CICS Transaction Server for z/OS

# **External Interfaces Guide**

Version 3 Release 2

CICS Transaction Server for z/OS

# **External Interfaces Guide**

Version 3 Release 2

#### Note!

Before using this information and the product it supports, be sure to read the general information under "Notices" on page 363.

This edition applies to Version 3 Release 2 of CICS Transaction Server for z/OS, program number 5655-M15, and to all subsequent versions, releases, and modifications until otherwise indicated in new editions.

	What this book is about.
	How to use this book
	What you need to know to understand this book
	Notes on terminology
	Summary of changes.
	Changes for CICS Transaction Server for z/OS, Version 3 Release 2
	Changes for CICS Transaction Server for z/OS, Version 3 Release 1
	Changes for CICS Transaction Server for z/OS, Version 2 Release 3
Part 1. Overview	of CICS external interfaces
	Chapter 1. Interfaces to CICS transactions and programs
	The Client/Server concept
	Distributed computing
	Security support
	TCP/IP protocols.
	TCP/IP internet addresses and ports
	ONC and DCE concepts
	DCE
	EXCI concepts
	3270 bridge concepts
Part 2 Bridging	to 3270 transactions
Tart 2. Dridging	
Tart 2. Dridging	Chapter 2. Introduction to the 3270 bridge
Tart 2. Druging (	Chapter 2. Introduction to the 3270 bridge
Tart 2. Druging (	Chapter 2. Introduction to the 3270 bridge       17         The Link3270 bridge mechanism       17         The bridge facility       17
Tart 2. Druging (	Chapter 2. Introduction to the 3270 bridge       17         The Link3270 bridge mechanism       17         The bridge facility       17         Lifetime of the bridge facility       18         Lifetime of the bridge facility       19
Tart 2. Druging (	Chapter 2. Introduction to the 3270 bridge       17         The Link3270 bridge mechanism       17         The bridge facility       18         Lifetime of the bridge facility       19         The application data structure (ADS)       19
Tart 2. Druging	Chapter 2. Introduction to the 3270 bridge       17         The Link3270 bridge mechanism       17         The bridge facility       18         Lifetime of the bridge facility       19         The application data structure (ADS)       19         The ADS descriptor (ADSD)       19
Tart 2. Druging	Chapter 2. Introduction to the 3270 bridge       17         The Link3270 bridge mechanism       17         The bridge facility       18         Lifetime of the bridge facility       19         The application data structure (ADS)       19         The ADS descriptor (ADSD)       19         Link3270 programming considerations       20
r art 2. Dhuging i	Chapter 2. Introduction to the 3270 bridge       17         The Link3270 bridge mechanism       17         The bridge facility       17         The bridge facility       17         The bridge facility       17         The bridge facility       18         Lifetime of the bridge facility       19         The application data structure (ADS)       19         The ADS descriptor (ADSD)       19         Link3270 programming considerations       20         Transaction Routing considerations       24
r art 2. Dhuging i	Chapter 2. Introduction to the 3270 bridge       17         The Link3270 bridge mechanism       17         The bridge facility       18         Lifetime of the bridge facility       19         The application data structure (ADS)       19         The ADS descriptor (ADSD)       19         Link3270 programming considerations       20
r art 2. Dhuging i	Chapter 2. Introduction to the 3270 bridge       17         The Link3270 bridge mechanism       17         The bridge facility       17         The bridge facility       18         Lifetime of the bridge facility       19         The application data structure (ADS)       19         The ADS descriptor (ADSD)       19         Link3270 programming considerations       20         Transaction Routing considerations       24         Allocating a bridge facility name for a pseudoconversation when using the Link3270 bridge for transaction routing       25         Chapter 3. Using the Link3270 bridge.       27
r art 2. Dhuging i	Chapter 2. Introduction to the 3270 bridge       17         The Link3270 bridge mechanism       17         The bridge facility       17         The bridge facility       18         Lifetime of the bridge facility       19         The application data structure (ADS)       19         The ADS descriptor (ADSD)       19         Link3270 programming considerations       20         Transaction Routing considerations       24         Allocating a bridge facility name for a pseudoconversation when using the Link3270 bridge for transaction routing       25         Chapter 3. Using the Link3270 bridge.       27         Establish Link3270 suitability.       27
r art 2. Dhuging i	Chapter 2. Introduction to the 3270 bridge       17         The Link3270 bridge mechanism       17         The bridge facility       17         The bridge facility       18         Lifetime of the bridge facility       19         The application data structure (ADS)       19         The ADS descriptor (ADSD)       19         Link3270 programming considerations       20         Transaction Routing considerations       24         Allocating a bridge facility name for a pseudoconversation when using the Link3270 bridge for transaction routing       25         Chapter 3. Using the Link3270 bridge.       27         Using the Load Module Scanner Utility       28
Tart 2. Druging	Chapter 2. Introduction to the 3270 bridge       17         The Link3270 bridge mechanism       17         The bridge facility       18         Lifetime of the bridge facility       19         The application data structure (ADS)       19         The ADS descriptor (ADSD)       19         Link3270 programming considerations       20         Transaction Routing considerations       24         Allocating a bridge facility name for a pseudoconversation when using the Link3270 bridge for transaction routing       25         Chapter 3. Using the Link3270 bridge.       27         Using the Load Module Scanner Utility       28         Using the 3270 Bridge Passthrough SupportPak       28
r art 2. Druging i	Chapter 2. Introduction to the 3270 bridge       17         The Link3270 bridge mechanism       17         The bridge facility       18         Lifetime of the bridge facility       19         The application data structure (ADS)       19         The ADS descriptor (ADSD)       19         Link3270 programming considerations       20         Transaction Routing considerations       24         Allocating a bridge facility name for a pseudoconversation when using the       25         Chapter 3. Using the Link3270 bridge.       27         Establish Link3270 suitability.       27         Using the Load Module Scanner Utility       28         Writing the Link3270 client       28
r art 2. Druging i	Chapter 2. Introduction to the 3270 bridge       17         The Link3270 bridge mechanism       17         The bridge facility       18         Lifetime of the bridge facility       19         The application data structure (ADS)       19         The ADS descriptor (ADSD)       19         Link3270 programming considerations       20         Transaction Routing considerations       24         Allocating a bridge facility name for a pseudoconversation when using the Link3270 bridge for transaction routing       25         Chapter 3. Using the Link3270 bridge.       27         Establish Link3270 suitability.       28         Using the Load Module Scanner Utility       28         Writing the Link3270 client       28         Writing the Link3270 client       28         Select Link3270 client scenarios       29

Copybooks and default vectors	3	5
Using Link3270 single transaction mode	36	6
Updating data length fields	37	7
Using Link3270 session mode	37	7
How to create a message		
Allocating a bridge facility		
Running transactions.	38	8
Deleting a bridge facility	40	0
Delivering large messages	4	1
Recovery from connection failure	. 4	1
Validity of Link3270 requests		
Calling the Link3270 bridge	4:	3
Calling Link3270 using LINK		3
Calling Link3270 using EXCl.		3
Calling Link3270 using ECI		2
Multiple Bouter regions	+	1
Multiple Router regions	+-	+ /
Converting PDIU and PDIV baseder data	44	+ 1
Converting BRIH and BRIV header data	44	+
	4:	Э Г
Converting User data	4:	С
Chapter 4 Managing the Link 2070 bridge environment	1-	-
Chapter 4. Managing the Link3270 bridge environment		
Defining Link3270 SIT parameters.		
Defining the bridge facility	40	5
Defining the facilitylike		
Defining the bridge facility name		
Defining a specific bridge facility name	5	1
Initializing the TCTUA	5	1
Accessing bridge facility properties	52	2
Managing Link3270 bridge resources.		
INQUIRE/SET AUTOINSTALL with the Link3270 bridge		
INQUIRE/SET BRFACILITY with the Link3270 bridge.		
INQUIRE TASK with the Link3270 bridge		
INQUIRE/SET TRACETYPE with the Link3270 bridge		
INQUIRE TRANSACTION with the Link3270 bridge		
XPI commands for the Link3270 bridge		
Using Link3270 bridge load balancing		
Using the dynamic transaction routing program with Link3270	57	7
Chapter 5. Link3270 message formats		
Link3270 message header (BRIH)		
Inbound BRIH message header		
Outbound BRIH message header		
Inbound Link3270 vectors		
Link3270 inbound vector header		
Link3270 INPUT CONVERSE vector	67	7
Link3270 RECEIVE vector.	68	8
Link3270 RECEIVE MAP vector	69	9
Link3270 RETRIEVE vector	7	1
Outbound Link3270 vectors	72	2
Link3270 output vector header	72	2
Link3270 ISSUE ERASEAUP vector		
Link3270 SEND vector		
Link3270 SEND CONTROL vector.		
Link3270 SEND MAP vector		
Link3270 SEND TEXT vector		

	Link3270 SEND PAGE vector83Link3270 PURGE MESSAGE vector84Link3270 SYNCPOINT vector84Link3270 CONVERSE request vector88Link3270 RECEIVE request vector88Link3270 RECEIVE mapped vector88Link3270 ADS descriptor88ADS descriptor header88ADS field descriptor88
	Chapter 6. Link3270 diagnostics.
	Chapter 7. Using the Link3270 samples       97         The NACT transaction       98         Running the sample client programs       98         Setup the Link3270 environment       98         Setup for the CICS-based clients       98         Setup for OS/390 based client       100         Setup for the NACT transaction       100         Setup for the NACT transaction       100
Part 3. External C	CICS Interface
	Chapter 8. Introduction to the external CICS interface.       100         Overview       100         The EXCI programming interfaces       100         Choosing between the EXEC CICS and the CALL interface       100         Illustrations of the external CICS CALL interface       100         Illustration of the EXCI EXEC CICS interface       111         Resource recovery       111         Using RRMS with the external CICS interface       111         Requirements for the external CICS interface       111         Requirements for the external CICS interface       111         Chapter 9. The EXCI CALL interface       111         The EXCI CALL interface commands       111         Initialize_User       111         Allocate_Pipe       122         Open_Pipe       122         Open_Pipe       133         Deallocate_Pipe       133         Deallocate_Pipe       133         Return area and function call EQUATE copybooks       133         Return area and function call EQUATE copybooks       133         Dpl_retarea return codes       133         Example of EXCI CALLs with null parameters       134         Chapter 10. The EXCI EXEC CICS interface       144         Using EXEC CICS LINK command       1
	Translation required for EXEC CICS LINK command
	Chapter 11. Defining connections to CICS

CONNECTION resource definition for EXCI
SESSIONS resource definitions for EXCI connections
Inquiring on the state of EXCI connections
Chapter 12. The EXCI user-replaceable module
Charter 12 Using the EVOL antions table DEUVCODT
Chapter 13. Using the EXCI options table, DFHXCOPT
Chapter 14. Compiling and link-editing EXCI client programs
Job control language to run an EXCI client program.
CICS-supplied procedures for the EXCI
EXCI programming considerations
PL/I considerations
C considerations
Setting the return code (R15) at termination.
Using EXCI sample application programs.
Description of the sample applications
Installing the EXCI sample definitions
Running the EXCI sample applications.
Results of running the EXCI sample applications
Chapter 15. EXCl security
Using MRO logon and bind-time security
Defining DFHAPPL FACILITY class profiles for an EXCI region
Link security
User security
Surrogate user checking
Chapter 16. Problem determination
Trace
Formatting GTF trace
Using System dumps
Formatting system dumps
Capturing SYSMDUMPs
Using the MVS DUMP command at the console for dumps
MVS 04xx abends for the external CICS interface

# What this book is about

This book describes how you can make the CICS<sup>®</sup> transaction processing services of CICS Transaction Server for  $z/OS^{®}$  available to a variety of external users.

# How to use this book

Read Overview of CICS external interfaces for planning information, and for guidance about which other parts of the book to consult.

# What you need to know to understand this book

This book assumes that you are familiar with CICS, either as a system administrator or as a system or application programmer. Some parts of the book assume additional knowledge about CICS and other products.

# Notes on terminology

When the term "CICS" is used without any qualification in this book, it refers to the CICS element of  $IBM^{\ensuremath{\mathbb{B}}}$  CICS Transaction Server for z/OS.

# Summary of changes

This book is based on the CICS External Interfaces Guide for CICS TS for z/OS, Version 3.1, SC34-6449. Changes from that edition are marked by vertical bars in the left margin.

# Changes for CICS Transaction Server for z/OS, Version 3 Release 2

For information about changes that have been made in CICS Transaction Server for z/OS, Version 3 Release 2, please refer to *What's New* in the information center, or the following publications:

- CICS Transaction Server for z/OS Release Guide
- CICS Transaction Server for z/OS Migration from CICS TS Version 3.1
- CICS Transaction Server for z/OS Migration from CICS TS Version 2.3
- CICS Transaction Server for z/OS Migration from CICS TS Version 2.2
- CICS Transaction Server for z/OS Migration from CICS TS Version 1.3

# Changes for CICS Transaction Server for z/OS, Version 3 Release 1

There were no significant changes in this edition.

# Changes for CICS Transaction Server for z/OS, Version 2 Release 3

There are two versions of the Link3270 bridge in CICS Transaction Server for z/OS, Version 2 Release 3. Link3270 bridge with basic support provides the same support as CICS Transaction Server for z/OS, Version 2 Release 2. Link3270 bridge with extended support provides support for the ACCUM option on the EXEC CICS SEND CONTROL, EXEC CICS SEND MAP and EXEC CICS SEND TEXT commands.

# Part 1. Overview of CICS external interfaces

This part of the book outlines some the ways in which you can make CICS transaction processing services available to a variety of external users.

Overview

# Chapter 1. Interfaces to CICS transactions and programs

This book describes the following sources of external requests, and the routes that they can use into CICS:

# WebSphere® MQ users

WebSphere MQ users can use the CICS 3270 bridge to access CICS transactions. See Bridging to 3270 transactions and *CICS integration with WebSphere MQ*.

# MVS<sup>™</sup> applications

Applications running in MVS address spaces can use the External CICS Interface (EXCI) to access CICS programs. See External CICS Interface.

#### ONC RPC clients

ONC RPC clients can use CICS ONC RPC support to access CICS programs. See CICS ONC RPC support

### DCE RPC clients

DCE RPC clients use the Application Support (AS) server to access CICS programs. See Using CICS as a DCE server.

The following types of external requests are described in other books:

### User socket applications

User socket applications can use the CICS Sockets feature of CICS Transaction Server. See *TCP/IP for MVS Version 3.1 CICS TCP/IP Socket Interface Guide and Reference*.

# Web browsers

Web browsers can use a variety of methods:

# **CICS Web support**

The CICS Web support is a CICS-provided facility for supporting Web browsers. See the *CICS Internet Guide* 

# **IBM WebSphere**

The IBM WebSphere Application Server for z/OS is an MVS application that supports Web browsers and routes their requests into CICS.

# **CICS Transaction Gateway**

The CICS Transaction Gateway is a workstation application that can accept requests from Web browsers and route them into CICS. It uses the EXCI and ECI.

# JVM applications

Java Virtual Machine applications can use a local gateway connection that uses the EXCI to pass requests to CICS. See *Java Applications in CICS*.

# Java-enabled Web browsers

Java-enabled Web browsers can use applets that communicate with CICS. Writers of applets can use CICS-provided Java classes to construct external call interface (ECI) and external presentation interface (EPI) requests. The Web browsers communicate with Web servers, and with the CICS Transaction Gateway.

# **CICS** client applications

CICS client applications use a distributed CICS client (either CICS Transaction Gateway or the CICS Universal Client ) and the ECI or the EPI. See the *CICS Transaction Gateway: Programming Guide.* 

# **CICS** programs

Programs running in CICS Servers on any platform can use EXEC CICS LINK to call a CICS program, or can use transaction routing to send transaction requests to CICS Transaction Server. Programs running in CICS Transaction Server can use the CICS front end programming interface (FEPI) to start transactions in the same or another instance of CICS Transaction Server. See *CICS Front End Programming Interface User's Guide*.

# Telnet clients

Telnet clients can use TN3270 to start transactions.

### 3270 users

Users of the IBM 3270 Display System can start transactions. This is the most familiar method of introducing work to CICS Transaction Server.

Figure 2 on page 5 shows the principal ways of using CICS transaction processing services from outside CICS.

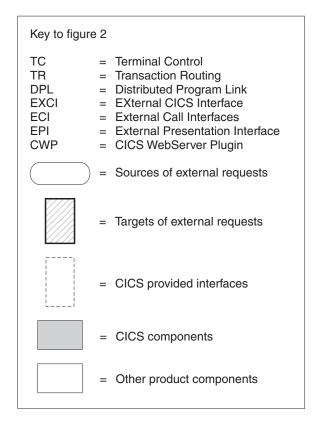

Figure 1. Key for External Interface diagram

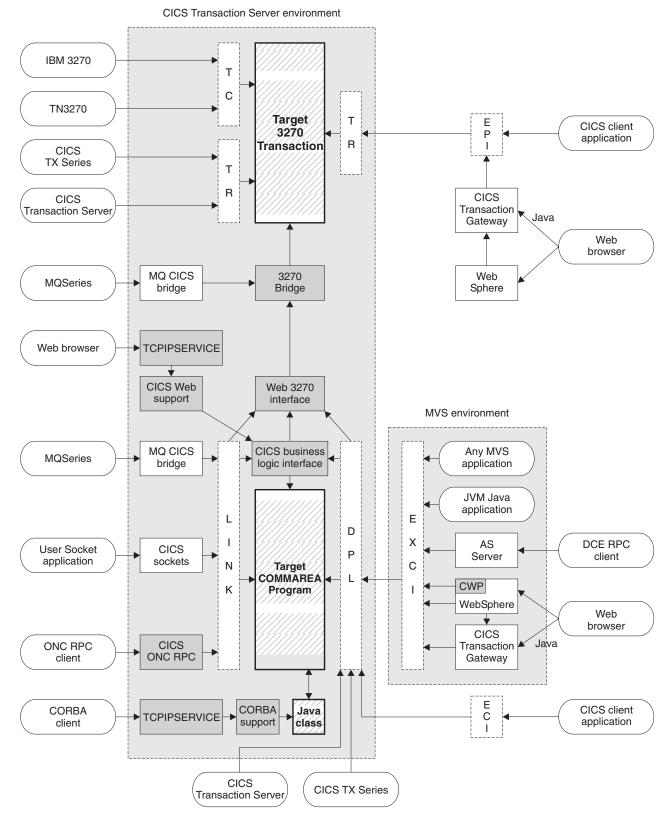

Figure 2. Client access to existing business logic

# The Client/Server concept

All the mechanisms described in this book follow a similar pattern. A client is the source of the external request which comes into CICS over a network using a variety of transport protocols, or from another CICS region, using Inter Region Communication (IRC). CICS (or another product) provides a transport-specific listener (a long-running task) that starts another task (a facilitator such as an **alias** or a **mirror**), to process the incoming request. The facilitator uses CICS services to access the application.

The priorities of different alias transactions can be adjusted to determine the service that a client request receives. There must be enough free tasks to service the alias transactions as they are started by the listener. The CICS programs that service the client requests are subject to contention for resources in the CICS system, and to transmission delays if they are remote from the CICS system, or if they request the use of remote resources by function shipping or distributed program link.

The CICS server is independent of the application model (2/3-tier, 2/3 platforms). The listener/facilitator deals with the different transports used and sets the rules for which programming models are supported.

# **Distributed computing**

Distributed computing involves the cooperation of two or more machines communicating over a network. The machines participating in the system can range from personal computers to super computers; the network can connect machines in one building or on different continents.

The main benefit of distributed computing is that it enables you to optimize your computing resources for both responsiveness and economy. For example, it enables you to:

- Share the cost of expensive resources, such as a typesetting and printing service, across many desktops. It also gives you the flexibility to change the desktop-to-server ratio, depending on the demand for the service.
- Allocate an application's presentation, business, and data logic appropriately. Often, the desktop is the best place to perform the presentation logic, as it is nearest to the end user and can provide highly responsive processing for such actions as drag and drop GUI interfaces.

Conversely, you may feel that the best place for the database access logic is close to the actual storage device - that is, on an enterprise or departmental server. The most appropriate place for the business logic may be less clear, but there is much to be said for placing this too in the same node as the data logic, thus allowing a single desktop request to initiate a substantial piece of server work without intervening network traffic.

Distributed computing enables you to make such trade-offs in a flexible way.

Along with the advantages of distributed computing come new challenges. Examples include keeping multiple copies of data consistent, keeping clocks in individual machines synchronized, and providing network-wide security. A system that provides distributed computing support must address these new issues.

CICS supports distributed computing and the client/server model by means of:

**Internet Inter-Orb Protocol (IIOP)** CORBA clients can access CICS Java servers using IIOP.

### Distributed Computing Environment (DCE)

The remote procedure call model implemented by the Open Software Foundation's DCE is supported in CICS.

#### Distributed program link (DPL)

This is similar to a DCE remote procedure call. A CICS client program passes parameters to a remote CICS server program and waits for the server to send data in reply. Parameters and data are exchanged by means of a communications area.

### The external CICS interface (EXCI)

An MVS client program links to a CICS server program. Again, this is similar to a DCE RPC.

### The external call interface (ECI)

The ECI enables CICS Transaction Server for z/OS server programs to be called from client programs running on a variety of operating systems. For information about CICS Clients, see the *CICS Transaction Gateway: Programming Guide.* 

# Function shipping

The parameters for a single CICS API request are intercepted by CICS code and sent from the client system to the server. The CICS mirror transaction in the server executes the request, and returns any reply data to the client program. This can be viewed as a specialized form of remote procedure call.

#### Asynchronous transaction processing

A CICS client transaction uses the EXEC CICS START command to initiate another CICS transaction, and pass data to it. The START request can be intercepted by CICS code, and function shipped to a server system. The client transaction and started transactions execute independently. This is similar to a remote procedure call with no response data.

### Distributed transaction processing

A program in the client system establishes a conversation with a complementary program in the server, and exchanges messages. The programs may use the APPC protocols.

#### Transaction routing

Terminals owned by one CICS system to run transactions owned by another.

The CICS family of products runs on a variety of operating systems, and provides a standard set of functions to enable members to communicate with each other. For information about the CICS family, see the *CICS Family: Interproduct Communication* manual.

# Security support

CICS Transaction Server for z/OS supports:

- A single network signon (through the ATTACHSEC option of the DEFINE CONNECTION command)
- · Authentication of the client system through bind-time security.

RACF<sup>®</sup> or an equivalent security manager provides mechanisms similar to the DCE access control lists and login facility.

There is no CICS concept similar to the DCE Directory Service. In all the above scenarios the client environment must know which server CICS system to

communicate with. This is normally done by specifying the name of the required remote CICS system in the definition of the relevant remote CICS resource, or in the client application program.

# **TCP/IP** protocols

TCP/IP is a communication protocol used between physically separated computer systems. TCP/IP can be implemented on a wide variety of physical networks.

TCP/IP is a large family of protocols that is named after its two most important members, Transmission Control Protocol and Internet Protocol. Figure 3 shows the TCP/IP protocols used by CICS ONC RPC in terms of the layered Open Systems Interconnection (OSI) model. For CICS users, who may be more accustomed to SNA, the left side of Figure 3 shows the SNA layers that correspond very roughly to the OSI layers.

SNA		OSI	_	TCP/IP family	_
Application	7	Application		RPC	
Presentation	6	Presentation		XDR	Sockets
Data flow	5	Session		(empty)	interface
Transmission	4	Transport		TCP or UDP	
Path control	3	Network		IP	
Data link	2	Data link		subnetwork	
Physical	1	Physical	]	Subnetwork	

Figure 3. TCP/IP protocols compared to the OSI and SNA models

The protocols used by TCP/IP are shown in the right-hand box in Figure 3.

#### Internet Protocol (IP)

In terms of the OSI model, IP is a network-layer protocol. It provides a *connectionless* data transmission service, and supports both TCP and UDP. Data is transmitted link by link; an end-to-end connection is never set up during the call. The unit of data transmission is the *datagram*.

#### Transmission Control Protocol (TCP)

In terms of the OSI model, TCP is a transport-layer protocol. It provides a *connection-oriented* data transmission service between applications, that is, a connection is established before data transmission begins. TCP has more error checking that UDP.

#### User Datagram Protocol (UDP)

UDP is also a transport-layer protocol and is an alternative to TCP. It provides a connectionless data transmission service between applications. UDP has less error checking than TCP. If UDP users want to be able to respond to errors, the communicating programs must establish their own protocol for error handling. With high-quality transmission networks, UDP errors are of little concern.

#### ONC RPC and XDR

XDR and ONC RPC correspond to the sixth and seventh OSI layers.

# Sockets interface

The interface between the fourth and higher layers is the *sockets* interface.

In some TCP/IP implementations, the sockets interface is the API that customers use to write their higher-level applications.

# **TCP/IP** internet addresses and ports

TCP/IP provides for process-to-process communication, which means that calls need an addressing scheme that specifies both the physical host connection (Host A and Host B in Figure 4) and the software process or application (C, D, E, F, G, and H). The way this is done in TCP/IP is for calls to specify the host by an *internet address* and the process by a *port number*. You may find internet addresses also referred to elsewhere as internet protocol (IP) addresses or host IDs.

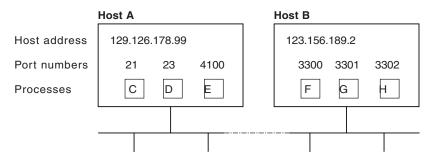

Figure 4. How applications are addressed

### Internet addresses

Each host on a TCP/IP internet is identified by its internet address. An internet address is 32 bits, but it is usually displayed in dotted decimal notation. Each byte is converted to a decimal number in the range 0 to 255, and the four numbers are separated by dots thus: 129.126.178.99.

Remember that an internet is a collection of networks — hence the internet address must specify both the network and the individual host. How this is done varies with the size of the network. In the example just given, 129.126 specifies the network, 178.99 specifies the host on that network.

# Port numbers (for servers)

An incoming connection request specifies the server that it wants by specifying the server's port number. For instance, in Figure 4, a call requesting port number 21 on host A is directed to process C.

*Well-known ports* identify servers that carry standard services such as the File Transfer Protocol (FTP) or Telnet. The same service is always allocated the same port number, so, for example, FTP is always 21 and Telnet always 23. Networks generally reserve port numbers 1 through 255 for well-known ports.

# Port numbers (for clients)

Client applications must also identify themselves with port numbers so that server applications can distinguish different connection requests. The method of allocating client port numbers must ensure that the numbers are unique; such port numbers are termed *ephemeral port numbers*. For example, in Figure 4, process F is shown with port number 3300 on host B allocated.

# ONC and DCE concepts

ONC (Open Network Computing) RPC (Remote Procedure Call) is an open source RPC framework developed by Sun Microsystems. DCE (Distributed Computing Environment) is an architecture defined by the Open Software Foundation (OSF). Both technologies support client-server applications in heterogeneous distributed environments.

DCE RPC is different from ONC RPC in many ways. For example, DCE RPC does not limit the number of parameters on the call, whereas an ONC RPC call is limited to one input and one output parameter (but these may be structures that contain many fields, including pointers to other data).

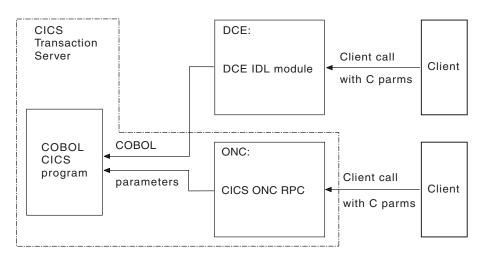

Figure 5. Remote procedures provided for DCE RPC and ONC RPC

Figure 5 shows how the two CICS RPC implementations provide the same function.

You provide a definition of the client's parameter list in the interface definition language (IDL) provided as a part of DCE RPC. The DCE IDL module maps the incoming parameters into a CICS communication area, so the communication area format is defined by the client's parameter list.

CICS ONC RPC CICS programs can be written in any CICS-supported programming language, and the conversion from client format to communication area is done by the **Decode** function of the converter. With ONC RPC you get more flexibility, but you have more work to do.

CICS programs that are used as servers for DCE RPC clients can also be used as servers for ONC RPC clients. You need to write a **Decode** function that converts the incoming data structure into the predefined communication area, and converts the incoming data from C types to COBOL types.

DCE

DCE provides a high-level, coherent environment for developing and running applications on a distributed system. The DCE components fall into two categories: tools for developing distributed applications and services for running them. The tools, such as Remote Procedure Calls and Threads, assist in the development of an application. The services, like the Directory Service, Security Service, and Time Service, provide support in a distributed system that is analogous to the support an operating system provides in a centralized system. DCE includes management tools for administering all of the DCE services and many aspects of the distributed environment itself.

DCE is oriented towards heterogeneous rather than homogeneous systems. The DCE architecture allows for different operating systems and hardware platforms. Using DCE, a process running on one computer can interoperate with a process on a second computer, even when the two computers have different hardware or operating systems.

# **EXCI** concepts

The external CICS interface makes CICS applications more easily accessible from non-CICS environments.

Programs running in MVS can issue an EXEC CICS LINK PROGRAM command to call a CICS application programs running in a CICS region. Alternatively, the MVS programs can use the CALL interface when it is more appropriate to do so.

The provision of this programming interface means that, for example, MVS programs can:

- Update resources with integrity while CICS is accessing them.
- Take CICS resources offline, and back online, at the start and end of an MVS job. For example, you can:
  - Open and close CICS files.
  - Enable and disable transactions in CICS (and so eliminate the need for a master terminal operator during system backup and recovery procedures).

The external CICS interface opens up a new way to implement client/server applications, where the client program in a non-CICS environment calls a server program running in the CICS address space. The external CICS interface benefits not only TSO and batch applications, but allows you to extend the use of CICS application programs in an open client/server environment.

Although the CICS external interface operates over CICS MRO links, the client program can run on non-MVS platforms, and pass requests to CICS over an open system interface (OSI) using the IBM z/OS Distributed Computing Environment Application Support MVS/ESA CICS feature (DCE AS/CICS). In this way the external CICS interface provides an open interface to a wide variety of other application platforms.

# 3270 bridge concepts

The 3270 bridge allows you to introduce new GUI front ends to access existing 3270-based CICS applications without modifying them. This means that you can concentrate your efforts on the new user interfaces and avoid, or at least postpone, rewriting stable mainframe applications. You do not need to restructure your applications to separate the business logic from the presentation logic; the bridge effectively does this for you.

The same applications can be used both by 3270 terminals, and by the new client applications. This allows a phased migration of users from the 3270 applications to the new client applications. Applications written for 3270 terminals can be run on CICS systems without VTAM<sup>®</sup>.

The bridge can process commands faster than existing front-end methods, such as FEPI and EPI, because the terminal emulation is part of the same CICS transaction. With the START BREXIT bridge mechanism, there is only a single unit of work. This means that the bridge can use a recoverable WebSphere MQ queue. This greatly simplifies recovery.

For BMS user transactions, there is no need to convert BMS data to 3270 format, because the client application receives the BMS Application Data Structure, rather than a 3270 datastream. This provides an easier method for the application programmer to interface with the user transaction compared to FEPI. A utility program (DFHBMSUP) is provided to recreate map source code from existing load modules, so that installations that do not have access to the original source code can still exploit the new ADS descriptor provided by the BMS macros.

The target transaction is unchanged, but because of the way it now executes in the bridge environment, there are some restrictions on what it can do. These restrictions are described in "Link3270 programming considerations" on page 20..

CICS provides two types of 3270 bridge mechanism:

# The Link3270 mechanism

This mechanism was introduced in CICS Transaction Server for z/OS, Version 2 Release 2 and provides a simplified interface using LINK, ECI or EXCI. All messages have a fixed format and you are not required to provide any user-written supporting programs.

### The START BREXIT mechanism

This 3270 bridge mechanism requires a *bridge monitor* transaction to initiate the bridge environment by issuing a START BREXIT command, which specifies the target user transaction and also the name of a user-written *bridge exit*. The bridge exit is called to intercept 3270 requests and pass them in the form of messages to the client application. You can write your own bridge exit and also define your own message formats. Bridge exits are provided to support client applications using Temporary Storage, the Web and Websphere MQ as transport mechanisms for requests, using sample message formats.

The START BREXIT mechanism was introduced in earlier releases of CICS. It is still supported, and the sample bridge exits are still provided, but you are recommended to use the simpler Link3270 mechanism, and migrate to it where possible. The START BREXIT is not documented in this release of CICS. If you need to use it, or modify existing implementations, you should refer to the CICS Transaction Server for OS/390<sup>®</sup>, Version 1 Release 3 External Interfaces Guide, which can be found in the CICS Transaction Server for OS/390, Version 1 Release 3 library at:

http://www-4.ibm.com/software/ts/cics/library/books/os390/

# The 3270 Bridge and FEPI

To help you decide between the 3270 bridge technology and FEPI, the following table summarizes the major characteristics.

START Bridge	Link3270 Bridge	FEPI
Enabling technology	Enabling technology	An application programming interface

Table 1. Comparision between 3270 bridge technology and FEPI

START Bridge	Link3270 Bridge	FEPI
Based on application data structure	Based on application data structure	Based on the 3270 data stream
Enables optimization due to integral knowledge of the target	Enables optimization due to integral knowledge of target	Easier to create generic driver (data structure is architected)
Efficient; no terminal control involved	Efficient, no terminal control involved	VTAM managed connection between source and target
Single COMMAREA API and user replaceable program	COMMAREA API	Requires system programming and VTAM skills
CICS specific: source and target must be in the same region	LINK, DPL, EXCI or ECI interface supported	Ideal for driving remote applications, not just CICS
Driven exit decides method of communication with the client	Client interface is LINK, DPL, EXCI or ECI	Can be freed from the workings of the target; terminal emulation
Knowledge of UOW	Standard CICS LINK coordination	No coordination
Ideal when the routing is done elsewhere	Supports workload balancing	Sysplex support requires three regions
Available in CICS Transaction Server for OS/390, Version 1 Release 2 and later	Available in CICS Transaction Server for z/OS, Version 2 Release 2	Available for CICS/ESA 3.3 and later

Table 1. Comparision between 3270 bridge technology and FEPI (continued)

# Part 2. Bridging to 3270 transactions

This part of the book describes the 3270 bridge. The 3270 bridge provides an interface that enables you to run 3270-based CICS transactions without a 3270 terminal.

Bridging to 3270 transactions

# Chapter 2. Introduction to the 3270 bridge

The 3270 bridge provides an interface so that you can run 3270-based CICS transactions without a 3270 terminal.

The 3270 terminal and end-user are replaced by an application program, known as the *client application*. Commands for the 3270 terminal in the CICS 3270 user transaction are intercepted by CICS and replaced by a messaging mechanism that provides a bridge between the client application and the CICS user transaction.

CICS provides two types of 3270 bridge mechanism:

#### The Link3270 mechanism

This mechanism is introduced in CICS Transaction Server for z/OS, Version 2 Release 2 and provides a simplified interface using LINK, ECI or EXCI. All messages have a fixed format and you are not required to provide any user-written supporting programs. This mechanism supports CICSPlex<sup>®</sup> SM load balancing; bridge facilities are shared between CICS regions on the CICSplex.

#### The START BREXIT mechanism

This 3270 bridge mechanism requires a *bridge monitor* transaction to initiate the bridge environment by issuing a START BREXIT command, which specifies the target user transaction and also the name of a user-written *bridge exit*. The bridge exit is called to intercept 3270 requests and pass them in the form of messages to the client application. You can write your own bridge exit and also define your own message formats. Bridge exits are provided to support client applications using Temporary Storage, the Web and WebSphere MQ as transport mechanisms for requests, using sample message formats. This mechanism is single region only: bridge facilities are local to the region.

The START BREXIT mechanism was introduced in earlier releases of CICS. It is still supported, and the sample bridge exits are still provided, but you are recommended to use the simpler Link3270 mechanism, and migrate to it where possible. The START BREXIT is not documented in this release of CICS. If you need to use it, or modify existing implementations, refer to the CICS Transaction Server for OS/390, Version 1 Release 3 External Interfaces Guide, which can be found in the CICS Transaction Server for OS/390, Version 1 Release 3 library at http://www.ibm.com/software/htp/cics/tserver/v13/library/.

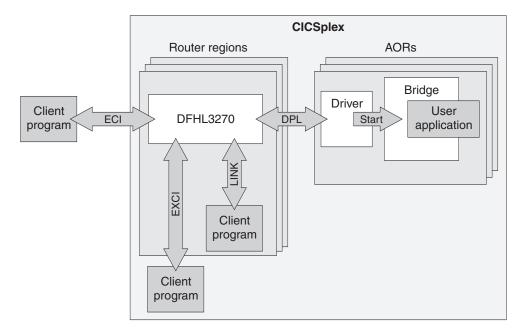

# The Link3270 bridge mechanism

The client application uses the Link3270 bridge to run 3270 transactions by linking to the DFHL3270 program in the router region and passing a COMMAREA that identifies the transaction to be run and contains the data used by the user application. The response contains the 3270 screen data reply. If the target application used BMS, this is presented in the form of an **application data structure (ADS)**, another name for the symbolic map that is generated by the BMS macros used to define the mapping of the 3270 screen.

The Link3270 bridge is called in the same way for all request mechanisms of the interface: EXEC CICS LINK, the EXternal CICS Interface (EXCI), and the CICS External Call Interface (ECI).

The following flow describing the Link3270 mechanism is shown also in Figure 6 on page 18:

- 1. The client application creates a Link3270 request message.
- The client application issues an appropriate link request (ECI, EXCI or LINK) to the CICS router program DFHL3270, passing the Link3270 message as a COMMAREA. Note that CICS takes care of the codepage conversion if necessary.
- 3. DFHL3270 dynamically routes the request to the bridge **driver** task, which may be in the same or another CICS region. Load balancing can be implemented in this step.
- 4. The driver starts the user application ( the target 3270 transaction), running in a bridge environment.
- 5. The response Link3270 message is returned to the client as a COMMAREA.
- 6. The client application processes the outbound message .

#### Figure 6. Link3270 request flow

The Link3270 mechanism supports non-conversational, pseudoconversational and conversational applications.

## The bridge facility

The 3270 user application was designed to be used with a real 3270 terminal and the CICS commands that it uses assume that a real 3270 exists. The 3270 bridge mechanism simulates the presence of a real 3270 by providing internal interfaces for a virtual 3270, known as the **bridge facility**.

This replaces the terminal resource definition that you would normally provide for a 3270 application. The bridge facility emulates a real terminal in the following EXEC CICS interfaces:

- ASSIGN
- Terminal control and some of the BMS API
- EIB
- INQUIRE TASK

#### INQUIRE TERMINAL

You do not provide a resource definition for the bridge facility, but you can control some of the terminal properties used by providing a 3270 TERMINAL resource definition to be used as a template. The name of this TERMINAL definition, known as the **facilitylike**, is passed to the bridge on the Link3270 call.

See "Defining the bridge facility" on page 48 for further information about the bridge facility.

### Lifetime of the bridge facility

When simple transactions are run in **single transaction mode**, the bridge facility is created dynamically by CICS and deleted at the end of the transaction.

In **session mode**, multiple transactions or pseudotransactions can be run using the same bridge facility. In this mode the client application can request creation and deletion of the bridge facility, and can also specify a **keeptime** in BRIH-FACILITYKEEPTIME in the Allocate function. See "Using Link3270 session mode" on page 37.

The maximum keeptime value can be limited by the BRMAXKEEPTIME system initialization parameter. Bridge facilities are deleted automatically if they are inactive for the keeptime interval.

See Specifying DFHSIT macro parameters, in the *CICS System Definition Guide* for information about the SIT.

## The application data structure (ADS)

Application data structure (ADS) is another name for the symbolic map that is generated by the BMS macros used to define the mapping of the 3270 screen. For BMS programs, terminal data is passed between the client and the bridge in this format, giving the client application a simplified interface to the terminal data, without the need to understand 3270 data streams.

An ADS descriptor is also optionally provided, to help the client interpret the contents of the ADS. See "DFHBMSUP" on page 20 for guidance on creating the ADSD if you have no source.

### The ADS descriptor (ADSD)

The ADS descriptor allows interpretation of the BMS application data structure (the symbolic map used by your application program for the data in SEND and RECEIVE MAP requests) - without requiring your client program to include the relevant DSECT or copybook at compile time.

The ADS descriptor contains a header with general information about the map, and a field descriptor for every field that appears in the ADS, corresponding to every named field in the map definition macro. It can be located in the mapset from an offset field in DFHMAPDS.

The ADS descriptor is available only if the map load module has been reassembled (using CICS Transaction Server for OS/390, Version 1 Release 2 or a later release) to include the descriptor, and CICS attempts to locate the descriptor only if the BRIH-ADSDESCRIPTOR indicator is set to BRIHADSD-YES in the Link3270 message header.

#### DFHBMSUP

If you are unable to reassemble the mapset because you do not have the source, you can use the DFHBMSUP utility to re-create source statements from your mapset load module. See BMS macro generation utility program (DFHBMSUP), in the *CICS Operations and Utilities Guide* for information about DFHBMSUP.

### Link3270 programming considerations

The user transaction is unchanged, but because of the way it now executes in the bridge environment, there are some restrictions on what it can do, and some limitations on how it can use the bridge facility, because it is not a real terminal.

You can use the Load Module Scanner utility (described in Load module scanner (DFHEISUP), in the *CICS Operations and Utilities Guide*), using the supplied table DFHEIDBR, to identify any CICS commands in your program that are not supported by the bridge.

**Note:** The bridge only supports valid documented CICS API interfaces. If either the application or vendor programs use undocumented interfaces, the results will be unpredictable.

If you are using CICS Service Flow Runtime there are additional restrictions described in Link3270 bridge restrictions .

#### Abend information

The bridge facility name is not used as the TERMID in any diagnostic information produced as the result of an abend, except in a transaction dump.

#### ASSIGN

If the user transaction issues ASSIGN NETNAME, the value returned is the NETNAME if there is one, or else the TERMID. The name is not visible outside the user transaction, and may contain '}' characters.

You can only use ASSIGN to request information about BMS attributes such as MAPCOLUMN, MAPHEIGHT, MAPLINE, and MAPWIDTH if an ADS descriptor is present in the mapset. See "The ADS descriptor (ADSD)" on page 19.

#### BMS requests

The Link3270 bridge supports the following BMS commands. If other BMS functions that require a principal facility are used, they cause the user transaction to abend ABR3.

#### **RECEIVE commands**

- RECEIVE MAP TERMINAL
- RECEIVE MAP FROM
- RECEIVE MAP MAPPINGDEV

Note: TERMINAL is implied if neither TERMINAL nor FROM is specified.

#### SEND commands

- SEND MAP TERMINAL
- SEND TEXT TERMINAL
- SEND TEXT NOEDIT TERMINAL
- SEND TEXT MAPPED TERMINAL
- SEND CONTROL TERMINAL
- SEND MAP SET

- SEND TEXT SET
- SEND TEXT NOEDIT SET
- SEND TEXT MAPPED SET

#### Note:

1. TERMINAL is implied if none of TERMINAL, SET, or PAGING is specified.

#### Routing

Routing to real terminals from a transaction running on a bridge facility is supported, but it is not possible to route to a bridge facility, nor to specify a bridge facility as ERRTERM on ROUTE. If ERRTERM without a name is specified on a ROUTE request issued in a bridge environment, the INVERRTERM condition is raised.

PAGING is supported only under routing.

#### Partitions

Partition related commands and options are supported, but are treated in the same way as they would be for a real terminal that does not support partitions.

#### SEND PARTNSET

Supported, but the bridge exit is not invoked.

#### **RECEIVE PARTN**

Supported; the bridge exit is invoked with bridge exit area command fields set up for a terminal control RECEIVE.

#### INPARTN

Accepted but ignored; not passed to the bridge exit.

#### OUTPARTN

Accepted but ignored; not passed to the bridge exit.

#### ACTPARTN

Accepted but ignored; not passed to the bridge exit.

#### CICS-supplied transactions

CEDF, CEDX, CSFE, and CSGM cannot run as user transactions.

#### DB2<sup>®</sup> authorization check

The RCT allows AUTHTYPE=TERMID or OPID which means that security checking is done against the corresponding name. This fails in a bridge environment, and AUTHTYPE=USERID must be used instead. This is the preferred method in all environments.

#### External security customization

TERMID/OPID/TCTUA information is not passed in the DFHXSID parameter list.

#### **Global User Exits**

The following global user exits (GLUEs) are **not** driven because the bridge facility is not a real terminal.

#### XBMIN

to intercept a RECEIVE MAP request.

#### XBMOUT

to intercept a SEND MAP request.

#### **XTCATT**

before a task attach.

#### XZCATT

before a task attach (VTAM).

**XZCIN** after an input event (VTAM).

#### XZCOUT

before an output event (VTAM).

#### XZCOUT1

before a message is broken into RUs (VTAM).

The XALTENF and XICTENF exits can be driven if a request is made for a bridge facility. The 'terminal-not-found' condition is raised because the bridge facility is not a real terminal.

The standard user exit parameter list field UEPTERM that points to the TERMID are not set for exits invoked under a bridge task.

#### **ISSUE PASS**

ISSUE PASS is not supported and results in an INVREQ.

#### **ISSUE PRINT**

ISSUE PRINT is not supported and results in a no-op. A NORMAL condition is returned.

#### Monitoring

A 3270 bridge transaction identifier is present in monitoring records.

#### **Remote DLI requests**

No security check of the PSB against the terminal is done for function-shipped DLI requests.

#### Security Processing

When a bridge facility is created, it is signed on as a preset USERID terminal, with the client's USERID. As with other preset terminals, the SIGNON and SIGNOFF commands are not permitted, and INVREQ is raised.

The bridge facility is signed off when it is discarded. It remains signed on in session mode until a specific delete facility request is sent, or the keeptime interval expires.

#### START

The user transaction can issue EXEC CICS START requests for its own bridge facility. This allows existing menu-driven and pseudo-conversational applications that use this interface to work in a bridge environment. See "Pseudoconversational transactions" on page 40 for a description of START

"Pseudoconversational transactions" on page 40 for a description of START TERMID where TERMID specifies the bridge facility.

The time delay options, (INTERVAL, TIME, AFTER, AT, HOURS, MINUTES, SECONDS) are not normally used in the bridge environment, but the bridge mechanism uses them to put the STARTs for a particular bridge facility in time order, but the exact delays requested are not implemented. TIME and AT specifications are ignored completely.

Other options on the START command are partly supported :

#### TERMID

You can specify the name of your own bridge facility for this transaction, or for any real terminal.

#### USERID

USERID and TERMID are mutually exclusive. The CICS translator rejects START requests with both USERID and TERMID specified.

#### TRANSID

If the TRANSID cannot be defined as REMOTE, the TERMID will not be found if the request is shipped to a remote system.

**SYSID** Routing of START requests is not possible in a bridge environment. This option is not supported, unless the value of the SYSID is the local SYSID. If you specify any other value, the request will be shipped and the TERMID will not be found on the remote system.

#### NOCHECK

This option only applies to shipped start requests and is ignored.

#### PROTECT

If you specify the PROTECT option on a START request for a bridge facility, and the starting task abends before taking a syncpoint, the START request is discarded. PROTECT normally delays the starting of the new task until a SYNCPOINT has occurred. This happens automatically for a task issuing a START for its own facility because the START cannot take effect until the starting task has terminated and freed up its bridge facility.

#### STARTed transactions

Some menu applications use START to initiate subsequent transactions.

You can specify BRIHSC-START in the BRIH-STARTCODE field of a single transaction mode request message, or in the first transaction of a session mode pseudoconversation, to return the correct response to ASSIGN STARTCODE and INQUIRE TASK STARTCODE commands issued by the user transaction.

User transactions that are initiated by START may issue one or more RETRIEVEs to obtain data passed on the START. When the bridge has passed all the data provided in the Link3270 request message, ENDDATA is returned to the user transaction.

#### Statistics

You cannot use EXEC CICS COLLECT STATISTICS TERMINAL(xxxx) where xxxx is a bridge facility.

#### Storage violation counts

No storage violation counts will be kept in a bridge facility.

#### TCTUA

The TCTUA is available to the user transaction using the EXEC CICS ADDRESS command. You can modify the contents of the TCTUA using the XFAINTU global user exit. See "Initializing the TCTUA" on page 51. Note that the TCTUA is NOT available to any programs in other CICS regions that are linked to by the user transaction using DPL.

#### **Transaction restart**

RESTART(NO) is forced for user transactions because CICS has no way of restoring the initial input message.

#### Transaction Routing

Transaction Routing is not directly supported, see "Transaction Routing considerations" on page 24 for a technique you can use.. The Link3270 bridge supports work load balancing with an affinity.

#### TWA

The TWA is available to the user transaction.

## **Transaction Routing considerations**

Although the 3270 bridge does not directly support transaction routing, you can migrate applications using the following technique.

Client	Router wrapper	Bridged tran
Link to wrapper1		
	wrapper1	app1
	ADDRESS COMMAREA(msg)	BMS or 3270 commands
	brih-transaction =	RETURN
	briht-allocate-facility	COMMAREA(appl-commarea)
	LINK PROG(DFHL3270)	
	COMMAREA(alloc-msg)	
		term
	brih-transaction = <b>appl1</b>	ADDRESS
	LINK PROG(DFHL3270)	COMMAREA(appl-commarea)
	COMMAREA(msg)	WRITEQ TS
		FROM(appl-commarea)
	brih-transaction = <b>term</b>	
	LINK PROG(DFHL3270)	
	COMMAREA(dummy-msg)	
	brih transaction =	
	briht-delete-facility	
	LINK PROG(DFHL3270)	
	COMMAREA(del-msg)	
	READQ TS	
	INTO(appl-commarea)	
	RETURN	
	COMMAREA(msg+appl-commarea)	

Add a **wrapper** program in the router region to drive initialization and termination routines as shown in the following table:

Client	Router wrapper	Bridged tran
Link to wrapper2		
	wrapper2	init
	ADDRESS	READQ TS INTO(appl-commarea)
	COMMAREA(msg+appl-commarea)	RETURN
		COMMAREA(appl-commarea)
	WRITEQ TS	
	FROM(appl-commarea)	
		appl2
		ADDRESS
	brih-transaction =	COMMAREA(appl-commarea)
	briht-allocate-facility	BMS or 3270 commands
	LINK PROG(DFHL3270)	RETURN
	COMMAREA(alloc-msg)	COMMAREA(appl-commarea)
	brih-transaction=init	
	LINK PROG(DFHL3270)	
	COMMAREA(dummy-msg)	
	brih-transaction= <b>appl2</b>	
	LINK PROG(DFHL3270)	
	COMMAREA(msg)	
	brih-transaction =	
	briht-delete-facility	
	LINK PROG(DFHL3270)	
	COMMAREA(del-msg)	
	BETUBN	
	COMMAREA(msg)	

#### Note:

- 1. This solution could be varied according to the commarea size. If the msg+appl-commarea is greater than 32K, then rather than returning the appl-commarea to the listener, the init and term transansactions could write the commarea to a shared TS queue.
- 2. The same method can be used to initialize a TCTUA, large amounts of start data , or anything other parameters relating to the transaction environment.

## Allocating a bridge facility name for a pseudoconversation when using the Link3270 bridge for transaction routing

In this example the application is controlled by a bridge client on the host as described in "Select Link3270 client scenarios" on page 29.

Before running your client program:

- 1. Set the AIBRIDGE system initialization parameter to "yes" in the router region. This causes CICS to call the autoinstall user-replaceable program when a terminal ID has been allocated.
- Ensure that your autoinstall user-replaceable program contains code to change the last character of the terminal ID in SELECTED-BRFAC-TERMID if it is set to is set to "}". This character must be changed to a character that is unique to the system and can be an alphanumeric character or one of the following special characters: ¢@#./\_\$?!:|"=¬,;<>

If you are using NETNAME change it by copying SELECTED-BRFAC-TERMID to SELECTED-BRFAC-NETNAME.

Your client program should contain the following steps:

- 1. Call the Link3270 bridge with an allocate-facility request. This bridge facility is referred to as the primary bridge facility in this example.
- 2. Set BRIH-FACILITYKEEPTIME to the time the application will take to run. If in doubt set it to the maximum value allowed. The maximum value is given in the description of BRMAXKEEPTIME in "Defining Link3270 SIT parameters" on page 47. Set BRIH-FACILITYKEEPTIME to the time the application will take to run. If in doubt set it to the maximum value allowed. The maximum value is given in the description of BRMAXKEEPTIME in "Defining Link3270 SIT parameters" on run. If in doubt set it to the maximum value allowed. The maximum value is given in the description of BRMAXKEEPTIME in "Defining Link3270 SIT parameters" on page 47.

CICS calls the autoinstall user-replaceable program when the terminal ID for the bridge facility has been allocated.

- 3. When the transaction completes you may want to route to a different AOR:
  - a. Keep the terminal ID and NETNAME which are returned from the Link3270 call in BRIH-TERMINAL and BRIH-NETNAME and do not delete the primary bridge facility.
  - b. Allocate a new bridge facility using a Link3270 allocate-facility request. Before issuing this request, set BRIH-TERMINAL to the value of the primary bridge facility. Set BRIH-NETNAME also if you need NETNAME to be the same throughout. The facility allocated by this request is referred to as the secondary bridge facility in this example.
  - c. When the autoinstall user-replaceable program is called for the new facility, SELECTED-BRFAC-TERMID is set to the value in BRIH-TERMINAL. Note that this name does not have "}" as the last character and the program will accept it.
  - d. When changing to a third AOR, call Link3270 with a delete-facility request for the secondary bridge facility.
  - e. Repeat steps 3a to 3d each time the target AOR changes.
- 4. When all transaction routing has finished, call Link3270 with a delete-facility request for the primary bridge facility.

# Chapter 3. Using the Link3270 bridge

To run transactions using the Link3270 bridge, you must provide a client program that drives the Link3270 interface using LINK, EXCI LINK, or ECI requests. The message passed on each request determine the mode of operation, and the service to be performed.

To develop a client program to run an existing CICS 3270 transaction using the Link3270 bridge you need to:

- Establish the suitability of your applications for use with Link3270.
- Design and write your client programs

CICS provides sample ECI, EXCI and LINK client programs to run the NACT sample transaction. You can use these as guidance in converting your own applications. See Chapter 7, "Using the Link3270 samples," on page 97 for more information about the Link3270 samples and NACT.

This chapter describes:

- "Establish Link3270 suitability"
- "Writing the Link3270 client" on page 28
- "Using Link3270 messages" on page 33
- "Using Link3270 single transaction mode" on page 36
- "Using Link3270 session mode" on page 37
- "Calling the Link3270 bridge" on page 43
- "Using data conversion with Link3270" on page 44

## Establish Link3270 suitability

You need to establish that your applications are suitable for use with the Link3270 bridge. This can be done in two ways:

- 1. Using the load module scanner to identify if the applications use any instructions that are not supported by the bridge. This involves the following steps:
  - · Identify the programs used by the application
  - Run the load module scanner against the programs (see "Using the Load Module Scanner Utility" on page 28), using the bridge restrictions table DFHEIDBR. If there are any hits this indicates that there may be unsupported EXEC CICS commands.
    - **Note:** note that the load module scanner can occasionally generate a false hit, so you will need to investigate the program to ensure that this has not occurred.
  - If there are unsupported commands you may be able to change them. If not, then the application is not supported by Link3270.
- 2. Using the 3270 Bridge Passthrough SupportPak (See "Using the 3270 Bridge Passthrough SupportPak" on page 28) to check if the application uses any unsupported interfaces.

The bridge is designed to support applications conforming to the documented CICS API specified in the *CICS Application Programming Reference*, subject to the restrictions described in "Link3270 programming considerations" on page 20. To confirm whether the application (and associated vendor products used on the system) conform to this, the application should be run under the Passthrough

application. There may be various routes through the program which use different EXEC CICS API commands. Each of these routes should be tested using the Passthrough.

## Using the Load Module Scanner Utility

The load module scanner is a batch utility that scans load modules for specified CICS API commands. The commands to be reported upon are defined as a filter input file. A sample command filter list (DFHEIDBR) is provided to search for commands that are not supported in the 3270 bridge environment, and an output report identifies the commands and load module offsets, including EDF information if available. See Load module scanner (DFHEISUP), in the *CICS Operations and Utilities Guide* for information about running the Load Module Scanner Utility.

## Using the 3270 Bridge Passthrough SupportPak

The CA1E SupportPak is a support package providing the CICS 3270 Bridge Passthrough tool. This allows you to run a CICS 3270 user transaction from a 3270 terminal in the normal way, but internally CICS uses the Link3270 bridge logic instead of real 3270 terminal support. This allows you to evaluate whether a CICS 3270 transaction is suitable to be driven using the 3270 bridge.

The Passthrough transactions also allow you to examine the 3270 data streams and log them for further analysis. You can then use this information to write the client program that will drive the CICS 3270 transaction instead of a real 3270 terminal.

The CA1E SupportPak can be obtained from the Web, at the following URL: http://www.software.ibm.com/ts/cics/txppacs

### Writing the Link3270 client

To design and write a client program to run an existing CICS 3270 transaction using the Link3270 bridge you need to:

- 1. select a suitable bridge scenario to decide where code needs to be written
- 2. analyze the application to understand the business data that flows between the 3270 and the application, so that you can replace it with messages
- 3. decide whether you can use the simplified single transaction mode interface or whether you need to use the full session mode interface
- 4. Write you client program using the selected scenario and transaction mode, using Link3270 messages to communicate with Link3270.

Link3270 has two modes of operation:

#### Single transaction mode

This is a 'one-shot' type of request. A single transaction is run, and a single response message returned. The bridge facility is allocated automatically by CICS and deleted at the end of the transaction. This mode is appropriate for inquiry type applications.

#### Session mode

This mode is appropriate for sequences of transactions where state data is maintained between transactions. In this mode, the client program can request:

- allocation of a bridge facility
- · running of a transaction

- sending of continuation responses
- recovery from communication failure
- · deletion of the bridge facility

Your client program manages the sequence of requests and the creation and deletion of the bridge facility. Note that this is different from the implementation of the START bridge, where the bridge facility is created dynamically.

## Select Link3270 client scenarios

The following scenarios describe some common client environments. They show how you can develop your client program to run in the most appropriate environment to make best use of existing skills and experience. These scenarios demonstrate tiered client applications that enable you to divide the logic to make best use of skills and experience. They use some common terms:

#### **Business client**

The business client is concerned only with the business data and its representation in the client end-user environment

#### bridge client

The bridge client builds the bridge messages and manages the communication with the bridge using the Link3270 interface. You can develop the more complex bridge client to run in CICS, using CICS commands, and the business client portion can run in any environment that allows communication with the bridge client. The bridge client can be designed to be reusable.

#### 1. Host CICS Client

In this scenario, shown in Figure 7 on page 30, the programmer has CICS skills and experience, so it is more appropriate to write the Link3270 interface code on CICS.

You can separate the client logic into a business client, and a bridge client.

The LINK and EXCI samples show how a client application can be separated in this way and how common logic can be shared in the bridge client. Note that a business client in another CICS region can use DPL to access the bridge client.

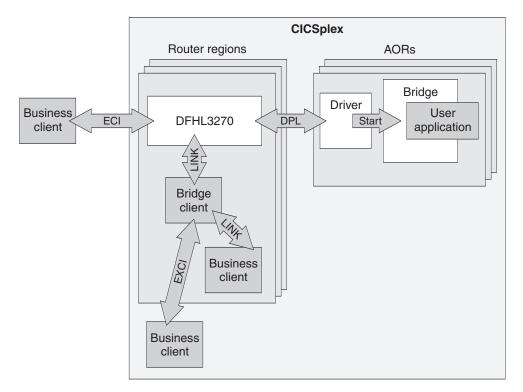

Figure 7. Link3270 host CICS client scenario

### 2. CICS Workstation Client

In this scenario, shown in Figure 8, where a CICS product is installed on the workstation (such as CICS for Unix) then the client can be a CICS program using LINK to interface with Link3270, or with a host CICS bridge client. In the three tier model the writer of the bridge client needs to have CICS skills, but the business client programmer only needs skills on that platform.

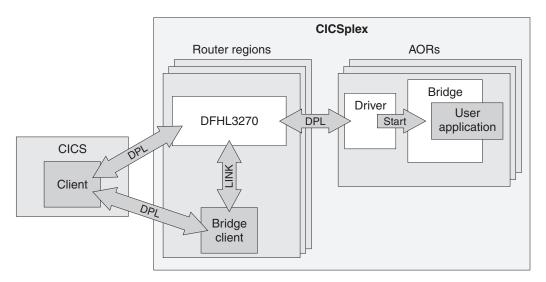

Figure 8. Link3270 CICS workstation client scenario

3. Non - CICS Workstation Client

In this scenario, shown in Figure 9, the programmer has workstation skills and limited CICS experience. For the two tier scenario, the programmer must have some CICS experience to understand the messages (which involve EXEC CICS instructions).

The client program executes on a remote workstation, using ECI to drive the user application. A single client program is written, combining the business logic in the client environment and the interface to Link3270.

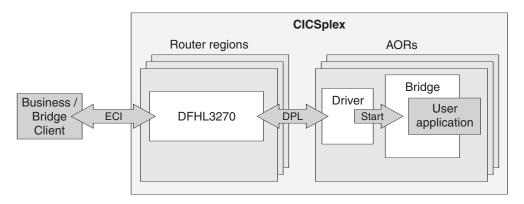

Figure 9. Link3270 non-CICS workstation client scenario

#### 4. 3-tier Workstation client

In this scenario, shown in Figure 10 on page 32, the workstation business client calls a bridge client in another environment, perhaps to utilize existing skills. For example, a Unix program could send a user-defined XML message to WebSphere on OS/390. A user-written bridge client application in WebSphere could then parse the XML message and convert it to a Link3270 message and use an EXCI LINK to call Link3270.

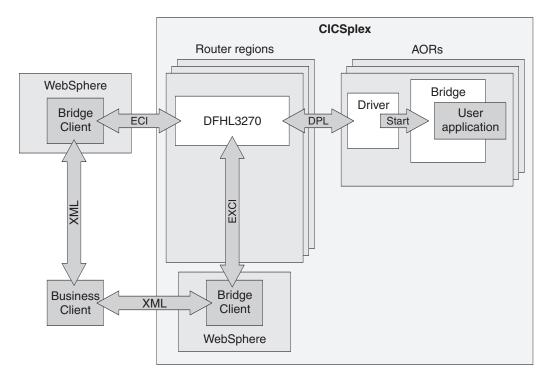

Figure 10. Link3270 3-tier client scenario

## Analyze the 3270 application

You need to analyze the 3270 application programs that form your transaction in order to replace the 3270 input data with messages sent by your client program. You can use the 3270 Bridge Passthrough SupportPak (See "Using the 3270 Bridge Passthrough SupportPak" on page 28) to drive your applications and log 3270 commands.

3270 programs fall mainly into the following types:

#### Minimum function BMS

This includes minimum function, SEND TEXT, and ACCUM. Link3270 supports these applications. Bridge clients can be written relatively easily by a CICS programmer.

#### BMS and little 3270 datastream

A typical example of this type is an application that issues RECEIVE of command line input, and issues a send MAP as output. Link3270 supports these applications. Client applications can be written relatively easily by a CICS programmer.

#### Mixed BMS and 3270 datastream

A typical example of this type is an application that issues RECEIVE and then RECEIVE MAP FROM. Link3270 supports these applications but the client programs are more difficult to write because MAP information has to be supplied in 3270 datastream format.

#### Pure 3270 datastream

Typically user-written 3270 datastream where the user has a well-understood fixed 3270 datastream structure. This is supported but the client program is more difficult to program than with BMS. However this is usually the format understood by the programmer of the target application.

#### Alternative map generators

3270 datastreams are generated dynamically. Link3270 supports these applications but the client programs are more difficult to write because MAP information has to be supplied in 3270 datastream format.

#### Full function BMS

Including ACCUM, PAGE and PARTITION support. These programs are not supported and will be detected by the load module scanner or the Passthrough tool.

### Select operation mode

### Using Link3270 messages

To run transactions using the Link3270 Bridge, a client program does the following:

- 1. Creates an inbound message
- 2. Links to DFHL3270 with a COMMAREA containing the message
- 3. Interprets the result of the outbound message

#### The inbound message

The inbound message is passed on the LINK, ECI or EXCI call as a COMMAREA. It contains the following data structures:

#### Bridge message header (BRIH)

A data structure containing parameters to be passed to the Link3270 bridge mechanism, such as the name of the user transaction; the facilitylike template to be used when the bridge facility is created, and the termid to be assigned to the bridge facility.

#### Bridge message vectors (BRIV)s

Zero or more data structures containing data to be passed to the user transaction containing the data requested by the EXEC CICS command for 3270 terminal input.

For example, if the application issues an EXEC CICS RECEIVE MAP, the inbound message will have the following form:

Table 2. Message structure for the	EXEC CICS RECEIVE MAP command
------------------------------------	-------------------------------

[	BRIH	BRIV-RM	ADS

Where ADS is the application data structure expected by the RECEIVE MAP command.

Sample BRIH and BRIV copybooks are supplied, primed with the default values, to simplify programming. You can include these in your program and then change only the specific fields relevant to the request.

#### The outbound message

The outbound message is passed in the COMMAREA on return from the LINK, ECI or EXCI call. It contains the following data:

#### Bridge message header (BRIH)

A data structure containing parameters returned by the Link3270 mechanism, such as return and response codes; the actual termid assigned to the bridge facility, and the length of the returned message.

#### Bridge message vectors (BRIV)s

Zero or more data structures containing the data supplied by the EXEC

CICS command for a 3270 terminal output request, or requests for more data, to be passed to the client program.

For example, if the application issues several non-terminal EXEC CICS commands, an EXEC CICS SEND MAP and then an EXEC CICS RETURN, the outbound message will have the following form: Where ADS is the application data structure expected by the SEND MAP command.

Table 3. Message structure for the EXEC CICS SEND MAP command

BRIH BRIV-SM ADS
------------------

A more complicated example would be one where the application issues several non-terminal EXEC CICS commands, an EXEC CICS SYNCPOINT, an EXEC CICS SEND CONTROL, an EXEC CICS SEND MAP, and then an EXEC CICS RETURN. In this case the outbound message will have the following form:

Table 4. More complicated message structure

BRIH BRIV-SP BRIV-SC BRIV-SM ADS
----------------------------------

### Inbound BRIV vectors

One BRIV vector is required containing the data requested by every EXEC CICS command for 3270 terminal input issued by the user transaction. The following commands are supported:

- CONVERSE
- RECEIVE
- RECEIVE MAP
- **Note:** If the application issues CONVERSE, and there is an inbound converse vector to satisfy this request, then the output from the converse is used to build an output SEND vector.

