CICS Transaction Server for z/OS Supplementary Data Areas

This information is supplementary to the CICS® Transaction Server for z/OS® Data Areas. It contains data areas (control blocks, parameter lists and constants) that are part of the CICS product implementation. These data areas might be useful for tasks such as CICS problem diagnosis, performance monitoring, and tuning. These data areas are intended for use by only a limited set of users involved in designing products complementary to CICS that perform one of these specialized tasks and require this information, which can be expected to change with subsequent releases of CICS.

Most products can be designed without using this information, because they can use the facilities provided by the CICS SPI commands and the exit programming interface (XPI).

This information is not required by CICS application programmers, nor is it required when requesting assistance from the IBM® service organization.

This manual documents information NOT intended to be used as a Programming Interface of Version 4 Release 1.

Licensees are allowed to copy information derived from this information set into the source code of their products.

Data Areas

How the data areas are presented

The data areas are listed in alphabetical order of their shortened names. The shortened name usually, but not always, matches the first few characters of the data area name, disregarding the DFH prefix; for example DFHTCA is shortened to TCA. Some data areas are grouped together according to usage. If you do not find a data area under the expected short name, you should look in the table of contents or the index for the full name of the area or for the name of the macro or copy book that generates the area.

For each field in each data area, the following information is listed:

- The hexadecimal offset, in parentheses
- The data type and for bitstring values, the bit representation
- The length in bytes (decimal)
- The name (symbolic label)
- A brief description of the function

Where the name of a field is shown as an asterisk (*), the field is reserved.

Where bit settings are indicated, the symbolic labels that have been equated to the bit settings are given. These labels are used to refer to the numeric values in programs that use the data area, and are included in this book to help you understand the program listings. The offset given for one of these fields applies only to the symbolic label assigned to the field as a unit; it does not apply to the labels equated to bit settings (hex values).

Where a storage definition has a duplication factor, for example DCREGS (16), the length of the field is the length of each element of the storage. The total length of the storage is this length multiplied by the duplication factor which is shown in parentheses after the name

For EQUATE statements, the operand is shown in quotation marks in the description.

APH8C AP state data for H8 TCB

```

!:refstep.dfhaph8c ----- DFHLIDC 559 -
!
!
! APLX uses this control block to store state associated with an XP
! TCB. The lifetime of the TCB exceeds that of a CICS task. The
! ap_xptcb is addressed by the OWNER_TCB_TOKEN which DS domain
! stores (in the DS_TCB) with the SET_TCB function, and returns with
! the INQUIRE_TCB function.
!
! If there is no ap_xptcb, then this is the first use of the x8/x9
! tcb. Generally, fields which are zero indicate that the function
! which sets them needs to be called.
!
! To assist service and dump, the ap_xptcb starts with a length,
! followed by an eyecatcher ">DFHAP_XPTCB". The DS_TCB_TOKEN is
! stored for back-tracking into DS domain. The last_task field is
! set to the packed decimal task number of the most recent CICS task
! to own the TCB, and the STCK value is set at the same time.
!
! The AP trace level is captured once per task.
!
! If the ap_xptcb is empty, we have not started a PIPI environment
! in it. When a PIPI environment is started, the PIPI token is saved
! in APXP_PIPI_TOKEN. When a PIPI environment is terminated, the
! ap_xptcb is cleared.
!
! The LE initial heap size is saved so that each time the heap is
! measured, we can see whether 95% of the heap has been consumed,
! and drive the code to end the enclave.
!
! The number of invocations and the number of enclave
! initialisations allow us to report efficiency.
!
! The PIPI services adaptor returns its parameter list address which
! is passed to PIPI init. It is passed back on other calls, and is
! therefore preserved in the ap_xptcb.

APH8S AP Static storage for APLH

```

!:refstep.dfhaplxs ----- DFHLIDC 658 -
!
!
! The static storage area address list is pointed at from CSASSA and
! mapped by DFHSSAPS and DFHSSAD. In the address list, APLX_STATIC
! is addressed by SSZAPLX (SSAAPLX in DFHSSAD if needed in
! Assembler). APLX uses static (global) storage for several reasons:
!
! - To record that the X8/X9 modes has been activated.
!
! - To manage the termination of enclaves on X8/X9 TCBs when

Storage

Catalog's storage consists of :
 "Static" storage, which is GETMAINED during DFHCCDM
 initialisation and lasts until FREEMAINED during
 DFHCCDM termination.
 This storage is DECLARED in this copybook, which is

included in DFHCCCC and DFHCCDM. This storage contains the anchor block.
Automatic storage which is acquired each time a call is made to DFHCCCC or DFHCCDM.
This storage is defined by the DECLAREs made in DFHCCCC and DFHCCDM.
Catalog's anchor block
based on anchor CCANCHORP, double word aligned.
anchor defined in DFHKERN TYPE(DOMENTER)
storage GETMAINED during catalog's initialization
Catalog's static storage based on CCANCHORP, double word aligned.

1. Area whose size is known at PL/AS compile time.
Pointers to ACB, array of RPLs, array of buffers.
Catalog's status variables
Array of per thread variables
2. Areas whose size is not known until assemble time
Array of buffers (one per thread)
ACB
Array of RPLs (one per thread)

Macro parameter settings
MAX_DATA_LENGTH must be set to the length used when the DFHCCD dataset was defined, minus the length of the VSAM key.

 CPI-C Conversation Control Block (CPC)
 and log data records

Restricted Materials of IBM

FUNCTION =

To provide CPI-C's principal control block record structure
 There is one instance of a CPC per CPI-C conversation.
 A CPC contains conversation identifier and control
 information relating to its CPI-C conversation.
 At various stages during the lifetime of a CPI-C
 conversation the CPC will be associated with a session
 control block (TCTTE) which will act as the CPI-C
 conversations principal facility for communication.

LIFETIME =

The lifetime of a single CPI-C conversation

STORAGE CLASS =

The CPC will exist in CICS main (31bit) storage.

LOCATION =

All CPCs associated with a single task are chained from
 the system TCA at TCACPCCN.

INNER CONTROL BLOCKS =

A further record definition is included in this copybook
 for CPIC_LOG_DATA. This control block is addressed via
 a pointer in the CPC named "log_data_buffer_ptr".

CPSPS CPI Static Storage Area

CONTROL BLOCK NAME = DFHCPSPS
 DESCRIPTIVE NAME = CICS CPI Static Storage Area

Restricted Materials of IBM

FUNCTION =

This control block provides the global information for the CPI which must be around for the duration of the CICS execution.

It contains:

- CPI initialization suspend token
- CPI status
- Entry points of CPI modules
- CPI-C last conversation-id

LIFETIME =

The control block is created during CICS initialisation by DFHSIB1, and exists for as long as the CICS system.

STORAGE CLASS =

The control block is in subpool DFHAPDANY

D2CSB CSUB block

CONTROL BLOCK NAME = DFHD2CSB
 DESCRIPTIVE NAME = CICS DB2 Connection block

Restricted Materials of IBM

FUNCTION =

The DFHD2CSB block contains state data for the CICS-DB2 Connection. With DB2 5.1 and below a connection is hardwired into a CICS-DB2 subtask and the DFHD2CSB is used as working storage by the subtask. With DB2 6.1 and above, CICS-DB2 connections are not hardwired to a subtask TCB, they only have TCB affinity as long as the DB2 thread is used by a CICS task. They can be "dissociated" from one CICS open TCB and "associated" with another CICS open TCB.

LIFETIME =

A DFHD2CSB is getmained when a CICS-DB2 connection is required. It is freemained when a CICS-DB2 connection is terminated by means of a terminate identify call to DB2.

LOCATION =

DFHD2CSB blocks are chained together off the DFHD2GLB and off either a DB2ENTRY or the pool or command thread section of the DFHD2GLB. There are a number of chains. Which chain a DFHD2CSB is on is governed by the state of the Thread. There are chains for free connections, free protected threads and active threads.

DFHD2RCT declares the whole of the layout of a DB2ENTRY as a type. The type is for the layout of the DB2ENTRY and for the layout of the pool and command sections in DFHD2GLB. Some fields, although declared, will not be used in the pool and command sections of DFHD2GLB.

D2GLB CICS/DB2 Global Block

CONTROL BLOCK NAME = DFHD2GLB
 DESCRIPTIVE NAME = CICS DB2 attach Global block

Restricted Materials of IBM

FUNCTION =

The DFHD2GLB block represents the DB2CONN RDO object and contains global state information for the CICS-DB2 connection. It also contains the state information for Pool threads and command threads. These are mapped by the generic DB2ENTRY structure DFHD2RCT but are included in the DFHD2GLB as there can only be one pool definition and command thread definition and hence are global in nature. A DB2CONN and hence a DFHD2GLB is the minimum required to operate the CICS-DB2 Attachment facility.

LIFETIME =

A DFHD2GLB is getmained when a DB2CONN entity is installed. It is freemained when a DB2CONN is discarded.

LOCATION =

DFHD2GLB is anchored off CICS/DB2 static storage (DFHD2SS). It resides above the 16MB line.

D2LOT CICS/DB2 Life of task block

CONTROL BLOCK NAME = DFHD2LOT
 DESCRIPTIVE NAME = CICS DB2 attach Life of Task block

Restricted Materials of IBM

FUNCTION =

The DFHD2LOT block holds task lifetime information about the task currently accessing DB2. It is the CICS-DB2 equivalent of the TCA.

LIFETIME =

The DFHD2LOT is a mapping of the task Local work area of the CICS-DB2 TRUE DFHD2EX1. It is getmained by CICS the time a CICS task calls the CICS-DB2 TRUE. It is freemained by CICS at task termination time.

LOCATION =

DFHD2LOT resides above the 16MB line. It is located using UEPTAA in the TRUE's DFHUEPAR parameter list

NOTES :

DEPENDENCIES = S/370
 RESTRICTIONS = none

D2SS CICS/DB2 Static Storage

CONTROL BLOCK NAME = DFHD2SS
 DESCRIPTIVE NAME = CICS DB2 attach Static Storage

Restricted Materials of IBM

FUNCTION =

The DFHD2SS block contains global data for the CICS-DB2 connection established during CICS startup before the DFHD2GLB is created. It is also used to store data that needs to survive even if the DB2CONN is discarded and hence the DFHD2GLB freemained.

LIFETIME =

DFHD2SS is getmained by DFHSIB1C during CICS initialisation. Its lifetime is the lifteime of CICS, it is not freemained.

LOCATION =

DFHD2SS resides above the 16MB line. It is anchored off the static storage address list DFHSSAPS which is turn is anchored off the CSA optional features list.

DMAFC DM Authorized Facility State

```

!:refstep.dfhdmafc ----- DFHDMEN 384 -
!
!
! DFHDMAFC
!
! DFHDMAFC is the copy book that defines the domain manager
! authorized facility state and interface.
!
! The domain manager authorized facilities are provided to the CICS
! address space. This state is anchored in the AFCB.
!
! When an ENFREQ ACTION=LISTEN request is issued MVS returns a token
! that uniquely identifies the listen request. This token must be
! specified on the ACTION=DELETE request. These tokens will be
! stored in key 0 storage to ensure that CICS will not delete some
! other subsystems listen requests. A slot in the AFCB will be
! required to anchor the domain manager key 0 state. The address of
! the AFCB will be passed as the PARM on the ENFREQ ACTION=LISTEN.

DSANC Dispatcher Domain Anchor Block

