2

DFHDB2044 *date time applid* **Authorization parameters for *resname* have been corrupted.**

Explanation: The CICS-DB2 attachment facility detected that the AUTHTYPE or AUTHID parameters for *resname* have been corrupted since it was last installed or updated by a SET command. *Resname* is the name of the DB2ENTRY involved, or it is set to 'POOL' or 'COMMAND' if it is the pool or command thread authorizations of the DB2CONN that are involved.

System action: The transaction is abnormally terminated.

User response: If it is a DB2ENTRY involved, the DB2ENTRY needs to be reinstalled, or the AUTHID or AUTHTYPE parameters reset using a SET command to make the DB2ENTRY usable.

For pool or command thread authorizations, a SET DB2CONN command needs to be issued to reset the AUTHID or AUTHTYPE parameters, or the DB2CONN needs to be reinstalled. Note however that a DB2CONN cannot be re-installed without stopping the CICS-DB2 attachment facility first.

Module: DFHD2EX1

XMEOUT Parameters: *date, time, applid, resname*

Destination: CDB2

DFHDB2045 *date time applid* **Resource Manager rmi-name is unknown to the CICS-DB2 Attachment facility.**

Explanation: The CICS-DB2 Attachment facility received a request for a resource manager with entryname *rmi-name*. This resource name is not known by the CICS-DB2 attachment facility.

System action: The transaction is abnormally terminated with abend code AD21. A CICS system dump is taken.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2EX1

XMEOUT Parameters: *date, time, applid, rmi-name*

Destination: CDB2

DFHDB20471 *date time applid* **The CICS-DB2 Attachment cannot find DB2 {subsystem | group} id**

Explanation: The CICS-DB2 attachment facility failed to connect because the DB2ID or DB2GROUPID *id* cannot be found.

System action: The CICS-DB2 attachment facility is inactive.

User response: None.

Module: DFHD2STR

XMEOUT Parameters: *date, time, applid, {1=subsystem, 2=group}, id*

Destination: Console and Transient Data Queue CDB2 and Terminal End User

DFHDB2048 *date time applid* **Unable to interpret SQL call while formatting an EDF display for transaction transid task taskid**

Explanation: The CICS attachment facility was unable to call its EDF processor DFHD2EDF or the CICS attachment facility was unable to decipher storage associated with an SQL statement for CICS transaction *transid* and task *taskid*. Either the SQL communications area (SQLCA) or the RDS input parameter list (RDI) storage could not be interpreted by the CICS-DB2 attachment facility.

System action: If the CICS attachment facility was unable to call its EDF processor DFHD2EDF and a transaction dump is taken with dump code AD29.

If DFHD2EDF was called but it was unable to decipher storage, a transaction dump of the storage in question is taken with dump code AD22.

User response: For an AD29 dump, analyze the trace in the CICS transaction dump to determine why the call to DFHD2EDF failed. For an AD22 dump, analyze the CICS transaction dump of the storage in question. In this situation the information supplied by the Execution Diagnostic Facility (EDF) of CICS for SQL statements consists of

- The EDF status: ABOUT TO EXECUTE or COMMAND EXECUTION COMPLETE
- The processing status: CALL TO RESOURCE MANAGER DSNCSQL
- The ARG values associated with this call to the CICS-DB2 attachment facility

No other information is provided about the SQL statement.

Module: DFHD2EX1

XMEOUT Parameters: *date, time, applid, transid, taskid*

Destination: CDB2

DFHDB2049 *date time applid* **CICS-DB2 resynchronization for db2-id Unit of Work X'uowid' failed with reason code X'reason-code'**

Explanation: A resolve indoubt request passed to DB2 from CICS for Unit of Work *uowid* failed with DB2 reason code *reason-code*. The DB2 subsystem involved is *db2id*.

System action: The UOW remains indoubt in DB2 and CICS keeps hold of the UOW disposition. A CICS system dump is taken with dumpcode 00C30003.

User response: Use the reason code to determine why the resolve indoubt request failed.

Module: DFHD2EX1

XMEOUT Parameters: *date, time, applid, db2-id, X'uowid', X'reason-code'*

Destination: Console and Transient Data Queue CDB2

DFHDB2050 *date time applid tranid termid* **Abend abcode has occurred in dynamic plan exit program progname**

Explanation: Dynamic plan exit program *progname* has abnormally terminated with abend code *abcode*.

System action: Normal transaction abend processing continues.

User response: See the description of abend code *abcode* for further guidance.

If the code is not a CICS transaction abend code, it is a user abend code. Request an explanation from the programmer responsible for this area.

Module: DFHD2EX1

XMEOUT Parameters: *date, time,applid, tranid, termid, abcode, progname*

Destination: CDB2

DFHDB2051 *date time applid tranid termid* **Abend abcode in DFHD2EX1 - Dynamic plan exit program progname must be AMODE 31.**

Explanation: The CICS-DB2 attachment facility has failed to link to dynamic plan exit program *progname* because it is not link edited AMODE 31.

System action: Normal transactionabend processing continues.

User response: Relinkedit the dynamic plan exit program AMODE 31.

Module: DFHD2EX1

XMEOUT Parameters: *date, time,applid, tranid, termid, abcode, progname*

Destination: CDB2

DFHDB2053 *date time applid tranid termid* **Abend abcode in DFHD2EX1 - Dynamic plan exit program progname is disabled.**

Explanation: The CICS-DB2 attachment facility has failed to link to dynamic plan exit program *progname* because it is disabled.

System action: Normal transactionabend processing continues.

User response: Enable the dynamic plan exit program.

Module: DFHD2EX1

XMEOUT Parameters: *date, time,applid, tranid, termid, abcode, progname*

Destination: CDB2

DFHDB2054 *date time applid tranid termid* **Abend abcode in DFHD2EX1 - Link to the dynamic plan exit progname failed.**

Explanation: An unexpected return code was returned from the link to the dynamic plan exit program *progname* by the CICS-DB2 attachment facility.

System action: Normal transactionabend processing continues.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2EX1

XMEOUT Parameters: *date, time,applid, tranid, termid, abcode, progname*

Destination: CDB2

DFHDB2055 *date time applid* **Single phase commit failed with reason code X'reason-code' for transaction transid task taskid**

Explanation: CICS requested a single-phase commit from DB2, but DB2 was unable to comply. The request failed with DB2 reason code *reason-code*.

System action: The CICS-DB2 attachment facility abnormally terminates the transaction withabend code AD2W. CICS recovery manager will supersede the AD2Wabend code withabend code ASPR.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2EX1

XMEOUT Parameters: *date, time,applid, X'reason-code', transid,taskid*

Destination: CDB2

DFHDB2057 *date time applid tranid termid* **Abend abcode in DFHD2EX1 - PPT entry for dynamic plan exit program progname was not found.**

Explanation: CICS was unable to find a PPT entry for the dynamic plan exit program *progname*.

System action: Normal transactionabend processing continues.

User response: Ensure that the dynamic plan exit program *progname* has been correctly defined to CICS.

Module: DFHD2EX1

XMEOUT Parameters: *date, time,applid, tranid, termid, abcode, progname*

Destination: CDB2

DFHDB2058 *date time applid tranid termid* **Abend abcode in DFHD2EX1 - Fetch for dynamic plan exit program progname failed.**

Explanation: CICS was unable to load the dynamic plan exit program *progname*.

System action: Normal transactionabend processing continues.

User response: Ensure that the dynamic plan exit program *progname* has been correctly defined and is in a load library accessible to CICS.

Module: DFHD2EX1

XMEOUT Parameters: *date, time, applid, tranid, termid, abcode, progname*

Destination: CDB2

DFHDB2061 *date time applid* **The INITPARM specified for the CICS-DB2 attachment is invalid. The attachment facility cannot start.**

Explanation: The initparm for the CICS-DB2 attachment facility is not in the correct format. The format of the INITPARM should be

```
INITPARM=(DFHD2INI='yyyy')
```

where **yyyy** is a one to four character DB2 subsystem id. CICS no longer supports running with a macro RCT, so an RCT suffix should not be specified in the initparm string.

System action: The CICS-DB2 attachment facility initialization does not complete.

User response: Correct the INITPARM and restart the CICS region, or specify a DB2 subsystem id on a DSNC STRT command or in the DB2CONN. INITPARM is only used when the DB2CONN definition does not contain a DB2ID and a DB2ID is not specified on the startup command.

Module: DFHD2STR, DFHD2CM1

XMEOUT Parameters: *date, time, applid*

Destination: CDB2

DFHDB2063 *date time applid* **Authorization failure starting the CICS-DB2 attachment with RESP=xxxx and RESP2=yyyy**

Explanation: An authorization error occurred when starting the CICS-DB2 attachment. The SET DB2CONN CONNECTED responses for RESP (xxxx) and RESP2 (yyyy) indicate the specific error.

System action: The CICS-DB2 attachment initialization does not complete.

User response: Ensure that the DSNC transaction definition in group DFHDB2 is the installed definition.

Module: DFHD2CM1

XMEOUT Parameters: *date, time, applid, xxxx, yyyy*

Destination: CDB2

DFHDB2064 *date time applid* **Resynchronization outstanding for subsystem *db2id* after DB2 Group Attach has connected to subsystem *db2id2***

Explanation: CICS indicates that resynchronization is outstanding for subsystem *db2id* after DB2 Group Attach has connected to subsystem *db2id2*.

System action: The CICS is connected to DB2 subsystem *db2id* but UOWs remain outstanding for DB2 subsystem *db2id2*.

User response: The DB2CONN definition either has RESYNCMEMBER(NO) specified, or RESYNCMEMBER(YES) is specified but CICS detected that all the UOWs outstanding are shunted indoubt meaning that resynchronization with DB2 cannot take place immediately. Both these situations allow group attach to proceed, and the result is CICS has connected to a different DB2 subsystem than previously. The user must manually reconnect to the original DB2 subsystem which automatically resynchronizes the outstanding (non shunted) units of work. Shunted units of work wait to be unshunted at which point resynchronization takes place if CICS is connected to the original DB2 subsystem.

Module: DFHD2STR

XMEOUT Parameters: *date, time, applid, db2id, db2id2*

Destination: Console and Transient Data Queue
CDB2

DFHDB2065 **INVALID LENGTH. DATA NOT DISPLAYABLE.**

Explanation: The module running under the CICS Execution Diagnostic Facility (EDF) attempted to display an input or output variable that had an incorrect length indicator.

System action: EDF processing continues, but the value of the variable is not displayed.

User response: Examine the SQL statement in the application program.

Module: DFHD2EDF

Destination: Terminal End User

DFHDB2066 *date time applid tranid termid* **Abend *abcode* in DFHD2EX1 - PPT entry for dynamic plan exit program *progname* defines the program as remote.**

Explanation: The PPT entry for the dynamic plan exit program *progname* defines the program as remote. The dynamic plan exit program must be local to this CICS system.

System action: Normal transaction abend processing continues.

User response: Correct the PPT entry to define the program as local.

Module: DFHD2EX1

XMEOUT Parameters: *date, time, applid, tranid, termid, abcode, progname*

Destination: CDB2

DFHDB2067 *date time applid* **The CICS-DB2 attachment facility is already inactive.**

Explanation: A DSNB STOP command or an EXEC CICS SET DB2CONN NOTCONNECTED command was issued when the CICS-DB2 interface was already inactive.

System action: The CICS-DB2 attachment facility stop processing is ended.

User response: If this was unexpected, examine earlier messages to determine why the CICS-DB2 attachment facility is inactive.

Module: DFHD2STP

XMEOUT Parameters: *date, time, applid*

Destination: CDB2 and Terminal End User

DFHDB2068 *applid* **Send text command to terminal *termid* failed with eibresp *X'eibresp'*.**

Explanation: While processing a DSNB command, an EXEC CICS SEND TEXT command to terminal *termid* failed with EIBRESP *eibresp*.

System action: Processing of the command terminates.

User response: Examine the eibresp value *eibresp* to determine why the SEND TEXT command failed.

Module: DFHD2CC

XMEOUT Parameters: *applid, termid, X'eibresp'*

Destination: Console and Terminal End User

DFHDB2069 *applid* **Send page command to terminal *termid* failed with eibresp *X'eibresp'*.**

Explanation: While processing a DSNB command, an EXEC CICS SEND PAGE command to terminal *termid* failed with EIBRESP *eibresp*.

System action: Processing of the command terminates.

User response: Examine the eibresp value to determine why the SEND PAGE command failed.

Module: DFHD2CC

XMEOUT Parameters: *applid, termid, X'eibresp'*

Destination: Console and Terminal End User

DFHDB2070 *date time applid* **Syncpoint rollback failed for transaction *transid* with eibresp2 *X'eibresp2'***

Explanation: DB2 detected a deadlock and the CICS-DB2 attachment facility attempted a syncpoint rollback command for transaction *transid* because DROLLBACK(YES) was specified for the DB2ENTRY or

POOL. The syncpoint rollback command failed with EIBRESP2 set to *eibresp2*.

System action: The transaction is abnormally terminated with abend code AD2Z.

User response: Examine the eibresp2 value *eibresp2* to determine why the syncpoint rollback request failed. One possible reason could be that the transaction running is a DPL server transaction which was DPLed to by a client transaction without specifying the SYNCONRETURN parameter. In this case syncpoints or syncpoint rollbacks cannot be taken by the server transaction, so DROLLBACK(YES) is invalid in this case.

Module: DFHD2EX1

XMEOUT Parameters: *date, time, applid, transid, X'eibresp2'*

Destination: CDB2

DFHDB2071 *date time applid* **The first error destination cannot be null.**

Explanation: This message is in response to a CICS-DB2 attachment facility DSNB MODIFY DESTINATION command. An attempt was made to nullify the first error destination by setting it to '*****'. The CICS-DB2 attachment facility does not allow a null first error destination. The second and third error destinations may be nullified.

System action: The CICS-DB2 attachment facility command is not processed.

User response: Re-enter the command with a correct destination ID.

Module: DFHD2CM1

Destination: Terminal End User

DFHDB2072 *date time applid* **Transaction *transid*, task *tasknum* has been directed to the pool as DB2ENTRY *db2ename* is disabled.**

Explanation: Transaction *transid* is associated with DB2ENTRY *db2ename*. However DB2ENTRY *db2ename* is disabled or disabling and the DISABLEDACT keyword on the DB2ENTRY specifies that new work should be directed to the pool.

System action: The transaction will use a DB2 thread from the pool.

This message is output for each task that attempts to use the disabled DB2ENTRY.

User response: Determine why the DB2ENTRY has been disabled. If appropriate re-enable the DB2ENTRY.

Module: DFHD2EX1

DFHDB2073 • DFHDB2101

XMEOUT Parameters: *date, time,applid, transid, tasknum, db2ename*

Destination: CDB2

DFHDB2073 *date time applid* **Transaction *transid* has been directed to the pool as DB2TRAN *db2tname* refers to DB2ENTRY *db2ename* which is not installed.**

Explanation: Transaction *transid* is associated with DB2TRAN *db2tname* which in turn refers to DB2ENTRY *db2ename*. However DB2ENTRY *db2ename* is not installed in the CICS system. The DB2TRAN *db2tname* is an 'orphan' in that it refers to a DB2ENTRY that does not exist. A DB2TRAN cannot be installed unless its associated DB2ENTRY has been installed first. Hence either the DB2ENTRY has subsequently been discarded or the DB2TRAN modified by a SET command to refer to a non-existent DB2ENTRY.

System action: The transaction will use a DB2 thread from the pool.

This message is output only when an attempt is made to locate a DB2ENTRY for the transaction. Having decided to use the pool, the CICS-DB2 attachment facility will use the pool for all subsequent transactions of the same name without locating the DB2ENTRY each time. When any DB2TRAN or DB2ENTRY is installed or modified will this force a relocate of the DB2ENTRY next time the transaction is run.

User response: Determine why the DB2ENTRY is not installed. If appropriate re-install the DB2ENTRY.

Module: DFHD2EX1

XMEOUT Parameters: *date, time,applid, transid, db2tname, db2ename*

Destination: CDB2

DFHDB2074 *date time applid* **CICS-DB2 Attachment facility startup cannot proceed as the currently installed DB2CONN is not useable.**

Explanation: The CICS-DB2 Attachment facility detected that the currently installed DB2CONN is marked for discard. This implies that a previous discard of the DB2CONN did not complete successfully. A discard of a DB2CONN involves CICS discarding all DB2TRANs and DB2ENTRYs first before discarding the DB2CONN. The discard request failed before finally deleting the DB2CONN.

System action: Startup of the CICS-DB2 interface does not complete.

User response: If an RDO-defined RCT is being used, re-issue the discard for the DB2CONN. When it has been successfully discarded, re-install the required DB2CONN, DB2ENTRYs and DB2TRANs and then retry the startup of the CICS-DB2 interface.

If a macro RCT is to be used, issue a discard for the current DB2CONN and then retry the startup of the CICS-DB2 interface.

Module: DFHD2STR

XMEOUT Parameters: *date, time,applid*

Destination: CDB2 and Terminal End User

DFHDB2100 *applid* **Program DFHD2RP cannot be found.**

Explanation: CICS cannot link to the CICS/DB2 restart program (DFHD2RP).

CICS cannot find DFHD2RP in any data set concatenated in the DFHRPL DD statement in the CICS startup job stream.

System action: CICS initialization terminates with message DFHS11521 and a dump is taken.

User response: To correct this error, place DFHD2RP in a partitioned data set in the DFHRPL DD statement.

Module: DFHD2IN2

XMEOUT Parameter: *applid*

Destination: Console

DFHDB2101 *date time applid terminal userid tranid* **DB2CONN *db2conn-name* has been added.**

Explanation: This is an audit log message indicating that DB2CONN *db2conn-name* has been added to the CICS system using the INSTALL command or EXEC CICS CREATE. Where

- *terminal* is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- *userid* is the user identifier of the user associated with the transaction issuing the message.
- *tranid* is the transaction issuing the message.

There can be only one DB2CONN installed in the CICS system at a time. A DB2CONN is the minimum required for an RCT.

System action: The system continues normally.

User response: None.

Module: DFHD2TM

XMEOUT Parameters: *date, time,applid, terminal, userid, tranid, db2conn-name*

Destination: CDB2

DFHDB2102 *date time applid terminal userid tranid*
DB2CONN *db2conn-name* **has been replaced.**

Explanation: This is an audit log message indicating that DB2CONN *db2conn-name* has been replaced in the RCT using the INSTALL command or EXEC CICS CREATE. Where

- *terminal* is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- *userid* is the user identifier of the user associated with the transaction issuing the message.
- *tranid* is the transaction issuing the message.

System action: The system continues normally.

User response: None.

Module: DFHD2TM

XMEOUT Parameters: *date, time,applid, terminal, userid, tranid, db2conn-name*

Destination: CDB2

DFHDB2103 *date time applid terminal userid tranid*
DB2CONN *db2conn-name* **has been deleted.**

Explanation: This is an audit log message indicating that DB2CONN *db2conn-name* has been deleted from the CICS system using the DISCARD command. Where

- *terminal* is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- *userid* is the user identifier of the user associated with the transaction issuing the message.
- *tranid* is the transaction issuing the message.

Deleting of a DB2CONN means that the whole RCT is deleted. This message will have been preceded by messages indicating the deletion of any currently installed DB2ENTRYs and DB2TRANS which by definition are always associated with the currently installed DB2CONN.

System action: The system continues normally.

User response: None.

Module: DFHD2TM

XMEOUT Parameters: *date, time,applid, terminal, userid, tranid, db2conn-name*

Destination: CDB2

DFHDB2104 *date time applid terminal userid tranid*
DB2ENTRY *db2entry-name* **has been added.**

Explanation: This is an audit log message indicating that DB2ENTRY *db2entry-name* has been added to the CICS system using the INSTALL command or EXEC CICS CREATE. Where

- *terminal* is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- *userid* is the user identifier of the user associated with the transaction issuing the message.
- *tranid* is the transaction issuing the message.

System action: The system continues normally.

User response: None.

Module: DFHD2TM

XMEOUT Parameters: *date, time,applid, terminal, userid, tranid, db2entry-name*

Destination: CDB2

DFHDB2105 *date time applid terminal userid tranid*
DB2ENTRY *db2entry-name* **has been replaced.**

Explanation: This is an audit log message indicating that DB2ENTRY *db2entry-name* has been replaced in the RCT using the INSTALL command or EXEC CICS CREATE. Where

- *terminal* is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- *userid* is the user identifier of the user associated with the transaction issuing the message.
- *tranid* is the transaction issuing the message.

System action: The system continues normally.

User response: None.

Module: DFHD2TM

XMEOUT Parameters: *date, time,applid, terminal, userid, tranid, db2entry-name*

Destination: CDB2

DFHDB2106 *date time applid terminal userid tranid*
DB2ENTRY *db2entry-name* **has been deleted.**

Explanation: This is an audit log message indicating that DB2ENTRY *db2entry-name* has been deleted from the CICS system using the DISCARD command. Where

- *terminal* is the netname or termid of the terminal associated with the transaction issuing the message.

DFHDB2107 • DFHDB2208

If there is no terminal associated with the transaction, the terminal name is suppressed.

- *userid* is the user identifier of the user associated with the transaction issuing the message.
- *tranid* is the transaction issuing the message.

System action: The system continues normally.

User response: None.

Module: DFHD2TM

XMEOUT Parameters: *date, time,applid, terminal, userid, tranid, db2entry-name*

Destination: CDB2

DFHDB2107 *date time applid terminal userid tranid*
DB2TRAN *db2tran-name* **has been added.**

Explanation: This is an audit log message indicating that DB2TRAN *db2tran-name* has been added to the CICS system using the INSTALL command or EXEC CICS CREATE. Where

- *terminal* is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- *userid* is the user identifier of the user associated with the transaction issuing the message.
- *tranid* is the transaction issuing the message.

System action: The system continues normally.

User response: None.

Module: DFHD2TM

XMEOUT Parameters: *date, time,applid, terminal, userid, tranid, db2tran-name*

Destination: CDB2

DFHDB2108 *date time applid terminal userid tranid*
DB2TRAN *db2tran-name* **has been replaced.**

Explanation: This is an audit log message indicating that DB2TRAN *db2tran-name* has been replaced in the RCT using the INSTALL command or EXEC CICS CREATE. Where

- *terminal* is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- *userid* is the user identifier of the user associated with the transaction issuing the message.
- *tranid* is the transaction issuing the message.

System action: The system continues normally.

User response: None.

Module: DFHD2TM

XMEOUT Parameters: *date, time,applid, terminal, userid, tranid, db2tran-name*

Destination: CDB2

DFHDB2109 *date time applid terminal userid tranid*
DB2TRAN *db2tran-name* **has been deleted.**

Explanation: This is an audit log message indicating that DB2TRAN *db2tran-name* has been deleted from the CICS system using the DISCARD command. Where

- *terminal* is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- *userid* is the user identifier of the user associated with the transaction issuing the message.
- *tranid* is the transaction issuing the message.

System action: The system continues normally.

User response: None.

Module: DFHD2TM

XMEOUT Parameters: *date, time,applid, terminal, userid, tranid, db2tran-name*

Destination: CDB2

DFHDB2207 *date time applid* **Load error** *rc*
abend-code **for module** *modname*

Explanation: Error *rc* with *abend-code* occurred when the CICS-DB2 attachment facility initialization attempted to use the MVS LOAD macro to load module *modname*.

System action: The CICS-DB2 attachment initialization does not complete.

User response: Resolve the problem indicated by the LOAD return code and abend code.

Module: DFHD2STR

XMEOUT Parameters: *date, time,applid, rc, abend-code, modname*

Destination: CDB2

DFHDB2208 *date time applid* **Delete error** *rc* **for**
module *modname*

Explanation: Error *rc* occurred when the CICS-DB2 attachment facility attempted to use the MVS DELETE macro to delete module *modname* during shutdown of the CICS-DB2 interface.

System action: The CICS-DB2 attachment shutdown continues.

User response: Resolve the problem indicated by the DELETE return code.

Module: DFHD2STP

XMEOUT Parameters: *date, time, applid, rc, modname*

Destination: CDB2

DFHDB2210 *date time applid* **DB2 subsystem id *db2-id* contains invalid characters. The CICS-DB2 Attachment facility is not started.**

Explanation: The CICS-DB2 attachment facility startup cannot complete because the *db2-id* subsystem id specified on the DSNCR STRT command contains invalid characters.

System action: The CICS-DB2 attachment facility does not start.

User response: Correct the DB2 subsystem id and retry the DSNCR STRT command.

Module: DFHD2CM1

Destination: Terminal End User

DFHDB2211I *date time applid* **Maxopentcbs setting of *xxx* in the SIT conflicts with the tcblimit setting of *yyy* in the DB2CONN definition.**

Explanation: The CICS-DB2 Attachment Facility detected that CICS is connected to DB2 Version 6 or later and that the setting of MAXOPENTCBS in the SIT is lower than the TCBLIMIT setting in the DB2CONN definition.

When CICS is connected to DB2 Version 6 or later, the CICS-DB2 Attachment Facility uses CICS open TCBs to access DB2 rather than privately managed subtask TCBs. The MAXOPENTCBS SIT parameter defines the maximum number of open TCBs allowed in the CICS system for use by all openapi enabled task related user exits. The TCBLIMIT parameter on the DB2CONN definition defines how many of the open TCBs can be used for DB2, that is, a subset of MAXOPENTCBS for use with DB2.

System action: Startup of the CICS-DB2 attachment continues.

User response: Review the setting of MAXOPENTCBS to ensure there are enough TCBs to process your DB2 workload. The MAXOPENTCBS parameter can be changed online via the SET DISPATCHER command.

You can suppress this message with the SIT parameter, MSGLVL = 0.

Module: DFHD2STR

XMEOUT Parameters: *date, time, applid, xxx, yyy*

Destination: Console and Transient Data Queue
CDB2

DFHDB2300 *date time applid tranid* **DB2 command output truncated (*ifcabnm* bytes not shown).**

Explanation: *ifcabnm* bytes of a DB2 command response could not be shown.

System action: The command processing completes, but the output is truncated.

User response: If you need complete command output, modify the command to reduce the amount of output. For example, specify specific databases rather than an asterisk on a -DISPLAY DATABASE(*xxxx*).

Module: DFHD2CM1

XMEOUT Parameters: *date, time, applid, tranid, ifcabnm*

Destination: CDB2

DFHDB2301 *date time applid tranid* **DB2 command complete.**

Explanation: The DB2 command processing is complete.

System action: Control is returned to the user.

User response: None.

Module: DFHD2CM1

XMEOUT Parameters: *date, time, applid, tranid*

Destination: CDB2 and Terminal End User

DFHDB8101I *date time applid* **Connection to DBCTL *xxxx* is now complete. Startup Table Suffix used is *xx*.**

Explanation: DBCTL has notified CICS that the CICS-DBCTL connection is complete.

System action: CICS resynchronizes any outstanding DBCTL in-doubts.

User response: None.

Module: DFHDBCT

XMEOUT Parameters: *date, time, applid, xxxx, xx*

Destination: CDBC

DFHDB8102I *date time applid* **Disconnection from DBCTL *xxxx* is now complete.**

Explanation: CICS has successfully disconnected from DBCTL.

System action: CICS has successfully disconnected from DBCTL and performed its clean up.

User response: None.

Module: DFHDBDI

XMEOUT Parameters: *date, time, applid, xxxx*

Destination: CDBC

DFHDB8103E *date time applid IDENTIFY request to DBCTL xxxx has failed. MVS SSI return code rc, reason code reason.*

Explanation: CICS has attempted to connect to DBCTL. The attempt has failed. CICS has been notified that DBCTL is not currently executing. The return code from MVS SSI, reported in PAPLRETC, is *rc*. The reason code from MVS SSI, reported in PAPLRCOD, is *reason*. The return and reason codes reported in PAPLRETC and PAPLRCOD are explained in the *IMS Messages and Codes*.

System action: CICS attempts to connect to DBCTL at 5 second intervals, issuing this message at each attempt, and message DFHDB8297 at 1 minute intervals, until either

1. Disconnection is requested via the CICS supplied DBCTL support menu transaction, CDBC.
2. 10 minutes have elapsed, after which time CICS stops attempting to connect and IMS message DFS0690 is issued, requesting the operator to type in WAIT (retry the connection attempt) or CANCEL (abandon the connection attempt).

Refer to the explanation of DFHDB8297 for more information. Refer to the *IMS Messages and Codes* for further information on message DFS0690.

User response: Check why DBCTL is not running. You can cancel the connection attempts by using the CDBC transaction to issue a disconnect request. If message DFH0690 has been issued you should reply to this.

Module: DFHDBCT

XMEOUT Parameters: *date, time, applid, xxxx, rc, reason*

Destination: CDBC

DFHDB8104E *date time applid IDENTIFY request to DBCTL xxxx has been rejected by DBCTL. {System abend code | IMS user abend code | DBCTL return code }rc.*

Explanation: CICS has attempted to connect to DBCTL. The attempt has failed. CICS has been notified that DBCTL has rejected the identify request.

System action: The attempt to connect to DBCTL is abandoned and the storage associated with the CICS-DBCTL interface is cleaned up. Message DFHDB8102 is output.

User response: For further information about the nonzero response code, if *rc* is

- A **system abend code**, refer to the *OS/390 MVS System Codes* manual

- An **IMS user abend code**, refer to the *IMS Messages and Codes*
- A **DBCTL return code**, refer to the *IMS Messages and Codes*

Module: DFHDBCT

XMEOUT Parameters: *date, time, applid, xxxx, {1=System abend code, 2=IMS user abend code, 3=DBCTL return code }, rc*

Destination: CDBC

DFHDB8105W *date time applid Operator has requested cancellation of the connection to DBCTL.*

Explanation: DBCTL notifies CICS that the operator has replied 'CANCEL' to IMS message DFS0690. Refer to the *IMS Messages and Codes* for information on IMS message DFS0690.

System action: CICS cleans up the storage associated with the CICS-DBCTL interface and issues message DFHDB8102.

User response: None. This message is for information only.

Module: DFHDBCT

XMEOUT Parameters: *date, time, applid*

Destination: CDBC

DFHDB8106E *date time applid The DRA has abnormally terminated. CICS is no longer connected to DBCTL id xxxx.*

Explanation: DBCTL has notified CICS that the database resource adapter (DRA) is abnormally terminating.

System action: CICS cleans up the storage associated with the CICS-DBCTL interface and disconnects from DBCTL. CICS then issues message DFHDB8102.

User response: See the *CICS IMS Database Control Guide* for information about problem determination. If you wish to reconnect CICS to DBCTL, use the menu transaction CDBC.

Module: DFHDBCT

XMEOUT Parameters: *date, time, applid, xxxx*

Destination: CDBC

DFHDB8107E *date time applid DBCTL xxxx has abnormally terminated. Will attempt to reconnect.*

Explanation: DBCTL notifies CICS it is about to terminate.

System action: CICS will attempt to reconnect to DBCTL.

User response: Notify the system programmer.

Look for messages output by the DBCTL system and determine why DBCTL failed. Restart DBCTL if required.

Module: DFHDBCT

XMEOUT Parameters: *date, time, applid, xxxx*

Destination: CDBC

DFHDB8108I *date time applid* **DBCTL xxxx has received a CHECKPOINT FREEZE command. CICS will disconnect from DBCTL.**

Explanation: DBCTL notifies CICS that it is about terminate because a CHECKPOINT FREEZE command has been issued.

System action: CICS will clean up the storage associated with the CICS-DBCTL interface and will then output message DFHDB8102.

User response: None.

Module: DFHDBCT

XMEOUT Parameters: *date, time, applid, xxxx*

Destination: CDBC

DFHDB8109E *date time applid* **Request to DL/I failed for transaction *tranid*, task *taskid*, recovery token *X'nn'*{, system abend code *l*, IMS user abend code *l*, DBCTL return code }*rc*, DBCTL id *xxxx*.**

Explanation: DBCTL *xxxx* returns a nonzero response code *rc* when a DL/I request has been issued from an application program.

System action: The CICS transaction may be abnormally terminated.

User response: If the CICS transaction is abnormally terminated, refer to the accompanying CICS transaction abend code.

For further information about the nonzero response code, if *rc* is

- A **system abend code**, refer to the *OS/390 MVS System Codes*
- An **IMS user abend code**, refer to the *IMS Messages and Codes*
- A **DBCTL return code**, refer to the *IMS Messages and Codes*

For further information about the unit of recovery, refer to the *CICS IMS Database Control Guide*.

Module: DFHDLIDP

XMEOUT Parameters: *date, time, applid, tranid, taskid,*

X'nn', {1=, system abend code , 2=, IMS user abend code , 3=, DBCTL return code }, *rc, xxxx*

Destination: CDBC

DFHDB8110E *date time applid* **Non zero return code from DFHDBAT. Return code *rc* for request request.**

Explanation: The module DFHDBAT, which is a task related user exit forming part of the CICS-DBCTL interface, returns a nonzero return code in reply to a request issued from CICS to DBCTL.

System action: The request to DBCTL fails.

Three types of request to DBCTL can fail in this way

1. A request to connect to DBCTL from module DFHDBCON
2. A request to disconnect from DBCTL from module DFHDBDSC
3. A DL/I request from an application program via module DFHDLIDP

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: The return code is one of the following

4 — CALL NOT UNDERSTOOD

This can be returned when attempting to connect, disconnect or issue DL/I requests to DBCTL. The most likely cause is a storage overwrite. If CICS detects a storage overwrite, a dump is taken.

8 — REDUNDANT INTERFACE CALL

This can be returned when attempting to connect or disconnect from DBCTL. The request is ignored.

16 — DISCONNECT PRE-EMPTED

This can be returned when attempting to disconnect from DBCTL while a disconnection request is already being processed.

24 — ADAPTER NOT READY

A request has been made to the adaptor DFHDBAT but CICS is still in the process of connecting to DBCTL.

28 — ADAPTER IS DISABLED

This indicates that the CICS-DBCTL interface is not available. The DBCTL interface terminates normally after any inflight tasks accessing DBCTL complete the unit of work. Subsequently any new unit of work or ATI task can receive this return code because of a PCB schedule failure.

Module: DFHDBCON, DFHDBDSC, DFHDLIDP

XMEOUT Parameters: *date, time, applid, rc, request*

Destination: CDBC

DFHDB8111E *date time applid* **Connection has failed. DBCTL return code rc.**

Explanation: DBCTL returns a nonzero response code when CICS is attempting to connect to it.

System action: The connection attempt is abandoned.

User response: Notify the system programmer.

For further information about the DBCTL return code, refer to the *IMS Messages and Codes*

Module: DFHDBCON

XMEOUT Parameters: *date, time, applid, rc*

Destination: CDBC

DFHDB8112E *date time applid* **Unable to generate Task Token due to purge request.**

Explanation: The module, DFHDBTOX, was invoked

- To set up a task token, or
- To GETMAIN some storage.

The GETMAIN failed.

System action: Processing continues.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: This message indicates that there is a storage management problem. You should check for other messages issued from the CICS region to the MVS console.

See the *CICS Problem Determination Guide* for guidance on dealing with storage problems.

Module: DFHDBTOX

XMEOUT Parameters: *date, time, applid*

Destination: CDBC

DFHDB8113E *date time applid* **Getmain failure for storage to hold the indoubt list. Resync has not taken place.**

Explanation: Connection to DBCTL has been completed, but there are some in-doubts outstanding. The GETMAIN to store the in-doubts has failed.

System action: CICS remains connected to DBCTL but the in-doubts are not resolved.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: This message indicates that there is a storage management problem. You should check for other messages issued from the CICS region to the MVS console.

See the *CICS Problem Determination Guide* for guidance on dealing with storage problems.

Module: DFHDBCT

XMEOUT Parameters: *date, time, applid*

Destination: CDBC

DFHDB8114E *date time applid* **Connection has failed. DRA startup table with suffix xx cannot be found.**

Explanation: An attempt has been made to connect CICS to DBCTL but the DRA Startup Table with the suffix xx cannot be found.

System action: The connection attempt is abandoned.

User response: If you were using the DBCTL Support Menu transaction, CDBC, check to see if you have mistyped the suffix value.

If you have not mistyped the suffix value then notify the system programmer.

Place the DRA Startup Table in a CICS STEPLIB library. For further guidance on how to do this, see the *CICS IMS Database Control Guide*.

Module: DFHDBCON

XMEOUT Parameters: *date, time, applid, xx*

Destination: CDBC

DFHDB8115E *date time applid* **Connection has failed. Module DFSPRR0 cannot be found.**

Explanation: An attempt has been made to connect CICS to DBCTL but the DRA Router module, DFSPRR0, cannot be found.

System action: The connection attempt is abandoned.

User response: Place the module DFSPRR0 in a CICS STEPLIB library. For further guidance on how to do this, refer to the *CICS IMS Database Control Guide*.

Module: DFHDBCON

XMEOUT Parameters: *date, time, applid*

Destination: CDBC

DFHDB8116I *date time applid* **Connection to DBCTL xxxx is proceeding. Startup Table Suffix used is xx.**

Explanation: The first phase of connecting CICS to DBCTL has been completed.

System action: CICS connection to DBCTL proceeds.

User response: None.

Module: DFHDBCON

XMEOUT Parameters: *date, time, applid, xxxx, xx*

Destination: CDBC

DFHDB8117W *date time applid* **No connection to DBCTL made although the connection program is in the PLT.**

Explanation: The connection program, DFHDBCON, has been placed in the program list table (PLT) but CICS was not connected when CICS last shut down.

System action: CICS will not connect to DBCTL.

User response: This is a warning message. In this case, if you wish to connect CICS to DBCTL then use the DBCTL Support Menu transaction, CDBC.

Module: DFHDBCON

XMEOUT Parameters: *date, time, applid*

Destination: CDBC

DFHDB8118E *date time applid* **Connection to DBCTL xxxx has been rejected by CICS.**
Reason code rc.

Explanation: CICS has rejected the connection attempt to DBCTL for reason *rc*. The value in the reason code field is 4. This indicates an invalid IMS/ESA release for storage protection. That is, CICS storage protection was active, and an attempt was made to connect to a DBCTL system running a release of IMS/ESA that does not support the storage protection function.

System action: On completion of phase 2 connection processing, CICS indicates to the database resource adapter (DRA), in the control exit, that the DRA should terminate. CICS then completes cleanup of the CICS-DBCTL interface. The status of the interface is that CICS is not connected to DBCTL.

User response: Connection to this DBCTL system is only possible if CICS is run with storage protection turned off. To run with storage protection on, install a release of IMS/ESA that supports the storage protection function.

Module: DFHDBCT

XMEOUT Parameters: *date, time, applid, xxxx, rc*

Destination: CDBC

DFHDB8119I *date time applid* **CICS is INDOUBT about the LUW with recovery token X'rectok' after issuing a single phase commit request to DBCTL, {SYSTEM ABEND CODE | IMS USER ABEND | DBCTL RETURN CODE} rc.**

Explanation: CICS was attempting to syncpoint updates made to IMS databases via DBCTL for the logical unit of work (LUW) identified by unit of recovery X'rectok. CICS has detected that updates were made to only one resource manager, DBCTL, in this LUW, and hence has issued a single-phase commit to DBCTL, in

place of the normal two-phase commit process. An unexpected response to the single-phase commit has been received from DBCTL, and so CICS is INDOUBT about this LUW. CICS is unable to report whether the updates made via DBCTL have been committed or backed out. No local CICS resources are affected.

System action: The transaction terminates abnormally with abend code ADCS and a transaction dump. CICS processing continues.

User response: The unit of recovery X'rectok output with this message can be used in conjunction with IMS message DFSxxxx output on the IMS console to determine the outcome of the LUW.

If the IMS region has failed, on restart of the IMS region, IMS will output DFSxxxx messages for each LUW that has committed using the single-phase commit protocol. The DFSxxxx message contains the same X'rectok recovery token as output in this message. While matching up the recovery tokens, if a DFSxxxx message is found with the same recovery token, then the LUW was committed. Failure to find a relevant DFSxxxx message means that the LUW has been backed out.

Rather than the IMS region failing, if the bad response to single-phase commit was caused by an individual thread failure and the LUW has been committed, then IMS outputs a DFSxxxx message for just this LUW.

For further information on IMS message DFSxxxx, refer to the *IMS Messages and Codes*.

For further information about the nonzero response code, if *rc* is

- A **system abend code**, refer to the *OS/390 MVS System Codes* manual
- An **IMS user abend code**, refer to the *IMS Messages and Codes*
- A **DBCTL return code**, refer to the *IMS Messages and Codes*

Module: DFHDBAT

XMEOUT Parameters: *date, time, applid, X'rectok', {1=SYSTEM ABEND CODE, 2=IMS USER ABEND, 3=DBCTL RETURN CODE}, rc*

Destination: CDBC

DFHDB8120I *date time applid* **DBCTL may be INDOUBT about the LUW with recovery token X'nn', which CICS has {committed | backed out}, {SYSTEM ABEND CODE | IMS USER ABEND CODE | DBCTL RETURN CODE} rc.**

Explanation: CICS has received a bad return code from DBCTL for a commit or backout request for the logical unit of work (LUW) identified by unit of recovery X'nn.

System action: CICS has either backed out or committed this LUW. CICS continues.

User response: At the next reconnection, CICS and DBCTL resolve all INDOUBTs.

Alternatively you can request DBCTL to find out if the LUW is INDOUBT, and instruct DBCTL to commit it or back it out. For more information on how to do this, refer to the *CICS IMS Database Control Guide*.

For further information about the nonzero response code, if *rc* is

- a **system abend code**, refer to the *OS/390 MVS System Codes* manual
- an **IMS user abend code**, refer to the *IMS Messages and Codes*
- a **DBCTL return code**, refer to the *IMS Messages and Codes*

Module: DFHDBAT

XMEOUT Parameters: *date, time, applid, X'nn'*, {1=committed, 2=backed out}, {1=SYSTEM ABEND CODE, 2=IMS USER ABEND CODE, 3=DBCTL RETURN CODE}, *rc*

Destination: CDBC

DFHDB8121I *date time applid* **A failure has occurred in DBCTL during syncpoint prepare processing.** {System abend code | IMS user abend code | DBCTL return code | IMS fast path status code} *rc*.

Explanation: CICS has detected a failure in DBCTL during syncpoint prepare processing.

System action: The transaction terminates abnormally with abend code ASP7 and a transaction dump. CICS processing continues.

User response: Refer to the abend code ASP7 for further information about the accompanying CICS transaction.

For further information about the nonzero response code, if *rc* is

- A **system abend code**, refer to the *OS/390 MVS System Codes* manual
- An **IMS user abend code**, refer to the *IMS Messages and Codes*
- A **DBCTL return code**, refer to the *IMS Messages and Codes*
- An **IMS fast path status code**, refer to the *IMS Application Programming: EXEC DLI Commands* if you were running an EXEC DLI program at the time of the message, or if you were using CALL, refer to the *Application Programming: DLI Calls*.

Module: DFHDBAT

XMEOUT Parameters: *date, time, applid*, {1=System abend code, 2=IMS user abend code, 3=DBCTL return code, 4=IMS fast path status code}, *rc*

Destination: CDBC

DFHDB8122I *applid* **CICS is about to disconnect from DBCTL for CICS shutdown.**

Explanation: CICS was connected to DBCTL when CICS termination commenced. CICS is going to issue a disconnect request.

System action: CICS disconnection from DBCTL proceeds.

User response: None. You can suppress this message with the SIT parameter, MSGLVL = 0.

Module: DFHDBAT

XMEOUT Parameter: *applid*

Destination: Console

DFHDB8123I *applid* **CICS disconnection from DBCTL for CICS shutdown has completed successfully.**

Explanation: CICS was connected to DBCTL when CICS termination commenced. CICS has successfully disconnected from DBCTL.

System action: CICS shutdown continues.

User response: None. You can suppress this message with the SIT parameter, MSGLVL = 0.

Module: DFHDBAT

XMEOUT Parameter: *applid*

Destination: Console

DFHDB8124E *date time applid* **CICS disconnection from DBCTL for CICS shutdown has {failed, | timed out.}{System abend code | IMS user abend code | DBCTL return code | }rc**

Explanation: CICS was connected to DBCTL when CICS termination commenced. CICS disconnection from DBCTL failed for one of the reasons given in the message text.

System action: CICS shutdown continues.

User response: If the failure is due to a timed out condition, the message indicates that the time elapsed since CICS requested disconnection has reached the interval specified in the TIMEOUT parameter of the DRA interface without a response from DCBTL. The default interval is 60 seconds.

If failure is due to any other condition, a nonzero return code is given. If *rc* is

- A **system abend code**, refer to the *OS/390 MVS System Codes* manual
- An **IMS user abend code**, refer to the *IMS Messages and Codes*
- A **DBCTL return code**, refer to the *IMS Messages and Codes*

Module: DFHDBAT

XMEOUT Parameters: *date, time, applid, {1=failed,, 2=timed out.}, {1=System abend code , 2=IMS user abend code , 3=DBCTL return code , 4= }, rc*

Destination: Console

DFHDB8128W *date time applid* **Error linking to the CICS-DBCTL user replaceable program DFHDBUEX from module *modname*.**

Explanation: An attempt was made to invoke the user replaceable module, DFHDBUEX, but the module was not available.

System action: CICS disregards the failure and continues execution.

User response: Ensure that module DFHDBUEX is available.

Module: DFHDBCT, DFHDBDSC.

XMEOUT Parameters: *date, time, applid, modname*

Destination: CDBC

DFHDB8129E *date time applid* **Getmain failure in the Control Exit DFHDBCTX.**

Explanation: The MVS GETMAIN request failed in DFHDBCTX.

System action: The CICS-DBCTL interface remains unchanged.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: This message indicates that there is a storage management problem. Check for other messages issued from the CICS region to the MVS console.

See the *CICS Problem Determination Guide* for guidance on dealing with storage problems.

Module: DFHDBCTX

XMEOUT Parameters: *date, time, applid*

Destination: CDBC

DFHDB8130E *date time applid* **Disconnection has failed. DBCTL return code *rc*.**

Explanation: The disconnection attempt failed in DBCTL.

System action: CICS abandons the attempt to disconnect from DBCTL.

User response: For further information about the DBCTL return code, refer to the *IMS Messages and Codes*.

Module: DFHDBDSC

XMEOUT Parameters: *date, time, applid, rc*

Destination: CDBC

DFHDB8131E *date time applid* **The CICS-DBCTL control transaction has abnormally terminated with abend *abcode*.**

Explanation: The CICS-DBCTL control transaction, CDBO, has failed.

System action: The CICS/DBCTL interface is no longer usable.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: See the description of abend *abcode* for further guidance.

If you wish to use DBCTL from this CICS system again, you have to restart CICS.

Module: DFHDBCT

XMEOUT Parameters: *date, time, applid, abcode*

Destination: CDBC

DFHDB8199E **GETMAIN REQUEST FOR CICS-DBCTL CONTROL WORK ELEMENT (CWE) HAS FAILED.**

Explanation: While notifying the CICS-DBCTL control transaction of changes to the state of the CICS-DBCTL interface a GETMAIN request for storage to hold a CICS-DBCTL control work element failed.

System action: CICS uses control exit storage in DBCTL global block (DGB) to notify the control transaction of the error. The control transaction issues message DFHDB8129 to transient data destination CDBC. CICS abandons the attempt to change the state of the CICS-DBCTL interface.

User response: This message indicates that there is a storage management problem. See any other messages issued from the CICS region to the MVS console for further guidance. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHDBCTX

Destination: Console

DFHDB8201I **The key that you pressed has no meaning on this panel.**

Explanation: The terminal operator has pressed the wrong key when using either

- CDBI, the CICS-DBCTL support inquiry transaction (Module DFHDBIQ), or
- CDBC, the CICS-DBCTL support menu transaction (Module DFHDBME).

System action: CICS ignores the key pressed.

User response: Check the allowable keys display which appears at the bottom of the screen and try a valid key.

Module: DFHDBIQ, DFHDBME

Destination: TERMCDBC

DFHDB8202 Selection must be one of those shown above.

Explanation: The terminal operator has typed in an invalid option when using CDBC, the DBCTL Support Menu Transaction.

System action: CICS rejects the invalid option.

User response: Check the allowable options that appear on the screen and choose the appropriate one.

Module: DFHDBME

Destination: TERMCDBC

DFHDB8204 Invalid DRA startup table suffix supplied.

Explanation: The terminal operator has typed an invalid startup table suffix when using CDBC, the DBCTL Support Menu Transaction. The suffix must be one or two characters long consisting only of characters valid for a partitioned data set member name.

System action: CICS rejects the invalid Startup Table Suffix.

User response: Correct the startup table suffix and try again. You may need to check the suffix with your system programmer.

Module: DFHDBME

Destination: TERMCDBC

DFHDB8207D Connection to DBCTL requested. Press PF5 to confirm.

Explanation: The terminal operator has requested that CICS should be connected to DBCTL.

This message is not used when you are running the CDBC transaction at the console. If you are running the CDBC transaction on the console, the terminal PF5 key function (to confirm the request) is not used.

System action: If the PF5 key is pressed, then CICS will connect to DBCTL. If any other key is pressed in response to this message, CICS will not connect to DBCTL.

User response: Press the PF5 key if you wish to proceed with connecting CICS to DBCTL. If you do not wish the connection to proceed then press the PF3 key to terminate the transaction, or change the input data and press enter.

Module: DFHDBME

Destination: TERMCDBC

DFHDB8208D DBCTL immediate disconnection requested. Press PF5 to confirm.

Explanation: The terminal operator has requested that CICS should be disconnected from DBCTL immediately.

This message is not used when you are running the CDBC transaction at the console. If you are running the CDBC transaction on the console, the terminal PF5 key function (to confirm the request) is not used.

System action: If the PF5 key is pressed, then all DL/I requests issued from this CICS system and currently being processed in DBCTL will complete and then CICS will disconnect from DBCTL. Tasks which have been using DBCTL but have not yet issued a CICS SYNCPOINT, either explicitly in the application or implicitly as a result of CICS task termination processing, will abnormally terminate with abend code ASP7. If any other key is pressed in response to this message, CICS will not disconnect from DBCTL.

User response: Press the PF5 key if you wish to proceed with disconnecting CICS from DBCTL immediately. If you do not wish the disconnection to proceed then press the PF3 key to terminate the transaction, or change the input data and press enter.

Module: DFHDBME

Destination: TERMCDBC

DFHDB8209D DBCTL orderly disconnection requested. Press PF5 to confirm.

Explanation: The terminal operator has requested that CICS should be disconnected from DBCTL in an orderly manner.

This message is not used when you are running the CDBC transaction at the console. If you are running the CDBC transaction on the console, the terminal PF5 key function (to confirm the request) is not used.

System action: If the PF5 key is pressed, then all tasks running in this CICS system that have already used DBCTL will complete and then CICS will disconnect from DBCTL. No new tasks running in this CICS system will be permitted to use DBCTL until CICS is connected to DBCTL again. If any other key is pressed in response to this message, CICS will not disconnect from DBCTL.

User response: Press the PF5 key if you wish to proceed with disconnecting CICS from DBCTL in an orderly way. If you do not wish the disconnection to proceed then press the PF3 key to terminate the transaction, or change the input data and press enter.

Module: DFHDBME

Destination: TERMCDBC

DFHDB8210D Connection to DBCTL is proceeding. Check CDBC TD queue.

Explanation: The operator has pressed PF5 in response to message DFHDB8207 or the CDBC transaction was used from the MVS operator console to connect to DBCTL. CICS issues further messages concerning the connection to the CDBC transient data destination.

System action: CICS proceeds with the connection attempt.

User response: Press PF3 to terminate the transaction. Press PF2 to refresh the status information on the screen. If you are running the CDBC transaction on the console, the PF key functions are not available. Check the CDBC transient data destination for further messages.

Module: DFHDBME

Destination: TERMCDBC

DFHDB8211D Orderly disconnection from DBCTL is proceeding. Check CDBC TD queue.

Explanation: The operator has pressed PF5 in response to message DFHDB8209. CICS issues further messages concerning the disconnection to the CDBC transient data destination. Additionally, DBCTL issues some messages to the MVS console.

System action: CICS proceeds with the disconnection attempt.

User response: You are now able to use your terminal to perform other functions. You can check to see how the disconnection attempt is proceeding by using the refresh key to refresh the CICS-DBCTL status information on the screen. In case of problems, for example, CICS does not disconnect from DBCTL, check the CDBC transient data destination.

Module: DFHDBME

Destination: TERMCDBC

DFHDB8212D Immediate disconnection from DBCTL is proceeding. Check CDBC TD queue.

Explanation: The operator has pressed PF5 in response to message DFHDB8208. CICS issues further messages concerning the disconnection to the CDBC transient data destination. Additionally, DBCTL issues some messages.

System action: CICS proceeds with the disconnection attempt.

User response: You are now able to use your terminal to perform other functions. You can check to see how the disconnection attempt is proceeding by using the refresh key to refresh the CICS-DBCTL status

information on the screen. In case of problems, for example, CICS does not disconnect from DBCTL, check the CDBC transient data destination.

Module: DFHDBME

Destination: TERMCDBC

DFHDB8213 Connection to DBCTL is already in progress. Request is ignored.

Explanation: The terminal operator has requested that CICS should connect to DBCTL and CICS is already trying to connect to DBCTL.

System action: This connection request is ignored.

User response: Use the PF2 key to refresh the CICS-DBCTL status information on the screen. If the "DBCTL connected and ready" message is not displayed, check the CDBC transient data destination to ensure that no errors have occurred while CICS was connecting to DBCTL. The operator should also check the MVS console as the message DFS0690 may have been issued, and be waiting for a reply.

Module: DFHDBME

Destination: TERMCDBC

DFHDB8214 Connection to DBCTL has already been done. Request is ignored.

Explanation: The terminal operator has requested that CICS should connect to DBCTL when CICS is already connected to DBCTL.

System action: This connection request is ignored.

User response: If you did not expect DBCTL to be connected to CICS then check the CDBC transient data destination to see when CICS did connect to DBCTL (message DFHDB8101).

Module: DFHDBME

Destination: TERMCDBC

DFHDB8215 Orderly disconnection from DBCTL in progress. Request is ignored.

Explanation: The terminal operator has either

- Requested that CICS should disconnect from DBCTL when CICS is already disconnected from DBCTL, or
- Requested that CICS should connect to DBCTL when CICS is still disconnecting from DBCTL.

System action: This disconnection request is ignored.

User response: Use the refresh key to refresh the CICS-DBCTL status information on the screen. If the 'DBCTL not connected to CICS' message is not displayed, check the CDBC transient data destination to ensure that no errors have occurred while CICS was disconnecting from DBCTL.

Module: DFHDBME

Destination: TERMCDBC

DFHDB8216 Immediate disconnection from DBCTL in progress. Request is ignored.

Explanation: The terminal operator has either

- Requested that CICS should disconnect from DBCTL while CICS is already disconnected from DBCTL, or
- Requested that CICS should connect to DBCTL while CICS is still disconnecting from DBCTL.

System action: This disconnection request is ignored.

User response: Use the PF2 key to refresh the CICS-DBCTL status information on the screen. If the 'DBCTL not connected to CICS' message is not displayed, check the CDBC transient data destination to ensure that no errors have occurred while CICS was disconnecting from DBCTL. If necessary, check the location of the CDBC destination with your system programmer.

Module: DFHDBME

Destination: TERMCDBC

DFHDB8217 DBCTL not currently connected to CICS. Request ignored.

Explanation: The terminal operator has requested that CICS should disconnect from DBCTL when CICS is not connected to DBCTL.

System action: This disconnection request will be ignored.

User response: If you did not expect DBCTL to be disconnected from CICS then check the CDBC transient data destination to see when and why CICS did disconnect from DBCTL (message DFHDB8102). If you do not know where the CDBC destination is, then please check with your system programmer.

Module: DFHDBME

Destination: TERMCDBC

DFHDB8218 CDBC - Please specify CONNECT or DISCONNECT.

Explanation: The terminal operator has used CDBC, the DBCTL support menu transaction, from the MVS operator console and has not selected an option.

System action: No action is taken until the operator selects an option.

User response: Select an option by typing in CDBC with a connect or disconnect option.

See the *CICS Supplied Transactions* for guidance on using CDBC.

Module: DFHDBME

Destination: TERMCDBC

DFHDB8219 DBCTL connection phase 1 in progress. Request is ignored.

Explanation: The first phase of connecting CICS to DBCTL has not completed yet, but the terminal operator has requested disconnection from DBCTL.

System action: This disconnection request is ignored.

User response: Try requesting disconnection again if you wish to proceed with disconnecting CICS from DBCTL. If you still cannot disconnect then check the CDBC transient data destination to see if any messages have been issued which indicate that there are problems with the connection attempt. Also check if any messages have been issued from DBCTL.

Module: DFHDBME

Destination: TERMCDBC

DFHDB8220 CICS-DBCTL connection is unusable. Request is ignored.

Explanation: A failure has occurred in the CICS-DBCTL interface.

System action: Any requests to connect or disconnect from DBCTL is ignored.

User response: Look for earlier messages identifying the source of the error by checking the CDBC transient data destination for any messages issued from CICS and also by checking for any messages issued from DBCTL.

Module: DFHDBME

Destination: TERMCDBC

DFHDB8221 Non zero return code rc from DFHDBAT. The request is ignored.

Explanation: The module DFHDBAT returns a nonzero return code in reply to a request issued to DBCTL. DFHDBAT is a task-related user exit and forms part of the CICS-DBCTL interface.

System action: The request to DBCTL fails.

User response: See message DFHDB8110 for further guidance.

Module: DFHDBME

Destination: TERMCDBC

DFHDB8222 Connection has failed. DBCTL return code is rc.

Explanation: DBCTL rejects a request from CICS to connect to it.

System action: The connection does not proceed.

User response: See the *IMS Messages and Codes* for an explanation of the DBCTL return code.

Module: DFHDBME

Destination: TERMCDBC

DFHDB8223 DRA startup table with suffix xx cannot be found. Request is ignored.

Explanation: A connection request has been issued and the startup table with the suffix specified cannot be found.

System action: The connection does not proceed.

User response: If you were using the DBCTL Support Menu transaction, CDBC, check if you have mistyped the suffix value.

Place the DRA startup table in a CICS STEPLIB library. For guidance on how to do this, see the *CICS IMS Database Control Guide*.

Module: DFHDBME

Destination: TERMCDBC

DFHDB8224 Module DFSPRRC0 cannot be found. Connection cannot be done.

Explanation: The DRA router module, DFSPRRC0, could not be found during an attempt to connect to DBCTL.

System action: The connection does not proceed.

User response: Place the module DFSPRRC0 in a CICS STEPLIB library. For guidance on how to do this, see the *CICS IMS Database Control Guide*.

Module: DFHDBME

Destination: TERMCDBC

DFHDB8225I applid The DBCTL ID is xxxx. The DRA Startup Table suffix is xx.

Explanation: This message is issued from module DFHDBME when CDBC, the DBCTL support menu transaction, is used from the MVS operator's console. This message is issued from module DFHDBIQ when CDBI, the DBCTL support inquiry transaction, is used from the MVS operator's console.

System action: Processing continues.

User response: None.

Module: DFHDBME, DFHDBIQ

Destination: TERMCDBC

DFHDB8226 There was an error starting CDBT. Disconnection from DBCTL failed.

Explanation: An error has occurred, starting the disconnection transaction CDBT.

System action: The disconnection attempt fails.

User response: Look for earlier messages identifying the source of the error on the CDBC or CSMT transient data destinations. Check that the disconnection transaction CDBT is available. Check that the disconnection module DFHDBDSC is available.

Module: DFHDBME

Destination: TERMCDBC

DFHDB8227 There was an error linking to DFHDBCON. Connection to DBCTL failed.

Explanation: An attempt was made to connect to DBCTL but there was an error when linking to the connection module.

System action: The connection attempt fails.

User response: Look for earlier messages identifying the source of the error on the CDBC or CSMT transient data destinations. Check that module DFHDBCON is available.

Module: DFHDBME

Destination: TERMCDBC

DFHDB8228 The period (.) and subsequent characters have been removed.

Explanation: A comment was found at the end of the command. The CDBM transaction has removed the comment before sending the IMS command. Comments start with the period character (.) and continue to the end of the command.

System action: The IMS command is sent without the comment.

User response: None.

Module: DFHDBMP

Destination: Terminal End User

DFHDB8229 Spaces immediately after the CRC (/) have been removed.

Explanation: One or more spaces were found between the command recognition character (CRC) and the IMS verb. The default CRC is the oblique stroke (/). Spaces in this position would normally cause an IMS command to fail.

System action: The CDBM transaction removes the spaces before sending the IMS command.

DFHDB8230 • DFHDB8236

User response: None. The operator should not add spaces between the CRC and the command.

Module: DFHDBMP

Destination: Terminal End User

DFHDB8230 The key that you pressed has no meaning on this panel.

Explanation: The terminal operator has pressed the wrong key.

System action: CICS ignores the key pressed.

User response: Check the display of key functions at the bottom of the screen and try a valid key.

Module: DFHDBMP

Destination: Terminal End User

DFHDB8231 FORCE IMS LOG END OF VOLUME was not set to 1 or 2.

Explanation: When entering a /DBDUMP or /DBRECOVER IMS command, the value in the FORCE IMS LOG END OF VOLUME field must be set to either 1 or 2. If you select 1, which is the default, the command has the NOFEOV option set; this does not force IMS End Of LOG for this command. To override this, select option 2; the NOFEOV option is not added.

System action: The command is not sent.

User response: Choose option 1 or 2 and press Enter.

Module: DFHDBMP

Destination: Terminal End User

DFHDB8232 Initial CRC (/) was not found. Reenter the IMS command.

Explanation: The command recognition character (CRC) is expected at the start of the command line. The default CRC is the oblique stroke (/).

System action: The command is not sent.

User response: Reenter the command with the CRC as the initial character.

Module: DFHDBMP

Destination: Terminal End User

DFHDB8233 A second CRC (/) was found. Reenter the IMS command.

Explanation: The command field can accept only one command. A command must start with the command recognition character (CRC). The default CRC is the oblique stroke (/). A second CRC within the command field is not allowed and must be removed before the command is sent to IMS.

System action: The command is not sent.

User response: Correct the command field by removing the second command or correcting the command syntax.

Module: DFHDBMP

Destination: Terminal End User

DFHDB8234 An invalid wildcard was found. Reenter the IMS command.

Explanation: More than one database name contains a wildcard. You can use the asterisk (*) to refer to any number of characters, or the plus sign (+) to refer to a single character. However, in a command you can use wildcard characters in one database name only. Wildcards in more than one database name are not permitted and should be removed.

System action: The command is not sent.

User response: Remove the invalid wildcard. Either change the first wildcard string to include the database names matched by the second wildcard string, or explicitly name the databases. Alternatively issue the command with the first wildcard string, retrieve the command by pressing F9 (Retrieve) and replace the first wildcard string with the second. If there are other database names within the command, you may need to remove them before sending the command.

Module: DFHDBMP

Destination: Terminal End User

DFHDB8235 Incorrect wildcard position. Reenter the IMS command.

Explanation: You can use a wildcard character in a command only to refer to database names. In this case a wildcard character, an asterisk (*) or plus sign (+), has been wrongly positioned in the command.

System action: The command is not sent.

User response: Correct the command by moving the wildcard to a position where it can refer to a database name or names.

Module: DFHDBMP

Destination: Terminal End User

DFHDB8236 Invalid IMS command verb. Reenter the IMS command.

Explanation: The command has been rejected by IMS because the verb is not recognized as a valid IMS operator command.

System action: IMS rejects the command.

User response: Correct the command and press Enter.

Module: DFHDBMP

Destination: Terminal End User

DFHDB8237 Command not allowed. Enter a valid IMS command.

Explanation: This command has been rejected by IMS because it cannot be executed using the AIB interface used by CICS.

Certain IMS operator commands such as /MODIFY are not valid with the CDBM transaction and must be issued via the MVS console.

System action: IMS rejects the command.

User response: Enter a valid IMS operator command.

Module: DFHDBMP

Destination: Terminal End User

DFHDB8238 Command not authorized. Enter a valid IMS command.

Explanation: The command has been rejected by IMS because the application or user does not have the necessary authorization to execute the command as entered.

System action: IMS rejects the command.

User response: Get the necessary authorization and reissue the command.

Module: DFHDBMP

Destination: Terminal End User

DFHDB8239 aaaa call failed, AIB Return X'bbbb' Reason X'cccc'

Explanation: The command has been rejected by IMS.

System action: IMS rejects the command.

User response: For the IMS function code, examine the AIB return code and reason code to determine the cause of the error. See the *IMS/ESA Application Programming: Database Manager* manual, SC26-8015 for an explanation of these codes.

Module: DFHDBMP

Destination: Terminal End User

DFHDB8240 DBCTL not connected. Run CDBC to connect.

Explanation: CICS was unsuccessful in its attempt to schedule the program specific block (PSB) DFHDBMP before issuing the IMS command.

System action: The command is not sent.

User response: Ensure that the DBCTL system is

attached using the CICS supplied transaction CDBC.

Module: DFHDBMP

Destination: Terminal End User

DFHDB8241 PSB schedule unsuccessful. UIB return codes (X'aaaa')

Explanation: CICS was unsuccessful in its attempt to schedule the program specification block (PSB) DFHDBMP before issuing the IMS command.

System action: The command is not sent.

User response: Ensure that PSB DFHDBMP is available to your system. See the summary of abends and return codes in the *CICS IMS Database Control Guide* for an explanation of the UIB return codes.

Module: DFHDBMP

Destination: Terminal End User

DFHDB8242 Command in progress. Issue /DISPLAY command for status.

Explanation: The command sent to IMS has not returned a segment but has sent an acknowledgment.

System action: The IMS command is proceeding or has completed.

User response: Issue a /DISPLAY command to determine the status. Press F9 (Retrieve) to retrieve the IMS command and change the command to a /DISPLAY command. Alternatively press F12 (Cancel) and enter a new command to display the status.

Module: DFHDBMP

Destination: Terminal End User

DFHDB8243 No match has been found for wildcard (aaaaaaaa).

Explanation: CICS was unsuccessful in its attempt to match any IMS databases with the wildcard supplied.

System action: The command is not sent.

User response: Check the names of the databases required and/or the wildcard supplied.

Module: DFHDBMP

Destination: Terminal End User

DFHDB8244 The requested command cannot be found in the command file.

Explanation: The group command entered does not exist in the command file.

System action: No action

User response: Check that the group name and command were typed correctly. A list of all available

DFHDB8245 • DFHDB8252

commands can be found using the browse function in the group command maintenance section of CDBM.

Module: DFHDBMP

Destination: Terminal End User

DFHDB8245 The command file, DFHDBFK, cannot be opened.

Explanation: CDBM failed to open the command file, DFHDBFK.

System action: CDBM will not allow the user to enter the maintenance section.

User response: Determine the cause of the open failure, and correct the error. Retry selecting the maintenance option from within CDBM.

Module: DFHDBMP

Destination: Terminal End User

DFHDB8246 An error has occurred reading the command file, DFHDBFK.

Explanation: An error occurred whilst CDBM was trying to read a record from the command file, DFHDBFK.

System action: CDBM cannot read and execute the requested group command.

User response: Determine the cause of the read failure, and correct the error. Retry issuing the group command again from within CDBM.

Module: DFHDBMP

Destination: Terminal End User

DFHDB8247 Record not found.

Explanation: There was no record in the group command file, DFHDBFK, for the specified group and command.

System action: None.

User response: Browse the group command file to locate the correct record. If this message was issued during a browse request, clear the group and name fields and retry the browse.

Module: DFHDBMP

Destination: Terminal End User

DFHDB8248 End of file reached during browse. Press enter to wrap.

Explanation: The end of the file was reached during a browse request on the group command file, DFHDBFK.

System action: None.

User response: Press return to browse the group

command file from the beginning.

Module: DFHDBMP

Destination: Terminal End User

DFHDB8249 A record already exists for this command in this group.

Explanation: A record with a matching group and command names already exists in the group command file, DFHDBFK.

System action: A new group command record is not added to the group command file.

User response: Check the command name is correct. If it is, use a different group name.

Module: DFHDBMP

Destination: Terminal End User

DFHDB8250 A record must be read before updating.

Explanation: Before a record in the group command file, DFHDBFK, can be updated, it must first be read.

System action: The group command record is not updated in the group command file.

User response: Read the record and apply the changes before issuing an update request.

Module: DFHDBMP

Destination: Terminal End User

DFHDB8251 A record must be read before deletion.

Explanation: Before a record in the group command file, DFHDBFK, can be deleted, it must first be read.

System action: The record is not deleted from the group command file.

User response: Read the record before issuing a delete request.

Module: DFHDBMP

Destination: Terminal End User

DFHDB8252 Group and command must not be altered. Record not updated.

Explanation: The group and command fields must not be altered during a group command record update request.

System action: The record is not updated in the group command file, DFHDBFK.

User response: Add a new record with the required group and name fields. Delete the unwanted record.

Module: DFHDBMP

Destination: Terminal End User

DFHDB8253 Group and command must not be altered. Record not deleted.

Explanation: The group and command fields must not be altered during a group command record delete request.

System action: The record is not deleted from the group command file, DFHDBFK.

User response: Read the correct record before issuing a delete request.

Module: DFHDBMP

Destination: Terminal End User

DFHDB8254 Cannot update during browse. Read record to update.

Explanation: Before a record in the group command file, DFHDBFK, can be updated, it must first be read.

System action: The group command record is not updated in the group command file.

User response: Read the record and apply the changes before issuing an update request.

Module: DFHDBMP

Destination: Terminal End User

DFHDB8255 Cannot delete during browse. Read record to delete.

Explanation: Before a record in the group command file, DFHDBFK, can be deleted, it must first be read.

System action: The record is not deleted from the group command file.

User response: Read the record before issuing a delete request.

Module: DFHDBMP

Destination: Terminal End User

DFHDB8256 Both group and command must be specified.

Explanation: The group and command fields must both be specified when adding a new group command record to the group command file, DFHDBFK.

System action: A new group command record is not added to the group command file.

User response: Enter data in both the group and command fields and issue the add request.

Module: DFHDBMP

Destination: Terminal End User

DFHDB8257 Function invalid. Must be A, B, D, R or U.

Explanation: An action requested was not valid.

System action: None.

User response: Enter a valid action letter.

Module: DFHDBMP

Destination: Terminal End User

DFHDB8258 File {write / rewrite / delete / read / browse} failure. EIBRESP=eibresp, EIBRESP2=eibresp2.

Explanation: An unexpected error has occurred during a file operation on the group command file, DFHDBFK.

System action: The requested update to the group command file is not made.

User response: Determine the reason for the failure using the EIBRESP and EIBRESP2 values. Fix the cause of the error and retry the operation.

Module: DFHDBMP

Destination: Terminal End User

DFHDB8259 Group command, group command, {added / updated / deleted / read / browsed}.

Explanation: The operation indicated has been performed on the group command file, DFHDBFK.

System action: The group command file has been successfully modified.

User response: None.

Module: DFHDBMP

Destination: Terminal End User

DFHDB8260 Record length exceeds screen size.

Explanation: The record read from the group command file, DFHDBFK, was found to contain more data than could be displayed on the screen.

System action: None.

User response: The data set associated with the group command file, DFHDBFK, has been created with a larger record size than allowed. Recreate the data set with the correct record size, and reload the data.

Module: DFHDBMP

Destination: Terminal End User

DFHDB8290I DBCTL not connected to CICS.

Explanation: This message is issued when CICS is not connected to DBCTL.

If you are using the CDBC transaction, the DBCTL Support Menu transaction, then the message is issued from module DFHDBME.

If you are using the CDBI transaction, the DBCTL Support Inquiry transaction, the message is issued from module DFHDBIQ.

System action: Processing continues.

User response: None.

Module: DFHDBME, DFHDBIQ

Destination: TERMCDBC

DFHDB8291I DBCTL connect phase 1 in progress.

Explanation: CICS is in phase 1 of connecting to DBCTL and has not yet moved into phase 2 of connection processing.

If you are using the CDBC transaction, the DBCTL Support Menu transaction, this message is issued from module DFHDBME.

If you are using the CDBI transaction, the DBCTL Support Inquiry transaction, this message is issued from module DFHDBIQ.

System action: Processing continues.

User response: Press the PF2 key to refresh the status information on the screen. Check the CDBC transient data message destination for any other messages issued from CICS concerning the CICS-DBCTL interface.

Module: DFHDBME, DFHDBIQ

Destination: TERMCDBC

DFHDB8292I DBCTL connect phase 2 in progress.

Explanation: CICS is in phase 2 of connecting to DBCTL. (That is, phase 1 of connection has been completed and CICS has not yet heard from DBCTL that phase 2 of connection has been completed.)

If you are using the CDBC transaction, the DBCTL Support Menu transaction, this message is issued from module DFHDBME.

If you are using the CDBI transaction, the DBCTL Support Inquiry transaction, then this message is issued from module DFHDBIQ.

System action: Processing continues.

User response: Press the PF2 key to refresh the status information on the screen.

Check the CDBC transient data message destination for any other messages issued from CICS concerning the

CICS-DBCTL interface. Check that the DBCTL system you are trying to connect to has been initialized.

Check the MVS operator console for any IMS console messages that need a reply (for example, message DFS0690).

Module: DFHDBME, DFHDBIQ

Destination: TERMCDBC

DFHDB8293I DBCTL connected and ready.

Explanation: CICS is connected to DBCTL.

If you are using the CDBC transaction, the DBCTL Support Menu transaction, the message is issued from module DFHDBME.

If you are using the CDBI transaction, the DBCTL Support Inquiry transaction, the message is issued from module DFHDBIQ.

System action: Processing continues.

User response: Press the PF3 key to terminate the transaction.

Press the PF2 key to refresh the status information on the screen.

Check the CDBC transient data message destination for any other messages issued from CICS concerning the CICS-DBCTL interface.

Module: DFHDBME, DFHDBIQ

Destination: TERMCDBC

DFHDB8294I DBCTL orderly disconnect in progress.

Explanation: CICS is disconnecting from DBCTL in an orderly manner. (That is, all tasks using DBCTL from this CICS system will run to termination before CICS is disconnected from DBCTL.)

If you are using the CDBC transaction, the DBCTL Support Menu transaction, the message is issued from module DFHDBME.

If you are using the CDBI transaction, the DBCTL Support Inquiry transaction, the message is issued from module DFHDBIQ.

System action: Processing continues.

User response: Press the PF3 key to terminate the transaction.

Press the PF2 key to refresh the status information on the screen.

Check the CDBC transient data message destination for any other messages issued from CICS concerning the CICS-DBCTL interface.

Module: DFHDBME, DFHDBIQ

Destination: TERMCDBC

DFHDB8295I DBCTL immediate disconnect in progress.

Explanation: CICS is disconnecting from DBCTL immediately. (That is, all DL/I requests issued from this CICS system and currently being processed by DBCTL will complete before CICS is disconnected from DBCTL.)

If you are using the CDBC transaction, the DBCTL Support Menu transaction, this message is issued from module DFHDBME.

If you are using the CDBI transaction, the DBCTL Support Inquiry transaction, this message is issued from module DFHDBIQ.

If there is an IMS console message DFS0690 waiting for an operator reply, this message continues to be displayed until the operator replies to the IMS console message.

System action: Processing continues.

User response: Press the PF3 key to terminate the transaction.

Press the PF2 key to refresh the status information on the screen.

Check the CDBC transient data message destination for any other messages issued from CICS concerning the CICS-DBCTL interface.

Module: DFHDBME, DFHDBIQ

Destination: TERMCDBC

DFHDB8296I DBCTL cannot be connected to CICS.

Explanation: A failure has occurred in the CICS-DBCTL interface.

If you are using the CDBC transaction, the DBCTL Support Menu transaction, the message is issued from module DFHDBME.

If you are using the CDBI transaction, the DBCTL Support Inquiry transaction, the message is issued from module DFHDBIQ.

System action: Processing continues.

User response: Look for earlier messages identifying the source of the error by checking the CDBC transient data destination and checking any messages issued from DBCTL.

DFHDDnnnn messages

DFHDD0001 *applid* **An abend (code *aaa/bbbb*) has occurred at offset *X'offset'* in module *modname*.**

Explanation: An unexpected program check or abend occurred with abend code *aaa/bbbb*.

Module: DFHDBME, DFHDBIQ

Destination: TERMCDBC

DFHDB8297 *applid* **CICS/DBCTL CONNECTION BEING ATTEMPTED**

Explanation: This message only occurs when there is no recoverable service table (RST). CICS has attempted to connect to DBCTL but has failed on one or more occasions. DBCTL may not be running, or it may be restarting after a DBCTL abend.

System action: CICS continues to attempt to connect every 5 seconds. This message is reissued every minute for ten minutes or until connection is made.

If the connection is not made in ten minutes, CICS will stop attempting to connect and IMS message DFS0690 is issued. If the user replies WAIT to the IMS DFS0690 message, then the IMS DRA will take over responsibility for retrying the connection attempt. The TIMER parameter in the DRA startup table specifies how often the DRA will retry the connect to DBCTL.

User response: Check why DBCTL is not running. You can cancel the connection attempts using the CDBC transaction by issuing a disconnect request.

Module: DFHDXAX

Destination: Console

DFHDB8298 *applid* **An attempt has been made to connect to DBCTL via PLT phase 1. The request has been rejected.**

Explanation: The attempt to connect to DBCTL has been unsuccessful.

You are using a startup PLT and the request for DFHDBCON has been issued in PLT phase 1 processing. It can only be issued from PLT phase 2.

System action: Processing continues.

User response: Look at the source for your startup PLT. Ensure the DBCTL startup program (DFHDBCON) is after the statement specifying DFHDELIM.

Module: DFHDBME, DFHDBCON

XMEOUT Parameter: *applid*

Destination: Console

The program status word (PSW) at the time of the program check or abend indicated that CICS was executing at offset *X'offset'* in module *modname*. This may have been caused by corruption of CICS code or control blocks.

System action: A system dump is taken and the

DFHDD0002 • DFHDD0006

system attempts to continue operation unless otherwise directed by entries in the dump table.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Investigate the cause of the program check or abend using the system dump and any previously output diagnostic information provided by CICS, the access methods, or the operating system.

If you cannot resolve the problem, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHDDAP, DFHDDDM, DFHDDDI, DFHDDL0, DFHDDBR

XMEOUT Parameters: *applid, aaa/bbbb, X'offset', modname*

Destination: Console

DFHDD0002 *applid* **A severe error (code X'code') has occurred in module modname.**

Explanation: Directory Domain has received an unexpected error response from some other part of CICS. The operation requested by Directory Domain is described by code X'code'.

For further information about CICS exception trace entries, refer to the *CICS Problem Determination Guide*.

System action: A system dump is taken and the system attempts to continue operation unless specifically inhibited by dump table entries.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Investigate the cause of the problem as follows

1. Determine if the problem can be explained by any previous messages output from some other part of CICS.
2. Examine the symptom string.
3. Examine the dump.

If you cannot resolve the problem, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHDDAP, DFHDDDM, DFHDDDI, DFHDDL0, DFHDDBR

XMEOUT Parameters: *applid, X'code', modname*

Destination: Console

DFHDD0004 *applid* **A possible loop has been detected at offset X'offset' in module modname.**

Explanation: A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset X'offset'. This is

the offset of the instruction which was executing at the time the error was detected.

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHMDM). A message is issued to this effect.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Notify the system programmer. If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function that exceeds the runaway task time interval that you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module *modname* in the message is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname*, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. However you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHDDAP

XMEOUT Parameters: *applid, X'offset', modname*

Destination: Console

DFHDD0006 *applid* **Insufficient storage to satisfy Getmain (code X'code') in module modname. MVS code mvscod.**

Explanation: An MVS GETMAIN was issued by module *modname*, but there was insufficient storage available to satisfy the request.

The code X'code' is the exception trace point ID which uniquely identifies the place where the error was detected.

The code *mvscod* is the MVS GETMAIN return code.

System action: An exception entry is made in the trace table (code *X'code'*). A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMMDM). A message is issued to this effect.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: If CICS has been terminated by another module, look out for the relevant termination messages (from, for example, the domain manager), and look up the user response suggested for these messages.

If CICS is still running, the problem may be a temporary one which corrects itself if more storage becomes

available. If you can manage without module *modname*, you may decide to continue and bring CICS down at a convenient time to resolve the problem. If the message recurs or if you cannot run without the full use of all CICS modules, you should bring CICS down in a controlled shutdown.

You can get diagnostic information about the MVS return code by consulting the relevant MVS codes manual.

Try decreasing the size limits of the DSAs or EDSAs. Or, try increasing the size of the whole region, if it is not already at maximum size. See the *CICS System Definition Guide* or the *CICS Performance Guide* for further information on CICS storage.

Module: DFHDDAP

XMEOUT Parameters: *applid, X'code', modname, mvscode*

Destination: Console

DFHHDnnnn messages

DFHHD0001 *applid* **An abend (code *aaa/bbbb*) has occurred at offset *X'offset'* in module *modname*.**

Explanation: An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMMDM). A message is issued to this effect.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem. If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHHDHDH, DFHHDHDM, DFHHDHSL

XMEOUT Parameters: *applid, aaa/bbbb, X'offset', modname*

Destination: Console

DFHHD0002 *applid* **A severe error (code *X'code'*) has occurred in module *modname*.**

Explanation: An error has been detected in module *modname*. The code *X'code'* is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

System action: An exception entry (code *X'code'* in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for

DFH0004 • DFH0105

example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHDH004, DFHDH0105, DFHDHSL

XMEOUT Parameters: *applid, X'code', modname*

Destination: Console

DFH0004 *applid* **A possible loop has been detected at offset X'offset' in module modname.**

Explanation: A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset X'offset'. This is the offset of the instruction which was executing at the time the error was detected.

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Notify the system programmer. If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function, so there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the ICVR system initialization parameter, which is measured in milliseconds. This means that

module *modname* in the message is terminated and CICS continues.

But if you have specified ICVR=0 you consider that module *modname* is looping, you must terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname*, and you consider that it was not a runaway, you should increase the ICVR system initialization parameter. You can change the RUNAWAY time interval temporarily using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHDH004

XMEOUT Parameters: *applid, X'offset', modname*

Destination: Console

DFH0100I *applid* **Document domain initialization has started.**

Explanation: This is an informational message indicating that document domain initialization has started.

System action: System initialization continues.

User response: None. The message can be suppressed with the system initialization parameter MSGLVL=0.

Module: DFHDH010I

XMEOUT Parameter: *applid*

Destination: Console

DFH0101I *applid* **Document domain initialization has ended.**

Explanation: This is an informational message indicating that document domain initialization has completed successfully.

System action: System initialization continues.

User response: None. The message can be suppressed with the system initialization parameter MSGLVL=0.

Module: DFHDH010I

XMEOUT Parameter: *applid*

Destination: Console

DFH0105 *date time applid* **Document template definition doctemplate has been added as {PDS-MEMBER IFILE | PROGRAM | TSQUEUE | TDQUEUE | EXITPGM | HFSFILE}(resourcename) with template name templatenamename.**

Explanation: The document template definition *doctemplate* has been successfully added to the Document Handler domain. The template definition maps on to one of the following resources named *resourcename*

PDS-MEMBER

A member of a partitioned dataset

FILE A CICS file

PROGRAM

A CICS program

TSQUEUE

A CICS Temporary Storage queue

TDQUEUE

A CICS Transient Data queue

EXITPGM

A User-replaceable program that reads in a template of its own specification

HFSFILE

A file in the z/OS UNIX System Services Hierarchical File System (HFS).

The document template is assigned a template name of *templatename*.

System action: The definition is written to the CICS global catalog and will be restored on a CICS warm start.

User response: Application programs can now use the template using the name *templatename*.

Module: DFHDHTM

XMEOUT Parameters: *date, time, applid, doctemplate, {1=PDS-MEMBER, 2=FILE, 3=PROGRAM, 4=TSQUEUE, 5=TDQUEUE, 6=EXITPGM, 7=HFSFILE}, resourcename, templatename*

Destination: CSDH

DFH0106 *date time applid* **Document template definition *doctemplate* has been deleted.**

Explanation: The document template definition *doctemplate* has been successfully deleted from the Document Handler domain.

System action: The definition is removed from the CICS global catalog and will not be restored on a CICS warm start.

User response: Application programs can no longer use the template using the name *templatename*.

Module: DFHDHTM

XMEOUT Parameters: *date, time, applid, doctemplate*

Destination: CSDH

DFH0107I *date time applid* **DD statement *ddname* not found. DOCTEMPLATE *doctemplate* is not installed.**

Explanation: A document template definition specified a DDNAME value *ddname*, but a DD statement with that name was not present in the CICS JCL. The corresponding template data set cannot be opened.

System action: The document template *doctemplate* is not installed.

User response: Either restart CICS with a suitable template library allocated to DD name *ddname*, or use the ADYN transaction to allocate the library dynamically. The ADYN transaction is described in the *CICS Customization Guide*.

Module: DFHDHRP

XMEOUT Parameters: *date, time, applid, ddname, doctemplate*

Destination: Console

DFH0108I *date time applid* **Member *member* not found in *dsname*. DOCTEMPLATE *doctemplate* is not installed.**

Explanation: A document template definition specified a MEMBER name of *member*, but the data set *dsname* allocated to the specified DDNAME does not contain that member.

System action: The document template *doctemplate* is not installed.

User response: Add the specified member *member* to the data set named *dsname*. Then reinstall the document template.

Module: DFHDHRP

XMEOUT Parameters: *date, time, applid, member, dsname, doctemplate*

Destination: Console

DFHDMnnnn messages

DFHDM0001 *applid* An abend (code *aaa/bbbb*) has occurred at offset *X'offset'* in module *modname*.

Explanation: An abnormal end (abend) or program check has occurred in the module *modname*. This implies that there may be an error in CICS code.

Alternatively,

- Unexpected data has been input, or
- Storage has been overwritten.

The code *aaa/bbbb* is a three digit hexadecimal MVS code (if applicable), followed by a four digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Either CICS will continue unless you have specified in the dump table that CICS should terminate. This action will be taken by DFHDMIQ.

Or this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate. This action is taken by DFHDMDM, DFHDMDS and DFHDMWQ.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

Then look up the CICS alphanumeric code in this manual. This tells you, for example, whether the error was a program check, an abend, a runaway or something else and may give you some guidance concerning user response.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHDMDM, DFHDMEN, DFHDMENF, DFHDMIQ, DFHDMDS, DFHDMWQ

XMEOUT Parameters: *applid*, *aaa/bbbb*, *X'offset'*, *modname*

Destination: Console

DFHDM0002 *applid* A severe error (code *X'code'*) has occurred in module *modname*.

Explanation: An error has been detected in module

modname. The code *code* is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

For further information about CICS exception trace entries, refer to the *CICS Problem Determination Guide*.

System action: An exception entry (code *code* in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Either CICS will continue unless you have specified in the dump table that CICS should terminate. This action will be taken by DFHDMIQ.

Or, this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate. This action is taken by DFHDMDM, DFHDMDS and DFHDMWQ.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: This indicates a possible error in the CICS code. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHDMDM, DFHDMEN, DFHDMENF, DFHDMIQ, DFHDMDS, DFHDMWQ

XMEOUT Parameters: *applid*, *X'code'*, *modname*

Destination: Console

DFHDM0003 *applid* Insufficient storage to satisfy GETMAIN (code *X'code'*) in module *modname*.

Explanation: A CICS GETMAIN was issued by module *modname*, but there was insufficient storage available to satisfy the request.

The code *X'code'* is the exception trace point id which uniquely identifies the place where the error was detected.

This error has occurred above the 16Mb line.

System action: An exception entry is made in the trace table (code *code* in the message). A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Either CICS continues unless you have specified in the dump table that CICS should terminate. This action is taken by DFHDMIQ.

Or this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate. This action is taken by DFHDMDM and DFHDMWQ.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Try increasing the size limits of the DSAs or EDSAs. See the *CICS System Definition Guide* or the *CICS Performance Guide* for further information on CICS storage.

Module: DFHDMMDM, DFHDMIQ, DFHDMWQ

XMEOUT Parameters: *applid, X'code', modname*

Destination: Console

DFHDM0004 *applid* **A possible loop has been detected at offset X'offset' in module modname.**

Explanation: A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at *X'offset*. This is the offset of the instruction which was executing at the time the error was detected.

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Either CICS continues unless you have specified in the dump table that CICS should terminate. This action is taken by DFHDMIQ.

Or this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate. This action is taken by DFHDMMDM, DFHDMDS and DFHDMWQ.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of CPU time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that the module *modname* is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname* and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHDMMDM, DFHDMEN, DFHDMENF, DFHDMIQ, DFHDMDS, DFHDMWQ

XMEOUT Parameters: *applid, X'offset', modname*

Destination: Console

DFHDM0005 *applid* **A hardware error has occurred (module modname, code X'code'). The Time-of-Day clock is invalid.**

Explanation: A hardware error has occurred during the running of module *modname*. The MVS Store Clock facility is the timing mechanism for the operating system.

The code *code* is the exception trace point id which uniquely identifies the place where the error was detected.

System action: An exception entry (code *code* in the message) is made in the trace table. A dump is taken, unless you have specifically suppressed dumps in the dump table.

This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: This is in all probability a hardware error and you should in the first instance investigate the MVS Store Clock and find out whether it is working properly. If this is the cause, you should take the appropriate action to have it repaired or replaced.

In the unlikely event that this is not a hardware problem, you need further assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHDMMDM, DFHDMWQ, DFHDMDS

XMEOUT Parameters: *applid, modname, X'code'*

Destination: Console

DFHDM01011 *applid* **CICS is initializing.**

Explanation: This message is for information only.

CICS initialization has started. The domain (DM) manager is about to attach an initialization task for each domain defined in the local CICS catalog, DFHLCD.

System action: Processing continues.

User response: None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Module: DFHDMMDM

XMEOUT Parameter: *applid*

Destination: Console

DFHDM0102I *applid* CICS is quiescing.**Explanation:** This message is for information only.

The controlled shutdown of CICS has started. The domain (DM) manager is about to attach a quiesce task for each CICS component.