When the user transaction issues the command, the bridge mechanism searches the inbound message for the first BRIV that matches the command type. For RECEIVE MAP commands it attempts to match the MAPSET and MAP if these have been supplied by the client. RECEIVE MAP vectors are processed in order, and those that do not match the current command are discarded until a match is found. Blank names in the vector match any command.

Where there are several input vectors of different types, the order is not important.

For 'conversational' transactions (see "Conversational transactions" on page 39) when the client is asked for further input, the previous inbound message vectors (except RETRIEVE vectors) are discarded when a new inbound message is received. Note that RETRIEVE vectors can only flow in the first message of the first transaction in a session. See "Using Link3270 session mode" on page 37 for an explanation of the session programming mode.

### **Outbound BRIV vectors**

One BRIV vector is created containing the data supplied by every EXEC CICS command for 3270 terminal output issued by the user transaction. This passes to the client all the information and data relating to the command. The following commands are supported:

- ISSUE ERASEUP
- SEND

- SEND MAP
- SEND TEXT
- SEND CONTROL
- SYNCPOINT
- SEND PAGE<sup>1</sup>
- PURGE MESSAGE<sup>1</sup>

#### Note:

 SEND PAGE and PURGE MESSAGE are only available for the Link3270 bridge with extended support. See"Link3270 bridge basic and extended support" for an explanation of the differences between Link3270 bridge basic and extended support.

For 'conversational' transactions (see "Conversational transactions" on page 39), the last BRIV vector can represent an EXEC CICS command that requests more data. This vector is only created if the previous input message did not contain a BRIV to satisfy all the CICS commands. The following commands are supported:

- CONVERSE request
- RECEIVE request
- RECEIVE MAP request
- RETRIEVE request

### Link3270 bridge basic and extended support

There are two levels of support for the Link3270 bridge:

- Link3270 bridge with basic support provides the same as the support as that provided in CICS Transaction Server for z/OS, Version 2 Release 2. If you wish to continue using basic support, you do not need to take any action. Basic support is provided automatically.
- Link3270 bridge with extended support provides support for the ACCUM option on EXEC CICS SEND TEXT, EXEC CICS SEND MAP, and EXEC CICS SEND CONTROL, in addition to the basic support. To support the ACCUM option, there are two extra outbound vectors, SEND PAGE and PURGE MESSAGE. If you wish to take advantage of extended support, you must recompile any CICS Transaction Server for z/OS, Version 2 Release 2 Link3270 programs using the extended copybooks (listed in Table 6 on page 36), instead of the basic copybooks.

## Copybooks and default vectors

To simplify the task of constructing and analyzing Link3270 messages, CICS provides copybooks and header files containing BRIH and BRIV structures. Sample BRIH and input BRIV structures already primed with default values are also supplied, so all you need to do is copy them into your COMMAREA and modify relevant fields. The following default structures are supplied in all supported languages:

- BRIH-DEFAULT
- BRIV-CONVERSE-DEFAULT
- BRIV-RECEIVE-DEFAULT
- BRIV-RECEIVE-MAP-DEFAULT
- BRIV-RETRIEVE-DEFAULT

You will find the copybooks and headers in the files listed in the tables below. Table 5 shows the basic copybooks. Table 6 shows the extended copybooks.

structure	COBOL	С	PLI	Assembler
BRIH	DFHBRIHO	DFHBRIHH	DFHBRIHL	DFHBRIHD
Inbound BRIVs	DFHBRIIO	DFHBRIHH	DFHBRIHL	DFHBRIHD
Outbound BRIVs	DFHBRIOO	DFHBRIHH	DFHBRIHL	DFHBRIHD
Defaults and constants	DFHBRICO	DFHBRICH	DFHBRICL	DFHBRICD

Table 5. Link3270 message copybooks for basic support

Table 6. Link3270 message copybooks for extended support

structure	COBOL	С	PLI	Assembler
BRIH	DFHBR2HO	DFHBR2HH	DFHBR2HL	DFHBR2HD
Inbound BRIVs	DFHBR2IO	DFHBR2HH	DFHBR2HL	DFHBR2HD
Outbound BRIVs	DFHBR2OO	DFHBR2HH	DFHBR2HL	DFHBR2HD
Defaults and constants	DFHBR2CO	DFHBR2CH	DFHBR2CL	DFHBR2CD

Sample client programs are supplied to illustrate the use of the copybooks and defaults. You will find a description of these in "Running the sample client programs" on page 99.

## Using Link3270 single transaction mode

Single transaction mode allows a client to run a single transaction. The bridge facility is automatically created, then deleted at the end of the transaction. This mechanism is more efficient and easier to program than session mode, if only one transaction is being run. It is particularly suited to inquiry transactions.

To run in single transaction mode, your client program must supply the name of the user transaction in the BRIH\_TRANSACTIONID field of the bridge message header (BRIH). See "Link3270 message header (BRIH)" on page 60 for a description of the BRIH. The following parameters may also be optionally defined:

- BRIH-DATALENGTH (if BRIV vectors are appended to the message)
- BRIH-FACILITYLIKE
- BRIH-TERMINAL
- BRIH-NETNAME
- BRIH-ADSDESCRIPTOR
- BRIH-ATTENTIONID
- BRIH-STARTCODE
- BRIH-CURSORPOSITION

Your client program must also create BRIV vectors for any input commands. If you add data to a BRIV, you must also update the BRIH-DATALENGTH field. See "Updating data length fields" on page 37.

To use single transaction mode your application must satisfy the following restrictions, otherwise session mode should be used:

- Only one input and one output message are allowed. To run conversational transactions, you must provide all the input data in sequential BRIV structures in the input message. The BRIH-CONVERSATIONALTASK and BRIH-GETWAITINTERVAL parameters in the BRIH are ignored.
- The COMMAREA should be large enough to receive the output message. If it is not, the message is truncated at the last complete vector, and the rest of the message is discarded. BRIH-REMAININGDATALENGTH is set to a non zero value to indicate there has been truncation.
- If a communications link breaks, you can not obtain the output using a resend message request. For this reason it is recommended that single transaction mode is mainly used for inquiry type transactions.

## Updating data length fields

If you add data to a BRIV you must update the following fields to include the length of the data:

- · The BRIV data length field
- The BRIV header vector length field

If you add a BRIV to a message, you must add the value in the BRIV header vector length field to BRIH-DATALENGTH.

## Using Link3270 session mode

Session mode allows a client to run a number of transactions using the same bridge facility. It is more efficient than running each of these transaction in single transaction mode. Session mode supports the following operations:

- Allocating a bridge facility
- Running transactions
- Deleting a bridge facility
- Delivering large messages
- · Recovery in the event of communications failure

**Note:** The USERID must be the same for the whole session and must be specified in every Link3270 request.

### How to create a message

Before sending each message:

- 1. Move the default bridge message header (BRIH) into a message area.
- 2. For all messages other than the allocate, set BRIH\_FACILITY to the value returned on the allocate.
- 3. Modify other parameters of the message as required, as described in the following sections.

## Allocating a bridge facility

To allocate a bridge facility, your client program must set the value of the BRIH\_TRANSACTIONID field of the bridge message header (BRIH) to BRIHT-ALLOCATE-FACILITY. See "Link3270 message header (BRIH)" on page 60 for a description of the BRIH. The following parameters may also be optionally defined:

• BRIH-FACILITYKEEPTIME

- BRIH-FACILITYLIKE
- BRIH-TERMINAL
- BRIH-NETNAME

Other fields in the message are ignored.

For example, to allocate a bridge facility using the supplied default BRIH and constants:

**Note:** The BRIH-FACILITYLIKE value supplied by your client program is not validated until the first application transaction is run. It is only when the first application transaction is processed that the AOR region is determined and the facilitylike value can be validated within the selected AOR.

### **Running transactions**

To run transactions in session mode, your client program must supply the name of the user transaction in the BRIH\_TRANSACTIONID field of the bridge message header (BRIH), and set BRIH-FACILITY to the value returned by the allocate request. The following parameters may also be optionally defined:

- BRIH-DATALENGTH
- BRIH-CONVERSATIONALTASK
- BRIH-GETWAITINTERVAL
- BRIH-ADSDESCRIPTOR
- BRIH-ATTENTIONID
- BRIH-STARTCODE
- BRIH-CURSORPOSITION

Other fields in the BRIH are ignored.

For example, to run transaction NACT using the supplied default BRIH and constants: Working-Storage Section

```
.

.

.

.

Linkage Section.

01 msg-area.

.

.

.

.

03 msg-vectors pic x(2000).
```

Procedure Division

```
move brih-default to msg-area
move 'NACT' to brih-transactionid
move facility to brih-facility
move brih-datalength to len
EXEC CICS LINK PROGRAM('DFHL3270') COMMAREA(msg-area)
LENGTH(length of msg-area) DATALENGTH(len)
END-EXEC
```

Your client program must also create BRIV vectors for any input commands. For example:

```
move briv-receive-map-default to briv-in.move 'DFH0MNA 'to briv-rm-mapset.move 'ACCTMNU 'to briv-rm-map.move '422'to briv-rm-cposn.move length of acctmnuito briv-rm-data-len.set address of acctmnuito address of briv-rm-data.move low-valuesto acctmnui.add briv-rm-data-lento briv-input-vector-length.addbriv-rm-data-lenbriv-input-vector-length to brih-datalength.
```

Note: When adding a BRIV always remember to increment the BRIH-DATALENGTH

#### **Conversational transactions**

A traditionally conversation transaction, making multiple interactions with a terminal, can be run under the Link3270 bridge as a simple 'non-conversational' transaction by providing all the terminal input in multiple BRIV vectors in the Link3270 request message.

Here, the term 'conversational' refers to transactions where there are multiple flows between the client and the user transaction. To enable this conversational interaction, you must set BRIH-CONVERSATIONALTASK to BRIHCT-YES.

If the user transaction encounters a CONVERSE, RECEIVE or RECEIVE MAP and the Link3270 mechanism has not received a BRIV to satisfy the request, and the BRIH allows conversations (BRIH-CONVERSATIONALTASK is set to BRIHCT-YES), a message is returned to the client requesting further data. The value of BRIH-TASKENDSTATUS is set to the value BRIHTES-CONVERSATION, and a request BRIV is the last vector in the message.

The client then responds by sending a further input message containing the required 3270 input data. The client initializes the message to the default BRIH and sets the value of the BRIH-TRANSACTIONID field to BRIHT-CONTINUE-CONVERSATION and BRIH-FACILITY to the value returned on the allocate request. The following parameters may also be optionally defined:

- BRIH-DATALENGTH (if BRIV vectors are appended to the message)
- BRIH-CONVERSATIONALTASK
- BRIH-GETWAITINTERVAL
- BRIH-CANCELCODE

Other fields in the BRIH are ignored.

The client program may also need to create BRIV vectors if appropriate, and it must reply within the time specified in BRIH-GETWAITINTERVAL

**Note:** If BRIH-CONVERSATIONALTASK is set to BRIHCT-NO, the bridge will abend the user transaction if it issues an input command for which no vector has been supplied.

### **Pseudoconversational transactions**

A pseudoconversation normally involves a series of transactions, each initiated by the previous transaction, which may also pass some data. The name of the next transaction to be run can be defined by the user transaction in different ways:

- 1. EXEC CICS RETURN TRANSID
- 2. EXEC CICS RETURN TRANSID IMMEDIATE
- 3. EXEC CICS START TRANSID TERMID
- 4. EXEC CICS SET TERMINAL/NETNAME NEXTTRANSID
- 5. Terminal data
- **Note:** Transactions initiated by START TERMID are not necessarily pseudoconversational. Here we are considering only those transactions initiated by a START to the principal facility (the bridge facility) where the STARTING and STARTED applications are associated in a pseudoconversation. In this case, START TERMID must specify the bridge facility.

Commands 1-4 all cause the bridge mechanism to set the next transaction identifier in the BRIH-NEXTTRANSACTIONID field to be returned to the client in the next response message.

The client responds by sending a run request for the next transaction, with BRIH-TRANSACTIONID set to the value from BRIH-NEXTTRANSACTIONID and BRIH-FACILITY set to the value returned on the allocate request. The following parameters may also be optionally defined:

- BRIH-DATALENGTH (if BRIV vectors are appended to the message)
- BRIH-CONVERSATIONALTASK
- BRIH-GETWAITINTERVAL (if conversational)
- BRIH-ADSDESCRIPTOR
- BRIH-ATTENTIONID
- BRIH-CURSORPOSITION

Other fields in the BRIH are ignored.

**Note:** The same bridge facility must be used by all transactions in the pseudoconversation.

### Deleting a bridge facility

When all session activity is complete, the client can delete the bridge facility. To do this, your client program must set the value of the BRIH\_TRANSACTIONID field of the BRIH to BRIHT-DELETE-FACILITY, and set BRIH-FACILITY to the value returned by the allocate request. Other fields in the message are ignored.

For example, to delete a bridge facility using the supplied default BRIH and constants:

Working-Storage Section

. copy dfhbrico

```
Linkage Section.

01 msg-area.

copy DFHBRIHO.

.

Procedure Division

.

move brih-default to msg-area

set briht-delete-facility to true

move facility to brih-facility

move brih-datalength to len

EXEC CICS LINK PROGRAM('DFHL3270') COMMAREA(msg-area)

LENGTH(length of brih) DATALENGTH(len)

END-EXEC

.
```

If the bridge facility is not explicitly deleted, it is scheduled for deletion automatically by CICS if it is unused for the time specified in the BRIH-FACILITYKEEPTIME field, or in the BRMAXKEEPTIME system initialization parameter. The smaller interval is used.

### **Delivering large messages**

If the output message from the user transaction is larger than the size of the COMMAREA passed on the request, the bridge mechanism returns a BRIH and as many complete BRIV vectors as will fit into the returned COMMAREA. If it is not possible to fit the whole of the outbound message into the COMMAREA, the field BRIH-REMAININGDATALENGTH is set to a non zero value. The client can then issue one or more requests to obtain the rest of the data. To do this, your client program must set the value of the BRIH-TRANSACTIONID field to BRIHT-GET-MORE-MESSAGE, and set BRIH-FACILITY to the value returned by the allocate request. Other fields in the message are ignored.

When further sections of the message are returned, they are always be prefixed by a BRIH. This is so that CICS can return error information. Clients should follow CICS recommendations regarding COMMAREA lengths described in LENGTH options in CICS commands, in the *CICS Application Programming Reference*.

### **Recovery from connection failure**

If the communications connection fails before a response message is received, the client can reconnect to the same router and request that the message be sent again. To do this, your client program must set the value of the BRIH-TRANSACTIONID field to BRIHT-RESEND-MESSAGE, and set BRIH-FACILITY to the value returned by the allocate request. Other fields in the message are ignored.

If successful, the outbound Link3270 bridge Message will contain as much of the message as can be fitted into the COMMAREA. If either the router or the AOR CICS region has failed, the message returned indicates that the facilitytoken is unknown.

If unsuccessful, the output is the BRIHT-RESEND-MESSAGE message with an appropriate BRIH-RETURNCODE.

Note:

- A resend request must be sent before the interval specified in BRIH-FACILITYKEEPTIME on the allocate request has expired. Otherwise, both the bridge facility and the outstanding message are deleted.
- 2. You can use the field BRIH-SEQNO to check whether the previous request has worked.

## Validity of Link3270 requests

At any time, the bridge facility is considered to be in a specific *state*. Some requests are only valid is the facility is in an appropriate state. If the request is not valid, BRIH-RETURNCODE is set to the value indicated in Table 7.

Possible states are:

- Not Allocated
- Allocated
- Conversational
- Transaction Ended

The following table will help you to decide when a request is valid, and what the resulting state will be. If a request is invalid, the state does not change:

Request	Not Allocated	Allocated	Conversational	Transaction ended
Allocate Facility	valid ->Allocated	note <sup>8</sup>	note <sup>8</sup>	note <sup>8</sup>
Run Transaction	valid <sup>2</sup>	valid <sup>4</sup>	invalid <sup>3</sup>	valid <sup>4</sup>
Continue Conversation	invalid <sup>1</sup>	invalid⁵	valid⁴	invalid⁵
Get More Message	invalid <sup>1</sup>	invalid⁵	valid/invalid7	valid/invalid7
Resend Message	invalid <sup>1</sup>	invalid⁵	valid ->Conversational	valid ->Transaction ended
Delete Facility	invalid <sup>1</sup>	valid ->Not Allocated	invalid <sup>3</sup>	valid ->Not Allocated

Table 7. Validity of Link3270 requests

#### Note:

- 1. BRIH-RETURNCODE set to BRIHRC-INVALID-FACILITYTOKEN.
- 2. This is defined as single transaction mode.
- 3. BRIH-RETURNCODE set to BRIHRC-FACILITYTOKEN-IN-USE.
- The resulting stated depends on whether the transaction issues further requests for which there is no BRIV. Possible new states are Conversational or Transaction-ended
- 5. BRIH-RETURNCODE set to BRIHRC-TRANSACTION-NOT-RUNNING.
- 6. BRIH-RETURNCODE set to BRIHRC\_NO-DATA.
- 7. The resulting state depends on whether there is more data to send ( indicated by BRIH-REMAININGDATALENGTH).
- 8. This state is not relevant, as Allocate always creates a new facility.

### Expiry of facilitytoken

If the facilitytoken expires due to inactivity, any subsequent requests are invalid. BRIH-RETURNCODE is set to BRIHRC-INVALID-FACILITYTOKEN and the resulting state is Not Allocated. Conversational requests may result in loss of data.

## Calling the Link3270 bridge

The Link3270 bridge supports the following external request mechanisms:

- 1. EXEC CICS LINK. This includes both local link and DPL.
- 2. The EXternal CICS Interface (EXCI). This includes both the EXCI call interface and the EXEC CICS interface.
- 3. The External Call Interface (ECI).

## Calling Link3270 using LINK

The interface is the standard EXEC CICS LINK interface, for example:

EXEC CICS LINK PROGRAM('DFHL3270') COMMAREA(Link3270\_message) DATALENGTH(inbound\_message\_length) LENGTH(outbound\_message\_length)

- PROGRAM must specify DFHL3270.
- The COMMAREA must contain a structured Link3270 message, as described in Chapter 5, "Link3270 message formats," on page 59.

If you are using DPL:

- SYSID may be specified. If there are multiple router regions, all calls must be issued to the same region where the allocate-facility call was sent.
- SYNCONRETURN can be used, but is not required. If it is not used, a mirror task remains in the router for the duration of the session.
- TRANSID can be used
- INPUTMSG and INPUTMSGLEN are ignored.

The bridge header (BRIH) indicates whether the transaction ran successfully or not. See Chapter 6, "Link3270 diagnostics," on page 91 for a full description of the return codes from the Link3270 call.

See LINK, in the *CICS Application Programming Reference* manual for a full description of the LINK command.

## Calling Link3270 using EXCI

Either form of the EXCI interface can be used to run the bridge. The EXEC CICS interface is recommended for the single transaction mode. The call interface is recommended for the session mode. See Chapter 3, "Using the Link3270 bridge," on page 27 for a description of single transaction and session modes. See "The EXCI programming interfaces" on page 108. for information about using the EXCI interface.

## Calling Link3270 using ECI

The interface is the standard ECI interface, passing the ECIPARMS parameter list. This should contain the following specific fields:

parameter	value
eci_call_type	synchronous or asynchronous

parameter	value
eci_program_name	DFHL3270
eci_userid	Userid for security validation. The user transaction runs with this userid
eci_password	Password or Passticket for security validation
eci_tpn	User transaction name
eci_commarea	Address of the Link3270 message
eci_commarea_length	Length of the Link3270 message

The other fields are set according to normal ECI programming. See *CICS Family: Client/Server Programming* for more information about the using the ECI interface.

The return code from the ECI call indicates whether the request was accepted by CICS. A return code of ECI\_NO\_ERROR does not imply that the transaction ran successfully. It implies that the transmission of the message was successful. The client application should look in the returned bridge header (BRIH) for the return code and abendcode. See Chapter 6, "Link3270 diagnostics," on page 91 for a full description of the return codes from the Link3270 call.

### **Multiple Router regions**

If there are multiple router regions, all calls must be issued to the same region where the allocate-facility call was sent.

### Using data conversion with Link3270

If the codepage of your client program is different from the codepage used by the CICS user program, your messages need to be converted.

The BRIH, all BRIV vector headers and RETRIEVE data can be converted using the CICS conversion program DFHCCNV. See The conversion process, in the *CICS Family: Communicating from CICS on zSeries* manual for information about the data conversion process.

DFHCCNV uses the DFHCNV table to determine the required conversions. You need to supply **entries** in this table for each resource that requires conversion. See Defining the conversion table, in the *CICS Family: Communicating from CICS on zSeries* manual.

### Converting BRIH and BRIV header data

In your DFHCNV, you should include: COPY DFHBRCTD

If you are using codepages other than the defaults, that is, other than 437 for the client and 037 for the server, then you must ensure that the correct codepage conversion is applied to DFHBRCTD. You can do this by coding SRVERCP and CLINTCP parameters on the DFHCNV TYPE=INITIAL statement. The COPY DFHBRCTD statement should follow DFHCNV TYPE=INITIAL.

If the application programs run using the same codepages as those specified on the TYPE=INITIAL statement, then the TYPE=ENTRY statements do not need to specify the codepages.

If an application program, or programs, need to use different codepages, then the new values must be specified on the appropriate TYPE=ENTRY statements.

Build DFHCNV as described in Assembling and link-editing the conversion programs, in the *CICS Family: Communicating from CICS on zSeries* manual. This will convert the BRIH and BRIV vector headers using the codepages described in your conversion template.

#### **DFHCNV example for Link3270**

Figure 11 shows an example of a DFHCNV for a CICS region using codepage 939 for the server programs and codepage 943 for most of the clients.

The COPY DFHBRCTD statement follows the DFHCNV TYPE=INITIAL statement, so it will use 939 and 943. This is used in the conversion of BRIHs.

PROG1 uses the same codepages, but PROG2 uses client codepage 932 instead of 939. In order to achieve this, the TYPE=ENTRY statement for PROG2 contains overrides for the client and server codepages.

```
DFHCNV TITLE 'EXAMPLE DFHCNV CONVERSION TABLE'
```

DFHCNV TYPE=INITIAL,SRVERCP=939,CLINTCP=943

```
COPY DFHBRCTD
```

```
* DFHCNV TYPE=ENTRY,RTYPE=PC,RNAME=PROG1
DFHCNV TYPE=SELECT,OPTION=DEFAULT
DFHCNV TYPE=FIELD,OFFSET=0,DATATYP=CHARACTER,DATALEN=10018, *
LAST=YES
* DFHCNV TYPE=ENTRY,RTYPE=PC,RNAME=PROG2, *
SRVERCP=939,CLINTCP=932
DFHCNV TYPE=SELECT,OPTION=DEFAULT
DFHCNV TYPE=FIELD,OFFSET=0,DATATYP=CHARACTER,DATALEN=500, *
LAST=YES
* DFHCNV TYPE=FINAL
END
```

Figure 11. DFHCNV example for Link3270

## **Converting RETRIEVE data**

RETRIEVE data is converted using the conversion template for the user transaction. You should provide a DFHCNV entry with RTYPE=IC RNAME=*user tranid*.

## **Converting User data**

User data following each BRIV (including the ADSD, but excluding RETRIEVE data) is converted in the AOR using the GCHARS and GCODES values defined for the facilitylike terminal that was used as a template to build the bridge facility. You should define these values appropriately for your client program, and specify the facilitylike name in your Link3270 call if you are not using the default. The client codepage must be specified in value 2 of CGCSGID in the AOR as well as in the DFHCNV conversion table in the router region.

The codepage conversion for user data is based on the codepage conversion for EPI emulation. Refer to EPI character sets and server code pages , in the *CICS Family: Communicating from CICS on zSeries* manual for the correct values for the CGCSGID field in the TYPETERM definition associated with the facilitylike.

CGCSGID values 1 and 2 can be retrieved by an application program using EXEC CICS ASSIGN GCHARS and EXEC CICS ASSIGN GCODES respectively.

**Note:** SEND TEXT NOEDIT data is always converted as if it were in 3270 data stream format.

# Chapter 4. Managing the Link3270 bridge environment

Before you can use the Link3270 bridge you must:

 Define a DFHBRNSF file as described in "Defining the bridge facility name" on page 49.

Optionally, you can also:

- Allocate specific names to bridge facilities using the autoinstall user replaceable program. See "Defining the bridge facility" on page 48.
- Control the keeptime for bridge facilities. See "Defining Link3270 SIT parameters."
- Use the dynamic transaction routing program to enable load balancing. See "Using Link3270 bridge load balancing" on page 56

This chapter describes the CICS interfaces provided to help you set up and control a Link3270 bridge environment. It describes:

- "Defining Link3270 SIT parameters"
- "Defining the bridge facility" on page 48
- "Managing Link3270 bridge resources" on page 54
- "Using Link3270 bridge load balancing" on page 56

## **Defining Link3270 SIT parameters**

The following system initialization parameters affect the operation of the Link3270 bridge:

#### AIBRIDGE={AUTO | YES}

Code this parameter to specify whether the autoinstall URM is called when bridge facilities are created and deleted.

#### AUT0

The autoinstall URM is not called.

#### YES

The URM is called for all new bridge facilities and can change the termid and netname, or can reject the request

#### BRMAXKEEPTIME={86400 | timeout }

Bridge facilities are deleted after they have been unused for a given length of time. The timeout value can be specified by the client when it sends in a request to create a bridge facility in session mode. This parameter specifies the maximum timeout value that a client can specify (in seconds). If the client specifies a larger value than the BRMAXKEEPTIME value in the AOR, then CICS will change this parameter in the link parameter list ( but does not return the reduced value to the client).

Use this parameter to ensure that CICS does not run short of bridge facilities caused by clients reserving bridge facilities for too long a period.

#### 86400

The default maximum timeout value (24 hours) that a client can specify to retain an unused bridge facility before it is deleted.

#### timeout

The maximum timeout value that a client can specify (in seconds), before an unused bridge facility is deleted. The value specified must be

in the range 0 to 86400. A value of 0 means that bridge facilities are never kept at the end of a transaction. Therefore CICS will not be able to run pseudoconversational transactions. This may be useful if the region is only used for inquiry transactions. The default value is 24 hours (86400 seconds).

You can also specify the SPCTR and STNTR parameters to request standard and special tracing for the bridge (BR) and partner (PT) domains:

#### BR domain tracing

- Exception tracing for disasters and significant user errors.
- Level 1 normal domain tracing.
- Level 2 additional information. Messages and vectors trace only up to 4000 bytes.

#### PT domain tracing

- Exception tracing for disasters and significant user errors.
- · Level 1 normal domain tracing.
- Level 2 additional information.

See Specifying DFHSIT macro parameters, in the *CICS System Definition Guide* for further information about the SIT.

### Defining the bridge facility

The bridge facility is an emulated 3270 terminal. It is a virtual terminal, created by DFHL3270 when it receives a single transaction mode request, or a session mode request to allocate a bridge facility.

You do not provide a TERMINAL resource definition for the bridge facility, but you can control the terminal properties used by providing a 3270 TERMINAL resource definition to be used as a template. This TERMINAL definition, is known as the **facilitylike**.

### Defining the facilitylike

The facilitylike value is the name of a real terminal resource definition that is used as a template for some of the properties of the bridge facility.

The name of the facilitylike definition to be used can be passed to CICS in one of three ways (the first non-blank value found is used):

- From the BRIH-FACILITYLIKE parameter in the Link3270 call.
- From the PROFILE resource definition for the user transaction.
- The default is CBRF, a definition supplied by CICS to support the bridge.
- Once the bridge facility has been defined, its facilitylike template cannot be changed. Therefore, if the bridge facility is reused in session mode, CICS ignores the facilitylike value passed in subsequent calls.
- **Note:** If you are running in a CICS system started with the VTAM=NO system initialization parameter, the resource definition specified by facilitylike must be defined as REMOTE. A default definition of CBRF, defined as REMOTE, is provided in the group DFHTERM.

See Defining PROFILE resources, in the *CICS Resource Definition Guide* for information about the PROFILE resource definition.

# Defining the bridge facility name

When CICS creates a bridge facility, it creates both an eight-byte token to identify it (the **facilitytoken**) and a four-character terminal identifier, which is used as both TERMID and NETNAME. The facilitytoken is returned on the Link3270 allocate call and must be supplied by you on all subsequent session mode calls (See "Using Link3270 session mode" on page 37).

For bridge facilities created by the Link3270 bridge, the token and name are unique across the CICSplex, and the TERMID and NETNAME are of the form AAA}. Naming occurs in the routing region, at the time of processing an "allocate" command in session mode, or the internal allocate step in single-transaction mode. See Chapter 3, "Using the Link3270 bridge," on page 27 for information about session and single-transaction modes.

Link3270 bridge facility name space allocation information is recorded in a shared file, DFHBRNSF, to ensure uniqueness of the names. The router regions that share file DFHBRNSF and their associated AOR's form the bridge CICSplex. Multi-bridge CICSplexes can be set up within a larger CICSplex , each router region within a bridge CICSplex sharing the same DFHBRNSF file. The AOR regions of a bridge CICSplex can only be associated with router regions on one bridge CICSplex.

To improve performance, the Link3270 bridge name space is split into allocation ranges, so that a 'chunk' of names is allocated to each router region, and the DFHBRNSF file is only accessed when a name space range is allocated or released. Names within the allocated chunks can be reused when keeptimes expire, and chunks may also be reused in other regions, so you may see the same names appearing in different regions, but they are only active in one region at any given time.

Message DFHBR0505 is issued when 90% of the DFHBRNSF names have been allocated and is issued for each percentage point increase in the names being allocated. Message DFHBR0506 is issued for each percentage point reduction in names allocated until below 90%. When no more names are available, message DFHBR0507 is issued, and client application new allocation (or one shot) requests receive a return code of BRIHRC\_NO\_FREE\_NAME.

# DFHBRNSF file types

The bridge facility name space allocation file (DFHBRNSF) can be a local user data table, a local VSAM file, a coupling facility data table (CFDT), a remote VSAM file or a VSAM RLS file.

If only one router region is used a user maintained data table or local VSAM version of DFHBRNSF is recommended.

If multi-router regions are used, the DFHBRNSF file can be defined as a local VSAM file in a remote file owning region (FOR) and as a remote VSAM file in the router regions; as a VSAM RLS in all the router regions, or as a coupling facility data table in all the router regions.

If the user maintained data table version of DFHBRNSF is used, the VSAM data set specified in the CICS file definition must be empty; no records should be loaded from the file to the data table. The data table should not be closed when the router region is running, because all bridge facility name space data will be lost and the

next request to allocate or release a range of bridge facilities will fail. For this reason, a user maintained data table is not recommended for a production environment.

# Defining DFHBRNSF

For VSAM files and data tables you will need to use IDCAMS to create file DFHBRNSF. Figure 12 shows a some sample IDCAMS statements that you can modify to create the DFHBRNSF file. The cluster name and volume values should be changed to comply with your own standards.

```
//DEFDS
            JOB accounting info, name, MSGCLASS=A
//TDINTRA EXEC PGM=IDCAMS
//SYSPRINT DD SYSOUT=A
//SYSIN
           DD
      DEFINE CLUSTER(NAME(CICSTS22.CICS.DFHBRNSF)-
                INDEXED-
                TRK(1 1)-
                RECORDSIZE(384 384)-
                KEYS(13 20)-
                FREESPACE(0 50)-
                SHAREOPTIONS(2 3)-
                LOG(NONE) -
                VOLUME(DISK01)-
                CISZ(512)) -
              DATA (NAME(CICSTS22.CICS.DFHBRNSF.DATA) -
              CISZ(512))
             INDEX (NAME(CICSTS22.CICS.DFHBRNSF.INDEX) -
               CISZ(512))
/*
11
```

Figure 12. Sample IDCAMS job to create the DFHBRNSF file

See Coupling facility data tables, in the *CICS System Definition Guide* for guidance on creating coupling facility data tables.

File DFHBRNSF contains two control records plus 1 record for each router region that accesses the file. The maximum number of records that can be written to DFHBRNSF is 731 (this includes the 2 control records).

You need to define file DFHBRNSF to CICS in the Link3270 router regions. Resource definitions have been provided for all versions of the file. You should include the appropriate group in your startup grouplist, or copy chosen definitions into a group in the grouplist. You will need to edit the definitions to match your IDCAMS statements. Change the DSN field to match the cluster name used with IDCAMS to create the file, unless the CFDT version of the file is to be used. If the CFDT definition is being used, change the CFDTPOOL value to the name of the pool containing the table defined by the file definition. The table below shows the groups provided that contain the DFHBRNSF definitions.

Table 8. Supplied resource definitions for DFHBRNSF

Group	Туре
DFHBRVR	VSAM RLS
DFHBRVSL	Local VSM, non-RLS
DFHBRVSR	Remote VSAM, non-RLS

Table 8. Supplied resource definitions for DFHBRNSF (continued)

Group	Туре
DFHBRCF	Coupling facility data table
DFHBRUT	User maintained data table

#### Note:

- If DFHBRNSF becomes unavailable, only Link3270 requests that do not cause an allocation or release of a bridge facility name space range will still complete successfully.
- If DFHBRNSF file has to be redefined for any reason, all router regions that access the file should be shut down before the file is redefined, and restarted after the file has been redefined.

# **DFHBRNSF** at CICS termination

During the normal termination of a CICS router region, new Link3270 requests are rejected and existing Link3270 facilities are released. When all facilities have been released, the DFHBRNSF name ranges associated with the router region are freed.

It is possible that the freeing of the DFHBRNSF name ranges will fail. For example, if file DFHBRNSF is remote, the shutdown transaction CESD breaks the connection to the file owning region before the name ranges have been freed. If this happens an error message will be issued. The name ranges are only freed when the CICS region is restarted and a Link3270 transaction has run in that region.

If the CICS termination is immediate, the Link3270 request is rejected with return code BRIH-CICS-TERMINATION, but the Link3270 facilities and DFHBRNSF name ranges associated with the facilities are not released. The name ranges are only freed when the CICS region is restarted and a Link3270 transaction has run in that region.

# Defining a specific bridge facility name

If the name or netname of the 3270 terminal is important to the logic of the 3270 application, you can supply a specific name in the BRIH-TERMINAL or BRIH-NETNAME parameter on the Link3270 call and also optionally request that the autoinstall user replaceable module (URM) is called when the bridge facility is allocated. The autoinstall URM is called if you specify the system initialization parameter AIBRIDGE=YES at CICS startup, or use SET AUTOINSTALL to activate this option at a later time.

The AUTOINSTALL URM can accept, reject or modify the supplied or generated terminal name and netname. See How bridge facility virtual terminals are autoinstalled, in the *CICS Customization Guide* for information about the autoinstall URM.

# Initializing the TCTUA

The bridge facility can have a TCTUA (Terminal Control Table User Area), which can be accessed by EXEC CICS ADDRESS TCTUA in the normal way. The TCTUA is initialized to nulls when the bridge facility is created. A global user exit (GLUE) called XFAINTU is called when a bridge facility is created and discarded. XFAINTU is passed the address of the TCTUA, so you can use this exit to initialize the TCTUA. See Bridge facility exit XFAINTU, in the *CICS Customization Guide* for information about the XFAINTU global user exit.

# Accessing bridge facility properties

The user transaction can retrieve information about its principal facility (the bridge facility) from the EIB or by using INQUIRE and ASSIGN commands, in exactly the same way that it does when running normally, where the principal facility is a real 3270. For example, the TERMID can be obtained from EIBTERMID or from an ASSIGN FACILITY, INQUIRE TASK FACILITY or INQUIRE NETNAME command, and the NETNAME can be obtained with ASSIGN NETNAME or INQUIRE TERMINAL.

You can use the INQUIRE BRFACILITY command to obtain information about any bridge facility, identified by its facilitytoken, but all other INQUIRE commands return only information about the bridge facility that is the principal facility of the transaction issuing the command. To other transactions, a transaction running in a bridged environment appears to be a non-terminal transaction, and an INQUIRE TERMID against a bridge facility TERMID issued by another transaction will result in TERMIDERR. INQUIRE NETNAME and INQUIRE TASK behave similarly.

Bridge facilities do not appear in response to INQUIRE TERMINAL browses.

All keywords of ASSIGN and INQUIRE are supported and return the values that have been set for the bridge facility from the FACILITYLIKE terminal definition, or that have been set during the execution of the transaction.

Some keywords return values fixed by CICS for the bridge environment. These are:

Keyword	Returned value
ACQSTATUS	ACQUIRED
ACCESSMETHOD	VTAM
CORRELID	blanks
EXITTRACING	NOTAPPLIC
LINKSYSTEM	blanks
MODENAME	blanks
REMOTENAME	blanks
REMOTESYSTEM	blanks
REMOTESYSNET	blanks
SERVSTATUS	INSERVICE
TCAMCONTROL	X'FF'
TERMSTATUS	ACQUIRED
TTISTATUS	YES
ZCPTRACING	NOZCPTRACE

Table 9. INQUIRE TERMINAL values

# Table 10. INQUIRE TASK values

Keyword	Returned value
FACILITY	the bridge facility name
FACILITYTYPE	TERM or TASK
STARTCODE	S,SD,TO,TP

# QUERY

The keywords listed below represent terminal attributes that can be set by the 3270 Query function at logon time for a real device:

ALTSCRNHT	ALTSCRNWD	APLKYBDST	APLTEXTST
BACKTRANSST	COLORST	EXTENDEDDSST	GCHARS
GCODES	HILIGHTST	MSRCONTROLST	OUTLINEST
PARTITIONSST	PROGSYMBOLST	SOSIST	VALIDATIONST

If the real FACILITYLIKE terminal is logged on when the bridge facility is created, the QUERY will have been performed and the values returned will apply to the bridge facility.

If the real FACILITYLIKE terminal is not logged on at the time that the bridge facility is created, the QUERY will not have been performed and the bridge facility will be created using values from the FACILITYLIKE resource definition.

# SET TERMINAL/NETNAME

The following table shows the effect of each of the SET TERMINAL/NETNAME keywords when issued by a user transaction for its bridge facility. Unless otherwise specified, the response is DFHRESP(NORMAL).

KEYWORD	EFFECT
ACQSTATUS	Ignored.
ALTPRINTER	Value is SET, and is returned on INQUIRE, but is never used by CICS.
ALTPRTCOPYST	Value is SET, and is returned on INQUIRE, but is never used by CICS.
ATISTATUS	Works as for normal 3270.
CANCEL	Ignored
CREATESESS	Ignored.
DISCREQST	Value is SET, and is returned on INQUIRE, but is never used by CICS.
EXITTRACING	Ignored.
FORCE	Ignored.
MAPNAME	Works as for normal 3270.
MAPSETNAME	Works as for normal 3270.
NEXTTRANSID	Works as for normal 3270.
OBFORMATST	Works as for normal 3270.
PAGESTATUS	Ignored.
PRINTER	Value is SET, and is returned on INQUIRE, but is never used by CICS.
PRTCOPYST	Value is SET, and is returned on INQUIRE, but is never used by CICS.
PURGE	Ignored.
PURGETYPE	Ignored.
RELREQST	Value is SET, and is returned on INQUIRE, but is never used by CICS.

KEYWORD	EFFECT
SERVSTATUS	Works as for normal 3270.
TCAMCONTROL	Returns INVREQ, as for normal 3270.
TERMPRIORITY	Value is SET, and is returned on INQUIRE, but is never used by CICS.
TERMSTATUS	Ignored.
TRACING	Value is SET, and is returned on INQUIRE, but is never used by CICS.
TTISTATUS	Ignored.
UCTRANST	Works as for normal 3270.
ZCPTRACING	Ignored.

# Managing Link3270 bridge resources

You can use the following commands and interfaces to obtain information about the Link3270 bridge environment and the bridge facility:

- INQUIRE/SET AUTOINSTALL
- INQUIRE/SET BRFACILITY
- INQUIRE TERMINAL/NETNAME
- INQUIRE TASK
- INQUIRE/SET TRACETYPE
- INQUIRE TRANSACTION
- CEMT
- The exit programming interface (XPI)

See the *CICS System Programming Reference* for details of INQUIRE and SET commands, and the *CICS Supplied Transactions* for information about the CEMT command.

**Note:** The BRIDGE option of the ASSIGN command returns the name of the transaction that issued the Link3270 command. It returns blanks if the transaction is not run in a bridge environment.

# INQUIRE/SET AUTOINSTALL with the Link3270 bridge

You can use the AIBRIDGE option of the INQUIRE AUTOINSTALL command and CEMT INQUIRE AUTOINSTALL to indicate whether the autoinstall URM is called when bridge facilities are allocated. You can change this setting using the SET AUTOINSTALL command and CEMT SET AUTOINSTALL.

# INQUIRE/SET BRFACILITY with the Link3270 bridge

You can use the INQUIRE BRFACILITY command and CEMT INQUIRE BRFACILITY to return the following information about a bridge facility:

- The terminal name associated with the bridge facility (TERMID)
- · The netname associated with the bridge facility
- · The name of the user transaction running with this bridge facility
- · The number of the task running the user transaction
- The applid of the AOR
- · The sysid of the AOR

- · The applid of the router region
- · The sysid of the router region
- An indicator showing whether the Link3270 or START BREXIT bridge mechanism is being used
- The length of time this bridge facility will be kept if unused
- · The current status of the bridge facility

You can change the status setting of the bridge facility to RELEASED using the SET BRFACILITY command and CEMT SET BRFACILITY.

# INQUIRE TASK with the Link3270 bridge

You can use the BRFACILITY option of the EXEC CICS INQUIRE TASK or CEMT INQUIRE TASK command to return an 8-byte field containing the facilitytoken for the bridge facility in use by the task.

# INQUIRE/SET TRACETYPE with the Link3270 bridge

You can use the INQUIRE TRACETYPE command to indicate whether tracing is enabled for the bridge (BR) and partner (PT) domains. You can change this setting using the SET TRACETYPE command .

# **INQUIRE TRANSACTION** with the Link3270 bridge

You can use the FACILITYLIKE option of the INQUIRE TRANSACTION command and CEMT INQUIRE TRANSACTION to return the 4-character name of the terminal defined by the FACILITYLIKE parameter of the PROFILE associated with the named transaction resource definition. If FACILITYLIKE is not defined, blanks are returned.

**Note:** The BREXIT option returns information about the START BREXIT bridge mechanism, and is not used with Link3270.

# XPI commands for the Link3270 bridge

You can use the INQUIRE\_CONTEXT function of the DFHBRIQX call to return the following information:

- The name of the bridge exit program used by a task running the START BREXIT bridge mechanism.
- The bridge facilitytoken associated with a user transaction running in a bridge environment.
- The address of the bridge facility. This has the same format as a TCTTE and can be mapped using the DSECT DFHTCTTE.
- The name of the bridge monitor transaction used to start a user transaction using the START BREXIT bridge mechanism.
- A token that contains the address of the bridge exit area used by a task running the START BREXIT bridge mechanism.
- The type of environment in which the transaction is running. This can be :

**Note:** The BRIDGE and IDENTIFIER options return information about the START BREXIT bridge mechanism, and are not used with Link3270.

# NORMAL

A transaction that is not running in a bridge environment.

# BRIDGE

A user transaction that was started using a bridge.

# BREXIT

A bridge exit program.

See Transaction management XPI functions, in the *CICS Customization Guide* for full details of the INQUIRE-CONTEXT interface.

# Using Link3270 bridge load balancing

The Link3270 bridge mechanism extends the dynamic routing capability of base CICS to support dynamic routing of 3270 bridge transactions. Figure 13 shows that the DPL request from the Link3270 bridge program to a remote user transaction can be sent to any of a number of AORs where the user transaction is enabled.

The dynamic transaction routing user replaceable program (URM) is called when DFHL3270 needs to identify the AOR to which an eligible transaction should be routed. New parameters on the interface allow the dynamic transaction routing program to identify Link3270 bridge requests and obtain the names of the target transaction and the bridge facility token. You can write your own transaction routing program to exploit these new parameters, use the CICS supplied dynamic routing program (DFHDYP), or use workload balancing services provided by CICSPlex System Manager.

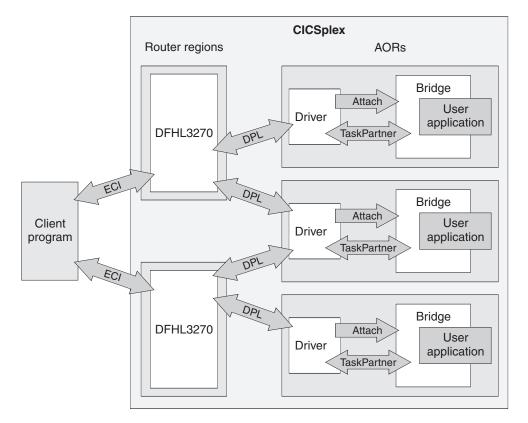

Figure 13. Link3270 load balancing

# Using the dynamic transaction routing program with Link3270

When the dynamic transaction routing user replaceable program is called in the Link3270 bridge environment, the following input parameters are set:

# DYRTYPE

8

# DYRBRTK

bridge facilitytoken

# **DYRTRAN**

name of user transaction as known in the router region

When a client links to the bridge routing program (DFHL3270) with the first application transaction for that facility and that transaction is defined as dynamic, the dynamic transaction routing program is called to determine if the request should be routed (using DPL) to another server region. The dynamic transaction routing program is passed the transaction id in the message, and determines the sysid of the region (AOR) where the user transaction will be started.

The dynamic transaction routing program is only called if the transaction is defined as DYNAMIC(YES).

Once a bridge transaction has been routed successfully to an AOR, all transactions executing with the same FACILITYTOKEN are routed to the same AOR. This affinity continues until the bridge facility is deleted in the AOR.

In session mode, subsequent transactions that are defined as dynamic will cause a notify call to the dynamic transaction routing program, informing the routing program that the transaction request is being routed to a specific region.

See Routing bridge requests dynamically, in the *CICS Customization Guide* for information about using a dynamic routing program.

# Chapter 5. Link3270 message formats

This section contains Product sensitive Programming Interface and Associated Guidance Information.

Link3270 messages contain the following components:

- "Link3270 message header (BRIH)" on page 60
- "Inbound Link3270 vectors" on page 66
- "Outbound Link3270 vectors" on page 72
- "The application data structure (ADS)" on page 19

To help simplify the programming of clients, CICS provides copybooks and header files defining the BRIH and BRIV data structures in Assembler, COBOL, PLI and C. Defaults are provided for each inbound vector. These vectors are used to initialize the input message. There are two versions of the copybooks. When the basic copybooks (listed in Table 5 on page 36) are used the current version is set to indicate basic support. The extended copybooks (listed in Table 6 on page 36) provide extended support, and when they are used the current version is set to indicate extended support.

The copybook names for the basic copybooks are:

## DFHBRIHx

BRIH and inbound and outbound BRIVs for C, PLI, and Assembler

# DFHBRIIx

Inbound BRIVs for COBOL

# DFHBRIOx

Outbound BRIVs for COBOL

# DFHBRICx

Constants and default values

and the names for the extended copybooks are:

# DFHBR2Hx

BRIH and inbound and outbound BRIVs for C, PLI, and Assembler

# DFHBR2Ix

Inbound BRIVs for COBOL

## DFHBR2Ox

Outbound BRIVs for COBOL

## DFHBR2Cx

Constants and default values

where x is the language suffix:

- D Assembler
- H C
- L PLI
- O COBOL

## Field names

Field names are shown in this documentation with "-" (dash) separators, as used in COBOL. Other languages use "\_" (underscore) separators.

#### Constants

Constants are provided for all enumerated values (input and output). For COBOL, these are provided as level 88's in the copybook.

# Link3270 message header (BRIH)

The Link3270 bridge message header prefixes all input and output messages. Some fields are meaningful only on input, and some are meaningful only on output. Some input fields are modified. Table 11 shows the fields that you need to define for input, and Table 12 on page 64 shows the fields that are relevant in an output message. "Inbound BRIH message header" on page 61 describes the values of fields used for input. "Outbound BRIH message header" on page 64 describes the values of fields used for output.

Default Offset Type Len Name Hex (0) STRUCTURE 180 BRIH (0) CHARACTER 4 BRIH-STRUCID **BRIH-STRUC-ID** (4) FULLWORD 4 BRIH-VERSION **BRIH-CURRENT-VERSION** (8) FULLWORD 4 BRIH-STRUCLENGTH BRIH-CURRENT-LENGTH (C) n/a 36 reserved (30) FULLWORD 4 BRIH-GETWAITINTERVAL **BRIHGWI-MAXWAIT** (34) n/a 4 reserved (38) FULLWORD 4 BRIH-DATALENGTH **BRIH-CURRENT-LENGTH** (3C) FULLWORD 4 BRIH-FACILITYKEEPTIME **BRIHKT-DEFAULT** (40) FULLWORD 4 BRIH-ADSDESCRIPTOR **BRIHADSD-YES** (44) FULLWORD 4 BRIH-CONVERSATIONALTASK **BRIHCT-NO** (48) n/a 4 reserved (4C) CHARACTER 8 BRIH-FACILITY **BRIHFACT-NEW** (54) n/a 40 reserved (7C) CHARACTER **BRIH-TRANSACTIONID** 4 (80) CHARACTER BRIH-FACILITYLIKE **BRIHFACL-DEFAULT** 4 (84) CHARACTER **BRIH-ATTENTIONID** DFHENTER 4 (88) CHARACTER 4 BRIH-STARTCODE **BRIHSC-TERMINPUT** (8C) CHARACTER BRIH-CANCELCODE 4 blanks 4 reserved (90) n/a (94) CHARACTER 8 BRIH-NETNAME **BRIHNN-DEFAULT** (9C) CHARACTER 4 **BRIH-TERMINAL BRIHTN-DEFAULT** 4 (A0) n/a reserved (A4) FULLWORD 4 **BRIH-CURSORPOSITION BRIHCP-DEFAULT** 12 (A8) n/a reserved

Table 11. The BRIH message header on input

# Inbound BRIH message header

The following fields are used in an input message. You can supply values in these fields, other fields are ignored on input. A BRIH structure primed with input default values (BRIH-DEFAULT) is supplied in the DFHBRICx copybooks. If a default value is not specified, the field is initialized to nulls.

Fields are valid on all calls, except where indicated. See also "Using Link3270 single transaction mode" on page 36 and "Using Link3270 session mode" on page 37.

# BRIH-STRUCID

The identifier for the header structure. You must set this to BRIH-STRUC-ID. The default is BRIH-STRUC-ID.

## **BRIH-VERSION**

The version number for the header structure. You must set this to BRIH-CURRENT-VERSION, which is the default. Refer to "Link3270 bridge basic and extended support" on page 35 for a description of the different levels of support for the Link3270 bridge.

# **BRIH-STRUCLENGTH**

The length of the header structure. You must set this to BRIH-CURRENT-LENGTH. The default is BRIH-CURRENT-LENGTH.

# **BRIH-DATALENGTH**

The length of the input message, including the BRIH. The default is BRIH-CURRENT-LENGTH.

# BRIH-TRANSACTIONID

The transaction identifier of the user transaction, as defined in the routing region. In session mode, this can also specify the following request values:

## BRIHT-ALLOCATE-FACILITY

Allocate a new bridge facility

# **BRIHT-DELETE-FACILITY**

Delete an existing bridge facility

## **BRIHT-CONTINUE-CONVERSATION**

Reply to a conversational request message

## BRIHT-GET-MORE-MESSAGE

Obtain the remainder (or next section) of the Link3270 message. This applies if the COMMAREA in the original request was too small to accommodate the output message

# BRIHT-RESEND-MESSAGE

Resend the previous saved Link3270 message. This is used if the communications connection is broken in executing the previous request. See "Recovery from connection failure" on page 41 for further information.

**Note:** A message is not saved if an error occurs before the message starts the user transaction. The BRIH-SEQNO can be used to determine whether a message returned by the RESEND-MESSAGE command is from the last Link3270 request issued, or the previous request.

# BRIH-FACILITY

The facilitytoken of the bridge facility. For single transaction mode this must be

set to BRIHFACT-NEW. For session mode, on allocation, this is set to BRIHFACT-NEW. For subsequent requests, this must be set to the value returned on the allocate.

The default is BRIHFACT-NEW.

#### BRIH-FACILITYLIKE

(Single transaction mode and allocation of a bridge facility in session mode)

The name of an installed terminal that is to be used as a model for the bridge facility. If no value is supplied in single-transaction mode, and a FACILITYLIKE value has been specified in the PROFILE definition of the user transaction, this value is used. Otherwise, or if no value is specified in session mode, a CICS-supplied definition, CBRF, is used.

The default BRIHFACL-DEFAULT means that no value is specified.

#### **BRIH-NETNAME**

(Single transaction mode and allocation of a bridge facility in session mode)

The NETNAME to be assigned to the bridge facility.

The default value, BRIHNN-DEFAULT, causes CICS to generate a name. The name is subject to change or rejection by the autoinstall URM whether specified by the user or generated by CICS. The name, as modified, is returned in this field in the response from the Link3270 bridge.

If you are specifying your own BRIH-NETNAME, the valid character set is the same as that for the NETNAME attribute of the CICS TERMINAL definition. See Terminal definition attributes, in the *CICS Resource Definition Guide*.

#### **BRIH-TERMINAL**

(Single transaction mode and allocation of a bridge facility in session mode)

The TERMID to be assigned to the bridge facility.

The default value, BRIHTN-DEFAULT, causes CICS to generate a name. The name is subject to change or rejection by the autoinstall URM whether specified by the user or generated by CICS. The name, as modified, is returned in this field in the response from the Link3270 bridge.

If you are specifying your own BRIH-TERMINAL, the valid character set is the same as that for the TERMINAL attribute of the CICS TERMINAL definition. See Terminal definition attributes, in the *CICS Resource Definition Guide*.

If you plan to specify your own BRIH-TERMINAL and to allow BRIH-NETNAME to default to this, you must use the BRIH-NETNAME character set, which is more restricted.

# BRIH-FACILITYKEEPTIME

(Allocation of a bridge facility in session mode)

The length of time that the bridge facility is kept after the user transaction has ended (in seconds). The value used is the smaller of this value, and the value specified in the router region's SIT parameter BRMAXKEEPTIME.

The default is BRIHKT-DEFAULT.

## **BRIH-CONVERSATIONALTASK**

(Run transaction in session mode)

An indicator specifying what the Link3270 bridge should do if the user transaction issues an input command for which no input vector has been provided. Possible values are:

# **BRIHCT-YES**

The Link3270 bridge suspends the transaction and adds a request vector to the end of the output message. The client is expected to send a CONTINUE-CONVERSATION message containing the requested vector.

## **BRIHCT-NO**

The Link3270 bridge abends the user transaction.

The default is BRIHCT-NO.

#### **BRIH-GETWAITINTERVAL**

(Run transaction in session mode)

The maximum wait interval for message input (in milliseconds). The value used is the smaller of the BRIH-GETWAITINTERVAL and the RTIMEOUT value for the transaction.

This value is used only when BRIH-CONVERSATIONALTASK is BRIHCT-YES

The default is BRIHGWI-MAXWAIT.

#### **BRIH-CANCELCODE**

(Session mode - continue conversation only)

The abend code with which the Link3270 bridge is to terminate a user transaction. This value is meaningful only in CONTINUE-CONVERSATION messages. If it is non-blank, Link3270 I abends the suspended user transaction with an abend code of BRIH-CANCELCODE. It should be used only when the client wants to terminate the transaction rather than supply the requested vector.

## **BRIH-ADSDESCRIPTOR**

(Single transaction mode and run transaction in session mode)

An indicator specifying whether ADS descriptors are sent on outbound SEND MAP and RECEIVE MAP messages. Possible values are:

## BRIHADSD-YES

ADS descriptors are sent.

#### **BRIHADSD-NO**

ADS descriptors are not sent.

The default is BRIHADSD-YES.

#### **BRIH-ATTENTIONID**

(Single transaction mode and run transaction in session mode)

The initial value of the AID key (EIBAID) when the user transaction is started. This is a 1-byte value, left justified. EIBAID is reset after each RECEIVE, RECEIVE, or CONVERSE command from the AID value in the input vector

The default is DFHENTER (The enter key).

# BRIH-STARTCODE

(Single transaction mode and first run transaction in a session)

An indicator available to the first transaction in a session to show the type of start that the request is emulating. The value generated depends on whether there is a RETRIEVE vector present in the input. Possible values are:

# **BRIHSC-START**

START command

## **BRIHSC-TERMINPUT**

Terminal input

The default is BRIHSC-TERMINPUT.

# BRIH-CURSORPOSITION

(Single transaction mode and run transaction in session mode)

The initial cursor position, EIBCPOSN, when the transaction is started. EIBCPOSN is reset from the value in the input vector after every RECEIVE, RECEIVE MAP or CONVERSE command.

The default is BRIHCP-DEFAULT, the top left of the screen.

# Note:

1. BRIH-SYSID is available only for the Link3270 bridge with extended support.

The following fields are returned in an output message. Other fields are not relevant.

#### **BRIH-RETURNCODE**

Return code from the Link3270 interface. See "BRIH-RETURNCODE values" on page 92 for a list of possible return codes, and their associated BRIH-COMPCODE and BRIH-REASON values.

## BRIH-COMPCODE

Additional error information. See "BRIH-RETURNCODE values" on page 92 for a list of possible return codes, and their associated BRIH-COMPCODE and BRIH-REASON values.

## **BRIH-REASON**

Additional error information. See "BRIH-RETURNCODE values" on page 92 for a list of possible return codes, and their associated BRIH-COMPCODE and BRIH-REASON values.

## **BRIH-REMAININGDATALENGTH**

(Session mode)

The length of the remaining message if the COMMAREA is too small to return the complete outbound message. The remaining message is prefixed by another BRIH (included in the length). If there is no more data, this field is set to zero. See "Delivering large messages" on page 41 for information about processing large messages.

#### BRIH-DATALENGTH

The length of the output message, including the BRIH.

## **BRIH-TASKENDSTATUS**

The status of the user transaction. Possible values are:

# BRIHTES-CONVERSATION

The user transaction has issued an input command for which no vector has been supplied, and BRIH-CONVERSATIONALTASK was specified in the inbound BRIH header.

## **BRIHTES-ENDTASK**

The user transaction has ended (or abended).

#### BRIH-FACILITY

This value identifies the session. It is set on return from an allocate request and must be supplied on every subsequent request in the session. On return from a delete-facility request or a run request in single-transaction mode, it is reset to BRIHFACT-NEW.

## **BRIH-FUNCTION**

Additional error information returned for some return codes. See "BRIH-RETURNCODE values" on page 92 for details.

#### **BRIH-ABENDCODE**

The abend code returned if the transaction abends. If the transaction completed successfully, this is set to BRIHAC-NONE.

Transaction abends are indicated by the return code BRIHAC-APPLICATION-ABEND. See "BRIH-RETURNCODE values" on page 92 for details.

#### **BRIH-SYSID**

The region in which the transaction ran. This is the system ID of the AOR as it is known by the routing region. If the transaction ran in the routing region, this field is set to blanks. This field is available only for the Link3270 bridge with extended support. See "Link3270 bridge basic and extended support" on page 35 for a description of the different levels of support for the Link3270 bridge.

#### BRIH-TRANSACTIONID

BRIH-TRANSACTIONID is both an input and an output field. Normally the output value is the same as the input value. The exceptions to this are:

- 1. When the request is for message recovery and the input BRIH-TRANSACTIONID is set to BRIHT-RESEND-MESSAGE. See "Recovery from connection failure" on page 41 for further information.
- 2. When the router region resource definition of the transaction is an alias of the definition in the AOR, the transaction id in the AOR is returned.

# **BRIH-NEXTTRANSACTIONID**

The name of the next transaction returned by the user transaction (usually by EXEC CICS RETURN TRANSID). If there is no next transaction, this field is set to blanks.

## **BRIH-NETNAME**

(Allocation only)

The NETNAME assigned to the bridge facility.

# BRIH-TERMINAL

(Allocation only)

The TERMID assigned to the bridge facility.

# BRIH-NEXTTRANIDSOURCE

The source of the next transaction id. Possible values are:

# **BRIHNTS-NORMAL**

Created by the TRANSID option of an EXEC CICS RETURN command, or by SET TERMINAL NEXTTRANSID.

# **BRIHNTS-IMMEDIATE**

Created by the TRANSID option of an EXEC CICS RETURN IMMEDIATE command.

# **BRIHNTS-STARTED**

Created by the TRANSID option of an EXEC CICS START command.

## **BRIH-ERROROFFSET**

The offset from the start of the message to the location of the invalid data for message validation errors.

# **BRIH-SEQNO**

(Session mode only)

A sequence number returned on every message. The sequence number is set to 0 on an allocate facility request and incremented on subsequent requests. The exceptions to this are:

- 1. A successful BRIHT-RESEND-MESSAGE request returns the previous message and its sequence number.
- 2. If BRIHRC-INVALID-FACILITY-TOKEN is returned, the sequence number is undefined.

# Inbound Link3270 vectors

Inbound Link3270 bridge vectors all have a common header. Table "Link3270 inbound vector header" on page 67 shows the common header. One BRIV vector is required to satisfy each input CICS command issued by the user transaction. The following inbound vector types are supported:

- "Link3270 INPUT CONVERSE vector" on page 67
- "Link3270 RECEIVE vector" on page 68
- "Link3270 RECEIVE MAP vector" on page 69
- "Link3270 RETRIEVE vector" on page 71

# Link3270 inbound vector header

This header precedes all the vectors (both inbound and outbound) in the message.

# BRIV-INPUT-VECTOR-LENGTH

The length of the vector. This is rounded up to the next multiple of 4, to facilitate full word alignment of subsequent vectors in the message. The default is the length of the default BRIV with no data.

# BRIV-INPUT-VECTOR-DESCRIPTOR

An indicator to define the CICS command associated with this vector. Valid values are:

**BRIVDSC-CONVERSE (0406)** 

CONVERSE

## **BRIVDSC-RECEIVE (0402)** RECEIVE

# BRIVDSC-RECEIVE- MAP (1802) **RECEIVE MAP**

#### **BRIVDSC-RETRIEVE (100A)** RETRIEVE

# **BRIV-INPUT-VECTOR-TYPE**

This must be set to BRIVVT-INBOUND. This is the default.

# Link3270 INPUT CONVERSE vector

This vector is used to supply data to an EXEC CICS CONVERSE command. See CONVERSE (3270 logical), in the CICS Application Programming Reference manual for details of the command options.

The default vector is BRIV-CONVERSE-DEFAULT

#### Offset Type Hex

# BRIV-CO-TRANSMIT-SEND-AREAS

This flag is a performance option that allows the client to limit the amount of data returned in the output message. Valid values are:

Len Name (0) STRUCTURE 36 BRIV-CONVERSE

## **BRIVCOTSA-YES**

The whole output message is returned.

# **BRIVCOTSA-NO**

All output vectors created prior to the command that uses this vector are not returned in the output message.

The default is BRIVCOTSA-YES.

# BRIV-CO-AID

The AID key used to transmit the input. This value is used to set EIBAID on completion of the RECEIVE MAP command. The first byte of this field contains equivalent values to EIBAID, as defined by DFHAID. The remaining three bytes are ignored. The default is DFHENTER.

# BRIV-CO-CPOSN

The position of the cursor in the data. This value is used to set EIBCPOSN on completion of the RECEIVE MAP command. Valid values are:

# **BRIVCOCP-DEFAULT**

top left of the screen

# **BRIVCOCP-MAX-CURSORPOSITION**

bottom right of the screen

nn User specified value

The default is BRIVCOCP-DEFAULT.

# BRIV-CO-DATA-LEN

The length of the data provided in this vector in BRIV-CO-DATA. This value is copied into the LENGTH or FLENGTH field specified in the CONVERSE command represented by this vector.

The default is zero (no data).

# BRIV-CO-DATA

Character field of length BRIV-CO-DATA-LEN to be copied into the INTO area, or referenced by the SET option, of the CONVERSE command represented by this vector.

# Link3270 RECEIVE vector

This vector is used to supply data to an EXEC CICS RECEIVE command. See RECEIVE (3270 logical), in the *CICS Application Programming Reference* manual for details of the command options.

The default vector is BRIV-RECEIVE-DEFAULT

Offset	Туре	Len	Name

(24)	CHARACTER		BRIV-RE-DATA

#### BRIV-RE-TRANSMIT-SEND-AREAS

This flag is a performance option that allows the client to limit the amount of data returned in the output message. Valid values are:

## **BRIVRETSA-YES**

The whole output message is returned.

#### **BRIVRETSA-NO**

All output vectors created prior to the command that uses this vector are not returned in the output message.

The default is BRIVRETSA-YES.

## BRIV-RE-BUFFER-INDICATOR

A flag indicating whether the data provided in the inbound vector is in a format to be received by a CICS RECEIVE command with the BUFFER option. Valid values are:

# **BRIVREBI-YES**

Data in BUFFER format.

#### **BRIVREBI-NO**

Data not in BUFFER format.

The default is BRIVREBI-NO.

# BRIV-RE-AID

The AID key used to transmit the input. This value is used to set EIBAID on completion of the RECEIVE MAP command. The first byte of this field contains equivalent values to EIBAID, as defined by DFHAID. The remaining three bytes are ignored.

The default is DFHENTER.

#### **BRIV-RE-CPOSN**

The position of the cursor in the data. This value is used to set EIBCPOSN on completion of the RECEIVE MAP command. Valid values are:

#### **BRIVRECP-DEFAULT**

#### **BRIVRECP-MAX-CURSORPOSITION**

nn User specified value

The default is BRIVRECP-DEFAULT.

#### **BRIV-RE-DATA-LEN**

The length of the data provided in this vector in BRIV-RE-DATA. This value is copied into the LENGTH or FLENGTH field specified in the RECEIVE command represented by this vector.

The default is zero (no data).

#### BRIV-RE-DATA

Character field of length BRIV-RE-DATA-LEN to be copied into the INTO area, or referenced by the SET option, of the RECEIVE command represented by this vector.

# Link3270 RECEIVE MAP vector

This vector is used to supply data to an EXEC CICS RECEIVE MAP command. See RECEIVE MAP, in the *CICS Application Programming Reference* manual for details of the command options.

## The default vector is BRIV-RECEIVE-MAP-DEFAULT

Offset	Туре	Len	Name
Hex			
(0)	STRUCTURE	48	BRIV-RECEIVE-MAP
(0)	STRUCTURE	16	INPUT header

(30)	CHARACTER		BRIV-RM-DATA

## BRIV-RM-TRANSMIT-SEND-AREAS

This flag is a performance option that allows the client to limit the amount of data returned in the output message. Valid values are:

#### **BRIVRMTSA-YES**

The whole output message is returned.

#### **BRIVRMTSA-NO**

All output vectors created prior to the command that uses this vector are not returned in the output message.

The default is BRIVRMTSA-YES.