```
IF (MODNAME = 'DFHTRPT') | (MODNAME = 'DFHTRFT')
CONTROL BLOCK NAME = DFHDSANC
DESCRIPTIVE NAME = CICS Dispatcher Anchor Block
```

Restricted Materials of IBM

FUNCTION =

This include contains the definition of the Dispatcher Anchor Block. It also contains definitions of the DS_TCB, Sub_dispatcher, Stimer and Authorised blocks. See below for descriptions.

The anchor block contains all dispatcher-related information that is not task, or suspend_resume_area specific.

LIFETIME =

Dispatcher Lifetime.

STORAGE CLASS =

OS Getmaind from subpool 0.

LOCATION =

Held by Kernel

INNER CONTROL BLOCKS =

DS_TCB contains information associated with particular MVS

TCBs controlled by the Dispatcher. This consists mainly of wait related data, eg the wake up ecb for the TCB. There is also a macro included here to post the wake up ecb of a particular TCB. Sub_dispatcher data is associated with one particular mode. Currently there is only one TCB per mode, but in case of more being introduced, we should distinguish between TCB and mode-related data. The key data is concerned with the dispatchable chain of tasks with the sub-dispatcher's mode. The STimer block contains an array of blocks to associate with the up to 11 outstanding stimerm calls that can be issued by dispatcher.

<p>ECB queue. This chain is for aliens to chain requests to the dispatcher for a service. This is to be used when DFHIRP (in the FOR) wants the AOR to post an AOR ECB. Rather than doing an MVS post (with the overhead of an SRB) it will queue the request so the local dispatcher can do a local post or, even better, do a hand post. (1A0)	CHARACTER	8	DELAY_QUEUE	
The delay queue consists of tasks which have received a resume request which we wish to delay until either a specified interval has expired, or CICS has nothing better to do. This facility is used by high priority server tasks such as CSNC which do not necessarily want to be awoken as soon as requests arrive. This allows a CICS server task to achieve batching under the CICS TCB. This method of batching is separate from that used to reduce the MVS dispatching overhead: the delay queue is intended to offer a mechanism for server tasks to reduce the CICS dispatching overhead.

<p>The mode/sub_dispatcher control blocks. A SUB_Dispatcher is responsible for a given dispatch "mode". It contains a list of dispatcher tcbs owned by this mode, a Dispatchable Q that is a list of tasks that are ready to be dispatched. (i.e. not suspended), and a set of flags representing the state for this sub dispatcher. In this release, there is exactly one tcb for each sub_disp. The Modes introduced in CICS/ESA 3.1.1 were: QR: Quasi-Reentrant. This mode runs all old CICS non-reentrant code. It also runs all application code. R0: Resource Owning Tasks switch to this mode to perform operations that will tie up a TCB for a long period of time. An example open and close files or perform any BLDL operations. Tasks running in this mode run concurrently with any other tasks in the system. CO: Concurrent Mode. Tasks running in this mode run concurrently with any other tasks in the system. Tasks in this mode are expected to give control back to the dispatcher in a reasonable time. CO mode can be viewed as a superior VSAM subtask mode. The current users of CO mode are all the old VSAM subtask users. TSP,FCP,TDP and JCP and domain service tasks, eg for TI and SM. In CICS/ESA 3.3 the following TCB was added: SZ: Secondary LU support mode. Tasks running in this mode run concurrently with any other tasks in the system. This mode is used by tasks processing EXEC CICS FEPI requests. This mode is NOT for general purpose use, but is reserved exclusively for use by the secondary LU support code. In CICS/ESA 4.1 the following TCB was added: RP: ONC/RPC support mode This mode is used by tasks using the ONC/RPC feature and is intended as a tactical solution only. In CICS/TS 1.1 the following TCB was added: FO: file open/close mode This mode is used rather than R0 mode to avoid the possible delay caused to other tasks when migrated files are opened (takes a long time). The sub_dispatchers are implemented as an array within the dispatcher anchor block. The array indices correspond with (QR,R0,CO,SZ,RP,FO) modes respectively, followed by entries for the more recent open power of 2 to speed up indexing into the array.</p>

Double Chains.

A Double Chain is a type of linked list that is designed to provide a sorted list of tasks while allowing concurrent push/pop operations on it from multiple TCBS..

It consists of 2 linked lists. These are described as the "front" and the "back" halves of the Q.

Any TCB can "push" a new element onto the "Front" half with a Compare and Swap instruction.

When a TCB wants to pop a task of the Q, it "hides" the frontq by zeroing the frontq ptr. Any future pushes to the front half therefor start a fresh front half.

The TCB then sorts and merges the tasks from the hidden front half down onto the back half.

The back half then consists of a list of tasks sorted in priority Order.

The Dispatchable chain is implemented as a double chain.

<p>Timeout array. This array contains timeout counts for the next 11 quarter second stimer ticks. The count field contains the number of timeouts that will expire at the completion of the tick. During a wait or suspend one is added to the appropriate elements count and at the completion of the wait or suspend one is subtracted from the count. CDS is used to maintain the timeout value and count. The check_executables routine reassigns expired elements and ensures that suspended tasks that timeout times have come into the array range because of this reassignment of expired elements are included in the appropriate count. The timeout elements are chained using halfword indexes from stimer_timeout_next_tick_index. The last available element index is contained in stimer_timeout_last_tick_index.</p>

<p style="text-align: center;">OPEN_POOL</p> <p>The open TCB pool control block. Open TCBs are kept in separate pools of disparate types of TCBs. For example, TCBs with JVMs (which are expensive to build) are kept separate from OPENAPI TCBs (eg. DB2 threads) so that they can be better protected. All TCBs of a given mode are in the same pool. The pool number for the mode is a parameter to ACTIVATE_MODE. Each pool is managed as a separate entity, with its own wait queue, internal stealing, and pool size (eg MAXOPENTCBS) parameter.</p>

DTCPS Data Tables Connection Anchor Blocks

DTCHD_BLOCK, the Data Tables Connect Header Block, is allocated once per region which has performed client initialization processing to allow connections to other regions. It is addressed via the region anchor. It contains information used by the supervisor routines which establish and validate connections to files associated with data tables in server regions.

DTCON_VECTOR, the Data Tables Connect Vector, is effectively a variable length extension of the Connect Header Block, but it is stored separately to allow it to be reallocated at a larger size if necessary. It contains information used to establish and validate cross-memory connections to data tables.

DTLPS Data Tables Local Access Anchor Blocks

DTHDR_BLOCK, the Data Tables Header Block, is a unique CICS lifetime block which is maintained by CICS data tables initialization and referenced by CICS data tables loading and record access services. It contains heads of chains and other information which occurs once per CICS region, plus a storage area which is used by the record retrieval module DFHDTRE for its working storage.

At Data Tables FOR initialization, DFHDTINS getmains and initializes DTDUM_BLOCK. This block represents a dummy table and must always overlay the first part of DTTBL_BLOCK so that the pointer to the header block is at the same offset in both control blocks. Its address is passed in DTP_TABLE_TOKEN whenever DFHDTUP is called for a commit/backout request, and it allows commit and backout to find the header block.

DTTBL_BLOCK, the DT Table Block, is the control block which describes a table and its associated index and record storage. The first few fields should never be moved without also changing DTDUM_BLOCK, because the pointer to the header block must remain at the same offset in both.

-----
-- Shared access to a file uses the DTFIL_ENABLED and
DTFIL_CONTINUE flags. DTFIL_ENABLED flag on means file
enabled for new requests. This flag is tested on shared
access when the request specifies TEST_ENABLE, but is
ignored otherwise. The feature should never set this flag to
disabled unless it knows from file control that the file
really is disabled. The flag is therefore set ON when the
file is opened, and reset to ON or OFF on a SET_ENABLEMENT
call. If the flag is OFF then new requests will fail with a
DISABLED exception. DTFIL_CONTINUE flag on means old
requests can continue. When this flag is ON, existing
requests to the file can continue. If the flag is OFF then
all requests will fail with a DISABLED exception, regardless
of whether or not they are continuations of existing
requests (which do not test DTFIL_ENABLED). This flag will
always be ON unless a FORCE DISABLE is issued, when it will
be set to OFF. A subsequent ENABLE request will turn it back
on. The flag is set ON when the file block is opened. -----

DTRPS Data Tables Remote Sharing Anchor Block

DTRHD_BLOCK, the Data Tables Remote Header Block, is a unique CICS lifetime block which is getmained by CICS data tables remote initialization. It contains information which occurs once per application region which has connections to shared data tables in other regions. In the current implementation, this only consists of a pointer used for diagnostic purposes.

DTSPS Data Tables SVC Routine Anchor Blocks

DTSYS_ANCHOR, the Data Tables System Anchor, is allocated once within an MVS image. It primarily provides an anchor point to enable code running in one address space to find out about data table servers running in other address spaces.

Each region using data tables initially accesses the system anchor via the internal CICS QSSCT chain starting at SSCTSUS2 in the "CICS" SSCVT, then saves the address in the region anchor for subsequent use. The address also appears in the server element for use by the EOM RESMGR routine.

DTRGN_ANCHOR, the Data Tables Region Anchor, is allocated once per region which is using shared data tables support, and is located via AFDTRGNP for the appropriate CICS QR TCB. It provides a common anchor for the data areas used by supervisor code for data tables server and connection processing. Note that the offset of DTRGN_LOOKUP_EP is relied on by code outside the SVC routine, and must remain fixed for any new version.

DTSRV_ELEMENT, a Data Tables Server element, is created in ECSA when a server region logs on. Its address is stored in the region anchor, and when it is active it can be located from other address spaces via a chain from the the system anchor. Substitution bytes in <code>ecfp_code</code>				

- When these byte codes are found in <code>ecfp_code</code> of a model filter predicate they are to be replaced by the corresponding <code>ecfp_values</code> .				
- When the mask length, <code>CFx</code> , is being substituted, replace with <code>length-1</code> , or for packed decimal 2 nibbles of <code>length-1</code> .				
e.g. Non packed decimal length of 20, replace with 13x.

EJBBE Enterprise Java Bean Browse Blocks

This Structure defines the Bean Browse blocks
Each of these fixed-length items comprises an active browse upon the Beans.
This block is chained from the EJ Elements Anchor Block (ejae_b_broot) and obtained from the fixed length ejae_b_bspn/t storage subpool).
The `_l_` field shows the current position in the Browse (the last returned element) - if this is not found on a `get_next` then this absence breaks the browse.
The `_s_` fields shows what selection the browse is running - no wild cards are supported.

EJDBE Enterprise Java DJAR Browse Block

This Structure defines the DJar Browse blocks
Each of these fixed-length items comprises an active browse upon the DJars.
This block is chained from the EJ Elements Anchor Block (ejae_d_broot) and obtained from the fixed length ejae_d_bspn/t storage subpool).
The `_l_` field shows the current position in the Browse (the last returned element) - if this is not found on a `get_next` then this absence breaks

the browse.
 The `_s_` field shows what selection the browse
 is running - no wild cards are supported.

FBWAC File Browse Work Area for data tables

CONTROL BLOCK NAME = DFHFBWAC
 DESCRIPTIVE NAME = CICS (FC) File Browse Work Area

Restricted Materials of IBM

FUNCTION =

Browse work area for browsing data tables.
 This control block is part of data tables support within CICS file control. It is used to keep track of the status of a browse to a data table. It is used for both shared data tables support and coupling facility data table support, although not all fields are used by both.
 An instance of the FBWA represents a browse thread by a unit of work to a data table, so there will be one FBWA per data table being browsed per UOW that is browsing.

LIFETIME =

An FBWA is created when a START_BROWSE is issued to a data table, and destroyed when the browse is ended.

STORAGE CLASS =

FBWAs are getmained from one of the FC buffer pools in the FC_ABOVE subpool, which is above the line, CICS key stg. It is freed back to the buffer pool when the browse ends.

LOCATION =

The FBWA for a request is addressed by FRT_FBWA_ADDRESS in the FRTE.

File Browse Work Area

This area is used to record status information about a browse sequence. It is addressed via a pointer in the FRTE associated with the browse and created using an IO buffer of appropriate size obtained from a file control IO buffer pool.

Some of the data relate to the state of the browse as perceived at the API, e.g. whether the browse is GENERIC and what key was last returned to the application.

CMT-specific fields

Because browsing a CICS-maintained shared data table may require references to the source data set it may be necessary institute a source browse. Some data in the FBWA relate to the state of any such browse and its relationship to the API browse. The following is an explanation of some of the less immediately obvious items which refer to the source data set browse.

FBWA_SOURCE_CURRENT

is meaningful only if FBWA_SOURCE_STARTED is on. It shows that the last browse request was satisfied by reference to the source so the next one could validly be processed by simply passing the request on to the source browse service.

FBWA_SOURCE_IN_SEQ

is meaningful only if FBWA_SOURCE_STARTED is on. It shows that the browse is full key GTEQ and that the source browse is known to be positioned at a key less than or equal to that of the current API browse position.

It is used to determine whether a RESETBR can be safely omitted in some cases where recourse to the source browse is necessary to satisfy a request.

It is used solely for optimization and is set only in circumstances in which it is easy to be sure of its truth. SOURCE_IN_SEQ is used to hold the value of the flag at the start of a request and the flag itself is set off. It is set on again at the end of the request if appropriate.

FBWA_TOKEN_VALID

shows that the last browse request was satisfied from the table and that the token in the FRTE, FRT_DT_RECORD_TOKEN, corresponds to the current browse key FBWA_CURRENT_KEY.

The token is used to optimize table access for sequential browse requests by avoiding the index search.

This field is also used for UMTs.

FBWA_NEXT_KEY_VALID

Shows that the key in FBWA_NEXT_KEY is valid. If a gap is encountered while browsing a table SDTF returns the next key in the table. This is copied into FBWA_NEXT_KEY and FBWA_NEXT_KEY_VALID is set on. As long as the browse remains sequential, no attempt will be made to revert to table retrieval until this key value is reached.

FBWA_SEQUENTIAL

shows that the next browse request may be treated as sequential provided that it satisfies the criteria. The indicator is set only after a request has completed with an OK or ENDFILE response so that continuation in any other

case, e.g. after NOTFND, will be treated as a reposition.
 This field is also used for UMTs and CFDTs.

UMT-specific fields

There are no fields used exclusively for UMTs.

CFDT-specific fields

There are no fields used exclusively for CFDTs.

FCPEC File Control CFDT Pool Element

CONTROL BLOCK NAME = DFHFCPEC
 DESCRIPTIVE NAME = CICS FC Pool Element (FCPE)

Restricted Materials of IBM

FUNCTION =

DFHFCPE describes the DSECT for a File Control Pool Element. A pool element represents one connection to a Coupling Facility Data Table Pool. Coupling Facility Data Tables are organised into pools, each of which is similar in scope and function to a CICS FOR.

For each table pool which can be accessed by a given MVS image, there is a table server region running in that image which manages access to the pool.

A pool element is created and chained to FC static when a file definition that refers to the pool is installed and there is not already a pool element for that CFDR pool. A connection to the CFDT server is made when CICS opens the first table for the pool, and a flag in the FCPE is set to indicate that the pool is now connected.

If the CFDT server goes down the FCPE will be marked connect_failed when CICS realises the server has gone.

This flag is only reset when the server returns and a new connection is successfully made. Note : it is important that the testing of the connect_failed flag is always serialised with any connect that may already be in progress, by waiting on the connect complete ECB. The address of the head of the FCPE chain in FC Static is field FC_FCPE_CHAIN.

FCPEs are getmained from the FCPE subpool which is created by DFHFICRP during File Control Initialisation. File Control Pool Elements are freemained by DFHFICSD at CICS shutdown when pool disconnections are issued.

LIFETIME =

Created during installation of a file definition that refers to the associated pool.

Deleted at shutdown (when disconnects are also issued for all pools to which CICS is currently connected).

FCPWC File Control CFDT Pool Wait Element

CONTROL BLOCK NAME = DFHFCPWC
DESCRIPTIVE NAME = CICS FC CFDT Pool Wait Element

Restricted Materials of IBM

FUNCTION =

DFHFCPW describes the DSECT for a File Control CFDT Pool Wait Element. A pool wait element represents a task which has tried to issue a request to a coupling facility data table that resides in a particular server pool, but which has to wait because the number of requests allowed in the server at any one time has been reached. Depending on the kind of request, the FCPW will represent either a 'Locking request slot' waiter or a 'MaxReqs' waiter. A Locking request slot waiter is a Locking request (one which will acquire locks) that has to wait because all the slots allocated to Locking requests are currently in use. A MaxReqs waiter is a non-locking request which has to wait because the maximum number of requests (of any kind) allowed in the server has been exceeded. Thus the Locking request slots are a subset of the MaxReqs slots. Different kinds of waiter are chained on separate queues. When a request has to wait, it needs to be appended to a chain anchored from the pool element, and unchained when the request can be resumed. The different kinds of waiter are chained on separate wait queues. FCPWs are getmained from the FCPW subpool which is created by DFHFICRP during File Control Initialisation. A file control CFDT Pool Wait Element is freemained when the waiter that it represents has been successfully resumed.

The FCPW contains the following fields:

- Pointer to next FCPW in chain
- Pointer to previous FCPW in chain
- Suspend token
- Task token for the waiting task
- Suspend start time (for monitoring)
- Transaction number (for debug - so it appears in a dump)
- The priority at which the task should be resumed (it will be set to a higher priority when it is dequeued, to give it more chance of restarting)
- Some flags, indicating: type of waiter

LIFETIME =

The lifetime of an FCPW is the time during which the waiter task has to wait. It is created by the module issuing the request when it is discovered that the request will have to wait, and destroyed by that module when the request is resumed.

STORAGE CLASS =

Above 16M line. CICS key.

LOCATION =

The addresses for the heads of the different FCPW wait chains are in the pool element for the server pool being accessed, in fields FCPE_LRS_WAIT_CHAIN (for the Locking request slot waiters) and FCPE_WAIT_CHAIN (for the MaxReqs waiters).

FCUPC File Control CFDT UOW Pool Block

CONTROL BLOCK NAME = DFHFCUPC
 DESCRIPTIVE NAME = CICS (FC) CFDT UOW Pool Block

Restricted Materials of IBM

FUNCTION =

The FCUP block represents recoverable updates made within a unit of work to tables within a coupling facility data table pool.

THE FCUP block is used by the CF data tables part of the File Control component. Each FCUP block represents the RMC link to a CF data table pool within a unit of work.

This means that within a unit of work, each CF data table pool which contains one or more CF data tables to which the UOW has made recoverable updates will be represented by an FCUP block: there is one FCUP block per UOW per recoverably-updated CFDT pool.

FCUP blocks are getmained from the FCUP subpool which is created by DFHFICRP during File Control Initialisation.

LIFETIME =

The lifetime of an FCUP block is the same as that of the RMC Link which it represents.

An FCUP block is created by the CF data tables request processor, DFHFICDR, when the first recoverable update is made within a unit of work to a table which resides in the CF data table pool to which the FCUP block will refer.

The FCUP block is created at the same time as an RMC link is created, and it represents File Control's interest in that link.

The FCUP block is freed at syncpoint time by the CFDT Syncpoint processor, DFHFICDW, at the successful completion of syncpoint for that pool within the unit of work.

STORAGE CLASS =

Above 16M line. CICS key.

LOCATION =

The FCUP blocks for a unit of work are chained from the FRAB, addressed by FRAB_FCUP_CHAIN_ADDRESS.

PGHM Handle Manager declarations *LAA

=====

Handle Table Block

The Handle Manager owns and manages the repository of the data which needs to be held to record a user program's EXEC CICS Handle requests.

Data for each unique Condition, AID or Abend is retained as a single entry in the repository: an entry in this repository is known as a Handle Table Entry. There are three such tables of entries: The Conditions Table which contains the entries for all handled Conditions, the AIDs Table which contains the entries for all handled AIDs and the Abend Table which contains the entry - there can only be one entry in this table - for a handled Abend. In addition, 16 bits are set aside in the Block to hold a set of flags used to indicate whether any of the following conditions have been handled by the user: RDATT, WRBRK, EOF, SIGNAL, OVERFLOW, NOSPACE, QBUSY, NOSTG, ENQBUSY, NOJBUFSP, SYSBUSY and SESSBUSY. These flags are used by various EXEC CICS API handling modules and are provided to improve run-time performance in their respective areas.

A Handle Table Block therefore holds all data representing a single level of the handle state. A multi-level handling system is enabled with this technique because the current Handle Table Block can be stacked at any time, for example as a result of a PUSH command, and a new level instated; similarly, a previous level can be reinstated following a POP.

Addressability to the current Handle Table Block is via a pointer named the Handle Level Token which is defined in the Program Level Control Block owned by the PG Domain. The Program Level Control Block is addressed via the PG Domain Transaction Storage which is in turn anchored off the PG Transaction Token, managed by the Transaction Manager. The Handle Manager obtains addressability to the PG Token and thus to the Handle Level Token using the DFHXMIQ Inquire_Transaction-Token service. Whenever a Handle Table Block is PUSHed onto the stack and a new Block created, the new Block contains a pointer, in its htb_prev_table field, to the PUSHed Block. This both facilitates the reinstatement of the previous Block if a POP is driven, but also allows for the speedy freeing up of all Handle Table Blocks at program termination.

A Handle Table Block is acquired out of the HTB subpool.

Handle Table Entry

An unique entry exists in the appropriate table for every possible condition, AID or abend.

Handle Condition entries are held within the table known as htb_conditions_table: Handle AID entries are held within the htb_aids_table: and the single Handle Abend entry is held in htb_abend_table. All three tables form part of the current Handle Table Block.

The first byte of every entry - named HTE_ ACTIVE - is used to denote whether or not that particular entry is active, ie that some user handle for that condition, AID or abend has been issued at the current level.
 Should HTE_ ACTIVE be 00, ie FALSE, then the entry is not active. For any value of HTE_ ACTIVE other than 00, the entry IS active.

=====
Handle Manager Register Save Area
A register save area has to be acquired by CICS during the processing of Handle requests for Cobol programs: the area is needed to hold the contents of the user's registers as at the time of the Handle command. These register values remain unchanged for the duration of that handle, and do not alter for any intervening EXEC CICS commands.
The Handle registers are necessary because, in the case of Cobol programs only, when a handled event occurs, CICS passes control back to the program instruction immediately following the Handle: this instruction is a Cobol 'goto lab1, lab2... depending on dfheigdi' statement and it needs the register values at the original handle in order to operate correctly.
A single register save area is acquired when needed out of the HM RSA subpool. Every distinct event within a single command is able to share the same registers, therefore in order to assist with the management of the save areas, a count is maintained for each area. For every event in any one Handle command the `rsa_user_count` field is incremented by one. Whenever a new handle for an event is issued, thereby rendering the first save area unwanted for that event, the count is decremented. When the count reaches zero, the register save area is returned to the subpool.
Register save areas are chained together so that those in use may be speedily freed during program termination.

IECCB - IE Client Conversation Block
The IECCB contains the state for a specific conversation with
the client. A conversation is uniquely identified by its session
id (which is re-used by the client) and sequence number. An
IECCB is created when an attach FMH is received for a mirror
transaction (which flows with BB) and deleted when we send or
receive CEB.

<pre> !:refstep.iimd_class_data ----- DFHIIMD 190 - ! ! This defines the control blocks used for the RQMODEL class data ! structures. There is a class anchor block which contains data ! items for the class as a whole such as subpool tokens and a lock ! manager token for the class lock. ! ! There are two types of control block, model blocks and browse ! blocks. There is a single doubly-chained list of browse blocks ! which are managed in a fairly standard way. ! ! For the models, there is a global chain containing all models in ! collating sequence of model name. There are also two match ! chains, one for EJB type models and one for CORBA type models. ! Within each chain, the blocks are held in match order (i.e. most ! specific first in case of possible ambiguity). In the case of a ! model which can match both EJB and CORBA requests, the model block ! is inserted into both chains at the appropriate point so that ! matches of either type will find it. ! !----- MDA - RQ model class anchor block. !----- </pre>

! :erefstep.dfhismf_is_http_header_names -----
! :refstep.dfhismf_is_http_header ----- DFHISMF 159 -
!
! The name of this header is defined in constant ISHH_NAME. It is
! the main HTTP header present on all protocol(IPIC) HTTP requests
! and responses.
!
! The IS HTTP header is added by the ISSR send_request and
! send_response functions and inspected by the ISRR
! process_input_queue function to determine what action to take on
! receipt of incoming IPIC data.
!