System action: Processing continues.**User response:** None. You can suppress this message with the SIT parameter, MSGLVL=0.**Module:** DFHDMMDM**XMEOUT Parameter:** *applid***Destination:** Console

DFHDM0103 *applid* Unsuccessful quiesce of *domain domain*. CICS will terminate.**Explanation:** A domain has failed to quiesce.**System action:** CICS terminates. An exception trace and a dump are issued by the domain in error.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.**Module:** DFHDMDS**XMEOUT Parameters:** *applid, domain***Destination:** Console

DFHDM0104 *applid* Unsuccessful load of program *domain*. CICS will terminate.**Explanation:** The domain (DM) manager has called the loader to load a program for an initialization task but the load has failed. The module is missing from the DFHRPL concatenation, possibly because the SDFHLOAD is missing. Alternatively, if the module name given in the message is not a legitimate CICS module, the CICS catalog could be corrupted.**System action:** CICS terminates. A system dump with dump code DM0006 is taken unless you have suppressed dumps in the dump table.

An exception trace is issued by the domain manager. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.**Module:** DFHDMMDM**XMEOUT Parameters:** *applid, domain***Destination:** Console

DFHDM0105 *applid* Unsuccessful initialization of *domain domain*. CICS will terminate.**Explanation:** A domain has failed to initialize.**System action:** CICS terminates.

Diagnostics are issued by the domain in error. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Review the diagnostics and take remedial action for any installation-related problems. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.**Module:** DFHDMDS**XMEOUT Parameters:** *applid, domain***Destination:** Console

DFHDM0106 *applid* The Domain Manager records on the CICS Catalog may have been corrupted.**Explanation:** A problem was detected when calling the CICS catalog to browse the domain (DM) manager records. For example, the domain manager records may not be present.

This message may follow message DFHDM0002.

System action: This is a critical error and CICS terminates, even if you have specified in the dump table that CICS should not terminate.

A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Try reinitializing the local CICS catalog, DFHLCD, using DFHCCUTL, and perform an initial start of CICS.If this does not solve the problem, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.**Module:** DFHDMMDM**XMEOUT Parameter:** *applid***Destination:** Console

DFHDPnnnn messages

DFHDP0001 *applid* An abend (code *aaa/bbbb*) has occurred at offset *X'offset'* in module *modname*.

Explanation: An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHDP1310).

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue and bring CICS down at a convenient time to resolve the problem.

If you cannot continue without the full use of module *modname* you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHDP*

XMEOUT Parameters: *applid, aaa/bbbb, X'offset', modname*

Destination: Console

DFHDP0002 *applid* A severe error (code *X'code'*) has occurred in module *modname*.

Explanation: An error has been detected in module *modname*. The code *X'code'* is the exception trace point id which uniquely identifies what the error is and where the error was detected.

System action: An exception entry (code *X'code'* in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHDPFM, DFHDPLM, DFHDPUM.

XMEOUT Parameters: *applid, X'code', modname*

Destination: Console

DFHDP0100 *applid* An unexpected exception response with reason code *X'code'* has been returned by CICS file control to module *modname*. The debugging profiles file, *filename*, is not usable.

Explanation: A call to CICS file control from a DP domain module has received an unexpected exception response from DFHF CFR. The reason code given in the message is the reason from the CFR parameter list on return from file control.

System action: The file given in the message is not usable.

The application debugging profiles manager will fail until

DFHDP0100

the problem has been corrected. If the CICS supplied transaction, CADP, is being used to define debugging profiles it will fail with an ADPA abend.

The meaning of the reason code in the message is given below

- X'08' (FCFR_CACHE_FAILURE)
There has been an input/output(IO) error trying to access the debugging profiles base file, DFHDPFMB, or path file, DFHDPFMP. Examine the console to find file control or VSAM messages that will indicate the reason for the error.
- X'15' (FCFR_DATASET_BEING_COPIED)
The data set for the debugging profiles file, DFHDPFMB, is currently unavailable because it is being copied. Retry when it becomes available.
- X'1F' (FCFR_FILE_DISABLED)
The file definition for the debugging profiles base data set, DFHDPFMB, or path data set, DFHDPFMP, is disabled. Enable the disabled file and retry.
- X'20' (FCFR_FILE_NOT_OPEN)
The file definition for the debugging profiles base data set, DFHDPFMB, or path data set, DFHDPFMP, cannot be opened. Examine the console to find file control or VSAM messages that will indicate the reason for the error.
- X'22' (FCFR_FILENOTFOUND)
A definition for the debugging profiles base file, DFHDPFMB, or path file, DFHDPFMP, could not be found. Sample definitions for these files are available and should be defined and installed before retrying.
- X'27' (FCFR_INSUFFICIENT_SPACE)
The debugging profiles base file, DFHDPFMB, is full. Investigate whether there are debugging profiles that can be deleted. Or, increase the storage allocation for the underlying VSAM data set, and recreate. Existing profiles could be backed up on another data set and then copied to the newly defined debugging profiles data set as part of the JCL to recreate it. To achieve this, replace REPRO INFILE with REPRO INDATASET in the JCL and replace SYS01 with the name of the data set containing the backed up profiles.
- X'2B' (FCFR_IO_ERROR)
There has been an IO error trying to access the debugging profiles base file, DFHDPFMB, or path file, DFHDPFMP. Examine the console to find file control or VSAM messages that will indicate the reason for the error.
- X'2D' (FCFR_ISC_NOT_SUPPORTED)
An attempt has been made to ship a file control request but ISC=NO for the system. Determine if ISC should be YES or if the file definition should be changed so that shipping is not required and retry.
- X'31' (FCFR_LOCKED)
An attempt has been made to write a record to the debugging profiles base file, DFHDPFMB, but a retained lock exists against the key of the record being written.
- X'32' (FCFR_LOST_LOCKS)
There has been an IO error trying to access the debugging profiles base file, DFHDPFMB, or path file, DFHDPFMP. Examine the console to find file control or VSAM messages that will indicate the reason for the error.
- X'33' (FCFR_LOCK_STRUCTURE_FULL)
There has been an IO error trying to access the debugging profiles base file, DFHDPFMB, or path file, DFHDPFMP. Examine the console to find file control or VSAM messages that will indicate the reason for the error.
- X'37' (FCFR_NOTAUTH)
The user is not authorized to use the debugging profiles base file, DFHDPFMB, or path file, DFHDPFMP. If the user should have access to the files, allow access and retry.
- X'39' (FCFR_PREVIOUS_RLS_FAILURE)
The debugging profiles file, DFHDPFMB, has been defined as record level sharing(RLS) but RLS is currently unavailable due to a failure. Investigate the reason for the RLS failure by looking for messages from file control and VSAM on the console. Retry when RLS is available.
- X'3B' (FCFR_READ_NOT_AUTHORISED)
The external security manager would not allow the debugging profiles base file, DFHDPFMB, or path file, DFHDPFMP, to be accessed. If the user should have access to the files, allow access and retry. .
- X'3D' (FCFR_RECLEN_EXCEEDS_LOGGER_BFSZ)
A journal referenced in the definition for the debugging profiles file, DFHDPFMB, is using an MVS which in turn, is using a coupling facility structure that has been defined with a MAXBUFSIZE parameter less than the recommended 64000. Redefine the coupling facility structure that the logstream is using with a MAXBUFSIZE parameter of 64000. The journal in error can be the forward recovery log or the journal used for auto-archiving.
- X'46' (FCFR_RLS_DISABLED)
The debugging profiles file, DFHDPFMB, has been defined as record level sharing(RLS) but RLS is currently disabled. Investigate why RLS is disabled by examining the console for file control and VSAM messages. Retry when RLS is available.
- X'47' (FCFR_RLS_FAILURE)
The debugging profiles file has been defined as record level sharing(RLS) but RLS is currently unavailable due to a failure. Investigate the reason for the failure by examining the console for file control and VSAM messages. Retry when RLS is available.
- X'4B' (FCFR_SERVREQ_VIOLATION)

The definition for the debugging profiles base file, DFHDPFMB, or path file, DFHDPFMP, does not allow all types of file request to be issued. Alter the file definitions to allow all file requests and retry.

- X'4E' (FCFR_SUPPRESSED)

A user exit has suppressed the writing of records to the debugging profiles base file, DFHDPFMB, or path file, DFHDPFMP. The exit should not be allowed to suppress records being written to these files. Correct the exit and retry.

- X'4F' (FCFR_SYSIDERR)

The SYSID for the file definition for the debugging profile base file, DFHDPFMB, or path file, DFHDPFMP, specifies a name that is neither the local CICS region nor a remote system defined to CICS by a CONNECTION definition. SYSIDERR can also occur if the link to the remote system is closed. Correct the SYSID or reopen the link and retry.

- X'52' (FCFR_TIMEOUT) A request to file control has timed out. Investigate the reason for the timeout by examining the console for messages.

- X'58' (FCFR_UPDATE_NOT_AUTHORISED)

The external security manager would not allow the debugging profiles base file, DFHDPFMB, or path file, DFHDPFMP, to be accessed. If the user should have access to the files, allow access and retry. .

- X'59' (FCFR_VSAM_REQUEST_ERROR)

There has been an IO error trying to access the debugging profiles base file, DFHDPFMB, or path file, DFHDPFMP. Examine the console to find file control or VSAM messages that will indicate the reason for the error.

User response: Investigate and correct the error based on the reason given and retry.

Module: DFHDPFM, DFHDPLM, DFHDPUM.

XMEOUT Parameters: *applid, X'code', modname, filename*

Destination: Console

DFHDP0200 *applid* **Debug Tool is back level. Language Environment Debugging profiles may be defined but not used on this system.**

Explanation: CICS is running with a level of Debug Tool which is older than Version 3.1.

System action: The CADP transaction and the web

interface can be used to define debugging profiles and they can be activated. However, Debug Tool will not be able to use these profiles.

User response: If you do not intend to perform Language Environment debugging on this system or you only want to use CADP and the web interface to define profiles for use on another CICS region which does have Debug Tool at least at the version 3.1 level, then no action is required. If the intention is to use Language Environment debugging profiles on this CICS, then Debug Tool version 3.1 or later must be installed.

Module: DFHDPLU

XMEOUT Parameter: *applid*

Destination: Console

DFHDP0300 *applid num* **debugging profile(s) have been inactivated.**

Explanation: The transaction CIDP or the program DFHDPIN has been run to inactivate all currently active debugging profiles. *num* debugging profiles have been inactivated.

System action: None.

User response: None.

Module: DFHDPIN.

XMEOUT Parameters: *applid, num*

Destination: Console

DFHDP0301 *applid* **The file DFHDPFMB is not available. No debugging profiles have been inactivated.**

Explanation: The transaction CIDP or the program DFHDPIN has been run to inactivate all currently active debugging profiles. It was not possible to inactivate the profiles as the CADP file DFHDPFMB was not available.

System action: Inactivation is canceled.

User response: Make the CADP file DFHDPFMB available and reissue the CIDP command.

Module: DFHDPIN.

XMEOUT Parameter: *applid*

Destination: Console

DFHDSnnnn messages

DFHDS0001 *applid* **An abend (code *aaa/bbbb*) has occurred at offset *X'offset'* in module *modname*.**

Explanation: An abnormal end (abend) or program check has occurred in module *modname*. This implies

that there may be an error in CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a three digit hexadecimal MVS code (if applicable), followed by a four digit

alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table. CICS continues unless you have specified in the dump table that CICS should terminate.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: If CICS is still running, it is necessary to decide whether to terminate CICS.

1. Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.
2. Next, look up the CICS alphanumeric code in this manual. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.
3. If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.
4. If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHDSAT, DFHDSBR, DFHSDM, DFHSDS2, DFHSDS3, DFHSDS4, DFHDSIT, DFHDSKE, DFHDSSM, DFHDSSR, DFHDSST, DFHDSTCB, DFHDSUE

XMEOUT Parameters: *applid, aaa/bbbb, X'offset', modname*

Destination: Console

DFHDS0002 *applid* A severe error (code *X'code'*) has occurred in module *modname*.

Explanation: An error has been detected in module *modname*. The code *X'code'* is the exception trace point id which uniquely identifies what the error is and where the error was detected. For further information about CICS exception trace entries, see the *CICS Problem Determination Guide*.

System action: An exception entry (code *code* in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Either CICS will continue unless you have specified in

the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message will be issued to this effect.

Or this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

The system action taken depends on the context.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Inform the system programmer. This indicates a possible error in CICS code. The severity of its impact will depend on the importance of the function being executed at the time of the error.

CICS may not have been terminated.

If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHDSAT, DFHDSBR, DFHSDM, DFHSDS2, DFHSDS3, DFHSDS4, DFHDSIT, DFHDSKE, DFHDSSM, DFHDSSR, DFHDSST, DFHDSTCB, DFHDSUE

XMEOUT Parameters: *applid, X'code', modname*

Destination: Console

DFHDS0003 *applid* Insufficient storage (code *X'code'*) in module *modname*.

Explanation: A CICS GETMAIN was issued by module *modname* but there was insufficient storage available to satisfy the request.

The code *X'code'* is the exception trace point id which uniquely identifies the place where the error was detected. This error has occurred above the 16M line.

System action: An exception entry is made in the trace table (code *code* in the message). A system dump is taken, unless you have specifically suppressed dumps in the dump table. CICS will continue unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message will be issued to this effect.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Inform the system programmer. If CICS has been terminated by another module, look out for the relevant termination messages (from, for example, the domain manager), and look up the user response suggested for these messages.

If CICS is still running, the problem may be a temporary one which will right itself if more storage becomes available. If you can manage without module *modname*, you may decide to continue and bring CICS down at a convenient time to resolve the problem. If the message recurs or if you cannot run without the full use of all CICS modules, you should bring CICS down in a controlled shutdown.

Try increasing the overall size limits of the DSAs or EDSAs. If CICS is not already terminated, you will need to bring CICS down to do this. See the *CICS System Definition Guide* or the *CICS Performance Guide* for more information on CICS storage.

You may need further assistance from IBM to fully resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHDSBR

XMEOUT Parameters: *applid, X'code', modname*

Destination: Console

DFHDS0004 *applid* **A possible loop has been detected at offset *X'offset'* in module *modname*.**

Explanation: A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset *X'offset'*. This is the offset of the instruction which was executing at the time the error was detected.

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table. CICS will continue unless you have specified in the dump table that CICS should terminate. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Inform the system programmer. If CICS has not been terminated, it will be necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of CPU time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS will purge a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module *module* will be terminated and CICS will continue.

But if you have declared ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you will have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname*, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You will have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHDSAT, DFHDSBR, DFHSDSM, DFHSDS2, DFHSDS3, DFHSDS4, DFHDSIT, DFHDSKE, DFHDSSM, DFHDSSR, DFHDSST, DFHDSTCB, DFHDSUE

XMEOUT Parameters: *applid, X'offset', modname*

Destination: Console

DFHDS0005 *applid* **A hardware error has occurred (code *X'code'*, module *modname*). The Time-of-Day clock is invalid.**

Explanation: A hardware error has occurred during the running of module *module*. The MVS Store Clock facility is the timing mechanism for the operating system.

The code *X'code'* is the exception trace point ID which uniquely identifies the place where the error was detected.

System action: An exception entry (code *code* in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table. This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Inform the system programmer. This is in all probability a hardware error and you should in the first instance investigate the MVS Store Clock and find out whether it is working properly. If this is the cause, you should take the appropriate action to have it repaired or replaced.

In the unlikely event that this is not a hardware problem, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHDSTCB

XMEOUT Parameters: *applid, X'code', modname*

Destination: Console

DFHDS0006 *applid* **Insufficient storage to satisfy GETMAIN (code *X'code*) in module *modname*. MVS code *mvscode*.**

Explanation: An MVS GETMAIN was issued by module *modname* but there was insufficient storage available to satisfy the request.

The code *code* is the exception trace point ID which uniquely identifies the place where the error was detected.

This error may occur either above or below the 16M line. This depends on context.

The code *mvscode* is the MVS GETMAIN return code.

System action: An exception entry is made in the trace table (code *code* in the message). A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Either CICS will continue unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message will be issued to this effect.

Or this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

The system action depends on the context.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Inform the system programmer. If CICS has been terminated by another module, look out for the relevant termination messages (from, for example, the domain manager), and look up the user response suggested for these messages.

If CICS is still running, the problem may be a temporary one which will right itself if more storage becomes available. If you can manage without module *modname*, you may decide to continue and bring CICS down at a convenient time to resolve the problem. If the message recurs or if you cannot run without the full use of all CICS modules, you should bring CICS down in a controlled shutdown.

You can get diagnostic information about the MVS return code by consulting the relevant MVS codes manual which is listed in the book list at the front of this book.

Try decreasing the overall size limits of the DSAs or EDSAs. Or, try increasing the size of the whole region, if it is not already at maximum size. If CICS is not already terminated, you will need to bring CICS down to do this. See the *CICS System Definition Guide* or the *CICS Performance Guide* for more information on CICS storage.

You may need further assistance from IBM to fully resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHDSAT, DFHDSDM, DFHSDS2, DFHDSSR

XMEOUT Parameters: *applid, X'code',modname, mvscode*

Destination: Console

DFHDS0010 *applid* **Kill request accepted for transaction id *transid*, transaction number *tranum*, userid *userid*.**

Explanation: A request to kill a CICS task has been accepted.

System action: The CICS task has been marked to be killed. The kill will be actioned as soon as possible. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Check for subsequent messages or abend codes to determine the state of the task when the kill was actioned and the possible repercussions of the kill.

Module: DFHDSAT

XMEOUT Parameters: *applid, transid,tranum, userid*

Destination: Console

DFHDS0011 *applid* **Kill request reaccepted for transaction id *transid*, transaction number *tranum*, userid *userid*.**

Explanation: A request to kill a CICS task has been reaccepted. A kill has previously been accepted for this task but has not been actioned yet.

System action: The CICS task has been marked to be killed. The kill will be actioned as soon as possible. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Check for subsequent messages or abend codes to determine the state of the task when the kill was actioned and the possible repercussions of the kill.

Module: DFHDSAT

XMEOUT Parameters: *applid, transid,tranum, userid*

Destination: Console

DFHDS0101 *applid* **Dispatcher cannot enable the CICS post exit.**

Explanation: The dispatcher has been unable to gain authorization to enable the CICS post exit. This is probably because the CICS SVC number has been defined incorrectly in the SIT.

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Check to see whether the CICS SVC number has been defined correctly in the SIT and the SIT overrides.

Check that the SVC and other code has been correctly installed as described in the *CICS Transaction Server for z/OS Installation Guide*. In particular, ensure that the CICS post-exit stub (DFHDSPEX) is in the LPA.

Module: DFHDSDM

XMEOUT Parameter: *applid*

Destination: Console

DFHDUnnnn messages

DFHDU0001 *applid* An abend (code *aaa/bbbb*) has occurred at offset *X'offset'* in module *modname*.

Explanation: An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a three digit hexadecimal MVS code (if applicable), followed by a four digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action: An exception entry is made in the trace table.

For module DFHDUDT, a system dump is taken unless you have specifically suppressed the dumps (by a user exit program at the XDUREQ exit, in the dump table or by global system dump suppression). CICS processing continues unless you have specified in the dump table that CICS should terminate.

For module DFHDUTM, a system dump is taken. This dump cannot be suppressed. CICS processing continues.

For module DFHDUDU, a system dump cannot be taken as doing so could cause CICS to loop. CICS processing continues.

For other modules, a system dump is taken.

CICS processing continues.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant

MVS codes manual which is detailed in the book list in the front of this manual.

Then look up the CICS alphanumeric code in this manual. This tells you, for example, whether the error was a program check, an abend, a runaway or a recovery percolation, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

If the abend occurred in modules DFHDUDT or DFHDUTM, the dump table is not available. Therefore, any EXEC API commands relating to dump codes fail and any dumps taken are processed using default information (for example, whether to terminate CICS or not) rather than information you may have put on the dump table for specific dump codes.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHDUDT, DFHDUTM, DFHDUDU, DFHDUXD, DFHDUIO, DFHDUSU, DFHDUXW, DFHPCXDF, DFHSAXDF, DFHDLXDF, DFHXDXDF, DFHXRDXDF, DFHTCXDF, DFHTRXDF, DFHFCXDF

XMEOUT Parameters: *applid*, *aaa/bbbb*, *X'offset'*, *modname*

Destination: Console

DFHDU0002 *applid* A severe error (code *X'code'*) has occurred in module *modname*.

Explanation: An error has been detected in module *modname*. The code *code* is the exception trace point ID which uniquely identifies what the error is and where the error was detected. For further information about CICS exception trace entries, refer to the *CICS Problem Determination Guide*.

System action: An exception entry (code *code* in the message) is made in the trace table.

For module DFHDUDT, a system dump is taken unless you have specifically suppressed the dumps (by a user exit program at the XDUREQ exit, in the dump table or by global system dump suppression). CICS processing continues unless you've specified in the dump table that CICS should terminate.

For module DFHDUTM, a system dump is taken. This dump cannot be suppressed. CICS processing continues.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller. A message will be issued to this effect.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Inform the system programmer. This indicates a possible error in CICS code. The severity of its impact will depend on the importance of the function being executed at the time of the error.

CICS may not have been terminated.

If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

If the error occurred in modules DFHDUDT or DFHDUTM, the dump table may not be available. Therefore, any EXEC API commands relating to dump codes may fail and any dumps taken may be processed using default information (for example, whether to terminate CICS or not) rather than information you may have put on the dump table for specific dump codes.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHDUDT, DFHDUTM

XMEOUT Parameters: *applid, X'code', modname*

Destination: Console

DFHDU0004 *applid* A possible loop has been detected at offset *X'offset'* in module *modname*.

Explanation: A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset *X'offset'*. This is the offset of the instruction which happened to be executing at the time when the error was detected.

System action: An exception entry is made in the trace table.

For module DFHDUDT, a system dump is taken unless you have specifically suppressed the dumps (by a user exit program at the XDUREQ exit, in the dump table or by global system dump suppression). CICS processing continues unless you have specified in the dump table that CICS should terminate.

For module DFHDUTM, a system dump is taken. This dump cannot be suppressed. CICS processing continues.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Notify the system programmer. If CICS has not been terminated, it will be necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of CPU time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS will purge a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module *modname* will be terminated and CICS will continue.

If you have declared ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you will have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname*, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You will have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHDUDT, DFHDUTM, DFHDUXD, DFHDUIO, DFHDUSU, DFHDUXW, DFHPCXDF, DFHSAXDF, DFHDLXDF, DFHXDXDF, DFHXRXDF, DFHTCXDF, DFHTRXDF, DFHFCXDF

XMEOUT Parameters: *applid, X'offset', modname*

Destination: Console

DFHDU0006 *applid* Insufficient storage to satisfy Getmain (code *X'code'*) in module *modname*. MVS code *mvscode*.

Explanation: An MVS GETMAIN was issued module *modname*, but there was insufficient storage available to satisfy the request.

The code *X'code'* is the exception trace point id which uniquely identifies the place where the error was detected. This error has occurred above the 16M line.

The code *mvscode* is the MVS GETMAIN return code.

System action: An exception entry is made in the trace table (code *code* in the message) and a system dump is taken. This dump cannot be suppressed. CICS processing continues.

User response: Inform the system programmer. If CICS has been terminated by another module, look out for the relevant termination messages (from, for example, the domain manager), and look up the user response suggested for these messages.

If CICS is still running, the problem may be a temporary one which will right itself if more storage becomes available. If you can manage without module *modname*, you may decide to continue and bring CICS down at a convenient time to resolve the problem. If the message recurs or if you cannot run without the full use of all CICS modules, you should bring CICS down in a controlled shutdown.

As the problem is in module DFHDUTM, EXEC API commands for browsing the dump tables may not work, or additions to the dump tables may not work.

You can get diagnostic information about the MVS return code by consulting the relevant MVS codes manual which is listed in the book list at the front of this book.

Try decreasing the size limit of the DSAs or EDSAs. Or, try increasing the size of the whole region, if it is not already at maximum size. If CICS is not already terminated, you need to bring CICS down to do this.

Module: DFHDUTM

Destination: Console

DFHDU0102 *applid* **DFHUIO could not be loaded. Transaction dump is inoperative.**

Explanation: CICS could not locate module DFHUIO during initialization.

System action: An exception trace entry is produced, and CICS continues with the transaction dump facility inoperative.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Use the exception trace entry and any other relevant messages to determine why module DFHUIO was not available.

Module: DFHDUDM

XMEOUT Parameter: *applid*

Destination: Console

DFHDU0103 *applid* **An abend has occurred during initialization of dump domain in module DFHDUDM.**

Explanation: A dump domain has failed to initialize.

System action: CICS terminates.

An exception trace and a kernel dump are issued by the dump domain. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHDUDU

XMEOUT Parameter: *applid*

Destination: Console

DFHDU0201 *applid* **About to take SDUMP. Dumpcode: *dumpcode*, Dumpid: *dumpid*.**

Explanation: An error, possibly signalled by a previous message, has caused a call to the CICS dump (DU) domain. Dump domain will issue this message immediately before calling the MVS SDUMP facility if the following conditions are satisfied

- The SIT option, DUMP=YES, for SDUMPS has been specified.
- The dump table entry for dump code *dumpcode* specifies that a system SDUMP is required.
- The maximum dump limit for this dump code in the dump table entry has not been exceeded.
- The user exit XDUREQ does not suppress the taking of this dump.

The dump code *dumpcode* is an 8-character system dump code identifying the CICS problem. However some of these characters may be blanks. A system dump code is a CICS message number with the DFH prefix removed.

The dumpid *dumpid* is the unique 9-character string identifying this dump.

System action: When the dump is complete, message number DFHDU0202 is issued.

User response: Inform the system programmer, who should refer to the CICS message indicated by *dumpcode* to resolve the problem.

Module: DFHDUDU

Destination: Console

DFHDU0202 *applid* SDUMP complete.

Explanation: This message is issued on successful completion of an SDUMP.

System action: Processing continues unless a CICS shutdown is requested by either the dump table entry for this dump or the dump call to the dump (DU) domain.

User response: Print off the system dump if required. A previous MVS message identifies in which SYS1.DUMP data set this dump can be found.

Module: DFHDUDU

Destination: Console

DFHDU0203I *date time applid* A transaction dump was taken for **dumpcode:** *dumpcode*, **Dumpid:** *dumpid*.

Explanation: A CICS transaction has abnormally terminated, possibly signalled by a previous message, and the CICS dump (DU) domain has taken a transaction dump.

The dump code *dumpcode* is normally the 4-character CICS transaction abend code if the dump was requested as a result of a transaction abend. It may also be the value of the DUMPCODE operand on an EXEC CICS DUMP TRANSACTION request.

The dump ID *dumpid* is the unique 9-character string identifying this dump

System action: A transaction dump is written to the current CICS dump data set, either DFHDMPA or DFHDMPB.

CICS may terminate if the dump table entry for the specified abend code specifically requests it.

User response: Print off the transaction dump if required.

Module: DFHDUDU

XMEOUT Parameters: *date, time, applid, dumpcode, dumpid*

Destination: CDUL

DFHDU0205 *applid* A system dump for **dumpcode:** *dumpcode* was suppressed by the *reason*.

Explanation: An error, possibly signalled by a previous message, has caused a call to the CICS (DU) dump domain, which failed to take a system dump for reason *reason*. Reason *reason* indicates what has caused dump suppression.

- The XDUREQ user exit.
- The dump table option for dump code *dumpcode*.
- The global system dump suppression option.

The dump code *dumpcode* is an 8-character system dump code identifying the CICS problem. However some of these characters may be blanks. A system dump code is a CICS message number with the DFH prefix removed.

System action: A system dump is not produced. However, CICS is terminated if the dump table entry for this dump code or the caller of the dump domain requests CICS termination.

User response: If a system dump is required for this dump code, perform the user action appropriate to the reason *reason* given in the message.

- If the user exit XDUREQ has suppressed the dump, either inactivate this exit, or as a more permanent measure change the user exit program not to suppress the dump.
- If the dump table has suppressed the dump, use CEMT or CECI to browse and update the dump table entry for dump code *dumpcode*.
- If the global system dump suppression option has suppressed the dump, specify DUMP=YES on the SIT to allow future system dumps to be taken.
The SIT DUMP option can be over-ridden by using CEMT or the system programming interface for SET SYSTEM DUMPING (NOSYSDUMPISYSDUMP).

Module: DFHDUDU

Destination: Console

DFHDU0206I *date time applid* A transaction dump for **dumpcode** *dumpcode* was suppressed by the *reason*.

Explanation: A CICS transaction has abnormally terminated, possibly signalled by a previous message, and the CICS dump (DU) domain has failed to take a transaction dump for the reason *reason*. Reasons *reason* indicates the reason for dump suppression.

- XDUREQ user exit.
- Dump table option for this dump code.

The dump code *dumpcode* is the 4-character CICS transaction abend code.

System action: A transaction dump is not produced. However, CICS is terminated if the dump table entry for this dump code or the caller of the dump domain specifically requests such.

User response: If a transaction dump is required for this dump code, perform the user action appropriate to the reason *reason* given in the message.

- If the user exit, XDUREQ, has suppressed the dump, either inactivate this exit, or as a more permanent measure, change the user exit program so that it does not suppress the dump.
- If the dump table has suppressed the dump, use CEMT or CECI to browse and update the dump table entry for dump code *dumpcode*.

Module: DFHDUDU

XMEOUT Parameters: *date, time, applid, dumpcode, reason*

Destination: CDUL

DFHDU0207I *date time applid* **Transaction and system dumps for dumpcode: *dumpcode* were suppressed by the *reason*.**

Explanation: Either an EXEC CICS DUMP TRANSACTION DUMPCODE command has been issued, or a CICS transaction has abnormally terminated, possibly signalled by a previous message, and the CICS dump (DU) domain has failed to take a transaction dump nor a system dump for reason *reason*. Reasons *reason* indicates what caused dump suppression.

- XDUREQ user exit.
- Dump table option for this dump code.

The dump code *dumpcode* is the 4-character CICS transaction abend code.

System action: Neither a transaction nor a system dump is produced. However, CICS is terminated if the dump table entry for this dump code or the caller of the dump domain makes such a request.

User response: If a transaction dump and/or a system dump is required for this dump code, perform the user action appropriate to the reason *reason* given in the message

- If the user exit XDUREQ has suppressed the dump, either inactivate this exit, or, as a more permanent measure change, the user exit program so it does not suppress the dump.
- If the dump table has suppressed the dump, use CEMT or CECI to browse and update the dump table entry for this dump code.

Module: DFHDUDU

XMEOUT Parameters: *date, time, applid, dumpcode, reason*

Destination: CDUL

DFHDU0208 *applid* **SDUMP busy - CICS will retry in five seconds.**

Explanation: At the time of the MVS SDUMP request issued by CICS, another address space in the same MVS system was in the process of taking an SDUMP. This caused MVS to reject the new request. A non-zero value for the DURETRY parameter on the SIT means that CICS is waiting for five seconds before reissuing the SDUMP request.

System action: CICS issues an MVS STIMERM macro which caused CICS to stop for five seconds. The request is reissued when the delay interval has expired. CICS will delay and retry every five seconds for a total

time equal to the number of seconds specified on the DURETRY SIT parameter.

User response: None.

Module: DFHDUDU

Destination: Console

DFHDU0209 *applid* **Retrying SDUMP.**

Explanation: At the time of the MVS SDUMP request issued by CICS, another address space in the same MVS system was in the process of taking an SDUMP. This caused MVS to reject the new request. CICS has waited for five seconds (as indicated by message DFHDU0208) and is now about to reissue the SDUMP request.

System action: CICS reissues the SDUMP request.

User response: None.

Module: DFHDUDU

Destination: Console

DFHDU0210 *applid* **SDUMPX REQUEST FAILED - *reason*.**

Explanation: An MVS SDUMPX request from CICS signalled by message DFHDU0201 has failed to complete successfully. The possible reasons, (*reason*) for the failure are as follows

**SDUMPX RETURN CODE X'nn REASON X'mm
SDUMPX BUSY**

At the time of the MVS SDUMPX request issued by CICS, another address space in the same MVS system was in the process of taking an SDUMP. This causes MVS to reject the new request. If a nonzero value is specified for the DURETRY SIT parameter, CICS retries the SDUMPX request every five seconds for the specified period. This message is only issued if SDUMPX is still busy after the final retry.

**SDUMPX RETURN CODE X'nn REASON X'mm NO
DATA SET AVAILABLE**

No SYS1.DUMP data sets were available at the time the SDUMPX request was issued.

SDUMPX RETURN CODE X'nn REASON = X'mm

MVS has rejected the SDUMPX request for some other reason than those listed above. X'nn gives the SDUMPX return code and X'mm gives the SDUMPX reason code.

STIMERM FAILED

In order to delay for five seconds before retrying SDUMPX after an SDUMPX BUSY condition, CICS issues an MVS STIMERM macro request. MVS has indicated that the STIMERM request has failed.

NOT AUTHORIZED IN CICS

SDUMP is not authorized for this CICS run.

INSUFFICIENT STORAGE

CICS issued an MVS GETMAIN for Subpool 253 storage during the processing of the SDUMPX request. The GETMAIN has been rejected by MVS.

DFHDUSVC FESTAE FAILED

CICS issued an MVS FESTAE request from DFHDUSVC during the processing of the SDUMPX request. The FESTAE has been rejected by MVS.

**IWMWQWRK RETURN CODE X'xx REASON X'yy
REMOTE DUMPS NOT TAKEN**

CICS issued an MVS IWMWQWRK request during the processing of the SDUMPX request for dumps of related CICS systems. The IWMWQWRK request has been rejected by MVS return code X'xx and reason X'yy. In this case CICS was unable to dump related CICS address spaces but has attempted to dump the local address space.

DFHDUSVC INVALID PROBDASC

The SDUMPX PROBDASC parameters, created by DFHDUSVC, contain invalid data.

System action: CICS proceeds as if the dump had been successful.

User response: The user response depends on the reason, (*reason*), for the failure.

**SDUMPX RETURN CODE X'nn ONLY PARTIAL
DUMP.**

See the *OS/390 MVS Programming: Authorized Assembler Services Reference* for an explanation of the SDUMPX return code X'nn. Use MVS problem determination methods to determine why a partial dump was taken.

**SDUMPX RETURN CODE X'nn REASON X'mm
SDUMPX BUSY**

Cause the SDUMP to be reissued after, if appropriate, increasing the value of the DURETRY system initialization parameter. See the *OS/390 MVS Programming: Authorized Assembler Services Reference* for an explanation of the SDUMPX return code X'nn and reason X'mm.

**SDUMPX RETURN CODE X'nn REASON X'mm NO
DATA SET AVAILABLE**

Clear a SYS1.DUMP data set and then cause the SDUMP request to be reissued. See the *OS/390 MVS Programming: Authorized Assembler Services Reference* for an explanation of the SDUMPX return code X'nn and reason X'mm.

SDUMPX RETURN CODE X'nn REASON X'mm

No action is required if the dump was suppressed deliberately. If the dump has failed

because of an error in the MVS SDUMP routine, use MVS problem determination methods to fix the error and then cause the SDUMP request to be reissued. See the *OS/390 MVS Programming: Authorized Assembler Services Reference* for an explanation of the SDUMPX return code X'nn and reason code X'mm

STIMERM FAILED

Use MVS problem determination methods to fix the STIMERM failure and then cause the SDUMP request to be reissued.

NOT AUTHORIZED IN CICS

This reason is unlikely to occur because SDUMPX is unconditionally authorized during CICS initialization, and should be authorized throughout the CICS run. If you do get this reason, the CICS AFCB (authorized function control block) has probably been accidentally overwritten.

INSUFFICIENT STORAGE

Ensure sufficient storage is available to MVS for subpool 253 requests.

DFHDUSVC FESTAE FAILED

Use MVS problem determination methods to fix the FESTAE failure and then cause the SDUMP request to be reissued. See the *OS/390 MVS Programming: Authorized Assembler Services Reference* for an explanation of the FESTAE macro.

IWMWQWRK RETURN CODE X'xx REASON X'yy.

CICS issued an MVS IWMWQWRK request during the processing of the SDUMPX request. The IWMWQWRK request has been rejected by MVS return code X'xx and reason X'yy. See the *OS/390 MVS Programming: Authorized Assembler Services Reference* for an explanation of the return and reason codes.

DFHDUSVC INVALID PROBDASC

The SDUMPX PROBDASC parameters, created by DFHDUSVC during the processing of the SDUMPX request, are invalid. The PROBDASC parameters have probably been accidentally overwritten.

Module: DFHDUDU

Destination: Console

DFHDU0211 *applied* **THE XDUREQ USER EXIT IS NOT CALLED FOR DUMPCODE** *dumPCODE.*

Explanation: Because of a severe system error, the XDUREQ user exit (which allows you to suppress system dumps) has not been called for system dump *dumPCODE.*

System action: The XDUREQ user exit is not called. DFHDU0211 is followed either by message

DFHDU0201, indicating that dump *dumpcode* was taken, or by message DFHDU0205, indicating that dump *dumpcode* was suppressed. Message DFHDU0201 or DFHDU0205 is followed by message DFHDU0309 if CICS terminates.

The XDUREQ user exit is called for subsequent system dumps.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHDUDU

Destination: Console

DFHDU0212 *applid* Requested transaction dump code *dumpcode* is invalid.

Explanation: A requested transaction dump code has unprintable characters, or has leading or imbedded blanks.

System action: A transaction dump is produced unless suppressed by the user exit XDUREQ. However, no dump statistics are committed. The transaction dump is complete when message DFHDU0203 is issued. The invalid dump code is shown in dump domain (DU) trace points X'0600 and X'0601.

User response: Print off the transaction dump and determine how an abend or EXEC CICS request was issued with an invalid dump code.

Module: DFHDUDU

XMEOUT Parameters: *applid*, *dumpcode*

Destination: Console

DFHDU0213 REMOTE SDUMPX REQUEST FAILED - *reason*.

Explanation: A remote MVS SDUMPX request from CICS has failed to complete successfully. The possible reasons, (*reason*) for the failure are as follows

DFHDUMPX AUTOMATIC STORAGE GETMAIN FAILED.

CICS issued an MVS GETMAIN for Subpool 253 storage during the processing of the SDUMPX request. The GETMAIN has been rejected by MVS.

DFHDUMPX NOT RUNNING IN THE MASTER ADDRESS SPACE.

DFHDUMPX must run in the MASTER address space. CICS stops processing the remote SDUMPX request if it detects that DFHDUMPX is running in another address space.

IWMWQWRK FOUND NO ADDRESS SPACES TO DUMP.

The MVS IWMWQWRK service found no CICS

address spaces with work relating to the remote SDUMPX request.

IWMWQWRK FAILED WITH A WARNING.

CICS issued an MVS IWMWQWRK request from DFHDUMPX during the processing of the remote SDUMPX request. MVS has rejected the IWMWQWRK request with a warning return code.

IWMWQWRK FAILED WITH AN ERROR.

CICS issued an MVS IWMWQWRK request from DFHDUMPX during the processing of the remote SDUMPX request. MVS has rejected the IWMWQWRK request with an error return code.

DFHDUMPX OUTPUT WORKAREA GETMAIN FAILED

CICS issued an MVS GETMAIN for Subpool 253 storage during the processing of the SDUMPX request. The GETMAIN has been rejected by MVS.

DFHDUMPX RECOVERY ROUTINE ENTERED

An abnormal end (abend) or program check has occurred in DFHDUMPX. This implies that there is an error in CICS code.

Alternatively, unexpected data has been input, or storage has been overwritten.

CICS adds diagnostic data to the MVS SDWA and makes an entry in SYS1.LOGREC.

System action: CICS proceeds as if the dump had been successful.

User response: The user response depends on the reason, (*reason*), for the failure.

DFHDUMPX AUTOMATIC STORAGE GETMAIN FAILED.

Ensure sufficient storage is available to MVS for subpool 253 requests.

DFHDUMPX NOT RUNNING IN THE MASTER ADDRESS SPACE.

This reason is unlikely to occur because CICS requests that the MVS CSVDYNEX service adds DFHDUMPX as an IEASDUMP.QUERY exit in the MASTER address space.

If you do get this reason, there was probably an error during CICS initialization.

Notify the system programmer.

You will need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

IWMWQWRK FOUND NO ADDRESS SPACES TO DUMP.

This is unlikely to be an error. DFHDUMPX is invoked on all the MVS images in a SYSPLEX for a remote SDUMPX request. Some of the

images may not have any CICS address spaces with work relating to the CICS system which originated the remote SDUMPX request.

IWMWQWRK FAILED WITH A WARNING.

The IWMWQWRK return code and reason are included in a CICS trace entry which is written to the GTF data set. The trace entry is not written to the CICS internal trace or in the CICS auxiliary trace data set because DFHDUMPX does not execute under a CICS TCB.

See the *OS/390 MVS Programming: Authorized Assembler Services Reference* for an explanation of the IWMWQWRK return code and reason.

IWMWQWRK FAILED WITH AN ERROR.

The IWMWQWRK return code and reason are included in a CICS trace entry which is written to the GTF data set. The trace entry is not written to the CICS internal trace or in the CICS auxiliary trace data set because DFHDUMPX does not execute under a CICS TCB.

See the *OS/390 MVS Programming: Authorized Assembler Services Reference* for an explanation of the IWMWQWRK return code and reason.

DFHDUMPX OUTPUT WORKAREA GETMAIN FAILED

Ensure sufficient storage is available to MVS for subpool 253 requests.

DFHDUMPX RECOVERY ROUTINE ENTERED

Notify the system programmer.

To resolve the problem, collect any data from SYS1.LOGREC, any dumps and any relevant messages. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHDUMPX

Destination: Console

DFHDU0214 DFHDUMPX IS ABOUT TO REQUEST A REMOTE SDUMP.

Explanation: DFHDUMPX is called under the MVS IEASDUMP.QUERY exit and determines whether a remote dump should be taken.

DFHDUMPX issues this message immediately before returning to MVS if the following conditions are satisfied

- a dump has been requested for a CICS dump code, whose dump table entry specified that related dumps are required, and DFHDUMPX has found related CICS work on this MVS image or
- the operator requested remote dumps from the console, including the CICS DFHJOBN keyword in

the MVS PROBDESC parameters, and DFHDUMPX has found CICS jobs on this MVS image which match the DFHJOBN data.

System action: Processing continues.

User response: None.

Module: DFHDUMPX

Destination: Console

DFHDU0215 DFHDUMPX IS ABOUT TO SUPPRESS A REMOTE SDUMPX.

Explanation: DFHDUMPX is called under the MVS IEASDUMP.QUERY exit and determines whether a remote dump should be taken.

DFHDUMPX issues this message immediately before returning to MVS if it has found that a remote dump should be suppressed.

The remote dump is suppressed under the following conditions

- A dump has been requested for a CICS dump code, whose dump table entry specified that related dumps are required, and DFHDUMPX has found no related CICS work on this MVS image or
- The operator requested remote dumps from the console, including the CICS DFHJOBN keyword in the MVS PROBDESC parameters, and DFHDUMPX has found no CICS jobs on this MVS image which match the DFHJOBN data.

The remote dump is also suppressed if an error occurred during the DFHDUMPX processing. Look for a previous DFHDU0213 message to find the reason for the error.

System action: Processing continues.

User response: To determine whether action is necessary refer to any DFHDU0213 message preceding this one.

Module: DFHDUMPX

Destination: Console

DFHDU0216 PROBDESC DOES NOT CONTAIN CICS DATA.

Explanation: DFHDUMPX is called under the MVS IEASDUMP.QUERY exit and determines whether a remote dump should be taken.

DFHDUMPX issues this message if it has found that the SDUMPX PROBDESC parameters do not contain CICS data. It is probable that this is not an error and that the remote dump was requested by a product other than CICS. However, if you were expecting a CICS remote dump it could be that the PROBDESC parameters were accidentally overwritten.

System action: DFHDUMPX will request that MVS

suppresses the remote dump and then processing continues.

User response: You need to take the action only if you were expecting a remote CICS dump.

Notify the system programmer.

To resolve the problem, collect any data from GTF trace, any dumps and any relevant messages. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHDUMPX

Destination: Console

DFHDU0217 *applid* **SDUMPX request completed with a return code of X'04'. A complete or partial dump has been taken.**

Explanation: An MVS SDUMPX request from CICS signalled by message DFHDU0201 may have resulted in a complete or partial SVC dump. Even though the request completed with an SDUMPX return code x'04', it is possible that sufficient information has been dumped to enable successful diagnosis of the problem that caused the dump to be taken. The accompanying message(s) IEA611E/IEA911E should be used to determine the suitability of the dump for successful diagnosis.

System action: CICS proceeds as if the dump had been successful.

User response: See the OS/390 MVS Programming: Authorized Assembler Services Reference for an explanation of the SDUMPX return code X'04'.

Module: DFHDUDU

Destination: Console

DFHDU0218 **No PROBDISC parameters supplied to DFHDUMPX.**

Explanation: A remote MVS SDUMPX request has failed to complete successfully because there were no SDUMPX PROBDISC parameters supplied.

MVS invokes DFHDUMPX under the IEASDUMP.QUERY exit and without the SDUMPX PROBDISC parameters DFHDUMPX cannot determine whether to take or suppress a remote dump.

This is only an error if the remote SDUMPX request was made by CICS for a system dump code that included the RELATED option, or if the operator entered a remote SDUMPX request that included PROBDISC parameters. This is not an error if another non-CICS component intentionally calls DFHDUMPX without PROBDISC.

System action: CICS proceeds as if the dump had been successful.

User response: If you believe this is an error you will

require further assistance from IBM to resolve this problem. Collect any data from GTF trace, dumps, and any relevant messages. Then see Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Note: This message cannot be changed with the message editing utility.

Module: DFHDUMPX

Destination: Console

DFHDU0302I *applid* **Transaction Dump Data set dataset to be closed due to text-descr**

Explanation: This message is output when attempting to write a record to the transaction dump data set. *text-descr* is one of the following

- DCB ABEND
- TASK TIMEOUT
- TASK CANCEL

System action: None unless *text-descr* is DCB ABEND, in which case an exception entry is made in the trace table and a system dump is taken.

User response: Notify the system programmer.

In the case of DCB ABEND, there will normally be an accompanying MVS error message to help identify the problem with the data set.

If the problem is not due to a major corruption of CICS, successful switching of dump data sets will reinstate the transaction dump environment. Otherwise, the transaction dump environment will be available only if the XDUOUT user-exit is active.

Module: DFHDUIO

XMEOUT Parameters: *applid, dataset, text-descr*

Destination: Console

DFHDU0303I *applid* **Transaction Dump Data set dataset closed.**

Explanation: This message is issued in one of the following situations

- A request to close the dump data set is issued by the operator.
- The CICS system is shut down.
- A request to switch between dump data sets is issued by the operator.
- A transaction dump data set becomes full.

The insert *dataset* indicates the name of the data set being closed.

System action: Processing continues.

If autoswitching of the transaction dump data set is not active, the transaction dump environment is available only if the XDUOUT user-exit is active.

DFHDU0304I • DFHDU0307

If autoswitching is enabled, this message is followed by DFHDU0304 and DFHDU0305 to indicate that the data set switch is successful.

If the switch is unsuccessful, this message is followed by DFHDU0306.

User response: None.

Module: DFHDUSU

XMEOUT Parameters: *applid, dataset*

Destination: Console

DFHDU0304I *applid* Transaction Dump Data set *dataset* opened.

Explanation: This message is output when any of the following situations occur

- A request to open the dump data set is issued by the operator.
- The CICS system is brought up.
- A request to switch between dump data sets is issued by the operator.
- Automatic switching between dump data sets is being performed.

dataset in the message indicates the name of the data set being opened.

System action: Processing continues.

User response: None.

Module: DFHDUSU

XMEOUT Parameters: *applid, dataset*

Destination: Console

DFHDU0305I *applid* Transaction Dump Data set switched to *ddname*

Explanation: This message is issued when one of the following situations occurs

- A command is issued by the operator to switch dump data sets.
- Automatic switching is being performed between dump data sets due to a dump data set being full.

This message is always preceded by message DFHDU0304 and also, if the old dump data set was open, by message DFHDU0303.

ddname in the message indicates the *ddname* of the active transaction dump data set (either DFHDMPA or DFHDMPB).

System action: Processing continues.

User response: Print or copy the completed dump data set, and if required, reissue the command CEMT SET DUMP AUTO.

Module: DFHDUSU

XMEOUT Parameters: *applid, ddname*

Destination: Console

DFHDU0306 *applid* Unable to open Transaction Dump Data set *dataset - text-descr*

Explanation: This message occurs when attempting to open a transaction dump data set.

text-descr is one of

OPEN ERROR

An attempt was made to open the dump data set, and an abend exit was invoked. This condition is usually accompanied by MVS system messages.

INSUFFICIENT STORAGE

An MVS GETMAIN was issued to obtain storage below the 16MB line. This request was unsuccessful.

System action: An exception entry is made in the trace table.

In both cases, the transaction dump data set is not open, and unless the XDUOUT exit is active, the transaction dump is inoperative.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: See any associated MVS messages for further guidance.

Module: DFHDUIO

XMEOUT Parameters: *applid, dataset, text-descr*

Destination: Console

DFHDU0307 *applid* Module DFHDUIO is unavailable. Transaction dump is inoperative.

Explanation: This message is issued either when an attempt is made to open or close a dump data set, or when switching between dump data sets, to remind the user that CICS could not locate module DFHDUIO during initialization. CICS will have issued message DFHDU0102 during initialization to warn the user of this condition.

System action: CICS continues with the transaction dump facility inoperative.

User response: If necessary, refer to the user response for message DFHDU0102.

Module: DFHDUSU

XMEOUT Parameter: *applid*

Destination: Console

DFHDU0308I *applid* CICS will terminate because the Dump Table entry for the transaction dump code: *dumpcode* specifies shutdown.

Explanation: This message is issued when a transaction dump has been requested for the transaction dump code *dumpcode* and the associated dump table entry specifies that CICS should be terminated.

This message records that it was a transaction dump table entry which requested the termination of CICS.

System action: CICS is terminated.

User response: Process any transaction dump in the normal way.

On a warm or emergency start, explicitly defined dump table entries are restored from the catalog. If the dump table entry for *dumpcode* was explicitly defined, it can be modified to prevent CICS from terminating, if desired, using CEMT or EXEC API commands.

Implicitly defined dump table entries are not recorded on the catalog and are therefore not restored. On a cold or initial start, CICS does not restore the dump table from the catalog.

Module: DFHDUDU

XMEOUT Parameters: *applid*, *dumpcode*

Destination: Console

DFHDU0309I *applid* CICS will terminate because the Dump Table entry for the system dump code: *dumpcode* specifies shutdown.

Explanation: This message is issued when a system dump has been requested for the system dump code *dumpcode* and the associated dump table entry specifies that CICS should be terminated.

This message records that it was a system dump table entry which requested the termination of CICS.

System action: CICS is terminated.

User response: Print off any system dump if required.

On a warm or emergency start, explicitly defined dump table entries are restored from the catalog. If the dump table entry for *dumpcode* was explicitly defined, it can be modified to prevent CICS from terminating using CEMT or EXEC API commands.

Implicitly defined dump table entries are not recorded on the catalog and are therefore not restored. On a cold or initial start, CICS does not restore the dump table from the catalog.

Module: DFHDUDU

Destination: Console

DFHDU0310 *applid* XDUCLESE auto-switch request overridden. Transaction dump data sets are too small.

Explanation: This message is issued when

- the transaction dump is too large to fit in the current dump data set.
- a request to auto-switch between transaction dump data sets is issued by the XDUCLESE user-exit.
- the transaction dump is too large to fit in the newly opened dump data set.
- a second request to auto-switch between transaction dump data sets is issued by XDUCLESE.

System action: CICS can not write the transaction dump to a transaction dump data set because the data sets are too small. CICS closes the data sets and processing continues.

User response: Inform the system programmer.

You need to bring CICS down and increase the space allocation for the transaction dump data sets to resolve this problem.

You may decide to delay terminating CICS until a convenient time. You can issue the command CEMT SET DUMP OPEN to reinstate the transaction dump environment but you will continue to lose any dumps that are too large to be written to the data sets.

Module: DFHDUSU

XMEOUT Parameter: *applid*

Destination: Console

DFHDU1601 DATA SET READ ERROR.

Explanation: The access method has indicated a read error. The dump data set may not have been opened during the most recent CICS execution.

System action: The record is skipped.

User response: Either ensure that the JCL is correct, or determine the reason for the read errors.

Module: DFHDU650

Destination: Console

DFHDU1602 36 CONSECUTIVE UNIDENTIFIABLE RECORDS, DUMP UTILITY TERMINATED.

Explanation: An identification record has an incorrect code or format. The most common reasons for this error include the following.

- The wrong data set is being processed.
- The dump data set that the utility is trying to process has not been used in the current CICS execution.

DFHDU1603 • DFHDU1611

In the latter case, the error would arise because no dumps were produced in the current execution or because the data sets had been switched.

System action: Records are skipped and execution is terminated with a return code of 8.

User response: Ensure that the correct data set is being processed. Alternatively, check for a possible error in the dump control program, DFHDCP.

If two dump data sets are being used, check that the data set being processed has been used before in the current CICS execution.

Module: DFHDU650

Destination: Console

DFHDU1603 NO {DUMP | PRINT} DATA SET DD CARD {DFHDMPPDS | DFHPRINT}, DUMP UTILITY TERMINATED.

Explanation: A dump or a print data set was not successfully opened.

System action: If it was a dump data set that failed to open successfully, the system prints the message on the print data set and terminates execution with a return code of 12.

If it was the print data set that failed to open successfully, the system terminates execution with a return code of 16.

User response: If the JCL is correct with the stated ddnames as in the message, determine why the data set cannot be opened. The return codes are issued by DFHDU650. They only identify whether a dump or print data set failed.

Module: DFHDU650

Destination: Console

DFHDU1604 END OF FILE ENCOUNTERED, LAST DUMP MAY BE INCOMPLETE.

Explanation: The dump data set has been filled.

System action: The dump utility program DFHDU650 terminates.

User response: Check that the dump is complete and that no incomplete message is at the end of it. If there is an incomplete message at the end of the dump, the last dump in the data set may not contain all the information required. You should recreate the problem to try and get a complete dump. If dump data set auto-switching was active at the time the dump was taken, a complete version of the dump is present on the alternate dump data set.

Module: DFHDU650

Destination: SYSPRINT

DFHDU1609 36 READ ERRORS ENCOUNTERED. DUMP UTILITY TERMINATED.

Explanation: The access method has indicated 36 invalid records in the dump data set. The most probable cause of this problem is an invalid end-of-file marker which caused the access method to attempt to read beyond the last record in the data set. This problem may also have been caused if

- DFHDU650 has been run with a data set that has never been accessed by CICS before. The data set may contain an invalid type of record format.
- DFHDU650 has been run with a data set that has been copied with the wrong block size and record format.

System action: The dump utility execution is terminated with a return code of 8 from DFHDU650.

User response: Determine and correct the reason for the access failure. Recreate the dump if necessary.

Module: DFHDU650

Destination: Console

DFHDU1610 DUMP FORMATTING HAS ENCOUNTERED AN INVALID TRACE BLOCK. TRACE ENTRIES MAY BE LOST.

Explanation: The dump utility program, DFHDU410, has detected an error while copying trace records from the trace data set. Trace records may be omitted from the formatted output.

System action: DFHDU410 attempts to read the next trace block and continues formatting trace records.

User response: To resolve the problem, keep the dump and contact your IBM Support Center. Further guidance on how to prepare information for IBM support is given in the *CICS Problem Determination Guide*. If you are not familiar with this process, refer to the guide before contacting IBM.

Module: DFHDU650

Destination: Console

DFHDU1611 FILE ERROR, FULL TRACE FAILED. DUMP FORMATTING WILL CONTINUE WITH ABBREVIATED TRACE.

Explanation: Due to an error in the MVS NOTE macro, the dump utility program, DFHDU650 was unable to note the position on the data set at which the trace data started. It is therefore not possible to return to the start of the trace data after the abbreviated trace has been formatted in order to print the trace with format FULL.

System action: Transaction dump formatting continues with only abbreviated trace for this dump.

User response: If only the full trace is required, rerun the DFHDU410 job with the NOABBREV parameter. Otherwise attempt to recreate the dump. If the problems recurs, keep the dump and contact your IBM Support Center. Further guidance on how to prepare information for IBM support is given in the *CICS Problem*

Determination Guide. If you are not familiar with this process, refer to the guide before contacting IBM.

Module: DFHDU650

Destination: Console

DFHDXnnnn messages

DFHDX8300I *applid* GETMAIN REQUEST FAILED. NOT ATTEMPTING TO CONNECT TO ALTERNATE SYSTEMS.

Explanation: The CICS system, with specific applid given, was unable to obtain working storage to control the sequencing of DBCTL connection attempts defined in the RST. (Recovery Service Table).

System action: CICS attempts to connect only to the DBCTL subsystem defined in the DBCTL start-up table.

User response: The working storage can be above the 16MB line so the GETMAIN request is unlikely to fail for genuine lack of space. If the error is persistent it may be necessary to cancel CICS with a dump to resolve the problem.

Module: DFHDXAX

Destination: Console

User response: Check that the RST suffix in the SIT is correct and that the RST has been correctly prepared using the DFHRST macro that is supplied as part of the CICS product.

Module: DFHDXAX

Destination: Console

DFHDX8301I *applid* LOAD REQUEST FAILED FOR *rstname*. NOT ATTEMPTING TO CONNECT TO ALTERNATE SYSTEMS.

Explanation: The CICS system, with the specific applid given, was unable to load the RST *rstname* while looking for the names of alternative DBCTL subsystems to which to connect.

System action: CICS will attempt to connect only to the DBCTL subsystem defined in the DBCTL start-up table.

User response: Check that the RST suffix in the SIT is correct and that the RST is actually present in the authorized library.

Module: DFHDXAX

Destination: Console

DFHDX8303 *applid* DELETE REQUEST FAILED FOR *rstname*.

Explanation: The CICS system, with the specific applid given, was unable to delete the RST *rstname* after completing an attempt to connect to a DBCTL subsystem.

System action: CICS continues normally.

User response: If the error is persistent it may be necessary to cancel CICS with a dump to resolve the problem.

Module: DFHDXAX

Destination: Console

DFHDX8302I *applid* VALIDATION FAILED FOR *rstname*. NOT ATTEMPTING TO CONNECT TO ALTERNATE SYSTEMS.

Explanation: The CICS system, with the specific applid given, found that the RST *rstname* was invalid.

It is unable to use it to look for the names of alternative DBCTL subsystems to which to connect.

System action: CICS will attempt to connect only to the DBCTL subsystem defined in the DBCTL start-up table.

DFHDX8304 *applid* CICS/DBCTL RECONNECTION IN PROGRESS.

Explanation: This message occurs in an XRF environment only. It occurs when CICS attempts to connect to DBCTL but believes that DBCTL is restarting.

The message is displayed two minutes after the attempted connection, and then after each subsequent minute.

System action: CICS continues to attempt to reconnect.

User response: Check why DBCTL is not restarting. You can cancel the connection using the CDBC transaction.

Module: DFHDXAX

Destination: Console

DFHDX8309 *applid* Unable to detach subtask during CICS termination.

Explanation: CICS has detected that a subtask, attached during CICS XRF support of DBCTL, cannot be detached during CICS termination.

DFHDX8310I • DFHDX8316I

System action: CICS abends with code A03.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: None. This abend occurs as a result of a previous error. Check for earlier DFHDX832x, DFHDX833x, or DFHDX834x error messages for further information and guidance.

Module: DFHAPDM

XMEOUT Parameter: *applid*

Destination: Console

DFHDX8310I *applid* Initiating catch-up tasks.

Explanation: The catch-up transaction, CXCU, has received control.

System action: The catch-up transaction is about to initiate the catch-up tasks for specific functional areas.

User response: None. This is simply a "work is in progress" message. You can suppress this message with the system initialization parameter, MSGLVL=0.

Module: DFHCXCU

XMEOUT Parameter: *applid*

Destination: Console

DFHDX8311I *applid* System initialized with XRF=NO. Catch-up transaction CXCU took no action.

Explanation: The catch-up transaction, CXCU, was invoked but the CICS system specified XRF=NO. Catchup functions are not relevant.

System action: The catch-up transaction terminates normally without taking any action.

User response: None.

Module: DFHCXCU

XMEOUT Parameter: *applid*

Destination: Console

DFHDX8312I *applid* Catch-up transaction failed to run program *progrname*. Catch-up is incomplete.

Explanation: The catch-up transaction, CXCU, running on the CICS system with specific applid given, was unable to call the specific catch-up service routine *progrname*. This may be either DFHDXCU (DBCTL catch-up) or DFHZXCU (terminal catch-up).

System action: The catch-up associated with routine *progrname* is not performed.

The active and alternate CICS systems continue, but the alternate will be less effective in the event of a takeover.

User response: Retry by entering 'CXCU' from a terminal. If the error persists check that the routine *progrname* is present in the load library.

Module: DFHCXCU

XMEOUT Parameters: *applid, progrname*

Destination: Console

DFHDX8313I *applid* Catch-up transaction failed.

Explanation: The catch-up transaction, CXCU, running on the CICS system with specific applid given, has failed. CXCU runs either in response to a transaction request from an end-user, or automatically by an active CICS system in response to the appearance of an alternate CICS system. Its purpose is to inform the alternate of the active's state regarding terminals and DBCTL connection.

System action: The CXCU transaction abends with a dump and transaction abend code ACXA.

Both active and alternate CICS systems continue, but the alternate will be less effective in the event of a takeover. For example, terminal backup sessions may not be established.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Retry by entering 'CXCU' from a terminal. If the error persists diagnose problem from the dump.

Module: DFHCXCU

XMEOUT Parameter: *applid*

Destination: Console

DFHDX8315I *applid* XRF DBCTL state catch-up starting.

Explanation: The catch-up transaction to transmit the active's DBCTL state to the alternate has been started on the CICS system with specific applid named.

System action: None.

User response: None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Module: DFHDXCU

XMEOUT Parameter: *applid*

Destination: Console

DFHDX8316I *applid* XRF DBCTL state catch-up ending.

Explanation: The catch-up transaction to transmit the active's DBCTL state to the alternate has been completed on the CICS system with specific applid given.

System action: None.

User response: None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Module: DFHDXCU

XMEOUT Parameter: *applid*

Destination: Console

DFHDX8317I *applid* XRF DBCTL state catch-up ignored for reason *nn*.

Explanation: The XRF DBCTL catch-up transaction has been invoked on the CICS system with the given specific applid.

Although this system has DL/I installed, and an RST has been specified in the SIT, catch-up for DBCTL has proved unnecessary for reason *nn*, where *nn* may be one of the following.

Reason Meaning

- | | |
|-----------|---|
| 01 | DBCTL has not been used yet. |
| 02 | XRF DBCTL has not been used yet. |
| 03 | There is no connection state information to send. |
| 04 | The system is running with XRF=NO. |
| 05 | There is no alternate CICS to which to send state data. |

System action: None. No catch-up is needed.

User response: None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Module: DFHDXCU

XMEOUT Parameters: *applid, nn*

Destination: Console

DFHDX8318I *applid* XRF DBCTL state catch-up failed for reason *nn*.

Explanation: The XRF DBCTL catch-up transaction has been invoked on the CICS system with the given specific applid.

The transaction has failed for reason *nn*, where *nn* may be one of the following.

Reason Meaning

- | | |
|-----------|--|
| 01 | The CAVM message service returned an unidentifiable return code. |
| 02 | The CAVM message service returned an unexpected exception return code. |
| 03 | The CAVM message service returned an unexpected failure reason code. |

System action: The DBCTL catch-up transaction is terminated with a dump. The transaction abend code is ADXB.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Check for any other messages relating to CAVM data set problems for further information and guidance.

Module: DFHDXCU

XMEOUT Parameters: *applid, nn*

Destination: Console

DFHDX8319I *applid* XRF DBCTL state catch-up failed.

Explanation: The XRF DBCTL catch-up transaction has been invoked on the CICS system with the given specific applid.

The transaction has failed.

System action: The DBCTL catch-up transaction is terminated with a dump. The transaction abend code is ADXA.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Diagnose the error from the dump.

Module: DFHDXCU

XMEOUT Parameter: *applid*

Destination: Console

DFHDX8320I *applid* DBCTL Restart processing completed after DBCTL failure.

Explanation: The user exit XXDFA requested a restart of DBCTL. The restart was initiated successfully.

System action: The active CICS continues normally and will attempt to reconnect to DBCTL.

User response: None. You can suppress this message with the SIT parameter, MSGLVL=0.

Module: DFHDBCT

XMEOUT Parameter: *applid*

Destination: Console

DFHDX8321 *applid* Unable to determine JES affiliation of DBCTL subsystem for reason X'*nn*'.

Explanation: CICS can offer full XRF support only if the DBCTL to which it is connected is running under the same JES as CICS itself.

nn may be one of the following.

DFHDX8322 • DFHDX8326

nn Meaning

X'09 MVS GETMAIN failure.

X'10 MVS ATTACH failure.

System action: The active CICS continues, but, in the event of failure, CICS will not attempt to restart DBCTL automatically.

User response: None.

Module: DFHDBCT

XMEOUT Parameters: *applid, X'nn'*

Destination: Console

DFHDX8322 *applid* LOAD request failed for xxxxxxxx. DBCTL/XRF support will not be provided for this connection.

Explanation: CICS has been notified of a DBCTL failure, but has been unable to load the specified Recovery Service Table (RST) to determine if XRF support is required.

System action: CICS continues as if no XRF support had been requested for the failing DBCTL subsystem.

User response: Re-link-edit a valid RST into STEPLIB. DBCTL may have to be restarted manually.

Module: DFHDBCT

XMEOUT Parameters: *applid, xxxxxxxx*

Destination: Console

DFHDX8323 *applid* Unable to complete search for DBCTL alternate.

Explanation: CICS has been notified of a DBCTL failure, but has been unable to complete the search for a DBCTL alternate, possibly due to an unexpected return code from an IEFSSREQ request.

System action: CICS continues as if no DBCTL alternate had been found. An ADDI transaction dump will be produced. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

It may be necessary to restart DBCTL manually.

Module: DFHDBCT

XMEOUT Parameter: *applid*

Destination: Console

DFHDX8324 *applid* Unable to restart DBCTL xxxxxxxx for reason X'nn'.

Explanation: CICS was unable to restart DBCTL owing to an internal failure indicated by the value of *n*. *n* may be one of the following.

n Meaning

X'08 An MVS GETMAIN failed.

X'09 An MVS ATTACH failed.

System action: The active CICS continues but was not able to restart DBCTL automatically. However, it will attempt to reconnect to DBCTL in the normal way.

User response: It may be necessary to restart DBCTL manually.

Module: DFHDBCT

XMEOUT Parameters: *applid, xxxxxxxx, X'nn'*

Destination: Console

DFHDX8325 *applid* Restart command issued unsuccessfully to *subsysid* for reason X'xx' X'yy'.

Explanation: The user exit XXDFA requested a restart of DBCTL. The restart request was issued to *subsysid* but was rejected with hexadecimal reason codes X'xx' and X'yy'.

System action: The active CICS continues normally and will attempt to reconnect to DBCTL.

User response: It may be necessary to restart DBCTL manually.

Module: DFHDBCT

XMEOUT Parameters: *applid, subsysid, X'xx', X'yy'*

Destination: Console

DFHDX8326 *applid* DBCTL state message lost owing to message services error.

Explanation: The active CICS system was unable to report a change of DBCTL connection status to the alternate.

System action: The active system writes an error entry in its CAVM status record, but otherwise continues normally.

User response: Check for any other messages relating to CAVM data set problems.

Were the CICS alternate to take over now it might try to restart the wrong DBCTL. There would be no database integrity exposure but there might be some loss of availability as well as operational inconvenience. It may be preferable to cancel the alternate and restart it, either manually or via an overseer.

Module: DFHDBCT

XMEOUT Parameter: *applid*

Destination: Console

DFHDX8327 *applid* **DBCTL state message lost owing to CAVM services failure.**

Explanation: The active CICS system was unable to report a change of DBCTL connection status to the overseer.

System action: Processing continues.

User response: Check for any other CICS messages relating to CAVM data set problems (DFH66xx).

Were the overseer to oversee a takeover now it might try to restart the wrong DBCTL. There would be no database integrity exposure but there might some loss of availability as well as operational inconvenience.

If the overseer is being used to control XRF takeovers then disconnecting and reconnecting to the DBCTL will cause a re-write of the status record.

Module: DFHDBCT

XMEOUT Parameter: *applid*

Destination: Console

DFHDX8328 *applid* **Unable to determine Jes affiliation of (*jobname, jobid*).**

Explanation: CICS can offer full XRF support only if the DBCTL to which it is connected is running under the same JES as CICS itself.

System action: The active CICS continues, but, in the event of failure, CICS will not attempt to restart DBCTL automatically.

User response: It is recommended that DBCTL should be run under the same JES as the active CICS system.

The message indicates that either a system or set-up problem has occurred. If there is a system problem then message DFHDX8321 will also be displayed.

Module: DFHDBCT

XMEOUT Parameters: *applid, jobname, jobid*

Destination: Console

DFHDX8329 *applid* **Restart request after DBCTL failure ignored for reason X'*nn*'.**

Explanation: The user exit XXDFA requested a restart of DBCTL. This request has been ignored for the reason indicated by *nn*.

The reason code *nn* should be one of the following.

nn	Meaning
-----------	----------------

X'09	There is no alternate DBCTL to be restarted.
-------------	--

X'10 Possibly, the DBCTL subsystem is under a different JES from the active CICS system.

X'11 The DBCTL subsystem was an IMS DB/DC system.

System action: The active CICS continues as if the user exit had indicated 'no action'.

User response: Check that the user exit is performing as intended and that the CICS and DBCTL systems have been set up with the correct options.

Module: DFHDBCT

XMEOUT Parameters: *applid, X'nn'*

Destination: Console

DFHDX8330 *applid* **IMS DB/DC region has requested XRF support.**

Explanation: This message is produced when CICS connects to an IMS system for which the user has requested XRF support (via the RST), but which is unable to participate in XRF. For example, in an IMS/DC system without the XRF option.

System action: The system continues to run without XRF.

User response: Either enable IMS/DC for XRF, or remove SSID from RST.

Module: DFHDBCT

XMEOUT Parameter: *applid*

Destination: Console

DFHDX8331 *applid* **CAVM message input service error xxxxxxxx, X'*nn*', xxxxxxxx.**

Explanation: The alternate CICS system task responsible for tracking the DBCTL connection status of the active CICS has received an error response from the CAVM message input service.

System action: The tracking transaction terminates. No further action will be taken in response to DBCTL status changes. The global exits XXDFB and XXDTO will never be invoked and no attempt at a DBCTL restart will be made in the event of a takeover. An ADMA transaction dump is produced.

User response: Check for any other messages relating to CAVM data set problems. In the event of a takeover it may be necessary to restart DBCTL manually.

Module: DFHDBCR

XMEOUT Parameters: *applid, xxxxxxxx, X'nn', xxxxxxxx*

Destination: Console

DFHDX8332I *applid* Connection to xxxxxxxx notified after xxxxxxxx failure initiated takeover.

Explanation: The alternate CICS system task responsible for tracking the DBCTL connection status of the active CICS has received a message from the CAVM message input service, after a takeover decision from the global user exit XXDFB has been accepted.

This problem is usually caused by a setup or an operational error.

System action: The takeover continues. If the message is a notification of a successful connection, then the global user exit XXDTO may be driven.

User response: In order for the active CICS system to reconnect to an element of the RSE, a DBCTL must have been restarted in the active CEC. Consequently, the alternate CICS will not be able to restart an element of the RSE in the alternate CEC without terminating this new active DBCTL.

The global user exit XXDTO will be driven as part of CICS takeover processing. This exit could be used to request a takeover of the DBCTL that was restarted in the active CEC.

Locate and correct any setup or operational errors.

Module: DFHDBCR

XMEOUT Parameters: *applid*, xxxxxxxx, xxxxxxxx

Destination: Console

DFHDX8333 *applid* Unrecognized message type xxxxxxxx received by DBCTL tracking task.

Explanation: The alternate CICS system task responsible for tracking the DBCTL connection status of the active CICS has received an unrecognized message from the CAVM message input service.

System action: The tracking transaction terminates. No further action will be taken in response to DBCTL status changes. The global exits XXDFB and XXDTO will never be invoked and no attempt at a DBCTL restart will be made in the event of a takeover. An ADMB transaction dump is produced. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: In the event of a takeover it may be necessary to restart DBCTL manually.

Module: DFHDXCU

XMEOUT Parameters: *applid*, xxxxxxxx

Destination: Console

DFHDX8334 *applid* Error detected in xxxxxxxx for reason nn.

Explanation: The alternate CICS system task responsible for tracking the DBCTL connection status of the active CICS has detected an invalid recovery service table (RST) during processing of a CICSIDBCTL failure.

nn may be one of the following.

nn	Meaning
01	The CICS SVC detected an error in the RST. Refer to the accompanying DFHXG64xx or DFHXA65xx message for the reason for the error.
02	The RST could not be loaded by the XRF/DBCTL tracking task, or the XRF/DBCTL tracking task detected that the RST was invalid.
03	The CICS SVC detected an error in the RST during initialization. Refer to the accompanying DFHXG64xx or DFHXA65xx message for the reason for the error.
04	The CICS SVC detected an error in the RST during connect time. Refer to the accompanying DFHXG64xx or DFHXA65xx message for the reason for the error.

System action: The tracking transaction continues as if no XRF support had been requested via the RST for the connected DBCTL.

User response: In the event of a takeover it may be necessary to restart DBCTL manually. When the failure is detected during the initialization of the XRF/DBCTL tracking task the RST should be assembled and link-edited to resolve the problem.

Module: DFHDBCR

XMEOUT Parameters: *applid*, xxxxxxxx, *nn*

Destination: Console

DFHDX8335 *applid* Unable to complete search for DBCTL alternate.

Explanation: The alternate CICS system task responsible for tracking the DBCTL connection status of the active CICS has been unable to complete its search for a DBCTL alternate, possibly due to an unexpected return code from an IEFSSREQ request.

System action: The tracking transaction continues as if no DBCTL alternate had been found. An ADMD transaction dump will be produced.

User response: In the event of a takeover it may be necessary to restart DBCTL manually.

Module: DFHDBCR

XMEOUT Parameter: *applid*

Destination: Console

DFHDX8336 *applid* **Unable to provide DBCTL/XRF support for reason X'nn'**.

Explanation: The user exit XXDFB or XXDTO requested a restart of DBCTL. This request has been ignored for the reason indicated by the value of *nn*.

n may be one of the following.

nn	Meaning
X'46	No valid RST was found. Refer to DFHDX8334.
X'50	DBCTL subsystem is an IMS DB/DC system.
X'51	There is no alternate DBCTL to be restarted.
X'52	The DBCTL subsystem is, or may be, under a different JES from the active CICS system.
X'53	The active CICS system has already attempted a restart of DBCTL.

System action: The alternate CICS continues as if the user exit had indicated 'no action'.

User response: Check that the user exit is performing as intended and that the CICS and DBCTL systems have been set up with the correct options.

Module: DFHDBCR

XMEOUT Parameters: *applid, X'nn'*

Destination: Console

DFHDX8337 *applid* **Takeover request rejected by CAVM, reason code X'nn'**.

Explanation: The user exit XXDFB requested a takeover as a result of a DBCTL failure, but the CAVM rejected the takeover request.

System action: The alternate CICS continues as if the user exit had indicated 'no action'.

User response: Check that the user exit is performing as intended and that the CICS and DBCTL systems have been set up with the correct options. The message indicates that a CICS internal error has occurred, normally as a result of an earlier problem. It may be necessary to initiate a manual CICS takeover.

Module: DFHDBCR

XMEOUT Parameters: *applid, X'nn'*

Destination: Console

DFHDX8338 *applid* **Unable to issue command command to subsysid for reason X'nn'**.

Explanation: The user exit XXDFB/XXDTO issued a restart request to the DBCTL/XRF tracking task, the task was unable to process the request for the reason indicated in the message.

The issued command should either be a switch system backup command or an ERE command.

The reason code *X'nn'* should be one of the following.

nn	Meaning
X'09	MVS GETMAIN failure
X'10	MVS ATTACH failure.

System action: The takeover continues.

User response: Restart the DBCTL subsystem manually.

Module: DFHDBCR

XMEOUT Parameters: *applid, command, subsysid, X'nn'*

Destination: Console

DFHDX8339 *applid command* **command issued unsuccessfully to subsysid for reason X'nn'**.

Explanation: The DBCTL/XRF tracking task issued a restart command (either switch or ERE) to an alternate DBCTL subsystem but the request was rejected for reason *nn*.

XXDFA or XXDTO requested CICS takeover with DBCTL. The error was detected when the request was made.

System action: The takeover continues.

User response: Restart the DBCTL subsystem manually.

Module: DFHDBCR

XMEOUT Parameters: *applid, command, subsysid, X'nn'*

Destination: Console

DFHDX8340 *applid* **DBCTL tracking task started in an invalid environment reason X'nn'**.

Explanation: The alternate CICS system task responsible for tracking the DBCTL connection status of the active CICS has been started in an environment which does not support DBCTL/XRF.

Reason code *X'nn'* may be one of the following.

nn	Meaning
X'65	XRF=NO specified in the SIT.
X'67	CICS system is running as active.
X'69	MVS GETMAIN failure.

System action: The tracking transaction terminates. No further action will be taken in response to DBCTL status changes. The global exits XXDFB and XXDTO will never be invoked and no attempt at a DBCTL restart will be made in the event of a takeover.

User response: The user response depends on the reason code issued.

For reasons X'65 and X'67, there is a possible error in CICS code. In this case you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

For reason X'69, specify a smaller overall size limit for the EDSAs.

Module: DFHDBCR

XMEOUT Parameters: *applid, X'nn'*

Destination: Console

DFHDX8341I *applid* **Takeover request accepted.**

Explanation: The DBCTL/XRF tracking task issued a takeover request due to a request from user exit XXDFB. The request has been accepted.

System action: The takeover continues.

User response: None. You can suppress this message with the system initialization parameter MSGLVL = 0.

Module: DFHDBCR

XMEOUT Parameter: *applid*

Destination: Console

DFHDX8342I *applid* **Restart command issued successfully.**

Explanation: The DBCTL/XRF tracking task issued a restart command to an alternate DBCTL subsystem due to a request from user exit XXDFB/XXDTO. The request was issued successfully.

System action: Takeover continues.

User response: None. You can suppress this message with the system initialization parameter MSGLVL = 0.

Module: DFHDBCR

XMEOUT Parameter: *applid*

Destination: Console

DFHEJnnnn messages

DFHEJ0001 *applid* **An abend (code *aaa/bbbb*) has occurred at offset *X'offset'* in module *modname*.**

Explanation: An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue and bring CICS down at a convenient time to resolve the problem.

If you cannot continue without the full use of module *modname* you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHEJ**

XMEOUT Parameters: *applid, aaa/bbbb, X'offset', modname*

Destination: Console

DFHEJ0002 *applid* **A severe error (code *X'code*) has occurred in module *modname*.**

Explanation: An error has been detected in module *modname*. The code *X'code* is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

System action: An exception entry (code *X'code* in the message) is made in the trace table. A system

dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot continue without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHEJ**

XMEOUT Parameters: *applid, X'code',modname*

Destination: Console

DFHEJ0004 *applid* **A possible loop has been detected at offset X'offset' in module *modname*.**

Explanation: A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset X'offset'. This is the offset of the instruction which was executing at the time the error was detected.

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Notify the system programmer. If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function, so there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module *modname* in the message is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname*, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently, but you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHEJ**

XMEOUT Parameters: *applid, X'offset', modname*

Destination: Console

DFHEJ0101 *applid* **Enterprise Java domain initialization has started. Java is a trademark of Sun Microsystems, Inc.**

Explanation: The Enterprise Java (EJ) domain initialization has started. Java is a trademark of Sun Microsystems, Inc.

System action: Initialization continues.

User response: None.

Module: DFHEJDM

XMEOUT Parameter: *applid*

Destination: Console

DFHEJ0102 *applid* **Enterprise Java domain initialization has ended.**

Explanation: The Enterprise Java (EJ) domain initialized correctly. CICS will accept CorbaServer, DJar and Bean operations.

System action: Initialization continues.

User response: None.

Module: DFHEJDM

XMEOUT Parameter: *applid*

Destination: Console

DFHEJ0103 *applid* Enterprise Java domain initialization has failed.

Explanation: The Enterprise Java (EJ) domain did not correctly initialize.

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and the domain is not crucial to the running of your CICS system, you may decide to continue and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot continue without the full use of Enterprise Java domain, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHEJDM

XMEOUT Parameter: *applid*

Destination: Console

DFHEJ0501A *applid* The file definition for DFHEJDIR does not specify RECOVERY(BACKOUTONLY). File open request failed.

Explanation: A request has been made to open file DFHEJDIR. The request has failed because the RDO file definition for this file does not specify RECOVERY(BACKOUTONLY).

System action: File DFHEJDIR remains closed.

User response: Change the RDO file definition for DFHEJDIR to RECOVERY(BACKOUTONLY). Reinstall the file and the CorbaServer.

Module: DFHEJDI

XMEOUT Parameter: *applid*

Destination: Console

DFHEJ0601W *date time applid*
JRAS_informational_message

Explanation: An informational message has been issued by a Java class running in a CICS JVM that has not been recognized as a CICS message. The insert *JRAS_informational_message* contains the message that was issued.

System action: Processing continues.

User response: An exception trace giving the name of the class and method issuing the message along with the message text will be made.

If the message is issued by an IBM supplied class then you may need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: com.ibm.cics.ras.CICSMessageService

XMEOUT Parameters: *date, time, applid, JRAS_informational_message*

Destination: CJRM

DFHEJ0602W *date time applid*
JRAS_warning_message

Explanation: A warning message has been issued by a Java class running in a CICS JVM that has not been recognized as a CICS message. The insert *JRAS_warning_message* contains the message that was issued.

System action: Processing continues.

User response: An exception trace giving the name of the class and method issuing the message along with the message text will be made.

If the message is issued by an IBM supplied class then you may need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: com.ibm.cics.ras.CICSMessageService

XMEOUT Parameters: *date, time, applid, JRAS_warning_message*

Destination: CJRM

DFHEJ0604E *date time applid* *JRAS_error_message*

Explanation: An error message has been issued by a Java class running in a CICS JVM that has not been recognized as a CICS message. The insert *JRAS_error_message* contains the message that was issued.

System action: Processing continues.

User response: An exception trace giving the name of the class and method issuing the message along with the message text will be made.

If the message is issued by an IBM supplied class then you may need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: com.ibm.cics.ras.CICSMessageService

XMEOUT Parameters: *date, time,applid, JRAS_error_message*

Destination: CJRM

DFHEJ0701I *date time applid userid* **CorbaServer**
CorbaServer_name **has been created.**

Explanation: The CorbaServer has been added to the Enterprise Java domain by placing it in the chain of CorbaServer Control Blocks. However, until the CorbaServer is resolved, it is not available for use.

System action: Processing continues. The CorbaServer will be resolved at a later stage.

User response: None.

Module: DFHEJCG

XMEOUT Parameters: *date, time,applid, userid, CorbaServer_name*

Destination: CEJL

DFHEJ0702E *date time applid userid* **CorbaServer**
CorbaServer_name **has not been created.**

Explanation: The CorbaServer *CorbaServer_name* was not added to the Enterprise Java domain. This error is most likely caused by an attempt to add a duplicate CorbaServer.

System action: Processing continues.

User response: Examine the exception trace entry that shows the cause of the error.

Module: DFHEJCG

XMEOUT Parameters: *date, time,applid, userid, CorbaServer_name*

Destination: CEJL

DFHEJ0706E *date time applid userid* **The EJ**
Resolution Transaction
transaction_name **did not attach.**

Explanation: After the CorbaServer has been created, it undergoes the Resolution process in a separate transaction. However, this transaction was not successfully attached. Another attachment of the Resolution Transaction will occur (if this failure does not re-occur) when the next CorbaServer is created, and hence this failure may be thereby corrected.

System action: Processing continues.

User response: Examine the exception trace entry

that shows the cause of the attachment error.

Module: DFHEJCG

XMEOUT Parameters: *date, time,applid, userid, transaction_name*

Destination: CEJL

DFHEJ0711I *date time applid userid* **CorbaServer**
CorbaServer_name **has been deleted.**

Explanation: A CorbaServer Control Block has been deleted and removed from the chain of CorbaServers held within the EJ domain. Consequently, the CorbaServer is no longer available for use.

System action: Processing continues.

User response: None.

Module: DFHEJCG

XMEOUT Parameters: *date, time,applid, userid, CorbaServer_name*

Destination: CEJL

DFHEJ0723E *date time applid userid* **CorbaServer**
CorbaServer_name **has failed**
Resolution during Shelf creation.

Explanation: Resolution for CorbaServer *CorbaServer_name* has failed. The Resolution process was attempting to create the Shelf for this CorbaServer.

System action: The CorbaServer is placed into the DISABLED state and cannot be used.

User response: Check that the CorbaServer's shelf directory does exist and that the CICS region id has permission to read and write to that directory. If the problem persists you may need to use the trace facility to determine the cause of the problem.

CorbaServer *CorbaServer_name* must be reenabled before processing can continue.

Module: DFHEJCG

XMEOUT Parameters: *date, time,applid, userid, CorbaServer_name*

Destination: CEJL

DFHEJ0724E *date time applid userid* **Catalog read**
for update during Resolution
processing for CorbaServer
CorbaServer_name **failed.**

Explanation: A failure occurred updating the Global Catalog for CorbaServer *CorbaServer_name*.

System action: The state is not updated in the Global Catalog for the CorbaServer.

User response: Discard and reinstall the CorbaServer. If the problem persists you may need to use the trace

facility to determine the cause of the problem.

Module: DFHEJCG

XMEOUT Parameters: *date, time,applid, userid, CorbaServer_name*

Destination: CEJL

DFHEJ0725E *date time applid userid* **Catalog Resolution processing for CorbaServer *CorbaServer_name* returned bad data.**

Explanation: An update to the Global Catalog for CorbaServer *CorbaServer_name*, to record that Resolution has occurred failed when the read for update operation returned invalid data.

System action: The state is not updated in the Global Catalog for the CorbaServer.

User response: The CorbaServer resource should be discarded and reinstalled. If the problem persists you may have to use the trace facility to determine the cause of the problem.

Module: DFHEJCG

XMEOUT Parameters: *date, time,applid, userid, CorbaServer_name*

Destination: CEJL

DFHEJ0726E *date time applid userid* **Catalog Resolution processing for CorbaServer *CorbaServer_name* returned an invalid CorbaServer.**

Explanation: An update of the Global Catalog for CORBASERVER *CorbaServer_name*, to record that Resolution has occurred, failed when the read for update operation returned an invalid CORBASERVER.

System action: The state is not updated in the Global Catalog for the CorbaServer.

User response: The CORBASERVER resource should be discarded and reinstalled.

If the problem persists you may have to use the trace facility to determine the cause of the problem.

Module: DFHEJCG

XMEOUT Parameters: *date, time,applid, userid, CorbaServer_name*

Destination: CEJL

DFHEJ0729E *date time applid userid* **State updating failed while creating the shelf during Resolution processing for CorbaServer *CorbaServer_name*.**

Explanation: An update to the state of CorbaServer *CorbaServer_name* to record the status of the Resolution process has failed. The Resolution process

was attempting to create the Shelf for this CorbaServer.

System action: Processing continues with CorbaServer *CorbaServer* in an incorrect state.

User response: Ensure that the region id under which CICS is running has write permission to the area of the HFS directory structure in which the shelf directory should be created. Also check that there is sufficient free space for the directory to be created.

The CorbaServer should be discarded and reinstalled.

If the problem persists you may need to use the trace facility to determine the cause of the problem.

Module: DFHEJCG

XMEOUT Parameters: *date, time,applid, userid, CorbaServer_name*

Destination: CEJL

DFHEJ0736E *date time applid userid* **Resolution for CorbaServer *CorbaServer_name* (related to Object Store operations on file *file_name* as store *store_name*) failed.**

Explanation: The Resolution of CorbaServer *CorbaServer_name* involved with the Object Store file *file_name* has failed.

System action: The CorbaServer is put into the DISABLED state.

User response: The most likely problem is that the file definition for VSAM file *file_name* has not been installed or is incorrectly defined. Verify that the both the file and the file definition have been created with appropriate attributes. Check that the resource definition for the file has been installed. Sample definitions for files DFHEJDIR and DFHEJOS are available in groups DFHEJVS, DFHEJCF and DFHEJVR.

Discard and reinstall the resource. If the problem persists you may need to use the trace service to find the failing object store operation.

Module: DFHEJCG

XMEOUT Parameters: *date, time,applid, userid, CorbaServer_name,file_name, store_name*

Destination: CEJL

DFHEJ0739E *date time applid userid* **State updating failed while opening the Object Store during Resolution processing for CorbaServer *CorbaServer_name*.**

Explanation: An update of CorbaServer *CorbaServer_name*'s state to record the status of the Resolution process has failed. The Resolution process failed opening an Object Store file.

System action: Processing continues with the CorbaServer in an incorrect state.

User response: The CorbaServer should be discarded and reinstalled.

If the problem persists you may need to use the trace facility to determine the cause of the problem.

Module: DFHEJCG

XMEOUT Parameters: *date, time,applid, userid, CorbaServer_name*

Destination: CEJL

DFHEJ0745E *date time applid userid* **Error found during install of CorbaServer**
CorbaServer_name **because**
TCPIPSERVICE *tcpipservice* **is not installed.**

Explanation: CORBASERVER *CorbaServer_name* was being installed but the TCPIPSERVICE *tcpipservice* named is not installed.

System action: The CORBASERVER is not installed. Processing continues.

User response: Examine the CORBASERVER definition to check that the correct TCPIPSERVICE has been named and then delete the CORBASERVER, install the TCPIPSERVICE first and then retry the install of the CORBASERVER.

The TCPIPSERVICE needs to be installed in the listener region AND where the CORBASERVER is installed (AOR) if they are separate regions. If the CORBASERVER is in a separate region, the listener needs to have IIOPLISTENER=(YES) specified in the System Initialization Table (SIT) and the AOR needs to have IIOPLISTENER=(NO) specified.