# BRIV-RM-MAPSET

The name of the MAPSET containing the map used to format the data, or blanks. When the user transaction issues a RECEIVE MAP command, the Link3270 bridge uses the first remaining RECEIVE MAP vector in the message in which BRIV-RM-MAPSET matches MAPSET in the command or is blank and BRIV-RM-MAP matches the MAP in the command or is blank. RECEIVE MAP vectors which do not match the command are discarded.

The default is blanks.

## BRIV-RM-MAP

The name of the MAP containing the map used to format the data, or blanks. When the user transaction issues a RECEIVE MAP command, the Link3270 bridge uses the first remaining RECEIVE MAP vector in the message in which BRIV-RM-MAPSET matches MAPSET in the command or is blank and BRIV-RM-MAP matches the MAP in the command or is blank. RECEIVE MAP vectors which do not match the command are discarded

The default is blanks.

#### BRIV-RM-AID

The AID key used to transmit the input. This value is used to set EIBAID on completion of the RECEIVE MAP command. The first byte of this field contains equivalent values to EIBAID, as defined by DFHAID. The remaining three bytes are ignored. The default is DFHENTER.

#### BRIV-RM-CPOSN

The position of the cursor in the data. This value is used to set EIBCPOSN on completion of the RECEIVE MAP command. Valid values are:

# BRIVRMCP-DEFAULT

# **BRIVRMCP-MAX-CURSORPOSITION**

nn User specified value

The default is BRIVRMCP-DEFAULT.

#### **BRIV-RM-DATA-LEN**

The length of the Application Data Structure (ADS) in BRIV-RM-DATA. This value is copied into the LENGTH or FLENGTH field specified in the RECEIVE MAP command represented by this vector.

#### **BRIV-RM-DATA**

The ADS to be copied into the INTO area, or referenced by the SET option, of the RECEIVE MAP command represented by this vector.

# Link3270 RETRIEVE vector

This vector is used to supply data to an EXEC CICS RETRIEVE command. See RETRIEVE, in the CICS Application Programming Reference manual for details of the command options.

The default vector is BRIV-CONVERSE-DEFAULT

# **BRIV-RT-RTRANSID**

The value to be returned in the RTRANSID field to the program that issued the RETRIEVE. A blank indicates that there is no RTRANSID. The default is blank.

## **BRIV-RT-RTERMID**

The value to be returned in the RTERMID field to the program that issued the RETRIEVE. A blank indicates that there is no RTERMID. The default is blank.

## **BRIV-RT-OUEUE**

The value to be returned in the QUEUE field to the program that issued the RETRIEVE. A blank indicates that there is no QUEUE. The default is blank.

# **BRIV-RT-DATA-LEN**

The length of the data provided in this vector in BRIV-RT-DATA that caused the bridge to be called. This value is copied into the LENGTH or FLENGTH field specified in the RETRIEVE command represented by this vector. The default is zero (no data).

## data

Character field of length BRIV-RT-DATA-LEN to be copied into the INTO area, or referenced by the SET option of the RETRIEVE command represented by this vector.

Note: The RETRIEVE vector is only valid in the first inbound message in session mode, or in single transaction mode. It is ignored in other messages.

# **Outbound Link3270 vectors**

Outbound Link3270 bridge vectors all have a common header. Table "Link3270 output vector header" shows the common header. One BRIV vector is required for each output EXEC CICS command issued by the user transaction. The following outbound vector types are supported:

- "Link3270 ISSUE ERASEAUP vector" on page 73
- "Link3270 SEND vector" on page 73
- "Link3270 SEND CONTROL vector" on page 75
- "Link3270 SEND MAP vector" on page 77
- "Link3270 SEND TEXT vector" on page 80
- "Link3270 SYNCPOINT vector" on page 84
- "Link3270 CONVERSE request vector" on page 85
- "Link3270 RECEIVE request vector" on page 86
- "Link3270 RECEIVE MAP request vector" on page 87
- "Link3270 SEND PAGE vector" on page 83
- "Link3270 PURGE MESSAGE vector" on page 84

# Link3270 output vector header

The type of ERASE specified by the CICS SEND or CONVERSE command. Valid values are:

# **BRIVSEEI-NOERASE**

No ERASE.

# BRIVSEEI-ERASE ERASE.

LNAGE.

# BRIVSEEI-ERASEALTERNATE

ERASE ALTERNATE.

## **BRIVSEEI-DEFAULT**

ERASE DEFAULT.

# **BRIV-SE-CTLCHAR**

The CTLCHAR value specified by the SEND or CONVERSE command. Valid values are:

cc The value in CTLCHAR.

# **BRIVSECC-DEFAULT**

X'C3'.

# BRIV-SE-STRFIELD-INDICATOR

The presence of STRFIELD on the SEND or CONVERSE command. Valid values are:

## **BRIVSESI-YES**

STRFIELD specified.

#### **BRIVSESI-NO**

STRFIELD not specified.

## BRIV-SE-DEFRESP-INDICATOR

The presence of DEFRESP on the SEND or CONVERSE command. Valid values are:

## **BRIVSEDRI-YES**

DEFRESP specified.

#### **BRIVSEDRI-NO**

DEFRESP not specified.

#### BRIV-SE-INVITE-INDICATOR

The presence of INVITE on the SEND or CONVERSE command. Valid values are:

#### **BRIVSEII-YES**

INVITE specified.

#### **BRIVSEII-NO**

INVITE not specified.

#### **BRIV-SE-LAST-INDICATOR**

The presence of LAST on the SEND or CONVERSE command. Valid values are:

#### **BRIVSELI-YES**

LAST specified.

#### **BRIVSELI-NO**

LAST not specified.

#### BRIV-SE-WAIT-INDICATOR

The presence of WAIT on the SEND or CONVERSE command. Valid values are:

#### **BRIVSEWI-YES**

WAIT specified.

## **BRIVSEWI-NO**

WAIT not specified.

# **BRIV-SE-DATA-LEN**

The length of the data associated with the FROM option of the SEND or CONVERSE command. This is explicitly defined in the LENGTH or FLENGTH option, or derived from the length of the field.

# **BRIV-SE-DATA**

Character field of length BRIV-SE-DATA-LEN containing the data addressed by the FROM option of the SEND or CONVERSE command.

# Link3270 SEND CONTROL vector

This vector is the data supplied by an EXEC CICS SEND CONTROL command. See SEND CONTROL, in the CICS Application Programming Reference manual for details of the command options.

FRSET specified.

#### **BRIVSCFSI-NO**

FRSET not specified.

#### BRIV-SC-LAST-INDICATOR

The presence of LAST on the SEND CONTROL command. Valid values are:

#### **BRIVSCLI-YES**

LAST specified.

## **BRIVSCLI-NO**

LAST not specified.

#### BRIV-SC-WAIT-INDICATOR

The presence of WAIT on the SEND CONTROL command. Valid values are:

# **BRIVSCWI-YES**

WAIT specified.

# BRIVSCWI-NO

WAIT not specified.

#### BRIV-SC-CURSOR

The presence of CURSOR(*data-value*) on the SEND CONTROL command. Valid values are:

#### **BRIVSCCRS-DYNAMIC**

CURSOR specified with dynamic cursor positioning.

# **BRIVSCCRS-NONE**

CURSOR(*data-value*) not specified.

nn The value of CURSOR(*data-value*) specified.

# BRIV-SC-MSR-DATA

The value of the MSR option specified on the SEND CONTROL command. Valid values are:

## **BRIVSCMSR-NONE**

MSR option not specified.

other The value of the MSR option specified.

# BRIV-SC-ACCUM-INDICATOR

Indicates whether or not the ACCUM option is specified for EXEC CICS SEND TEXT, EXEC CICS SEND MAP, or EXEC CICS SEND CONTROL. This parameter is only available for the Link3270 bridge with extended support. See "Link3270 bridge basic and extended support" on page 35 for a description of the different levels of support for the Link3270 bridge. Values are:

- Y The ACCUM option is specified.
- **N** The ACCUM option is not specified.

# Link3270 SEND MAP vector

This vector is the data supplied by an EXEC CICS SEND MAP command. See SEND MAP, in the *CICS Application Programming Reference* manual for details of the command options.

Offset Hex	Туре	Len	Name

4 BRIV-SM-DATA-INDICATOR

BRIV-SM-DATA<sup>2</sup>

# Note:

- 1. BRIV-SM-ACCUM-INDICATOR is available only for the Link3270 bridge with extended support.
- 2. BRIV-SM-DATA is included only for backward compatibility with the basic support version of the Link3270 bridge provided by CICS Transaction Server for z/OS, Version 2 Release 2. It is deprecated in CICS Transaction Server for z/OS, Version 3 Release 2. The recommended method for addressing this field is by using BRIV-SM-DATA-OFFSET. Use BRIV-SM-ADSD-OFFSET to address ADSD data.

# **BRIV-SM-ERASE-INDICATOR**

The type of ERASE specified by the CICS SEND MAP command. Valid values are:

# **BRIVSMEI-NOERASE**

No ERASE.

# **BRIVSMEI-ERASE**

ERASE.

# **BRIVSMEI-ERASEALTERNATE**

ERASE ALTERNATE.

# **BRIVSMEI-DEFAULT**

ERASE DEFAULT.

# **BRIV-SM-ERASEAUP-INDICATOR**

The presence of ERASEAUP on the SEND MAP command. Valid values are:

# **BRIVSMEUI-YES**

ERASEAUP specified.

# **BRIVSMEUI-NO**

ERASEAUP not specified.

# **BRIV-SM-FREEKB-INDICATOR**

The presence of FREEKB on the SEND MAP command. Valid values are:

# **BRIVSMFKI-YES**

FREEKB specified.

# **BRIVSMFKI-NO**

FREEKB not specified.

# BRIV-SM-ALARM-INDICATOR

The presence of ALARM on the SEND MAP command. Valid values are:

# **BRIVSMAI-YES**

ALARM specified.

## **BRIVSMAI-NO**

ALARM not specified.

# BRIV-SM-FRSET-INDICATOR

The presence of FRSET on the SEND MAP command. Valid values are:

#### **BRIVSMFSI-YES**

FRSET specified.

#### **BRIVSMFSI-NO**

FRSET not specified.

#### BRIV-SM-LAST-INDICATOR

The presence of LAST on the SEND MAP command. Valid values are:

#### **BRIVSMLI-YES**

LAST specified.

## **BRIVSMLI-NO**

LAST not specified.

# BRIV-SM-WAIT-INDICATOR

The presence of WAIT on the SEND MAP command. Valid values are:

#### **BRIVSMWI-YES**

WAIT specified.

# **BRIVSMWI-NO**

WAIT not specified.

# BRIV-SM-CURSOR

The presence of CURSOR or CURSOR(*data-value*) on the SEND MAP command. Valid values are:

#### BRIVSMCRS-DYNAMIC

CURSOR specified (dynamic cursor positioning).

#### **BRIVSMCCRS-NONE**

Neither CURSOR nor CURSOR(*data-value*) specified.

**nn** The value of CURSOR(*data-value*) specified.

#### **BRIV-SM-MSR-DATA**

The value of the MSR option specified on the SEND MAP command. Valid values are:

# **BRIVSMMSR-NONE**

MSR option not specified.

other The value of the MSR option specified.

## **BRIV-SM-MAPSET**

The value of the MAPSET option specified by the SEND MAP command.

#### BRIV-SM-MAP

The value of the MAP option specified by the SEND MAP command.

#### BRIV-SM-DATA-INDICATOR

The presence of MAPONLY and DATAONLY options on the SEND MAP command. Valid values are:

# **BRIVSMDI-DATAONLY**

DATAONLY specified.

# **BRIVSMDI-MAPONLY**

MAPONLY specified.

## **BRIVSMDI-DEFAULT**

Neither DATAONLY nor MAPONLY specified.

## BRIV-SM-DATA-LEN

The length of the data in BRIV-SM-DATA. This is the length of the symbolic map or ADS (application data structure).

#### BRIV-SM-DATA-OFFSET

The offset from the beginning of the SEND MAP vector to the data associated with the FROM option of the SEND MAP command.

## BRIV-SM-ADSD-LEN

The length of the ADS descriptor associated with this map. This length is zero if the ADSD is not available or was not requested (BRIH-ADSDESCRIPTOR set to BRIHADSD-NONE).

#### BRIV-SM-ADSD-OFFSET

The offset from the beginning of the SEND MAP vector to the ADSD. This is zero if the ADSD is not available or was not requested.

## BRIV-SM-ACCUM-INDICATOR

Indicates whether or not the ACCUM option is specified for EXEC CICS SEND TEXT, EXEC CICS SEND MAP, or EXEC CICS SEND CONTROL. This parameter is only available for the Link3270 bridge with extended support. See "Link3270 bridge basic and extended support" on page 35 for a description of the different levels of support for the Link3270 bridge. Values are:

- Y The ACCUM option is specified.
- **N** The ACCUM option is not specified.

## BRIV-SM-DATA

This field is included only for compatibility with the basic support version of the Link3270 bridge. (See "Link3270 bridge basic and extended support" on page 35 for a description of the different levels of support for the Link3270 bridge.) It is recommended that you use BRIV-SM-DATA-OFFSET to address this field.

# Link3270 SEND TEXT vector

This vector is the data supplied by an EXEC CICS SEND TEXT command. See SEND TEXT, in the *CICS Application Programming Reference* manual for details of the command options.

#	Offset	Туре	Len	Name
#	Hex			
#	(0)	STRUCTURE	60	BRIV-SEND-TEXT

#	(4C)	FULLWORD	4	BRIV-ST-TRAILER-OFFSET <sup>1</sup>
#	50	CHARACTER		BRIV-ST-DATA <sup>2</sup>
#				

# Note:

- 1. The fields in bold type are available only for the Link3270 bridge with extended support.
- BRIV-ST-DATA is included only for backward compatibility with the basic support version of the Link3270 bridge provided by CICS Transaction Server for z/OS, Version 2 Release 2. It is deprecated in CICS Transaction Server for z/OS, Version 3 Release 2. The recommended method for addressing this field is by using BRIV-ST-DATA-OFFSET.

#### BRIV-ST-ERASE-INDICATOR

The type of ERASE specified by the CICS SEND TEXT command. Valid values are:

#### **BRIVSTEI-NOERASE**

No ERASE.

BRIVSTEI-ERASE ERASE.

# **BRIVSTEI-ERASEALTERNATE**

ERASE ALTERNATE.

# BRIVSTEI-DEFAULT

ERASE DEFAULT.

# BRIV-ST-FREEKB-INDICATOR

The presence of FREEKB on the SEND TEXT command. Valid values are:

## **BRIVSTFKI-YES**

FREEKB specified.

# **BRIVSTFKI-NO**

FREEKB not specified.

#### BRIV-ST-ALARM-INDICATOR

The presence of ALARM on the SEND TEXT command. Valid values are:

## **BRIVSTAI-YES**

ALARM specified.

#### **BRIVSTAI-NO**

ALARM not specified.

#### BRIV-ST-ACCUM-INDICATOR

Indicates whether or not the ACCUM option is specified for EXEC CICS SEND TEXT, EXEC CICS SEND MAP, or EXEC CICS SEND CONTROL. This parameter is only available for the Link3270 bridge with extended support. See "Link3270 bridge basic and extended support" on page 35 for a description of the different levels of support for the Link3270 bridge. Values are:

- Y The ACCUM option is specified.
- **N** The ACCUM option is not specified.

#### BRIV-ST-LAST-INDICATOR

The presence of LAST on the SEND TEXT command. Valid values are:

## **BRIVSTLI-YES**

LAST specified.

#### **BRIVSTLI-NO**

LAST not specified.

#### BRIV-ST-WAIT-INDICATOR

The presence of WAIT on the SEND TEXT command. Valid values are:

#### **BRIVSTWI-YES**

WAIT specified.

#### **BRIVSTWI-NO**

WAIT not specified.

# BRIV-ST-CURSOR

The presence of CURSOR(*data-value*) on the SEND TEXT command. Valid values are:

## **BRIVSTCRS-DYNAMIC**

CURSOR specified (dynamic cursor positioning).

#### **BRIVSTCRS-NONE**

CURSOR(*data-value*) not specified.

nn The value of CURSOR(*data-value*) specified.

# BRIV-ST-MSR-DATA

The value of the MSR option specified on the SEND TEXT command. Valid values are:

#### **BRIVSTMSR-NONE**

MSR option not specified.

other The value of the MSR option specified.

#### **BRIV-ST-TEXT-TYPE**

The presence of MAPPED or NOEDIT options on the SEND TEXT command. Valid values are:

#### **BRIVSTTT-MAPPED**

MAPPED specified.

#### **BRIVSTTT-NOEDIT**

NOEDIT specified.

# **BRIVSTTT-DEFAULT**

Neither MAPPED nor NOEDIT specified.

# BRIV-ST-DATA-LEN

The length of the data in BRIV-ST-DATA<sup>1</sup>.

#### **BRIV-ST-DATA-OFFSET**

The offset of the data from the start of the vector. This parameter is only available for the Link3270 bridge with extended support. See "Link3270 bridge basic and extended support" on page 35 for a description of the different levels of support for the Link3270 bridge.

#### BRIV-ST-HEADER-LEN

The length of the text header. This parameter is only available for the Link3270

bridge with extended support. See "Link3270 bridge basic and extended support" on page 35 for a description of the different levels of support for the Link3270 bridge.

## **BRIV-ST-HEADER-OFFSET**

The offset of the text header from the start of the vector. Use this value to address the header. This parameter is only available for the Link3270 bridge with extended support. See "Link3270 bridge basic and extended support" on page 35 for a description of the different levels of support for the Link3270 bridge.

## BRIV-ST-TRAILER-LEN

The length of the text trailer. This parameter is only available for the Link3270 bridge with extended support. See "Link3270 bridge basic and extended support" on page 35 for a description of the different levels of support for the Link3270 bridge.

# BRIV-ST-TRAILER-OFFSET

The offset of the text trailer from the start of the vector. Use this value to address the trailer. This parameter is only available for the Link3270 bridge with extended support. See "Link3270 bridge basic and extended support" on page 35 for a description of the different levels of support for the Link3270 bridge.

# BRIV-ST-DATA

This field is included only for compatibility with the basic support version of the Link3270 bridge. See "Link3270 bridge basic and extended support" on page 35 for a description of the different levels of support for the Link3270 bridge. It is recommended that you use BRIV-ST-DATA-OFFSET to access the data contained in the FROM option of the SEND TEXT command.

## Note:

1. If the MAPPED option is used, you must add a 4 byte page control area (PGA) to the end of the data. See SEND TEXT MAPPED, in the *CICS Application Programming Reference* manual for a description of the PGA. These 4 bytes are not included in BRIV-ST-DATA-LEN, but are included in BRIV-OUTPUT-VECTOR-LENGTH and BRIH-DATALENGTH.

# Link3270 SEND PAGE vector

This vector is the data supplied by an EXEC CICS SEND PAGE command. See SEND PAGE, in the *CICS Application Programming Reference* manual for details of the command options. This vector is only available for the Link3270 bridge with extended support. See "Link3270 bridge basic and extended support" on page 35 for a description of the different levels of support for the Link3270 bridge.

Offset	Туре	Len	Name
Hex			
(0)	STRUCTURE	88	BRIV-SEND-PAGE
(0)	STRUCTURE	16	Output header
(10)	CHARACTER	4	BRIV-PG-RELEASE-INDICATOR
(14)	CHARACTER	4	BRIV-PG-RETAIN-INDICATOR
(18)	CHARACTER	4	BRIV-PG-LAST-INDICATOR
(1C)	CHARACTER	4	BRIV-PG-TRANSID
(20)	FULLWORD	4	BRIV-PG-TRAILER-LEN
(24)	FULLWORD	4	BRIV-PG-TRAILER-OFFSET

#### BRIV-PG-RELEASE-INDICATOR

Indicates whether or not the RELEASE option is specified. Valid values are:

- Y RELEASE is specified.
- N RELEASE is not specified.

#### BRIV-PG-RETAIN-INDICATOR

Indicates whether or not the RETAIN option is specified. Valid values are:

- Y RETAIN is specified.
- **N** RETAIN is not specified.

#### BRIV-PG-LAST-INDICATOR

Indicates whether or not LAST is specified. Valid values are:

- Y LAST is specified.
- N LAST is not specified.

#### BRIV-PG-TRANSID

The name of the transaction to be used on the next message.

# BRIV-PG-TRAILER-LEN

The length of the trailer.

# BRIV-PG-TRAILER-OFFSET

The offset of the trailer from the start of the vector.

# Link3270 PURGE MESSAGE vector

This vector is the data supplied by an EXEC CICS PURGE MESSAGE command. See PURGE MESSAGE, in the *CICS Application Programming Reference* manual for details of the command options. This vector is only available for the Link3270 bridge with extended support. See "Link3270 bridge basic and extended support" on page 35 for a description of the different levels of support for the Link3270 bridge.

There are no parameters for this vector.

# Link3270 SYNCPOINT vector

This vector is the data supplied by an EXEC CICS SYNCPOINT command. See SEND TEXT MAPPED, in the *CICS Application Programming Reference* manual for details of the command options.

This vector is supplied when the application issues one of the following:

- An EXEC CICS SYNCPOINT command
- A CICS command such as EXEC CICS SYNCONRETURN or EXEC CICS CREATE which issues an implicit syncpoint
- An RMI request which issues an implicit syncpoint
- **Note:** The vector is not supplied on the implicit syncpoint which occurs when a transaction completes.

Offset	Туре	Len	Name

4 BRIV-SP-RESP

### **BRIV-SP-ROLLBACK**

The presence of ROLLBACK on the CICS SYNCPOINT command. Valid values are:

## **BRIVSPR-YES**

ROLLBACK specified.

### **BRIVSPR-NO**

ROLLBACK not specified.

## BRIV-SP-EXPLICIT

Whether the syncpoint was explicit (resulting from a SYNCPOINT command) or implicit (resulting from a CICS or RMI command which issues an implicit syncpoint). Refer to the description above for more information. Valid values are:

## **BRIVSPE-YES**

The SYNCPOINT command was issued.

## **BRIVSPE-NO**

The syncpoint was implicit.

## **BRIV-SP-RESP**

The EIBRESP value returned from the SYNCPOINT command.

# Link3270 CONVERSE request vector

This vector is the data supplied by an EXEC CICS CONVERSE request that was issued by the user application, but there was no CONVERSE vector in the input message. See CONVERSE (3270 logical), in the CICS Application Programming Reference manual for details of the command options.

#### BRIV-COR-ERASE-INDICATOR

The type of ERASE specified by the CICS CONVERSE command. Valid values are:

## **BRIVCOREI-NOERASE**

No ERASE.

## **BRIVCOREI-ERASE**

ERASE.

## **BRIVCOREI-ERASEALTERNATE**

ERASE ALTERNATE.

# **BRIVCOREI-DEFAULT**

ERASE DEFAULT.

## **BRIV-COR-CTLCHAR**

The CTLCHAR value specified by the CONVERSE command. Valid values are:

#### **BRIVCORCC-DEFAULT**

X'C3'.

The value in CTLCHAR. CC

#### **BRIV-COR-STRFIELD-INDICATOR**

The presence of STRFIELD on the CONVERSE command. Valid values are:

### **BRIVCORSI-YES**

STRFIELD specified.

## **BRIVCORSI-NO**

STRFIELD not specified.

## BRIV-COR-DEFRESP-INDICATOR

The presence of DEFRESP on the CONVERSE command. Valid values are:

## **BRIVCORDRI-YES**

DEFRESP specified.

## **BRIVCORDRI-NO**

DEFRESP not specified.

## **BRIV-COR-DATA-LEN**

The length of the data in BRIV-COR-DATA. This is explicitly defined in the LENGTH or FLENGTH option, or derived from the length of the field.

## **BRIV-COR-DATA**

Character field of length BRIV-COR-DATA-LEN containing the data addressed by the FROM option of the CONVERSE command.

## Link3270 RECEIVE request vector

This vector is the data supplied by an EXEC CICS RECEIVE request . See RECEIVE (3270 logical), in the CICS Application Programming Reference manual for details of the command options.

### Offset Type

#### Len Name

Hex

- (0) STRUCTURE20 BRIV-RECEIVE-REQUEST(0) STRUCTURE16 Output header(10) CHARACTER4 BRIV-RER-BUFFER-INDICATOR

#### **BRIV-RER-BUFFER-INDICATOR**

The presence of BUFFER on the CICS RECEIVE command. Valid values are:

#### **BRIVRERBI-YES**

BUFFER specified.

#### **BRIVRERBI-NO**

BUFFER not specified.

## Link3270 RECEIVE MAP request vector

This vector is the data supplied by an EXEC CICS RECEIVE MAP request. See RECEIVE MAP, in the *CICS Application Programming Reference* manual for details of the command options.

Offset	Туре	Len	Name
Hex			
(0)	STRUCTURE	36	BRIV-RECEIVE-MAP-REQUEST
(0)	STRUCTURE	16	Output header
(10)	CHARACTER	8	BRIV-RMR-MAPSET
(18)	CHARACTER	8	BRIV-RMR-MAP
(20)	FULLWORD	4	BRIV-RMR-ADSD-LEN
(24)	CHARACTER		BRIV-RMR-ADSD

### BRIV-RMR-MAPSET

The value of the MAPSET option on the RECEIVE MAP command.

### BRIV-RMR-MAP

The value of the MAP option on the RECEIVE MAP command.

## BRIV-RMR-ADSD-LEN

The length of the ADS descriptor associated with this map. This length is zero if the ADSD is not available or was not requested (BRIH-ADSDESCRIPTOR set to BRIHADSD-NONE).

## BRIV-RMR-ADSD

The ADS descriptor associated with the requested map. No data is sent if BRIV-RMR-ADSD-LEN is zero.

## Link3270 ADS descriptor

The ADS descriptor contains a header with general information about the map, and a field descriptor for every field that appears in the ADS, corresponding to every named field in the map definition macro. It can be located in the mapset from an offset field in DFHMAPDS.

## **ADS descriptor header**

The ADS descriptor header contains general information about the map and a pointer to the first of a variable number of chained field descriptions.

Offset Hex	Туре	Len	Name
(0)	STRUCTURE	38	ADS-DESCRIPTOR
(0)	HALFWORD	2	ADSD-LENGTH

(1B)	CHARACTER	1	ADSD-MAP-JUSTIFY-VER
(1C)	HALFWORD	2	ADSD-MAP-STARTING-LINE
(1E)	HALFWORD	2	ADSD-MAP-STARTING-COLUMN

#### Offset Type Hex

Len Name

- (20) HALFWORD
- (22) HALFWORD
- (24) CHARACTER
- (25) CHARACTER(26) STRUCTURE
- 2 ADSD-MAP-LINES
- 2 ADSD-MAP-COLUMNS
- 1 ADSD-WRITE-CONTROL-CHARACTER
  - 1 (reserved)
    - ADSD-FIRST-FIELD

### ADSD-LENGTH

The length of the ADS descriptor.

## ADSD-EYECATCHER

An eye-catcher ('ADSD') to identify this as an ADS descriptor.

## ADSD-MAP-INDEX

The index number of the map within the mapset.

## ADSD-FIELD-COUNT

The number of fields within the ADS; that is, the number of named fields in the map definition. A separate field is counted for each element of an array defined with the OCCURS parameter, but subfields of group fields (GRPNAME) are not counted. The field count may be zero, in which case there are no field descriptors following the header.

## ADSD-STRUCTURE-LENGTH

The length of the application data structure.

## ADSD-ATTRIBUTE-NUMBER

The number of extended attributes in fields used in the map; that is, the number of attributes specified in DSATTS in the map definition.

## ADSD-ATTRIBUTE-TYPE-CODES

a 1-character code for the attribute types in each field, in order, derived from DSATTS:

- C = COLOR
- P = PS
- H = HILIGHT
- V = VALIDN
- O = OUTLINE
- S = SOSI
- T = TRANSP

## ADSD-MAP-JUSTIFY-HOR

The horizontal justification for the map, either L (LEFT) or R (RIGHT) from the JUSTIFY operand on the map definition.

## ADSD-MAP-JUSTIFY-VER

The vertical justification for the map, from the JUSTIFY operand on the map definition. This can have the values F (FIRST), L (LAST), B (BOTTOM), or blank (no vertical JUSTIFY operand).

## ADSD-MAP-STARTING-LINE

The starting line for the map, from the LINE operand on the DFHMDI macro, (LINE = NEXT gives a value of 255; LINE = SAME gives a value of 254.)

## ADSD-MAP-STARTING-COLUMN

The starting column for the map, from the COLUMN operand on the DFHMDI macro. (COLUMN = NEXT gives a value of 255; COLUMN = SAME gives a value of 254.)

#### ADSD-MAP-LINES

The number of lines in the map from the SIZE operand.

## ADSD-MAP-COLUMNS

The number of columns in the map from the SIZE operand.

#### ADSD-WRITE-CONTROL-CHAR

The 3270 encoded WCC derived from the CONTROL operand.

#### ADSD-FIRST-FIELD

The first field descriptor. The address of the first field descriptor in the ADSD (zero if ADSD-FIELD-COUNT is zero).

## ADS field descriptor

After the header, the ADS descriptor contains a variable number of field descriptors. Each field descriptor has the following format:

Offset	Туре	Len	Name
Hex			
(0)	STRUCTURE	42	ADS-FIELD-DESCRIPTOR
(0)	CHARACTER	32	ADSD-FIELD-NAME
(20)	HALFWORD	2	ADSD-FIELD-NAME-LEN
(22)	HALFWORD	2	ADSD-OCCURS-INDEX
(24)	HALFWORD	2	ADSD-FIELD-OFFSET
(26)	HALFWORD	2	ADSD-FIELD-DATA-LEN
(28)	CHARACTER	1	ADSD-FIELD-JUSTIFY
(29)	CHARACTER	1	ADSD-FIELD-FILL-CHAR
(2A)	CHARACTER		ADSD-NEXT-FIELD

#### ADSD-FIELD-NAME

The unsuffixed field name padded with blanks on the right.

## ADSD-FIELD-NAME-LEN

The number of characters in the field name.

### ADSD-OCCURS-INDEX

When OCCURS is specified for a field definition there is a separate field descriptor for each element of the array, and ADSD-OCCURS-INDEX indicates the array index for the particular field. If OCCURS is not specified, then ADSD-OCCURS-INDEX is 0.

### ADSD-FIELD-OFFSET

The offset of the field within the ADS. The offset is to the beginning of the (fullword) length field, and you must add 2 (for the length field) + 1 (for the 3270 attribute) + ADSD-ATTRIBUTE-NUMBER to obtain the offset of the data part of the field.

#### ADSD-FIELD-DATA-LEN

The length of the field in the ADS.

### ADSD-FIELD-JUSTIFY

A 1-character field indicating whether the data is to be justified left 'L' or right 'R' if the supplied length is less than the length in the ADS.

#### ADSD-FIELD-FILL-CHAR

The character (blank or '0') to be used to pad the remainder of the field in the ADS.

## ADSD-NEXT-FIELD

The next field descriptor. The address of ADSD-NEXT-FIELD can be used to update a pointer for the field descriptor.

# Chapter 6. Link3270 diagnostics

Link3270 messages are subject to a number of validation stages. The following types of validation error are described

- Invalid message
- Invalid BRIH
- Invalid facility
- Invalid BRIV
- · Invalid application data

Return codes and abend codes provided to assist in diagnosis of errors. Note that the order in which checks are made is subject to change, and therefore should not be used as an interface. "BRIH-RETURNCODE values" on page 92 shows the possible values of BRIH-RETURNCODE and the contents of any related diagnostic fields (BRIH-COMPCODE and BRIH-REASON). Where no specific value is shown, these fields are set to 0.

#### Invalid Message

If a COMMAREA is passed to DFHL3270 that is too small to contain a BRIH, or does not have the appropriate BRIH header, this will result in a transaction abend code:

ABR4 No COMMAREA

ABR5 COMMAREA too small to contain BRIH

ABR6 COMMAREA does not contain BRIH

## Invalid BRIH

Only relevant fields are validated on each request. If these are invalid, then BRIH-RETURNCODE is set to BRIHRC-VALIDATION-ERROR-BRIH and BRIH-ERROROFFSET points to the field in error. The system state is not changed by a validation error. Therefore user transactions are neither started nor abended.

## Invalid bridge facility

If the facility token is invalid, or has expired, this will result in BRIH-RETURNCODE being set to BRIHRC-INVALID-FACILITYTOKEN. Facilities which have expired are described by the state errors.

#### Invalid BRIV

BRIVs are validated as they are used. Therefore if a BRIV is not used, it is not checked. If these are invalid then BRIH-RETURNCODE is set to BRIHRC-VALIDATION-ERROR-BRIV and BRIH-ERROROFFSET points to the field in error

The transaction is abended with an ABXF abend code. BRIH-ABENDCODE is set to this value.

### Invalid Application data

Application data cannot be checked by the bridge. Incorrect data will give unexpected results that may result in transaction abends or erroneous processing. You should ensure that your client program creates the data correctly. If validation of the client data is essential, you can do this by creating a program in the router region that accepts the COMMAREA, validates the ADS and then passes it to the bridge with a link to DFHL3270.

## **BRIH-RETURNCODE** values

#### BRIHRC-OK (0)

The request completed successfully.

#### BRIHRC-AI-LINK-FAILED (23)

The link to the autoinstall URM failed.

### BRIH-COMPCODE

1 Set by router region code

#### BRIHRC-AI-REJECTED (22)

The terminal autoinstall URM rejected the bridge install request.

### BRIH-COMPCODE

1 Set by router region code

#### BRIHRC-AI-NETNAME-INVALID (21)

The netname supplied by the terminal autoinstall URM is invalid.

## BRIH-COMPCODE

1 Set by router region code

#### BRIHRC-AI-TERMID-INVALID (20)

The terminal id returned by the autoinstall URM is invalid.

#### **BRIH-COMPCODE**

1 Set by router region code

#### BRIHRC-APPLICATION-ABEND (160)

The user transaction abended. Additional diagnostics:

#### **BRIH-ABENDCODE**

The transaction abend code

#### BRIHRC-CICS-TERMINATION (66)

The CICS region is terminating and the Link3270 request has been rejected.

#### **BRIH-COMPCODE**

1 Set by router region code

#### BRIHRC-CLIENT-NETNAME-INVALID (24)

The client supplied an invalid netname.

#### BRIH-COMPCODE

1 Set by router region code

## BRIHRC-CLIENT-TERMID-INVALID (25)

The client supplied an invalid terminal id.

#### **BRIH-COMPCODE**

1 Set by router region code

## BRIHRC-DFHBRNSF-UNAVAILABLE (65)

File DFHBRNSF is unavailable.

#### BRIH-COMPCODE

1 Set by router region code

#### BRIHRC-FACILITYLIKE-INVALID (26)

The client supplied an invalid facilitylike.

2 Set by router region code

### BRIHRC-FACILITYTOKEN-IN-USE (63)

A transaction is already running with this facilitytoken.

#### **BRIH-COMPCODE**

- 1 Set by router region code
- 2 Set by driver code

#### BRIHRC-INVALID-BRIH-DATALENGTH (140)

The BRIH datalength value supplied by the client is not valid.

#### BRIH-COMPCODE

1 Set by router region code

#### BRIHRC-INVALID-CONTINUE\_REQ (143)

The message contained no BRIVs.

#### **BRIH-COMPCODE**

1 Set by router region code

#### BRIHRC-INVALID-FACILITY-TOKEN (61)

The bridge facilitytoken in the BRIH is invalid.

#### BRIH-COMPCODE

- **1** Set by router region code
- 2 Set by driver code

## BRIHRC-INVALID-KEEPTIME (142)

A KEEPTIME of zero was set on an allocate request.

## BRIH-COMPCODE

1 Set by router region code

#### BRIHRC-NO-DATA (120)

A BRIHT-GET-MORE-MESSAGE request failed because there was no more data to send.

### BRIH-COMPCODE

- 1 Set by router region code
- 2 Set by driver code

## BRIHRC-NO-FREE-NAME (62)

All bridge facilities are already allocated.

#### BRIH-COMPCODE

1 Set by router region code

#### BRIHRC-NO-STORAGE (64)

Insufficient storage in either the router region or AOR to run the request.

#### BRIH-COMPCODE

2 Set by driver code

### BRIHRC-NOT-SHUTDOWN-ENABLED (80)

An attempt was made to run a transaction at shutdown that is not enabled for running at shutdown.

Set by driver code

#### BRIHRC-PROFILE-NOT-FOUND (87)

The transaction PROFILE for the target transaction was not found.

#### **BRIH-COMPCODE**

2 Set by partner code

#### BRIHRC-RETRIEVE-NOT-SUPPORTED (121)

Retrieve vectors are only supported in the initial request.

#### BRIH-COMPCODE

2 Set by driver code

#### BRIHRC-ROUTING-BACKLEVEL-CICS (45)

The Link3270 request was routed to a back level CICS system that does not support Link3270. Additional diagnostics:

BRIH-COMPCODE EIBRESP

## BRIH-REASON

EIBRESP2

## **BRIH-FUNCTION**

EIBFN

## BRIHRC-ROUTING-CONNECTION (43)

The Link3270 request could not be routed to the remote region because of a connection error. Additional diagnostics:

BRIH-COMPCODE EIBRESP

#### BRIH-REASON EIBRESP2

EIDNEOFZ

## BRIH-FUNCTION

EIBFN

#### BRIHRC-ROUTING-TERMERR (44)

The EXEC CICS LINK from the DFHL3270 to the AOR failed with TERMERR. Additional diagnostics:

BRIH-COMPCODE EIBRESP

## BRIH-REASON

EIBRESP2

## BRIH-FUNCTION

EIBFN

## BRIHRC-ROUTING-TRANDEF-ERROR (42)

The TRANSACTION resource definition in the routing region does not allow the transaction to be routed to the chosen target region.

#### **BRIH-COMPCODE**

1 Set by router region code

#### BRIHRC-ROUTING-URM-LINK-FAILED (40)

The link to the dynamic routing URM failed. Additional diagnostics:

- 3 URM abended
- 4 AMODE error
- 5 No PROGRAM definition
- 6 Fetch error
- 7 Disabled
- 8 Program defined as remote

#### BRIHRC-ROUTING-URM-REJECTED (41)

The dynamic routing URM rejected the bridge routing request. Additional diagnostics:

## BRIH-COMPCODE

- 3 Select rejected
- 4 Sysid not found
- 5 Sysid not in service
- 6 Allocate rejected
- 7 Queue purged
- 8 Function not shipped
- 9 Netname not found
- **10** Sysid/netname mismatch

#### BRIH-REASON

Return code from dynamic routing URM (DYRRETC).

### BRIHRC-SECURITY-ERROR (100)

A Link3270 request in session mode has been issued with a different userid than that used in the request that allocated the bridge facility token.

#### BRIH-COMPCODE

- 1 Set by router region code
- 2 Set by driver code

#### BRIHRC-STATE-SYSTEM-ATTACH (82)

The user transaction can only be system attached, and so cannot be run under a bridge facility.

## BRIH-COMPCODE

2 Set by driver code

### BRIHRC-TRANSACTION-DISABLED (84)

The user transaction to be run under the bridge is disabled.

#### **BRIH-COMPCODE**

- **1** Set by router region code
- 2 Set by driver code
- **3** DTRTRAN disabled

#### BRIHRC-TRANSACTION-NOT-FOUND (85)

The user transaction to be run under the bridge was not found. Additional diagnostics:

- 1 Set by router region code
- 2 Set by driver code
- 3 DTRTRAN rejected by routing program

#### BRIHRC-TRANSACTION-NOT-RUNNING (86)

The next leg of a pseudoconversation cannot be run because there is no transaction running on the bridge facility.

#### BRIH-COMPCODE

- **1** Set by router region code
- 2 Set by driver code

### BRIHRC-VALIDATION-ERROR-BRIV (141)

A BRIV is invalid. BRIH-ERROROFFSET points to the field in error.

#### **BRIH-COMPCODE**

2 Set by driver code

## BRIHRC-ROUTER-BACKLEVEL

The router region does not support the version of the Link3270 message.

## BRIH-COMPCODE

1 Set by router region code

## **BRIHRC-AOR-BACKLEVEL**

The bridge driver task in the AOR does not support the version of the Link3270 message.

### BRIH-COMPCODE

2 Set by driver code

# Chapter 7. Using the Link3270 samples

CICS provides sample client programs that use the ECI, EXCI and LINK interfaces to call the Link3270 bridge to run the sample transaction NACT. The main objective of the sample programs is to provide coded examples that you can use to help you write your own client programs. NACT was chosen for this purpose as it has a well documented BMS interface.

The samples are not written to illustrate how a business client should process the data, so the business clients do not perform any special formatting of the data extracted from the user application.

The samples are designed to illustrate the two most common scenarios:

1. Host Client

The client program executes on the host system, using LINK or EXCI to drive the user application. In this scenario, the sample programs show how you can divide the client logic into a *business-client* that is concerned only with the business data and its representation in the client end-user environment, and a *bridge-client* that builds the bridge messages and manages the communication with the bridge. In this way, you can develop the more complex back-end using CICS, and can make it reusable.

The LINK and EXCI samples show how this common logic can be shared.

See Figure 7 on page 30 for an illustration of the host client.

## 2. Workstation Client

The client program executes on a remote workstation, using ECI to drive the user application. In this scenario, a single sample program is used, combining the business logic in the client environment and the interface to the bridge. In this environment, the programmer needs some, but not extensive, CICS knowledge.

See Figure 9 on page 31 for an illustration of the workstation client.

The following sample client programs and copybooks are supplied in source code, in the SDFHSAMP library.

Lang.	LINK	ECI	EXCI	Copybook
С	DFH\$BRCC DFH\$BRLC	DFH\$BREC	DFH\$BRXC	DFH\$BRSH
COBOL	DFH0CBRC DFH0CBRL		DFH0CBRX	DFH0CBRA

### DFH\$BRCC

This is the C language host business client sample, driven by transaction BRCH. DFH\$BRCC formats a COMMAREA using the structures defined in the DFH\$BRSH header file, to contain the business data that will be passed to the NACT transaction. DFH\$BRCC then LINKS to DFH\$BRLC ( the C bridge client) , passing the COMMAREA, to perform the following functions:

- Run the NACT search function to obtain an account number from a name.
- Run the NACT display function to obtain account details for the account number.

When DFH\$BRLC returns with the requested data, DFH\$BRCC writes it to TS queue BRCH.

### **DFH0CBRC**

This is the COBOL language host business client sample, driven by transaction BRCO. DFH0CBRC formats a COMMAREA using the structures defined in the DFH0CBRA copybook, to contain the business data that will be passed to the NACT transaction. DFH0CBRC then LINKS to DFH0CBRL, passing the COMMAREA, to perform the following functions:

- Run the NACT search function to obtain an account number from a name.
- Run the NACT display function to obtain account details for the account number.

When DFH0CBRL returns with the requested data, DFH0CBRC writes it to TS queue BRCO.

#### DFH\$BRLC/DFH0CBRL

DFH\$BRLC and DFH0CBRL LINK to DFHL3270 to drive the NACT transaction, using Link3270 in session mode. They do the following:

- · Allocate the bridge facility
- Format the vectors to send in the Link3270 message
- Call the NACT transaction using the Link3270 bridge
- Return the requested data in the COMMAREA
- Delete the bridge facility

#### DFH\$BRXC

This is the C language EXCI business client sample. DFH\$BRXC formats a COMMAREA using the structures defined in the DFH\$BRSH header file, to contain the business data that will be passed to the NACT transaction. DFH\$BRXC then LINKS to DFH\$BRLC, using the EXCI interface, passing the COMMAREA, to perform the following functions:

- Run the NACT search function to obtain an account number from a name.
- Run the NACT display function to obtain account details for the account number.

When DFH\$BRLC returns with the requested data, DFH\$BRXC writes it to SYSPRINT.

#### **DFH0CBRX**

This is the COBOL language EXCI business client sample. DFH0CBRX formats a COMMAREA using the structures defined in the DFH0CBRA copy book, to contain the business data that will be passed to the NACT transaction. DFH0CBRX then LINKS to DFH0CBRL, using the EXCI interface, passing the COMMAREA, to perform the following functions:

- Run the NACT search function to obtain an account number from a name.
- Run the NACT display function to obtain account details for the account number.

When DFH0CBRL returns with the requested data, DFH0CBRX writes it to SYSPRINT.

### DFH\$BREC

- · Allocates the bridge facility
- Sends an ECI request to program DFHL3270 to run NACT and obtain the menu screen
- Formats a message with BRIV vectors to run the NACT search function to obtain an account number from a name.
- Sends an ECI request to program DFHL3270 to run the NACT search function.

- Extracts the search output data from the outbound message.
- Sends an ECI request to program DFHL3270 to run NACT and obtain the menu screen
- Formats a message with BRIV vectors to run the NACT display function to obtain account details for the account number.
- Extracts the account details from the outbound message.
- Formats a client response using the structures defined in the DFH\$BRSH header file and displays it to the client end-user.
- Deletes the bridge facility

## The NACT transaction

The NACT sample transaction is used in the book *Designing and Programming CICS Applications*, published by O'Reilly & Associates, Inc; ISBN 1–56592–676–5, to demonstrate the design and development of CICS applications. It is a COBOL pseudoconversational 3270-based CICS application that operates on the customer account file of a fictitious company, KanDoIT.

The NACT application provides the following services:

- · access to an account record by account number
- · addition of a new account number and account record
- · modification of an account record
- deletion of an account record
- · access to an account record by customer name

The logic of the application is divided into the following pseudoconversational steps:

- 1. A menu is displayed to allow selection of the service required.
- 2. The updated menu screen is read; the requested record is obtained and displayed
- 3. If the record is modified, the changes are received and the file updated; the menu is re-displayed.

The Link3270 sample client programs request the record number for customer name JACOB JONES; retrieve the record and display, or store, the retrieved record.

## Running the sample client programs

The following setup is required to run the samples:

## Setup the Link3270 environment

Set up the Link3270 environment as described in Chapter 4, "Managing the Link3270 bridge environment," on page 47. Ensure that you have defined :

- Link3270 SIT parameters
- The DFHBRNSF file

## Setup for the CICS-based clients

1. Install and setup the NACT transaction, as described in "Setup for the NACT transaction" on page 102

2. Translate, compile and link the COBOL or C language programs DFH0CBRC, DFH0CBRL, DFH\$BRCC, and DFH\$BRLC, using a Language Environment<sup>®</sup> conforming compiler, ensuring the library containing the DFH\$BRSH and DFH0CBRA copybooks is accessible. See Device dependent support: DDS, in the *CICS Application Programming Guide* for guidance on translating and compiling CICS programs. Translate, compile and link the COBOL or C language programs DFH0CBRC, DFH0CBRL, DFH\$BRCC, and DFH\$BRLC, using a Language Environment conforming compiler, ensuring the library containing the DFH\$BRSH and DFH0CBRA copybooks is accessible. See Device dependent support: DDS, in the *CICS Application Programment* conforming compiler, ensuring the library containing the DFH\$BRSH and DFH0CBRA copybooks is accessible. See Device dependent support: DDS, in the *CICS Application Programming Guide* for guidance on translating and compiling CICS programs.

Add the load library containing the load modules to the RPL concatenation of your CICS startup job.

3. Install resource definitions for the following CICS resources:

Resource	Description	
DFH0CBRC	COBOL sample business client	
DFH0CBRL	COBOL sample bridge client	
DFH\$BRCC	C sample business client	
DFH\$BRLC	C sample bridge client	
BRCO	Transaction to drive DFHC0BRC	
BRCH	Transaction to drive DFH\$BRCC	

Table 13. Resource definitions for sample clients

Examples of these resource definitions are provided for you in group DFH\$BRLK. Install this group, or add it to the grouplist installed during CICS startup.

4. Run the samples by entering the transaction name BRCO (for the COBOL sample) or BRCH (for the C sample) at a CICS terminal.

## Setup for OS/390 based client

- 1. Install and setup the NACT transaction in CICS, as described in "Setup for the NACT transaction" on page 102.
- 2. Edit the DFH0CBRX or DFH\$BRXC sample to pass the netname of the CICS region where the bridge client program (DFH\$BRLC or DFH0CBRL) is installed. Compile and link the COBOL or C language programs DFH0CBRX or DFH\$BRXC, using a Language Environment conforming compile, ensuring the library containing the DFH\$BRSH and DFH0CBRA copybooks is accessible. Ensure also that the CICS supplied SDFHEXCI dataset is concatenated to SYSLIB for your compile step. Place the output load modules in an appropriate OS/390 library.
- 3. Translate, compile and link the COBOL or C language programs DFH0CBRL, and DFH\$BRLC, using a Language Environment conforming compiler, ensuring the library containing the DFH\$BRSH and DFH0CBRA copybooks is accessible. See Device dependent support: DDS, in the *CICS Application Programming Guide* for guidance on translating and compiling CICS programs.

Add the load library containing the load modules to the RPL concatenation of your CICS startup job.

4. Create and install a CONNECTION resource definition to define the interface between CICS and OS/390 that will be used by the EXCI request. See Chapter 11, "Defining connections to CICS," on page 151, and Chapter 8,

"Introduction to the external CICS interface," on page 107 for an introduction and guidance on how to use of the EXCI interface.

5. To run the EXCI samples, you can use the following JCL supplied in file DFH\$BRXJ in SDFHINST. You should edit this JCL to replace *hlq* with your own prefix, assigned during CICS installation, and to replace *application library* with the name of the library that contains the load modules created in step 1. Run this job in the OS/390 batch environment.

```
//DFH$BRXJ JOB (accounting information)
        CLASS=A,MSGCLASS=A,MSGLEVEL=(1,1),REGION=12M
//
//LINK3270 EXEC PGM=DFH0CBRX
//*
//* JCL NAME = DFH$BRXJ
//*
//* DESCRIPTIVE NAME = Link3270 bridge EXCI business client sample
//*
//* FUNCTION =
//*
//*
     Sample JCL for running the Link3270 bridge EXCI
//*
     business client samples DFHOCBRX and DFH$BRXC.
//*
//*
     The file DSN qualifier hlq must be changed.
//*
     This JCL runs the COBOL sample DFHOCBRX
//*
     This must be compiled into application library
//*
     before the JCL is run.
//*
     application library must be changed.
//*
     To run the C Sample change DFH0CBRX to DFH$BRXC.
//*
//*
     The CICS External Interface Guide contains a detailed
//*
     description of the Link3270 bridge.
//*
//STEPLIB DD DSN=application library,DISP=SHR
        DD DSN= hlq.SDFHEXCI,DISP=SHR
11
//SYSPRINT DD SYSOUT=*
//SYSABEND DD SYSOUT=*
//
```

Figure 14. EXCI sample JCL

Note: The output from the NACT sample is returned in the output from this job.

\*

## Setup for the workstation client

- 1. Install the CICS Transaction Gateway on your workstation, as described in the relevant CICS Transaction Gateway administration manual for your workstation platform, ensuring that the developer kit is included.
- 2. Download the following programs and header files:

Table 14. Required files

File	Source library
dfh\$brec.c	CICSTS32.CICS.SDFHSAMP
dfh\$brxc.h	CICSTS32.CICS.SDFHSAMP
dfh\$brmh.h	CICSTS32.CICS.SDFHSAMP
dfhbrich.h	CICSTS32.CICS.SDFHC370
dfhbrihh.h	CICSTS32.CICS.SDFHC370

Compile dfh\$brec, with these header files, and DFHAID.h in your path.

- 3. Setup the ECI connection in CICS as described in the *CICS Family: Communicating from CICS on zSeries* manual.
- 4. Setup the ECI connection in your workstation as described in the appropriate Client Administration manual.
- 5. Install and setup the NACT transaction in CICS, as described in "Setup for the NACT transaction"

## Setup for the NACT transaction

Table 15 shows the components that form the NACT sample application, supplied during CICS installation:

File	Туре	Library
DFH0CNA1	COBOL source	SDFHSAMP
DFH0CNA2	COBOL source	SDFHSAMP
DFH0CNA3	COBOL source	SDFHSAMP
DFH0CNA4	COBOL source	SDFHSAMP
DFH0CNA5	COBOL source	SDFHSAMP
DFH0MNA	Mapset	SDFHSAMP
DFH0CNAA	Copybook	SDFHSAMP
DFH0CNAB	Copybook	SDFHSAMP
DFH0CNAC	Copybook	SDFHSAMP
DFH0CNAE	Copybook	SDFHSAMP
DFH0CNAF	Copybook	SDFHSAMP
DFH0CNAG	Copybook	SDFHSAMP
DFH0CNAL	Copybook	SDFHSAMP
DFH0CNAM	Copybook	SDFHSAMP
DFH0CNAR	Copybook	SDFHSAMP
DFH0CNAU	Copybook	SDFHSAMP
DFH0CNAW	Copybook	SDFHSAMP
DFH\$NACT	RDO group	CSD
DFHNADEF	JCL	XDFHINST

Table 15. NACT sample components

To set up the NACT sample to use with the bridge sample clients, you need to perform the following steps:

1. Assemble and link the map DFH0MNA. Note that he map copybook can be created in this step, but the map copybook DFH0CNAM is supplied. See Using the CECI function keys, in the *CICS Application Programming Guide* for guidance on assembling CICS maps.

Add the load library containing the load modules to the RPL concatenation of your CICS startup job.

 Translate, compile and link the COBOL programs DFH0CNA1–5, ensuring that the copybooks listed inTable 15 are accessible. See Device dependent support: DDS, in the for guidance on translating and compiling CICS programs.

Add the load library containing the load modules to the RPL concatenation of your CICS startup job.

 Create NACT files. Edit the JCL provided in file DFHNADEF to conform to your own installation naming conventions, and run it to create the following NACT files:

## xxx.ACCTFILE

The account file

## xxx.ACCTNAIX

The names alternate index

## xxx.ACTINUSE

record locking file

- 4. Edit the resource definitions in sample group DFH\$NACT to conform to the naming conventions you have used in step 3. Install this group, or add it to the grouplist installed during CICS startup.
- 5. You can now test that installation is complete by entering the transaction NACT on a CICS terminal.

# Part 3. External CICS Interface

This part of the book describes the external CICS interface. The external CICS interface is an application programming interface that enables a non-CICS program (a client program) running in MVS to call a program (a server program) running in a CICS region and to pass and receive data by means of a communications area.

**External CICS Interface** 

# Chapter 8. Introduction to the external CICS interface

The external CICS interface is an application programming interface that enables a non-CICS program (a client program) running in MVS to call a program (a server program) running in a CICS region and to pass and receive data by means of a communications area. The CICS application program is invoked as if linked-to by another CICS application program.

This programming interface allows a user to allocate and open sessions, or *pipes* ( a one-way communication path between a sending process and a receiving process) to a CICS region, and to pass distributed program link (DPL) requests over them. The multiregion operation (MRO) facility of CICS interregion communication (IRC) facility supports these requests, and each pipe maps onto one MRO session, where the client program represents the sending process and the CICS server region represents the receiving process. There is a default limit of 100 pipes per EXCI address space; the limit can be changed when MVS is IPLed.

This limit is implemented to avoid EXCI clients monopolising MRO resources, which could prevent CICS systems from using MRO. The limit is applied in both MRO and cross system MRO (XCF/MRO) environments. An ALLOCATE\_PIPE request results in an MRO LOGON request being issued and there is a limit on the total number of MRO LOGON requests allowed from all address spaces. This is particularly critical when using XCF/MRO, where the limit on the number of members in a XCF group also limits the total number of MRO LOGONs

The external CICS interface identifies the CICS region to communicate with by the CICS region's applid, as defined in the SIT APPLID parameter. (In an XRF environment, it is the generic applid that must be used). You can specify the applid either on an EXCI API call or by means of the DFHXCURM user-replaceable program. (For more information about DFHXCURM, see Chapter 12, "The EXCI user-replaceable module," on page 157.)

**Note:** Do not confuse the term "generic applid" with "generic resource name". Generic resource names apply only to VTAM generic resource groups, which are not supported by EXCI.

The client program and the CICS server region (the region where the server program runs or is defined) must be in the same MVS image unless:

- · The CICS region is running in a sysplex that supports cross-system MRO .
- All DPL requests issued by the client program specify the SYNCONRETURN option.

Alternatively, if there is no local CICS region in the MVS image, you must specify the SVC parameter that the external CICS interface is to use, by coding a CICSSVC parameter in the DFHXCOPT table. Although the external CICS interface does not support the cross-memory access method, it can use the XCF access method provided by the CICS XCF/MRO facility. SeeChapter 13, "Using the EXCI options table, DFHXCOPT," on page 159 for information about XCF/MRO.

A client program that uses the external CICS interface can operate multiple sessions for different users (either under the same or separate TCBs) all coexisting in the same MVS address space without knowledge of, or interference from, each other.

#

# #

#

# #

#

#

#

Where a client program attaches another client program, the attached program runs under its own TCB.

This chapter describes:

- "The EXCI programming interfaces"
- "Resource recovery" on page 112
- "EXCI concepts" on page 11
- "Requirements for the external CICS interface" on page 116

## **Overview**

## The EXCI programming interfaces

The external CICS interface provides two forms of programming interface: the EXCI CALL interface and the EXEC CICS interface.

The EXCI CALL interface: This interface consists of six commands that allow you to:

- Allocate and open sessions to a CICS system from non-CICS programs running under MVS
- · Issue DPL requests on these sessions from the non-CICS programs
- · Close and deallocate the sessions on completion of the DPL requests.

The six EXCI commands are:

- Initialize-User
- Allocate\_Pipe
- Open\_Pipe
- DPL call
- Close\_Pipe
- Deallocate\_Pipe

The EXEC CICS interface: The external CICS interface provides a single, composite command—EXEC CICS LINK PROGRAM—that performs all six commands of the EXCI CALL interface in one invocation.

This command is similar but not identical to the distributed program link command of the CICS command-level application programming interface.

#### API restrictions for server programs

A CICS server program invoked by an external CICS interface request is restricted to the DPL subset of the CICS application programming interface. This subset (the DPL subset) of the API commands is the same as for a CICS-to-CICS server program.

See Distributed program link (DPL), in the *CICS Application Programming Guide* for details of the DPL subset for server programs.

## Choosing between the EXEC CICS and the CALL interface

As illustrated in the various language versions of the CICS-supplied sample client program (see "Using EXCI sample application programs" on page 168 for details), you can use both the CALL interface (all six commands) and the EXEC CICS LINK command in the same program, to perform separate requests. As a general rule, it is unlikely that you would want to do this in a production program.

Each form of the external CICS interface has its particular benefits.

• For low-frequency or single DPL requests, you are recommended to use the EXEC CICS LINK command.

It is easier to code, and therefore less prone to programming errors.

Note that each invocation of an EXEC CICS LINK command causes the external CICS interface to perform all the functions of the CALL interface, which results in unnecessary overhead.

Note also that this overhead is greatly increased if you use the EXEC CICS LINK command to communicate with a CICS server region in a different LPAR. In this case each invocation of the EXEC CICS LINK command generates a great deal of XCF activity because of the IRP logon, connect, disconnect and logoff which is required. You might find that you experience severe degradation of elapsed time between EXEC CICS LINK commands issued to a CICS server region in a separate LPAR, compared to the elapsed time of the same commands issued to a CICS server region in the same LPAR.

• For multiple or frequent DPL requests from the same client program, you are recommended to use the EXCI CALL interface.

This is more efficient, because you need only perform the Initialize\_User and Allocate\_Pipe commands once, at or near the beginning of your program, and the Deallocate\_Pipe once on completion of all DPL activity. In between these functions, you can open and close the pipe as necessary, and while the pipe is opened, you can issue as many DPL calls as you want.

## Illustrations of the external CICS CALL interface

The diagrams in Figure 15 through Figure 18 on page 111 illustrate the external CICS interface using the EXCI CALL interface.

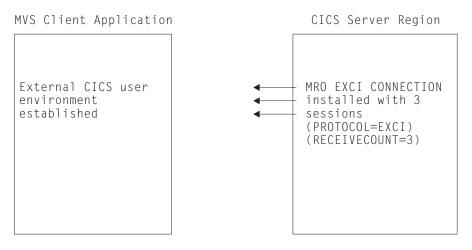

Figure 15. Stage 1: Status after an INITIALIZE\_USER call

#### Note:

- 1. In Figure 15, the target CICS region is running with IRC open, and one EXCI connection with three sessions installed, at the time the client application program issues an INITIALIZE\_USER call.
- The client application program address space is initialized with the EXCI user environment. There is no MRO activity at this stage, and no pipe exists.

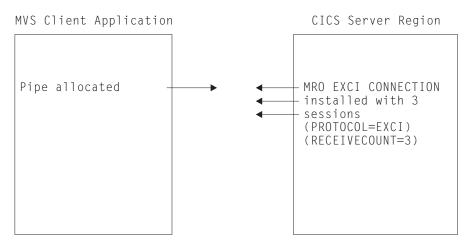

Figure 16. Stage 2: Status after the first ALLOCATE\_PIPE call

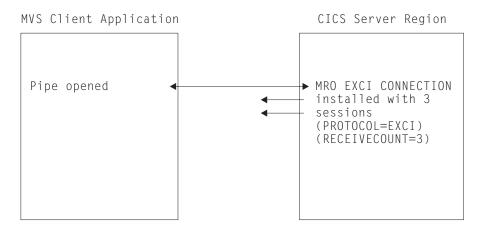

Figure 17. Stage 3: Status after the OPEN\_PIPE call

#### Note:

- 1. In Figure 17, the external CICS interface connects to the CICS server region, and the pipe is now available for use.
- 2. The remaining two EXCI sessions are free, and can be used by further open pipe requests from the same, or a different, client application program (provided the connection is generic).

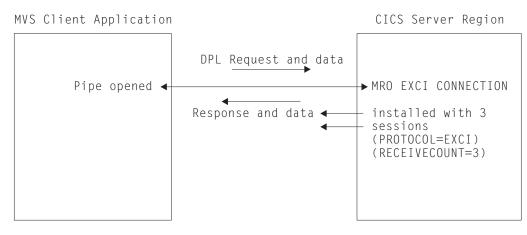

Figure 18. Stage 4: Status with one open pipe, processing a DPL call

**Note:** In Figure 18, the external CICS interface passes the DPL request over the open pipe, with any associated data. The CICS server region returns a response and data over the open pipe.

**Closing pipes:** When the client application program closes a pipe, it remains allocated ready for use by the same user, and the status is as shown in Figure 16 on page 110. At this stage, the MRO session is available for use by another open pipe request, from the same or from a different client application program (provided the connection is generic).

**Deallocating pipes:** When the client application program deallocates a pipe, it logs off from MRO and frees all the storage associated with the session. This leaves the status as shown in Figure 15 on page 109.

## Illustration of the EXCI EXEC CICS interface

Figure 19 on page 112 illustrates the EXEC CICS interface, and how it resolves to the six EXCI CALLs.

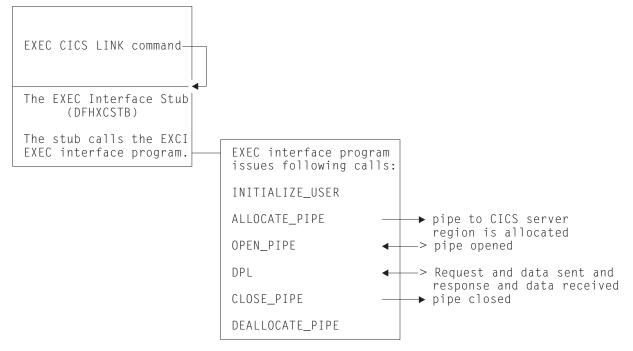

Figure 19. Illustration of the external CICS interface using the EXEC CICS command

## **Resource recovery**

Resource recovery consists of the protocols and program interfaces that allow an application program to make consistent changes to multiple protected resources. The external CICS interface supports resource recovery.

A CICS server program that is invoked by an external CICS interface request can update recoverable resources; the changes are committed when the mirror transaction in the CICS server region takes a syncpoint. The client program can determine when syncpointing should occur. There are two options:

- Resource recovery controlled by the CICS server regions. In this case, changes
  to recoverable resources are committed at the completion of each DPL request,
  independently of the client program. Also, in addition to the syncpoint taken when
  the server program returns control to CICS (the SYNCONRETURN option), the
  server program can take explicit syncpoints during execution.
- Resource recovery controlled by the EXCI client program with the support of recoverable resource management services (RRMS). When the client program requests it, updates made by the server program in successive DPL requests are committed together.

To support this option, CICS and the external CICS interface both make use of resource recovery services (RRS), the OS/390 syncpoint manager<sup>1</sup>,which is an MVS component of recoverable resource management services (RRMS). In the context of RRMS, CICS is a **resource manager**; the client program may issue

<sup>1.</sup> RRMS comprises three OS/390 components: registration services, context services, and resource recovery services (RRS)

requests to other resource managers, and have resources owned by those resource managers committed in the same **unit-of-recovery (UR).**<sup>2</sup>

These options are controlled as follows:

- By the DPL\_opts parameter of the DPL\_request.
- By the SYNCONRETURN option, either specified or omitted, on the EXEC CICS LINK PROGRAM command.

If you specify SYNCONRETURN, a syncpoint is taken on completion of each DPL request. If SYNCONRETURN is omitted, a syncpoint is taken when the client program requests it using the interfaces described in "Taking a syncpoint in the client program" on page 115.

## Using RRMS with the external CICS interface

To use RRMS to coordinate DPL requests, ensure that:

- The EXCI client and the CICS region to which it sends DPL requests are running in the same MVS image (this is an RRMS restriction, and does not apply to DPL requests that specify SYNCONRETURN).
- The CICS region that receives the DPL requests is started with RRMS=YES specified as a system initialization parameter (the default is RRMS=NO).
- RRS is running in the MVS image where CICS and the client program execute. See OS/390 MVS Programming: Resource Recovery.

For an illustration of the concept of the external CICS interface and CICS using RRMS, see Figure 20.

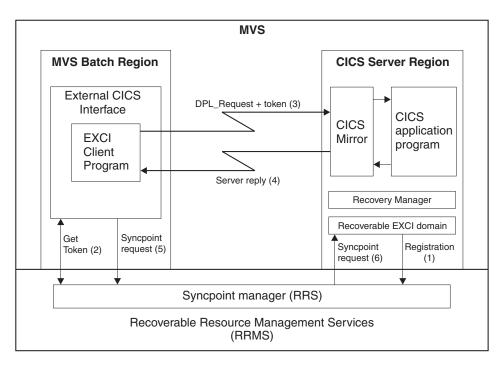

Figure 20. Conceptual view of EXCI client and CICS server region using RRMS. The main (numbered) steps within a unit-of-recovery are described in the list following the diagram

<sup>2.</sup> A unit of recovery is analogous to a CICS unit of work

- 1. If the CICS system initialization parameter RRMS=YES is specified, CICS registers with RRMS as a resource manager. This registration occurs during CICS initialization.
- 2. When the EXCI client program issues a DPL\_Request call in 2-phase commit mode (a call that omits the SYNCONRETURN option), it receives from RRMS:
  - A unit-of-recovery identifier (URID)
  - A context token
  - A pass token
- 3. The URID and the tokens obtained by EXCI on behalf of the client program are included on the DPL request passed to the CICS server region. If the DPL request is the first one within the UR, CICS calls RRS to express an interest in the UR, attaches a new mirror transaction, and validates the tokens. If the request is valid, the mirror program links to the specified server application program. The server program completes its work, which is all performed within the unit-of-recovery. This work can include updating recoverable resources in the local server region, or daisy-chaining to other CICS regions.
- 4. When the server program completes, it returns the communications area (COMMAREA) and return codes to the client program.