```

```

! It has a prefix and a data component.
!
! The conversation ID, ishh_conv_id, relates the message to its
! session. If a new conversation is to be started on a particular
! previous session, for example to implement the CICS RM Implicit
! Forget protocol, the ishh_prev_conv_id field must be set to the
! conversation ID that used that session previously. Otherwise it
! should be left blank.
!
! The ishh_msg_seqno is incremented for each new request within a
! conversation. This number is allowed to wrap back to 1 after
! 999999. The reply carries the same ishh_msg_seqno as the request
! to which it relates.
!
! There may be multiple chain elements within an IS request or
! response. Each IS chain element is an HTTP request or response
! message.
!
! The first or only chain element within a request should have
! ishh_chain_seqno = 1.
!
! A sender must wait for a pacing response after every four
! messages. A pacing message carries no body data.
!
! IS HTTP msgs are:
!
! ISHH_DATA
! half duplex flip-flop, conversation level messages. Change
! direction is implied at the end of every message, or chain of
! messages.
! ISHH_EXPD
! expedited conversation level command messages that carry no body
! data; may be sent with or against the conversation level flow.
! ishh_conv_state should be set to ishh_end, indicating that no
! reply to the conversation level command is expected.
! ISHH_CMD
! connection level command messages are at the IPCONN level and
! carry no body data; the ishh_conv_id and ishh_conv_state are
! ignored.

! The IS HTTP headers (ISHH) associated with the capability exchange
! messages have a convid of 0.
!
! When the initiator of a connection is a CICS system, this message
! is triggered by SET IPCONN ACQUIRED. This SPI command attaches
! transaction CISC which issue DFHISCO acquire_connection to create
! a socket and send a Capability Exchange to the partner.
!
! The partner CICS attaches the IPIC TCPIP SERVICE protocol
! transaction, CISS by default, to issue DFHISCO
! initialize_connection. The initialize_connection function calls
! the acquire_connection routine to create a similar connection back
! to the initiator, to allow work to be started from the partner
! back to the connection initiator.
!
! If the connection initiator has no requirement for a return
! connection e.g because it doesn't support inbound requests, the
! isce_callback_port should be set to ISCE_NO_PORT. (This is
! currently only supported for recovery protocol XA).
!
! If the partner supports multiple sockets per IPCONN, a capability
! exchange request is sent for each socket opened. Second and
! subsequent capex requests use the isce_reqd_sessions field to
! indicate how many IS sessions are to be allocated to the new
! socket. Data following the comment isce_primary_data is ignored in
! secondary capex requests.

ISSS - IS Session Set type
Blocks of this type contain the state for a web session used by
an IPCONN. The session set contains the web session token and
the head of a chain of IS sessions (ISSBs) representing tasks
sharing the web session. IPCONNs have at least one inbound client
session set.

ISLQ - IS Local Queue Element
An ISLQ is used to store a transformed START NOCHECK request
in until a session is available to allow it to be transmitted.
Local Queuing only applies when either the connection is
installed but not acquired, or to those requests that have
been rejected for queued allocates but have then been selected
by the XISQLCL exit. They are written to recoverable TS. !

KCB Kernel Anchor Block

CONTROL BLOCK NAME = DFHKEGBL
DESCRIPTIVE NAME = CICS (KE) Kernel Global.

Restricted Materials of IBM

FUNCTION =

Kernel's Anchor for all other control blocks.

This anchor points to kernel programs, domain and task tables.

These blocks are described in DFHKECB.

The Kernel Anchor is addressed in two ways:

First, if the Kernel is Called the R13 -> Linkage that identifies the Kernel Global.

Secondly, the KCB can be addressed from the AFCS via low core, the TCB Extension and the AFCB.

The AFCS/AFCB/AFT is defined in DFHAFCP, a PLAS copy book.

LIFETIME = One per Space, for the duration of the CICS Run.

An instance of Stream class consists of: ! ! - An eyecatcher. ! ! - A double chain link to other streams in the chain of all ! streams. ! ! - A stream lock which is used to manage concurrent requests made ! against the stream. Note that a Stream method requiring both the ! stream lock and the domain lock should acquire the stream lock ! first to prevent possible deadlock. ! ! - Two block-oriented data structures called StreamBlocks used for ! managing writes and deferred writes. At any given time one is ! for the Current block and the other is for the Previous block. ! ! - Pointers to the two StreamBlocks above. One identifies the ! Current, the other identifies the Previous. ! ! - The ForceToken currently associated with this stream. This is ! updated on every buffer switch. ! ! - The activity keypoint frequency of the stream, set to zero if ! activity keypoints do not apply, and an associated count which ! is used to monitor when activity keypoints are to be triggered. ! ! - Some context data which is owned by the Block class, and is ! passed to those Block methods that require it. ! ! - The HardStream object that is associated with this stream. ! ! - Whether the stream is an MVS Logger log or an SMF log. ! ! - The logstream name. This is for MVS Logger logs only. ! ! - The journal name. This is a real journal name for SMF logs, or ! is fabricated from the last qualifier of the logstream name for ! MVS Logger logs. ! ! - Whether the stream is for a System Log or General Log. ! ! - Some flags indicating progress through the initialization of a ! 				!
				! An instance of HardStream class consists of
				!
				! - An eyecatcher.
				!
				! This helps dump navigation.
				!
				! - A log stream name.
				!
				! This is the log stream name which denotes the MVS System Logger
				! log stream on connect operation, which returns a log stream
				! token.
				!
				! - A journal name.
				!
				! This is the journal name from the log stream name, used as the
				! resource name when a task is suspended.
				!
				! - A log type.
				!
				! This is either 'mvs' or 'smf'.
				!
				! - A connected/disconnected indicator.
				!
				! When 'connected' the HardStream object is operational, and when
				! 'disconnected' it has been disconnected and it about to be
				! destroyed.
				!
				! - A System Log indicator.
				!
				! If 'Y' the log stream forms part of the System Log.
				!
				! - dasd_only(y/n)
				!
				! This flag indicates whether the log stream is of type DASDONLY
				! or CF based.
				!
				! - structname
				!
				! If the log stream is CF based, this is the structure name used
				! by the log stream, otherwise this is set to binary 0 (meaning
				! not applicable).
				!
				! - retention_period
				!
				! The log stream retention period is the number in days that the
				! data must be kept before it can be physically deleted by the MVS
				! logger.
				!
				! - auto_delete
				!
				! Auto delete flag, if set to yes the MVS logger automatically
				! deletes the data as it matures beyond the retention period,
				! irrespective of any IXGDELET calls. If set to no the data is
				! deleted when it matures beyond the retention period and an
				! IXGDELET call has been issued.
				!
				! - A maximum block size.
				!
				! This is a constant, being the maximum block size allowed for the
				! MVS System Logger log stream or MVS SMF log.
				!
				! - An MVS log stream token.
				!
				! This is the token that denotes the MVS Logger log stream at its
				! interface. The MVS System Logger returns this value on the
				! connect operation.
				!
				! - A buffer pointer.

L2HP Log Manager History Point Class

```

!:refstep.L2HP_Class ----- DFHL2HP 72 -
!
!
! What follows defines the Log Manager HistoryPoint class.
!
! History points provide a means of remembering the age of records
! written to logs. They are used by the System Log class and the
! Chain class, so are only of relevance to the system log.
!
! The history point of a log record consists of the store clock
! value that was stored in the record when it was written to the
! buffer together with a block id, where the block id is not later
! than the block containing the record.
!
! The history points of a chain are the history points of the oldest
! records on the primary and secondary log streams belonging to the
! live part of the chain. If there is no oldest record on either log
! stream the corresponding history point is in the 'ultimate future'
! (the latest possible history point).
!
! If the oldest block id is unknown then the history point is in the
! 'ultimate past' (the oldest possible history point). This occurs,
! for example, during browse all when the first record of the chain
! has not yet been browsed, or on a very early write to a log stream
! after a cold start.
!
! The current history point of a log stream is the history point of
! the most recently written record on that log stream. If the most
! recently written record is unknown, then the history point is in
! the ultimate past. An empty log stream is an example of this.

L2LT Log Manager Lock Tracker Class

```

!:refstep.L2LT_Class ----- DFHL2LT 68 -
!
!
! What follows defines the Log Manager LockTracker class.
!
! Several Log Manager objects contain a lock. Such objects are
! Chains, Streams and Domain Manager. Under certain circumstances,
! notably when its recovery routine has been driven, a module that
! uses such an object needs to know whether a method it called has
! acquired the lock. This is so the lock can be released. It is
! therefore necessary to track the status of the lock. This requires
! knowing both the address of the object and whether the lock is
! held or not.
!
! This is achieved by declaring a LockTracker variable for each
! object lock the module is interested in. Each LockTracker must be
! explicitly initialised by the module using the l2lt_set_free
! method. Whenever the lock is acquired or released the LockTracker
! is automatically updated by the object using the l2lt_set_held and
! l2lt_set_free methods. If the module recovery routine is driven it
! must call the lock_release method of the object. This uses the
! l2lt_inq_status and l2lt_inq_token methods, and will only release
! the lock if the LockTracker indicates the lock is held.
!
! Only one Chain lock, one Stream lock and the Domain Manager lock
! may be tracked within a given module. This is because a
! LockTracker is not passed as a parameter to Stream or Chain.

L2RT Log Manager Record Token Class

```
!::refstep.L2RT_Class ----- DFHL2RT 76 -
!
!
! What follows defines the Log Manager RecordToken class.
!
! A RecordToken provides a means of identifying the location of a
! log record that is being written to or read from a logstream. It
! consists of a pointer to the Block object for the block containing
! the record, and an index which gives the offset of the record
! within that block.
!
! A 'flattened' form of a RecordToken is also required, so that the
! information contained within a RecordToken may be stored in log
! records, and later unflattened when the record is read back. The
! FlatRecordToken is defined with the log formats in DFHL2LFC.
!
! Whenever a RecordToken is created (by building, copying or
! unflattening) we immediately register interest in it. This holds
! the Block, and means that the Block can not disappear from under
! our caller's feet. When our caller has finished with the
! RecordToken he must deregister interest, and we will release the
! hold on the Block. Releasing the last hold destroys the Block.
```

L2SL Log Manager System Log Class

```

!:refstep.L2SL_Class ----- DFHL2SL 89 -
!
!
! What follows defines the Log Manager SystemLog class.
!
! The CICS system log consists of two MVS Logger logstreams, the
! primary (journal name DFHLOG) and the secondary (journal name
! DFHSHUNT). The SystemLog class knows which log stream objects are
! used for these (that is, which instances of the BrowseableStream
! class). It is responsible for opening the log streams at CICS
! startup, and for deleting all records from the log streams when
! CICS is cold started. It provides inquiry methods so other classes
! can obtain the tokens (actually BrLogStreamTokens) for the primary
! and secondary streams.
!
! It is possible for the user to define the primary and/or secondary
! stream as a dummy stream. If the primary is a dummy then this
! implies that the secondary is also a dummy (it does not make sense
! otherwise). A special dummy BrLogStreamToken is used to indicate
! that a stream is a dummy, and is returned by the inquiry method.

```

```

! It is the inquirer that decides upon the appropriate action to
! take.
!
! The SystemLog class owns the activity keypoint frequency
! (AKPFREQ). It provides methods for inquiring and setting its
! value. It also passes on the value of the activity keypoint
! frequency to the primary stream object. The activity keypoint
! frequency can be set at CICS startup and using the CICS API. If it
! is set at CICS startup and if the primary stream has not yet been
! opened, the call to the primary stream object is deferred until
! the open takes place.
!
! The SystemLog class must be notified of any failures that occur
! when writing critical data to or reading critical data from the
! primary or secondary stream. This normally results in a
! termination of CICS.
!
!-----
!:refstep.L2SL_Class_Declaration ----- DFHL2SL 144 -
!
! The SystemLog class has no instance data as there are no instances
! of this class. All data is stored in class data and is accessed by
! class methods. It has both internal and external methods.