Module: DFHEJCG

XMEOUT Parameters: *date, time,applid, userid, CorbaServer_name, tcpipservice*

Destination: CEJL

DFHEJ0746E *date time applid userid* **Error found during install of CorbaServer**
CorbaServer_name **because**
TCPIPSERVICE *tcpipservice* **named in the CorbaServer does not have a matching AUTHENTICATE parameter.**

Explanation: CorbaServer *CorbaServer_name* was being installed but the TCPIPSERVICE *TCPIPSERVICE* named does not have the same authenticate value as the TCPIPSERVICE.

System action: The CorbaServer is installed but becomes unusable. Processing continues.

User response: Examine the CORBASERVER definition to check that the correct TCPIPSERVICE has been named and then correct the authenticate parameter in the TCPIPSERVICE. Delete the

CorbaServer then reinstall the TCPIPSERVICE and the CorbaServer.

Module: DFHEJCG

XMEOUT Parameters: *date, time,applid, userid, CorbaServer_name, tcpipservice*

Destination: CEJL

DFHEJ0747E *date time applid userid* **Error found during install of CorbaServer**
CorbaServer_name **because**
TCPIPSERVICE *tcpipservice* **named in the CorbaServer for SSLUNAUTH has SSL(NO) set. SSL(YES|CLIENTAUTH) should be set.**

Explanation: CorbaServer *CorbaServer_name* was being installed but the TCPIPSERVICE *TCPIPSERVICE* named for SSLUNAUTH has an SSL setting of NO. The TCPIPSERVICE named must have an SSL value of YES or CLIENTAUTH.

System action: The CorbaServer becomes unusable. Processing continues.

User response: Examine the CORBASERVER definition to check that the correct TCPIPSERVICE has been named and then change the SSL parameter in the TCPIPSERVICE to YES or CLIENTAUTH. Delete the CorbaServer then reinstall the TCPIPSERVICE and the CorbaServer.

Module: DFHEJCG

XMEOUT Parameters: *date, time,applid, userid, CorbaServer_name, tcpipservice*

Destination: CEJL

DFHEJ0748E *date time applid userid* **Error found during install of CorbaServer**
CorbaServer_name **because**
TCPIPSERVICE *tcpipservice* **named in the CorbaServer for UNAUTH has SSL(YES|CLIENTAUTH) set. SSL(NO) should be set.**

Explanation: CorbaServer *CorbaServer_name* was being installed but the TCPIPSERVICE *TCPIPSERVICE* named for UNAUTH has an SSL setting of YES or CLIENTAUTH. The TCPIPSERVICE named must have an SSL value of NO.

System action: The CorbaServer becomes unusable. Processing continues.

User response: Examine the CORBASERVER definition to check that the correct TCPIPSERVICE has been named and then change the SSL parameter in the TCPIPSERVICE to NO. Delete the CorbaServer then reinstall the TCPIPSERVICE and the CorbaServer.

Module: DFHEJCG

DFHEJ0751I • DFHEJ0756E

XMEOUT Parameters: *date, time,applid, userid, CorbaServer_name,tcpiplibservice*

Destination: CEJL

DFHEJ0751I *date time applid userid* **About to wait for the availability of CorbaServer**
CorbaServer_name.

Explanation: A function needs to ensure that a CorbaServer is available for use, so it is going to wait until the CorbaServer becomes available (it enters the INSERVICE State).

This message will usually appear while Resolution is proceeding (or pending) for the CorbaServer. However, it can also occur after this time during consistency processing for the items associated with the CorbaServer.

System action: The transaction enters a Wait state until the CorbaServer becomes INSERVICE.

If the Wait is associated with consistency processing, it is likely that this delay will be short.

User response: None.

Module: DFHEJCG

XMEOUT Parameters: *date, time,applid, userid, CorbaServer_name*

Destination: CEJL

DFHEJ0752E *date time applid userid* **CorbaServer**
CorbaServer_name **availability wait**
ended in error as the CorbaServer was
not defined.

Explanation: The CorbaServer was not found during the availability wait. The CorbaServer has probably been deleted via CEMT while another transaction was waiting for the CorbaServer to be available.

System action: Processing continues.

User response: None.

Module: DFHEJCG

XMEOUT Parameters: *date, time,applid, userid, CorbaServer_name*

Destination: CEJL

DFHEJ0753I *date time applid userid* **CorbaServer**
CorbaServer_name **availability wait**
ended successfully.

Explanation: The CorbaServer is now available and so the availability wait has successfully ended.

System action: Processing continues.

User response: None.

Module: DFHEJCG

XMEOUT Parameters: *date, time,applid, userid, CorbaServer_name*

Destination: CEJL

DFHEJ0754I *date time applid userid* **CorbaServer**
CorbaServer_name **availability wait**
ended in error because the
CorbaServer was in the UNUSABLE
state.

Explanation: The CorbaServer entered the UNUSABLE state and so will never become available for use. Consequently, the availability wait has ended with this error condition.

System action: Processing continues.

User response: None.

Module: DFHEJCG

XMEOUT Parameters: *date, time,applid, userid, CorbaServer_name*

Destination: CEJL

DFHEJ0755I *date time applid userid* **CorbaServer**
CorbaServer_name **availability wait**
ended in error because the
CorbaServer was in the DISABLED
state.

Explanation: The CorbaServer entered the DISABLED state and so will never become available for use. Consequently, the availability wait has ended with this error condition.

System action: Processing continues.

User response: None.

DJar_name, CorbaServer_name

Destination: CEJL

DFHEJ0934E *date time applid userid* **DJar** *DJar_name*
within CorbaServer *CorbaServer_name*
has failed Resolution while it was
being copied to the Shelf.

Explanation: The Resolution for DJar *DJar_name*, involving copying the DJar to the Shelf, has failed.

System action: The DJar is put into the UNUSABLE state and cannot be used.

User response: Check that the CICS region id has permission to write to the HFS shelf directory and that there is sufficient free space available.

DJar *DJar_name* should be discarded and reinstalled.

Module: DFHEJDG

XMEOUT Parameters: *date, time,applid, userid, DJar_name, CorbaServer_name*

Destination: CEJL

DFHEJ0935E *date time applid userid* **Catalog read for update during Resolution processing for DJar *DJar_name* failed.**

Explanation: The updating of the Global Catalog entry for the DJar *DJar_name* failed when the read for update operation, to record the fact that Resolution has occurred, was executed. The state is not updated in the Global Catalog for the DJar; so, upon the next warm restart processing will not be as expected.

System action: The DJar is put into the UNUSABLE state and cannot be used.

User response: Discard and reinstall the DJar.

If the problem persists you may need to use the trace facility to determine the cause of the problem.

Module: DFHEJDG

XMEOUT Parameters: *date, time,applid, userid, DJar_name*

Destination: CEJL

DFHEJ0936E *date time applid userid* **DJar *DJar_name* Catalog Resolution processing returned bad data.**

Explanation: The updating of the Global Catalog entry for DJar *DJar_name*, to record the fact that Resolution has occurred, failed when the read for update operation returned invalid data. The state is not updated in the Global Catalog for the DJar; so, upon the next warm restart processing will not be as expected.

System action: The DJar is put into the UNUSABLE state and cannot be used.

User response: Discard and reinstall the DJar.

If the problem persists you may need to use the trace facility to determine the cause of the problem.

Module: DFHEJDG

XMEOUT Parameters: *date, time,applid, userid, DJar_name*

Destination: CEJL

DFHEJ0937E *date time applid userid* **DJar *DJar_name* Catalog Resolution processing returned an invalid DJar.**

Explanation: The updating of the Global Catalog entry for DJar *DJar_name*, to record the fact that Resolution has occurred, failed when the read for update operation returned an invalid DJar. The state is not updated in the Global Catalog for the DJar; so, upon the next warm restart processing will not be as expected.

System action: The DJar is put into the UNUSABLE state and cannot be used.

User response: Discard and reinstall the DJar.

If the problem persists you may need to use the trace facility to determine the cause of the problem.

Module: DFHEJDG

XMEOUT Parameters: *date, time,applid, userid, DJar_name*

Destination: CEJL

DFHEJ0940E *date time applid userid* **State updating failed while copying the DJar to the shelf during Resolution processing for DJar *DJar_name*.**

Explanation: The updating of the state, to record the status of Resolution processing, for DJar *DJar_name* has failed. The Resolution process was attempting to copy the DJar to the Shelf.

System action: Processing continues with the DJar in an incorrect state.

User response: Check that the CICS region id has write permission to the HFS shelf directory and that there is sufficient space available for the write operation to succeed.

Discard and reinstall the DJar.

If the problem persists you may need to use the trace facility to determine the cause of the problem.

Module: DFHEJDG

XMEOUT Parameters: *date, time,applid, userid, DJar_name*

Destination: CEJL

DFHEJ0946E *date time applid userid* **The Beans contained within DJar *DJar_name* within CorbaServer *CorbaServer_name* were not correctly confirmed during Bean Resolution.**

Explanation: All Beans within DJar *DJar_name* were correctly loaded. However, an error occurred while making the Beans within this DJar available for use during Resolution.

A System error has occurred which probably does not have anything to do with the DJar or the Beans themselves.

System action: The DJar is put into the UNRESOLVED state and is not available for use. An attempt is made to delete any Beans associated with the DJar.

User response: Discard and reinstall the DJar.

If the problem persists you may need to use the trace

facility to determine the cause of the problem.

Module: DFHEJDG

XMEOUT Parameters: *date, time,applid, userid, DJar_name, CorbaServer_name*

Destination: CEJL

DFHEJ0947E *date time applid userid* **Beans contained within DJar *DJar_name* within CorbaServer *CorbaServer_name* are invalid and unusable.**

Explanation: An error occurred while installing the Beans from DJar *DJar_name* during the Bean copying phase of Resolution.

The most probable reason is that an attempt was made to install a duplicate Bean twice within the scope of the CorbaServer. In other words the duplicate Bean occurs in more than one DJar.

System action: The partially processed Beans within the DJar are deleted and the DJar is put into the UNRESOLVED state.

User response: Investigate why the Beans within the DJar within the scope of the CorbaServer caused this error to occur. In the most likely case, check that the contents of the DJar are not already present within the scope of the CorbaServer (for example, copying a Bean and then using both copies).

Module: DFHEJDG

XMEOUT Parameters: *date, time,applid, userid, DJar_name, CorbaServer_name*

Destination: CEJL

DFHEJ0948I *date time applid userid* **Deletion of Beans contained within DJar *DJar_name* within CorbaServer *CorbaServer_name* succeeded.**

Explanation: Beans are being deleted due to an error in the Resolution process which was loading Beans from DJar *DJar_name*. This deletion has succeeded.

System action: Processing continues.

User response: A previous message should explain why the Bean failed to install.

Discard and reinstall the DJar.

If the problem persists you may need to use the trace facility to determine the cause of the problem.

Module: DFHEJDG

XMEOUT Parameters: *date, time,applid, userid, DJar_name, CorbaServer_name*

Destination: CEJL

DFHEJ0949E *date time applid userid* **Deletion of Beans contained within DJar *DJar_name* within CorbaServer *CorbaServer_name* failed.**

Explanation: Beans are being deleted due to an error in the Bean Resolution process for DJar *DJar_name*. However, this deletion of Beans has failed.

System action: Processing continues.

User response: A previous message should explain why the Bean failed to install.

Discard and reinstall the DJar.

If the problem persists you may need to use the trace facility to determine the cause of the problem.

Module: DFHEJDG

XMEOUT Parameters: *date, time,applid, userid, DJar_name, CorbaServer_name*

Destination: CEJL

DFHEJ0951E *date time applid userid* **State updating failed while loading Beans from the DJar during Resolution processing for DJar *DJar_name*.**

Explanation: The updating of the state, to record the status of Bean Resolution processing, for DJar *DJar_name* has failed. The Bean Resolution process consists of loading Beans from the DJar.

System action: Processing continues with the DJar in an incorrect state.

User response: Discard and reinstall the DJar.

If the problem persists you may need to use the trace facility to determine the cause of the problem.

Module: DFHEJDG

XMEOUT Parameters: *date, time,applid, userid, DJar_name*

Destination: CEJL

DFHEJ0961I *date time applid userid* **About to wait for the availability of DJar *DJar_name*.**

Explanation: A function needs to ensure that a DJar is available for use, so it is going to wait until this DJar becomes available by entering the INSERVICE state).

This message will usually be generated while the DJar is awaiting or undergoing Resolution Processing. However, it can also occur during consistency processing of items associated with the DJar.

System action: The transaction enters a Wait state until the DJar is INSERVICE.

If the Wait is due to consistency processing, the delay is likely to be small.

DFHEJ0962I • DFHEJ0971I

User response: None.

Module: DFHEJDG

XMEOUT Parameters: *date, time,applid, userid, DJar_name*

Destination: CEJL

DFHEJ0962I *date time applid userid DJar DJar_name*
availability wait ended in error because the DJar was not defined.

Explanation: The DJar was not found during the availability wait. The DJar has probably been deleted via CEMT while another transaction was waiting for the DJar to be available.

System action: Processing continues.

User response: None.

Module: DFHEJDG

XMEOUT Parameters: *date, time,applid, userid, DJar_name*

Destination: CEJL

DFHEJ0963I *date time applid userid DJar DJar_name*
availability wait ended successfully.

Explanation: The DJar is now available and so the availability wait has successfully ended.

System action: Processing continues.

User response: None.

Module: DFHEJDG

XMEOUT Parameters: *date, time,applid, userid, DJar_name*

Destination: CEJL

DFHEJ0964I *date time applid userid DJar DJar_name*
availability wait ended in error because the DJar was in the UNUSABLE state.

Explanation: The DJar entered the UNUSABLE state and so will never become available for use. Consequently, the availability wait has ended with this error condition.

System action: Processing continues.

User response: None.

Module: DFHEJDG

XMEOUT Parameters: *date, time,applid, userid, DJar_name*

Destination: CEJL

DFHEJ0965I *date time applid userid DJar DJar_name*
availability wait ended in error because the DJar was in the UNRESOLVED state.

Explanation: The DJar entered the UNRESOLVED state and so will never become available for use. Consequently, the availability wait has ended with this error condition.

System action: Processing continues.

User response: None.

Module: DFHEJDG

XMEOUT Parameters: *date, time,applid, userid, DJar_name*

Destination: CEJL

DFHEJ0966E *date time applid userid DJar DJar_name*
availability wait ended in error because an error occurred during the wait.

Explanation: The DJar availability wait ended in error. This is probably due to the transaction being cancelled via CEMT.

System action: Processing continues.

User response: None.

Module: DFHEJDG

XMEOUT Parameters: *date, time,applid, userid, DJar_name*

Destination: CEJL

DFHEJ0971I *date time applid userid* **About to wait for the availability of all Beans contained within DJars associated with CorbaServer** *CorbaServer_name*.

Explanation: A function needs to ensure that all the Beans contained within DJars associated with a CorbaServer are present. Thus, it is going to wait until all DJars associated with the CorbaServer have been resolved (they all enter the INSERVICE state).

System action: The transaction enters a Wait state until the all the DJars associated with the CorbaServer enter the INSERVICE state.

User response: None.

Module: DFHEJDG

XMEOUT Parameters: *date, time,applid, userid, CorbaServer_name*

Destination: CEJL

DFHEJ0972I *date time applid userid* **All Beans contained within DJars associated with CorbaServer *CorbaServer_name* are now available for use.**

Explanation: All Beans contained within the DJars associated with this CorbaServer are present. This means that the CorbaServer and all associated DJars are in the INSERVICE state.

System action: None.

User response: None.

Module: DFHEJDG

XMEOUT Parameters: *date, time,applid, userid, CorbaServer_name*

Destination: CEJL

DFHEJ0973E *date time applid userid* **Bean wait for DJars associated with CorbaServer *CorbaServer_name* failed.**

Explanation: The waiting has ended without all Beans contained within the DJars associated with this CorbaServer being present. This will probably be a side effect of a previous error in DJar or CorbaServer processing.

This could be a side effect of the CorbaServer being deleted or in the UNUSABLE state, or a DJar being in the UNUSABLE or UNRESOLVED state, or the wait being cancelled via CEMT.

System action: None.

User response: Examine the exception trace entry showing the failure of the operation which caused the wait to end in error.

Module: DFHEJDG

XMEOUT Parameters: *date, time,applid, userid, CorbaServer_name*

Destination: CEJL

DFHEJ1101E *date time applid userid* **Bean *Bean_name* from DJar *DJar_name* within CorbaServer *CorbaServer_name* has not been created because the CorbaServer is absent.**

Explanation: The Bean contained in DJar *DJar_name* and associated with the named CorbaServer has not been created because the CorbaServer *CorbaServer_name* was not found. The CorbaServer was probably deleted via CEMT while the Bean loading phase of the DJar Resolution was in progress.

System action: Processing continues.

User response: The owning DJar should be deleted and reinstalled when CorbaServer *CorbaServer_name* is present.

Module: DFHEJBG

XMEOUT Parameters: *date, time,applid, userid, Bean_name, DJar_name, CorbaServer_name*

Destination: CEJL

DFHEJ1102E *date time applid userid* **Bean *Bean_name* from DJar *DJar_name* within CorbaServer *CorbaServer_name* has not been created because the CorbaServer is not in the correct state.**

Explanation: The Bean, contained in the named DJar and associated with the named CorbaServer, has not been created because the CorbaServer was not in the INSERVICE state.

System action: Processing continues.

User response: The DJar should be deleted.

Module: DFHEJBG

XMEOUT Parameters: *date, time,applid, userid, Bean_name, DJar_name, CorbaServer_name*

Destination: CEJL

DFHEJ1103E *date time applid userid* **Bean *Bean_name* from DJar *DJar_name* within CorbaServer *CorbaServer_name* has not been created because the DJar is absent.**

Explanation: The Bean contained in the DJar *DJar_name* and associated with the named CorbaServer has not been created because the DJar was not found. The DJar was probably deleted via CEMT while the Bean copying phase of the DJar Resolution was in progress.

System action: Processing continues.

User response: None.

Module: DFHEJBG

XMEOUT Parameters: *date, time,applid, userid, Bean_name, DJar_name, CorbaServer_name*

Destination: CEJL

DFHEJ1104E *date time applid userid* **Bean *Bean_name* from DJar *DJar_name* within CorbaServer *CorbaServer_name* has not been created because the DJar is not in the correct state.**

Explanation: The Bean, contained in the named DJar and associated with the named CorbaServer, has not been created because the DJar was not in the RESOLVING state.

System action: Processing continues.

This indicates some sort of internal race condition and should not occur.

User response: You may need to contact your IBM service representative.

Module: DFHEJBG

XMEOUT Parameters: *date, time, applid, userid, Bean_name, DJar_name, CorbaServer_name*

Destination: CEJL

DFHEJ1105E *date time applid userid* **Bean**
Bean_name **from DJar** *DJar_name*
within CorbaServer *CorbaServer_name*
has not been created because the
Bean is already present.

Explanation: The Bean, contained in the named DJar and associated with the named CorbaServer, has not been created because the Bean was already defined. This probably means that an attempt was being made to process a copy of an already defined DJar.

System action: Processing continues.

User response: The DJar should be deleted.

Module: DFHEJBG

XMEOUT Parameters: *date, time, applid, userid, Bean_name, DJar_name, CorbaServer_name*

Destination: CEJL

DFHEJ1106E *date time applid userid* **Bean**
Bean_name **from DJar** *DJar_name*
within CorbaServer *CorbaServer_name*
has not been created because the
Bean is already present in the
namespace of the CorbaServer.

Explanation: The Bean, contained in the named DJar and associated with the named CorbaServer, has not been created because the Bean was already known within the namespace of the CorbaServer.

This probably means that an attempt was being made to process a copy of an already defined DJar.

Another possibility is that a Bean with the same name is present within two different DJars. Within the scope of a CorbaServer, all the Beans within all the DJars associated with the CorbaServer must be unique.

System action: Processing continues.

User response: The DJar should be deleted.

Module: DFHEJBG

XMEOUT Parameters: *date, time, applid, userid, Bean_name, DJar_name, CorbaServer_name*

Destination: CEJL

DFHEJ1107E *date time applid userid* **Bean**
Bean_name **from DJar** *DJar_name*
within CorbaServer *CorbaServer_name*
has not been created.

Explanation: The Bean, contained in the named DJar and associated with the named CorbaServer, has not been created.

System action: Processing continues.

User response: A prior message will usually indicate the cause of the error. The DJar should be deleted.

Module: DFHEJBG

XMEOUT Parameters: *date, time, applid, userid, Bean_name, DJar_name, CorbaServer_name*

Destination: CEJL

DFHEJ1301 *applid* **The elements portion of the**
Enterprise Java Domain did not
initialize. Enterprise Java function is
unavailable.

Explanation: The portion of the Enterprise Java (EJ) Domain which deals with CorbaServers, DJars and Beans has not correctly initialized. This EJ function is not available.

This message indicates a system error while creating the Elements part of the EJ Domain. This processing manipulates CorbaServers, DJars and Beans. This implies that an EJ Gate was not created or a GETMAIN for required areas failed. A failure to recover a CorbaServer or a DJar upon a warm restart is also a possibility.

System action: All EJ elements function is unavailable. However, other components of the EJ domain (such as Object Store) may be available.

User response: This is a system-related failure and an exception trace entry will indicate why the EJ domain has failed to install.

Module: DFHEJGE

XMEOUT Parameter: *applid*

Destination: Console

DFHEJ1510E *date time applid userid* **CorbaServer**
CorbaServer_name **previously failed**
Resolution and was found in the
INITING state.

Explanation: A prior Resolution transaction (CEJR) failed and left a CorbaServer in the INITING state.

System action: The CorbaServer is put into the DISABLED state in order to prevent its use.

User response: A prior message should indicate the cause of the previous error.

Module: DFHEJIO

XMEOUT Parameters: *date, time,applid, userid, CorbaServer_name*

Destination: CEJL

DFHEJ1513E *date time applid userid CorbaServer CorbaServer_name* **previously failed Resolution and was found in an intermediate state.**

Explanation: A prior Resolution transaction (CEJR) failed and left a CorbaServer in an intermediate state.

System action: The CorbaServer will be put into the DISABLED state in order to prevent its use.

User response: Examine the message log to determine why the CorbaServer Resolution failed. The CorbaServer should either be discarded or reenabled.

Module: DFHEJIO

XMEOUT Parameters: *date, time,applid, userid, CorbaServer_name*

Destination: CEJL

DFHEJ1518E *date time applid userid CorbaServer CorbaServer_name* **is UNUSABLE.**

Explanation: The CorbaServer *CorbaServer_name* failed to complete the part of the Resolution process which involves creation of the shelf onto which components associated with the CorbaServer are placed.

System action: The CorbaServer is put into the DISABLED state.

User response: Check that the CICS region id has write permission to the shelf HFS directory structure.

The CorbaServer should be discarded and reinstalled.

If the problem persists you may have to use the trace facility to determine the cause of the problem.

Module: DFHEJIO

XMEOUT Parameters: *date, time,applid, userid, CorbaServer_name*

Destination: CEJL

DFHEJ1520I *date time applid userid CorbaServer CorbaServer_name* **is now accessible.**

Explanation: The CorbaServer *CorbaServer_name* has successfully completed the part of the Resolution process which involves opening CorbaServer related Object Store files. The CorbaServer *CorbaServer_name* is now accessible.

System action: Processing continues.

User response: None.

Module: DFHEJIO

XMEOUT Parameters: *date, time,applid, userid, CorbaServer_name*

Destination: CEJL

DFHEJ1521E *date time applid userid CorbaServer CorbaServer_name* **is DISABLED.**

Explanation: The CorbaServer *CorbaServer_name* failed to complete the part of the Resolution process which involves opening the CorbaServer related Object Store files.

System action: The CorbaServer is put into the DISABLED state.

User response: Discard and reinstall the CorbaServer.

If the problem persists you may need to use the trace facility to determine the cause of the problem.

Module: DFHEJIO

XMEOUT Parameters: *date, time,applid, userid, CorbaServer_name*

Destination: CEJL

DFHEJ1530E *date time applid userid DJar DJar_name* **previously failed Resolution and was found in the INITING state.**

Explanation: A prior Resolution transaction (CEJR) failed and left a DJar in the INITING state.

System action: The DJar will be put into the UNUSABLE state to prevent its use.

User response: A prior message will usually indicate the cause of the previous error. Discard and reinstall the DJar.

If the problem persists you may need to use the trace facility to determine the cause of the problem.

Module: DFHEJIO

XMEOUT Parameters: *date, time,applid, userid, DJar_name*

Destination: CEJL

DFHEJ1533E *date time applid userid DJar DJar_name* **previously failed Resolution and was found in the RESOLVI NG state.**

Explanation: A prior Resolution transaction (CEJR) failed and left a DJar in the RESOLVING state.

System action: The DJar will be put into the UNRESOLVED state to prevent its use.

User response: A prior message will usually indicate the cause of the previous error. Discard and reinstall the CorbaServer.

If the problem persists you may need to use the trace

DFHEJ1538E • DFHEJ1801E

facility to determine the cause of the problem.

Module: DFHEJIO

XMEOUT Parameters: *date, time,applid, userid, DJar_name*

Destination: CEJL

DFHEJ1538E *date time applid userid DJar DJar_name*
and the Beans it contains are UNUSABLE.

Explanation: DJar *DJar_name* failed to Resolve. The Resolution process failed while attempting to copy this DJar to the Shelf.

System action: The DJar has been put into the UNUSABLE state.

User response: Check that the CICS region id has permission to write to the HFS shelf directory structure. Discard and reinstall the CorbaServer.

If the problem persists you may need to use the trace facility to determine the cause of the problem.

Module: DFHEJIO

XMEOUT Parameters: *date, time,applid, userid, DJar_name*

Destination: CEJL

DFHEJ1540I *date time applid userid DJar DJar_name*
and the Beans it contains are now accessible.

Explanation: The DJar *DJar_name* has correctly Resolved. This means that the Resolution process successfully loaded all the Beans from this DJar. DJar *DJar_name* and all the Beans which are contained in the DJar are now accessible and ready for use. This message does not imply that the Beans have been published. If the DJar has been published then CICS is now ready to accept requests for the Beans.

System action: Processing continues.

User response: None.

Module: DFHEJIO

XMEOUT Parameters: *date, time,applid, userid, DJar_name*

Destination: CEJL

DFHEJ1541E *date time applid userid DJar DJar_name*
and the Beans it contains are UNRESOLVED.

Explanation: DJar *DJar_name* failed to Resolve. The Resolution process failed while attempting to load the Beans from this DJar because the Beans contained within the DJar were invalid.

System action: The DJar is put into the UNRESOLVED state.

User response: A prior message should describe the error in the DJar. Fix this error and then reinstall the DJar.

Module: DFHEJIO

XMEOUT Parameters: *date, time,applid, userid, DJar_name*

Destination: CEJL

DFHEJ1801E *date time applid userid* **The EJ domain is unable to run the Enterprise Java event URM: *module*. Reason(*X'reason*)**

Explanation: The EJ domain attempted to invoke the Enterprise Java event URM *module* but failed with a code supplied as *reason*.

System action: Exception trace point 6000 is issued. Enterprise resource processing continues.

User response: Possible causes of the problem and an indication of how to solve them are given in the following list of reason code meanings:

Reason Meaning and Solution

- 1 The user exit program should be linked with AMODE(31). Ensure that the user exit is linked to the correct AMODE.
- 2 The user exit program has no PPT entry. Ensure that the PPT entry for the user exit program exists and is valid.
- 3 The user exit program could not be loaded. Ensure that the user exit program is contained in one of the data sets concatenated in the DFHRPL DD statement and has the correct name.
- 4 The user exit program has abended. This is a possible error within the user exit program. Check for any abend codes that may have been issued.
- 5 The user exit program is not enabled. CICS may have disabled the program due to an earlier error or the program may have been defined as disabled.
- 6 CICS is unable to load the user exit program for some other reason. Use trace to determine why the DFHPGLU call failed.

Module: DFHEJDG

XMEOUT Parameters: *date, time,applid, userid, module, X'reason'*

Destination: CEJL

DFHEJ5001E *date time applid userid* **The HFS file *hfs_name* for DJar *DJar_name* could not be located.**

Explanation: Installation of a DJar has failed because either the HFS file referred to by the DJar definition could not be found or the security permissions on HFS prevented CICS from opening it.

System action: Processing continues, but this particular DJar is not installed.

User response: Check that the HFS filename defined in the DJar definition is correct and that the file exists on HFS. Also check the permissions on the jar file and the permissions on the directory hierarchy in which it can be found.

Module:
com.ibm.cics.ejs.csi.commands.InstallDJarCommand

XMEOUT Parameters: *date, time, applid, userid, hfs_name, DJar_name*

Destination: CEJL

DFHEJ5002E *date time applid userid* **Unable to delete JAR file *DJar_file_name* from the Shelf directory *shelf_partition*.**

Explanation: There was an HFS problem when attempting to remove a .jar file from the Shelf directory.

System action: Processing continues and the DJar object is discarded, but CICS was unable to tidy up HFS.

User response: Check the permissions on the Shelf directory and .jar file described in the message to ensure CICS has access. The file can then either be removed manually or install of a subsequent DJar definition with the same name overwrites the file.

Module:
com.ibm.cics.ejs.csi.commands.DiscardDJarCommand

XMEOUT Parameters: *date, time, applid, userid, DJar_file_name, shelf_partition*

Destination: CEJL

DFHEJ5003E *date time applid userid* **CICS is unable to write to the destination file *hfs_file_name* while installing DJar *djar_name*.**

Explanation: Whilst installing a DJar, CICS was unable to open a file on the shelf for writing.

System action: Processing continues, but this DJar will not be installed.

User response: Check the permissions for the shelf directory specified for the related CORBASERVER into which this DJar is being installed. CICS should be able

to read and write to all files and directories within that shelf directory.

Module:
com.ibm.cics.ejs.csi.commands.InstallDJarCommand

XMEOUT Parameters: *date, time, applid, userid, hfs_file_name, djar_name*

Destination: CEJL

DFHEJ5004E *date time applid userid* **The container encountered problems processing the contents of the HFS file referred to by DJar *DJar_name*.**

Explanation: The container was attempting to process a .jar file, looking for enterprise beans. The container was working with the copy of the .jar file that is held on the Shelf, not the original HFS .jar file described in the DJar definition.

System action: Processing continues, but this particular DJar is not installed.

User response: Check the validity of the .jar file referred to in the DJar definition. Check it has a valid deployment descriptor and the generated code contained within the jar file is correct. The CICS deployment tooling can be used to check the deployment descriptor and perform the code generation step if it is suspected that the generated code within the jar is incorrect.

Module:
com.ibm.cics.ejs.csi.commands.InstallDJarCommand

XMEOUT Parameters: *date, time, applid, userid, DJar_name*

Destination: CEJL

DFHEJ5005E *date time applid userid* **Unable to obtain the remotable reference for bean *bean_name* from the container.**

Explanation: To publish a home IOR for a bean to JNDI, it is necessary to obtain a remote reference for that bean from the container. This message indicates there was a problem retrieving the reference from the container.

System action: Processing continues, but this particular bean does not have its home published to JNDI.

User response: Check the validity of the .jar file referred to in the DJar definition. Check it is fully deployed with an ASCII manifest file.

Module:
com.ibm.cics.ejs.csi.commands.AdminCommand

XMEOUT Parameters: *date, time, applid, userid, bean_name*

Destination: CEJL

DFHEJ5006I *date time applid userid* **Creating new JNDI subcontext** *jndi_subcontext*.

Explanation: Before publishing a home for a bean in JNDI, the subcontext hierarchy described in the CorbaServer definition must exist. This informational message indicates that part of that hierarchy does not exist and is being created.

System action: None.

User response: None.

Module:
com.ibm.cics.ejs.csi.commands.AdminCommand

XMEOUT Parameters: *date, time, applid, userid, jndi_subcontext*

Destination: CEJL

DFHEJ5007I *date time applid userid* **Destroying empty JNDI subcontext** *jndi_subcontext*.

Explanation: After a home for a bean has been unbound from JNDI, it is possible that the namespace can be tidied up. CICS attempts to remove the hierarchy of subcontexts described in the CorbaServer definition. It only deletes a subcontext if it is empty.

System action: None.

User response: None.

Module:
com.ibm.cics.ejs.csi.commands.AdminCommand

XMEOUT Parameters: *date, time, applid, userid, jndi_subcontext*

Destination: CEJL

DFHEJ5008E *date time applid userid* **Unable to write home IOR for bean** *bean_name* **to the Shelf directory** *shelf_partition*.

Explanation: The home IOR for a bean may be written to the HFS Shelf. This message indicates that CICS had a problem in attempting to write to the Shelf.

System action: Processing continues, but this particular bean does not have its home published to the Shelf.

User response: Check the permissions of the Shelf directory. If there already exists an IOR for the bean in the Shelf directory, check its permissions. CICS must have write access to the directory and to overwrite any files that might exist.

Module:
com.ibm.cics.ejs.csi.commands.AdminCommand

XMEOUT Parameters: *date, time, applid, userid, bean_name, shelf_partition*

Destination: CEJL

DFHEJ5009I *date time applid userid* **Published bean** *bean_name* **to JNDI server** *jndi_server* **at location** *jndi_location*.

Explanation: CICS has successfully published the home for the bean in JNDI. The location where the home is bound, and hence where the home can be looked up, is also supplied in the message.

System action: None.

User response: None.

Module:
com.ibm.cics.ejs.csi.commands.AdminCommand

XMEOUT Parameters: *date, time, applid, userid, bean_name, jndi_server, jndi_location*

Destination: CEJL

DFHEJ5010I *date time applid userid* **Publishing bean** *bean_name* **in the Shelf directory** *shelf_partition* **as file** *file_name*.

Explanation: CICS is publishing the home for the bean on the Shelf. The location where the home is being written is supplied in the message as a directory and filename.

System action: None.

User response: None.

Module:
com.ibm.cics.ejs.csi.commands.AdminCommand

XMEOUT Parameters: *date, time, applid, userid, bean_name, shelf_partition, file_name*

Destination: CEJL

DFHEJ5011I *date time applid userid* **Retracted bean** *bean_name* **from JNDI server** *jndi_server* **at location** *jndi_location*.

Explanation: CICS has successfully retracted the home for a bean from JNDI. The JNDI location that is being unbound is supplied in the message. Once this message has appeared, clients are no longer able to look up the bean home at this location.

System action: None.

User response: None.

Module:
com.ibm.cics.ejs.csi.commands.AdminCommand

XMEOUT Parameters: *date, time, applid, userid, bean_name, jndi_server, jndi_location*

Destination: CEJL

DFHEJ5012I *date time applid userid* **Retracting bean *bean_name* from the Shelf directory shelf_partition, file *file_name*.**

Explanation: CICS is retracting the home for the bean from the Shelf. When retracting bean homes from the Shelf, retraction means deletion of the IOR file object created at publish.

System action: None.

User response: None.

Module:
com.ibm.cics.ejs.csi.commands.AdminCommand

XMEOUT Parameters: *date, time, applid, userid, bean_name, shelf_partition, file_name*

Destination: CEJL

DFHEJ5013E *date time applid userid* **Bean *bean_name* cannot be retracted from JNDI as it cannot be found at lo cation *jndi_location*.**

Explanation: CICS is attempting to retract the home of a bean from JNDI. However, the home has not been found at the expected location in JNDI. This is usually due to a previous retraction having removed the home already.

System action: None.

User response: None.

Module:
com.ibm.cics.ejs.csi.commands.AdminCommand

XMEOUT Parameters: *date, time, applid, userid, bean_name, jndi_location*

Destination: CEJL

DFHEJ5014E *date time applid userid* **The HFS file *hfs_name* for DJar *DJar_name* exists but could not be opened for reading by CICS.**

Explanation: Installation of a DJar has failed because although the HFS file referred to by the DJar definition exists, it cannot be opened for reading by CICS.

System action: Processing continues, but this particular DJar is not installed.

User response: Check the permissions on the HFS file referred to by the DJar definition. Change the permissions if necessary to enable reading by CICS.

Module:
com.ibm.cics.ejs.csi.commands.InstallDJarCommand

XMEOUT Parameters: *date, time, applid, userid, hfs_name, DJar_name*

Destination: CEJL

DFHEJ5015E *date time applid userid* **Unable to delete HFS file *hfs_file_name* which exists on the shelf while installing DJar *djar_name*.**

Explanation: Whilst installing a DJar, CICS found a file on the shelf of the same name that it wanted to use when copying the users source deployed jar. CICS was unable to delete that file.

System action: Processing continues, but this particular DJar is not installed.

User response: Check the permissions of the shelf directory for the CORBASERVER and the permissions of the HFS file that the CICS message describes as already existing on the shelf. CICS should normally have the ability to read and write to all directories and files that exist under the directory defined as the CORBASERVERs shelf.

Module:
com.ibm.cics.ejs.csi.commands.InstallDJarCommand

XMEOUT Parameters: *date, time, applid, userid, hfs_file_name, djar_name*

Destination: CEJL

DFHEJ5016E *date time applid userid* **IO exception while attempting to read *hfs_file_name* during install of DJar *djar_name*.**

Explanation: During install of a DJar, CICS encountered an exception reading the HFS file described in the DJar definition.

System action: Processing continues, but this particular DJar is not installed.

User response: This is a very unusual situation. The file was found to exist and CICS had read permission, but a problem occurred whilst reading it. Retry the install operation.

Module:
com.ibm.cics.ejs.csi.commands.InstallDJarCommand

XMEOUT Parameters: *date, time, applid, userid, hfs_file_name, djar_name*

Destination: CEJL

DFHEJ5017E *date time applid userid* **IO exception while attempting to write *hfs_file_name* to the shelf during install of DJar *djar_name*.**

Explanation: During install of a DJar, CICS encountered an exception writing the HFS file described in the DJar definition.

System action: Processing continues, but this particular DJar is not installed.

User response: This is usually due to running out of

space in the filesystem. Check the size of the filesystem where the shelf is defined to exist for the CORBASERVER into which the DJar is being installed.

Module:

com.ibm.cics.ejs.csi.commands.InstallDJarCommand

XMEOUT Parameters: *date, time, applid, userid, hfs_file_name, djar_name*

Destination: CEJL

DFHEJ5018E *date time applid userid* **EJB Classloader unable to locate class** *class_name*.

Explanation: The Java classloader responsible for loading Enterprise Beans was asked to load a class and was unable to locate it.

System action: Processing stops. The request processor reporting the error shuts down, returning an exception to the client.

User response: If the class is part of an Enterprise Bean, check the class exists in the deployed jar file you have named on the DJar definition. If it is a utility class used by an Enterprise Bean, check the utility class is on the user application classpath.

Module: com.ibm.cics.ejs.csi.DJarClassLoader

XMEOUT Parameters: *date, time, applid, userid, class_name*

Destination: CEJL

DFHEJ5019E *date time applid userid* **DJar** *djar_name* **contains a bean whose name contains one or more invalid c haracters.**

Explanation: CICS is only able to process beans whose names are composed of characters from a specific set. This set being a subset of those allowable in the deployment descriptor.

System action: Processing continues, but none of the beans from this DJar are installed.

User response: Check the names of your beans against the allowable character set.

Module: com.ibm.cics.ejs.csi.CICSBeanMetaDataStore

XMEOUT Parameters: *date, time, applid, userid, djar_name*

Destination: CEJL

DFHEJ5020E *date time applid userid* **A bean installed in CORBASERVER** *corbaserver* **has been incorrectly deployed for use in CICS.**

Explanation: This message indicates that a bean installed in CICS contains generated code at the incorrect level. This can happen if, for example,

Visualage for Java has been used to fully deploy a bean for use in CICS, the generated code produced by Visualage is not of the correct level (it is EJB 1.0 level code).

System action: Processing against this bean stops and the initiating method request fails.

User response: Use the CICS deployment tool to generate code at the correct EJB level for all the beans installed in the named corbaserver.

Module: com.ibm.cics.ejs.csi.DJarClassLoader

XMEOUT Parameters: *date, time, applid, userid, corbaserver*

Destination: CEJL

DFHEJ5021E *date time applid userid* **Failed to publish bean** *bean_name* **to JNDI server** *jndi_server* **at location** *jndi_location*.

Explanation: CICS has failed to publish the home of the bean in JNDI. The location where the home was being bound, and the server which was being used are included in the message.

System action: None.

User response: Check that the JNDI server named in the message is working.

Module:

com.ibm.cics.ejs.csi.commands.AdminCommand

XMEOUT Parameters: *date, time, applid, userid, bean_name, jndi_server, jndi_location*

Destination: CEJL

DFHEJ5022E *date time applid userid* **DJar** *DJar* **contains bean** *bean_name* **which has already been installed in CorbaServer** *CorbaServer*. **The DJar will not be installed.**

Explanation: The HFS file named in the DJar definition contains a deployed Enterprise Bean whose name conflicts with a bean already installed in the CorbaServer.

System action: The DJar named in the message is not installed. None.

User response: Change the name of the bean in the named DJar so that it does not conflict, or install the DJar in an alternative CorbaServer.

Module: com.ibm.cics.ejs.csi.MethodInfoStore

XMEOUT Parameters: *date, time, applid, userid, DJar, bean_name, CorbaServer*

Destination: CEJL

DFHEJ5023E *date time applid userid* **Scan for CorbaServer CorbaServer failed, the djardir djardir is not a valid HFS directory.**

Explanation: A CorbaServer scan failed because the djardir attribute on the CorbaServer definition is invalid. The djardir is invalid either because it is not an HFS directory or CICS does not have read access to it.

System action: The scan fails. There is no change to the currently installed set of DJar resources.

User response: Check the HFS directory exists and is accessible by CICS.

Module:

com.ibm.cics.ejs.csi.commands.ScanCommand

XMEOUT Parameters: *date, time,applid, userid, CorbaServer, djardir*

Destination: CEJL

DFHEJ5024I *date time applid userid* **Scan commencing for CorbaServer CorbaServer, directory being scanned is djardir.**

Explanation: A CorbaServer scan has been requested against the specified CorbaServer. This message also indicates the HFS directory that is scanned for new or updated deployed jars. When the scan has completed a summary message is produced indicating how many new DJar resources have been created and how many have been updated.

System action: None.

User response: None.

Module: DFHEJCG

XMEOUT Parameters: *date, time,applid, userid, CorbaServer, djardir*

Destination: CEJL

DFHEJ5025I *date time applid userid* **Scan completed for CorbaServer CorbaServer, newdjarcount DJars created, upddjarcount DJars updated.**

Explanation: A CorbaServer scan has completed against the specified CorbaServer. The message indicates how many new DJar resources have been created based on the contents of the scanned djardir. It also indicates how many DJar resources have been upgraded due to new versions of jar files being discovered in the djardir.

System action: None.

User response: None.

Module: DFHEJDG

XMEOUT Parameters: *date, time,applid, userid, CorbaServer, newdjarcount, upddjarcount*

Destination: CEJL

DFHEJ5026W *date time applid userid* **Scan for CorbaServer CorbaServer is ignoring subdirectory subdir which was found to exist in the djardir djardir.**

Explanation: During a scan operation against the specified CorbaServer, CICS discovered a subdirectory in the djardir. The subdirectory is ignored. Scan does not recurse into subdirectories when looking for deployed jars to install.

System action: The scan continues, simply ignoring the subdirectory.

User response: The subdirectory does not harm the scan operation, but it may be advisable to remove it from the djardir as the scan operation always has to look at every object (directory or file) that exists in the djardir when performing a scan.

Module:

com.ibm.cics.ejs.csi.commands.ScanCommand

XMEOUT Parameters: *date, time,applid, userid, CorbaServer, subdir, djardir*

Destination: CEJL

DFHEJ5027W *date time applid userid* **Scan for CorbaServer CorbaServer is ignoring the file file found in the djardir djardir because it has an incorrect file suffix.**

Explanation: During a scan operation against the specified CorbaServer, CICS discovered a file that has an incorrect suffix. The scan code is looking for candidate deployed jar files and these files are expected to have .jar as their file suffix.

System action: The scan continues, simply ignoring the incorrectly named file.

User response: If the file was meant to be installed as a DJar resource in CICS, it should be renamed such that it ends .jar. If the file is not a deployed jar file, it should be deleted since CICS will examine it every time a scan is executed against this CorbaServer.

Module:

com.ibm.cics.ejs.csi.commands.ScanCommand

XMEOUT Parameters: *date, time,applid, userid, CorbaServer, file, djardir*

Destination: CEJL

DFHEJ5028W *date time applid userid* **Scan for CorbaServer CorbaServer is ignoring the file file found in the djardir djardir because the filename is too long.**

Explanation: During a scan operation against the specified CorbaServer, CICS discovered a file whose name was too long for it to be installed into CICS as a DJar resource. The maximum length for deployed jar files on HFS is 36 characters. That is a 32 character base name plus four characters for the .jar suffix. The DJar resource installed in CICS uses the basename for the deployed jar file as its resource name.

System action: The scan continues, simply ignoring the file whose name is too long.

User response: If the file was meant to be installed as a DJar resource in CICS, it should be renamed such that its basename is less than 33 characters. If it is not a deployed jar file, it should be deleted since CICS examines it every time a scan is executed against this CorbaServer.

Module:
com.ibm.cics.ejs.csi.commands.ScanCommand

XMEOUT Parameters: *date, time, applid, userid, CorbaServer, file, djardir*

Destination: CEJL

DFHEJ5029W *date time applid userid* **Scan for CorbaServer CorbaServer is ignoring the file file found in the djardir djardir because the filename contains invalid characters.**

Explanation: During a scan operation against the specified CorbaServer, CICS discovered a file whose name contained characters that cannot be used when constructing a DJar resource. The name used for the DJar resource created in the CICS region is based on the 32 character basename of the deployed jar file discovered in the djardir.

System action: The scan continues, simply ignoring the file whose name contains unacceptable characters.

User response: If the file was meant to be installed as a DJar resource in CICS, it should be renamed such that its basename contains only valid characters. For the list of suitable characters to use in the name, see the character set restrictions for normal CEDA defined DJar resources. If it is not a deployed jar file, it should be deleted since CICS will examine it every time a scan is executed against this CorbaServer.

Module:
com.ibm.cics.ejs.csi.commands.ScanCommand

XMEOUT Parameters: *date, time, applid, userid, CorbaServer, file, djardir*

Destination: CEJL

DFHEJ5030I *date time applid userid* **New DJar Djar is being created during a scan against CorbaServer CorbaServer.**

Explanation: A new deployed jar file has been discovered on HFS during a scan. A corresponding CICS DJar resource is being automatically created to represent it. The DJar resource then goes through the normal stages of DJar resolution before it is ready for use.

System action: None.

User response: None.

Module:
com.ibm.cics.ejs.csi.commands.ScanCommand

XMEOUT Parameters: *date, time, applid, userid, Djar, CorbaServer*

Destination: CEJL

DFHEJ5031I *date time applid userid* **DJar Djar is being updated during a scan against CorbaServer CorbaServer.**

Explanation: An update has been detected for a DJar resource. CICS compares the last modification time of the deployed jar file on HFS with the last modification time stored in the DJar resource definition. If the deployed jar file on HFS is newer than the currently installed resource, the DJar resource goes through the resolution process again, this causes the new version of the deployed jar file on HFS to be picked up.

System action: None.

User response: None.

Module:
com.ibm.cics.ejs.csi.commands.ScanCommand

XMEOUT Parameters: *date, time, applid, userid, Djar, CorbaServer*

Destination: CEJL

DFHEJ5032I *date time applid userid* **DJar Djar is having its contents automatically published to the namespace.**

Explanation: When a DJar completes resolution and becomes inservice, CICS checks the autopublish setting for the related CorbaServer. If autopublish is set to YES, the DJar is automatically published to the namespace.

System action: None.

User response: None.

Module: DFHEJDG

XMEOUT Parameters: *date, time, applid, userid, Djar*

Destination: CEJL

DFHEJ5034I *date time applid userid* **Scan completed for CorbaServer CorbaServer, no D jars created, no DJars updated.**

Explanation: A CorbaServer scan has completed against the specified CorbaServer. The message indicates how many new DJar resources have been created based on the contents of the scanned djardir. It also indicates how many DJar resources have been upgraded due to new versions of jar files being discovered in the djardir.

System action: None.

User response: None.

Module: DFHEJDG

XMEOUT Parameters: *date, time,applid, userid, CorbaServer*

Destination: CEJL

DFHEJ5035W *date time applid userid* **The pickup directory for CorbaServer CorbaServer could not be read.**

Explanation: A CorbaServer scan has discovered that the pickup directory could not be read. This may be because the region does not have read access to the HFS directory.

System action: The scan ends and no djar resources are installed.

User response: Check that the directory exists and that the read access permissions are set.

Module: DFHEJDG

XMEOUT Parameters: *date, time,applid, userid, CorbaServer*

Destination: CEJL

DFHEJ5036W *date time applid userid* **Scan for CorbaServer CorbaServer is ignoring a jar file found on djardir djardir because the file basename is blank.**

Explanation: During a scan operation against the specified CorbaServer, CICS discovered a file whose name had a .jar suffix but could not be installed in CICS because it had no file basename. Everything prior to the .jar suffix is the file basename and the basename is used as the name of the DJar resource that represents this jar file in the CICS system. CICS cannot install a DJar resource with an empty name.

System action: The scan continues, simply ignoring the file with an invalid basename.

User response: If the file was meant to be installed as a DJar resource in CICS, it should be renamed such that it has a suitable basename. A suitable basename is between 1 and 32 characters in length inclusive. If it is

not a deployed jar file, it should be deleted since CICS examines it every time a scan is executed against this CorbaServer.

Module:

com.ibm.cics.ejs.csi.commands.ScanCommand

XMEOUT Parameters: *date, time,applid, userid, CorbaServer, djardir*

Destination: CEJL

DFHEJ5037W *date time applid userid* **An exception occurred while parsing the deployment descriptor for jarFileName at Line: line , Column: col**

Explanation: During an attempt to process the deployment descriptor for the specified jar file an exception was generated. The message indicates the source location of the exception in the deployment descriptor.

System action: The djar fails to resolve and will have its state set to UNRESOLVED.

User response: The jar file should be opened with appropriate tools and the deployment descriptor corrected.

Module: com.ibm.cics.ejs.csi.ContainerUtil

XMEOUT Parameters: *date, time,applid, userid, jarFileName, line, col*

Destination: CEJL

DFHEJ5038I *date time applid userid* **The LDAP service provider is being configured to initialize to context ldap_context on the nameserver ldap_server.**

Explanation: CICS has processed the supplied system properties and jndi properties, and it has determined the location upon the LDAP server where it attempts to place the InitialContext. The context described in the message is made up of several properties, containerrdn and noderootrdn amongst them.

System action: CICS continues processing. Any subsequent namespace processing against LDAP occurs relative to the named context.

User response: No action is necessary unless the context is not as expected. If there is a problem with it, check the settings of the noderootrdn and containerrdn LDAP properties, the CICS LDAP documentation and your LDAP administrator can help ensure they are set appropriately.

Module:

com.ibm.cics.ejs.csi.commands.AdminCommand

XMEOUT Parameters: *date, time,applid, userid, ldap_context,ldap_server*

Destination: CEJL

DFHEJ5039E *date time applid userid* **Unable to publish bean *bean_name* to JNDI server *jndi_server* at location *jndi_location* because a JNDI context exists at that location.**

Explanation: CICS has failed to publish the home for the bean in the JNDI namespace. This is because at the location CICS tried to publish the bean a JNDI context was found. CICS is unable to overwrite a context with a bean reference. The location where CICS attempted to publish the bean is included in the message.

System action: The bean is not published. CICS continues to publish any further beans from the CorbaServer or DJar against which the publish operation was issued.

User response: It is likely that another CorbaServer is sharing the same JNDI namespace and has a JNDI prefix that clashes with the JNDI prefix of the CorbaServer whose contents are currently being published. This may be a CorbaServer in a different CICS region. In order to avoid such clashes it is advisable to have an organized structure for JNDI prefixes used by CorbaServers sharing a namespace. This could include the machine name, region name and CorbaServer name in the JNDI prefix. Clashes usually occur because the name of a bean conflicts with a component of the JNDI prefix defined for the other CorbaServer. One of the CorbaServers must have its JNDI prefix altered to avoid this clash.

Module:
com.ibm.cics.ejs.csi.commands.AdminCommand

XMEOUT Parameters: *date, time, applid, userid, bean_name, jndi_server, jndi_location*

Destination: CEJL

DFHEJ5040E *date time applid userid* **Unable to retract bean *bean_name* from JNDI server *jndi_server* at location *jndi_location* because a JNDI context exists at that location.**

Explanation: CICS has failed to retract the home for the bean from the JNDI namespace. This is because at the location CICS tried to retract the bean reference a JNDI context was found. CICS does not attempt to unbind the context because it is likely to be an area of the JNDI namespace in use by another CorbaServer. The location where CICS found the context is included in the message.

System action: The bean is not retracted. CICS attempts to retract any further beans from the CorbaServer or DJar against which the retract operation was issued.

User response: It is likely that another CorbaServer is sharing the same JNDI namespace and has a JNDI

prefix that clashes with the JNDI prefix of the CorbaServer whose contents are currently being retracted. This may be a CorbaServer in another CICS region. In order to avoid such clashes, it is advisable to have an organized structure for JNDI prefixes used by CorbaServers sharing a namespace. This could include the machine name, region name and CorbaServer name in the JNDI prefix. Clashes usually occur because the name of a bean conflicts with a component of the JNDI prefix defined for the other CorbaServer. One of the CorbaServers must have its JNDI prefix altered to avoid this clash.

Module:
com.ibm.cics.ejs.csi.commands.AdminCommand

XMEOUT Parameters: *date, time, applid, userid, bean_name, jndi_server, jndi_location*

Destination: CEJL

DFHEJ5041E *date time applid userid* **DJar (*djar_name*) is not being installed. It contains a bean (*bean_name*) whose method (*method_name*) has no transaction attribute specified in the deployment descriptor.**

Explanation: The container was attempting to install a bean which has been deployed to use container managed transactions. The container was unable to find a suitable transaction attribute for a bean method whilst processing the DJar's deployment descriptor. According to the EJB Specification, the deployment descriptor must contain valid transaction attributes for all methods defined on the remote interface (excluding `ejbCreate` and `ejbRemove` methods which always run as `NotSupported`). This does not imply that each individual method must have an entry in the deployment descriptor as it is valid to use a wildcard to give all methods on the bean the same transactional characteristics. The message describes which jar file, bean and method it encountered problems with.

System action: The bean and its containing DJar fail to install.

User response: Modify the deployment descriptor in a suitable deployment tool to ensure that all the methods on the remote interface have a valid transaction attribute set.

Module:
com.ibm.cics.ejs.csi.commands.InstallDJarCommand

XMEOUT Parameters: *date, time, applid, userid, djar_name, bean_name, method_name*

Destination: CEJL

DFHEJ5043E *date time applid userid* **An exception occurred processing DJar *file_name* . The following exception message may help to diagnose the problem:**
exception_message

Explanation: CICS has failed to install a DJAR. This is probably due to a problem in the EJB-Jar file. This may be due to an invalid deployment descriptor, unresolved classpath requirement or the EJB-Jar file not having been 'deployed'. A Java exception was generated during the processing of the DJAR. The message string associated with the exception is included in this message.

System action: The DJAR is put in the UNRESOLVED state.

User response: Read the message from the Java exception and fix the problem. You will probably need to use the Application Assembly Tool (AAT) to verify or change the contents of the deployment descriptor for this DJAR. Ensure that any classes needed by the enterprise beans in this DJAR are available either in the DJAR or on the shareable application class path. Ensure that you 'deployed' the EJB-Jar file using the "Generate code for deployment" option within AAT.

Module: com.ibm.cics.ejs.csi.ContainerUtil

XMEOUT Parameters: *date, time, applid, userid, file_name, exception_message*

Destination: CEJL

DFHEJ5044E *date time applid userid* **Error found in the deployment descriptor for DJar *djar_name*.**

Explanation: CICS has failed to install a DJAR. This is due to a problem in the EJB-Jar file's deployment descriptor. Further information is not available.

System action: The DJAR is put in the UNRESOLVED state.

User response: Correct the deployment descriptor. To do this you need to use WebSphere Application Assembly Tool (AAT) or equivalent to verify or change the contents of the deployment descriptor for this DJAR.

Module: com.ibm.cics.ejs.csi.ContainerUtil

XMEOUT Parameters: *date, time, applid, userid, djar_name*

Destination: CEJL

DFHEJ5045E *date time applid userid* **Error found in the deployment descriptor for DJar *djar_name*. Duplicate element of type *element_type* found with name *element_name* .**

Explanation: CICS has failed to install a DJAR. This

is due to a problem in the EJB-Jar file's deployment descriptor. Specifically, an element of type *element_type* has been found which duplicates a similar element with the same name. The duplicated name is *element_name*.

According to the EJB 1.1 specification this element name cannot be duplicated within the same deployment descriptor.

System action: The DJAR is put in the UNRESOLVED state.

User response: Correct the deployment descriptor. To do this you need to use the WebSphere Application Assembly Tool (AAT) or equivalent to verify or change the contents of the deployment descriptor for this DJAR.

Module: com.ibm.cics.ejs.csi.ContainerUtil

XMEOUT Parameters: *date, time, applid, userid, djar_name, element_type, element_name*

Destination: CEJL

DFHEJ5046E *date time applid userid* **DJar *djar_name* is invalid.**

Explanation: CICS has failed to install a DJAR. This is because a problem was discovered while trying to access or interpret the jar file.

System action: The DJAR is put in the UNRESOLVED state.

User response: Ensure that the HFS file specified on the DJAR resource definition exists. Also check that CICS has read permission for this file, that the file has been transferred in binary mode and that the file conforms to the jar file format.

The HFS file attribute of the DJAR resource definition is case sensitive. Please ensure that it has been entered correctly.

Module: com.ibm.cics.ejs.csi.ContainerUtil

XMEOUT Parameters: *date, time, applid, userid, djar_name*

Destination: CEJL

DFHEJ5047E *date time applid userid* **Error found in the deployment descriptor for DJar *djar_name*. An element of type *element_type* and value *element_value* references another element that cannot be found.**

Explanation: CICS has failed to install a DJAR. This is due to a problem in the EJB-Jar file's deployment descriptor. Specifically, a cross reference has been found which cannot be resolved. The reference was found in a *element_type* element of the deployment descriptor. The value in this element is *element_value*.

For example, a role-link element may have been found where the textual content of the role-link does not

DFHEJ5048E • DFHEJ5051E

represent a valid security-role element from this same deployment descriptor.

System action: The DJAR is put in the UNRESOLVED state.

User response: Correct the deployment descriptor. To do this you need to use the WebSphere Application Assembly Tool (AAT) or equivalent to verify or change the contents of the deployment descriptor for this DJAR.

Module: com.ibm.cics.ejs.csi.ContainerUtil

XMEOUT Parameters: *date, time, applid, userid, djar_name, element_type, element_value*

Destination: CEJL

DFHEJ5048E *date time applid userid* **Invalid Resource found in DJar** *djar_name*.
Class *class_name* **for bean** *bean_name* **does not implement** *interface_name* .

Explanation: CICS has failed to install a DJAR. This is because a class specified in the deployment descriptor as a home, remote or bean implementation class for bean *bean_name* does not extend the appropriate ejb marker interface for that class. The interface that should be extended is *interface_name*.

According to the EJB 1.1 specification

The home interface class must inherit from the javax.ejb.EJBHome interface.

The remote interface class must inherit from the javax.ejb.EJBObject interface.

The session bean implementation class must implement the javax.ejb.SessionBean interface.

System action: The DJAR is put in the UNRESOLVED state.

User response: Correct the deployment descriptor and/or classes in the jar file. To do this you may need to use the WebSphere Application Assembly Tool (AAT) or equivalent to verify or change the contents of the deployment descriptor for this DJAR.

Module: com.ibm.cics.ejs.csi.ContainerUtil

XMEOUT Parameters: *date, time, applid, userid, djar_name, class_name, bean_name, interface_name*

Destination: CEJL

DFHEJ5049E *date time applid userid* **Error found in the deployment descriptor for DJar** *djar_name*. **Bean** *bean_name* **implements the**
SessionSynchronization interface but has a n incompatible deployment descriptor.

Explanation: CICS has failed to install a DJAR. This is due to a problem in the EJB-Jar file's deployment

descriptor. Specifically, bean *bean_name* implements the javax.ejb.SessionSynchronization interface but the deployment descriptor has conflicting values specified.

According to the EJB 1.1 specification, if a session bean implements session synchronization, it must be stateful, use container managed transactions and limit itself to TxRequired, TxRequiresNew or TxMandatory transactions.

System action: The DJAR is put in the UNRESOLVED state.

User response: Correct the deployment descriptor. To do this you need to use the WebSphere Application Assembly Tool (AAT) or equivalent to verify or change the contents of the deployment descriptor for this DJAR.

Module: com.ibm.cics.ejs.csi.ContainerUtil

XMEOUT Parameters: *date, time, applid, userid, djar_name, bean_name*

Destination: CEJL

DFHEJ5050E *date time applid userid* **Error found in the deployment descriptor for DJar** *djar_name*. **An element of type** *element_type* **and value** *element_value* **for bean** *bean_name* **has an invalid value.**

Explanation: CICS has failed to install a DJAR. This is due to a problem in the EJB-Jar file's deployment descriptor. Specifically, an XML element has been found with an invalid value.

Many elements of the deployment descriptor are only permitted to have one of a small number of possible values. For example, the transaction-type element may only contain the values 'Bean' or 'Container'. These values are case sensitive.

System action: The DJAR is put in the UNRESOLVED state.

User response: Correct the deployment descriptor. To do this you need to use the WebSphere Application Assembly Tool (AAT) or equivalent to verify or change the contents of the deployment descriptor for this DJAR.

Module: com.ibm.cics.ejs.csi.ContainerUtil

XMEOUT Parameters: *date, time, applid, userid, djar_name, element_type, element_value, bean_name*

Destination: CEJL

DFHEJ5051E *date time applid userid* **DJar** *djar_name* **is not fully deployed. Class** *class_name* **cannot be found.**

Explanation: CICS has failed to install a DJAR. This is because the jar file has not been fully deployed. The process of 'deploying' an ejb-jar file causes some infrastructure code to be generated. This code is

required by CICS but is absent from the jar file. The class that CICS was looking for but could not find is indicated in *class_name*.

System action: The DJAR is put in the UNRESOLVED state.

User response: Use the WebSphere Application Assembly Tool (AAT) or equivalent to produce the deployed jar file required by CICS.

Module: com.ibm.cics.ejs.csi.ContainerUtil

XMEOUT Parameters: *date, time, applid, userid, djar_name, class_name*

Destination: CEJL

DFHEJ5052E *date time applid userid* **Error found in the deployment descriptor for DJar *djar_name*. An element of type *parent_element* is missing a subelement of type *missing_element*.**

Explanation: CICS has failed to install a DJAR. This is due to a problem in the EJB-Jar file's deployment descriptor. Specifically, an XML element of type *missing_element* should have been found beneath any element of type *parent_element*. The missing element is required.

For example, the 'assembly-descriptor' subelement of the 'ejb-jar' element may be missing.

System action: The DJAR is put in the UNRESOLVED state.

User response: Correct the deployment descriptor. To do this you need to use the WebSphere Application Assembly Tool (AAT) or equivalent to verify or change the contents of the deployment descriptor for this DJAR.

Module: com.ibm.cics.ejs.csi.ContainerUtil

XMEOUT Parameters: *date, time, applid, userid, djar_name, parent_element, missing_element*

Destination: CEJL

DFHEJ5053E *date time applid userid* **Missing Resource in DJar *djar_name*. Resource *resource_name* cannot be found.**

Explanation: CICS has failed to install a DJAR. This is because a class or other resource required by the DJAR cannot be found. The missing resource may be the XML deployment descriptor, the XML bindings file or a Java class. The name of the missing resource is given in *resource_name*.

If the missing resource is a Java class, this class is required by either the bean's home interface or the bean's remote interface and should be present in the jar file.

System action: The DJAR is put in the UNRESOLVED state.

User response: Correct the deployment descriptor and/or classes in the jar file. To do this you may need to use the WebSphere Application Assembly Tool (AAT) or equivalent to verify or change the contents of the deployment descriptor for this DJAR.

Module: com.ibm.cics.ejs.csi.ContainerUtil

XMEOUT Parameters: *date, time, applid, userid, djar_name, resource_name*

Destination: CEJL

DFHEJ5054E *date time applid userid* **Error found in the deployment descriptor for DJar *djar_name*. An element of type *element_type* and value '*element_value*' is not a valid XML NMOKEN.**

Explanation: CICS has failed to install a DJAR. This is due to a problem in the EJB-Jar file's deployment descriptor. Specifically, an XML element has been found with an invalid value.

The bean-name and role-name elements of the deployment descriptor are defined in the EJB specification as having to conform to the lexical rules for an NMOKEN. One of these elements was found which contained an illegal NMOKEN character.

The full definition of an NMOKEN can be found here <http://www.w3.org/TR/1998/REC-xml-19980210#NT-Nmtoken>.

System action: The DJAR is put in the UNRESOLVED state.

User response: Correct the deployment descriptor. To do this you need to use the WebSphere Application Assembly Tool (AAT) or equivalent to verify or change the contents of the deployment descriptor for this DJAR.

Module: com.ibm.cics.ejs.csi.ContainerUtil

XMEOUT Parameters: *date, time, applid, userid, djar_name, element_type, element_value*

Destination: CEJL

DFHEJ5055E *date time applid userid* **Error found in the deployment descriptor for DJar *djar_name*. No Session beans defined.**

Explanation: CICS has failed to install a DJAR. This is due to a problem in the EJB-Jar file's deployment descriptor. The deployment descriptor is valid but does not contain any Session beans.

A EJB-jar file must contain at least one Session bean before CICS is able to install it.

System action: The DJAR is put in the UNRESOLVED state.

User response: Correct the deployment descriptor. To do this you need to use WebSphere Application Assembly Tool (AAT) or equivalent to verify or change

the contents of the deployment descriptor for this DJAR.

Module: com.ibm.cics.ejs.csi.ContainerUtil

XMEOUT Parameters: *date, time, applid, userid, djar_name*

Destination: CEJL

DFHEJ5056E *date time applid userid* **Error found in the deployment descriptor for DJar *djar_name*. An element of type *element_type* and name *element_name* is missing a JNDI binding.**

Explanation: CICS has failed to install a DJAR. This is because an element in the EJB-Jar file's deployment descriptor has not been bound to a JNDI lookup string.

All 'resource-ref' elements and many 'ejb-ref' elements have to be associated with a JNDI string. This is done using the WebSphere Application Assembly Tool. The JNDI bindings are stored in a separate XML bindings file in the EJB-Jar file.

System action: The DJAR is put in the UNRESOLVED state.

User response: Add the JNDI bindings. To do this you need to use the WebSphere Application Assembly Tool (AAT) or equivalent to verify or change the contents of the XML bindings file for this DJAR.

Module: com.ibm.cics.ejs.csi.ContainerUtil

XMEOUT Parameters: *date, time, applid, userid, djar_name, element_type, element_name*

Destination: CEJL

DFHEJ5057E *date time applid userid* **Error found in the deployment descriptor for DJar *djar_name*. An unexpected element of type *element_type* was found.**

Explanation: CICS has failed to install a DJAR. This is because an unexpected element has been found in the EJB-Jar file's deployment descriptor.

Some combinations of XML elements in the deployment descriptor are invalid. For example, if a session bean is defined to use bean managed transactions, it must not have any container-transaction elements associated with it.

System action: The DJAR is put in the UNRESOLVED state.

User response: Correct the deployment descriptor. To do this you need to use the WebSphere Application Assembly Tool (AAT) or equivalent to verify or change the contents of the deployment descriptor for this DJAR.

Module: com.ibm.cics.ejs.csi.ContainerUtil

XMEOUT Parameters: *date, time, applid, userid, djar_name, element_type*

Destination: CEJL

DFHEJ5058E *date time applid userid* **XML Parse failure in the deployment descriptor for DJar *djar_name*. Problem found at line *line_number* and column *column_number*. The XML parser returned the following exception message: *XML_message*.**

Explanation: CICS has failed to install a DJAR. This is due to a problem in the EJB-Jar file's deployment descriptor. The XML parser was unable to validate the deployment descriptor or the XMI bindings file as the deployment descriptor is invalid.

The XML parser issued a message which is available in *XML_message*.

System action: The DJAR is put in the UNRESOLVED state.

User response: Use the *XML_message* to find and fix the problem in the deployment descriptor.

Module: com.ibm.cics.ejs.csi.ContainerUtil

XMEOUT Parameters: *date, time, applid, userid, djar_name, line_number, column_number, XML_message*

Destination: CEJL

DFHEJ5059W *date time applid userid*. **One or more non-Session beans were found and ignored for DJar *djar_name*.**

Explanation: The deployment descriptor for DJAR *djar_name* contained references to enterprise beans which cannot be installed in CICS as they are not Session beans. CICS does not support non-Session enterprise beans such as Entity beans or Message-Driven beans.

System action: The non-Session beans are ignored. Processing continues.

User response: Either remove these beans from the deployment descriptor or ignore this warning.

Module: com.ibm.cics.ejs.csi.ContainerUtil

XMEOUT Parameters: *date, time, applid, userid, djar_name*

Destination: CEJL

DFHEJ5060E *date time applid userid* **A problem was found in the manifest file for DJar *djar_name*. The problem was found in the following manifest entry: *attribute*.**

Explanation: CICS has failed to install a DJAR. This is due to a problem in the EJB-Jar file's manifest file. The manifest file contains an invalid entry. The entry which contained the problem is called *attribute*.

The most common cause for this problem is a Class-Path entry in the manifest file that includes absolute file locations. For more information about manifest files visit this URL <http://java.sun.com/j2se/1.4.1/docs/guide/extensions/spec.html>

System action: The DJAR is put in the UNRESOLVED state.

User response: Either fix the manifest file or remove the manifest file from the jar file.

Module: com.ibm.cics.ejs.csi.ContainerUtil

XMEOUT Parameters: *date, time, applid, userid, djar_name, attribute*

Destination: CEJL

DFHEJ5061E *date time applid userid* **DJar** *djar_name* **contains a bean whose name includes characters CICS cannot accept. The bean name is:** *bean_name* .

Explanation: CICS has failed to install a DJAR. This is due to a problem in the name of one of the beans from the DJAR. CICS can only install enterprise beans with names whose characters fall in the following range: A-Z a-z 0-9 _ .

System action: The DJAR is put in the UNRESOLVED state.

User response: Either fix the bean name or remove the bean from the DJAR.

Module: com.ibm.cics.ejs.csi.ContainerUtil

XMEOUT Parameters: *date, time, applid, userid, djar_name, bean_name*

Destination: CEJL

DFHEJ5062E *date time applid userid* **Error found in the deployment descriptor for DJar** *djar_name*. **Bean** *bean_name* **has EJB 2.0 local interfaces. These are not supported in CICS.**

Explanation: CICS has failed to install a DJAR. This is due to a problem in the EJB-Jar file's deployment descriptor. Specifically, bean *bean_name* has EJB 2.0 local interfaces defined.

CICS does not tolerate the presence of EJB 2.0 local interfaces.

System action: The DJAR is put in the UNRESOLVED state.

User response: Remove the local interfaces. To do this you need to use the WebSphere Application Assembly Tool (AAT) or equivalent to remove the interfaces and to regenerate the EJB Jar file's deployed code.

Module: com.ibm.cics.ejs.csi.ContainerUtil

XMEOUT Parameters: *date, time, applid, userid, djar_name, bean_name*

Destination: CEJL

DFHEJ5101 *date time applid userid* **Cannot activate bean class exception.**

Explanation: The EJB Container is unable to activate a bean. The bean being activated is named in the *bean* insert of the message. The class trying to activate the bean is named in *class* and the specific exception which caused the failure is given in *exception*.

System action: Processing of the EJB Container continues but it is unlikely that any subsequent operations on the specified bean will be possible.

User response: The *exception* insert is likely to be one of two values. If the exception contains the text 'ClassNotFoundException', then check that the jar file containing the bean has been included in the classpath. Also, check that the bean does exist in the jar file. If the exception contains the text 'IOException', then this may indicate a problem with reading the serialized bean from the bean store.

Module:

com.ibm.ejs.container.passivator.StatefulPassivator

XMEOUT Parameters: *date, time, applid, userid, bean, class, exception*

Destination: CEJL

DFHEJ5102E *date time applid userid* **Cannot passivate bean class exception.**

Explanation: The EJB Container is unable to passivate a bean. The bean being passivated is named in the *bean* insert of the message. The class trying to passivate the bean is named in *class* and the specific exception which caused the failure is given in *exception*.

System action: Processing of the EJB Container continues but it is unlikely that any subsequent operations on the specified bean will be possible.

User response: If the exception contains the text 'IOException', then this may indicate a problem with writing the serialized bean to the bean store.

Module:

com.ibm.ejs.container.passivator.StatefulPassivator

XMEOUT Parameters: *date, time, applid, userid, bean, class, exception*

Destination: CEJL

DFHEJ5103E *date time applid userid* **Unable to passivate enterprise bean** *bean class* **exception.**

Explanation: The EJB Container is unable to passivate a bean. The bean being passivated is named

in the *bean* insert of the message. The class trying to passivate the bean is named in *class* and the specific exception which caused the failure is given in *exception*.

System action: Processing of the EJB Container continues but it is unlikely that any subsequent operations on the specified bean will be possible.

User response: If the exception contains the text 'IOexception', then this may indicate a problem with writing the serialized bean to the bean store.

Module:
com.ibm.ejs.container.activator.ActivationStrategy

XMEOUT Parameters: *date, time, applid, userid, bean, class, exception*

Destination: CEJL

DFHEJ5104E *date time applid userid* **Exception thrown by discard strategy** *element exception.*

Explanation: The EJB Container is unable to evict an element from its cache. The element being evicted is named in the *element* insert of the message. The specific exception which caused the failure is given in *exception*.

System action: Processing of the EJB Container continues. As the element was being removed from the cache, then no further operations on it would be expected.

User response: None.

Module: com.ibm.ejs.util.cache.Cache

XMEOUT Parameters: *date, time, applid, userid, element, exception*

Destination: CEJL

DFHEJ5105E *date time applid userid* **Encountered a failure in the fireAlarm method** *exception.*

Explanation: The EJB Container has encountered a problem while firing an alarm. The specific exception which caused the failure is given in *exception*.

System action: Processing of the EJB Container continues.

User response: None.

Module: com.ibm.ejs.util.am.AlarmManager

XMEOUT Parameters: *date, time, applid, userid, exception*

Destination: CEJL

DFHEJ5106E *date time applid userid* **Failed to get the wrapper for home:** *exception.*

Explanation: The EJB Container is unable to locate the home wrapper for a bean object. The specific exception which caused the failure is given in *exception*.

System action: Processing of the EJB Container continues.

User response: None.

Module: com.ibm.ejs.container.BeanO

XMEOUT Parameters: *date, time, applid, userid, exception*

Destination: CEJL

DFHEJ5107E *date time applid userid* **LRU thread was interrupted. Terminating.** *exception.*

Explanation: The thread within the EJB Container, which monitors elements in the cache which are potential candidates for removal, has been interrupted. The specific exception which caused the failure is given in *exception*.

System action: Processing of the EJB Container continues.

User response: None.

Module:
com.ibm.ejs.util.cache.BackgroundLruEvictionStrategy

XMEOUT Parameters: *date, time, applid, userid, exception*

Destination: CEJL

DFHEJ5108E *date time applid userid* **Caught an exception during LRU sweep** *class exception.*

Explanation: An unexpected exception occurred in the thread, within the EJB Container, which monitors elements in the cache which are potential candidates for removal. The specific exception which caused the failure is given in *exception*.

System action: Processing of the EJB Container continues.

User response: None.

Module:
com.ibm.ejs.util.cache.BackgroundLruEvictionStrategy

XMEOUT Parameters: *date, time, applid, userid, class, exception*

Destination: CEJL

DFHEJ5109E *date time applid userid* **Coordinator was not available** *exception.*

Explanation: An unexpected exception occurred when the Container tried to get the transaction coordinator. The specific exception which caused the failure is given in *exception*.

System action: Processing of the EJB Container continues.

User response: None.

Module:
com.ibm.websphere.csi.TransactionControlImpl

XMEOUT Parameters: *date, time, applid, userid, exception*

Destination: CEJL

DFHEJ5110E *date time applid userid* **Bean *bean_name* has an incomplete EJB Reference. Reference is *reference*.**

Explanation: Whilst processing the deployment descriptor for a bean, the container found an EJB reference was not fully specified. An EJB reference must have either a valid ejb-link to another EJB within the same Jar file or it must have a valid binding specified.

System action: The bean and its containing DJar fail to install.

User response: Modify the EJB reference in a suitable deployment tool and add either a valid ejb-link or binding.

Module: com.ibm.ejs.container.BeanMetaData

XMEOUT Parameters: *date, time, applid, userid, bean_name, reference*

Destination: CEJL

DFHEJ5111E *date time applid userid* **Bean *bean_name* has an incomplete EJB Resource Reference specified. Resource Reference is *reference*.**

Explanation: Whilst processing the deployment descriptor for a bean, the container found an EJB resource reference that did not have a binding specified. A valid resource reference must have a binding specified.

System action: The bean and its containing DJar fail to install.

User response: Modify the resource reference in a suitable deployment tool and enter a suitable binding value.

Module: com.ibm.ejs.container.BeanMetaData

XMEOUT Parameters: *date, time, applid, userid, bean_name, reference*

Destination: CEJL

DFHEJ5112E *date time applid userid* **Bean *bean_name* has an EJB environment entry with an invalid value specified. Environment entry is *env_entry*.**

Explanation: Whilst processing the deployment descriptor for a bean, the container found an EJB environment entry whose value was null. Environment entries must have a value specified in order to be valid.

System action: The bean and its containing DJar fail to install.

User response: Modify the environment entry in a suitable deployment tool and set a value appropriate to the type of the entry.

Module: com.ibm.ejs.container.BeanMetaData

XMEOUT Parameters: *date, time, applid, userid, bean_name, env_entry*

Destination: CEJL

DFHEJ5113E *date time applid userid* **Unexpected naming problem occurred: *message***

Explanation: An unexpected message was produced by the CICS/WebSphere JNDI code. The full text of this message should explain the problem.

System action: The behaviour of the system depends on the kind of naming problem. Naming problems could occur during bean publish, bean retract or bean lookup, any of these three operations may fail depending on the severity of the error.

User response: If unable to determine an appropriate action from the full CICS message, lookup the WebSphere naming message code (NMSVnnnn) in your WebSphere documentation.

Module: com.ibm.ejs.ns.* com.ibm.ws.naming.*

XMEOUT Parameters: *date, time, applid, userid, message*

Destination: CEJL

DFHEJ5114W *date time applid userid* **The class *com.ibm.ejs.ns.jndi.CNInitialContextFactory* has been deprecated as the CICS initial context factory. Class *com.ibm.websphere.naming.WsnInitialContextFactory* has replaced it.**

Explanation: The JNDI initial context factory which is specified as property `java.naming.factory.initial` has been set to `com.ibm.ejs.nd.jndi.CNInitialContextFactory`. This value specifies a deprecated class and has been replaced by

com.ibm.websphere.naming.WsnInitialContextFactory.

System action: Depending on the kind of naming operation attempted, it may succeed or fail.

User response: Begin using the new initial context factory as soon as possible. This can be achieved by ensuring the `java.naming.factory.initial` property is set to the correct value, or by ensuring it is not set anywhere, so CICS can default appropriately. If unsure where it is being set, check the system properties file and any `jndi.properties` that exist on the classpath for the CICS system.

Module: com.ibm.ejs.ns.jndi.CNInitialContextFactory

XMEOUT Parameters: *date, time, applid, userid*

Destination: CEJL

DFHEJ6000E *date time applid userid* **The CICS EJB container failed to find the requested plugin *plugin*.**

Explanation: The CICS EJB container attempted to instantiate the requested plugin class *plugin* but the container could not find this class on the current classpath.

System action: The plugin is not loaded.

User response: Examine the value set for the

classpath in the JVM profile being used from the XDFHENV dataset. The pathname for the requested plugin must be present in the classpath.

Module: com.ibm.cics.ejs.csi.CICSContainerConfig

XMEOUT Parameters: *date, time, applid, userid, plugin*

Destination: CEJL

DFHEJ6001E *date time applid userid* **The CICS EJB container plugin *plugin* has thrown exception *exception*.**

Explanation: The CICS EJB container caught an exception thrown from plugin *plugin*.

System action: The EJB container attempts to continue processing the user application.

User response: Either contact the *plugin* vendor for further assistance or catch the exception in the body of your plugin.

Module: com.ibm.cics.ejs.csi.CICSContainerConfig

XMEOUT Parameters: *date, time, applid, userid, plugin, exception*

Destination: CEJL

DFHEMnnnn messages

DFHEM0001 *applid* **An abend (code *aaa/bbbb*) has occurred at offset *X'offset'* in module *modname*.**

Explanation: An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 should be produced containing

the symptom string for this problem.

User response: Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHEMDM, DFHEMEM.

XMEOUT Parameters: *applid, aaa/bbbb, X'offset', modname*

Destination: Console

DFHEM0002 *applid* A severe error (code X'code') has occurred in module *modname*.

Explanation: An error has been detected in module *modname*. The code X'code' is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

System action: An exception entry (code X'code' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHEMDM, DFHEMEM.

XMEOUT Parameters: *applid, X'code',modname*

Destination: Console

DFHEM0100I *applid* Event Manager initialization has started.

Explanation: This is an informational message indicating the start of event manager domain initialization.

System action: Initialization continues.

User response: None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Module: DFHEMDM

XMEOUT Parameter: *applid*

Destination: Console

DFHEM0101I *applid* Event Manager initialization has ended.

Explanation: Event manager domain initialization has completed successfully

System action: Initialization continues.

User response: None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Module: DFHEMDM

XMEOUT Parameter: *applid*

Destination: Console

DFHERnnnn messages

DFHER2813I *applid* Program DFHRCEX cannot be found

Explanation: CICS cannot find DFHRCEX in any data set concatenated in the DFHRPL DD statement in the CICS startup job stream.

System action: CICS terminates abnormally with a dump.

User response: To correct this error, place DFHRCEX in a partitioned data set in the DFHRPL DD statement.

Module: DFHTCBP, DFHUSBP

XMEOUT Parameter: *applid*

Destination: Console

DFHER5730 *applid* User recovery beginning

Explanation: During warm or emergency restarts CICS issues this message when it is about to start processing records from the system log.

System action: If the global user exit XRCINIT is enabled, it is invoked with an indication that this is the initial call. Processing continues.

User response: None.

Module: DFHAPRC

XMEOUT Parameter: *applid*

Destination: Console

DFHER5731 *applid* No active user records on the system log

Explanation: During warm or emergency restarts CICS issues this message when it has completed its scan of the system log and has found no active user journal records. Active user journal records are written by user applications that use commands such as EXEC CICS WRITE JOURNAL. They are written to the system log by one of the following:

- A unit of work that was in flight or in doubt when the preceding CICS system terminated.
- An application request in which the high order bit of the JTYPEID value was set to 1 (provided that the record lies within the compass of the restart system log scan).

DFHEXnnnn messages

DFHEX0001 An abend (code *aaa/bbbb*) has occurred in module *modname*.

Explanation: An unexpected program check or abend *aaa/bbbb* has occurred in module *modname*. This implies that there may be an error in external CICS interface code.

- The XAKUSER global user exit during the last completed activity keypoint.

If there are such active user journal records, they are presented to the global user exit XRCINPT and this message is not issued.

System action: Processing continues.

User response: None.

Module: DFHAPRC

XMEOUT Parameter: *applid*

Destination: Console

DFHER5732 *applid* User recovery completed

Explanation: During warm or emergency restarts CICS issues this message when it has finished processing records from the system log. Any active user journal records have by now been presented to the global user exit XRCINPT. Active user journal records are those written to the system log by one of the following

- A unit of work that was in flight or in doubt when the preceding CICS system terminated.
- An application request in which the high order bit of the JTYPEID value was set to 1 (provided that the record lies within the compass of the restart system log scan).
- The XAKUSER global user exit during the last completed activity keypoint.

System action: If the global user exit XRCINIT is enabled, it is invoked with an indication that this is the final call. Processing continues.

User response: None.

Module: DFHAPRC

XMEOUT Parameter: *applid*

Destination: Console

Alternatively, unexpected data has been passed on an external CICS interface call or storage has been overwritten.

The code *aaa/bbbb* is, if applicable, a 3-digit hexadecimal MVS system completion code *aaa* (for example, 0C1 or D37). If an MVS code is not

applicable, this field is filled with three hyphens. The 4-digit code *bbbb*, which follows *aaa* is, if applicable, a user abend code produced by the external CICS interface. If the user abend code is not applicable, this field is filled with four hyphens.

System action: An exception entry is made in the external CICS interface internal trace table, and to the GTF trace dataset (if GTF is active), and a SYSMDUMP is taken.

The external CICS interface terminates the current request, and attempts to recover to a consistent state so that further EXCI requests can be serviced. For an application using the EXCI CALL API, a response of EXCI_SYSTEM_ERROR with a REASON of ESTAE_INVOKED is returned to the application. For an application using the EXCI EXEC API, an EXEC_RESP of LINKERR is returned to the application, together with an EXEC_RESP2 of ESTAE_INVOKED or EXEC_ESTAE_INVOKED, depending on whether the call level ESTAE routine, or the EXEC level ESTAE routine was invoked.

User response: Look up the MVS code *aaa*, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

If applicable, see the description of abend code *bbbb* for further guidance.

You may need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXCPRH, DFHXCEIP

Destination: Console

DFHEX0002 A severe error (code X'code') has occurred in module *modname*.

Explanation: An error has been detected in module *modname*. The code X'code' is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

System action: An exception entry is made in the EXCI internal trace table and to GTF if it is active, (X'code' in the message). A system dump is taken.

This is a critical error and the EXCI request is terminated. The external CICS interface attempts to recover to a consistent state so that further EXCI requests can be issued. For applications using the EXCI CALL API, the EXCI_REASON returned to the application indicates the reason for the error. For applications using the EXCI EXEC API, the reason is returned in the EXEC_RESP2 field of the RETCODE area.

User response: This failure indicates a serious error in the external CICS interface code. For further information about the EXCI exception trace entries, refer to the *CICS Problem Determination Guide*.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXCPRH, DFHXCEIP

Destination: Console

DFHEX0003 A GETMAIN request in module *modname* (code X'code') has failed. Reason X'rc'.

Explanation: An MVS GETMAIN was issued by module *modname*, but it failed with return code *rc*.

The code X'code' is the exception trace point ID which uniquely identifies the place where the MVS GETMAIN was issued.

System action: An exception entry is made in the EXCI internal trace table (code X'code' in the message). This is a critical error and the EXCI request is terminated. The external CICS interface attempts to recover to a consistent state so that further EXCI requests can be issued.

For applications using the EXCI CALL API, the EXCI_REASON returned to the application indicates the point of failure.

For applications using the EXCI EXEC API, the point of failure is returned in the EXEC_RESP2 field of the RETCODE area.

For EXCI_REASON and EXCI_RESP of 603, the EXCI module DFHXCPRH also issues abend 0410 which drives the ESTAE exit. Message DFHEX0001 is issued and a SYSMDUMP is taken

User response: Look up the MVS GETMAIN return code *rc* in the relevant MVS codes manual.

If the reason is insufficient storage, try increasing the size of the region for the batch EXCI job.

You may need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXCPRH, DFHXCTRI

Destination: Console

DFHEX0004 Jobname: *jobname*, Stepname: *stepname*, Procname *procname*, Sysid in SMF: *sysid*, Applid: *applid*.

Explanation: This message accompanies message DFHEX0001 and will provide the *jobname*, *stepname*, *procname*, *Sysid in SMF* and *applid* to which the EXCI job is connecting to. If an insert value is unknown or not specified then the message insert will read Unknown. For example, *procname* and *stepname* are not mandatory in an EXCI job, if they were omitted and DFHEX0004 was issued then the inserts for *procname* and *stepname* will read Unknown.

DFHEX0100 • DFHEX0112

System action: Follow system action for DFHEX0001.

User response: Follow user response for DFHEX0001.

Module: DFHXCPRH, DFHXCEIP

Destination: Console

DFHEX0100 The installed level of CICS SVC does not support the EXCI call.

Explanation: The external CICS interface module DFHXCPRH detected that the level of CICS SVC (DFHCSVC) in use does not support the external CICS interface.

System action: The EXCI request is terminated. An exception trace is made in the EXCI internal trace table, and if GTF is active, in the GTF trace data set. The external CICS interface module DFHXCPRH issues abend 0407 which drives the ESTAE exit. Message DFHEX0001 is issued, and a SYSMDUMP is taken.

User response: Check the level of DFHCSVC installed in the LPA. A CICS/ESA 4.1 level of DFHCSVC is required for the external CICS interface. Generally, the latest level of DFHCSVC must be used when running CICS and the external CICS interface. For more information about installing DFHCSVC see the *CICS Transaction Server for z/OS Installation Guide*.

Module: DFHXCPRH

Destination: Console

DFHEX0101 Unable to start interregion communication because DFHIRP level check failed.

Explanation: The call to DFHIRP to check DFHIRP's service level has failed.

This is probably because the version of DFHIRP being used is at a lower level than that of the External CICS Interface (EXCI) module DFHXCPRH. A less likely reason is that a failure occurred before DFHIRP could make the level check.

System action: The EXCI allocate pipe request is rejected. A return code is passed back to the batch application.

User response: Ensure that the correct level of DFHIRP exists in the LPA such that it matches the level of the latest CICS version in use.

Module: DFHXCPRH

Destination: Console

DFHEX0110 EXCI SDUMP has been taken.

Dumpcode: *dumpcode*, **Dumpid** *dumpid*.

Explanation: This message is issued on successful completion of a MVS SDUMP issued by external CICS interface module DFHXCDMP. An error, signalled by a previous message, caused a call to be made to DFHXCDMP to take a system dump.

The dump code *dumpcode* is an 8-character system dump code identifying the external CICS interface problem. A system dump code is the EXCI message number with the DFH prefix removed.

dumpid is the unique 9-character string identifying this dump.