Note: Steps 3 and 4 can repeated many times for the same UR.

- 5. When the EXCI client program is ready to commit or back out its changes, the program invokes RRS to begin the 2-phase commit protocol.
- 6. RRS acts as coordinator and either:
  - Asks the resource managers to prepare to commit all updates within the UR. (Note that resource managers other than the CICS server region may also have expressed an interest in the UR.) If all vote yes, RRS tells them to go ahead and commit the changes. If any vote no, all resource managers are told to perform backout.
  - Tells all the resource managers that expressed an interest in the UR to perform backout of all the changes made with the UR.

The UR is now complete and CICS detaches the mirror task. If the EXCI client sends any new DPL requests after this point, EXCI starts a new unit-of-recovery and CICS attaches a new mirror transaction.

Each DPL request that specifies the SYNCONRETURN option attaches a new mirror task in the target CICS region. The first DPL request that does not specify SYNCONRETURN also attaches a new mirror task , but subsequent requests are directed to the same mirror task. When a syncpoint takes place, the mirror task ends, and the next non-SYNCONRETURN request attaches a new mirror. To see the effect of mixing DPL requests with and without the SYNCONRETURN option, see Figure 21 on page 115.

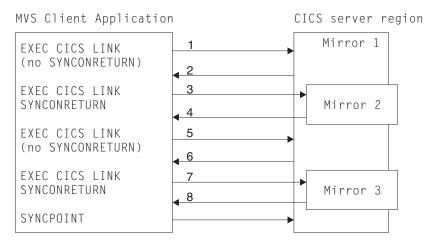

Figure 21. Effect of mixing DPL requests with and without SYNCONRETURN

- 1. Client issues DPL request omitting SYNCONRETURN. Because no mirror transaction is running, a new mirror (mirror 1) is attached.
- 2. The DPL request completes, and because it was issued without the SYNCONRETURN option, the mirror transaction waits for another request.
- 3. Client issues DPL request with the SYNCONRETURN option. A new mirror transaction (mirror 2) is attached.
- 4. On completion of the DPL request, resources updated by the mirror transaction are committed, and the mirror transaction ends.
- 5. Client issues another DPL request omitting SYNCONRETURN. Mirror 1 receives and executes the DPL request.
- 6. The DPL request completes, and once again the mirror transaction waits for another request.
- 7. Client issues DPL request with the SYNCONRETURN option.
  - A new mirror transaction (mirror 3) is attached.
- 8. On completion of the DPL request, resources updated by the mirror transaction are committed, and the mirror transaction ends.
- 9. The client program requests a syncpoint. Resources updated by mirror 1 are committed, and the transaction ends.

## Taking a syncpoint in the client program

To commit changes instigated by the client program, use one of the following MVS callable services:

## Application\_Commit\_UR (SRRCMIT)

For a description of Application\_Commit\_UR, see OS/390 MVS Programming: Callable Services for High-Level Languages.

## Commit\_UR (ATRCMIT)

For a description of Commit\_UR, see OS/390 MVS Programming: Resource Recovery.

To backout changes in the client program, use one of the following services:

## Application\_Backout\_UR (SRRBACK)

For a description of Application\_Backout\_UR, see OS/390 MVS Programming: Callable Services for High-Level Languages.

## Backout\_UR (ATRBACK)

For a description of Backout\_UR, seeOS/390 MVS Programming: Resource Recovery.

If none of these interfaces is used, changes are committed or backed out explicitly when the client program either ends normally or abends. The use of implicit commit or backout is not recommended:

- The client program has no way of knowing if updates were committed or backed out; even if the program ends normally, a resource manager may choose to backout any changes.
- The run time environment for high level languages may intercept errors that would otherwise result in an operating system abend. If an error is intercepted in this way, and the client program does not take any explicit action, the program may terminate normally and updates committed. Your client program should be coded to ensure that resources are committed or backed out correctly in these situations. For example, a PL/I program might include an ON unit that issues SRRBACK when errors are encountered. A COBOL program might use the ON phrase on statements that could encounter errors to achieve the same result.

## **Requirements for the external CICS interface**

Client programs running in an MVS address space can communicate only with CICS server regions running under Version 4 of CICS for MVS/ESA, or a later release.

Also, the client program can connect to the server CICS region only through the Version 4 of CICS for MVS/ESA (or later) level of the interregion communication program, DFHIRP.

For information about DFHIRP, and its requirement to be installed in the MVS extended link pack area (ELPA), see Installing MRO support, in the *CICS Transaction Server for z/OS Installation Guide*.

When you use RRMS to coordinate DPL requests, the server CICS region must be running CICS TS Release 3 or later.

# Chapter 9. The EXCI CALL interface

The EXCI CALL interface consists of six commands that allow you to:

- Allocate and open sessions to a CICS system from non-CICS programs running under MVS
- Issue distributed program link (DPL) requests on these sessions from the non-CICS programs
- · Close and deallocate sessions on completion of DPL requests.

The six EXCI commands are:

- Initialize\_User
- Allocate\_Pipe
- · Open\_Pipe
- DPL\_Request
- Close\_Pipe
- Deallocate\_Pipe

**The application program stub, DFHXCSTB**: The EXCI commands invoke the external CICS interface via an application programming stub provided by CICS, called DFHXCSTB. You must include this stub when you link-edit your non-CICS program.

## The EXCI CALL interface commands

In the description of each command that follows, the syntax box illustrates the assembler form of the command. The syntax shows VL,MF=(E,(1)) for each command, indicating the execute form of the CALL macro, with the parameter list storage area addressed by Register 1.

The commands are also supported by C, COBOL, and PL/I programming languages, using the CALL conventions appropriate for these languages.

There are examples of these CALLs, in all the supported languages, in the sample client programs provided by CICS. See "Using EXCI sample application programs" on page 168 for information about these.

## Initialize\_User

Initialize the user environment. This includes obtaining authority to use IRC facilities. The environment is created for the lifetime of the TCB, so the command needs to be issued only once per user per TCB. Further commands from this user must be issued under the same TCB.

## Syntax

CALL DFHXCIS, (version\_number, return\_area, user\_token, call\_type, user\_name), VL, MF=(E,(1))

## **Parameters**

version\_number

A fullword binary input area indicating the version of the external CICS interface parameter list being used. It must be set to 1 in the client program.

The equated value for this parameter in the CICS-supplied copybook DFHXCPL*x* (where *x* indicates the language) is VERSION\_1. See page Table 18 on page 138 for copybook details.

#### return\_area

A 5-word output area to receive response and reason codes, and a message pointer field. For more details see "Return area for the EXCI CALL interface" on page 138.

### user\_token

A 1-word output area containing a 32-bit token supplied by the CICS external interface to represent the client program.

The user token corresponds to the *user-name* parameter. The client program must pass this token on all subsequent external CICS interface commands made for the user defined on the *user\_name* parameter.

#### call\_type

A 1-word input area indicating the function of the command. It must be set to 1 in the client program to indicate that this is an Initialize\_User command.

The equated value for this call in the CICS-supplied copybook DFHXCPLx (where x indicates the language) is INIT\_USER. See page Table 18 on page 138 for copybook details.

#### user\_name

An input area holding a name that identifies the user of the external CICS interface. Generally, this is the client program. If this user is to use a specific pipe, then the value in *user\_name* must match that of the NETNAME attribute of the CONNECTION definition for the specific pipe.

## **Responses and reason codes**

For all non-zero response codes, a unique reason code value identifies the reason for the response.

Note: All numeric response and reason code values are in decimal.

The following is a summary of the response and reason codes that the external CICS interface can return on the Initialize\_User call:

#### **Response OK**

Command executed successfully (RC 0). Reason code:

0 Normal response

#### **Response WARNING**

The command executed successfully, but with an error (RC 4). Reason codes:

3 VERIFY\_BLOCK\_FM\_ERROR

Initialize\_User processing requires storage below 16MB to build the parameter list for the SSI Verify call, and an error has occurred during the FREEMAIN for this area.

4 WS\_FREEMAIN\_ERROR

An attempt to FREEMAIN working storage has resulted in an MVS FREEMAIN error.

## Response RETRYABLE

The command failed because of setup errors but can be reissued (RC 8). Reason code:

201 NO\_CICS\_IRC\_STARTED

An Initialize\_User command has been issued on an MVS image that has had no IRC activity since the previous IPL, and the external CICS interface cannot determine the CICS SVC number.

## **Response USER\_ERROR**

The command failed because of an error in either the client or the server (RC 12). Reason codes:

401 INVALID\_CALL\_TYPE

An invalid call-type parameter value is specified on this EXCI request.

402 INVALID\_VERSION\_NUMBER

The version\_number parameter does not specify a value of 1 or 2.

403 INVALID\_USER\_NAME

The user\_name parameter consists of all blank characters (X'40').

410 DFHMEBM\_LOAD\_FAILED

During Initialize\_User processing, the external CICS interface attempted to load the main message module in preparation for issuing external CICS interface messages, and the load of this module failed.

411 DFHMET4E\_LOAD\_FAILED

The load of message module, DFHMET4E, has failed. During Initialize\_User processing, the external CICS interface attempted to load its message table in preparation for issuing messages. The load of this module failed.

412 DFHXCURM\_LOAD\_FAILED

During Initialize\_User processing, the external CICS interface attempted to load the user-replaceable module, DFHXCURM. The load of this module failed.

413 DFHXCTRA\_LOAD\_FAILED

During Initialize\_User processing, the external CICS interface attempted to load the trap module (DFHXCTRA). The load of this module has failed.

419 CICS\_AFCB\_PRESENT

An Initialize\_User request has been issued on a TCB that has already been used by CICS or by CICS batch shared database. The external CICS interface cannot share a TCB with CICS, ensuring that a CICS application program cannot issue EXCI requests.

420 DFHXCOPT\_LOAD\_FAILED

During Initialize\_User processing, the external CICS interface attempted to load its options module, DFHXCOPT. The load of this module failed.

### 421 RUNNING\_UNDER\_AN\_IRB

The EXCI call is issued under an MVS IRB, which is not permitted.

## 422 SERVER\_ABENDED

While processing a DPL request, the CICS server application program abended without handling the error.

423 SURROGATE\_CHECK\_FAILED

A DPL request has been issued specifying a USERID parameter.

424 RRMS\_NOT\_SUPPORTED

A DPL request omitting the SYNCONRETURN option has been made on a system that is not running OS/390<sup>®</sup> Release 5 or higher.

## 425 UOWID\_NOT\_ALLOWED

A DPL request omitted the SYNCONRETURN option, but specified a value of UOWID. This combination of parameters is not permitted on a DPL request.

426 INVALID\_TRANSID2

A DPL request has been issued with a **TRANSID2** parameter that consists of all blanks.

427 INVALID\_CCSID

A DPL request has been issued with a **CCSID** parameter that specifies an invalid value.

428 INVALID\_ENDIAN

A DPL request has been issued with a endian parameter that specifies an invalid value.

## 429 DFHXCEIX\_LOAD\_FAILED

During Initialize\_User processing, the external CICS interface attempted to load the module (DFHXCEIX). The load of this module has failed.

## 430 DFHXCPRX\_LOAD\_FAILED

During Initialize\_User processing, the external CICS interface attempted to load the module (DFHXCPRX). The load of this module has failed.

## Response SYSTEM\_ERROR

The command failed (RC 16). Reason codes:

601 WS\_GETMAIN\_ERROR

During Initialize\_User processing, a GETMAIN for working storage failed.

602 XCGLOBAL\_GETMAIN\_ERROR

During Initialize\_User processing, a GETMAIN failed for a critical control block (XCGLOBAL).

603 XCUSER\_GETMAIN\_ERROR

During Initialize\_User processing, a GETMAIN request failed for the user control block (XCUSER).

605 VERIFY\_BLOCK\_GM\_ERROR

During Initialize\_User processing, a GETMAIN failed for an EXCI internal control block.

606 SSI\_VERIFY\_FAILED

A VERIFY call to the MVS subsystem interface (SSI) to obtain the current CICS SVC number failed.

607 CICS\_SVC\_CALL\_FAILURE

During Initialize\_User processing, a call to the currently installed CICS SVC failed.

622 ESTAE\_SETUP\_FAILURE

In order to protect itself from possible program checks the external CICS interface establishes an MVS ESTAE. In this case, the MVS ESTAE macro has failed.

623 ESTAE\_INVOKED

A program check is encountered during call processing, and the ESTAE is invoked.

627 INCORRECT\_SVC\_LEVEL

The release level of the CICS SVC (DFHCSVC) is not the same (or higher) than the release level of the external CICS interface.

For more information about response codes, see "EXCI call response code values" on page 137.

For information about the reason codes, see Chapter 17, "Response and reason codes returned on EXCI calls," on page 205.

## Allocate\_Pipe

Allocate a single session, or pipe, to a CICS region. This command does not connect the client program to a CICS region; this happens on the Open\_Pipe command. You can allocate up to 250 pipes in an EXCI address space. The default limit is 100 pipes. However, you can use the CICS system initialization parameter, LOGONLIM, to change the limit when MVS is IPLed. This limit is set to prevent EXCI clients from monopolising MRO resources, which could prevent CICS systems from using MRO. The limit is applied in both MRO and cross system MRO (XCF/MRO) environments. An ALLOCATE\_PIPE request results in an MRO LOGON requests being issued and there is a limit on the total number of MRO LOGON requests allowed from all address spaces. This is particularly critical when using XCF/MRO, where the limit on the number of members in a XCF group also limits the total number of MRO LOGONs

#### Syntax

CALL DFHXCIS, (version\_number, return\_area, user\_token, call\_type, pipe\_token, CICS applid, allocate\_opts), VL, MF=(E,(1))

#### Parameters

#### version number

A fullword binary input area indicating the version of the external CICS interface parameter list being used. It must be set to 1 in the client program.

The equated value for this parameter in the CICS-supplied copybook DFHXCPL*x* (where *x* indicates the language) is VERSION\_1. See page Table 18 on page 138 for copybook details.

#### return\_area

A 5-word output area to receive response and reason codes, and a message pointer field. For more details see "Return area for the EXCI CALL interface" on page 138.

## user\_token

The 1-word token returned on the Initialize\_User command.

## call\_type

A 1-word input area indicating the function of the command. It must be set to 2 in the client program to indicate that this is an Allocate\_Pipe command.

The equated value for this call in the CICS-supplied copybook DFHXCPLx (where x indicates the language) is ALLOCATE\_PIPE. See page Table 18 on page 138 for copybook details.

#### pipe\_token

A 1-word output area. CICS returns a 32-bit token in this area to represent the allocated session. This token must be used on any subsequent command that uses this session.

#### CICS\_applid (or null\_ptr)

An 8-byte input area containing the generic applid of the CICS system to which the allocated session is to be connected.

Although an applid is required to complete the Allocate\_Pipe function, this parameter is optional on the Allocate\_Pipe call. You can either specify the applid on this parameter to the Allocate\_Pipe call, or in the user-replaceable module, DFHXCURM, using the URMAPPL parameter (DFHXCURM is always invoked during Allocate\_Pipe processing). You can also use the URMAPPL parameter in DFHXCURM to override an applid specified on the Allocate\_Pipe call. See Chapter 12, "The EXCI user-replaceable module," on page 157 for information about the URMAPPL parameter.

If you omit the applid from the call, you must ensure that the CALL parameter list contains a null address for *CICS\_applid*. How you do this depends on the language you are using for the non-CICS client program. For an example of a call that omits an optional parameter, see "Example of EXCI CALLs with null parameters" on page 140.

#### allocate\_opts

A 1-byte input area to represent options specified on this command. The options specify which type of session is to be used—specific or generic. X'00' represents a specific session. X'80' represents a generic session.

The equated value for these options in the CICS-supplied copybook DFHXCPLx (where x indicates the language) are SPECIFIC\_PIPE and GENERIC\_PIPE. See page Table 18 on page 138 for copybook details.

#### **Responses and reason codes**

For all non-zero response codes, a unique reason code value identifies the reason for the response.

Note: All numeric response and reason code values are in decimal.

The following is a summary of the response and reason codes that the external CICS interface can return on the Allocate\_Pipe call:

#### **Response OK**

Command executed successfully (RC 0). Reason code:

0 Normal response

#### **Response USER\_ERROR**

The command failed because of an error in either the client or the server (RC 12). Reason codes:

- 401 INVALID\_CALL\_TYPE
- 402 INVALID\_VERSION\_NUMBER
- 404 INVALID\_USER\_TOKEN
- 421 RUNNING\_UNDER\_AN\_IRB

#### **Response SYSTEM\_ERROR**

The command failed (RC 16). Reason codes:

- 604 XCPIPE\_GETMAIN\_ERROR
- 608 IRC\_LOGON\_FAILURE
- 622 ESTAE\_SETUP\_FAILURE
- 623 ESTAE\_INVOKED
- 628 IRP\_LEVEL\_CHECK\_FAILURE

For information about response codes, see "EXCI call response code values" on page 137.

For information about the reason codes, see Chapter 17, "Response and reason codes returned on EXCI calls," on page 205.

## **Open\_Pipe**

Cause IRC to connect an allocated pipe to a receive session.

Open\_Pipe causes IRC to connect an allocated pipe to a receive session of the appropriate connection defined in the CICS region named either on the Allocate\_Pipe command, or in DFHXCURM. The appropriate connection is either:

- The EXCI connection with a NETNAME value equal to the user\_name parameter on the Initialize\_User command (that is, you are using a specific connection, dedicated to this client program), or
- The EXCI connection defined as generic.

If you shut down CICS without the support of the CICS-supplied shutdown-assist transaction (CESD) or an equivalent, and sessions are left open, CICS may not be able to shut its IRC facility in an orderly manner. A normal shutdown of CICS without the support of the shutdown assist transaction waits if any EXCI sessions are not closed. CICS issues message DFHIR2321 indicating the following information:

- The netname of the session if it is on a specific connection
- The word GENERIC if the open sessions are on a generic connection.

If you use the CICS-supplied shutdown-assist transaction, CESD, sessions left open do not present a problem to normal shutdown, because CESD issues an immediate close of IRC. Provided that at least one DPL\_Request call has been issued on the session, message DFHIR2321 also shows the job name, step name, and procedure name of the client job that is using the session, and the MVS ID of the MVS image on which the client program is running.

### Syntax

### **Parameters**

#### version\_number

A fullword binary input area indicating the version of the external CICS interface parameter list being used. It must be set to 1 in the client program.

The equated value for this parameter in the CICS-supplied copybook DFHXCPL*x* (where *x* indicates the language) is VERSION\_1. See page Table 18 on page 138 for copybook details.

#### return\_area

A 5-word output area to receive response and reason codes, and a message pointer field. For more details, see "Return area for the EXCI CALL interface" on page 138.

#### user\_token

The 1-word token returned on the Initialize\_User command.

call\_type

A 1-word input area indicating the function of the command. This must be set to 3 in the client program to indicate that this is an Open\_pipe command.

The equated value for this call in the CICS-supplied copybook DFHXCPLx (where x indicates the language) is OPEN\_PIPE. See page Table 18 on page 138 for copybook details.

#### pipe\_token

A 1-word output area containing the token passed by CICS on the Allocate\_Pipe command. It represents the pipe being opened on this command.

### **Responses and reason codes**

For all non-zero response codes, a unique reason code value identifies the reason for the response.

Note: All numeric response and reason code values are in decimal.

The following is a summary of the response and reason codes that the external CICS interface can return on the Open\_Pipe call:

#### **Response OK**

Command executed successfully (RC 0). Reason code:

0 NORMAL

#### **Response WARNING**

The command executed successfully, but with an error (RC 4). Reason codes:

1 PIPE\_ALREADY\_OPEN

#### **Response RETRYABLE**

The command failed because of setup errors but can be reissued (RC 8). Reason codes:

- 202 NO\_PIPE
- 203 NO CICS

#### **Response USER\_ERROR**

The command failed because of an error in either the client or the server (RC 12). Reason codes:

- 401 INVALID\_CALL\_TYPE
- 402 INVALID\_VERSION\_NUMBER
- 404 INVALID\_USER\_TOKEN
- 418 INVALID\_PIPE\_TOKEN
- 421 RUNNING\_UNDER\_AN\_IRB

#### **Response SYSTEM\_ERROR**

The command failed (RC 16). Reason codes:

- 609 IRC\_CONNECT\_FAILURE
- 621 PIPE\_RECOVERY\_FAILURE
- 622 ESTAE\_SETUP\_FAILURE
- 623 ESTAE\_INVOKED

For information about response codes, see "EXCI call response code values" on page 137.

For information about the reason codes, see Chapter 17, "Response and reason codes returned on EXCI calls," on page 205.

## **DPL\_Request**

Issue a distributed program link request across an open pipe connected to the CICS system on which the server (or target) application program resides. The command is synchronous, and the TCB waits for a response from CICS. Once a pipe is opened, any number of DPL requests can be issued before the pipe is closed. To the server program, the link request appears just like a standard EXEC CICS LINK request from another CICS region, and it is not aware that it is sent from a non-CICS client program using EXCI. The syntax of the call is shown in two forms: the parameters that can be used when **version\_number** is set to **VERSION\_1**, and the parameters that can be used when **version\_number** is set to **VERSION\_2**.

#### Syntax

#### **VERSION\_1**

CALL DFHXCIS, (version\_number, return\_area, user\_token, call\_type, pipe\_token, pgmname, COMMAREA, COMMAREA\_len, data\_len, transid, uowid, userid, dpl\_retarea, DPL\_opts), VL,MF=(E,(1))

#### VERSION\_2

## **Parameters**

#### version number

A fullword binary input area indicating the version of the external CICS interface parameter list being used. This can be set to 1 or 2 in the client program.

The equated value for this parameter in the CICS-supplied copybook DFHXCPL*x* (where *x* indicates the language) is either VERSION\_1 or VERSION\_2. See page Table 18 on page 138 for copybook details.

#### return\_area

A 5-word output area to receive response and reason codes, and a message pointer field. For more details, see "Return area for the EXCI CALL interface" on page 138.

#### user\_token

A 1-word input area specifying the user token returned to the client program on the Initialize\_User command.

#### call\_type

A 1-word input area indicating the function of the command. This must be set to 6 in the client program to indicate that the pipe is now being used for the DPL\_Request call.

The equated value for this call in the CICS-supplied copybook DFHXCPL*x* (where *x* indicates the language) is DPL\_REQUEST. See page Table 18 on page 138 for copybook details.

#### pipe\_token

A 1-word input area specifying the token returned by EXCI on the Allocate\_Pipe command. It represents the pipe being used for the DPL\_Request call.

#### pgmname

The 8-character name of the CICS application program being called as the server program.

This is either the name as specified on a predefined PROGRAM resource definition installed in the CICS server region, or as it is known to a user-written autoinstall program if the program is to be autoinstalled. The program can be defined in the CICS server region as a local program, or it can be defined as remote. Programs defined as remote enable "daisy-chaining", where EXCI-CICS DPL calls become EXCI-CICS DPL calls.

#### COMMAREA (or null ptr)

A variable length input area for the communications area (COMMAREA) between the client and server programs. The length is defined by *COMMAREA\_len*.

This is the storage area that contains the data to be sent to the CICS application program. This area is also used to receive the updated COMMAREA from the CICS application program (the server program).

This parameter is optional. If it is not required, you must ensure that the CALL parameter list contains a null address for this parameter. How you do this depends on the language you are using for the non-CICS client program. For an example of a call that omits an optional parameter, see "Example of EXCI CALLs with null parameters" on page 140.

#### COMMAREA\_len

A fullword binary input area. This parameter specifies the length of the COMMAREA. It is also the length of the server program's COMMAREA (EIBCALEN).

If you specify a COMMAREA, you must also specify this parameter to define the length.

This value may not exceed 32 500 bytes if the COMMAREA is to be passed between any two CICS servers (for any combination of product/version/release), otherwise, if you are confident that the COMMAREA will not be passed on a further LINK request, you can use a COMMAREA up to 32k in length.

If you don't specify a COMMAREA, this parameter is ignored.

#### data len

A fullword binary input area. This parameter specifies the length of contiguous storage, from the start of the COMMAREA, to be sent to the server program.

This parameter restricts the amount of data sent to the server program, and should be used to optimize performance if, for example, the COMMAREA is large but the amount of data being passed is small.

Note that on return from the server program, the EXCI data transformer program ensures that the COMMAREA in the non-CICS client program is the same as that of the server program. This caters for the following conditions:

- The data returned is more than the data passed in the original COMMAREA.
- The data returned is less than the data passed in the original COMMAREA.
- There is no data returned because it is unchanged.
- The server is returning null data.

The value of *data\_len* must not be greater than the value of *COMMAREA\_len*. A value of zero is valid and results in no data being sent to the server program.

If you don't specify a COMMAREA, this parameter is ignored.

#### transid (or null\_ptr)

A 4-character input area containing the id of the CICS mirror transaction under which the server program is to run. This transaction must be defined to the CICS server region, and its definition must specify:

#### PROGRAM(DFHMIRS)

The initial program must be the CICS supplied mirror program DFHMIRS.

Failure to specify DFHMIRS as the initial program means that a COMMAREA passed from the client application program is not passed to the CICS server program. Furthermore, the DPL request fails and the client application program receives a response of SYSTEM\_ERROR and reason SERVER\_PROTOCOL\_ERROR.

#### PROFILE(DFHCICSA)

The DFHCICSA profile specifies the correct value for the INBFMH parameter, which must be specified as INBFMH(ALL) for a mirror transaction.

When the CICS server region receives a DPL request, it attaches the mirror transaction and invokes DFHMIRS. The mirror program then passes control to the requested server program, passing the COMMAREA supplied by the client program. The COMMAREA passed to the server program is primed with the data only, the remainder of the COMMAREA being set to nulls.

The purpose of the *transid* parameter is to distinguish between different invocations of the server program. This enables you to run different invocations of the server program under transactions that specify different attributes. For example, you can vary the transaction priorities, or the security requirements.

A transid is optional. By default, the CICS server region uses the CICS-supplied mirror transaction, CSMI. If you don't want to specify *transid*, you must ensure that the CALL parameter list contains a null address for this parameter. How you do this depends on the language you are using for the non-CICS client program. For an example of a call that omits an optional parameter, see "Example of EXCI CALLs with null parameters" on page 140.

If you issue multiple requests in the same MVS unit-of-recovery, the same transid must be used in all of them.

#### uowid (or null\_ptr)

An input area containing a unit-of-work identifier, using the APPC architected format, that is passed on the DPL\_Request for correlation purposes.

For DPL requests that are committed when the CICS program returns control to the MVS application, this parameter is optional.

For DPL requests that are part of an RRMS unit-of-recovery, null\_ptr must be specified. The unit-of-work identifier that is already associated with the RRMS unit-of-recovery is used, if there is one; if not, CICS (or another RRMS resource manager) generates a unique unit-of-work identifier and associates it with the RRMS unit-of-recovery.

If you don't want to specify *uowid*, you must ensure that the CALL parameter list contains a null address for this parameter. How you do this depends on the language you are using for the non-CICS client program. For an example of a call that omits an optional parameter, see "Example of EXCI CALLs with null parameters" on page 140.

The *uowid* parameter is passed to the CICS server region, which uses it as the UOWID for the first unit of work executed by the CICS server program. If the server program issues intermediate syncpoints before returning to the client program, CICS uses the supplied *uowid* for the subsequent units of work, but with the two-byte sequence number incremented for each new logical unit of work. If the CICS server program updates remote resources, the client-supplied UOWID is distributed to the remote systems that own the resources.

The *uowid* parameter is supplied on the EXCI CALL interface for correlation purposes only, to allow units of work that originated from a particular client program to be identified in CICS. The *uowid* is not provided for recovery purposes between CICS and the client program.

The *uowid* can be a maximum of 27 bytes long and has the following format:

- A 1-byte length field containing the overall length of the UOWID (excluding this field).
- A 1-byte length field containing the length of the logical unit name (excluding this field).
- A logical unit name field of variable length up to a maximum of 17 bytes. To conform to APPC architecture rules, the LUNAME must be of the form *AAAAAAAA.BBBBBBBB*, where *AAAAAAAA* is optional and:
  - AAAAAAAA and BBBBBBBB are 8-byte names separated by a period
  - If AAAAAAAA is omitted, the period must also be omitted

- AAAAAAAA and BBBBBBB must be type–1134 symbol strings (that is, character strings consisting of one or more EBCDIC uppercase letters A–Z and 0–9, the first character of which must be an uppercase letter).
- The clock value—the middle 6 bytes of an 8-byte store clock (STCK) value.
- A 2-byte sequence number.

If you omit a unit-of-work identifier (by specifying a null pointer), and the DPL request is not part of an RRMS unit-of-recovery, the external CICS interface generates one for you, consisting of the following:

- A 1-byte length field set to X'1A'.
- A 1-byte LU length field set to X'11'.
- A 17-byte LU name consisting of:
  - An 8-byte eyecatcher set to 'DFHEXCIU'.
  - A 1-byte field containing a period (.)
  - A 4-byte field containing the MVS system identifier (SYSID), in characters, under which the client is running.
  - A 4-byte field containing the address space id (ASID) in which the MVS client program is running. The field contains the four character EBCDIC representation of the two-byte hex address space id.
- The clock value—the middle 6 bytes of an 8-byte store clock (STCK) value
- A two-byte sequence number set to X'0001'.

#### userid (or null\_ptr)

An 8-character input area containing the RACF userid for user security checking in the CICS region. The external CICS interface passes this userid to the CICS server region for user resource and command security checking in the server application program.

A userid is required only if the MRO connection specifies the ATTACHSEC(IDENTIFY) attribute. If the connection specifies ATTACHSEC(LOCAL), the CICS server region applies link security checking. See the *CICS RACF Security Guide* for information about link security on MRO connections.

See also Chapter 15, "EXCI security," on page 177 for information about external CICS interface security considerations.

This parameter is optional. However, if you don't specify a userid, the external CICS interface passes the security userid under which the client program is running. For example, if the client program is running as an MVS batch job, the external CICS interface obtains and passes the userid specified on the USER parameter of the JOB statement.

If you specify a userid and SURROGCHK=YES is specified in the EXCI options table DFHXCOPT, the userid under which the EXCI job is running is subject to a surrogate user check. This check is performed by the external CICS interface to ensure that the client job userid is authorized to use the userid specified on the DPL call. For more information about surrogate user security checking, see Chapter 15, "EXCI security," on page 177.

If you want to let *userid* default, you must ensure that the CALL parameter list contains a null address for this parameter. How you do this depends on the language you are using for the non-CICS client program. For an example of a call that omits an optional parameter, see "Example of EXCI CALLs with null parameters" on page 140.

If you issue multiple requests in the same MVS unit-of-recovery, the same userid must be used in all of them. If the unit-of-recovery also includes EXEC CICS calls, you should allow the userid on all DPL\_requests to default to the security userid under which the client program is running.

#### dpl\_retarea

A 12-byte output area into which the DPL\_Request processor places responses to the DPL request. Generally, these responses are from CICS, but in some cases the error detection occurs in the external CICS interface, which returns exception conditions that are the equivalent of those returned by an EXEC CICS LINK command.

This field is only meaningful in the following circumstances:

- · The response field of the EXCI return-area has a zero value, or
- The EXCI *return-area* indicates that the server program has abended (response=USER\_ERROR and reason=SERVER\_ABENDED).

The 12 bytes form three fields, providing the following information:

#### Field 1 (fullword value)

This field is a fullword containing a RESP value from the DPL\_Request call. See "Error codes" on page 145 for the RESP values that can be returned on a DPL\_Request call.

If the DPL\_Request call reaches CICS, this field contains the EIBRESP value, otherwise it contains an equivalent response set by the external CICS interface. If this field is set by the external CICS interface, RESP is further qualified by a RESP2 value in the second field.

A zero value is the normal response, which equates to EXEC\_NORMAL in the return codes copybooks.

#### Field 2 (fullword value)

This field is a fullword that may contain a RESP2 value from the link request, further qualifying the RESP value in field 1.

If the DPL\_Request call reaches CICS, the RESP2 field generally is null (CICS does not return RESP2 values across MRO links). However, if the RESP field indicates SYSIDERR (value 53), this field provides a reason code. See"Dpl\_retarea return codes" on page 139 for more information.

If the RESP field is set by the external CICS interface, it is further qualified by a RESP2 value in this second field. For example, if the *data\_len* parameter specifies a value greater than the *COMMAREA\_len* parameter, the external CICS interface returns the RESP value 22 (which equates to EXEC\_LENGERR in the return codes copybooks), and a RESP2 value of 13.

See the LINK conditions in LINK, in the *CICS Application Programming Reference* for full details of the possible RESP and RESP2 values.

**Note:** The data transformer program makes special use of the RESP2 field. If any error occurs in the transformer, the error is returned in RESP2.

#### Field 3 (fullword value)

The third field, a 4-character field, contains:

- The abend code if the server program abended
- Four blanks if the server program did not abend.

If a server program abends, it is backed out to its last syncpoint which may be the start of the task, or an intermediate syncpoint. The server program can issue intermediate syncpoints because SYNCONRETURN is forced.

DPL\_opts (or null\_ptr)

A 1-byte input area indicating options to be used on the DPL\_Request call.

If you omit this parameter, it defaults to the value X'00' (see below). If you want to omit *DPL\_opts* and let it default, ensure that the CALL parameter list contains a null address for this parameter. How you do this depends on the language you are using for the non-CICS program. For an example of a call that omits an optional parameter, see "Example of EXCI CALLs with null parameters" on page 140.

Currently, the *DPL\_opts* parameter applies only to resource recovery, using the following values:

- X'00' Indicates that you specified NOSYNCONRETURN, because you want the client batch program to control resource recovery, using 2-phase commit protocols supported by MVS RRS. With this option, the CICS server region does not perform a syncpoint when the server program returns control to CICS. Furthermore, the CICS server application program must not take any explicit syncpoints, otherwise it is abended by CICS. For more information, see "Resource recovery" on page 112.
- X'80' indicates that SYNCONRETURN is required in the CICS server region.

SYNCONRETURN specifies that the server region is to take a syncpoint on successful completion of the server program, independently of the client program. This option does *not* prevent a server program from taking its own explicit syncpoints.

The equated value for this parameter in the CICS-supplied copybook DFHXCPLx (where x indicates the language) is SYNCONRETURN. See page Table 18 on page 138 for copybook details.

transid2 (or null ptr) VERSION\_2 only

A 4-character input area containing a CICS transaction id.

The server program runs under a CICS supplied mirror transaction, CSMI or CPMI. However the transaction id made available to the server program through the EIBTRNID field in the Exec Interface Block is the one specified by the transid2 parameter. The transid2 parameter is ignored if the transid parameter is specified. The following table gives an example of different combinations of transid and transid2:

transid	transid2	program executes under	EIBTRNID seen by program
UTRN	omitted	UTRN	UTRN
UTRN	UEIB	UTRN	UTRN
omitted	omitted	CSMI	CSMI
omitted	UEIB	CSMI	UEIB

Table 16. Use of transid2

The transid2 parameter is useful for server programs that access DB2, as EIBTRNID is used to determine which DB2ENTRY definition to use. Previously, EIBTRNID could only be set by using transid, which then required you to define a mirror transaction to CICS. Using transid2, EIBTRNID is set, but the mirror program executes under the CICS provided definition CSMI.

#### ccsid (or null\_ptr) VERSION\_2 only

A fullword binary input area indicating the Coded Character Set Identifier (CCSID) of the character data contained in the COMMAREA. The ccsid parameter must be specified if character data has to be converted when the COMMAREA is passed to, or returned from, the server program. The parameter can take the following values:

#### -1 (X'FFFFFFF)

Indicates that conversion of character data is required and that the source CCSID is defined in the conversion template installed in the server.

#### 1 <= ccsid <= 65535

Indicates that conversion of character data is required and that the value specified overrides the source CCSID defined in the conversion template installed in the server.

#### endian (or null\_ptr) VERSION\_2 only

A fullword binary input area indicating the format, big endian or little endian, for binary data contained in the COMMAREA. Big endian indicates that the leftmost byte contains the most significant digits, as used, for example, in System 390 architecture. Little endian indicates that the rightmost byte contains the most significant digits, as used, for example, in Intel architecture. The endian parameter should be specified if binary data has to be converted when the COMMAREA is passed to, or returned from, the server program. If the *ccsid* parameter indicates that conversion is required, but *endian* is not specified ( defaults to null), then conversion template installed in the server. The parameter can take the following values:

### 16909060 (X'01020304')

indicates that binary data is held in big endian format .

#### 67305985 (X'04030201')

indicates that binary data is held in little endian format.

## **Responses and reason codes**

For all non-zero response codes, a unique reason code value identifies the reason for the response.

Note: All numeric response and reason code values are in decimal.

The following is a summary of the response and reason codes that the external CICS interface can return on the DPL call:

#### **Response OK**

Command executed successfully (RC 0). Reason code:

0 NORMAL

#### **Response WARNING**

The command executed successfully, but with an error (RC 4). Reason codes:

- 6 IRP\_IOAREA\_FM\_FAILURE
- 7 SERVER\_TERMINATED

#### **Response RETRYABLE**

The command failed because of setup errors but can be reissued (RC 8). Reason codes:

- 203 NO\_CICS
- 204 WRONG\_MVS\_FOR\_RRMS
- 205 RRMS\_NOT\_AVAILABLE

#### **Response USER\_ERROR**

The command failed because of an error in either the client or the server (RC 12). Reason codes:

- 401 INVALID\_CALL\_TYPE
- 402 INVALID\_VERSION\_NUMBER
- 404 INVALID\_USER\_TOKEN
- 406 PIPE\_NOT\_OPEN
- 407 INVALID\_USERID
- 408 INVALID\_UOWID
- 409 INVALID\_TRANSID
- 414 IRP\_ABORT\_RECEIVED
- 415 INVALID\_CONNECTION\_DEFN
- 416 INVALID\_CICS\_RELEASE
- 417 PIPE\_MUST\_CLOSE
- 418 INVALID\_PIPE\_TOKEN
- 421 RUNNING\_UNDER\_AN\_IRB
- 422 SERVER\_ABENDED
- 423 SURROGATE\_CHECK\_FAILED
- 425 UOWID\_NOT\_ALLOWED
- 426 INVALID\_TRANSID2
- 427 INVALID\_CCSID
- 428 INVALID\_ENDIAN

#### **Response SYSTEM\_ERROR**

The command failed (RC 16). Reason codes:

- 612 TRANSFORM\_1\_ERROR
- 613 TRANSFORM\_4\_ERROR
- 614 IRP\_NULL\_DATA\_RECEIVED
- 615 IRP\_NEGATIVE\_RESPONSE
- 616 IRP\_SWITCH\_PULL\_FAILURE
- 617 IRP\_IOAREA\_GM\_FAILURE
- 619 IRP\_BAD\_IOAREA
- 620 IRP\_PROTOCOL\_ERROR
- 622 ESTAE\_SETUP\_FAILURE

- 623 ESTAE\_INVOKED
- 624 SERVER\_TIMEDOUT
- 625 STIMER\_SETUP\_FAILURE
- 626 STIMER\_CANCEL\_FAILURE
- 629 SERVER\_PROTOCOL\_ERROR
- 630 RRMS\_ERROR
- 631 RRMS\_SEVERE\_ERROR
- 632 XCGUR\_GETMAIN\_ERROR

For information about response codes, see "EXCI call response code values" on page 137.

For information about the reason codes, see Chapter 17, "Response and reason codes returned on EXCI calls," on page 205.

## Close\_PIPE

Disconnect an open pipe from CICS. The pipe remains in an allocated state, and its tokens remain valid for use by the same user. To reuse a closed pipe, the client program must first reissue an Open\_Pipe command using the pipe token returned on the Allocate\_Pipe command for the pipe. Pipes should not be left open when not in use because this prevents CICS from shutting down its IRC facility in an orderly manner. Therefore, the Close\_Pipe command should be issued as soon as possible after all DPL\_Request calls have completed.

#### Syntax

CALL DFHXCIS,(version\_number,return\_area,user\_token,call\_type, pipe\_token),VL,MF=(E,(1))

### Parameters

version\_number

A fullword binary input area indicating the version of the external CICS interface parameter list being used. It must be set to 1 in the client program.

The equated value for this parameter in the CICS-supplied copybook DFHXCPL*x* (where *x* indicates the language) is VERSION\_1. See page "Deallocate\_Pipe" on page 135 for copybook details.

#### return\_area

A 5-word output area to receive response and reason codes, and a message pointer field. For more details, see "Return area for the EXCI CALL interface" on page 138.

#### user\_token

The 1-word input area specifying the token, returned to the client program by EXCI on the Initialize\_User command, that represents the user of the pipe being closed.

#### call\_type

A 1-word input area indicating the function of the command. This must be set to 4 in the client program to indicate that this is a Close\_Pipe command.

The equated value for this call in the CICS-supplied copybook DFHXCPL*x* (where *x* indicates the language) is CLOSE\_PIPE. See page Table 18 on page 138 for copybook details.

#### pipe\_token

A 1-word input area specifying the token, returned to the client program by EXCI on the original Allocate\_Pipe command, that represents the pipe being closed.

### **Responses and reason codes**

For all non-zero response codes, a unique reason code value identifies the reason for the response.

Note: All numeric response and reason code values are in decimal.

The following is a summary of the response and reason codes that the external CICS interface can return on the Close\_Pipe call:

#### **Response OK**

Command executed successfully (RC 0). Reason code:

0 NORMAL

#### **Response WARNING**

The command executed successfully, but with an error (RC 4). Reason codes:

2 PIPE\_ALREADY\_CLOSED

#### **Response USER\_ERROR**

The command failed because of an error in either the client or the server (RC 12). Reason codes:

- 401 INVALID\_CALL\_TYPE
- 402 INVALID\_VERSION\_NUMBER
- 404 INVALID\_USER\_TOKEN
- 418 INVALID\_PIPE\_TOKEN
- 421 RUNNING\_UNDER\_AN\_IRB

#### **Response SYSTEM\_ERROR**

The command failed (RC 16). Reason codes:

- 610 IRC\_DISCONNECT\_FAILURE
- 622 ESTAE\_SETUP\_FAILURE
- 623 ESTAE\_INVOKED

For information about response codes, see "EXCI call response code values" on page 137.

For information about the reason codes, see Chapter 17, "Response and reason codes returned on EXCI calls," on page 205.

## Deallocate\_Pipe

Deallocate a pipe from CICS. On completion of this command, the pipe can no longer be used, and its associated tokens are invalid. This command should be issued for pipes that are no longer required. This command frees storage associated with the pipe.

## Syntax

### **Parameters**

version\_number

A fullword binary input area indicating the version of the external CICS interface parameter list being used. It must be set to 1 in the client program.

The equated value for this parameter in the CICS-supplied copybook DFHXCPL*x* (where *x* indicates the language) is VERSION\_1. See page Table 18 on page 138 for copybook details.

#### return\_area

A 5-word output area to receive response and reason codes, and a message pointer field. For more details, see "Return area for the EXCI CALL interface" on page 138.

#### user\_token

A 1-word input area containing the token returned on the Initialize\_User command.

#### call\_type

A 1-word input area indicating the function of the command. This must be set to 5 in the client program to indicate that this is a Deallocate\_Pipe command.

The equated value for this call in the CICS-supplied copybook DFHXCPL*x* (where *x* indicates the language) is DEALLOCATE\_PIPE. See page Table 18 on page 138 for copybook details.

#### pipe\_token

A 1-word input area containing the token passed back on the original Allocate\_Pipe command, that represents the pipe now being deallocated.

## **Responses and reason codes**

For all non-zero response codes, a unique reason code value identifies the reason for the response.

Note: All numeric response and reason code values are in decimal.

The following is a summary of the response and reason codes that the external CICS interface can return on the Deallocate\_Pipe call:

#### **Response OK**

Command executed successfully (RC 0). Reason code:

0 NORMAL

#### **Response WARNING**

The command succeeded successfully, but with an error (RC 4). Reason codes:

- 5 XCPIPE\_FREEMAIN\_ERROR
- 6 IRP\_IOAREA\_FM\_FAILURE

#### **Response USER\_ERROR**

The command failed because of an error in either the client or the server (RC 12). Reason codes:

401 INVALID\_CALL\_TYPE

- 402 INVALID\_VERSION\_NUMBER
- 404 INVALID\_USER\_TOKEN
- 405 PIPE\_NOT\_CLOSED
- 418 INVALID\_PIPE\_TOKEN
- 421 RUNNING\_UNDER\_AN\_IRB

#### **Response SYSTEM\_ERROR**

The command failed (RC 16). Reason codes:

- 611 IRC\_LOGOFF\_FAILURE
- 622 ESTAE\_SETUP\_FAILURE
- 623 ESTAE\_INVOKED

For information about response codes, see "EXCI call response code values."

For information about the reason codes, see Chapter 17, "Response and reason codes returned on EXCI calls," on page 205.

# EXCI call response code values

The values that can be returned in the response field are shown in Table 17 (all values are in decimal).

Code	Meaning	Explanation
0	ОК	For all EXCI CALL commands other than the DPL_request, the call was successful. If an OK response is received for a DPL_request, you must also check <i>dpl_retarea</i> to ensure CICS did not return a condition code. If the EIBRESP field of <i>Dpl_retarea</i> is zero, the DPL call was successful.
4	WARNING	The external CICS interface detected an error, but this did not stop the CALL command completing successfully. The reason code field describes the error detected.
8	RETRYABLE	The EXCI CALL command failed. This class of failure relates to errors in the setup of the system environment, and not errors in the external CICS interface or client program. The reason code documents the specific error in the environment setup.
		The external CICS interface command can be reissued without changing the client program once the environment error has been corrected. The environmental errors concerned are ones that do not require an MVS re-IPL. Each reason code value for a RETRYABLE response documents whether the CALL can be reissued directly, or whether the pipe being used has to be closed and reopened first.

Table 17. EXCl response codes (returned in response field of return\_area)

Table 17. EXCl response codes (returned in response field of return\_area) (continued)CodeMeaningExplanation

0000	meaning		
12	USER_ERROR	The EXCI CALL command failed. This class of error mean there is an error either in the client program, or in the CIC server program, or in the CICS server region. An example an error in the CICS server system would be a failed secu check, or an abend of the CICS server program, in which case the abend code is set in the abend code field of <i>dpl_retarea</i> . Each reason code value for a response of USER_ERROR explains whether the command can be reissued directly, or whether the pipe being used has to b closed and reopened first	
16	SYSTEM_ ERROR	closed and reopened first. The EXCI CALL command failed. This class of error means that the external CICS interface has detected an error. The reason code value identifies the specific error. If the error can be corrected, then the command can be reissued. Each reason code value for a SYSTEM_ERROR response explains whether the command can be reissued directly, or whether the pipe being used has to be closed and reopened first.	

## Return area for the EXCI CALL interface

The format of the 5-word return area for the EXCI CALL interface is as follows:

- 1. 1-word response field.
- 2. 1-word reason field.
- 3. Two 1-word subreason fields-subreason field-1 and subreason field-2.
- 4. 1-word CICS message pointer field. This is zero if there is no message present. If a message is present, this field contains the address of the storage area containing the message, which is formatted as follows:
  - A 2-byte LL field. LL is the length of the message plus the length of the LLBB field.
  - A 2-byte BB field, set to binary zero.
  - A variable length field containing the text of the message.

## Return area and function call EQUATE copybooks

CICS provides four language-specific copybooks that map the storage areas for the *return\_area* and *dpl\_retarea* parameters of the EXCI CALL commands. The copybooks also provide EQUATE statements for each type of EXCI CALL.

These copybooks, and the libraries they are supplied in for the supported languages, are shown in Table 18.

Copybook name	Language	Library
DFHXCPLD	Assembler	CICSTS32.CICS.SDFHMAC
DFHXCPLH	С	CICSTS32.CICS.SDFHC370
DFHXCPLO	COBOL	CICSTS32.CICS.SDFHCOB
DFHXCPLL	PL/I	CICSTS32.CICS.SDFHPL1

Table 18. Supplied copybooks of return areas and equated names

## **Return codes**

All the possible return codes are contained in a CICS-supplied copybook, which you must include in the program source of your external, non-CICS program. The names of the copybooks for the supported languages, and the libraries they are supplied in, are shown in Table 19.

Copybook name	Language	Library
DFHXCRCD	Assembler	CICSTS32.CICS.SDFHMAC
DFHXCRCH	С	CICSTS32.CICS.SDFHC370
DFHXCRCO	COBOL	CICSTS32.CICS.SDFHCOB
DFHXCRCL	PL/I	CICSTS32.CICS.SDFHPL1

Table 19. Supplied copybooks of RESPONSE and REASON codes

OS/390 provides copybooks for use with the interfaces described on "Taking a syncpoint in the client program" on page 115. These are described in OS/390 MVS *Programming: Resource Recovery* and OS/390 MVS *Programming: Callable Services for HLL*.

## Dpl\_retarea return codes

These are the same as for CICS-to-CICS EXEC CICS DPL commands but with the following additions for the EXCI call interface:

Table 20. Exceptio	nal conditi	ons. RESP and RESP2 values returned to dpl_retarea
Condition	RESP2	Meaning
LENGERR	22	COMMAREA_LEN_TOO_BIG
LENGERR	23	COMMAREA_BUT_NO_COMMAREA_LEN

SYSIDERR also can be returned on an EXCI DPL\_Request, if the DPL\_Request specifies a program defined in the CICS server region as a remote program, and the link between the server and the remote CICS region is not open. In this situation, SYSIDERR is returned in the first word of the DPL\_Retarea (code 53). The reason code qualifying SYSIDERR is placed in the second word of this area (the equivalent of a RESP2 value).For SYSIDERR, the information stored in this field is derived from bytes 1 and 2 of the CICS EIBRCODE field. For example, if a remote link is not available, the EIBRCODE value stored in bytes 2 and 3 of the DPL\_Retarea RESP2 field is X'0800'. For a list of the SYSIDERR reason codes that can be returned in the RESP2 field, see the SYSIDERR section of the notes on EIBRCODE in Attention identifier constants, DFHAID, in the *CICS Application Programming Reference* manual.

TERMERR also may be returned on an EXCI DPL request if the DPL request was to a program defined as remote, and an unrecoverable error occurs during conversation with the mirror on the remote CICS system. For example, suppose client program BATCH1 issues an EXCI DPL request to CICSA for program PROG1, which is defined as remote, and the request is function-shipped to CICSB where the program resides. If the session between CICSA and CICSB fails, or CICSB itself fails whilst executing the program PROG1, then TERMERR is returned to CICSA, and in turn to BATCH1.

No unique EXCI\_DPL\_RESP2 values are returned for TERMERR, PGMIDERR, NOTAUTH, and ROLLBACK.

## Example of EXCI CALLs with null parameters

If you omit an optional parameter, such as *userid* on a DPL\_Request, you must ensure that the parameter list is built with a null address for the missing parameter. The example that follows illustrates how to issue an EXCI DPL\_Request with the *userid* and *uowid* parameters omitted in a COBOL program.

**DPL CALL without userid and uowid (COBOL):** In this example, the DPL parameters used on the call are defined in the WORKING-STORAGE SECTION, as follows:

<b>DPL parameter</b>	COBOL variable	Field definition
version_number	01 VERSION-1	PIC S9(8) COMP VALUE 1.
return_area	01 EXCI-RETURN-CODE.	(structure)
user_token	01 USER-TOKEN	PIC S9(8) COMP VALUE ZERO.
call_type	03 DPL-REQUEST	PIC S9(8) COMP VALUE 6.
pipe_token	01 PIPE-TOKEN	PIC S9(8) COMP VALUE ZERO.
pgmname	01 TARGET-PROGRAM	PIC X(8) VALUE "DFHœAXCS".
commarea	01 COMMAREA.	(structure)
commarea_len	01 COMM-LENGTH	PIC S9(8) COMP VALUE 98.
data_len	01 DATA-LENGTH	PIC S9(8) COMP VALUE 18.
transid	01 TARGET-TRANSID	PIC X(4) VALUE "EXCI".
dpl_retarea	01 EXCI-DPL-RETAREA.	(structure)
dpl_opts	01 SYNCONRETURN	PIC X VALUE X'80'.

The variable used for the null address is defined in the LINKAGE SECTION, as follows:

LINKA	GE SECTION.	
01	NULL-PTR	USAGE

USAGE IS POINTER.

Using the data names specified in the WORKING-STORAGE SECTION as described above, and the NULL-PTR name as described in the LINKAGE SECTION, the following invocation of the DPL function omits the *uowid* and the *userid* parameters, and replaces them in the parameter list with the NULL-PTR variable:

```
DPL-SECTION.

*

SET ADDRESS OF NULL-PTR TO NULLS.

*

CALL 'DFHXCIS' USING VERSION-1 EXCI-RETURN-CODE USER-TOKEN

DPL-REQUEST PIPE-TOKEN TARGET-PROGRAM

COMMAREA COMM-LENGTH DATA-LENGTH

TARGET-TRANSID NULL-PTR NULL-PTR

EXCI-DPL-RETAREA SYNCONRETURN.
```

This example is taken from the CICS-supplied sample external CICS interface program, DFH0CXCC, which is supplied in CICSTS32.CICS.SDFHSAMP. For an example of how to omit the same parameters from the DPL call in the other supported languages, see the following sample programs:

#### DFH\$AXCC

The assembler sample

## DFH\$PXCC

The PL/I sample

## DFH\$DXCC

The C sample.

# Chapter 10. The EXCI EXEC CICS interface

The external CICS interface provides this as a single, composite command, to invoke all the calls of the EXCI CALL interface. Each time you issue an EXEC CICS LINK PROGRAM command in a client application program, the external CICS interface invokes on your behalf each of the six EXCI calls.

This chapter describes:

- "Using EXEC CICS LINK command"
- "Retries on an EXEC CICS LINK command" on page 147
- "Translation required for EXEC CICS LINK command" on page 150

## Using EXEC CICS LINK command

Link from an MVS client program to the specified server program in a server CICS region.

## Format

LINK

h

b

►—LINK—PROGRAM—(—name—)—RETCODE—(—data-area—)—	SYNCONRETURN
COMMAREA—( <i>—data-area</i> —)—LENGTH—( <i>—data-value</i> —)—	•
APPLID(name)TRANSID(name)	

**Error conditions:**LENGERR, LINKERR, NOTAUTH, PGMIDERR, ROLLEDBACK, SYSIDERR, TERMERR, WARNING

#### Comments

With the exception of the APPLID and RETCODE parameters, the external CICS interface parameters for an EXEC CICS LINK command are the same as for a CICS-CICS DPL command.

This book describes only those parameters that you can use with the external CICS interface. For programming information about the EXEC CICS LINK PROGRAM command, see LINK, in the *CICS Application Programming Reference* manual.

Note that the LENGTH and DATALENGTH parameters specify halfword binary values, unlike the corresponding *COMMAREA\_len* and *data\_len* parameters of the EXCI CALL interface, which specify fullword values.

An external CICS interface EXEC CICS LINK command always uses a generic connection.

## Parameters

The parameters that you can use on the external CICS interface form of the LINK command, are as follows:

### **APPLID**(*name*)

Specifies the generic APPLID of the target CICS server region.

Although an applid is required for an external CICS interface command, this parameter is optional on the LINK command itself because you can also specify it in the user-replaceable module, DFHXCURM. If you omit the generic APPLID from the LINK command, you must ensure it is specified by the user-replaceable module, DFHXCURM, on the URMAPPL parameter. You can also use the URMAPPL parameter in DFHXCURM to override an applid specified on the LINK command. See Chapter 12, "The EXCI user-replaceable module," on page 157 for information about the URMAPPL parameter.

### **COMMAREA**(data-area)

Specifies a communication area that is to be made available to the invoked program. In this option, a pointer to the data area is passed.

See Passing data to other programs, in the *CICS Application Programming Guide* for more information about passing data to CICS application programs.

#### **DATALENGTH**(*data-value*)

Specifies a halfword binary value that is the length of a contiguous area of storage, from the start of the COMMAREA, to be passed to the invoked program. If the amount of data being passed in a COMMAREA is small, but the COMMAREA itself is large so that the linked-to program can return the requested data, you should specify DATALENGTH in the interest of performance.

#### LENGTH(data-value)

Specifies a halfword binary value that is the length in bytes of the communication area.

This value may not exceed 32 500 bytes if the COMMAREA is to be passed between any two CICS servers (for any combination of product/version/release), otherwise, if you are confident that the COMMAREA will not be passed on a further LINK request, you can use a COMMAREA up to 32k in length.

#### **PROGRAM**(name)

Specifies the program name (1-8 characters) of the CICS server application program to which control is to be passed unconditionally. The specified name must either have been defined as a program to CICS, or the CICS server region must be capable of autoinstalling a definition for the named program.

Note the use of quotes:

EXEC CICS LINK PROGRAM('PROGX')

PROGX is in quotes because it is the program name.

EXEC CICS LINK PROGRAM(DAREA)

DAREA is not in quotes because it is the name of a data area that contains the 8-character program name.

#### **RETCODE** (data-area)

Specifies a 20-byte area into which the external CICS interface places return code information. This area is formatted into five 1–word fields as follows:

**RESP** The primary response code indicating whether the external CICS interface LINK command caused an exception condition during its execution.

#### RESP2

The secondary response code that further qualifies, where necessary, some of the conditions raised in the RESP parameter.

#### ABCODE

Contains a valid CICS abend code if the server program abended in the server region.

#### MSGLEN

Indicates the length of the message (if any) issued by the CICS server region during the execution of the server program. Note that the length is the actual length of the message text only, and does not include this 1—word length field.

#### MSGPTR

This is the address of the message text returned by the CICS server region.

**Note:** MSGLEN and MSGPTR are only valid on a LINKERR condition, with the RESP2 value 414.

#### SYNCONRETURN

Specifies that the CICS server region, named on the APPLID parameter, is to take a syncpoint on successful completion of the server program.

#### TRANSID(name)

Specifies the name of the mirror transaction that the remote region is to attach, and under which it is to run the server program. If you omit the TRANSID option, the CICS server region attaches CSMI.

**Note:** The TRANSID option specified on the LINK command overrides any TRANSID option specified on the program resource definition installed in the CICS server region.

While you can specify your own name for the mirror transaction initiated by DPL requests, the transaction *must* be defined in the server region, and the transaction definition must specify the mirror program, DFHMIRS. Defining your own transaction to invoke the mirror program gives you the freedom to specify appropriate values for some other options on the transaction resource definition.

See also the important rules about specifying transid with a DPL\_Request on page transid, parameter of DPL\_Request command.

### Error codes

Most of the exception conditions that are returned on the external CICS interface LINK command are the same as for the CICS-to-CICS distributed program link command. Those that are the same, and their corresponding numeric values are as follows:

```
LENGERR
22
PGMIDERR
27
```

```
SYSIDERR
53
NOTAUTH
70
TERMERR
81
ROLLEDBACK
82
```

These exception condition codes are returned in the RESP field.

**RESP and RESP2:** References to the RESP and RESP2 fields in this section are to the first two fields of the RETCODE parameter.

The exception conditions that are specific to the external CICS interface are as follows:

- The RESP2 values on the error condition LENGERR is specific to the external CICS interface.
- The exception conditions WARNING and LINKERR are specific to the external CICS interface.

The WARNING and LINKERR exceptions are a result of responses to individual EXCI calls issued by the external CICS interface in response to an EXEC CICS LINK command. These WARNING and LINKERR exceptions correspond to EXCI call responses as follows:

#### WARNING (RESP value 4)

This is returned when the EXCI module handling the EXEC CICS LINK request receives a USER\_ERROR or SYSTEM\_ERROR response to a Close\_Pipe or Deallocate\_Pipe request issued on behalf of an EXEC CICS LINK command. The RESP value is set to WARNING because the DPL request to CICS completed successfully, but an error occurred in subsequent processing.

The RESP2 field is set to the EXCI reason code, which gives more information about the error.

#### LINKERR (RESP value 88)

This is returned when the EXCI module handling the EXEC CICS LINK request receives a RETRYABLE, USER\_ERROR, or SYSTEM\_ERROR response to an EXCI call issued on behalf of the EXEC CICS LINK command. The DPL request has failed. The RESP2 field is set to the EXCI reason code, which gives more information about the error.

See Chapter 17, "Response and reason codes returned on EXCI calls," on page 205 for descriptions of EXCI reason codes.

**Note:** The external CICS interface ignores any WARNING conditions that occur in response to EXCI calls it issues on behalf of an EXEC CICS LINK command. It treats the WARNING on an EXCI call as a good response and continues normally. If no other errors occur, the EXEC CICS command completes with a zero response in the EXEC\_RESP field.

## **Retries on an EXEC CICS LINK command**

If the external CICS interface receives a RETRYABLE response on an EXCI call that it makes on behalf of an EXEC CICS LINK command, it automatically retries the EXEC CICS LINK command up to five times, providing more serious errors do not occur. If the RETRYABLE response is still received after the fifth retry, the RESP field is set to LINKERR, and the reason returned on the EXCI CALL request that causes the exception is returned in the RESP2 field.

The external CICS interface retries the EXEC CICS LINK command by first closing and deallocating the pipe, then reissuing the six EXCI CALL commands. During Allocate\_Pipe processing, the EXCI CALL interface calls the user-replaceable module, DFHXCURM, to give you the opportunity to change the APPLID of the CICS system to which the request has been sent. See Chapter 12, "The EXCI user-replaceable module," on page 157 for details of DFHXCURM.

Table 21 lists all the exception conditions and RESP2 values that are specific to the EXEC CICS LINK command for the external CICS interface.

Table 21. Exceptional conditions. RESP and RESP2 values returned from the EXEC API.ConditionRESP2Meaning(RESP)

(RESP)		
LENGERR (22)	22	COMMAREA length greater than 32763 bytes specified
	23	COMMAREA specified but no LENGTH parameter specified
WARNING (4)	401	Invalid <i>call_type</i> parameter value specified on Close_Pipe or Deallocate_Pipe call
	402	Invalid version_number parameter specified on Close_Pipe or Deallocate_Pipe call
	404	Invalid user_token specified on Close_Pipe or Deallocate_Pipe call
	405	A Deallocate_Pipe call has been issued against a pipe that is not yet closed
	418	An invalid pipe token has been issued on a Close_Pipe or Deallocate_Pipe call
	421	A Close_Pipe or Deallocate_Pipe command has been issued under an IRB
	610	There has been a CICS IRP logoff failure on a Deallocate_Pipe call
	611	There has been a CICS IRC disconnect failure on a Close_Pipe call
	622	There has been an MVS ESTAE setup failure on a Close_Pipe on Deallocate_Pipe call
	623	A program check on a Close_Pipe or Deallocate_Pipe call has caused the ESTAE to be invoked
LINKERR (88)	201	Command has been issued on an MVS image which has had no IRC activity since the previous IPL
	202	There are no available sessions
	203	CICS has not yet been brought up, or (2) has not yet opened IRC, or (3) no generic connection is installed, or (4) no specific connection is installed with the required netname.
	204	An EXEC CICS LINK command without the SYNCONRETURN option has been issued specifying a CICS system on a different MVS image.
	205	An EXEC CICS LINK command without the SYNCONRETURN option has been issued when RRS is not available
	401	Invalid parameter

EXEC API. Condition (RESP)	RESP2	Meaning
	402	Invalid version number
	403	User name is all blanks
	404	Invalid address in user token
	405	Command has been issued against a pipe that is not closed
	406	Command has been issued against a pipe that is not open
	407	Userid of all blanks has been passed
	408	Error in UOWID parameter
LINKERR (88)	409	Transid consisting of all blanks or zero has been passed
	410	Load of message module, DFHMEBMX, failed
	411	Load of message module, DFHMET4E, failed
	412	Load of DFHXCURM failed
	413	Load of DFHXCTRA failed
	414	If run as a CICS-to-CICS linked-to program, this server program
	414	would have resulted in an error with an appropriate message sent to the terminal. Running the program as an EXCI server program returns the message addressed by the MSGPTR field o the RETCODE area.
	415	Target connection is an MRO connection, not an EXCI connection
	416	Command has been issued against a CICS region running under a release of CICS earlier than CICS for MVS/ESA 4.1
	417	Command has been issued against a pipe in the MUST CLOSE state. Further EXCI EXEC CICS LINK commands will have
		unpredictable results and are, therefore, not permitted
	418	Pipe_token does not address an XCPIPE control block, or there is a mismatch between user_token and pipe_token
	419	CICS runs, or did run, under the TCB that this command is attempting to use. This is not permitted and the command fails
	420	Load of DFHXCOPT failed
	421	The command has been issued under an MVS IRB, which is not permitted
	422	The server has abended
	423	Surrogate user check failed
	424	An EXEC CICS LINK command without the SYNCONRETURN option has been issued on a system that does not support RRMS
	425	A DPL request omitted the SYNCONRETURN option, but specified a value of UOWID.
	601	A GETMAIN of working storage failed. This error leads to user abend 408
	602	A GETMAIN failed. This error leads to user abend 403.
	602 603	A GETMAIN failed. This error leads to user abend 403.
	603 604	A GETMAIN failed.
	605	A GETMAIN for the VERIFY block failed. This error leads to user abend 409.
	606	An SSI verify request (to obtain CICS SVC instruction) failed. This error leads to user abend 405.
	607	An SVC call failed. This error leads to user abend 406.
	608	Logon to IRP failed
	609	Connect to IRP failed
	610	Disconnect from IRP failed
	611	Logoff from IRP failed
	612	Invalid data input to transformer_1

Table 21. Exceptional conditions (continued). RESP and RESP2 values returned from the EXEC API.