L2SR Log Manager Stream Class

```

! :refstep.L2SR_Class ----- DFHL2SR 121 -
!
!
! What follows defines the Log Manager Stream class.
!
! A Stream object provides the ability to write data records to and
! read data records from an MVS Logger or SMF logstream. It provides
! a layer between the logstream user and the code that actually
! calls MVS. This layer is necessary to hide the details involved
! with writing to and reading from logstreams. In particular, it
! provides a record-level interface for the logstream user, and it
! hides various performance related techniques such as double

```

```

! buffering and deferred force of buffers.
!
! A logstream may be viewed as consisting of a number of blocks.
! These are the units by which data is written to the physical
! medium. A logstream will typically comprise a number of such
! blocks on the physical medium (referred to as +hard+), plus two
! buffers called +Current+ and +Previous+ which provide the double
! buffering when writing data (referred to as +soft+), plus possibly
! some +Read+ buffers used when reading blocks back from the
! logstream.
!
! A Block object represents an individual block on the hard stream
! or a buffer. A Stream object therefore cooperates with several
! Block objects when writing and reading data. However a Block is
! not independent of the Stream that it belongs to. A Block object
! requires some context information, primarily to implement its
! block numbering scheme. This context data is owned by Block, is
! held as part of a Stream object, and is passed to Block methods
! where appropriate.
!
! A General Log logstream is represented by a Stream object.
! However, a System Log logstream is more complex and is represented
! by a BrowseableStream object. The BrowseableStream class inherits
! from the Stream class, and so has all the properties of Stream
! declared here.
!
!-----
!:refstep.L2SR_Class_Declaration ----- DFHL2SR 187 -
!
! The Stream class has both instance and class data. It has both
! internal and external methods.

LDCBS Loader Domain Control Blocks

Segment Name = DFHLDCBS
 DESCRIPTIVE NAME = CICS Loader (LD) Domain
 Control Block declarations.

Restricted Materials of IBM

Function =

This file contains the control block and constant declarations used by the Loader domain. The file is included by each Loader domain module.

The control blocks are:

- APE - Active Program Element.
- BLDL - BLDL PARAMETER LIST.
- CPE - Current Program Element.
- CSECTL - CSECT LIST BLOCK AND ENTRY.
- DUMMY_CDE - used by SLD
- DUMMY_XTLST - used by SLD
- DUMP - LOADER DUMP CODES.
- GLOBAL - Loader global storage area.
- LAFPB - LOADER AUTHORISED FACILITIES PARAMETER BLOCK.
- LDBE - Loader Domain Browse Element.
- LDWE - Loader Domain Wait Element.
- LOB - LOADER OPTION BLOCK.
- MSGS - LOADER MESSAGE NUMBERS.
- PDB - Program Descriptor Block.
- PLDB - Program Library Descriptor Block.
- PLIBE - Program Library Element.
- PSCHT - Program Search Table
- TRACE - Trace point definitions.

Each control block declaration is followed by the constant declarations related to it.

- Attributes = N/A

 A P E - ACTIVE PROGRAM ELEMENT

For each instance of a program currently loaded there will be a associated APE. A program instance is associated with it's definition by chaining the APE to the CPE (Current Program Element).

<p>APE Chain Fields, there are three APE chains:</p> <ol style="list-style-type: none"> 1.The Global APE chain which is anchored in LD Global. This contains all the APEs in the system in ascending order of entry point. 2.The CPE/APE chain which is anchored in the CPE. This chains all the instances of a program to the program definition. The most recently acquired instance is at the head of the chain. 3.The APE Not-In-Use (NIU) chain which is anchored in LD Global. This contains all the APEs in the system which have a use count of zero and are defined as REUSABLE. During program compression these programs are eligible to be removed. APEs are added to the head of the chain and only removed if the program is freemained or reused.

B L D L _ L I S T - BLDL PARAMETER LIST

The BPAM directory entry is built by the MVS LLACOPY interface and contains a copy of the directory entry from the Partitioned Dataset (PDS) containing the named program.

The BLDL parameter list passed on the LLACOPY is a series of directory entries preceded by entry count and entry length fields.

(10)	ADDRESS	4	CPE_NEXT	-> next CPE in chain
(14)	ADDRESS	4	CPE_PRIOR	-> previous CPE in chain
<p>The following are valid CPE statuses:</p> <p>UNUSED - program has been defined but not yet acquired.</p> <p>LOCATED - An LLACOPY has been issued for the program and it has been found in the DFHRPL library.</p> <p>LOADED - The program has been loaded. It should be noted that a CPE defined as RELOAD will never have the status updated to loaded, hence, on every acquire a new program instance is loaded. Also, if a REFRESH PROGRAM is requested (CEMT S NEWCOPY) the status will be reduced to LOCATED for a DFHRPL loaded program.</p> <p>DELETED - The program definition has been deleted ie DELETE_PROGRAM has been issued. The CPE has not been freemained as there are still active APEs chained off it. The CPE will be freemained when all the active APEs are released.</p> <p>BAD - Invalid data has been detected in the CPE, hence, it is marked as unusable.</p> <p>FREED - The CPE has been freemained. This status is solely to mark deleted CPEs in the case where they are not overwritten and they appear in a dump.</p>				
(18)	UNSIGNED	1	CPE_PROGRAM_STATUS	Status of the program
<p>The CPE control block lock is used to ensure that it is not possible to have multiple updates of a CPE. While a CPE is locked no other task may access it.</p> <p>UNLOCKED - No task is currently attempting to update the CPE.</p> <p>LPA_LOCATING - A task is currently attempting to locate a program in the LPA.</p> <p>RPL_LOCATING - A task is currently attempting to locate a program in the DFHRPL library.</p> <p>RPL_LOADING - A task is currently attempting to load a program from thr DFHRPL library.</p> <p>DISCONNECTING - A task is currently disconnecting from the member in RPL</p>

C E S E C T L - CSECT LIST

The CESCT list contain the CSECT name ,the address of the CSECT, the CICS version, the PTF level and time the CSECT was last updated. A CSECTL only contains four entries, therefore, several CSECTL blocks maybe chained off the APE. The CSECT details are obtained from the header data.

C D E - DUMMY CDE

The DUMMY CDE is used by SLD to detect modules loaded by the CICS Loader. As the MVS LOADs are directed no CDE is built so we have to supply a dummy one so SLD can set its breakpoints.

LGSF System Log Format

```

!:refstep.lg_system_log_format ----- DFHLGLF 233 -
!
!
! The CICS System Log is a special log where CICS keeps enough data
! to satisfy the requirements of transaction backout, emergency
! restart and indoubt resolution. It resides upon the MVS Logger.
! The System Log comprises a sequence of contiguous blocks on two
! physical log streams, the primary and the secondary. Blocks are
! written to the primary. They may be moved to the secondary at a
! later point in time so that the tail of the primary can be
! periodically deleted. This is a performance optimization.
!
! Each block comprises a block header followed by a variable number
! of CICS records. The format of the block header is defined by the
! dsect "lgsf_block_header"
!
! Each CICS record comprise a record header followed by caller data
! normally belonging to CICS Recovery Manager (RM). The record
! header is defined by the dsect "lgsf_record_header".
!
! The format of the caller data is unknown at the Log Manager

! :refstep.lg_system_log_record_header ----- DFHLGLF 293 -
!
! Each record starts with a header as defined here, followed by RM
! data.
!
! The header comprises two parts. The first part is common to all
! records, and contains a link to the previous record on this
! logstream. This enables the entire logstream to be sequentially
! read back on a record basis (during CICS emergency restart). This
! is known as the 'master chain'.
!
! The second part identifies the different record types. There are
! four record types, as described below.
!
! - A record written to the primary log as part of a UOW. Contains a
! link to the previous record in the UOW on the primary.
!
! - A special fork record written to the primary log as part of a
! UOW. Contains a link to the previous record in the UOW on the
! primary (the dead tail) and the previous record in the UOW on
! the secondary.
!
! - A record written to the secondary log as part of a UOW. Contains
! a link to the previous record in the UOW on the secondary.
!
! - A record written to the primary log by a user and not part of
! any UOW (unchained).
!
! The UOW links described above enable a UOW to be sequentially read
! back on a record basis (during dynamic backout). Note that the RM
! data starts immediately after the chain header finishes, so the RM

```

! data starts at a different offset for each different record type.

MEPS Message Domain Anchor Block

MODULE NAME = DFHMEPS COPY
 DESCRIPTIVE NAME = CICS Message Domain Anchor Block

Restricted Materials of IBM

FUNCTION = This member describes the structure of the data contained in the ME domain Anchor Block. It also contains the global variables used throughout the ME domain, eg. YES, NO, ON, OFF, etc, the NLS Table, and the ME Catalog Record.
 The ME domain Anchor block is set up during Pre-initialise and Initialise, by DFHMEDM. It remains until CICS is terminated.
 The anchor block contains the necessary system options for Messages, eg the Languages in the system and the default language etc. These are SIT options, and are assumed to hold true until the next CICS start.

USAGE = This is %INCLUDED by the following programs:

- 1) DFHSUME
- 2) DFHMEDM
- 3) DFHMEBU
- 4) DFHMEIN
- 5) DFHMESR
- 6) DFHMEME

MEMMS Message Table Definition

MODULE NAME = DFHMEMMS COPY
 DESCRIPTIVE NAME = CICS MESSAGE DOMAIN - STRUCTURE OF DATA
 IN MESSAGE DEFINITION MODULE (DFHMET)

 Restricted Materials of IBM

to be generated

FUNCTION= This member describes the structure of data contained in the Message Definition Table (DFHMET). It provides symbolic access to the message templates, together with the globals in storage created by message domain initialisation.

USAGE = This is %INCLUDED in PLAS programs for:

- (a) The Message Domain (DFHMEEx)
- (b) Message Module CMS Utility (DFHMEU) to build the message module from CMS Source data in DFHMET.

Module Header

FUNCTION= This member describes the structure of data contained in the Message Definition Table (DFHMET). It provides symbolic access to the message templates, together with the globals in storage created by message domain initialisation.

MNCBS Monitoring Domain Control Blocks

CONTROL BLOCK NAME = DFHMNCBS
 DESCRIPTIVE NAME = CICS/MVS Monitoring (MN) Domain
 Control Block declarations.

Restricted Materials of IBM

Function =

This file contains the control block and constant declarations used by the Monitoring domain.
 The file is included by each Monitoring domain module.
 The control blocks are:
 TMA - Transaction Monitoring Area.
 TRMA - Transaction Resource Monitoring Area.
 TIMA - Transaction Identity Monitoring Area.
 GLOBAL - Monitoring global storage area.
 - Dictionary Entry.
 - Connector Arrays.
 DUMP - Dump control values.
 MSGS - Message Numbers.
 TRACE - Trace point definitions.
 Each control block declaration is followed by the constant declarations related to it.

MQGLB CICS/MQ Global block

CONTROL BLOCK NAME = DFHMQGLB
 DESCRIPTIVE NAME = CICS MQ attach Global block
 FUNCTION =
 The DFHMQGLB block represents the MQCONN RDO object and contains global state information for the CICS-MQ connection. It also contains the MQ Life of Connection block DFHMQLOC.
 A MQCONN and hence a DFHMQGLB is the minimum required to operate the CICS-MQ Attachment facility.
 LIFETIME =
 A DFHMQGLB is getmained when a MQCONN entity is installed. It is freemained when a MQCONN is discarded.
 LOCATION =
 DFHMQGLB is anchored off CICS/MQ static storage (DFHMQSS). It resides above the 16MB line.

MQLOA CICS-MQ Life of Adapter block

CONTROL BLOCK NAME = DFHMQLOA (previously CSQCLOA when in MQ)
 DESCRIPTIVE NAME = CICS Life of Adapter storage block

Restricted Materials of IBM

FUNCTION =

Contains the storage relevant to the CICS MQ adapter.
 Primary purpose is to locate the DFHMQLOC chain of Life of connection control blocks.

LIFETIME =

This control block is created when the DFHMQTRU module is enabled.

STORAGE CLASS =

Storage is acquired by CICS in CICS key.

LOCATION =

Storage address is passed to TRUE by CICS. Alternatively the storage address can be obtained by CICS commands.

MODULE TYPE = Control block definition

MQLOC CICS-MQ Life of Connection block

CONTROL BLOCK NAME = DFHMQLCLOC (previously CSQCLOC when in MQ)
 DESCRIPTIVE NAME = CICS Life of Connection storage block

Restricted Materials of IBM

FUNCTION =

Contains the storage relevant to a connection between CICS and a MQ subsystem.

LIFETIME =

This control block is created during the connect process and destroyed during disconnect.

One CLOC is maintained inside the CLOA and is used for a default connection.

STORAGE CLASS =

Storage is acquired by CICS GETMAIN in CICS key.

LOCATION =

The CLOCs are chained together from the default CLOC which is addressed via the CSQCLOA.

OTHER CONTROL BLOCKS =

RESTRICTIONS =

Fields Id, csSubSys and pABLK are referenced outside of

CICS adapter code in Data conversion routines.
 To maintain inter-release compatibility the offsets of these
 fields must never be changed

MQSS CICS/MQ Static storage

CONTROL BLOCK NAME = DFHMQSS

DESCRIPTIVE NAME = CICS MQ attach Static Storage

FUNCTION =

The DFHMQSS block contains global data for the CICS-MQ connection established during CICS startup before the DFHMQGLB is created. It is also used to store data that needs to survive even if the MQCONN is discarded and hence the DFHMQGLB freemained.

LIFETIME =

DFHMQSS is getmained by DFHSIB1C during CICS initialisation. Its lifetime is the lifteime of CICS, it is not freemained.

LOCATION =

DFHMQSS resides above the 16MB line. It is anchored off the static storage address list DFHSSAPS which is turn is anchored off the CSA optional features list.

NOTES :

DEPENDENCIES = S/370

RESTRICTIONS = none

MQTHD CICS-MQ Life of Thread block

CONTROL BLOCK NAME = DFHMQTHD (previously CSQCTHD when in MQ)
 DESCRIPTIVE NAME = CICS Life of Thread block

Restricted Materials of IBM

FUNCTION =

Contains the storage relevant to a CICS task communicating with a given MQ subsystem.

LIFETIME =

The CTHD for the default connection is contained in the CLOT block, any other (currently none) CTHDs will be chained from the default CTHD.

The block is formatted as a CTHD on the first call by this task.

STORAGE CLASS =

CICS task storage.

LOCATION =

The CTHDs are anchored in CLOT.

OTHER CONTROL BLOCKS - None

RESTRICTIONS - None

MODULE TYPE = Control block definition

NQEA Enqueue Domain Queue Element Area

```

!:refstep.nqea_declaration ----- DFHNQNQ 701 -

!
! Queue Element Area (NQEA)
!
! A single NQEA is used to represent each resource that is currently
! enqueued upon. Tasks waiting to gain control of a resource are
! also represented by an NQEA. A flag indicates whether the NQEA
! represents the resource owner or a task that is waiting for that
! resource.
!
! Another flag indicates the scope (region or sysplex) of the
! enqueue.
!
!

```

! Both owning and waiting NQEAs are chained from the 'NQ' work token

PLCB - PG Program Level Control Block.
 This block contains the PG domain storage for a logical level within a transaction.
 ALLOCATED : as part of link to a logical level. There is no explicit GETMAIN in PG because it resides in automatic storage.
 FREED : on return from the logical level. There is no explicit FREEMAIN in PG because it resides in automatic storage.
 WHERE : automatic storage supplied by the Kernel.
 HOW TO FIND : chained from the PTA for the transaction.
 PCBs are in a singly linked list.

PGWE

The PGWE represents a task which is attempting to acquire the program lock. If the program lock is locked, the PGWE is added to the PGWE chain and the task is suspended.

ALLOCATED : when Program Manager attempts to obtain the program lock.

FREED : when the lock is obtained successfully.

WHERE : obtained from the pgwe subpool.

HOW TO FIND : elements are chained to the PGWE chain anchored in the PG anchor block by pga_pgwe_head.

LLE

A Load List Element represents an instance of a program that has been explicitly loaded.

ALLOCATED : when a program is explicitly loaded

FREED : when a program is explicitly released, or at end of task for programs loaded for the lifetime of the task.

WHERE : obtained from the lle subpool

HOW TO FIND : elements are chained to the system LLE chain anchored in the PG anchor block or the task LLE chain anchored in the Program Transaction Area.

TX_CONTROL_BLOCK !

We need some storage on a Transaction basis, particularly !
for PIAT to hold the piim_token created during create_context !
PI domain also needs a pointer to the current requester !
pipeline instance, and provider pipeline instance. These were !
previously stored in the xm_token. The token only has space !
for two pointers, so we have restructured to hang a !
tx_token_block off the xm_token. The tx_token_block has space !
for all three pointers (and is extensible). All previous uses !
of xm_token in PI domain have been updated to use the !
xm_token as a pointer to the tx_control_block, rather than !
direct to requester and provider pipelines. !

The WSBind file index section is used to group ICMs into
operations. This is pointed to by pi_wsr_first_index_offset.
All WSBind files (other than v1 vendor style WSBind files)
have an index section with at least one entry. Each entry
represents a single WSDL Operation and is associated with
up to 2 ICMs. There will be one ICM for the request message
and an optional ICM for the response message. XML-ONLY and
v2 vendor WSBind files do not have ICMs.
There is a list of index entries in the WSBind file, the
total number of which is given in pi_wsr_entries_in_index.
Each text field in the index is encoded using the CCSID of
the WSBind file. If the WSBind file has a CCSID of '0' then
US EBCDIC is used.

```

The index can have two different types of entry. The first is the normal variety and is used for regular WSDL operations.