System action: The EXCI request is terminated.

User response: See the EXCI message indicated by *dumpcode* for further guidance.

You may need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXCDMP.

Destination: Console

DFHEX0111 EXCI SDUMP attempted but SDUMP is busy - will retry every five seconds for *nnnn* seconds.

Explanation: At the time of the MVS SDUMP request issued by DFHXCDMP another address space in the same MVS system was in the process of taking an SDUMP. This causes MVS to reject the new request. A nonzero value for the dump retry parameter in the DFHXCOPT table means that the external CICS interface waits five seconds before retrying the SDUMP request. If necessary, the external CICS interface retries every five seconds for the total time specified on the retry parameter.

System action: The external CICS interface issues an MVS STIMERM macro which causes it to wait for five seconds. The request is reissued when the delay interval has expired.

User response: None.

Module: DFHXCDMP.

Destination: Console

DFHEX0112 SDUMP request failed - *reason X'nn'*.

Explanation: An MVS SDUMP request issued from the external CICS interface has failed to complete successfully. The possible reasons, (*reason*) for the failure are as follows

ONLY PARTIAL DUMP

The SYS1.DUMP data set to which the dump is written is not large enough to contain all of the dumped storage.

SDUMP BUSY

At the time of the MVS SDUMP request issued by the EXCI, another address space in the same MVS system was in the process of taking an SDUMP. This causes MVS to reject the new request. If a nonzero value is specified for the dump retry parameter in DFHXOPTS table, the EXCI has retried the SDUMP request every five seconds for the specified period. This message is only issued if SDUMP is still busy after the final retry.

STIMERM FAILED

In order to delay for five seconds before retrying SDUMP after an SDUMP BUSY condition, the EXCI issues an MVS STIMERM macro request. MVS has indicated that the STIMERM request has failed.

NO DATA SET AVAILABLE

No SYS1.DUMP data sets were available at the time the SDUMP request was issued.

REJECTED BY MVS, REASON = X'nn

MVS has rejected the SDUMP request because of user action (for example, specifying DUMP=NO in the MVS IPL) or because of an I/O error or terminating error in the SDUMP routine. X'nn is the SDUMP reason code.

NOT AUTHORIZED FOR EXCI

SDUMP is not authorized for the external CICS interface.

INSUFFICIENT STORAGE

The EXCI issued an MVS GETMAIN for subpool 253 storage during the processing of the SDUMP request. The GETMAIN has been rejected by MVS.

System action: The EXCI proceeds as if the dump had been successful.

User response: The user response depends on the reasons, (*reason*), for the failure.

ONLY PARTIAL DUMP

Increase the size of the SYS1.DUMP data sets and cause the SDUMP request to be reissued.

SDUMP BUSY

Cause the SDUMP to be reissued after, if appropriate, increasing the dump retry time in DFHXCOPT.

STIMERM FAILED

Use MVS problem determination methods to fix the STIMERM failure and then cause the SDUMP request to be reissued.

NO DATA SET AVAILABLE

Clear a SYS1.DUMP data set and then cause the SDUMP request to be reissued.

REJECTED BY MVS, REASON = X'nn

No action is required if the dump is suppressed deliberately. If the dump has failed because of an error in the MVS SDUMP routine, use MVS problem determination methods to fix the error and then cause the SDUMP request to be reissued. See the *OS/390 MVS Programming: Authorized Assembler Services Reference* for an explanation of the SDUMP reason code X'nn.

NOT AUTHORIZED FOR EXCI

This reason is unlikely because SDUMP is unconditionally authorized during EXCI initialization, and should be authorized throughout the EXCI run. If you do get this reason, the EXCI AFCB (authorized function control block) has probably been accidentally overwritten.

INSUFFICIENT STORAGE

Ensure sufficient storage is available to MVS for subpool 253 requests.

Module: DFHXCDMP

Destination: Console

DFHEX0113 EXCI trace Initialization has failed.

Explanation: An attempt to initialize external CICS interface (EXCI) trace facilities during EXCI initialization has failed.

System action: The EXCI request continues without trace facilities. An earlier message identifies the cause of the failure.

User response: Refer to the earlier message to determine the cause of the failure.

Module: DFHXCTRI

Destination: Console

DFHEX0114 Incorrect data has been passed for EXCI tracing causing a program check in DFHXCTRP.

Explanation: Some data passed to the external CICS interface (EXCI) trace module DFHXCTRP for addition to the EXCI internal trace table, or GTF trace, caused a program check to occur when an attempt was made to access it.

The most likely cause of this error is incorrect data passed on an EXCI CALL API request that the trace program DFHXCTRP is attempting to access.

System action: The EXCI request is terminated and a SYSMDUMP is taken.

User response: Examine the dump to determine the source of the incorrect data.

You may need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXCTRI

Destination: Console

DFHEX0115 EXCI trace services have been disabled due to a previous error.

Explanation: An error occurred in the external CICS interface (EXCI) trace module DFHXCTRP indicated by message DFHEX0001. In trying to recover from the error, module DFHXCTRI determined that the error was not caused by accessing incorrect data passed to DFHXCTRP, but was due to a program check in DFHXCTRP.

System action: The EXCI trace facilities are disabled to prevent further errors. A SYSMDUMP is taken.

User response: See the DFHEX0001 message and the SYSMDUMP to determine the cause of the error.

You may need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXCTRI

Destination: Console

DFHEX0116 Program check occurred within global trap exit - DFHXCTRA now marked unusable.

Explanation: After making a trace entry, the external CICS interface (EXCI) trace program DFHXCTRP called the EXCI field engineering global trap program DFHXCTRA. A program check occurred during execution of DFHXCTRA.

System action: The EXCI marks the currently active version of DFHXCTRA as unusable and ignores it on subsequent calls to DFHXCTRP for all subsequent calls made under this TCB. The EXCI request is terminated, and a SYSMDUMP is taken.

User response: Use the dump to find the cause of the program check.

You may need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

You should use the global trap exit only in consultation with an IBM support representative.

Module: DFHXCTRI

Destination: Console

DFHFCnnnn messages

DFHFC0001 *applid* An abend (code *aaa/bbbb*) has occurred at offset *X'offset'* in module *modname*.

Explanation: An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in CICS code.

Alternatively,

- Unexpected data has been input, or
- Storage has been overwritten.

The code *aaa/bbbb* is a three digit hexadecimal MVS code (if applicable), followed by a four digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

Then look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some further guidance.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCAT, DFHFCCA, DFHFCDN, DFHFCDTS, DFHFCDTX, DFHFCES, DFHFCFL, DFHFCFR, DFHFCFS, DFHFCIR, DFHFCFLF, DFHFCFLJ, DFHFCMT, DFHFCQI, DFHFCQR, DFHFCQS, DFHFCQU, DFHFCRC, DFHFCRL,

DFHFCRO, DFHFCRP, DFHFCRR, DFHFCRS,
DFHFCRV, DFHFCSD, DFHFCST, DFHFCVR,
DFHFCVS

XMEOUT Parameters: *applid, aaa/bbbb, X'offset',
modname*

Destination: Console

DFHFC0002 *applid* **A severe error (code *X'code*) has occurred in module *modname*.**

Explanation: An error has been detected in module *modname*. The code *code* is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

To discover the cause of the problem, examine the exception trace entry and immediately preceding entries. For further information about CICS exception trace entries, see the *CICS Problem Determination Guide*.

System action: An exception entry (code *code* in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Inform the system programmer. This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated.

If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCAT, DFHFCCA, DFHFCDN,
DFHFCDTS, DFHFCDTX, DFHEIFC, DFHFCES,
DFHFCFL, DFHFCFR, DFHFCFS, DFHFCIR,
DFHFCLE, DFHFCLJ, DFHFCMT, DFHFCOR,
DFHFCQI, DFHFCQR, DFHFCQS, DFHFCQU,
DFHFCRC, DFHFCDR, DFHFCDL, DFHFCRO,
DFHFCRP, DFHFCRR, DFHFCRS, DFHFCSD,
DFHFCST, DFHFCVR, DFHFCVS

XMEOUT Parameters: *applid, X'code',modname*

Destination: Console

DFHFC0003 *applid* **Insufficient storage (code *X'code*) in module *modname*.**

Explanation: A CICS GETMAIN was issued by module *modname*, but there was insufficient storage available to satisfy the request.

The code *X'code* is the exception trace point ID which uniquely identifies the place where the error was detected.

System action: An exception entry is made in the trace table (code *code* in the message). A system dump is taken, unless you have specifically suppressed dumps in the dump table. CICS continues unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Inform the system programmer. If CICS has been terminated by another module, look out for the relevant termination messages (from the domain manager, for example), and look up the user response for these messages.

If CICS is still running, the problem may be a temporary one which rights itself if more storage becomes available. If you can manage without module *modname*, you may decide to continue and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of all CICS modules, you should bring CICS down in a controlled shutdown.

Try increasing the size limits of the DSAs or EDSAs. See the *CICS System Definition Guide* or the *CICS Performance Guide* for further information on CICS storage.

Module: DFHFCRP

XMEOUT Parameters: *applid, X'code',modname*

Destination: Console

DFHFC0004 *applid* **A possible loop has been detected at offset *X'offset* in module *modname*.**

Explanation: A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset *X'offset*. This is the offset of the instruction which was executing at the time the error was detected.

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table. CICS

continues unless you have specified in the dump table that CICS should terminate.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Notify the system programmer. If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of CPU time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module *modname* is terminated and CICS continues.

But if you have declared ICVR=0 as a system initialization parameter and you consider that module *modname* has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname*, and you consider that it was not a runaway, increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will require further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCAT, DFHFCDN, DFHFCDTS, DFHFCDTX, DFHFCDR, DFHFCDFS, DFHFCDT, DFHFCDRL, DFHFCDR, DFHFCDSD, DFHFCDST, DFHFCDV, DFHFCDVS

XMEOUT Parameters: *applid, X'offset', modname*

Destination: Console

DFHFC0005 *applid* **A hardware error has occurred (module *modname*, code *X'code*). The Time-of-Day clock is invalid.**

Explanation: A hardware error has occurred during the running of module *modname*. The MVS store clock facility is the timing mechanism for the operating system.

The code *code* is the exception trace point ID which uniquely identifies the place where the error was detected.

System action: An exception entry (code *code* in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table. CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated

by the caller (for example, the domain manager, DFHDMDM). A message to this effect is issued.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Notify the system programmer. This is in all probability a hardware error and you should in the first instance investigate the MVS store clock and find out whether it is working properly. If this is the cause, you should take the appropriate action to have it repaired or replaced.

In the unlikely event that this is not a hardware problem, you will require further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: XMEOUT **Parameters:** *applid, modname, X'code'*

Destination: Console

DFHFC0100I *applid* **File Control initialization has started.**

Explanation: This is an informational message indicating the start of file control initialization.

System action: Initialization continues.

User response: None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Module: DFHFCDR

XMEOUT Parameter: *applid*

Destination: Console

DFHFC0101I *applid* **File Control initialization has ended.**

Explanation: File control initialization has completed successfully.

System action: Initialization continues.

User response: None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Module: DFHFCDR

XMEOUT Parameter: *applid*

Destination: Console

DFHFC0102 *applid* **File Control initialization has failed.**

Explanation: File control has failed to initialize correctly.

System action: Message DFHSI1521 is usually issued and initialization is terminated.

If the failure occurred at a critical stage during file

control initialization, CICS initialization is terminated immediately with a dump, and message DFHSI1521 is not issued.

User response: The error can be identified by a trace entry, and possibly by a prior message. You should then take action that is appropriate to the error.

Module: DFHFRCRP

XMEOUT Parameter: *applid*

Destination: Console

DFHFC0103 *applid* Required module *modname* could not be loaded.

Explanation: Module *modname* is required by file control. It could not be loaded because it is missing from the DFHRPL library list.

System action: The system terminates with a system dump and code FC0103.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Ensure that module *modname* is in the DFHRPL library list.

If this is not the cause of the problem you will require further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCIN1, DFHFRCRP, DFHFCFS

XMEOUT Parameters: *applid, modname*

Destination: Console

DFHFC0104 *applid* Unexpected catalog error.

Explanation: File control issued a request to the catalog (CC) domain which failed. This is probably caused by an I/O error on the catalog.

System action: A system dump is produced with code FC0104.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Determine the cause of the error from the messages issued from the catalog domain.

Module: DFHFRCRP

XMEOUT Parameter: *applid*

Destination: Console

DFHFC0106 *applid* Insufficient storage to satisfy GETMAIN request in module *modname*.

Explanation: The storage (SM) domain has insufficient space to satisfy a GETMAIN request made during CICS initialization.

System action: A system dump is produced.

User response: None.

Module: DFHFRCRP

XMEOUT Parameters: *applid, modname*

Destination: Console

DFHFC0107D *applid* Unable to load File Control table DFHFCT_{xx}. Enter either an alternative suffix, or 'YES', or 'NO'.

Explanation: The file control table, DFHFCT_{xx} could not be found in the DFHRPL library list during a cold or initial start of CICS.

System action: File control initialization waits for a reply to this message.

User response: Reply as follows

- With a 1 or 2 character suffix to cause file control to load DFHFCT_{xx}, or
- YES to load an unsuffixed FCT, or
- NO to initialize file control without an FCT.

Module: DFHFRCRP

XMEOUT Parameters: *applid, xx*

Destination: Console

DFHFC0108 *applid* Invalid reply to message DFHFC0107D. A 1 or 2 character suffix, or YES or NO is required

Explanation: The reply to message DFHFC0107 was invalid. The reply may have been too long or may have contained invalid characters.

System action: Message DFHFC0107 is reissued and initialization waits for a reply.

User response: Reply to message DFHFC0107.

Module: DFHFRCRP

XMEOUT Parameter: *applid*

Destination: Console

DFHFC0110 *applid* Error, a *xxxx* version of DFHFCT_{xx} has been loaded.

Explanation: DFHFRCRP loaded DFHFCT_{xx} that was assembled for CICS release *xxxx*. It is not valid to run CICS with an FCT assembled against a previous release.

System action: File control initialization, and hence CICS, is terminated.

User response: Reassemble DFHFCT_{xx} for the CICS release being used. Cold start CICS.

Module: DFHFRCRP

XMEOUT Parameters: *applid, xxxx,DFHFCTxx*

Destination: Console

DFHFC0111 *applid* **Error, CICS is attempting to initialize with release *xxxx* of DFP.**

Explanation: DFHFRCRP detected that CICS was being initialized with data facility product (DFP) level *xxxx*. CICS does not support this level of DFP.

System action: File control initialization, and hence CICS, is terminated.

User response: Install a level of DFP supported by this release of CICS.

Module: DFHFRCRP

XMEOUT Parameters: *applid, xxxx*

Destination: Console

DFHFC0112 *applid* **Install of remote FCT entry *filename* failed. SYSID *sysid*, specified in the entry, is the local SYSID.**

Explanation: DFHFRCRP attempted to install file *filename* from the assembled FCT. The install failed because the file was defined as TYPE=REMOTE but the SYSIDNT specified, *sysid*, was the system identifier of this local system.

System action: File *filename* is not installed and file control initialization continues.

User response: Examine the entry for *filename* in the FCT and either make the entry a local entry (TYPE=FILE) or correct the SYSIDNT specified.

Module: DFHFRCRP

XMEOUT Parameters: *applid, filename, sysid*

Destination: Console

DFHFC0116 *applid* **The load of callable service IGWARLS has failed with return code *X'eeee'*.**

Explanation: Callable service IGWARLS is required by file control for processing files which have update SERVREQs and are using the VSAM catalog as a repository for data set recovery attributes. The load of IGWARLS requested by file control initialization has failed. This is a serious problem because CICS is using a level of VSAM that supports use of the VSAM catalog for specifying data set recovery attributes.

System action: CICS initialization fails.

User response: IGWARLS is supplied on SYS1.CSSLIB. Ensure that SYS1.CSSLIB is in the concatenation for the MVS linklist or LPA. If the failure persists, this is likely to be an internal CICS error. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFRCRP

XMEOUT Parameters: *applid, X'eeee'*

Destination: Console

DFHFC0118 *applid* **System initialization parameter requesting RLS support has been ignored because the level of VSAM does not support RLS.**

Explanation: RLS=YES has been specified on CICS startup but the level of VSAM does not support RLS access.

System action: CICS initialization continues without RLS support.

User response: If you intend to use RLS access ensure that the level of VSAM is DFSMS 1.3 or later.

Module: DFHFRCRP

XMEOUT Parameter: *applid*

Destination: Console

DFHFC0119 *applid* **The load of callable service IGGCSI00 has failed with return code *X'eeee'*.**

Explanation: Callable service IGGCSI00 is required by file control for examining catalog entries for data sets. The load of IGGCSI00 requested by file control initialization has failed.

System action: CICS initialization fails.

User response: IGGCSI00 is supplied on SYS1.CSSLIB. Ensure that SYS1.CSSLIB is in the concatenation for the MVS linklist or LPA. If the failure persists, this is likely to be an internal CICS error. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: **XMEOUT Parameters:** *applid, X'eeee'*

Destination: Console

DFHFC0150 *date time applid termid tranid* **An attempt to release locks for unit of work *X'uowid'* failed. VSAM return code *X'rrrr'* reason code *X'cccc'*.**

Explanation: Unit of work *uowid* for tranid *tranid* has attempted to release its RLS locks. The release locks request made to VSAM has failed because VSAM detected an error.

The IDALKREL response is *rrrr* and the reason code is *cccc*.

termid identifies the terminal running this transaction.

System action: CICS continues with the completion of the unit of work.

The unit of work is shunted. The shunt reason indicates

that a further release locks attempt is required.

Some records may remain locked until a successful lock release command can be processed by VSAM.

If the failure is caused by the SMSVSAM server being unavailable, CICS automatically retries the completion of the UOW when the server becomes available.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Use the VSAM codes to determine the cause of the problem. The most likely cause of this failure is that the SMSVSAM server failed at the time of the error. For the meaning of the VSAM codes, see *OS/390 V2R10.0 DFSMS Macro Instructions for Data Sets*.

When the condition that caused the lock release to fail has been resolved, you may need to retry the unit of work using

```
CEMT SET DSNAME RETRY
```

or

```
EXEC CICS SET DSNAME(dsname) ACTION(RETRY)
```

.

If you cannot resolve the problem or the problem recurs, there may be a more severe error. In this case, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCCA

XMEOUT Parameters: *date, time, applid, termid, tranid, X'uowid', X'rrrr', X'cccc'*

Destination: Console and Transient Data Queue CSFL

DFHFC0151 *date time applid termid tranid* **An attempt to retain locks for unit of work X'uowid' failed. VSAM return code X'rrrr' reason code X'cccc'.**

Explanation: Unit of work *uowid* for transaction *tranid* has gone indoubt because it has lost contact with its coordinating system. Consequently CICS has attempted to convert all RLS locks owned by this unit of work into retained locks. This attempt has failed because VSAM has detected an error.

The IDARETLK macro response is *rrrr* and the reason code is *cccc*.

termid identifies the terminal running this transaction.

System action: CICS continues shunting this unit of work. It is possible that some locks may remain as active locks (which cause other transactions to wait until their timeout value is reached) rather than as retained

locks (which cause other transactions to encounter LOCKED responses.)

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Use the VSAM codes to determine the cause of the problem. For the meaning of the VSAM codes, see *OS/390 V2R10.0 DFSMS Macro Instructions for Data Sets*. The most likely reason for the failure to convert locks into retained locks is that the SMSVSAM server was not available. Other VSAM codes may indicate a more severe error.

Normally no other action should be necessary. When contact is reestablished, the coordinating system instructs this system to commit or backout. At the end of commit or backout, all retained and active locks are released.

A problem that you may encounter is that some locks may have been left as active locks. This may cause slow response (and eventual failures) from transactions that wait for these locks and have to wait for their full timeout interval.

In this case, you can use the CEMT SET UOW command to force the unit of work to commit or backout, or to make a decision to commit or backout according to the ACTION attribute in the transaction definition. Alternatively, you can use the CEMT SET DSNAME command which will force all in-doubt units of work which had updated the specified data set. However, you should not normally use these commands because they can cause this CICS to become out of step with its coordinating system with consequent loss of data integrity.

If you cannot resolve the problem or the problem recurs, there may be a more severe error. In this case, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCCA

XMEOUT Parameters: *date, time, applid, termid, tranid, X'uowid', X'rrrr', X'cccc'*

Destination: Console and Transient Data Queue CSFL

DFHFC0152 *date time applid termid tranid* **An attempt to retain locks for data set within unit of work X'uowid' failed. VSAM return code X'rrrr' reason code X'cccc'.**

Explanation: Unit of work *uowid* for transaction *tranid* has failed backout for one of its data sets. CICS has attempted to convert all the RLS locks owned by this unit of work that are associated with the failing data set into retained locks. This attempt has failed because VSAM has detected an error.

The IDARETLK response is *rrrr* and the reason code is *cccc*.

DFHFC0153

termid identifies the terminal running this transaction.

This message is followed by message DFHFC0312 which identifies the failing data set.

System action: CICS continues shunting this unit of work. Some locks may remain as active locks (which cause other transactions to wait until their timeout value is reached) rather than as retained locks (which cause other transactions to encounter LOCKED responses).

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Use the VSAM codes to determine the cause of the problem. For the meaning of the VSAM codes, see *OS/390 V2R10.0 DFSMS Macro Instructions for Data Sets*.

The most likely reason for the failure to convert locks into retained locks is that the SMSVSAM server was not available. It is also possible to get a failure because the specified logical unit of work ID does not exist for the subsystem (that is, the unit of work does not hold any locks) during lost locks recovery, or after a CICS restart which specified OFFSITE=YES as a system initialization override. If you are performing RLS lost locks recovery, message DFHFC0555 will have been issued when lost locks recovery started; if you are performing RLS offsite recovery, message DFHFC0574 will have been issued during file control initialization. Other VSAM codes may indicate a more severe error.

Normally no other action is necessary. When the condition that caused the backout failure has been resolved, the backout of this unit of work is retried. If the attempt to retry the backout succeeds, all locks are released.

Message DFHFC4701 specifies the cause of the backout failure. The most common cause of backout failures is a hardware problem causing I/O errors. In this case the data set needs to be restored and forward recovered. If CICSVR (or a functionally equivalent product) is used to perform forward recovery, and the data set was being accessed in RLS mode, units of work that have failed backout for this data set are retried automatically. If the data set was quiesced, you need to unquiesce it to allow the backout to succeed. When the data set is unquiesced, CICS automatically retries the backout.

Backouts may also be retried using
CEMT SET DSNAME RETRY

or

```
EXEC CICS SET DSNAME(dsname) ACTION(RETRY)
```

.

The only problem that you may encounter is that some locks may have been left as active locks. This can

cause a slow response (and eventual failures) from transactions that wait for these locks and have to wait for their full timeout interval.

In this case, consider releasing all locks held against this data set using the CEMT SET DSNAME RESETLOCKS command. This command should only be considered in extreme cases because it discards both the retained locks held by this CICS system against the named data set and all associated log records. The consequence is that the corresponding backout operations are never performed and data integrity is lost.

If you cannot resolve the problem or the problem recurs, there may be a more severe error. In this case, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCCA

XMEOUT Parameters: *date, time, applid, termid, tranid, X'uowid', X'rrrr', X'cccc'*

Destination: Console and Transient Data Queue CSFL

DFHFC0153 *applid* **The previous instance of the SMSVSAM server has failed. File control RLS access is being closed down.**

Explanation: The SMSVSAM server is the separate VSAM address space that handles all VSAM requests made in RLS mode. The instance of this address space which CICS has been using has terminated, and CICS has just detected the failure. CICS must close down all accesses from file control to this instance of the SMSVSAM server in order to be able to register with the next server instance when the server restarts.

If message DFHFC0568 is issued before DFHFC0153, CICS did not detect the failure until the server restarted and notified CICS that a new instance was available. If message DFHFC0568 is not issued before DFHFC0153, CICS detected the failure when it tried to access the failed instance of the server.

System action: CICS disables all further RLS accesses, closes all files which were open in RLS mode, and attempts to unregister the RLS control ACB.

Transactions that attempt to access files previously opened in RLS mode abend. The abend code depends upon what the transaction was doing at the time of the failure.

User response: The SMSVSAM server address space should normally restart itself. If it does not, restart the SMSVSAM server address space manually. If the SMSVSAM server address space fails to restart, there may be a more severe error. In this case, you need assistance from IBM. See Part 4 of the *CICS Problem*

Determination Guide for guidance on how to proceed.

Module: DFHFCCA

XMEOUT Parameter: *applid*

Destination: Console

DFHFC0156 *applid* **A failure to reset the PERMITNONRLSUPDATE state has occurred. Vsam return code X'rrrr' reason code X'cccc'.**

Explanation: CICS has completed processing after a PERMITNONRLSUPDATE batch override response was returned by VSAM when CICS issued an RLS open. The call to VSAM from CICS to reset the state so that it is no longer in batch override status has failed.

The VSAM response is *rrrr* and the VSAM reason is *cccc*.

This message is followed by message DFHFC0312 which identifies the failing data set.

System action: CICS takes a system dump.

User response: To resolve the problem, keep the dump and contact your IBM Support Center.

Module: DFHFCCA

XMEOUT Parameters: *applid, X'rrrr',X'cccc'*

Destination: Console

DFHFC0157 *applid tranid termid userid* **An I/O error has occurred on base data set *dsname* accessed via file *filename* component code X'*code*'.**

Explanation: An I/O error has been reported by VSAM after a request to update VSAM file *filename*.

The name of the base data set associated with the file is *dsname* although the error may have been encountered elsewhere. This is indicated by the value of the component code X'*code*'. Its possible values and the corresponding error locations are as follows.

- X'00 or X'01 - Base cluster.
- X'02 or X'03 - Alternate index.
- X'04 or X'05 - Upgrade set.

System action: The application request which encountered the error receives an 'IOERR' response.

CICS also issues message DFHFC0158 to display the VSAM diagnostic information for this error.

User response: Follow standard procedure for I/O errors. No special additional action is required to respond to this particular message although the data set name and component code may help in identifying the problem.

Module: DFHFCCRS

XMEOUT Parameters: *applid, tranid, termid, userid, dsname, filename, X'code'*

Destination: Console

DFHFC0158 *applid vsam-error-data*

Explanation: This message displays additional VSAM diagnostic information that is available following I/O errors and cache failures. The message is provided for information only.

The format of the data contained in message DFHFC0158 is described in *OS/390 V2R10.0 DFSMS Macro Instructions for Data Sets*. in the section describing the physical error message format. This is a common data format used by other IBM products following I/O errors.

This message is issued after messages DFHFC0157, DFHFC0162 and DFHFC0163 and provides additional information to go with those messages.

System action: Processing continues.

User response: See the description of the associated preceding message (DFHFC0157, DFHFC0162 or DFHFC0163.)

Module: DFHFCCRS, DFHFCCVS

XMEOUT Parameters: *applid, vsam-error-data*

Destination: Console

DFHFC0159 *applid* **A request issued to cold start the RLS subsystem has failed. VSAM return code X'rrrr' reason code X'cccc'.**

Explanation: A cold or initial start of CICS has been requested. CICS has made a call to the RLS component of VSAM which requested RLS to cold start its status with respect to this CICS. This request has failed because VSAM RLS detected an error while performing cold start processing.

System action: CICS continues to initialize. However, the restart of the RLS component of file control has failed and all RLS eligible files are unusable.

No dump is taken with this message. However, file control restart may subsequently produce message DFHFC0001 and take a dump if the error is of a type which should not occur during normal running.

User response: If the VSAM return code indicates that the SMSVSAM server has failed, restart the SMSVSAM server (if it has not already automatically restarted). You also need to restart CICS because CICS has been warm started with respect to RLS when the server returns.

If the SMSVSAM server has not failed, this is probably an error in CICS or VSAM. You should keep the dump associated with message DFHFC0001. See Part 4 of

the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCCA

XMEOUT Parameters: *applid, X'rrrr',X'cccc'*

Destination: Console

DFHFC0160 *applid* **An attempt to notify VSAM that CICS has completed lost locks processing for a data set has failed. VSAM return code X'rrrr' reason code X'cccc'.**

Explanation: Following a failure of the VSAM lock structure, VSAM has marked a data set as being in lost locks state with regard to this CICS. CICS has performed all recovery actions necessary to resolve its locks against this data set and has attempted to inform VSAM that it has completed its recovery. This attempt has failed.

The VSAM response is *rrrr* and the VSAM reason is *cccc*.

This message is followed by message DFHFC0312 which identifies the failing data set.

System action: If the VSAM return code does not indicate that the SMSVSAM server has failed, CICS takes a system dump.

User response: The most likely cause of this failure is that the SMSVSAM server failed at the time that CICS issued the request.

If the problem was caused by the SMSVSAM server having failed at the time that the request was issued, restart the SMSVSAM server (if it has not already automatically restarted). Otherwise, you can make CICS retry the attempt to notify VSAM of the completion of lost locks processing either by restarting CICS or by restarting the SMSVSAM server.

It is possible that your installation may have performed some action, such as deleting the data set, which would cause VSAM not to recognize the data set and therefore return an error. If this is the case for the data set named in message DFHFC0312, you need take no further action.

If the VSAM return and reason codes suggest an internal CICS or VSAM error, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCCA

XMEOUT Parameters: *applid, X'rrrr',X'cccc'*

Destination: Console

DFHFC0161 *applid* **Inquire recovery has failed. VSAM return code X'rrrr' reason code X'cccc'.**

Explanation: During restart CICS has issued an inquire recovery request to VSAM. This request has failed because VSAM has detected an error.

System action: CICS restart continues. All RLS files are unusable.

If the VSAM return code does not indicate that the SMSVSAM server has failed, CICS later issues message DFHFC0001 which has an associated system dump.

User response: The most likely cause of this failure is that the SMSVSAM server failed at the time that CICS issued the request. In that case you should restart the SMSVSAM server, if it has not already automatically restarted. There is no need to restart CICS.

If the VSAM return and reason codes indicate an internal CICS or VSAM error, keep the dump from message DFHFC0001. You will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCCA

XMEOUT Parameters: *applid, X'rrrr',X'cccc'*

Destination: Console

DFHFC0162 *applid* **A VSAM data cache has failed.**

Explanation: A data cache structure being used by VSAM RLS has failed.

System action: The application request which encountered the error receives an 'IOERR' response.

CICS also issues message DFHFC0158 to display the VSAM diagnostic information for this error. The name of the failing cache can be derived from the information displayed in the following DFHFC0158 message.

While the data cache remains unusable, all data sets bound to this cache are also unusable. Any attempt to read from or write to such a data set cause an IOERR response.

CICS issues messages DFHFC0162 and DFHFC0158 the first time that an I/O request fails because of a cache failure. To prevent flooding the console with messages, CICS does not display these messages again until it is notified that a cache has been recovered. If several caches fail, DFHFC0162 and DFHFC0158 are only displayed for the first cache to fail. However, VSAM issues messages for all failed caches.

User response: Allocate a new data cache and bring it on line to VSAM.

CICS is notified as soon as the new cache is available and is able to take appropriate recovery action.

Module: DFHFCRS

XMEOUT Parameter: *applid*

Destination: Console

DFHFC0163 *applid* **Connectivity to a VSAM RLS data cache has been lost.**

Explanation: Connectivity has been lost to a data cache that is being used by VSAM RLS.

System action: The application request which encountered the error receives an 'IOERR' response.

CICS also displays message DFHFC0158 to display the VSAM diagnostic information for this error. The name of the failing cache can be derived from the information displayed in the following DFHFC0158 message.

While the data cache remains unusable, all data sets bound to this cache are also unusable. Any attempt to read from or write to such a data set receives an 'IOERR' response.

CICS issues messages DFHFC0163 and DFHFC0158 the first time that an I/O request fails because contact has been lost between the processor running this MVS image and the coupling facility that holds the data cache. To prevent flooding the console with messages, CICS does not display these messages again until it is notified that a cache has been recovered. If contact with several caches is lost, messages DFHFC0163 and DFHFC0158 are only displayed for the first cache to fail. However, VSAM issues messages for all caches for which contact has been lost.

User response: Reestablish contact between the processor running CICS and the coupling facility that contains the cache.

CICS is notified as soon as contact has been reestablished and is able to take appropriate recovery action.

Module: DFHFCRS

XMEOUT Parameter: *applid*

Destination: Console

DFHFC0164 *date time applid tranid trannum termid userid*. **A request has timed out waiting for an RLS lock. There are *nn* transactions or Transactional VSAM units of recovery holding this lock.**

Explanation: This message and the following DFHFC0165 or DFHFC0175 messages are issued to assist in problem determination when transactions abend with the AFCV abend code, or when application programs receive the RECORDBUSY condition.

An attempt made by transaction *tranid* with task number *trannum* to update a file which is open in VSAM RLS mode has failed because the request timed out waiting

to obtain a lock on a record.

VSAM RLS has detected that a request has waited for a lock for more than the timeout interval. However, RLS was unable to detect any deadlock. Possibly there is a deadlock between VSAM RLS requests and requests to another resource manager such as DB2 or DBCTL.

When the timeout occurred there were *nn* other transactions or Transactional VSAM units of recovery holding the required lock.

System action: If the application request which encountered the error specified NOSUSPEND, it receives the RECORDBUSY condition and continues. If the request did not specify NOSUSPEND, it receives an AFCV abend.

CICS displays message DFHFC0164 to identify the failing transaction and the number of owners of the lock. CICS also issues message DFHFC0165 or DFHFC0175 once for each lock owner. CICS issues message DFHFC0168 instead of DFHFC0165 or DFHFC0175 in the unlikely event that VSAM RLS is unable to identify the lock owner.

User response: The following DFHFC0165 or DFHFC0175 messages identify the transactions that are holding the required lock and the CICS systems that they are running in or the unit of recovery holding the required lock and the Transactional VSAM instance this is running in, respectively. Examine these transactions or units of recovery to see why they are not releasing VSAM RLS locks. For example

- They may be holding VSAM RLS locks and waiting for terminal input.
- They may be trying to access resources from both VSAM RLS and another resource manager, creating an inter-resource manager deadlock.

Module: DFHFCRS

XMEOUT Parameters: *date, time, applid, tranid, trannum, termid, userid, nn*

Destination: CSFL

DFHFC0165 *date time applid tranid trannum termid userid*. **Transaction *transid* (*tasknum*) unit of work *X'uowid* running in job *jobname* with *applid* *applid2* in MVS *mvsid* holds {*add to end lock* | *internal lock* | *exclusive lock on key* | *shared lock on key* }*X'keyid* in data set *dsname* causing {*true* | *false*} contention.**

Explanation: This message and the preceding message DFHFC0164 or DFHFC0174 are issued to assist in problem determination when transactions abend with the AFCV or AFCW abend codes, or when applications receive the RECORDBUSY condition.

Normally this message appears after VSAM returns a timeout response to CICS. However, it may also appear after VSAM returns a deadlock response to CICS when

DFHFC0166

that deadlock arises as a result of a failure to promote a lock. When this message is associated with a timeout response from VSAM, it is preceded by message DFHFC0164. When this message is associated with a deadlock response from VSAM it is associated with message DFHFC0174.

There is one occurrence of message DFHFC0165 for each transaction currently owning the required lock.

The name of the transaction that has failed is *tranid* and it has task number *trannum*.

The message inserts that identify the owner of the lock which caused this transaction to time out are as follows

- *transid* is the name of the transaction running in the system that owns the lock. If the job that holds the lock is not a CICS system, this is displayed as *????*.
- *tasknum* is the task number of *transid*. If the job that holds the lock is not a CICS system, this is displayed as *?????*.
- *uowid* is the unit of work ID associated with the above transaction. The unit of work ID is also used by VSAM RLS as its logical unit of work ID (luwid).
- *jobname* is the job name of the CICS system that owns the lock.
- *applid2* is the applid of the CICS system whose job name was given by the previous insert.
- *mvsid* is the name of the MVS in which this CICS is running.
- *dsname* is the name of the data set against which the lock is held.
- *keyid* identifies the key which is locked. As it is not always possible to display keys in character form, the key is displayed in hexadecimal notation. If the message indicates that the transaction is waiting for an add to end lock or an internal lock, no key information is displayed.

The message identifies whether the lock is held as an exclusive lock or a shared lock

- A lock is exclusive if it can only have one holder. For example, exclusive locks are used to protect update operations.
- A lock is shared if it can have many holders. Shared locks are used to protect repeatable and consistent read operations.

A lock causes true contention if the request was for a lock against the locked key. A lock causes false contention if the request was for a lock against a different key but the lock requests clashed because of the RLS key hashing algorithm which is used when the key length exceeds 16 characters.

System action: This message is preceded by DFHFC0164 or DFHFC0174. See the description of DFHFC0164 or DFHFC0174 for a description of the system action associated with this message.

User response: This message is preceded by DFHFC0164 or DFHFC0174. See the description of

DFHFC0164 or DFHFC0174 for a description of the user actions associated with this message.

Module: DFHFCRS

XMEOUT Parameters: *date, time, applid, tranid, trannum, termid, userid, transid, tasknum, X'uowid', jobname, applid2, mvsid, {1=add to end lock, 2=internal lock, 3=exclusive lock on key, 4=shared lock on key}, X'keyid', dsname, {1=true, 2=false}*

Destination: CSFL

DFHFC0166 *date time applid tranid termid userid.*
VSAM RLS has detected a deadlock.
There are *nn* transactions or Transactional VSAM units of recovery in the deadlock chain.

Explanation: This message and the following DFHFC0167 or DFHFC0177 messages are issued to assist in problem determination when transactions abend with AFCW abend codes.

An attempt made by transaction *tranid* to update a file which is open in VSAM RLS mode has failed because VSAM RLS detected that this request would have caused a deadlock with other transactions.

At the time that the timeout occurred there were *nn* other transactions or Transactional VSAM units of recovery in the chain which caused deadlock.

System action: The application request which encountered the error receives an AFCW abend.

CICS issues message DFHFC0166 to identify the failing transaction and the number of transactions or units of recovery in the deadlock chain.

CICS also issues message DFHFC0167 or DFHFC0177 once for each transaction or unit of recovery involved in the deadlock chain. DFHFC0167 and DFHFC0177 identify the resource that the transaction or unit of recovery is holding and the resource that the transaction is waiting for.

User response: Examine the transactions or units of recovery in the deadlock chain to determine why deadlock arose. If necessary, correct the programming logic to avoid deadlock-creating situations.

For guidance on writing programs that avoid deadlock problems, see the *CICS Application Programming Guide*.

Module: DFHFCRS

XMEOUT Parameters: *date, time, applid, tranid, termid, userid, nn*

Destination: CSFL

DFHFC0167 *date time applid tranid termid userid.*
Transaction *transid(tasknum)* **with unit of work id** *X'uowid'* **running in** *jobname/applid2* **in MVS** *mvsid* **holds** *{add to end lock | internal lock | exclusive lock on key | shared lock on key }X'key1'* **on data set** *dsname1* **and is waiting for** *{add to end lock | internal lock | exclusive lock on key | shared lock on key }X'key2'* **on data set** *dsname2.*

Explanation: This message and the preceding DFHFC0166 message are issued to assist in problem determination when transactions abend with AFCW abend codes.

The preceding message DFHFC0166 reports that a deadlock has been detected and includes how many transactions exist in the deadlock chain.

Message DFHFC0167 is issued once for each transaction in the deadlock chain and includes the resource that transaction holds and which resource it is waiting for.

The message inserts are as follows

- *transid(tasknum)* is the transaction name and the associated task number of a transaction that owns a lock and is waiting for another lock. If this participant in the deadlock chain is not a CICS system, this will appear as *????(?????)*.
- *uowid* is the unit of work ID associated with task *transid(tasknum)*. The unit of work is also used by VSAM as the logical unit of work ID (*luwid*).
- *jobname/applid2* is the job name and applid of the CICS system in which this transaction is running.
- *mvsid* is the name of the MVS in which this CICS job is running.
- *dsname1* is the name of the data set against which this transaction holds a lock.
- *key1* identifies the key which is locked. As it is not always possible to display keys in character form, the key is displayed in hexadecimal notation. If the message indicates that an add to end lock or an internal lock is held then no key information is displayed.
- *dsname2* is the name of the data set against which this transaction is attempting to acquire a lock.
- *key2* identifies the key which this transaction is attempting to lock. If the message indicates that the transaction is attempting to obtain an add to end lock or an internal lock then no key information is displayed.

The message identifies whether the lock is held as an exclusive lock or a shared lock and whether the transaction is attempting to acquire an exclusive or shared lock.

- A lock is exclusive if it can only have one holder. For example, exclusive locks are used to protect update operations.
- A lock is shared if it can have many holders. Shared locks are used to protect repeatable and consistent read operations.

System action: The application request which encountered the error receives an AFCW abend.

User response: See the description of message DFHFC0166.

Module: DFHFCSRS

XMEOUT Parameters: *date, time, applid, tranid, termid, userid, transid(tasknum), X'uowid', jobname/applid2, mvsid, {1=add to end lock, 2=internal lock, 3=exclusive lock on key, 4=shared lock on key }, X'key1', dsname1, {1=add to end lock, 2=internal lock, 3=exclusive lock on key, 4=shared lock on key }, X'key2', dsname2*

Destination: CSFL

DFHFC0168 *date time applid tranid tranum termid userid.* *{ An exclusive | A shared } lock on key X'keyid' in data set dsname is causing {true | false} contention but the owner of this lock is unknown.*

Explanation: This message and the preceding DFHFC0164 message are issued to assist in problem determination when transactions abend with AFCW abend codes.

Message DFHFC0168 is issued whenever VSAM RLS is unable to determine the owner of a lock. This is an abnormal condition. It may indicate that a processor in the sysplex is stopped.

dsname is the name of the data set against which the lock is held. *keyid* identifies the key which is locked. As it is not always possible to display keys in character form, the key is displayed in hexadecimal notation.

The message identifies whether the lock is held as an exclusive lock or a shared lock.

- A lock is exclusive if it can only have one holder. For example, exclusive locks are used to protect update operations.
- A lock is shared if it can have many holders. Shared locks are used to protect repeatable and consistent read operations.

A lock causes true contention if the request was for a lock against the locked key. A lock causes false contention if the request was for a lock against a different key but the lock requests clashed as a result of hashing algorithms used in creating RLS keys.

System action: Processing continues.

User response: None. The message is issued to assist in problem determination.

Module: DFHFCRS

XMEOUT Parameters: *date, time, applid, tranid, trannum, termid, userid, {1= An exclusive, 2= A shared}, X'keyid', dsname, {1=true, 2=false}*

Destination: CSFL

DFHFC0169 *date time applid termid userid.*
Transaction *tranid* with transaction number *trannum* encountered an RLS retained lock held on data set *dsname* by unit of work *X'uowid*' within CICS with applid *applid2*.

Explanation: An attempt was made to update a record which is currently held locked by a retained RLS lock.

Message inserts are as follows

- *applid2* is the applid of the CICS system which owns the lock.
- *uowid* is the identifier of the unit of work that owns the lock.
- *dsname* is the name of the data set against which the lock is held.

This message is issued to aid in problem diagnosis. It identifies the owner of the lock that is causing a request to fail with a 'LOCKED' response.

System action: The application request which encountered the error receives a 'LOCKED' response.

User response: If repeated LOCKED responses are causing a problem, note the name of the CICS system and the identifier of the unit of work and attempt to find why this unit of work is holding a retained lock. There are three reasons why a unit of work can hold a retained lock.

1. The unit of work was running in a CICS system that has failed. If this CICS system is restarted, the lock is normally released.
2. The unit of work has gone indoubt. Indoubt failures occur as a result of a failure in communication between two CICS systems, neither of which need be the CICS system that is encountering the 'LOCKED' response.

From a terminal connected to the CICS system with applid *applid2*, issue the command

```
CEMT I UOW(uowid)
```

or

```
CEMT I UOWDSNFAIL
```

to identify the applid of the CICS system that is coordinating the distributed unit of work. Then attempt to reestablish contact between the coordinating CICS and the system that owns the lock.

3. The unit of work has failed backout. From a terminal connected to the CICS system with applid *applid2*, issue the command

```
CEMT INQUIRE  
UOWDSNFAIL DATASET(dsname)
```

to determine the reason why unit of work *uowid* failed backout while processing data set *dsname*. There are several reasons why a unit of work can fail backout, each identified by a different reason code from CEMT INQUIRE UOWDSNFAIL. See the *CICS Problem Determination Guide* for guidance on how to resolve each of these types of backout failure.

Module: DFHFCRS

XMEOUT Parameters: *date, time, applid, termid, userid, tranid, trannum, dsname, X'uowid', applid2*

Destination: CSFL

DFHFC0170 *applid* **An attempt to release locks which are held by RLS but unknown to CICS has failed.**

Explanation: An attempt was made to release locks which are held on behalf of this CICS system by the VSAM RLS lock manager, but about which CICS has no knowledge. Such locks are known as "orphan" locks. The attempt to release the locks failed, either because the VSAM RLS server is not available or because there were no locks to release.

System action: CICS continues. The locks are automatically released after the VSAM RLS server becomes available again.

The presence of these "orphan" locks could prevent the running of non-RLS applications against the data sets which hold such locks. "Orphan" locks can also cause LOCKED responses to be returned to applications running on CICS systems which have access to an available VSAM RLS server and try to update the locked records, or try to read the records with one of the read integrity options.

Since CICS has no knowledge of "orphan" locks, it is not possible to get information about them using CICS API commands.

User response: If the failure is due to the server not being available, wait for the VSAM RLS server to restart. If it does not restart automatically, determine the reason and attempt to start it manually.

If the failure is due to there being no locks to release, this could either be a result of some user action resulting in locks being deleted such as deleting the data set, or it could indicate a severe VSAM error. If user action is not responsible, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCRR

XMEOUT Parameter: *applid*

Destination: Console

DFHFC0171 *applid* **Lost locks recovery might be delayed by inflight transactions.**

Explanation: A coupling facility (CF) lock structure failure has occurred, and SMSVSAM has been unable to rebuild the lock structure dynamically. This has resulted in the loss of VSAM RLS locks. SMSVSAM has notified CICS of this event so that CICS can perform lost locks recovery processing. In the course of this processing, CICS has attempted to purge inflight transactions that hold one or more of the lost locks in order to expedite recovery from the lost locks condition. However, it has not been possible to purge all of the transactions.

RLS lost locks recovery cannot complete until all UOWs that have updated data sets in RLS mode are completed. It is unlikely that an inflight transaction can complete normally in a lost locks situation because it will abend at the next attempt to access RLS. CICS attempts to purge inflight transactions because allowing them to run to completion (when they will probably abend anyway) could take a long time. This is particularly the case for conversational transactions.

System action: CICS continues.

If the failure to purge a transaction is due to a severe error, message DFHFC0002 is issued and a dump is taken.

User response: It may not be necessary to take any action because the purging of transactions is only a precautionary measure.

This message indicates that there are inflight UOWs that have not yet completed only when there are data sets that return a LOSTLOCKS value of RECOVERLOCKS after you have resolved any failed units of work that had updated the data sets. (See the EXEC CICS INQUIRE DSNAME(...) command for information about the LOSTLOCKS parameter.)

If it is possible to identify the transactions in question, either ensure that they run to normal completion, or attempt to force purge them using the CEMT master terminal command. However, as this should be a rare situation, consider performing an immediate shutdown of CICS followed by an emergency restart as an alternative solution. This causes all inflight transactions to be backed out.

Module: DFHFCRR

XMEOUT Parameter: *applid*

Destination: Console

DFHFC0172 *applid* **File control is unable to return to processing on the QR TCB because a change mode request has failed. CICS will terminate.**

Explanation: Normally most CICS functions are run on a TCB called the QR TCB. Exceptionally, file control issues OPEN and CLOSE requests on a TCB called the FO TCB. File control may also process VSAM read and write requests on a TCB called the CO TCB if SUBTSKS=1 has been specified in the SIT.

After completing its work on the RO or CO TCB, file control must return to processing on the QR TCB. In order to return to the QR TCB, file control has issued a CHANGE_MODE call to the CICS dispatcher. This request has failed.

System action: This is a severe error. CICS is unable to continue processing because it must be running on the QR TCB in order to do so. CICS is terminated with a dump.

The dispatcher domain has put out messages to describe the failure in the CHANGE_MODE request.

User response: See the messages issued by the dispatcher domain for further guidance.

Module: DFHFCRO, DFHFCOA, DFFCRV, DFHFCFS

XMEOUT Parameter: *applid*

Destination: Console

DFHFC0173 *date time applid* **VSAM has issued a {deadlock | timeout | locked} response but cannot supply problem determination data.**

Explanation: After certain failures, VSAM normally provides problem determination information which CICS uses to issue diagnostic messages and create exception trace entries.

However, although VSAM set a return code indicating that a failure occurred, it is unable to provide any problem determination information.

The failure detected by VSAM RLS is one of the following

- A deadlock - CICS normally issues message DFHFC0166 and two or more DFHFC0167 or DFHFC0177 messages.
- A timeout - CICS normally issues message DFHFC0164 and one or more DFHFC0165 or DFHFC0175 messages.
- A record locked by a retained lock - CICS normally issues message DFHFC0169 or DFHFC0179.

System action: CICS continues processing the error in the normal way but cannot issue any of the normal problem determination messages or create the usual exception trace entries.

DFHFC0174 • DFHFC0175

CICS does not take a dump. However, you can request a dump via the dump table in the usual way.

User response: This indicates an error in VSAM RLS. You may wish to take a dump of the SMSVSAM server. See the appropriate DFSMS/MVS manual for further guidance.

Module: DFHFRCRS

XMEOUT Parameters: *date, time, applid, {1=deadlock, 2=timeout, 3=locked}*

Destination: CSFL

DFHFC0174 *date time applid tranid trannum termid userid* **A deadlock has occurred as a result of a lock promote failure. There are *nnn* transactions or Transactional VSAM units of recovery holding this lock.**

Explanation: This message and the following DFHFC0165 or DFHFC0175 messages are issued to assist in problem determination when transactions abend with the AFCW abend code or receive RECORDBUSY response as NOSUSPEND was specified.

An attempt made by transaction *tranid* with transaction number *trannum* to update a file which is open in VSAM RLS mode has failed because VSAM has detected a deadlock while attempting to promote a shared lock to become an exclusive lock.

VSAM RLS returns problem determination information to CICS to assist with debugging the deadlock. However, this type of deadlock looks to VSAM like a timeout and thus the information returned to CICS looks like the information returned after a timeout. Hence this message is followed by one or more DFHFC0165 or DFHFC0175 messages instead of the DFHFC0167 messages which follow other types of deadlocks.

When the deadlock occurred there were *nnn* other transactions or Transactional VSAM units of recovery holding the required lock.

System action: The transaction receives an AFCW abend or RECORDBUSY response.

CICS displays message DFHFC0174 to identify the failing transaction and the number of owners of the lock. CICS also issues message DFHFC0165 or DFHFC0175 once for each lock owner. CICS issues message DFHFC0168 instead of DFHFC0165 or DFHFC0175 in the unlikely event that VSAM RLS is unable to identify the lock owner.

User response: The following DFHFC0165 or DFHFC0175 messages identify the transactions that are holding the required lock and the CICS systems that they are running in, or the units of recovery which are holding the locks and the Transactional VSAM instances they are running in, respectively. Examine these transactions or units of recovery to determine why they

are not releasing VSAM RLS locks. Examine other RLS resources they acquire to determine whether this could cause a deadlock with the failing transaction.

Module: DFHFRCRS

XMEOUT Parameters: *date, time, applid, tranid, trannum, termid, userid, nnn*

Destination: CSFL

DFHFC0175 *date time applid tranid trannum termid userid. Transactional VSAM unit of recovery X'urid' running in job jobname on Transactional VSAM instance TVSInstance in MVS mvsid holds {add to end lock | internal lock | exclusive lock on key | shared lock on key }X'keyid' in data set dsname causing {true | false} contention.*

Explanation: This message and the preceding message DFHFC0164 or DFHFC0174 are issued to assist in problem determination when transactions abend with the AFCV or AFCW abend codes, or when applications receive the RECORDBUSY condition.

Normally this message appears after VSAM returns a timeout response to CICS. However, it may also appear after VSAM returns a deadlock response to CICS when that deadlock arises as a result of a failure to promote a lock. When this message is associated with a timeout response from VSAM, it is preceded by message DFHFC0164. When this message is associated with a deadlock response from VSAM it is associated with message DFHFC0174.

There is one occurrence of message DFHFC0175 for each unit of recovery currently owning the required lock.

The name of the transaction that has failed is *tranid* and it has task number *trannum*.

The message inserts that identify the owner of the lock which caused this transaction to time out are as follows

- *urid* is the unit of recovery id running in the Transactional VSAM instance which owns the lock.
- *jobname* is the job name of the CICS system that owns the lock.
- *TVSInstance* is the name of the Transactional VSAM instance whose job name was given by the previous insert.
- *mvsid* is the name of the MVS in which this Transactional VSAM instance is running.
- *dsname* is the name of the data set against which the lock is held.
- *keyid* identifies the key which is locked. As it is not always possible to display keys in character form, the key is displayed in hexadecimal notation. If the message indicates that the transaction is waiting for an add to end lock or an internal lock, no key information is displayed.

The message identifies whether the lock is held as an exclusive lock or a shared lock

- A lock is exclusive if it can only have one holder. For example, exclusive locks are used to protect update operations.
- A lock is shared if it can have many holders. Shared locks are used to protect repeatable and consistent read operations.

A lock causes true contention if the request was for a lock against the locked key. A lock causes false contention if the request was for a lock against a different key but the lock requests clashed because of the RLS key hashing algorithm which is used when the key length exceeds 16 characters.

System action: This message is preceded by DFHFC0164 or DFHFC0174. See the description of DFHFC0164 or DFHFC0174 for a description of the system action associated with this message.

User response: This message is preceded by DFHFC0164 or DFHFC0174. See the description of DFHFC0164 or DFHFC0174 for a description of the user actions associated with this message.

Module: DFHFCRS

XMEOUT Parameters: *date, time, applid, tranid, trannum, termid, userid, X'urid', jobname, TVSInstance, mvssid, {1=add to end lock , 2=internal lock , 3=exclusive lock on key , 4=shared lock on key }, X'keyid', dsname, {1=true, 2=false}*

Destination: CSFL

DFHFC0177 *date time applid tranid termid userid.*
Transactional VSAM unit of recovery id X'urid' running in jobname/TVSInstance in MVS mvssid holds {add to end lock | internal lock | exclusive lock on key | shared lock on key } X'key1' on data set dsname1 and is waiting for {add to end lock | internal lock | exclusive lock on key | shared lock on key } X'key2' on data set dsname2.

Explanation: This message and the preceding DFHFC0166 message are issued to assist in problem determination when transactions abend with AFCW abend codes.

The preceding message DFHFC0166 reports that a deadlock has been detected and includes how many units of recovery exist in the deadlock chain.

Message DFHFC0177 is issued once for each unit of recovery in the deadlock chain and includes the resource that unit of recovery holds and which resource it is waiting for.

The message inserts are as follows

- *urid* is the unit of recovery ID which owns a lock and is waiting for another lock.

- *jobname/TVSInstance* is the job name and TVS instance in which this unit of recovery is running.
- *dsname1* is the name of the data set against which this unit of recovery holds a lock.
- *key1* identifies the key which is locked. As it is not always possible to display keys in character form, the key is displayed in hexadecimal notation. If the message indicates that an add to end lock or an internal lock is held then no key information is displayed.
- *dsname2* is the name of the data set against which this unit of recovery is attempting to acquire a lock.
- *key2* identifies the key which this unit of recovery is attempting to lock. If the message indicates that the unit of recovery is attempting to obtain an add to end lock or an internal lock then no key information is displayed.

The message identifies whether the lock is held as an exclusive lock or a shared lock and whether the unit of recovery is attempting to acquire an exclusive or shared lock.

- A lock is exclusive if it can only have one holder. For example, exclusive locks are used to protect update operations.
- A lock is shared if it can have many holders. Shared locks are used to protect repeatable and consistent read operations.

System action: The application request which encountered the error receives an AFCW abend.

User response: See the description of message DFHFC0166.

Module: DFHFCRS

XMEOUT Parameters: *date, time, applid, tranid, termid, userid, X'urid', jobname/TVSInstance, mvssid, {1=add to end lock , 2=internal lock , 3=exclusive lock on key , 4=shared lock on key }, X'key1', dsname1, {1=add to end lock , 2=internal lock , 3=exclusive lock on key , 4=shared lock on key }, X'key2', dsname2*

Destination: CSFL

DFHFC0179 *date time applid termid userid.*
Transaction tranid with transaction number trannum encountered an RLS retained lock held on data set dsname by unit of recovery X'urid' within Transactional VSAM instance TVSInstance.

Explanation: An attempt was made to update a record which is currently held locked by a retained RLS lock.

Message inserts are as follows

- *TVSInstance* is the number of the Transactional VSAM instance which owns the lock.
- *urid* is the identifier of the unit of recovery that owns the lock.

DFHFC0200 • DFHFC0205

- *dsname* is the name of the data set against which the lock is held.

This message is issued to aid in problem diagnosis. It identifies the owner of the lock that is causing a request to fail with a 'LOCKED' response.

System action: The application request which encountered the error receives a 'LOCKED' response.

User response: If repeated LOCKED responses are causing a problem, note the name of the Transactional VSAM instance and the identifier of the unit of recovery and attempt to find out why the unit of recovery is holding a retained lock. The Transactional VSAM unit of recovery may have failed or suffered backout failure. If the Transactional VSAM application has failed the lock will normally be released if the application is rerun. If the Transactional VSAM application has suffered backout failure you will need to use Transactional VSAM procedures to perform backout failure retry in order to release the lock.

Module: DFHFCRS

XMEOUT Parameters: *date, time, applid, termid, userid, tranid, trannum, dsname, X'urid', TVSInstance*

Destination: CSFL

DFHFC0200 *date time applid {RLS | Non-RLS} file filename has been allocated to data set dataset. Module module.*

Explanation: This message provides a record of the dynamic allocation of the file *filename* to the data set *dataset*.

System action: Processing continues.

User response: None.

Module: DFHFCN, DFHFCRO

XMEOUT Parameters: *date, time, applid, {1=RLS, 2=Non-RLS}, filename, dataset, module*

Destination: CSFL

DFHFC0201 *date time applid {RLS | Non-RLS} file filename has been deallocated. Module module.*

Explanation: This message provides a record of the dynamic deallocation of the file *filename*.

System action: Processing continues.

User response: None.

Module: DFHFCN, DFHFCRO

XMEOUT Parameters: *date, time, applid, {1=RLS, 2=Non-RLS}, filename, module*

Destination: CSFL

DFHFC0202 *date time applid terminal userid tranid FCT entry for filename has been added.*

Explanation: This message provides the system with a record of the dynamic addition of FCT entry, *filename*.

System action: Processing continues.

User response: None.

Module: DFHFCMT.

XMEOUT Parameters: *date, time, applid, terminal, userid, tranid, filename*

Destination: CSFL

DFHFC0203 *date time applid terminal userid tranid FCT entry for filename has been deleted.*

Explanation: This message provides a record of the dynamic deletion of FCT entry *filename*.

This occurs when a file, which already exists in the system, is being installed using RDO. It should be followed by message DFHFC0202 indicating that the new file definition has been added.

System action: Processing continues.

User response: None.

Module: DFHFCMT.

XMEOUT Parameters: *date, time, applid, terminal, userid, tranid, filename*

Destination: CSFL

DFHFC0204 *date time applid terminal userid tranid FCT entry for filename has been updated.*

Explanation: This message provides a record of updates to an FCT entry other than OPEN, CLOSE, ENABLE and DISABLE.

An FCT entry is updated by an EXEC CICS SET FILE command or by a CEMT SET FILE command.

System action: Processing continues.

User response: None.

Module: DFHFCMT.

XMEOUT Parameters: *date, time, applid, terminal, userid, tranid, filename*

Destination: CSFL

DFHFC0205 *date time applid terminal userid tranid SHRCTL block for LSR pool lsrpool has been updated.*

Explanation: This message provides a record of the updates to a SHRCTL block.

A SHRCTL block exists for VSAM LSR pools 1–8 and is updated by an RDO install of an LSRPOOL object.

System action: Processing continues.

User response: None.

Module: DFHFCRL.

XMEOUT Parameters: *date, time, applid, terminal, userid, tranid, lsrpool*

Destination: CSFL

DFHFC0206 *date time applid terminal userid tranid*
AFCT entry for filename has been added.

Explanation: This message provides the system with a record of the dynamic addition of a remote file *filename*.

System action: Processing continues.

User response: None.

Module: DFHAFMT.

XMEOUT Parameters: *date, time, applid, terminal, userid, tranid, filename*

Destination: CSFL

DFHFC0207 *date time applid terminal userid tranid*
AFCT entry for filename has been deleted.

Explanation: This message provides a record of the dynamic deletion of a remote file *filename*.

This occurs when a remote file, which already exists in the system, is being deleted using RDO.

System action: Processing continues.

User response: None.

Module: DFHAFMT.

XMEOUT Parameters: *date, time, applid, terminal, userid, tranid, filename*

Destination: CSFL

DFHFC02081 *applid* LSR pool *n* is being built dynamically by CICS because all of the necessary parameters have not been supplied. Either there is no LSRPOOL definition or it is incomplete. The following are not defined: 'CISIZE' 'STRINGS' 'MAXKEYLENGTH'. A delay is possible.

Explanation: If one or more of the parameters, CI size, strings and maxkeylength are not defined for a LSR pool, either because there is no LSRPOOL definition or it is incomplete, then CICS will calculate the size by using information from the VSAM Catalog for

data sets allocated to this LSR pool.

System action: CICS will issue SHOWCATS to obtain the information necessary to calculate the LSR pool size. If any data sets have been migrated the SHOWCAT could take longer than expected.

User response: If there are severe delays due to SHOWCAT processing, you will have to wait for migrated data sets to be recalled, and for the calculation of the LSR pool size to complete. If you wish to avoid similar problems in the future, consider defining the LSR pool explicitly. The missing parameters are contained in this message.

Normally, you will not experience delays, in which case no user action is required.

You can suppress this message with the system initialization parameter, MSGLVL=0.

Module: DFHFCL

XMEOUT Parameters: *applid, n, 'CISIZE', 'STRINGS', 'MAXKEYLENGTH'*

Destination: Console

DFHFC0300 *applid (tranid termid)* purge deferred due to incomplete I/O operation on VSAM file '*filename*'.

Explanation: An attempt has been made to purge a transaction using FORCE. Transaction *tranid* is currently waiting for completion of an I/O operation on the VSAM file *filename*. *termid* identifies the terminal running this transaction. The data set name appears in message DFHFC0305 which follows this message.

System action: The transaction waits until the I/O operation is completed before the purge is allowed to take effect. This is done to avoid a risk to data integrity. After the I/O completes the transaction is terminated with transaction abend code AFCY.

User response: If the transaction does not terminate within a few seconds, it may be that the I/O wait is genuine (for example, another CEC has reserved the DASD volume). If this is the case, wait until the I/O situation is relieved before trying again.

Alternatively, there may be a system problem that warrants terminating CICS and using emergency restart to guarantee data integrity. If this is the case, terminate CICS and perform an emergency restart.

Module: DFHFCVR

XMEOUT Parameters: *applid, tranid, termid, filename*

Destination: Console

DFHFC0301 *applid (tranid termid) purge deferred due to incomplete I/O operation on BDAM file 'filename'.*

Explanation: An attempt has been made to purge a transaction using FORCE. Transaction *tranid* is currently waiting for completion of an I/O operation on the BDAM file *filename*. *termid* identifies the terminal running this transaction. The data set name appears in message DFHFC0305 which follows this message.

System action: The transaction waits until the I/O operation is completed before the purge is allowed to take effect. This is done to avoid a risk to data integrity. After the I/O operation is completed, the transaction is terminated with transaction abend code AFCY.

User response: If the transaction does not terminate within a few seconds, the I/O wait might be genuine (for example, another CEC has reserved the DASD volume). If this is the case, wait until the I/O situation is relieved before trying again.

Alternatively, there may be a system problem that warrants terminating CICS and using emergency restart to guarantee data integrity. If this is the case, terminate CICS and perform an emergency restart.

Module: DFHFCBD

XMEOUT Parameters: *applid, tranid, termid, filename*

Destination: Console

DFHFC0302 *applid (tranid termid) CICS terminating. Failure while waiting for I/O operation on VSAM file 'filename'.*

Explanation: A DISASTER type error occurred when the transaction *tranid* was waiting for the completion of an I/O operation on the VSAM file whose file name and data set name appear in message DFHFC0305 which follows this message. *termid* identifies the terminal running this transaction.

System action: CICS is terminated with a system dump (dump code FC0302).

User response: This problem was caused by an earlier error. Look for earlier messages and return codes (for example, from the dispatcher domain) and associated trace entries and dumps.

If the problem cannot be traced to an application error, you will require further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCVR

XMEOUT Parameters: *applid, tranid, termid, filename*

Destination: Console

DFHFC0303 *applid (tranid termid) CICS terminating. Failure while waiting for I/O operation on BDAM file 'filename'.*

Explanation: A DISASTER type error occurred when transaction *tranid* was waiting for the completion of an I/O operation on BDAM file *filename*.

termid identifies the terminal running this transaction.

System action: CICS is terminated with a system dump (dump code FC0303).

User response: This problem was caused by an earlier error. Look for earlier messages and return codes (for example, from the dispatcher domain) and associated trace entries and dumps.

If the problem cannot be traced to an application error, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCBD

XMEOUT Parameters: *applid, tranid, termid, filename*

Destination: Console

DFHFC0304 *applid Dump taken in module_name due to a file control OPEN/CLOSE error.*

Explanation: This message is issued after DFHFCFS has made an OPEN or CLOSE request which has completed with an error. The specific error is identified by another message. In most cases the other message appears before this message, but if the error occurs during the building of a shared resources pool, the other message appears after this message.

The failure is identified as one of the following

- An invalid request (not OPEN or CLOSE) has been sent
- There has been a subtask failure
- There has been a system failure other than "DSNAME NOT FOUND" or "VSAM CATALOG DOMAIN NOT FOUND".
- There has been a failure during shared resources pool building.

System action: A trace entry is made and a dump is taken with dumpcode FC0304.

User response: Locate the fault by examining the trace entry and the dump.

Module: DFHFCL, DFHFCLM, DFHFCLN

XMEOUT Parameters: *applid, module_name*

Destination: Console

DFHFC0305 *applid Message msgno file 'filename' dsname 'dataset'.*

Explanation: This message follows message DFHFC0300, DFHFC0302, DFHFC0307, DFHFC0308 or DFHFC0309. It identifies the VSAM data set name referred to in those messages.

If this message follows DFHFC0300 or DFHFC0302, it is issued from DFHFCVR.

If this message follows DFHFC0308 or DFHFC0309, it is issued from DFHFCRV.

If this message follows DFHFC0307, it is issued from DFHFCVS.

System action: Processing continues in the way specified in the preceding message from the list above, whichever is applicable.

User response: Find the earlier message to which this information refers and follow the user response for that message.

Module: DFHFCVR, DFHFCVS, DFHFCRV

XMEOUT Parameters: *applid, msgno, filename, dataset*

Destination: Console

DFHFC0307 *applid I/O error on file 'filename', component code X'code'. File is temporarily disabled.*

Explanation: An I/O error was reported by VSAM after a request to update VSAM file *filename*.

The file has been specified with LSR so VSAM has not released the buffers it assigned to process the request. Therefore, CICS must take special action to release them.

The name of the data set associated with the file is in message DFHFC0305 which follows, although the error may have been encountered elsewhere. This is indicated by the value of the component code *X'code*. Its possible values and the corresponding error locations are as follows.

- X'00 or X'01—base cluster.
- X'02 or X'03—alternate index.
- X'04 or X'05—upgrade set.

System action: Activity against the file is stopped, and the file is closed and then reopened in order to release the VSAM output buffers. Until the close has completed successfully, the file appears 'UNENABLED' to new would-be users and they receive a 'NOTOPEN' response to requests to use the file. The application request which encountered the error receives an 'IOERR' response.

User response: The installation should follow its standard procedure for I/O errors. No special additional action is required to respond to this particular message although the data set name and component code may

help in identifying the problem.

Module: DFHFCVS

XMEOUT Parameters: *applid, filename, X'code'*

Destination: Console

DFHFC0308 *applid tranid termid Purge deferred due to incomplete I/O operation on VSAM RLS file filename*

Explanation: An attempt has been made to purge a transaction using FORCE. Transaction *tranid* is currently waiting for completion of an I/O operation on the VSAM RLS file *filename*. *termid* identifies the terminal running this transaction. The data set name is included in message DFHFC0305 which follows this message.

System action: The transaction waits until the I/O operation is completed before the purge is allowed to take effect. This is done to avoid a risk to data integrity. After the I/O operation is completed, the transaction is terminated with transaction abend code AFCY.

User response: If the transaction does not terminate within a few seconds, the I/O wait might be genuine (for example, another CEC has reserved the DASD volume). If this is the case, wait until the I/O situation is relieved before trying again.

Alternatively, there may be a system problem that warrants terminating CICS and using emergency restart to guarantee data integrity. If this is the case, terminate CICS and perform an emergency restart.

Module: DFHFCRV

XMEOUT Parameters: *applid, tranid, termid, filename*

Destination: Console

DFHFC0309 *applid tranid termid Failure while waiting for I/O operation on VSAM RLS file filename*

Explanation: A DISASTER type error occurred when the transaction *tranid* was waiting for the completion of an I/O operation on the VSAM RLS file *filename*

System action: CICS returns to VSAM who completes the wait for the I/O operation on CICS behalf. Since VSAM rather than CICS completes the wait for I/O to complete, there may be a significant degradation in CICS performance until the operation completes.

User response: This problem was caused by an earlier error. Look for earlier messages and return codes (for example, from the dispatcher domain) and associated trace entries and dumps.

If the problem cannot be traced to an application error, you will require further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCRV

XMEOUT Parameters: *applid, tranid, termid, filename*

Destination: Console

DFHFC0310 *applid tranid termid* **Purge deferred due to incomplete I/O operation on the RLS control ACB.**

Explanation: An attempt has been made to purge a transaction using FORCE. Transaction *tranid* is currently waiting for completion of an I/O operation on the VSAM RLS control ACB.

termid identifies the terminal running this transaction.

System action: The transaction waits until the I/O operation is completed before the purge is allowed to take effect. This is done to avoid a risk to data integrity. After the I/O operation is completed, the transaction is terminated with transaction abend code AFCY.

User response: If the transaction does not terminate within a few seconds, the VSAM wait might be genuine (for example, certain requests may take a fairly long time to complete). If this is the case, wait until the VSAM request has completed before trying again.

Alternatively, there may be a system problem that warrants terminating CICS and using emergency restart to guarantee data integrity. If this is the case, terminate CICS and perform an emergency restart.

Module: DFHFCCA

XMEOUT Parameters: *applid, tranid, termid*

Destination: Console

DFHFC0311 *applid tranid termid* **Failure waiting for I/O operation on the RLS control ACB.**

Explanation: A DISASTER type error occurred when the transaction *tranid* was waiting for the completion of an I/O operation on the VSAM RLS control ACB.

System action: CICS returns to VSAM and VSAM completes the wait for the I/O operation on CICS behalf. Since VSAM rather than CICS completes the wait for I/O to complete, there may be a significant degradation in CICS performance until the operation completes.

User response: This problem was caused by an earlier error. Look for earlier messages and return codes (for example, from the dispatcher domain) and associated trace entries and dumps.

If the problem cannot be traced to an application error, you will require further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCCA

XMEOUT Parameters: *applid, tranid, termid*

Destination: Console

DFHFC0312 *applid* **Message** *msgno data set dsname*

Explanation: This message follows message DFHFC0152 or DFHFC0160. It identifies the VSAM data set name referred to in those messages.

System action: Processing continues as specified in either DFHFC0152, or DFHFC0160.

User response: Find the earlier message to which this information refers and follow the user response for that message.

Module: DFHFCCA

XMEOUT Parameters: *applid, msgno, dsname*

Destination: Console

DFHFC0313I *applid* **VSAM has returned an error with an RPL feedback - return code : X'rc' component code : X'cc' error code : X'ec' for file : filename and dsname : dataset** **The data set may be out of synch with its Alternate Indices.**

Explanation: VSAM has returned an error for VSAM file *filename*.

An ILLOGIC response is returned to the application.

This is indicated by the value of the component code X'cc'. Its possible values and the corresponding error locations are as follows

- X'00 or X'01—base cluster.
- X'02 or X'03—alternate index.
- X'04 or X'05—upgrade set.

System action: An ILLOGIC response is returned to the application.

User response: You may need to delete, redefine and re-build your alternate indices based on this file.

Module: DFHFCCVS

XMEOUT Parameters: *applid, X'rc', X'cc', X'ec', filename, dataset*

Destination: Console

DFHFC0314I *applid* **VSAM has insufficient LSR buffers to fully backout the failed request.**

Explanation: VSAM has returned an error for VSAM file mentioned in DFHFC0313 and an error code of X'98'.

An ILLOGIC response is returned to the application.

The error code indicates that VSAM has insufficient LSR buffers to backout the failed request fully.

System action: An ILLOGIC response is returned to the application.

User response: Increase the allocation of LSR

buffers. You may also need to delete, redefine and re-build your alternate indices based on this file.

Module: DFHFCVS

XMEOUT Parameter: *applid*

Destination: Console

DFHFC0400 *applid* **This CICS system is not authorized to provide shared access to data tables - reason code X'code'.**

Explanation: CICS is about to open a data table but has been unable to make provision for sharing the table with other CICS systems because a security check for update access to the resource name DFHAPPL.*applid* has failed. The value of the reason code, X'code, provides further information on the reason for the failure of the security check. It has the format X'ffrraaaa where *ff* identifies the authorization check which failed, *rr* gives the register 15 return code from SAF, and *aaaa* is the SAFPRRET value.

The values of X'*ff* are

X'01 Access was refused by an AUTH security check.

X'02 Access was refused by a FASTAUTH security check.

System action: CICS continues normally but no other CICS systems are able to share any data tables it creates until authority is granted and a table is subsequently opened.

User response: Ensure that CICS has the necessary authorization to provide shared access to data tables. Refer to the description of either the AUTH or FASTAUTH macro in the RACF documentation for explanations of the values that were reported in the reason code, X'code, and to determine the changes to the security definitions or setup that are required to allow the CICS system to act as a shared data table server (assuming that this is desired).

Module: DFHFCFS

XMEOUT Parameters: *applid*, X'code'

Destination: Console

DFHFC0401 *applid* **This CICS system is now authorized to provide shared access to data tables.**

Explanation: CICS is about to open a data table. On a previous occasion message DFHFC0400 was issued because authorization checks failed preventing this CICS system from making provision for sharing its data tables with any other CICS system. The check has been retried successfully.

System action: CICS continues normally. Subject to specific authorization checks, other CICS systems are

now able to share this system's data tables.

User response: None.

Module: DFHFCFS

XMEOUT Parameter: *applid*

Destination: Console

DFHFC0402 *applid* **CICS cannot provide shared access to data tables because CICS is not defined as an MVS subsystem.**

Explanation: CICS is about to open a data table but has been unable to make provision for sharing the table with other CICS systems because CICS has not been defined as an MVS subsystem.

System action: CICS continues normally but no other CICS systems are able to share any data tables it creates.

User response: CICS must be defined as an MVS subsystem in order to permit the sharing of data tables between CICS systems.

See the *CICS Shared Data Tables Guide* for more guidance.

Module: DFHFCFS

XMEOUT Parameter: *applid*

Destination: Console

DFHFC0403 *applid* **CICS cannot provide shared access to remote data tables because CICS is not defined as an MVS subsystem.**

Explanation: CICS is about to access a remote file resource. However, shared data tables cannot be used to access any remote tables because CICS has not been defined as an MVS subsystem.

If this message is issued on a CICS system at release 3.2.1, it means that the shared data tables module DFHDTINS is installed in the LPA or in the load library used by this CICS system, and has therefore been loaded by mistake.

System action: CICS continues normally and function ships this and subsequent remote file requests.

User response: CICS must be defined as an MVS subsystem in order to permit the sharing of data tables between CICS systems.

If the message was issued by a CICS/ESA 3.2.1 system, check where the DFHDTINS module is located. If DFHDTINS is in the load library specified by this CICS, it should be removed: shared data tables support cannot be installed on a CICS system at a lower level than 3.3. If it is in the link pack area (LPA) of this MVS system, it should be removed: the DFHDTINS module should not be placed in the LPA of an MVS system

DFHFC0405 • DFHFC0408

which contains any CICS regions at release 3.2.1 which might want to use data tables, unless a PTF has been applied to the CICS 3.2.1 regions.

Module: DFHFCFS

XMEOUT Parameter: *applid*

Destination: Console

DFHFC0405 *applid* **This CICS system cannot provide shared access to data tables because an earlier job step has used MVS cross-memory services.**

Explanation: CICS is prevented from using shared data tables because of the use of MVS cross-memory services by an earlier job step. CICS has attempted to create an entry table during LOGON as a shared data table server, but this has resulted in an MVS 052 ABEND because a prior jobstep owned space-switching entry tables. (MVS does not allow subsequent job steps to establish a cross-memory environment.)

System action: CICS continues normally but other CICS systems are unable to gain shared access to any data tables that this CICS system creates.

User response: In order to use the shared access to data tables feature, review the sequence of job steps in the job which includes this CICS system.

See the *CICS Shared Data Tables Guide* and also the explanation of system abend code 052, reason code 0314 in *MVS System Codes* for more guidance.

Module: DFHFCFS

XMEOUT Parameter: *applid*

Destination: Console

DFHFC0406 *applid* **This CICS system is not authorized for shared access to any data tables owned by the CICS system with applid *applid2* - reason code *X'code'*.**

Explanation: A file request for a remote file resource is about to be passed to a CICS system with the specified *applid*. The remote system has registered as a shared data table server, but this system cannot access any of its tables because a security check for read access to the resource name DFHAPPL.*applid2* has failed, where *applid2* is the *applid* of the data table owning CICS system. The value of the reason code, *X'code'*, provides further information on the reason for the failure of the bind security check. It has the format *X'ffrraaaa* where *ff* identifies the authorization check which failed, *rr* gives the register 15 return code from SAF, and *aaaa* is the SAFPRRET value.

The values of *X'ff* are

X'01 Access was refused by an AUTH security check.

X'02 Access was refused by a FASTAUTH security check.

System action: CICS continues normally and function ships this and subsequent requests directed to the specified remote system until authority is granted. Access is retried after about 10 minutes.

User response: If it was intended that this CICS system should be able to access data tables owned by the system *applid2*, refer to the description of either the AUTH or FASTAUTH macro in the RACF documentation for explanations of the values that were reported in the reason code, *X'code'*, and to determine what changes to the security definitions or setup are required.

Module: DFHFCFS

XMEOUT Parameters: *applid, applid2, X'code'*

Destination: Console

DFHFC0407 *applid* **This CICS system is now authorized for shared access to data tables owned by the CICS system with applid *applid2*.**

Explanation: The security check which failed earlier and was reported in message DFHFC0406, has now succeeded. This system can now attempt to access shared data tables owned by the CICS system with *applid applid2*.

System action: CICS continues normally. Subject to specific resource authorization checks, shared data tables owned by the remote CICS system can now be accessed by this system.

User response: None.

Module: DFHFCFS

XMEOUT Parameters: *applid, applid2*

Destination: Console

DFHFC0408 *applid* **This CICS system is not authorized for shared access to remote file *filename* - reason code *X'code'*.**

Explanation: A file request to the specified remote file resource has just been processed. The file owning region contains shared data tables. An attempt was made to connect to any data table associated with the file but the connecting region failed the security check for shared access to the file resource. However, function shipped access was not similarly prevented.

This message can be issued whether or not the remote file has an associated data table. This is because it is not possible to determine whether a table exists until cross-memory linkage has been established to the file owning region, and this is only done after a connection attempt has passed all security checks. Once cross-memory linkage has been set up, any further connection attempts can first check whether a table

exists. The shared access security check is then only needed when a data table is known to be available.

The value of the reason code, *X'code*, provides further information on the reason for the failure of the file security check. It has the format *X'ffraaaa*; where *ff* identifies the userid that was refused access, *rr* gives the register 15 return code from SAF, and *aaaa* is the SAFPRRET value.

The values of *X'ff* are

- X'01** The requesting system's own userid was refused read access to the remote file *filename*.
- X'02** The default userid of the CICS system which owns the remote file *filename* was used in the security check for read access to the file, and access was refused.

System action: CICS continues normally and function ships this and subsequent requests directed to the specified remote file until authority to use shared access is granted. Access is retried after about 10 minutes.

User response: Check whether shared access from this system to the specified file is intended. If it is, use the additional information provided in the reason code to determine what changes to the security definitions or set-up are required.

See the *CICS Shared Data Tables Guide* for an explanation of the rules determining which userid is used for a file security check.

Module: DFHEIFC

XMEOUT Parameters: *applid, filename, X'code'*

Destination: Console

DFHFC0409 *applid* **This CICS system is now authorized for shared access to remote file *filename*.**

Explanation: The security check which failed earlier, and was reported in message DFHFC0408, has now succeeded. This system can now use shared access to the specified table.

System action: CICS continues normally.

User response: None.

Module: DFHFCFS

XMEOUT Parameters: *applid, filename*

Destination: Console

DFHFC0410 *applid* **Data table cannot be opened. Data table initialization has failed for reason *X'code'*.**

Explanation: CICS is about to open a data table but has been unable to initialize shared data table services. The value of the reason code, *X'code*, provides further

information about why CICS was unable to initialize shared data table services.

The format of the reason code is either *X'ffaaaaaa*, in which *ff* is a value less than X'80 that identifies the type of failure, and *aaaaaa* is additional information provided for some of the failures, or when an abnormal termination (abend) has occurred, *X'axxxrrrr* in which *a* is a value greater than or equal to X'8 that categorizes the type of abend, *rrrr* contains any register 15 abend reason code, and *xxx* contains the system or user completion code as three hexadecimal digits.

When *X'code* < X'80000000, the values of *X'ff* are

- X'01** An unexpected failure occurred. This code is reported when the data tables SVC detects an unexpected error.
- X'04** An error was returned by the MVS RESMGR macro, called to establish an MVS resource manager for end-of-task processing. The first byte of the additional information, *X'aa0000* contains the low order byte of the register 15 return code from the MVS RESMGR macro.
- X'06** An error was returned by the CICS SVC. The first byte of the additional information, *X'aa0000* is the register 15 return code from the attempt to call the CICS SVC.
- X'08** An error was returned by the MVS DSPSERV macro. The additional information in the reason code consists of 1 byte containing the register 15 return code followed by 2 bytes containing the middle bytes from the register 0 reason code returned by DSPSERV.
- X'09** An error was returned by the MVS ALESERV macro, called to create an access list entry either for the data space or for references to the primary address space. The additional information in the reason code consists of one byte containing the register 15 return code followed by two bytes containing the ALESERV function code (service type) and qualifier (options) which identify the failing request.
- X'0E** An attempt to serialize the use of shared data table services (thus ensuring that only one TCB per address space can use the services) has failed. The first byte of additional information contains the ENQ return code.

When *X'code* ≥ X'80000000, the values of *X'a* are formed from combinations of

- X'8** An abend was detected.
- X'4** A user abend was detected, in which case *xxx* contains the hexadecimal equivalent of the user completion code (otherwise, *xxx* contains the hexadecimal system completion code).

DFHFC0411

- X'2** An abend was detected but could not be analyzed fully because no SDWA was available.
- X'1** An asynchronous abend was detected (otherwise, the abend was synchronous or could not be classified because there was no SDWA).

System action: CICS continues normally. This message is followed either by message DFHFC0931 or by DFHFC0932. The following message indicates the action taken for the table involved. A system dump is taken for unexpected errors (X'ff=X'01) and for abends (if dumps are requested for that abend code).

User response: The response depends on the reason for the failure as indicated in the first byte of the reason code

- X'01** Use the system dump to help you determine the cause of the problem.
- X'04** Refer to the documentation of the MVS RESMGR macro to interpret the low-order byte of the register 15 return code reported in the reason code.
- X'06** The most likely reason for a failure of the CICS SVC call is that the data tables SVC module DFHDT SVC could not be loaded, in which case the return code value is X'02. If this is the case, check that the DFHDT SVC module is in the LPA or in an authorized library in the link list of the MVS system. If the module is in the correct location, investigate why it could not be loaded. There might be a hardware fault on the disk. Another less likely value for the return code is X'06, which implies that DFHDT SVC has been relink-edited and not marked reentrant.
- X'08** Refer to the documentation of the MVS DSPSERV macro to interpret the register 0 and register 15 return codes reported in the additional information part of the reason code.
- X'09** The function code (service type) and qualifier (options) reported in the reason code can be used to determine which ALESERV request was being attempted. Refer to the MVS ALESERV documentation and macro to interpret the function code, qualifier, and register 15 return code reported in the reason code.
- X'0E** This might indicate that the limit on the number of ENQs per address space has been reached, or that another TCB running in this CICS address space has already initialized as a requester of shared data table services.
- ≥X'80** When the reason code indicates that an abend has been detected, use the additional information provided in the reason code to find

out what the abend was, and refer to information on that abend code to determine the cause.

Module: DFHFCFS

XMEOUT Parameters: *applid, X'code'*

Destination: Console

DFHFC0411 *applid* **Data table cannot be opened. Data table initialization has failed owing to a storage failure - reason code X'code'.**

Explanation: CICS is about to open a data table but has been unable to initialize shared data table services because of a failure to obtain storage. The value of the reason code, *X'code*, provides further information about the type of storage which could not be obtained.

The format of the reason code is *X'tnnnnnn* in which *tt* identifies the type of storage and, for some of the codes, *nnnnnn* gives the hexadecimal size in bytes of the storage which could not be obtained. For fixed-length storage blocks, the reason code does not usually report the size.

The values of *X'tt* are

- X'01** Private storage from MVS subpool 230 (key 0) for a work area used by the data tables SVC
- X'02** Private storage from MVS subpool 0 for the local header block used by a shared data table server
- X'03** Private storage from MVS subpool 0 for a pool for data table blocks
- X'04** Private storage from MVS subpool 0 for a pool for file blocks
- X'08** MVS/ESA data space storage
- X'09** Private storage from MVS subpool 230 (key 0) for a region anchor
- X'11** Private storage from MVS subpool 0 for a dummy recovery block
- X'12** Storage from MVS subpool 252 required to load the DFHDTAM load module
- X'13** Private storage from MVS subpool 230 (CICS key) for a parameter list used by the data tables SVC
- X'14** Private storage from MVS subpool 230 (key 0) for a new ALET list section

System action: CICS continues normally. This message is followed either by message DFHFC0931 or by DFHFC0932. The following message indicates the action taken for the table involved.

User response: The response depends on the type of storage indicated by the reason code. If it indicates private storage, you should reconsider the various

region size parameters which have been specified on the CICS job, or have been set as defaults for the system by IEALIMIT or the IEFUSI installation exit. It might be necessary to take an SDUMP of the CICS job and process it using the VERBEXIT VSMDATA in order to investigate the way in which MVS storage has been allocated to the various subpools.

If it indicates data space storage, check whether the size of data spaces in this MVS system has been limited by use of the IEFUSI installation exit.

Module: DFHFCFS

XMEOUT Parameters: *applid, X'code'*

Destination: Console

DFHFC0412 *applid* **Data table cannot be opened. Data table initialization has failed owing to a module loading failure - reason code X'code'.**

Explanation: CICS is about to open a data table but a module loading failure has prevented the initialization of shared data table services. The value of the reason code, X'code, provides further information about which module was being loaded, and what went wrong with the attempt to load it.

The format of the reason code is X'mfrraaaa in which *m* identifies the module and *f* is a code for the type of failure. For some failures, *rr* contains the register 15 return code from the failing macro call, and *aaaa* might contain additional information.

The value of X'*m* can be

X'1 DFHDTFOR
X'2 DFHDTAM
X'6 DFHMVRMS

The values of X'*f* are

X'1 module not found by a LOAD, BLDL or CSVQUERY macro call.
X'2 an error was returned by the MVS LOAD macro. The two bytes X'aaaa of additional information in the reason code contain the completion code from the LOAD. X'*rr* is the register 15 return code.
X'3 an error was returned by the MVS CSVQUERY macro. X'*rr* is the register 15 return code.
X'4 an error was returned by the MVS BLDL macro. The two bytes X'aaaa of additional information in the reason code contain the R0 reason code returned by BLDL.
X'5 the module is not reentrant.
X'6 the module had the wrong AMODE.
X'7 the module had the wrong RMODE.

There is an additional code of X'08000000 which is only seen on a CICS/ESA 3.2.1 system that has DFHDTINS installed in the LPA or in its load library, and has mistakenly loaded this module.

System action: CICS continues normally. This message is followed either by message DFHFC0931 or by DFHFC0932. The following message indicates the action taken for the table involved.

User response: The response depends on the reason for the failure as indicated in the second hex digit of the reason code

X'1 Use the first hex digit to determine which module could not be found, and ensure that it is in the correct library.
X'2 Refer to the documentation of the MVS LOAD macro to interpret the return and completion codes given in the reason code. There might also be a message from the MVS LOAD which explains the reason for the failure.
X'3 Refer to the documentation of the MVS CSVQUERY macro to interpret the return code given in the second byte of X'code.
X'4 This indicates an I/O error or a storage allocation failure. Refer to the documentation of the MVS BLDL macro to interpret the values in the reason code X'code.
X'5, X'6, X'7 Use the first digit of the reason code to determine the name of the module, then check the status of that module. These errors imply that it is either not the module which was supplied with CICS or that it has become corrupted.