Condition (RESP)	RESP2	Meaning
	613	Invalid data input to transformer_4
LINKERR (88)	614	CICS has responded but has not sent any data
	615	CICS cannot satisfy the request
	616	IRP_SWITCH_PULL request (to read data sent from CICS into a larger input/output area) has failed
	617	A GETMAIN for a larger input/output area failed
	619	IRP has had a problem with the input/output area passed from the client program
	620	IRP has disconnected from EXCI
	621	A DISCONNECT command is issued in an error situation following an IRP CONNECT. The DISCONNECT has failed, indicating a serious error.
	622	XCPRH ESTAE setup command failed This error leads to user abend 402.
	623	XCPRH ESTAE invoked due to program check during the processing of this command. ESTAE attempts backout and takes a SYSMDUMP. Further requests are permitted although the pipe is now in a MUST CLOSE state.
	624	The DPL request has been passed to CICS but the time specified in DFHXCOPT has been exceeded. The request is aborted.
	625	An MVS STIMERM macro call failed
	626	An MVS STIMERM CANCEL request failed
	627	The CICS SVC is at the incorrect level. This error leads to user abend 407.
	628	DFHIRP is at the incorrect level.
	629	A response to a DPL request has been returned by CICS but the external CICS interface does not understand the response.
	630	An unexpected return code was received from RRMS when processing an EXEC CICS LINK command without the SYNCONRETURN option.
	631	An unexpected error was encountered when processing an EXEC CICS LINK command without the SYNCONRETURN option.
	632	A GETMAIN for DFHXCGUR's working storage failed while processing an EXEC CICS LINK command without the SYNCONRETURN option.
	903	AN XCEIP ESTAE setup command failed
	904	The server program abended with the abend code in the ABCODE field of the RETCODE area
	905	An XCEIP ESTAE invoked

Table 21. Exceptional conditions (continued). RESP and RESP2 values returned from the EXEC API.

See "Return codes" on page 139 for details of the various copybooks that contain full details of all response and reason codes, including equated values.

Note: All numeric response and reason code values are shown in decimal.

**#** #

## Translation required for EXEC CICS LINK command

Application programs that use the EXEC CICS LINK form of the external CICS interface command must translate their programs before assembly or compilation. You do this using the version of the CICS translator that is appropriate for the language of your client program, specifying the translator option EXCI.

The translator option EXCI is mutually exclusive with the CICS and DLI options.

For more information about translating programs that contain EXEC CICS commands, see The CICS-supplied translators, in the *CICS Application Programming Guide*.

For information about compiling and link-editing external CICS interface client programs, see page Chapter 14, "Compiling and link-editing EXCI client programs," on page 165.

# Chapter 11. Defining connections to CICS

Connections between an EXCI client program and a CICS region require connection definitions in the CICS region. You define these using the CONNECTION and the SESSIONS resource definition facilities provided by CICS.

The following options are provided specifically for the external CICS interface:

- CONNTYPE on the CONNECTION resource definition
- EXCI on the PROTOCOL attribute of the CONNECTION and SESSIONS resource definitions.

This chapter describes:

- "CONNECTION resource definition for EXCI"
- "SESSIONS resource definitions for EXCI connections" on page 152
- "Inquiring on the state of EXCI connections" on page 155

## **CONNECTION resource definition for EXCI**

The EXCI option is provided on the PROTOCOL attribute of the CONNECTION resource definition to indicate that the connection is for use by an MVS program using the external CICS interface.

The CONNTYPE attribute is provided on the CONNECTION resource definition. For EXCI connections, this indicates whether the connection is generic or specific. It is not to be used for any protocol other than the external CICS interface.

The following parameters are relevant to EXCI:

#### CONNTYPE({SPECIFIC|GENERIC})

For external CICS interface connections, indicates the nature of the connection.

#### SPECIFIC

The connection is for communication from a non-CICS client program to the CICS region, and is specific. A specific connection is an MRO link with one or more sessions dedicated to a single user in a client program.

- **Note:** A *user* is a program that has issued an Initialize\_User request (or for which an Initialize\_User request has been issued), with a unique name per TCB. For example:
  - A simple client program running under MVS can be a single user of the external CICS interface.
  - A client program running under MVS can open several pipes and issue external CICS interface calls over them sequentially, on behalf of different vendor packages. In this case, from the viewpoint of the client program, each of the packages is a user, identified by a unique user name. Thus a single client program can operate on behalf of multiple users.
  - A program running under MVS can attach several TCBs, under each of which a vendor package issues external CICS interface calls on its own behalf. Each package is a client program in its own right, and runs under its own TCB. Each is also a user, with a unique user name.

For a specific connection, NETNAME is mandatory.

#### GENERIC

The connection is for communication from a non-CICS client program to the CICS system, and is generic. A generic connection is an MRO link with a number of sessions to be shared by multiple EXCI users. For a generic connection you cannot specify the NETNAME attribute.

Note: You must install only one generic EXCI connection in a CICS region.

#### NETNAME

For an external CICS interface connection, NETNAME corresponds to the name of the user of a specific pipe, as specified on the *user\_name* parameter of an INITIALISE\_USER call.

For an external CICS interface specific pipe, you must specify a NETNAME.

For external CICS interface generic pipes, you must leave NETNAME blank.

#### PROTOCOL({APPC|LU61|EXCI|blank})

The type of protocol that is to be used for the link.

#### blank

For MRO between CICS regions. You must leave the PROTOCOL blank for MRO, and on the SESSIONS definition you must specify LU6.1 as the PROTOCOL.

#### APPC (LUTYPE6.2 protocol)

Advanced program-to-program communication, or APPC protocol. This is the default value for ACCESSMETHOD(VTAM). Specify this for CICS-CICS ISC.

#### LU61

LUTYPE6.1 protocol. Specify this for CICS-CICS ISC or CICS-IMS ISC, but not for MRO.

#### EXCI

The external CICS interface. Specify this to indicate that this connection is for use by a non-CICS client program using the external CICS interface.

If you specify PROTOCOL(EXCI), you must also specify ACCESSMETHOD(IRC). EXCI is implemented in MRO using the CICS interregion communication program, DFHIRP, and cannot use MRO links that use MVS cross-memory services (XM). EXCI can use also XCF MRO links, which also work through DFHIRP.

## **SESSIONS resource definitions for EXCI connections**

You indicate on the PROTOCOL attribute of the SESSIONS resource definition whether the sessions allocated on the MRO connection are for use by the external CICS interface. See SESSION resource definitions, in the *CICS Resource Definition Guide* for full details of the SESSIONS resource definition. The following parameters are relevant to EXCI:

#### PROTOCOL({APPC|LU61|EXCI})

Indicates the type of protocol that is to be used for an intercommunication link (ISC or MRO).

#### APPC (LUTYPE6.2)

Advanced program-to-program communication (APPC) protocol. Specify this for CICS-CICS ISC.

LU61

LUTYPE6.1 protocol. Specify this for CICS-CICS ISC, for CICS-IMS, or for MRO.

#### EXCI

The external CICS interface. Specify this to indicate that the sessions are for use by a non-CICS client program using the external CICS interface. If you specify EXCI, you must leave SENDCOUNT blank.

#### **RECEIVECOUNT({blank** *number*})

The number of MRO, LUTYPE6.1, or EXCI sessions that usually receive before sending.

For MRO, receive sessions can only receive before sending.

#### b1ank

These sessions can send only; there are no receive sessions.

#### number

Specifies the number of receive sessions on connections that specify blank, LU61, or EXCI on the protocol parameter of the CONNECTION definition. CICS uses the number to generate the last two or three characters of the session names (see RECEIVEPFX for details).

If you are using the default receive prefix (<), or your own 1-character prefix, specify a number in the range 1 through 999.

If you specify a 2-character prefix, the number is restricted to the range 1 through 99.

Except for external CICS interface (EXCI) connections, the RECEIVECOUNT in this system should equal SENDCOUNT in the other system.

#### **RECEIVEPFX(**<|*prefix*)

Specifies a 1- or 2-character prefix that CICS is to use as the first 1 or 2 characters of the receive session names (the names of the terminal control table terminal entries (TCTTEs) for the sessions).

Prefixes must not cause a conflict with an existing connection or terminal name.

#### < (MRO and EXCI sessions)

For MRO sessions, if you do not specify your own receive prefix, CICS enforces the default prefix—the less-than symbol (<), which is used in conjunction with the receive count to generate receive session names.

CICS creates the last three characters of the session names from the alphanumeric characters A through Z, and 1 through 9. These 3-character identifiers begin with the letters AAA, and continue in ascending sequence until the number of session entries reaches the limit set by the RECEIVECOUNT value. Note that receive session names are generated *after* the send sessions, and they follow in the same sequence.

For example, if the last session name generated for the send sessions is <AAJ, using the default prefix (<) CICS generates the receive session names as <AAK, <AAL, <AAM, and so on. (This method of generation of session identifiers is the same as for APPC sessions, except for the initial prefix symbol.)

**Note:** If you specify your own prefix, CICS generates the session names as in earlier releases, which is the same as for LUTYPE6.1 sessions.

#### prefix (LUTYPE6.1 sessions)

If the sessions are on LUTYPE6.1 ISC connections, you must specify a 1or 2-character prefix. Do not use the default < symbol for LUTYPE6.1 sessions.

For LUTYPE6.1 sessions (and MRO if you specify your own 1- or 2-character prefix) CICS generates session names by appending a number to the prefix, either in the range 1 through 99, or 1 through 999. The number begins with 1 and is incremented by 1 until the specified RECEIVECOUNT is reached.

#### SENDCOUNT(blank|number)

The number of MRO or LUTYPE6.1 sessions that usually send before receiving.

For MRO, send sessions must send before they can receive.

#### blank

These sessions can receive only; there are no send sessions.

You must leave this field blank when the sessions are on an external CICS interface (EXCI) connection.

#### number

Specifies the number of send sessions on connections that specify blank or LU61 on the protocol parameter of the CONNECTION definition. CICS uses the number to generate the last two or three characters of the session names (see SENDPFX for details).

If you are using the default send prefix (>), or your own 1-character prefix, specify a number in the range 1 through 999.

If you specify a 2-character prefix, the number is restricted to the range 1 through 99.

Except for external CICS interface (EXCI) connections the SENDCOUNT in the sending system should equal RECEIVECOUNT in the receiving system.

#### SENDPFX(>|prefix)

Specifies a 1- or 2-character prefix that CICS is to use as the first 1 or 2 characters of the send session names (the names of the terminal control table terminal entries (TCTTEs) for the sessions).

Prefixes must not cause a conflict with an existing connection or terminal name.

#### > (MRO sessions)

For MRO sessions, if you do not specify your own send prefix, CICS enforces the default prefix—the greater-than symbol (>), which is used in conjunction with the send count to generate send session names.

CICS creates the last three characters of the session names from the alphanumeric characters A through Z, and 1 through 9. These 3-character identifiers begin with the letters AAA, and continue in ascending sequence until the number of session entries reaches the limit set by the SENDCOUNT value.

For example, using the default prefix (>) CICS generates session names as >AAA, >AAB, >AAB, >AAC, and so on. (This method of generation of session identifiers is the same as for APPC sessions, except for the initial symbol.)

**Note:** If you specify your own prefix, CICS generates the session names as in earlier releases, which is the same as for LUTYPE6.1 sessions.

#### prefix (for LUTYPE6.1 sessions)

If the sessions are on LUTYPE6.1 ISC connections, you must specify a 1or 2-character prefix. Do not use the default > symbol for LUTYPE6.1 sessions.

For LUTYPE6.1 sessions (and MRO if you specify your own 1- or 2-character prefix) CICS generates session names by appending a number to the prefix, either in the range 1 through 99, or 1 through 999. The number begins with 1 and is incremented by 1 until the specified SENDCOUNT is reached.

#### **USERID**(*userid*)

The preset user identifier to be used for link security checking.

If you do not specify a preset userid for link security, CICS uses the userid passed from the remote user as the userid for link security, which in the case of an external CICS interface link is the client userid.

## Inquiring on the state of EXCI connections

If you have access, through a CICS terminal, to the CICS server region, you can inquire about batch jobs that are running a client application program, and which are using the external CICS interface to link to a server program in CICS.

To obtain this information about batch jobs linked to CICS through MRO, you use the CEMT INQUIRE EXCI command. This command enables you to identify the names of external CICS interface batch jobs currently connected to CICS through the interregion communication (IRC) facility.

CICS returns job identifications in the form:

```
jobname.stepname.procname - mvsid
```

Either stepname, or procname, or both may not be present, indicated by the periods (.) being adjacent to one another.

The mvsid identifies the MVS system on which the job is running. If XCF/MRO is in use, the job can reside on a different MVS image from that on which CICS is running.

Information about jobs using the external CICS interface is available only when the job has issued at least one DPL request. A non-zero task number indicates that a DPL request is currently active. A zero task number indicates an external CICS interface session is still open (connected) for that job, although no DPL request is currently active.

See CEMT—master terminal, in the *CICS Supplied Transactions* manual for more information about the CEMT command.

# Chapter 12. The EXCI user-replaceable module

This chapter contains Product-sensitive Programming Interface information.

The external CICS interface provides a user-replaceable module, DFHXCURM. The load module is supplied in CICSTS32.CICS.SDFHEXCI, and the source in CICSTS32.CICS.SDFHSAMP. You can find information about assembling and link-editing user-replaceable programs in Assembling and link-editing user-replaceable programs, in the *CICS Customization Guide*.

DFHXCURM is invoked by the external CICS interface in the non-CICS region during the processing of Allocate\_Pipe commands, and after the occurrence of any retryable error. The retryable responses are:

- The target CICS region is not available
- · There are no pipes available on the target CICS region
- · There has been no IRC activity since the MVS IPL.

To retry after a retryable error, issue the EXCI call again.

As supplied, DFHXCURM is effectively a dummy program because of a branch instruction that bypasses the sample logic and returns control to the external CICS interface caller. To use the sample logic, remove the branch instruction and assemble and link-edit the module. Customizing DFHXCURM allows you to do the following:

- When invoked during Allocate\_Pipe processing, you can change the specified CICS APPLID, in order to route the request to another CICS system.
- When invoked after a retryable error you can store information regarding CICS availability. You can then use this information on the next invocation of DFHXCURM for Allocate\_Pipe processing, so that you can decide to which CICS system to route the request.

DFHXCURM is called using standard MVS register conventions, with register 1 containing the address of the parameter list, and register 14 the return address of the caller. The parameters addressed by register 1 are mapped in the EXCI\_URM\_PARMS DSECT, which is contained within the DFHXCPLD copybook. The parameters passed to DFHXCURM are as follows:

#### URMINV

The address of a fullword that contains the reason for the invocation of DFHXCURM, defined by the following equates:

URM_ALLOCATE	EQU 1	This invocation is for an Allocate_Pipe
URM NO CICS	EQU 2	The target CICS region is not available
URM_NO_PIPE	EQU 3	There are no pipes available
URM_NO_CICS_IRC	EQU 4	There has been no IRC activity since the MVS IPL

#### URMCICS

The address of an 8-byte area that contains the generic APPLID of the target CICS system, as specified on the *CICS\_applid* parameter of the Allocate\_Pipe command, or on the APPLID parameter of the EXEC CICS LINK command.

When specified by one of these commands, you can change the APPLID to that of a different target CICS region.

If the *CICS\_applid* parameter is omitted from the Allocate\_Pipe call, or APPLID is omitted from the EXEC CICS LINK command, the field addressed by this

parameter contains 8 blanks. In this case, you must specify an APPLID in DFHXCURM before returning control to the caller.

#### URMAPPL

The address of an 8-byte area that contains the client program's user name as specified on the *my\_name* parameter of the Initialize\_User command. Note that if DFHXCURM is invoked for an EXEC CICS LINK command, this name is always set to DFHXCEIP.

#### URMPROG

The address of an 8-byte area that contains the name of the target program (if available). This name is available only if DFHXCURM is invoked for an EXEC CICS LINK command. For an external CICS interface Allocate\_Pipe command, the program name is not known until the DPL call is issued.

#### URMOPTS

The address of a 1-byte area that contains the allocate options, which can be X'00' or X'80', as specified on the *allocate\_opts* parameter. This address is valid for an Allocate\_Pipe request only.

#### URMANCH

The address of a 4-byte area that is provided for use by DFHXCURM only. A typical use for this is to store a global anchor address of an area used to save information across a number of invocations of DFHXCURM. For example, you can GETMAIN the necessary storage and save the address in the 4-byte area addressed by this parameter. The initial value of the 4-byte area is set to zero.

There is one URMANCH for each TCB in the address space using EXCI.

# Chapter 13. Using the EXCI options table, DFHXCOPT

The EXCI options table, generated by the DFHXCOPT macro, enables you to specify a number of parameters that are required by the external CICS interface.

# # # #	The format of the DFHXCOPT options table has changed since it was first introduced. In CICS TS for z/OS, Version 3.2 (and, by APAR, also in CICS TS 2.1, CICS TS 2.2, and CICS TS 3.1) the table now includes a version number, which is intended to allow more flexibility for future extensions. You need to be aware of this change if, for example, you plan to migrate a customized DFHXCOPT table from an earlier release of CICS to CICS TS for z/OS, Version 3.2.
# # # # #	<ul> <li>To distinguish between the old and newer formats, the new-format table is link-edited with an alias called "DFHXCOPE". The following sequence is used to load the options table:</li> <li>1. CICS tries to load the DFHXCOPT table using its alias name of DFHXCOPE. If it finds a load module named DFHXCOPE, and successfully loads it, CICS assumes that the table is in the new format.</li> <li>2. If CICS does not find a load module named DFHXCOPE (or finds it but fails to</li> </ul>
# # # # #	load it), it tries to load the table using its "base" name of DFHXCOPT. In this case, CICS assumes that the table is in the older format. CICS provides a default DFHXCOPT table. The source code of the default table, which you can tailor to your own requirements, is supplied in the CICSTS32.CICS.SDFHSAMP library. The load module of the default DFHXCOPT table, with its alias DFHXCOPE, is in the CICSTS32.CICS.SDFHEXCI library.
# # # #	If you create your own, customized, DFHXCOPT table, ensure that you link-edit it using the DFHXCOPE alias. (Using the standard DFHAUPLE procedure, described below, ensures that this happens.) If you reassemble and link-edit your table without the alias, CICS will load the default table (found by means of its DFHXCOPE alias), rather than your customized table.
	You must assemble and link-edit your customized DFHXCOPT table into a suitable library in the STEPLIB concatenation of the job that runs the MVS client program. You can use your own version of the CICS DFHAUPLE procedure to do this. The DFHAUPLE procedure is supplied in CICSTS32.CICS.SDFHINST.

Unlike the tables you specify for CICS regions, the DFHXCOPT table cannot be suffixed.

Table 22 shows the format of the DFHXCOPT macro and its parameters.

DFHXCO	TYPE={CSECTIDSECT}
	[,ABENDBKOUT={ <b>NO</b>  YES}]
	[,CICSSVC={ <b>0</b>   <i>number</i> }]

	[,TRACESZE={ <b>16</b>   <i>number-of-kilobytes</i> }] [,TRAP={ <b>OFF</b> ION}] [,XCFGROUP={ <b>DFHIR000</b>  name}]
	You must terminate your parameters with the following END statement.
END	DFHXCOPT

#### TYPE={CSECT|DSECT}

Indicates the type of table to be generated.

## CSECT

I

A regular control section that is normally used.

#### DSECT

A dummy control section.

# # # # #	ABENDBKOUT={NO YES} Specifies whether a task that abends within the CICS server is to trigger an automatic rollback of the global unit of work. A global unit of work exists when an EXCI client program is controlling resource recovery through MVS RRS (that is, SYNCONRETURN is <i>not</i> specified on the DPL request). In this case you may well want the global unit of work to be marked for rollback if the CICS server program abends.
#	<b>Note:</b> ABENDBKOUT has no effect when SYNCONRETURN is specified on the DPL request.
#	NO The global unit of work is not marked for rollback.
# # #	YES When processing the abend of the server program, the CICS mirror program marks the global unit of work for backout.
#	In both cases the EXCI client program receives a return code of 422, SERVER_ABENDED, on the EXCI DPL request.
	<b>CICSSVC={0</b>   <i>number</i> } Specifies the CICS type 3 SVC number being used for MRO communication.
	The external CICS interface must use the same SVC number that is in use by the CICS MRO regions that reside in the MVS image in which the client program is running.
	If you do not specify a specific CICS SVC number, the external CICS interface determines the SVC in use for MRO by means of an MVS VERIFY command.
	<ul> <li>Specify zero to indicate that the external CICS interface is to obtain the CICS SVC number from MVS. This is the default.</li> </ul>
	You should only specify 0 when you are sure that at least one CICS region has logged on to DFHIRP during the life of the MVS IPL.
	number Specify the CICS SVC number, in the range 200—255, that is in use for CICS interregion communications. This must be the SVC number that is installed in the MVS image in which the client program is running (the local MVS).

If no MRO CICS regions have ever logged on to DFHIRP in the local MVS during the life of the IPL, you must specify the SVC number. If you allow this parameter to default, and the external CICS interface requests the SVC from MVS, the request will fail if no CICS region has logged on to DFHIRP.

This parameter is required in those MVS images that do not run any CICS regions, and the client program is issuing DPL requests to a server CICS region that resides in another MVS. In these circumstances, the client program logs on to the local DFHIRP using the locally defined SVC, and communicates with the remote CICS region using XCF/MRO.

**Note:** All CICS regions using MRO within the same MVS image must use the highest level of both DFHIRP and the CICS SVC, DFHCSVC. If your MRO CICSplex consists of CICS regions at different release levels, the DFHIRP and DFHCSVC installed in the LPA must be from highest release level of CICS within the CICSplex.

MVS client programs using the external CICS interface can communicate only with server regions running under CICS for MVS/ESA 4.1 or later.

#### CONFDATA={SHOW|HIDETC}

Code this parameter to indicate whether the external CICS interface is to suppress (hide) user data that might otherwise appear in EXCI trace entries output to GTF or in EXCI dumps. This option applies to the tracing of the COMMAREA flowing between the EXCI client program and the CICS server program.

#### SHOW

Data suppression is not in effect. User data is traced.

#### HIDETC

This specifies that you want EXCI to 'hide' user COMMAREA data from trace entries. Instead of the COMMAREA data, the trace entry contains a character string stating that the data has been suppressed.

#### **DURETRY={30** *number-of-seconds* **|0}**

Specifies the total time, in seconds, that the external CICS interface is to continue trying to obtain an MVS system dump using the SDUMP macro.

DURETRY allows you to control whether, and for how long, the external CICS interface is to reissue the SDUMP if another address space in the same MVS system is already taking an SDUMP when the external CICS interface issues an SDUMP request.

In the event of an SDUMP failure, the external CICS interface reacts as follows:

- If MVS is already taking an SDUMP for another address space, and the DURETRY parameter is nonzero, the external CICS interface issues an MVS STIMERM macro to wait for five seconds, before retrying the SDUMP macro. The external CICS interface issues a message to say that it will retry the SDUMP every five seconds until the DURETRY time limit.
- If the SDUMP fails for any other reason such as:
  - There are no SYS1.DUMP data sets available, or
  - There are I/O errors preventing completion of the dump, or
  - The DURETRY limit expires while retrying SDUMP

the external CICS interface issues a message to inform you that the SDUMP has failed, giving the reason why.

**30** 30 seconds allows the external CICS interface to retry up to six times (once every five seconds).

#### number-of-seconds

Code the total number of seconds (up to 32767 seconds) during which you want the external CICS interface to continue retrying the SDUMP macro. The external CICS interface retries the SDUMP, once every five seconds, until successful or until retries have been made over a period equal to or greater than the DURETRY value.

Code a zero value if you do not want CICS to retry the SDUMP.

#### GTF={OFF|ON}

Specifies whether all trace entries normally written to the external CICS interface internal trace table are also to be written to an MVS generalized trace facility (GTF) data set (if GTF tracing is active).

#### 0FF

Code this if trace entries are not to be written to GTF.

**ON** Code this if trace entries are to be written to GTF.

#### MSGCASE={MIXED|UPPER}

Specifies whether the DFHEXxxxx messages are to be issued in mixed or uppercase.

#### MIXED

Code this if messages are to be issued in mixed case.

#### UPPER

Code this if messages are to be issued in uppercase.

#### SURROGCHK={YES|N0}

Specifies whether the external CICS interface is to perform surrogate user checks against the client job user id (the user ID under which the EXCI job is running).

#### YES

The external CICS interface is to perform a surrogate user check to verify that the user ID under which the EXCI client job is running is authorized as a surrogate for the user ID specified on a DPL call. The check is made only when the client user ID is different from the user ID on the DPL call.

The client user ID must be authorized to the appropriate profile in the SURROGAT general resource class. You do this by giving the client user ID READ authority to a profile named *userid*.DFHEXCI in the SURROGAT general resource class, where *userid* is the user ID specified on the DPL call.

See "Surrogate user checking" on page 179 for an example of how to authorize the batch region user ID as a surrogate user for a DPL user ID.

**NO** Surrogate user checks are not to be performed.

#### **TIMEOUT={0**|*number*}

Specifies the time interval, in hundredths of a second, during which the external CICS interface waits for a DPL command to complete.

9 Specifies that you do not want any time limit applied, and that the external CICS interface is to wait indefinitely for a DPL command to complete.

#### number

Specifies the time interval, in hundredths of a second, that the external

CICS interface is to wait for a DPL command to complete. The number represents hundredths of a second, from 1 up to a maximum of 2 147 483 647. For example:

- 6000 Represents a timeout value of one minute
- 30000 Represents a timeout value of five minutes

60000 Represents a timeout value of ten minutes.

#### TRACE={0FF|1|2}

Specifies whether you want external CICS interface internal tracing, and at what level.

#### 0FF

External CICS interface internal tracing is not required. However, even with normal tracing switched off, exception trace entries are always written to the internal trace table.

- 1 Exception and level-1 trace entries are written to the internal trace table.
- 2 Exception, level-1, and level-2 trace entries are written to the internal trace table.

#### TRACESZE={16 | number-of-kilobytes}

Specifies the size in kilobytes of the internal trace table for use by the external CICS interface. This table is allocated in virtual storage above the 16MB line. You should ensure that there is enough virtual storage for the trace table by specifying a large enough region size on the MVS REGION parameter.

16 16KB is the default size of the trace table, and also the minimum size.

#### number-of-kilobytes

The number of kilobytes of storage to be allocated for the internal trace table, in the range 16KB through 1 048 576KB. Subpool 1 is used for the trace table storage, which exists for the duration of the jobstep TCB. The table is page-aligned and occupies a whole number of pages. If the value specified is not a multiple of the page size (4KB), it is rounded up to the next multiple of 4KB.

#### TRAP={OFF|ON}

Specifies whether the service trap module, DFHXCTRA, is to be used. DFHXCTRA is supplied as a user-replaceable module, in which IBM service personnel can add code to trap errors.

#### 0FF

L

I

Т

Т

I

Т

Т

|

L

Code this if you do not want to use DFHXCTRA.

**ON** Code this if you require DFHXCTRA.

#### XCFGROUP={DFHIR000|name}

Specifies the name of the cross-system coupling facility (XCF) group to be joined by this client program.

**Note:** XCF groups allow CICS regions in different MVS images within the same sysplex to communicate with each other across multi-region operation (MRO) connections. For introductory information about XCF/MRO, and instructions on how to set up XCF groups, see Cross-system multiregion operation (XCF/MRO) in the *CICS Intercommunication Guide*.

Each client program can join a maximum of one XCF group.

#### DFHIR000

The default XCF group name.

#### name

L

I

L

T

T

T

I

I

The group name must be eight characters long, padded on the right with blanks if necessary. The valid characters are A-Z 0-9 and the national characters \$ # and @. To avoid using the names IBM uses for its XCF groups, do not begin group names with the letters A through C, E through I, or the character string "SYS". Also, do not use the name "UNDESIG", which is reserved for use by the system programmer in your installation.

It is recommended that you use a group name beginning with the letters "DFHIR".

# Chapter 14. Compiling and link-editing EXCI client programs

All programs that use the external CICS interface to pass DPL requests to a CICS server region must include the CICS-supplied program stub, DFHXCSTB.

The stub intercepts all external CICS interface commands, whether they are EXCI CALL interface commands, or EXEC CICS LINK commands, and ensures they are passed to the appropriate external CICS interface routine for processing.

DFHXCSTB is a common stub, designed for inclusion in programs written in all the supported languages. It is supplied in the CICSTS32.CICS.SDFHEXCI library.

**Note:** The CICSTS32.CICS.SDFHEXCI also contains entries for DFHXCIE and DFHXCIS, which are aliases for DFHXCSTB.

To help you ensure that the stub is included, CICS provides a number of procedures, one for each language, which you can use for translating, compiling, and link-editing.

You must specify AMODE(31) for your EXCI client program.

The CICS-supplied procedures for compiling and link-editing client programs include the following parameters on the PARM statement of the linkage editor job step:

LNKPARM='AMODE(31),LIST,XREF'

The rest of this chapter describes:

- "Job control language to run an EXCI client program"
- "EXCI programming considerations" on page 167
- "Using EXCI sample application programs" on page 168

## Job control language to run an EXCI client program

An EXCI client program runs in an MVS address space, for example, as a batch job. Note the following requirements when writing the JCL for your client program:

 Include in the STEPLIB concatenation those libraries that contain the CICS-supplied external CICS interface modules and also the client program. The external CICS interface modules are supplied in CICSTS32.CICS.SDFHEXCI, which contains the following:

DFH\$AXCC DFHMEBMX DFHMET4E DFHXCEIX DFHXCIE (alias of DFHXCSTB) DFHXCIS (alias of DFHXCTSB) DFHXCOPT DFHXCOPT DFHXCPRX DFHXCTRA DFHXCTRA DFHXCURM

• You are recommended to include a DD statement for SYSMDUMP. The external CICS interface uses SYSMDUMP for some error conditions.

- The REGION parameter must specify a large enough region size to allow for the size of the internal trace table specified by the TRACESZE parameter in the DFHXCOPT options table.
- Include a SYSPRINT or equivalent DD statement for any output from the client program.

Figure 22 shows a sample job that you can use or modify to start a client program.

```
//EXCI JOB (accounting_information),CLASS=A,TIME=1440,
// USER=userid,PASSWORD=pswd,REGION=100M
//*-----*
//* JCL to execute an external CICS interface client program *
//*-----*
// EXEC PGM=pgmname
//STEPLIB DD DSN=CICSTS32.CICS.EXCI.LOADLIB,DISP=SHR
// DD DSN=CICSTS32.CICS.SDFHEXCI,DSIP=SHR
// DD DSN=CICSTS32.CICS.SDFHEXCI,DSIP=SHR
//SYSPRINT DD SYSOUT=A
//SYSMDUMP DD DSN=SYS1.SYSMDP00,VOL=SER=volid,SPACE=(CYL,(1,1)),
DISP=OLD,UNIT=3390
```

Figure 22. Sample job for starting an EXCI client program

#### Note:

- 1. The job user ID, specified on the USER parameter, must be defined to RACF, or an equivalent external security manager (ESM).
- In addition to being used for job step initiation security, the job user ID is also used for MRO logon and bind-time security checking.
   See Chapter 15, "EXCI security," on page 177 for information about security when using the external CICS interface.
- See "Installing the EXCI sample definitions" on page 173 for information about modifying the sample connection definitions before you run the sample application programs in an environment that does not have RACF, or an equivalent external security manager (ESM), installed and active.

## CICS-supplied procedures for the EXCI

CICS provides seven procedures to enable you to translate, compile, and link-edit your client programs. Four of these are for use with specific language compilers or assembler, the other three being for use with Language Environment. These procedures, with the four language-specific procedures shown first, are:

#### DFHEXTAL

The assembler procedure for assembler versions of client programs

#### DFHYXTEL

The procedure for C++ versions of client programs running under Language Environment

#### DFHYXTDL

The procedure for C versions of client programs running under Language Environment

#### DFHYXTPL

The procedure for PL/I versions of client programs running under Language Environment

#### DFHYXTVL

The procedure for COBOL versions of client programs running under Language Environment.

To ensure that the EXCI stub is included with your client program, all these procedures include a step, COPYLINK, that unloads the stub into a temporary data set defined with a block length suitable for the linkage-editor. This temporary data set is then concatenated with the temporary data set containing your object program on the SYSLIN DD statement in the LKED step.

These procedures are supplied in the CICSTS32.CICS.SDFHPROC library. You are recommended to copy these to SYS1.PROCLIB or another suitable procedure library.

## **EXCI** programming considerations

There are some language requirements that apply to writing an MVS client program that uses the external CICS interface. These affect programs written in PL/I and C. Also, for all languages, consider how you handle return codes before terminating your MVS client program.

## **PL/I** considerations

PL/I programs written to the external CICS interface must provide their parameters on the CALL to DFHXCIS in the form of an assembler-style parameter list.

The EXCI copybook for PL/I, DFHXCPLL, contains the necessary definition of the DFHXCIS entry point, as follows:

DCL DFHXCIS ENTRY OPTIONS(INTER ASSEMBLER);

The same rule applies for the EXCI LINK command, and in this case the CICS translator ensures that the correct parameter list is built.

For an example of an EXCI client program written in PL/I, see the source of the sample program, DFH\$PXCC.

## **C** considerations

C programs written to the external CICS interface must provide their parameters on the CALL to DFHXCIS in the form of an assembler-style parameter list. You ensure this by declaring the entry point to DFHXCIS with OS LINKAGE.

The EXCI copybook for PL/I, DFHXCPLH, contains the necessary definition of the DFHXCIS entry point, as follows:

#pragma linkage(dfhxcis,OS)

The same rule applies for the EXCI LINK command, and in this case the CICS translator ensures that the correct parameter list is built.

For an example of an EXCI client program written in C, see the source of the sample program, DFH\$DXCC.

#### Setting the return code (R15) at termination

The external CICS interface does not clear register 15 at termination, regardless of whether your client program executes normally or not. Therefore, even if your MVS

client program terminates normally after successfully using the external CICS interface, the job step could end with an undefined return code.

To ensure a meaningful return code is given at termination, set the job step return code before terminating your program. The sample client programs illustrate how you can do this, using the saved response code from last call to the external CICS interface. For example, the COBOL sample DFH0CXCC program moves SAVED-RESPONSE to special register RETURN-CODE before terminating.

## Using EXCI sample application programs

CICS provides a number of sample programs that are designed to help you in writing your own application programs. To help with writing programs that use the external CICS interface, CICS provides sample MVS client programs and a sample CICS server program.

The samples show you how to code client applications that use both the EXCI CALL interface and EXEC CICS LINK command.

EXEC Level Processor. \* Setting up the EXEC level call. The Link Request has successfully completed. ## Description of the sample applications

The sample external CICS interface programs are included on the CICS Transaction Server for z/OS distribution tape.

Two sample MVS client programs are supplied. One is provided in assembler language, COBOL, C, and PL/I. The other is only provided in assembler. The sample CICS server program is provided in assembler only. Assembler language programs are in source and executable form. COBOL, PL/I, and C programs are provided in source form only. Each version of the client program has basically the same function, but programming methods vary somewhat according to the language used.

The sample programs, shown in Table 23, are supplied in source form in CICSTS32.CICS.SDFHSAMP. The sample assembler server program is also supplied in executable form in CICSTS32.CICS.SDFHLOAD. The assembler client program is supplied in CICSTS32.CICS.SDFHEXCI.

#### Note:

L

L

Т

- The assembler versions of the client program use BSAM, which requires the programs to be link-edited in RMODE(24), as a switch to AMODE(24) is made around the BSAM call. The assembler source code includes the required RMODE(24) statement. Normally, EXCI client programs run AMODE(31),RMODE(ANY).
- 2. Because of this, the assembler versions of these client programs are unsuitable for use as Language Environment MAIN programs.
- SDFHEXCI and SDFHDLL1 are downwardly compatible with CICS TS for z/OS, Version 3.1, CICS TS for z/OS, Version 2.3 and CICS TS for z/OS, Version 2.2.

Language	Name	Type of program
Assembler	DFH\$AXCC	Client program
Assembler	DFH\$ATXC	Client program
Assembler	DFH\$AXCS	Server program
COBOL	DFH0CXCC	Client program
PL/I	DFH\$PXCC	Client program
С	DFH\$DXCC	Client program

Table 23. The external CICS interface sample programs

The sample client programs show you how to code a simple MVS client application using the EXCI CALL interface and the EXEC CICS LINK command.

Each version of the client is divided into three separate sections as follows:

1. The first section issues a single EXEC CICS LINK command to inquire on the state of the sample VSAM file, FILEA, in the target CICS system.

If the file is in a suitable state, processing continues to sections two and three, which together provide complete examples of the use of the EXCI CALL interface.

2. The second section initiates a specific MRO connection to the target CICS system and, once the pipe is open, performs a series of calls that each retrieve a single sequential record from the sample VSAM file, until no more records are available.

 The third section is a simple routine to close the target sample file once processing of the data is complete. It also terminates the MRO connection now that the link is no longer required.

Some of the parameters used on the EXCI CALL and EXEC CICS LINK commands in the client program need to be tailored for your own target CICS server region. Change these as required, then retranslate, compile (or assemble), and link-edit the program.

The variables and their values specified in the sample programs are given in Table 24.

Variable name in sample program	Default value
TARGET_FILE	FILEA
TARGET_TRANSID	EXCI
TARGET_SYSTEM	DBDCCICS (applid)
TARGET_PROGRAM	DFH\$AXCS
TARGET_USERID	Defaults to batch region's user ID
APPLICATION	BATCHCLI

Table 24. Parameters used in the sample client programs

The assembler versions of the client programs are supplied pregenerated in an executable form. All versions of the program accept two run-time parameters, as follows:

1. The first (TARGET\_SYSTEM) specifies the server region APPLID.

For the pregenerated assembler versions this avoids you having to reassemble the programs to specify the applid of your own CICS server region. You can also use the sample client programs with different CICS regions without needing to modify the programs each time.

2. The second specifies the user ID to be used on the call interface DPL\_request.

You specify these positional parameters on the PARM statement, separated by a comma.

#### Using the COMMAREA in the sample programs

Data is passed between the sample client and server programs using a standard CICS communications area (COMMAREA) for passing data between programs. The definitions of this COMMAREA are identical on each side of the EXCI link to ensure that data is mapped correctly.

The sample client program DFH\$AXCC minimizes data transmission by specifying a specific data length to avoid sending the whole COMMAREA over the link. The data length option specifies a binary value that is the length of a contiguous area of storage, from the start of the COMMAREA, to be passed to the server program. This is because the amount of data being passed to the server is small, but the COMMAREA itself is much larger so that the server can return the requested records from FILEA. Specifying a data length when the amount of data being passed is smaller than the COMMAREA improves performance.

Sample program DFH\$ATXC passes the full COMMAREA to the server program because it makes changes to the file records and the whole of the changed record needs to be passed to the server.

The first and third sections of the sample client programs define the COMMAREA as only 18 bytes (no data is requested from the server in these sections). For the second section, the sample client program defines the COMMAREA as 98 bytes, the extra 80 bytes being required for the sample server program to return a record from FILEA. In all sections, the data length is defined as 18 bytes. The COMMAREA structure is defined in the sample programs as follows:

Bytes	Data type	Field description
0-3	Fullword	Call type code.
4-11	Char(8)	Target file name.
12-17	Char(6)	Ridfield identifier.
18-97	Char(80)	FILEA record data area.

Note that, although the COMMAREA structure is described in both the client and server programs, the actual size of the COMMAREA made available by CICS to the server is determined by the client program. If you modify the sample programs to work with one of your own application programs, make sure you specify a COMMAREA large enough to handle the maximum amount of data the server is expected to return to the client. The server must not attempt to return data that is larger than the COMMAREA specified by the client.

For more information about using a COMMAREA for passing data between CICS programs, see Sharing data across transactions, in the *CICS Application Programming Guide*.

## Installing the EXCI sample definitions

Resource definitions that support the EXCI sample programs are included in the CICS system definition file (CSD) in groups DFH\$EXCI and DFH\$FILA.

Note that the sample definitions, while included in the CSD, are not included in the IBM-defined group list DFHLIST. Thus, if CICS is initialized with GRPLIST=DFHLIST, you must install the EXCI resource definition groups before using the samples. Alternatively, you can add the sample groups to your startup group list, so that they are installed automatically at system initialization.

Transactions that are to be linked to from the batch program need to specify the mirror program (DFHMIRS) as the program name in their transaction definitions.

The resource definition groups that must be installed are as follows:

#### **DFH\$EXCI**

This contains definitions for the sample server transaction, server program, EXCI connections, and sessions.

Only one server program is included—in assembler language, called DFH\$AXCS.

The sample application is designed to run the transaction EXCI, which is defined to invoke the DFHMIRS mirror program and references profile DFHCICSA. The required transaction definition for EXCI is included in the group.

Sample CONNECTION and SESSIONS definitions for specific and generic connections are included.

**Note:** Both the generic and specific connection definitions supplied in the sample group DFH\$EXCI specify ATTACHSEC(IDENTIFY). This security option causes the server program DFH\$EXCS to fail with an ATCY abend if you run the sample programs in an environment that does not have RACF, or an equivalent external security manager (ESM), installed and active.

If you want to run the external CICS interface sample programs without any security active, you must alter the connection resource definitions to specify ATTACHSEC(LOCAL).

#### **DFH\$FILA**

This contains the definition for the supplied sample VSAM file, FILEA, which is referenced by the EXCI sample programs.

Once these are installed, you must ensure that interregion communication (IRC) is open. If IRC is not opened during CICS initialization, set it open using the CEMT SET IRC OPEN command.

## **Running the EXCI sample applications**

If you want to use the COBOL, PL/I, or C version of the EXCI client program, you must translate, compile, and link-edit the program into a suitable library.

You can use the sample JCL shown in Figure 22 on page 166 as a basis for creating your own batch job to run the client program.

If you use the pregenerated assembler version, specify the APPLID of your target CICS server region as a parameter on the EXEC statement for the client program, as follows:

Where: *applid* is the applid of the CICS server region *userid* is the userid for the DPL\_request call. Note: If you omit *applid*, you must keep the comma preceding the userid.

Change PGM=DFH\$AXCC to PGM=DFH\$ATXC to run the other client sample program.

## **Results of running the EXCI sample applications**

An example of the output produced by successful execution of the pregenerated assembler version of the client program, DFH\$AXCC, is shown in Figure 25 on page 175.

Figure 28. Incorrect transaction identifier. The target transid passed in the external CICS interface call is not defined on the target CICS system. Note the message received from the target CICS system.

If an error occurs while running the application, then, assuming the error is not severe, messages are written to the SYSPRINT output log displaying the reasons and/or return codes that cause processing to be aborted. Several examples of error-invoked output are shown in Figure 26, Figure 27, and Figure 28.

An example of the output produced by a successful execution of the pregenerated assembler version of the client program DFH\$ATXC is shown in Figure 23 on page 169. If an error occurs while running the application, errors are produced as for DFH\$AXCC.

After running DFH\$ATXC, program DFH\$AXCC should be re-run. The output should be as shown in Figure 24 on page 170. The changes up to and including records with RIDFLD values of 500000 were committed using an SRRCMIT call to tell RRS to tell CICS to perform commit processing. Later changes were backed out by issuing an SRRBACK call. This caused RRS to tell CICS to perform a ROLLBACK of these changes.

Clearly, FILEA is changed as a result of running DFH\$ATXC. It should be restored to its original state by running the LOADFILE step of DFHDEFDS.

# Chapter 15. EXCI security

CICS applies security checks in a number of ways against requests received from an MVS client program. These are described in the following topics:

- "Using MRO logon and bind-time security"
- "Link security" on page 178
- "User security" on page 179
- "Surrogate user checking" on page 179

## Using MRO logon and bind-time security

DFHIRP, the CICS interregion communication program, performs two security checks against users that want to:

- 1. Log on to IRP (specific connections only)
- 2. Connect to a CICS region (also referred to as bind-time security).

# **Generic EXCI connections:** The discussion about logon security checking in this chapter applies only to EXCI connections that are defined as SPECIFIC. The MRO logon security check is not performed for generic connections.

The MVS client program is treated just the same as another CICS region as far as MRO logon and connect (bind-time) security checking is concerned. This means that when the client program logs on to the interregion communication program, IRP performs logon and bind-time security checks against the user ID under which the client program is running. In the remainder of this chapter, we refer to this as the batch region's user ID.

To enable your client program to log on successfully to IRP, and to connect to the target server region, first ensure that you define the batch region's user ID in a user profile to RACF. When you have defined the batch region's user ID to RACF, you can then give the batch region the appropriate logon and bind-time authorizations.

#### 1. Logon authorization

Authorize the batch region's user ID to the DFHAPPL.*user\_name* RACF FACILITY class profile, with UPDATE authority. The *user\_name* part of the profile name is the user name defined on the INITIALIZE\_USER command.

Failure to authorize the batch region's user ID to the DFHAPPL profile of the specific user ID logging on to IRP causes Allocate\_Pipe processing to fail with RESPONSE(SYSTEM\_ERROR) REASON(IRC\_LOGON\_FAILURE). The subreason field-1 for a logon security check failure returns decimal 204.

See "Defining DFHAPPL FACILITY class profiles for an EXCI region" on page 178 for information about FACILITY class profiles for an EXCI client program.

#### 2. Bind-time authorization

Authorize the batch region's user ID to the DFHAPPL.*applid* RACF FACILITY class profile of the target CICS server region, with READ authority.

Failure to authorize the batch region's user ID to the CICS server region's DFHAPPL.*applid* profile causes Open\_Pipe processing to fail with RESPONSE(SYSTEM\_ERROR) REASON(IRC\_CONNECT\_FAILURE). The subreason field-1 for a bind-time security check failure returns decimal 176.

See Bind security, in the *CICS RACF Security Guide* for information about the MRO logon and bind-time security checks, and for examples of how to define the RACF DFHAPPL profiles.

## Defining DFHAPPL FACILITY class profiles for an EXCI region

Define the *user\_name* part of the DFHAPPL profile name as follows:

• For the EXCI CALL interface, the *user\_name* must be the name you specify on the *user\_name* parameter of the INITIALIZE\_USER command.

Define FACILITY class profiles, with appropriate authorizations, for each user name specified in a client program if the program has INITIALIZE\_USER commands for more than one user name.

For example, if the *user\_name* defined on an INITIALIZE\_USER command is DCEUSER1, define the DFHAPPL profile in the FACILITY class as follows: RDEFINE FACILITY (DFHAPPL.DCEUSER1) UACC(NONE)

If the batch region's user ID is CLIENTA, authorize the batch region to log on to IRP as follows:

PERMIT DFHAPPL.DCEUSER1 CLASS(FACILITY) ID(CLIENTA) ACCESS(UPDATE)

 For the EXEC CICS LINK command, the user\_name is preset by the external CICS interface as DFHXCEIP. This does not require authorization for IRP logon, because the EXEC CICS LINK interface uses a generic connection to which the logon security check does not apply.

## Link security

The target CICS server region performs link security checking against requests from the client program. These security checks cover transaction attach security (when attaching the mirror transaction), and resource and command security checking within the server application program. The link user ID that CICS uses for these security checks is the batch region's user ID.

To ensure these link security checks do not cause security failures, you must ensure that the link user ID is authorized to the following resource profiles, as appropriate:

- The profile for the mirror transaction, either CSMI for the default, or the mirror transaction specified on the *transid* parameter. This is required for transaction attach security checking.
- The profiles for all the resources accessed by the CICS server application program—files, queues (transient data and temporary storage), programs, and so on. This is required for resource security checking.
- The CICS command profiles for the SPI commands issued by the CICS server application program—INQUIRE, SET, DISCARD and so on. This is required for command security checking.

See Bind security, in the *CICS RACF Security Guide* for information about MRO link security checking.

## User security

The target CICS server region performs user security checking against the user ID passed on a DPL\_ Request call. User security checking is performed only when connections specify ATTACHCSEC(IDENTIFY).

User security is performed in addition to any link security.

For user security, in addition to any authorizations you make for link security, you must also authorize the user ID specified on the DPL\_Request call.

Note that there is no provision for specifying a user ID on the EXEC CICS LINK command. In this case, the external CICS interface passes the batch region's user ID. User security checking is therefore performed against the batch region's user ID if the connection definition specifies ATTACHSEC(IDENTIFY).

**Note:** If your connection resource definitions for the external CICS interface specify ATTACHSEC(IDENTIFY), your server programs will fail with an ATCY abend if you run them in an environment that does not have RACF, or an equivalent external security manager (ESM), installed and active.

If you want to run external CICS interface server programs without any security active, you must specify ATTACHSEC(LOCAL).

## Surrogate user checking

A surrogate user check is performed to verify that the batch region's user ID is authorized to issue DPL calls for another user (that is, is authorized as a surrogate of the user ID specified on the DPL\_Request call).

EXCI client jobs are subject to surrogate user checking if SURROGCHK=YES (the default) is specified in the EXCI options table, DFHXCOPT. If you specify SURROGCHK=YES (or allow it to default) authorize the batch region's user ID as a surrogate of the user ID specified on all DPL\_Request calls. This means the batch region's user ID must have READ access to a profile named *userid*.DFHEXCI in the SURROGAT general resource class (where*userid* is the user ID specified on the DPL call). For example, the following commands define a surrogate profile for a DPL userid, and grant READ access to the EXCI batch region:

RDEFINE SURROGAT dpl\_userid.DFHEXCI UACC(NONE) OWNER(DPL\_userid) PERMIT userid.DFHEXCI CLASS(SURROGAT) ID(batch\_region\_userid) ACCESS(READ)

If surrogate user checking is enabled (SURROGCHK=YES), but no user ID is specified on the DPL\_Request call, no surrogate user check is performed, because the user ID on the DPL\_Request call defaults to the batch region's user ID. For this bypass of surrogate user checking to be successful, ensure that you have correctly omitted the user ID on the DPL\_Request call. See "Example of EXCI CALLs with null parameters" on page 140 for information about the correct way to specify a null pointer when omitting an EXCI call parameter.

If you don't want surrogate user security checking, specify SURROGCHK=NO in the DFHXCOPT options table (note that SURROGCHK=YES is the default).

Surrogate user checking is useful when the batch region's user ID is the same as the CICS server region user ID, in which case the link security check (see "Link security" on page 178) is bypassed. In this case, a surrogate user check is

recommended, because the user ID specified on the DPL\_Request call is not an authenticated user ID (no password is passed).

If the batch region's user ID and the CICS region user ID are different, link security checking is enforced. With link security, a non-authenticated user ID passed on a DPL\_Request call cannot acquire more authority than that allowed by the link security check. It can acquire only the same, or less, authority than that allowed by the link security check.

For more information about CICS security, see the CICS RACF Security Guide.

# **Chapter 16. Problem determination**

This chapter contains Diagnosis, Modification or Tuning information.

This chapter describes some of the aids to problem determination provided by the external CICS interface. It covers:

- Trace
- · System dumps
- · MVS 04xx abends for the external CICS interface
- The EXCI service trap, DFHXCTRA
- EXCI trace entry points

Details of the external CICS interface messages and abend codes are given in Chapter 18, "Messages and Codes," on page 233.

## Trace

The external CICS interface writes trace data to two destinations: an internal trace table and an external MVS GTF data set. The internal trace table resides in the non-CICS MVS address space. Trace data is formatted and included in any dumps produced by the external CICS interface.

Trace entries are issued by the external CICS interface destined for the internal trace table, an MVS GTF data set, or both. They are listed in "EXCI trace entry points" on page 191.

To use GTF for external CICS interface tracing, GTF user tracing must be active, GTF must be started in the MVS image, and you must specify GTF=ON in the DFHXCOPT options table.

If you use GTF trace for both the CICS server region and the external CICS interface region, the trace entries are interleaved, which can help you with problem determination in the CICS–EXCI environment.

**Note:** The external CICS interface maintains a separate trace table for each user TCB in an external CICS interface application program.

The external CICS interface does not support any form of auxiliary trace.

## Formatting GTF trace

To format external CICS interface trace entries written to GTF, you can use the standard CICS DFHTR650 trace formatting routine.

To format external CICS interface trace entries you use the same FID and ID as for CICS (that is, FID=X'EF', and ID=X'F6C').

## Using System dumps

The external CICS interface produces MVS SYSMDUMPs for some error conditions and MVS SDUMPs for other, more serious conditions. These dumps contain all the external CICS interface control blocks, as well as trace entries.

## Formatting system dumps

You can use the CICS IPCS verb exit, DFHPD650, to format the system dumps. The following keywords are available for use when formatting an external CICS interface dump using DFHPD650:

- KE Formats PSW and registers, and all external CICS interface control blocks.
- LD Formats a load map of where the external CICS interface modules are loaded in the address space, and gives their PTF level.

#### MR0

Formats the MRO control blocks for the external CICS interface address space, including common control blocks that reside in the MVS common service area (CSA). This option also formats some MRO blocks that reside in the CICS address space for pipes connected to CICS.

- **TR** Formats the external CICS interface trace table. You can format the trace table in abbreviated and full forms (TR=1 gives you the abbreviated trace).
- SU Produces a dump summary.

#### Multiple TCBs

If the external CICS interface takes a system dump when there is more than one TCB in use, it dumps only the control blocks and trace table for the TCB that requested the dump.

If you take a dump of the external CICS address space using a console command, the CICS verb exit routine, DFHPD650 formats the control blocks and trace tables for every TCB it finds in the dump.

## Capturing SYSMDUMPs

To capture SYSMDUMPs produced by the external CICS interface, ensure you always include a DD statement for the SYSMDUMP data set in the client application program's JCL.

## Using the MVS DUMP command at the console for dumps

In addition to the dumps taken automatically by the external CICS interface, you can also force a dump of an address space running a client application program by means of an MVS DUMP command entered at the console. You can use the CICS IPCS verb exit routine DFHPD650 to format dumps taken in this way.

Note: You can also issue the DUMP command from TSO, SDSF, or NetView<sup>®</sup>.

You can use the console to issue the DUMP command also to dump the CICS server address space as well as the client address space, and use the CICS IPCS verb exit routine DFHPD650 to format both address space dumps together.

## MVS 04xx abends for the external CICS interface

The following MVS 04xx abends can occur when you are running an external CICS interface job:

## 0401

## Explanation

An external CICS interface (EXCI) request was issued using the CALL API or the EXEC API, and the EXCI stub DFHXCSTB link-edited with the application detected that it was running in AMODE 24. The external CICS interface only supports calls made in AMODE 31.

## **System Action**

The application terminates abnormally.

#### **User Response**

Change the application so that EXCI calls are made in AMODE 31, or relink-edit the application AMODE 31.

#### Module

DFHXCSTB

## 0402

## Explanation

The external CICS interface module DFHXCPRH issued an MVS ESTAE macro to establish a recovery environment, but a nonzero return code was returned from MVS.

## **System Action**

The application terminates abnormally with a dump.

#### **User Response**

Examine the dump and any associated MVS messages produced to determine why the MVS ESTAE request failed.

If the error occurred while processing an INITIALIZE\_USER request on behalf of the application, an attempt to format the dump using the CICS IPCS dump formatter does not produce any formatted output. This is because the error occurred too early in EXCI initialization for there to be any control blocks.

## Module

DFHXCPRH

0403

## Explanation

The external CICS interface module DFHXCPRH issued an MVS GETMAIN request to obtain storage for its XCGLOBAL block, but a nonzero return code was returned from MVS.

## **System Action**

Module DFHXCPRH issues an MVS abend with abend code 0403 which invokes its ESTAE routine to clear up its environment. A SYSMDUMP is taken before returning control to the application. An application using the EXCI CALL API receives RESPONSE(SYSTEM\_ERROR) REASON(XCGLOBAL\_GETMAIN\_ERROR) in its return area. The subreason1 field of the return area contains the R15 return code from MVS indicating why the GETMAIN failed. An application using the EXCI EXEC API receives RESP(LINKERR) RESP2(602).

#### **User Response**

Use the MVS R15 return code obtained from the application or from the dump to determine why the MVS GETMAIN request failed. If the reason is insufficient storage, increase the region size of the batch application.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter does not produce any formatted output for the job because the error occurred too early in EXCI initialization for there to be any control blocks.

#### Module

DFHXCPRH

0404

## Explanation

The external CICS interface module DFHXCPRH needed to take an MVS SDUMP for an earlier reported problem. However the error has occurred too early in EXCI initialization for EXCI dump services to be available.

## **System Action**

Module DFHXCPRH issues an MVS abend with abend code 0404 which invokes its ESTAE routine from which a SYSMDUMP is taken instead of an SDUMP to capture the earlier reported problem.

## **User Response**

Examine the SYSMDUMP to determine the cause of the earlier reported problem.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter does not produce any formatted output for the job because the error occurred too early in EXCI initialization for there to be any control blocks.

#### Module

DFHXCPRH

## 0405

## Explanation

The external CICS interface module DFHXCPRH issued an IEFSSREQ SSI verify request to MVS to determine the number of the CICS SVC type 3 SVC to use. The SSI VERIFY request failed.

## **System Action**

Module DFHXCPRH issues an MVS abend with abend code 0405 which invokes its ESTAE routine to clear up its environment. A SYSMDUMP is taken before returning control to the application. An application using the EXCI CALL API receives RESPONSE(SYSTEM\_ERROR) REASON(SSI\_VERIFY\_FAILED) in its return area. The subreason1 field of the return area contains the R15 return code from MVS indicating why the SSI verify failed. An application using the EXCI EXEC API receives RESP(LINKERR) RESP2(606).

#### **User Response**

Use the MVS R15 return code obtained from the application or from the dump to determine why the SSI VERIFY request failed.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter does not produce any formatted output for the job because the error occurred too early in EXCI initialization for there to be any control blocks.

#### Module

DFHXCPRH

## 0406

## **Explanation**

The external CICS interface module DFHXCPRH called the CICS SVC to initialize the EXCI environment. The CICS SVC call failed.

#### **System Action**

Module DFHXCPRH issues an MVS abend with abend code 0406 which invokes its ESTAE routine to clear up its environment. A SYSMDUMP is taken before returning control to the application. An application using the EXCI CALL API receives RESPONSE(SYSTEM\_ERROR) REASON(CICS\_SVC\_CALL\_FAILURE) in its return area. The subreason1 field of the return area contains the R15 return code from the CICS SVC indicating why it failed. An application using the EXCI EXEC API receives RESP(LINKERR) RESP2(607).

#### **User Response**

Use the MVS R15 return code obtained from the application or from the dump to determine why the CICS SVC call failed.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter does not produce any formatted output for the job because the error occurred too early in EXCI initialization for there to be any control blocks.

#### Module

DFHXCPRH

0407

## Explanation

The external CICS interface module DFHXCPRH issued a call to the CICS SVC to check whether the SVC in use is at the correct level to be used with the external CICS interface. The check failed indicating that the CICS SVC is not at the correct level.

#### System Action

Message DFHEX0100 is output, and module DFHXCPRH issues an MVS abend with abend code 0407 which invokes its ESTAE routine to clear up its environment. A SYSMDUMP is taken before returning control to the application. An application using the EXCI CALL API receives RESPONSE(SYSTEM\_ERROR) REASON(INCORRECT\_SVC\_LEVEL) in its return area. An application using the EXCI EXEC API receives RESP(LINKERR) RESP2(627).

#### **User Response**

See the explanation of message DFHEX0100 for guidance.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter does not produce any formatted output for the job because the error occurred too early in EXCI initialization for there to be any control blocks.

#### Module

DFHXCPRH

0408

## Explanation

The external CICS interface module DFHXCPRH issued an MVS GETMAIN request for its working storage but a nonzero return code was returned from MVS.

## **System Action**

Module DFHXCPRH issues an MVS abend with abend code 0408 which invokes its ESTAE routine to clear up its environment. A SYSMDUMP is taken before returning control to the application. An application using the EXCI CALL API receives RESPONSE(SYSTEM\_ERROR) REASON(WS\_GETMAIN\_ERROR) in its return area. The subreason1 field of the return area contains the R15 return code from MVS indicating why the GETMAIN failed. An application using the EXCI EXEC API receives RESP(LINKERR) RESP2(601).

## **User Response**

Use the MVS R15 return code obtained from the application or from the dump to determine why the MVS GETMAIN request failed. If the reason is insufficient storage, increase the region size of the batch application.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter does not produce any formatted output for the job because the error occurred too early in EXCI initialization for there to be any control blocks.

## Module

DFHXCPRH

0409

## Explanation

The external CICS interface module DFHXCPRH issued an MVS GETMAIN request for storage required for its SSI VERIFY request, but a nonzero return code was returned from MVS.

## **System Action**

Module DFHXCPRH issues an MVS abend with abend code 0409 which invokes its ESTAE routine to clear up its environment. A SYSMDUMP is taken before returning control to the application. An application using the EXCI CALL API receives RESPONSE(SYSTEM\_ERROR) REASON(VERIFY\_BLOCK\_GM\_ERROR) in its return area. The subreason1 field of the return area contains the R15 return code from MVS indicating why the GETMAIN failed. An application using the EXCI EXEC API receives RESP(LINKERR) RESP2(605).

## **User Response**

Use the MVS R15 return code obtained from the application or from the dump to determine why the MVS GETMAIN request failed. If the reason is insufficient storage, increase the region size of the batch application.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter does not produce any formatted output for the job because the error occurred too early in EXCI initialization for there to be any control blocks.

## Module

DFHXCPRH

0410

## Explanation

The external CICS interface module DFHXCPRH issued an MVS GETMAIN request for an XCUSER block but a nonzero return code was returned from MVS.

## **System Action**

Module DFHXCPRH issues an MVS abend with abend code 0410 which invokes its ESTAE routine to clear up its environment. A SYSMDUMP is taken before returning control to the application. An application using the EXCI CALL API receives RESPONSE(SYSTEM\_ERROR) REASON(XCUSER\_GETMAIN\_ERROR) in its return area. The subreason1 field of the return area contains the R15 return code from MVS indicating why the GETMAIN failed. An application using the EXCI EXEC API receives RESP(LINKERR) RESP2(603).

## **User Response**

Use the MVS R15 return code obtained from the application or from the dump to determine why the MVS GETMAIN request failed. If the reason is insufficient

storage, increase the region size of the batch application.

#### Module

DFHXCPRH

## 0411

## Explanation

The external CICS interface dump module DFHXCDMP was attempting to call the CICS SVC in order for an MVS SDUMP to be taken to capture an earlier problem. DFHXCDMP was unable to call the SVC as no SVC number was available. DFHXCDMP issued an 0411 abend in order that the callers ESTAE routine is invoked which takes a SYSMDUMP instead.

#### System Action

A SYSMDUMP is taken instead of an SDUMP for an earlier reported problem.

#### **User Response**

Use the SYSMDUMP produced to diagnose the earlier reported problem.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter does not produce any formatted output for the job because the error occurred too early in EXCI initialization for there to be any control blocks.

#### Module

DFHXCDMP

## 0412

#### Explanation

The external CICS interface dump module DFHXCEIP was processing an EXCI EXEC API request and detected that the EXEC parameter list passed to it contained a function that is not supported by the external CICS interface.

#### System Action

The application is abnormally terminated with a dump.

#### **User Response**

This error indicates that the parameter list being passed to the EXCI has not been generated by the CICS translator. The translator should always be used. Correct the application to specify the correct EXCI EXEC API command.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter may not produce any formatted output for the job if this was the first EXCI request for this TCB.

#### Module

DFHXCEIP

## 0413

## Explanation

The external CICS interface dump module DFHXCEIP was processing an EXCI EXEC API request and detected that the EXEC parameter list passed to it did not require the mandatory RETCODE parameter in which return codes are returned to the application.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter may not produce any formatted output for the job if this was the first EXCI request for this TCB.

## **System Action**

The application is abnormally terminated with a dump.

#### **User Response**

This error indicates that the parameter list being passed to the EXCI has not been generated by the CICS translator. The translator should always be used. Correct the application to specify RETCODE.

#### Module

DFHXCEIP

## 0414

## Explanation

The external CICS interface module DFHXCEIP issued an MVS ESTAE macro to establish a recovery environment but a nonzero return code was returned from MVS.

## System Action

The application terminates abnormally with a dump.

## **User Response**

Examine the dump and any associated MVS messages to determine why the MVS ESTAE request failed.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter may not produce any formatted output for the job if this was the first EXCI request for this TCB.

## Module

DFHXCEIP

0415

## Explanation

The external CICS interface module DFHXCEIP detected an error early in EXCI initialization before EXCI dump services were available. DFHXCEIP issues abend 0415 so that its ESTAE routine is invoked from where an SYSMDUMP is taken instead to capture the error.

## **System Action**

The application terminates abnormally with a dump.

#### **User Response**

Examine the SYSMDUMP to determine the cause of the earlier reported error.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter does not produce any formatted output for the job because the error occurred too early in EXCI initialization for there to be any control blocks.

#### Module

#### DFHXCEIP

## The EXCI service trap, DFHXCTRA

A user-replaceable program, DFHXCTRA, is available for use under the guidance of IBM service personnel. It is the equivalent of DFHTRAP used in CICS. It is invoked every time the external CICS interface writes a trace entry.

DFHXCTRA can perform one or all of the following actions:

- 1. Request the external CICS interface to write a trace entry on its behalf
- 2. Instruct the external CICS interface to take an SDUMP
- 3. Instruct the external CICS interface to skip writing the current trace entry to GTF
- 4. Instruct the external CICS interface to disable DFHXCTRA

The CICS-supplied sample version of DFHXCTRA performs all four of the above functions if it detects a trace entry that indicates that a FREEMAIN error occurred while trying to free an EXCI pipe control block.

The source for DFHXCTRA is supplied in CICSTS32.CICS.SDFHMAC. The parameter list passed to DFHXCTRA is defined in the copybook DFHXCTRD, which is supplied in CICSTS32.CICS.SDFHMAC.DFHXCTRD also defines all the external CICS interface trace points for use by DFHXCTRA.

## Problem determination with RRMS

When Recoverable Resource Management Services (RRMS) is used to coordinate DPL requests, you can obtain additional problem determination information from RRMS. To do this, you use ISPF dialogs provided by Resource Recovery Services (RRS). The dialogs enable you to:

- Browse the RRS log streams
- Display information about RRS resource managers

· Display information about RRS Units of Recovery

Please refer to *OS/390 MVS Programming: Resource Recovery* for information about how to install and use the dialogs.

# Chapter 17. Response and reason codes returned on EXCI calls

This chapter gives details of the reason codes for the responses returned on the EXCI call interface.

Note: All numeric response and reason code values shown are in decimal.

## Reason code for response: OK

#### 0: NORMAL

#### Explanation

Call completed normally.

## **Reason codes for response: WARNING**

## 1: PIPE\_ALREADY\_OPEN

#### Explanation

An Open\_Pipe request has been issued for a pipe that is already open.

#### **System Action**

None. The pipe remains open.

#### **User Response**

If this response is unexpected, investigate whether an incorrect pipe token has been used on the Open\_Pipe call.

## 2: PIPE\_ALREADY\_CLOSED Explanation

A Close\_Pipe request has been issued for a pipe that is already closed.

#### System Action

The external CICS interface ignores the request and the pipe remains closed.

#### **User Response**

If the response is unexpected, check that the Close\_Pipe call is specifying the correct pipe token.

## 3: VERIFY\_BLOCK\_FM\_ERROR Explanation

Initialize\_User processing requires storage below 16MB to build the parameter list for the SSI Verify call, and an error has occurred during the FREEMAIN for this area.

The return code from the FREEMAIN is returned in the EXCI subreason field-1. The Initialize\_User request continues unaffected.

#### **User Response**

If the problem persists, take a dump of the batch region and use the dump, together with the return code from the MVS FREEMAIN, to determine why the FREEMAIN is failing.