				Repeated for each operation
The following field is the local name of the WSDL operation, it is padded to 255 characters with nulls.				
(0)	CHARACTER	255	PI_WSR_OPERATION_NAME	
The following field is the 'wire signature' for the operation. This is used to guess the operation based on the immediate child tags of the SOAP Body tag. It is a set of whitespace separated XML tag local names sorted into alphabetical order. Yes, sorted! The original design called for the index to be sorted in order of signatures, but the implementation@DLA gave us an unsorted index with each signature sorted by the order of the local names. Which is both pointless and expensive at runtime.				
(FF)	CHARACTER	255	PI_WSR_OPERATION_SIG	
The following byte indicates the HTTP method to use. This isn't currently used. In old style WSBind files this byte was initialised to an EBCDIC space character (x'40') and so the second bit is used to represent HTTP POST. Which is the normal value. HTTP GET is not supported.

 The ICM Header section

The index_entry is needed to be able to perform a binary search on the indexes which must be properly sorted. In order to reduce run-time search overheads, an optimized index is created at run time which is in the same sequence but has range limits for each level of the index tree so that it is only necessary to search the part of the subtree which is for the current structure level.

 The ICM data section
 The ICM data section immediately appears after the index section.
 The data records are of varying lengths where the length depends upon the record type. During XML input processing, entries are located via the index. During output processing, entries are scanned sequentially.

type_ 2 record structure

This record represents a fixed length array of primitive or complex types.

Usage notes : On parsing XML, this record will be pointed to by the index entry. A temporary storage will be allocated and controlled by a 'manager'. Each element will create its data and use the 'manager' to store the data to the temporary storage. When <end-element> is reached, the number of elements is compared to the content_ count. The temporary storage is copied to the offset indicated by 'structure' then deleted.
On parsing a commarea/channel, the ICM is read sequentially. The data is obtained using the 'structure' offset.

type_ 3 record structure

A type 3 record represents a variable/unbounded array of stuff. Handling it is similar to handling fixed arrays except that the data is stored/retrieve from a channel. A token consisting of the number of elements and the channel name is stored in the 'parent channel/commarea'. Think of this 'token' as the forwarding address to where the data actually is.

Variable length data can't be stored in a commarea due to a commarea's fixed storage limitation. Channels to the rescue !!!

type_ 4 record structure
This structure terminates the list of elements belonging to a type_ 2 record. In XML generation, this record tells the processor to 'loop back' to the corresponding type_ 2 record while elements are still forthcoming in the input stream.
In XML parsing, it is really not needed.

PRS Partner domain static storage area

CONTROL BLOCK NAME = DFHPRSPS
 DESCRIPTIVE NAME = CICS Partner Static Storage Area

Restricted Materials of IBM

FUNCTION =
 This control block provides the global information for the Partner Resource Manager which must be around for the duration of the CICS execution.
 It contains:
 Partner Resource Manager subpool token
 Partner Resource Manager initialization suspend token
 Partner Resource Manager status
 Addresses of Partner Resource Manager gates

LIFETIME =
 The control block is created during CICS initialization by DFHPRIN1, and exists for as long as the CICS system.

STORAGE CLASS =
 The control block is in subpool DFHAPDAN. The token for this subpool is stored in the CSA optional features list in field CSADSANT.

LOCATION =
 The Partner Static Area is located by field SSZPRM in the static storage address list.

PTE Partner Table Entry

```
=====
CONTROL BLOCK NAME = DFHPTEPS
DESCRIPTIVE NAME   = CICS (PARTNER)
                   Partner Table Entry
```

Restricted Materials of IBM

FUNCTION =

Defines the layouts of entries in the Partner Table, as it exists both in main storage and in the CICS catalog. The Partner Table is owned by the Partner component, also called the Partner Resource Manager, which encapsulates all accesses to the table.

The Partner Table is the CICS implementation of the Side Information Table introduced by SAA CPI-C. (See the SAA CPI Communications Reference for details.) Each entry in the Partner Table contains information needed to initialize a conversation with a partner program on a remote LU, which can thus be specified by the application by specifying only the name of the entry (known as the `sym_dest_name`).

An entry in the Partner Table contains the following pieces of information:

- `partner_LU_name`
indicates the name of the LU where the partner program is located. It can be either a simple network LU name, or `netname`, of one to eight characters, or else a fully qualified name of the form `network.netname` where `network` is a one to eight character network id and `netname` is a one to eight character network LU name.
- `profile_name`
the name of the CICS communication profile. This profile contains a `mode_name` which is used to designate the properties for the session which will be allocated for the conversation.
- `TP_name`
the name of the remote transaction program.

Note that this implementation accesses the `mode_name` of the side information indirectly via the CICS profile.

LIFETIME =

PTEs are created and destroyed only via the PRPT gate of the Partner Resource Manager, module DFHPRPT.

STORAGE CLASS =

Storage for PTEs is drawn from a subpool created by DFHPRRP for this sole purpose.

LOCATION =

PTEs are located via scatter tables managed by DFHTMP.

RDUB Resource Definition Update Block

CONTROL BLOCK NAME = DFHRDUB
 DESCRIPTIVE NAME = CICS Resource definition update Block

Restricted Materials of IBM

SOURCE = DFHRRAB DESIGN part of DFHAPRDR DESIGN

FUNCTION =

DFHRDUB describes the DSECT for the Resource definition Update Block. This block lists deletions that have been made by this unit-of-work from tables. It is chained both from the RRAB and from the RDAB.

When an add or quiesce is performed, the contents of RDUBs for other tasks are examined to see if we would overwrite an entry which may be backed out subsequently.

If one is found the taskid and tranid are returned as though they had been locks found by TMP.

The Resource Definition Update Block is built by Table Builder Services as part of the processing of an Install or Delete. It is added both to a chain from the Resource definition Recovery Anchor Block (RRAB), and from the Resource Definition Anchor Block (RDAB).

The Resource Definition Update Block is deleted when the associated RRAB is deleted.

Consider the following cases :-

Task 1 deletes an entry for terminal ABCD

Task 2 must not be allowed to add another entry for ABCD until Task 1 has committed its unit of work. We used to use TMP to hold a global lock until Task1's syncpoint but this means that we are very limited in the number of install requests that can be processed. So now we hold a list of update requested TCT names in the RDUB which allows us to ensure that full concurrency can occur.

Another case is that if Task 1 adds an entry for WXYZ we must show it to Task 1, but not to Task 2 or 3. For tasks which dont specify SHOW UPDATES on ZGTI this happens because TCTTEDAP,TCTTEDDP,TCSEDAP or TCSEDDP are on. If SHOW_UPDATES(YES) is specified, ZGTI will INQUIRE_LOCK find out if this entry is soft-locked by another task and if so, it will not be returned to the requestor.

LIFETIME =

Created when the first Table Builder call that causes a delete is processed.

Deleted at end of a UOW.

STORAGE CLASS =

Above 16M line.

LOCATION =

Chained from the RRAB and the RDAB.

! All classes in &rm..domain inherit from the &rm..Object Class

RMUW Recovery Manager Unit Of Work Instance

```

!:refstep.muw_class_declaration ----- DFHRMUW 2202 -
!
!
! The rmuw class is the Recovery Manager Unit of Work.
!
! It may only be used by Recovery Manager. It is used to implement
! the RMUW gate.
!

```

! rmuw inherits from rml0 and, via simulated inheritance, from rmpo
! and rmlg.

RRAB Resource Definition Recovery definitions

CONTROL BLOCK NAME = DFHRRAB
 DESCRIPTIVE NAME = CICS Resource definition Recovery Anchor

Restricted Materials of IBM

FUNCTION =

DFHRRAB describes the DSECT for the Resource definition Recovery Anchor Block. This block serves as an anchor for the set of Resource Recovery Anchor Blocks with Names (RABNs) and also two action-lists containing Resource Definition Action Lists (RDALs). These action-lists and RABNs describe the work undertaken during an Install

process for communication resources (terminals, typeterms, connections and sessions). It also contains a flag which indicates whether Terminal Object Resolution needs to be driven at the end of the UOW. There is only one RRAB for each UOW, fresh requests reuse an existing RRAB.

The RRAB also points to a list of Resource definition update blocks which list the definitions that have been locked during this UOW. This list is checked before an add to ensure that we are not attempting to add a defn which another UOW is attempting to delete.

The Resource definition Recovery Anchor Block is built by Table Builder Services as part of the processing of an Install (or Delete) request. It is also built by Terminal Object Resolution during Install or Delete Requests. It is used as the Recovery Manager Client token for 'APRD'.

The Resource definition Recovery Anchor Block is deleted when all the action-lists and RABN chain are empty the TOR flag is reset, the RDUB chain is empty, eith by TBS, TOR or DFHAPRD. At the same time Recovery Manager token is reset to zero.

LIFETIME =

Created when the first Table Builder or Terminal Object Resolution request that is recoverable is processed, or a lock is obtained.

Deleted at end of transaction.

STORAGE CLASS =

Above 16M line.

LOCATION =

Issuing an INQUIRE_WORK_TOKEN to the recovery manager with Client Name 'APRD' returns the address of the Resource Recovery Anchor Block.

CONTROL BLOCK NAME = DFHRABN
 DESCRIPTIVE NAME = CICS Resource Recovery Atom Block Name

Restricted Materials of IBM

SOURCE = DFHRRAB DESIGN part of DFHAPRDR DESIGN
 FUNCTION =

DFHRABN describes the DSECT for the Resource Recovery Atom Block Name. This block serves as an anchor for an action-list. It defines the set of actions that are performed for a named 'atom' of resource recovery for either a Pipe-Line or a Connection definition. It retains a flag that describes the back-out of the atom in case further actions for that atom arrive, so that they can be prevented.

The Resource Recovery Atom Block Name is built by Table Builder Services as part of the processing of an Install request. It is added to a chain from the Resource definition Recovery Anchor Block (RRAB), and pointed to as the active RABN.

The Resource Recovery Anchor Block is deleted when an END_ATOMS call is made or the UOW ends. The action-list is transferred to the delayed-action-list on the RRAB.

LIFETIME =
 Created when the first Table Builder or Terminal Object Resolution request that is recoverable for an atom is processed.
 Deleted at end of a UOW.

! :refstep.shrt_types ----- DFHSHRTP 215 -
!
! The following defines the various types used by this class.
!
! -----
! :refstep.shrt_routing_data_type ----- DFHSHRTP 228 -
!
! Routing data is a public type which is passed on most of the calls
! to &shrt.class. IT MUST BE KEPT IN STEP WITH THE DFHDYPDS
! COMMAREA

```

```

!
! Since PQ81378 shipped, this structure is of a fixed size (1520

! there is some space for the DFHDYPDS structure to grow, but
! eventually that might run out and result in a compilation error.

PPA - Page Pool control Area
 There is a PPA for each DSA (ie there are 8). The PPAs are chained from the SMA. In addition there is an array in the SMA which allows each PPA to be addressed directly.
 Each SCA contains the address of the PPA from which that subpool

is allocated.

Other blocks chained from the PPA are:

PPA_ NEXT - address of next PPA.

PPA_ PREV - address of previous PPA.

PPA_ PPX_FIRST - address of the first PPX for this DSA.

PPA_ PPX_LAST - address of the last PPX for this DSA.

GPPA - Page Pool control Area

There is a GPPA for each GDSA (ie there are 4). The GPPAs are chained from the SMA. In addition there is an array in the SMA which allows each GPPA to be addressed directly.

Each GSCA contains the address of the GPPA from which that subpool is allocated.

Other blocks chained from the GPPA are:

GPPA_ NEXT - address of next GPPA.

GPPA_ PREV - address of previous GPPA.

GPPA_ GPPX_FIRST - address of the first GPPX for this GDSA.

GPPA_ GPPX_LAST - address of the last GPPX for this GDSA.

TUNING FIELDS

The following fields can be changed after CICS initialisation to influence the behaviour of the MMSM mechanism:

smva_timeout_interval - fullword wait timeout (secs)
 (default=60 secs) - can be changed at any time
 - (takes effect on next wait)

smva_storage_threshold_size - fullword threshold size
 (default=40M) - can be changed at any time
 - (takes effect on next rqst)

smva_storage_cushion_size - fullword max cushion size
 (default=20M) - takes effect on next rqst...
 ..when cushion not yet built,
 or is breached

Len	Type	value	Name	Description
4	DECIMAL	7	SOCK#SO_EXCLWRITE	Control Stream Write Serialization SetlbnSockOpt option to toggle system supplied serialization on TCP stream socket writes. A socket's initial value is on and this may be turned off if an application provides its own serialization or never writes to the same TCP socket from more than one thread at a time. Accepted sockets inherit their initial setting from the listening socket's value. This option does not apply to UPD sockets. A four byte value of 0 turns the option off and any non-zero four byte value turns it on.

4	DECIMAL	439 :c 4.JRBRLMRANGENOTAVAILABLE		
				All or part of requested range is held by another user
4	DECIMAL	440 :c 4.JRBRLMDEADLOCKDETECTED		
				Waiting on the specified range causes a deadlock

Table 689. (continued)

Len	Type	value	Name	Description
4	DECIMAL	441	JRBRLMSIGNALPOSTED	While the process was waiting for a byte-range lock, a signal was posted
4	DECIMAL	443	JRPTSIGACTIONFAILED	Read sigaction failed
4	DECIMAL	444 :c 4.JRPTSIGPROC	MASKFAILED	
				Ptrace sigprocmask failed
4	DECIMAL	445	JRBRLMBADL_LEN	A byte-range lock request specified an incorrect l_len
4	DECIMAL	447 :c 4.JRREADUSERSTORAGE	FAILED	
				A read error occurred on the user data area passed to the service
4	DECIMAL	448 :c 4.JRWRITEUSERSTORAGE	FAILED	
				A write error occurred on the user data area passed to the service
4	DECIMAL	450	JRBRLMALREADYWAITING	Includes a range already being waited on
4	DECIMAL	451	JRBRLMPROMOTEPENDING	Range is waiting to promote the requested range
4	DECIMAL	452	JRPTYNOPTYRSTORAGE	There is not enough storage in the kernel address space
4	DECIMAL	453	JRBRLMPROCESSBROKEN	Process has been marked broken for byte locking
4	DECIMAL	454	JRPTYCONNECTIONINOPERATIVE	The pseudo-TTY connection is inoperative

4	DECIMAL	546	JRNOSOCKET	The requested operation cannot be performed on a socket file descriptor
4	DECIMAL	547	JRMUSTBESOCKET	The requested operation is only valid on a socket file descriptor
4	DECIMAL	548	JRTARGETENDING	The target process is ending
4	DECIMAL	549	JRQUIESCETYPEINVALID	The quiescetype specified by the caller is invalid
4	DECIMAL	550	JRQUIESCEINPROGRESS	A thread in the process has already requested quiescing of all threads
4	DECIMAL	551	JRLASTTHREAD	The last pthread is exiting when the PTFAILIFLASTTHREAD option is specified
4	DECIMAL	552	JRDOMAINNOTSUPPORTED	The requested domain is not supported
4	DECIMAL	553	JRNETWORK	Vfs operation network is not supported by this file system
4	DECIMAL	554	JROUTOFVDECELLS	All Vde cells have been allocated
4	DECIMAL	555	JRTOKENMAX	The maximum number of Vnode tokens have been allocated for this process
4	DECIMAL	556	JRVTOKENFREED	The Vnode token has already been released
4	DECIMAL	557	JRWRONGPID	The process does not own this Vde
4	DECIMAL	558	JRSTALEVNODETOKEN	The Vnode token is stale

Table 689. (continued)

Len	Type	value	Name	Description
4	DECIMAL	559	JRINVALIDVNODE	The Vnode token does not point to a Vde
4	DECIMAL	560 :c 4.JRNOTREGISTEREDSERVER		The process is not a registered server
4	DECIMAL	561	JRINVALIDREGTYPE	The server type supplied in NRegSType is not valid
4	DECIMAL	562	JRNAMETOOLONG	The name supplied is longer than the allowed maximum
4	DECIMAL	563	JRALREADYREGISTERED	The process is already registered as a server
4	DECIMAL	564	JRINVALIDNREG	An incorrect NReg parameter list was passed
4	DECIMAL	565	JRNOLEADINGSLASH	The pathname does not begin with /
4	DECIMAL	566	JRSTALEVFSTOK	The VFS token is stale
4	DECIMAL	567	JRSMALLATTR	The Attr length parameter was too small
4	DECIMAL	568	JRSMALLMNTE	The Mnte length parameter was too small
4	DECIMAL	569	JRRWNOTREGFILE	The rdwr call is valid only on a regular file
4	DECIMAL	576	JRDUBSETTING	The dub setting value specified on the BPX1SDD service call is not correct
4	DECIMAL	577	JRINVALIDATT	The Attribute structure passed to BPX1CHR or BPX1FCR was not valid
4	DECIMAL	578	JRINVALIDOSS	The OSS is not valid