If the reason code was X'08000000, the shared data tables module DFHDTINS has been incorrectly installed in a library which is used by this CICS/ESA 3.2.1 system. If DFHDTINS is in the load library specified by this CICS, it should be removed: shared data tables support cannot be installed on a CICS system at a lower level than 3.3. If it is in the link pack area (LPA) of this MVS system, it should be removed: the DFHDTINS module should not be placed in the LPA of an MVS system which contains any CICS regions at release 3.2.1 which might want to use data tables, unless a PTF has been applied to the CICS 3.2.1 regions

Module: DFHFCFS

XMEOUT Parameters: *applid, X'code'*

Destination: Console

DFHFC0415 *applid* **Remote data tables cannot be accessed. Shared data table initialization has failed for reason X'code'.**

DFHFC0416

Explanation: CICS is about to access a remote file resource which may have an associated shared data table. However, shared data tables cannot be used to access any remote tables because CICS has been unable to initialize data table services. Note that if CICS finds module DFHTDINS in the STEPLIB concatenation or in the LPA it will assume that shared data tables is required and will thus try to initialize it. The value of the reason code, *X'code*, provides further information about why this CICS region was unable to perform the initialization required to act as a requester of shared data table services.

The format of the reason code is either: *X'ffaaaaaa* in which *ff* is a value less than X'80 that identifies the type of failure, and *aaaaaa* is additional information provided for some of the failures; or, when an abnormal termination (ABEND) has occurred, *X'axxxrrrr* in which *a* is a value greater than or equal to X'8 that categorizes the type of abend, *rrrr* contains any register 15 abend reason code, and *xxx* contains the system or user completion code as three hexadecimal digits.

When *X'code* < X'80000000, the values of *X'ff* are

- X'01** An unexpected failure occurred. This code is reported when the data tables SVC detects an error which should never occur.
- X'06** An error was returned by the CICS SVC. The first byte of the additional information, *aa0000*, is the register 15 return code from the attempt to call the CICS SVC.
- X'0E** An attempt to serialize the use of shared data table services (thus ensuring that only one TCB per address space can use the services) has failed. The first byte of additional information contains the ENQ return code.

When *X'code* ≥ X'80000000, the values of *X'a* are formed from combinations of

- X'8** An abend was detected.
- X'4** A user abend was detected, in which case *xxx* contains the hexadecimal equivalent of the user completion code (otherwise, *xxx* contains the hexadecimal system completion code).
- X'2** An abend was detected but could not be analyzed fully because no SDWA was available.
- X'1** An asynchronous abend was detected (otherwise, the abend was synchronous or could not be classified because there was no SDWA).

System action: CICS continues normally and function ships this and subsequent remote file requests. Initialization is retried after about 10 minutes. A system dump is taken for unexpected errors (*X'ff* = X'01) and for abends (if dumps are requested for that abend code).

User response: The response depends on the reason

for the failure as indicated in the first byte of the reason code

- X'01** Use the system dump to help you determine the cause of the problem.
- X'06** The most likely reason for a failure of the CICS SVC call is that the data tables SVC module DFHDT SVC could not be loaded, in which case the return code value is X'02. If this is the case, check that the DFHDT SVC module is in the LPA or in an authorized library in the link list of the MVS system. If the module is in the correct location, then investigate why it could not be loaded; possibly there might be a hardware fault on the disk. Another less likely value for the return code is X'06, which implies that DFHDT SVC has been relink-edited and not marked reentrant.
- X'0E** This might indicate that the limit on the number of ENQs per address space has been reached, or that another TCB running in this CICS address space has already initialized as a requester of shared data table services.
- ≥X'80** When the reason code indicates that an abend has been detected, use the additional information provided in the reason code to find out what the abend was, and refer to information on that abend code to determine the cause.

Module: DFHFCFS

XMEOUT Parameters: *applid*, *X'code'*

Destination: Console

DFHFC0416 *applid* Remote data tables cannot be accessed. Shared data table initialization has failed owing to a storage failure - reason code *X'code'*.

Explanation: CICS is about to access a remote file resource. However, a failure to get storage has prevented CICS from initializing shared data table services. The value of the reason code, *X'code*, provides further information about the type of storage which could not be obtained

The format of the reason code is *X'tnnnnnn* in which *tt* identifies the type of storage and, for some of the codes, *nnnnnn* gives the hexadecimal size in bytes of the storage which could not be obtained. For storage blocks whose length is fixed, the reason code does not usually report the size.

The values of *X'tt* are

- X'01** Private storage from MVS subpool 253 (below the 16MB line) for a work area required by module DFHQSSS
- X'02** Private storage from MVS subpool 0 for the

shared data table header block required for this CICS to act as a data tables requester

- X'09** Private storage from MVS subpool 230 (key 0) for a region anchor
- X'0A** ECSA storage from subpool 241 (key 0) for a qualified subsystem block
- X'0B** ECSA storage from MVS subpool 241 (key 0) for a system anchor
- X'0E** Private storage from MVS subpool 230 (key 0) for a connect header block

System action: CICS continues normally and function ships this and subsequent remote file requests. Initialization is retried after about 10 minutes.

User response: The response depends on the type of storage indicated by the reason code.

If it indicates private storage, you should reconsider the various region size parameters which have been specified on the CICS job or have been set as defaults for the system by IEALIMIT or the IEFUSI installation exit. It might be necessary to take an SDUMP of the CICS job and process it using the VERBEXIT VSMDATA in order to investigate the way in which MVS storage has been allocated to the various subpools.

If it indicates ECSA (extended common service area) storage, you should review the CSA size specified in system parameter list IEASYSxx, or by use of the CSA override on initialization of the MVS system. You should also review the size of the ESQA, since the system might have started to use ECSA storage if the ESQA storage is depleted.

Module: DFHFCFS

XMEOUT Parameters: *applid, X'code'*

Destination: Console

DFHFC0417 *applid* Remote data tables cannot be accessed. Shared data table initialization has failed owing to a module loading failure - reason code *X'code'*.

Explanation: CICS is about to access a remote file resource. However, shared data tables cannot be used to access any remote tables because a module loading failure prevents CICS from initializing data table services.

The value of the reason code, *X'code'*, provides further information about which module was being loaded, and what went wrong with the attempt to load it.

The format of the reason code is *X'mfraaaa* in which *m* identifies the module and *f* is a code for the type of failure. For some failures, *rr* contains the register 15 return code from the failing macro call, and *aaaa* might contain additional information.

The value of *X'm* can be

- X'3** DFHDTAOR
- X'4** DFHDTCV

The values of *f* are

- X'1** module not found by LOAD
- X'2** an error was returned by the MVS LOAD macro. The two bytes *X'aaaa* of additional information in the reason code contain the completion code from the LOAD. *X'rr* contains the register 15 return code
- X'5** the module is not reentrant.
- X'6** the module had the wrong AMODE.

System action: CICS continues normally and function ships this and subsequent remote file requests. Initialization is retried after about 10 minutes.

User response: The response depends on the reason for the failure as indicated in the second hex digit of the reason code

- X'1** Use the first hex digit to determine which module could not be found, and ensure that it is in the correct library.
- X'2** Refer to the documentation of the MVS LOAD macro to interpret the return and completion codes reported in the reason code. There might also be a message from the MVS LOAD which explains the reason for the failure.

X'5, X'6

Use the first digit of the reason code to determine the name of the module, then check the status of that module. This error implies that it is either not the module which was supplied with CICS or that it has become corrupted.

Module: DFHFCFS

XMEOUT Parameters: *applid, X'code'*

Destination: Console

DFHFC0420 *applid* Shared access to data tables cannot be provided by this CICS system because it has not been registered as a shared data table server - reason code *X'code'*.

Explanation: CICS is about to open a data table but has been unable to do so because this CICS system has not been registered as a shared data table server. The value of the reason code, *X'code'*, provides further information about why this CICS system was unable to register (LOGON) as a shared data table server.

The format of the reason code is either: *X'ffaaaaaa* in which *ff* is a value less than X'80 that identifies the type of failure, and *aaaaaa* is additional information provided

DFHFC0420

for some of the failures; or, when an abnormal termination (ABEND) has occurred, *X'axxxxxr* in which *a* is a value greater than or equal to *X'8* that categorizes the type of ABEND, *rrrr* contains any register 15 ABEND reason code, and *xxx* contains the system or user completion code as three hexadecimal digits.

When *X'code* < *X'80000000*, the values of *X'ff* are

- X'01** This code is reported when the data tables SVC detects an unexpected error.
- X'02** Another region within the MVS image with the same APPLID as this region is already registered (logged on) as a shared data tables server.
- X'03** DFHDTRM has supplied the data tables SVC with an invalid address for the PC vector, or the PC vector specifies an invalid number of entry table entries (ETEs). In the latter case, *X'aaaaaa* contains the number of ETEs that were requested.
- X'04** A failure occurred when attempting to establish an MVS resource manager for end-of-memory processing. The first byte of the additional information, *X'aa0000* contains the low order byte of the register 15 return code from the MVS RESMGR macro.
- X'05** A failure occurred when attempting to make the server address space permanently non-swappable. The additional information, *X'aaaaaa*, contains the low order 3 bytes of the code posted in an ECB that was specified when the SYSEVENT TRANSWAP macro was issued.
- X'06** An error was returned by the CICS SVC. The first byte of the additional information, *X'aa0000* is the register 15 return code from the attempt to call the CICS SVC.
- X'0D** An error occurred when issuing an MVS ENQ to ensure that, at any given time, only one server per MVS system can be active for a given APPLID. The first byte of the additional information, *X'aa0000* contains the return code from ENQ.
- X'10** An attempt to create the environment for shared data tables connect security checks has found that the security environment has already been set up.
- X'11** There is a disparity between the actual version of the CICS security block and the version which was used to assemble the shared data tables module DFHDTSX.

When *X'code* ≥ *X'80000000*, the values of *X'a* are formed from combinations of

- X'8** An ABEND was detected.

- X'4** A user ABEND was detected, in which case *xxx* contains the hexadecimal equivalent of the user completion code (otherwise, *xxx* contains the hexadecimal system completion code).
- X'2** An ABEND was detected but could not be analyzed fully because no SDWA was available.
- X'1** An asynchronous ABEND was detected (otherwise, the abend was synchronous or could not be classified because there was no SDWA).

System action: CICS continues normally and attempts to open the table for local use only. A system dump is taken for unexpected errors (*X'ff* = *X'01*) and for ABENDs (if dumps are requested for that ABEND code).

User response: The response depends on the reason for the failure as indicated in the first byte of the reason code

- X'01** Use the system dump to help you determine the cause of the problem.
- X'02** There cannot be more than one region with a given APPLID acting as a shared data table server within the same MVS image.
- X'03** This error might indicate that some corruption of the system has occurred, or that there is an error in CICS code.
- X'04** Refer to the documentation of the MVS RESMGR macro to interpret the return code reported in the additional information part of the reason code.
- X'05** Refer to the documentation of the MVS SYSEVENT macro to interpret the ECB contents reported in the additional information part of the reason code.
- X'06** Server initialization should have been completed before LOGON is issued, so CICS SVC errors associated with the loading of the data tables SVC module DFHDTSVC should not be encountered. Therefore this error probably indicates a logic problem or corruption of your system.
- X'0D** Refer to the documentation of the MVS ENQ macro to interpret the return code reported in the additional information part of the reason code.
- X'10** This error might indicate that some corruption of the system has occurred, or that there is an error in CICS code.
- X'11** This error might indicate that service has been applied which requires PTFs to both base CICS and the shared data tables code, and only one has been correctly updated, or that some corruption of the system has occurred, or that there is an error in CICS.

≥X'80 When the reason code indicates that an ABEND has been detected, use the additional information provided in the reason code to find out what the ABEND was, and refer to information on that ABEND code to determine the cause.

Module: DFHFCFS

XMEOUT Parameters: *applid, X'code'*

Destination: Console

DFHFC0421 *applid* **Shared access to data tables cannot be provided by this CICS system because a storage failure has prevented it from registering as a shared data table server - reason code X'code'.**

Explanation: CICS is about to open a data table but cannot do so because a failure to acquire storage has prevented the register of this CICS system as a shared data table server. The value of the reason code, *X'code'*, provides further information about the type of storage which could not be obtained

The format of the reason code is *X'tnnnnnn* in which *tt* identifies the type of storage and, for some of the codes, *nnnnn* gives the hexadecimal size in bytes of the storage which could not be obtained. For storage blocks whose length is fixed, the reason code does not usually report the size.

The values of *X'tt* are

- X'01** private storage from MVS subpool 253 (below the 16MB line) for a work area for module DFHQSSS or from MVS subpool 230 (key 0) for a work area used by the data tables SVC LOGON processing
- X'0A** ECSA storage from MVS subpool 241 (key 0) for a qualified subsystem block
- X'0B** ECSA storage from MVS subpool 241 (key 0) for a system anchor
- X'0C** ECSA storage from MVS subpool 241 (key 0) for a server element
- X'0D** ECSA storage from MVS subpool 241 (key 0) for a security block

System action: CICS continues normally and attempts to open the table for local use only.

User response: The response depends on the type of storage indicated by the reason code.

If it indicates private storage then you should probably reconsider the various region size parameters which have been specified on the CICS job, or have been set as defaults for the system by IEALIMIT or the IEFUSI installation exit. It might be necessary to take an SDUMP of the CICS job and process it using the VERBEXIT VSMDATA in order to investigate the way in

which MVS storage has been allocated to the various subpools.

If it indicates ECSA (extended common service area) storage, you should review the CSA size specified in system parameter list IEASYSxx, or by use of the CSA override on initialization of the MVS system. You should also review the size of the ESQA, since the system might have started to use ECSA storage if the ESQA storage is depleted.

Module: DFHFCFS

XMEOUT Parameters: *applid, X'code'*

Destination: Console

DFHFC0422 *applid* **Shared access to data tables cannot be provided by this CICS system because a module loading failure has prevented it from registering as a shared data table server - reason code X'code'.**

Explanation: CICS is about to open a data table but cannot do so because a module loading failure has prevented the register of this CICS system as a shared data table server.

The value of the reason code, *X'code'*, provides further information about which module was being loaded, and what went wrong with the attempt to load it.

The format of the reason code is *X'mfrraaaa* in which *m* identifies the module and *f* is a code for the type of failure. For some failures, *rr* contains the register 15 return code from the failing macro call, and *aaaa* might contain additional information.

The value of *X'm* can be

X'5 DFHDTXS

The values of *X'f* are

- X'1** module not found by LOAD
- X'2** an error was returned by the MVS LOAD macro. The two bytes *X'aaaa* of additional information in the reason code contain the completion code from the LOAD. *X'rr* contains the register 15 return code.
- X'5** the module is not reentrant.
- X'6** the module had the wrong AMODE.

System action: CICS continues normally and attempts to open the table for local use only.

User response: The response depends on the reason for the failure as indicated in the second hex digit of the reason code

- X'1** Use the first hex digit to determine which module could not be found, and ensure that it is in the correct library.

X'2 Refer to the documentation of the MVS LOAD macro to interpret the return and completion codes given in the reason code. There might also be a message from the MVS LOAD which explains the reason for the failure.

X'5, X'6

Use the first digit of the reason code to determine the name of the module, then check the status of that module. This error implies that it is either not the module which was supplied with CICS or that it has become corrupted in some way.

Module: DFHFCFS

XMEOUT Parameters: *applid, X'code'*

Destination: Console

DFHFC0430 *applid* **Data table open request for file *filename* has failed for reason *X'code'*.**

Explanation: CICS has attempted to create a data table for file resource *filename* but has been unable to do so.

System action: CICS continues normally. This message is followed either by message DFHFC0931 or by DFHFC0932. The following message indicates the action taken for the specified table.

User response: This indicates an internal error or a corruption of your system. You may need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCFS

XMEOUT Parameters: *applid, filename, X'code'*

Destination: Console

DFHFC0431 *applid* **Data table open request for file *filename* has failed owing to a storage failure - reason code *X'code'*.**

Explanation: CICS has attempted to create a data table for file resource *filename* but has been unable to do so owing to a failure to get storage. There is insufficient storage above the 16MB line or within the appropriate data space and the value of the reason code, *X'code*, provides further information about the type of storage which could not be obtained.

The format of the reason code is *X'tnnnnnn* in which *tt* identifies the type of storage and, for some of the codes, *nnnnn* gives the hexadecimal size in bytes of the storage which could not be obtained. For storage blocks whose length is fixed, the reason code does not usually report the size.

The values of *X'tt* are

X'03 private storage from MVS subpool 0 for a data table block

X'04 private storage from MVS subpool 0 for a file block

X'05 data space storage from data space DFHDT001 for a pool of backout cells (the pool is created if the file being opened is the first recoverable user-maintained table to be opened in this CICS run)

X'06 data space storage from data space DFHDT001 for a pool of table entry descriptor blocks, or for a descriptor block to be used when loading the table

X'07 data space storage from data space DFHDT002 for data table index storage

X'08 data space storage from data space DFHDT003 upwards for a pool of data table records

System action: CICS continues normally. This message is followed either by message DFHFC0931 or by DFHFC0932. The following message indicates the action taken for the table involved.

User response: The response depends on the type of storage indicated by the reason code.

If it indicates private storage then you should probably reconsider the various region size parameters which have been specified on the CICS job, or have been set as defaults for the system by IEALIMIT or the IEFUSI installation exit. It might be necessary to take an SDUMP of the CICS job and process it using the VERBEXIT VSMDATA in order to investigate the way in which MVS storage has been allocated to the various subpools.

If it indicates data space storage then check whether the size of data spaces in this MVS system has been limited by use of the IEFUSI installation exit.

Module: DFHFCFS

XMEOUT Parameters: *applid, filename, X'code'*

Destination: Console

DFHFC0435 *applid* **Data table access request for remote file *filename* has failed for reason *X'code'*.**

Explanation: An error has occurred while the requesting region was attempting to establish a connection to the remote file *filename* owned by the serving region. The value of the reason code, *X'code*, provides further information about why CICS was unable to connect to the remote file.

The format of the reason code is either: *X'faaaaaa* in which *ff* is a value less than X'80 that identifies the type of failure, and *aaaaaa* is additional information provided for some of the failures; or, when an abnormal

termination (ABEND) has occurred, *X'axxxrrrr* in which *a* is a value greater than or equal to X'8 that categorizes the type of ABEND, *rrrr* contains any register 15 ABEND reason code, and *xxx* contains the system or user completion code as three hexadecimal digits.

When *X'code* < X'80000000, the values of *X'ff* are

- X'01** An unexpected failure occurred. This code is reported when the data tables SVC detects an error which should never occur.
- X'06** An error was returned by the CICS SVC. The first byte of the additional information, *aa0000*, is the register 15 return code from the attempt to call the CICS SVC.
- X'07** The connection index returned by the data tables SVC exceeds the maximum value supported by the calling module ($2^{20} - 1$).
- X'0A** The scan of the chain of files owned by the serving region has failed because there is a permanently invalid entry on the chain which indicates that the chain has become damaged.
- X'0B** The number of connections by this requesting CICS region to the remote file is already at the allowed maximum ($2^{32} - 1$).
- X'0C** The vector which records details of all connections to shared data tables by this requesting CICS region needs expanding, but this would cause it to equal or exceed a size of 16MB.
- X'0F** An attempt to serialize with termination of the server has failed because the number of ENQs has reached the address space limit. The first byte of the additional information, *X'aa0000*, contains the return code from the ENQ.

When *X'code* \geq X'80000000, the values of *X'a* are formed from combinations of

- X'8** An ABEND was detected.
- X'4** A user ABEND was detected, in which case *xxx* contains the hexadecimal equivalent of the user completion code (otherwise, *xxx* contains the hexadecimal system completion code).
- X'2** An ABEND was detected but could not be fully analyzed because no SDWA was available.
- X'1** An asynchronous ABEND was detected (otherwise, the abend was synchronous or could not be classified because there was no SDWA).

System action: CICS continues normally and function ships this and subsequent remote file requests. Use of shared tables is retried after about 10 minutes. A system dump is taken for unexpected errors (*X'ff*=X'01) and for ABENDs (if dumps are requested for that ABEND code).

User response: The response depends on the reason for the failure as indicated in the first byte of the reason code

- X'01** Use the system dump to help you determine the cause of the problem.
- X'06** Requester initialization should have been completed before CONNECT is issued, so CICS SVC errors associated with the loading of the data tables SVC module DFHDSVC should not be encountered. Therefore this error probably indicates a logic problem or corruption of your system.
- X'07** Some changes to your system configuration should be made, as this requesting region is trying to access too many shared data tables owned by other regions. It is necessary either to reduce the number of remote files being used, or to split the requesting CICS region into a number of smaller regions.
- X'0A** This indicates corruption of subpool 0 storage in the server region.
- X'0B** This indicates that either the requesting region contains more than $2^{32} - 1$ remote file definitions, all of which refer to the same file in the server region, or that storage has been corrupted.
- X'0C** Same response as X'07.
- X'0F** Refer to the documentation of the MVS ENQ macro to interpret the return code reported in the additional information part of the reason code.
- \geq X'80** When the reason code indicates that an ABEND has been detected, use the additional information provided in the reason code to find out what the ABEND was, and refer to information on that ABEND code to determine the cause.

Module: DFHFCFS

XMEOUT Parameters: *applid, filename, X'code'*

Destination: Console

DFHFC0436 *applid* Data table access request for remote file *filename* has failed because of a storage failure - reason code *X'code'*.

Explanation: CICS has attempted to access the remote file resource *filename* but cannot do so because of a failure to get storage.

The value of the reason code, *X'code*, provides further information about the type of storage which could not be obtained

The format of the reason code is *X'tnnnnnn* in which *tt* identifies the type of storage and, for some of the

DFHFC0440 • DFHFC0445

codes, *nnnnn* gives the hexadecimal size in bytes of the storage which could not be obtained. For storage blocks whose length is fixed, the reason code does not usually report the size.

The values of *X'tt* are

X'01 Private storage from MVS subpool 230 (key 0) for a work area used by module DFHDTXS or for a work area used by data tables SVC CONNECT processing.

X'0F Private storage from MVS subpool 230 (key 0) for a connect vector

System action: CICS continues normally and function ships this and subsequent remote file requests. Use of shared tables is retried after about 10 minutes.

User response: The response depends on the type of storage indicated by the reason code.

As it indicates private storage, you should probably reconsider the various region size parameters which have been specified on the CICS job, or have been set as defaults for the system by IEALIMIT or the IEFUSI installation exit. It might be necessary to take an SDUMP of the CICS job and process it using the VERBEXIT VSMDATA in order to investigate the way in which MVS storage has been allocated to the various subpools.

Module: DFHFCFS

XMEOUT Parameters: *applid, filename, X'code'*

Destination: Console

DFHFC0440 *applid* Data table close request for file *filename* has failed for reason *X'code'*.

Explanation: CICS has attempted to close a data table for file resource *filename* but has been unable to do so.

System action: CICS continues normally. The table is treated as having been closed.

A system dump is taken for unexpected errors (*X'ff* =*X'01*) and for abends (if dumps are requested for that abend code).

User response: The response depends on the reason for the failure as indicated in the first byte of the reason code

X'01 Use the system dump to help you determine the cause of the problem.

X'06 Server initialization should have been completed before LOGON is issued, so CICS SVC errors associated with the loading of the data tables SVC module DFHDSVC should not be encountered. Therefore this error probably indicates a logic problem or corruption of your system.

X'09 The function code (service type) and qualifier

422 Messages and Codes

(options) reported in the reason code can be used to determine which ALESERV request was being attempted. Refer to the MVS ALESERV documentation and macro to interpret the function code, qualifier, and register 15 return code reported in the reason code.

≥X'80 When the reason code indicates that an ABEND has been detected, use the additional information provided in the reason code to find out what the ABEND was, and refer to information on that abend code to determine the cause.

Module: DFHFCFS

XMEOUT Parameters: *applid, filename, X'code'*

Destination: Console

DFHFC0441 *applid* Data table close request for file *filename* has failed owing to a storage failure - reason code *X'code'*.

Explanation: CICS has attempted to close a data table for file resource *filename* but has been unable to do so owing to a failure to release storage.

The format of the reason code is *X'tnnnnnn* in which *tt* identifies the type of storage and, for some of the codes, *nnnnn* gives the hexadecimal size in bytes of the storage which could not be obtained. For storage blocks whose length is fixed, the reason code does not usually report the size.

The values of *X'tt* are

X'14 private storage from MVS subpool 230 (key 0) for a new ALET list section

System action: CICS continues normally. The table is treated as having been closed.

User response: You should probably reconsider the various region size parameters which have been specified on the CICS job, or have been set as defaults for the system by IEALIMIT or the IEFUSI installation exit. It may be necessary to take an SDUMP of the CICS job and process it using the VERBEXIT VSMDATA in order to investigate the way in which MVS storage has been allocated to the various subpools.

Module: DFHFCFS

XMEOUT Parameters: *applid, filename, X'code'*

Destination: Console

DFHFC0445 *applid* Data table disconnect request for remote file *filename* has failed for reason *code*.

Explanation: CICS has attempted to disconnect from the remote data table *filename* but has been unable to do so.

An error has occurred while the requesting region was attempting to break the connection to the remote file *filename* owned by the serving region. The value of the reason code, *X'code*, provides further information about why CICS was unable to disconnect from the remote file.

The format of the reason code is either: *X'ffaaaaa* in which *ff* is a value less than X'80 that identifies the type of failure, and *aaaaaa* is additional information provided for some of the failures; or, when an abnormal termination (ABEND) has occurred, *X'axxxxx* in which *a* is a value greater than or equal to X'8 that categorizes the type of ABEND, *xxxx* contains any register 15 ABEND reason code, and *xxx* contains the system or user completion code as three hexadecimal digits.

When *X'code* < X'80000000, the values of *X'ff* are

- X'01** An unexpected failure occurred. This code is reported when the data tables SVC detects an error which should never occur.
- X'06** An error was returned by the CICS SVC. The first byte of the additional information, *aa0000*, is the register 15 return code from the attempt to call the CICS SVC.

When *X'code* ≥ X'80000000, the values of *X'a* are formed from combinations of

- X'8** An ABEND was detected.
- X'4** A user ABEND was detected, in which case *xxx* contains the hexadecimal equivalent of the user completion code (otherwise, *xxx* contains the hexadecimal system completion code).
- X'2** An ABEND was detected but could not be analyzed fully because no SDWA was available.
- X'1** An asynchronous ABEND was detected (otherwise, the abend was synchronous or could not be classified because there was no SDWA).

System action: CICS continues normally. The table is treated as having been disconnected from the requesting CICS system. A system dump is taken for unexpected errors (*X'ff* = X'01) and for ABENDs (if dumps are requested for that ABEND code).

User response: The response depends on the reason for the failure as indicated in the first byte of the reason code

- X'01** Use the system dump to help you determine the cause of the problem.
- X'06** Requester initialization should have been completed before DISCONNECT is issued, so CICS SVC errors associated with the loading of the data tables SVC module DFHDT SVC

should not be encountered. Therefore this error probably indicates a logic problem or corruption of your system.

- ≥X'80** When the reason code indicates that an ABEND has been detected, use the additional information provided in the reason code to find out what the ABEND was, and refer to information on that ABEND code to determine the cause.

Module: DFHFCFS

XMEOUT Parameters: *applid, filename, code*

Destination: Console

DFHFC0446 *applid* **Data table disconnect request for remote file *filename* has failed because of a storage failure - reason code *X'code*'.**

Explanation: CICS has attempted to disconnect from the remote data table *filename* but has been unable to do so owing to a failure to release storage.

System action: CICS continues normally. The table is treated as having been disconnected from the requesting CICS system.

User response: This indicates an internal error or a corruption of the system. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCFS

XMEOUT Parameters: *applid, filename, X'code'*

Destination: Console

DFHFC0490 *applid* **Unable to use data table for file *filename*.**

Explanation: The data set to which file *filename* relates has an associated data table but CICS is unable to make use of the table data owing to a lack of storage.

System action: CICS continues normally. Performance of read-only accesses to the file is degraded because records cannot be retrieved from the table.

User response: Ensure that there is sufficient storage in the CICS region outside the EDSA.

See the *CICS Shared Data Tables Guide* for further guidance.

Module: DFHFCFS

XMEOUT Parameters: *applid, filename*

Destination: Console

DFHFC0500 *applid* RLS OPEN of file *filename* failed. VSAM has returned code X'eeee' in R15 and reason X'cccc'.

Explanation: While CICS was opening file *filename*, the CICS file control RLS open/close routine received a nonzero return code from VSAM.

System action: CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use RLS files is sent a NOTOPEN condition.

User response: For the meaning of the VSAM return code, see *OS/390 V2R10.0 DFSMS Macro Instructions for Data Sets*.

Module: DFHFCRO

XMEOUT Parameters: *applid, filename, X'eeee', X'cccc'*

Destination: Console

DFHFC0501 *applid* RLS OPEN of file *filename* failed. VSAM has returned code 16 in R15. RLS access has been disabled.

Explanation: While CICS was opening file *filename*, the CICS file control open/close routine received a return code of 16 in register 15. This means that the RLS VSAM server is currently unavailable so file control has disabled RLS access.

System action: CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use RLS files is sent a NOTOPEN condition.

CICS file control reenables RLS access when the RLS VSAM server restarts.

User response: None.

Module: DFHFCRO

XMEOUT Parameters: *applid, filename*

Destination: Console

DFHFC0502 *applid* RLS OPEN of file *filename* failed. Access type switch to RLS attempted while other files open for the same data set have non-RLS access type.

Explanation: While CICS was opening file *filename*, the CICS file control RLS open/close routine detected that the access type for the file has been changed to RLS but there are still other files open for the data set with non-RLS access type. The file cannot be opened until all the other files have closed.

System action: CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use the file is sent a NOTOPEN condition.

User response: Close all the other files or change

access of this file back to non-RLS. Files for the same data set should have the same access type.

Module: DFHFCRO

XMEOUT Parameters: *applid, filename*

Destination: Console

DFHFC0503 *applid* Non-RLS OPEN of file *filename* failed. Access type switch to non-RLS attempted while other files open for the same data set have RLS access type.

Explanation: While CICS was opening file *filename*, the CICS file control open/close routine detected that the access type for the file has been changed to non-RLS but there are still other files open for the data set with RLS access type. The file cannot be opened until all the other files have closed.

System action: CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use the file is sent a NOTOPEN condition.

User response: Close all the other files or change access of this file back to RLS. Files for the same data set should have the same access type.

Module: DFHFCFS

XMEOUT Parameters: *applid, filename*

Destination: Console

DFHFC0504 *applid* RLS OPEN of file *filename* failed. The VSAM SHOWCB macro has detected a RLS VSAM server failure. RLS access has been disabled.

Explanation: While CICS was opening file *filename*, the CICS file control RLS open/close routine received a return code of X'1A' in register 15. This means that the RLS VSAM server is not available so file control has disabled RLS access. The return code was returned by the SHOWCB macro when CICS was attempting to find the reason for the open failure that had just been detected.

System action: CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use RLS files is sent a NOTOPEN condition. CICS reenables RLS access when the RLS VSAM server restarts.

User response: None.

Module: DFHFCRO

XMEOUT Parameters: *applid, filename*

Destination: Console

DFHFC0505 *applid* RLS CLOSE of file *filename* failed. The VSAM SHOWCB macro has detected a RLS VSAM server failure. RLS access has been disabled.

Explanation: While CICS was closing file *filename*, the CICS file control RLS open/close routine received a return code which indicates that the RLS VSAM server is unavailable. Consequently file control has disabled and closed down RLS access. This does not affect the rest of the close processing. The return code is returned by the SHOWCB macro which is invoked during CICS close.

System action: CICS continues processing with file *filename* closed and its state UNENABLED. Any subsequent close requests for other files which are issued while the server is unavailable also receive the error return code but do not issue this message. CICS reenables RLS access when the RLS VSAM server restarts.

User response: None.

Module: DFHFCRO

XMEOUT Parameters: *applid, filename*

Destination: Console

DFHFC0507 *applid* RLS OPEN of file *filename* failed. Callable service IGWARLS is not present.

Explanation: Callable service IGWARLS is required by file control for processing files which have update SERVREQs and are using the VSAM catalog as a repository for data set recovery attributes. CICS expects to find IGWARLS in the LPA. IGWARLS resides in library SYS1.CSSLIB. If SYS1.CSSLIB is not in the LPA concatenation, RLS files with update SERVREQs cannot be opened.

System action: CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use RLS files is sent a NOTOPEN condition.

User response: If you intend to use RLS access for files with UPDATE SERVREQs, ensure that SYS1.CSSLIB is included in the LPA concatenation.

Module: DFHFCRO

XMEOUT Parameters: *applid, filename*

Destination: Console

DFHFC0508 *applid* RLS OPEN of file *filename* failed. VSAM has returned code X'AA' in register 15. RLS access has been disabled.

Explanation: While CICS was opening file *filename*, the CICS file control open/close routine received a

return code of X'AA' in register 15. This means that the RLS VSAM server is currently unavailable so file control has disabled RLS access.

System action: CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use RLS files is sent a NOTOPEN condition.

CICS file control reenables RLS access when the RLS VSAM server restarts.

User response: None.

Module: DFHFCRO

XMEOUT Parameters: *applid, filename*

Destination: Console

DFHFC0510 *applid* {RLS | Non-RLS} OPEN of file *filename* failed because the data set is unavailable. Module *module*.

Explanation: An attempt to open file *filename* failed because CICS has internally marked the data set as unavailable. This is the result of an earlier EXEC CICS SET DSNAME UNAVAILABLE command, or CEMT equivalent. This prevents the opening of new RLS and non-RLS files against the data set.

System action: CICS continues processing with file *filename* closed and its state UNENABLED. Any transactions attempting to use the data set from this CICS region are sent a NOTOPEN condition.

User response: Ensure that an EXEC CICS SET DSNAME AVAILABLE command (or the CEMT equivalent) is issued before attempting to open the file.

Module: DFHFCFS, DFHFCRO

XMEOUT Parameters: *applid, {1=RLS, 2=Non-RLS}, filename, module*

Destination: Console

DFHFC0511 *applid* RLS OPEN of file *filename* failed. This CICS has other files open for the data set (or its associated base) with non-RLS access mode. The data set name is *dsname*.

Explanation: While CICS was opening file *filename*, the CICS file control RLS open/close routine detected that this region has other files open for the data set *dsname*, or its associated base data set, in non-RLS access mode. The file cannot be opened in RLS access mode until all the other non-RLS mode files have closed, even if these files are accessing the data set in read-only mode. This constraint is to ensure a consistent view of this data set from within each CICS region.

System action: CICS continues processing with file *filename* closed and its state UNENABLED. Any

transaction attempting to use the file is sent a NOTOPEN condition.

User response: Close all the other files or change access of this file to non-RLS mode. Files accessing the same base data set from within a given CICS region must all have the same access mode. This includes access via a path data set.

Module: DFHFCRO

XMEOUT Parameters: *applid, filename, dsname*

Destination: Console

DFHFC0512 *applid* **Non-RLS OPEN of file *filename* failed. This CICS has other files open for the data set (or its associated base) with RLS access mode. The data set name is *dsname*.**

Explanation: While CICS was opening file *filename*, the CICS file control non-RLS open/close routine detected that this region has other files open for the data set *dsname*, or its associated base data set, in RLS access mode. This file cannot be opened in non-RLS access mode until all the other RLS mode files have closed, even if this file is opening the data set in read-only mode. This constraint is to ensure a consistent view of this data set from within each CICS region.

System action: CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use the file is sent a NOTOPEN condition.

User response: Close all the other files or change access of this file to RLS mode. Files accessing the same base data set from within a given CICS region must all have the same access mode. This includes access via a path data set.

Module: DFHFCFS

XMEOUT Parameters: *applid, filename, dsname*

Destination: Console

DFHFC0513 *applid* **Non-RLS OPEN of file *filename* has failed. CICS has unresolved RLS recovery work for the data set (or its associated base). The data set name is *dsname*.**

Explanation: While CICS was opening file *filename*, the CICS file control non-RLS open/close routine detected that this region has unresolved recovery work for the data set *dsname*, or its associated base data set, which requires the base data set and any associated path data sets to be accessed in RLS mode. This file cannot be opened until all the RLS recovery work has been resolved. This constraint ensures that any automatic resolution of the recovery work is not impeded by non-RLS accesses to the data set.

System action: CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use the file is sent a NOTOPEN condition.

User response: Use the INQUIRE UOWDSNFAIL command to investigate the RLS recovery work, and take action to resolve it. This may involve retrying backout-failed units of work and resynchronising indoubt-failed units of work. See the *CICS Recovery and Restart Guide* for more information on unit of work failures and their resolution.

Module: DFHFCFS

XMEOUT Parameters: *applid, filename, dsname*

Destination: Console

DFHFC0517 *applid {RLS | Non-RLS}* **OPEN of file *filename* failed. An error was detected when reading the VSAM catalog.**

Explanation: As part of processing a request to OPEN a file, CICS requires to obtain information from the VSAM catalog. The attempt to obtain catalog information has failed.

System action: The file open request fails. CICS has previously issued message DFHFC0519 giving information about the earlier catalog inquiry failure.

Any transaction attempting to use file *filename* is sent a NOTOPEN condition.

User response: See the response to message DFHFC0519.

Module: DFHFCFS

XMEOUT Parameters: *applid, {1=RLS, 2=Non-RLS}, filename*

Destination: Console

DFHFC0518 *applid* **File Control is using an extended addressing ESDS dataset.**

Explanation: File Control has opened at least one file which refers to an extended addressing ESDS.

System action: None. The message is informational.

User response: Forward recovery log records and file journal records written for files which refer to addressing ESDS data sets have a new format.

If the dataset is forward recoverable, ensure that you are using a forward recovery utility that is capable of handling the new format forward recovery log records. If you use file journaling, ensure that all journal reading utilities are capable of reading the new format journal records.

To determine which files reference extended addressing ESDS data sets, use the operator command CEMT INQ FILE(*) RBATYPE(EXTENDED).

Module: DFHFCFS

XMEOUT Parameter: *applid*

Destination: Console Routecodes 2 and 12

DFHFC0519 *applid* **Call to VSAM Catalog utility IGGCSI00 for dataset *dsname* failed. Return code *X'rrrr'* Reason code *X'cccc'*.**

Explanation: As part of processing a request to OPEN a file, CICS called program IGGCSI00 in order to obtain information about data set *dsname* from the VSAM catalog. The call to IGGCSI00 failed. The return code from IGGCSI00 was *rrrr* and the reason code was *cccc*.

System action: The file open request fails. CICS will subsequently issue message DFHFC0517 indicating the name of the file that failed to open. Any transaction attempting to use this file is sent a NOTOPEN condition.

User response: You have probably specified DSNAME incorrectly in the FCT. If DSNAME is correctly specified, see the explanation of the IGGCSI00 return and reason codes in *DFSMS Managing Catalogs*.

Module: DFHFCVC

XMEOUT Parameters: *applid, dsname, X'rrrr', X'cccc'*

Destination: Console

DFHFC0520 *applid {RLS | Non-RLS}* **OPEN of file *filename* failed. IGWARLS call returned codes *X'rrrr'*, *X'cccc'* and problem determination *X'ddddddd'* to module *module*.**

Explanation: While CICS was opening file *filename* and retrieving information from the VSAM catalog using callable service IGWARLS, the CICS file control open/close routine in module *module* detected an error. The return code and reason code from IGWARLS are respectively *rrrr* and *cccc*. *ddddddd* is any available problem determination information.

System action: CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Use the IGWARLS reason code to determine the cause of the problem. For the meaning of the IGWARLS reason code, see *OS/390 V2R10.0 DFSMSdfp Advanced Services*.

If you cannot resolve the problem or the problem recurs, there may be a more severe error. In this case, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCFS, DFHFCRO

XMEOUT Parameters: *applid, {1=RLS, 2=Non-RLS}, filename, X'rrrr', X'cccc', X'ddddddd', module*

Destination: Console

DFHFC0521 *applid* **RLS OPEN of file *filename* failed. Undefined LOG parameter is invalid for an RLS file with update type SERVREQs.**

Explanation: While CICS was opening file *filename* and retrieving information from the VSAM catalog using callable service IGWARLS, the CICS file control open/close routine detected that the LOG parameter for the sphere is undefined. LOG must be specified for a file that has RLS access type and update type servreqs.

System action: CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

User response: Use IDCAMS ALTER to set the LOG parameter for the sphere.

Module: DFHFCRO

XMEOUT Parameters: *applid, filename*

Destination: Console

DFHFC0522 *applid {RLS | Non-RLS}* **OPEN of file *filename* failed. IGWARLS call has returned that the LOG parameter is set to ALL but LOGSTREAMID has not been specified. Module *module*.**

Explanation: While CICS was opening file *filename* and retrieving information from the VSAM catalog using callable service IGWARLS, the CICS file control open/close routine in module *module* detected that the LOG(ALL) has been specified without LOGSTREAMID.

System action: CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

User response: If forward recovery is required, use IDCAMS ALTER to add a LOGSTREAMID for the sphere. Otherwise, remove the forward recovery setting.

Module: DFHFCFS, DFHFCRO

XMEOUT Parameters: *applid, {1=RLS, 2=Non-RLS}, filename, module*

Destination: Console

DFHFC0523 *applid* **RLS OPEN of file *filename* failed. The LOGSTREAMID for forward recovery is the same as the system log. Module *module*.**

Explanation: While CICS was opening file *filename*, the CICS file control open/close routine in module

DFHFC0524 • DFHFC0528

module detected that the LOGSTREAMID for forward recovery is the same as that for the system log. The forward recovery LOGSTREAMID must be different from the system log.

System action: CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

User response: Use IDCAMS ALTER to change the LOGSTREAMID for forward recovery for the sphere. Ensure that it is different from the system log.

Module: DFHFCRO

XMEOUT Parameters: *applid, filename, module*

Destination: Console

DFHFC0524 *applid* **An attempt to write a log record failed because the record length was greater than the maximum supported by that log. Module** *module*.

Explanation: An attempt to write a log record, as part of a file update operation, has failed because the length of the data in the record was greater than the maximum supported by the associated log stream.

System action: A trace entry is made and a dump is taken with a dumpcode of FC0524.

User response: Redefine the log stream using a structure which has a MAXBUFSIZE larger than that of the file update record size.

Module: DFHFCLJ

XMEOUT Parameters: *applid, module*

Destination: Console

DFHFC0525 *applid {RLS | Non-RLS}* **OPEN of file** *filename* **failed because the forward recovery log stream could not be opened. Module** *module*

Explanation: While CICS was opening file *filename*, the CICS file control open/close routine in module *module* detected that the forward recovery log stream for the sphere could not be opened. An internal call to the CICS logger has returned an error.

System action: CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

| **User response:** Check for an IXGxxxx message with
| the name of the logstream. Refer to the appropriate
| z/OS MVS System Messages manual and also the z/OS
| Programming: Assembler Services Reference IAR-XCT.
| If this does not help, you will need further assistance
| from IBM to resolve this problem. See Part 4 of the

| *CICS Problem Determination Guide* for guidance on
| how to proceed.

Module: DFHFCFS,DFHFCRO

XMEOUT Parameters: *applid, {1=RLS, 2=Non-RLS}, filename, module*

Destination: Console

DFHFC0526 *applid* **An error occurred on the request to the CICS log manager to close the forward recovery log stream for file** *filename*. **Module** *module*.

Explanation: While CICS was processing file *filename*, the CICS file control open/close routine in module *module* detected that a request to close the forward recovery log stream for the associated sphere returned an error.

System action: Processing continues.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCFS, DFHFCRO

XMEOUT Parameters: *applid, filename, module*

Destination: Console

DFHFC0527 *applid* **Recovery attributes for file** *filename* **have been overridden by new settings found on the catalog.**

Explanation: While CICS was opening file *filename*, the CICS file control open/close routine detected that the recovery settings for the sphere have changed.

System action: Processing continues. The new recovery settings are assumed for the sphere.

User response: Ensure that the change is as required.

Module: DFHFCRO

XMEOUT Parameters: *applid, filename*

Destination: Console

DFHFC0528 *applid* **RLS OPEN of file** *filename* **failed. Recovery attributes on the catalog have changed while there are other files still open for the sphere.**

Explanation: While CICS was opening file *filename* and retrieving information from the VSAM catalog using callable service IGWARLS, the CICS file control open/close routine detected that the recovery attributes on the catalog have changed. There are currently other files open for the sphere which have assumed the previous recovery attributes. Further opens will fail until all files have closed or the recovery attributes are returned to their previous settings. Recovery attributes

on the catalog should not be changed without first quiescing the associated sphere in all CICS systems that use it.

System action: CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

User response: Quiesce the sphere and start again with the new settings.

Module: DFHFCRO

XMEOUT Parameters: *applid, filename*

Destination: Console

DFHFC0529 *applid* **Recovery attributes for file *filename* have been reset as there has been a switch of access type. Module *module*.**

Explanation: While CICS was opening file *filename*, the CICS file control open/close routine in module *module* detected that the access type had been changed from RLS to non-RLS VSAM or vice versa. This has the effect of clearing out existing recovery attributes and starting again.

System action: Processing continues. The new recovery settings are assumed for the sphere.

User response: None.

Module: DFHFCRO, DFHFCFS

XMEOUT Parameters: *applid, filename, module*

Destination: Console

DFHFC0530 *applid {RLS | Non-RLS}* **OPEN of file *filename* failed. The automatic journal is the same stream as the system log. Module *module*.**

Explanation: While CICS was opening file *filename*, the CICS file control open/close routine in module *module* detected that the automatic journal for the file is the same stream as that for the system log. This is not allowed so an internal call to the CICS logger has returned an error.

System action: CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

User response: Ensure that the stream given in the FCTE for automatic journaling is different from the system log.

Module: DFHFCFS, DFHFCRO

XMEOUT Parameters: *applid, {1=RLS, 2=Non-RLS}, filename, module*

Destination: Console

DFHFC0531 *date time applid* **Automatic journal *journalname* *journalname*, opened for file *filename* is not of type MVS. Module *module*.**

Explanation: While CICS was opening file *filename*, the CICS file control open/close routine in module *module* detected that the stream specified for the automatic journal, *journalname*, was not of type MVS. For example, it might be a dummy log, or you might be journaling to an SMF data set. This message informs you of this in case the journal type is not what you intended. *journal* is the number specified for JOURNAL on the file definition.

System action: CICS continues processing.

User response: Ensure that the stream type for the automatic journal is correct.

Module: DFHFCN, DFHFCRO

XMEOUT Parameters: *date, time, applid, journal, journalname, filename, module*

Destination: CSFL

DFHFC0532 *applid {RLS | Non-RLS}* **OPEN of file *filename* failed because the automatic journal could not be opened. Module *module*.**

Explanation: While CICS was opening file *filename*, the CICS file control open/close routine in module *module* detected that the automatic journal for the file could not be opened. An internal call to the CICS logger has returned an error.

System action: CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

User response: This is likely to be an internal CICS error. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCFS, DFHFCRO

XMEOUT Parameters: *applid, {1=RLS, 2=Non-RLS}, filename, module*

Destination: Console

DFHFC0533 *applid* **An error occurred on the request to the CICS log manager to close the automatic journal for file *filename*. Module *module*.**

Explanation: While CICS was processing file *filename*, the CICS file control open/close routine in module *module* detected that a request to close the automatic journal returned an error.

System action: CICS continues processing.

User response: This is likely to be an internal CICS error. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCFS, DFHFCRO

XMEOUT Parameters: *applid, filename, module*

Destination: Console

DFHFC0534 *applid* Recovery attributes for file *filename* previously taken from the VSAM catalog have been overridden by new settings from the FCTE. Module *module*.

Explanation: While CICS was opening file *filename*, the CICS file control open/close routine in module *module* detected that the recovery settings for the sphere have been changed to undefined. For a non-RLS VSAM file, recovery attributes from the FCTE now take effect.

System action: Processing continues. The new recovery settings are assumed for the file.

User response: Ensure that this change to the recovery attributes is correct.

Module: DFHFCFS

XMEOUT Parameters: *applid, filename, module*

Destination: Console

DFHFC0535 *applid* Recovery attributes for file *filename* previously taken from the VSAM catalog have been overridden by new settings from the VSAM catalog. Module *module*.

Explanation: While CICS was opening file *filename*, the CICS file control open/close routine in module *module* detected that the recovery settings for the sphere on the VSAM catalog have changed. The new recovery attributes now take effect because there are no other files open for the data set.

System action: Processing continues. The new recovery settings are assumed for the file.

User response: Ensure that this change to the recovery attributes is correct.

Module: DFHFCFS

XMEOUT Parameters: *applid, filename, module*

Destination: Console

DFHFC0536 *applid* Recovery attributes for file *filename* previously taken from the FCTE have been overridden by new settings from the VSAM catalog. Module *module*.

Explanation: While CICS was opening file *filename*, the CICS file control open/close routine in module *module* detected that the recovery settings for the sphere on the VSAM catalog are no longer undefined. The new recovery attributes now take effect because there are no other files open for the data set.

System action: Processing continues. The new recovery settings are assumed for the file.

User response: Ensure that this change to the recovery attributes is correct.

Module: DFHFCFS

XMEOUT Parameters: *applid, filename, module*

Destination: Console

DFHFC0537 *applid* OPEN of file *filename* failed. The request to write a tie up record for the OPEN failed.

Explanation: While CICS was opening file *filename*, a request to write a tie up record for the OPEN failed. CICS has closed the file again and failed the OPEN request.

System action: CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

User response: This is likely to be an internal CICS error. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCFS

XMEOUT Parameters: *applid, filename*

Destination: Console

DFHFC0539 *applid* {RLS | Non-RLS} OPEN of file *filename* failed. IGWARLS call has returned that the LOG parameter is not set to ALL but the BWO setting has been defined as TYPECICS. Module *module*.

Explanation: While CICS was opening file *filename* and retrieving information from the VSAM catalog using callable service IGWARLS, the CICS file control open/close routine in module *module* detected that BWO has been set to TYPECICS but LOG(ALL) has not been specified.

System action: CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

User response: If BWO(TYPECICS) is required, specify LOG(ALL). Alternatively, the setting BWO(NO) is recommended.

Module: DFHFCFS

XMEOUT Parameters: *applid, {1=RLS, 2=Non-RLS}, filename, module*

Destination: Console

DFHFC0540 *applid* **The BWO setting for file *filename* has not been explicitly set to NO or TYPECICS and is assumed to be BWO(NO). Module *module*.**

Explanation: While CICS was opening file *filename*, the CICS file control open/close routine in module *module* detected that the BWO setting for the sphere on the VSAM catalog had not been explicitly specified as either BWO(TYPECICS) or BWO(NO). The setting is assumed to be BWO(NO).

System action: Processing continues. The BWO(NO) setting is assumed for the file.

User response: If you require to use backup while open, use the ALTER function of access method services to set BWO(TYPECICS) for this data set. If you do not require to backup while open, you do not need to take any action, but you may wish to use the ALTER function of access method services to explicitly set BWO(NO).

Module: DFHFCFS

XMEOUT Parameters: *applid, filename, module*

Destination: Console

DFHFC0541 *applid* **RLS OPEN of file *filename* failed. RLS is not supported.**

Explanation: While CICS was opening file *filename* the CICS file control open/close routine in module *module* detected that RLS was not supported. Either this CICS system is running with system initialization parameter RLS=NO or the level of VSAM does not support RLS.

System action: CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use RLS files is sent a NOTOPEN condition. Determine why RLS access is not supported.

Module: DFHFCFS

XMEOUT Parameters: *applid, filename*

Destination: Console

DFHFC0542 *date time applid* **Forward recovery log ID *fwdrecovlog*, *journalname* opened for file *filename* is not of type MVS. Module *module*.**

Explanation: While CICS was opening file *filename*, the CICS file control open/close routine in module *module* detected that the forward recovery log,

journalname, was not of type MVS. For example, it might be a dummy log, or you might be logging to an SMF data set. This message informs you of this in case the log type is not what you intended.

fwdrecovlog is the forward recovery log ID specified in the file definition. If the forward recovery log stream is specified in the VSAM catalog rather than in the file definition, it must be of type MVS, so this message can be issued only when the forward recovery log is specified in the file definition.

System action: CICS continues processing.

User response: Correct the definition of the forward recovery log if it was not what you had intended.

Module: DFHFCFS

XMEOUT Parameters: *date, time, applid, fwdrecovlog, journalname, filename, module*

Destination: CSFL

DFHFC0555 *applid* **One or more data sets are in lost locks status. CICS will perform lost locks recovery.**

Explanation: CICS had one or more data sets open in RLS access mode at the time of a failure of the coupling facility lock structure from which SMSVSAM was not able to recover transparently. As a result, the RLS locks held by CICS for those data sets have been lost.

SMSVSAM has informed CICS that one or more data sets are in a lost locks state with respect to this CICS. CICS must therefore perform lost locks recovery for those data sets.

This can occur on a CICS warm or emergency restart, and on a dynamic RLS restart. On a CICS cold or initial start, if there are any data sets with lost locks status, that status is cleared with respect to this CICS.

System action: The data sets with lost locks status are marked as being unavailable for general use. Units of work that attempt to access such data sets abend with an AFCU abend code.

CICS performs lost locks recovery for the data sets. For each data set, lost locks recovery involves waiting until all units of work that had made uncommitted updates to the data set have completed. These units of work are allowed to access the data set, in order to perform their recovery. When CICS has completed lost locks recovery for a data set, it reports this fact to SMSVSAM. When all CICS regions that had been accessing the data set have completed their lost locks recovery, then the data set is made available for general use again. Note that a data set becomes available for general use as soon as its lost locks recovery has been completed; it does not have to wait for all data sets to be recovered.

CICS takes the following actions to expedite lost locks recovery

DFHFC0556 • DFHFC0563

- Backout-failed and commit-failed units of work are driven for retry
- On a dynamic RLS restart, inflight transactions that had updated the data set are purged (on a warm or emergency restart, inflight units of work are automatically backed out).

User response: Lost locks recovery normally completes automatically without requiring any action from the user. However, if there are shunted units of work which had updated a data set with lost locks status, these prevent lost locks recovery from completing until they are resolved. Use the INQUIRE UOWDSNFAIL command to investigate these shunted units of work.

If lost locks recovery appears to be taking a long time, you can compare the output obtained by issuing the IDCAMS SHCDS LISTSUBSYS(ALL) command at different intervals, to determine what progress has been made.

See the *CICS Recovery and Restart Guide* for guidance on resolving shunted units of work which hold RLS retained locks.

Module: DFHFCRR

XMEOUT Parameter: *applid*

Destination: Console

DFHFC0556 *applid* **Unexpected notification of completion of lost locks recovery for data set *dsname*.**

Explanation: CICS has received a notification from SMSVSAM that lost locks recovery has completed for data set *dsname*, but CICS still has outstanding lost locks recovery work for that data set. This notification has therefore been issued out of sequence.

System action: CICS continues processing. The data set remains in a lost locks state, and CICS continues with its lost locks recovery. New file control requests against the data set will continue to be rejected with AFCU abends. When all CICS regions have completed their lost locks recovery for the data set, then a valid notification will be received and CICS will remove the data set from the lost locks state.

There will be an instance of this message on each CICS system for each data set when an unexpected notification is received.

User response: Lost locks recovery processing should complete normally without any user intervention.

However, this message is an indication of a probable logic error in SMSVSAM, so you should take dumps of all the SMSVSAM servers and their associated data spaces in the sysplex. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCRR

XMEOUT Parameters: *applid, dsname*

Destination: Console

DFHFC0560 *applid* **The register of the RLS control ACB has failed because the SMSVSAM server is not available. VSAM macro IDAREGP return code *X'rrrr'*, reason code *X'cccc'*.**

Explanation: While CICS was initializing file control, the call to VSAM to register the control ACB for RLS processing returned an error. The codes returned mean that the SMSVSAM server address space is not available.

System action: CICS continues processing but all RLS access is disabled. Any transaction attempting to use RLS files is sent a NOTOPEN condition. CICS reenables RLS access when the SMSVSAM server restarts.

User response: The SMSVSAM server address space should restart itself. If it does not, restart the SMSVSAM server address space manually. If the SMSVSAM server address space fails to restart, there may be a more severe error. In this case, you need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCCA

XMEOUT Parameters: *applid, X'rrrr',X'cccc'*

Destination: Console

DFHFC0562 *applid* **The RLS control ACB has been successfully registered by CICS.**

Explanation: This message provides a record of the register of the RLS control ACB by CICS.

System action: CICS processing continues.

User response: None.

Module: DFHFCCA.

XMEOUT Parameter: *applid*

Destination: Console

DFHFC0563 *applid* **The RLS control ACB has been successfully unregistered by CICS.**

Explanation: This message provides a record of the unregister of the RLS control ACB by CICS.

System action: CICS processing continues.

User response: None.

Module: DFHFCCA.

XMEOUT Parameter: *applid*

Destination: Console

DFHFC0564 *applid* **The register of the RLS control ACB has failed. VSAM macro IDAREGP return code X'rrrr', reason code X'cccc', error data X'dddd'.**

Explanation: While CICS was initializing access to VSAM RLS, the call to VSAM to register the RLS control ACB returned an error.

System action: CICS continues processing but all RLS access is disabled. Any transaction attempting to use RLS files is sent a NOTOPEN condition.

User response: Use the VSAM codes to determine the cause of the problem. For the meaning of the VSAM codes, see *OS/390 V2R10.0 DFSMS Macro Instructions for Data Sets*.

If you cannot resolve the problem or the problem recurs, there may be a more severe error. In this case, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCCA

XMEOUT Parameters: *applid, X'rrrr',X'cccc', X'dddd'*

Destination: Console

DFHFC0565 *applid* **The unregister of the RLS control ACB has failed. VSAM macro IDAUNRP return code X'rrrr', reason code X'cccc', error data X'dddd'.**

Explanation: While CICS was quiescing RLS access the call to VSAM to unregister the RLS control ACB returned an error.

System action: CICS continues processing and all RLS access is disabled. Any transaction attempting to use RLS files is sent a NOTOPEN condition.

User response: Use the VSAM codes to determine the cause of the problem. For the meaning of the VSAM codes, see *OS/390 V2R10.0 DFSMS Macro Instructions for Data Sets*.

If you cannot resolve the problem or the problem recurs, there may be a more severe error. In this case, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

XMEOUT Parameters: *applid, X'rrrr',X'cccc', X'dddd'*

Destination: Console

DFHFC0566 *applid* **The register of the RLS control ACB has failed. VSAM macro IDAREGP return code X'rrrr', reason code X'cccc'.**

Explanation: While CICS was initializing access to VSAM RLS, the call to VSAM to register the RLS

control ACB returned an error.

System action: CICS continues processing but all RLS access is disabled. Any transaction attempting to use RLS files is sent a NOTOPEN condition.

User response: Use the VSAM codes to determine the cause of the problem. For the meaning of the VSAM codes, see *OS/390 V2R10.0 DFSMS Macro Instructions for Data Sets*.

If you cannot resolve the problem or the problem recurs, there may be a more severe error. In this case, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCCA

XMEOUT Parameters: *applid, X'rrrr',X'cccc'*

Destination: Console

DFHFC0567 *applid* **The unregister of the RLS control ACB has failed. VSAM macro IDAUNRP return code X'rrrr', reason code X'cccc'.**

Explanation: While CICS was quiescing RLS access, the call to VSAM to unregister the RLS control ACB returned an error.

System action: CICS continues processing and all RLS access is disabled. Any transaction attempting to use RLS files is sent a NOTOPEN condition.

User response: Use the VSAM codes to determine the cause of the problem. For the meaning of the VSAM codes, see *OS/390 V2R10.0 DFSMS Macro Instructions for Data Sets*.

If you cannot resolve the problem or the problem recurs, there may be a more severe error. In this case, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCCA

XMEOUT Parameters: *applid, X'rrrr',X'cccc'*

Destination: Console

DFHFC0568I *applid* **File control dynamic RLS restart has started.**

Explanation: File control dynamic RLS restart has started.

System action: Processing continues.

User response: None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Module: DFHFCRR

XMEOUT Parameter: *applid*

Destination: Console

DFHFC0569I *applid* File control dynamic RLS restart has ended.

Explanation: File control dynamic RLS restart has completed successfully.

System action: Processing continues.

User response: None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Module: DFHFCRR.

XMEOUT Parameter: *applid*

Destination: Console

DFHFC0570 *applid* File control RLS access has been enabled.

Explanation: RLS access is now available.

System action: Processing continues.

User response: None.

Module: DFHFCRR.

XMEOUT Parameter: *applid*

Destination: Console

DFHFC0571 *applid* RLS access cannot be restarted.

Explanation: An error has occurred while attempting to restart CICS access to VSAM RLS, either at startup, or during a dynamic RLS restart which took place when the VSAM RLS server became available while CICS was running. Because of this error, it may not be possible to access VSAM RLS again during this CICS run.

Access is made available again only if the VSAM RLS server in this MVS system fails causing CICS to perform dynamic RLS restart processing when it restarts, or if you choose to deliberately recycle the RLS server to trigger a dynamic restart.

System action: CICS continues, but with access to VSAM RLS disabled (unless an offsite restart is being performed). Other CICS functions, including access to non-RLS VSAM files, should continue.

At the time the error affecting RLS restart is detected, CICS issues one or more messages and takes a system dump.

This error might also affect other aspects of this CICS system, for example if it is due to the corruption of internal CICS control structures.

If an **offsite restart** is being performed; that is, if OFFSITE=YES was specified as a system initialization override, then CICS does not continue, but is terminated with a system dump. When RLS offsite recovery is

required, then there is no value in continuing without RLS, because it will be needed in order for the offsite restart to be able to complete. Until all CICS systems complete their offsite recovery work, including this one, no other CICS system in the CICSplex will be allowed to perform new RLS work either.

User response: If you do not need access to any VSAM RLS files from this CICS system, you can allow CICS to continue. For example, this CICS system might never open files in RLS access mode, or you might prefer to continue without RLS access in order to continue this CICS run.

If you do need to access VSAM RLS files from this CICS, consider shutting CICS down and restarting it, or recycling the VSAM RLS server. However, be aware that recycling the server causes all CICS systems in this MVS to go through dynamic RLS restart processing, which implicitly closes all files that were open in RLS access mode.

To determine the cause of the original error, examine the messages and the system dump that were issued when the error was detected.

If you are performing an **offsite restart**, then restart CICS with OFFSITE=YES still specified as a system initialization override.

Module: DFHFCRR.

XMEOUT Parameter: *applid*

Destination: Console

DFHFC0574 *applid* RLS offsite recovery will be performed. Normal RLS access is not allowed.

Explanation: OFFSITE=YES has been specified as a SIT override, and RLS is supported by this CICS (RLS=YES has been specified and the level of DFSMS/MVS supports RLS). This message is issued during file control initialization to indicate that RLS offsite recovery processing is to be carried out during this CICS run.

System action: RLS access is not allowed until after this CICS has performed its RLS recovery work. Only tasks performing the recovery work are allowed RLS access. Message DFHFC0575 is issued when RLS recovery has been completed by this CICS. RLS access for normal work is not allowed until this CICS has issued message DFHFC0575 and received the reply GO. The description of message DFHFC0575 explains when it is safe to reply to the message.

User response: Wait for message DFHFC0575 to be issued. If this does not happen shortly after CICS restart has completed, there are probably some backout failed or indoubt failed units of work which had updated RLS data sets, and which are now delaying the completion of RLS recovery. In this case you should use the INQUIRE UOWDSNFAIL command to determine the causes of

such failures, and to resolve them.

If some of the failures cannot be resolved cleanly, you may decide to force indoubt units of work and to reset locks for backout failed units of work. See the *CICS Recovery and Restart Guide* for guidance on resolving RLS retained locks.

If CICS terminates for any reason before message DFHFC0575 is issued, specify OFFSITE=YES on the restart.

OFFSITE=YES must be specified on all restarts until the offsite recovery has completed and you have responded to message DFHFC0575.

Module: DFHFCRP

XMEOUT Parameter: *applid*

Destination: Console

DFHFC0575D *applid* Reply 'GO' only after all CICS regions have completed offsite recovery and issued this message.

Explanation: This message is issued when a CICS system is participating in an offsite recovery of a CICSplex.

The message is issued when this CICS system has completed all of its RLS recovery work. CICS has backed out or committed all units of work which had made updates to data sets open in RLS mode, and which were either inflight or shunted at the time of the disaster at the primary site (or, more exactly, which were in that state at the common point in time to which the CICS system logs have been pruned).

System action: CICS processing continues, but the system task which issued this message waits for your reply. RLS access is not allowed for user applications until the reply is received, after which CICS allows new RLS work to run. The User Response explains when it is safe for you to reply.

User response: The message indicates that RLS recovery work has been completed by a particular CICS region. Replying to it indicates that all RLS recovery for the offsite CICSplex has been completed. Do not reply until all CICS regions in the CICSplex have issued this message. When this has happened, you should reply GO. When you next restart this CICS region after having replied GO, you should revert to the default value of NO for the system initialization parameter OFFSITE.

GO is the only reply allowed. If you supply any other response, the message is reissued with a new reply number.

If you suspect that there will be a problem getting some of the CICS regions in the CICSplex to complete their RLS recovery work, and would therefore prefer to shut this CICS down in the meantime, you can use the master terminal to do so. You must specify

OFFSITE=YES when you restart the CICS region because offsite recovery for the CICSplex has not been completed. Remember that OFFSITE=YES must be specified on all restarts until the offsite recovery has completed and you have responded to message DFHFC0575.

Module: DFHFCOR

XMEOUT Parameter: *applid*

Destination: Console

DFHFC0577 *applid* RLS offsite recovery is now complete. RLS access is allowed.

Explanation: This message is issued when a CICS system is participating in an offsite recovery of a CICSplex.

The message is issued when the reply GO has been supplied to message DFHFC0575.

System action: CICS allows user applications to access RLS because it is assumed that a reply of GO means that all CICS systems in the CICSplex have completed their RLS recovery work, and it is therefore safe to allow sharing of RLS data sets.

User response: Once you have received this message, you can recode your SIT overrides so that OFFSITE=NO is specified when this CICS is next restarted.

Module: DFHFCOR

XMEOUT Parameter: *applid*

Destination: Console

DFHFC0920 *applid* Open of empty file *filename* failed. VSAM codes - *eeee,rrrr,cccc*

Explanation: CICS file control issued an OPEN command for VSAM file *filename* but the command failed with VSAM return code *cccc*. The CICS internal error code *eeee* has a value of 8509 and *rrrr* is the return code in register 15.

This failure is probably caused by the file not being loaded before use by CICS.

System action: CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

Message DFHME0116 should be produced containing the symptom string for this problem.

VSAM issues a console error message.

User response: Check whether the file has been loaded before being accessed by CICS. This condition is probably the result of a user error in passing an empty file to CICS.

For the meaning of the VSAM return code, see *OS/390*

V2R10.0 DFSMS Macro Instructions for Data Sets.

Module: DFHFCFS

XMEOUT Parameters: *applid, filename, eeee, rrrr, cccc*

Destination: Console

DFHFC0931 *applid* **OPEN of data table *name* failed for reason *n*.**

Explanation: CICS was unable to OPEN the user-maintained data table *name* for reason *n*, where *n* may have one of the following values:

- 1 The data table support initialization module DFHDTINS could not be loaded.
- 2 Initialization of data table support has failed. This message is preceded by one of messages DFHFC0410, DFHFC0411 or DFHFC0412 which identifies the reason for the failure.
- 3 The source data set for the data table is not a KSDS base data set.
- 4 The data table OPEN module DFHDTST has reported an error. This message is preceded by one of messages DFHFC0430 or DFHFC0431 which identifies the error.
- 6 The file definition for the data table allows neither read nor browse access.

System action: The data table remains closed and is DISABLED. CICS processing continues.

User response: The appropriate user response depends on the reason code *n* as follows:

- 1 Check that module DFHDTINS is present in the library.
- 2 See the user action for the preceding message (which will be one of DFHFC0410, DFHFC0411 or DFHFC0412).
- 3 Check whether the data table has been associated with the intended source data set.
- 4 See the user action for the preceding message (which will be one of DFHFC0430 or DFHFC0431).
- 6 Change the SERVREQs in the file definition. There is no benefit in using data tables support for a file which cannot be read or browsed.

Module: DFHFCFS

XMEOUT Parameters: *applid, name,n*

Destination: Console

DFHFC0932 *applid* **OPEN of data table *name* was incomplete for reason *n*.**

Explanation: CICS was unable to treat *name* as a CICS-maintained data table for reason *n*.

System action: The data table's source data set is opened for access as a normal VSAM data set, and no main storage table is built. CICS processing continues.

User response: The appropriate user response depends on the reason code *n*. Refer to message DFHFC0931 for a list of reason codes and their appropriate user responses.

Urgent action is probably not necessary when this message occurs, as no function has been lost. However, READ performance may be adversely affected.

Module: DFHFCFS

XMEOUT Parameters: *applid, name,n*

Destination: Console

DFHFC0933 *applid* **MVS FREEMAIN failure detected during CLOSE of data table *name*.**

Explanation: An MVS FREEMAIN, issued while CICS was attempting to release the storage associated with data table *name*, returned the error response R15=4. Some storage in the CICS address space has not been freed. The error is probably the result of some earlier overwriting of data table control areas.

System action: CICS closes data table *name*. CICS processing continues.

User response: This condition does not adversely affect the data tables function. However, if the problem recurs take a system dump (SDUMP) as soon as possible after the appearance of this message. For example, by means of a CEMT PERFORM SNAP command.

Module: DFHFCFS

XMEOUT Parameters: *applid, name*

Destination: Console

DFHFC0935 *applid* **SHAREOPTIONS of the source for data table *name* allow inconsistencies between table and source.**

Explanation: The cross region SHAREOPTION for the source data set associated with the data table *name* is 3 or 4, or the SHAREOPTION is 2 and the table is being opened only for read access. It is possible for another job in this MVS system to update the source without notifying CICS. The result of this is that the data table may no longer match the source data set.

System action: Opening and loading of the data table

continues normally. CICS processing continues.

User response: Check that the SHAREOPTION is specified correctly and that the DISP parameter is correct.

Note that source data set changes are reflected in the data table only when the changes are made by the CICS system which owns the table.

Module: DFHFCFS

XMEOUT Parameters: *applid, name*

Destination: Console

DFHFC0936 *applid* **Initiation of loading of data table *name* has failed.**

Explanation: An attempt to initiate the table loading transaction for the data table *name* has failed.

System action: CICS processing continues. The effect this has is that the table always appears to be in the process of being loaded and the load completion exit, XDTLC, is not invoked.

One consequence of this is that the table is effectively **demand loaded**. This means that an entry is only made in the table when a transaction refers to it explicitly. A further consequence is that, for user maintained tables, API requests (other than READ) always result in a LOADING condition.

User response: Take remedial action after determining the cause of the failure from the trace of the OPEN request and from any related messages and dumps. It may be that the system action of leaving the table open, but not loaded, adversely affects your application. For example, if the application depends on being able to update a user maintained table as soon as loading is complete. If so, closing and reopening the data table may be successful as an immediate response, if the problem was simply a temporary lack of resources.

Module: DFHFCFS

XMEOUT Parameters: *applid, name*

Destination: Console

DFHFC0937 *applid* **OPEN of *name1* as a data table was not possible. The file has been opened and will use data table *name2* which has the same source.**

Explanation: File *name1* could not be opened as a CICS-maintained data table (CMT) because another CMT *name2* is already open for the source data set specified in the file definition of *name1*. However, *name1* is still able to benefit from shared data tables support by accessing the already open CMT.

System action: *name1* is opened as a normal CICS file, and therefore automatically uses the existing data

table *name2* whenever possible.

User response: This is not normally a problem, but you should ensure that the data table *name2* has the required characteristics in terms of its maximum number of records and in the behavior of any data table user exits that refer to it.

Module: DFHFCFS

XMEOUT Parameters: *applid, name1, name2*

Destination: Console

DFHFC0940I *date time applid* **CICS data table load has started for data table *name*.**

Explanation: CICS file control has detected that an open request has been issued for data table *name*, and a task has been attached to load the data table.

System action: CICS processing continues.

User response: None.

Module: DFHDTLX

XMEOUT Parameters: *date, time, applid, name*

Destination: CSFL

DFHFC0941I *date time applid* **CICS data table load has completed successfully for data table *name*.**

Explanation: The task that was attached to load the data table *name* has successfully completed loading.

System action: The user exit XDTLC is invoked, if enabled, with the parameter UEPDTORC set to indicate a successful load. CICS processing continues.

User response: None.

Module: DFHDTLX

XMEOUT Parameters: *date, time, applid, name*

Destination: CSFL

DFHFC0942E *date time applid* **CICS data table load has terminated abnormally for data table *name*, reason code = X'xx'.**

Explanation: The CICS task that is loading data table *name* has received a reason code X'xx', where X'xx' has one of the following values:

- X'FB** CICS file control has requested that the data table load be abandoned. This may occur, for example, if a close request has been made against the data table
- X'FD** an attempt has been made to add more entries to the data table than the maximum specified in the table definition
- X'FE** a shortage of virtual storage has been reported by the add entry (from DASD) service, due to a failure to get storage for the record.

System action: The user exit XDTLC is invoked, if enabled, unless file control has requested that the load be abandoned (reason code X'FB). The value of the UEPDTORC parameter passed to the exit indicates that loading completed abnormally. No more records are loaded into the data table. The user exit may ask for the file to be closed.

If the table is CICS-maintained, provided that the user exit has NOT requested that the file be closed, those records which were not added are retrieved from the source data set to satisfy API requests.

If the table is user-maintained, requests to access any record which was not added results in a “not found” response code. If the table has been closed, then API requests result in an “unenabled” response code.

CICS processing continues.

User response: The appropriate user response depends on the reason code. User responses are as follows:

- X'FB** no action necessary
- X'FD** increase the size specified for the data table, either using the SIZE parameter in the FCT entry or the MAXNUMRECS field in the CEDA definition
- X'FE** increase the available storage above the 16MB line.

Module: DFHDTLX

XMEOUT Parameters: *date, time, applid, name, X'xx'*

Destination: Console and Transient Data Queue CSFL

DFHFC0943E *date time applid* **CICS data table load has terminated abnormally for data table *name*, reason code = X'xx'.**

Explanation: The CICS task that is loading data table *name* has received an unexpected return code from CICS file control while browsing the source data set. The reason code X'xx' should be one of the following.

- X'02** ILLOGIC—A VSAM error which does not fall into one of the other categories.
- X'0C** NOTOPEN—The file is CLOSED and UNENABLED, or still open and in use, but a CLOSE request has been received.
- X'0D** DISABLED—The file is disabled.
- X'80** IOERR—I/O error.

System action: The user exit XDTLC is invoked, if enabled, with the parameter UEPDTORC set to indicate that loading completed abnormally. No more records are loaded into the data table. The user exit may ask for the file to be closed.

If the table is CICS-maintained, provided that the user exit has NOT requested that the file be closed, those records which were not added are retrieved from the source data set to satisfy API requests.

If the table is user maintained, requests to access any

record which was not added results in a “not found” response code. If the table has been closed, API requests result in an “unenabled” response code.

CICS processing continues.

User response: Investigate the reason for the return code from CICS file control. For further information about the reason code, see the description of exception conditions for the STARTBR and READNEXT commands, in the *CICS Application Programming Reference*.

Module: DFHDTLX

XMEOUT Parameters: *date, time, applid, name, X'xx'*

Destination: Console and Transient Data Queue CSFL

DFHFC0945E *date time applid* **CICS data table load has terminated abnormally for data table *name*.**

Explanation: The special CICS transaction that was loading data table *name* has detected an abnormal termination.

System action: Depending on the cause of this abnormal termination, CICS may produce either a system dump or a transaction dump.

The user exit XDTLC is invoked, if enabled, with the parameter UEPDTORC set to indicate that loading completed abnormally. CICS then terminates the loading transaction with abend code AFCM. No more records are loaded into the data table. The user exit may ask for the file to be closed.

If the table is CICS-maintained, provided that the user exit has NOT requested that the file be closed, those records which were not added, are retrieved from the source data set to satisfy API requests.

If the table is user-maintained, requests to access any record which was not added result in a “not found” response code. If the table has been closed, then API requests result in an “unenabled” response code.

CICS processing continues.

User response: Look at the system log for related CICS messages to determine the original abend detected by the loading transaction. Refer to the description of abend code AFCM for further information about the cause of the original termination.

For more information on how to determine system problems, refer to the *CICS Problem Determination Guide*.

Module: DFHDTLX

XMEOUT Parameters: *date, time, applid, name*

Destination: Console and Transient Data Queue CSFL

DFHFC0946E *date time applid* **CICS data table load has terminated abnormally for data table *name*, a call to FCFR has failed for reason code = *n*.**

Explanation: The CICS task that is loading data table *name* has failed while calling file control to browse the source data set. The value of the reason code *n* indicates the type of failure as follows

1. Response from FCFR was INVALID.
2. Response from FCFR was DISASTER.
3. Response from FCFR was PURGED.
4. FCFR failed for some unexpected reason.

System action: The user exit XDTLC is invoked, if enabled, with parameter UEPDTCORC set to indicate that loading has completed abnormally. CICS then terminates the loading transaction with abend code AFCEM. No more records are loaded into the data table. The user exit may ask for the file to be closed.

If the table is CICS-maintained, provided that the user exit has NOT requested that the file be closed, records which were not added are retrieved from the source data set to satisfy API requests. If the table is user-maintained, requests to access any record which was not added result in a “not found” response code. If the table has been closed, API requests result in an “unenabled” response code.

CICS processing continues.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Determine the cause of the failure of the domain call using the diagnostic information provided by file control.

Module: DFHDTLX

XMEOUT Parameters: *date, time, applid, name, n*

Destination: Console and Transient Data Queue CSFL

DFHFC0947E *date time applid* **CICS data table load has failed to close data table *name*, a call to FCFS has failed for reason code = *n*.**

Explanation: The CICS task that is loading data table *name* has failed while trying to close the file at the request of an exit program invoked at exit point XDTLC. The value of reason code *n* indicates the type of failure as follows

1. Response from FCFS was INVALID.
2. Response from FCFS was DISASTER.
3. Response from FCFS was PURGED.
4. FCFS failed for some unexpected reason.

System action: CICS terminates the loading transaction with abend code AFCEM.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: It is unlikely that the user exit invoked at the XDTLC exit point would request that the file should be closed unless a previous problem had occurred with the load. Determine the cause of any such previous problem by checking for earlier messages which may have been issued referring to data table *name*. Diagnostic information provided by file control may be used to investigate the failure of the close file call.

CICS processing continues.

Report the details of the symptom string given in message DFHME0116. It will aid problem determination.

Module: DFHDTLX

XMEOUT Parameters: *date, time, applid, name, n*

Destination: Console and Transient Data Queue CSFL

DFHFC0949 *date time applid* **CICS shared data table load has terminated abnormally. A call to DFHXMIQ to retrieve the parameters for the load transaction has failed with response code = *n*.**

Explanation: The CICS task to load a shared data table has failed while trying to inquire on the parameters passed to it during attach. The value of the reason code *n* indicates the type of failure as follows

1. Response from XMIQ was INVALID.
2. Response from XMIQ was DISASTER.
3. Response from XMIQ was PURGED.
4. XMIQ failed for some unexpected reason.

System action: The user exit XDTLC is not invoked as failure to retrieve the attach parameters means the filename is not known. CICS terminates the loading transaction with abend code AFCL. No records are loaded into the data table.

Requests to access any record which was not added result in a “not found” response code.

CICS processing continues.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Determine the cause of the failure of the domain call using the diagnostic information provided by the CIS Transaction Manager.

The file should be closed so that a load may be attempted again when it is next opened.

Module: DFHDTLX

XMEOUT Parameters: *date, time, applid, n*

Destination: Console and Transient Data Queue CSFL

DFHFC0950 *applid* Warning. File *filename* Opened with VSAM SHROPT 3 or 4. CICS cannot prevent concurrent updates

Explanation: VSAM share options 3 and 4 permit updating of a data set from multiple regions. Under these circumstances, CICS cannot prevent concurrent updates.

The file is being opened for update against a data set defined with share options 3 or 4, and the file has been defined with the following auto-journaling options

Either: JREQ=WU or WN if the file is defined using the FCT macro,

Or: JNLADD = BEFORE, AFTER, OR ALL if the file is defined using RDO.

System action: The file is opened and a warning message is issued.

User response: None.

Module: DFHFCN

XMEOUT Parameters: *applid, filename*

Destination: Console

DFHFC0951 *applid* {RLS | Non-RLS} OPEN of file *filename* failed. DSNAMES not available from JCL or FCT. Module *module*.

Explanation: A CICS attempt to open file *filename* failed because neither the JCL nor the FCT specified the data set name.

CICS file control did not open file *filename*, because

1. At initialization time, the startup JCL did not include a DD statement, *and*
2. No user-submitted routine allocated the file dynamically, *and*
3. The FCT does not contain a DSNAMES parameter to enable CICS to allocate the file dynamically.

System action: CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

User response: Before resubmitting the transaction, you must supply the data set name in the JCL or the FCT. You can set the name in the FCT while CICS is running by using the CEMT transaction or the EXEC CICS SET command or by using CEDA to correct and reinstall the FCT entry.

Module: DFHFCFS, DFHFCRO

XMEOUT Parameters: *applid, {1=RLS, 2=Non-RLS}, filename, module*

Destination: Console

DFHFC0952 *applid* Dynamic allocation of {RLS | Non-RLS} file *filename* failed. Return code *X'rrrr',X'cccc'* in module *module*.

Explanation: While dynamically allocating file *filename*, CICS file control issued an MVS DYNALLOC macro. The DYNALLOC failed with return code *cccc*. *rrrr* is the additional return code in register 15.

System action: CICS continues with file *filename* closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

User response: for the meaning of the DYNALLOC return codes, see the *OS/390 MVS Programming: Authorized Assembler Services Guide*.

Module: DFHFCFS DFHFCRO

XMEOUT Parameters: *applid, {1=RLS, 2=Non-RLS}, filename, X'rrrr', X'cccc', module*

Destination: Console

DFHFC0953 *applid* Non-RLS OPEN or CLOSE of file *filename* failed. CICS logic error *eeee,cccc*

Explanation: While processing a request to open or close file *filename*, CICS detected an internal logic error in the file control services program. The value of *eeee* identifies the error as follows

- 8105** The DFHFCFS set base dsname block failed. *cccc* is the return code from DFHFCFS.
- 8302** Request to DFHFCN for a pool that is not in the FCT.
- 8701** Request to DFHFCN is not OPEN or CLOSE.
- 8704** Request to DFHFCL is not BUILD or DELETE.
- 8705** Request to DFHFCL is for invalid pool number *cccc*.
- 8706** Request to DFHFCL is for pool number *cccc* that is not in the FCT.
- 8707** DFHFCL failed to build BLDVRP parameters. *cccc* is the pool number.
- 8798** Logic error at OPEN detected in DFHFCN at offset *cccc*.

System action: CICS terminates the task abnormally, produces a dump and continues processing with the status of file *filename* unchanged.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: This is probably a logic error in CICS. You should note, however, that terminating CICS with an immediate shutdown while opening or closing files may cause such logic errors to happen as a normal occurrence. This is because CICS terminated immediately without regard to running tasks.

It is also possible for this error to occur if CICS has to calculate parameters for the BLDVRP macro, (this happens if you do not supply an LSR pool definition either by CEDA DEFINE LSRPOOL or by DFHFCT

TYPE=SHRCTL), and all attempts to access the VSAM catalog for files in this LSR pool fail. Other messages are issued for the individual catalog failures.

Module: DFHFCFS

XMEOUT Parameters: *applid, filename, eeee, cccc*

Destination: Console

DFHFC0954 *applid {RLS | Non-RLS}* **OPEN of file *filename* failed. No disposition specified for dynamic allocation. Module *module*.**

Explanation: CICS file control cannot open file *filename*, because it is not allocated. It is not allocated because

1. At initialization time, the startup JCL did not include a DD statement, *and*
2. The FCT does not contain a DISP parameter to enable CICS to allocate the file dynamically.

System action: CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use this file are sent a NOTOPEN condition.

User response: If you want to use file *filename* in this run, supply the DISP parameter with the CEMT transaction or with a user transaction using the EXEC CICS SET command. When you have done this, transactions are able to access the file successfully.

The change described above is only effective for the lifetime of the CICS system. A permanent disposition definition of a file can be made either through a JCL DD statement, through a DEFINE file command, or through the DISP=operand of a macro FCT definition.

Module: DFHFCFS DFHFCRO

XMEOUT Parameters: *applid, {1=RLS, 2=Non-RLS}, filename, module*

Destination: Console

DFHFC0955 *applid* **Associated data set is *dataset*. Module *module*.**

Explanation: This message follows DFHFC0952 or DFHFC0510. It identifies the VSAM data set referred to in that message.

System action: Processing continues in the way specified in DFHFC0952 or DFHFC0510.

User response: Follow the user response for DFHFC0952 or DFHFC0510 as appropriate.

Module: DFHFCFS, DFHFCRO

XMEOUT Parameters: *applid, dataset,module*

Destination: Console

DFHFC0956 *applid {RLS | Non-RLS}* **OPEN of file *filename* failed. VSAM catalog error. Return code - X'eeee',X'cccc' in module *module*.**

Explanation: While reading the VSAM catalog to open the VSAM data set *filename*, CICS file control received the return code *cccc* from a SHOWCAT macro. The value of *eeee* is an error code from DFHFCN as follows

8112 SHOWCAT for the AIX of a path failed.

8113 SHOWCAT for the data component of a base failed.

8116 SHOWCAT for the base of a path failed.

8117 SHOWCAT for an upgrade member failed.

System action: CICS writes a system dump, and continues processing, with file *filename* closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: For the meaning of the SHOWCAT return code, see *OS/390 V2R10.0 DFSMS Macro Instructions for Data Sets*.

Module: DFHFCFS, DFHFCRO

XMEOUT Parameters: *applid, {1=RLS, 2=Non-RLS}, filename, X'eeee', X'cccc', module*

Destination: Console

DFHFC0958 *applid* **Non-RLS OPEN of file *filename* failed. VSAM resource usage conflict with open file.**

Explanation: CICS did not open file *filename* because it found that its access method control block (ACB) specified a different buffer/string resource (NSR or LSR pool) from that specified by another ACB that is already open for the same base cluster.

VSAM provides integrity for different ACBs open for the same base cluster only if they use the **same** buffer/string resource.

System action: CICS writes a system dump and continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

User response: Determine the correct buffer/string resource and change the FCT.

Alternatively, if you specify DSNSHR=UPDATE in the FCT and open the file for read only, CICS permits the use of different buffer/string resources because no integrity exposure exists.

Module: DFHFCFS

XMEOUT Parameters: *applid, filename*

Destination: Console

DFHFC0960 *applid* Non-RLS OPEN of file *filename* failed. Unable to build its LSR pool *n*. Return code - *cccc*.

Explanation: CICS has requested VSAM to build the local shared resource (LSR) pool specified in the FCT entry for file *filename*. However, VSAM was unable to complete the request. *n* is the pool number, and *cccc* is the VSAM BLDVRP return code.

System action: CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition. The first time this error occurs, CICS writes a system dump before continuing.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: For the meaning of the BLDVRP return code, see *OS/390 V2R10.0 DFSMS Macro Instructions for Data Sets*.

Module: DFHFCFS

XMEOUT Parameters: *applid, filename, n, cccc*

Destination: Console

DFHFC0961 *date time applid* Calculation of LSR pool *n* parameters incomplete. Filename *filename* has no DSNAME.

Explanation: While dynamically calculating the parameters for the local shared resource pool (LSR) *n*, CICS found an FCT entry for which no DSNAME exists (either the FCT entry has no DSNAME, or no DD statement exists).

System action: CICS processing continues.

Without a DSNAME, CICS cannot use the VSAM catalog to determine the file attributes. Therefore, in the LSR calculation, CICS uses the number of strings specified in the STRNO parameter of the FCT entry but does not use the BUFFERS or KEYLEN information.

User response: Ensure that each FCT entry has either a DSNAME, or a DD statement corresponding to its DATASET name.

Exceptionally, if you use CPSM, please note that this message is normal for file EYUDREPN in a CMAS. Do not attempt to allocate a DSNAME or a DD statement for EYUDREPN in the JCL for the CMAS.

Module: DFHFCFS

XMEOUT Parameters: *date, time, applid, n, filename*

Destination: Console and Transient Data Queue CSMT

DFHFC0962 *date time applid* Calculation of LSR pool *n* parameters incomplete for file *filename*. VSAM catalog access error. Return code - *cccc*

Explanation: While CICS was dynamically calculating the parameters for the local shared resource (LSR) pool *n*, a VSAM SHOWCAT or a VSAM LOCATE failed with return code *cccc*. Parameters for file *filename* are incomplete.

System action: CICS retains the accumulated LSR parameters for file *filename* and continues processing. No further attempts at calculating LSR parameters for file *filename* are made.

An exception trace is taken which identifies the failing VSAM request and its return code.

User response: For the meaning of the SHOWCAT return code, see *OS/390 V2R10.0 DFSMS Macro Instructions for Data Sets*. For the meaning of the LOCATE return code, see *OS/390 V2R10.0 DFSMS Advanced Services*. This error indicates a corrupted VSAM catalog. If you cannot restore the catalog, you will need further assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCL

XMEOUT Parameters: *date, time, applid, n, filename, cccc*

Destination: Console and Transient Data Queue CSMT

DFHFC0963 *applid* LSR pool *n* not deleted. Code - *cccc*

Explanation: CICS requested VSAM to delete a local shared resource (LSR) pool *n*. During processing of the request, a VSAM DLVRP macro failed with return code *cccc*. (*cccc* is the VSAM DLVRP return code.)

System action: CICS takes a system dump and continues processing with the pool still in existence.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: For the meaning of the DLVRP return code, see the *OS/390 V2R10.0 DFSMS Macro Instructions for Data Sets*.

Module: DFHFCFS

XMEOUT Parameters: *applid, n, cccc*

Destination: Console

DFHFC0964 *applid* **Non-RLS OPEN of file *filename* failed. VSAM codes - *eeee,rrrr,cccc*.**

Explanation: CICS file control issued an open for a VSAM file, *filename*. The open has failed with VSAM return code, *cccc*. *eeee* has a value of 8502 and represents the CICS internal error code and *rrrr* is the return code in register 15.

System action: CICS continues processing, with file *filename* closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: VSAM will have issued a console error message. Use the VSAM message and the VSAM return code in the CICS message to solve the problem.

For the meaning of the VSAM return code, see *OS/390 V2R10.0 DFSMS Macro Instructions for Data Sets*.