## 4: WS\_FREEMAIN\_ERROR Explanation

An attempt to FREEMAIN working storage has resulted in an MVS FREEMAIN error.

#### System Action

The return code from the FREEMAIN is returned in the EXCI subreason field-1. The Initialize\_User request continues unaffected.

#### **User Response**

If the problem persists, take a dump of the batch region and use the dump, together with the return code from the MVS FREEMAIN to determine why the FREEMAIN is failing.

## 5: XCPIPE\_FREEMAIN\_ERROR

Explanation

An attempt to FREEMAIN pipe storage has resulted in an MVS FREEMAIN error.

#### **System Action**

The return code from the FREEMAIN is returned in the EXCI subreason field-1. However, the external CICS interface continues processing the Deallocate\_Pipe request. If the request fails with another error, this reason code is overwritten.

#### **User Response**

If the problem persists, take a dump of the client application program address space, and use the dump, with the return code from the MVS FREEMAIN to determine why the FREEMAIN is failing.

## 6: IRP\_IOAREA\_FM\_FAILURE Explanation

An attempt to FREEMAIN an MRO I/O area has resulted in an MVS FREEMAIN error.

The return code from the FREEMAIN is returned in the EXCI subreason field-1, but the DPL request continued to completion. Reason IRP\_IOAREA\_FM\_FAILURE is returned to your application only if the DPL request completes, otherwise it is overwritten by subsequent response and reason codes.

#### **User Response**

If the problem persists, take a dump of the batch region and use it with the return code from the MVS FREEMAIN to determine why the FREEMAIN is failing.

## 7: SERVER\_TERMINATED Explanation

The CICS session, on which the server program has been executing, has been freed by CICS.

#### System Action

The CICS application server program has been detached at some point in its processing, and control is returned to the external CICS interface, which writes a trace entry for this error.

#### **User Response**

The most likely reason for this error is that the server program has caused CICS to terminate, perhaps by an EXEC CICS PERFORM SHUTDOWN command. During shutdown, CICS frees EXCI sessions so that shutdown can complete.

## 8: XFRASTG1\_FM\_FAILURE Explanation

An attempt to FREEMAIN the transmission area has resulted in an MVS FREEMAIN error.

#### **System Action**

The return code from the FREEMAIN is returned in the EXCI subreason field-1 but the DPL request continued to completion. Reason XFRASTG1\_FM\_FAILURE is returned to your application only if the DPL request completes, otherwise it is overwritten by subsequent response and reason codes.

#### User Response

If the problem persists, take a dump of the batch region and use it with the return code from the MVS FREEMAIN to determine why the FREEMAIN is failing.

## **Reason codes for response: RETRYABLE**

## 201: NO\_CICS\_IRC\_STARTED Explanation

An Initialize\_User command has been issued on an MVS image that has had no IRC activity since the previous IPL, and the external CICS interface cannot determine the CICS SVC number.

#### **System Action**

The Initialize\_User call fails, and the external CICS interface invokes the user-replaceable module, DFHXCURM.

#### **User Response**

Ensure that a CICS region in the MVS image has logged on to IRC (that is, has started up with the system initialization parameter IRCSTRT=YES or has started IRC dynamically with an OPEN IRC command). Alternatively, if there is no local CICS region in the MVS image, you must specify the SVC parameter that the external CICS interface is to use, by coding a CICSSVC parameter in the DFHXCOPT table. This situation can occur if you are using XCF to communicate to a CICS region in another MVS image. Once the problem has been resolved, re-issue the Initialize\_User request.

## 202: NO\_PIPE

#### Explanation

An attempt has been made to open a pipe, but the target CICS system associated with the pipe has no free receive sessions.

#### **System Action**

The Open\_pipe call fails, and the external CICS interface invokes the user-replaceable module, DFHXCURM.

#### **User Response**

This situation can occur even if the client application program has allocated (using Allocate\_Pipe calls) no more pipes than the number of receive sessions defined on the target connection. This is because CICS can be in the process of cleaning up a pipe from a Close\_Pipe request. For this reason, you are recommended to specify a larger RECEIVECOUNT value than is theoretically necessary when defining the SESSIONS resource definition to CICS. The application program can reissue the Open\_Pipe request.

## 203 (on Open\_Pipe call): NO\_CICS Explanation

An attempt has been made to open a pipe but the target CICS system is not available, or hasn't yet opened IRC, or the target connection is out of service, or the relevant EXCI connection definition is not installed in the target CICS.

The open pipe request fails, and the external CICS interface invokes the user-replaceable module, DFHXCURM.

#### **User Response**

If subreason field-1 is non-zero (the IRP response code (R15)), subreason field-2 contains the IRP reason code. For an explanation of the IRP return codes, see the interregion control blocks in the *CICS Data Areas* manual. The IRP return codes are in the DFHIRSPS copybook, listed under the heading IRC.

When you have corrected the problem, your client application program can reissue the Open\_Pipe call.

## 204: WRONG\_MVS\_FOR\_RRMS Explanation

A DPL request omitting the SYNCONRETURN option has been made specifying a CICS region that is on a different MVS system from the batch program. Because the Recoverable Resource Management Services (RRMS) context is not recognised in the target system, the request is rejected.

#### **System Action**

The DPL request fails, and the external CICS interface invokes the user-replacable module, DFHXCURM.

#### **User Response**

Ensure that the batch program that issued the DPL request and the CICS region it was sent to are on the same MVS system.

## 205: RRMS\_NOT\_AVAILABLE Explanation

A DPL request omitting the SYNCONRETURN option has been made when the Resource Recovery Services (RRS) is not available. There are two cases:

- When Resource Recovery Services (RRS) is not available.
- When Resource Recovery Services has restarted since the last DPL request omitting the SYNCONRETURN option, and there has been no intervening syncpoint.

- -

Note: RRS is a part of Recoverable Resource Management Services (RRMS).

#### **System Action**

The DPL request fails, and the external CICS interface invokes the user-replacable module, DFHXCURM.

#### **User Response**

Retry the DPL request when Resource Recovery Services has restarted since the last DPL request omitting the SYNCONRETURN option, and there has been no intervening syncpoint.

## Reason codes for response: USER\_ERROR

## 401: INVALID\_CALL\_TYPE

#### Explanation

An invalid *call-type* parameter value is specified on this EXCI request.

#### **System Action**

The request is rejected.

#### **User Response**

Check your EXCI client program and ensure the *call\_type* parameter specifies the appropriate value for the EXCI call, as follows.

- 1 Initialize\_User
- 2 Allocate\_Pipe
- 3 Open\_Pipe
- 4 Close\_Pipe
- 5 Deallocate\_Pipe
- 6 DPL

## 402: INVALID\_VERSION\_NUMBER Explanation

The *version\_number* parameter does not specify a value of 1 or 2.

#### System Action

The request is rejected.

#### User Response

Check the client application program and ensure that all EXCI calls specify the value of 1 or 2 for the version number.

## 403: INVALID\_APPL\_NAME Explanation

The *user\_name* parameter consists of all blank characters (X'40').

#### System Action

The call is rejected.

#### **User Response**

Change the application program to specify a valid, non-blank user name.

## 404: INVALID\_USER\_TOKEN Explanation

The client application program has issued an EXCI request using a user token that is unknown to the external CICS interface.

#### **System Action**

The request is rejected.

#### **User Response**

The Initialize\_User call returns a 4-byte token that must be used on *all* further requests for the that user. Check the client application program and correct the error to ensure that the correct token is passed.

## 405: PIPE\_NOT\_CLOSED

#### Explanation

A Deallocate\_Pipe request has been issued against a pipe that has not yet been closed.

#### System Action

The external CICS interface ignores the request and the pipe remains open.

#### **User Response**

Check the client application program, and ensure that the Deallocate\_Pipe request is intended. If so, issue a Close\_Pipe request for the pipe before issuing the Deallocate\_Pipe request.

## 406: PIPE\_NOT\_OPEN Explanation

A DPL call has been issued on a pipe that is not open.

#### **System Action**

The external CICS interface rejects the DPL request.

#### **User Response**

Check the client application program, and ensure that an Open\_Pipe request is issued before using the pipe on a DPL request. If an Open\_Pipe has been issued by the application program, check that it has not been closed inadvertently before all the DPL requests have been made.

## 407: INVALID\_USERID Explanation

A DPL request has been issued with a USERID parameter that consists of all blanks.

#### **System Action**

The DPL request is rejected.

#### **User Response**

Check the EXCI client program and ensure that the DPL request passes a valid USERID parameter. If you don't want to specify a userid, code the call parameter list with a null address for *userid*. If you pass a null address, the external CICS interface passes the userid under which the client application program is running (the batch region's userid).

## 408: INVALID\_UOWID

#### Explanation

A DPL request has been issued with a *uowid* parameter that has invalid length fields.

#### System Action

The DPL request is rejected.

#### **User Response**

Check the client application program and ensure that the DPL request passes a valid *uowid* parameter. If you don't want to specify a unit of work id, code the call parameter list with a null address for *uowid*, in which case the external CICS interface generates a unit of work id for you.

## 409: INVALID\_TRANSID Explanation

A DPL request has been issued with a transid parameter that consists of all blanks.

#### **System Action**

The DPL request is rejected.

#### **User Response**

Check the client application program and ensure that the *transid* parameter is specified correctly or has not been overwritten in some way. If you don't want to specify your own transid, code the call parameter list with a null address for *transid*, in which case the external CICS interface uses the default CICS mirror transaction, CSMI.

## 410: DFHMEBM\_LOAD\_FAILED Explanation

During Initialize\_User processing, the external CICS interface attempted to load the main message module in preparation for issuing external CICS interface messages, and the load of this module failed.

#### **System Action**

The Initialize\_User call is rejected. The return code from the MVS load macro (R15) is returned in the subreason field-1. The external CICS interface handles the error, and returns the abend (R0) that would have occurred in the subreason field-2.

#### **User Response**

Using the MVS return code, determine why the load failed. The most likely reason is that the message module, DFHMEBMX, is not in any library included in the STEPLIB of the batch job. Ensure the CICSTS32.CICS.SDFHEXCI library is included in the STEPLIB concatenation, and restart the client application program.

## 411: DFHMET4E\_LOAD\_FAILED Explanation

The load of message module, DFHMET4E, has failed. During Initialize\_User processing, the external CICS interface attempted to load its message table in preparation for issuing messages. The load of this module failed.

#### **System Action**

The Initialize\_User call is rejected. The return code from the MVS load macro (R15) is returned in the subreason field-1. The external CICS interface handles the error, and returns the abend (R0) that would have occurred in the subreason field-2.

#### **User Response**

Using the MVS reason code, determine why the load failed. The most likely reason is that the message table, DFHMET4E, is not in any library included in the STEPLIB of the batch job. Ensure the CICSTS32.CICS.SDFHEXCI library is included in the STEPLIB concatenation, and restart the client application program.

## 412: DFHXCURM\_LOAD\_FAILED Explanation

During Initialize\_User processing, the external CICS interface attempted to load the user-replaceable module, DFHXCURM. The load of this module failed.

#### **System Action**

The Initialize\_User call is rejected. The return code from the MVS load macro (R15) is returned in the subreason field-1. The external CICS interface handles the error, and returns the abend (R0) that would have occurred in the subreason field-2.

#### **User Response**

Using the MVS reason code, determine why the load failed. The most likely reason is that module DFHXCURM is not in any library included in the STEPLIB of the batch job. Ensure the library containing the module is included in the STEPLIB concatenation, and restart the client application program.

## 413: DFHXCTRA\_LOAD\_FAILED Explanation

During Initialize\_User processing, the external CICS interface attempted to load the trap module (DFHXCTRA). The load of this module has failed.

#### System Action

The Initialize\_User call is rejected. The return code from the MVS load macro (R15) is returned in the subreason field-1. The external CICS interface handles the error, and returns the abend (R0) that would have occurred in the subreason field-2.

#### **User Response**

Using the MVS reason code, determine why the load failed. The most likely reason is that DFHXCTRA is not in any library included in the STEPLIB of the batch job. Ensure the library containing the module is included in the STEPLIB concatenation, and restart the client application program.

## 414: IRP\_ABORT\_RECEIVED Explanation

Whilst processing a DPL request, an error occurred in the CICS server region, resulting in an abort FMH7 flow being returned to the external CICS interface.

#### **System Action**

A message is returned to the client application program. This is the message that would have been issued to the terminal if the server program had been initiated from a terminal. A pointer to the message is returned to the client application program in the message pointer field of the EXCI return area. See the description of the EXCI return areas for the exact definition of the message format. The pipe is put into a "must close" state.

#### **User Response**

Use the message to determine the cause of the error. A typical example is where the server transaction cannot be attached, either because is disabled, or it has not been defined, or because of a security failure. Correct the problem, close and reopen the pipe, and reissue the DPL request.

## 415: INVALID\_CONNECTION\_DEFN Explanation

A DPL request has been rejected by CICS because the target connection is not defined for use by an external CICS client application program.

The DPL request is rejected and the pipe is put into a "must close" state.

#### **User Response**

The most likely reason for this is that the connection definition in the CICS server region has been defined incorrectly as a CICS-to-CICS MRO connection, instead of an EXCI connection. Ensure that PROTOCOL(EXCI) is specified on the appropriate CONNECTION and SESSIONS resource definitions. You must close and reopen the pipe before reissuing the DPL request.

## 416: INVALID\_CICS\_RELEASE Explanation

A DPL request has been rejected by the target CICS server region because it doesn't recognize the request.

#### **System Action**

The DPL call is rejected and the pipe is put into a "must close" state.

#### **User Response**

The most likely reason for this is that the client application program has specified a target CICS server region that does not support the external CICS interface. CICS regions earlier than CICS for MVS/ESA 4.1 do not recognize EXCI call requests. Correct the problem, close and reopen the pipe and then reissue the DPL request.

## 417: PIPE\_MUST\_CLOSE Explanation

A DPL request has been issued on a pipe that is in a "must close" state.

#### **System Action**

The DPL request is rejected.

#### **User Response**

Some EXCI errors are serious enough to require that the pipe be closed and reopened in order to restore the pipe to a point where it can be used for further DPL requests. Others, more minor errors, allow further calls without closing and reopening the pipe. A previous error on this pipe has been of the more serious variety and the pipe is now in a "must close" state. Close and reopen the pipe and reissue the DPL request.

## 418: INVALID\_PIPE\_TOKEN Explanation

An Open\_Pipe, Close\_Pipe, Deallocate\_Pipe, or DPL request has been issued, but the pipe token passed on the call is either not a valid pipe, or is not a valid pipe allocated for this user (that is, there is mismatch between the user token and the pipe token).

The call is rejected.

#### **User Response**

Ensure that the pipe token has not been overwritten and is being passed correctly on the call. Also ensure there is no mismatch between the user token and the pipe token.

## 419: CICS\_AFCB\_PRESENT Explanation

An Initialize\_User request has been issued on a TCB that has already been used by CICS or by CICS batch shared database. The external CICS interface cannot share a TCB with CICS, ensuring that a CICS application program cannot issue EXCI requests.

#### **System Action**

The Initialize\_User request is rejected.

#### **User Response**

To use the external CICS interface, you must create a new TCB (or daughter TCB), and issue the EXCI calls under that unique TCB.

## 420: DFHXCOPT\_LOAD\_FAILED Explanation

During Initialize\_User processing, the external CICS interface attempted to load its options module, DFHXCOPT. The load of this module failed.

#### System Action

The Initialize\_User call is rejected. The return code from the MVS load macro (R15) is returned in the subreason field-1. The external CICS interface handles the error, and returns the abend (R0) that would have occurred in the subreason field-2.

#### **User Response**

Using the MVS reason code, determine why the load failed. The most likely reason is that DFHXCOPT is not in any library included in the STEPLIB of the batch job. Correct the problem and restart the client application program.

## 421: RUNNING\_UNDER\_AN\_IRB Explanation

The EXCI call is issued under an MVS IRB, which is not permitted.

#### System Action

The call is rejected.

#### **User Response**

Determine why the call was issued under an IRB and change the client application program.

## 422: SERVER\_ABENDED Explanation

Whilst processing a DPL request, the CICS server application program abended without handling the error.

#### **System Action**

The server application program is abended and backout out. The abend code is returned in the abend code field of the EXCI return area.

#### **User Response**

Determine why the server program abended and fix the problem.

## 423: SURROGATE\_CHECK\_FAILED

#### Explanation

A DPL request has been issued specifying a USERID parameter. The userid specified was subject to a surrogate user security because SURROGCHK=YES is specified in the EXCI options table, DFHXCOPT. The surrogate user check failed. The surrogate security check verifies whether the EXCI batch region's userid is authorized as a surrogate of the userid specified on the DPL call.

#### **System Action**

The DPL call is rejected. The MVS external security manager's return code and reason code are returned in subreason field-1 and field-2. For RACF, these documented in the *External Security Interface (RACROUTE) Macro Reference for MVS, GC23-3733.* 

#### **User Response**

If you want surrogate user checking, ensure that the EXCI batch region's userid has READ access to the profile *userid*.DFHEXCI in the SURROGAT general resource class, where *userid* is the userid specified on the DPL call.

If you don't want surrogate user security checking, specify SURROGCHK=NO in the DFHXCOPT options table.

See "Surrogate user checking" on page 179 for more information.

## 424: RRMS\_NOT\_SUPPORTED Explanation

A DPL request omitting the SYNCONRETURN option has been made on a system that is not running OS/390 Release 5 (or a later, upward-compatible, release).

The call is rejected.

#### **User Response**

Ensure that the batch program is run on a system that is running the correct level of OS/390.

## 425: UOWID\_NOT\_ALLOWED

#### Explanation

A DPL request omitted the SYNCONRETURN option, but specified a value of UOWID. This combination of parameters is not permitted on a DPL request.

#### **System Action**

The DPL\_Request is rejected.

#### **User Response**

Check the client application program and ensure that the correct combination of parameters is used on the DPL call.

## 426: INVALID\_TRANSID2

#### Explanation

A DPL request has been issued with a *transid2* parameter that consists of all blanks.

#### System Action

The DPL request is rejected.

#### **User Response**

Check the client application program and ensure that the *transid2* parameter is specified correctly or has not been overwritten in some way.

## 427: INVALID\_CCSID

#### Explanation

A DPL request has been issued with a *ccsid* parameter that specifies an invalid value.

#### System Action

The DPL request is rejected.

#### **User Response**

Check the client application program and ensure that the *ccsid* parameter is specified correctly or has not been overwritten in some way.

## 428: INVALID\_ENDIAN Explanation

A DPL request has been issued with a *endian* parameter that specifies an invalid value.

## **System Action**

The DPL request is rejected.

#### **User Response**

Check the client application program and ensure that the *endian* parameter is specified correctly or has not been overwritten in some way.

## 429: DFHXCEIX\_LOAD\_FAILED

|

I

I

L

L

L

I

I

L

L

I

L

I

I

|

I

1

L

Т

During Initialize\_User processing, the external CICS interface attempted to load the module (DFHXCEIX). The load of this module has failed.

Explanation

#### System Action

The Initialize\_User call is rejected. The return code from the MVS load macro (R15) is returned in the subreason field-1. The external CICS interface handles the error, and returns the abend (R0) that would have occurred in the subreason field-2.

#### User Response

Using the MVS reason code, determine why the load failed. The most likely reason is that DFHXCEIX is not in any library included in the STEPLIB of the batch job. Ensure the library containing the module is included in the STEPLIB concatenation, and restart the client application program.

430: DFHXCPRX\_LOAD\_FAILED

During Initialize\_User processing, the external CICS interface attempted to load the module (DFHXCPRX). The load of this module has failed.

#### Explanation

#### System Action

The Initialize\_User call is rejected. The return code from the MVS load macro (R15) is returned in the subreason field-1. The external CICS interface handles the error, and returns the abend (R1) that would have occurred in the subreason field-2.

#### User Response

Using the MVS reason code, determine why the load failed. The most likely reason is that DFHXCPRX is not in any library included in the STEPLIB of the batch job. Ensure the library containing the module is included in the STEPLIB concatenation, and restart the client application program.

## Reason codes for response: SYSTEM\_ERROR

## 601: WS\_GETMAIN\_ERROR Explanation

During Initialize\_User processing, a GETMAIN for working storage failed.

#### **System Action**

Processing cannot continue without working storage, so the request is terminated. At this point the external CICS interface trace and dump services are not available to provide diagnostic information, therefore EXCI issues an MVS abend (U0408) to force a SYSMDUMP. The return code from the MVS GETMAIN request is returned in the return area.

#### **User Response**

Locate the GETMAIN return code in the dump, and use this and the rest of the dump to determine why the GETMAIN failed. A possible reason for this is that the region size specified for the job is too small. If this is the case, increase the region size and restart the client application program.

## 602: XCGLOBAL\_GETMAIN\_ERROR Explanation

During Initialize\_User processing, a GETMAIN failed for a critical control block (XCGLOBAL).

#### **System Action**

Processing cannot continue without this control block, and the request is terminated. At this point the external CICS interface trace and dump services are not available to provide diagnostic information, therefore EXCI issues an MVS abend (U0403) to force a SYSMDUMP. The return code from the MVS GETMAIN request is returned in the return area.

#### **User Response**

Locate the GETMAIN return code in the dump, and use this and the rest of the dump to determine why the GETMAIN failed. A possible reason for this is that the region size specified for the job is too small. If this is the case, increase the region size and restart the client application program.

## 603: XCUSER\_GETMAIN\_ERROR Explanation

During Initialize\_User processing, a GETMAIN request failed for the user control block (XCUSER).

#### System Action

Initialize\_User processing is terminated. The return code from the GETMAIN is returned in subreason field-1 of the return area. The external CICS interface issues

message DFHEX0003 and issues an MVS user abend (0410) to force a SYSMDUMP.

#### **User Response**

Use the return code from the GETMAIN, with the dump, to determine why the GETMAIN failed. A possible reason for this is that the region size of the job is too small. If this is the case, increase the region size and restart the client application program.

## 604: XCPIPE\_GETMAIN\_ERROR Explanation

During Allocate\_Pipe processing, a GETMAIN request for the pipe control block (XCPIPE) failed.

#### System Action

Allocate\_Pipe processing is terminated. The return code from the GETMAIN is returned in subreason field-1 of the EXCI return area. The external CICS interface issues message DFHEX0003, and takes a system dump.

#### **User Response**

Use the return code from the GETMAIN, and the dump, to determine why the GETMAIN failed. A possible reason for this is that the region size for the job is too small. If this is the case, increase the region size and restart the client application program.

## 605: VERIFY\_BLOCK\_GM\_ERROR Explanation

During Initialize\_User processing, a GETMAIN failed for an EXCI internal control block.

#### **System Action**

Initialize\_User processing is terminated. The return code from the GETMAIN is returned in the subreason field-1 of the EXCI return area. This error occurs before EXCI dumping services are initialized, Therefore EXCI issues an MVS abend (U0409) to force a SYSMDUMP The return code from the MVS GETMAIN request is returned in the return area.

#### User Response

Locate the GETMAIN return code in the dump, and use this and the rest of the dump to determine why the GETMAIN failed. A possible reason for this is that the region size specified for the job is too small. If this is the case, increase the region size and restart the client application program.

## 606: SSI\_VERIFY\_FAILED Explanation

A VERIFY call to the MVS subsystem interface (SSI) to obtain the current CICS SVC number failed.

#### **System Action**

The Initialize\_User request is terminated. The return code from the SSI call is returned in subreason field-1 of the return area. This error occurs before the external CICS interface dump services are initialized, therefore EXCI issues an MVS user abend (0405) to force a SYSMDUMP.

#### **User Response**

Locate the return code in the dump, and use this with the rest of the dump and SSI documentation to determine why the VERIFY request failed. When the problem is resolved, restart the client application program.

## 607: CICS\_SVC\_CALL\_FAILURE Explanation

During Initialize\_User processing, a call to the currently installed CICS SVC failed.

#### System Action

The return code from the CICS SVC is returned in the subreason field-1 of the EXCI return area. This error occurs before the external CICS interface dump services are initialized, therefore EXCI issues an MVS user abend (0406) to force a SYSMDUMP.

#### **User Response**

Contact your IBM support center for assistance, with the return code and the dump available.

## 608: IRC\_LOGON\_FAILURE Explanation

During Allocate\_Pipe processing, an attempt by the external CICS interface to LOGON to DFHIRP failed.

#### **System Action**

The Allocate\_Pipe request fails. DFHIRP returns a R15 value to subreason field-1 and a R0 value (the reason code) to subreason field-2. The first two bytes of subreason field-1 are the return code qualifier and the last two bytes are the return code itself.

#### User Response

For an explanation of the IRP return codes, see the interregion control blocks in the *CICS Data Areas* manual. The IRP return codes are in the DFHIRSPS copybook, listed under the heading IRC. Use the return codes to determine why the logon

failed, or contact your IBM support personal with details of the failure.

## 609: IRC\_CONNECT\_FAILURE Explanation

During Open\_Pipe processing, an attempt to connect to the target CICS system failed.

#### System Action

The Open\_Pipe request fails. DFHIRP returns a R15 value to subreason field-1 and a R0 value (the reason code) to subreason field-2. The first two bytes of subreason field-1 are the return code qualifier and the last two bytes are the return code itself.

#### User Response

For an explanation of the IRP return codes, see the interregion control blocks in the *CICS Data Areas* manual. The IRP return codes are in the DFHIRSPS copybook, listed under the heading IRC.

Use the return code to determine why the logon failed, and reissue the open pipe request.

**Note:** This error is not caused by the target CICS being unavailable, which is returned as a RETRYABLE condition (NO\_CICS).

## 610: IRC\_DISCONNECT\_FAILURE Explanation

During Close\_Pipe processing, CICS issued a DFHIRP disconnect call to terminate the connection to CICS. This request has failed.

#### System Action

The call fails and the pipe is left open. DFHIRP returns a R15 value to subreason field-1 and a R0 value (the reason code) to subreason field-2. The first two bytes of subreason field-1 are the return code qualifier and the last two bytes are the return code itself.. The external CICS interface takes a system dump.

Although the disconnect failed, it is possible that the pipe is still connected to CICS. However, all connections are automatically disconnected at the end of the batch program.

#### User Response

For an explanation of the IRP return codes, see the interregion control blocks in the *CICS Data Areas* manual. The IRP return codes are in the DFHIRSPS copybook, listed under the heading IRC. Use the return code and the dump to determine the cause of the error.

## 611: IRC\_LOGOFF\_FAILURE Explanation

During Deallocate\_Pipe processing, CICS issued a DFHIRP logoff call. This request failed.

#### System Action

The Deallocate\_Pipe call fails and the pipe remains allocated. DFHIRP returns a R15 value to subreason field-1 and a R0 value (the reason code) to subreason field-2. The first two bytes of subreason field-1 are the return code qualifier and the last two bytes are the return code itself. The external CICS interface takes a system dump.

**Note:** Because it remains allocated, the pipe is available for further calls. Any storage associated with the pipe is not freed. However, this storage is freed at the end of the client application program.

#### **User Response**

For an explanation of the IRP return codes, see the interregion control blocks in the *CICS Data Areas* manual. The IRP return codes are in the DFHIRSPS copybook, listed under the heading IRC. Use the return code and the dump to determine the cause of the error.

## 612: TRANSFORM\_1\_ERROR Explanation

During DPL processing, whilst processing the data in preparation for sending to CICS, an internal call to program DFHXFQ resulted in an error.

#### System Action

The DPL request is terminated.

#### **User Response**

The return code from the call is returned in the EXCI subreason field-1, and the external CICS interface takes a system dump.

This is an external CICS interface error. Contact your IBM support center with details of the return code and the dump.

## 613: TRANSFORM\_4\_ERROR Explanation

During DPL processing, whilst processing the data returned by the CICS server region, an internal call to module DFHXFQ resulted in an error.

#### **System Action**

The DPL request is terminated. Note that the server application program has executed. The return code from the call to DFHXFQ is returned in the EXCI subreason field-1. This return code corresponds to any EIBRCODE information that

was available. The external CICS interface takes a system dump.

#### **User Response**

This is an external CICS interface error. Contact your IBM support center with details of the return code and the dump.

## 614: IRP\_NULL\_DATA\_RECEIVED Explanation

During DPL processing, a request has been sent to the target CICS and this target CICS has replied without returning any data.

#### System Action

The DPL processing is terminated and the external CICS interface takes a system dump.

#### User Response

This is an internal protocol error. Contact your IBM support center with details of the dump.

## 615: IRP\_NEGATIVE\_RESPONSE Explanation

An internal protocol error has occurred whilst trying to communicate with the target CICS region.

#### System Action

The DPL request fails, the pipe is put into a "must close" state, and the external CICS interface takes a system dump.

#### User Response

This is an external CICS interface error. Keep the dump and contact your IBM support center.

**Note:** The pipe is in a "must close" state. Before attempting further calls, the pipe must first be closed and reopened.

## 616: IRP\_SWITCH\_PULL\_FAILURE Explanation

An internal protocol error has occurred whilst trying to communicate with the target CICS region.

#### System Action

The DPL request fails, the pipe is put into a "must close" state, and the external CICS interface takes a system dump. The IRP return code (R15) and reason code if any (R0) are returned in the EXCI subreason field-1 and subreason field-2.

#### **User Response**

This is an external CICS interface error. Keep the dump and contact your IBM support center.

**Note:** The pipe is in a "must close" state, and before attempting further DPL calls, the pipe must first be closed and reopened.

## 617: IRP\_IOAREA\_GM\_FAILURE Explanation

During DPL processing, an MVS GETMAIN request for an internal control block failed.

#### System Action

The DPL request is terminated. The return code from the GETMAIN is returned in the EXCI subreason field-1.

**Note:** This error occurs whilst processing the data returned by CICS, after the server application program has completed execution. This error results in the pipe being put into a "must close" state.

#### **User Response**

Use the return code to determine why the GETMAIN failed. A possible reason for this is that the region size of the job is too small. If this is the case, increase the region size and restart the batch job.

## 619: IRP\_BAD\_IOAREA

#### Explanation

During a DPL request, an I/O area has been supplied to DFHIRP that could not be used.

#### System Action

The DPL request is terminated, the pipe is forced into a "must close" state, and the external CICS interface takes a system dump.

#### **User Response**

This is an external CICS interface error. Contact the IBM support center with details of the return code and the dump.

**Note:** The pipe is in a "must close" state after this error, and before attempting further calls must first be closed and reopened.

## 620: IRP\_PROTOCOL\_ERROR Explanation

An internal protocol error has occurred whilst trying to communicate with the target CICS system.

The DPL request is terminated, the pipe is forced into a "must close" state, and the external CICS interface takes a system dump.

#### **User Response**

This is an external CICS interface error. Keep the dump and contact your IBM support center.

**Note:** The pipe is in a "must close" state after this error, and before attempting further calls must first be closed and reopened.

## 621: PIPE\_RECOVERY\_FAILURE Explanation

An error has occurred during an open pipe request. The external CICS interface attempts to recover by disconnecting the pipe again. During this disconnection, further errors have occurred.

#### **System Action**

The Open\_Pipe call is terminated and the pipe is placed in a "must close" state. The return code from DFHIRP is returned in the EXCI subreason field-1, and a system dump is taken.

#### **User Response**

For an explanation of the IRP return codes, see the interregion control blocks in the *CICS Data Areas* manual. The IRP return codes are in the DFHIRSPS copybook, listed under the heading IRC. Use the dump and IRP return codes to determine why the disconnect failed. You may also want to use the EXCI trace to determine the earlier error that caused the open pipe recovery routine to be invoked.

**Note:** The pipe is now in a "must close" state and if further calls are to be issued, the pipe must be closed and reopened again first.

## 622: ESTAE\_SETUP\_FAILURE Explanation

In order to protect itself from possible program checks the external CICS interface establishes an MVS ESTAE. In this case, the MVS ESTAE macro has failed.

#### System Action

The call terminated, and the return code from the MVS ESTAE command is returned in the EXCI subreason field-1. This error may occur before EXCI dump services are initialized, therefore an EXCI issues an MVS abend (U0402) to force a SYSMDUMP.

#### **User Response**

Use the return code and the dump to determine why the ESTAE command failed. This may be an internal EXCI error and if the problem persists, contact your IBM support center.

## 623: ESTAE\_INVOKED Explanation

A program check is encountered during call processing, and the ESTAE is invoked.

#### **System Action**

The program check is handled by the EXCI ESTAE and an attempt is made to recover to a state that can support further EXCI calls. The MVS abend code is returned in the EXCI subreason field-1 of the return area. To aid further diagnosis, a SYSMDUMP is taken.

#### **User Response**

Use the return code and the dump to determine why a program check occurred in the external CICS interface. The most likely reason for this is that the EXCI code abended whilst trying to access the client program's parameters. Use the EXCI trace to determine if any of the parameters might have caused this error. If this is not the case, this may be an error in the external CICS interface. Keep the dump and contact your IBM support center.

## 624: SERVER\_TIMEDOUT Explanation

A DPL request has been issued and the target server program has executed in the CICS server region. However, the server program has been executing for longer than the time-out value specified in the DFHXCOPT table.

#### **System Action**

The external CICS interface stops waiting for the server program to complete. Because the server program might complete some time after the time-out, and try to respond to the DPL call, the pipe is forced into a "must close" state.

#### **User Response**

Determine why the server application program timed out. Either there is a problem with the server program itself (for example, it might be in a loop), or the timeout value is too low.

## 625: STIMER\_SETUP\_FAILURE Explanation

In order to provide a TIMEOUT mechanism, the external CICS interface issues an MVS STIMERM macro call. This call has failed.

#### **System Action**

The return code from the call is returned in the subreason field-1 of the EXCI return area. The DPL request is terminated and the external CICS interface takes a system dump. The pipe is placed in a "must close" state.

#### **User Response**

Use the MVS return code and the dump to determine why the call failed. This could be an external CICS interface error. Contact your IBM support center with details of the dump.

**Note:** The pipe is in a "must close" state after this error, and before attempting further calls must first be closed and reopened.

# 626: STIMER\_CANCEL\_FAILURE

# Explanation

On successful completion of a DPL request, the cancel of an STIMERM request issued to check the TIMEOUT value has failed with an error.

#### **System Action**

The return code from the STIMERM CANCEL is returned in the subreason field-1 of the EXCI return area. The pipe is placed in a "must close" state, and the external CICS interface takes a system dump.

#### **User Response**

Use the return code and the dump to determine why the MVS STIMERM CANCEL command failed. This could be an external CICS interface error. Contact your IBM support center with details of the dump.

**Note:** The pipe is in a "must close" state after this error, and before attempting further calls must first be closed and reopened.

# 627: INCORRECT\_SVC\_LEVEL Explanation

The release level of the CICS SVC (DFHCSVC) is not the same (or higher) than the release level of the external CICS interface.

#### System Action

The Initialize\_User request is terminated. This error occurs before the external CICS interface SDUMP facilities are initialized, therefore EXCI issues an MVS abend (U0407) to force a SYSMDUMP.

#### **User Response**

Determine the level of the CICS SVC being used and ensure it is the same release level as the external CICS interface, or higher. If the SVC number is allowed to default (CICSSVC=0 in DFHXCOPT), the SVC number being used is the SVC first used by a CICS region on the MVS image. That is, the SVC used by the first CICS region to open the CICS interregion communications (IRC). If the SVC number is specified on CICSSVC in DFHXCOPT, the SVC number specified is at an incorrect level. For more information, see the description of the CICSSVC parameter in Chapter 13, "Using the EXCI options table, DFHXCOPT," on page 159.

# 628: IRP\_LEVEL\_CHECK\_FAILURE Explanation

The release level of the module DFHIRP is not at the same, or higher, level than the release level of the external CICS interface.

#### **System Action**

The Allocate\_pipe request is terminated. The IRP return code (R15) is returned in the EXCI subreason field-1, and the function level of DFHIRP being used is returned in the EXCI subreason field-2. Subreason field-2 is only meaningful if subreason field-1 is zero. The external CICS interface takes a system dump.

#### **User Response**

Check the level of the DFHIRP module installed in the LPA. Ensure that it is at least the same as the external CICS interface. The installed level of DFHIRP must be the highest level of CICS or external CICS interface in use in the MVS image. For more details about installing DFHIRP, see the *CICS Installation Guide*.

# 629: SERVER\_PROTOCOL\_ERROR Explanation

A response to a DPL request has been returned by CICS but the external CICS interface does not understand the response.

#### System Action

The DPL request is terminated and the external CICS interface takes a system dump.

#### **User Response**

Use the dump to determine why the response was in error. The most likely reason for this is that the CICS application server program was not running under the control of a CICS mirror task. This can happen if the transaction definition named by the transid parameter on the DPL call does not specify DFHMIRS as the program name. This would cause unidentified responses being sent from the CICS server region.

## 630: RRMS\_ERROR

#### Explanation

An unexpected return code was received from Recoverable Resource Management Services (RRMS) while processing a DPL\_Request.

#### **System Action**

DPL\_Request processing is terminated.

The value in subreason field-1 of the return area indicates which RRMS interface returned the unexpected return code:

1 CTXRCC

- 2 ATRRURD
- 3 CTXSDTA

The return code from the RRMS request is returned in subreason field-2.

The external CICS interface issues message DFHEX0002, and takes a system dump.

#### **User Response**

Use the return code from the RRMS request and the dump, to determine why the request failed. This may be an internal EXCI error or a problem with RRMS and you may need the assistance of your IBM support center.

### 631: RRMS\_SEVERE\_ERROR Explanation

During the processing of a DPL\_Request, the EXCI code encountered an unexpected error while using its interface with Recoverable Resource Management Services (RRMS).

#### System Action

DPL\_Request processing is terminated.

The external CICS interface issues message DFHEX0002, and takes a system dump.

#### **User Response**

Use the dump, to determine why the request failed. This may be an internal EXCI error and you may need the assistance of your IBM support center.

# 632: XCGUR\_GETMAIN\_ERROR Explanation

During DPL\_Request processing, a GETMAIN request for working storage for module DFHXCGUR failed.

#### System Action

DPL\_Request processing is terminated.

The return code from the GETMAIN is returned in subreason field-1 of the return area. The external CICS interface issues message DFHEX0003, and takes a system dump.

#### **User Response**

Use the return code from the GETMAIN, and the dump, to determine why the GETMAIN failed. A possible reason is that the region size of the job is too small. If this is the case, increase the region size and restart the client application program.

# **Chapter 18. Messages and Codes**

This chapter lists messages and abend codes for the external CICS interface.

# DFHEX0001: An abend (code *aaa/bbbb*) has occurred in module modname.

#### **Explanation**

An unexpected program check or abend *aaa/bbbb* has occurred in module *modname*. This implies that there may be an error in external CICS interface code.

Alternatively, unexpected data has been passed on an external CICS interface call or storage has been overwritten.

The code *aaa/bbbb* is, if applicable, a 3-digit hexadecimal MVS system completion code *aaa* (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The 4-digit code *bbbb*, which follows *aaa* is, if applicable, a user abend code produced by the external CICS interface. If the user abend code is not applicable, this field is filled with four hyphens.

#### **System Action**

An exception entry is made in the external CICS interface internal trace table, and to the GTF trace dataset (if GTF is active), and a SYSMDUMP is taken.

The external CICS interface terminates the current request, and attempts to recover to a consistent state so that further EXCI requests can be serviced. For an application using the EXCI CALL API, a response of EXCI\_SYSTEM\_ERROR with a REASON of ESTAE\_INVOKED is returned to the application. For an application using the EXCI EXEC API, an EXEC\_RESP of LINKERR is returned to the application, together with an EXEC\_RESP2 of ESTAE\_INVOKED or EXEC\_ESTAE\_INVOKED, depending on whether the call level ESTAE routine, or the EXEC level ESTAE routine was invoked.

#### **User Response**

Look up the MVS code *aaa*, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

If applicable, see the description of abend code *bbbb* for further guidance.

You may need further assistance from IBM to resolve this problem. See the *CICS Problem Determination Guide* for guidance on how to proceed.

Console

#### Module

DFHXCPRH, DFHXCEIP

# **DFHEX0002:** A severe error (code X'code') has occurred in module *modname*.

#### Explanation

An error has been detected in module *modname*. The code *code* is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

#### **System Action**

An exception entry is made in the EXCI internal trace table and to GTF if it is active, (*X'code'* in the message). A system dump is taken.

This is a critical error and the EXCI request is terminated. The external CICS interface attempts to recover to a consistent state so that further EXCI requests can be issued. For applications using the EXCI CALL API, the EXCI\_REASON returned to the application indicates the reason for the error. For applications using the EXCI EXEC API, the reason is returned in the EXEC\_RESP2 field of the RETCODE area.

#### **User Response**

This failure indicates a serious error in the external CICS interface code. For further information about the EXCI exception trace entries, refer to the *CICS Problem Determination Guide*.

#### Destination

Console

#### Module

DFHXCPRH, DFHXCEIP

# **DFHEX0003: A GETMAIN request in module** *modname* (code X'code') has failed. Reason X'rc'.

#### Explanation

An MVS GETMAIN was issued by module *modname*, but it failed with return code *rc*.

The code *code* is the exception trace point ID which uniquely identifies the place where the MVS GETMAIN was issued.

#### System Action

An exception entry is made in the EXCI internal trace table (code *code* in the message). This is a critical error and the EXCI request is terminated. The external CICS interface attempts to recover to a consistent state so that further EXCI requests can be issued.

For applications using the EXCI CALL API, the EXCI\_REASON returned to the application indicates the point of failure.

For applications using the EXCI EXEC API, the point of failure is returned in the EXEC\_RESP2 field of the RETCODE area.

For EXCI\_REASON and EXCI\_RESP of 603, the EXCI module DFHXCPRH also issues abend 0410 which drives the ESTAE exit. Message DFHEX0001 is issued and a SYSMDUMP is taken

#### **User Response**

Look up the MVS GETMAIN return code rc in the relevant MVS codes manual.

If the reason is insufficient storage, try increasing the size of the region for the batch EXCI job.

You may need further assistance from IBM to resolve this problem. See the *CICS Problem Determination Guide* for guidance on how to proceed.

DFHXCPRH, DFHXCTRI

# **DFHEX0004:** JOBNAME: *jobname*, **STEPNAME**: *stepname*, **PROCNAME**: *procname*, **SYSID IN SMF**: *sysid*, **APPLID**: *applid*.

#### **Explanation**

This message accompanies message DFHEX0001 and provides the jobname, stepname, procname, Sysid in SMF and applid to which the EXCI job is connecting. If an insert value is unknown or not specified, then the message insert will show Unknown. For example, procname and stepname are not mandatory in an EXCI job. If they are omitted and DFHEX0004 is issued, then the inserts for procname and stepname show Unknown.

#### System Action

Follow system action for DFHEX0001.

#### **User Response**

Follow user response for DFHEX0001.

#### Destination

Console

#### Module

DFHXCPRH, DFHXCEIP

# DFHEX0100: The installed level of CICS SVC does not support the EXCI call.

#### Explanation

The external CICS interface module DFHXCPRH detected that the level of CICS SVC (DFHCSVC) in use does not support the external CICS interface.

#### System Action

The EXCI request is terminated. An exception trace is made in the EXCI internal trace table, and if GTF is active, in the GTF trace data set. The external CICS interface module DFHXCPRH issues abend 0407 which drives the ESTAE exit. Message DFHEX0001 is issued, and a SYSMDUMP is taken.

#### **User Response**

Check the level of DFHCSVC installed in the LPA, which Generally, the latest level of DFHCSVC must be used when running CICS and the external CICS interface. For more information about installing DFHCSVC see Installing the CICS Type 3 SVC, in the *CICS Transaction Server for z/OS Installation Guide*.

#### Destination

Console

#### Module

DFHXCPRH

# DFHEX0101: Unable to start interregion communication because DFHIRP services are down level.

#### Explanation

The version of DFHIRP being used is at a lower level than that of the External CICS Interface (EXCI) module DFHXCPRH.

#### System Action

The EXCI allocate pipe request is rejected, and a return code passed back to the batch application.

#### User Response

Update the level of the DFHIRP module in the LPA such that it matches the level of the latest CICS version in use.

#### Destination

Console

#### Module

DFHXCPRH

# DFHEX0110: EXCI SDUMP has been taken. Dumpcode: *dumpcode*, Dumpid: *dumpid*.

#### Explanation

This message is issued on successful completion of a MVS SDUMP issued by external CICS interface module DFHXCDMP. An error, signalled by a previous message, caused a call to be made to DFHXCDMP to take a system dump.

The dump code *dumpcode* is an 8-character system dump code identifying the external CICS interface problem. A system dump code is the EXCI message number with the DFH prefix removed.

dumpid is the unique 9-character string identifying this dump.

#### **System Action**

The EXCI request is terminated.

#### **User Response**

See the EXCI message indicated by *dumpcode* for further guidance.

You may need further assistance from IBM to resolve this problem. See the *CICS Problem Determination Guide* for guidance on how to proceed.

#### Destination

Console

#### Module

DFHXCDMP.

# DFHEX0111: EXCI SDUMP attempted but SDUMP is busy - will retry every five seconds for *nnnn* seconds.

#### **Explanation**

At the time of the MVS SDUMP request issued by DFHXCDMP another address space in the same MVS system was in the process of taking an SDUMP. This causes MVS to reject the new request. A nonzero value for the dump retry parameter in the DFHXCOPT table means that the external CICS interface waits five seconds before retrying the SDUMP request. If necessary, the external CICS interface retries every five seconds for the total time specified on the retry parameter.

#### **System Action**

The external CICS interface issues an MVS STIMERM macro which causes it to wait for five seconds. The request is reissued when the delay interval has expired.

#### **User Response**

None.

#### **Destination**

Console

#### Module

DFHXCDMP.

# **DFHEX0112: SDUMP request failed -** reason X'nn'.

#### Explanation

An MVS SDUMP request issued from the external CICS interface has failed to complete successfully. The possible reasons, (*reason*) for the failure are as follows:

#### **ONLY PARTIAL DUMP**

The SYS1.DUMP data set to which the dump is written is not large enough to contain all of the dumped storage.

#### **SDUMP BUSY**

At the time of the MVS SDUMP request issued by the EXCI, another address space in the same MVS system was in the process of taking an SDUMP. This causes MVS to reject the new request. If a nonzero value is specified for the dump retry parameter in DFHXOPTS table, the EXCI has retried the SDUMP request every five seconds for the specified period. This message is only issued if SDUMP is still busy after the final retry.

#### STIMERM FAILED

In order to delay for five seconds before retrying SDUMP after an SDUMP BUSY condition, the EXCI issues an MVS STIMERM macro request. MVS has indicated that the STIMERM request has failed.

#### NO DATA SET AVAILABLE

No SYS1.DUMP data sets were available at the time the SDUMP request was issued.

#### **REJECTED BY MVS, REASON = X'nn'**

MVS has rejected the SDUMP request because of user action (for example, specifying DUMP=NO in the MVS IPL) or because of an I/O error or terminating error in the SDUMP routine. X'nn' is the SDUMP reason code.

#### NOT AUTHORIZED FOR EXCI

SDUMP is not authorized for the external CICS interface.

#### **INSUFFICIENT STORAGE**

The EXCI issued an MVS GETMAIN for subpool 253 storage during the processing of the SDUMP request. The GETMAIN has been rejected by MVS.

#### System Action

The EXCI proceeds as if the dump had been successful.

#### **User Response**

The user response depends on the reasons, (*reason*), for the failure.

#### ONLY PARTIAL DUMP

Increase the size of the SYS1.DUMP data sets and cause the SDUMP request to be reissued.

#### SDUMP BUSY

Cause the SDUMP to be reissued after, if appropriate, increasing the dump retry time in DFHXCOPT.

#### STIMERM FAILED

Use MVS problem determination methods to fix the STIMERM failure and then cause the SDUMP request to be reissued.

#### NO DATA SET AVAILABLE

Clear a SYS1.DUMP data set and then cause the SDUMP request to be reissued.

#### **REJECTED BY MVS, REASON = X'nn'**

No action is required if the dump is suppressed deliberately. If the dump has failed because of an error in the MVS SDUMP routine, use MVS problem determination methods to fix the error and then cause the SDUMP request to be reissued. See the *OS/390 MVS Programming: Assembler Services Reference, GC28-1910*, for an explanation of the SDUMP reason code X'nn'.

#### NOT AUTHORIZED FOR EXCI

This reason is unlikely because SDUMP is unconditionally authorized during EXCI initialization, and should be authorized throughout the EXCI run. If you do get this reason, the EXCI AFCB (authorized function control block) has probably been accidentally overwritten.

#### **INSUFFICIENT STORAGE**

Ensure sufficient storage is available to MVS for subpool 253 requests.

#### Module

DFHXCDMP

# DFHEX0113: EXCI trace Initialization has failed.

#### Explanation

An attempt to initialize external CICS interface (EXCI) trace facilities during EXCI initialization has failed.

#### System Action

The EXCI request continues without trace facilities. An earlier message identifies the cause of the failure.

#### **User Response**

Refer to the earlier message to determine the cause of the failure.

#### Destination

Console

#### Module

DFHXCTRI

# DFHEX0114: Incorrect data has been passed for EXCI tracing causing a program check in DFHXCTRP.

#### Explanation

Some data passed to the external CICS interface (EXCI) trace module DFHXCTRP for addition to the EXCI internal trace table, or GTF trace, caused a program check to occur when an attempt was made to access it.

The most likely cause of this error is incorrect data passed on an EXCI CALL API request that the trace program DFHXCTRP is attempting to access.

#### System Action

The EXCI request is terminated and a SYSMDUMP is taken.

#### **User Response**

Examine the dump to determine the source of the incorrect data.

You may need further assistance from IBM to resolve this problem. See the *CICS Problem Determination Guide* for guidance on how to proceed.

#### Destination

Console

#### Module

DFHXCTRI

# DFHEX0115: EXCI trace services have been disabled due to a previous error.

#### Explanation

An error occurred in the external CICS interface (EXCI) trace module DFHXCTRP indicated by message DFHEX0001. In trying to recover from the error, module DFHXCTRI determined that the error was not caused by accessing incorrect data passed to DFHXCTRP, but was due to a program check in DFHXCTRP.

#### System Action

The EXCI trace facilities are disabled to prevent further errors. A SYSMDUMP is taken.

#### User Response

See the DFHEX0001 message and the SYSMDUMP to determine the cause of the error.

You may need further assistance from IBM to resolve this problem. See the *CICS Problem Determination Guide* for guidance on how to proceed.

#### Destination

Console

#### Module

DFHXCTRI

# DFHEX0116: Program check occurred within global trap exit - DFHXCTRA now marked unusable.

#### **Explanation**

After making a trace entry, the external CICS interface (EXCI) trace program DFHXCTRP called the EXCI field engineering global trap program DFHXCTRA. A program check occurred during execution of DFHXCTRA.

#### **System Action**

The EXCI marks the currently active version of DFHXCTRA as unusable and ignores it on subsequent calls to DFHXCTRP for all subsequent calls made under this TCB. The EXCI request is terminated, and a SYSMDUMP is taken.

#### **User Response**

Use the dump to find the cause of the program check.

You may need further assistance from IBM to resolve this problem. See the *CICS Problem Determination Guide* for guidance on how to proceed.

You should use the global trap exit only in consultation with an IBM support representative.

# Part 4. CICS ONC RPC support

This part describes the support in CICS for Open Network Computing Remote Procedure Call (ONC RPC) clients. CICS ONC RPC allows client applications to access CICS programs by calling them as remote procedures using the ONC RPC format.

### **CICS ONC RPC support**

# **Chapter 19. Introduction to ONC RPC**

CICS ONC RPC allows client applications to access CICS programs by calling them as remote procedures using the ONC RPC format.

CICS ONC RPC can be used:

- To allow clients to use existing CICS programs and the transaction processing services they provide
- · To allow clients to use newly created CICS programs

TCP/IP for MVS is a prerequisite for CICS ONC RPC; it provides the library code for Sun Microsystems' ONC RPC Version 3.9. Hence, CICS ONC RPC servers work with any remote client compatible with ONC RPC Version 3.9, regardless of operating system or machine type. See the *TCP/IP for MVS: Programmer's Reference* for information about the function of ONC RPC Version 3.9 supported by TCP/IP for MVS.

Figure 29 shows how CICS ONC RPC allows a variety of client applications to communicate with CICS programs using ONC RPC.

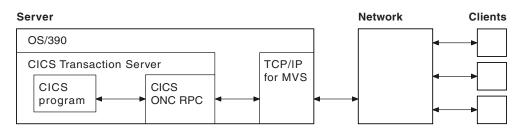

Figure 29. How CICS ONC RPC might be used

The CICS program called to service a client request is executed by a transaction that has no principal facility. It is therefore not allowed to use some commands of the CICS application programming interface:

- · Terminal control commands that reference the principal facility
- · Options of EXEC CICS ASSIGN that return terminal attributes
- BMS commands
- Sign-on and sign-off commands.

The rest of this chapter describes:

- "ONC RPC concepts"
- "ONC RPC facilities" on page 246
- "ONC RPC naming and routing" on page 249

### **ONC RPC concepts**

This section introduces the basics of ONC RPC operation, its place in TCP/IP networks, and how its main facilities work. It does not cover all aspects of ONC RPC or TCP/IP, only those that relate to CICS ONC RPC.

**CICS ONC RPC:** In the rest of this chapter, notes like this point out how CICS ONC RPC implements the area of ONC RPC being described in the text.

# RPC

When a process invokes or calls a process on a remote system, that call is a *remote procedure call (RPC)*. The calling process is a *client* (that is, a process requesting a service); the remote process is a *server* (a process offering a service). As shown in Figure 30, the client sends a request for a procedure to be run, and supplies parameters for that particular run. Once the server has run the procedure, it returns the reply.

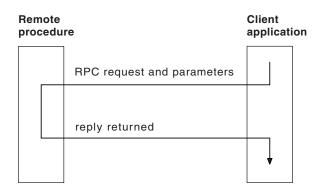

Figure 30. Basic RPC operation

In the RPC model, there is no provision for coordinating changes to recoverable resources in different servers, nor for coordinating changes to recoverable resources in successive calls to the same server. Committing changes to recoverable resources is under the control of the remote procedure, not the client application.

Several RPC implementations have been developed and are now available on a variety of systems. RPC allows a programmer to network an application by distributing the procedures that make up the application across different processors. This is done without the programmer becoming involved with the details of the communication interface required to transmit the parameters to and from the remote procedures.

# ONC

ONC is Open Network Computing, a range of software developed by Sun Microsystems. As well as the ONC RPC routines, Sun provides XDR (eXternal Data Representation) routines, which are used for data conversion. The ONC RPC and XDR protocols and formats are supported on many different platforms.

**CICS ONC RPC:** CICS ONC RPC allows users to run only ONC RPC servers under CICS hosts. It does not support client applications running under CICS.

# TCP/IP

ONC RPC applications use the TCP/IP family of protocols. See "TCP/IP protocols" on page 8 for more information about TCP/IP.

# **ONC RPC facilities**

The ONC RPC implementation consists of:

• **XDR routines**. XDR library functions are supplied to enable conversion to and from the standard data format for transmission.

- **RPCGEN compiler**. This takes a user-written definition of a remote procedure interface and generates the required parts of the application that deal with the RPC interface.
- ONC RPC API library.

# **XDR** routines

Data exchanged between systems engaged in ONC RPC must always flow in a standard format specified by XDR, because different machine architectures have different representations of the same information.

Both client and server use *XDR routines* to convert the input and output parameters between XDR format and the local data format. You either write these yourself, or specify an XDR library function, as described below. In Figure 31, **inproc** and **outproc** are the XDR routines.

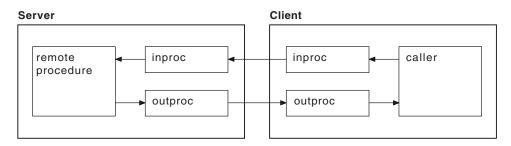

Figure 31. XDR routines used in a remote procedure call

Notice that in Figure 31, the same XDR routine, **inproc**, is used to encode and decode the data as it flows from client to server, and similarly for **outproc** as it flows back to the client. The source for **inproc** is the same in the client and server, but XDR library functions in the routines are compiled to encode or decode as appropriate. Such routines are termed *bidirectional*, and they help to ensure that the encoding and decoding is done symmetrically in the two routines.

#### **Using XDR library functions**

XDR library functions are a set of C functions supplied with ONC RPC, which application programmers can use when writing XDR routines. They can be used as follows, depending on the complexity of the structure pointed to by the call argument and reply parameters.

#### For parameters that are simple single-field C data types

Use an XDR library function for inproc and outproc.

For parameters that are C data type vectors, arrays, strings, and so on Use an XDR library function for **inproc** and **outproc**.

#### For more complex structures

Write an XDR routine, using XDR library functions as required. Alternatively, use the RPCGEN compiler, described in "RPCGEN compiler," to create an XDR routine from an XDR data description.

**CICS ONC RPC:** CICS ONC RPC supports the use of the XDR library functions that support data conversion.

#### **RPCGEN** compiler

To use RPCGEN, you write a program definition in RPCL, a language similar to a subset of C, designed for the definition of ONC RPC distributed programs. The

definition defines the data to be transferred and procedures to be used for both client and server. The client application source program is written as though the remote procedure call were a call to a local program. The code to send the call and get the reply are part of the client stub, which is generated by RPCGEN. Similarly the code the server needs to accept the call and send back the reply are part of the server stub, which is also generated by RPCGEN. Figure 32 illustrates the role of RPCGEN in application development.

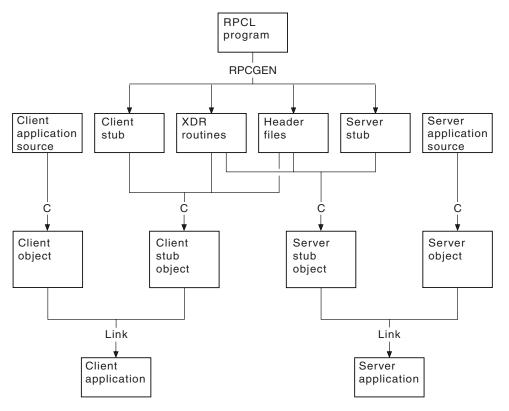

Figure 32. Using the RPCGEN compiler

CICS ONC RPC: RPCGEN may only be used for:

- Generating pairs of XDR routines, as described in the previous section
- Generating a client stub to be linked with the application for the client system
- · Generating header files

CICS ONC RPC does not use the server stub generated by RPCGEN.

## **ONC RPC API library**

The ONC RPC API library contains two types of call: high level and low level.

The high-level ONC RPC API can be used only with UDP. It enables users to make remote procedure calls very simply and with a minimum of library calls, but at a cost of some restriction in available function. The main function of the API is provided by three calls:

#### registerrpc

Used in the server to register a procedure to be called as a remote procedure by clients.

#### svc\_run

Used in the server to see if a request has arrived from a client.

#### callrpc

Used in the client to make a remote procedure call.

The low-level ONC RPC API contains many more calls, which give more control and flexibility. For example:

- Low-level calls give the user the choice of transport below ONC RPC, including TCP or UDP.
- With low-level calls, user-written network registration services other than the Portmapper (the Portmapper is described below) can be used.
- Low-level calls allow the variation of ONC RPC time-outs and retry values.
- Low-level calls allow standard ONC RPC authorization to be applied. Only UNIX authorization is available in ONC RPC Version 3.9.

**CICS ONC RPC:** CICS ONC RPC provides all the server function. You don't specify any server RPC calls.

The client can make its request with the high-level call **callrpc**, or can use low-level calls. CICS ONC RPC is implemented using low-level ONC RPC calls. The implementation allows concurrent dispatching of individual procedures and allows TCP to be supported as well as UDP.

# **ONC RPC naming and routing**

Remote procedures in ONC RPC are identified by the 3-tuple: program number, version number, and procedure number.

It is usual to package several related procedures together into a single program. When changes are made to the procedures, a new version of the program is created, but the new version usually contains the same procedure numbers as the previous version.

#### **Procedure zero**

Users define procedure numbers for each program, conventionally starting at 1 and proceeding in sequence. Procedure 0 is usually defined as a procedure with no parameters and no processing that returns an empty reply. This is useful for clients, who can call procedure 0 to see if a particular service exists and to test performance on a null call.

## **Registration and the Portmapper**

Servers on a host need to let clients know their logical addresses and which services they offer. In ONC RPC, servers generally do this by *registering* with a utility service called the *Portmapper*. This maintains a list of mappings from program/version numbers (also qualified by protocol used) to TCP/IP port numbers on a host.

The Portmapper itself can always be located by clients because it is always on well-known port 111 on a given host. If using low-level calls, the client first asks the

Portmapper for the port number for the particular remote procedure, and then calls that port directly. The high-level call, **callrpc**, performs the same function transparently to the user.

**CICS ONC RPC:** Registration is done by CICS ONC RPC automatically, or under operator control.

# Routing

Before calling a procedure, a client asks the Portmapper at the host for the port number of the program and version that the client wishes to call. (The protocol is determined when the connection between TCP/IP systems is set up.) In the remote procedure call, the client supplies only the IP address, port number, and procedure number. Figure 33 shows how the IP address, port number, and procedure number identify the server procedure.

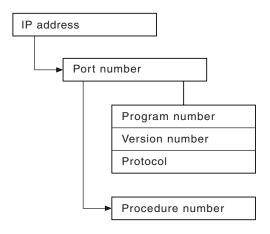

Figure 33. TCP/IP and RPC routing

# Types of remote procedure call

#### Synchronous

This is the normal method of operation. The client makes a call and does not continue until the server returns the reply.

#### Nonblocking

The client makes a call and continues with its own processing. The server does not reply.

#### **Batching**

This is a facility for sending several client nonblocking calls in one batch.

#### **Broadcast RPC**

RPC clients have a broadcast facility, that is, they can send messages to many servers and then receive all the consequent replies.

#### Callback RPC

The client makes a nonblocking client/server call, and the server signals completion by calling a procedure associated with the client.

**CICS ONC RPC:** CICS ONC RPC cannot support callback RPC, because callback requires that both ends contain both client and server procedures.

# Chapter 20. CICS ONC RPC concepts

This chapter describes the CICS ONC RPC components and control flow.

It describes:

- "ONC RPC remote procedures and CICS programs"
- "CICS ONC RPC transactions" on page 252
- "CICS ONC RPC user-replaceable programs" on page 253
- "CICS ONC RPC control flow" on page 254
- "CICS ONC RPC data flow" on page 256

# **ONC RPC remote procedures and CICS programs**

In CICS ONC RPC, the CICS programs are identified by a 4-tuple.

- Program number—same as the ONC RPC program number
- Version number—same as the ONC RPC version number
- Procedure number—same as the ONC RPC procedure number
- Protocol—determined by the protocol used to communicate between the client system and TCP/IP for MVS.

When a client request arrives, the CICS program chosen to service it is the one associated with the 4-tuple just described. Figure 34 shows a state of CICS ONC RPC in which five 4-tuples are associated with three CICS programs.

4-tuples				CICS programs
24127AC0	5	1	U	PROGA
24127AC0	5	1	Т	PROGA
CE00457F	3	1	U	PROGB
CE00457F	3	1	Т	└──── <b>─</b>
CE00457F	3	2	т	PROGC

Figure 34. Remote procedures and CICS programs

The program numbers are given in hexadecimal. The protocols are U for UDP and T for TCP.

- If a client request arrives for program 24127AC0, version 5, procedure 1, the CICS program PROGA is used to service it whether the protocol is TCP or UDP.
- If a request arrives for program CE00457F, version 3, procedure 1, and the protocol is UDP, the CICS program PROGB is used to service it. But if the same request arrives and the protocol is TCP, PROGC is used to service it.

It is, however, usual to use the same program, version, and procedure irrespective of the protocol used to transmit the request.

 The CICS program PROGC is also used for procedure 2 of the same program and version if the protocol is TCP. How you set up and control the relationship between 4-tuples and CICS programs is described in Chapter 22, "Configuring CICS ONC RPC using the connection manager," on page 267.

# Where the CICS program might be

The CICS program might be in one of three places:

- · In the same CICS region as CICS ONC RPC
- · In a different CICS region on the same host
- · On a different host that supports CICS and inbound DPL

The CICS programs can reside on any CICS system accessible by means of DPL from the CICS region running CICS ONC RPC. DPL operation is described in the *CICS Intercommunication Guide*.

# **CICS ONC RPC transactions**

Three CICS transactions are supplied with CICS ONC RPC:

- Connection manager
- Server controller
- Alias

# **Connection manager (CRPC)**

The connection manager is a transaction that allows you to enable and disable CICS ONC RPC, and configure and inquire on it. You run the connection manager transaction as required, and several instances of it can be active at the same time. The connection manager is described in Chapter 22, "Configuring CICS ONC RPC using the connection manager," on page 267.

# Server controller (CRPM)

The server controller monitors the TCP/IP for MVS interface for client requests, and starts instances of the alias transaction, using EXEC CICS START, to service them. The server controller is a transaction of long duration. It is started by the connection manager when CICS ONC RPC is enabled, and stopped when CICS ONC RPC is disabled. Only one instance of the server controller can be active in a CICS system.

# Alias (CRPA)

CICS ONC RPC supplies one alias *program*. Multiple instances of the alias *transaction* can be run in parallel, each in response to a client request.

An alias is started by the server controller for each client request that arrives to be processed, as shown in Figure 35 on page 253. This allows CICS ONC RPC to process many client requests concurrently.

The alias program uses EXEC CICS LINK to transfer control to the CICS program.

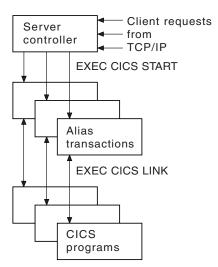

Figure 35. The server controller and alias transactions

## CICS ONC RPC user-replaceable programs

Servicing a client request involves not only a CICS program, but a converter program and XDR routines. For compatibility with earlier releases of CICS you can use a resource checker program to validate incoming client requests, or you can use CICS security facilities.

## **XDR** routines

XDR (eXternal Data Representation) is described in "XDR routines" on page 247.

You need to provide one or two XDR routines for each 4-tuple. You always need an inbound XDR routine, and unless the client call is nonblocking, you need an outbound XDR routine as well.

The XDR routines for each 4-tuple are specified by using the connection manager.

#### **Resource checker module**

CICS ONC RPC provides an interface to a resource checker (which you write). The module can be used to validate incoming client requests. It is described in "Writing the resource checker" on page 317.

### Converters

You can also supply a converter for each program-version-procedure-protocol 4-tuple. Each converter can contain up to three functions.

- **Getlengths function**. The **Getlengths** function might be called by the connection manager when a 4-tuple is registered. **Getlengths** can supply the following information:
  - The length of the input and output data for the CICS program
  - Whether the output data overlays the input data in the communication area

Because its processing is done before any client requests are received, It is appropriate to use **Getlengths** to provide the values of data lengths that do not

vary from call to call. Refer to "Lengths of the CICS program input and output data" on page 295 for a fuller description of when **Getlengths** should be used for this purpose.