Table 689. (continued)

Len	Type	value	Name	Description
4	DECIMAL	579	JRSMALLFSATTR	The FSAttr length parameter was too small
4	DECIMAL	580	JRAPFAUTHCHAN	Local process exec tried to change APF authorization
4	DECIMAL	581	JRIDCHANGE	A local process exec tried to change the UID / GID
4	DECIMAL	582	JROTHERPROCESSES	Exec was attempted that would terminate the other processes in the address space
4	DECIMAL	583	JRPTREQUESTDENIED	The trace request is not allowed for the current debugged program environment
4	DECIMAL	584	JRINVALIDFUIO	An incorrect FUio area was passed
4	DECIMAL	585	JRTOKDIR	The VNODE token specifies a directory
4	DECIMAL	586	JRTOKNOTDIR	The VNODE token does not specify a directory
4	DECIMAL	587	JRINVALIDATTR	The supplied Attribute structure was not valid
4	DECIMAL	588	JRMAXTASKS	The number of tasks in the process is greater than the maximum allowable limit
4	DECIMAL	589	JRMAXSOCKETS	The number of active sockets is equal to the value specified on the MAXSOCKETS parmlib statement

Table 689. (continued)

Len	Type	value	Name	Description
4	DECIMAL	590	JROUTOFLATCHES	All latches in the socket latch set pool are assigned to Snodes
4	DECIMAL	591	JROUTOFSOCKETCELLS	The system was unable to obtain a cell from the sockets cell pool
4	DECIMAL	592	JRNOTDIR	The name does not specify a directory
4	DECIMAL	593 :c 4.JROUTOFSOCKETSNODECELLS		
				The system was unable to obtain a cell from the sockets node cell pool
4	DECIMAL	594	JREXTERNALLINK	An external symbolic link was found but is not supported
4	DECIMAL	595	JRCKETNOTFOUND	Requested socket was not found, or is not active
4	DECIMAL	596	JRCKETNAME	A Bind request was received for a socket that was previously named
4	DECIMAL	597 :c 4.JRINVALIDCALLINGSTATE		
				The caller is not supervisor state and key 0
4	DECIMAL	598	JRPIDSCALLER	Pid specifies the PID for the calling process
4	DECIMAL	599	JRPIDNOLATCH	Unable to obtain latch for PID
4	DECIMAL	600 :c 4.JROUTOFSOCKETDATACELLS		
				The system was unable to obtain a cell from the sockets data buffer cell pool

Table 689. (continued)

Len	Type	value	Name	Description
4	DECIMAL	601	JRSOCANWKBITO	Duplicate NETWORK parmlib statements exist
4	DECIMAL	602	JRISGLCRTFAILE	Latch set service ISGLCRT failed
4	DECIMAL	603	JRLISTENNOTAC	CEPDED syscall was issued for a socket that has not been bound, for a socket that is already a server, or for a socket that is already connected
4	DECIMAL	604	JRSOCKETCLOSE	An attempt was made to read, write or connect to a socket that is closed
4	DECIMAL	605	JRTOOMANYTHD	An attempt was made to create another thread but the process limit for pthreads has already been reached
4	DECIMAL	606 :c 4.	JRSOCKETCALL	PARMERROR
				A socket syscall contains incorrect parameters
4	DECIMAL	607	JRRECOVERY	The recovery VFS operation is not supported
4	DECIMAL	608	JRINVALIDROUT	INE incorrect routine address was passed
4	DECIMAL	609	JRROUTINEERR	OR An error occurred while the user-provided routine was in control
4	DECIMAL	610	JRNOLISTS	A Select request was issued without a read, write or exception list

Table 689. (continued)

Len	Type	value	Name	Description
4	DECIMAL	611	JRLISTTOOLONG	The read, write or exception list is too long
4	DECIMAL	612	JRLISTTOOSHOR	The read, write or exception list is too short to contain the specified number of file descriptors and message queue identifiers
4	DECIMAL	613	JRMSOUTOFRAN	The value specified for microseconds is outside the allowable range
4	DECIMAL	614	JRSECOUTOFRAN	The value specified for seconds is outside the allowable range
4	DECIMAL	615	JRNOFDS	The read, write or exception list did not contain any file descriptors, or the Number_FDs parameter was not greater than 0
4	DECIMAL	616	JRPTQUIESCEFA	Port quiesce failed
4	DECIMAL	617 :c 4.JRINCORRECT	SOCKETTYPE	The socket type is incorrect for the request
4	DECIMAL	618	JRWOLDBLOCK	The O_NONBLOCK flag is set and this request would block
4	DECIMAL	619 :c 4.JREXCEEDSBAC	KLOGCOUNT	This connect request exceeds the connect backlog count that was specified on the Listen request

Table 689. (continued)

4	DECIMAL	620	JRLEVELNOTSUPP	The value specified for Level is not supported by the physical file system
4	DECIMAL	621	JRSETNOTSUPP	The UNIX Domain Socket File System does not support the setting of socket options
4	DECIMAL	622	JRINVOOPT	The Option name specified is not valid
4	DECIMAL	623	JRBUFF	The buffer for return information is too small
4	DECIMAL	624	JROPTNOTSUPP	The Option name specified is not supported
4	DECIMAL	625	JRPTASYNCTHREAD	The ptrace request is not allowed because the target thread is asynchronous
4	DECIMAL	626	JR SOCKETNOTCONN	The requested socket is not connected
4	DECIMAL	627	JRPTYNOPTYSTORAGE	There is insufficient storage in the kernel address space
4	DECIMAL	628	JRUNKNOWNKPRC	Kernpost returned an invalid return code
4	DECIMAL	629	JR SOCKRDWRSIGINT	Signal interrupt during socket read or write processing
4	DECIMAL	630	JR SOCKBUFMAX	There is insufficient storage for the socket message
4	DECIMAL	631	JRINVALIDMSGH	The socket message header is not correct

Table 689. (continued)

Len	Type	value	Name	Description
4	DECIMAL	632	JRSOCKNONAME	The request requires a socket name structure
4	DECIMAL	633 :c 4.JRINVALIDSERVERNAMELEN		The server name length supplied in NRegSNameLen is too long or negative
4	DECIMAL	634	JRNOOBDATAAVAILABLE	The MSG_OOB flag is set but no OOB data is available or OOB data is inline
4	DECIMAL	635 :c 4.JRINCORRECTTYPEFORFLAG		MSG_OOB flag is set but socket is not a stream socket
4	DECIMAL	636	JRSOCKSHUTDOWN	Socket has been shutdown
4	DECIMAL	637	JRMSGHINVALID	msg_controllen or a cmsg_len has an incorrect length
4	DECIMAL	638	JRNOADDRSPACE	The caller's address space name cannot be determined
4	DECIMAL	640	JRNONAME	The name length is zero
4	DECIMAL	641	JRLISTLENBAD	The length of one or all of the input bit lists is not a multiple of four or is not more than 256 bytes
4	DECIMAL	642	JRINVUSEROP	The value specified for the User Option was not 0 or 1
4	DECIMAL	643 :c 4.JRSOCKETPROTOCOLINVALID

4	DECIMAL	649	JRLISTENNOTDONE	The socket is not ready to accept connections
4	DECIMAL	650	JRSTEPLIBDSORGABAD	Unpartitioned data set was specified in the STEPLIB concatenation

Table 689. (continued)

Len	Type	value	Name	Description
4	DECIMAL	651	JRSTEPLIBTOOBIG	More than 255 data sets were specified in the STEPLIB concatenation
4	DECIMAL	652	JRLISTENNOTSTREAM	Listen syscall was issued for a socket that is not a stream socket. Listen is only valid for stream sockets
4	DECIMAL	653	JRLISTENALREADYDONE	Request has already been completed
4	DECIMAL	654	JRSTLACTIONINVALID	The value specified for the action parameter is not valid
4	DECIMAL	655	JRSTLTASKSINVALID	The value specified for the task limit is not valid
4	DECIMAL	656	JRSTLTHREADSINVALID	The value specified for the thread limit is not valid
4	DECIMAL	657	JRTCPERROR	Tcp returned an error identified by the return code
4	DECIMAL	658	JRNOSPACE	Pthread_create failed, due to unavailable user address space storage
4	DECIMAL	659	JRMAXTCPPATHIDS	The maximum number of Tcp/Ip path IDs has been exceeded
4	DECIMAL	660	JRPTNOTXTDEVENT	The ptrace request is not allowed because the target process is not stopped for an extended event

Table 689. (continued)

Len	Type	value	Name	Description
4	DECIMAL	661	JRPTTOOMANYEVENTS	The TRACE PT_EVENTS request attempted to add more events than the specified maximum
4	DECIMAL	662	JRTCPNOTACTIVE	No AF_INET socket provider is active
4	DECIMAL	663	JRMAXINETSOCKETS	The number of active INET sockets is equal to the value specified on the MAXSOCKETS parmlib statement
4	DECIMAL	664	JRECBERROR	The last ECB pointer in the list of ECB pointers does not have the high order bit (X'80000000') set on to indicate that it is the last ECB pointer in the list
4	DECIMAL	665	JRECBLISTBAD	An error occurred accessing the list of pointers to ECBs on a call to the MVSpauseInit service
4	DECIMAL	666	JRECBSTATEBAD	An error occurred accessing one or more of the input ECBs on a call to the MVSpauseInit or MVSpause service
4	DECIMAL	667	JRECBLISTNOTSET	The MVSpause service was called but the MVSpauseInit service was never called to prepare for an MVSpause

Table 689. (continued)

Len	Type	value	Name	Description
4	DECIMAL	668 :c 4.JR SOCKETTYPE	NOTSUPPORTED	
				The requested socket type is not supported
4	DECIMAL	669	JRECBWAITBIT	The wait bit (the high order bit) was on in the specified event control block (ECB)
4	DECIMAL	670	JRINVALIDVLOCK	The supplied VLock structure was not valid
4	DECIMAL	671	JRINVALIDSERVERPID	The supplied VLockServerPID value was not valid
4	DECIMAL	672	JRNOLOCKERTOKEN	No Locker token was specified in the Vlock structure
4	DECIMAL	673	JRBRLMOBJECTMISSING	Object was specified in the Vlock structure
4	DECIMAL	674	JRBRLMWRONGLINE	The byte-range lock manager does not support the request
4	DECIMAL	675 :c 4.JRBRLMLOCKER	NOTREGISTERED	
				The Locker token specified in the Vlock structure is not registered
4	DECIMAL	676	JRMULTIPROC	The specified function is not supported in an address space running multiple processes
4	DECIMAL	677	JRTASKACEE	The specified function is not supported when a task level ACEE is active for the calling task
4	DECIMAL	678	JRUSERNAMELENGTH	ERROR name length value was incorrect.

Table 689. (continued)

Len	Type	value	Name	Description
4	DECIMAL	679	JRPASSWORDLENGTHERROR	The password length value was incorrect.
4	DECIMAL	680 :c 4.JRNEWPASSWORDLENGTHERROR		The password length value was incorrect.
4	DECIMAL	681	JRMIXEDSECURITYENV	The specified function is not supported after a setuid has changed the security environment of the caller
4	DECIMAL	682	JRQUIESCETERM	A pthread_quiesce(term) is already in progress on another thread in the caller's process.
4	DECIMAL	683	JRQUIESCEFORCE	A pthread_quiesce(force) is already in progress on another thread in the caller's process.
4	DECIMAL	684	JRQUIESCFREEZE	A pthread_quiesce(freeze) is already in progress on another thread in the caller's process.
4	DECIMAL	685	JRQUIESCFREEZEFORCE	A pthread_quiesce(freeze_force) is already in progress on another thread in the caller's process.
4	DECIMAL	686	JRTSO	The specified function is not supported in a TSO space running multiple processes

Table 689. (continued)

Len	Type	value	Name	Description
4	DECIMAL	687	JRENVDIRTY	The specified function is not supported in an address space where a load was done that is not program controlled.
4	DECIMAL	770	JRIPCBADID	The ID is not valid or has been removed from the system
4	DECIMAL	771	JRIPC DENIED	Access was denied because the caller does not have the correct permission
4	DECIMAL	772	JRIPC EXISTS	The caller issued CREATE, EXCL and the key was already defined to InterProcess Communications
4	DECIMAL	773	JRIPC MAXIDS	The number of IDs exceeds the system limit and the create fails
4	DECIMAL	774	JRIPC NOEXIST	The caller tried to locate a member for the key specified but it does not exist
4	DECIMAL	775	JRIPC RETRY	NOWAIT was specified but the operation could not be performed immediately
4	DECIMAL	776	JRIPC SIGNED	An IPC wait was interrupted by a signal
4	DECIMAL	777	JRIPC BADFLAGS	Extraneous bits were set in the flags word parameter or in the mode flag bit field.
4	DECIMAL	778	JRMSQBADTYPE	Message type must be greater than zero

Table 689. (continued)

Len	Type	value	Name	Description
4	DECIMAL	779	JRMSQBADSIZ	The message length exceeds the system limit or is less than zero.
4	DECIMAL	780	JRMSQNOMSG	No message of the type requested was found
4	DECIMAL	781	JRMSQ2BIG	The message to receive was too large for the buffer and MSG_NOERROR was not specified
4	DECIMAL	782	JRSEMA4BADADJ	The value specified would exceed the system limit for semadj
4	DECIMAL	783	JRSEMA4BADNOBS	Number of semaphore operation exceeds the system limit
4	DECIMAL	784	JRSEMA4BADNSEM	Semaphore ID already exists for the KEY, but the number of semaphores is less than requested
4	DECIMAL	785	JRTYPENOTPID	A msgrcv or msgsnd did not have its process ID as type
4	DECIMAL	786	JRSEMA4BADSEM	The semaphore number is invalid
4	DECIMAL	787	JRSEMA4BADVAL	The value specified would exceed the system limit
4	DECIMAL	788	JRSEMA4BIGNSEM	The number of semaphores exceeds the system maximum

Table 689. (continued)

Len	Type	value	Name	Description
4	DECIMAL	789	JRSEMA4ZERONS	EMSN number of semaphores specified was zero and the semaphore does not exist
4	DECIMAL	790	JRSHMBADSIZE	The shared memory segment size is incorrect or outside the system defined range of valid segment sizes.
4	DECIMAL	791	JRSHMMAXATTACH	EMSN The number of shared memory attaches for the current process exceeds the system defined maximum.
4	DECIMAL	792	JRIPCREMOVED	During a wait, the IPC member ID was removed from the system
4	DECIMAL	793	JRMSQQBYTES	Not permitted to increase message qbytes or attempt by superuser to set message qbytes exceeds system limit.
4	DECIMAL	794	JRBADPERFGROUP	The specified priority or nice value represents a performance group that could not be used.
4	DECIMAL	795	JRBADSERVCLASS	The specified priority or nice value represents a service class that could not be used.

4	DECIMAL	1124	JRSRX	Vnode operation SR_CSM is not supported by this file system
4	DECIMAL	1125	JRWRONGKEY	An error occurred during process signal initialization
4	DECIMAL	1126	JRPTBADBLKOFF	SETPtBRIInfo entry has an offset that either points to within the PtBRIInfo block or past the end of the area provided by the user.
4	DECIMAL	1127	JRSETTOOSMAL	The OldCount value supplied was too small to accommodate the number of built entries
4	DECIMAL	1128	JRINVALIDRANG	The NewCount or OldCount was greater than the maximum number of signals allowed
4	DECIMAL	1129	JRINVALIDOPTIO	The option specified is not supported
4	DECIMAL	1130	JRINVALIDBINSE	The requested operation violates binary semaphore rules by specifying UNDO option.

Table 689. (continued)

Len	Type	value	Name	Description
4	DECIMAL	1131 :c 4.JRINVALIDBINSEMNUMSEMOPS		
				The requested operation violates binary semaphore rules by specifying more than one operation per semop.
4	DECIMAL	1132 :c 4.JRINVALIDBINSEMNOTBINOP		
				The requested operation violates binary semaphore rules by specifying too large a semop or semctl value for the semval.
4	DECIMAL	1133	JRINVALIDBINSEMMSG	A request matched an existing key or ID but the __IPC_BINSEM flag operand does not match.
4	DECIMAL	1134 :c 4.JRINVALIDBINSEMSETALL		
				A requested semctl SETALL is being done after a semop for a __IPC_BINSEM semaphore set.
4	DECIMAL	1135	JRNEGATIVELEN	A negative length was specified for either the header length or trailer length on the SEND_FILESyscall.