Module: DFHFCFS

XMEOUT Parameters: *applid, filename, eeee, rrrr, cccc*

Destination: Console

DFHFC0965 *applid* **Open of BDAM file *filename* failed.**

Explanation: CICS file control issued an open for a BDAM file, *filename*. The open failed.

System action:

| CICS takes a system dump and continues processing,
| with file *filename* closed and with its state
| UNENABLED. Any transaction attempting to use this file
| is sent a NOTOPEN condition.

| Message DFHME0116 should be produced containing
| the symptom string for this problem.

User response: BDAM will have issued a console error message. Refer to the BDAM message for further guidance to solve the problem.

Module: DFHFCFS

XMEOUT Parameters: *applid, filename*

Destination: Console

DFHFC0966 *applid* **Non-RLS OPEN of file *filename* failed. Unable to position ESDS. Error codes: *eeee,rrrr,cccc*.**

Explanation: Before opening the VSAM ESDS file *filename* for output, CICS file control could not determine the end-of-data relative byte address (RBA) correctly. During the positioning process, CICS may perform **any** of the following steps, each of which can fail

- Dynamically allocate the base cluster to DDname DFHESDS (if it is a path that is being opened)
- Open the base cluster for control interval (CI) processing
- Read the last CI in the file
- Determine the end-of-data in the file
- Close the base cluster
- Dynamically deallocate the base cluster.

The value of *eeee* in the message indicates the error or the failing function as follows

- 8503** Open base cluster. *rrrr* is the VSAM return code in register 15. *cccc* is the error field in the VSAM ACB.
- 8504** Read last control interval (CI). *rrrr* is the VSAM return code in register 15. *cccc* is the FDBK field in the VSAM RPL.
- 8505** Last CI middle of spanned record.
- 8506** Close base cluster. *rrrr* is the VSAM return code in register 15. *cccc* is the error field in the VSAM ACB.
- 8507** Insufficient storage to get CI
- 8508** Dynamic allocation of base. *rrrr* is the MVS return code in register 15. *cccc* is the MVS DYNALLOC return code.

System action: CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: For the meaning of the VSAM return codes, see *OS/390 V2R10.0 DFSMS Macro Instructions for Data Sets*. For the meaning of the DYNALLOC return codes, refer to the *OS/390 MVS Programming: Authorized Assembler Services Guide*. CICS file control uses control interval processing when opening a VSAM ESDS. Therefore, ensure that you have specified ACCESS(CONTROL) for the data set.

Module: DFHFCFS

XMEOUT Parameters: *applid, filename, eeee, rrrr, cccc*

Destination: Console

DFHFC0967 *applid* **Error detected while closing {RLS | Non-RLS} file *filename* - VSAM codes *X'rrrr',X'cccc'* in module *module*.**

Explanation: CICS file control issued a close for VSAM file *filename*. The close failed with VSAM return code *cccc*. *rrrr* is the return code in register 15.

System action: CICS processing continues. CICS marks file *filename* as closed because VSAM will have closed the access method control block (ACB).

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Use the VSAM return code, *cccc* and

DFHFC0968 • DFHFC0972

the preceding VSAM console message to determine the cause of the problem.

For the meaning of the VSAM return code, see *OS/390 V2R10.0 DFSMS Macro Instructions for Data Sets*.

Module: DFHFCFS, DFHFCRO

XMEOUT Parameters: *applid*, {1=RLS, 2=Non-RLS}, *filename*, X'rrrr', X'cccc', *module*

Destination: Console

DFHFC0968 *applid* **Close of BDAM file *filename* failed**

Explanation: CICS file control issued a close for a BDAM file, *filename*. The close failed.

System action:

CICS takes a system dump and continues, with file *filename* still open.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: BDAM will have issued a console error message. Use the BDAM message to solve the problem.

Module: DFHFCFS

XMEOUT Parameters: *applid*, *filename*

Destination: Console

DFHFC0969 *applid* **Non-RLS CLOSE of file *filename* failed. CICS logic error - 8799 rrrr,cccc.**

Explanation: While attempting to close file *filename*, CICS detected internal logic error 8799 in the file control services program. *cccc* is the offset in DFHFCN at which the error occurred.

System action: CICS terminates the task abnormally, takes a system dump, and continues processing with the status of file *filename* unchanged.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCFS

XMEOUT Parameters: *applid*, *filename*, *rrrr*, *cccc*

Destination: Console

DFHFC0970 *applid* **Recoverable non-RLS file *filename* opened with VSAM SHROPT 3 or 4. CICS cannot ensure integrity.**

Explanation: While opening the recoverable VSAM file *filename* for update, CICS detected that it was defined with SHAREOPTION 3 or 4, which allows updating from

multiple regions. CICS issues this message to warn you that it cannot ensure data integrity.

System action: CICS opens file *filename* and continues processing.

User response: If this integrity exposure is acceptable, no further user action is required.

If this integrity exposure is unplanned and unacceptable, cancel CICS, redefine file *filename* with a different SHAREOPTION, and restart.

Module: DFHFCFS

XMEOUT Parameters: *applid*, *filename*

Destination: Console

DFHFC0971 *applid* **Non-RLS OPEN of file *filename* returned warning when positioning ESDS. Error codes: rrrr,cccc.**

Explanation: Before opening the VSAM ESDS file *filename* for output, CICS file control had to determine the end-of-data relative byte address (RBA). The positioning process involved the dynamic allocation and deallocation of the base cluster to DDname DFHESDS. The deallocation failed.

The MVS DYNALLOC return code is *cccc*. *rrrr* is the additional return code in register 15.

System action: CICS opens the file *filename* and continues processing.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: For the meaning of the DYNALLOC return codes, see the *OS/390 MVS Programming: Authorized Assembler Services Guide*.

Module: DFHFCFS

XMEOUT Parameters: *applid*, *filename*, *rrrr*, *cccc*

Destination: Console

DFHFC0972 *applid* {RLS | Non-RLS} **OPEN of file *filename* failed. VSAM catalog entry not found, return code - 8111 X'cccc' in module *module*.**

Explanation: While opening a VSAM file *filename*, CICS file control attempted to retrieve information from the VSAM catalog using the file name given in the JCL or the FCT. This initial retrieval failed with VSAM return code *cccc* from the SHOWCAT macro. 8111 indicates where within CICS file control the error was detected.

System action: CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

User response: You have probably specified DSNAME incorrectly in the FCT. If DSNAME is correctly

specified, see the explanation of the SHOWCAT return code in *OS/390 V2R10.0 DFSMS Macro Instructions for Data Sets*.

Module: DFHFCFS, DFHFCRO

XMEOUT Parameters: *applid*, {1=RLS, 2=Non-RLS}, *filename*, X'cccc', *module*

Destination: Console

DFHFC0973 *applid* **Dynamic deallocation of {RLS | Non-RLS} file *filename* failed. Return code - X'rrrr',X'cccc' in module *module*.**

Explanation: While closing file *filename*, CICS file control issued the MVS macro, DYNALLOC, to dynamically deallocate the file. Deallocation failed with the MVS return code, *cccc*. *rrrr* is the return code in register 15.

System action: CICS continues with the file closed, but still allocated.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: If you change the DSNAME in the FCT, and then reopen the file in the same CICS run, CICS may open the original data set. For an explanation of the MVS return code, refer to the *OS/390 MVS Programming: Authorized Assembler Services Guide*.

Module: DFHFCFS, DFHFCRO

XMEOUT Parameters: *applid*, {1=RLS, 2=Non-RLS}, *filename*, X'rrrr', X'cccc', *module*

Destination: Console

DFHFC0974 *date time applid* **Calculation of LSR pool *n* parameters incomplete for file *filename*. VSAM catalog inconsistency - *oooo***

Explanation: While dynamically calculating local shared resource (LSR) parameters for file *filename*, CICS found that a VSAM SHOWCAT macro gave a normal return code, but the object retrieved was logically incorrect. *n* is the pool number, and *oooo* is the VSAM object type in error.

System action: CICS retains the accumulated LSR parameters for file *filename*, and continues processing. No further attempts at calculating LSR parameters for file *filename* are made.

User response: This error indicates a corrupted VSAM catalog. If you cannot restore the catalog, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCL

XMEOUT Parameters: *date*, *time*, *applid*, *n*, *filename*, *oooo*

Destination: Console and Transient Data Queue CSMT

DFHFC0975 *applid* **LSR pool *n* already exists**

Explanation: CICS requested VSAM to build the local shared resource (LSR) pool *n*. However, this pool already exists.

System action:

| CICS takes a system dump and continues processing. If
| the existing pool is unsuitable, subsequent file OPENS
| may fail.

| Message DFHME0116 should be produced containing
| the symptom string for this problem.

User response: Examine the system console log and the LSR statistical data for pool creation and deletion times, and in the case of the log, for possible pool delete failures. (The simplest and most likely reason for this error is the failure of a previous attempt to delete pool *n*.)

Module: DFHFCL

XMEOUT Parameters: *applid*, *n*

Destination: Console

DFHFC0976 *applid* {RLS | Non-RLS} **file *filename* not opened. DSNAME = NULLFILE or DD DUMMY. Module *module*.**

Explanation: CICS could not open file *filename*, because the DSNAME was NULLFILE or the DD statement was DUMMY.

System action: CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

User response: None.

Module: DFHFCFS, DFHFCRO

XMEOUT Parameters: *applid*, {1=RLS, 2=Non-RLS}, *filename*, *module*

Destination: Console

DFHFC0977 *applid* {RLS | Non-RLS} **OPEN of file *filename* failed. VSAM catalog error. Return code - X'eeee',X'cccc' in module *module*.**

Explanation: While CICS was opening file *filename* and retrieving information from the VSAM catalog, an SVC 26 (LOCATE macro) failed with return code *cccc*. *eeee* is the CICS internal return code, as follows

8114 SVC 26 failed on index or data.

8115 SVC 26 failed on base cluster.

System action: CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

User response: For the meaning of the LOCATE return code, see *OS/390 V2R10.0 DFSMSdfp Advanced Services*.

Module: DFHFCFS, DFHFCRO

XMEOUT Parameters: *applid*, {1=RLS, 2=Non-RLS}, *filename*, X'eeee', X'cccc', *module*

Destination: Console

DFHFC0978 *applid* {RLS | Non-RLS} **OPEN of file *filename* failed. VSAM catalog error. Return code - X'eeee' in module *module*.**

Explanation: While CICS was opening file *filename* and retrieving information from the VSAM catalog, CICS file control open/close detected a CICS logic error. *eeee* is as follows

- 8118** A VSAM catalog entry for a path does not have a base cluster or an AIX as its first association.
- 8119** In a VSAM catalog entry for an AIX, either the data association or the base cluster association is missing.
- 811A** In a VSAM catalog entry for a base cluster, the data association or the index association is missing.
- 811C** The open was requested against the data association or the index association. The base cluster, AIX or path should be specified instead.

System action: CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

User response: Obtain a VSAM LISTCAT listing for file *filename*. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCFS, DFHFCRO

XMEOUT Parameters: *applid*, {1=RLS, 2=Non-RLS}, *filename*, X'eeee', *module*

Destination: Console

DFHFC0979 *date time applid* **LSR pool *n* parameters incomplete for file *filename* because the DSNAME specified in the file entry could not be found on the VSAM catalog. VSAM has returned code *rrrr* in R15.**

Explanation: While dynamically calculating VSAM local shared resource (LSR) parameters, CICS attempted to retrieve information from the VSAM catalog

using the data set name in the FCT entry for file *filename*. The catalog access failed with the VSAM return code *rrrr* from the SHOWCAT macro.

System action: CICS continues processing, but does not use any parameters for file *filename* in calculations for the LSR pool.

User response: Ensure that you have correctly specified the JCL for the file, and that the catalog containing the file is included in the JCL. If these checks do not reveal the error, see the meaning of the SHOWCAT return code, *rrrr*, in *OS/390 V2R10.0 DFSMS Macro Instructions for Data Sets*.

Module: DFHFCFS

XMEOUT Parameters: *date*, *time*, *applid*, *n*, *filename*, *rrrr*

Destination: CSMT

DFHFC0980 *applid* **Non-RLS OPEN of base for file *filename* failed. CICS logic error *eeee*, *cccc*.**

Explanation: While trying to open the VSAM ESDS base of a path through which a record insert has been requested for file *filename*, CICS has detected an internal logic error. *eeee* is as follows

- 8E01** Request to DFHFCM is not OPEN or CLOSE.
- 8E99** Logic error during DFHFCM processing at offset *cccc*.

System action: CICS takes a system dump and terminates the transaction abnormally.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCM

XMEOUT Parameters: *applid*, *filename*, *eeee*, *cccc*

Destination: Console

DFHFC0981 *applid* **Dynamic allocation of base for non-RLS file *filename* failed. Return code *rrrr*, *cccc*.**

Explanation: While trying to open the VSAM KSDS base of a path through which a record insert has been requested for file *filename*, CICS file control issued an MVS DYNALLOC command which failed with the return code *cccc*. *rrrr* is the return code in register 15.

System action: CICS takes a system dump and terminates the transaction abnormally.

User response: For the meaning of the DYNALLOC return codes, refer to the *MVS/ESA System Programming Reference Application Development Guide*.

Module: DFHFCM

XMEOUT Parameters: *applid, filename, rrrr, cccc*

Destination: Console

DFHFC0982 *applid* **Non-RLS OPEN of base for file *filename* failed. VSAM codes - *rrrr, cccc*.**

Explanation: While trying to open the VSAM KSDS base of a path through which a record insert has been requested for file *filename*, CICS file control issued an OPEN which failed with the VSAM error code *cccc* from the ACB. *rrrr* is the VSAM return code in register 15.

System action: CICS takes a system dump and terminates the transaction abnormally.

User response: VSAM issues a console error message. Use the VSAM message and the VSAM return code in the CICS message to solve the problem.

For the meaning of the VSAM return code, see the *MVS/DFP Access Method Services for VSAM Catalogs*.

Module: DFHFCM

XMEOUT Parameters: *applid, filename, rrrr, cccc*

Destination: Console

DFHFC0983 *applid* **Non-RLS CLOSE of base for file *filename* failed. CICS logic error *eeee, cccc*.**

Explanation: While trying to close the VSAM KSDS base of a path through which a record insert has been requested for file *filename*, CICS has detected an error. *eeee* is as follows

- 8E05** Failure in DFHFCM to close VSAM base. *cccc* is the error code from the VSAM ACB.
- 8E07** SVC 99 dynamic deallocation in DFHFCM failed. *cccc* is the SVC 99 error return code.

System action: CICS takes a system dump and continues processing, with base left open.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCM

XMEOUT Parameters: *applid, filename, eeee, cccc*

Destination: Console

DFHFC0987 *applid {RLS | Non-RLS}* **OPEN of file *filename* failed: Not available for type of processing. VSAM codes - 0008, 00A8 in module *module*.**

Explanation: When CICS attempted to open the VSAM file *filename*, the OPEN failed with the VSAM

return codes shown in the message text. The probable reason for the failure is that the data set is in use by another region or another ACB in the CICS region, and that the VSAM share options prohibit the level of sharing needed to permit the OPEN.

A data set may not be open in both RLS and non-RLS mode, via different files, at the same time, with one exception. It is possible for a data set to be open in non-RLS read-only mode from either another CICS region or from batch at the same time as the data set is open in RLS mode.

System action: CICS continues processing, with the file left closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: If the data set is in use by another user, wait until it is free and then retry the OPEN.

If the problem recurs and you cannot resolve the problem, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCFS, DFHFCRO

XMEOUT Parameters: *applid, {1=RLS, 2=Non-RLS}, filename, module*

Destination: Console

DFHFC0988 *applid* **Non-RLS OPEN of file *filename* failed. This data set type is not supported by CICS.**

Explanation: An attempt to open file *filename* has failed because the file referenced a data set of a type not supported by CICS.

CICS File Control supports opening VSAM KSDS, ESDS, RRDS and VRRDS data sets, paths over KSDS and ESDS data sets, and BDAM data sets. No other data set types are supported. For example, CICS does not support opening a VSAM linear data set.

System action: CICS continues processing with *filename* closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: You have probably specified DSNAME incorrectly in the file definition. Correct the file definition.

Module: DFHFCFS

XMEOUT Parameters: *applid, filename*

Destination: Console

DFHFC0989I *applid* Non-RLS OPEN of file *filename* will be delayed because the associated data set *dataset* is being recalled.

Explanation: File *filename* is taking longer than expected to open because the associated data set has been migrated and has to be recalled before the file open processing can complete.

System action: The open of file *filename* will be delayed until its associated data set has been recalled.

User response: None.

Module: DFHFCN

XMEOUT Parameters: *applid*, *filename*, *dataset*

Destination: Console

DFHFC0990 *applid* {RLS | Non-RLS} OPEN of file *filename* failed. Recovery specified, but the path is not in the upgrade set. Base data set *dsname*. Module *module*.

Explanation: An attempt was made to open a recoverable file, associated with a VSAM path over an alternate index, for update processing (SERVREQ=ADD, DELETE or UPDATE set). However, the alternate index is not in the upgrade set of the base. CICS detects this condition and does not attempt to open the file.

If the alternate index is not in the upgrade set of the base, any updates made via the base are not reflected in the alternate index and so updates made via the path may compromise data integrity. Note the open of the path fails if RECOVERY=ALL or RECOVERY=BACKOUTONLY is specified on the path FCTE entry, or on the base data set.

The base takes the recovery attributes of the first file to open for update against it since a cold or initial start. Those attributes remain in force on the data set, and consistency checks are performed between the FCT entry and the data set at file open time.

System action: CICS continues processing with file *filename* closed and not enabled.

User response: Take the data set offline and redefine the alternate index with the UPGRADE option. Run a BLDINDEX job to bring the alternate index up to date with the base data set and then retry the open of the file.

Module: DFHFCFS, DFHFCRO

XMEOUT Parameters: *applid*, {1=RLS, 2=Non-RLS}, *filename*, *dsname*, *module*

Destination: Console

DFHFC0991 *applid* Non-RLS OPEN of file *filename* failed. Recovery attributes conflict with those on the VSAM data set - *cccc*. Base data set *dsname*

Explanation: An attempt was made to open a file *filename* for update processing. (SERVREQ=ADD, DELETE or UPDATE set), CICS detected that the recovery attributes on the file were inconsistent with those currently in force for the VSAM data set as recorded in the CICS data set name block. The file was not opened in order to maintain data integrity.

The data set takes the recovery attributes of the first file to open for update against it since a cold or initial start. Code *cccc* identifies the inconsistency found and takes the following values

- 8514** Both the file and the data set have RECOVERY=ALL specified, but the forward recovery logs specified are different.
- 8515** The data set has RECOVERY=BACKOUTONLY or RECOVERY=NONE specified, and the file is trying to open with RECOVERY=ALL.
- 8516** The data set has RECOVERY=NONE specified. The file is attempting to open with RECOVERY=BACKOUTONLY.
- 851B** The file specified RECOVERY=NONE or BACKOUTONLY. The VSAM data set had RECOVERY=ALL specified.
- 851C** The file specified RECOVERY=NONE. The VSAM data set had BACKOUTONLY specified.

System action: CICS continues processing with file *filename* closed and not enabled.

User response: Ensure that files referencing the same VSAM data set have the same recovery attributes specified.

Alter the FCT entries using the CEDA ALTER FILE command and reinstall the group.

To nullify the recovery attribute set for the base data set, the user can issue a CEMT SET DSNAME REMOVE or EXEC CICS SET DSNAME REMOVE command. This deletes the base cluster block, and leaves CICS with no record of prior recovery settings for this VSAM data set. The **first** file to subsequently open against this data set causes a new base cluster block to be built. If the file is opened for update processing, the recovery attributes of this file are copied into the base cluster block.

If you want to have files referencing the same VSAM data set with different **backout** recovery attributes you should use Global User Exit XFCNREC.

Module: DFHFCFS

XMEOUT Parameters: *applid*, *filename*, *cccc*, *dsname*

Destination: Console

DFHFC0995 *applid* Hiperspace allocation for LSR pool *n* was incomplete or zero.

Explanation: CICS requested VSAM to provide hiperspace buffers when building local shared resource (LSR) pool number *n*, but there was insufficient expanded storage available to satisfy the request completely.

System action: CICS continues processing. VSAM uses the buffers it has been able to provide.

User response: Review your installation's use of expanded storage and use MVS facilities to adjust its allocation, or change your RDO LSRPOOL definition or DFHFCT TYPE=SHRCTL definition, to reduce the hiperspace buffer requirements for pool *n*.

Module: DFHFCL

XMEOUT Parameters: *applid, n*

Destination: Console

DFHFC0996 *date time applid {Open | Close | Enable | Disable | Cancel of close}* of file *filename* suppressed due to intervention of User Exit.

Explanation: An open, close, enable, disable or cancel close request has been issued against the specified file. An exit program enabled at the global user exit point XFCSREQ in CICS file control has directed CICS not to carry out the request.

System action: If the request being issued is an enable, disable, close or cancel close request, the file state remains unchanged, that is, it remains in the same state as before the request was issued.

If the request is an open request, the state remains unchanged unless the file was in a closed, enabled state. In this state, the open request could be an implicit open request, (that is, the file is being opened as part of a file API request). If it is an implicit open request, the file state is changed to closed unenabled to ensure the file API request is halted, and a NOTOPEN condition is returned to the application.

User response: Examine the reason for the command being suppressed. This is installation specific.

Module: DFHFCFS

XMEOUT Parameters: *date, time, applid, {1=Open, 2=Close, 3=Enable, 4=Disable, 5=Cancel of close}, filename*

Destination: Console and Transient Data Queue CSMT

DFHFC0997I *applid* RLS OPEN of file *filename* is delayed because the associated data set *dsname* is being recalled.

Explanation: RLS file *filename* is taking longer than expected to open because the associated data set has been migrated and has to be recalled before the file open processing can complete.

System action: The open of file *filename* is delayed until its associated data set has been recalled.

User response: None.

Module: DFHFCRO

XMEOUT Parameters: *applid, filename, dsname*

Destination: Console

DFHFC0998 *applid* User exit XFCNREC is causing file *filename* to be opened even though a file recovery inconsistency of type *X'code'* exists. CICS cannot guarantee data integrity for base data set *dsname*

Explanation: An attempt was made to open file *filename* for update processing, (SERVREQ=ADD, DELETE or UPDATE set), and CICS detected that the backout recovery attribute on the file was inconsistent with that on the VSAM base data set. Normally CICS would fail the open on detection of an inconsistency. However, a program running at user exit XFCNREC has indicated that the open should continue even though an inconsistency has been detected. CICS can no longer guarantee the integrity of the data on the associated data set. Code *X'code'* identifies the inconsistency and can take one of the following values

X'8516 The data set has RECOVERY=NONE specified. The file is attempting to open with RECOVERY=BACKOUTONLY.

X'851C The file specified RECOVERY=NONE. The VSAM data set had BACKOUTONLY specified.

An INQUIRE on the RECOVSTATUS for the data set from this point onwards returns a NOTRECOVERABLE response. The data set is marked as not recoverable until the next CEMT SET DSNAME REMOVE, EXEC CICS SET DSNAME REMOVE command or cold or initial start.

System action: CICS opens file *filename* and continues processing using the recovery setting from the file definition to determine whether backout logging should be performed.

User response: Ensure that it is correct for the backout recovery attribute inconsistency to be ignored for this data set.

If the backout recovery attribute inconsistency should not have been ignored, ensure that files referencing the same VSAM data set have the same recovery

attributes. If they do not, either alter the FCT entries using the CEDA ALTER FILE command and reinstall the group, or alter the FCT macro definition of the file. Note that this reassembled FCT only takes effect at the next CICS cold or initial start.

To nullify the recovery attribute set for the base data set, issue a CEMT SET DSNAME REMOVE or EXEC CICS SET DSNAME REMOVE command. This deletes the base cluster block and leaves CICS with no record of prior recovery settings for this VSAM data set. The **first** file to subsequently open against this data set causes a new base cluster block to be built. If the file is opened for update processing, the recovery attributes of this file are copied into the base cluster block.

Module: DFHFCN

XMEOUT Parameters: *applid, filename, X'code', dsname*

Destination: Console

DFHFC0999 *applid* RLS OPEN of file *filename* failed. RLS access is disabled.

Explanation: While CICS was opening file *filename* the CICS file control open/close routine detected that RLS access is disabled. A PREVIOUS open or record management request received a serious error from VSAM and disabled RLS access.

System action: CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use RLS files is sent a NOTOPEN condition.

User response: Determine why RLS access was disabled.

Module: DFHFCRO

XMEOUT Parameters: *applid, filename*

Destination: Console

DFHFC2813 *applid* Program DFHRCEX cannot be found.

Explanation: An attempt to link to program DFHRCEX during file control initialization has failed. This is a severe error.

System action: CICS startup is abnormally terminated with a dump.

User response: Find out why DFHRCEX could not be located.

Module: DFHF CRP

XMEOUT Parameter: *applid*

Destination: Console

DFHFC3001 *date time applid* Record not backed out because it may have been overridden by a non-RLS batch job. Diagnostic information follows in message DFHFC3010. The record was updated by unit of work *X'local-uowid'* for file *filename*, base data set *data-set-name*

Explanation: A log record was presented to file control for backing out, but although the updated record was protected by a VSAM RLS lock, a non-RLS batch job had elected to override the RLS locks held on this data set and therefore the condition of the record can no longer be guaranteed. The update had been made to the base data set *data-set-name* via the CICS file *filename*, under the unit of work identified by *local_uowid*.

System action: The update is not backed out because the condition of the updated record cannot be guaranteed, The updated data is committed instead. Diagnostic information is provided by this message and the subsequent message DFHFC3010.

User response: See the associated message DFHFC3010 for more information and guidance.

Module: DFHFCRC

XMEOUT Parameters: *date, time,applid, X'local-uowid', filename,data-set-name*

Destination: CSFL

DFHFC3002 *date time applid* Record backed out at request of user exit although it may have been overridden by a non-RLS batch job. Diagnostic information follows in message DFHFC3010. The record was updated by unit of work *X'local-uowid'* for file *filename*, base data set *data-set-name*

Explanation: A log record was presented to file control for backing out, but although the updated record was protected by a VSAM RLS lock, a non-RLS batch job had elected to override the RLS locks held on this data set. However, an exit program enabled at the XFCBOVER exit point decided that the non-RLS batch job would not have caused corruption of the record, and requested that the backout should go ahead. The update had been made to the base data set *data-set-name* via the CICS file *filename*, under the unit of work identified by *local_uowid*.

System action: An attempt to backout the update is made because the user exit requested that backout should go ahead. Diagnostic information is provided by this message and the subsequent message DFHFC3010.

User response: See the associated message DFHFC3010 for more information and guidance.

Module: DFHFCRC

XMEOUT Parameters: *date, time, applid, X'local-uowid', filename, data-set-name*

Destination: CSFL

DFHFC3003 *date time applid* **Record not backed out because locks for a backout-failed data set have been reset. Diagnostic information follows in message DFHFC3010. The record was updated by unit of work X'local-uowid' for file filename, base data set data-set-name**

Explanation: An update made by unit of work *local-uowid* to the base data set *data set name* via the CICS file *filename* was protected by a lock while awaiting successful backout, but a decision has been taken locally to reset the locks for this data set. The log record representing the update has therefore been presented to file control for the purpose of providing diagnostic information in this and the subsequent message DFHFC3010.

System action: The update is not backed out and the lock is released. The implication of resetting the locks for a data set is that the backout has failed for some reason which cannot be easily corrected. Diagnostic information is provided by this message and the subsequent message DFHFC3010.

User response: See the associated message DFHFC3010 for more information and guidance.

Module: DFHFCRC

XMEOUT Parameters: *date, time, applid, X'local-uowid', filename, data-set-name*

Destination: CSFL

DFHFC3004 *date time applid* **Record backed out because of the forced back out of an indoubt unit of work. Diagnostic information follows in message DFHFC3010. The record was updated by unit of work X'local-uowid' for file filename, base data set data-set-name**

Explanation: A log record has been presented to file control for backing out because the local unit of work *local-uowid*, which was part of a distributed unit of work, has gone in-doubt, and CICS has backed out the local unit of work. This decision to back out the record is the result of one of the following

- CICS received an SPI SET UOW or SET DSNAME command that specified BACKOUT.
- CICS received an SPI SET UOW or SET DSNAME command that specified FORCE and the indoubt attributes on the transaction definition specified BACKOUT.
- An indoubt WAIT timeout occurred, and the transaction definition specified BACKOUT.

- One of the resource managers involved in the unit of work did not support waiting during the indoubt period.

The update being backed out was made to the base data set *data-set-name* via the CICS file *filename*. This and the subsequent message provides diagnostic information which is of use in correcting the situation if the actual resolution of the distributed unit of work was to commit it rather than to back it out.

System action: The update is backed out, and diagnostic information is provided by this message and the subsequent message DFHFC3010.

User response: See the associated message DFHFC3010 for more information and guidance.

Module: DFHFCRC

XMEOUT Parameters: *date, time, applid, X'local-uowid', filename, data-set-name*

Destination: CSFL

DFHFC3010 *date time applid* **Diagnostic information for unit of work X'local-uowid' and file filename. Update was a {read-update | write-add} made by transaction tranid at terminal termid under task number tasknum. Key length key-length, data length data-length, base ESDS RBA X'base-RBA-or-zero', record key X'record-key'**

Explanation: This message follows each DFHFC3001, DFHFC3002, DFHFC3003, or DFHFC3004 message, and provides additional information to help diagnose and correct the situation reported in the preceding message.

For any given filename and unit of work CICS normally issues messages of only one type; for example, a series of DFHFC3001 messages each followed by DFHFC3010, or a series of DFHFC3003 messages each followed by DFHFC3010.

The exception to this is when an exit program enabled at the XFCBOVER global user exit point elects to backout some updates and not to backout others. In this situation CICS might issue a combination of DFHFC3001 and DFHFC3002 messages (each followed by DFHFC3010) for the same filename and unit of work.

This message includes the following information

local-uowid

The local unit-of-work identifier for correlation with the preceding message.

filename

The file name for correlation with the preceding message.

read-update or write-add

The type of before-image log record presented

DFHFC4700

to file control. The type is *read-update* if the update made to the file was either: a READ UPDATE, READNEXT UPDATE or READPREV UPDATE request (which will normally have been followed by a REWRITE or DELETE request), or a DELETE request which specified a RIDFLD. The type is *write-add* if the update made to the file was a WRITE request.

transid The transaction under which the original update was made.

termid The terminal from which the transaction which made the original update was run.

tasknum
The task number under which the transaction which made the original update was run

key-length
The length of the record key

data-length
The length of the data in the before-image.

base-RBA-or-zero
The base RBA if the update was made to a standard addressing ESDS, or zero if the update was made to any other kind of data set. If the update was made to an extended addressing ESDS, the XRBA of the record can be found in record-key.

record-key
The value of the record key field, in hexadecimal.

System action: None beyond the system action described under the preceding message.

User response: Use the diagnostic information to determine any changes that need to be made to the data set to ensure that the contents are correct. Once you have identified the record which may not now contain the correct contents, and the transaction which originally updated it, a knowledge of your application programs should allow you to determine the necessary action.

Module: DFHFRC

XMEOUT Parameters: *date, time, applid, X'local-uowid', filename, {1=read-update, 2=write-add}, transid, termid, tasknum, key-length, data-length, X'base-RBA-or-zero', X'record-key'*

Destination: CSFL

DFHFC4700 *applid {An unexpected | A VSAM | A length | A lock | A timeout | An unexpected delete} error has occurred during file backout. (Module DFHFRCFR has returned reason code (X'xx), access method code (X'ccccccc) and length error code (X'yy).)*

Explanation: File backout has called module DFHFRCFR as part of its processing, and an error has been returned which should not be possible during backout. The message text includes the type of error that has occurred.

Additional diagnostic information is provided by the reason code *xx* returned from DFHFRCFR, the code *ccccccc* which was returned to DFHFRCFR from the access method that it called, and the length error code *yy*.

The length error code is normally either X'00, indicating that length errors are not applicable to the type of request which was in error, or X'01, indicating that there was no length error. A value greater than X'01 occurs when the message text indicates that the type of error is a length error.

System action: An exception trace point is written, and a system dump is taken.

The error is processed as a backout failure. Unless a user exit program enabled at the XFCBFAIL exit point bypasses backout failure processing, message DFHFC4701 or DFHFC4702 follows and gives details of the file and data set involved.

CICS continues.

User response: Inform the system programmer. This indicates a possible error in CICS, VSAM or BDAM code. The severity of its impact depends on whether the backout can be successfully retried.

If the data set being backed out is a VSAM data set, you can retry the backout. Message DFHFC4701 names the data set, and the failed backout can be retried using SET DSNAME RETRY. If the problem is due to some transient condition which has since cleared, the backout will now succeed.

If the data set being backed out is a BDAM data set, the backout cannot be retried. The data is committed and the locks are released, unless an exit program enabled at the XFCBFAIL exit point terminates CICS, in which case data integrity can be preserved by performing an emergency restart.

If the backout cannot be successfully retried, then take action depending on the type of error indicated in the message text

- An unexpected error
This probably indicates either a corruption of storage or an error within CICS code. It might also indicate an error within the access method called to process the request (VSAM or BDAM).

The reason code *xx* is the reason code from the DFHFRCFR parameter list and has been included as additional documentation in case you need further help from IBM.

The access method code *ccccccc* is information returned to file control in the VSAM RPL if the error was detected by VSAM, or the BDAM DECB if the

error was detected by BDAM. For VSAM, the first byte is the VSAM return code and the second byte is the VSAM reason code; the third and fourth bytes may contain additional VSAM diagnostics (for more information, see *OS/390 V2R10.0 DFSMS Macro Instructions for Data Sets*). For BDAM, the access method code is the 4-byte exception codes field from the DECB (for more information, see *OS/390 V2R10.0 DFSMS: Using Data Sets*).

- A VSAM error

This indicates that an error has occurred within VSAM.

The access method code *cccccccc* is information returned to file control in the VSAM RPL. The first byte is the VSAM return code and the second byte is the VSAM reason code; the third and fourth bytes may contain additional VSAM diagnostics (for more information, see *OS/390 V2R10.0 DFSMS Macro Instructions for Data Sets*).

- A length error

When a length error is reported, the length error code *yy* will be greater than X'01. This normally indicates a serious error in CICS, VSAM, or BDAM processing. If it occurs for a BDAM data set, check the FCT and DCB definitions in case there is a mismatch between, for example, the block sizes, which would result in a length error.

- A lock error

This indicates that backout processing has encountered a LOCKED response on attempting to acquire a lock on a record which is held as a retained lock by another unit of work. This should not be possible because the record should be locked by the unit of work being backed out. If this error occurs for a file being accessed in RLS mode, then it probably indicates an error in the SMSVSAM server. If this error occurs for a file being accessed in non-RLS mode, then it probably indicates an error in CICS enqueue processing.

- A timeout error

This indicates that backout processing has timed out attempting to acquire an RLS lock. This should not be possible during backout because the record should already be locked by the unit of work being backed out. If this error occurs then it probably indicates an error in the SMSVSAM server.

- An unexpected delete error

This indicates that the request to be backed out was a delete request, but that the file type is one for which deletes are not supported (VSAM ESDS or BDAM). The most likely cause of this error would be some corruption of the data set, although it might also indicate an error within CICS, or a storage corruption.

You may need assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCRC

XMEOUT Parameters: *applid*, {1=An unexpected, 2=A VSAM, 3=A length, 4=A lock, 5=A timeout, 6=An unexpected delete}, X'xx', X'cccccc', X'yy'

Destination: Console

DFHFC4701 *date time applid* **Backout failed for transaction *tranid*, VSAM file *filename*, unit of work X'*local_uowid*', task *task_number*, base *base_dsname*, path *path_dsname*, failure code X'*bfail_code*'.**

Explanation: File backout has been unable to backout an uncommitted change made to a VSAM data set via file *filename*, that was made by the unit of work *local_uowid*.

The file is associated with the data set *path_dsname*. This is either a base cluster data set if the *path_dsname* and *base_dsname* given in the message are the same, or is a path data set whose base cluster is the *base_dsname* given in the message if the two names differ.

The change that is being backed out was originally made by task *task_number* servicing transaction code *tranid*, running under the unit of work *local_uowid*. The current task number will differ from the original one that is given in the message if this backout is itself a retry of an earlier backout which also failed, or is a backout being carried out following resolution of an indoubt situation, and the current transaction code will differ from the original one if the transaction has been disabled.

The failure code X'*bfail_code*' indicates the reason for the failure.

System action: The system continues normally.

Backing out of the unit of work continues, but no further attempts to backout updates made by this unit of work to the *base_dsname* named in the message are made.

When the unit of work has been backed out as far as is possible, those updates which could not be backed out are deferred (shunted) until the backout can be retried.

It is possible for other work to continue to access the base cluster data set, but the records in that data set that were changed by this unit of work are locked by retained locks. This ensures that any attempt to access these records results in a LOCKED response being returned to the application. The records must remain locked until the backout has been successfully retried in order to preserve data integrity.

If, when the backout is retried, it fails again for either the same or another reason, this message is issued again, with the failure code indicating the reason for the failure on this occasion.

User response: You may decide to leave the data set online for any of the errors indicated by X'*bfail_code*'.

especially if you believe that the backout failure may have been due to some transient situation, and that the backout may succeed if retried. You can manually drive retry of the backout using the SET DSNAME REPLY command, or alternatively wait until some event triggers retries of the shunted backouts in the system.

As a last resort, and at the cost of losing data integrity, you could bypass the deferred backout of uncommitted changes to this data set using the SET DSNAME RESETLOCKS command.

The user response depends on the value of the failure code *X'bfail_code'*.

10 The backout attempted to add a duplicate key value to a unique alternate index. The backout can never be carried out unless you can delete the existing record with this alternate key value, then retry the backout using SET DSNAME REPLY. This failure can only occur for a file being accessed in non-RLS mode.

20 The data set ran out of storage while the request was being processed. You should reallocate the data set with more space, then retry the backout using SET DSNAME REPLY. Do not forward recover the data set. If you accessed the file in RLS mode, there are extra steps required to ensure that the retained locks remain associated with the data set. These are explained in the *CICS Recovery and Restart Guide*.

24 An I/O error has occurred on the data set. You should consider the possibility that the data set needs restoring, especially if there have been a large number of these messages referring to the same base cluster data set, or if there have also been I/O errors issued during request processing for that data set.

If you do decide to restore the data set, you should take the following steps

1. Prevent access to the data set
2. Restore a backup copy and forward recover the data set (for example, using CICSVR)
3. Reallow access to the data set
4. Retry deferred backouts.

For an RLS mode data set, prevent access by issuing a SET DSNAME QUIESCED command which closes all open files throughout the sysplex and prevents further RLS opens. Reallow access by issuing a SET DSNAME UNQUIESCED command, which also retries deferred backouts automatically.

For a non-RLS mode data set, prevent access by issuing a SET DSNAME UNAVAILABLE command to prevent further non-RLS opens and issue SET FILE CLOSED commands for all open files. Reallow access by issuing a SET

DSNAME AVAILABLE command, and retry deferred backouts using SET DSNAME REPLY.

- 40** Logical delete for an ESDS data set was not performed because the XFCLDEL exit either chose not to carry out the logical delete, or was not enabled.
- 41** A DFSMSdss non-BWO backup is in progress for the data set. The backout will be automatically retried when the backup completes.
- B0** A deadlock was detected. This can only happen for files opened in non-RLS mode. Since this is a transient condition, you should just retry the backout using SET DSNAME REPLY.
- C0** A failure of the VSAM RLS server was detected by this request. The backout is automatically retried when the server becomes available again.
- C1** VSAM RLS access is disabled because the server is unavailable. The backout is automatically retried when the server becomes available again.
- C2** The VSAM RLS server has recycled (failed and restarted) whilst a record was being backed out. This is a very rare occurrence since the failure and restart must have taken place after the record to be backed out was read for update, and before it was rewritten or deleted. A retry of the backout should be successful, but because the server has already become available, backout will not be automatically retried. You should use SET DSNAME REPLY to drive backout retry.
- C3** The VSAM RLS cache structure to which the data set was bound has either failed or has lost connectivity, and VSAM has been unable either to rebuild the failed cache structure, or to bind the data set to an alternative cache structure in the cache set. The backout is automatically retried when the cache structure becomes available again.
- C4** VSAM has returned a response indicating that the RLS lock structure in the coupling facility is full. Allocate a larger lock structure, rebuild into it and retry the backout using set dsname reply. See *OS/390 MVS Setting up a Sysplex*, (GC28-1779) and *DFSMS/MVS DFSMSdfp Storage Administration Reference*, (SC26-4920) for further information on how to allocate, and build into, larger lock structures.
- F0** There was no space to add another alternate key value to a non-unique alternate index. You should rebuild the data set with a larger alternate index data CI size (unless you are

already at the maximum), and then retry the backout using SET DSNAME RETRY. If you accessed the file in RLS mode, there are extra steps required to ensure that the retained locks remain associated with the data set. These are explained in the *CICS Recovery and Restart Guide*. Do not forward recover the data set.

FB An error occurred when opening the file for backout. Determine why the file would not open, and if it is possible to correct it, do so and then issue SET DSNAME RETRY to retry the backout. If the error occurred because the data set was quiesced, the backout is automatically retried when the data set is unquiesced. If the error occurred because the VSAM RLS server was not available, the backout is automatically retried when it becomes available again.

FE An error occurred which is not expected to be possible during backout. An exception trace point is written, message DFHFC4700 is issued and a system dump is taken. Use these to determine the cause of the error. It might be worth retrying the backout, using SET DSNAME RETRY, since the problem could have been some transient condition which has since cleared.

Module: DFHFCRC

XMEOUT Parameters: *date, time, applid, tranid, filename, X'local_uowid', task_number, base_dsname, path_dsname, X'bfail_code'*

Destination: Console and Transient Data Queue CSFL

DFHFC4702 *date time applid* **Backout failed for transaction *tranid*, BDAM file *filename*, unit of work *X'local_uowid'*, task *task_number*.**

Explanation: File backout has been unable to backout an uncommitted change made to a BDAM data set via file *filename*, that was made by the unit of work *local_uowid*.

The change that is being backed out was originally made by task *task_number* servicing transaction code *tranid*, running under the unit of work *local_uowid*. However, if this backout is being attempted after waiting for an indoubt situation to be resolved, the current task number will be different from the original one given in the message, and transaction code will be different from the original one if the transaction has been disabled.

System action: The system continues normally.

Backing out of the unit of work continues, and any further failures to backout changes made to this BDAM data set result in the message being reissued.

Unless a program invoked at the backout failure exit

point, XFCEBFAIL, took some action to prevent it, it is possible for other work to continue to access the BDAM data set, but data integrity is compromised because the changes have not been backed out.

User response: Unless you are prepared to continue using the data set in spite of the loss of data integrity, you should take some action to correct matters, such as closing all files that are using the data set and backing out the uncommitted changes offline.

One possible cause of a BDAM backout failure is that a logical delete could not be performed because the XFCLDEL exit either chose not to carry out the logical delete or was not enabled. If this is the case then you may want to ensure that a suitable exit program is enabled at the XFCLDEL exit point, so that any future attempts at backing out writes made to BDAM data sets will succeed.

Module: DFHFCRC

XMEOUT Parameters: *date, time, applid, tranid, filename, X'local_uowid', task_number*

Destination: Console and Transient Data Queue CSFL

DFHFC4800 *date time applid* **A failure has been detected on forward recovery log stream *log_stream*. The associated RLS data set has been quiesced. Data set *dsname***

Explanation: The logger domain has detected an error on the forward recovery log stream *log_stream*. As a result, the associated RLS data set *dsname* cannot safely continue to be used.

System action: Processing continues. The RLS data set *dsname* has been quiesced.

User response: First, take a backup of the data set to establish a new forward recovery point. You can then correct the problem causing the log stream failure, delete and redefine the failed MVS log stream, and unquiesce the data set to reallocate RLS access.

Module: DFHFCLF

XMEOUT Parameters: *date, time, applid, log_stream, dsname*

Destination: Console and Transient Data Queue CSFL

DFHFC4801 *date time applid* **A failure has been detected on forward recovery log stream *log_stream*. The associated non-RLS data set has been set unavailable and its files closed. Data set *dsname***

Explanation: The logger domain has detected an error on the forward recovery log stream *log_stream*. As a

DFHFC4802 • DFHFC5802A

result, the associated non-RLS data set *dsname* cannot safely continue to be used.

System action: Processing continues. The data set *dsname* has been set unavailable and all files associated with it have been closed.

User response: First, take a backup of the data set to establish a new forward recovery point. Then, having corrected the problem which caused the log stream failure, you can delete and redefine the failed MVS log stream. If the name of the forward recovery log stream for the data set is held in the VSAM catalog, you can now make the data set available again, using SET DSNNAME AVAILABLE. If the name of the forward recovery log stream for the data set is held in the file definition, you must issue SET JOURNALNAME RESET for the forward recovery log before making the data set available again using SET DSNNAME AVAILABLE.

Module: DFHFCLF

XMEOUT Parameters: *date, time,applid, log_stream, dsname*

Destination: Console and Transient Data Queue CSFL

DFHFC4802 *date time applid* **A failure has been detected on auto journal *journal_name*. The associated file *file_name* has been closed.**

Explanation: The logger domain has detected an error on the automatic journal *journal_name*. As a result, the automatic journal is no longer reliable.

System action: The associated file *filename* has been set closed.

User response: The appropriate action depends on how you use the automatic journal, and on whether you can tolerate missing information.

If you require a complete automatic journal with no missing information, you need to take some action to establish a new start point for the automatic journal. You can then correct the error causing the log stream failure, delete and redefine the log stream, issue SET JOURNALNAME RESET, and reopen the file.

If you do not require a complete automatic journal, if the log stream is still writeable, you can issue SET JOURNALNAME RESET, open the file, and continue autojournaling to the same journal. A message preceding this one reports details of the log stream failure.

Module: DFHFCLF

XMEOUT Parameters: *date, time,applid, journal_name, file_name*

Destination: Console and Transient Data Queue CSFL

DFHFC5801A *applid* **File OPEN has failed for VSAM data set. The BWO values in the ICF catalog indicate that data set needs to be restored and forward recovered. Data set '*dsname*'.**

Explanation: CICS has rejected a file open for the VSAM base data set *dsname*. This base data set could not be opened because the integrated catalog facility (ICF) catalog backup while open (BWO) flags indicated a corrupted data set.

This message is accompanied by message DFHFC5806 which includes the name of the file involved in the OPEN failure.

System action: The file open for data set *dsname* fails. CICS continues processing but the file is closed and its state is set to UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

User response: Carry out the following procedure

1. If a BWO copy of this VSAM data set is available
 - a. Restore the BWO copy of this data set via DFHSM and/or DFDSS.
 - b. Apply the CICS forward recovery logs via a log-apply utility, such as CICS VSAM Recovery (CICSVR), to bring the data set to a point of consistency.
2. If no BWO copy of this base data set exists but a normal quiesced copy does, apply the forward recovery logs to the data set in the normal way to bring the data set to a point of consistency.
3. Set the ICF catalog BWO flags to indicate that the data set has been recovered to the point of failure. This can be done by issuing a CEMT SET DSNNAME RECOVERED or EXEC CICS SET DSNNAME RECOVERED command.
4. Rename the data set to that of the original data set prior to the failure.
5. Make the data set available.

Some log-apply utilities, such as CICS VSAM Recovery MVS/ESA (CICSVR MVS/ESA) Version 2, set the ICF catalog BWO flags to a RECOVERED state after the CICS forward recovery logs have been applied.

Module: DFHFCACT

XMEOUT Parameters: *applid, dsname*

Destination: Console

DFHFC5802A *applid* **File OPEN has failed for VSAM data set. The BWO values in the ICF catalog indicate that data set needs to be forward recovered. Data set '*dsname*'.**

Explanation: CICS has rejected a file open for the VSAM base data set *dsname*. This base data set could not be opened because the ICF catalog backup while

open (BWO) flags indicated that the data set was back-level and needed to be forward recovered. This failure occurs if a BWO of a VSAM base data set is restored but not forward recovered. This message is accompanied by DFHFC5806 which includes the name of the file involved in the OPEN failure.

System action: The file open for data set *dsname* fails. CICS continues processing but the file is closed and its state set to UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

User response: Carry out the following procedure

1. Apply the CICS forward recovery logs via a log-apply utility, such as CICS VSAM Recovery (CICSVR), to bring the data set to a point of consistency.
2. Set the ICF catalog BWO flags to indicate that the data set has been recovered to the point of failure. This can be done by issuing a CEMT SET DSNAME RECOVERED or EXEC CICS SET DSNAME RECOVERED command.

Some log-apply utilities, such as CICS VSAM Recovery (CICSVR), set the ICF catalog BWO flags to a RECOVERED state after the CICS forward recovery logs have been applied.

Module: DFHFCAT

XMEOUT Parameters: *applid, dsname*

DFHFC5803 *applid* A severe error (code *X'code'*) has occurred while inquiring/setting VSAM data set BWO attributes. Data set '*dsname*' Return Code *X'xxxxxxx'* Reason Code *X'yyyyyyyy'* Prob Det *X'zzzzzzzzzzzzzzzzzz'*.

Explanation: A severe error has been detected in DFHFCAT while inquiring or setting ICF catalog backup while open (BWO) attributes of base data set *dsname*. The error code is the exception trace point ID which uniquely identifies the call which has failed. The code *X'code'* can take the following values

Value Meaning

X'0B57 A call to MVS/DFP Callable Services to inquire if a data set is known to a SMS sub-system has failed

X'0B59 A call to MVS/DFP Callable Services to update the BWO flags to a forward recovered state for a data set has failed

X'0B5A

A call to MVS/DFP Callable Services to update the recovery point for a data set has failed

X'0B5B

A call to MVS/DFP Callable Services to update the BWO flags to a BWO disabled state for a data set has failed

X'0B5C

A call to MVS/DFP Callable Services to inquire if the BWO flags for a data set were in a BWO enabled state has failed

X'0B5D

A call to MVS/DFP Callable Services to update the BWO flags to a BWO enabled state for a data set has failed.

For further information about CICS exception trace entries, see the *CICS Problem Determination Guide*.

The values *xxxxxxx*, *yyyyyyy* and *zzzzzzzzzzzzzzzzzz* are the BWO return code, reason code and problem determination code from the MVS/DFP Callable Services Interface call to update/inquire the ICF catalog BWO attributes.

This message is accompanied by message DFHFC5806 when a file open failure occurs or by message DFHFC5810 when a file close failure occurs.

System action: CICS makes an exception trace point entry and issues this message. No system dump is taken. The actions taken depend on the operation in progress at the time of the error.

If the error occurs while opening a file, the open request fails, the file is closed, and its state is set to UNENABLED.

If the error occurs while closing a file, the status of the file is unchanged.

If the error occurs during activity keypoint when updating the recovery point, CICS tries to update the recovery point on the next activity keypoint that creates a keypoint directory element (KPDE).

If the error occurs while setting the data set RECOVERED via CEMT or EXEC CICS commands, a non-OK response is returned.

User response: Use the return code, reason code and problem determination code to determine why the call to MVS/DFP Callable Services has failed. For further information see *MVS/DFP Callable Services* in the *MVS/DFP V3.2 System Programming Reference*.

Ensure that the appropriate level of MVS/DFP is installed on the processor where CICS is running. Also ensure that the data set is SMS managed and known to the SMS subsystem.

Module: DFHFCAT

XMEOUT Parameters: *applid, X'code', dsname, X'xxxxxxx', X'yyyyyyyy', X'zzzzzzzzzzzzzzzzzz'*

Destination: Console

DFHFC5804 *applid* File CLOSE failed during CICS termination. File ' *filename*'.

Explanation: An attempt to close file *filename* during orderly CICS termination has failed. This message is produced only as a warning that this file could not be closed. Data integrity has been maintained.

System action: CICS termination continues.

If this file was open against a base data set open for update with BACKUPTYPE=DYNAMIC specified, one of the following messages is issued on the first open for update for this base data set in the next CICS run

DFHFC5807

DFHFC5808

DFHFC5809.

User response: In order to avoid repetition of this failure, try to determine why the file was not closed from any other DFHFCxxxx messages produced during termination.

Module: DFHFCSD

XMEOUT Parameters: *applid, filename*

Destination: Console

DFHFC5805 *applid* File OPEN failed. RECOVERY attributes of VSAM data set are not valid. File ' *filename*' data set ' *dsname*'.

Explanation: The file *filename* is defined as eligible for backup while open for update (BACKUPTYPE=DYNAMIC). An attempt to open this file for update processing (SERVREQ=ADD, DELETE or UPDATE set), has failed because CICS has detected that the RECOVERY attributes have not been validated for the VSAM base data set *dsname*. A data set cannot be defined with BACKUPTYPE=DYNAMIC without RECOVERY=ALL specified.

System action: The file open for data set *dsname* fails. Processing continues but the file is closed and its state set to UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

User response: This is probably caused by a logic error in CICS. You should, however, check if there are any other DFHFCxxxx messages that indicate the cause of the error.

Module: DFHFCFS

XMEOUT Parameters: *applid, filename, dsname*

Destination: Console

DFHFC5806 *applid* File OPEN failed. DFHFCAT returned an error response from a BWO action on a VSAM data set. File ' *filename*' data set ' *dsname*'.

Explanation: An attempt to open file *filename* has failed due to the failure of a call to MVS/DFP Callable

Services or due to an invalid state returned from a call to MVS/DFP Callable Services for the VSAM base data set *dsname*. This message is accompanied by one of the following messages depending on the type of error being reported

DFHFC0002

DFHFC5801

DFHFC5802

DFHFC5803

System action: CICS fails the file open request for data set *dsname*. Processing continues but the file is closed and its state set to UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

User response: See the accompanying message for the appropriate action to take in resolving this error.

Module: DFHFCFS

XMEOUT Parameters: *applid, filename, dsname*

Destination: Console

DFHFC5807 *applid* File OPEN failed. BACKUPTYPE attributes conflict with those currently defined for the VSAM data set. File ' *filename*' data set ' *dsname*'.

Explanation: An attempt to open file *filename* for update processing, (SERVREQ=ADD, DELETE or UPDATE set), against the VSAM base data set *dsname* has failed. This is because CICS has detected an attribute conflict between the opening CICS FCT entry and the base data set's DSNB which was already opened for update. An FCT entry with a BACKUPTYPE=STATIC cannot be opened against a DSNB which already has or had an FCT entry opened against it with BACKUPTYPE=DYNAMIC. Similarly, an FCT entry with a BACKUPTYPE=DYNAMIC cannot be opened against a DSNB which already has or had an FCT entry opened against it with BACKUPTYPE=STATIC. cannot change BACKUPTYPE midway through a CICS run. In order to do this, you must destroy the DSNB and create a new one. There are three ways of doing this

- CEMT SET DSNAME REMOVE
- EXEC CICS SET DSNAME REMOVE
- Terminate CICS and restart with a cold start.

If you respecify a DSNB with BACKUPTYPE=DYNAMIC, where previously it was specified with RECOVERY=NONE or BACKOUTONLY and BACKUPTYPE=STATIC, no forward recovery logging exists for the time that the DSNB had RECOVERY=NONE or BACKOUTONLY specified. Therefore you should take a backup copy of the data set before the change. This ensures that the data set can be recovered to a consistent point should a failure occur.

System action: The file open for data set *dsname* fails. CICS continues processing but the file is closed

and its state set to UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

User response: Determine the correct values for the BACKUPTYPE and RECOVERY attributes, and if necessary, redefine them for the FCT entry via CEDA.

Alternatively, remove the old DSNB as already described and reattempt the open.

Module: DFHFCFS

XMEOUT Parameters: *applid, filename, dsname*

Destination: Console

DFHFC5808 *applid* File OPEN warning. VSAM data set already set eligible for BWO on first open for update. File '*filename*' data set '*dsname*'.

Explanation: The file *filename* is defined as eligible for backup while open for update (BACKUPTYPE=DYNAMIC). While opening this file for update processing, (SERVREQ=ADD, DELETE or UPDATE set), against the VSAM base data set *dsname*, CICS detected that the ICF catalog has already defined this base data set as eligible for BWO.

If a batch job has updated this data set in a prior batch window and a DFHSM backup was scheduled for the same time, you should discard the backup produced in the batch window as it is not possible to forward recover it to a consistent point should a failure occur. This is because updates made to the data set in the batch window are not reflected in the CICS forward recovery logs. This situation is likely to arise if CICS fails to close a file defined with BACKUPTYPE=DYNAMIC during CICS termination.

System action: CICS updates the ICF catalog recovery point and open processing continues.

User response: To ensure complete data integrity, quiesce all files opened against this base data set and take a backup copy. This can now be forward recovered at a later date and reflects updates made to this data set during a prior batch window.

Module: DFHFCFS

XMEOUT Parameters: *applid, filename, dsname*

Destination: Console

DFHFC5809 *applid* File OPEN warning. BACKUPTYPE attributes conflict with BWO values defined in ICF catalog. BWO values have been updated. File '*filename*' data set '*dsname*'.

Explanation: The file *filename* is defined as not eligible for backup while open for update (BACKUPTYPE=STATIC). While opening this file for update processing (SERVREQ=ADD, DELETE or UPDATE set), against the VSAM base data set *dsname*,

CICS detected that the BWO flags in the ICF catalog already defined this base data set as eligible for BWO. However, the CICS FCT entry and the DSNB define the base data set as not eligible for BWO.

If a batch job has updated this data set in a prior batch window and a DFHSM backup was scheduled for the same time, you should discard the backup produced in the batch window as it is not possible to forward recover it to a consistent point should a failure occur. This is because updates made to the data set in the batch window are not reflected in the CICS forward recovery logs.

This situation is likely to arise if CICS fails to close a file that is defined with BACKUPTYPE=DYNAMIC, during CICS termination and the file is redefined with BACKUPTYPE=STATIC on a subsequent CICS run.

System action: CICS updates the ICF catalog to indicate that the data set is no longer eligible for BWO. File open processing continues.

User response: Determine the correct value for the BACKUPTYPE attribute, and if necessary, redefine it via CEDA.

Module: DFHFCFS

XMEOUT Parameters: *applid, filename, dsname*

Destination: Console

DFHFC5810 *applid* File CLOSE failed. DFHFCAT returned an error response from a BWO action on a VSAM data set. File '*filename*' data set '*dsname*'.

Explanation: An attempt to close file *filename* has failed because of the failure of a call to MVS/DFP Callable Services for the VSAM base data set *dsname*. This file is defined as eligible for backup while open for update (BACKUPTYPE=DYNAMIC), and is open for update processing, (SERVREQ=ADD, DELETE or UPDATE set). This message is accompanied by message DFHFC5803 or DFHFC0002, depending on the type of error reported.

System action: The file close request for data set *dsname* fails. Processing continues and the file remains open.

User response: See the accompanying message for the appropriate action to take in resolving this error.

Module: DFHFCFS

XMEOUT Parameters: *applid, filename, dsname*

Destination: Console

DFHFC5811 *applid* File OPEN warning. **BACKUPTYPE=DYNAMIC attribute has been ignored. File 'filename' data set 'dsname'.**

Explanation: The file *filename* is defined as eligible for backup while open for update (BACKUPTYPE=DYNAMIC). During an attempt to open this file for update processing, (SERVREQ=ADD, DELETE or UPDATE set), against the VSAM base data set *dsname*, either

- CICS has detected that the appropriate levels of software needed for VSAM backup while open (BWO) support have not been installed, or
- The appropriate MVS/DFP Callable Services modules could not be loaded.

System action: CICS ignores the BACKUPTYPE=DYNAMIC parameter and continues as if STATIC were specified. File open processing continues.

User response: If BWO support is required, ensure that the appropriate level of MVS/DFP Callable Services is installed.

If BWO support is not required, ensure that the file is defined with the BACKUPTYPE=STATIC attribute.

Module: DFHFCFS

XMEOUT Parameters: *applid, filename, dsname*

Destination: Console

DFHFC5812 *applid* File OPEN warning. **BACKUPTYPE=DYNAMIC has been ignored for VSAM AIX data set. STATIC has been defaulted. File 'filename' data set 'dsname'.**

Explanation: The file *filename* is defined as eligible for backup while open for update (BACKUPTYPE=DYNAMIC). This file is opening against the data set *dsname* which is a VSAM AIX. BACKUPTYPE=DYNAMIC is not a valid option for a VSAM AIX. BACKUPTYPE=STATIC has been defaulted.

System action: File open processing continues.

User response: Redefine this file via CEDA, specifying BACKUPTYPE=STATIC.

Module: DFHFCFS

XMEOUT Parameters: *applid, filename, dsname*

Destination: Console

DFHFC5813 *applid* File OPEN warning. **Level of {DFHSM | DFDSS | DFHSM and DFDSS} does not support BWO.**

Explanation: You have opened a VSAM file for update and requested backup while open (BWO) support by

specifying BACKUPTYPE=DYNAMIC in the FCT. However, CICS has detected that the software release level of DFHSM and/or DFDSS required for BWO support has not been installed on the processor on which CICS is running.

This message is issued once for the first file to open for update and be defined as eligible for BWO after a cold or initial start.

System action: CICS file open processing continues. If the file open completes without error, the file is defined as eligible for BWO. However, no BWO backup facilities are available using DFHSM and/or DFDSS on the processor on which CICS is running.

User response: Ensure that DFHSM and/or DFDSS, both of version 2.5.0 or later, are installed on the processor on which the BWO backup is to be made. DFSMS/MVS 1.1 (DFSMSHsm and DFSMSdss) supersedes DFHSM 2.5 and DFDSS 2.5.

Module: DFHFCAT

XMEOUT Parameters: *applid, {1=DFHSM, 2=DFDSS, 3=DFHSM and DFDSS}*

Destination: Console

DFHFC5814 *applid* An error (code *X'code'*) has occurred while inquiring on VSAM data set attributes in the ICF catalog. {SHOWCAT | LOCATE} return code *X'rrrr'*. Data set *dsname*.

Explanation: While reading the ICF catalog to obtain attributes of data set *dsname*, CICS received return code *rrrr* from a VSAM SHOWCAT or LOCATE macro or detected an associated error. The error code *code* is the exception trace which uniquely identifies the error. It can take the following values

Value Meaning

X'237A SHOWCAT for the data set failed with return code *rrrr*.

X'237B In the VSAM catalog entry for an AIX, either the data association or the base cluster association is missing.

X'237C SHOWCAT for the AIX of a path failed with return code *rrrr*.

X'237D The VSAM catalog entry for a path does not have a base cluster or an AIX as its first association.

X'237E LOCATE for the data set failed with return code *rrrr*.

For further information about CICS exception trace entries, see the *CICS Diagnosis Reference*.

System action: CICS processing continues after making an exception trace entry and taking a system dump with dumpcode FC5814.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Use the SHOWCAT or LOCATE return code if present to determine the cause of the problem. For the meaning of the SHOWCAT return code, see *OS/390 V2R10.0 DFSMS Macro Instructions for Data Sets*. For the meaning of the LOCATE return code, see *OS/390 V2R10.0 DFSMSdfp Advanced Services*. A VSAM LISTCAT listing for the data set may also be useful.

If you cannot resolve the problem or the problem recurs, there may be a more severe error. In this case, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCAT

XMEOUT Parameters: *applid, X'code',{1=SHOWCAT, 2=LOCATE}, X'rrrr', dsname*

Destination: Console

DFHFC5815 *applid* **An error has occurred while inquiring on VSAM data set attributes in the ICF catalog. VSAM RLS codes X'rrrr', X'cccc'. Problem determination: X'ddddddd'. Data set dsname.**

Explanation: While reading the ICF catalog to obtain RLS attributes of data set *dsname*, CICS received reason code *cccc* from a VSAM IGVARLS macro. *rrrr* is the return code in register 15. *dddddd* is any available VSAM problem determination information.

System action: CICS processing continues after making an exception trace entry and taking a system dump with dumpcode FC5815.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Use the IGVARLS reason code and problem determination information to determine the cause of the problem. For the meaning of the IGVARLS reason code, see *OS/390 V2R10.0 DFSMSdfp Advanced Services*.

If you cannot resolve the problem or the problem recurs, there may be a more severe error. In this case, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCAT

XMEOUT Parameters: *applid, X'rrrr',X'cccc', X'ddddddd', dsname*

Destination: Console

DFHFC5820 *applid* **Any files that are still open against the base data set may need to be closed. File filename, data set dsname.**

Explanation: File *filename* was the first file to open a dynamically allocated data set *dsname*. This file is being closed leaving one or more files still open against the same base data set. However, if one of these files requires secondary extents, the request will fail with a CICS ILLOGIC error (EIBRCODE X'08BA0000).

System action: Close processing completes normally.

User response: To avoid this potential problem, you are advised to close and reopen the files that remain open against the base data set. If you are unsure of the data set associations, run a LISTCAT against the above base dataset to produce a list of all associated data sets. Use CEMT INQ FILE(*) to identify which files are affected. All of these should be closed and reopened, for example, using the CEMT SET FILE(file name) CLOSE and CEMT SET FILE(file name) OPEN.

Module: DFHFCFS

XMEOUT Parameters: *applid, filename, dsname*

Destination: Console

DFHFC6000 *date time applid* **About to {quiesce | unquiesce} data set dsname**

Explanation: This message is issued just before a request is made to VSAM RLS to quiesce or unquiesce base data set *dsname* throughout the sysplex. The quiesce or unquiesce is initiated either by an end user issuing EXEC CICS SET DSNAME QUIESCESTATE or the CEMT equivalent, or internally by CICS.

System action: The data set is quiesced or unquiesced, as indicated in the message.

User response: None.

Module: DFHFCQS

XMEOUT Parameters: *date, time,applid, {1=quiesce, 2=unquiesce}, dsname*

Destination: CSFL

DFHFC6001 *date time applid* **Data set successfully {quiesced | unquiesced} by {CICS luser}. Data set dsname**

Explanation: A request to VSAM RLS to quiesce or unquiesce base data set *dsname* throughout the sysplex has been successfully completed.

System action: CICS processing continues. The quiesce state of the data set in the ICF catalog is set to quiesced or unquiesced, as indicated in the message.

User response: None.

Module: DFHFCQS

XMEOUT Parameters: *date, time, applid, {1=quiesced, 2=unquiesced}, {1=CICS, 2=user}, dsname*

Destination: Console and Transient Data Queue CSFL

DFHFC6003 *date time applid* **Attempt by {CICS luser} to {quiesce | unquiesce} a data set has been rejected because {quiesce | unquiesce | non-BWO backup |BWO backup | unknown event} is in progress. Data set dsname**

Explanation: This message is issued after a request to VSAM RLS to quiesce or unquiesce base data set *dsname* throughout the sysplex was rejected because a conflicting data set operation is in progress for that data set. The conflicting operation is specified in the message.

System action: CICS processing continues. The quiesce state of the data set in the ICF catalog remains unchanged.

User response: Wait for the conflicting data set operation to complete then retry the quiesce or unquiesce using EXEC CICS SET DSNAME or the CEMT equivalent.

Module: DFHFCQS

XMEOUT Parameters: *date, time, applid, {1=CICS, 2=user}, {1=quiesce, 2=unquiesce}, {1=quiesce, 2=unquiesce, 3=non-BWO backup, 4=BWO backup, 5=unknown event}, dsname*

Destination: Console and Transient Data Queue CSFL

DFHFC6005 *date time applid* **Attempt by {CICS luser} to quiesce a data set has failed. Quiesce was cancelled. Data set dsname**

Explanation: A request to VSAM RLS to quiesce base data set *dsname* throughout the sysplex has been cancelled by a participating CICS region. The CICS region could be any CICS in the sysplex. The quiesce was cancelled for one of the following reasons.

- An end user issued an EXEC CICS SET DSNAME UNQUIESCED command
- User code at global exit XFCVSDS suppressed the quiesce
- User code at global exit XFCSREQ suppressed the close of a file that is open against the data set
- The quiesce would not complete and was timed out

A preceding console message in the sysplex indicates the reason. For XFCVSDS the message is DFHFC6023. For XFCSREQ the message is DFHFC6024. For timeout the message is DFHFC6020. If there is no

preceding message, EXEC CICS SET DSNAME UNQUIESCED has been used.

System action: CICS processing continues. The quiesce state of the data set in the ICF catalog is set to unquiesced as a result of the cancel.

User response: The response depends on the reason for the cancellation. If a preceding message was issued, refer to the explanation for that message for background information.

If EXEC CICS SET DSNAME UNQUIESCED was the reason, determine what the desired quiesce state should really be. If it should be quiesced, issue an EXEC CICS SET DSNAME QUIESCED command or the CEMT equivalent.

If an exit suppressed the quiesce, the user code at XFCVSDS or XFCSREQ must be disabled on all CICS regions in the sysplex before the data set can be quiesced.

If the quiesce timed out, retry the quiesce using EXEC CICS SET DSNAME QUIESCED or the CEMT equivalent. If the timeout occurs again, consider using EXEC CICS SET DSNAME IMMQUIESCED or the CEMT equivalent. This force-purges transactions accessing the data set, thereby speeding up the closing of files. Alternatively, attempt to identify any long-running transactions that are using the data set, and terminate them.

Module: DFHFCQS

XMEOUT Parameters: *date, time, applid, {1=CICS, 2=user}, dsname*

Destination: Console and Transient Data Queue CSFL

DFHFC6007 *date time applid* **Attempt by {CICS luser} to {quiesce | unquiesce} a data set failed because the SMSVSAM server is not available. Data set dsname**

Explanation: A request to VSAM RLS to quiesce or unquiesce base data set *dsname* throughout the sysplex has failed because the SMSVSAM server address space is not available.

System action: CICS processing continues. The SMSVSAM server address space should attempt to restart automatically.

The quiesce state of the data set in the ICF catalog is unpredictable.

User response: The SMSVSAM server address space should normally restart itself. If it does not, restart the SMSVSAM server address space manually. Then issue an EXEC CICS SET DSNAME command or the CEMT equivalent to set the quiesce state in the ICF catalog to quiesced or unquiesced as desired.

If the SMSVSAM server address space fails to restart,

there may be a more severe error. In this case, you need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCQS

XMEOUT Parameters: *date, time,applid, {1=CICS, 2=user},{1=quiesce, 2=unquiesce}, dsname*

Destination: Console and Transient Data Queue CSFL

DFHFC6008 *date time applid* **Attempt by {CICS luser} to {quiesce | unquiesce} a data set has failed. VSAM RLS codes X'rrrr', X'cccc'. Data set dsname**

Explanation: This message is issued after a request to VSAM RLS to quiesce or unquiesce base data set *dsname* throughout the sysplex failed with an unexpected error. The VSAM IDAQUIES macro failed with reason code *cccc*. *rrrr* is the return code in register 15.

System action: CICS processing continues after taking a system dump with dumpcode FC6008. The quiesce state of the data set in the ICF catalog is unpredictable.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Use the IDAQUIES reason code to determine the cause of the problem. For the meaning of the IDAQUIES reason code, see the *OS/390 V2R10.0 DFSMSdfp Diagnosis Reference*.

When the problem has been resolved, issue an EXEC CICS SET DSNAME command or CEMT equivalent to set the quiesce state in the ICF catalog to quiesced or unquiesced as desired.

If you cannot resolve the problem or the problem recurs, there may be a more severe error. In this case, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCQS

XMEOUT Parameters: *date, time,applid, {1=CICS, 2=user},{1=quiesce, 2=unquiesce}, X'rrrr', X'cccc', dsname*

Destination: Console and Transient Data Queue CSFL

DFHFC6009 *date time applid* **Attempt by {CICS luser} to {quiesce | unquiesce} a data set has failed because a VSAM data set could not be located dsname**

Explanation: A request to VSAM RLS to quiesce or unquiesce base data set *dsname* throughout the sysplex failed because *dsname* could not be located.

System action: CICS processing continues.

User response: Investigate associated error messages to find the cause of the problem, then retry quiesce or unquiesce.

Module: DFHFCQS

XMEOUT Parameters: *date, time,applid, {1=CICS, 2=user},{1=quiesce, 2=unquiesce}, dsname*

Destination: Console and Transient Data Queue CSFL

DFHFC6010 *date time applid* **Attempt by {CICS luser} to {quiesce | unquiesce} a data set has failed because it has been migrated. Data set dsname**

Explanation: A request to VSAM RLS to quiesce or unquiesce base data set *dsname* throughout the sysplex failed because *dsname* has been migrated. The data set must be recalled before the quiesce or unquiesce can take place.

System action: CICS processing continues.

User response: Recall the data set and retry the quiesce or unquiesce.

Module: DFHFCQS

XMEOUT Parameters: *date, time,applid, {1=CICS, 2=user},{1=quiesce, 2=unquiesce}, dsname*

Destination: Console and Transient Data Queue CSFL

DFHFC6015 *date time applid* **About to cancel {non-BWO | BWO} backup of data set dsname**

Explanation: A request is about to be made to VSAM RLS to cancel a DFSMSdss-initiated backup for base data set *dsname*. This is performed in response to user code at global exit XFCVSDS suppressing the backup.

The message indicates whether the backup is BWO or non-BWO.

System action: The backup is cancelled throughout the sysplex.

User response: None.

Module: DFHFCQS

XMEOUT Parameters: *date, time,applid, {1=non-BWO, 2=BWO}, dsname*

Destination: CSFL

DFHFC6016 *date time applid* **{Non-BWO | BWO} backup of a data set cancelled by CICS. Data set dsname**

Explanation: A request to VSAM RLS to cancel a

DFSMSdss-initiated backup for base data set *dsname* has been successful.

System action: CICS continues processing. The BWO or non-BWO backup is cancelled throughout the sysplex.

User response: None.

Module: DFHFCQS

XMEOUT Parameters: *date, time,applid, {1=Non-BWO, 2=BWO}, dsname*

Destination: Console and Transient Data Queue CSFL

DFHFC6017 *date time applid* **Attempt by CICS to cancel a {non-BWO | BWO} backup of a data set has been rejected because a cancel is already underway. Data set *dsname***

Explanation: A request to VSAM RLS to cancel a DFSMSdss-initiated backup for base data set *dsname* has been rejected because another cancel is already underway.

System action: CICS processing continues. The BWO or non-BWO backup is cancelled throughout the sysplex by the other cancel request.

User response: None.

Module: DFHFCQS

XMEOUT Parameters: *date, time,applid, {1=non-BWO, 2=BWO}, dsname*

Destination: Console and Transient Data Queue CSFL

DFHFC6018 *date time applid* **Attempt by CICS to cancel a {non-BWO | BWO} backup of a data set failed because the SMSVSAM server is not available. Data set *dsname***

Explanation: A request to VSAM RLS to cancel a DFSMSdss-initiated backup for base data set *dsname* failed because the SMSVSAM server address space was not available.

System action: CICS processing continues. The SMSVSAM server address space should attempt to restart automatically.

The BWO or non-BWO backup request is not canceled. The backup may fail or succeed depending on whether the SMSVSAM server concerned is coordinating the backup or not.

User response: The SMSVSAM server address space should normally restart itself. If it does not, restart the SMSVSAM server address space manually. Then use DFSMSdss to retry the backup if it failed.

If the SMSVSAM server address space fails to restart, a more severe error is indicated. In this case, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCQS

XMEOUT Parameters: *date, time,applid, {1=non-BWO, 2=BWO}, dsname*

Destination: Console and Transient Data Queue CSFL

DFHFC6019 *date time applid* **Attempt by CICS to cancel a {non-BWO | BWO} backup of a data set has failed. VSAM RLS codes *X'rrrr', X'cccc'*. Data set *dsname***

Explanation: A request to VSAM RLS to cancel a DFSMSdss-initiated backup for base data set *dsname* has failed with an unexpected error. The VSAM IDAQUIES macro failed with reason code *cccc*. *rrrr* is the return code in register 15.

System action: CICS processing continues after taking a system dump with dumpcode FC6019. The BWO or non-BWO backup is not cancelled.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Use the IDAQUIES reason code to determine the cause of the problem. For the meaning of the IDAQUIES reason code, see the *OS/390 V2R10.0 DFSMSdss Diagnosis Reference*.

If you cannot resolve the problem, or the problem recurs, a more severe error is indicated. In this case, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCQS

XMEOUT Parameters: *date, time,applid, {1=non-BWO, 2=BWO}, X'rrrr', X'cccc', dsname*

Destination: Console and Transient Data Queue CSFL

DFHFC6020 *date time applid* **Timeout has occurred while quiescing a data set. Quiesce will be cancelled. Data set *dsname***

Explanation: The request made to VSAM RLS to quiesce base data set *dsname* throughout the sysplex has timed out. The timeout limit is given by the system initialization parameter QUIESTIM.

This is probably due to the presence of long-running transactions on a participating CICS region failing to reach syncpoint, and therefore preventing the close of files open against the data set.

System action: CICS cancels the quiesce throughout

the sysplex by issuing an unquiesce for the data set. Depending upon the timing of the unquiesce request, one of two situations can result

1. Normally the unquiesce is processed immediately and the quiesce request is canceled by VSAM. In this case, message DFHFC6020 is followed by messages DFHFC6000 and DFHFC6001 for the unquiesce completing.
2. Occasionally, depending on the timing of the unquiesce, the original quiesce request completes before the unquiesce request has been processed. Because the unquiesce cannot be canceled, it completes thereby canceling the original quiesce. In this case, message DFHFC6020 is followed by messages DFHFC6000, DFHFC6027, a DFHFC6001 for the quiesce completing, and another DFHFC6001 for the unquiesce completing.

User response: If timeouts occur regularly, the following action can be taken to resolve the problem

- Increase the QUIESTIM SIT value. This can be useful if the system is particularly busy when quiesces are likely to be issued.
- Change the long-running transaction which is holding up the request. Note that the transaction can be on any CICS in the sysplex.

The SET DSNAME IMMQUIESCED command can be used to force purge any transaction and quiesce the data set. This should not be used regularly because force purges can occasionally abend CICS. The messages issued as part of the force purge enable the system programmer to identify the long-running transaction if no other method is available.

See also the Explanation of message DFHFC6005 for guidance.

Module: DFHFCQS

XMEOUT Parameters: *date, time, applid, dsname*

Destination: Console and Transient Data Queue CSFL

DFHFC6021 *date time applid* **An error has occurred while notifying VSAM RLS of the completion of CICS processing for a data set quiesce or backup. VSAM RLS codes X'rrrr', X'cccc'. Data set dsname**

Explanation: An unexpected error occurred when CICS notified VSAM RLS that it had completed its processing for a data set quiesce, or for a BWO or non-BWO backup. The VSAM IDAQUIES macro failed with reason code *cccc*. *rrrr* is the return code in register 15.

System action: CICS processing continues after taking a system dump is taken with dumpcode FC6021. The failure of the IDAQUIES macro may cause the data set operation to timeout or fail.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Use the IDAQUIES reason code to determine the cause of the problem. For the meaning of the IDAQUIES reason code, see the *OS/390 V2R10.0 DFSMSdfp Diagnosis Reference*.

If the data set operation has failed, retry the data set operation once the problem has been resolved,

If you cannot resolve the problem, or the problem reoccurs, a more severe error is indicated. In this case, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCQI

XMEOUT Parameters: *date, time, applid, X'rrrr', X'cccc', dsname*

Destination: Console and Transient Data Queue CSFL

DFHFC6022 STORAGE OBTAIN macro failure in CICS RLS quiesce exit. MVS code X'rrrr'

Explanation: The CICS RLS quiesce exit was driven by VSAM RLS to process a data set operation request. An attempt was made to get storage for the request but the STORAGE OBTAIN macro failed. *rrrr* is the return code in register 15.

System action: The CICS RLS quiesce exit writes a GTF trace entry. The request is **not** processed by CICS. The data set operation continues throughout the sysplex.

User response: Use the return code to determine the cause of the problem, then refer to the Explanation of message DFHFC6030 for guidance. For the meaning of the return code, refer to the *OS/390 MVS System Codes* manual.

Module: DFHFCQX

Destination: Console

DFHFC6023 *date time applid* **The quiesce of a data set has been suppressed by user exit XFCVSDS. Quiesce will be cancelled. Data set dsname**

Explanation: User code at global exit XFCVSDS has suppressed a quiesce for base data set *dsname*.

System action: CICS cancels the quiesce throughout the sysplex by issuing an unquiesce for the data set.

User response: See the Explanation of message DFHFC6005 for guidance.

Module: DFHFCQU

XMEOUT Parameters: *date, time, applid, dsname*

Destination: Console and Transient Data Queue
CSFL

DFHFC6024 *date time applid* **The quiesce of a data set has been suppressed by user exit XFCSREQ. Quiesce will be cancelled. Data set *dsname***

Explanation: User code at global exit XFCSREQ has suppressed the close of a file open against base data set *dsname*. The file was being closed because the data set was being quiesced.

System action: CICS cancels the quiesce throughout the sysplex by issuing an unquiesce for the data set.

User response: See the Explanation of message DFHFC6005 for guidance.

Module: DFHFCFS

XMEOUT Parameters: *date, time, applid, dsname*

Destination: Console and Transient Data Queue
CSFL

DFHFC6025 *date time applid {Non-BWO | BWO}* **backup of a data set has been suppressed by user exit XFCVSDS. Backup will be cancelled. Data set *dsname***

Explanation: User code at global exit XFCVSDS has suppressed a DFSMSdss-initiated backup for base data set *dsname*.

System action: CICS cancels the backup throughout the sysplex.

User response: If the backup must take place, before it can succeed the user code at XFCVSDS must be disabled on all CICS regions in the sysplex.

Module: DFHFCQU

XMEOUT Parameters: *date, time, applid, {1=Non-BWO, 2=BWO}, dsname*

Destination: Console and Transient Data Queue
CSFL

DFHFC6026 *date time applid* **An error has occurred while notifying VSAM RLS of the completion of CICS processing for a data set quiesce or backup. The SMSVSAM server is not available. Data set *dsname***

Explanation: CICS has notified VSAM RLS that it has completed its processing for a data set quiesce, or a BWO or non-BWO backup, but the SMSVSAM server address space is not available.

System action: CICS processing continues. The SMSVSAM server address space should attempt to restart automatically.

The data set operation may fail or succeed, depending on whether the SMSVSAM server concerned was coordinating the operation or not.

User response: The SMSVSAM server address space should normally restart itself. If it does not, restart the SMSVSAM server address space manually. Retry the data set operation if it has failed.

If the SMSVSAM server address space fails to restart, a more severe error is indicated. In this case, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCQI

XMEOUT Parameters: *date, time, applid, dsname*

Destination: Console and Transient Data Queue
CSFL

DFHFC6027 *date time applid* **VSAM RLS has been notified of the completion of CICS processing for a quiesce or backup of data set *dsname***

Explanation: CICS has successfully notified VSAM RLS that it has completed its processing for a data set quiesce, or a BWO or non-BWO backup.

System action: CICS processing continues. The data set operation continues throughout the sysplex, until all CICS systems involved have successfully notified VSAM RLS of the completion of their processing.

User response: None.

Module: DFHFCQI

XMEOUT Parameters: *date, time, applid, dsname*

Destination: CSFL

DFHFC6028 *date time applid* **File Control RLS quiesce system transaction *transid* has started.**

Explanation: CICS system transaction CFQS or CFQR has started successfully.

CFQS and CFQR provide support for VSAM RLS data set quiesce and unquiesce operations, DFSMSdss-initiated BWO and non-BWO backups, and certain other data set related operations.

System action: CICS processing continues.

User response: None.

Module: DFHFCQT

XMEOUT Parameters: *date, time, applid, transid*

Destination: CSFL

DFHFC6029 *date time applid* **File Control RLS quiesce system transaction *transid* has failed. Reattach will be attempted.**

Explanation: CICS system transaction CFQS or CFQR has failed due to a serious error. An attempt will be made to reattach the transaction *transid*.

A preceding message should indicate the cause of the error.

CFQS and CFQR provide support for VSAM RLS data set quiesce and unquiesce operations, DFSMSdss-initiated BWO and non-BWO backups, and certain other data set related operations.

System action: The transaction is reattached and CICS processing continues.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Check Transient Data Queue CSFL for message DFHFC6028, indicating that the reattach of the transaction was successful. If the reattach fails, VSAM RLS data set quiesce support is lost. If this happens, CICS must be restarted.

If it is not possible to restore VSAM RLS quiesce support, a more severe error is indicated. In this case, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCQT

XMEOUT Parameters: *date, time, applid, transid*

Destination: Console and Transient Data Queue CSFL

DFHFC6030 *date time applid* **The CICS RLS quiesce exit was unable to process data set operation request *X'type'* for {*data set* | *cache*} *name***

Explanation: The CICS RLS quiesce exit was driven by VSAM RLS to process data set operation request *type* for data set or cache *name*, but encountered a severe error and was unable to process the request. The error is normally caused by a STORAGE OBTAIN macro failure

A preceding console message (normally DFHFC6022) gives more information about the error.

This message is issued by DFHFCQR on behalf of the CICS RLS quiesce exit DFHFCQX. The CICS RLS quiesce exit is used by VSAM RLS to notify CICS that processing is required for the following data set related operations. The number corresponds to *type* in the message.

- 01** The quiesce of a data set
- 02** The unquiesce of a data set
- 03** The start of a DFSMSdss non-BWO backup
- 04** The end of a DFSMSdss non-BWO backup

- 05** The start of a DFSMSdss BWO backup
- 06** The end of a DFSMSdss BWO backup
- 07** The recovery of lost locks for a data set
- 08** The completion of forward recovery for a data set
- 09** The recovery of a coupling facility cache structure.

System action: CICS continues after taking a system dump with dumpcode FC6030. The data set operation request is **not** processed by CICS.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Referring to the preceding console message, attempt to determine the cause of the problem.

Because CICS could not process the request, this might invalidate later processing. For example, if the request was for the quiesce of a data set, open files against the data set must be closed manually, or the quiesce retried using EXEC CICS SET DSNAME QUIESCED or the CEMT equivalent. If the request was in connection with a BWO or non-BWO backup, the backup may be invalid and should be discarded.

If you cannot resolve the problem, or the problem recurs, a more severe error is indicated. In this case, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCQR

Explanation: An attempt by CICS to notify VSAM RLS of the completion of CICS processing for a data set quiesce or backup for the base data set *dsname* failed because the user is not authorized to access the sphere.

System action: CICS continues processing. See the message from DFSMSdss and the SMSVSAM server to identify the state of the backup request.

User response: None.

Module: DFHFCQI

XMEOUT Parameters: *date, time, applid, dsname*

Destination: Console and Transient Data Queue CSFL

DFHFC6037I *date time applid* **Program *program name* has issued an RBA request against an extended addressing ESDS data set. File *filename*. Data set *dsname*.**

Explanation: A program has issued a request using a 32-bit RBA against an extended addressing ESDS data set, which would normally be accessed by a 64-bit XRBA. The name of the file used is *filename*. The data set is *dsname*.

This message is informational.

Use of 32-bit RBAs with an extended addressing ESDS is allowed to enable existing programs to be used with extended addressing data sets. There are some limitations to what can be done by such programs because the RBA supplied is actually the low 32-bits of the 64-bit XRBA and is potentially ambiguous.

Existing programs that write records, and then subsequently browse the data set either from the beginning or the end will work. This is the normal way of using ESDS data sets.

An attempt to read a record by RBA or an attempt to start a browse at anywhere other than the beginning (RBA 0) or end (RBA -1) of the data set is unsupported and will fail.

If you do issue an unsupported RBA request you will receive one instance of message DFHFC6038 for each file against which an unsupported request is issued.

In order to avoid flooding the system with messages, this message is only produced once per CICS run. It is possible that other programs are issuing RBA requests against other extended addressing ESDS files.

System action: CICS continues processing.

User response: None. However, you may wish to review the program to ensure that it does not use RBAs in an unsupported way. You may wish to check that you have not received any instances of message DFHFC6038.

Module: DFHFCVS, DFHFCRS

XMEOUT Parameters: *date, time, applid, program name, filename, dsname*

Destination: CSFL

DFHFC6038 *date time applid* **Program** *program name*
has issued an unsupported type of RBA request against an extended addressing ESDS. The request has failed. File name *filename*. **Data set name *dsname*.**

Explanation: A program has issued a request using a 32-bit RBA against an extended addressing ESDS data set, which would normally be accessed by a 64-bit XRBA. The request failed. For extended addressing ESDS data sets, some types of file control commands are only supported with the XRBA keyword and are not supported with the RBA keyword.

The name of the file used is *filename*.. The data set is *dsname*.

Use of 32-bit RBAs with an extended addressing ESDS is allowed to enable existing programs to be used with extended addressing data sets. There are some limitations to what can be done by such programs because the RBA supplied is actually the low 32-bits of

the 64-bit XRBA and is potentially ambiguous.

The normal way of using ESDS data sets is to write records sequentially and then subsequently read the records back by a browse. This method of using an extended addressing ESDS with RBAs is supported and it should be possible to use most existing programs with an extended addressing ESDS. Programs that write records to an ESDS will work. Programs that browse the data set either from the beginning or the end will work.

However the following are not supported because they all rely on the value of the RBA.

- An attempt to read a record by RBA by a READ or READ UPDATE command.
- An attempt to start a browse (by STARTBR) at any position other than the beginning of the data set (RBA 0) or the end of the data set (RBA -1).
- An attempt to reposition a browse (by RESETBR) at any position other than the beginning of the data set (RBA 0) or the end of the data set (RBA -1).
- An attempt to change the position of the browse by changing the value of the RBA between successive READNEXT requests.
- An attempt to change the position of the browse by changing the value of the RBA between successive READPREV requests.
- An attempt to change the direction of a browse by following a READNEXT by a READPREV or by following a READPREV by a READNEXT.

In order to avoid flooding the system with messages, you will only receive one instance of message DFHFC6038 for each file against which an unsupported request is issued. It is possible that other programs are issuing unsupported RBA requests against the same file.

System action: CICS continues processing.

User response: If you do not need to store more than 4 gigabytes of data in the data set, you may be able to leave the program unchanged and convert the data set to one that does not use extended addressing. Otherwise you must change the program to use XRBA rather than RBA. When changing the program, you must change all 4-byte areas that hold RBAs into 8-byte areas to hold XRBA, as well as changing the RBA keyword to XRBA.