- **Decode function**. The **Decode** function is called by the server controller on receipt of a client request. **Decode** can do the following:
  - Supply the length of the input and output data for the CICS program. If the parameter lengths vary from call to call, **Decode** should return them for the current call.
  - Reconstruct the data from the client as a communication area for the CICS program. "CICS ONC RPC data flow" on page 256 illustrates the kinds of data that **Decode** might have to handle. The incoming data might include pointers, and **Decode** must gather up the incoming data into the communication area.
  - Convert data structures from C format to the format appropriate to the programming language in which the CICS program is written.
  - Process data from the client that is not intended for the CICS program. For example the data from the client might include the name of the CICS program to be called, and **Decode** can feed this information back to the server controller.
- **Encode function**. The **Encode** function is called by the alias when the CICS program ends. **Encode** can do the following:
  - Reconstruct the data from the communication area into the form expected by the client. "CICS ONC RPC data flow" on page 256 illustrates the kinds of data that **Encode** might have to handle. The client might expect to receive data accessed by pointers, and **Encode** must build this structure from the data in the communication area.
  - Convert data structures from the format appropriate to the programming language in which the CICS program is written into C format.

Not all 4-tuples need a converter with all three functions. You use the connection manager to specify the converter and the use of **Getlengths**, **Decode**, and **Encode** for each 4-tuple.

The way that particular language data structures are stored is documented in the appropriate language manuals, and a correspondence between C data types and those in other languages is given in the *Language Environment for OS/390 & VM Programming Guide*.

For detailed instructions on the writing of converters, refer to "Write theCICS ONC RPC converter" on page 295.

# **CICS ONC RPC control flow**

Figure 36 on page 255 shows the components involved in processing a typical client ONC RPC request.

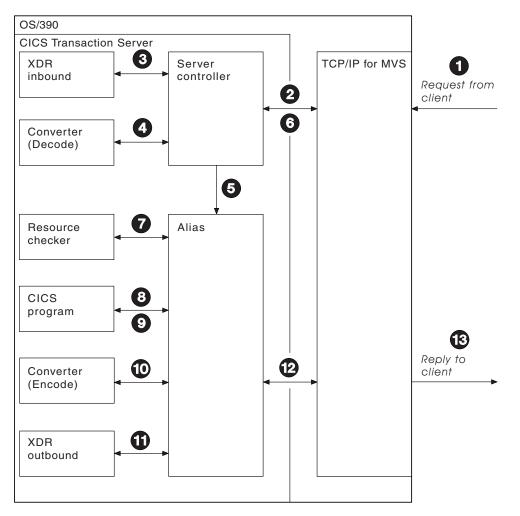

Figure 36. Call processing

Client requests are processed in the following steps:

- 1. A request from a client arrives in TCP/IP for MVS.
- 2. The server controller monitors the TCP/IP for MVS interface for incoming client requests, and the client request is passed to it. (From the 4-tuple for the request, the server controller can find the corresponding XDR routine and converter to call.)
- 3. The server controller invokes the inbound XDR routine.
- The server controller calls the converter, requesting the **Decode** function, if it is required for the 4-tuple. If **Decode** is not required, the server controller allocates storage for the CICS program communication area.
- 5. The server controller then starts an alias to deal with all further processing of the request within CICS.
- 6. The server controller returns to monitor the TCP/IP for MVS interface for client requests.
- 7. The alias optionally calls a user-written resource checker.
- 8. The alias issues an EXEC CICS LINK to the CICS program for the 4-tuple. The communication area set up by **Decode** is passed in the LINK command.
- 9. The CICS program processes the request and returns its output to the alias program in the communication area.
- 10. The alias calls the **Encode** function, if it is required for the 4-tuple.

- 11. The alias invokes the outbound XDR routine.
- 12. The alias returns the reply to TCP/IP for MVS, and ends.
- 13. The reply is sent back to the client.

### Updating recoverable resources

After **Decode** processing, the server controller uses EXEC CICS SYNCPOINT to commit any changes to recoverable resources that **Decode** might have made.

If the CICS program makes updates to recoverable resources, whether the changes are committed or backed out depends on the location of the CICS program, and on whether it uses the EXEC CICS SYNCPOINT command.

- If the CICS program is in a CICS region different from the one in which CICS ONC RPC is operating, the updates are committed when the CICS program returns control to the alias.
- If the CICS program is in the same CICS region as CICS ONC RPC, and it uses EXEC CICS SYNCPOINT, the updates are committed when the syncpoint is processed.
- If the CICS program is in the same CICS region as CICS ONC RPC, but it does *not* use EXEC CICS SYNCPOINT, the updates are committed when the alias transaction ends normally, or are backed out when the alias transaction abends.

# **CICS ONC RPC data flow**

This section describes data flow from a client to a CICS program, and from a CICS program back to the client.

## From client to CICS program

Figure 37 on page 257 shows the progress of data from the client to the CICS program during a remote procedure call.

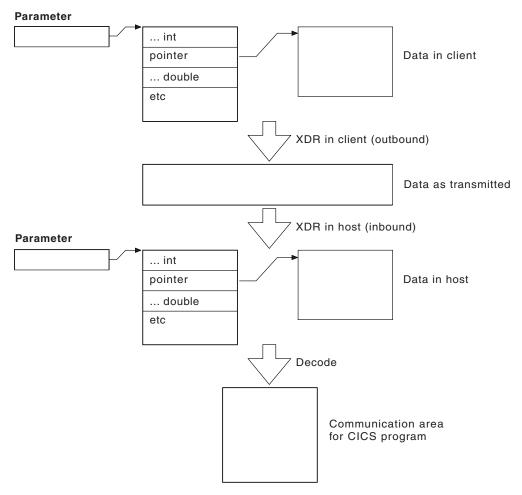

Figure 37. Data flow from client to CICS program

In this example the processing is as follows:

- 1. The client call has a parameter which includes a pointer to data that is to be passed to the CICS program. The client's outbound XDR routine packages the parameter and the indirect data for transmission to the host.
- 2. The data is transmitted over the network to the host.
- 3. In the host, the inbound XDR routine rebuilds the data as it was in the client.
- 4. The **Decode** function of the converter reorganizes the data into a communication area for the CICS program.

# Data format in the CICS program communication area

If the call is a blocking call, the position in the CICS program's communication area of data to be returned to the client has to be specified. The data in the CICS program's communication area can be organized in two ways:

- Contiguous—the data to be returned to the client does not start at the beginning of the communication area, but at some offset into it.
- Overlaid—the data to be returned starts at the beginning of the communication area. The CICS program overwrites the inbound client data in this area with any data to be returned to the client.

Figure 38 on page 258 illustrates these two possibilities.

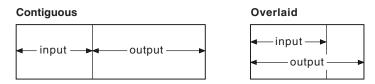

Figure 38. Use of communication area according to data format

# From CICS program to client

Figure 39 shows the progress of data from the CICS program back to the client.

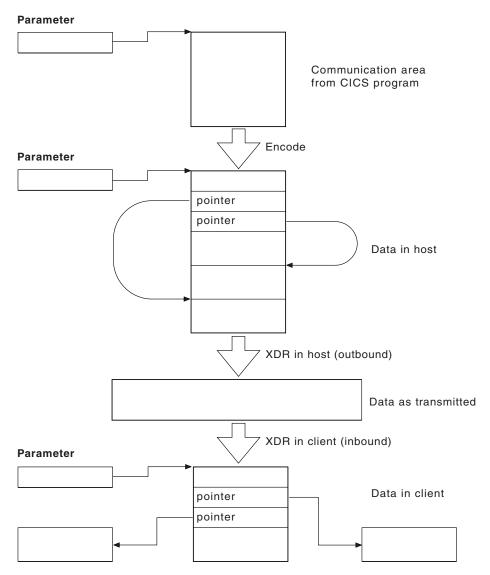

Figure 39. Data flow from CICS program to client

The processing is as follows:

 The CICS program's output is in the communication area that was created by the **Decode** function. The **Encode** function reorganizes the data in the manner that the client expects. In this case the client is expecting to get back a structure including two pointers to indirect data. The **Encode** function puts the data in a single area of storage to simplify storage management processing when the area is to be freed.

- 2. The outbound XDR routine packages the data for transmission.
- 3. The data is transmitted over the network to the client.
- 4. In the client, the inbound XDR routine rebuilds the data as it was in the host.

# Chapter 21. Setting up CICS ONC RPC

#### Clients

Clients must access servers on CICS ONC RPC over a TCP/IP network.

Client systems must use a library compatible with the library for ONC RPC Version 3.9, as this is the ONC RPC version supported by TCP/IP for MVS (Versions 2.2.1 and 3.1). To communicate over a TCP/IP network, appropriate hardware and software must be in place.

#### MVS

The following items are prerequisite, that is, must be installed on the MVS system for CICS ONC RPC to run.

- TCP/IP for MVS Version 2.2.1 or above. TCP/IP for MVS ports must be made available for use by the CICS region involved.
- Language Environment. This provides the C run-time libraries that are a prerequisite for running CICS ONC RPC.
- If you are using RPCGEN, or writing your own XDR routines, you need a C compiler to compile RPCGEN output and your XDR routines.

#### CICS

CICS must be set up for Language Environment support, as described in Installing Language Environment support, in the *CICS Transaction Server for z/OS Installation Guide* and in the *Language Environment for OS/390 Customization Guide*.

Note: TCP/IP for MVS CICS Sockets is not a prerequisite for CICS ONC RPC.

#### TCP/IP for MVS

CICS ONC RPC and TCP/IP for MVS CICS Sockets Version 2.2.1 cannot operate together from one CICS region to one TCP/IP for MVS region. You are advised to run CICS Sockets and CICS ONC RPC in different CICS regions.

TCP/IP for MVS Version 3.1 users do not have this problem; CICS Sockets and CICS ONC RPC can both be run from the same CICS region.

#### TCP/IP for MVS 2.2.1

There are no prerequisites for running CICS ONC RPC.

**Note:** CICS ONC RPC and TCP/IP for MVS CICS Sockets Version 2.2.1 cannot operate together from one CICS region to one TCP/IP for MVS region. You are advised to run CICS Sockets and CICS ONC RPC from different CICS regions.

#### TCP/IP for MVS 3.1

The following PTF is a prerequisite for running CICS ONC RPC:

- A PTF, number UN79963, related to the use of the **xdr\_text\_char** XDR library function.
- **Note:** CICS ONC RPC and TCP/IP for MVS CICS Sockets Version 2.2.1 cannot operate together from one CICS region to one TCP/IP for MVS region. You are advised to run CICS Sockets and CICS ONC RPC from different CICS regions.

#### Storage requirements

Except where otherwise noted, the storage used by CICS ONC RPC is obtained from CICS subpools.

When CICS ONC RPC is enabled, its storage requirements are as follows:

- 40 KB base storage
- 100 bytes for each registered 4-tuple.

For each client request being processed the following storage is required:

- MVS-controlled storage used by the inbound XDR routine for internal data structures
- Storage used by the inbound XDR routine for the data structure it builds for the **Decode** function
- Storage for the CICS program communication area
- · Storage used by the alias transaction while running the CICS program
- Storage used by the Encode function to create a data structure for the outbound XDR routine
- MVS-controlled storage used by the outbound XDR routine

The rest of this chapter describes how to set up your CICS system to exploit CICS ONC RPC. It contains the following sections:

- "CICS ONC RPC setup tasks"
- "Defining CICS ONC RPC resources to CICS" on page 263

## CICS ONC RPC setup tasks

There are tasks associated with the CICS ONC RPC data set, dump formatting, and a warning about migration.

## Creating the CICS ONC RCP data set

JCL is provided in the DFHCOMDS job to create the CICS ONC RPC data set. The data set is defined as a VSAM key-sequenced data set by a DEFINE CLUSTER command like the following:

DEFINE CLUSTER ( -NAME( xxxxxxx.CICSONC.RESOURCE ) -CYL ( 2 1 ) -KEYS( 19 0 ) -INDEXED -VOLUME ( vvvvv ) -RECORDSIZE( 150 150 ) -FREESPACE( 5 5 ) -SHAREOPTIONS( 1 ) -)

The job to define the data set must be run before you start the connection manager for the first time.

### JCL entry for dump formatting

To switch dump formatting on for CICS ONC RPC (and for all running features), change the IPCS VERBEXIT control statement as follows: IPCS VERBEXIT DFHPD650 FT=2

The VERBEXIT provides a formatted dump of CICS ONC RPC control blocks.

# **Migrating between CICS versions**

CICS ONC RPC was a separately-installed feature of CICS/ESA 3.3 and CICS for MVS/ESA 4.1, but is part of the CICS Transaction Server base. None of the IBM-supplied programs for CICS ONC RPC should be moved to CICS Transaction Server from earlier releases.

# Modifying TCP/IP for MVS data sets

You can define the CICS Transaction Server region to TCP/IP for MVS in the tcpip.PROFILE.TCPIP data set to reserve specific ports for ONC RPC applications (described in *TCP/IP for MVS: Customization and Administration Guide*).

# **Defining CICS ONC RPC resources to CICS**

CICS ONC RPC provides two RDO groups defining CICS resources used by CICS ONC RPC: DFHRP and DFHRPF.

# **Transaction definitions for CICS ONC RPC transactions**

The following CICS ONC RPC transactions are defined in the locked group DFHRP:

**CRPA** Alias

**CRPC** Connection manager

**CRPM** Server controller

These definitions cannot be changed.

# Transaction definitions for extra alias transactions

You may want to use other alias transaction names for various reasons:

- Auditing purposes
- · Resource and command checking
- · Allocating initiation priorities
- · Allocating database plan selection
- · Assigning different runaway values for different CICS programs

If you do, you must also define these to CICS, copying the definition from CRPA, and making amendments as necessary. The CRPA definition is as follows:

DEFINE	TRANSACTION(CRPA)	GROUP (DFHRP)
	PROGRAM(DFHRPAS)	TWASIZE(0)
	PROFILE(DFHCICST)	STATUS(ENABLED)
	TASKDATALOC(BELOW)	TASKDATAKEY (USER)
	RUNAWAY(SYSTEM)	SHUTDOWN(ENABLED)
	PRIORITY(1)	TRANCLASS(DFHTCL00)
	DTIMOUT(NO)	INDOUBT(BACKOUT)
	SPURGE(YES)	TPURGE(NO)
	RESSEC(NO)	CMDSEC (NO)

If you want a CICS program to run under an alias with a name other than CRPA, you can enter this in the connection manager when defining the attributes of the 4-tuple associated with the CICS program, as described in "Defining the attributes of a 4-tuple" on page 275. The name of the alias can also be changed by the **Decode** function, as described in "Changing the alias and CICS program" on page 296.

## Changing the CMDSEC and RESSEC values

You might wish to define new alias transactions with CMDSEC(YES) or RESSEC(YES) in order to enforce security checking on the programs run under the alias transaction, including the CICS program that services the client request. The effect of these options is described in "Security in CICS and its effect on CICS ONC RPC operations" on page 315. None of the IBM-supplied programs used by the alias use any of system programmer interface (SPI) commands, so CMDSEC need not be changed. However, if you wish to oversee the use of SPI commands by the CICS program, resource checker, or **Encode** function of the converter, CMDSEC(YES) is required.

# Program definitions for CICS ONC RPC programs

All the CICS ONC RPC programs are defined in the locked group DFHRP.

# Program definitions for user-written programs

You need to make definitions for:

- CICS programs
- Converters
- User-written XDR routines
- Resource checker

### LANGUAGE option

User-written XDR routines should be defined with LANGUAGE(C). Converters and CICS programs should be defined with an appropriate LANGUAGE.

#### **CEDF** option

Program definitions for CICS programs must include CEDF(YES) if EDF is required for debugging. If you wish to use EDF, you must enter a terminal ID in the connection manager when defining the attributes of the 4-tuple associated with the CICS program, as described in "Defining the attributes of a 4-tuple" on page 275.

#### **EXECKEY** option

CICS operates with storage protection only if the SIT parameter STGPROT is set to YES, and the system has the required hardware and software.

Converters and the resource checker should not be regarded as application programs when defining storage. You are recommended to define them as EXECKEY(CICS). This allows them to modify CICS-key storage.

When the **Decode** and **Encode** functions allocate storage to hold the converted data, that storage should be allocated as CICS-key.

User-written XDR routines must be defined as EXECKEY(CICS).

CICS programs should be defined as EXECKEY(USER), unless there is some reason for defining them as CICS-key in your CICS system. Defining programs as EXECKEY(USER) prevents them from overwriting CICS.

If you specify EXECKEY(USER) for the CICS program, ensure that TASKDATAKEY(USER) is specified for the alias. USER is the default TASKDATAKEY setting in the alias definition in the supplied group DFHRP.

If you have CICS programs that need to be specified with EXECKEY(CICS), you are advised to specify TASKDATAKEY(CICS) for the alias that will execute them.

### **RELOAD** option

You should specify RELOAD(YES) for any user-written XDR routines to prevent errors in CICS ONC RPC disable processing.

### **Definitions for remote CICS programs**

If a CICS program that is to service a remote procedure call runs in a different CICS system from CICS ONC RPC, a program definition is required on both the local system and the remote system. The program resides on the remote system, so its definition there is straightforward. The program definition on the local system:

- Must include a REMOTESYSTEM parameter to specify the system on which the program resides.
- Can optionally include a REMOTENAME parameter if you want the names on the local system and remote system to be different.
- Can optionally include a TRANSID parameter:
  - If TRANSID is not specified, the CICS program runs under the CICS mirror transaction on the remote CICS system.
  - If TRANSID is specified, the program in the remote CICS system runs under the transaction name given. See "Transaction definitions for extra alias transactions" on page 263 for reasons why you may want a different name.

If the remote transaction ID is specified, you must provide a matching transaction definition in the remote CICS system. This definition must specify the appropriate mirror program for the remote system (DFHMIRS for CICS for MVS/ESA and CICS Transaction Server for OS/390 systems).

If a CICS program is running on a CICS platform other than CICS for MVS/ESA or CICS Transaction Server for OS/390 similar considerations apply, but you should refer to the DPL details for that platform.

### Mapset definition

Mapset definitions are supplied in the group DFHRP for the connection manager mapsets. The definitions cannot be changed.

# **Transient data definitions**

You must supply DCT definitions for the CICS ONC RPC message transient data queue. The following sample is supplied with CICS ONC RPC as member DFHRPDCT of the SDFHSAMP target library:

```
DFHDCT TYPE=SDSCI,
BLKSIZE=137,
RECSIZE=133,
DSCNAME=CRPO,
RECFORM=VARUNB,
BUFNO=1,
TYPEFLE=OUTPUT
```

```
DFHDCT TYPE=EXTRA,
DESTID=CRPO,
DSCNAME=CRPO
```

If you define the destination in the manner of the sample, you must also add a suitable DD statement for the extrapartition queue in the CICS JCL, for instance: //CRP0 DD SYSOUT=A

The destination could also be made intrapartition or indirect.

# **XLT definitions**

The XLT system initialization parameter and its associated transaction list should allow the connection manager, CRPC, to be started during normal CICS shutdown. If CICS ONC RPC is delaying shutdown, the connection manager can be used to force an immediate disable of CICS ONC RPC.

# Chapter 22. Configuring CICS ONC RPC using the connection manager

The connection manager has four main functions:

- Enabling CICS ONC RPC
- Disabling CICS ONC RPC
- Controlling the operating options and 4-tuple information stored in the CICS ONC RPC data set
- Controlling the operating options and 4-tuple information in current use when CICS ONC RPC is enabled

The rest of this chapter describes:

- "Starting the connection manager"
- "Updating CICS ONC RPC status" on page 270
- "Enabling CICS ONC RPC" on page 272
- "Defining, saving, modifying, and deleting 4-tuples" on page 274
- "Registering the 4-tuples" on page 280
- "Unregistering 4-tuples" on page 280
- "Disabling CICS ONC RPC" on page 282
- "Updating the CICS ONC RPC data set" on page 284
- "Processing the alias list" on page 288

# Starting the connection manager

You can start the connection manager in various ways:

- From a terminal that supports BMS maps. You can work with the connection manager panels described in this chapter.
- From a CICS console.
- Using an EXEC CICS START command.
- From a sequential terminal.

The effect of starting the connection manager depends on:

- Whether CICS ONC RPC is enabled or disabled
- Whether you start the connection manager from a terminal that permits the use of BMS
- · Whether you enter additional data with the transaction name
- Whether the Automatic Enable option in the CICS ONC RPC definition record is set to YES

When CICS ONC RPC is disabled, the effect of entering the transaction name (and optional additional data) on a terminal that supports BMS is as follows:

### CRPC

- If Automatic Enable is YES, automatic enable processing occurs.
- If Automatic Enable is NO, a BMS panel (DFHRP01) is shown.
- If there is no CICS ONC RPC definition record yet, a BMS panel (DFHRP01) is shown.

#### CRPC E A(N)

• A BMS panel (DFHRP01) is shown.

### CRPC E A(Y)

 Automatic enable processing occurs. If there is no CICS ONC RPC definition record, one is created using default values for the options, but no 4-tuples are registered.

If you start the connection manager in a way that does not allow panels to be shown (EXEC CICS START, or non-BMS terminal, for example) and the action is to show a panel, error message DFHRP1505 is produced.

When CICS ONC RPC is enabled, the effect of entering the transaction name (and optional additional data) is as follows:

- CRPC displays panel DFHRP04, or produces error message DFHRP1505 if panels cannot be shown.
- CRPC D(N) causes normal disable processing.
- CRPC D(I) causes immediate disable processing.

The forms CRPC E A(N), CRPC E A(Y), CRPC D(N), and CRPC D(I) are called fast-path commands.

TCP/IP for MVS should be started before you try to enable CICS ONC RPC with the connection manager, otherwise you cannot register 4-tuples, and you have to reenable CICS ONC RPC after starting TCP/IP for MVS.

CRPC	CICS ONC RPC for MVS/ESA	A DFHRP01			
Select one of the	elect one of the following. Then press Enter.				
	1. Enable CICS ONC RPC 2. View or modify the CICS ONC RPC data set				
Current Status: D	isabled				
PF1=Help PF3=Ex	it PF9=Messages PF12=Return	SYSID= CI41 APPLID= IYK1ZFL1			

Figure 40. Panel DFHRP01

```
CRPC CICS ONC RPC for MVS/ESA DFHRP04
Select one of the following. Then press Enter.

- 1. Disable CICS ONC RPC

2. View or modify the CICS ONC RPC data set

3. View or modify CICS ONC RPC status

Current Status: Enabled

SYSID= CI41 APPLID= IYK1ZFL1

PF1=Help PF3=Exit PF9=Messages
```

Figure 41. Panel DFHRP04

# Using the connection manager BMS panels

All leading and trailing blanks are ignored on BMS input.

At the top of all panels is a panel identifier in the right corner (for example, DFHRP02) and CRPC in the left corner.

On the bottom of all panels, the fourth line from the bottom gives the status of CICS ONC RPC, the third line from the bottom is a prompt line, while the bottom line lists the available PF keys, which can include:

- **PF1** Help information (all panels)
- PF2 Delete definition from the CICS ONC RPC data set (only where shown)
- PF3 Exit CRPC (you are prompted to confirm by using PF3 again)
- **PF4** Write fields to the CICS ONC RPC data set (only where shown)
- **PF7** Scroll up (only where shown)
- PF8 Scroll down (only where shown)
- PF9 Display messages relating to current input
- PF12 Cancel this panel and return to the previous panel

### Connection manager error message output

The destination of connection manager messages depends on the nature of the message:

- Severe errors requiring operator intervention are sent to the console. No other messages go to the console.
- Messages relating to invalid input on the panel can be displayed by pressing PF9.
- Messages reporting internal errors are sent to CRPO, and in most cases they can be displayed on the terminal by pressing PF9.

### Using PF9 to display messages

During the operation of the connection manager, error messages might be issued. These are not displayed immediately on the screen, but a prompt appears on the prompt line to say that messages are waiting to be viewed. To see the messages, press PF9. The number and text of the messages is displayed. You can look up the messages in *CICS Messages and Codes* for more information about errors, and for advice about what to do next.

When you have read the messages, you can press Enter, PF3, or PF12 to return to the input panel.

# Starting the connection manager when CICS ONC RPC is disabled

If CICS ONC RPC is disabled, panel DFHRP01 is shown. (See Figure 40 on page 268.)

Select an option, then press Enter.

### **Option For more information see:**

- 1 "Enabling CICS ONC RPC" on page 272
- 2 "Updating the CICS ONC RPC data set" on page 284

### Starting the connection manager when CICS ONC RPC is enabled

If CICS ONC RPC is enabled, panel DFHRP04 is shown. (See Figure 41 on page 269.)

Select an option, then press Enter.

### **Option For more information see:**

- 1 "Disabling CICS ONC RPC" on page 282
- 2 "Updating the CICS ONC RPC data set" on page 284
- 3 "Updating CICS ONC RPC status"

# **Updating CICS ONC RPC status**

If you select option 3 on panel DFHRP04, panel DFHRP10 is shown.

CRPC	CICS ONC RPC for MVS/ESA U	Update Status DFHRP10
Select one	e of the following. Then press Enter.

Figure 43. Panel DFHRP16

# **Enabling CICS ONC RPC**

When CICS ONC RPC is disabled, the connection manager allows you to:

- · Create or update the CICS ONC RPC definition record in the data set
- · Add, delete, and change 4-tuple records in the data set
- Enable CICS ONC RPC

You can use the connection manager to enable CICS ONC RPC in two ways:

- Operator-assisted enable-before you enable CICS ONC RPC, you can:
  - Modify any or all of the options
  - Select which 4-tuples are to be registered
  - Modify the attributes of 4-tuples before registration

When you enable CICS ONC RPC, options to control its operation come into play, and 4-tuples can be registered.

The changes you make during an operator-assisted enable can be temporary, lasting only until the next time you disable CICS ONC RPC, or you can store them into the CICS ONC RPC data set, and use them the next time you enable CICS ONC RPC.

 Automatic enable—the contents of the CICS ONC RPC definition record determine the options to control the operation of CICS ONC RPC until the next time you disable it. Some 4-tuples might be registered, depending on an attribute in the 4-tuple definition.

The CICS ONC RPC data set is a store of operating environment information. It contains two kinds of records: the CICS ONC RPC definition record contains the operating options, and 4-tuple records contain the 4-tuple information.

# Setting and modifying options

If you start the connection manager when CICS ONC RPC is disabled, and select option 1 on panel DFHRP01, panel DFHRP02 is shown. (See Figure 44.)

CRPC	CICS ONC RE	PC for MVS/I	SA Enable DFHRP02	
Overtype to Modify	Cł	hoice	Possible Options	
Trace	===> (	STARTED	STArted   STOpped	
Trace Level	===> ]	1	1   2	
Resource Checker	===>	NO	Yes   No	
CRPM Userid	===> (	CICSUSER		
Automatic Enable	===> 1	NO	Yes   No	
Current Status: Disabled				
PF1=Help PF3=Exit PF	4=Save PF9	9=Messages	SYSID= CI41 APPLID= IYK1ZFL PF12=Return	1

Figure 44. Panel DFHRP02

The values displayed in the Choice column are those stored in the CICS ONC RPC data set. The data set is initialized with the values shown in Figure 44, except that the value displayed for CRPM Userid is the default CICS user ID for the CICS system in which CICS ONC RPC is operating.

You can make entries in the fields listed below. Entries may be in lowercase or uppercase. Where entries to a field are restricted (for example, YES or NO) you can enter the whole option (YES) or the minimum (Y). In the panels, the minimum entry is shown in uppercase in the Possible Options column. In the reference material in this manual, the minimum entry is given in parentheses after the full entry.

**Trace** Specifies whether CICS ONC RPC tracing is active. STARTED (STA) means it is active, STOPPED (STO) means it is not. The default value is STARTED.

CICS ONC RPC exception trace entries are always written to CICS internal trace whatever the setting of this option. To get non-exception trace entries written, CICS trace must be started, and this option must be set to STARTED.

#### **Trace Level**

Specifies the trace level for CICS ONC RPC. The value 1 means that level 1 trace points are traced, and 2 means that both level 1 and 2 are traced. The default value is 1.

### **Resource Checker**

YES (Y) means that CICS ONC RPC is to call the user-written resource-checking module on receipt of every incoming RPC request. NO (N) means the resource checker is not to be called. The default is NO.

### **CRPM Userid**

Specifies the CICS user ID under which the server controller is to run. The default is the default user ID for the CICS system in which CICS ONC RPC is operating.

### **Automatic Enable**

Enter YES (Y) or NO (N). If YES is stored in the CICS ONC RPC data set, you can enable CICS ONC RPC by just typing CRPC; all values are defaulted from the CICS ONC RPC data set, CICS ONC RPC becomes enabled without further user input, and all the 4-tuples with YES for their Register from Data Set option are registered. The default value is NO.

Setting this field has an effect only when you enable CICS ONC RPC. If you use PF4 to save the values to the CICS ONC RPC data set, this value will be effective the next time you enable, unless you override it. A YES in this field in the CICS ONC RPC data set may be overridden by the fast path command CRPC E A(N).

### Validating, saving, and activating options

After you have made your changes on panel DFHRP02, press Enter to get them validated by the connection manager.

If you wish to save the new values in the CICS ONC RPC data set, press PF4.

If you press Enter a second time, CICS ONC RPC becomes enabled, and panel DFHRP03 is shown, as described in "Defining, saving, modifying, and deleting 4-tuples."

### When CICS ONC RPC is enabled

When CICS ONC RPC is enabled, the connection manager allows you to:

- Update the CICS ONC RPC definition record in the data set
- · Add, delete, and change 4-tuple records in the data set
- · Change the options being used to control the operation of CICS ONC RPC
- · Register 4-tuple definitions from the data set
- · Create temporary 4-tuple definitions and register them
- Unregister 4-tuple definitions
- Disable CICS ONC RPC

There are two ways of disabling CICS ONC RPC: normal, and immediate. The effects of disable processing are described in "Disabling CICS ONC RPC" on page 282.

# Defining, saving, modifying, and deleting 4-tuples

The first panel for defining, saving, modifying, and deleting 4-tuples is DFHRP03. (See Figure 45 on page 275.) This panel is shown as soon as you have enabled CICS ONC RPC, or if you choose option 2 on panel DFHRP10.

CRPC	CICS ONC RPC for MVS/ESA DFHRP03 Remote Procedure Registration
Select	one of the following. Then press Enter.
- 2. 3.	Register procedures from the data set         List procedures sequentially         Register a new procedure         Retrieve a specified procedure from the data set (Enter required data)         Program Number       ===>         0-FFFFFFF         Version Number       ===>         0-FFFFFFF         Procedure Number       ===>         1-FFFFFFF         Protocol       ===>         UDP       Udp   Tcp
Curren	t Status: Enabled
PF1=He	SYSID= CI41 APPLID= IYK1ZFL1 PF3=Exit PF9=Messages PF12=Return

Figure 45. Panel DFHRP03

If you wish to select option 4, you must first supply the following information:

#### **Program Number**

The program number of the 4-tuple whose definition is to be retrieved.

#### Version Number

The version number of the 4-tuple whose definition is to be retrieved.

#### **Procedure Number**

The procedure number of the 4-tuple whose definition is to be retrieved.

#### Protocol

The protocol of the 4-tuple whose definition is to be retrieved.

Select an option, then press Enter.

#### **Option For more information see:**

- 1 See below.
- 2 "Defining the attributes of a 4-tuple"
- **3** "Unregistering 4-tuples" on page 280
- 4 See below.

**If you select option 1**, the 4-tuples in the CICS ONC RPC data set that have YES for their Register from Data Set attribute are all registered.

If you specify a 4-tuple for which there is no definition in the CICS ONC RPC data set, a message is issued when you press Enter, and panel DFHRP03 remains on the screen.

# Defining the attributes of a 4-tuple

When you select option 3 or option 4 on panel DFHRP03, panel DFHRP5 is shown. (See Figure 46 on page 276.) If you chose option 3, some of the fields are empty, but if you chose option 4, the details of the selected 4-tuple are shown. You have to supply more information on panel DFHRP5B.

CRPC CICS ONC RPC for MVS/ESA Remote Procedure Registration DFHRP5

Figure 46. Panels DFHRP5 and DFHRP5B

After you have made your modifications to panel DFHRP5, you should press PF8 to move to panel DFHRP5B. From panel DFHRP5B you can press PF7 if you wish to go back to panel DFHRP5. After you have made your modifications to the panels, you press Enter to get all the modifications validated.

The attributes of a 4-tuple are divided into three categories:

- ONC RPC attributes
- CICS attributes
- · CICS ONC RPC attributes

### **ONC RPC attributes**

The first four options establish the 4-tuple whose attributes are being defined.

### **ONC RPC Program Number**

Specifies the program number of the 4-tuple as a hexadecimal string of 1 through 8 characters. You are advised not to use numbers in the range 0 through 1FFFFFF, as these numbers are reserved for public network services and are allocated by Sun Microsystems.

#### **ONC RPC Version Number**

Specifies the version number of the 4-tuple as a hexadecimal string of 1 through 8 characters.

### **ONC RPC Procedure Number**

Specifies the procedure number of the 4-tuple as a hexadecimal string of 1 through 8 characters. Procedure 0 is reserved by TCP/IP for MVS for a procedure with no parameters and no processing that returns an empty reply.

#### Protocol

Specifies the protocol of the 4-tuple. UDP (U) for UDP, or TCP (T) for TCP.

The remaining options specify the attributes of the 4-tuple.

### **RPC Call Type**

Specifies whether CICS ONC RPC is to treat calls from clients as BLOCKING (B) or NONBLOCKING (N). If NONBLOCKING is specified, the outbound XDR routine cannot be specified, and no reply is sent to the client. The default is BLOCKING.

### Inbound XDR Routine

Specifies the name of the inbound XDR routine. If an XDR library function is used, its full name is specified. See Table 26 on page 293 to find out which library routines can be specified here. If a user-defined routine is used, its name (maximum 8 characters) is specified.

### **Outbound XDR Routine**

Specifies the name of the outbound XDR routine, if RPC Call Type is BLOCKING. If an XDR library function is used, its full name is specified. See Table 26 on page 293 to find out which library routines can be specified here. If a user-defined routine is used, its name (maximum 8 characters) is specified. A blank input is valid only if RPC Call Type is NONBLOCKING.

### **CICS** attributes

### **ALIAS Transaction ID**

Specifies the transaction ID to be used for the alias. If this is omitted, and not provided by the **Decode** function, the alias transaction ID is CRPA. For reasons why you might want a different name from CRPA, see "Transaction definitions for extra alias transactions" on page 263.

### **EDF Terminal ID**

Specifies the terminal ID to be used for the alias. You need a terminal ID only if you want to use execution diagnostic facility (EDF) to debug the resource checker, CICS program, or **Encode** function of the converter. A blank means that you cannot use EDF. EDF setup is described in "Using EDF" on page 326.

#### **Program Name**

Specifies the name of the CICS program that is to be called to service a request for this 4-tuple.

### **CICS ONC RPC attributes**

### **Converter Program Name**

Specifies the name of the converter program. This name must be specified.

#### Encode

YES (Y) means that CICS ONC RPC must call the **Encode** function of the converter when servicing a client request for this 4-tuple; NO (N) means that it must not. The default is NO.

#### Decode

YES (Y) means that CICS ONC RPC must call the **Decode** function of the converter when servicing a client request for this 4-tuple; NO (N) means that it must not. The default is YES.

#### Getlengths

YES (Y) means that the connection manager must call the **Getlengths** function of the converter before registering this 4-tuple. NO (N) means that it must not. If you specify YES here, you should ignore the next two attributes, but you can set Server Data Format. If you specify NO here, you must specify the next three attributes. The default is YES.

### Server Input Length

For the use of this option, see the description of Server Data Format.

If you specified YES for the Getlengths option, leave this field blank.

### Server Output Length

For the use of this option, see the description of Server Data Format.

If you specified YES for the Getlengths option, leave this field blank.

### Server Data Format

A value that controls:

- · How the input data pointer for Encode will be set up
- How the communication area length to be checked by the connection manager is calculated

The values you can specify are as follows:

### CONTIGUOUS

The value of the data pointer that will be passed to **Encode**, or to the outbound XDR routine if **Encode** is not used for this 4-tuple, is the address of the CICS program communication area plus the value of Server Input Length, though **Decode** can modify this offset.

The connection manager calculates a communication area length by adding the values of Server Input Length and Server Output Length. If this length exceeds 32 767 bytes, message DFHRP1965 is issued. If this length is different from the actual length of the communication area passed from **Decode** to the CICS program, errors might occur in the processing of client requests.

### OVERLAID

The value of the data pointer that will be passed to **Encode**, or to the outbound XDR routine if **Encode** is not used for this 4-tuple, is the address of the CICS program communication area.

The connection manager calculates a communication area length by taking the larger of the output values of Server Input Length and Server Output Length. If this length is different from the actual length of the communication area passed to the CICS program, errors might occur in the processing of client requests.

If you specified YES for the Getlengths option, the value in this field is used as an input to the **Getlengths** function of the converter.

### Register from Data Set

YES (Y) means that the 4-tuple is to be registered:

- During automatic enable processing
- When option 1 is selected on panel DFHRP03, as described in "Registering the 4-tuples" on page 280

NO (N) means that it is not. The default is YES. Entries specified as NO can be stored in the CICS ONC RPC data set and you can register them at any time when CICS ONC RPC is enabled.

### Saving new 4-tuple definitions

There are five ways of doing this:

- On panel DFHRP03, select option 3. Complete panels DFHRP5 and DFHRP5B, and validate your input as described in "Defining the attributes of a 4-tuple" on page 275. Press PF4 to save the definition in the CICS ONC RPC data set.
- On panel DFHRP03, select option 4. Modify the panels DFHRP5 and DFHRP5B, and validate your input as described in "Defining the attributes of a 4-tuple" on page 275. Press PF4 to save the definition in the CICS ONC RPC data set.
- On panel DFHRP20, select option 3. Complete panels DFHRP21 and DFHRP2B, and validate your input as described in "Changing the attributes of a 4-tuple" on page 287. Press Enter to save the definition in the CICS ONC RPC data set.
- On panel DFHRP20, select option 4. Modify the panels DFHRP21 and DFHRP2B, and validate your input as described in "Changing the attributes of a 4-tuple" on page 287. Press Enter to save the definition in the CICS ONC RPC data set.
- On panel DFHRP03, select option 2. Then on panel DFHRP14, enter command **M** against a 4-tuple. Modify the panels DFHRP21 and DFHRP2B, and validate your input as described in "Changing the attributes of a 4-tuple" on page 287. Press Enter to save the definition in the CICS ONC RPC data set.

# Modifying existing 4-tuple definitions

To change some of the attributes of a 4-tuple that already has a definition in the CICS ONC RPC data set, select option 4 on panel DFHRP03 or panel DFHRP20. Change the attributes and validate your input as described in "Defining the attributes of a 4-tuple" on page 275, and press PF4, or Enter, to save the definition in the data set.

# **Deleting existing 4-tuple definitions**

You can delete existing 4-tuple definitions from the CICS ONC RPC data set in either of the following ways:

- On panel DFHRP03, select option 2. Then on panel DFHRP14 you can enter D against 4-tuples in the list, and they are deleted from the data set when you press Enter.
- On panel DFHRP21, by using key PF2, as described in "Changing the attributes of a 4-tuple" on page 287.

# **Registering the 4-tuples**

You can register 4-tuples in any of the following ways:

- You can register all the 4-tuples in the CICS ONC RPC data set that are defined with YES specified for Register from Data Set. To do this, select option 1 on panel DFHRP03, and press Enter. After these 4-tuples have been registered, panel DFHRP03 is still displayed, so you can make other selections.
- You can register 4-tuple definitions one at a time. To do this, you use option 3 or option 4 on panel DFHRP03. Make changes, if you need any, to panels DFHRP5 and DFHRP5B and get them validated as described in "Defining the attributes of a 4-tuple" on page 275. To register the definition, press Enter.
- You can register 4-tuples from a list. See "Working with a list of 4-tuples" on page 286.
- When CICS ONC RPC is disabled, you can register all the 4-tuples in the CICS ONC RPC data set that have YES for their Register from Data Set attribute by initiating automatic enable processing.

When a 4-tuple is registered, two things happen:

- If the program-version-protocol 3-tuple has not yet been registered with TCP/IP for MVS, it is registered. The Portmapper assigns a port number to this combination, and that port number is the one that clients use to request the service represented by this 4-tuple. Procedure 0 for the program, version, and protocol becomes available to callers.
- The resources associated with the 4-tuple become available to service client requests. When a client request arrives in CICS ONC RPC, the resources used to service it are those of the 4-tuple whose program, version, and procedure numbers match those of the request, and whose protocol matches the protocol used to transmit the request from the client to the server.

### Limits on registration

CICS ONC RPC makes 252 sockets available for use as follows:

- One socket is used by each program/version/protocol 3-tuple from the time the first 4-tuple for that program, version and protocol is registered. This socket remains in use until the last 4-tuple with that program and version is unregistered.
- One socket is used by each TCP call for the duration of the call.

If you register too many 4-tuples, you reduce the service that CICS ONC RPC can give to incoming client requests. If you attempt to register more than 252 program-version-protocol 3-tuples with TCP/IP for MVS, the results are unpredictable.

### **Unregistering 4-tuples**

You can unregister 4-tuples that have previously been registered with CICS ONC RPC only when CICS ONC RPC is already enabled. From panel DFHRP10, if you select option 3, panel DFHRP11 is shown. (See Figure 47 on page 281.)

CRPC	CICS ONC RPC for MVS/ESA Remote Procedure Unregister	DFHRP11
Select on	e of the following. Then press Enter.	
	egister procedures from a list egister a specified procedure (Enter required Program Number ===> 0-FFFF Version Number ===> 0-FFFF Procedure Number ===> 1-FFFF Protocol ===> UDP Udp   T	FFF FFF FFF
Current S	tatus: Enabled	
PF1=Help	SYSI PF3=Exit PF9=Messages PF12=Return	D= CI41 APPLID= IYK1ZFL1

Figure 47. Panel DFHRP11

Select an option, then press Enter.

### **Option For more information see:**

- 1 "Unregistering 4-tuples from a list"
- 2 "Unregistering 4-tuples one by one"

# Unregistering 4-tuples one by one

Before you select option 2 on panel DFHRP11, you must supply the following information:

### **Program Number**

The program number of the 4-tuple to be unregistered.

### Version Number

The version number of the 4-tuple to be unregistered.

### **Procedure Number**

The procedure number of the 4-tuple to be unregistered.

#### Protocol

The protocol of the 4-tuple to be unregistered.

If you specify a 4-tuple that is registered, it is unregistered when you press Enter, and panel DFHRP11 remains on the screen.

If you specify a 4-tuple that is not registered, a message is issued when you press Enter, and panel DFHRP11 remains on the screen.

# **Unregistering 4-tuples from a list**

If you select option 1 on panel DFHRP11, the panel DFHRP12 is shown. (See Figure 48 on page 282.)

This panel presents a list of 4-tuples currently registered with CICS ONC RPC. If you enter **U** against 4-tuples in the list, they are unregistered when you press Enter.

You can display the attributes of a 4-tuple by entering **?** against it, and pressing Enter. Panel DFHRP13 is shown. (See Figure 49.)

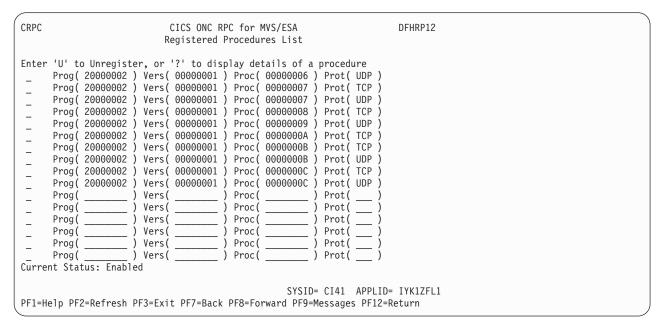

Figure 48. Panel DFHRP12

CRPC	CICS ONC RPC f Display Register	·

# **Disabling CICS ONC RPC**

From panel DFHRP04, select option 1; panel DFHRP06 is shown. (See Figure 50 on page 283.)

CRPC	CICS ONC RPC for MVS/ESA	A Disable	DFHRP06
Select the type of dis	sable required. Then press	Enter.	
Type of Disable ==	==> Normal	Immediate	
Current Status: Enable	ed		
PF1=Help PF3=Exit	PF9=Messages PF12=Return	SYSID= CI41 APPLID=	IYK1ZFL1

Figure 50. Panel DFHRP06

In this panel there is only one field to enter.

### Type of Disable

### NORMAL (N)

Normal disable processing is started.

- All program-version pairs are unregistered from TCP/IP for MVS.
- All work that has already entered CICS ONC RPC is allowed to run to completion, and replies are sent to the relevant client.

### IMMEDIATE (I)

Immediate disable processing is started.

- Aliases not yet started do not start at all.
- CICS programs running under aliases are allowed to end, and then the alias abends. If the CICS program ends normally, and was called using DPL, the changes it makes to recoverable resources are committed. If the CICS program is a local program, the changes it makes to recoverable resources are backed out unless the CICS program takes a syncpoint with EXEC CICS SYNCPOINT.
- All the program-version pairs are unregistered from TCP/IP for MVS.
- No replies are sent to clients, so they do not know whether the CICS program has run or not.

Pressing Enter causes the entry you have made to be validated. Pressing Enter a second time begins disable processing. The Current Status is changed to Disabling or Disabled, depending on the progress of disable processing. When disable processing is complete, pressing Enter will change the Current Status to Disabled.

The panel is displayed until you use PF3 or PF12.

# **On CICS normal shutdown**

CICS normal shutdown starts normal disable processing for CICS ONC RPC.

# **On CICS immediate shutdown**

On CICS immediate shutdown, all transactions are terminated. Clients are not informed of the shutdown or its effects. The program-version-protocol 3-tuples that are registered with TCP/IP for MVS might remain registered.

# Updating the CICS ONC RPC data set

If you select option 2 on panel DFHRP01, or option 2 on panel DFHRP04, panel DFHRP20 is shown. (See Figure 51.)

CRPC	CICS ONC RPC for MVS/ESA Update CICS ONC RPC Data set	DFHRP20
Select one	of the following. Then press Enter.	
2. Displ 3. Defin 4. Retri	or modify the CICS ONC RPC definition record lay a list of remote procedure definitions ne a new procedure ieve a specified procedure from the data set (Enter required Program Number ===> 0-FFFFFFF Version Number ===> 0-FFFFFFF Procedure Number ===> 1-FFFFFFF Protocol ===> UDP Udp   Tcp	data)
Current Sta	atus:	
PF1=Help	SYSID= CI41 APPLID= PF3=Exit PF9=Messages PF12=Return	IYK1ZFL1

Figure 51. Panel DFHRP20

The Current Status field in this panel might show Enabled or Disabled, depending on which panel you came from.

Before selecting option 4, you must supply the following information:

### Program Number

The program number of the 4-tuple whose definition is to be retrieved.

#### Version Number

The version number of the 4-tuple whose definition is to be retrieved.

#### **Procedure Number**

The procedure number of the 4-tuple whose definition is to be retrieved.

#### Protocol

1

The protocol of the 4-tuple whose definition is to be retrieved.

Select an option, then press Enter.

#### **Option For more information see:**

"Updating the CICS ONC RPC definition record" on page 285

- 2 "Working with a list of 4-tuples" on page 286
- **3** "Changing the attributes of a 4-tuple" on page 287
- 4 "Changing the attributes of a 4-tuple" on page 287

If you specify a 4-tuple which is not defined in the CICS ONC RPC data set, a message is issued when you press Enter, and panel DFHRP20 remains on the screen.

# Updating the CICS ONC RPC definition record

If you select option 1 on panel DFHRP20, panel DFHRP22 is shown. (See Figure 52.)

	CICS ON Update CICS ON	NC RPC for MVS	
Overtype to Modify		Choice	Possible Options
Trace	===>	STARTED	STArted   STOpped
Trace Level	===>	1	1   2
Resource Checker	===>	NO	Yes   No
CRPM Userid	===>	CICSUSER	
Automatic Enable	===>	NO	Yes   No
Current Status:			
			SYSID= CI41 APPLID= IYK1ZFL1
PF1=Help PF3=Exit	PF9=Messages	PF12=Retur	

Figure 52. Panel DFHRP22

The values displayed in the Choice column are those stored in the CICS ONC RPC data set.

After you have made your changes you should press Enter to get them validated. You can then press Enter again to update the CICS ONC RPC data set with the values you have supplied. The next time you start the connection manager, the saved options are used to set up panel DFHRP02

**Trace** Specifies whether CICS ONC RPC tracing is active. STARTED (STA) means it is active, STOPPED (STO) means it is not. The default value is STARTED.

CICS ONC RPC exception trace entries are always written to CICS internal trace whatever the setting of this option. To get non-exception trace entries written, CICS trace must be started, and this option must be set to STARTED.

#### **Trace Level**

Specifies the trace level for CICS ONC RPC. The value 1 means that level 1 trace points are traced, 2 means that both level 1 and level 2 are traced. The default value is 1.

### **Resource Checker**

YES (Y) means that CICS ONC RPC is to call the user-written resource-checking module on receipt of every incoming RPC request. NO (N) means the resource checker is not to be called. The default is NO.

#### **CRPM Userid**

Specifies the CICS user ID under which the server controller is to operate. The default is the default user ID for the CICS system in which CICS ONC RPC is operating.

#### **Automatic Enable**

Enter YES (Y) or NO (N). If YES is stored in the CICS ONC RPC data set, you can enable CICS ONC RPC by just typing CRPC; all values are defaulted from the CICS ONC RPC data set, CICS ONC RPC becomes enabled without further user input, and all the 4-tuples with YES for their Register from Data Set option are registered. The default value is NO.

Setting this field has an effect only when you enable CICS ONC RPC. If you save the values to the CICS ONC RPC data set, this value will be effective the next time you enable, unless you override it. The value of this field in the CICS ONC RPC data set may be overridden by the fast path command CRPC E A(N).

### Working with a list of 4-tuples

If you select option 2 on panel DFHRP03, or option 2 on panel DFHRP20, panel DFHRP14 is shown. (See Figure 53.)

CRPC	CICS ONC RPC for MVS/ESA Remote Procedure Definition List	DFHRP14

PF1=H	SYSID= CI41 APPLID= IYK1ZFL1 PF1=Help PF2=Refresh PF3=Exit PF7=Back PF8=Forward PF9=Messages PF12=Return				

This panel presents a list of 4-tuples currently defined in the CICS ONC RPC data set. If CICS ONC RPC is enabled, the 4-tuples that are currently registered are shown highlighted. You can put a command against a 4-tuple, and it takes effect when you press Enter. The following commands can be entered against a 4-tuple:

- **D** Deletes the definition from the data set.
- **R** If CICS ONC RPC is enabled, registers the 4-tuple with CICS ONC RPC. If CICS ONC RPC is disabled, this command produces an error message.

Figure 53. Panel DFHRP14

- **M** Shows panel DFHRP21. See "Changing the attributes of a 4-tuple" for details.
- **?** Shows panel DFHRP15, which displays the attributes of a 4-tuple, but does not allow changes.

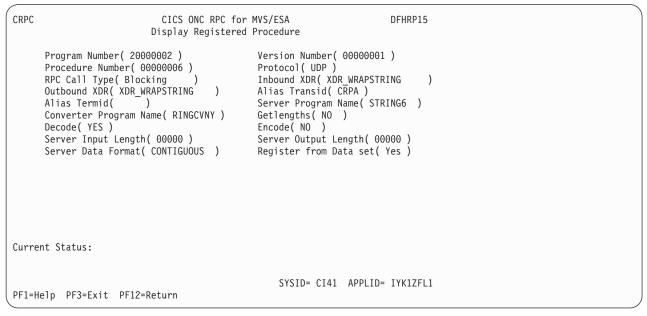

Figure 54. Panel DFHRP15

### Changing the attributes of a 4-tuple

If you select option 3 or 4 on panel DFHRP20, or if you enter the **M** command on panel DFHRP14, panel DFHRP21 is shown. (See Figure 55 on page 288.)

The attributes of a 4-tuple are divided into three categories:

- ONC RPC attributes—see "ONC RPC attributes" on page 276.
- CICS attributes—see "CICS attributes" on page 277.
- CICS ONC RPC attributes—see "CICS ONC RPC attributes" on page 278.

Figure 55. Panels DFHRP21 and DFHRP2B

You can use these panels to delete a 4-tuple definition from the CICS ONC RPC data set by pressing PF2.

If you wish to modify the 4-tuple definition, you should first make modifications to panel DFHRP21, and then press PF8 to move to panel DFHRP2B. From panel DFHRP2B you can press PF7 if you wish to go back to panel DFHRP21. After you have made your modifications to the panels, you should press Enter to get all the modifications validated, and then press Enter again to get the definition changed.

# Processing the alias list

If you select option 4 on panel DFHRP10, panel DFHRP17 is shown. (See Figure 56 on page 289.)

This panel gives a list of the aliases that have been started, or scheduled, by the server controller, but have not yet ended. Each alias has two lines on the panel.

- The first line shows the 4-tuple for the client request.
- The second line shows the CICS task number of the alias that is processing the client request.

If the alias is scheduled, but not yet started, the task number is blank. If the alias has started, a task number is given and the line is highlighted.

You can enter the following commands against an alias:

- **P** Purges the alias.
- **?** Shows panel DFHRP18, which displays details of the alias and the associated client request. (See Figure 57 on page 290.)

If the alias is scheduled, but not yet started, the task number and start time are blank. If the alias has started, a task number and start time are given.

CRPC	CICS ONC RPC for MVS/ESA Alias List	DFHRP17

# **Chapter 23. Programming with CICS ONC RPC**

This chapter tells you how to write the user-replaceable programs that were described in "CICS ONC RPC user-replaceable programs" on page 253. It describes the general process of development, including details of the interfaces to the converter functions.

This chapter contains Product-sensitive Programming Interface and Associated Guidance Information.

This chapter is organized as follows:

- "Developing an ONC RPC application for CICS ONC RPC"
- "Reference information for the converter functions" on page 303

# **Developing an ONC RPC application for CICS ONC RPC**

ONC RPC applications are always developed as client/server pairs. The process described in this section takes account of this, but concentrates on the server, because CICS ONC RPC affects this and not the client. For details of the client development process, read the documentation of the ONC RPC system running on the client machine.

The process of developing all the material needed for an ONC RPC application using CICS ONC RPC is summarized in Figure 58, which should be compared with Figure 32 on page 248, which showed the process for ONC RPC without CICS ONC RPC.

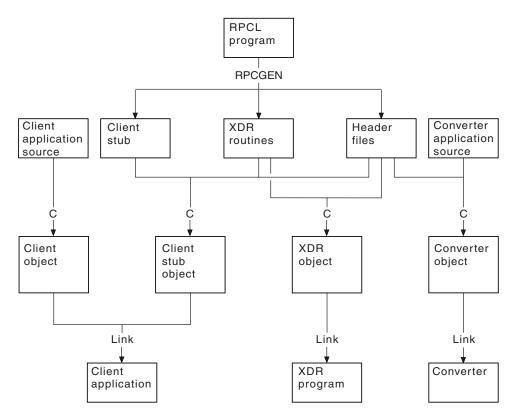

Figure 58. Program development with CICS ONC RPC

The figure shows the development process when RPCGEN is used to create source text from the interface definition in the RPCL program. If you do not use RPCGEN, you must supply some of its output—XDR routines and header files—yourself. The development of the CICS program to service client requests is not shown.

The sequence of development of an ONC RPC application is summarized below. Each step is described in detail in the sections following the summary.

- Decide what data is to be sent from client to server and what is to be returned. If the data structures the client uses are not simple, you might choose to use RPCGEN to help with managing the data. If you choose to use RPCGEN, some of its output is useful for writing the user-replaceable programs for CICS ONC RPC.
- 2. Decide the format of the communication area to be used by the CICS program. If the client is to use an existing CICS program, the format is already decided.
- 3. Write the XDR routines. If the translations you need can be done by an XDR library function supported by the connection manager (see Table 26 on page 293), you do not need to write an XDR routine. If you used RPCGEN, it has generated source for XDR routines. In any other case you must write the XDR routines yourself.

XDR routines must be written in C.

- 4. Write the converter. If you used RPCGEN, and you are going to write your converter in C, the header files produced by RPCGEN describe the data structures that **Decode** receives and **Encode** returns. The format of the CICS program communication area is also used by **Decode** and **Encode**.
- 5. Write the resource checker, if required. You may want to write your own resource checker to validate incoming client requests. Chapter 24, "CICS ONC RPC security," on page 315 tells you about this and other security facilities available for use with CICS ONC RPC. "Writing the resource checker" on page 317 gives you details on writing a resource checker.
- 6. Compile and link the user-replaceable programs. If you used RPCGEN, the header files are needed for the compilation of the XDR routines and the converter if it is in C.
- 7. Define the server application set to CICS. This means defining programs for the CICS program, any XDR routines that are not just XDR library functions, and the converter. One or more alias transaction definitions may also be required, see "Defining CICS ONC RPC resources to CICS" on page 263.
- 8. Use the connection manager to define a 4-tuple and save it in the CICS ONC RPC data set. The definition specifies the CICS program, XDR routines, and converter, as described in "Defining the attributes of a 4-tuple" on page 275.

### Step 1—Decide what data is to be sent

This step is outside the scope of this manual. What you do depends on the nature of the data to be sent with the request and with the reply. Defining data with RPCL and the use of RPCGEN are described in Sun Microsystems' publication *Network Programming.* 

# Step 2—Decide the format of the communication area

This step is also outside the scope of this manual. You are reminded that if the CICS program that services a client request is not in the same CICS region as CICS ONC RPC, the maximum communication area length is 35 000 bytes. If the CICS program resides in a server other than CICS Transaction Server for OS/390, other restrictions might also apply.

# Step 3—Write the XDR routines

If you used RPCGEN in Step 1, you use the XDR source programs generated by RPCGEN. If the XDR source uses the **xdr\_char** or **xdr\_u\_char** XDR library functions, you must use the C #define directive to make the compiler use the **xdr\_text\_char** function instead.

If the translations you need can be done by an XDR library function supported by the connection manager (see Table 26), you do not need to write an XDR routine. Instead you specify one of the XDR library functions described below when you register a 4-tuple with the connection manager.

If you write your own XDR routine, you need to use the XDR library functions. The full C definitions of these functions are documented in the *TCP/IP for MVS: Programmer's Reference*.

CICS ONC RPC supports only the functions listed below. You should use only these functions in your own XDR routines. These functions convert C data types to XDR formats, and XDR formats to C data types.

Some of these function names cannot be used in the connection manager when specifying XDR library functions for the inbound and outbound XDR routines for a 4-tuple. In the column headed **CM**, an asterisk means that the XDR library routine can be specified in the connection manager, while a blank means that it cannot.

XDR library function	СМ	C type
xdr_int	*	int
xdr_u_int	*	unsigned int
xdr_long	*	long
xdr_u_long	*	unsigned long
xdr_short	*	short int
xdr_u_short	*	unsigned short int
xdr_float	*	float
xdr_bool	*	bool_t (see note)
xdr_double	*	double
xdr_enum		enum
xdr_void	*	void
xdr_array		variable-length array
xdr_opaque		fixed-length uninterrupted data
xdr_bytes		variable-length array of bytes
xdr_pointer		object references, including null pointers
xdr_reference		object references
xdr_char	*	character
xdr_u_char	*	unsigned character
xdr_text_char	*	text character
xdr_string		null-terminated character arrays
xdr_vector		fixed-length array with arbitrary element size
xdr_wrapstring	*	variable-length null-terminated character arrays
xdr_union		discriminated union

Table 26. Supported XDR library functions

Note: bool\_t is not a built-in C data type; it is defined in an ONC RPC header (as a C int).

Names of user-written XDR routines are subject to the same restrictions as CICS programs.

You must take care when writing your own XDR routines. These run in the CICS address space and can overwrite CICS code and other user application storage, because they are defined with EXECKEY(CICS).

### Code page conversions

Conversion between ASCII and EBCDIC (or vice versa) is done by XDR library functions supplied as part of TCP/IP for MVS. The relevant XDR routines are **xdr\_text\_char**, **xdr\_string**, and **xdr\_wrapstring**. These routines use EBCDIC-to-ASCII and ASCII-to-EBCDIC translate tables, which are loaded at TCP/IP for MVS initialization from a data set containing one of the possible translate tables provided with TCP/IP for MVS.

Thus all ONC RPC requests from all clients use the same translate table. There is no provision for ONC RPC data from different client workstations or from different client end users to have different character sets.

Various single-byte character set (SBCS) translate tables are provided with TCP/IP for MVS, one of which is generated during TCP/IP for MVS customization. If none of these is suitable, you could provide your own, as described in the *TCP/IP for MVS: Customization and Administration Guide*.

TCP/IP for MVS 3.1 provides several code pages for double-byte character sets (DBCS). If you want to include DBCS in ONC RPC data you have to write your own XDR routines to convert the double-byte characters.

### Step 4—Write the converter

Write the converter as described in "Write theCICS ONC RPC converter" on page 295, using reference information supplied in "Reference information for the converter functions" on page 303.

Step 5—Write a resource checker

This step is optional. See "Writing the resource checker" on page 317 for details.

### Step 6—Compile and link

This step puts the programs you have written into CICS load libraries.

### Converter

The header files needed to compile the converter are discussed in "Organizing the converter" on page 297.

The program is linked into a CICS load library, since it is a normal CICS program.

### **XDR** routines

If your XDR routines are not just XDR library functions, you must compile each XDR routine separately and link it into a CICS load library. If you used RPCL to define the data, the XDR source and header files for the compilation have been generated by RPCGEN.

### **Resource checker**

If you need a resource checker, you must link it into a CICS load library. It must be called DFHRPRSC.

# Step 7—Make CICS definitions

You must define the CICS program, converter program, resource checker, and any XDR routines that are not just library routines to CICS. See "Defining CICS ONC RPC resources to CICS" on page 263.

# Step 8—Make a connection manager entry

Use the connection manager to define each 4-tuple. Completing an entry for a 4-tuple in the connection manager ensures that you provide CICS ONC RPC with all the information that it needs to service the client request.

The fields used to define each 4-tuple are described in "Defining the attributes of a 4-tuple" on page 275.

# Write theCICS ONC RPC converter

This section describes how you can write a converter to perform various tasks. Some of these tasks are required for all 4-tuples, others only for some.

The section describes in turn each of the tasks, indicating the converter function (**Getlengths**, **Decode**, or **Encode**) used.

The parameter details and responses of each of the converter functions are given at the end of the section in "Getlengths" on page 304, "Decode" on page 306, and "Encode" on page 311.

### Tasks that can be performed by a converter

The tasks to be performed are:

- Telling the connection manager or the server controller the lengths of the input and output data for the CICS program
- Telling the connection manager the CICS program data format
- Mapping data between client and CICS program formats, as illustrated in Figure 37 on page 257 and Figure 39 on page 258
- Telling the server controller which alias and CICS program are to be used to service a request, if those specified when the 4-tuple was defined are to be changed

### Lengths of the CICS program input and output data

CICS ONC RPC needs to know the length of the CICS program input and output data for each 4-tuple. For each 4-tuple, the lengths may be defined in one of three places:

- In the connection manager if the lengths do not vary from call to call. You specify the lengths in the connection manager and specify NO for the Getlengths attribute of the 4-tuple. In this case **Getlengths** is not called.
- In Getlengths if the lengths do not vary from call to call, returning the values in the glength\_server\_input\_data\_len and glength\_server\_output\_data\_len output fields. In the connection manager you specify YES for the Getlengths attribute of the 4-tuple, and leave the length fields blank.

In either of these first two cases, if **Decode** is specified for the 4-tuple, the **Decode** function can change the lengths.

 In Decode, if the lengths of the data structures vary from call to call. You return the lengths on each call by using the decode\_server\_input\_data\_len and **decode\_server\_output\_data\_len** output fields. The lengths specified with the connection manager or **Getlengths** are supplied as inputs to **Decode** in these fields.

### Setting the CICS program data format

CICS ONC RPC needs to know the CICS program data format for each 4-tuple. The data format defines how the input and output data is arranged in the CICS program communication area. You can set this either in **Getlengths** or in the connection manager. If you choose **Getlengths**, use the output field **glength\_server\_data\_format**. The value specified with the connection manager is supplied as input to **Getlengths** in this field.

### Mapping data between client and CICS program formats

You need to map the incoming data intended for the CICS program only if it is not in the format required by the CICS program. This is typically for:

- Client data structures that contain pointers to other data. These are rebuilt by the inbound XDR routine in the same form as they existed in the client. The data for the CICS program must be copied into a single area of storage to be passed to the CICS program as its communication area.
- CICS programs that are written in a language other than C. The incoming client request always has a C data structure. If your CICS program is written in COBOL, for example, you need to perform a C-to-COBOL mapping in **Decode**.

The mapping is always done by **Decode** for the input data for the CICS program. In most cases, the output data needs to be mapped in the opposite direction by **Encode**.

On input, the client data is pointed to by the **Decode** input field **decode\_client\_data\_ptr**. **Decode** maps this data into the form which the CICS program requires.

To achieve the mapping, **Decode** must allocate an area of CICS storage, using EXEC CICS GETMAIN SHARED. **Decode** must set the output field **decode\_returned\_data\_ptr** to the address returned by the GETMAIN command, and put the input data passed from the client into the storage, making changes where applicable.

### Changing the alias and CICS program

You can use **Decode** to redirect a client request to another CICS program. CICS ONC RPC then ignores the original program name that was defined in the connection manager for the requested 4-tuple. To reroute a client request, specify a new CICS program name in the **decode\_server\_program** field in **Decode**. This facility allows a client to pass a CICS program name in the data it sends in the remote procedure call. The new CICS program must work with the same communication area format, converter, and XDR output routine as the original program.

You can use **Decode** to change the name of the alias transaction to run the CICS program by setting the **decode\_alias\_transid** output field. CICS ONC RPC then ignores the transaction ID that was defined in the connection manager for the requested 4-tuple. This facility allows a client to pass the alias transaction ID in the data it sends with the remote procedure call.

### Changing security information

You may want your CICS ONC RPC system to implement security checking on incoming client requests. Such checking usually involves checks on the client user ID and password. One of the ways the client can provide these is by including them in the data structure it sends.

**Decode** can retrieve this information from the incoming data, and return it in the output fields. The user ID should be returned in the output field **decode\_userid**; the password should be returned as part of the data pointed to by the **decode\_returned\_data\_ptr** field. These outputs can either be passed by the client or generated by **Decode** in whatever way you want. For instance, **Decode** can derive the CICS user ID and password for the client request by using the **decode\_client\_address** field, or the authentication fields **decode\_aup\_...** that identify the client.