Table 689. (continued)

Len	Type	value	Name	Description
4	DECIMAL	1136	JRINVALIDOFFSET	The offset parameter specified on the SEND_FILE syscall is not correct. It is either a negative number or it specifies an offset past the end of the file.
4	DECIMAL	1137	JRTOOMANYBYTES	The FILE_BYTES parameter specified on the SEND_FILE syscall is larger than the file size.
4	DECIMAL	1138	JRSOCKETNONBLOCK	Socket descriptor specified on the SEND_FILE syscall is a non-blocking socket. SEND_FILE requires a blocking socket.
4	DECIMAL	1139 :c	JRLOCALSPAWNNOTALLOWED	
				A request to spawn a local child process could not be completed.
4	DECIMAL	1140	JRINVALIDSFPLLEN	The SFPL_LENGTH parameter specified on the SEND_FILE syscall is not correct.
4	DECIMAL	1141	JRPTINVFPWRITE	The value specified for writing into the Floating Point Control Register is not valid.
4	DECIMAL	1142	JRMAXAIOCBES	The maximum number of AIOCBs with user defined ECBs was exceeded on the requested function.

4	DECIMAL	1143	JRCERTALREADYDEFINED	The LockToken being registered/deregistered is already defined for another user.
4	DECIMAL	1144	JRCERTDOESNOTMEETREQ	The LockToken being registered/deregistered does not meet RACF requirements.
4	DECIMAL	1145	JRLOCKFCNCODE	The value specified for the LockFcnCode parameter for the BPX1SLK service is not valid.
4	DECIMAL	1146	JRLOCKREQTYPE	The value specified for the LockReqType parameter for the BPX1SLK service is not valid.
4	DECIMAL	1147	JRLOCKTYPE	The value specified for the LockType parameter for the BPX1SLK service is not valid.
4	DECIMAL	1148	JRLOCKADDR	The address specified for the LockAddr parameter for the BPX1SLK service is not a valid shared memory address.
4	DECIMAL	1149	JRLOCKTOKEN	The value specified for the LockToken parameter for the BPX1SLK service is not valid.

Table 689. (continued)

Len	Type	value	Name	Description
4	DECIMAL	1150	JRLOCKEDALREADY	The lock represented by the specified lock token is already in a held state.
4	DECIMAL	1151	JRLOCKINUSE	The lock represented by the specified lock token is in use for a condition wait.
4	DECIMAL	1152	JRLOCKSHMACC	The caller does not have read/write access to the shared memory in which the specified lock resides.
4	DECIMAL	1153	JRLOCKNOTOWNED	The calling thread does not own the lock represented by the specified lock token.
4	DECIMAL	1154	JRLOCKMAXCNTSYS	The maximum number of shared memory locks for the system have been initialized.
4	DECIMAL	1155	JRLOCKMAXCNTTHR	The maximum number of shared memory locks for the calling thread have been obtained.
4	DECIMAL	1156	JRLOCKMAXCNTRECURSE	The maximum number of recursive lock obtains for a given lock has been reached.
4	DECIMAL	1157	JRLOCKSHMREMOVED	The specified lock cannot be obtained because it is in shared memory that has been removed.

Table 689. (continued)

4	DECIMAL	1203	JRINRECOVERY	The filesystem requested to be moved is in recovery.
4	DECIMAL	1204	JRNOMOUNTPOINTNOTFOUND	The mount point requested to be moved can not be found.
4	DECIMAL	1205	JRBLACKHOLE	Filesystem is unowned.
4	DECIMAL	1206	JRNOPLACE	This filesystem can not be placed.
4	DECIMAL	1207	JRNOSYSTEMFOUND	There is no system with that name.
4	DECIMAL	1208 :c 4.JRSYSPLEXDATA	ASYNCLOST	
				The I/O request is rejected because the file integrity was lost due to the failure of the file system server.
4	DECIMAL	1209	JRTDGONE	The socket Transport Driver has terminated and restarted.
4	DECIMAL	1210	JRNODEVICEFOUND	There is no longer any device with that device number.
4	DECIMAL	1212	JRNOTMOVEABLE	This filesystem can not be moved.
4	DECIMAL	1213	JRNOLONGERSEVER	The server detected it is no longer the server.
4	DECIMAL	1214	JRLOCKCTL	The lockctl service vnode operation is not supported

Table 689. (continued)

Len	Type	value	Name	Description
4	DECIMAL	1215	JRCPLNOTAUTH	__cpl service call failed permission check for BPX.CF facility class profile.
4	DECIMAL	1216	JRCPLINVFCNCODE	__cpl service call failed because the supplied function code is not valid.
4	DECIMAL	1217	JRCPLINVBUFFLEN	__cpl service call failed because the supplied buffer length is not valid.
4	DECIMAL	1218	JRCPLBUFFTOOSMALL	__cpl service call failed because the supplied buffer was too small for the data to be returned.
4	DECIMAL	1219	JRSYSLEXBLACKHOLE	Request is rejected because access to the owning file system was lost. This is a temporary condition.
4	DECIMAL	1220	JRSYSLEXRECOVERY	System recovery timeout. One or multiple file systems may not have been recovered, and are thus black holes.
4	DECIMAL	1221	JRCPLINVSTRUCTYPE	__cpl service call failed because one of the supplied structure entries is defined with an incorrect type.

Table 689. (continued)

Len	Type	value	Name	Description
4	DECIMAL	1222	JRCPLCFNOTFOUND	_cpl service call failed because a Coupling Facility at the appropriate level (level 8 or greater) could not be found in the sysplex where this __cpl callable service routine is running.
4	DECIMAL	1223 :c 4.JRSHRLIBNOTAUTHORIZED		
				The chattr function can not be performed to change the shared library attribute because the caller is not permitted to the BPX.FILEATTR.SHARELIB facility class.
4	DECIMAL	1224 :c 4.JROUTOFAUTOMOUNTENTRIES		
				The system is unable to obtain an entry in the file system automount table in the OMVS couple data set
4	DECIMAL	1225	JRNEEDABSPATH	An absolute path name must be used when performing a mount command from a userid that has changed roots.
4	DECIMAL	1226	JRMAPBADFUNCTION	The _Map function or sub-function code was not valid.
4	DECIMAL	1227	JRNOTAUTHMAP	_map_init call failed permission check for BPX.MAP facility class profile.

Table 689. (continued)

Len	Type	value	Name	Description
4	DECIMAL	1228	JRBADBLKADDR	__map service was passed a bad block address. The block address specified was not within the map area, or was not on a block boundary.
4	DECIMAL	1229	JRMAPALREADYACTIVE	__map init requested for a process that already had an __map environment active.
4	DECIMAL	1230	JRMAPOUTOFBLOCKS	__map service, processing for a new block or connect request, was asked to select a map block that was not currently in use, but none was available as all blocks were currently in use.
4	DECIMAL	1231	JRMAPNOTACTIVE	__map service was requested but either no map environment is active or the current map environment is being shut down.
4	DECIMAL	1232	JRMAPTOKENNOTFOUND	__map service data block token not defined.
4	DECIMAL	1233	JRMAPBLOCKNOTINUSE	__map service disconnect is issued for a map block that is not currently in use
4	DECIMAL	1234	JRMAPBLOCKINUSE	__map service new block or connect specified a map block that is currently in use.

Table 689. (continued)

Len	Type	value	Name	Description
4	DECIMAL	1235 :c 4.JRMAPBLOCKFREEPENDING		
				__map service connect request specified a data block that is currently being freed.
4	DECIMAL	1236	JRMAPBADSTORAGE	The parameter list either could not be accessed or was in read only storage and could not be updated.
4	DECIMAL	1237	JRMAPUNEXPECTEDERR	An error occurred in an __map service
4	DECIMAL	1238 :c 4.JRRESERVEDVALUEINVALID		
				A reserved field contained a value other than zero
4	DECIMAL	1239	JRMAPARRAYCOUNTERR	The array count was outside the valid values
4	DECIMAL	1240	JRNOTCLIENT	This system is not a client of the requested filesystem
4	DECIMAL	1241	JRJOINTMSGSENT	The joint LFS/PFS message requested for osi_xmsg to send has already been sent
4	DECIMAL	1242	JRNOWILDAUTOMOVE	The automove setting can not be changed while moving a collection of filesystems.
4	DECIMAL	1243	JRINVALIDFSP	The file does not have a valid FSP.
4	DECIMAL	1244	JRNOROOT	There is no system root mounted.

Table 689. (continued)

Len	Type	value	Name	Description
4	DECIMAL	1245	JRMOVEINPROG	PFS filesystem is in the process of being moved to a different server.
4	DECIMAL	1246	JRBADBODYLEN	THE MNTE2 does not have a correct body length coded into the body length field in the MNTE header.
4	DECIMAL	1247	JRXCFNOSTOR	QZO buffer shortage for writing data through XCF
4	DECIMAL	1248	JRPFSFAILED	A PFS returned a RetVal of -1 with an errno and errnojrof zero.
4	DECIMAL	1249	JRPTINVGPRH	UMBER trace call has an incorrect general register number
4	DECIMAL	1250	JRFILETOOLAR	File size exceeded the value that can be held in object of type off_t.
4	DECIMAL	1251	JRCANTEXPCL	IENT export of a sysplex client file system is not allowed.
4	DECIMAL	1252	JRISEXPORTED	Moving a file system that is exported is not allowed. Remounting an exported filesystem to a mode where it would then be exported on a served client is not allowed.
4	DECIMAL	1253	JRFSQUIESCED	MTA file system operation was rejected because the owning file system is quiesced and the operation cannot be delayed. order to prevent a latch deadlock.

Table 689. (continued)

Len	Type	value	Name	Description
4	DECIMAL	1254	JRMPTFSQUIESCE	ED mount request was rejected because a file system in the mount path is quiesced.
4	DECIMAL	1255	JRMMAPSUSPEND	ED memory map request was rejected because the memory map function is suspended
4	DECIMAL	1256	JRSFSDIAGACT	A Shared-FS diagnostic operation is already in progress.
4	DECIMAL	1257	JRINVALIDFILETAG	The file tag supplied is invalid
4	DECIMAL	1258	JRDOMPARMS	The CCADOMToken and CCAMsgIdList are mutually exclusive, both were specified.
4	DECIMAL	1259	JRTOOMANYMSGIDS	The maximum number of messages that can be deleted in one operation is 60, more than 60 were specified.
4	DECIMAL	1260	JRAUTHROUTINGCODE	Authorized caller (not UID=0) specified a message routing code reserved for authorized caller.
4	DECIMAL	1261	JRROUTCODE	An invalid message routing code was specified.
4	DECIMAL	1262	JRDESCCODE	An invalid message descriptor code was specified.

Table 689. (continued)

Len	Type	value	Name	Description
4	DECIMAL	1263	JRROUTINGLIST	All or part of the list of routing codes pointed to by CCARoutCdeList is not addressable by the caller.
4	DECIMAL	1264	JRDESCLIST	All or part of the list of descriptor codes pointed to by CCADescList is not addressable by the caller.
4	DECIMAL	1265	JRMSGIDLIST	All or part of the list of message ids to be deleted pointed to by CCAMsgIdList is not addressable by the caller.
4	DECIMAL	1266	JRTOOMANYROUTINGCODES	The maximum number of routing codes that can be specified is 128 but was exceeded.
4	DECIMAL	1267	JRTOOMANYDESCRIPTORCODES	The maximum number of descriptor codes that can be specified is 6 but was exceeded.
4	DECIMAL	1268	JRMSGID	All or part of the location specified by the caller for the returned message id (CCAMsgIDPtr) is not addressable by the caller.
4	DECIMAL	1269	JRSYSPLEXENQ	The ENQ for file system sysplex serialization is already held by another local task or by another system in the sysplex.

Table 689. (continued)

Len	Type	value	Name	Description
4	DECIMAL	1270	JRLFSPROTOCOL	The function could not be performed because the minimum required LFS protocol level was not met by all systems in the sysplex group.
4	DECIMAL	1271	JRMEMBERLIST	An inconsistency between the XCF representation of the BPXGRP member group and the local representation exists.
4	DECIMAL	1272	JRRCVBUFTOOS	A message will not fit in the receive buffer. The size of the receive buffer for the receiving socket, which was set by the setsockopt syscall with the so_rcvbuf option, is too small to contain the data being sent to it. Truncation would occur.
4	DECIMAL	1273 :c 4.JRMUTUALEX	CLINPROGRESS	
				Mutually-exclusive operations are currently in progress in the sysplex. The request cannot proceed.
4	DECIMAL	1274	JRUNMOUNTALL	INDIRECT FILESYS=UNMOUNTALL is in progress. MOUNT cannot proceed.

<p>Part Name: EZBYAPPL Descriptive Name: IOCTL SIOCSAPPLDATA constant and structures = Component Name: IOCTL Enablement 5694-A01</p> <p>Function: This file defines the ioctl constant and data for the SIOCSAPPLDATA ioctl socket function. The SIOCSAPPLDATA ioctl enables an application to associate application-specific information with the TCP socket on which the ioctl socket function is invoked.</p> <p>The SIOCSAPPLDATA ioctl requires a SetAppplData structure as input. The SetAppplData fields SetAD_ptr64 or SetAD_ptr contain the address of a SetADcontainer structure. The SetADcontainer structure maps the information to be associated with the TCP socket.</p> <p>Part Type: MACRO - assembler, PL/X Usage: SIOCSAPPLDATA associates a forty byte buffer of application specific data with a TCP socket. This buffer may be displayed by Netstat and may be used with a Netstat filter to locate specific sockets. It is recorded in SMF 119 TCP Connection Termination records. It is also available as a returned field and search filter through the TCP/IP Network Management Interface (NMI). The application should uniquely identify itself using printable EBCDIC characters at the beginning of the data. Printable EBCDIC characters are preferred but not required for the entire buffer. Using applications are responsible for documenting the content, format and meaning of the string(s) they provide.</p> <p>CFD List: Flag Reason Release Date Origin Description ----- End CFD List:</p>

FEP03 VTAM ACB Work Area

CONTROL BLOCK NAME = DFHSZDAC
 DESCRIPTIVE NAME = CICS (FEPI) VTAM ACB Work Area

Restricted Materials of IBM

FUNCTION = Define 24-bit memory requirements for FEPI
 VTAM control blocks.
 1 control block will exist for each active
 VTAM ACB managed by FEPI. The area is released
 whenever the ACB is deactivated.

LIFETIME = Created by DFHSZRIO during INSTALL processing.
 Deleted by DFHSZRCA during node deactivation.

STORAGE CLASS = 24-bit addressable.
 LOCATION = Located from the DFHSZDND which describes the
 node to which the VTAM ACB relates. The DFHSZDND
 is chained from the DFHSZDCM.

CONTROL BLOCK NAME = DFHSZDBI
 DESCRIPTIVE NAME = CICS (FEPI) BIND Request Save Area

Restricted Materials of IBM

FUNCTION =

Defines the BIND Request Save Area.
 This data area is a part of the FEPI Resource Manager.
 It defines the format of the Bind Request Save Area which
 is used when a BIND is received by the SCIP exit and a
 Connection Block is not yet available.

Lifetime = Until OPNSEC can be completed

<p>End of portion that must match DFHSZDQE P1GPTR is also the base address of the area whose length is contained in DLENGTH. This is the address used to release storage if the connection is discarded. P1APTR thru P1CPTR are the base addresses of the various attribute planes needed to support 3270. The storage for all of the planes is obtained at BIND time. P1CPTR is only allocated if one of the 3279 device-types was specified. PIX, P1S and P1V are only allocated if the EDS flag is set in the LU profile at BIND time. This allows for a storage efficient operating mode of non-EDS monochrome.</p>

Implicit partition (00) dimension information PSIZE is calculated at BIND time and is used to determine the amount of dynamic storage required and to detect wraparound during buffer processing. It is recalculated each time the session is bound or an ERASE/WRITE is received. Default default and alternate sizes are set based upon the device-type value provided in the pool. When the BIND is received, the BIND values override. The BIND also determines whether or not the device can switch between default and alternate.