Module: DFHFCVS, DFHFCRS

XMEOUT Parameters: *date, time, applid, program name, filename, dsname*

Destination: CSFL

DFHFC6040 *date time applid* Timeout period has expired processing a generic delete against an RLS file. The task was waiting on a record that was beyond the genus of the generic delete request. Once the request has timed out, the request completed and the task resumed normal execution. File name *filename*. Data set name *dsname*.

Explanation: A program has issued a generic delete command against an RLS file. The request involves a series of get update and erase requests to VSAM to remove the records within the genus of the delete. When a record with a key outside the genus of the delete is encountered, the command completes. It is possible that this record is currently locked to another request. If so, the generic delete waits for the other request to complete, or eventually will timeout. If it times out, CICS treats this as a successful completion of the generic delete operation, and the task resumes normal execution.

The name of the file used is *filename*. The data set is *dsname*.

System action: This is an informational message that identifies when a generic delete request against an RLS file is delayed for this particular reason. CICS continues processing.

User response: Investigate the other users of the file if appropriate.

Module: DFHFRCRS

XMEOUT Parameters: *date, time, applid, filename, dsname*

Destination: CSFL

DFHFC6041 W *DATE TIME APPLID* ATTEMPT TO UNQUIESCE DATA SET "DSNAME" FAILED DUE TO A CONFLICT WITH ANOTHER TASK.

Explanation: An attempt by CICS to unquiesce data set *dsname* has failed because of a conflict with another task attempting to use the same data set.

System action: CICS processing continues. The quiesce state of the data set is unpredictable.

User response: Try the unquiesce request again by issuing an EXEC CICS SET DSNAME or the CEMT equivalent command specifying the UNQUIESCE option to set the quiesce state of the data set in the ICF catalog to unquiesced.

If the problem persists, a more severe error has occurred. Change the dump table to take a system dump on this message and contact IBM for assistance. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFRCQU

XMEOUT Parameters: *date, time, applid, dsname*

Destination: Console and Transient Data Queue CSFL

DFHFC7000 *applid* The maximum records parameter(*rrrr*) specified on OPEN of coupling facility data table *dddd*, poolname *pppp*, for file *filename*, differs from the current maximum records parameter(*ssss*) for the table.

Explanation: During OPEN of coupling facility data table *dddd* for file *filename* it has been found that the maximum records parameter *rrrr* specified in the file definition is different from that already specified for the table on a previous OPEN or server SET command.

System action: The open continues. This is a warning message. The maximum records parameter *ssss* already set is the one that applies. The different maximum records parameter is ignored.

User response: Ensure that the maximum records parameter that is in use is as expected. If not, delete the table and reopen it after correcting the maximum records parameter in the file definition. Alternatively, reopen the table via another file definition that already has the correct maximum records parameter or use the coupling facility data table server SET command to change the maximum records parameter for the table.

Module: DFHFRCDO

XMEOUT Parameters: *applid, rrrr, dddd, pppp, filename, ssss*

Destination: Console

DFHFC7002 *applid* OPEN of coupling facility data table *dddd* for file *filename*, pool *poolname*, has failed because access is not allowed.

Explanation: The OPEN of coupling facility data table *dddd* for file *filename*, pool *poolname* has failed because access is not allowed. The security check for the table has failed.

A RACF message containing a return code indicating the reason for failure will have been issued prior to this message.

System action: The table cannot be opened.

User response: Set the correct table access using RACF.

Module: DFHFRCDO

XMEOUT Parameters: *applid, dddd, filename, poolname*

Destination: Console

DFHFC7003 *applid* **OPEN of coupling facility data table *dddd* for file *filename*, pool *poolname*, has failed because the table is not currently available for access.**

Explanation: The OPEN of coupling facility data table *dddd* for file *filename*, pool *poolname*, has failed because the table is currently not available for access. The table has been set unavailable by an earlier server command. This prevents the opening of new files against this table.

System action: The table cannot be opened. CICS continues processing with the table closed and its state unenabled. Any transactions attempting to use the table will get a NOTOPEN condition.

User response: Ensure that the server command to set the table available is issued before attempting to open the file. The format of this command is MODIFY server-name,SET TABLE=name,AVAILABLE=YES/NO

Module: DFHFCDO

XMEOUT Parameters: *applid, dddd,filename, poolname*

Destination: Console

DFHFC7004 *applid* **OPEN of coupling facility data table *dddd* for file *filename*, pool *poolname*, has failed because the table is not yet loaded.**

Explanation: The OPEN of coupling facility data table *dddd* for file *filename*, pool *poolname*, has failed because the table requires loading and is not already being loaded. The user has tried to open it for shared access. A shared access open will only succeed if the table is already being loaded or has completed loading.

System action: The table cannot be opened.

User response: Investigate why the table has not already been loaded or started loading. Change the file definition to make this OPEN do the load if that is appropriate.

Module: DFHFCDO

XMEOUT Parameters: *applid, dddd,filename, poolname*

Destination: Console

DFHFC7005 *applid* **OPEN of coupling facility data table *dddd* for file *filename*, pool *poolname*, has failed because of a shared access conflict.**

Explanation: The OPEN of coupling facility data table *dddd* for file *filename*, pool *poolname*, has failed because of a shared access conflict. CICS either requests an EXCLUSIVE open (for the purposes of loading) or a SHARED open (for all other cases).

For a shared open request, this error means that the open mode which CICS has specified for this data table

conflicts with the shared access mode which has been specified by an existing exclusive open for the data table. For an exclusive open request, this means that the shared access mode which CICS has specified on the open conflicts with one or more existing shared opens for the data table. CICS should not normally specify conflicting open or shared access modes.

System action: The file cannot be opened.

User response: Investigate the access modes of other opens against the data table *dddd* in pool *poolname*, using a server query, to determine whether there is an error.

Module: DFHFCDO

XMEOUT Parameters: *applid, dddd,filename, poolname*

Destination: Console

DFHFC7006 *applid* **OPEN of coupling facility data table *dddd* for file *filename*, pool *poolname*, has failed because of an exclusive access conflict.**

Explanation: The OPEN of coupling facility data table *dddd* for file *filename*, pool *poolname* has failed because of an exclusive access conflict. Exclusive access to the data table is not available. This error can occur when CICS has requested an exclusive open in order to load the data table from a source data set, if another open already has exclusive access. The error can also occur on a request to delete a data table if there are any opens against the data table. CICS should not normally specify access modes which could result in an exclusive access conflict.

System action: The table cannot be opened.

User response: Investigate any other opens against the data table *dddd* in pool *poolname*, for example using a server query, to determine whether it is expected that access is denied.

Module: DFHFCDO

XMEOUT Parameters: *applid, dddd,filename, poolname*

Destination: Console

DFHFC7007 *applid* **OPEN of coupling facility data table *dddd* for file *filename*, pool *poolname*, has failed because one or more attributes on the file definition are incompatible with those that were set for the table when it was created.**

Explanation: An OPEN request naming an existing table specifies one or more attributes for the table which are not compatible with those for the existing table. The coupling facility data table server has rejected the open.

The attributes that may be incorrect are

- record length

- key length
- initial load option
- update model
- recovery status

This can also occur if the coupling facility data table server that is attempting to open the table is at a lower release level than the server which created the table, as the newer server may have set internal attributes when it created the table which are not supported by the older server.

System action: CICS fails the open.

User response: Use the coupling facility data table server DISPLAY command to view the attributes for the table and then determine whether

- the file definition for the table just opened should have its attributes changed to match the server values
- the already created table is incorrect because the file definition whose open caused the creation of the table has incorrect attributes. In this case the table should be deleted and recreated either by correcting the file definition or via a file definition which already has the correct values.

Note that this problem could occur if there has been unintentional use of the same table name in different file definitions.

When the problem has been corrected, retry the open.

Module: DFHFCDO

XMEOUT Parameters: *applid, dddd, filename, poolname*

Destination: Console

DFHFC7010 *applid* **OPEN of coupling facility data table *dddd* for file *filename*, pool *poolname*, has failed because recovery is not enabled.**

Explanation: An attempt was made to open a recoverable table *dddd* for read/write access, but the client region has not yet issued a restart request to enable recovery support for this pool connection.

System action: The open fails.

User response: Investigate why there has been no restart request by checking for CICS error messages.

Module: DFHFCDO

XMEOUT Parameters: *applid, dddd, filename, poolname*

Destination: Console

DFHFC7012 *applid* **OPEN of coupling facility data table *dddd* for file *filename*, pool *poolname*, has failed because there is no space in the pool.**

Explanation: The coupling facility list structure for the table pool has no more space available.

System action: The open fails.

User response: Investigate whether space can be freed in the coupling facility list structure by deleting tables, or records in tables, that are no longer required.

Alternatively, use the DISPLAY POOLSTATS command to find if the structure is currently at its maximum size; and if not, increase the size using the SETXCF ALTER command.

Module: DFHFCDO

XMEOUT Parameters: *applid, dddd, filename, poolname*

Destination: Console

DFHFC7013 *applid* **OPEN of coupling facility data table *dddd* for file *filename*, pool *poolname*, has failed because the maximum number of tables has been reached.**

Explanation: A new table cannot be created because the maximum number of tables specified when the first server was started for the structure has been reached.

System action: The open fails.

User response: Investigate whether the number can be increased or whether there are any tables no longer required that could be deleted.

Module: DFHFCDO

XMEOUT Parameters: *applid, dddd, filename, poolname*

Destination: Console

DFHFC7014 *applid* **OPEN of coupling facility data table *dddd* for file *filename*, pool *poolname*, has failed because there are too many users.**

Explanation: The number of concurrent opens for table *dddd* has reached the maximum supported limit which is currently 1024. This means that there are already 1024 files open which all reference the same coupling facility data table in the same coupling facility data table pool.

System action: The open fails.

User response: Investigate reducing the number of concurrent users; that is, the number of files open against this coupling facility data table.

Module: DFHFCDO

XMEOUT Parameters: *applid, dddd, filename, poolname*

Destination: Console

DFHFC7015 *applid* **OPEN of coupling facility data table *dddd* for file *filename*, pool *poolname*, has failed because the table has been destroyed.**

Explanation: Table *dddd* in pool *poolname* is no longer valid. The most likely cause is that a delete request overlapped with the current request.

System action: The open fails.

User response: Investigate whether the table was deleted. This is not an error if the table is no longer required. If the table is still required, it should be recreated by opening it again.

Module: DFHFCDO

XMEOUT Parameters: *applid, dddd,filename, poolname*

Destination: Console

DFHFC7018 *applid* **OPEN of coupling facility data table *dddd* for file *filename*, pool *poolname*, has failed because the table requires loading.**

Explanation: The OPEN of file *filename* has failed because it requires the associated coupling facility data table *dddd*, which resides in coupling facility data table pool *poolname*, to have been pre-loaded, but the table has not yet been loaded. Automatic loading of the data table could not be initiated because there is no source data set specified for this file, either in the file definition or in the CICS startup JCL.

System action: The file cannot be opened.

User response: There are a number of possible operational errors which might have resulted in this failure

1. The application does not require the coupling facility data table *dddd* to be pre-loaded. The 'load required' parameter should be removed from the file definition for file *filename*.
2. The application does require the coupling facility data table *dddd* to be pre-loaded, but it should already have been loaded before file *filename* was opened.

If this is the case, then there should be at least one file definition within the sysplex that names data table *dddd* in pool *poolname* and which specifies a source data set, or for which the source data set is supplied in the CICS startup JCL. You should issue an open for one of the files which specifies the source data set, after which an open of this file should succeed.

You may also want to put operational procedures in place which will ensure that in future this file is only opened after the data table has been loaded. Use of

the data tables load complete global user exit point, XD TLC, might be one way of achieving this.

3. The application does require the coupling facility data table *dddd* to be pre-loaded, and it is intended that the load should be automatically initiated by opening file *filename* (unless the table has already been loaded).

A source data set name should have been specified, either in the file definition for file *filename* or in the CICS startup JCL as a DD card for file *filename*, depending on whether dynamic allocation or preallocation is required respectively.

Module: DFHFCDO

XMEOUT Parameters: *applid, dddd,filename, poolname*

Destination: Console

DFHFC7019 *applid* **OPEN of coupling facility data table *dddd* for file *filename*, pool *poolname*, has failed because the table requires loading but the supplied data set is not KSDS.**

Explanation: The OPEN of file *filename* has failed because it requires the associated coupling facility data table *dddd*, which resides in coupling facility data table pool *poolname*, to have been pre-loaded, but the table has not yet been loaded. Automatic loading of the data table could not be initiated because the source data set specified for this file, either in the file definition or in the CICS startup JCL, is not a KSDS. Coupling facility data tables can only be loaded from VSAM KSDS data sets.

System action: The file cannot be opened.

User response: Investigate whether the reason for this error is that the file should not have been defined as requiring loading, or that the data set name specified is incorrect, or that no data set name should have been specified (because the data table should be pre-loaded via some other file definition before this file is opened). Correct the file definition, re-install and retry the open.

Module: DFHFCDO

XMEOUT Parameters: *applid, dddd,filename, poolname*

Destination: Console

DFHFC7032 *applid* **CLOSE of coupling facility data table *dddd* for file *filename*, pool *poolname*, has failed because the table has been destroyed.**

Explanation: The table is no longer valid in the pool. The most likely reason is that a delete request overlapped with the current request.

System action: The close fails.

User response: Investigate whether the table was deleted. This is not an error if the table is no longer required. If the table is still required, it should be

DFHFC7051 • DFHFC7073

recreated by opening it again.

Module: DFHFCDO

XMEOUT Parameters: *applid, dddd,filename, poolname*

Destination: Console

DFHFC7051 *applid* **A request to inquire on which attributes of coupling facility data table dddd, file filename, pool poolname, are incompatible has failed because the table could not be found.**

Explanation: Inquire for coupling facility data table *dddd* has failed because during the request it was found that the table could not be found. CICS File Control issued the inquire as the result of an open failure due to incompatible table attributes. The inquire was intended to provide which attributes were in error so that they could be given as part of the open failure diagnostics.

System action: The table open has failed due to incompatible attributes and the processing to provide more information on which attributes are incorrect has detected that the table can now not be found.

User response: Investigate why the table cannot be found.

Module: DFHFCDO

XMEOUT Parameters: *applid, dddd,filename, poolname*

Destination: Console

DFHFC7071 *applid* **The request to set shared access for coupling facility data table dddd, file filename, pool poolname, at the end of a successful table load, has failed because access is not allowed.**

Explanation: At the end of a coupling facility data table load, the source data set is closed and CICS File Control requests the server to change the table access from the exclusive access that was required for loading, to a shared access. The server has indicated that the table is not available for access. The security check for the table has failed.

A RACF message containing a return code indicating the reason for failure will have been issued prior to this message.

System action: Although the table successfully opened and loaded, the load is not considered complete because the request to the server to set the access to 'shared' has not occurred. The table is closed again ready for the next open attempt which will reattempt the load. The close will still get the security error, but the CICS side of close will complete.

User response: Investigate why the table is not available for access. Set the required table access, if possible, using RACF.

Module: DFHFCDO

XMEOUT Parameters: *applid, dddd,filename, poolname*

Destination: Console

DFHFC7072 *applid* **The request to set shared access for coupling facility data table dddd, file filename, pool poolname, at the end of a successful table load, has failed because the table cannot be found.**

Explanation: At the end of a coupling facility data table load the source data set is closed, and CICS File Control requests the server to change the table access from the exclusive access that was required for loading to shared access. The server has returned that the table cannot be found.

System action: Although the table was successfully opened and loaded, the load is not considered complete because the request to the server to set the access to shared has not occurred. The table is closed again ready for the next open attempt which will retry the load. The close will still get the error, but the CICS side of close will complete.

User response: Investigate why the table cannot be found. If it is still required open it again so that it will be recreated and reloaded.

Module: DFHFCDO

XMEOUT Parameters: *applid, dddd,filename, poolname*

Destination: Console

DFHFC7073 *applid* **The request to set shared access for coupling facility data table dddd, file filename, pool poolname, at the end of a successful table load, has failed because of a shared access conflict.**

Explanation: At the end of a coupling facility data table load the source data set is closed, and CICS File Control requests the server to change the table access from the exclusive access that was required for loading to shared access. The server has returned that it cannot process the request because of a shared access conflict.

System action: Although the table successfully opened and loaded, the load is not considered complete because the request to the server to set the access to shared has not occurred. The table is closed again ready for the next open attempt which will retry the load. The close will still get the error, but the CICS side of close will complete.

User response: Investigate the access mode of other table, and what other files are open against it, to determine if there is an error. The coupling facility data table server supports commands, such as DISPLAY

TABLE, which will provide you with this information.

Module: DFHFCDO

XMEOUT Parameters: *applid, dddd,filename, poolname*

Destination: Console

DFHFC7079 *applid* **The request to set shared access for coupling facility data table dddd, file filename, pool poolname, at the end of a successful table load, has failed because the table has been destroyed.**

Explanation: At the end of a coupling facility data table load the source data set is closed, and CICS File Control requests the server to change the table access from the exclusive access that was required for loading to shared access. The server has returned that the request has failed because the table has been destroyed.

System action: All requests to use the table will return the same error.

User response: Investigate why the table has been destroyed. If it is still required open it again so that it will be recreated and reloaded.

Module: DFHFCDO

XMEOUT Parameters: *applid, dddd,filename, poolname*

Destination: Console

DFHFC7081 *applid* **OPEN of coupling facility data table dddd for file filename, pool poolname, has failed because the key length or record length parameter on the file definition is inconsistent with the equivalent for the source data set.**

Explanation: The OPEN of coupling facility data table *dddd* has failed because before the call to the server to perform the actual open, CICS has found that the record length and/or keylength specified by the user on the file definition does not match that returned by VSAM when the associated source data set was opened.

System action: The table cannot be opened.

User response: Check whether the file definition is in error or whether the wrong data set has been specified. It is not necessary to specify the parameters on the file definition if there is a source data set. Clear the parameters or make them the same as the source.

Module: DFHFCDO

XMEOUT Parameters: *applid, dddd,filename, poolname*

Destination: Console

DFHFC7082 *applid* **OPEN of coupling facility data table dddd for file filename, pool poolname, has failed because the key length or record length parameter for the source data set is inconsistent with the value already set for the table.**

Explanation: The OPEN of coupling facility data table *dddd* has failed because the values for record length and/or key length returned for the table on the open do not match those for the source data set specified in the file definition.

System action: The table cannot be opened.

User response: Check whether the wrong data set has been specified in the file definition. If the table is opened and loaded by another user, it is not necessary for this user to specify a source data set in the definition.

Module: DFHFCDO

XMEOUT Parameters: *applid, dddd,filename, poolname*

Destination: Console

DFHFC7083 *applid* **OPEN of coupling facility data table dddd for file filename, pool poolname, has failed because the key length or record length parameter specified on the file definition is inconsistent with that already set for the table.**

Explanation: The OPEN of coupling facility data table *dddd* has failed because the values for record length and/or key length returned for the table on the open do not match those specified in the file definition for the table.

System action: The table is closed again.

User response: Check whether the wrong data set has been specified in the file definition. If the table is opened and loaded by another user, it is not necessary for this user to specify record length and key length on the file definition. Attention is drawn to the mismatch rather than ignoring it in case there is an error.

Module: DFHFCDO

XMEOUT Parameters: *applid, dddd,filename, poolname*

Destination: Console

DFHFC7084 *applid* **OPEN of coupling facility data table dddd for file filename, pool poolname, has failed because the table cannot be found.**

Explanation: When a coupling facility data table server fails, all the files which were accessing tables in that pool are marked as requiring a re-open after connection to a new server instance. This is required so

DFHFC7085 • DFHFC7090

that a valid table token is obtained for the new instance. The re-open for coupling facility data table *dddd* for file *filename*, pool *poolname*, has failed because the table has gone away (possibly due to a failure of the coupling facility) since it was last opened for this file.

System action: The table cannot be opened. CICS closes and enables the file so that a full open can be tried later. The full open will recreate the table (unless the file definition specifies that the table must already have been recreated, in which case another file definition which specifies it is capable of recreating and loading the table must be opened first).

User response: Retry when the table is available.

Module: DFHFCDO

XMEOUT Parameters: *applid, dddd, filename, poolname*

Destination: Console

DFHFC7085 *applid* On a request to process {OPEN | CLOSE | EXTRACT STATISTICS} for coupling facility data table *dddd* for file *filename*, it has been found that the server for coupling facility data table pool *poolname*, is down. The server should be restarted.

Explanation: CICS has issued a request to a file which is defined to use a coupling facility data table which resides in the pool *poolname*. CICS did not currently have a connection established to the pool, so an attempt to connect to the pool has to be made. Before the connect, a query is issued to check whether the server for the pool is available. The query has failed because the server is currently down.

A coupling facility data table server is a separate address space which handles all requests made to coupling facility data tables that reside in the pool which it serves.

System action: If the request is an open, CICS fails the request to the coupling facility data table.

If the request is a close, CICS can complete close processing as normal.

If the request is to extract statistics, issued while gathering file control statistics, the request to obtain the statistics will fail. If the request is to extract statistics, issued as part of INQUIRE FILE processing in order to return the current MAXNUMRECS limit, then the INQUIRE FILE request can complete as normal, but the MAXNUMRECS value returned may differ from the current actual value.

New requests to coupling facility data tables which reside in this pool will check whether the server is available, and will attempt another connect if it is.

User response: Determine the reason for the failure. Diagnostic messages issued by the coupling facility data table server address space should assist you in doing

this. The most likely cause of this error is a problem with the coupling facility. The coupling facility data table server does not automatically restart itself, so after you have corrected the cause of the error, you should resubmit the job which starts the server.

Module: DFHFCDO

XMEOUT Parameters: *applid, {1=OPEN, 2=CLOSE, 3=EXTRACT STATISTICS}, dddd, filename, poolname*

Destination: Console

DFHFC7086 *applid* OPEN of coupling facility data table *dddd* for file *filename*, pool *poolname*, has failed because the {keylength | recordsize} of the source data set is greater than the supported maximum.

Explanation: The OPEN of file *filename*, associated with coupling facility data table *dddd* in coupling facility data table pool *poolname*, has failed because the key length and/or record size of the source data set specified for the file is greater than the value supported.

For a coupling facility data table, the key length must be less than or equal to 16 bytes, and the record size must be less than or equal to 32767 bytes.

The message indicates whether it was the key length or the record size which was found to be too large.

System action: The file is left closed.

User response: Check whether the wrong data set has been specified for this file (either in the file definition or in the CICS start-up JCL), and whether this data table really requires pre-loading from a source data set.

If the correct data set was specified, then this file may not be suitable for use as a coupling facility data table. If this was because the key length was beyond the range supported for coupling facility data tables, then consider redefining the file as a user-maintained data table or as an RLS file.

If the data table does not need to be pre-loaded, then specify LOAD(NO) on the file definition, and a key length and record size which are in the supported ranges.

Module: DFHFCDO

XMEOUT Parameters: *applid, dddd, filename, poolname, {1=keylength, 2=recordsize}*

Destination: Console

DFHFC7090 *date time applid* CICS coupling facility data table load has started for data table *dddd*, file *filename*, pool *poolname*.

Explanation: CICS file control has detected that an open request has been issued for coupling facility data

table data table *dddd*, and a task has been attached to load the data table.

System action: CICS processing continues.

User response: None.

Module: DFHFCDL

XMEOUT Parameters: *date, time, applid, dddd, filename, poolname*

Destination: CSFL

DFHFC7091 *date time applid* **CICS coupling facility data table load has successfully processed all records in the source data set for table *dddd*, file *filename*, pool *pool*.**

Explanation: The task which was attached to load coupling facility data table *dddd* has successfully processed all of the records in the associated source data set. The load, however, is not complete until user exit XDTLC has been called, and the table has been marked as loaded, with its access changed from EXCLUSIVE to SHARED.

System action: The user exit XDTLC is invoked, if enabled, with the parameter UEPDTORC set to indicate a successful load. The coupling facility data table server is called to mark the table as loaded and to set the access to shared. Another message (DFHFC7095) will be issued indicating that these have completed and that the load is complete. CICS processing continues.

User response: None.

Module: DFHFCDL

XMEOUT Parameters: *date, time, applid, dddd, filename, pool*

Destination: CSFL

DFHFC7092 *date time applid* **CICS data table load has terminated abnormally for coupling facility data table *dddd*, file *filename*, pool *poolname*, because the table has been closed.**

Explanation: The CICS task that is loading coupling facility data table *dddd* has found that CICS file control has requested that the load be abandoned because the file has been closed.

System action: The load transaction terminates. CICS processing continues. Any records already loaded will remain in the table. The next open will start the load transaction again which will continue the load.

User response: Investigate why the file has been closed.

Module: DFHFCDL

XMEOUT Parameters: *date, time, applid, dddd, filename, poolname*

Destination: Console and Transient Data Queue CSFL

DFHFC7093 *date time applid* **CICS data table load has terminated abnormally for coupling facility data table *dddd*, file *filename*, pool *poolname*, reason code = *X'xx'*.**

Explanation: The CICS task that is loading coupling facility data table *dddd* has received a reason code *X'xx*, where *X'xx* has one of the following values:

- X'02** ILLOGIC - A VSAM error which does not fall into one of the other categories.
- X'0C** NOTOPEN - The file is CLOSED and UNENABLED, or still open and in use, but a CLOSE request has been received.
- X'0D** DISABLED - The file is DISABLED.
- X'0F** ENDFILE - The file is CLOSED and UNENABLED, or still open and in use, but a CLOSE request has been received.
- X'80** IOERR - I/O error.
- X'84** TABLE_FULL - Maximum records exceeded.
- X'85** RLS_DISABLED - RLS access currently not available.
- X'86** RLS_FAILURE - The RLS server has failed.
- X'87** PREVIOUS_RLS_FAILURE - The RLS server has been recycled in this unit of work.
- X'88** CACHE_FAILURE - Cache connectivity failure.
- X'89** CFDT_POOL_FULL - No more space available in the coupling facility structure for the table pool.
- X'8A** DATASET_BEING_COPIED - DSS is performing a sharp copy

System action: The user exit XDTLC is invoked, if enabled, with the parameter UEPDTORC set to indicate that loading completed abnormally. The user exit may ask for the file to be closed. No more records are loaded into the coupling facility data table.

If the user exit did not request the file to be closed (or if no user exit program was enabled at the XDTLC exit point), then API requests to access records within the range of keys which has already been loaded into the data table will succeed, but requests to access any record beyond the loaded range will receive the "LOADING" condition.

If the file has been closed, then API requests will receive a "NOTOPEN" condition.

CICS processing continues.

User response: Investigate the reason for the return code from CICS file control. For further information about the reason code, see the description of exception conditions for the STARTBR, READNEXT and WRITE commands in the *CICS Application Programming Reference*.

You may be able to correct the cause of the failure, for

example by explicitly enabling the file if the reason is DISABLED, or re-cycling the RLS server if it has failed. If the error is TABLE_FULL, meaning that the number of records to be loaded into the table exceeds the MAXNUMRECS parameter, then you can increase this parameter using the coupling facility data tables server command SET TABLE=tablename,MAXRECS=n. (Note that although altering the MAXNUMRECS parameter on the file definition within CICS, using SET FILE for example, will not have any effect on the current setting for the data table, you should consider resetting it to the new value in order to avoid getting a warning message about the mismatch.) If the error is CFDT_POOL_FULL, then you can increase the size of the coupling facility data table pool that this data table resides in.

If it is possible to correct the problem which caused the load to fail, then you can complete the load of the coupling facility data table by closing the file which attempted the load (if it has not already been closed) and re-opening it, or any other file which is capable of loading the table; that is, which has access to the source data set. This will cause the load to be restarted from the point at which it failed.

Module: DFHFCDL

XMEOUT Parameters: *date, time,applid, dddd, filename, poolname, X'xx'*

Destination: Console and Transient Data Queue CSFL

DFHFC7094 *date time applid CICS data table load has terminated abnormally for coupling facility data table dddd, file filename, pool poolname, reason code = X'xx'.*

Explanation: The request to close the source data set at the end of load of coupling facility data table *dddd* has failed. The most likely cause of the failure is an error on the SET call to the coupling facility data table server to mark the table as loaded and to set the table access as shared, either because the server was down at the time of the SET or because of an error returned by file control during processing.

System action: The table and source are closed, leaving the table in a state such that a subsequent open may be able to complete the load.

CICS processing continues.

User response: Determine the cause of the failure using the diagnostic information provided by file control.

Module: DFHFCDL

XMEOUT Parameters: *date, time,applid, dddd, filename, poolname, X'xx'*

Destination: Console and Transient Data Queue CSFL

DFHFC7095 *date time applid CICS coupling facility data table load has completed successfully for data table dddd, file filename, pool pool.*

Explanation: The task that was attached to load coupling facility data table *dddd* has successfully completed loading.

System action: The user exit XD TLC has been invoked and has accepted the load. The table has been marked as loaded and the table access has been set to SHARED. CICS processing continues.

User response: None.

Module: DFHFCDL

XMEOUT Parameters: *date, time,applid, dddd, filename, pool*

Destination: CSFL

DFHFC7096 *date time applid CICS has successfully performed the first connection to the Coupling Facility Data Table Server for pool pool.*

Explanation: The first connection to the coupling facility data table server has completed successfully.

System action: CICS processing continues.

User response: None.

Module: DFHFCDL DFHFCDR

XMEOUT Parameters: *date, time,applid, pool*

Destination: CSFL

DFHFC7097 *date time applid CICS has successfully reconnected to the Coupling Facility Data Table Server for pool pool.*

Explanation: A reconnection to the coupling facility data table server has completed successfully.

System action: CICS processing continues.

User response: The reason for the reconnection should be investigated by examining the joblog for the coupling facility data table server. Messages will have been output by the server detailing what events have occurred and whether there is a risk that any data has been lost.

Module: DFHFCDL DFHFCDR

XMEOUT Parameters: *date, time,applid, pool*

Destination: CSFL

DFHFC7100 *date time applid* CICS data table load has terminated abnormally for coupling facility data table *name*, file *filename*, pool *poolname*, a call to FCFR to BROWSE the source data set has failed for reason code = *n*.

Explanation: The CICS task which is loading coupling facility data table *dddd* has failed while calling file control to browse the source data set. The value of the reason code *n* indicates the type of failure as follows

1. Response from FCFR was INVALID.
2. Response from FCFR was DISASTER.
3. Response from FCFR was PURGED.
4. FCFR failed for some unexpected reason.

System action: The user exit XDTLC is invoked, if enabled, with the parameter UEPDTORC set to indicate that loading completed abnormally. The user exit may ask for the file to be closed. No more records are loaded into the coupling facility data table, and CICS terminates the loading transaction with abend code ACFA.

If the user exit did not request that the file be closed (or if no user exit program was enabled at the XDTLC exit point), then API requests to access records within the range of keys which has already been loaded into the data table will succeed, but requests to access any record beyond the loaded range will receive the "LOADING" condition.

If the file has been closed, then API requests will receive a "NOTOPEN" condition.

CICS processing continues.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Determine the cause of the failure of the domain call using the diagnostic information provided by file control.

If it is possible to correct the problem which caused the browse to fail, then you can complete the load of the coupling facility data table by closing the file which attempted the load (if it has not already been closed) and re-opening it, or any other file which is capable of loading the table; that is, which has access to the source data set. This will cause the load to be restarted from the point at which it failed.

Module: DFHFCDL

XMEOUT Parameters: *date, time, applid, name, filename, poolname, n*

Destination: Console and Transient Data Queue CSFL

DFHFC7101 *date time applid* CICS data table load has failed to close coupling facility data table *dddd*, file *filename*, pool *poolname*, a call to FCFS has failed for reason code = *n*.

Explanation: The CICS task that is loading coupling facility data table *dddd* has failed while trying to close the file at the request of an exit program invoked at exit point XDTLC. The value of reason code *n* indicates the type of failure as follows

1. Response from FCFS was INVALID.
2. Response from FCFS was DISASTER.
3. Response from FCFS was PURGED.
4. FCFS failed for some unexpected reason.

System action: CICS terminates the loading transaction with abend code ACFA.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: It is unlikely that the user exit invoked at the XDTLC exit point would request that the file should be closed unless a previous problem had occurred with the load. Determine the cause of any such previous problem by checking for earlier messages which may have been issued referring to data table *dddd*. Diagnostic information provided by file control may be used to investigate the failure of the close file call.

CICS processing continues.

Report the details of the symptom string given in message DFHME0116. It will aid problem determination.

Module: DFHFCDL

XMEOUT Parameters: *date, time, applid, dddd, filename, poolname, n*

Destination: Console and Transient Data Queue CSFL

DFHFC7103 *date time applid* CICS data table load has terminated abnormally for coupling facility data table *dddd*, file *filename*, pool *poolname*.

Explanation: The special CICS transaction that was loading coupling facility data table *dddd* has detected an abnormal termination.

System action: Depending on the cause of this abnormal termination, CICS may produce either a system dump or a transaction dump.

The user exit XDTLC is invoked, if enabled, with the parameter UEPDTORC set to indicate that loading completed abnormally. The user exit may ask for the file to be closed. No more records are loaded into the coupling facility data table, and CICS terminates the loading transaction with abend code ACFA.

If the user exit did not request that the file be closed (or if no user exit program was enabled at the XDTLC exit point), then API requests to access records within the range of keys which has already been loaded into the data table will succeed, but requests to access any record beyond the loaded range will receive the "LOADING" condition.

If the file has been closed, then API requests will receive a "NOTOPEN" condition.

CICS processing continues.

User response: Look at the system log for related CICS messages to determine the original abend detected by the loading transaction. Refer to the description of abend code ACFA for further information about the cause of the original termination.

For more information on how to determine system problems, refer to the *CICS Problem Determination Guide*.

If it is possible to correct the problem which caused the load to abend, then you can complete the load of the coupling facility data table by closing the file which attempted the load (if it has not already been closed) and re-opening it, or any other file which is capable of loading the table; that is, which has access to the source data set. This will cause the load to be restarted from the point at which it failed.

Module: DFHFCDL

XMEOUT Parameters: *date, time, applid, dddd, filename, poolname*

Destination: Console and Transient Data Queue CSFL

DFHFC7104 *date time applid* **CICS data table load has terminated abnormally for coupling facility data table *dddd*, file *filename*, pool *poolname*, a call to FCFR to WRITE a record has failed for reason code = *n*.**

Explanation: The CICS task that is loading coupling facility data table *dddd* has failed while calling file control to write to the data table. The value of the reason code *n* indicates the type of failure as follows

1. Response from FCFR was INVALID.
2. Response from FCFR was DISASTER.
3. Response from FCFR was PURGED.
4. FCFR failed for some unexpected reason.

System action: The user exit XDTLC is invoked, if enabled, with the parameter UEPDTORC set to indicate that loading completed abnormally. The user exit may ask for the file to be closed. No more records are loaded into the coupling facility data table, and CICS terminates the loading transaction with abend code ACFA.

If the user exit did not request that the file be closed (or if no user exit program was enabled at the XDTLC exit

point), then API requests to access records within the range of keys which has already been loaded into the data table will succeed, but requests to access any record beyond the loaded range will receive the "LOADING" condition.

If the file has been closed, then API requests will receive a "NOTOPEN" condition.

CICS processing continues.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Determine the cause of the failure of the domain call using the diagnostic information provided by file control.

If it is possible to correct the problem which caused the write to fail, then you can complete the load of the coupling facility data table by closing the file which attempted the load (if it has not already been closed) and re-opening it, or any other file which is capable of loading the table; that is, which has access to the source data set. This will cause the load to be restarted from the point at which it failed.

Module: DFHFCDL

XMEOUT Parameters: *date, time, applid, dddd, filename, poolname, n*

Destination: Console and Transient Data Queue CSFL

DFHFC7110 *applid* **An attempt to connect to coupling facility data table pool *poolname*, issued by module *modulename*, has failed.**

Explanation: CICS has issued a request to a file which is defined to use a coupling facility data table which resides in the pool *poolname*. CICS did not currently have a connection established to the pool, so an attempt to connect to the pool has been made. This attempt has failed. The connect attempt was issued from module *modulename*.

A coupling facility data table server is a separate address space that handles all requests made to coupling facility data tables which reside in the pool which it serves. CICS must have a connection to the server before it can open and access coupling facility data tables in the pool.

System action: CICS fails the request to the coupling facility data table.

New requests to coupling facility data tables which reside in this pool will check whether the server is available and will attempt another connect if it is.

User response: Determine the reason for the failure to connect. Diagnostic messages issued by the coupling facility data table server address space should assist you in doing this. The most likely cause of this error is a

problem with the coupling facility. The coupling facility data table server does not automatically restart itself, so after you have corrected the cause of the error, you should resubmit the job which starts the server.

Module: DFHFCDR, DFHFCDO, DFHFCDU

XMEOUT Parameters: *applid, poolname, modulename*

Destination: Console

DFHFC7111 *applid* **An attempt to disconnect from the coupling facility data table server for pool *poolname* for connection token *X'connecttoken'*, issued by module *modulename*, has failed.**

Explanation: CICS has detected that an instance of the coupling facility data table server for pool *poolname* has failed. CICS has therefore attempted to disconnect from this pool server, but this attempt has failed. The disconnect has been issued by module *modulename*, and *connecttoken* is the token which was associated with the connection to this pool server.

A coupling facility data table server is a separate address space that handles all requests made to coupling facility data tables which reside in the pool which it serves.

System action: CICS continues. As soon as a new instance of the pool server is available (which it might already be) then CICS can re-establish a connection to the server and continue to process coupling facility data table requests.

In many cases, CICS will later be able to disconnect from the server automatically. If not, the only effect of this failure is that some storage allocated by the server to the connection will not be freed until CICS terminates, at which time a disconnect message will be issued by the pool server for each instance from which CICS failed to disconnect.

User response: Determine the reason for the failure to disconnect. Diagnostic messages issued by the coupling facility data table server address space should assist you in doing this.

Module: DFHFCDR, DFHFCDO, DFHFCDU

XMEOUT Parameters: *applid, poolname, X'connecttoken', modulename,*

Destination: Console

DFHFC7112 *applid* **Resynchronization of coupling facility data table pool *poolname* issued from module *modulename* has failed.**

Explanation: CICS has issued a request to a file which is defined to use a coupling facility data table which resides in the pool *poolname*. CICS did not currently have a connection established to the server for this pool, so an attempt to connect to and resynchronize

the pool server has been made, but the resynchronization has failed. The attempt to resynchronize was issued from module *modulename*.

A coupling facility data table server is a separate address space that handles all requests made to coupling facility data tables which reside in the pool which it serves. When CICS re-establishes its connection to a coupling facility data table pool server, it must perform resynchronization in order to complete recovery processing for any unresolved units of work which had made recoverable updates to coupling facility data tables residing in the pool.

System action: CICS fails the request to the coupling facility data table.

Other requests to coupling facility data tables which reside in this pool will succeed if they do not require the pool to have been resynchronized, or might attempt another resynchronization if they do.

User response: Determine the reason for the failure to resynchronize. Diagnostic messages issued by CICS components involved in the resynchronization and by the coupling facility data table server address space should assist you in doing this.

Depending on the stage during resynchronization at which the failure occurred, any subsequent request to a recoverable file which uses a coupling facility data table in the pool might trigger an attempt to retry the resynchronization. If such requests do not trigger a retry, then you should recycle the server region for this pool (by stopping or cancelling the server region using a server command, and then restarting it).

Module: DFHFCDR, DFHFCDO, DFHFCDU

XMEOUT Parameters: *applid, poolname, modulename*

Destination: Console

DFHFC7113 *applid* **An attempt to retry resynchronization of coupling facility data table pool *poolname* issued from module *modulename* has failed.**

Explanation: CICS has issued a request to the coupling facility data table server for pool *poolname*. This request requires the pool to have been resynchronized.

Although CICS currently has a connection established to the pool server, an earlier attempt to resynchronize the pool failed, so the resynchronization has been retried. This retry has also failed. The attempt to retry resynchronization of the pool was issued from module *modulename*.

A coupling facility data table server is a separate address space that handles all requests made to coupling facility data tables which reside in the pool which it serves. When CICS has re-established its connection to a coupling facility data table pool server, it must perform resynchronization in order to perform

recovery processing for any unresolved units of work which had made recoverable updates to coupling facility data tables residing in the pool.

Certain requests require the coupling facility data table pool to have been resynchronized before they can succeed. Such requests include

- Open requests for files which are defined to use recoverable coupling facility data tables (open requests against non-recoverable coupling facility data tables do not require the pool to have been resynchronized).
- Syncpoint requests for units of work which have made recoverable updates to coupling facility data tables such as commit or backout requests.

These requests do not require all the units of work to have been resolved, but they do require CICS to have successfully restarted its recoverable connection to the pool server.

System action: CICS fails the request to the coupling facility data table pool.

Other requests to this pool server will succeed if they do not require the pool to have been resynchronized, or will attempt another resynchronization if they do.

User response: Determine the reason for the failure to resynchronize. Diagnostic messages issued by CICS components involved in the resynchronization and by the coupling facility data table server address space should assist you in doing this.

Module: DFHFCDO, DFHFCDU

XMEOUT Parameters: *applid, poolname, modulename*

Destination: Console

DFHFC7114 *applid* **Force purge of transaction *trannum* which made recoverable updates to coupling facility data table pool *poolname* has failed.**

Explanation: An attempt to force purge transaction *trannum* has failed. The system attempted to force purge the transaction because it had made recoverable updates to one or more coupling facility data tables residing in the coupling facility data table pool *poolname*, and the server for that coupling facility data table pool is undergoing resynchronization. The fact that this resynchronization is taking place is an indication that a failure has occurred which will have resulted in all recoverable updates made to the coupling facility data table pool *poolname*, which have not yet been committed, having been backed out. This transaction had therefore made updates which have since been backed out, so the transaction needs to be abended, in order to ensure that any updates which it made to other recoverable resources will also be backed out. However, it has not been possible to purge this transaction.

The effect of the failure to purge this transaction is that updates made to other recoverable resources may be

committed, with the result that the overall unit of work will not be commit-consistent. It is also possible that the transaction will try to make subsequent updates to the coupling facility data table pool which will cause it to be abnormally terminated.

System action: Resynchronization of the coupling facility data table server pool continues.

User response: If the transaction is still active, then attempt to force purge the transaction using the CEMT master terminal command. However, as this should be a rare situation, consider performing an immediate shutdown of CICS followed by an emergency restart as an alternative solution. This causes all in-flight transactions to be backed out.

Module: DFHFCDY

XMEOUT Parameters: *applid, trannum, poolname*

Destination: Console

DFHFC7115 *applid* **The coupling facility data table server for pool *poolname* has failed and restarted. One or more in-flight transactions which had made recoverable updates to coupling facility data tables residing in the pool will be abended.**

Explanation: The coupling facility data table server for data table pool *poolname* is undergoing resynchronization. The fact that this resynchronization is taking place is an indication that a failure has occurred which will mean that any recoverable updates made to the coupling facility data table pool *poolname* that had not yet been committed will have been backed out. Any in-flight transaction which had made recoverable updates to one or more coupling facility data tables residing in data table pool *poolname* therefore needs to be abended, in order to ensure that any updates which it made to other recoverable resources will also be backed out.

This message is issued to inform you that one or more such in-flight transactions has been found, and that CICS will attempt to abend the transactions and cause them to back out by force purging them. You should therefore expect that one or more transactions will be abnormally terminated with an ATCH transaction abend code (or possibly, in some instances, with an AKC3 abend code).

System action: Resynchronization of the coupling facility data table server pool will complete, and one or more in-flight transactions will be abnormally terminated.

User response: None.

This message is purely informational, to indicate that transactions will be abended in order to preserve data integrity.

Module: DFHFCDY

XMEOUT Parameters: *applid, poolname*

Destination: Console

DFHFC7120 *applid* **The coupling facility data table pool *poolname* has an unresolved unit of work *X'UOWid'* for this CICS region of which CICS has no knowledge.**

Explanation: CICS is resynchronizing the coupling facility data table server for pool *poolname*.

A coupling facility data table server is a separate address space that handles all requests made to coupling facility data tables which reside in the pool that it serves. When CICS has established its connection to a coupling facility data table pool server, it must perform resynchronization in order to perform recovery processing for any unresolved units of work which had made recoverable updates to coupling facility data tables residing in the pool. The resynchronization involves restarting the recoverable connection to the pool server, and completing any unresolved units of work known to the server for which the resolution is now known.

The server has an unresolved unit of work *UOWid*, but CICS has no knowledge of a link to the pool server for this unit of work. Knowledge of links will be lost when CICS performs an initial start, but in the case of unit of work *UOWid* there has not been a CICS initial start since the unit of work was created.

System action: CICS resolves the unit of work by backing out the updates that it made to coupling facility data tables within the pool, and completes resynchronization of the pool.

User response: Since CICS will have resolved the unit of work, you do not need to take any immediate action. This message is issued to provide diagnostic information which you may want to use to understand why CICS had no knowledge of the link.

Module: DFHFCDY

XMEOUT Parameters: *applid, poolname, X'UOWid'*

Destination: Console

DFHFC7121 *applid* **CICS coupling facility data table load has terminated abnormally. A call to DFHXMIQ to retrieve the parameters for the load transaction has failed with response code = *n*.**

Explanation: The CICS task to load a coupling facility data table has failed while trying to inquire on the parameters passed to it during attach. The value of the reason code *n* indicates the type of failure as follows

1. Response from XMIQ was INVALID.
2. Response from XMIQ was DISASTER.
3. Response from XMIQ was PURGED.
4. XMIQ failed for some unexpected reason.

System action: The user exit XD TLC is not invoked as failure to retrieve the attach parameters means the filename is not known. CICS terminates the loading transaction with abend code ACFD. No records are loaded into the data table.

Requests to access the table result in a "loading" response code.

CICS processing continues.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Determine the cause of the failure of the domain call using the diagnostic information provided by file control.

The file should be closed so that a load may be attempted again when it is next opened.

Module: DFHFCDL

XMEOUT Parameters: *applid, n*

Destination: Console

DFHFC7130 *date time applid tranid trannum termid userid.* **Unit of work *X'uowid'* running in region *owner-applid* in MVS system *MVSid* holds a lock on key *X'keyid'* in coupling facility data table *tablename* in pool *CFDTpool*, which caused this request to wait.**

Explanation: This message is issued to aid problem determination when a transaction that has accessed, or attempted to access, a coupling facility data table is about to terminate abnormally with an AFCY abend code.

The message is issued when a request to a coupling facility data table times out waiting on a lock. A request that requires a lock on a coupling facility data table has been issued, but was forced to wait because the record was locked by another unit of work. The wait has been purged by one of the following actions

- The timeout time for the transaction has been exceeded.
- CICS has purged transactions in an attempt to alleviate a short-on-storage (SOS) condition.
- The transaction has been purged by an operator request.

The name of the transaction that has failed is *tranid* and it is running under task number *trannum*, at terminal *termid*, for user *userid*.

The message inserts identify the owner of the lock that caused this transaction to timeout

- *uowid* is the local UOW id of the unit of work running in the region that owns the lock.
- *owner-applid* is the applid of the region that owns the lock.

DFHFE3301 • DFHFE3308

- *MVSid* is the name of the MVS system in which the region that owns the lock is running.
- *keyid* identifies the key that is locked. As it is not always possible to display keys in character form, the key is displayed in hexadecimal notation.
- *tablename* is the name of the coupling facility data table against which the lock is held.
- *CFDTPool* is the name of the coupling facility data table pool in which the CF data table *tablename* resides.

The locks held against coupling facility data tables are always exclusive locks, and can only have one holder. Therefore, this message uniquely identifies the owner of the required lock.

System action: The transaction is abended with an AFCY abend code.

User response: This message identifies the unit of work that is holding the required lock and the region in which it is running. Examine this unit of work to see why it is not releasing the lock; for example

- The unit of work may be holding CF data table locks and waiting for terminal input.
- The unit of work may be trying to access both coupling facility data table resources and resources owned by another resource manager, creating an inter-resource manager deadlock.

Module: DFHFCDR

XMEOUT Parameters: *date, time,applid, tranid, trannum, termid, userid, X'uowid', owner-applid, MVSid, X'keyid', tablename, CFDTPool*

Destination: CSFL

DFHFEnnnn messages

DFHFE3301 Transaction complete

Explanation: The field engineering program, DFHFEP, which was called by the field engineering transaction, CSFE, has completed.

System action: Other processing continues.

User response: None.

Module: DFHFEP

Destination: Terminal End User

DFHFE3302 Invalid debug request

Explanation: The field engineering program, DFHFEP, which was called by the field engineering transaction, CSFE, either found a syntax error in the debug request, or found that the installed transaction definition option was invalid.

System action: The task ends.

User response: Check for syntax errors or for an invalid installed transaction definition option. Correct the errors and reenter the request.

Module: DFHFEP

Destination: Terminal End User

DFHFE3303 Invalid trace option

Explanation: The field engineering program, DFHFEP, which was called by the field engineering transaction, CSFE, found a syntax error in the trace request (ZCQTRACE).

System action: The task ends.

User response: Check for syntax errors. Correct the errors and reenter the request.

Module: DFHFEP

Destination: Terminal End User

DFHFE3304 Enter PRINT for character set, END to terminate. All other data will be echoed.

Explanation: This message is sent to the terminal when the CSFE transaction is started. It asks the engineer what action is required from the field engineering program, DFHFEP.

System action: The task waits for a response.

User response: Enter PRINT to display the character set.

Enter END to terminate module DFHFEP.

All other data typed in is echoed to the screen.

Module: DFHFEP

Destination: Terminal End User

DFHFE3307 Invalid option specified in request

Explanation: The field engineering program, DFHFEP, which was called by the field engineering transaction, CSFE, found an error in one of the options specified in the request. Either the specified option could not be found (for example, an invalid transaction definition) or it was an invalid type. CSFE ends without completing the request.

System action: The task ends.

User response: Correct the error and reenter the request.

Module: DFHFEP

Destination: Terminal End User

DFHFE3308 Program DFHTRAP is not available -

global trap not activated

Explanation: CICS could not find the global trap exit program, DFHTRAP, during execution of the CICS field engineering transaction request, CSFE DEBUG,TRAP=ON.

System action: CICS continues with the global trap not activated.

User response: Ensure that DFHTRAP is defined in the processing program table and made available in the program library. **You should use the global trap exit only in consultation with an IBM support representative.**

Module: DFHFEP

Destination: Terminal End User

DFHFE3309 Global trap DFHTRAP is unusable following program check in exit

Explanation: While executing a field engineering (FE) transaction request to activate the global trap exit (CSFE DEBUG,TRAP=ON), the FE program, DFHFEP, has found that the global trap exit program, DFHTRAP, is already active but marked unusable. This is because, when the trap was last used, a program check occurred in DFHTRAP. This error is fully documented in message DFHTR1001.

System action: CICS continues with the global trap still marked unusable.

User response: Refer to DFHTR1001 for more information. To replace the currently active but unusable version of DFHTRAP by a new version from the CICS program library, issue the following commands in the sequence

CSFE DEBUG,TRAP=OFF (to de-activate the current trap);
 CEMT SET PROGRAM(DFHTRAP) NEWCOPY (to update the disk trap known to CICS);
 CSFE DEBUG,TRAP=ON (to activate the new version of the trap).

You should use the global trap exit only in consultation with an IBM support representative.

Module: DFHFEP

Destination: Terminal End User

DFHFE3310 *applid* Program DFHTRAP is not available - global trap not activated.

Explanation: CICS could not find the global trap exit program, DFHTRAP, during execution of the CICS field engineering transaction request, CSFE DEBUG,TRAP=ON.

System action: CICS continues with the global trap not activated.

User response: Ensure that DFHTRAP is defined in the processing program table and made available in the program library. **You should use the global trap exit only in consultation with an IBM support representative.**

Module: DFHFEP

DFHICnnnn messages

DFHIC0002 *applid* A severe error (code X'code') has occurred in module *modname*.

Explanation: An error has been detected in module *modname*. The code X'code' is the exception trace point ID which uniquely identifies what the error is and where it was detected.

System action: An exception entry (code X'code' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated.

If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname*, you will need assistance. Bring CICS down in a controlled shutdown and collect the dumps and any relevant messages sent by the module identified in the message. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHEIIC

XMEOUT Parameters: *applid, X'code',modname*

Destination: Console

DFHIC0200 *date time applid* Automatic transaction restart for transaction *tranid* has failed.

Explanation: A STARTed nonterminal transaction is ending abnormally and automatic transaction restart was requested via the user replaceable module DFHREST. A severe error occurred when CICS attempted to restart the transaction.

System action: Message DFHAP0002 with a dump is issued for the severe error that caused the restart to fail. Abnormal termination of the transaction for which restart was requested continues. The transaction is not automatically restarted.

User response: Investigate the reason for the earlier severe error. See message DFHAP0002 for further guidance. Restart the transaction manually if necessary.

Module: DFHICXM

XMEOUT Parameters: *date, time, applid, tranid*

Destination: Console and Transient Data Queue CSMT

DFHIC0310 *date time applid* **Unable to attach transaction - tranid to terminal - termid**

Explanation: An attempt was made to start transaction *tranid* on terminal *termid* as a result of

- a START command, or
- a DFHIC TYPE=PUT macro, or
- a DFHIC TYPE=INITIATE macro.

The attempt was rejected. The most likely cause is that, at the time the attempt was made, the terminal was unknown in the system.

This message is also issued when:

- A START command is issued in an application owning region (AOR) for a terminal that exists as a remote terminal entry in the AOR, but the destination system ID associated with the remote terminal has not been defined.
- A START command is issued against a pipeline device, or other device which is not eligible for ATI requests.

System action: The request is deleted from the system.

User response: Ensure that a valid terminal name is being specified. If the name is valid, examine the trace (if one is available) to determine why the attempt was rejected.

Module: DFHICP

XMEOUT Parameters: *date, time, applid, tranid, termid*

Destination: Console

DFHIC0360 *date time applid* **An attempt to establish security for userid *userid* has failed. Transaction *tranid* cannot be started without a terminal. SAF codes are (*X'safresp'*,*X'safreas'*). ESM codes are (*X'esmresp'*,*X'esmreas'*).**

Explanation: An attempt was made to establish security for userid *userid* but it was rejected by the external security manager (ESM).

A time ordered request, such as an EXEC CICS START command, required security to be established for the userid in order to start the transaction *tranid* without a terminal.

System action: Security has not been established for the userid. The attempt to start the transaction has failed.

User response: The response and reason codes (*safresp* and *safreas*) returned by the system authorization facility (SAF), and the response and reason codes (*esmresp* and *esmreas*) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=VERIFY or RACROUTE REQUEST=EXTRACT macros. These return codes are described in the *OS/390 MVS Programming: Authorized Assembler Services Guide*, and in *External Security Interface (RACROUTE) Macro Reference for MVS and VM (SC28-1366)*. See these manuals for an explanation of the codes.

There may be further messages produced by CICS or the external security manager (ESM) which provide more information.

Module: DFHICXM

XMEOUT Parameters: *date, time, applid, userid, tranid, X'safresp', X'safreas', X'esmresp', X'esmreas'*

DFHIC0801 *applid* **CICS time altered from *hh.mm.sss* to *hh.mm.sss* - date *ddddddd* - relative day *rrr***

Explanation: This console message is printed when the operating system-maintained time of day has been rolled back (for example, when the operating system clock is reset to zero at midnight). Where

- *hh.mm.sss* is the time in hours minutes and tenths of a second
- *ddddddd* is the current date in the format specified by the DATFORM parameter in the system initialization table
- *rrr* is the day number relative to the day CICS was started.

System action: CICS has recognized the condition and adjusted its own time of day to agree with that of the operating system.

User response: None

Module: DFHTAJP

XMEOUT Parameters: *applid, hh.mm.sss, hh.mm.sss, dddddd, rrr*

Destination: Console

DFHIC0802 *applid* **S/370 clock inoperative ... external action required**

Explanation: CICS execution is dependent on the continued operation of the processor time-of-day clock. This warning message is sent to the console operator during the execution of the time adjustment program if the system detects a processor clock failure at that time. Immediate corrective action (if possible) must be

taken by the console operator, if the clock has been disabled for any reason.

System action: CICS abnormally terminates itself after the condition is detected.

User response: The ability to enable or disable the time-of-day clock is under the control of the console operator. If the clock is disabled, it must be enabled immediately.

Module: DFHTAJP

XMEOUT Parameter: *applid*

Destination: Console

DFHIEnnnn messages

DFHIE0001 *applid* **An abend (code *aaa/bbbb*) has occurred at offset *X'offset'* in module *modname*.**

Explanation: An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and

bring CICS down at a convenient time to resolve the problem. If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHIEXM

XMEOUT Parameters: *applid, aaa/bbbb, X'offset', modname*

Destination: Console

DFHIE0002 *applid* **A severe error (code *X'code*) has occurred in module *modname*.**

Explanation: An error has been detected in module *modname*. The code *X'code* is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

System action: An exception entry (code *X'code* in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to

continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHIEXM

XMEOUT Parameters: *applid, X'code',modname*

Destination: Console

DFHIE0003 *applid* **Insufficient storage to satisfy Getmain (code *X'code*) in module *modname*.**

Explanation: A CICS GETMAIN was issued by module *modname*, but there was insufficient storage available to satisfy the request.

The code *X'code* is the exception trace point ID which uniquely identifies the place where the error was detected.

System action: An exception entry is made in the trace table (code *code* in the message). A system dump is taken, unless you have specifically suppressed dumps in the dump table. This is a critical error.

If DFHIEDM issues this message, CICS terminates, even if you have specified in the dump table that CICS should not terminate.

If DFHIEXM issues this message, an exception trace and a system dump is taken and CICS continues.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: If CICS has been terminated by another module, look out for the relevant termination messages (from, for example, the domain manager), and look up the user response for these messages.

If CICS is still running, the problem may be a temporary one which will right itself if more storage becomes available. If you can manage without module *modname*, you may decide to continue and bring CICS down at a convenient time to resolve the problem. If the message recurs or if you cannot run without the full use of all CICS modules, you should bring CICS down in a controlled shutdown.

Try increasing the size limits of the DSAs or EDSAs. See the *CICS System Definition Guide* or the *CICS Performance Guide* for further information on CICS storage.

Module: DFHIEXM

XMEOUT Parameters: *applid, X'code',modname*

Destination: Console

DFHIE0004 *applid* **A possible loop has been detected at offset *X'offset* in module *modname*.**

Explanation: A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset *X'offset*. This is the offset of the instruction that was executing at the time the error was detected.

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Either this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Or CICS will continue unless you have specified in the dump table that CICS should terminate. Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Notify the system programmer. If CICS has not been terminated, it will be necessary to decide whether the problem is serious enough to bring CICS down.

Because some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS will purge a CICS function that exceeds the runaway task time interval that you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that the module *modname* will be terminated and CICS will continue.

If you have declared ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you will have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname*, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You will have to bring CICS down at a suitable time to do this permanently. However, you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you may need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHIEXM

XMEOUT Parameters: *applid, X'offset', modname*

Destination: Console

DFHIE0360 *date time applid* **An attempt to establish security for userid *userid* has failed. Transaction *transid* cannot be started. SAF codes are (*X'safresp',X'safreas*). ESM codes are (*X'esmresp',X'esmreas*).**

Explanation: An attempt was made to establish security for userid *userid* but it was rejected by the external security manager (ESM).

A time ordered request, such as an EXEC CICS START command, required security to be established for the userid in order to start transaction *transid*.

System action: Security has not been established for the userid. The attempt to start the transaction has failed.

User response: The response and reason codes (*safresp* and *safreas*) returned by the system authorization facility (SAF), and the response and reason codes (*esmresp* and *esmreas*) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=VERIFY or RACROUTE REQUEST=EXTRACT macros. These return codes are described in the *OS/390 MVS Programming: Authorized Assembler Services Guide*, and in *External Security Interface (RACROUTE) Macro Reference for MVS and VM (SC28-1366)*. See these manuals for an explanation of the codes.

There may be further messages produced by CICS or the external security manager (ESM) which provide more information.

Module: DFHIEXM

XMEOUT Parameters: *date, time, applid, userid, transid, X'safresp', X'safreas', X'esmresp', X'esmreas'*

Destination: CSCS

DFHIE0361E *date time applid* **A security error has been detected whilst processing an attach from a TCP/IP attached client.**

Explanation: A request to attach a transaction failed due to a security problem. The security fields extracted from the Attach FMH5 were passed to the Security Domain to signon the user, but the signon call failed.

System action: The attach request is rejected.

User response: Refer to previous security messages which are written to TDQ CIEO such as DFHIE0360 for further information and guidance. If no previous messages were issued, examine the trace to determine the reason for the signon failure. Check that if the userid or password are passed on the Attach FMH5, then they are valid.

Module: DFHIEP

XMEOUT Parameters: *date, time, applid*

Destination: CIEO

DFHIE0998 *date time applid* **Mirror transaction processing ECI request from TCP/IP connected client has abended with code *abcode*.**

Explanation: A mirror transaction processing an ECI request for a TCP/IP connected client has abended with the specified abend code. This is because of an error in the user program linked for the ECI request, or because of an error in CICS. The abend processing has invoked IE domain to inform the client of the failure.

System action: If the original problem was in IE domain, the appropriate error actions will already have been taken. If the problem was not in IE domain, this message will be attached as Error Log Data to an FMH7 that is sent to the client to abend the conversation.

User response: Use the messages and dumps from the transaction abend to determine the root cause of the problem.

Module: DFHIEIE

XMEOUT Parameters: *date, time, applid, abcode*

Destination: CIEO

DFHIE0999 *date time applid* **An attempt to start transaction CIEP by something other than an attach request from sockets domain has been made. This is not allowed.**

Explanation: An attempt has been made to start transaction CIEP by some method other than a transaction attach from sockets domain. Transaction CIEP is a system task and cannot be entered from a terminal.

System action: The CIEP transaction has not been started.

User response: Do not attempt to enter CIEP from a terminal or from any other device. CICS will start the transaction if an ECI request is made via a TCP/IP attached client. No user action is required.

Module: DFHIEP

XMEOUT Parameters: *date, time, applid*

Destination: CIEO

DFHIE1001 *date time applid client_ip_addr tcpipservice* **Data received from the client violated the bracket protocol.**

Explanation: Data received from the client violated the bracket protocol used in communication between the client and CICS to delimit the start and end of conversations. One of the following situations has occurred.

DFHIE1002 • DFHIE1004

- A flow without Begin Bracket arrived when there was no active conversation
- A flow with Begin Bracket arrived when there was an active conversation
- An FMH7 (conversation abend) flow without End Bracket was received.

This has probably happened because a separate error has caused CICS and the client to have a different view of the current state of conversations on the connection, or because the data has been corrupted at some point in the transmission.

System action: An exception trace is written. It contains the data received from the client, and the state of any relevant conversation in CICS. The data is then ignored.

User response: If there are any other errors preceding this one, then take action to correct them and retry the client transaction. If there are no other errors apparent, restart the client connection and retry the client transaction.

Module: DFHIEIE

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpipSERVICE*

Destination: CIEO

DFHIE1002 *date time applid client_ip_addr tcpipSERVICE* **Data received from the client violated the chaining protocol.**

Explanation: Data received from the client violated the chaining protocol used in communication between the client and CICS. All flows must have the Only In Chain (OIC) indicators set on.

This has probably happened because a separate error has caused the data to be corrupted at some point in the transmission.

System action: An exception trace is written. It contains the data received from the client, and the state of any relevant conversation in CICS. The data is then ignored.

User response: If there are any other errors preceding this one, then take action to correct them and retry the client transaction. If there are no other errors apparent, restart the client connection and retry the client transaction.

Module: DFHIEIE

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpipSERVICE*

Destination: CIEO

DFHIE1003 *date time applid client_ip_addr tcpipSERVICE* **Connection to client lost during conversation.**

Explanation: A mirror task processing work for a client was waiting to receive more data, but nothing arrived before the RTIMOUT interval had expired. The PING protocol was then used to see if the client was still active, and this also failed to receive a response.

System action: An exception trace is written. It contains information on the current state of the client and the state of the relevant conversation in CICS. An AIEA abend is issued for the mirror task. CICS attempts to purge any active conversations for the client. The connection to the client is terminated.

User response: Determine why the client has stopped responding. If there are any other errors preceding this one, then take action to correct them, restart the client connection and retry the client transaction. If there are no other errors apparent, restarting the client connection and retrying the client transaction may also work.

Module: DFHIEIE

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpipSERVICE*

Destination: CIEO

DFHIE1004 *date time applid client_ip_addr tcpipSERVICE* **Data received from the client had an invalid length field.**

Explanation: Data received from the client contains a standard header, the first four bytes of which contain the length of the rest of the data. This length was either less than the length of the standard header, or more than the maximum possible for an ECI flow. This has probably happened because a separate error has caused the data to be corrupted at some point in the transmission.

System action: An exception trace is written. It contains the four byte length received from the client, and information describing the current state of the client in CICS. CICS attempts to purge any active conversations for the client. The connection to the client is terminated.

User response: If there are any other errors preceding this one, then take action to correct them, restart the client connection and retry the client transaction. If there are no other errors apparent, restarting the client connection and retrying the client transaction may also work.

Module: DFHIEIE

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpipSERVICE*

Destination: CIEO

DFHIE1005 *date time applid client_ip_addr*
tcpipSERVICE ECI client install failed.

Explanation: A CICS client attempted to connect over TCP/IP. The subsequent install processing failed due to an internal CICS error.

System action: An exception trace is written. It contains the data received from the client in the install flow. The connection to the client is terminated. There should be messages and (possibly) dumps from a component of CICS other than IE to indicate the cause of the failure.

User response: Proceed as recommended by the messages issued by the failing component.

Module: DFHIEIE

XMEOUT Parameters: *date, time, applid, client_ip_addr,*
tcpipSERVICE

Destination: CIEO

DFHIE1006 *date time applid client_ip_addr*
tcpipSERVICE ECI request received before
install.

Explanation: CICS received an ECI request from a TCP/IP connected client before the client install request had arrived or been completed.

System action: An exception trace is written. It contains the ECI request data received from the client. The connection to the client is terminated.

User response: If there are any other errors preceding this one, then take action to correct them, restart the client connection and retry the client transaction. If there are no other errors apparent, restarting the client connection and retrying the client transaction may also work.

Module: DFHIEIE

XMEOUT Parameters: *date, time, applid, client_ip_addr,*
tcpipSERVICE

Destination: CIEO

DFHIE1007 *date time applid client_ip_addr*
tcpipSERVICE Invalid install request.

Explanation: CICS received a request to either install or uninstall a TCP/IP connected ECI client. The data describing the request was invalid. This is probably caused by an earlier error corrupting the data.

System action: An exception trace is written. It contains the request data received from the client. The connection to the client is terminated.

User response: If there are any other errors preceding this one, then take action to correct them. If the failure was while starting a client connection, then re-try the start.

Module: DFHIEIE

XMEOUT Parameters: *date, time, applid, client_ip_addr,*
tcpipSERVICE

Destination: CIEO

DFHIE1008 *date time applid client_ip_addr*
tcpipSERVICE Install request received
from unsupported version of the client.

Explanation: CICS received a request to install a TCP/IP connected ECI client. The request header indicated that the client code was a version not supported by this level of CICS.

System action: An exception trace is written. It contains the request data received from the client. The connection to the client is terminated.

User response: Check which versions of the client are supported by CICS and re-install as appropriate.

Module: DFHIEIE

XMEOUT Parameters: *date, time, applid, client_ip_addr,*
tcpipSERVICE

Destination: CIEO

DFHIE1009 *date time applid client_ip_addr*
tcpipSERVICE Unsupported codepage
codepage specified in client install.

Explanation: CICS received a request to install a TCP/IP connected ECI client. The client code page specified in the request is not one that this CICS system's DFHCNV table supports.

System action: An exception trace is written. It contains the request data received from the client, including the client code page. The connection to the client is terminated.

User response: Modify the DFHCNV table to include the necessary information to support this client code page.

Module: DFHIEIE

XMEOUT Parameters: *date, time, applid, client_ip_addr,*
tcpipSERVICE, codepage

Destination: CIEO

DFHIE1010 *date time applid client_ip_addr*
tcpipSERVICE Data arrived when CICS in
SEND state.

Explanation: CICS received data from a client conversation that was in SEND state at the CICS end.

This has probably happened because a separate error has caused CICS and the client to have a different view of the current state of conversations on the connection, or because the data has been corrupted at some point in the transmission.

System action: An exception trace is written. It contains the data received from the client, and the state of the relevant conversation in CICS. The data is then ignored.

User response: If there are any other errors preceding this one, then take action to correct them and retry the client transaction. If there are no other errors apparent, restart the client connection and retry the client transaction.

Module: DFHIEIE

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpipSERVICE*

Destination: CIEO

DFHIE1011 *date time applid client_ip_addr tcpipSERVICE* **Invalid data received from client.**

Explanation: CICS expected the data received from a client to contain an ECI request or a syncpoint flow but it was not recognizable as such.

This has probably happened because a separate error has caused CICS and the client to have a different view of the current state of conversations on the connection, or because the data has been corrupted at some point in the transmission.

System action: An exception trace is written. It contains the data received from the client, and the state of the relevant conversation in CICS. The data is then ignored.

User response: If there are any other errors preceding this one, then take action to correct them and retry the client transaction. If there are no other errors apparent, restart the client connection and retry the client transaction.

Module: DFHIEIE

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpipSERVICE*

Destination: CIEO

DFHIE1012 *date time applid client_ip_addr tcpipSERVICE* **Install request from the client did not contain the client codepage.**

Explanation: An install request has been received from a CICS client. One of the parameters which must be supplied is the codepage which the CICS client intends to use. This parameter is missing.

System action: An exception trace is written. The request to install the CICS client is rejected. A response code of DISASTER and a reason code of INVALIDREQUEST is sent to the client.

User response:

Module: DFHIEIE

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpipSERVICE*

Destination: CIEO

DFHIE1013 *date time applid client_ip_addr tcpipSERVICE* **Unexpected connection level PING reply received.**

Explanation: CICS received a connection level PING reply when it had not issued a request. This is probably because the client and CICS are out of step with regard to their connection state.

System action: An exception trace is written. It contains the data received from the client. The data is then ignored.

User response: Restart the client connection, if the condition repeats.

Module: DFHIEIE

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpipSERVICE*

Destination: CIEO

DFHIE1101 *date time applid client_ip_addr tcpipSERVICE* **Error obtaining IE domain storage. Task terminated.**

Explanation: The IP ECI (IE) domain issued a storage manager getmain which did not complete successfully. This is probably because of a storage overwrite or an internal error in SM domain. This message should be preceded by an SM failure message.

System action: An exception trace is written by IE domain and the IP ECI listener task (CIEP) or the mirror task is abended.

User response: Determine the reason for the storage manager failure.

Module: DFHIEIE

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpipSERVICE*

Destination: CIEO

DFHIE1102 *date time applid client_ip_addr tcpipSERVICE* **Invalid parameter list passed to IE domain.**

Explanation: A call was made to the IP ECI (IE) domain during the processing of a request but the parameter list was not valid. This is probably because of a storage overwrite or an internal error in the calling component.

System action: An exception trace is written by IE domain, a system dump is taken and the IP ECI listener task (CIEP) or the mirror task is abended.

User response: Use the dump to determine the fault in the calling component.

Module: DFHIEIE

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpipservice*

Destination: CIEO

DFHIE1103 *date time applid client_ip_addr tcpipservice* **Invalid request by mirror task.**

Explanation: A call was made to the IP ECI (IE) domain during the processing of a request by a mirror task. The call was a receive when the conversation was in send state, or the call was a send when the conversation was in receive state. This is probably because an error on the TCP/IP connection has caused a loss of synchronization between the mirror task and the IE domain, but could be due to an internal error in IE domain.

System action: An exception trace is written by IE domain, a system dump is taken and the mirror task is abended.

User response: Use the dump to determine the fault in IE domain, or just retry the failing request if there were signs of other errors on the connection.

Module: DFHIEIE

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpipservice*

Destination: CIEO

DFHIE1104 *date time applid client_ip_addr tcpipservice* **Error attempting socket receive from ECI client.**

Explanation: The IP ECI (IE) domain issued a Sockets Domain receive which did not complete successfully. This is probably because of a storage overwrite or an internal error in SO domain. This message should be preceded by an SO failure message.

System action: An exception trace is written by IE domain and the IP ECI listener task (CIEP) is abended.

User response: Determine the reason for the Sockets Domain failure.

Module: DFHIEIE

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpipservice*

Destination: CIEO

DFHIE1105 *date time applid client_ip_addr tcpipservice* **Error attempting socket send to ECI client.**

Explanation: The IP ECI (IE) domain issued a Sockets Domain send which did not complete successfully. This is probably because of a storage overwrite or an internal error in SO domain. This message should be preceded by an SO failure message.

System action: An exception trace is written by IE domain and the IP ECI listener task (CIEP) or mirror task is abended.

User response: Determine the reason for the Sockets Domain failure.

Module: DFHIEIE

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpipservice*

Destination: CIEO

DFHIE1106 *date time applid client_ip_addr tcpipservice* **Error attempting to wait for client data.**

Explanation: The IP ECI (IE) domain issued a Dispatcher WAIT_MVS from a mirror task to await the arrival of more data from the client. The WAIT_MVS did not complete successfully. This is probably because of a storage overwrite or an internal error in DS domain. This message should be preceded by a DS failure message.

System action: An exception trace is written by IE domain and the mirror task is abended.

User response: Determine the reason for the DS Domain failure.

Module: DFHIEIE

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpipservice*

Destination: CIEO

DFHIE1107 *date time applid client_ip_addr tcpipservice* **Error freeing IE domain storage. Task terminated.**

Explanation: The IP ECI (IE) domain issued a storage manager freemain which did not complete successfully. This is probably because of a storage overwrite or an internal error in SM domain. This message should be preceded by an SM failure message.

System action: An exception trace is written by IE domain and the IP ECI listener task (CIEP) or the mirror task is abended.

User response: Determine the reason for the storage manager failure.

Module: DFHIEIE

XMEOUT Parameters: *date, time,applid, client_ip_addr, tcpipSERVICE*

Destination: CIEO

DFHIE1201 *date time applid client_ip_addr tcpipSERVICE* **Error attaching mirror transaction id transid.**

Explanation: The IP ECI (IE) domain issued a transaction manager attach for a mirror task to process an ECI request received from a client. The attach did not complete successfully. This is probably because of a storage overwrite or an internal error in XM domain. This message should be preceded by an XM failure message.

System action: An exception trace is written by IE domain. An error flow (FMH7) is sent to the client to inform it of the failure of the request.

User response: Determine the reason for the XM failure.

Module: DFHIEIE

XMEOUT Parameters: *date, time,applid, client_ip_addr, tcpipSERVICE, transid*

Destination: CIEO

DFHIE1202 *date time applid client_ip_addr tcpipSERVICE* **ECI request timed out. Abnormal termination initiated.**

Explanation: The conversation ping protocol was used because a current ECI conversation appeared to be inactive. The protocol confirmed that the client and CICS were both unable to continue so the decision was taken to abend the conversation. The most likely cause of this is that the user program specified in the ECI request has issued calls that have caused the mirror task to go into a prolonged wait state, so preventing a reply to the ECI request being sent to the client.

System action: An exception trace is written by IE domain. An attempt is made to purge the mirror task that is responsible for processing the ECI request. If this fails, the task is marked so that it will abend when it next attempts to communicate with the client.

User response: Determine the reason for the mirror task going into a prolonged wait state.

Module: DFHIEIE

XMEOUT Parameters: *date, time,applid, client_ip_addr, tcpipSERVICE*

Destination: CIEO

DFHIE1203 *date time applid client_ip_addr tcpipSERVICE* **EPI request attempted by TCP/IP connected client.**

Explanation: The IP ECI (IE) domain received an attach request for the CTIN transaction, which is only used in the processing of EPI requests. EPI is not supported by CICS for TCP/IP connected clients.

System action: An exception trace is written by IE domain. A CTIN INSTALL error response is sent to the client to tell it that the install was cancelled.

User response: Do not attempt to use EPI from TCP/IP connected clients.

Module: DFHIEIE

XMEOUT Parameters: *date, time,applid, client_ip_addr, tcpipSERVICE*

Destination: CIEO

DFHIE1204 *date time applid client_ip_addr tcpipSERVICE* **Data lost during ECI request processing.**

Explanation: The conversation ping protocol was used because a current ECI conversation appeared to be inactive. The client returned NOT_ABENDED to the conversation ping request sent by CICS, indicating that it is in RECEIVE state having sent the data that CICS timed out waiting to receive. However, CICS has not received the data. This error is probably due to other errors that occurred during the lifetime of the conversation.

System action: An exception trace is written by IE domain. An error flow (FMH7) is sent to the client indicating that the conversation is to be abended. An attempt is made to purge the mirror task that is responsible for processing the ECI request. If this fails, the task is marked so that it will abend when it next attempts to communicate with the client.

User response: Determine the reason for the loss of data by analyzing the cause of the associated errors.

Module: DFHIEIE

XMEOUT Parameters: *date, time,applid, client_ip_addr, tcpipSERVICE*

Destination: CIEO

DFHIE1205 *date time applid client_ip_addr tcpipSERVICE* **Unrecognizable data received from a TCP/IP connected client.**

Explanation: CICS has received data from TCP/IP on a port number for which the TCPIP SERVICE specifies transaction id CIEP. This means that CICS expects it to be an ECI request or an ECI-related flow. The data was not recognizable as either of these. This error is

probably due to an incorrect TCPIP SERVICE definition or to other errors related to the TCP/IP connection that have corrupted the flow sequence.

System action: An exception trace is written by IE domain. If the first part of the flow was recognizable as the header of an ECI flow then CICS may have matched it up with its state for an existing conversation. If so, an attempt is made to purge the mirror task that is responsible for processing the ECI request. If this fails, the task is marked so that it will abend when it next attempts to communicate with the client.

User response: Ensure that only ECI requests are sent in on the specified TCPIP SERVICE or determine the reason for the corrupted data by analyzing the cause of the associated errors.

Module: DFHIEIE

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpip service*

Destination: CIEO

DFHIE1206 *date time applid client_ip_addr tcpip service* **Mirror transaction id transid is disabled.**

Explanation: The IP ECI (IE) domain issued a transaction manager attach for a mirror task to process an ECI request received from a client. The attach did not complete successfully because the specified transaction id for the mirror task has been disabled.

System action: An exception trace is written by IE domain. An error flow (FMH7) is sent to the client to inform it of the failure of the request.

User response: If the transaction id should not have been disabled then use CEMT or a similar control transaction to enable it. The ECI request can then be retried.

Module: DFHIEIE

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpip service, transid*

Destination: CIEO

DFHIE1207 *date time applid client_ip_addr tcpip service* **Mirror transaction id transid not found.**

Explanation: The IP ECI (IE) domain issued a transaction manager attach for a mirror task to process an ECI request received from a client. The attach did not complete successfully because the specified transaction id for the mirror task is not defined on this CICS system.

System action: An exception trace is written by IE domain. An error flow (FMH7) is sent to the client to inform it of the failure of the request.

User response: Install a definition for the specified transaction id or change the client to use the correct one. The ECI request can then be retried.

Module: DFHIEIE

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpip service, transid*

Destination: CIEO

DFHIE1208 *date time applid client_ip_addr tcpip service* **Mirror transaction id transid has been disabled because CICS is shutting down.**

Explanation: The IP ECI (IE) domain issued a transaction manager attach for a mirror task to process an ECI request received from a client. The attach did not complete successfully because the specified transaction id for the mirror task has been disabled by the system during shutdown.

System action: An exception trace is written by IE domain. An error flow (FMH7) is sent to the client to inform it of the failure of the request.

User response: If you wish to allow mirror tasks to run during shutdown then the transaction id must be defined as SHUTDOWN(ENABLED).

Module: DFHIEIE

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpip service, transid*

Destination: CIEO

DFHIE1209 *date time applid client_ip_addr tcpip service* **Error assigning termid to mirror task.**

Explanation: The IP ECI (IE) domain issued a call to allocate a unique value to be placed in EIBTRMID for the mirror task processing an ECI request. This call failed for some internal reason or, much less likely, because all 46656 names are currently in use. This is probably because of a storage overwrite or an internal error in the DFHZGBM routine that allocates the names. This message should be preceded by a failure message from DFHZGBM.

System action: An exception trace is written by IE domain. The mirror attach is rejected with an FMH7 flow.

User response: Determine the reason for the DFHZGBM failure.

Module: DFHIEIE

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpip service*

Destination: CIEO

DFHIE1210 *date time applid client_ip_addr*
tcpipSERVICE **ECl request timed out.**
Client says conversation not known.

Explanation: The conversation ping protocol was used because a current ECI conversation appeared to be inactive. The client indicated that it did not know about the specified conversation so CICS will attempt to purge the associated mirror task. The most likely cause of this is that the client program encountered an error and lost track of current requests.

System action: An exception trace is written by IE domain. An attempt is made to purge the mirror task that is responsible for processing the ECI request. If this fails, the task is marked so that it will abend when it next attempts to communicate with the client.

User response: Determine the reason for the client losing track of the conversation.

Module: DFHIEIE

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpipSERVICE*

Destination: CIEO

DFHIE1211 *date time applid client_ip_addr*
tcpipSERVICE **ECl request mirror task**
abended because of read time out or
earlier error.

Explanation: This ECI request mirror task was flagged for abend for one of the following reasons.

- There was no response within the RTIMOUT period when CICS was waiting for data from the client on this conversation.
- There was an error on the conversation and the mirror task purge request could not be completed (probably because the mirror has the recommended setting of SPURGE(NO)).

System action: An exception trace is written by IE domain. The mirror task issues a transaction abend.

User response: Determine why the client has not sent the next flow in this conversation or see the user response for the earlier IE domain message.

Module: DFHIEIE

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpipSERVICE*

Destination: CIEO

DFHInnnn messages

DFHII0001 *applid* **An abend (code *aaa/bbbb*) has occurred at offset *X'offset'* in module *modname*.**

Explanation: An abnormal end (abend) or program check has occurred in module *modname*. This implies

DFHIE1212 *date time applid client_ip_addr*
tcpipSERVICE **Unexpected user data**
received from TCP/IP connected client.

Explanation: CICS has received user data (an ECI request or SYNCPOINT flow) for a mirror task that was not expecting any. This error is probably due to other errors related to the TCP/IP connection that have corrupted the flow sequence.

System action: An exception trace is written by IE domain. An attempt is made to purge the mirror task that is responsible for processing the ECI request. If this fails, the task is marked so that it will abend when it next attempts to communicate with the client.

User response: Determine the reason for the corrupted data by analysing the cause of the associated errors.

Module: DFHIEIE

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpipSERVICE*

Destination: CIEO

DFHIE1213 *date time applid client_ip_addr*
tcpipSERVICE **Client has encountered an**
error during ECl processing. FMH7
sense *sense* received from client.

Explanation: CICS has received an FMH7 error flow from a TCP/IP connected ECI client. This indicates that the client encountered an error during its processing of the work related to the ECI request and wishes to abnormally terminate the conversation. The sense code specifies the type of error.

System action: An exception trace is written by IE domain. An attempt is made to purge the mirror task that is responsible for processing the ECI request. If this fails, the task is marked so that it will abend when it next attempts to communicate with the client.

User response: Determine the problem at the client end.

Module: DFHIEIE

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpipSERVICE, sense*

Destination: CIEO

that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for

example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHIICP, DFHIIDM, DFHIIMM, DFHIIRH, DFHIIRP, DFHIIRQ, DFHIIRR, DFHIIXM

XMEOUT Parameters: *applid, aaa/bbbb, X'offset', modname*

Destination: Console

DFHII0002 *applid* **A severe error (code *X'code*) has occurred in module *modname*.**

Explanation: An error has been detected in module *modname*. The code *X'code* is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

System action: An exception entry (code *X'code* in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump

table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHIICP, DFHIIDM, DFHIIMM, DFHIIRH, DFHIIRP, DFHIIRQ, DFHIIRR, DFHIIXM

XMEOUT Parameters: *applid, X'code', modname*

Destination: Console

DFHII0004 *applid* **A possible loop has been detected at offset *X'offset* in module *modname*.**

Explanation: A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset *X'offset*. This is the offset of the instruction which was executing at the time when the error was detected.

System action: An exception entry is made in the trace table.

A system dump is taken unless you have specifically suppressed the dump (by a user exit program at the XDUREQ exit, in the dump table or by global system dump suppression). CICS processing continues unless you have specified in the dump table that CICS should terminate.

Message DFHME0116 should be produced containing the symptom string for this problem.

User response: If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of CPU time, this message may have been caused by a long-running function, and there may not be an error. Usually, CICS purges a CICS function which exceeds the runaway task time interval that you have specified in the ICVR

Module: DFHIIRR

XMEOUT Parameters: *date, time,applid, client_ip_addr, tcpipSERVICE*

Destination: CIIL

DFHII0104E *date time applid client_ip_addr tcpipSERVICE* **The request receiver received a request on a connection whose TCPIP SERVICE specified AUTHENTICATE(CERTIFICATE) but no CERTIFICATE_USERID is available.**

Explanation: The IIO Request Receiver received a GIOP request; however, the TCPIP SERVICE *tcpipSERVICE* specified AUTHENTICATE(CERTIFICATE) but the client has not provided a client certificate that maps to a valid userid in the external security manager. This may be for one of the following reasons:

- The client has not provided any certificate.
- The client's certificate is not installed in the external security manager's database.
- The client's certificate is not marked as TRUSTED in the external security manager's database.

System action: Exception trace point 0125 is issued. Outstanding replies are processed. A systemException of NO_PERMISSION is sent to the client. The socket is closed and the transaction is terminated.

User response: Ensure that the client has a valid certificate. Install the certificate in the external security manager with the TRUSTED attribute and which maps to a valid userid. If the security manager is the IBM OS/390 Security Server (RACF), this can be done with the RACDCERT command.

Data 2 in the exception trace point entry contains the first 1024 bytes of the GIOP request.

Module: DFHIIRR

XMEOUT Parameters: *date, time,applid, client_ip_addr, tcpipSERVICE*

Destination: CIIL

DFHII0105E *date time applid client_ip_addr tcpipSERVICE* **The request receiver received a request but the userid *userid* supplied by the URM *urmname* is not authorised.**

Explanation: The IIO Request Receiver received a GIOP request, the URM specified in the TCPIP SERVICE *tcpipSERVICE* was called and returned a different userid. However, this userid is not valid.

System action: Exception trace point 0126 is issued. Outstanding replies are processed. A systemException of NO_PERMISSION is sent to the client. The socket is closed and the transaction terminated.

User response: Determine why the URM *urmname* returned an invalid userid.

Data 2 in the exception trace point entry contains the first 1024 bytes of the GIOP request.

Module: DFHIIRR

XMEOUT Parameters: *date, time,applid, client_ip_addr, tcpipSERVICE, urmname, userid*

Destination: CIIL

DFHII0106E *date time applid client_ip_addr tcpipSERVICE* **The request receiver find request stream failed.**

Explanation: The IIO Request Receiver received a GIOP request; however, the attempt to find a Request Stream failed.

System action: Outstanding replies are processed. A systemException of COMM_FAILURE is sent to the client. The socket is closed and the transaction is terminated.

User response: Use trace and the previous DFHII0002 message to determine why program DFHIIRH failed to find a Request Stream.

Module: DFHIIRR

XMEOUT Parameters: *date, time,applid, client_ip_addr, tcpipSERVICE*

Destination: CIIL

DFHII0107E *date time applid client_ip_addr tcpipSERVICE* **The request receiver is unable to receive a reply from the request processor. Request ID: *req_id***

Explanation: The IIO Request Receiver received a GIOP request and sent it to the ORB via a Request Stream. A reply was expected but the request receiver was unable to receive it. The failure to receive the request could be caused by a transport failure or by the failure of the Request Processor. *req_id* is the requestId of the request expecting the reply.

System action: Exception trace point 012D is issued. A systemException of COMM_FAILURE or INTERNAL is sent to the client. The Request Receiver attempts to continue.

User response: Use trace to determine why the RZSO RECEIVE_REPLY failed.

Data 2 in the exception trace point entry contains the first 1024 bytes of the GIOP request.

Module: DFHIIRR

XMEOUT Parameters: *date, time,applid, client_ip_addr, tcpipSERVICE, req_id*

Destination: CIIL

DFHII0108E *date time applid client_ip_addr tcpipSERVICE* **The request receiver was notified that a reply could not be delivered for requestId req_id. Reason: {Request Processor ABEND. | Request Stream closed. | Timeout. | Undefined.}**

Explanation: The IIOp Request Receiver request streams notify gate was called with a status that indicated that the reply was not available. The reply was for requestId *req_id*. The *reason* is set from the notify status.

System action: Exception trace point 013A is issued. A systemException of COMM_FAILURE or INTERNAL is sent to the client. The request receiver task attempts to continue.

User response: If the *reason* is *TIMEOUT* then determine why the Request Processor was unable to respond within the RTIMOUT time specified in the DFHCICS profile. Otherwise use trace to determine why the Request Processor abended or why the Request Stream closed abnormally.

Module: DFHIIRR

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpipSERVICE, req_id, {1=Request Processor ABEND., 2=Request Stream closed., 3=Timeout., 4=Undefined.}*

Destination: CIIL

DFHII0109E *date time applid client_ip_addr tcpipSERVICE* **The request receiver received a request with an OTS PropagationContext with a null coordinator.**

Explanation: The IIOp Request Receiver received a GIOP request. The request handler found an OTS PropagationContext with a null coordinator in the transaction context within the request header.

System action: Exception trace point 0148 is issued. Outstanding replies are processed. A systemException of INVALID_TRANSACTION is sent to the client. The socket is closed and the transaction terminated.

User response: Trace point II 0212 data 1 contains the transaction sequence (the contents of the transaction context - for a maximum of 512 bytes).

If the transaction context originated in WebSphere Application Server Advanced Edition, you should use the WebSphere administration console to set the command line option `com.ibm.ejs.jts.jts.ControlSet.nativeOnly=false` for the relevant server to cause it to propagate interoperable transaction contexts.

Module: DFHIIRR

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpipSERVICE*

Destination: CIIL

DFHII0110E *date time applid client_ip_addr tcpipSERVICE* **The request receiver received a request with no object key. Reason(X'pointId').**

Explanation: The IIOp Request Receiver received a GIOP header with no object key in the request or locate request header. The actual problem with the request or locate header depends on the reason *pointid* which is the II exception trace point id issued with the message

013C The addressing disposition value is invalid. From GIOP 1.2 the addressing disposition within the target address should be a 2 byte value of 0, 1 or 2 indicating whether a KeyAddr, ProfileAddr or ReferenceAddr follows. This means that CICS cannot find an object key.