### Organizing the converter

You can write converters for any CICS-supported compiler. If you choose a language other than C or COBOL, you must write your own header files to define the CICS ONC RPC data structures and constants.

A converter is passed a communication area that contains a parameter that specifies which of the three functions **Getlengths**, **Decode**, or **Encode** is required, and parameters for the particular function, as described in the reference material: "Getlengths" on page 304, "Decode" on page 306, and "Encode" on page 311.

The following C header files (in the SDFHC370 target library) and COBOL copybooks (in the SDFHCOB target library) are provided to help with writing the converter:

- DFHRPUCH for C (DFHRPUCO for COBOL)—contains definitions of the constants that are used in the interface between CICS ONC RPC and the converter.
- DFHRPCDH for C (DFHRPCDO for COBOL)—defines the format of the communication area that is presented to the converter. The communication area is in two parts. The format of the first part is independent of the function that the converter is being asked to perform, and it contains:
  - The eyecatcher for the requested function
  - The function code for the requested function
  - A response to be supplied by the converter
  - A reason code to be supplied by the converter

The format of the rest of the communication area depends on the converter function requested.

You need a header file produced by RPCGEN only if you used RPCL to define the data structures, and you are writing **Decode** or **Encode**. If you are writing your converter in a language other than C, you need to rewrite the header file in your chosen language, since RPCGEN produces its output only in C.

You need definitions of the CICS structures that you use, and the definition of the CICS program communication area.

### Writing a converter in C

The following discussion is based on a converter that consists of four main parts:

- A routing part that consults the function code in the communication area, and then calls the appropriate function
- A function for Getlengths processing
- A function for **Decode** processing
- A function for Encode processing

Figure 59 shows how you can route control to the appropriate function.

```
EXEC CICS ADDRESS EIB(dfheiptr);
                                       /*Get addressability of EIB*/
EXEC CICS ADDRESS COMMAREA(converter parms ptr);
switch(converter parms ptr->converter function) {
 case URP GETLENGTHS:
 ł
   converter_getlengths();
   break;
 }
 case URP DECODE:
 ł
   converter decode();
   break;
 }
 case URP_ENCODE:
 {
   converter encode();
   break;
 }
 default:
 ł
   converter_parms_ptr->converter_response = URP_INVALID;
 }
}
    /* end switch */
EXEC CICS RETURN;
```

```
} /* end main */
```

Figure 59. Routing control to the functions in C

In this program fragment, converter\_parms\_ptr is a locally declared pointer to the converter\_parms structure declared in DFHRPCDH. All the other names beginning converter\_ are names from this structure.

The processing is as follows:

- 1. The converter\_parms\_ptr pointer is set by using EXEC CICS ADDRESS COMMAREA.
- 2. The **switch** statement is used to select the function to be called. If you are not providing all the functions, you need fewer **case** statements.
- 3. If the function is not valid, the response URP\_INVALID is returned from the converter. This test is always advised, especially if the converter does not provide all three functions.

Figure 60 on page 299 is an example of a **Decode** function.

```
void converter decode(void)
  decode parms *decode parms ptr;
 decode parms ptr = (decode parms *)converter parms ptr;
  if (strncmp
  (decode parms ptr->decode eyecatcher, DECODE EYECATCHER INIT, 8)
  == 0)
  {
    EXEC CICS GETMAIN
      SET(decode parms ptr->decode returned data ptr)
      FLENGTH(sizeof(rem_proc_parms_103) + PW_LEN)
      SHARED
      NOSUSPEND
      CICSDATAKEY
      RESP(response)
      RESP2(response2);
    if (response != DFHRESP(NORMAL))
      memcpy(outline,errmsg1,strlen(errmsg1));
      EXEC CICS WRITEQ TD QUEUE(tdq) FROM(outline) LENGTH(30);
      decode parms ptr->decode response = URP EXCEPTION;
      decode parms ptr->decode reason = NO STORAGE;
    else
    ł
      /* move password and data to decode password and
      decode_server_input_data */
      decode_parms_ptr->decode_response = URP_OK;
    };
  }
  else
    decode_parms_ptr->decode_response = URP_INVALID;
```

Figure 60. Example of a Decode function in C

In this program fragment, names beginning decode\_, except decode\_parms\_ptr, are names from the decode\_parms structure defined in DFHRPCDH.

The processing is as follows:

- 1. The pointer decode\_parms\_ptr is set from converter\_parms\_ptr.
- 2. The eyecatcher is checked to see if it agrees with the function code. If it does:
  - a. EXEC CICS GETMAIN is used to get storage for the password and for the communication area to be passed to the CICS program. The value of PW\_LEN is set elsewhere in the program to 8 by #define. The output parameter decode\_returned\_data\_ptr is used directly in the GETMAIN. In this case there is no conversion of data to be done, and the communication area size is the same as the size of the client data structure. (rem\_proc\_parms\_103 is a structure that defines the input data after XDR conversion.)
  - b. If the response to the EXEC CICS GETMAIN is not NORMAL, an error message is directed to a transient data queue, the converter response is set to URP\_EXCEPTION, and the reason code is set to NO\_STORAGE, which is locally declared.
  - c. If the response to the EXEC CICS GETMAIN is NORMAL, the data and password are transferred to the storage acquired by GETMAIN (not shown), and the converter response is set to URP\_OK.

3. If the eyecatcher is not the one for the function being called, the converter response is set to URP\_INVALID.

### Writing a converter in COBOL

In the working storage section of the data division, you should use the COPY statement to copy the copybook DFHRPUCO, and any other copybooks you need. You should also define any other data items you need in working storage.

You use the COPY statement to include the definition of the communication area in the linkage section of the data division.

Figure 61 on page 301 shows the layout of the data division. Comments, which would be part of a well-documented converter, are omitted.

The following discussion is based on a converter that consists of four main parts:

- A routing part that consults the function code in the communication area, and then calls the appropriate function
- · A function for Getlengths processing
- A function for **Decode** processing
- A function for Encode processing

Figure 62 on page 302 shows how you can route control to the appropriate function.

```

           TO ADDRESS OF DECODE-SERVER-INPUT-DATA
MOVE CLIENT-IN-U-CHAR TO REM-PROC-U-CHAR
MOVE CLIENT-IN-CHAR TO REM-PROC-CHAR
MOVE URP-OK TO DECODE-RESPONSE.
```

Figure 63. Example of a Decode function in COBOL

In this program fragment, the names beginning DECODE- (except DECODE-PASSWORD) are fields in the communication area for the **Decode** function. DECODE-PASSWORD is the field at the beginning of the returned data. The processing is as follows:

- 1. The eyecatcher is checked to see if it agrees with the function code. If it does not, the URP-INVALID response is returned.
- 2. If it does:
  - a. The structure CLIENT-IN-DATA is overlaid on the data coming from the inbound XDR routine addressed by DECODE-CLIENT-DATA-PTR.
  - b. The communication area size is increased by 8 to allow for the password field.
  - c. EXEC CICS GETMAIN is used to get storage for the password and for the communication area. REM-PROC-COMMSIZE is the size of the structure REM-PROC-DATA, which defines the format of the communication area. The address of the storage is put directly into DECODE-RETURNED-DATA-PTR.
  - d. The structure DECODE-RETURNED-DATA is overlaid on the newly-acquired storage addressed by DECODE-RETURNED-DATA-PTR.
  - e. The password is moved into DECODE-PASSWORD.
  - f. The data is moved from CLIENT-IN-DATA to REM-PROC-DATA, and the response is set to URP-OK.

## **Using converters**

Converters run as CICS programs under the connection manager, server controller, and aliases. Converters must reside in the same CICS system as CICS ONC RPC.

## Preparation

Before using a converter, you must:

- 1. Translate the converter using the appropriate CICS translator. If it is a COBOL program, you must use the QUOTE translator directive.
- 2. Compile the output from the translator.
- 3. Link the converter as a standard CICS application program into a CICS load library used by the CICS system on which CICS ONC RPC is installed.
- 4. Define the converter to CICS as a program.
- 5. Use the connection manager to specify the converter in one of the 4-tuple definitions, and define which of the converter functions are required for that 4-tuple.

# Reference information for the converter functions

This section contains reference material for each of the three functions of a converter. Each function is documented in the same way:

- A summary table of parameters, showing which are for input only, which for input and output, and which for output only.
  - **Input** is for parameters that your function may consult, but not change.
  - **Inout** is for parameters that your function may consult, and change.
  - **Output** is for parameters that your function must not consult, but may change.
- A description of the processing that the function is expected to do.
- A list of parameters in alphabetical order, with a description of how CICS ONC RPC sets up the inputs, and what use it makes of the outputs.

 A list of the responses and reason codes that the converter can return, with a description of the action that CICS ONC RPC takes for each response and reason code.

The descriptions give the names of the program elements as they appear in C. In COBOL the names are all in uppercase, and the underscores are replaced by hyphens.

## Getlengths

Getlengths is called when the definition of the 4-tuple is being registered.

**Getlengths** is called when the definition of the 4-tuple is being registered, provided that the definition of the 4-tuple specified that **Getlengths** was to be called. It is not called to process client requests.**Getlengths** is responsible for providing CICS ONC RPC with:

- · The size of the data that is passed to and from the CICS program
- · The data format (contiguous or overlaid) of the CICS program data

## Summary of parameters

The names of the parameters are given in abbreviated form: each name in the table must be prefixed with **glength**\_ to give the name of the parameter.

To find the C type of each parameter, consult the header file DFHRPCDH provided with CICS ONC RPC. For COBOL, consult the copybook DFHRPCDO.

Input glength_	Inout glength_	Output glength_
	server_data_format	
eyecatcher		server_input_data_len
function		server_output_data_len
		response
		reason

## **Parameters**

#### glength\_eyecatcher

(Input only)

A string of length 8. (The values of the eyecatchers are defined in the DFHRPUCH header file and the DFHRPUCO copybook.)

## glength\_function

(Input only)

A code indicating that **Getlengths** is being called. The value is URP\_GETLENGTHS.

### glength\_reason

(Output only)

A reason code—see "Response and reason codes" on page 305.

#### glength\_response

(Output only)

A response code—see "Response and reason codes" on page 305.

#### glength\_server\_data\_format

(Input and output)

On input, that value specified for Server Data Format for the 4-tuple in the connection manager.

On output, the value is to control:

- · How the input data pointer for Encode will be set up
- How the communication area length to be checked by the connection manager is calculated

The values you can supply are as follows:

## **URP\_CONTIGUOUS**

The value of the data pointer that will be passed to **Encode**, or to the outbound XDR routine if **Encode** is not used for this 4-tuple, is the address of the CICS program communication area plus the output value of **glength\_server\_input\_data\_len**, though **Decode** can modify this offset.

The connection manager calculates a communication area length by adding the output values of **glength\_server\_input\_len** and **glength\_server\_output\_len**. If this length is different from the actual length of the communication area passed to the CICS program, errors might occur in the processing of client requests.

## URP\_OVERLAID

The value of the data pointer that will be passed to **Encode**, or to the outbound XDR routine if **Encode** is not used for this 4-tuple, is the address of the CICS program communication area.

The connection manager calculates a communication area length by taking the larger of the output values of

glength\_server\_input\_len and glength\_server\_output\_len. If this length is different from the actual length of the communication area passed to the CICS program, errors might occur in the processing of client requests.

## glength\_server\_input\_data\_len

(Output only)

For the use of this field, see the description of **glength\_server\_data\_format**. If you do not set a value in this field, a default value of zero is used.

## glength\_server\_output\_data\_len

(Output only)

For the use of this field, see the description of

**glength\_server\_data\_format**. If you do not set a value in this field, a default value of zero is used.

## **Response and reason codes**

You must return one of the following values in the glength\_response field:

## URP\_OK

The connection manager checks that the communication area length does not exceed 32 767. If it does not, the information is saved and used to process incoming client requests, and the 4-tuple is registered. If it does, the connection manager writes an exception trace entry (trace point 9EE6), sends a message (DFHRP1991) describing the error to the terminal from which the connection manager was started, and does not register the 4-tuple.

## **URP\_EXCEPTION**

The connection manager writes an exception trace entry (trace point 9EE5), sends a message (DFHRP1988) to the terminal from which the connection manager was started, and does not register the 4-tuple.

### **URP\_INVALID**

The connection manager writes an exception trace entry (trace point 9EE5), sends a message (DFHRP1989) to the terminal from which the connection manager was started, and does not register the 4-tuple.

#### **URP\_DISASTER**

The connection manager writes an exception trace entry (trace point 9EE5), sends a message (DFHRP1990) to the terminal from which the connection manager was started, and does not register the 4-tuple.

If you return any other value in **glength\_response**, it is treated as URP\_DISASTER.

You can supply a 32-bit reason code in conjunction with the response value to provide further information in error cases. CICS ONC RPC does not take any action on the reason code returned by **Getlengths**. The reason code is output in any trace that results from the invocation of **Getlengths**, and you may use it as a debugging aid.

See "Numeric values of response and reason codes" on page 324 for the numeric values of the response codes in trace output.

## Decode

**Decode** is invoked by the server controller after the inbound XDR routine.

**Decode** is invoked by the server controller after the inbound XDR routine. **Decode** processing must avoid making the server controller wait for resources, as this prevents the server controller from dealing efficiently with other requests. **Decode** has four main responsibilities:

- To set data lengths for the CICS program when the lengths are not the same for all requests.
- To map the input data passed from the inbound XDR routine to the input data format required by the CICS program.
- To set the user ID and password that are used to control subsequent processing.
- To set the name of the alias and CICS program for the request if those specified for the 4-tuple need to be changed.

## Summary of parameters

The names of the parameters are given in abbreviated form: each name in the table must be prefixed with **decode**\_ to give the name of the parameter.

To find the C type of each parameter, consult the header file DFHRPCDH provided with CICS ONC RPC. For COBOL, consult the copybook DFHRPCDO.

Input decode_	Inout decode_	Output decode_
eyecatcher function client_address client_data_ptr server_data_format program_number version_number procedure_number aup_time aup_time aup_machname_ptr aup_machlen aup_uid aup_gid aup_len aup_gids_ptr	server_program alias_transid server_input_data_len server_output_data_len	returned_data_ptr userid user_token response reason

**Decode** must issue EXEC CICS GETMAIN to allocate storage for the communication area to be passed to the CICS program. Note the following points about GETMAIN options:

- You must use the SHARED option, since the storage is acquired under the server controller, but is used under the alias.
- You must use the FLENGTH option.
- You must use the NOSUSPEND option to prevent the server controller from being made to wait for storage, as this would prevent the server controller from attending to incoming requests.
- To prevent overwriting by user-key programs, you should consider using the CICSDATAKEY option in the following circumstances:
  - The CICS program to be called by the alias is in another CICS system.
  - The CICS program to be called by the alias is defined as EXECKEY(CICS).
  - The CICS program to be called by the alias is defined as EXECKEY(USER), but the amount of data to be copied is small.

If an overlaid data format is specified, the requested length must be the greater of the output values of **decode\_server\_input\_data\_len** and **decode\_server\_output\_data\_len** plus 8 for DECODE-PASSWORD. If the data format is not overlaid, this length must be the sum of the output values of **decode\_server\_input\_data\_len** and **decode\_server\_output\_data\_len** plus 8 for DECODE-PASSWORD.

Because **Decode** specifies the SHARED option, the data remains available to CICS ONC RPC modules and to CICS programs. CICS ONC RPC frees the storage when it is no longer required.

## **Parameters**

## decode\_alias\_transid

(Input and output)

On input, the name of the alias associated with the 4-tuple for the client request.

On output, the name of the transaction to be started by the server controller to process this client request.

See "Changing the alias and CICS program" on page 296.

## decode\_aup\_gid

(Input only)

The client's UNIX group id.

#### decode\_aup\_gids\_ptr

(Input only)

A pointer to an array of 32-bit integers that are the UNIX group ids of which the client is a member.

#### decode\_aup\_len

(Input only)

The number of elements in the array of UNIX group identifiers pointed to by **decode\_aup\_gids\_ptr**.

#### decode\_aup\_machlen

(Input only)

The number of characters in the machine name.

## decode\_aup\_machname\_ptr

(Input only)

A pointer to a variable length character string representing the name of the machine on which the client is executing.

## decode\_aup\_time

(Input only)

The time at which the client created the credentials. The time is measured in seconds since 00h00m GMT on 1 January 1970.

#### decode\_aup\_uid

(Input only)

The client's UNIX user ID.

## decode\_client\_address

(Input only)

The 32-bit internet address of the client from which the request was received.

## decode\_client\_data\_ptr

(Input only)

A pointer to the data passed from the client. If there is no data, this pointer points to a null string.

Note: The data area pointed to by this pointer must not be changed by Decode, or CICS storage management errors are likely to occur.

## decode\_eyecatcher

(Input only)

A string of length 8. (The values of the eyecatchers are defined in the DFHRPUCH header file and the DFHRPUCO copybook.)

#### decode\_function

(Input only)

A code indicating that **Decode** is being called. The value is URP\_DECODE.

## decode\_procedure\_number

(Input only)

The procedure number of the 4-tuple to which the client request was made.

## decode\_program\_number

(Input only)

The program number of the 4-tuple to which the client request was made.

## decode\_reason

(Output only)

A reason code—see "Response and reason codes" on page 310.

## decode\_response

(Output only)

A response code—see "Response and reason codes" on page 310.

### decode\_returned\_data\_ptr

(Output only)

A pointer to an area of storage allocated by the converter that contains:

- decode\_password—the password to be used for user authentication
- decode\_server\_input\_data—the data that is to be passed to the CICS program as input.

It may be null if there is no password and if no data is to be passed to the CICS program.

## decode\_server\_data\_format

(Input only)

A value that controls:

- · How the input data pointer for Encode will be set up
- How the communication area length to be checked by the connection manager is calculated

## **URP\_CONTIGUOUS**

The value of the data pointer that will be passed to **Encode**, or to the outbound XDR routine if **Encode** is not used for this 4-tuple, is the address of the CICS program communication area plus the output value of **decode\_server\_input\_data\_len**.

The server controller calculates a communication area length by adding the output values of **decode\_server\_input\_data\_len** and **decode\_server\_output\_data\_len**. If this length is different from the actual length of the communication area passed to the CICS program, errors might occur in the processing of client requests.

## URP\_OVERLAID

The value of the data pointer that will be passed to **Encode**, or to the outbound XDR routine if **Encode** is not used for this 4-tuple, is the address of the CICS program communication area.

The server controller calculates a communication area length by taking the larger of the output values specified of **decode server input data len** and

**decode\_server\_output\_data\_len**. If this length is different from the actual length of the communication area passed to the CICS program, errors might occur in the processing of client requests.

## decode\_server\_input\_data\_len

(Input and output)

On input, the output value of **glength\_server\_input\_data\_len**, or the value specified for Server Input Length for this 4-tuple in the connection manager.

On output, see the description of decode\_server\_data\_format.

## decode\_server\_output\_data\_len

(Input and output)

On input, the output value of **glength\_server\_output\_data\_len**, or the value specified for Server Output Length for this 4-tuple in the connection manager.

On output, see the description of **decode\_server\_data\_format**.

#### decode\_server\_program

(Input and output)

On input, the name of the CICS program associated with the 4-tuple for the client request.

On output, the name of the CICS program to be linked to by the alias.

You should use this field if you want to direct the client call to a different CICS program.

## decode\_userid

(Output only)

An 8-character field, the user ID known to CICS that correlates to the requesting client ID. If you store no value in this field, the user ID used in subsequent processing is the default CICS user ID.

#### decode\_user\_token

(Output only)

A fullword that may be used to pass information to the **Encode** function that is subsequently invoked for the client request.

## decode\_version\_number

(Input only)

The version number of the 4-tuple to which the client request was made.

## Response and reason codes

You must return one of the following values in the decode\_response field:

#### **URP\_OK**

The server controller checks that the communication area length does not exceed 32 767. If it does not, the alias is started using the information supplied as output. If it does, the server controller writes an exception trace entry (trace point 9FC2), and issues a message (DFHRP0516) describing the error. The alias is not started, and an **svcerr\_systemerr** call is used to send a reply to the client.

### **URP\_EXCEPTION**

The server controller writes an exception trace entry (trace point 9FAA), and issues a message that depends on the reason code:

• URP\_CORRUPT\_CLIENT\_DATA—message DFHRP0626

An **svcerr\_decode** call is used to send a reply to the client.

URP\_AUTH\_BADCRED—message DFHRP0628

An **svcerr\_auth** call with a why-value of AUTH\_BADCRED is used to send a reply to the client.

- URP\_AUTH\_TOOWEAK—message DFHRP0629
   An svcerr\_auth call with a why-value of AUTH\_TOOWEAK is used to send a reply to the client.
- Any other value—message DFHRP0631

An **svcerr\_systemerr** call is used to send a reply to the client.

#### **URP\_INVALID**

The server controller writes an exception trace entry (trace point 9FAA), and issues a message (DFHRP0632).

An **svcerr\_systemerr** call is used to send a reply to the client.

## URP\_DISASTER

The server controller writes an exception trace entry (trace point 9FAA), and issues a message (DFHRP0635).

An svcerr\_systemerr call is used to send a reply to the client.

If you return any other value in **decode\_response**, the server controller writes an exception trace entry (trace point 9FAA), and issues a message (DFHRP0625). An **svcerr\_systemerr** call is used to send a reply to the client.

You can supply a 32-bit reason code in conjunction with the response value to provide further information in error cases. CICS ONC RPC does not take any action on the reason code returned by **Decode**, except as indicated above under URP\_EXCEPTION. The reason code is output in any trace that results from the invocation of **Decode**, and you may use it as a debugging aid.

See "Numeric values of response and reason codes" on page 324 for the numeric values of the response and CICS-defined reason codes in trace output.

# Encode

**Encode** is called by the alias after the CICS program ends. **Encode** is responsible for taking the data returned from the CICS program and changing its format so that it is suitable to be passed to the outbound XDR routine for return to the client. If no restructuring of outbound data is required, you can specify to the connection manager that **Encode** is not to be called. The reference to the CICS program data to be returned to the client is passed to **Encode** in the **encode\_input\_data\_ptr** input field. This data is in CICS program format, which is a communication area structure in any CICS supported language. The CICS program data may be mapped from this format into the format required by the client, which is likely to be C, and might include pointer references, by allocating an area of storage and mapping the server data into it.**Encode** must set **encode\_output\_data\_ptr** to point to the start of the allocated storage.

## Summary of parameters

The names of the parameters are given in abbreviated form: each name in the table must be prefixed with **encode**\_ to give the name of the parameter.

To find the C type of each parameter, consult the header file DFHRPCDH provided with CICS ONC RPC. For COBOL, consult the copybook DFHRPCDO.

Input encode_	Inout encode_	Output encode_
eyecatcher function input_data_ptr input_data_len user_token	none	output_data_ptr output_data_len response reason

**Encode** must issue EXEC CICS GETMAIN to allocate storage for the data that it returns. Note the following points about GETMAIN options:

- You do not need to use the SHARED option.
- You must use the FLENGTH option.
- If your CICS system is using storage protection, you can use the CICSDATAKEY option to prevent overwriting by user-key programs.

## **Parameters**

### encode\_eyecatcher

(Input only)

A string of length 8. (The values of the eyecatchers are defined in the DFHRPUCH header file and the DFHRPUCO copybook.)

### encode\_function

(Input only)

A code indicating that **Encode** is being called. The value is URP\_ENCODE.

## encode\_input\_data\_len

(Input only)

The length in bytes of the data returned from the CICS program. The value is determined as follows:

- 1. It is the output value of **decode\_server\_output\_data\_len**, if **Decode** set it.
- If Decode did not set the value, it is the output value of glength\_server\_output\_data\_len, if Getlengths was called when the 4-tuple was registered.
- 3. If neither of the above is the case, it is the value specified for Server Output Length in the connection manager when the 4-tuple was defined.

## encode\_input\_data\_ptr

(Input only)

A pointer to the data returned from the CICS program. The setting of this pointer depends on the definition of the 4-tuple in the connection manager, **Getlengths** processing when the 4-tuple was registered, and **Decode** processing for the client request.

## encode\_output\_data\_len

(Output only)

The length in bytes of the data to be passed to the outbound XDR routine.

### encode\_output\_data\_ptr

(Output only)

A pointer to an area of allocated storage that contains the data that is to be passed to the outbound XDR routine.

## encode\_reason

(Output only)

A reason code-see "Response and reason codes."

### encode\_response

(Output only)

A response code—see "Response and reason codes."

## encode\_user\_token

(Input only)

A fullword containing information which was output from **Decode** for this client request.

## **Response and reason codes**

You must return one of the following values in the encode\_response field:

#### **URP\_OK**

The alias passes the output data to the outbound XDR routine.

## **URP\_EXCEPTION**

The alias writes an exception trace entry (trace point 9F17), and issues a message (DFHRP0161). An **svcerr\_systemerr** call is used to send a reply to the client.

#### **URP\_INVALID**

The alias writes an exception trace entry (trace point 9F17), and issues a message (DFHRP0162). An **svcerr\_systemerr** call is used to send a reply to the client.

## **URP\_DISASTER**

The alias writes an exception trace entry (trace point 9F17), and issues a message (DFHRP0169). An **svcerr\_systemerr** call is used to send a reply to the client.

If you return any other value in **encode\_response**, the alias writes an exception trace entry (trace point 9F17), and issues a message (DFHRP0163). An **svcerr\_systemerr** call is used to send a reply to the client.

You can supply a 32-bit reason code in conjunction with the response value to provide further information in error cases. CICS ONC RPC does not take any action on the reason code returned by **Encode**. The reason code is output in any trace that results from the invocation of **Encode**, and you may use it as a debugging aid.

See "Numeric values of response and reason codes" on page 324 for the numeric values of the response in trace output.

# Chapter 24. CICS ONC RPC security

This chapter contains Product-sensitive Programming Interface and Associated Guidance Information.

Security is an important concern in the provision of ONC RPC support in the CICS environment, because CICS ONC RPC provides an Open Systems communications interface into CICS.

ONC RPC has its own security methods (called authentication in RPC) with dedicated fields in the ONC RPC call and reply message headers. There are three types of RPC authentication:

- **UNIX authentication**, which is used to transmit the client's UNIX user ID, group ID, and other identification information.
- Data Encryption Standard (DES) authentication, which is not available at ONC RPC Version 3.9, and so cannot be used with CICS ONC RPC.
- Null authentication, which offers no security checking.

This chapter describes how CICS ONC RPC interacts with the security facilities of ONC RPC and CICS.

It covers the following topics:

- · "Security in CICS and its effect on CICS ONC RPC operations"
- "Writing the resource checker" on page 317.

# Security in ONC RPC

ONC RPC has its own security methods (called authentication in RPC) with dedicated fields in the ONC RPC call and reply message headers. There are three types of RPC authentication:

- **UNIX authentication**, which is used to transmit the client's UNIX user ID, group ID, and other identification information.
- Data Encryption Standard (DES) authentication, which is not available at ONC RPC Version 3.9, and so cannot be used with CICS ONC RPC.
- Null authentication, which offers no security checking.

## Security in CICS and its effect on CICS ONC RPC operations

During the operation of CICS ONC RPC, various CICS commands are used to make security checks with an external security manager (ESM). The checks will always give positive results if SEC=NO is specified as a system initialization parameter. The checks will always give negative results if SEC=YES was specified, but the ESM abended while CICS was operating. The following discussion of the use made of CICS security commands assumes that SEC=YES is specified, and that the ESM is active.

 When a transaction whose user ID is userid1 issues EXEC CICS START USERID(userid2), a surrogate-user check is made with the ESM to see that userid1 is authorized to use userid2. The check is made only if XUSER=YES is specified as a system initialization parameter.

This command is issued when the connection manager starts the server controller, and each time the server controller starts an alias transaction. In the

first case, the user ID used is the one supplied to the connection manager as CRPM Userid on panel DFHRP02. In the second case, the user ID used is the one output from **Decode**.

- EXEC CICS VERIFY PASSWORD is issued by the alias before it links to the CICS program that services the client request. A check is made with the ESM that the user ID and password are an acceptable combination.
- EXEC CICS QUERY SECURITY is used by the alias to check that the user ID under which it is executing is authorized to use the CICS program. The check is made only if XPPT=YES is specified as a system initialization parameter.
- During the operation of the CICS program, security checks are made each time the program tries to access a protected resource. The check is made only if RESSEC(YES) is specified in the definition of the alias transaction, and the system initialization parameter controlling security checking for the resource type is set to YES.
- During the operation of the CICS program, security checks are made each time the program tries to use a command from the CICS SPI (system programming interface). The check is made only if CMDSEC(YES) is specified in the definition of the alias transaction, and if XCMD=YES is specified as a system initialization parameter.

Figure 64 shows how CICS security interacts with the operation of CICS ONC RPC.

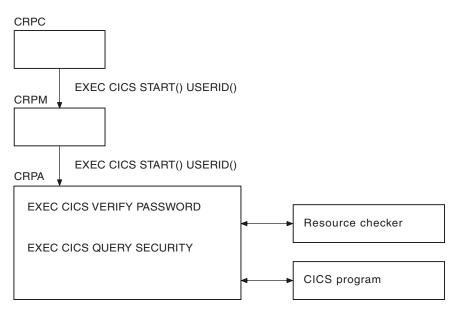

Figure 64. How CICS security interacts with CICS ONC RPC operations

The figure shows that the alias will link to the user-supplied resource checker program if one is configured, but the use of the resource checker program is not recommended. You should use the CICS security facilities, and make the appropriate definitions in the ESM.

## Using RACF Secured Sign-on

RACF Secured Sign-on support allows clients to gain security access to CICS facilities by sending a PassTicket (that is, a one-time-only password). This avoids the security hazard of a password being transmitted across the network in clear text.

For further information, see *Resource Access Control Facility: System Programmer's Guide, Version 2 Release 2.* This includes details of the algorithm that the RPC client must use to generate the PassTicket. This algorithm includes the DES algorithm.

## PassTicket generation

The algorithm that generates the PassTicket is a function of:

- · The CICS user ID of the client
- · The CICS application ID of the CICS region running CICS ONC RPC
- · A secured sign-on application key, known to both sides
- A time and date stamp

To generate the PassTicket, the client must:

- Know its CICS user ID, the server CICS application ID, and the application key.
- Synchronize its clock to within ten minutes of the server.
- Have access to the encryption algorithm on its machine. Only the DES algorithm may be used.

## Writing the resource checker

Your resource checker program must be called DFHRPRSC. There can be only one resource checker in a CICS region.

The resource checker allows you to check the credentials of inbound client requests.

The resource checker can check the client address, passed as an input parameter, against a list of known clients for the host on which the request has been received. The password passed to the resource checker is blank.

## Reference information for the resource checker

The resource checker is optionally invoked by the alias before it attempts to link to the CICS program that is to service the client request. It must say whether the client request is allowed to proceed.

The reference information for the resource checker is presented as follows:

- A summary table of parameters, showing which are for input only, and which for output only.
  - Input is for parameters that your resource checker may consult, but not change.
  - **Output** is for parameters that your resource checker must not consult, but may change.
- A description of the processing that the resource checker is expected to do.
- A list of parameters in alphabetical order, with a description of how CICS ONC RPC sets up the inputs, and what use it makes of the outputs.
- A list of the responses and reason codes that the resource checker can return, with a description of the action that CICS ONC RPC takes for each response and reason code.

The descriptions give the names of the program elements as they appear in C. In COBOL the names are all in uppercase, and the underscores are replaced by hyphens.

## Summary of parameters

The format of the communication area containing the resource checker parameters is in the C header file DFHRPRDH, and the COBOL copybook DFHRPRDO. You will also need values defined in the C header file DFHRPUCH, or in the COBOL copybook DFHRPUCO.

Input	Output
res_check_alias_transid res_check_cics_password_ptr res_check_cics_userid res_check_client_ip_address res_check_eyecatcher res_check_host_ip_address res_check_server_program_name	res_check_reason res_check_response

## **Parameters**

## res\_check\_alias\_transid

(Input only)

The 4-character name of the alias transaction that has linked to the resource checker.

#### res\_check\_cics\_password\_ptr

(Input only)

A pointer to the 8-character password passed from the requesting client or supplied by **Decode**. The value of this field is blank, and it is provided for compatibility with earlier versions of CICS ONC RPC.

## res\_check\_cics\_userid

(Input only)

The 8-character CICS user ID under which the alias is running.

## res\_check\_client\_ip\_address

(Input only)

The fullword internet address of the client.

## res\_check\_eyecatcher

(Input only)

A string of length 8. (Its value is defined in the header file DFHRPUCH and the copybook DFHRPUCO).

## res\_check\_host\_ip\_address

(Input only)

The fullword internet address of the TCP/IP for MVS host with which the server controller is in communication.

## res\_check\_reason

(Output only)

The reason to be returned to the alias.

#### res\_check response

(Output only)

The response to be returned to the alias.

## res\_check\_server\_program\_name

(Input only)

The 8-character name of the CICS program that is to be invoked to perform the server function requested by the client.

## **Response and reason codes**

You must return one of the following values in the res\_check\_response field.

## URP\_OK

The alias will continue to process the client request.

## **URP\_EXCEPTION**

The alias writes an exception trace entry (trace point 9F0E), and issues a message that depends on the reason code:

• URP\_AUTH\_BADCRED—message DFHRP0130

An **svcerr\_auth** call with a why-value of AUTH\_BADCRED is used to send a reply to the client.

URP\_AUTH\_TOOWEAK—message DFHRP0184

An **svcerr\_auth** call with a why-value of AUTH\_TOOWEAK is used to send a reply to the client.

• Any other value-message DFHRP0185

An svcerr\_systemerr call is used to send a reply to the client.

## URP\_INVALID

The alias writes an exception trace entry (trace point 9F0E), and issues a message (DFHRP0186).

An **svcerr\_systemerr** call is used to send a reply to the client.

## **URP\_DISASTER**

The alias writes an exception trace entry (trace point 9F0E), and issues a message (DFHRP0187).

An svcerr\_systemerr call is used to send a reply to the client.

If you return any other value in **res\_check\_response**, the alias writes an exception trace entry (trace point 9F0E), and issues a message (DFHRP0188). An **svcerr\_systemerr** call is used to send a reply to the client.

You can supply a 32-bit reason code in conjunction with the response value to provide further information in error cases. CICS ONC RPC does not take any action on the reason code returned by the resource checker, except as indicated above under URP\_EXCEPTION. The reason code is output in any trace or messages that result from the resource checker, and you may use it as a debugging aid.

See "Numeric values of response and reason codes" on page 324 for the numeric values of the response and CICS-defined reason codes in trace output.

# Chapter 25. CICS ONC RPC problem determination

This chapter helps you debug problems in CICS ONC RPC user-replaceable programs, the IBM-supplied parts of CICS ONC RPC, and in the system setup of CICS ONC RPC. If you suspect that you have a problem in another part of CICS, refer to the *CICS Problem Determination Guide*.

The formats of messages and trace outputs in CICS ONC RPC are also described.

Diagnostic information is designed to provide first failure data capture, so that if an error occurs, enough information about the error is available directly without having to reproduce the error situation. The information is presented in the following forms:

### Messages

CICS ONC RPC provides CICS messages. The CICS ONC RPC messages are listed in *CICS Messages and Codes*.

- **Trace** CICS ONC RPC outputs system trace entries containing all the important information required for problem diagnosis.
- Dump Dump formatting is provided for data areas relating to CICS ONC RPC.

## Abend codes

Transaction abend codes are standard 4-character names. The abend codes output by CICS ONC RPC are listed in *CICS Messages and Codes*.

The rest of this chapter describes:

- "CICS ONC RPC recovery procedures"
- "CICS ONC RPC operational considerations" on page 322.
- "Troubleshooting CICS ONC/RPC" on page 322
- "Using messages and codes for ONC RPC" on page 324
- "CICS ONC RPC trace information" on page 324
- "ONC RPC dump and trace formatting" on page 325
- "Debugging the ONC RPC user-replaceable programs" on page 325

# **CICS ONC RPC recovery procedures**

Software errors within the server controller may cause it to perform an immediate disable (if this is not prevented by the nature of the error). After an immediate disable of CICS ONC RPC, CICS continues to run.

CICS ONC RPC is not included in CICS recovery. Registration details are not saved on the CICS catalog. If CICS abends and is then restarted, RPC interface registrations from the previous run are not preserved. After a CICS abend, you must enable CICS ONC RPC as described in "Enabling CICS ONC RPC" on page 272. However, 4-tuple definitions can be stored in the CICS ONC RPC data set. Each time you enable CICS ONC RPC, the definitions can be retrieved from the CICS ONC RPC data set.

If TCP/IP for MVS abends, CICS ONC RPC enters immediate disable processing, but CICS continues to run.

The abending of an alias transaction might cause changes to recoverable resources to be backed out. See "Updating recoverable resources" on page 256.

CICS immediate shutdown might leave 3-tuples registered with TCP/IP for MVS. These 3-tuples can be registered again when CICS ONC RPC is enabled without loss of TCP/IP for MVS resources, since CICS ONC RPC always unregisters a 3-tuple before it registers it.

# **CICS ONC RPC operational considerations**

The server controller uses EXEC CICS START to start the aliases that run the CICS programs. CICS limits on the numbers of tasks that can be started may prevent aliases from running as soon as they are started by the server controller. This leads to delays in servicing the client requests, and this may lead to time-outs in the client.

In the XDR routines, storage allocation is done using MVS facilities, not CICS facilities. The storage is owned by the RP TCB. If an XDR routine abends, the storage is not freed by the server controller or the alias, nor is it freed by MVS, since the RP task does not end. Repeated abends in XDR routines may lead to shortage of storage that can only be corrected by stopping CICS.

# MVS task control blocks (TCBs) used by ONC RPC

The TCB that interacts with TCP/IP for MVS goes into a wait as a result of that interaction. If the wait were on the QR (quasi-reentrant) TCB, all the transactions in the whole CICS region would be delayed. This is avoided by using an extra TCB, the RP TCB, for issuing calls to TCP/IP for MVS.

The RP TCB is used for some processing for every client request, but most of the call processing done by CICS ONC RPC takes place under the QR TCB. The split between the two TCBs is transparent to you for most of your work, but you need to be aware of it for problem determination.

# ONC RPC task-related user exit (TRUE)

CICS ONC RPC includes a task-related user exit; this is used to anchor shared storage and to improve CICS ONC RPC's response to CICS shutdown. CICS ONC RPC does not use a TRUE to pass commands and data to and from TCP/IP for MVS.

# **Troubleshooting CICS ONC/RPC**

This section provides some hints on troubleshooting. It follows the general outline:

- 1. Define the problem.
- 2. Obtain information (documentation) on the problem.

# Defining the problem

When you have a problem, first try to define the circumstances that gave rise to it. If you need to report the problem to the IBM software support center, this information is useful to the support personnel.

- 1. What is the system configuration?
  - CICS Transaction Server release
  - TCP/IP for MVS release
  - Language Environment release
  - OS/390 release

- 2. What is the connection manager configuration?
  - Operating options
  - Registered 4-tuples
- 3. When did the problem first occur?
- 4. What were you trying to accomplish at the time the problem occurred?
- 5. What changes were made to the system before the occurrence of the problem?
  - To the OS/390 system
  - To CICS ONC RPC
  - To the CICS program being called by the client
  - To the converter being used in the call
  - To the XDR routines being used in the call
  - · To the client
  - To CICS Transaction Server
  - To TCP/IP for MVS
- 6. What is the problem?
  - Incorrect output
  - Hang/Wait: If you suspect that CICS ONC RPC aliases may be in a hung state, you can use the connection manager to display a list of alias transactions and can display associated details. See "Processing the alias list" on page 288.
  - Loop: Use CEMT INQUIRE to display the details of the transaction.
  - Abend in user-replaceable program
  - Abend in a CICS program
  - Abend in the IBM-supplied part of CICS ONC RPC
  - Performance problem
  - Storage violation
  - Logic Error
- 7. At what point in the processing did the problem occur? (Use Figure 36 on page 255.)
- 8. What was the state of TCP/IP for MVS? (Try the rpcinfo command.)

## Documentation about the problem

To investigate most problems, you must look at the dumps, traces, and logs provided with MVS and CICS.

- · System Dump: This contains the CICS internal trace
- CICS auxiliary trace, if enabled
- TCP/IP for MVS trace
- GTF trace, if enabled
- Console log
- CSMT log
- CRPO log
- · CICS job log

To identify which are likely to be useful for your problem, try to work out the area of CICS ONC RPC giving rise to the problem, and read the relevant section in the rest of this chapter.

## Using messages and codes for ONC RPC

CICS ONC RPC messages have identifiers of the form DFHRP*nnnn*, where *nnnn* are four numeric characters. These numbers indicate which of the CICS ONC RPC components generated the message, as shown in *CICS Messages and Codes*.

Messages are generated for end users by the connection manager. They are sent to the CICS ONC RPC message transient data queue CRPO, or the terminal user, or both, depending on the event that is being reported. If you define CRPO as an indirect destination for CSMT, the CICS ONC RPC messages appear in CSMT. Some messages are sent to the console.

When CICS ONC RPC issues a message as a result of an error, it also makes an exception trace entry. CICS ONC RPC also generates information messages, for instance during enable processing and disable processing.

CICS ONC RPC messages are supplied in English, Kanji, and Chinese. The CICS message editing utility can be used to translate them into other languages supported by CICS.

## CMAC (online help facility for messages and codes)

You can use utilities supplied as part of CICS to update your base CMAC file with the CICS ONC RPC CMAC file.

The CICS ONC RPC abend codes are listed in CICS Messages and Codes.

# **CICS ONC RPC trace information**

CICS ONC RPC outputs CICS system trace, which is formatted using software supplied as part of CICS ONC RPC.

Exception trace entries produced by CICS ONC RPC are written to CICS internal trace even when the Trace operating option is set to NO. See "Setting and modifying options" on page 273 for information about the Trace option.

If selected, level 2 trace gives a full trace of the data being transmitted between the client and the CICS program. CICS trace output is described in *CICS Trace Entries*.

## Feature trace points

Trace points with domain identifier FT are feature trace points. The format of these entries is slightly different from standard trace points in that the Module identifier contains the short name of the feature and a full module name. Feature trace point IDs are not globally defined. This means that a feature can reuse the trace point IDs of another feature. You should obtain information about the trace points of any other product from that product's documentation.

## Numeric values of response and reason codes

The response codes from the converter and resource checker appear in the trace output as numeric values as follows:

- URP\_OK (0)
- URP\_EXCEPTION (4)
- URP\_INVALID (8)

• URP\_DISASTER (12)

The CICS-defined reason codes from the converter and resource checker appear in the trace output as numeric codes as follows:

- URP\_AUTH\_BAD\_CRED (1)
- URP\_AUTH\_TOO\_WEAK (2)
- URP\_CORRUPT\_CLIENT\_DATA (3)

# ONC RPC dump and trace formatting

To switch dump formatting on and off for CICS ONC RPC, you change the CICS VERBEXIT in the JCL for dump formatting as follows: IPCS VERBEXIT DFHPD650 FT=0|1|2|3,TR=1|2

The parameters have these meanings:

- FT=0 Suppress system dump for all features
- FT=1 Produce system dump summary listing for all registered features
- **FT=2** Produce system dump for all registered features
- **FT=3** Produce system dump summary listing and a system dump for all registered features
- **TR=1** Produce abbreviated trace (includes trace for all registered features)
- TR=2 Produce full trace (includes trace for all registered features)

Full details of these and other parameters are described in the *CICS Operations and Utilities Guide*.

CICS ONC RPC output in the formatted dump consists of the major control blocks of CICS ONC RPC, with interpretation of some of the fields. The CICS ONC RPC output can be found in the IPCS output by searching for ===RP. It is under the heading CICS ONC RPC Feature for MVS/ESA.

Each trace entry for CICS ONC RPC has a comment ONC RPC to distinguish it from other trace points with the FT prefix.

# Debugging the ONC RPC user-replaceable programs

The user-replaceable programs are:

- The user-written XDR routines
- The converters
- The resource checker
- The CICS programs that service the client requests

The debugging of the CICS programs is not dealt with in this manual.

## **XDR** routines

The XDR routines, inbound and outbound, run under the RP TCB. The CICS application programming interface is not available under the RP TCB, so you cannot use EDF, CICS abend handling, or CICS trace to diagnose problems. The **printf** function must not be used. If an XDR routine has a program check, a C run-time message is written to the CICS job log.

# Converter and resource checker

The converter and resource checker run under the QR TCB, and the CICS application programming interface is available.

## **Using EDF**

EDF is available for debugging the resource checker and the **Encode** function. If you want to use EDF, you must:

- Ensure that the alias is terminal-attached. To do this, you must set the EDF Terminal ID field in the connection manager, as described in EDF Terminal ID. The chosen terminal must be a local terminal that is either logged on, or predefined.
- Define CEDF(YES) in the program definition of converter, or resource checker. The resource checker must run in the same CICS region as CICS ONC RPC if you want to use EDF to debug it.

## Using trace entries

Diagnostic information can be output to the CICS trace by the use of the EXEC CICS ENTER TRACENUM command. The amount of trace information and the information contained within trace entries is at your discretion. See ENTER TRACENUM, in the *CICS Application Programming Reference* for more information about this command.

## Writing messages

Diagnostic messages can be output by using EXEC CICS WRITEQ TD. Message information content, message format, frequency, and destination are at your discretion.

## Abends

You are recommended to use EXEC CICS HANDLE ABEND to trap abends. You should collect the diagnostic information you need by tracing, and other forms of diagnostic output, and then return a URP\_DISASTER response.

# Chapter 26. CICS ONC RPC performance and tuning

This chapter contains Diagnosis, Modification, or Tuning Information.

The performance of a single client request is affected by various aspects of the client, the network, CICS ONC RPC, the user-replaceable programs, and CICS.

#### The client

The client time-out interval must take account of the possible delays in dealing with a client request in CICS ONC RPC and in CICS.

If a client request cannot be processed, an error reply is sent to the client.

## The network

This manual does not deal with performance problems of TCP/IP networks.

## TCP/IP for MVS resources

If, while registering 4-tuples, you cause the connection manager to register too many 3-tuples with TCP/IP for MVS, you might reduce the service that CICS ONC RPC can give to incoming client requests. See "Limits on registration" on page 280.

### CICS ONC RPC

The allocation of different alias transaction names to different 4-tuples must be coordinated with the priorities given to the transactions in CICS.

## The converter URM

**Getlengths** is called only by the connection manager, and has no effect on the performance of a single client request, or on throughput.

**Decode** is called by the server controller. Delays here can reduce the throughput of CICS ONC RPC as well as reducing the performance of a single client request. The following recommendations are made:

- Do not use CICS trace here except to solve specific problems.
- Use NOSUSPEND on EXEC CICS GETMAIN. If GETMAIN errors occur because there is not enough storage, look for solutions that do not involve using the SUSPEND option.

**Encode** is called by the alias. Delays here reduce the performance of single client requests, but not the throughput of CICS ONC RPC.

### The resource checker URM

The resource checker is called by the alias, so delays here affect the performance of a single client request, but have no effect on throughput.

# Part 5. Using CICS as a DCE server

This part of the book describes CICS support for DCE remote procedure calls (RPCs). This support enables a non-CICS client program running in an open systems Distributed Computing Environment (DCE) to call a server program running in a CICS system and to pass and receive data using a communications area. The CICS program is invoked as if linked-to by another CICS program.

Using CICS as a DCE server

# Chapter 27. Introduction to the Distributed Computing Environment

CICS Transaction Server for z/OS supports DCE remote procedure calls.

In conjunction with the OS/390 Unix Systems Services DCE Base Services MVS/ESA and OS/390 Unix Systems Services DCE Application Support MVS/ESA CICS Feature products, CICS Transaction Server for z/OS enables a CICS program to act as a server for a DCE RPC. (Note that DCE RPC uses the DCE Security and Directory Services.) This is described in Chapter 28, "DCE remote procedure calls," on page 335.

The main advantage of a DCE remote procedure call over a CICS DPL call is that you can call CICS programs from non-CICS environments.

This chapter tells you what the Distributed Computing Environment (DCE) is and why you might want to use it. For more detailed information, you should refer to the books listed in Chapter 28, "DCE remote procedure calls," on page 335.

# What is DCE?

DCE (Distributed Computing Environment) is an architecture defined by the Open Software Foundation (OSF) to provide an Open Systems platform to address the challenges of distributed computing. It is being ported to all major IBM and many non-IBM environments. Note that all current DCE implementations use TCP/IP rather than SNA as their communication protocol.

DCE is based on three distributed computing models:

## **Client/server**

A way of organizing a distributed application

### Remote procedure call

A way of communicating between parts of a distributed application

## Shared files

A way of handling data in a distributed system, based on a personal computer file access model.

**Note:** CICS alone (without DCE) also supports distributed computing. See "Distributed computing" on page 6.

The rest of this section gives a high level view of the services provided by DCE.

## Remote procedure call (RPC)

One way of implementing communications between a client and a server of a distributed application is to use the procedure call model. In this model, the client makes what looks like a procedure call, and waits for a reply from the server. The procedure call is translated into network communications by the underlying RPC mechanism. The server receives a request and executes the procedure, returning the results to the client.

In DCE RPC, you define one or more DCE RPC interfaces, using the DCE interface definition language (IDL). Each interface comprises a set of associated RPC calls (called *operations*), each with their input and output parameters. You compile the

IDL, which generates data structure definitions and executable stubs for both the client and the server. The matching parameter data structures ensure a common view of the parameters by both client and server. The matching client and server executable stubs handle the necessary data transformations to and from the network transmission format, and between different machine formats (EBCDIC and ASCII).

You use the DCE Directory Service to advertise that your server now supports the new interface you defined using the IDL. Your client code can likewise use the Directory Service to discover which servers provide the required interface.

You can also use the DCE Security Service to ensure that only authorized client end users can access your newly defined server function.

## **Directory Service**

The DCE Directory Service is a central repository for information about resources in the distributed system. Typical resources are users, machines, and RPC-based services. The information consists of the name of the resource and its associated attributes. Typical attributes could include a user's home directory, or the location of an RPC-based server.

The DCE Directory Service consists of several parts: the Cell Directory Service (CDS), the Global Directory Service (GDS)<sup>3</sup>, the Global Directory Agent (GDA), and a Directory Service programming interface. The CDS manages a database of information about the resources in a group of machines called a DCE *cell*. The Global Directory Service implements an international, standard directory service and provides a global namespace that connects the local DCE cells into one worldwide hierarchy. The GDA acts as a go-between for cell and global directory services. Both CDS and GDS are accessed using a single Directory Service application programming interface (API).

## **Security Service**

There are three aspects to DCE security: authentication, secure communications, and authorization. They are implemented by several services and facilities that together comprise the DCE Security Service. These include the Registry Service, the Authentication Service, the Privilege Service, the Access Control List (ACL) Facility, and the Login Facility.

The identity of a DCE user or service is authenticated by the Authentication Service. Communications are protected by the integration of DCE RPC with the Security Service. Communication over the network can be checked for tampering or encrypted for privacy. Finally, access to resources is controlled by comparing the credentials conferred to a user by the Privilege Service with the rights to the resource, which are specified in the resource's Access Control List. The Login Facility initializes a user's security environment, and the Registry Service manages the information (such as user passwords) in the DCE Security database.

# **Time Service**

The DCE Time Service (DTS) provides synchronized time on the computers participating in a Distributed Computing Environment. DTS synchronizes a DCE host's time with Coordinated Universal Time (UTC), an international time standard. DTS cannot keep the time in each machine precisely the same, but can maintain it

<sup>3.</sup> The Global Directory Service is not currently supported by OS/390 Unix Systems Services DCE Base Services MVS/ESA.

to a known accuracy. DTS also provides services which return a time range to an application (rather than a single time value), and which compare time ranges from different machines. They can be used to schedule and synchronize events across the network.

## **File Service**

The DCE File Service (DFS) allows users to access and share files stored on a File Server anywhere on the network, without having to know the physical location of the file. Files are part of a single, global namespace. A user anywhere on a network can access any file, just by knowing its name. The File Service achieves high performance, particularly through caching of file system data. Many users can access files that are located on a given File Server without a large amount of network traffic or delays.

**Note:** The File Service is based on a personal computer view of files, and is not relevant to the CICS Transaction Server for z/OS environment.

# Threads

DCE Threads supports the creation, management, and synchronization of multiple threads of control within a single process. This component is conceptually a part of the operating system layer, the layer below DCE. If the host operating system already supports threads, DCE can use that software and DCE Threads is not necessary. Because all operating systems do not provide a threads facility and DCE components require threads be present, this user-level threads package is included in DCE.

# Chapter 28. DCE remote procedure calls

This chapter gives an overview of how CICS cooperates with the OS/390 Unix Systems Services DCE Base Services MVS/ESA and OS/390 Unix Systems Services DCE Application Support MVS/ESA CICS Feature products to enable a CICS program to act as a DCE server.

Refer to the following books for more information about the OS/390 Unix Systems Services DCE Base Services MVS/ESA product:

- DCE: Understanding the Concepts, GC09-1478
- Introducing the z/OS Distributed Computing Environment, GC09-1482
- z/OS Distributed Computing Environment: Application Development Guide, SC09-1484, for guidance information about developing the client code and using the Unix System Services DCE MVS/ESA base services.
- *z/OS Distributed Computing Environment: Application Development Reference, SC09-1487*, for reference information about application programming interfaces (APIs).

Refer to the following books for more information about the OS/390 Unix Systems Services DCE Application Support MVS/ESA CICS Feature:

- OS/390 DCE Application Support Programming Guide, SC24-5833, for information about how to install CICS remote procedure call server programs.
- *z/OS Distributed Computing Environment: Application Support Configuration and Administration Guide, SC09-1659*, for information about the administration tasks that complement the programming tasks.

# **Overview of DCE with CICS**

The OS/390 Unix Systems Services DCE Application Support MVS/ESA CICS Feature <sup>4</sup> enables a DCE client application anywhere in the DCE environment to access the resources of a CICS system. The client program uses the simple DCE Remote Procedure Call (RPC), or the DCE Transactional Remote Procedure Call (TRPC), mechanism to call a CICS application program.

The client program does not need to know where the required CICS application is located. Functions of the Application Support server and the OS/390 Unix Systems Services DCE Base Services MVS/ESA product (OS/390 Unix DCE Base MVS/ESA) provide the location information. When the client and server are on different systems, the differences are transparent to the application programmer.

The Application Support server supports client programs written in C, and CICS application programs written in COBOL. The Application Support server automatically handles the conversions of the COBOL and C data types. Components of OS/390 Unix DCE Base MVS/ESA handle conversions of EBCDIC and ASCII data types, if needed.

Thus the Application Support server provides the powerful CICS application environments on the host, and the familiar (to the client workstation programmer) C language and RPC mechanism on the client.

<sup>4.</sup> For clarity, in the rest of this book this product is called the "Application Support server".

The Application Support server:

- Coexists with all other ways of accessing CICS.
- · Allows access to existing CICS applications and data.
- Allows new CICS applications to be developed as servers in the z/OS UNIX System Services DCE Executive MVS/ESA environment.
- Allows access to all files and databases available to CICS, including DB2 databases.
- Gives the host programmer continued access to all the facilities and tools in the CICS environments. This includes requests to run other programs on the same subsystem or different subsystems using the existing CICS mechanisms.
- Allows a client program to access CICS and does not require the client machine to have CICS transaction processing function installed.

## DCE terminology

The CICS server programs are called *operations*. Each RPC requests the execution of one operation. The declarations for each operation, including the specifications for the input and output parameters, are contained in an *interface definition*. You define one or more related operations in an interface, using the Interface Definition Language (IDL).

IDL defines the server functions that a client can call. IDL is a declarative language with syntax similar to the C language. The Application Support server contains IDL extensions that enable a programmer to use COBOL syntax to define the parameters for the CICS application programs. The programmer coding the IDL declarations may be a COBOL or a C programmer.

**Note:** There are restrictions on the COBOL and C data structures that can be defined using the IDL. These are described in the *OS/390 DCE Application Support Programming Guide*.

## What CICS server programs can do

The Application Support server and CICS are connected by the external CICS interface (EXCI), which uses CICS interregion connection (IRC) facilities. The Application Support server maps the DCE RPC parameters into a CICS communications area, and then uses EXCI to invoke the required CICS program, as if it had been called by an EXEC CICS LINK command.

TRPCs from a client program within the scope of a single client transaction are handled by a single CICS task. A syncpoint issued by the client application commits or backsout all resources owned by the CICS server task as well as any owned by the client application.

Each RPC from a client program is handled as a CICS task, with an implied syncpoint at the end of the task. Note that this syncpoint only commits resources owned by the CICS server task. It does not commit any resources owned by the client program.

Your server program can access any file or database available in the CICS environment. It can use CICS distributed facilities to access data and programs that are managed by other CICS, IMS<sup>™</sup>, or other APPC-connected systems.

You can use DCE RPCor TRPC to access CICS programs for one or more of the following reasons:

- To access CICS data from a platform which does not support CICS, but which does support DCE.
- To access CICS data from workstation programs which do not run in a CICS environment. You may want to do this even if the workstation platform supports CICS.
- To use the DCE Security Service, with its high level of protection against interception of network traffic.
- To use the DCE Directory Service, to provide client independence of the location of the required server program.

For details of how to write CICS server programs, see Chapter 30, "Application programming for DCE remote procedure calls," on page 341.

#### What you need for DCE RPC to a CICS server

This support requires the following products:

- Connectivity through TCP/IP protocols to the client workstation, and to the DCE directory and security servers. This normally means a TCP/IP network, though for some partner platforms it may be possible to use an SNA network with ANYNET support at both ends to transport TCP/IP protocols using SNA transmission protocols.
- IBM TCP/IP for MVS, Version 3 Release 1 or later, to present a TCP/IP interface to the DCE software, even if you are using an SNA network and ANYNET software.
- OS/390 Unix Systems Services Distributed Computing Environment Base Services MVS/ESA, Version 5 Release 1 or later.
- OS/390 Unix Systems Services Distributed Computing Environment Application Support MVS/ESA CICS Feature, Version 1 Release 1 or later.

### Chapter 29. Defining CICS programs as DCE servers

This chapter gives an overview of how to define CICS programs as servers to DCE remote procedure calls (RPCs). For more detailed information, see the *OS/390 DCE Application Support Programming Guide* and the *z/OS Distributed Computing Environment: Application Support Configuration and Administration Guide*.

CICS DCE server programs are called *operations* in DCE terminology. Each RPC requests the execution of one operation. The declarations for each operation, including the specifications for the input and output parameters, are contained in an *interface definition*. You define one or more related operations in an interface, using the Interface Definition Language (IDL).

#### Interface definition

When you write your CICS server program and your DCE client program you must:

- Use the GENUUID command of the DCE MVS/ESA Application Support server to obtain a skeleton interface definition. (An interface defines one or more related *operations*. Each operation relates to a server program.) The skeleton includes a Universal Unique Identifier (UUID) that uniquely identifies the interface.
- 2. Use the DCE Interface Definition Language (IDL) to identify each operation in the interface and define its input and output parameters.
- Use the IDL compiler to generate data structure definitions for the RPC parameters and execution stubs for both client and server programs. The client stub packages (*marshalls*) the RPC parameters for transmission over the network to the server, and unpackages (*unmarshalls*) the parameters received from the server.

The server stubs contain function that converts host COBOL data types to C data types and vice versa. They also package and unpackage RPC parameters, and convert data between EBCDIC and ASCII representations.

- 4. Link edit and load the server stubs into the server stub library.
- 5. Link edit the client stub with the client program.

You must also define your server programs to CICS using RDO, as described in *CICS Resource Definition Guide*. The definitions can be statically defined and installed, or autoinstalled when the programs are first called.

#### Interface Installation

When you have completed your CICS server program you need to advertise its availability to potential clients. You do this by using the Application Support server administration facilities to install the interface. This exports details of the interface to the DCE distributed directory. Client programs can then use DCE facilities to locate servers which support required interfaces.

# Chapter 30. Application programming for DCE remote procedure calls

Support for DCE remote procedure calls (RPCs) enables a non-CICS client program running in an Open Systems Distributed Computing Environment (DCE) to link to a server program running in a CICS system. For an introduction to DCE RPCs, see Chapter 28, "DCE remote procedure calls," on page 335.

#### Writing a client program

For information about coding DCE client programs, see the *z/OS Distributed Computing Environment: Application Development Guide* and the *z/OS Distributed Computing Environment: Application Development Reference* manual.

#### Writing a server program

**Note:** This is an overview only of how to write CICS programs to act as servers to DCE remote procedure calls. For further related information, see Chapter 29, "Defining CICS programs as DCE servers," on page 339. For definitive information, see the *OS/390 DCE Application Support Programming Guide*.

CICS server programs must:

- Use a communications area to pass input and output parameters.
- · Pass input and output parameters by value (not by pointer).
- Contain only data-handling logic. Existing applications that have their data-handling and terminal input/output logic in separate programs can be used without modification.
- Ideally, be written in COBOL. This is because the Application Support server compiler produces only COBOL data structure definitions for your CICS communications area, to match the RPC parameters. You can, however, write your server application in another programming language, by manually defining a communications area data structure that exactly overlays that produced in COBOL by DCE.

CICS server programs can:

- Use the same subset of EXEC CICS commands as CICS DPL server programs. (The restricted commands are listed in the programming information in API restrictions for distributed program link*CICS Application Programming Reference* manual.)
- Use CICS intercommunication facilities to access data and programs owned by other APPC-connected systems. For example, they can use the Front End Programming Interface (FEPI) to emulate a 3270 terminal, and thereby act as a front end for other unchanged CICS or IMS applications.
- Communicate with applications in remote CICS systems, using function shipping, DPL, or distributed transaction processing.

The Application Support server does not support CICS application programs that:

- Contain terminal input/output logic to the principal facility. (Note that you can use APPC terminal control commands to do distributed transaction processing to a remote back-end system.)
- Use basic mapping support (BMS).

These restrictions are the same as those for CICS distributed program link servers. Thus, you may be able to use server programs written for CICS-to-CICS DPL as servers to DCE clients.

As described in Interface definition, you must use the DCE MVS/ESA Application Support server compiler to generate a data structure definition for the RPC parameters passed to your server program, and an execution stub for the server. You must link edit and load the stub into the server stub library.

## Part 6. Appendixes

### Appendix A. Static routing

A program-link request received from outside CICS can be statically routed to a remote CICS region by specifying the name of the remote region on the REMOTESYSTEM option of the installed program definition.

### Appendix B. Dynamic routing

A program-link request received from outside CICS can be dynamically routed by:

- Defining the program to CICS as DYNAMIC(YES)
- Coding your dynamic routing program to route the request.

#### The CICS Transaction Server for z/OS library

The published information for CICS Transaction Server for z/OS is delivered in the following forms:

#### The CICS Transaction Server for z/OS Information Center

The CICS Transaction Server for z/OS Information Center is the primary source of user information for CICS Transaction Server. The Information Center contains:

- Information for CICS Transaction Server in HTML format.
- Licensed and unlicensed CICS Transaction Server books provided as Adobe Portable Document Format (PDF) files. You can use these files to print hardcopy of the books. For more information, see "PDF-only books."
- Information for related products in HTML format and PDF files.

One copy of the CICS Information Center, on a CD-ROM, is provided automatically with the product. Further copies can be ordered, at no additional charge, by specifying the Information Center feature number, 7014.

Licensed documentation is available only to licensees of the product. A version of the Information Center that contains only unlicensed information is available through the publications ordering system, order number SK3T-6945.

#### Entitlement hardcopy books

The following essential publications, in hardcopy form, are provided automatically with the product. For more information, see "The entitlement set."

#### The entitlement set

The entitlement set comprises the following hardcopy books, which are provided automatically when you order CICS Transaction Server for z/OS, Version 3 Release 2:

Memo to Licensees, GI10-2559

CICS Transaction Server for z/OS Program Directory, GI13-0515

CICS Transaction Server for z/OS Release Guide, GC34-6811

CICS Transaction Server for z/OS Installation Guide, GC34-6812

CICS Transaction Server for z/OS Licensed Program Specification, GC34-6608

You can order further copies of the following books in the entitlement set, using the order number quoted above:

CICS Transaction Server for z/OS Release Guide

CICS Transaction Server for z/OS Installation Guide

CICS Transaction Server for z/OS Licensed Program Specification

#### **PDF-only books**

The following books are available in the CICS Information Center as Adobe Portable Document Format (PDF) files:

#### CICS books for CICS Transaction Server for z/OS General

CICS Transaction Server for z/OS Program Directory, GI13-0515 CICS Transaction Server for z/OS Release Guide, GC34-6811 CICS Transaction Server for z/OS Migration from CICS TS Version 3.1, GC34-6858 CICS Transaction Server for z/OS Migration from CICS TS Version 1.3, GC34-6855

CICS Transaction Server for z/OS Migration from CICS TS Version 2.2, GC34-6856

CICS 4.1 Sample Applications Guide	SC33-1173
CICS/ESA 3.3 XRF Guide	SC33-0661

#### Determining if a publication is current

IBM regularly updates its publications with new and changed information. When first published, both hardcopy and BookManager<sup>®</sup> softcopy versions of a publication are usually in step. However, due to the time required to print and distribute hardcopy books, the BookManager version is more likely to have had last-minute changes made to it before publication.

Subsequent updates will probably be available in softcopy before they are available in hardcopy. This means that at any time from the availability of a release, softcopy versions should be regarded as the most up-to-date.

For CICS Transaction Server books, these softcopy updates appear regularly on the *Transaction Processing and Data Collection Kit* CD-ROM, SK2T-0730-xx. Each reissue of the collection kit is indicated by an updated order number suffix (the -xx part). For example, collection kit SK2T-0730-06 is more up-to-date than SK2T-0730-05. The collection kit is also clearly dated on the cover.

Updates to the softcopy are clearly marked by revision codes (usually a # character) to the left of the changes.

### Accessibility

Accessibility features help a user who has a physical disability, such as restricted mobility or limited vision, to use software products successfully.

You can perform most tasks required to set up, run, and maintain your CICS system in one of these ways:

- using a 3270 emulator logged on to CICS
- using a 3270 emulator logged on to TSO
- using a 3270 emulator as an MVS system console

IBM Personal Communications provides 3270 emulation with accessibility features for people with disabilities. You can use this product to provide the accessibility features you need in your CICS system.

We appreciate your comments about this publication. Please comment on specific errors or omissions, accuracy, organization, subject matter, or completeness of this book. The comments you send should pertain to only the information in this manual or product and the way in which the information is presented.

For technical questions and information about products and prices, please contact your IBM branch office, your IBM business partner, or your authorized remarketer.

When you send comments to IBM, you grant IBM a nonexclusive right to use or distribute your comments in any way it believes appropriate without incurring any obligation to you. IBM or any other organizations will only use the personal information that you supply to contact you about the issues that you state on this form.

Comments:

Thank you for your support.