Datastream sequencing control flags. Due to the nature of buffering, the 3270 can never assume that all of the bytes associated with an attribute, order or structured field are present, it must assume that each byte could be its last. FEP07 Conversation Data Area

CONTROL BLOCK NAME = DFHSZDCV
 DESCRIPTIVE NAME = CICS (FEPI) Conversation Data Area

Restricted Materials of IBM

FUNCTION = Contains the information needed by the resource manager to control an allocated connection (a conversation). One CVCB will exist for each allocated connection.

LIFETIME = Created during ALLOCATE processing.
 Deleted during FREE processing.

STORAGE CLASS = 31-bit addressable.

LOCATION = Located from the DFHSZDCD which identifies the conversation which currently owns the connection.
 Also located from DFHSZDCM on two chains:
 (1) All active conversations.
 (2) All inactive conversations. ie. those

conversations relinquished with FREE(PASS).

FEP19 Terminal Simulation Facility

CONTROL BLOCK NAME = DFHSZDSR
 DESCRIPTIVE NAME = CICS (FEPI) Terminal Simulation Facility

Restricted Materials of IBM

FUNCTION = Identifies the nodes and targets associated with a given resource pool. One DSR is created for each node and target associated with each pool. It contains a pointer to either a node or target (depending upon which it represents)

LIFETIME = for the life of a node-pool or target-pool association. Created during INSTALL POOL/ ADD POOL processing, and deleted as a result of DISCARD POOL, DISCARD NODE, DISCARD TARGET or DELETE POOL processing.

STORAGE CLASS = 31-bit addressable

LOCATION = The DSR may be located from the DPD, DND or DTD data areas.

INNER CONTROL BLOCKS = DFHSZDEC eyecatcher data structure.

FEP20 Target Descriptor

CONTROL BLOCK NAME = DFHSZDTD
 DESCRIPTIVE NAME = CICS (FEPI) Target descriptor

Restricted Materials of IBM

FUNCTION = Contains the information needed by the resource manager to represent and control activity with a back-end application. One control block exists for each target defined by the installation during INSTALL processing.

LIFETIME = Created by DFHSZRIT during INSTALL processing.
 Deleted by DFHSZRDT during DISCARD processing.

STORAGE CLASS = 31-bit addressable.
 LOCATION = Located from the DFHSZDCM.

& NOTE
& The first portion of DFHSZDTD is structured to be identical to
& the first portion of the DQE. This MUST not change. If changes
& are made to the DQE, then this area must be updated to match.

ZCQ Builder Services Action Blocks

CONTROL BLOCK NAME = DFHTBSGC
 DESCRIPTIVE NAME = CICS Table Builder Services Action Blocks

Restricted Materials of IBM

FUNCTION =
 DFHTBSGC describes the dsect for Builder Services Action Blocks. These blocks are arrays of elements that describe the actions taken to Install , Delete, Recover or Catalog communication resource definitions.
 BS Action Blocks are hung of either the Resource definition Recovery Anchor Block (RRAB) (for those that either relate to general resources or have been moved onto the delayed_action_list prior to commitment/rollback), or from a Resource definition Atom Block (RABN) (because they are for a named atom).
 They are created by Table Builder Services when a request starts and are filled and/or added to the chain when Builder modules are driven. The log record that relates to a particular builders activity is chained from the relevant action element.
 The Table Builder Services Syncpoint program DFHTBSS frees the action_blocks once they have been used at the end of the Builder Services Request (often at Syncpoint)

LIFETIME =
 For the duration of the Table Builder Services Request

STORAGE CLASS =
 Above 16M line. CICS key.

LOCATION =
 Chained from the RRAB or one of the RABNs on the RRABs chain of named atoms.

UDB User Domain User Data Block

! DFHUSUDC US User Data Block
!
! The UDB defines the operator data and user attributes associated
! with a user who has been added to the CICS system.
!
! It is owned by the USAD Gate of the user domain.
!
! It contains the non-security attributes of the user that have been
! obtained from the CICS and LANGUAGE segments in the External
! Security Manager's database. It also contains a pointer to the
! ACEE (Access Control Environment Element), but ONLY for the use of
! the EXEC CICS ADDRESS ACEE command. There are NO security

! Manager has knowledge of these. If the User Data Block is enabled
! for timeout processing, then the user timeout queue entry (UTQE)
! token, which identifies the entry in the User Timeout Queue (UTQ),
! is stored in the user data block.

The following structure is used to define the structure containing Atom properties that are used by Atom feeds and Atom entries.

The components of the structure are all block descriptor types: that is, each contains a pointer and a length component.

The person can be referenced in an Atom document as an author or a contributor. There can be an unlimited number of person constructs in a document, so all the person descriptors are linked together in doubly-linked list.

WBA1C Web Business Logic Compatibility Interface

```

!:refstep.Business_Logic_Interface ----- DFHWBA1 194 -
!
!
! This copybook defines the 'parameter list' which is passed to
! program DFHWBA1 to perform the link to the business logic.
!
! A brief description of the fields and their usage follows:
!
! Variable
! Type and Usage
! wba1_parms_ptr
! A pointer variable used as base for the interface parameter list
! wba1_parms
! top_level of the interface parameter list structure
! wba1_eyecatcher
! A char(8) variable which should contain ' BLIP '
! wba1_converter_program_name
! A char(8) field containing the name of the program for decode
! and encode.
! wba1_client_address
! The IP address of the client.
! decode_client_address_string
! The IP address of the client in "ww.xx.yy.zz" format.
! wba1_data_ptr
! A pointer to the storage containing the HTTP request. For BLIO
! this is an offset.
! wba1_method_offset
! Offset into the HTTP request of the string containing the method
! specified for the request.
! wba1_http_version_offset
! Offset into the HTTP request of the string containing the
! version for the request.
! wba1_resource_offset

```

```

! Offset into the HTTP request of the string identifying the CICS
! resource to be invoked for this request.
! wba1_header_offset
! Offset into the HTTP request of the first HTTP header.
! wba1_user_data_offset
! Offset into the HTTP request to the "body" of the request -
! namely any forms data.
! wba1_method_length
! Length of the string containing the method.
! wba1_version_length
! Length of the string containing the version of HTTP supported by
! the client.
! wba1_resource_length
! Length of the string identifying the CICS resource to be invoked
! by this HTTP request.
! wba1_header_length
! Length of the HTTP header request information.(all the headers)
! wba1_user_data_length
! Length of the HTTP request body.
! wba1_input_data_length
! Length of the HTTP request body.
! wba1_server_program_name
! A char(8) name identifying the CICS program that dfhwba1 is to
! invoke by an EXEC CICS LINK.
! wba1_user_token
! A fullword token which uniquely identifies the HTTP request
! being processed.
! wba1_outdata_ptr
! A pointer to the output data.For BLIO this is an offset.
! wba1_response
! Response code of this request.
! wba1_data
! Data for this request if the data is given by offset.
!

WBBLC Web Business Logic Interface parameters

```

!:refstep.Business_Logic_Interface ----- DFHWBBLI 254 -
!
!
! This copybook defines the 'parameter list' which is passed to
! program DFHWBBLI to perform the link to the business logic.
!
! A brief description of the fields and their usage follows:
!
! Variable
! Type and Usage
! wdbl_parms_ptr
! A pointer variable used as base for the interface parameter list
! wdbl_length
! A halfword binary number that must be set to the total length of
! the BLI parameter list.
! wdbl_eyecatcher
! A 14-character field that must be set to the standard eyecatcher
! string '>DFHWBBLIPARMS'.
! wdbl_status_size
! A one-byte binary field that must be set to the length of the
! "wdbl_status" substructure (currently 8).
! wdbl_mode
! A single character that indicates the addressing mode for
! "wdbl_indata" and "wdbl_outdata". It must be set to 'P' to
! indicate that these values are pointers, or to '0' or 'D'
! to indicate that these values are offsets (from the start
! of the parameter list). 'D' also indicates that the user
! data is in ASCII (ISO-8859-1).
! wdbl_version
! A halfword binary number that indicates which version of the BLI
! parameter list is currently being used. It should be set using
! the constant value "wdbl_current_version".
! wdbl_prolog_size
! A halfword binary number that must be set to the length of the
! "wdbl_prolog" substructure (currently 56).
! wdbl_vector_size
! A halfword binary number that must be set to the length of the
! "wdbl_vector" substructure (currently 64).
! wdbl_response
! A fullword binary field in which DFHWBBLI returns its response
! code.
! wdbl_client_address
! A fullword 32-bit field that must be set to the binary IP
! address of the client, if this is known.
! wdbl_client_address_length

```

! A one-byte binary field that must be set to the length of
! "wbb1_client_address_string".
! wbb1_client_address_string
! A string of up to 15 characters which are the "dotted-decimal"
! representation of "wbb1_client_address", padded on the right
! with binary zeroes.
! wbb1_converter_program_name
! The eight-character name of the program that is to be used for
! converter DECODE and ENCODE functions.
! wbb1_server_program_name
! The eight-character name of the application program that is to
! be used to process the request and produce the response.
! wbb1_user_token
! An eight-character field in which the caller of DFHWBBLI can
! pass data which identifies the current conversational state with
! the client. It is usually set to the first eight characters of
! the +query-string+ portion of the URL (that is, any data
! following a question mark ('?')).
! wbb1_server_address
! A fullword 32-bit field that must be set to the binary IP
! address of the server, if this is known.
! wbb1_server_portnumber
! A halfword 16-bit field that must be set to the binary port
! number of the server, if this is known.
! wbb1_ssl_keysize
! Size of the encryption key negotiated during the SSL handshake,
! if secure sockets layer is being used. Zero if SSL is not being
! used.
! wbb1_indata_ptr
! If "wbb1_mode" is 'P', this is the address of the HTTP request
! data that is to be passed to the application.
! wbb1_indata_offset
! If "wbb1_mode" is 'O' or 'D', this field is the offset
! (from the start of the parameter list) of the HTTP
! request data that is to be passed to the application.
! wbb1_indata_length
! A fullword binary number that must be set to the length of the
! data located by "wbb1_indata_ptr" or "wbb1_indata_offset".
! wbb1_outdata_ptr
! If "wbb1_mode" is 'P', this is the fullword address in which
! DFHWBBLI will return the address of the response data from the
! application. This address is not necessarily the same as
! "wbb1_indata_ptr".
! wbb1_outdata_offset
! If "wbb1_mode" is 'O' or 'D', this is the fullword in
! which DFHWBBLI will return the offset (from the start of the
! parameter list) of the response data from the application.
! This offset is not necessarily the same as "wbb1_indata_offset".
! wbb1_outdata_length
! The fullword binary field in which DFHWBBLI will return the
! length of the response data located by "wbb1_outdata_ptr" or
! "wbb1_outdata_offset".
! wbb1_method_offset, wbb1_method_length
! Two fullword binary numbers that must contain the offset (from
! the start of the request data) and the length of the HTTP method
! that is to be used to process the request. The method should be
! one of: GET, POST, HEAD, PUT, DELETE, LINK, UNLINK, or REQUEUE.
! wbb1_http_version_offset, wbb1_http_version_length
! Two fullword binary numbers that must contain the offset (from
! the start of the request data) and the length of the version of
! the HTTP protocol that is to be used to process the request.
! wbb1_resource_offset, wbb1_resource_length
! Two fullword binary numbers that must contain the offset (from
! the start of the request data) and the length of the URI
! resource that is being requested (that is, the non-network part
! of the URL, starting at the first slash ('/') in the URL).
! wbb1_header_offset, wbb1_header_length

```

! Two fullword binary numbers that must contain the offset (from
! the start of the request data) and the length of the HTTP
! headers associated with this request. This is a list of zero or
! more headers in the format:
!
! header_name: header_valueCRLF
!
! where the colon and space (': ') delimit the header name from
! the value, and CRLF (X'0D25') delimits the end of the header
! value. The end of the list is denoted by an empty header, which
! contains only a single CRLF.
!
! The first CRLF-delimited line of an HTTP request is not
! regarded as a header. The offset to the start of the headers is
! to the character immediately following the CRLF that delimits
! the first HTTP request line (which may be another CRLF if no
! headers are present).
! wbb1_user_data_offset, wbb1_user_data_length
! Two fullword binary numbers that must contain the offset (from
! the start of the request data) and the length of the body of the
! HTTP request, if any.
! wbb1_client_certificate_offset, wbb1_client_certificate_length
! Two fullword binary numbers that must contain the offset (from
! the start of the request data) and the length of the X.509
! client certificate, if any. If the certificate is present, it
! must be in its binary BER-encoded form, and not base-64 encoded.
! wbb1_client_ipv6_address
! A 16-byte field containing the ip address of the client. This is
! the only place the user can supply a client IPV6 address. For
! ipv4 addresses the caller can choose to store the ipv4 address
! in the original field (wbb1_client_address) or construct a
! compatible ipv6 format from the ipv4 address and store it here.
! This compatibility feature allows the user to simplify their
! code by keeping all addresses in one format and placing them in
! the same field.
! wbb1_client_ipv6_address_length
! A one-byte binary field that must be set to the length of
! "wbb1_client_ipv6_address_string".
! wbb1_client_ipv6_address_string
! A string of up to 39 characters which contains the displayable
! representation of "wbb1_client_ipv6_address", padded to the
! right with blanks. If the connection is ipv4 then a
! "dotted-decimal" value should be placed here. Otherwise an
! appropriate IPV6 displayable format ("colon format") is placed
! here.
! wbb1_server_ipv6_address
! A 16-byte field containing the ip address of the server. This is
! the only place the user can supply a server IPV6 address. For
! ipv4 addresses the caller can choose to store the ipv4 address
! in the original field (wbb1_server_address) or construct a
! compatible ipv6 format from the ipv4 address and store it here.
! This compatibility feature allows the user to simplify their
! code by keeping all addresses in one format and placing them in
! the same field.

XCCBC External CICS Interface Control blocks

CONTROL BLOCK NAME = DFHXCCBC
 DESCRIPTIVE NAME = CICS External CICS Interface Control
 Block definitions

Restricted Materials of IBM

FUNCTION =

This file contains the control block and constant declarations used by the External CICS Interface. The file is included in each EXCI module. The control blocks are:

XCGLOBAL - XCGLOBAL block
 XCUSER - XCUSER block
 XCPPIPE - XCPPIPE block

All blocks are MVS GETMAINED from storage above the 16MB line, subpool 1.

LIFETIME =

There is only ever one XCGLOBAL block per TCB, and it is created on the first Initialise_user call for that TCB. It remains until TCB Termination.

An XCUSER Block is created for each new 'user' defined to the system via an Initialise_user call. It remains until TCB termination.

An XCPPIPE block is created when an allocate_pipe EXCI request is issued for a particular user. It is destroyed when a deallocate_pipe request is issued, or at TCB termination.

LOCATION =

XCGLOBAL is chained off the batch AFCB.

XCUSER blocks are chained together and anchored off XCGLOBAL

XCPPIPE blocks for a particular user are chained together and anchored off the relevant XCUSER.

! Transaction definition catalog record.
!
! The transaction definition externals are catalogued together with
! each of the aliases that the definition has. The alias existence
! bits indicate whether the alias names stored later in the record
! are actually active.
!
! Note that the 64 character TPName is not written to the catalog in
! the case when the definition does not have an active TPName alias.
!
! Both the externals and the alias information are copied directly
! from the transaction definition to this catalog record. The alias
! information is defined as a LIKE as it needs to be interpreted
! when the definition is recovered from the catalog. The externals
! are copied directly into the recovered definition and don't need
! to be interpreted.

Programming interface information

This book is intended to help you diagnose problems in your CICS s

CAUTION:

Do not use this Diagnosis, Modification, or Tuning Information as a programming interface.

However, this book also documents General-use Programming Interface and Associated Guidance Information and Product-sensitive Programming Interface and Associated Guidance Information provided by CICS.

General-use programming interfaces allow the customer to write programs that obtain the services of CICS.

General-use Programming Interface and Associated Guidance Information is identified where it occurs by an introductory statement to a data area.

Product-sensitive programming interfaces allow the customer installation to perform tasks such as diagnosing, modifying, monitoring, repairing, tailoring, or tuning of CICS. Use of such interfaces creates dependencies on the detailed design or implementation of the IBM software product. Product-sensitive programming interfaces should be used only for these specialized purposes. Because of their dependencies on detailed design and implementation, it is to be expected that programs written to such interfaces may need to be changed in order to run with new product releases or versions, or as a result of service.

Product-sensitive Programming Interface and Associated Guidance Information is identified where it occurs by an introductory statement to a data area.