013D The addressing disposition value is 2 but a 0 value for profile number indicates that there are no tagged profiles and thus no object key.

013E The addressing disposition value is 2 and one or more tagged profiles exist. However the object key is in the tagged internet profile (profileId = 00000000) which is not present.

System action: Exception trace point 013C, 013D or 013E is issued. Outstanding replies are processed. A systemException of INV_OBJREF is sent to the client. The socket is closed and the transaction terminated.

User response: Use the exception trace to determine why the request or located request header is invalid.

Data 2 in the exception trace point entry contains the first 1024 bytes of the GIOP request.

The Common Object Request Broker: Architecture and Specification manual contains the definition of the request and locate request header.

Module: DFHIIRR

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpipSERVICE, X'pointId'*

Destination: CIIL

DFHII0200E *date time applid client_ip_addr tcpipSERVICE* **The request receiver SOCB notify gate is unable to attach transaction transaction.**

Explanation: The socket domain received a request for a TCPIP service which specified PROTOCOL(IIOp). However, the socket notify gate in the Request Receiver was unable to attach the transaction specified in the TCPIP service definition.

System action: Exception trace point 012E is issued.

User response: Check the definitions in the TCPIP

service and the specified transaction.

Module: DFHIIRR

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpipSERVICE, transaction*

Destination: CIIL

DFHII0201E *date time applid client_ip_addr tcpipSERVICE* **The request receiver received an invalid GIOP header.**

Explanation: The IIOPI Request Receiver received a GIOP header with the magic field (first 4 bytes) not equal to 'GIOP'.

System action: Exception trace point 0106 is issued. Outstanding replies are processed. A messageError is sent to the client. The socket is closed and the transaction terminated.

User response: Determine why the GIOP header was sent with an incorrect magic field.

Data 2 in the exception trace point entry contains the GIOP header.

Module: DFHIIRR

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpipSERVICE*

Destination: CIIL

DFHII0202E *date time applid client_ip_addr tcpipSERVICE* **The request receiver received a GIOP header for an unsupported version. Supported version is GIOP sup_version. Received version is GIOP rec_version.**

Explanation: The IIOPI Request Receiver received a GIOP header with an invalid GIOP version. This CICS supports up to GIOP *sup_version*. The version of the received message is GIOP *rec_version*.

System action: Exception trace point 0108 is issued. Outstanding replies are processed. A systemException is sent to the client. The socket is closed and the transaction terminated.

User response: If this CICS region is part of a logical server which is being upgraded from one release to another, ensure that all regions within the logical server advertise the lowest level of GIOP supported across the logical server. Please see the Migration Guide of the most recent level of CICS for further advice.

Ensure that IORs published for use with this CICS region are at GIOP version *sup_version* and that the client ORB is using the IOR correctly.

Data 2 in the exception trace point entry contains the GIOP header.

Module: DFHIIRR

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpipSERVICE, sup_version, rec_version*

Destination: CIIL

DFHII0204E *date time applid client_ip_addr tcpipSERVICE* **The request receiver received a fragment when none was expected.**

Explanation: The IIOPI Request Receiver received a messageType of fragment; however, the 'more fragments' flag was not set in the previous message.

System action: Exception trace point 010F is issued. Outstanding replies are processed. A messageError is sent to the client. The socket is closed and the transaction terminated.

User response: Determine why the client sent a fragment when one was not expected.

Data 2 in the exception trace point entry contains the first 1024 bytes of the GIOP request.

Module: DFHIIRR

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpipSERVICE*

Destination: CIIL

DFHII0205E *date time applid client_ip_addr tcpipSERVICE* **The request receiver received a messageType of messageError.**

Explanation: The IIOPI Request Receiver received a messageType of messageError.

System action: Exception trace point 0120 is issued. Outstanding replies are processed. A messageError is sent to the client. The socket is closed and the transaction terminated.

User response: Determine why the client sent a messageError. If it was in response to a message from the server, determine the message in error.

Data 2 in the exception trace point entry contains the GIOP Header.

Module: DFHIIRR

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpipSERVICE*

Destination: CIIL

DFHII0206E *date time applid client_ip_addr tcpipSERVICE* **The request receiver received a messageType of reply or locateReply which is not supported.**

Explanation: The IIOPI Request Receiver received a messageType of reply or locateReply which is not supported by this Request Receiver.

System action: Exception trace point 0121 is issued. Outstanding replies are processed. A messageError is sent to the client. The socket is closed and the transaction terminated.

User response: Determine why the client sent a reply.

Data 2 in the exception trace point entry contains the GIOP Header.

Module: DFHIIRR

XMEOUT Parameters: *date, time,applid, client_ip_addr, tcpipSERVICE*

Destination: CIIL

DFHII0207E *date time applid client_ip_addr tcpipSERVICE* **The request receiver received a messageType of closeConnection which is not supported.**

Explanation: The IIOF Request Receiver received a messageType of closeConnection which is not supported by this Request Receiver.

System action: Exception trace point 0122 is issued. Outstanding replies are processed. A messageError is sent to the client. The socket is closed and the transaction terminated.

User response: Determine why the client sent a closeConnection.

Data 2 in the exception trace point entry contains the GIOP Header.

Module: DFHIIRR

XMEOUT Parameters: *date, time,applid, client_ip_addr, tcpipSERVICE*

Destination: CIIL

DFHII0208E *date time applid client_ip_addr tcpipSERVICE* **The request receiver received a GIOP header with an invalid messageType.**

Explanation: The IIOF Request Receiver received a GIOP header with an invalid message type.

System action: Exception trace point 0123 is issued. Outstanding replies are processed. A messageError is sent to the client. The socket is closed and the transaction terminated.

User response: Determine why the client sent GIOP header with an unknown messageType.

Data 2 in the exception trace point entry contains the GIOP Header.

Module: DFHIIRR

XMEOUT Parameters: *date, time,applid, client_ip_addr, tcpipSERVICE*

Destination: CIIL

DFHII0209E *date time applid client_ip_addr tcpipSERVICE* **The request receiver is unable to parse a request header.**

Explanation: The IIOF Request Receiver received a GIOP request header which it is unable to parse correctly.

System action: Exception trace point 0214 or 0215 is issued followed by Exception trace point 0128. Outstanding replies are processed. A messageError is sent to the client. The socket is closed and the transaction terminated.

User response: Determine why the request header is apparently invalid.

If exception trace point 0214 is issued then DFHIIRH was unable to parse the service contexts in the request header.

If exception trace point 0215 is issued then DFHIIRH found a length in the request header that was greater than the length of the whole buffer. The length is contained in data 1.

Data 2 in the exception trace point 0128 contains the first 1024 bytes of the request.

Module: DFHIIRR

XMEOUT Parameters: *date, time,applid, client_ip_addr, tcpipSERVICE*

Destination: CIIL

DFHII0210E *date time applid* **The request receiver is unable to run the security URM: module. Reason(X'reason)**

Explanation: The IIOF Request Receiver attempted to invoke the security URM *module* but failed with a code supplied as *reason*.

System action: Exception trace point 0209 is issued. Outstanding replies are processed. A messageError is sent to the client. The socket is closed and the transaction terminated.

User response: Possible causes of the problem and an indication of how to solve them are given in the following list of reason code meanings:

Reason Meaning and solution

- 1 The user exit program should be linked with AMODE(31). Ensure that the user exit is linked to the correct AMODE.
- 2 The user exit program has no PPT entry. Ensure that the PPT entry for the user exit program exists and is valid.
- 3 The user exit program could not be loaded. Ensure that the user exit program is contained

in one of the data sets concatenated in the DFHRPL DD statement and has the correct name.

- 4 The user exit program has abended. This is a possible error within the user exit program. Check for any abend codes that may have been issued.
- 5 The user exit program is not enabled. CICS may have disabled the program due to an earlier error or the program may have been defined as disabled.
- 6 CICS is unable to load the user exit program for some other reason. Use trace to determine why the DFHPGLU call failed.

Module: DFHIIRH

XMEOUT Parameters: *date, time, applid, module, X'reason'*

Destination: CIIL

DFHII0212E *date time applid client_ip_addr tcpipSERVICE* **The request receiver socket receive timed out. Replies outstanding: replies. Fragments in progress: fragments**

Explanation: The IIOF Request Receiver issued a socket receive request which timed out. There are *replies* replies outstanding. There are *fragments* fragments in progress.

System action: Exception trace point 010B or 010D is issued. Outstanding replies are NOT processed. A messageError is sent to the client. The socket is closed and the transaction terminated.

User response: Determine if the SOCKETCLOSE time in the TCPIP service definition is adequate and change it if necessary.

Data 2 in the exception trace point entry contains the first 1024 bytes of the request already received.

Module: DFHIIRR

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpipSERVICE, replies, fragments*

Destination: CIIL

DFHII0213E *date time applid* **The request receiver request streams notify gate was driven but the task no longer exists for request_id X'req_id'.**

Explanation: The IIOF Request Receiver Request Stream's notify gate was driven to indicate that a reply is ready, but the task no longer exists. The reply was for requestId *req_id*.

System action: Exception trace point 0139 is issued.

User response: Determine why the task no longer exists. It may have been purged or may not have expected a reply and so terminated.

Module: DFHIIRR

XMEOUT Parameters: *date, time, applid, X'req_id'*

Destination: CIIL

DFHII0214E *date time applid* **The request receiver request streams notify gate was driven but the resume for the task failed for request_id X'req_id'.**

Explanation: The IIOF Request Receiver Request Stream's notify gate attempted to resume a task when a reply was available, but the resume failed. The task may have been force purged. The reply was for requestId *req_id*.

System action: Exception trace point 0138 is issued.

User response: Determine why the resume failed.

Module: DFHIIRR

XMEOUT Parameters: *date, time, applid, X'req_id'*

Destination: CIIL

DFHII0215E *date time applid client_ip_addr tcpipSERVICE* **The request receiver socb_notify_gate was driven but the resume for the task failed.**

Explanation: The IIOF Request Receiver socket notify gate attempted to resume a task after new data or some other socket activity occurred, but the resume failed. This would occur if the Request Receiver task was force purged.

System action: Exception trace point 0137 is issued.

User response: Determine whether the task was purged - this can be determined by examining the DSSR RESUME exit trace point for an exception of TASK_CANCELLED. If the task was not purged examine the DSSR RESUME exit trace point to see why the resume failed.

Module: DFHIIRR

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpipSERVICE*

Destination: CIIL

DFHII0216E *date time applid client_ip_addr tcpipSERVICE* **The request receiver asynchronous socket receive failed with an IO error.**

Explanation: The IIOF Request Receiver socket notify gate was driven with an action code of ERROR because an outstanding asynchronous socket receive request ended with an IO error.

DFHII0217E • DFHII0220E

System action: Exception trace point 013B is issued. The socket is closed and the request receiver is terminated.

User response: Determine why an IO error occurred on this port.

Module: DFHIIRR

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpipSERVICE*

Destination: CIIL

DFHII0217E *date time applid client_ip_addr tcpipSERVICE* **The request receiver received a GIOP header with an invalid length.**

Explanation: The IIOF Request Receiver received a GIOP header and attempted to receive the number of bytes specified in the header, however, that number of bytes was not available.

System action: Exception trace point 0107 is issued. Outstanding replies are processed. A messageError is sent to the client. The socket is closed and the transaction terminated.

User response: Determine why the GIOP header was sent with an incorrect length field.

Data 2 in the exception trace point entry contains the GIOP header.

Module: DFHIIRR

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpipSERVICE*

Destination: CIIL

DFHII0218E *date time applid client_ip_addr tcpipSERVICE* **The request receiver socket first receive timed out.**

Explanation: The IIOF Request Receiver issued a socket receive request for the first time following a newly opened connection. The receive request timed out after a CICS defined interval. If a client opens a TCPIP connection with CICS then it must be followed by the request within 30 seconds. CICS purges the request after this time to prevent clients from sending in connection requests that are not followed by the request itself and possibly causing CICS to reach the maximum number of tasks (mxt) limit.

System action: Exception trace point 0144 is issued. A messageError is sent to the client. The socket is closed and the transaction terminated.

User response: Determine which client is sending in a connection request to a TCPIP service defined with protocol IIOF, without also sending in the request.

Module: DFHIIRR

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpipSERVICE*

Destination: CIIL

DFHII0219E *date time applid* **The request handler is unable to create or join a request stream because it is unable to reach the target for transaction *tranid*.**

Explanation: The IIOF request handler attempted to create or join a request stream for transaction *tranid*. The transaction specifies a REMOTESYSTEM which cannot be contacted. This might be because IRC is not open or the target system is unavailable.

If the caller is the Request Receiver, message DFHII0106 follows this message. DFHII0106 shows the client ip address and TCPIP SERVICE name of the client.

If *tranid* is specified as 'n/a' then the request handler was attempting to JOIN a request stream but the transaction id is not available to the request handler.

If the caller was a request processor and a JOIN was being attempted the request processor may attempt to send the request via an outbound TCPIP request stream.

System action: Exception trace point 020B is issued if create failed. Exception trace point 020A is issued if join failed. If the caller is the Request Receiver a systemError is sent to the client, the socket is closed and the transaction terminated. If the caller is the Request Processor a systemError is sent to the client and the transaction is terminated.

User response: Determine the remote system name from the *tranid* definition. Ensure that IRC is open and the IRC connection named is in service.

Module: DFHIIRH

XMEOUT Parameters: *date, time, applid, tranid*

Destination: CIIL

DFHII0220E *date time applid* **The request handler is unable to create or join a request stream because remote system specified in transaction *tranid* cannot be reached.**

Explanation: The IIOF request handler attempted to create or join a request stream for transaction *tranid*. The transaction specifies a REMOTESYSTEM which cannot be found. The transaction was specified in a Request Model TRANSID parameter.

If the caller is the Request Receiver, message DFHII0106 follows this message. DFHII0106 shows the client ip address and TCPIP SERVICE name of the client.

System action: Exception trace point 020B is issued if

create failed. Exception trace point 020A is issued if join failed. If the caller is the Request Receiver a `systemError` is sent to the client and the socket is closed and the transaction terminated. If the caller is the Request Processor a `systemError` is sent to the client and the transaction is terminated.

User response: Either install the relevant MRO connection or change the REMOTESYSTEM for transaction *tranid* to the required MRO connection that is installed.

Module: DFHIIRH

XMEOUT Parameters: *date, time, applid, tranid*

Destination: CIIL

DFHII0221E *date time applid client_ip_addr tcpipservice* **The Request Receiver failed to receive a request due to a socket error.**

Explanation: The IIOF Request Receiver attempted to receive a request from a socket, but the socket domain found an error.

System action: Exception trace point 010A is issued.

User response: Check for an earlier DFHSO message which describes the cause of this failure.

Module: DFHIIRR

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpipservice*

Destination: CIIL

DFHII0222E *date time applid client_ip_addr tcpipservice* **The Request Receiver received a request which indicated that a fragment is expected. This is not supported for GIOP 1.1 and earlier.**

Explanation: The IIOF Request Receiver received a GIOP 1.1 (or earlier) header with the 'fragment expected' bit on. CICS does not support fragments for GIOP 1.1.

System action: Exception trace point 0149 is issued.

User response: Find why the client is sending fragments.

Module: DFHIIRR

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpipservice*

Destination: CIIL

DFHII0223E *date time applid client_ip_addr tcpipservice* **The Request Receiver is unable to obtain storage.**

Explanation: The IIOF Request Receiver attempted to obtain storage from the storage manager domain.

System action: Exception trace point 0130 is issued.

User response: Find why the CICS system is short on storage. It may be necessary to limit the number of CIRR tasks by using the TRANCLASS mechanism on the TRANSACTION definition for CIRR or by lowering the MAXACTIVE parameter in the existing TRANCLASS. If this is not desirable then you may need to increase the EDSALIM specified in the System Initialization Table.

Module: DFHIIRR

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpipservice*

Destination: CIIL

DFHII0224E *date time applid client_ip_addr tcpipservice* **The Request Receiver received a request. Processing cannot continue because a security check has failed.**

Explanation: The IIOF Request Receiver received a request which contained a security context. The security check failed due to the reason stated in an earlier DFHII06xx message.

System action: Exception trace point 0150 is issued.

User response: Use the TCPIP service name and client ip address from this message and find the earlier DFHII06xx message to determine the cause of the failure.

Module: DFHIIRR

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpipservice*

Destination: CIIL

DFHII0225E *date time applid client_ip_addr tcpipservice* **The Request Receiver received a request without a valid security context for TCPIP SERVICE AUTHENTICATION({none | basic | asserted | unused | certificate}).**

Explanation: The IIOF Request Receiver received a request. The TCPIP SERVICE defined an authentication parameter specified in the message. However, no valid security context was found for that protocol.

System action: Exception trace point 0151 is issued.

User response: Determine whether the authentication parameter specified in the TCPIP SERVICE is wrong or

whether the client sent a request with an invalid security context.

1. There might be no security context at all.
2. There might be a security context but of the wrong type.
3. There might be a security context but with an unsupported version.
4. There might be a basic authentication security context which contains a mechanism other than 'SSL' in ASCII.

Use trace to examine the request header found in trace point II 0132. There may be several of these. The GIOP Header is traced first and this is followed by the request header and body of the request. Trace level 1 traces the first 512 bytes. If the security context occurs after 512 bytes you need II trace level 1 and 2 set.

This probably occurs on the first request for the connection but may occur for subsequent requests.

Module: DFHIIRR

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpipservice, {1=none, 2=basic, 3=asserted, 4=unused, 5=certificate}*

Destination: CIIL

DFHII0226 *date time applid client_ip_addr tcpipservice* **The Request Receiver is unable to send a reply to the client.**

Explanation: The IIOB Request Receiver had received a request from the client and was attempting to send the client a reply. However the request receiver received an exception from the socket domain.

System action: Exception trace point 010E is issued.

User response: Find why the client is unable to receive the reply. This may be because the client has been turned off or because the request was cancelled by an operator action.

Module: DFHIIRR

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpipservice*

Destination: CIIL

DFHII0227E *date time applid client_ip_addr tcpipservice* **The request receiver socket has been closed. Replies outstanding: replies. Fragments in progress: fragments**

Explanation: The IIOB Request Receiver received a socket closed notification from the client and at least one of the requests was for GIOP 1.2 or above. There are *replies* replies outstanding from the request processor to earlier requests or locate requests.

There are *fragments* fragmented requests or locateRequests started.

System action: Exception trace point 014A is issued. Outstanding replies are processed, but not sent on to the client. The transaction is terminated.

User response: Determine why the client closed the socket when there were still replies or fragments in progress.

Module: DFHIIRR

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpipservice, replies, fragments*

Destination: CIIL

DFHII0228E *date time applid client_ip_addr tcpipservice* **The request receiver socket has been closed.**

Explanation: The IIOB Request Receiver received a socket closed notification from the client and at least one of the requests was for GIOP 1.2 or above. At GIOP 1.2 or above the request receiver expects to receive a connectionClose request and not a socket close for an orderly shutdown. There are no replies outstanding.

System action: Exception trace point 014B is issued. The transaction is terminated.

User response: Determine why the client closed the socket before sending a closeConnection request.

Module: DFHIIRR

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpipservice*

Destination: CIIL

DFHII0229E *date time applid client_ip_addr tcpipservice* **The request receiver received a GIOP fragment with no preceding request for requestId: requestId**

Explanation: The IIOB Request Receiver received a fragment. However no GIOP request or locateRequest has been received for the fragment with the requestId *requestId* specified.

System action: Exception trace point 0152 is issued. Outstanding replies are processed. A messageError is sent to the client. The socket is closed and the transaction terminated.

User response: Determine why the client sent a fragment with no request. In GIOP 1.2 and above fragments contain a request header that just consists of the requestID. This should be consistent for all the fragments for the request or locate request being received including the first.

Fragments can be in progress for more than one request at a time.

Data 2 in the exception trace point entry contains the first fragment's GIOP header and request header.

Module: DFHIIRR

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpip-service, requestId*

Destination: CIIL

DFHII0230E *date time applid* **The request processor request streams notify gate was driven but the task no longer exists.**

Explanation: The IIO Request Processor Request Stream's notify gate was driven to indicate that a reply or request is ready, but the task no longer exists.

System action: Exception trace point 070F is issued.

User response: Determine why the task no longer exists. The task may have been purged or may not have expected a reply and so terminated.

Module: DFHIIRP

XMEOUT Parameters: *date, time, applid*

Destination: CIIL

DFHII0231E *date time applid* **The request processor request streams notify gate was driven but the resume for the task failed.**

Explanation: The IIO Request Processor Request Stream's notify gate attempted to resume a task when a reply or request was available, but the resume failed.

System action: Exception trace point 0710 is issued.

User response: Determine why the resume failed. The task may have been purged.

Module: DFHIIRP

XMEOUT Parameters: *date, time, applid*

Destination: CIIL

DFHII0232E *date time applid* **The request processor is unable to receive a request from the request receiver.**

Explanation: The IIO Request Processor issued a Request Stream receive request to receive a request from the Request Receiver but the receive failed.

System action: Exception trace point 0709 is issued. See the system action for the DFHII1nnn message that is issued after this message.

User response: Use trace to determine why the RZTA RECEIVE_REQUEST failed. Look for earlier Request Stream(RZ) trace and messages.

Module: DFHIIRP

XMEOUT Parameters: *date, time, applid*

Destination: CIIL

DFHII0233E *date time applid* **The request processor is unable to receive a reply from a target ORB.**

Explanation: The IIO Request Processor attempted to receive a reply from a target ORB but the receive failed.

System action: Exception trace point 070B is issued. See the system action for the DFHII1nnn message that is issued after this message.

User response: Use trace to determine why the receive reply failed.

Module: DFHIIRP

XMEOUT Parameters: *date, time, applid*

Destination: CIIL

DFHII0234E *date time applid* **The request processor is unable to send a reply to the request receiver.**

Explanation: The IIO Request Processor issued a Request Stream send reply to send a reply to the Request Receiver but the send failed.

System action: Exception trace point 070A is issued. See the system action for the DFHII1nnn message that is issued after this message.

User response: Use trace to determine why the RZTA SEND_REPLY failed. Look for earlier Request Stream (RZ) trace and messages.

Module: DFHIIRP

XMEOUT Parameters: *date, time, applid*

Destination: CIIL

DFHII0235E *date time applid* **The request processor is unable to send a request to a target ORB.**

Explanation: The IIO Request Processor attempted to send a request to a target ORB but the send failed.

System action: Exception trace point 070C is issued. See the system action for the DFHII1nnn message that is issued after this message.

User response: Use trace to determine why the send request failed. Look for earlier Request Stream (RZ) trace and messages.

Module: DFHIIRP

XMEOUT Parameters: *date, time, applid*

Destination: CIIL

DFHII0236E *date time applid* **The request processor is unable to receive a reply or a request from a target ORB or the request receiver.**

Explanation: The IIOF Request Processor attempted to await the arrival of a request from the Request Receiver or a reply from a target ORB but the attempt failed.

System action: Exception trace point 070D is issued. See the system action for the DFHII1nnn message that is issued after this message.

User response: Use trace to determine whether an RZLN LISTEN was for a reply or or a request. The 3 tokens in the RZLN LISTEN request will assist in this. The RZLN LISTEN exception will identify the reason for the failure.

Module: DFHIIRP

XMEOUT Parameters: *date, time,applid*

Destination: CIIL

DFHII0237E *date time applid* **The request handler is unable to create or join a request stream because transaction *transid* is not installed.**

Explanation: The IIOF request handler attempted to create or join a request stream for transaction *transid* which is not installed. The transaction was specified in a Request Model TRANSID parameter.

If the caller is the Request Receiver, message DFHII0106 follows this message. DFHII0106 shows the client ip address and TCIPSERVICE name of the client.

System action: Exception trace point 020B is issued if create failed. Exception trace point 020A is issued if join failed. If the caller is the Request Receiver a `systemError` is sent to the client and the socket is closed and the transaction terminated. If the caller is the Request Processor a `systemError` is sent to the client and the transaction is terminated.

User response: Either add an RDO definition for *transid* with a program name of DFJIIRP or change the matching RDO Request Model that specifies a TRANSID of *transid* to a transaction that is defined with a program of DFJIIRP.

Module: DFHIIRH

XMEOUT Parameters: *date, time,applid, transid*

Destination: CIIL

DFHII0238E *date time applid* **The request processor received a request with an invalid header.**

Explanation: The IIOF Request Processor issued a `receive_request` to receive data from a Request Receiver but the data received did not start with the GIOP magic characters.

System action: Exception trace point 0719 is issued. See the system action for the DFHII1nnn message that is issued after this message.

User response: Use trace to determine why a valid GIOP header was not received.

Module: DFHIIRP

XMEOUT Parameters: *date, time,applid*

Destination: CIIL

DFHII0239E *date time applid* **A request processor request does not contain a valid `cicsTaskTrackingContext`.**

Explanation: The IIOF Request Processor either received a request from the request receiver or was about to send a request. However, the request does not contain a valid `cicsTaskTrackingContext`.

System action: Exception trace point 0725 is issued if the context is missing. Exception trace point 0714 is issued if the request handler was unable to parse the request.

The transaction is abended.

User response: Use trace to determine whether the request had just been received from a Request Receiver (DFHIIRP RECEIVE_REQUEST) or whether it had been built by the ORB and was about to be sent (DFHIIRP INVOKE). Data3 in both trace points contain the request.

Module: DFHIIRP

XMEOUT Parameters: *date, time,applid*

Destination: CIIL

DFHII0240E *date time applid* **The request processor received a reply with an invalid header.**

Explanation: The IIOF Request Processor attempted to receive a reply from a target ORB but the data received did not start with the GIOP magic characters.

System action: Exception trace point 071B is issued. See the system action for the DFHII1nnn message that is issued after this message.

User response: Use trace to determine why a valid GIOP header was not received.

Module: DFHIIRP

XMEOUT Parameters: *date, time,applid*

Destination: CIIL

DFHII0241E *date time applid* **The request processor received a reply fragment with an invalid header.**

Explanation: The IIO Request Processor issued a receive_reply to receive a fragment from target ORB but the data received did not start with the GIOP magic characters.

System action: Exception trace point 071C is issued. See the system action for the DFHII1nnn message that is issued after this message.

User response: Use trace to determine why a valid GIOP fragment header was not received.

Module: DFHIIRP

XMEOUT Parameters: *date, time, applid*

Destination: CIIL

DFHII0242E *date time applid* **The request processor did not receive a reply fragment.**

Explanation: The IIO Request Processor issued a receive_reply to receive a fragment from a target ORB but the data received did not have a GIOPMessageType of GIOPFragment.

System action: Exception trace point 071D is issued. See the system action for the DFHII1nnn message that is issued after this message.

User response: Use trace to determine why a valid GIOP fragment was not received.

Module: DFHIIRP

XMEOUT Parameters: *date, time, applid*

Destination: CIIL

DFHII0243E *date time applid* **The request processor received a messageError reply.**

Explanation: The IIO Request Processor attempted to receive a reply from a target ORB but the data received had a GIOPMessageType of GIOPMessageError.

System action: Exception trace point 0720 is issued. See the system action for the DFHII1nnn message that is issued after this message.

User response: Use trace to determine why a GIOPMessageError was received.

Determine whether the original request was in error or whether the target ORB incorrectly sent a messageError.

Module: DFHIIRP

XMEOUT Parameters: *date, time, applid*

Destination: CIIL

DFHII0244E *date time applid* **The request processor received an invalid GIOPMessageType.**

Explanation: The IIO Request Processor attempted to receive a reply from a target ORB. The data received had a known GIOPMessageType but is not valid when sent from a server.

System action: Exception trace point 0721 is issued. See the system action for the DFHII1nnn message that is issued after this message.

User response: Use trace to determine why the target ORB sent an invalid GIOPMessageType.

Module: DFHIIRP

XMEOUT Parameters: *date, time, applid*

Destination: CIIL

DFHII0245E *date time applid* **The request processor received an unknown GIOPMessageType.**

Explanation: The IIO Request Processor attempted to receive a reply from a target ORB but the data received had an unknown GIOPMessageType.

System action: Exception trace point 0722 is issued. See the system action for the DFHII1nnn message that is issued after this message.

User response: Use trace to determine why the target ORB sent an unknown GIOPMessageType.

Module: DFHIIRP

XMEOUT Parameters: *date, time, applid*

Destination: CIIL

DFHII0246E *date time applid* **The request processor received an unexpected GIOPFragment.**

Explanation: The IIO Request Processor attempted to receive a reply from a target ORB. The data received had a GIOPMessageType of GIOPFragment but no earlier GIOPHeader was received with the 'more fragments to follow' bit on.

System action: Exception trace point 0723 is issued. See the system action for the DFHII1nnn message that is issued after this message.

User response: Use trace to determine why the target ORB sent a GIOPFragment without sending an earlier message indicating that a fragment is to follow.

Module: DFHIIRP

XMEOUT Parameters: *date, time, applid*

Destination: CIIL

DFHII0247E *date time applid* **The request processor is unable to receive a {reply from a target ORB | request from the Request Receiver}. Reason: {ABEND. | Request Stream closed. | Timeout.}**

Explanation: The IIO Request Processor attempted to await the arrival of a request from the Request Receiver or a reply from a target ORB but was notified that the data was not available. *Reason* is set from the notify status.

System action: Exception trace point 070E is issued. See the system action for the DFHII1nnn message that is issued after this message.

User response: Use trace to determine why the failure occurred. Trace point 070E Data 3 contains *listen_data* which contains the Request Stream token. The *listen_data* also contains the requestID of the request expecting a reply if the notification was for a reply.

A reason of *ABEND* indicates that the request stream detected an abend in the Request Receiver or target ORB.

A reason of *Request Stream closed* indicates that the Request Stream closed abnormally.

A reason of *TIMEOUT* when failing to receive a request, indicates that the RTIMOUT value in the profile for the Request Processor transaction has been exceeded.

A reason of *TIMEOUT* when failing to receive a reply, indicates that the RTIMOUT value in the DFHCICSI profile has been exceeded.

Module: DFHIIRP

XMEOUT Parameters: *date, time, applid, {1=reply from a target ORB, 2=request from the Request Receiver}, {1=ABEND., 2=Request Stream closed., 3=Timeout.}*

Destination: CIIL

DFHII0248E *date time applid* **The request processor may have been started invalidly.**

Explanation: The IIO Request Processor program DFHIIRP was unable to find its current request stream. This may be because a transaction specifying DFJIIRP was initiated from the wrong place.

System action: See the system action for the DFHII1nnn message that is issued after this message.

User response: Use trace to find which transaction caused DFJIIRP to be called and find where it was initiated. If it was not initiated by the request stream domain then it may have been initiated from a terminal which is not allowed. Another possibility is that an IIO TCPIP SERVICE definition mistakenly has a transaction parameter of CIRP where it should have CIRR or the customer equivalents. If, however, it was initiated by the

request stream domain then further investigation of the trace is needed.

Module: DFHIIRP

XMEOUT Parameters: *date, time, applid*

Destination: CIIL

DFHII0249E *date time applid* **The Request Processor received a reply which indicated that a fragment is expected. This is not supported for GIOP 1.1 and earlier.**

Explanation: The IIO Request Processor received a GIOP 1.1 (or earlier) reply header from a target orb with the 'fragment expected' bit on. CICS does not support fragments for GIOP 1.1.

System action: Exception trace point 0727 is issued.

User response: Find why the target ORB is sending fragments.

Module: DFHIIRP

XMEOUT Parameters: *date, time, applid*

Destination: CIIL

DFHII0250E *date time applid* **The request processor received an invalid reply fragment.**

Explanation: The IIO Request Processor issued a *receive_reply* to receive a fragment from a target ORB but the reply header did not contain the same requestID as the first fragment.

System action: Exception trace point 0728 is issued. See the system action for the DFHII1nnn message that is issued after this message.

User response: Use trace to determine why the requestID changed. Each fragment within a reply should contain the same requestID.

Module: DFHIIRP

XMEOUT Parameters: *date, time, applid*

Destination: CIIL

DFHII0251E *date time applid client_ip_addr tcpip service* **The request receiver received a GIOP fragment whose length is not divisible by 8.**

Explanation: The IIO Request Receiver received a request or locate request which indicated that further fragments are to follow. However, the length of the GIOP header plus the length of the message is not divisible by 8.

System action: Exception trace point 0135 is issued. Outstanding replies are processed. A messageError is sent to the client. The socket is closed and the transaction terminated.

User response: Determine why the client sent a fragment that contained an invalid length. In GIOP 1.2 and above each fragment except the last must have a total length that is divisible by 8.

Data 2 in the exception trace point entry contains the first fragment's GIOP header and request header.

Module: DFHIIRR

XMEOUT Parameters: *date, time, applid, client_ip_addr, tcpipservice*

Destination: CIIL

DFHII0252E *date time applid* **The request processor received a fragmented reply whose length is not divisible by 8.**

Explanation: The IIOF Request Processor issued a `receive_reply` to receive a fragment from target ORB but the `message_length` plus the length of the GIOP header was not divisible by 8.

System action: Exception trace point 071E is issued. See the system action for the DFHII1nnn message that is issued after this message.

User response: Use trace to determine why the client ORB sent a fragment with an invalid length.

Module: DFHIIRP

XMEOUT Parameters: *date, time, applid*

Destination: CIIL

DFHII0300E *date time applid* **The CICS ORB failed to find the requested plugin *plugin*.**

Explanation: The CICS ORB attempted to instantiate the requested plugin class *plugin* but the ORB could not find this class on the current classpath.

System action: The plugin is not loaded.

User response: Examine the value set for the classpath in the JVM profile being used from the XDFHENV dataset. The pathname for the requested plugin must be present in the classpath.

Module: com.ibm.cics.iiof.DebugRequestInterceptor

XMEOUT Parameters: *date, time, applid, plugin*

Destination: CIIL

DFHII0301E *date time applid* **The CICS ORB plugin *plugin* has thrown exception *exception*.**

Explanation: The CICS ORB caught an exception thrown from plugin *plugin*.

System action: The ORB attempts to continue processing the user application.

User response: Either contact the *plugin* vendor for

further assistance or catch the exception in the body of your plugin.

Module: com.ibm.cics.iiof.DebugRequestInterceptor

XMEOUT Parameters: *date, time, applid, plugin, exception*

Destination: CIIL

DFHII0401I *date time applid* **REQUESTMODEL *rqmodelName* has been installed.**

Explanation: This is an audit log message indicating that REQUESTMODEL *rqmodelName* has been added to the system using the INSTALL command.

System action: The system continues normally.

User response: None.

Module: DFHIIMM

XMEOUT Parameters: *date, time, applid, rqmodelName*

Destination: CIIL

DFHII0402I *date time applid* **REQUESTMODEL *rqmodelName* has been discarded.**

Explanation: This is an audit log message indicating that REQUESTMODEL *rqmodelName* has been removed from the system using the DISCARD command.

System action: The system continues normally.

User response: None.

Module: DFHIIMM

XMEOUT Parameters: *date, time, applid, rqmodelName*

Destination: CIIL

DFHII0501E *date time applid* **The II command processor is unable to run program DFJIIIRP.**

Explanation: DFHIIICP has been called to link to program DFJIIIRP however the link failed.

System action: The system continues normally.

User response: If there is a DFHSJ message indicating that there is a `jvmprofile` problem then take the necessary action. If there is a DFHPG message referring to DFJIIIRP then take the necessary action.

This message could also occur if you are attempting to operate on resources requiring a JVM, for example CORBASERVERs or DJARs, from within a JVM program.

Otherwise use trace to determine why the DFHPGLE link failed or examine the DFJIIIRP program definition. For instance the DFJIIIRP program definition might be disabled.

DFHII0601E • DFHII0603E

Module: DFHIICP

XMEOUT Parameters: *date, time,applid*

Destination: CIIL

DFHII0601E *date time applid* **The request receiver received a request with a basic authentication security context. The request is rejected because** *{the userid is too long | the password is too long | of an invalid msgType | the sessionId already exists | the sessionId is not found | of a malformed context | unused | the version is invalid}*.

Explanation: The IIOF Request Receiver received a request which contained a basic authentication security context. DFHIIRS was processing the security context but found the error identified in the message.

System action: Exception trace point in the range II 0900-09FF is issued. Message DFHII0223 is issued. Outstanding replies are processed. A systemException containing a modified security context and a string of MARSHAL or INTERNAL is sent to the client. The socket is closed and the transaction terminated.

User response: Use trace to examine the security context contained within the client causing the violation.

Message DFHII0223 contains the TCPIP service name and the client IP address.

Determine whether the source of the problem is within the client sending the context or within this CICS system.

Module: DFHIIRS

XMEOUT Parameters: *date, time,applid, {1=the userid is too long,2=the password is too long, 3=of an invalid msgType, 4=the sessionId already exists, 5=the sessionId is not found, 6=of a malformed context, 7=unused, 8=the version is invalid}*

Destination: CIIL

DFHII0602E *date time applid* **The request receiver received a request with a basic authentication security context. The request is rejected because** *{the ESM inactive | CICS security is inactive | of an unknown ESM error | the command is not authorised | the password is not authorised | the userid is undefined | the password has expired | the userid has been revoked | of a userid format error | the applid is not authorised | of an unexpected return code}*.

Explanation: The IIOF Request Receiver received a request which contained a basic authentication security context. DFHIIRS was processing the security context but found the error identified in the message.

System action: Exception trace point in the range II 0900-09FF is issued. Message DFHII0223 is issued. Outstanding replies are processed. A systemException containing a modified security context and a string of NO_PERMISSION, MARSHAL or INTERNAL is sent to the client. The socket is closed and the transaction terminated.

User response: If the problem is caused by a security violation determine which client caused the problem.

If the problem is an operational one take the necessary steps to allow the security process to work.

Message DFHII0223 contains the TCPIP service name and the client IP address.

Module: DFHIIRS

XMEOUT Parameters: *date, time,applid, {1=the ESM inactive, 2=CICS security is inactive, 3=of an unknown ESM error,4=the command is not authorised, 5=the password is not authorised, 6=the userid is undefined, 7=the password has expired,8=the userid has been revoked, 9=of a userid format error, 10=the applid is not authorised, 11=of an unexpected return code}*

Destination: CIIL

DFHII0603E *date time applid* **The request receiver received a request with an asserted identity security context. The request is rejected because** *{of an invalid msgType | the userid is too long | of an invalid credType | it contains an invalid length | the version is invalid}*.

Explanation: The IIOF Request Receiver received a request which contained an asserted identity security context. DFHIIRS was processing the security context but found the error identified in the message.

System action: Exception trace point in the range II 0900-09FF is issued. Message DFHII0223 is issued. Outstanding replies are processed. A systemException containing a modified security context and a string of MARSHAL or INTERNAL is sent to the client. The socket is closed and the transaction terminated.

User response: Use trace to examine the security context contained within the client causing the violation.

Message DFHII0223 contains the TCPIP service name and the client IP address.

Determine whether the source of the problem is within the client sending the context or within this CICS system.

Module: DFHIIRS

XMEOUT Parameters: *date, time,applid, {1=of an invalid msgType,2=the userid is too long, 3=of an invalid credType, 4=it contains an invalid length, 5=the version is invalid}*

Destination: CIIL

DFHII0604E *date time applid* **The request receiver received a request with an asserted identity security context. The request is rejected because** {CICS security is inactive | the userid is undefined | the userid is not determined | the ESM is inactive | the ESM is not present | the command is not authorised | the XSRC resource is not found | the XSRC class is not found | the XSRC resource name is invalid | the USAD reason is not expected | the XSRC reason is not expected}.

Explanation: The IIOOP Request Receiver received a request which contained an asserted identity security context. DFHIIIRS was processing the security context but found the error identified in the message.

System action: Exception trace point in the range II 0900-09FF is issued. Message DFHII0223 is issued. Outstanding replies are processed. A systemException containing a modified security context and a string of NO_PERMISSION, MARSHAL or INTERNAL is sent to the client. The socket is closed and the transaction terminated.

User response: If the problem is caused by a security violation determine which client caused the problem.

If the problem is an operational one take the necessary steps to allow the security process to work.

Message DFHII0223 contains the TCP/IP service name and the client IP address.

Module: DFHIIIRS

XMEOUT Parameters: *date, time, applid, {1=CICS security is inactive, 2=the userid is undefined, 3=the userid is not determined, 4=the ESM is inactive, 5=the ESM is not present, 6=the command is not authorised, 7=the XSRC resource is not found, 8=the XSRC class is not found, 9=the XSRC resource name is invalid, 10=the USAD reason is not expected, 11=the XSRC reason is not expected}*

Destination: CIIL

DFHII1000E *date time applid className methodName* **internal error** *desc*.

Explanation: An internal logic error *desc* was detected in method *methodName* of class *className* of the IIOOP RequestProcessor.

System action: An II domain exception trace entry is made and a system dump requested. The RequestProcessor terminates abnormally.

User response: Use the trace and dump to determine the cause of the problem. If the problem persists you may need to contact your IBM support representative.

Module: com.ibm.cics.iioop.RequestProcessor

XMEOUT Parameters: *date, time, applid, className, methodName, desc*

Destination: CIIL

DFHII1001E *date time applid* **Severe error:** *desc*, **resulting from:** *th*.

Explanation: A severe error, identified by the string *desc*, was detected by the IIOOP RequestProcessor. This is usually related to a Java Throwable, *th*.

System action: An II domain exception trace entry is made and a system dump requested. The RequestProcessor terminates abnormally.

User response: Use the trace, dump and any previous messages to determine the cause of the problem. If the problem persists you may need to contact your IBM support representative.

Module: com.ibm.cics.iioop.RequestProcessor

XMEOUT Parameters: *date, time, applid, desc, th*

Destination: CIIL

DFHII1002E *date time applid* **Failure *e* obtaining data for LogicalServer** *serverName*.

Explanation: An EJ domain INQUIRE_LOGICAL_SERVER command for this RequestProcessor's LogicalServer was issued by the setAttributesFromIILS method during RequestProcessor initialization. The call resulted in error *e*.

System action: An II domain exception trace is issued and RequestProcessor initialization is terminated.

User response: Ensure that a CORBASERVER definition for LogicalServer *serverName* is available in the CICS region.

Module: com.ibm.cics.iioop.LogicalServerImpl

XMEOUT Parameters: *date, time, applid, e, serverName*

Destination: CIIL

DFHII1003E *date time applid* **LogicalServerPlugin load failure *e* for class** *className*.

Explanation: The LogicalServerPluginRegistry received exception *e* attempting to instantiate LogicalServerPlugin class *className*. A possible cause of this error is that the class is missing from the class path for this RequestProcessor program. This could be due to a missing, corrupt or inaccessible CICS jar file.

System action: An II domain exception trace is made and RequestProcessor initialization is terminated because the LogicalServerPlugin classes are required for proper execution of a CICS RequestProcessor.

| **User response:** Use the message and/or trace to
| determine the class in error and ensure that it is
| available to the RequestProcessor on the class path.

DFHII1004E • DFHII1008E

Module: com.ibm.cics.iiop.LogicalServerPluginRegistry

XMEOUT Parameters: *date, time, applid, e, className*

Destination: CIIL

DFHII1004E *date time applid* **Exception e creating object of class *javaClassName* for OMG interface *interfaceName*.**

Explanation: The create_object method of the CICS CosLifeCycle GenericFactory implementation determined that an object of class *javaClassName* could implement OMG interface *interfaceName*, but it failed to instantiate such an object.

Common causes of this message are:-

- the named class cannot be found on the application CLASSPATH for this RequestProcessor program.
- the named class does not contain a public default constructor.

System action: An II domain exception trace is issued and a CosLifeCycle::NoFactory exception is returned to the caller.

User response: Correct the CLASSPATH and/or class implementation as necessary and/or inspect the exception data recorded in the trace dataset.

Module: com.ibm.cics.iiop.cso._GenericFactoryImpl

XMEOUT Parameters: *date, time, applid, e, javaClassName, interfaceName*

Destination: CIIL

DFHII1005E *date time applid* **Exception e creating object of class *className*.**

Explanation: CorbaStatelessManager, the servant manager for CORBA stateless objects, failed to instantiate or register an object of class *className* due to exception *e*. A possible cause of this message is that the named class cannot be found on the application CLASSPATH for this RequestProcessor program.

System action: An II domain exception trace is issued and a CORBA::OBJECT_NOT_EXIST exception is returned to the caller.

User response: Correct the CLASSPATH if necessary and/or inspect the exception data recorded in the trace dataset.

Module: com.ibm.cics.iiop.cso.CorbaStatelessManager

XMEOUT Parameters: *date, time, applid, e, className*

Destination: CIIL

DFHII1006E *date time applid* **Exception e writing IOR file *fileName*.**

Explanation: The command processor for CORBA stateless objects was invoked during a CORBA server publish operation to make the GenericFactory IOR file available. An attempt to write to file *fileName* from method writeToFile in class PublishLogicalServerCommand failed with exception *e*.

System action: An IILS_EXCEPTION with reason IILS_SHELF_ACCESS_ERROR is returned to the caller.

User response: Correct the HFS access available to the CICS job and reissue publish.

Module:

com.ibm.cics.iiop.cso.PublishLogicalServerCommand

XMEOUT Parameters: *date, time, applid, e, fileName*

Destination: CIIL

DFHII1007E *date time applid* **Unknown object adapter *oa* in object key.**

Explanation: The CICS ObjectResolver implementation, RootOAImpI, has received an ObjectKey from the ORB containing an unrecognisable ObjectAdapter name *oa*. This could be caused by invalid input data or a CICS code error.

System action: An II domain exception trace is made and a system dump requested. The ObjectResolver throws NoSuchObjectException to the ORB which returns CORBA::OBJECT_NOT_EXIST to the client.

User response: Use the trace and dump to determine the cause of the problem. Data-2 in the exception trace entry contains the UserKey part of the ObjectKey. Data-3 in the exception trace entry contains the ObjectAdapter name extracted from it. This ObjectAdapter name should either be an internal CICS adapter name, beginning with the letters DFH, or be the name of the CORBASERVER, padded as necessary with EBCDIC blanks, for which this RequestProcessor is active.

Module: com.ibm.cics.iiop.oa.RootOAImpI

XMEOUT Parameters: *date, time, applid, oa*

Destination: CIIL

DFHII1008E *date time applid* **Exception e creating UserKey.**

Explanation: The CICS ObjectResolver implementation, RootOAImpI, received an unexpected exception *e* creating a UserKey object from the input byte array. The byte array is passed to the ObjectResolver by the ORB. It is the object resolver defined part of the ObjectKey known as the UserKey. The constructor of the UserKey class was unable to map the byte array into the fields of a UserKey object.

This could be caused by invalid EJB or Corba object reference.

This may happen if you use multiple versions of CICS. If a CICS region performs a JNDI operation to a location previously published to by a later version of CICS with the same CORBASERVER resource name and TCPIP host name then this message is likely to be issued.

System action: An II domain exception trace is made. The ObjectResolver throws NoSuchObjectException to the ORB which returns CORBA::OBJECT_NOT_EXIST to the caller.

User response: If this message was issued whilst processing a JNDI operation then retract the existing JNDI object reference using the same version of CICS that was originally used to publish the reference.

If this message was issued whilst processing a GIOP request then use the trace and dump to determine the cause of the problem. Data-2 in the exception trace entry contains the UserKey part of the ObjectKey. Data-3 in the exception trace entry contains a stack trace of the exception.

Module: com.ibm.cics.iiop.oa.RootOAImpI

XMEOUT Parameters: *date, time, applid, e*

Destination: CIIL

DFHII1009E *date time applid* **Failure dr issuing IIRP invoke.**

Explanation: An unexpected failure *dr* occurred issuing an IIRP invoke request on an outbound RequestStream.

System action: An II domain exception trace entry is made. For an Exception response, the CICSSourceOutputStream throws a java.io.IOException and a CORBA::COMM_FAILURE is returned to the client. For Disaster or Invalid responses, a system dump will have already been requested by IIRP. The CICSSourceOutputStream throws a com.ibm.cics.iiop.RequestProcessorRuntimeException and the RequestProcessor terminates abnormally.

User response: Use trace and dump to determine the cause of the failure. If the problem persists you may need to contact your IBM support representative.

Module:
com.ibm.cics.iiop.orb.CICSSourceOutputStream

XMEOUT Parameters: *date, time, applid, dr*

Destination: CIIL

DFHII1010E *date time applid* **Failure dr receiving request from IIRP.**

Explanation: An unexpected failure *dr* occurred receiving a request from the RequestStream of which this RequestProcessor is the target.

System action: An II domain exception trace entry is made. For an Exception response, the CICSTargetInputStream throws a java.io.IOException. For Disaster or Invalid responses, a system dump will have already been requested by IIRP. The CICSTargetInputStream throws a com.ibm.cics.iiop.RequestProcessorRuntimeException. In both cases, the RequestProcessor terminates abnormally since it cannot reply to the client.

User response: Use trace and dump to determine the cause of the failure. If the problem persists you may need to contact your IBM support representative.

Module: com.ibm.cics.iiop.orb.CICSTargetInputStream

XMEOUT Parameters: *date, time, applid, dr*

Destination: CIIL

DFHII1011E *date time applid* **Failure dr sending a reply to IIRP.**

Explanation: An unexpected failure *dr* occurred sending a reply to the RequestStream of which this RequestProcessor is the target.

System action: An II domain exception trace entry is made. For an Exception response, the CICSTargetOutputStream throws a java.io.IOException. For Disaster or Invalid responses, a system dump will have already been requested by IIRP. The CICSTargetOutputStream throws a com.ibm.cics.iiop.RequestProcessorRuntimeException. In both cases, the RequestProcessor terminates abnormally since it cannot reply to the client.

User response: Use trace and dump to determine the cause of the failure. If the problem persists you may need to contact your IBM support representative.

Module:
com.ibm.cics.iiop.orb.CICSTargetOutputStream

XMEOUT Parameters: *date, time, applid, dr*

Destination: CIIL

DFHII1012E *date time applid* **Failure dr receiving reply from IIRP.**

Explanation: An unexpected failure *dr* occurred receiving a reply from an outbound RequestStream.

System action: An II domain exception trace entry is made. For an Exception response, the CICSSourceInputStream throws a java.io.IOException and a CORBA::COMM_FAILURE is returned to the client. For Disaster or Invalid responses, a system dump will have already been requested by IIRP. The CICSSourceInputStream throws a com.ibm.cics.iiop.RequestProcessorRuntimeException and the RequestProcessor terminates abnormally.

User response: Use trace and dump to determine the cause of the failure. If the problem persists you may

need to contact your IBM support representative.

Module: com.ibm.cics.iiop orb.CICSSourceInputStream

XMEOUT Parameters: *date, time, applid, dr*

Destination: CIIL

DFHII1013E *date time applid* **Failure establishing connection to host *host port port*.**
Reason is: *exception.*

Explanation: An unexpected failure *exception* occurred attempting to create an outbound RequestStream to host *host port port*. This problem usually implies the remote process is not currently active, a firewall has blocked the outbound request or that there is a mistake in either the hostname or port number specified.

If the response is Exception and the reason is Service_Not_Available, but the hostname is valid then this may be an error caused by a name server failure. This may be a transient failure or a configuration error.

System action: An II domain exception trace entry is made. For an Exception response, the CICSCONNECTION causes a CORBA::COMM_FAILURE to be returned to the client. For Disaster or Invalid responses, a system dump will have already been requested by RZ domain. The CICSCONNECTION throws a com.ibm.cics.iiop.RequestProcessorRuntimeException and the RequestProcessor terminates abnormally.

User response: Ensure that the remote process is active and able to receive inbound messages from the network. Ensure that the hostname and port number in use are correct. If you are still experiencing a problem then consider using trace and dump to determine the cause of the failure.

If the problem persists you may need to contact your IBM support representative.

Module: com.ibm.cics.iiop orb.CICSCONNECTION

XMEOUT Parameters: *date, time, applid, exception, host, port*

Destination: CIIL

DFHII1014E *date time applid* **Invalid SSL type *connSsl* used for connection to CORBASERVER *serverName*, with SSL *serverSsl*.**

Explanation: The SSL type *connSsl* received in a CICSCONNECTIONContext does not match the SSL parameter *serverSsl* configured for the target CORBASERVER *serverName*. The data in a CICSCONNECTIONContext is derived from the TCPIPService in the listener region, by the RequestReceiver. This problem can occur if the CORBASERVER definition is ALTERed but not

PUBLISHED, that is, IORs from a previous configuration are still in use.

System action: An II domain exception trace entry is made, a com.ibm.cics.iiop.RequestProcessorRuntimeException is thrown and the RequestProcessor terminates abnormally.

User response: Ensure that the IORs in use match the currently active CORBASERVER definitions.

Module: com.ibm.cics.iiop.LogicalServerImpl

XMEOUT Parameters: *date, time, applid, connSsl, serverName, serverSsl*

Destination: CIIL

DFHII1015E *date time applid* **Invalid port number *connPort* used for *sslType* connection to CORBASERVER *serverName*, with PORT *port*, SSLPORT *sslPort*.**

Explanation: The listenerPort *connPort* received in a CICSCONNECTIONContext does not match the port configured for the target CORBASERVER *serverName*. If the connection type in use, *sslType*, is SSL_NO, it should match the CORBASERVER PORT *port*. If the connection type in use, *sslType*, is SSL_YES, or SSL_CLIENTCERT, it should match the CORBASERVER SSLPORT parameter *sslPort*. The data in a CICSCONNECTIONContext is derived from the TCPIPService in the listener region, by the RequestReceiver. This problem can occur if the CORBASERVER definition is ALTERed but not PUBLISHED, that is, IORs from a previous configuration are still in use.

System action: An II domain exception trace entry is made, a com.ibm.cics.iiop.RequestProcessorRuntimeException is thrown and the RequestProcessor terminates abnormally.

User response: Ensure that the IORs in use match the currently active CORBASERVER definitions.

Module: com.ibm.cics.iiop.LogicalServerImpl

XMEOUT Parameters: *date, time, applid, connPort, sslType, serverName, port, sslPort*

Destination: CIIL

DFHII1016E *date time applid* **Failure obtaining JNDI context for CORBASERVER *serverName*, prefix *jndiPrefix* at level *prefixPart*. Exception *exc* was received.**

Explanation: An exception *exc* was returned during creation of the JNDI Context for publication of an object reference from CORBASERVER *serverName* to the name server. A JNDI context is created during a DJAR or CORBASERVER PUBLISH operation. Objects are

published to the subcontext defined by the JNDI prefix *jndiPrefix* attribute of the CORBASERVER, or to the Initial, or root, Context if no JNDI prefix value is given. The *prefixPart* value gives the level in the context hierarchy at which the error occurred. This problem may occur if CICS is unable to access the name server. It could also occur if some object, for example a bean, had been published previously with the same fully qualified name as that of the JNDI prefix, that is named *jndiPrefix*. It can occur if using a LDAP nameserver if the JNDI prefix is particularly long.

System action: No objects are published to JNDI.

User response: Check that the JNDI System properties for this PROGRAM are specified correctly and that the name server is active. If you need to change a System property, it is also necessary to reinstall the target CORBASERVER. If there is a naming conflict, either retract the previously published object or alter the JNDIPREFIX parameter of the CORBASERVER and reINSTALL it. If using a LDAP nameserver then CICS can encounter problems with very long JNDI prefixes being specified for CorbaServers since they can violate the schema in use on the LDAP server. If this message indicates a LDAP schema violation has occurred then it is advisable to shorten your JNDI prefix. Retry the PUBLISH operation.

Module: com.ibm.cics.iiop.LogicalServerImpl

XMEOUT Parameters: *date, time, applid, serverName, jndiPrefix, prefixPart, exc*

Destination: CIIL

DFHII1017E *date time applid* **Badly formed JNDI prefix: *prefix* in CORBASERVER *serverName*. The JNDI NameParser threw exception *exc*.**

Explanation: An exception *exc* was returned by the JNDI NameParser during validation of the JNDI prefix *prefix*, defined for CORBASERVER *serverName*. This operation is performed during a DJAR or CORBASERVER PUBLISH operation.

System action: No objects are published to JNDI.

User response: Correct the JNDI prefix defined for the target CORBASERVER, reinstall the CORBASERVER and reissue the PUBLISH command.

Module: com.ibm.cics.iiop.LogicalServerImpl

XMEOUT Parameters: *date, time, applid, prefix, serverName, exc*

Destination: CIIL

DFHII1018E *date time applid* **Failed to bind CORBA stateless GenericFactory for CORBASERVER *serverName* to JNDI subcontext *jndiPrefix* as *jndiName*. Exception *exc* was received.**

Explanation: An exception *exc* was returned by JNDI during a rebind of the CICS org.omg.CosLifeCycle GenericFactory implementation for CORBASERVER *serverName* to the JNDI subcontext at *jndiPrefix*. This operation is performed during a CORBASERVER PUBLISH operation.

System action: The GenericFactory object is not published to JNDI.

User response: Ensure the JNDI name server is available to CICS, reinstall the CORBASERVER and reissue the PUBLISH command.

Module:

com.ibm.cics.iiop.cso.PublishLogicalServerCommand

XMEOUT Parameters: *date, time, applid, serverName, jndiPrefix, jndiName, exc*

Destination: CIIL

DFHII1019I *date time applid* **CORBA stateless GenericFactory for CORBASERVER *serverName* bound to JNDI subcontext *jndiPrefix* as *jndiName*.**

Explanation: The CICS org.omg.CosLifeCycle GenericFactory implementation for CORBASERVER *serverName* was successfully rebound to the JNDI subcontext at *jndiPrefix*. This operation is performed during a CORBASERVER PUBLISH operation.

System action: The CORBASERVER PUBLISH completes normally.

User response: None.

Module:

com.ibm.cics.iiop.cso.PublishLogicalServerCommand

XMEOUT Parameters: *date, time, applid, serverName, jndiPrefix, jndiName*

Destination: CIIL

DFHII1020E *date time applid* **Failed to create HFS shelf *shelfName* for CORBASERVER *serverName*.**

Explanation: An attempt to create shelf *shelfName* for CORBASERVER *serverName* failed. This operation is performed during a CORBASERVER INSTALL operation.

System action: The CORBASERVER is not installed.

User response: Ensure CICS has the required HFS access, and that a directory of this name does not already exist, and reinstall the CORBASERVER.

Module:

com.ibm.cics.iiop.cso.AddLogicalServerCommand

XMEOUT Parameters: *date, time, applid, shelfName, serverName*

Destination: CIIL

DFHII1021E *date time applid* **Failed to unbind CORBA stateless GenericFactory for CORBASERVER *serverName* from JNDI subcontext *jndiPrefix*. Exception received *exc*.**

Explanation: An exception *exc* was returned by JNDI during an unbind of the CICS org.omg.CosLifeCycle GenericFactory implementation for CORBASERVER *serverName* from the JNDI subcontext at *jndiPrefix*.. This operation is performed during a CORBASERVER RETRACT operation.

System action: The GenericFactory object is not retracted from JNDI.

User response: Ensure the JNDI name server is available to CICS and that the CORBASERVER has not been retracted from another AOR.

Module:
com.ibm.cics.iiop.cso.RetractLogicalServerCommand

XMEOUT Parameters: *date, time, applid, serverName, jndiPrefix, exc*

Destination: CIIL

DFHII1022I *date time applid* **CORBA stateless GenericFactory for CORBASERVER *serverName* unbound from JNDI subcontext *jndiPrefix*.**

Explanation: The CICS org.omg.CosLifeCycle GenericFactory implementation for CORBASERVER *serverName* was successfully unbound from the JNDI subcontext at *jndiPrefix*.. This operation is performed during a CORBASERVER RETRACT operation.

System action: The CORBASERVER RETRACT completes normally.

User response: None.

Module:
com.ibm.cics.iiop.cso.RetractLogicalServerCommand

XMEOUT Parameters: *date, time, applid, serverName, jndiPrefix*

Destination: CIIL

DFHII1023E *date time applid* **Failed to delete GenericFactory IOR file *fileName* from the shelf of CORBASERVER *serverName*.**

Explanation: The command processor for CORBA stateless objects was invoked during a CORBASERVER RETRACT operation to delete the GenericFactory IOR file. It was unable to delete the file, named *fileName*. This problem may occur if the CICS job has insufficient HFS access.

System action: The RETRACT continues normally.

User response: Ensure CICS has sufficient HFS access and reissue retract.

Module:
com.ibm.cics.iiop.cso.RetractLogicalServerCommand

XMEOUT Parameters: *date, time, applid, fileName, serverName*

Destination: CIIL

DFHII1024I *date time applid* **JNDI subcontext subcontext destroyed during processing of CORBASERVER *serverName* with prefix *jndiPrefix*.**

Explanation: During processing of CORBASERVER *serverName*, the *subcontext* components of the JNDI prefix *prefixName* were removed from the name server. This will occur during CORBASERVER RETRACT processing for those parts of the subcontext that are completely emptied by the RETRACT.

System action: Processing continues.

User response: None.

Module: com.ibm.cics.iiop.LogicalServerImpl

XMEOUT Parameters: *date, time, applid, subcontext, serverName, jndiPrefix*

Destination: CIIL

DFHII1025E *date time applid* **Failed to delete HFS shelf *shelfName* for CORBASERVER *serverName*.**

Explanation: An attempt to delete shelf *shelfName* for CORBASERVER *serverName* failed. The shelf is a directory on this region's HFS. This operation is performed during a CORBASERVER DISCARD operation.

System action: The CORBASERVER is discarded.

User response: If a directory of this name does not exist on HFS, this is probably due to a previous install failure and may be ignored. If a directory of this name does exist, check that CICS has the required HFS access and delete the directory manually; it will need to be removed before the CORBASERVER can be reinstalled.

Module:
com.ibm.cics.iiop.cso.DeleteLogicalServerCommand

XMEOUT Parameters: *date, time, applid, shelfName, serverName*

Destination: CIIL

DFHII1026E *date time applid* **CORBASERVER**
serverName **not installed.**

Explanation: A definition for CORBASERVER *serverName* could not be found in this CICS region. This condition can occur if an Enterprise Bean or IIOp method request is received before the CORBASERVER to which the target object relates is installed. Another possible reason for the condition is that the referenced CORBASERVER is no longer valid and an old object reference is being used by the client.

System action: The request is rejected with a CORBA exception.

User response: Install the CORBASERVER or update the object reference (IOR) and retry the request.

Module: com.ibm.cics.iioP.RequestProcessor

XMEOUT Parameters: *date, time, applid, serverName*

Destination: CIIL

DFHII1027I *date time applid* **CORBA stateless**
GenericFactory for CORBASERVER
serverName **written to the shelf as**
fileName.

Explanation: The command processor for CORBA stateless objects was invoked during a CORBA server PUBLISH operation to make the GenericFactory IOR file available. The file was written to the HFS shelf of CORBASERVER *serverName* as file *fileName*.

System action: The PUBLISH operation continues.

User response: None.

Module:

com.ibm.cics.iioP.cso.PublishLogicalServerCommand

XMEOUT Parameters: *date, time, applid, serverName, fileName*

Destination: CIIL

DFHII1028W *date time applid* **Name server not**
defined for CORBASERVER
serverName **being initialized for**
PROGRAM *pgmName.*

Explanation: No name service system properties are defined for PROGRAM *pgmName*.

System action: The ORB configured for CORBASERVER *serverName* in this JVM will not be able to access JNDI. JNDI requests from objects in CORBASERVER *serverName* will fail if they are issued from a program using, or reusing, this JVM.

User response: If objects in this CORBASERVER need to use JNDI, define the name service in the com.ibm.cics.ejs.nameserver property, or set the com.ibm.CORBA.InitialReferencesURL property, in the system properties file available to PROGRAM

pgmName. The system properties file is defined in the JVMPROPS parameter of the PROGRAM's JVMPROFILE. The CORBASERVER should then be DISCARDEd and reINSTALLEd.

Module: com.ibm.cics.iioP.orb.ORBFactory

XMEOUT Parameters: *date, time, applid, serverName, pgmName*

Destination: CIIL

DFHII1029I *date time applid* **CORBA stateless**
GenericFactory file *fileName* **deleted**
from the shelf of CORBASERVER
serverName.

Explanation: The command processor for CORBA stateless objects was invoked during a CORBA server RETRACT operation to delete the GenericFactory IOR file. File *fileName* was deleted from the HFS shelf of CORBASERVER *serverName*.

System action: The RETRACT operation continues.

User response: None.

Module:

com.ibm.cics.iioP.cso.RetractLogicalServerCommand

XMEOUT Parameters: *date, time, applid, fileName, serverName*

Destination: CIIL

DFHII1030W *date time applid* **CORBA stateless**
GenericFactory for CORBASERVER
serverName **not found at JNDI**
subcontext *jndiPrefix.*

Explanation: During CORBASERVER RETRACT, an attempt is made to unbind the CICS org.omg.CosLifeCycle GenericFactory implementation from the name server. When this was attempted during RETRACT of CORBASERVER *serverName*, the GenericFactory was not found at JNDI subcontext *jndiPrefix*. It is likely that the CORBASERVER has been RETRACTed from another CICS region, or the name server has been cleared, since the last CORBASERVER PUBLISH.

System action: The CORBASERVER RETRACT completes normally.

User response: None.

Module:

com.ibm.cics.iioP.cso.RetractLogicalServerCommand

XMEOUT Parameters: *date, time, applid, serverName, jndiPrefix*

Destination: CIIL

DFHII1031E *date time applid* **Unable to obtain JNDI InitialContext *jndiPrefix* for CORBASERVER *serverName*.**

Explanation: CICS failed to obtain the JNDI InitialContext for CORBASERVER *serverName* whose *jndiPrefix* is defined as *jndiPrefix*. This can occur if the name server is unavailable or incorrectly configured. Some JNDI servers are sensitive to the presence or absence of a trailing '/' character following the *jndiPrefix*.

System action: The JNDI operation fails.

User response: Ensure the name server is available to CICS and correctly configured. Attempt the operation again.

Module: com.ibm.cics.iiop.LogicalServerImpl

XMEOUT Parameters: *date, time, applid, jndiPrefix, serverName*

Destination: CIIL

DFHII1032I *date time applid* **JNDI subcontext *subContext* created during processing of CORBASERVER *serverName*.**

Explanation: During processing of CORBASERVER *serverName*, the sub context *subContext* was created on the name server. This will occur during CORBASERVER PUBLISH processing for any parts of the subcontext that did not previously exist.

System action: Processing continues.

User response: None.

Module: com.ibm.cics.iiop.LogicalServerImpl

XMEOUT Parameters: *date, time, applid, subContext, serverName*

Destination: CIIL

DFHII1033I *date time applid* **JNDI subcontext *subContext* for CORBASERVER *serverName* not found during RETRACT.**

Explanation: JNDI sub context *subContext*, defined for CORBASERVER *serverName*, was not found on the name server during a RETRACT operation. Since the subcontext does not exist, there is nothing to retract for this CORBASERVER, so no further JNDI processing is required.

System action: IILS RETRACT processing continues.

User response: None.

Module:

com.ibm.cics.iiop.cso.RetractLogicalServerCommand

XMEOUT Parameters: *date, time, applid, subContext, serverName*

Destination: CIIL

DFHII1034E *date time applid* **No write access to file *fileName* for creation of shelf *shelfName*.**

Explanation: An attempt to create shelf *shelfName* failed because CICS is unable to modify file *fileName*. This operation is performed during a CORBASERVER INSTALL operation.

System action: Message DFHII1020 is also issued. The CORBASERVER is not installed.

User response: Ensure CICS has the required HFS access, and reinstall the CORBASERVER.

Module:

com.ibm.cics.iiop.cso.AddLogicalServerCommand

XMEOUT Parameters: *date, time, applid, fileName, shelfName*

Destination: CIIL

DFHII1035W *date time applid* **GenericFactory IOR file *fileName* not found on the shelf of CORBASERVER *serverName*.**

Explanation: The command processor for CORBA stateless objects was invoked during a CORBASERVER RETRACT operation to delete the GenericFactory IOR file. The file, named *fileName*, did not exist. This is probably because the CORBASERVER was not PUBLISHED from this CICS region, or had already been RETRACTed.

System action: The RETRACT continues normally.

User response: None.

Module:

com.ibm.cics.iiop.cso.RetractLogicalServerCommand

XMEOUT Parameters: *date, time, applid, fileName, serverName*

Destination: CIIL

DFHII1036W *date time applid* **Unexpected ORB creation within the scope of CORBASERVER *serverName* for PROGRAM *pgmName*.**

Explanation: A second or subsequent ORB is being created within a CORBASERVER environment. ORB initialization has detected that CORBASERVER *serverName* is currently active and, therefore, that ORB initialization is unexpected. This can occur if an application object issues ORB.init, either explicitly, or implicitly from, for example, a non-CICS JNDI initial context factory. This warning message is issued because the ORB being created will be limited to the functionality available to a CICS Java application ORB, for example

- any interactions involving objects connected to this ORB are unable to participate in any distributed OTS transaction.
- this is a client only ORB. It has no inbound server connection; IORs exported by objects connected to this ORB are unusable.
- objects retrieved from JNDI using this ORB are handled as remote objects, even if they are from the active CORBASERVER.

System action: ORB initialization continues.

User response: If this situation has occurred inadvertently, through usage of the incorrect naming context factory, check that the `javax.naming.Context.INITIAL_CONTEXT_FACTORY` Property, `java.naming.factory.initial`, has not been overridden. It should be allowed to default to `com.ibm.ejs.ns.jndi.CNInitialContextFactory`. This property can be set as a system property by an authorized application, or in the system properties file available to PROGRAM *pgmName*. The system properties file is defined in the `JVMPROPS` parameter of the PROGRAM's `JVMPROFILE`. The Property can also be passed as a parameter to the `InitialContext` constructor.

If this situation has occurred inadvertently, through explicit usage of `ORB.init`, it would normally be preferable for an application to gain access to the ORB that has already been created for the CORBASERVER. CORBA objects can obtain such a reference using the `org.omg.CORBA.portable.ObjectImpl._orb()` method.

EJB objects can obtain a reference to the current ORB by issuing a JNDI lookup of `'java:comp/ORB'` using the default initial JNDI context. For example

```
String ORBStr = "java:comp/ORB";
javax.naming.Context initCtx = new
javax.naming.InitialContext(); org.omg.CORBA.ORB
curORB = (org.omg.CORBA.ORB)
initCtx.lookup(ORBStr);
```

Module: `com.ibm.cics.iiop.orb.ORB`

XMEOUT Parameters: *date, time, applid, serverName, pgmName*

Destination: CIIIL

DFHII1037E *date time applid* **CORBASERVER** *serverName* **has received a request with AUTHTYPE** *authType*. **The** *attrName* **attribute in the request has a value of** (*value1*) **which does not match the value** (*value2*) **configured for the CORBASERVER.**

Explanation: A request has been received for a connection to CORBASERVER *serverName* with AUTHTYPE *authType*. However, there is a mismatch between one of the attributes in the request and the corresponding attribute of the configured

CORBASERVER or TCPIPSERVICE. The attribute will be one of:-

1. TCPIPSERVICE name.
2. Port number.
3. SSL type.

System action: An II domain exception trace entry is made, a `com.ibm.cics.iiop.RequestProcessorRuntimeException` is thrown and the RequestProcessor terminates abnormally.

User response: Ensure that the attributes of the TCPIP services in the AOR region match those of the Listener region. If any attributes have changed, reinstall the changed definitions and republish the relevant DJAR/CORBASERVER to ensure that the IORs in use match the currently active CORBASERVER and TCPIPSERVICE definitions.

Module: `com.ibm.cics.iiop.LogicalServerImpl`

XMEOUT Parameters: *date, time, applid, serverName, authType, attrName, value1, value2*

Destination: CIIIL

DFHII1038E *date time applid* **CORBASERVER** *serverName* **does not have a TCPIPSERVICE configured for AUTHTYPE** *authType*.

Explanation: A `CICSConnectionContext` has been received which contains an authentication type for which no TCPIPSERVICE is configured for this CORBASERVER. The data in a `CICSConnectionContext` is derived from the TCPIPSERVICE in the listener region, by the RequestReceiver.

System action: An II domain exception trace entry is made, a `com.ibm.cics.iiop.RequestProcessorRuntimeException` is thrown and the RequestProcessor terminates abnormally.

User response: Ensure that a TCPIPSERVICE is configured for the appropriate authentication type. Ensure that the attributes of the TCPIP services in the AOR region match those of the Listener region. If any attributes have changed, republish the relevant DJAR/CORBASERVER to ensure that the IORs in use match the currently active CORBASERVER and TCPIPSERVICE definitions.

Module: `com.ibm.cics.iiop.LogicalServerImpl`

XMEOUT Parameters: *date, time, applid, serverName, authType*

Destination: CIIIL

DFHII1039E *date time applid* **Failure establishing connection to host** *host* as unauthenticated connections are not supported. An attempt to establish a CSiv2 secure connection failed because: {CSiv2 security is not supported in the server | the server does not support the use of SSL/TLS | the server does not support client certification | a required capability is not supported by the server | the server requires something not supported by CICS | the server does not support identity assertion | the server does not support Principal Assertion | the server does not support GSSUP exported names}.

Explanation: An attempt to establish a secure CSiv2 Asserted Identity connection to a remote server has failed. The IOR for the remote object is incompatible with CICS. This IOR may contain multiple different CSiv2 configurations. If this is the case then CICS has considered all of them and has determined that none of them are compatible with CICS. This message records the problem that was detected with the last of the identified CSiv2 profiles.

CICS has also determined that the remote server does not support unauthenticated connections.

System action: The attempt to connect to the remote object is rejected.

User response: In order for CICS to connect to the remote server CICS requires that it supports the use of client certified SSL/TLS. It must also support identity assertion, integrity and confidentiality. It must not require the use of forward trust evaluation.

Module: com.ibm.cics.iiop.orb.CICSTransport

XMEOUT Parameters: *date, time, applid, host, {1=CSiv2 security is not supported in the server, 2=the server does not support the use of SSL/TLS, 3=the server does not support client certification, 4=a required capability is not supported by the server, 5=the server requires something not supported by CICS, 6=the server does not support identity assertion, 7=the server does not support Principal Assertion, 8=the server does not support GSSUP exported names}*

Destination: CIIL

DFHII1040E *date time applid* **A CSiv2 connection has been refused because:** {it was not an EstablishContext message | it contained authorization tokens | it used an unsupported identity type | the identity type was not recognized}.

Explanation: An attempt to establish a secure CSiv2 Asserted Identity connection with CICS has been rejected. The CSiv2 information within the GIOP

message was not compatible with CICS.

System action: The attempt to connect to CICS is rejected.

User response: The remote client process must be configured to assert identity using a principal name.

Module: DFHIIIRH

XMEOUT Parameters: *date, time, applid, {1=it was not an EstablishContext message, 2=it contained authorization tokens, 3=it used an unsupported identity type, 4=the identity type was not recognized}*

Destination: CIIL

DFHII1050W *date time applid* **Maximum version of GIOP has not been specified. Defaulting to GIOP 1.1 .**

Explanation: The maximum version of the General Inter-ORB Protocol (GIOP) has not been configured or is invalid.

The maximum GIOP version is included in all CORBA object references exported by CICS. You can use the CICS Resource Manager for Enterprise Beans (RMEB) to discover which version of GIOP your published enterprise beans currently advertise.

CICS can support up to GIOP version 1.2 . GIOP support in CICS TS 2.2 was limited to a maximum of GIOP version 1.1 . If you have a distributed CorbaServer which contains both CICS TS 2.2 and newer CICS regions, it is important that the newer CICS regions do not advertise support for anything beyond GIOP 1.1 .

You can set the maximum version of GIOP that CICS will use by setting the following environment variable in the CICS JVM properties file:
com.ibm.cics.iiop.MaxGIOPMinorVersion=<n> where <n> is either 1 or 2 representing GIOP 1.1 or GIOP 1.2 .

It is recommended that all regions be set to use GIOP 1.2 . GIOP 1.1 should only be set as the maximum supported version of GIOP if the CICS region is participating in a CorbaServer which includes CICS TS 2.2 regions.

System action: CICS defaults to compatibility mode for CORBA requests; the maximum version of GIOP advertised in published object references is GIOP 1.1 .

User response: You can suppress this message by telling CICS the maximum GIOP version to use via the MaxGIOPMinorVersion property (see above).

Module: com.ibm.cics.iiop.LogicalServerImpl

DFHINnnnn messages

DFHIN1001 *date time applid termid userid* **The indoubt tool is now active for DFHTCIND tranclass transactions.**

Explanation: The indoubt tool is active and causes all units of work (UOWs) running under transactions defined to be in transaction class DFHTCIND to fail indoubt when they reach syncpoint.

A unit of work that fails indoubt is either shunted by the recovery manager domain or is unilaterally committed or unilaterally backed out by recovery manager. A unit of work is shunted if the transaction definition under which it is running specifies WAIT(yes) as an indoubt option, and the unit of work has not accessed any resources that force a unilateral decision to be taken.

System action: CICS processing continues with the indoubt tool active.

User response: None.

Module: DFHINDT

XMEOUT Parameters: *date, time,applid, termid, userid*

Destination: CSMT and Terminal End User

DFHIN1002 *date time applid* **The indoubt tool is already active.**

Explanation: A CIND ON request was issued to activate the indoubt tool but CICS has detected that the indoubt tool is already active.

System action: CICS processing continues with the indoubt tool active.

User response: None.

Module: DFHINDT

Destination: Terminal End User

DFHIN1003 *date time applid* **The indoubt tool is active for DFHTCIND tranclass transactions.**

Explanation: A CIND INQUIRE request was issued to inquire on the status of the indoubt tool. CICS has detected that the indoubt tool is active.

System action: CICS processing continues with the indoubt tool active.

User response: None.

Module: DFHINDT

Destination: Terminal End User

DFHIN1004 *date time applid termid userid* **The indoubt tool is no longer active for DFHTCIND tranclass transactions.**

Explanation: A CIND OFF request was issued to deactivate the indoubt tool. No more units of work (UOWs) running under transactions defined in tranclass DFHTCIND will fail indoubt when they reach syncpoint.

Existing transactions in the DFHTCIND tranclass that are currently running fail indoubt at syncpoint, but no new transactions in the DFHTCIND tranclass will fail indoubt.

System action: CICS processing continues with the indoubt tool inactive.

User response: None.

Module: DFHINDT

XMEOUT Parameters: *date, time,applid, termid, userid*

Destination: CSMT and Terminal End User

DFHIN1005 *date time applid* **The indoubt tool is already inactive.**

Explanation: A CIND OFF request was issued to deactivate the indoubt tool but CICS has detected that the indoubt tool is already inactive.

System action: CICS processing continues with the indoubt tool inactive.

User response: None.

Module: DFHINDT

Destination: Terminal End User

DFHIN1006 *date time applid* **The indoubt tool is not active.**

Explanation: A CIND INQUIRE request was issued to inquire on the status of the indoubt tool. CICS has detected that the indoubt tool is inactive.

System action: CICS processing continues with the indoubt tool inactive.

User response: None.

Module: DFHINDT

Destination: Terminal End User

DFHIN1007 *date time applid termid userid* **Initiation of resynchronization for units of work awaiting coordinator DFHINDSP is now complete.**

Explanation: A CIND RESYNC COMMIT or CIND RESYNC BACKOUT request was issued. The indoubt tool has successfully initiated resynchronization of all units of work (UOWs) currently awaiting resynchronization with coordinator DFHINDSP.

System action: Shunted UOWs awaiting the return of

coordinator DFHINDSP are unshunted by the recovery manager (RM) domain. All participants in the UOW are notified of the outcome of the unit of work. The outcome of the unit of work is defined by the user of CIND, for example, CIND RESYNC COMMIT tells the RM domain to unshunt the UOWs and commit them. Likewise, CIND RESYNC BACKOUT tells the RM domain to backout the UOWs. Message DFHIN1012 is issued to transient data for each UOW resynchronized.

For UOWs awaiting the return of coordinator DFHINDSP which were not shunted, that is, they abended before syncpoint, or a unilateral decision was taken, a CIND RESYNC command merely results in message DFHIN1012 being issued to transient data. DFHIN1012 reports on whether this CICS system and DFHINDSP are synchronized.

User response: See the associated transient data DFHIN1012 messages.

Module: DFHINDT

XMEOUT Parameters: *date, time, applid, termid, userid*

Destination: CSMT and Terminal End User

DFHIN1008 *date time applid* **Invalid CIND keyword. Specify one of the following: ON, OFF, INQUIRE, RESYNC COMMIT, or RESYNC BACKOUT.**

Explanation: The CIND transaction was invoked with an invalid keyword.

System action: CICS processing continues and the status of the indoubt tool is unchanged.

User response: Reinvoke the CIND transaction with the correct keyword.

Module: DFHINDT

Destination: Terminal End User

DFHIN1009 *date time applid* **The indoubt tool has added coordinator link DFHINDSP to UOW X'uowid' for transaction tranid task number taskno.**

Explanation: The indoubt tool task related user exit DFHINTRU, invoked when a transaction is first started, has detected that the transaction is part of transaction class DFHTCIND. Coordinator DFHINDSP has been added to unit of work (UOW) so that the transaction will fail indoubt when a syncpoint is issued.

System action: The named transaction and UOW continue processing until it reaches syncpoint when it will fail indoubt.

User response: None.

Module: DFHINTRU

XMEOUT Parameters: *date, time, applid, X'uowid', tranid, taskno*

Destination: CSMT

DFHIN1010 *date time applid* **Coordinator DFHINDSP is not available. The indoubt tool has caused RM domain to shunt UOW X'uowid' for transaction tranid task number taskno.**

Explanation: The named UOW for the named transaction and task has failed indoubt during a syncpoint request due to the indoubt tool.

System action: The recovery manager domain shunts the UOW, and then abends the transaction.

User response: To initiate an unshunt of the UOW, issue a CIND RESYNC command.

Module: DFHINDSP

XMEOUT Parameters: *date, time, applid, X'uowid', tranid, taskno*

Destination: CSMT

DFHIN1011 *date time applid* **Coordinator DFHINDSP is not available, but UOW X'uowid' for transaction tranid task number taskno is not indoubt and has not been shunted.**

Explanation: UOW X'uowid' for transaction tranid was not shunted, and is not indoubt despite being monitored by the indoubt tool. One of the following has occurred

- The unit of work abended before syncpoint.
- The unit of work was rolled back.
- The unit of work failed indoubt at syncpoint time but the recovery manager domain was forced to take a unilateral decision instead of shunting the UOW.
- The unit of work failed indoubt at syncpoint time but the recovery manager domain detected that the unit of work was read-only, that is, no recoverable resources were updated, and therefore no shunting was required.

System action: CICS processing continues.

User response: If the unit of work was abended, rolled back, or a unilateral decision was taken, recovery manager keeps the resolution of the unit of work pending the return of the coordinator DFHINDSP.

To synchronize the outcome of the UOW with coordinator DFHINDSP, issue a CIND RESYNC command.

Module: DFHINDSP

XMEOUT Parameters: *date, time, applid, X'uowid', tranid, taskno*

Destination: CSMT

DFHIN1012 *date time applid* **The indoubt tool is resynchronizing UOW X'uowid' for transaction trandid task number taskno. DFHINDSP coordinator UOW status is {commit. | backout.} Recovery manager UOW status is {commit. | backout. | heuristic commit. | heuristic backout.}**

Explanation: The unit of work X'uowid for the named transaction and task has been resynchronized as a result of a CIND RESYNC command. The message reports the UOW status as defined by the coordinator DFHINDSP, and the unit of work status held by the recovery manager domain. The recovery manager domain also issues messages reporting whether or not the UOW is synchronized.

System action: CICS processing continues.

User response: None.

Module: DFHINDT

XMEOUT Parameters: *date, time, applid, X'uowid', trandid, taskno, {1=commit., 2=backout.}, {1=commit., 2=backout., 3=heuristic commit., 4=heuristic backout.}*

Destination: CSMT

DFHIN1013 *date time applid termid userid* **No units of work awaiting resynchronization with coordinator DFHINDSP were found.**

Explanation: A CIND RESYNC COMMIT or CIND RESYNC BACKOUT request was issued. The indoubt tool did not find any units of work (UOWs) that were awaiting resynchronization with coordinator DFHINDSP.

System action: CICS processing continues.

User response: Before initiating resynchronization, the indoubt tool needs to be activated via command CIND ON, and transactions in tranclass DFHTCIND run to create indoubt units of work.

Module: DFHINDT

XMEOUT Parameters: *date, time, applid, termid, userid*

Destination: CSMT and Terminal End User

DFHIN1014 *date time applid* **The indoubt tool will not operate on transaction trandid task number taskno as it is an internal CICS system transaction.**

Explanation: The indoubt tool task related user exit DFHINTRU, invoked when a transaction is first started, has detected that the transaction is part of transaction class DFHTCIND. However it has also detected that the transaction is an internal CICS system transaction. CIND cannot be used on internal CICS system transactions.

System action: The named transaction and task

continue processing and are not forced indoubt at syncpoint time.

User response: None.

Module: DFHINTRU

XMEOUT Parameters: *date, time, applid, trandid, taskno*

Destination: CSMT

DFHIN1015 *date time applid* **The Indoubt tool has already previously resynchronized UOW X'uowid' for transaction trandid task number taskno. DFHINDSP coordinator UOW status is {commit. | backout.} Recovery manager UOW status is {commit. | backout. | heuristic commit. | heuristic backout.}**

Explanation: The named unit of work (UOW) for the named transaction and task has already been resynchronized as a result of a previous CIND RESYNC command. The message documents the UOW status as defined by the coordinator DFHINDSP, and the unit of work status held by the recovery manager domain.

No messages are issued by the recovery manager domain in this case and no resynchronization takes place. Processing of a previous CIND RESYNC command did not complete fully before CICS failed. In particular, 'forget processing' whereby CICS removes DFHINDSP as a coordinator of the unit of work did not complete. This caused CICS to recover the unit of work on restart with DFHINDSP as coordinator, causing it to be processed by the subsequent CIND RESYNC command.

System action: CICS continues processing.

User response: None.

Module: DFHINDT

XMEOUT Parameters: *date, time, applid, X'uowid', trandid, taskno, {1=commit., 2=backout.}, {1=commit., 2=backout., 3=heuristic commit., 4=heuristic backout.}*

DFHIRnnnn messages

DFHIR2122 *date time applid* Intersystem session recovery. Database changes found to be synchronized. Original failure details **Time=***time*. Remote system=*sysid*. Intersystem terminal=*termid*. Transaction=*tranid*. Task number=*taskno*. Operator terminal=*termid*. Operator=*operid*. Unit of work ID=*uowid*

Explanation: An error occurred on an intersystem session recovery which has now been successfully recovered and resynchronized. This message is normally issued as a follow-up to message DFHRM0107, (which may have been issued at the time of the failure if the session failed at a critical time during syncpoint processing).

System action: Processing continues.

User response: None.

Module: DFHCRR

XMEOUT Parameters: *date, time, applid, time, sysid, termid, tranid, taskno, termid, operid, uowid*

Destination: CSMT

DFHIR2123 *date time applid* Intersystem session recovery. Data base changes found to be out of sync. Original failure details: **Time=***time*. Remote system=*sysid*. Intersystem terminal=*termid*. Transaction=*tranid*. Task number=*taskno*. Operator terminal=*termid*. Operator=*operid*. Unit of work ID=*uowid*

Explanation: This message is issued as a follow-up to message DFHRM0107. The original failure information provides a cross-reference.

System action: Processing continues.

User response: Take user-defined action to resynchronize the local and remote databases.

Module: DFHCRR

XMEOUT Parameters: *date, time, applid, time, sysid, termid, tranid, taskno, termid, operid, uowid*

Destination: CSMT

DFHIR2124 *date time applid* Intersystem session recovery. Error when data base changes may be out of sync. Original failure details **Time=***time*. Remote system=*sysid*. Intersystem terminal=*termid*. Transaction=*tranid*. Task number=*taskno*. Operator terminal=*termid*. Operator=*operid*. Unit of work ID=*uowid*

Explanation: This message is issued as a follow-up to message DFHRM0107. During session recovery, the system was unable to determine whether database changes were out of synchronization.

System action: Processing continues.

User response: Make the necessary database enquiries to detect whether changes are synchronized. If they are not, take user-defined action to resynchronize the databases.

Module: DFHCRR

XMEOUT Parameters: *date, time, applid, time, sysid, termid, tranid, taskno, termid, operid, uowid*

DFHIR2321 *applid* MRO/IRC Communication being Terminated. Session(s) with the following Netname(s) are still Active

Explanation: CICS is attempting to close MRO/IRC communication. This message is normally followed by the netname of each session that is still active, and additionally for EXCI sessions, the jobname, stepname, procname and MVS ID of the batch program communicating on that session.

For EXCI sessions, a netname of GENERIC indicates a generic pipe. For the batch job information to appear in the message, at least one DPL request must have been issued on that session. In some circumstances the message is not followed by any netnames. This can occur if CICS is using the cross-system coupling facility (XCF) to communicate across CECs, and CICS is unable to deliver an earlier message to XCF because, for example, the XCF buffer is full.

System action: CICS issues IRC STOP IMMEDIATE to force close the remaining session(s). This message is reissued at 30 second intervals, or until the last session is closed.

User response: None, unless the delay in closedown appears abnormally long. If this is the case, investigate why the session(s) are still active. Take appropriate action to allow the session(s) to close. If no netnames are displayed, investigate why XCF is unable to accept a message from CICS.

Module: DFHZDSP

XMEOUT Parameter: *applid*

Destination: Console

DFHIR3747 *applid* **CONNECTION** *connid* **with protocol(EXCI) has been connected to by a NON-BATCH system. Connection set out of service.**

Explanation: A CICS connection has been defined with the protocol EXCI and an attempt has been made to connect to it by a non-batch system.

There are two possible explanations for this message

- The non-batch system is attempting to communicate with the wrong target connection definition.
- The target connection definition has incorrectly been defined as an EXCI connection.

System action: CICS sets the connection out of service.

User response: Investigate and correct the relevant connection definitions and set back in service.

Module: DFHCRNP

XMEOUT Parameters: *applid, connid*

Destination: Console
